"With pleasure," said the Learned Doctor, "but it is an unpleasant truth. The fact of the matter is, this bicycle riding is retrogressive. We are rapidly reverting to the condition of our American predecessors, the aborigines. In another century, perhaps in half a century, we shall all become as pigeon-toed as the proudest family of Hurons or Senecas that ever walked a trail through the heart of the nation."

"What!" gasped the Beautiful Young Woman. "Pigeon-toed?"

"You heard me," replied the Learned Doctor, gloomily; "pigeon-toed."

"But why?"

"Why do birds sing?" rejoined the Learned Doctor, lifting his eyebrows. "Why do dogs bark? Why do horses trot, and other things do so and so and so and so? Because they can't help it. For three weeks I have made this matter a study. It began with my own experience. The first three or four times that I rode a bicycle I was learning, and I had so many new sensations that the subject of toes never gave me a moment's thought. One day, perhaps a week after I had become sufficient master of the machine not to run over a dog on the other side of the road, I felt rather a peculiar numbness in my toes. I thought at once that it was the result of weariness. So I dismounted for a time. But I rode again, and again I experienced that same sensation. Something made me look down at my feet, not that they are so striking as to command uncommon attention, and, do you know, I was sitting on my bicycle, with my toes describing lines of an acute angle whose apex was not more than two feet from the front wheel of the machine."

"Well, of all things," ejaculated the Beautiful Young Woman.

"Exactly. That's much the way I felt about it. I said to myself: 'Here I am going up and down the principal streets and through the parks looking like a perfect fright. Never in my life prior to this time had I the remotest idea that I was pigeon-toed, slightly or otherwise. I'll abandon the wheel the moment that I get home.' The longer I rode the more I thought about it. The pleasure of bicycling was so great that I hated to think of giving it up. At last I began to take observations. I found that every rider who passed me was inclined to be more or less pigeon-toed. You may think

this an exaggeration, but look for yourself. I never have seen so many pronounced cases as I have this afternoon, and that is responsible for the explosive manner in which I addressed the air some minutes ago."

"But do you think that women, too, are affected that way?" said the Beautiful Young Woman, with the faintest suspicion of a blush stealing over her cheeks.

"Why not?" candidly replied the Learned Doctor. "If anything, I am of the opinion that the conformation of the female form is such that women would be a trifle more pigeon-toed than men. Of course it would not show under skirts."

"That settles cycling for me," said the Beautiful Young Woman.

"Oh, no," said the Learned Doctor, earnestly. "Oh, no, I wouldn't sacrifice all its benefits for a little matter like that. Too much good can result from cycling for one to pay attention to such a thing as a small curvature of the toes. And your skirts hide it all in any event."

ISN'T THIS A NICE MAN ?

Philadelphia wheelmen should at once proceed to erect a monument to Superintendent Thayer. This official is too wise to live long, and his wisdom should not go unrewarded by wheelmen, a class for whom Superintendent Thayer evidently entertains naught but the kindest of feelings. That this is so, see the following rule Superintendent Thayer has just promulgated:

Two bicycles cannot be shoved up a hill by one person, nor lead one and ride another, nor tow a bicycle by rope or otherwise.

It is well to have it known as widely as possible that two bicycles cannot "lead one and ride another, nor tow a bicycle by rope or otherwise," but why the ungallant proclamation that "two bicycles cannot be shoved up a hill by one person." Suppose one of the riders is weak, inexperienced or incapacitated? Why should not his or her companion help the dismounted one over the hill by assuming temporary charge of both machines? This rule says no. If in any company of

NEW ONES ON HIM.

Father Noah, as he gazes earthward from his perch in the clouds: "Bless my soul! I thought I had a pair of every living thing in that ark of mine, but I have no recollection of having any of those creatures down there, nor do I find them on the good old Ark's manifest."

WAS NOT FAVORED.

"Look here," said the editor, "you include in this poem a line about the earth cycling around the sun."

"Yes," replied the poet, confidently; "and I'll stand by it. That line, sir, is not only an example of polished expression, but it is astronomically correct."

"Mebbe so. But it won't go here. 'Cycling around the sun,'" he repeated scornfully. "Why don't you take the earth and put bloomers on it, and be done with it?"

WHY HE WAS GENEROUS.

She—Precious, did you give me this beautiful wheel because you love me?

He—No, darling; I gave it to you because I am tired of lending you mine.

MARY AGAIN.

Mary had a little lamb,
It followed her each day,
Till Mary put the bloomers on,
And then it ran away.

wheelmen in Fairmount Park one of the number comes to grief and can neither ride nor take care of his bicycle, the luckless wheel must be left in the road if there is a hill intervening, since "two bicycles cannot be shoved up a hill by one person." All this, of course, supposing Superintendent Thayer's new rule is adopted by Philadelphia Park Commissioners.

ANYTHING GOES THERE.

"Dauber looks quite prosperous. What's her doing?"

"Drawing for one of the magazines."

"Indeed? I didn't know that he possessed any artistic ability."

"He doesn't. He draws the bicycle pictures."

REASON FOR REVERSES.

Some men are so careful in preparing for all possible accidents to the wheels they ride that they need a whole kit of tools just to make a mistake.

AN INTERESTING STORY.

Some Close Predictions Regarding the
Bicycle's Future Made by Back
Numbers.

Whoever compiled "The Olive Branch," as the Olive Wheel Company, of Syracuse, N. Y., title their advance catalogue, delved deep into the misty past. The result is a résumé of early cycling history, which, by the light of to-day, is uncommonly interesting. It shows how the cycling shadows cast themselves well in advance.

We are told, says "The Olive Branch," that the first step toward the most popular vehicle of the period was taken in France. It was in July, 1779, that the journals of Paris announced with much derision the appearance of the first velocipede of which there is authentic record. Two enthusiastic Frenchmen, Masurier and Blanchard, the latter a celebrated aeronaut, had invented "a wonderful two-wheeled machine," which was "destined to overthrow within a hundred years the monopoly held through long ages by the faithful horse and patient ass, and enable man to propel himself on the earth at a rate of speed only limited by his strength and endurance."

Louis XVI commanded the inventors to appear before the court and give a public exhibition, which was done, and in the presence of Marie Antoinette at Versailles he promptly turned it down as unworthy the serious consideration or even respectful attention of the French public.

The Duke of York learned of the curious wheelhorse of his enemies across the channel and invited the disheartened inventors to come over and display it for his own satisfaction. The Duke was pleased with it and his enthusiasm laid him open to much ridicule on the island and on the Continent. The first product was styled the "dandy horse." Two wooden wheels of equal diameter were joined by a wooden reach, which the "rider" straddled and propelled himself by thrusting his feet on the ground and pushing with the toes, directing the course of the contrivance by means of steering handles above the forward wheel. Saddles were not thought of. The popularity of this remote ancestor of the "safety" of to-day was of short duration, and it was soon forgotten, only a few being made for the "dandies" of London, from whom it took its name.

In 1818 Dennis Johnson improved on the "dandy horse" by adding an abdominal rest, but the riders still did more walking than riding, and three years later Louis Gomperts introduced a driving handle attached to a cogged segment fitted in a sprocket on the front axle to assist with the hands in propelling the machine. But to M. Salices, a French naval officer, belongs the credit of first lifting the "dandy horse" rider off his feet into a saddle. He discovered that by attaining a certain speed the rider could maintain his equilibrium, and he attached cranks to the axle of the front wheel and provided a saddle. This was in 1863, but strange to say, the improved machine did not receive much attention until introduced into New York in 1866. The next year all Paris became enthusiastic over the new mode of locomotion, and this was the first real "wheel craze."

The newspapers of Paris during the year 1868 had a rich field in ridicule and caricature for the parographers' and cartoonists' pencils. New York was not slow in taking up the subject and "The Tribune" of September 2, 1868, said, "With the Grecian bend, we are to have velocipedes in this country, which are so popular in Paris. These velocipedes have but two wheels, one of which immediately succeeds the other in a straight line. * * * It is three

feet high and seven feet long." The same month "The Scientific American" described in dignified language the first velocipede race, which took place in Paris early in the month.

The first riders in New York provoked a varied stream of comment from the newspapers and magazines. "The World" of October 20, 1868, said: "Two or three infatuated persons, probably driven mad by protracted tortures on the street railway cars, or by the spurs which patient pedestrians of the omnibus take, have made up their minds to introduce into New York the modern French velocipede. This is simply a contrivance to enable able-bodied persons of a malicious turn of mind to make catapults of themselves. Such persons, leaping on a velocipede and putting it to full speed by rapid pulsations of either leg, can launch themselves with terrific force and fury against the legs of their fellow-creatures. No matter what damage they may inflict upon their victims, they can always get out of the reach of an indignant populace, long before the nearest policeman can reach the spot."

The bloomer girl was foreseen by the venerable Horace Greeley, who, unwittingly, per-

speed the awkward Ixion never knew? Indeed, family velocipedes may be constructed to accommodate suburban pater familias—velocipedes with a baby seat in front." All this, written to ridicule, has come to pass and no longer attracts attention.

This caustic comment doubtless served to deter many prospective purchasers from attempting to master the wheel, and soon after 1868 followed a period of inactivity in velocipede riding which lasted until after 1873, in which J. K. Starley brought out the "ordinary," when the name "bicycle" was for the first time generally substituted for velocipede in public use. The "ordinary" started another boom and enjoyed its full popularity soon after the Centennial Exposition of 1876 at Philadelphia. In 1878 the first American company was organized to manufacture bicycles, and from that date the evolution of the bicycle was marked by rapid strides. The same man, Starley, is credited with the first application of the sprocket and chain which made the modern safety possible, and the improvements since 1886, aside from the substitution of first rubber tires for steel fellos and later the greater boom—pneumatic tires—the improvements have largely been in reducing weight while securing increased strength, achieving more graceful lines and in bettering the workmanship put into the vehicle generally.

THE JOYS OF MUD PUGGING.

"Ringing Wet."

haps, foreshadowed her coming when he wrote in his Tribune of November 21, 1868, two columns or more on the strange vehicle which had created such a furor in the civilized world. "It is a matter of doubt," wrote the great editor, "whether the ladies will take to velocipedes or not. The use of the bicycle is, of course, out of the question unless each fair rider follows Jessica's example and obscures herself in the lovely garments of the boy."

"The revived velocipede has fast run off with the wits of the male and the modicum of modesty pertaining to the past among ladies—both sexes joining in fast travelling on the straddlebug arrangement," another writer facetiously declared about the same time. "We shall soon see the strong-minded women of the day astride of their hobbies on wheels—blue-spectacled, spindle-shanked and pantalooned—their skeleton skirt having been discarded. What cometh with its downy tail flaunting over a third of the celestial plain will attract as many eyes as the blooming seventeen-year-old comet, shining with all the effulgence of voluptuous charms, veiled, not hid, by a dainty bloomer costume, mounted on a velocipede, which the little feet will propel at a

RUNNING OVER BUSINESS.

"Well," said the young undertaker to his friend, the reckless scorcher, "whenever you see a chance to help me out any let me hear from you."

"All right," replied the scorcher, "I may run across a little business for you most any day."

SLEEPING AND CYCLING.

The new \$300,000 dormitory of the New-York University contains some features novel in college, the first of which are the three bicycle halls, extending from stairway to stairway on the west side of the building, and fitted so that 100 bicycles may be stored.

WHAT THERE IS IN A NAME.

"Want a new name for that non-detachable tire of yours, eh? Well, how'd it do to call it the Bryan Inaugural?"

"What's appropriate about such an idiotic name as that?"

"It will never come off, will it?"

NOW THE GAS HOUSE.

The latest is that cycling has decreased the revenue of many gas companies, the reason given being that while in the past people would gather round their family hearths, they now go out for a ride.

WAS NOT SO FUNNY.

A Berlin workman who upset a cyclist the other day "just for fun" has been sentenced to three months' imprisonment, which no doubt will cause him to ponder over just where the "fun" comes in.

NOT ALL DECADENTS.

The popularity of cycling is proof enough that the weakness of luxury has not yet attacked the mass of the people to the injury of the health of the Nation, despite all of this twaddle about decadence.

INVERTED.

Girl, wheel;
Banana, peel.
Slip, whirl;
Bicycle?—girl?

WHEN NATURE SLEEPS.

It is winter in the suburban woodlands. Silence as of deep sleep has settled upon them, and the red warmth of many leaves has died out of the woodland carpet, leaving it throughout its whole length and breadth a uniform smooth russet. The eye of the rider who wisely forsakes city asphalt for rural rut and stone, and who formerly found every woodland aisle stopped with greenery, now follows for many hundred feet the undulations of the russet carpet, so that the woodland seems clean swept of its midsummer mystery, a broad domain open to wind and sky, flooded with sunlight on fine days, wavy with moonlight when the moon is great.

It is now that the country-bred wheelman, lover of wild things, sensitive to the charm of the rabbit's track in the snow or the raccoon's clawed footprint at the roadside, finds the suburban woodlands most lacking in the spell of untamed nature. As a matter of fact, however, even the suburban woodlands have a few wild creatures. Hickory nuts still hanging in bushes on some trees are found on the dead leaves cut open and picked clean by some sharp-toothed fellow of the squirrel kind. Red squirrels chase one another along the stone walls that edge the Hunt's Point road; quails in small coveys cross the path of the lone rider in Pelham Bay Park. But the casual wheel rider's rush past a suburban woodland seldom reveals these things, and, despite the mute beauty of trunks and branches, close-packed buds, massed as d lichened stones, and the occasional hardy plant still green, the December woodland has a touch of melancholy.

There is still, however, a freshness and balsamic spice to the woodland atmosphere. The woodland refuses the vulgar yoke that has been placed upon all things else suburban. Nobody has yet painted the tree trunks or introduced scroll saw decorations as a substitute for vine wreaths. The smell, the color, and the texture of unspooled open air nature still rests with the woodlands, and the great trees faithfully keep their trust. The area over which they sway and sigh in the winds is yet sacred ground, a region differentiated in climate and aspect from the fields that have been cut up into building lots.

Frosty mornings still find the woodlands filled with magic. There are strange tracings of the frost upon fallen leaves, and two hours after sunrise on such days a faint mist veils the whole russet area, as if caught in the tangles of twisted vines and bare branches. Sunset fires gleam low at the end of the woodland aisles. Frozen pools in the woodland hollows reflect the fleeting ethereal rose of the twilight day, and the moon comes to blanch the woodland carpet and mesh it with a tissue of divine shadows. A nut falls from time to time with sharp crackling thwack on the leaves, and the hull, parted in three, lays bare the hard white shell. By and by will come the snow, just infrequent enough hereabouts never to be commonplace, and the woodlands will then take on their Arctic beauty rare, and to the mind of the wheelman, surfeited with the recollections of midsummer greenery, fascinating beyond its coat in the more luxurious season.

CHICAGO THRIFT.

Wabash—I was sorry to hear of your divorce, old man. Couldn't you live happily together?

Van Buren—Oh, yes, happily enough, but matrimony was too expensive. You see, I am trying to save enough money to buy a bicycle.

THEY ARE NEVER SATISFIED.

"The robe and wings are very pretty, Mr. St. Peter, but, if you please, I would prefer a pair of bloomers and a wheel."

STRIPPED THREADS AND TUBE DENTS.

Repairers are sometimes required to lay out sprockets in order to replace a broken one. Ordinarily anything of the sprocket type may be patterned after the rules relating to shaping gears, and the tables of any mechanical or engineering text-book can be used. But in laying out sprockets for bicycles a departure from regular methods is necessary. A simple way to do the work in a repair shop is shown in Figs. 1 and 2.

First get the dimensions of the chain by ascertaining the distances between the centre of the studs in the links, as shown by A and B in Fig. 2. These distances will govern the laying out of the pattern as in Fig. 1, in which the pattern is first cut to conform to the size of the sprocket, the distances being marked A. Lines E and D should then be drawn, the centre obtained and lines C

spaced across evenly as indicated. The teeth (F) can then be marked off. The pitch of the teeth will, of course, be calculated in the usual way. The shoulder of the teeth will be ground off to suit the requirements of the chain. The holes G will be cut last, these furnishing a means to bolt the sprocket to the set-spokes.

Stripping or wearing off of the threads of a cone-shaft is common. A large number of wheels are brought to the repairer every season with this injury. Cone-shafts vary so in sizes and shapes that it is difficult to keep an assortment on hand. We have found it best to repair defective cone-shafts, and since the work can be done in an hour, the bicycle is not long laid up. Fig. 3 represents a part of a cone-shaft, A being the thread. If this thread is broken, worn or stripped, put the shaft in a lathe and turn the thread entirely off, leaving the shaft with the shoulder (B) as shown in Fig. 4. Next make a

shell from steel tubing the right proportions to fit snugly upon this shoulder, as shown by C in Fig. 5. This shell may be brazed on securely or pinned with a key. Either way answers the purpose. All that remains to be done is to cut a new thread the dimensions of the old, as signified by D in Fig. 6. Such a job will last as long as if a new cone-shaft had been put in.

The denting of tubing in frames has always been of frequent occurrence. There are several ways to remove such dents. A crude way consists in boring a hole in the tube opposite the indentation and driving back the dent by inserting a tool punch through this hole and hammering it. This sometimes cracks the tubing. There are one or two costly devices for expanding indentures in tubes. A cheap, home-made and unpatented device for doing this work is exhibited in Fig. 7, in which a simple frame of iron marked A is made in such way as to support the clasp rings BB, as shown. These rings encircle the tube to be treated.

The sectional view shows the interior of a tube in which is the dent D. A small hole must be bored at E, but this can be plugged and brazed over so as not to show. In the frame (A) is the threaded-shoulder in which operates the screw (F). This screw is in turn worked by the wrench (G). The pin (F) is steel, very stiff and flat-pointed. To press an indentation outward, it is only necessary to turn the wrench slowly until the pin (F) expands the bent tubing back to place.

GEO. D. RICE.

QUESTION OF FINANCE.

The physician looked troubled. "Do you know anything about the Browns?" he asked at last.

"What do you want to know?" inquired his wife. "I have met Mrs. Brown a number of times and she seems to be a very pleasant, well-bred woman, who?"

"Oh, I don't care anything about that," interrupted the physician, quickly. "I was thinking about Mr. Brown's financial condition."

"I think he pays his bills very promptly." "I know he does," exclaimed the physician, impatiently. "But is he really a wealthy man, or is he only moderately well off?"

"I don't see what business that is of yours," suggested his wife.

"I want to prescribe for his wife." "What's the matter with her?"

"Nothing. That's just the trouble. She complains of a feeling of lassitude and all that, and I must humor her or lose all the business of the family."

"I don't just see!" "Oh, of course you don't. You've been a doctor's wife for ten years, and you don't know anything about the business yet."

"But what effect can his health have upon your prescriptions?"

"Why, the whole thing depends upon that in a case like this. If I have no idea how much he is worth, how am I to know whether to advise a trip to Europe or the purchase of a bicycle and the moderate use thereof?"

DOUBLING UP ON HIM.

"If you buy one of my new patent economical lamps," said the inventor, "I'll guarantee that you'll save half the oil you now burn in the one you have."

"Why not buy two of your lamps," queried the prospective customer, "then, and save all my oil?"

THEY WANT NO MOTTO.

"A ring in time saves crime," would be an excellent motto for the reckless and scorching riders to adopt and follow.

PROVIDENCE.

Kindly mention The Wheel.

LONDON.

SOME FRICTIONAL FACTS.

How Various Forms of Bearings Have Been Introduced in Cycling to Avoid Friction.

Under the tires of our wheels we want friction, that we may get a grip on the earth and avoid very painful consequences; on the pedal it is positively necessary; total absence of it on handle and saddle would be inconvenient; even from sprocket and chain we could not quite spare it; but in bearings it is wholly execrable, if anywhere.

The little rapier of bee and wasp is said to appear, under the microscope, perfectly smooth and polished. This may be so; under the skin it is very jagged, and if it is really perfectly smooth we do not know of anything else that is. For all smooth surfaces are ragged, and all polished ones are rough. In Fig. 1, representing, if you like, two slips of steel of the finest polish, surfaces A B and C D are really full of little projections and inequalities, as shown, greatly exaggerated,

at E E, which hook into one another and hang on just as bush thorns hang to your clothes. Hence arises friction. The service of lubrication—and even water will temporarily act as a partial lubricant—is to level off these uneven surfaces and keep their tiny hooks apart. But it does this only imperfectly. The pressure squeezes the lubricant away; it thickens and dries, and it gets gradually mixed with dirt and with atoms of material ground off.

The old velocipede, which was only a pair of small wagon-wheels in a clumsy frame, followed the wagon in construction of bearings, and so did the bicycle itself at first. The bearing was "plain," the two surfaces rubbing or sliding on each other as best they could. But this is a very frictional method; and when man became his own horse and began to draw his wagon himself he discovered that he had no surplus power to spend on friction—so the bicycle-maker soon commenced contriving. He tried the "long parallel" bearing, which rubbed plain surfaces together as before, using simply a polished and hardened sleeve. A good example of this construction was furnished by the now defunct American Star, in market 1881 to 1887, its makers having been among those who did not "believe in ball bearings."

A plain bearing with parallel surfaces has the drawback of being non-adjustable, that is, as the rubbing surfaces wear away they become loose in fit, for there is no means of making the parts practically larger by bringing them nearer together. Strictly speaking, this is true only of parallel surfaces which are also parallel to the axis of rotation; set the planes of the rubbing surfaces at an angle with that axis, and the two may be made to approach each other. So the next step in improvement of bearings brought the "adjustable cone." (We should say here that the cone was known before the bicycle and that we do not pretend to chronological exactness). This cone (Fig. 2) was in general use about 1880, and riders of that day will recall what a plague it was on the "adjustable cone pedal" particularly. It is obvious that screwing cone C, to the right brings the surfaces A and B nearer together, and thus "takes up" wear; but the device had no other advantage, was very troublesome to adjust nicely, and was criticised, in its time, as a

means of making wear that wear might be taken up.

The true method of dealing with friction was known as long ago as the pyramids and the Tower of Babel, and was probably used by the primitive man almost as soon as he found he had hands. It consists of substituting rolling for sliding, and there is no other way possible; it is as solitary and final as the shape of the circle itself. For purpose of illustration we may consider that all surfaces are toothed, gears simply having larger and more regular teeth. Put rollers under a heavy thing, and the surfaces which would hang fast if they had to rub on each other, move tolerably well when they can roll on each other, just as gear wheels would stick fast by their teeth if pushed forward in a straight line, but yield easily because they can turn. An old and familiar example is the common grindstone bearing, thus:

Here the axle rolls easily on the wheels without lubrication, and the movement of the latter on their own rubbing bearings is so slow that friction is slight; by mounting each of these little wheels on another pair the rubbing movement would be further lessened, and by adding enough more pairs the friction might be almost eliminated.

So rollers were put into bicycle bearings, but there is one difficulty that nothing can overcome; everybody knows that when rollers are used under a load they always roll crooked. So in a bicycle they will not stay parallel, and thus they bind and block one another. One device to prevent this was to make them overlap, as in the Challenge form, thus:

and sometimes the ends were set into revolving rings like this:

Such an arrangement is necessarily large and cumbersome, and it also fails to accomplish the purpose; for although the rings

hold the rollers from going askew their effort to go askew makes friction on their ends. Now and then some one of the host of useless inventors who never inquire what has been tried before their day brings out the roller again, and sometimes he wants to pack the case full of rollers, so that they will keep one another parallel; this at last, is the long-sought frictionless (?) bearing, only the rollers quarrel so in keeping one another straight that friction is developed again. The roller has had its trial and day, and it is done, as respects cycles.

Shorten the roller and round its ends and it becomes a ball, which is only a short roller. A ball has as many possible axes of rotation as it has diameters, and can turn any way it pleases; so the ball bearing came in, and it is the ultimate device for doing the ultimate thing; substituting rolling for sliding motion in bearings. But the shape of the working surfaces, parallel or otherwise, flat or curved, between which the ball is held, and also their angle with the axis of rotation of the shaft, form a large subject which is not yet quite understood, and is certainly far from put in practice at its best. If we can throw some light on this subject, or, at least, incite to more patient and determined study, we shall not have discussed it in vain.

Some of the early and cruder forms of cone bearing did not thread one cone on the axle, but formed the bearing-case in halves on the "split lug" plan, the coned pieces (just like the halves of a split ring) having one of them movable toward the axle to take up for wear. An old pattern of ball bearing, adjusting on the same plan, is sketched in Fig. 6, as used on the front wheel of the Ordinary,

the axle not being shown. A disadvantage was that the axle, being grooved and hardened, was liable to break, although this could be met by using a collar; the Harvard of the Cunningham Company was of this pattern, and so was the Facile for several years. The adjustment was by closing the halves of the case nearer together, pieces of card or paper being originally inserted between. As with the cone just described, this adjustment was only in one direction, not circular, and it was criticised as inaccurate; it was, however, in the right direction to take up for the heaviest wear.

Then came the single-row pattern, shown

in Fig. 7, as first used on the Ordinary front wheel. This was covered by a patent of very doubtful validity, but that point has passed

out of discussion, nor, as already remarked, do we concern ourselves with exact chronological order. The name Eolus and the name of Bown have dropped out of use, and this single-row pattern, with adjustment by a cone movable laterally on or over the axle, is now universally employed on all cycle bearings. The double row has the advantage of width and steadiness, but the single row is simpler, more easily made, and favors narrow tread; with a few exceptions we need not consider, the "double-ball" went out long ago.

But balls only lessen friction; they do not entirely remove it. A perfectly frictionless bearing exists only in imagination and in the loosely phrased extravagance of advertisements; such a product is not in the nature of things. In Fig. 6 it is plain that the balls do not rub on each other, but they rub on the perforated collar which travels around with them. In the single-row pattern, as now used, they have no collar, but they rub more or less on each other; moreover, although they revolve in the same direction the adjacent surfaces of each two move in opposite directions. This statement disposes of the notion that a ball bearing needs no oil. Wherever moving parts rub there is friction; where there is friction there should be lubrication. The synovial fluid in our own joints and the tears which oil our eyeballs could tell us so much as this.

When the ball is in its place, what does it do? It must travel around the circle, unless jammed so tight that it cannot; but how does it travel? We have met one maker who avers that balls do not roll, but slide, and he can prove it; in his view, a ball bearing is therefore a plain one, with a row of little steel spheres shoved around between the two cones. We think his practice on ball bearings is better than his theory. Our own position is that the balls roll when they can and slide when they must; the proportion of sliding to rolling depends upon construction and treatment, yet we believe that faulty designing and a not thorough construction are compelling them to slide and twist as they ought not to do. Time was when ball bearings were special and a talking-point; now "balls all over" are common—indeed, they are rather too much so. If a bearing is to be so loose as to shake and knock about, it might as well be on the old plain model; on the other hand, if it is to be snug and even and is also to run freely, correctness of form and delicacy of fitting and adjustment are indispensable—if these are wanting, rolling friction will not be substituted for sliding, as intended and pretended. In practice this is now too largely so. Ball tracks not scientifically shaped and not accurately finished, balls not uniform in size and hardness, and not truly spherical, and (not least) wrong methods of adjusting, are, we think, responsible in the first instance for the bad condition often found by repairers, namely: bearings jammed, balls split, and cones flattened and "out."

The fact is that "high-grade" is as present a commercial phrase, much like all-wool. Any box with strings and keys passes for a piano; any construction with suspension wheels, wood rims and pneumatic tires is a bicycle; and dropping balls into a conical crevice at the axles makes a ball bearing. Yet there are differences, and the differences are going to be better recognized and considered. In our judgment, bearings have not received enough attention; this part of the structure has not kept pace with the rest, and it needs reform.

JULIUS WILCOX,

ALEX SCHWALBACH,

(To be Continued).

SADDLES TO SUIT ALL.

Not long since all bicycle saddles were practically of one style, the hammock pattern, made of hard leather swung between two points of a spring. This year, however, a very decided reaction has taken place and every saddle-maker shows a bewildering array. There are hard saddles and soft saddles, some are pneumatics and others are of felt, while the semi-pneumatic has also ap-

peared; all manner of widths are offered and the variations in lengths and heights leave little to be desired by even the most fastidious. The Sager Manufacturing Company, Rochester, N. Y., who make all sorts and sizes, are now showing their most recent addition—their "C" Anatomical, a saddle made somewhat on the lines of the usual rigid frame-seat, but instead of the customary metal base has a frame of veneered lami-

nated wood, which is, however, entirely covered with leather. The pads are of soft felt, constructed on scientific principles, and from appearance should make an extremely comfortable seat. The use of wood makes it possible to keep down the weight materially. It is only necessary to add that the Sager Company are among the pioneers in saddle manufacturing and know the business thoroughly.

HIS LAMPS WERE MISTY.

"Wonder which way the bicycle is going to turn?" thought a fat man, who, after considerable tacking, had managed to land at the corner of Eighty-fifth street and the Boulevard on Saturday night. "Guess I'd better stand still until it passes," and he braced himself for a short stop.

"Don't seem to be in any hurry," he continued, after weaving back and forth and watching the light for several minutes. "Most dangerous thing in the world; liable to run a man down in the dark and kill him. Always was afraid of those machines," he mused, nervously. "Safer to get on the sidewalk till it gets by," and he staggered to the walk and hung to a tree box.

Five minutes more slipped along, and he spoke to a passing boy.

"Sonny, what 'n thunder is that fellow doing on the bicycle up the Boulevard?"

"Can't see any bicycle," responded the youngster, looking in the direction indicated.

"Don't you see that bicycle light right ahead in the Boulevard?" asked the befuddled man.

"That! Oh, that is a lantern hung on a stick over ripped up car tracks at Eighty-sixth street," said the boy, as he went away whistling.

CONDUCTIVE.

Minnie—I wonder if I will get my stocking full this Christmas?

Mamie—It's rather late to begin, but you might try bicycle riding.

It's a credulous world—every man believes in himself.

SOMETHING TO STUDY.

Now that the rider of '96's vintage is perforce compelled to let his blood circulate at its normal speed through his anatomy and to turn his mind to other things in his leisure time than riding his favorite machine, it would not be a bad idea if a little attention were given by him to the construction of the wheel he has ridden, so that in case of emergency he might be able to save himself a possible walk.

Every rider, novice or otherwise, should know how to repair any possible form of tire puncture. No accident is of more common occurrence, and yet the prevailing ignorance regarding same is astonishing. Repairing is an accomplishment easily learned, and it behooves every rider, woman as well as man, in these days of relaxation to spend a little time in getting acquainted with the mysteries of the tires.

One does not have to travel far to come across men who have ridden pneumatic tires three or four years, yet who know little or nothing of their construction—being so ignorant, in fact, that the repair of a single puncture takes them an hour, against the ten minutes it should require; while others again have learned their lesson so badly that with them a flabby tire means nothing for it but to ride home on the rim, or reach their bourn per train or Shanks' mare.

Both chain adjustment and bearings should be accorded minute investigation, particularly as these parts of the machine have a penchant for getting out of gear oftener than other portions of the wheel.

DIVISION FOR CYCLE PATENTS.

The extraordinary growth and popularity of cycling has made its impress even upon the staid machinery of government. The Commissioner of Patents has been obliged to recommend the creation of a new examining division. The bicycle, he explains, has practically opened up a new industry, and has brought upon his office an enormous amount of work in this one line of invention.

All applications for patents on improvements are energetically prosecuted, and the pressure for early and prompt action is great, as it is a matter of the utmost importance to manufacturers and dealers that orders for each season should be filled with the latest improvements added. The amount of work in this field is sufficient to keep an examiner and his corps of assistants busy disposing of business as it comes in.

The bicycle is now classified with the harvester, and gets only a share of the attention of one division—No. 7. This division is now further in arrears with its work than any other in the office, and it is proposed to relieve it before the glut becomes worse.

CONSUMPTION CURER.

The best word yet said for the wheel comes from Dr. Abbott, secretary of the Massachusetts State Board of Health, who maintains that it is in great measure responsible for the decrease of consumption among women. Dr. Abbott points out that the decline in the death rate of women from pulmonary diseases began five years ago, the time of the first general popularity of the bicycle, and has continued since. The rapid respiration cycling induces strengthens the lungs and assists them to throw off foreign substances.

LANGUAGE OF THE EYE.

Magistrate—Do you mean to say the lady swore at you when you ran into and wrecked her wheel?

Wobblemore—Yes, Your Honor; only she done it with her eyes.

AN OIL COLUMN.

A new brake shown at the Stanley Show, although hydraulic in name, had no water in its composition, but a column of oil, which is better, as less likely to corrode, evaporate or freeze. Half the handle-bar and a portion of the steering post are filled with oil. One handle on being turned screws a concealed plunger in the handle-bar against the oil, and the pressure on the other end of the column of oil causes the spoon brake between the forks to descend upon the tire. The only part visible is the spoon and an inch or less of brake rod under the fork crowns; there is a perfectly clear handlebar and no outward fittings, except a small screw filling an aperture where oil is poured in if the handlebar is raised, because there must be just enough in it to exactly fill it. It is powerful, and remains on of its own accord.

The oil brake, like the pneumatic one, is not capable of being put on with excessive suddenness, as more than a slight turn (which corresponds to only one pinch of the pneumatic bulb) is needed to give the full force of the brake. It is, therefore, not an emergency brake, capable of being jammed on hard and throwing you off, but it is very powerful when on, and very simple in idea and in execution.

Like all brakes, the new one has some drawbacks, and in this case it is the springless nature of the application. If you grip a lever, there is the muscular springiness of your grip, or if compressed air applies the brake there is some degree of elasticity in the application, but the practically incompressible column of fluid holds the brake on rather rigidly, which is a fault found in most mechanical devices, such as straps or ratchets, designed to keep brakes on. A degree of springiness is desirable in the application of a brake, which wants accommodating to tire inequalities, to bumps in the road, and which minute adjustment is not here found.

GOING TO TEACH ENGLISHMEN.

The English "Cyclist" says: "Single-tube tires are, we understand, to be forced on the English markets 'for all they are worth' next season, and we were informed on good authority last week that two powerful American syndicates of capitalists, aggregating £300,000 and £500,000 respectively, had been formed to bring over from the States the latest machinery for their manufacture, and to push business. They contend that single-tube tires in this country have never been properly made, and in this they are doubtless correct, but all the same we have no rosy idea of their chances of success."

GEARS CLIMBING UP.

Gears at this year's Stanley Show on racing machines again show a markedly higher tendency on the part of the English rider and manufacturer. The average was about as follows: Racers, 78-96; tandems, 88-100; triplets, 100-110; quads, 110-120. The highest gear fitted was that to a quintet, 133. A single was shown geared to 120. A noteworthy feature was that several tandems had higher gears fitted than had many triplets, or even quads.

GOOD THING.

In London financial quarters it is reported that the profits of the Dunlop Tire Company at the close of its first year in April next are likely to be some \$6,250,000, instead of \$2,000,000, as estimated in the prospectus at the time the great company with its \$25,000,000 capital was floated.

WISE AGREEMENTS.

Worcester, Mass., dealers have formed a local Board of Trade. It will be mutually agreed not to allow more than \$50 on exchange for any wheel, or to give more than 10 per cent as a cash discount.

GOOD THINGS GONE ABROAD.

C. R. BLANCHARD,

Manager Tire Department of the Mechanical Rubber Co., Chicago.

RUMORS AND DENIALS.

Hiram S. Maxim, the famous gun and flying machine inventor, stated that his firm intend to manufacture cycles next season, and that they will be the best and most expensive machines in the world. He also stated that Messrs. Krupp intend flooding the market with one million cycles at the absurdly low price of \$20 each, a statement, however, which Messrs. Krupp themselves promptly and emphatically denied.

PROOF OF THE PUDDING.

"Kindly discontinue our advertisement in THE WHEEL'S want column. It has been very satisfactory. If we had answered all the applicants we have had, it would have taken most of our time."—Corson Cycle Manufacturing Company, Nashua, N. H.

A cynic is a man who has discovered neither cycling's greatness nor his own little-ness.

OPPOSED TO WILD-CAT METHODS.

Although comparatively early birds in cycle making, starting in 1890, the Columbus Bicycle Company, Columbus, Ohio, have, by ignoring wildcat methods of marketing, made conservative increases in production from year to year, and are now among the largest producers of wheels. The firm has made reliable cycles, on which the guarantee was lived up to, and which were always honest value. With the stability that comes of capital, experience and success, they are looked on as the best kind of a risk by the parts man, from whom, like other cycle makers in like shape, they generally get favors in the matter of occasional price-shaving that do not fall to the rank and file.

With all this it is not surprising that the firm enters on '97 with the orders of practically all of last year's customers. Among those who will handle the Columbus for '97 are Stanley & Jarvis, of Grand Rapids; C. G. Fisher & Co., Indianapolis; William Mills & Son, New York; Collister & Sayle, Cleveland, and Baker & Hamilton, San Francisco.

The Columbus Company claim for their '97 line as great adaptability for the wants of the average agent as any make on the market. It includes 24-inch, 26-inch and 28-inch in both ladies' and gentlemen's models. All are up-to-date in finish and mechanical features, and this is observable in the juveniles equally with the others. Usually juveniles are the neglected features of a line, but in the Columbus case they are wonderful little prototypes of the more fully grown members of the family.

WHY AMERICANS WIN.

Writing of the trade in India, a correspondent of the rabid anti-American English Cyclist states: Day by day the American-made cycles and allied sundries are taking firm hold, at least in Bombay, if not in other presidencies of India. One cause of this is that the British manufacturers do not pay particular attention to the items supplied by the dealers here, and the worst of it is that the most prominent British manufacturers, bearing Co., Ltd., mark, do not pay attention to the wishes of the dealers. Not only that, they quote the trade discounts freely to any private person here who asks for them, even if they have agents here. In the long run they will see the absurd folly of this method, and, I am afraid, by the fair dealings of the prominent American manufacturers, the trade will go to the Americans. The latter are very anxious to increase the trade, and they follow every instruction sent by their agents. This year many American cycles are seen in Bombay and other places, but the most prominent are the Ramblers, made by the well-known G. and J. Manufacturing Company.

GUARANTEED THE FIRST YEAR.

A St. Louis retail concern, the St. Louis Cycle Company, has been incorporated on a co-operative basis. Shares of its stock are sold to customers, on which the interest is guaranteed for the first year. The proposition is to interest all patrons of the concern in the success of the business, as the greater the profits are the larger will be the dividends in which the shareholders will participate.

ONCE SEEN, SOON SOLD.

Evidently the New York Tire Company believe in letting their goods speak for themselves. Their advance catalogue is devoted entirely to illustrations of the Sampson and Ixion tires. Beyond explanatory captions the booklet contains not one word of reading matter.

AT MADISON SQUARE GARDEN, RODE DUNLOP PREVIOUSLY MADE BY SCHOCK ON DUNLOP O'CLOCK IN THE AFTERNOON OF THE LAST THE SECOND MAN, WAS HELD RIGHT UP TO HE LOST A MILE IN FOUR HOURS, AND ONLY WAS OFF THE TRACK, BETWEEN NINE AND TEN OF A CERTAIN TIRE MAKER THAT HALE RODE STATED THAT HALE RODE THEM ONLY FIVE LOPS FROM CHOICE, AND OTHER TIRES WHEN

'97 ECLIPSE SPECIAL.

* *

FRAME. 22, 24, or 26 inch, 1 3-16, 22-gauge steel tubing. Special reinforcement. Flush joints throughout.

RIMS. Fairbanks' best Laminated.

SPOKES. Special direct T head; a new but tested feature.

HUB. An improvement on the popular barrel pattern, carrying direct spoke.

BEARINGS. Tool-steel triplex, $\frac{3}{8}$ balls in crank box; as near dustproof as possible to attain.

HANDLE-BARS. Wood; new clamp; adjustable; steel, if preferred.

SADDLE. Garford.

CHAIN. Our own make. None better.

CRANKS. Eclipse pattern; one key. Best drop-forged steel.

PEDALS. Rat Trap or Combination; our own make.

GEAR. From 60 to 88; 8 tooth rear to 23 tooth front. ;

TIRES. M. & W. or Hartford.

FORK CROWN. An improved pattern. A combination of the double square and oval.

FINISH. Black, Carmine or Terra Cotta.

WEIGHT. 24 lbs., "all on."

THE DROP FRAME. As above, excepting height of frame. Wood guards. Finish: Royal Blue or Black.

PRICE. Either model, \$100.00.

SIX OTHER MODELS.

THREE OTHER PRICES,
\$75, \$60, \$50.

Heartly Discounts to Agents.

PATENT PREROGATIVES.

The Rights of the Inventor and the Wrongs of the User Who Refuses Patent Recognition.

Mr. Editor, may I call your attention to a curious mental attitude in which some even highly intelligent men in commerce stand with regard to patents? The idea that a patent is of no real value until it is sustained by the courts is widespread; the fact that, after a careful examination, and frequently after many appeals or indeed interferences with other inventors, a patent has been issued by the Patent Office, seems to impress many persons as proving nothing. I have many times had me of broad business methods say to me: "Yes, just as soon as your patent is sustained by the courts, we will carefully take a license," quite oblivious of the fact that when a patent owner has got such a decision, he can compel, not ask, the infringer to take out a license; can deny him one at will; can dictate his own terms, or indeed shut up the infringers' business, as well as collect exemplary damages.

It is perhaps not surprising that Americans, whose dread of standing armies is bred in the bone, should also harbor an unreasoning antagonism to that other relic of kingly prerogatives—a monopoly, or its descent, a patent. But, if any American will for a moment think of McCormick's reaper, Morse's telegraph, Howe's sewing-machine, Good-year's vulcanizing process, Bell's telephone, of photography in its manifold applications, of aniline dyes in their million hues, of bicycles, or eke of pneumatic tires—and incidentally of the patent toilers who invented all these things, he will, from his American sense of fair play, instinctively alter his point of view, and cheerfully acknowledge that each and all deserve the success their patents have brought them. Were it not for our beneficent patent laws where should we be? Travelling by coach, mowing with scythes, sewing by hand, greasing our snow boots, and walking instead of flying on an air-shod wheel.

A patent is not solely a prima facie right; it is an actual right, which takes effect from its issue and lasts until its term expires or the courts pronounce it invalid. It is not a mere inchoate right requiring the action of the courts to make it good. This action of the court is a mere means of enforcing the right, just as is a suit of replevin, or ejectment, or trespass, or a bill for specific performance.

Consider for a moment, Mr. Editor, what a hardship would be inflicted on an inventor if his patent were not the real right, I indicate. Suppose to-day some clever, but poor man should invent and patent a tire which is actually non-puncturable, while losing none of its resiliency. Would not all of us join with one accord in wishing him a fortune out of what afforded us so much security and comfort? But if, though owning his patent, he were unable to collect license fees for the use of his invention until he had, at an expense of at least ten or twenty thousand dollars, and after a lapse of two or three years, secured against some infringers a decision sustaining his patents, would he not almost certainly be swamped financially before he reaped any benefit for his ingenuity?

Of course we all know that there is a class in the community (happily a small one), which thrives on pilferings from other people, which never pays until it is made to do so, and whose interest and discount come to more than its profit account. These are the people who will "gladly take a license when the patent is sustained," but meanwhile will

use the invention and pay nothing. Verily, they have their reward in hearty damages at the end. But I have found that the honorable American man of affairs is too generous and equitable to do this, and it is he who is in the large majority; it is he who helps the inventor, who is glad to pay tithes from his profit to the man whose ingenuity has helped him to make it; it is he who keeps a healthy, honest tone to the market, who does honor to the name of merchant.

There is, however, an intermediate class of men otherwise intelligent and scrupulous in their dealings, who know little about patents; who look on patent-owners as a species of land sharks, and who, from mere lack of interest in the subject, are ignorant of the equities of the patent law. Should a customer to whom they had delivered goods say to them, "I will pay you what these goods cost when you shall have proven to me through the courts that you are the owner," would they not tax him with idioy, and make short work of him by a legal process, which unfortunately does not exist in patent law? And yet this is what these men, merely from heedlessness, say daily to the inventor.

Now, Mr. Editor, there be inventions and inventions—inventors and inventors. Unquestionably there have been patent sharks, there are patent sharks still. A man who goes from village to village mulcting the farmers \$5 apiece for a gate post on which he claims to have a patent, or the farmer's wife \$1 for a broiler ditto, is not only an unmitigated nuisance, but a public enemy besides. But the majority of inventors and patent owners are as honest and intelligent folk as exist in the community; and it will add much to our reputation for sagacity as well as for honorable dealing, if we give each patent a fair credit for being what it purports to be.

The Patent Office in Washington contains many able men. According to their knowledge, which is really vast, if not all comprehensive, they issue to each applicant a patent for only what, so far as they know, he has really invented. An occasional patent, despite this, may be "not worth the paper it is written on," simply because the Patent Office examiners are not omniscient. But because of this, we must not assume that all patents are so. And in any event, the legal right of the patentee is an unquestioned one. He issues licenses at a reasonable royalty, to those who voluntarily acknowledge the validity of his patent; he is entitled by law and in equity to collect costs and exemplary damages from the manufacturer who forces him to prove his case in the courts.

INVENTOR.

WHEN HORSES HAVE PASSED.

"I couldn't have punctured my tire at a more inconvenient time," said Mr. Smallcash, as he surveyed his damaged wheel.

"Why so?" inquired his friend.

"Why," replied Mr. Smallcash, dolefully, "it will cost me just seven dollars to get a new tire, and I had been laying up just that amount to get a span of horses and a surrey for my wife."

SUFFICIENT REASON.

Cholly—I'm going to get an imported wheel. Algy—Do they make better wheels in England, Cholly?

Cholly—They make wheels in England, Algy.

Most of the cycle poetry published would indicate that the authors never knew how to ride and that they carried their wheels in their heads.

CYCLE CLASSIFYING.

How the Patent Office Places Cycles Under Different Names in Its Lists.

When the United States grants a patent, the patentee receives, by the fact of the grant, a reasonable assurance that the invention is novel; and the Federal courts will so presume until the contrary is proven. This presumption of novelty attaches to every United States patent, because, under the Federal laws, the Patent Office is obliged to make a careful examination of all patents relating to the same subject matter of invention, and of the publications bearing on it; and to deny a patent for any device found to be lacking in the quality of novelty. Inasmuch as there have been issued some 575,000 United States patents, to say nothing of the vast number of foreign ones, among which search has to be made whenever an application is filed, it is obvious that a careful classification, according to the various arts, is absolutely necessary in order to assure anything like dispatch and accuracy in handling the vast number of applications constantly flowing into the office. Such a classification now exists, and, as patents multiply, new classes are added and the old ones still further subdivided.

When Lallemand filed his now famous application for a velocipede, in 1866, the examiner classified it among "carriages." Only twenty patents for rider-propelled vehicles had then been granted by the United States, and it was not thought worth while to make a distinct class of so small a number of patents. If, therefore, M. Lallemand made any preliminary search to see if any one had anticipated his invention of the bicycle, he looked among the patents for "carriages."

In 1869 the applications for patents for pedomotive vehicles became so numerous that a sub-class of "Velocipedes" was created as a division of the class of "Carriages." "Velocipedes" existed as a sub-class of "Carriages" until November, 1892, when it had become so unwieldy, and was, withal, so frequently consulted, that it was removed from the class of "Carriages" and made a class by itself. The work of subdividing "Velocipedes" was then immediately undertaken, and, as a result, the 4,000 and odd hundreds of patents issued by the United States, as well as an equal number of foreign patents, now in the class of "Velocipedes," are distributed through forty-three sub-classes. Cycle accessories are not included among these forty-three subdivisions; nor are "wheels," "tires," or "sprocket chains," which are to be found, respectively, in the general classes of "Carriage Wheels," "Tires" and "Drive Chains," because they are articles of general application as well as of special use in cycles.

In seeking to classify "velocipedes," the most obvious dividing line is found to be that which is based on the number of wheels. Accordingly, one finds sub-classes of "unicycles," "bicycles" and "polycycles," the last including all cycles having more than two wheels. There is, furthermore, a sub-class of "epicycles," which includes all cycles propelled by a small wheel travelling on the inner periphery of a large rolling ring or wheel; a vehicle that has never been used except experimentally. "Dicycles" form another sub-class, and include all machines having a single pair of wheels arranged abreast, that is, of the Otto type—popular in England a dozen or more years ago.

"Bicycles," again, are divided into "ordinaries," "header preventers," both of these being now practically dead divisions—"rigid-frame safeties," "spring-frame safeties" and "tan-dems." Then there is a sub-class of "sup-

ports" for holding a bicycle in upright position, which contains many patents. "Brakes" and "bearings" are two voluminous subdivisions. "Children's seats" form a small sub-class, as do also "coupling bars" for holding two bicycles coupled together. "Crank clutches" is only a small class of devices which enable a rider to coast with his feet on the pedals, the pedal-cranks turning the drive wheel only by a forward motion. "Mudguards and dress protectors" is a large sub-class. "Pedals and cranks" form another large class full of most interesting mechanical contrivances. "Locks" that form a part of the cycle frame or modify its construction in some way make up a small class. Most bicycle locks, however, are found in the class of locks in general. "Saddles" is a very active class, and contains a great number of patents. "Steering-heads and handle-bars" is also very active and very large, while "steps and footrests" is a class sluggish and small.

Bicycles are still further subdivided, according to mode of propulsion, into "crank and gear," under which class falls the new chainless bicycle; "crank and chain," of

besides, a class of "crank and pitman," the driving means common in children's tricycles, and a class of "rowing machines."

Under "polycycles," as well as under "bicycles," there is a sub-class of "spring frames." "Figure polycycles" includes the cantering propellers, hobby-horses, and similar figures that make children's velocipedes attractive. "Polycycles" have a great variety of "steering devices," and a sub-class of them has been created. There is also a small class of "axle couplings"—devices which are necessary in some polycycles to enable them to readily turn corners by permitting one wheel to go at a higher rate of speed than its companion.

A need of still further sub-division now exists, and before long it is very likely that new sub-classes will be formed, such, for example, as "roller brakes," "band brakes," "pneumatic brakes," "automatic brakes," "pneumatic saddles," "handle-bar grips," "adjustable handles," "pedals," "toe clips," "crank shafts," "variable lever cranks," and "chain adjustments."

By the time the new classes become thoroughly established, it is very probable that, if inventors continue to be as prolific as of late, still other sub-divisions will be found necessary to expedite examination of applications for patents on cycles. E. D. S.

FLAT-DWELLERS' FAVORITE.

This is the latest British invasion of the realms of the folding bicycle. It is constructed with a dividing handle-bar, which collapses on the withdrawal of a bolt; the machine also has a hinge over the crank-bracket, thus it can be reduced in length to exactly half.

which the rear chain-driven safety is an example; "lever and crank," in which is found the "Facile" type of driving means; "lever, crank, and gear or chain," examples of which are found in the numerous machines that are boomed for a brief period, are invariably said to be able to go a mile a minute when driven by an average rider, and when geared to 150 can be driven with ease over a country road. There is also a propulsion class of "lever and ratchet," such as was used on the "American Star." "Lever, ratchet, and gear or chain" includes those machines in which the ratchet driving is applied to the rear-driven geared machines. Besides these there is a propulsion class of "rack and pinion." Machines having this latter device have rarely or never appeared before the public. Then there is, in addition, a class of anomalous, "unclassifiable" devices, which make up a subdivision of "miscellaneous" propulsion.

"Polycycles" also are divided into the same propulsion sub-classes as bicycles, and have,

RUSSIANS TO RIDE THEM.

Cycle shows are not always empty affairs. The Davis Sewing Machine Company can testify to this. At the Stanley show, just recently concluded, one of the plums which entered the active and appreciative maw of the Dayton folks was a very handsome order for '97 Daytonos for their Russian agent—T. Tansky by name—probably the largest order for American cycles for Russian sale every placed. Mr. Tansky controls his country on the Dayton, with headquarters at St. Petersburg.

He is very enthusiastic in the booming of his business, and will resort to Anglo-Saxon methods next season. He has already ordered several Dayton triplets and a quad, and will have a number of Russian racing men riding the Dayton and in various other methods will resort to the "push" so generally thought exclusive to the Yankee.

PUNCTURE CURERS COMBINE.

A representative of the Plugine Company is authority for the statement that several of the largest makers of puncture preventives will be combined into one company and will issue a guarantee on all tires in which their compounds are used, as an offset to the action of many tire concerns in withdrawing their guarantee of tires in which compounds have been used. Tire repair shops will be established, in which all plugged tires will be repaired free of charges.

BIG DIVIDEND PAYER.

Notwithstanding the loss which Humber & Co. sustained last July in the total destruction of their factory, the annual report of the company shows that they made a profit on the business of the year ending September 30 last amounting to nearly \$300,000, paying a dividend of 20 per cent.

BEGINNING THE NEW YEAR.

On January 1 the firm name of the Sieg & Walpole Manufacturing Company, Kenosha, Wis., will be changed to the Charles H. Sieg Manufacturing Company. This was determined at a recent meeting of the stockholders of the corporation.

FAMOUS FOX FLYERS ARE HONEST BICYCLES. Write us for advance circular.
FOX MACHINE CO., Grand Rapids, Mich. 260 N. Front St.

WILL NOW EXPAND.

As a result of the purchase of the New York business of the Anglo-American Cycle Fittings Company by Treasurer C. M. Rice, the firm is preparing for a largely increased business in their specialties. At their factory at Waterbury, Conn., they have a large section devoted to the manufacture of the favorably known Perry pen steel bushed chain and their American pattern chain, the Excelsior.

The chain plant is entirely novel. Every operation in the various stages of chain manufacture is automatic, even to the assembling; at the same time machines are so arranged that each part as it passes is automatically gauged and tested, thus insuring accuracy and uniformity from one portion to another. The steel used in the manufacture of these chains is made entirely to special analysis, and, in order to insure uniformity of quality, is made in crucibles holding not more than 100 pounds of metal. Three-sixteenths-inch racing chains are made to show no stretch on tests of 1,000 pounds, and possessing tensile strength of 1,950 to 2,000 pounds.

Hubs, axles, cups and cones are specialties that are also receiving the closest attention as to quality and workmanship. They also have a two-piece crank axle of special design, and, besides turning out almost every component part of a bicycle, will manufacture the Southard twisted crank under a license for 1897. The crank is twisted by a patent process, which gives the metal about three times its original strength, at the same time detects any flaws there might be in the metal.

The Anglo-American company has within the last year established direct agencies for the sale of their products in England, France, Germany, Norway, Sweden, Denmark and other Continental countries, as well as in India, South Africa and Australia.

AGED, BUT ALMOST A WINNER.

The Shelby Cycle Manufacturing Company has been notified that William H. Townsend, of Syracuse, N. Y., a gentleman past middle age of life, has ridden his Ideal bicycle, fitted with G. & J. tires, over eight thousand miles between April 1 and December 1, of this year, thereby winning two of the gold three-thousand-mile G. & J. souvenirs, which were offered by the makers of that tire. Mr. Townsend came within one of winning the greatest mileage on G. & J. tires prize of \$200 in cash. The gentleman speaks very enthusiastically of the manner in which his Ideal stood up during this hard test; he had no difficulty whatever except two small punctures, which were easily repaired.

FILLS EVERY REQUIREMENT.

Where the cyclistometer makers will stop heaven alone knows. Here comes the Anglo-American Fittings Co. with an instrument which registers up to 100,000 miles, and yet sells for \$1.50. It is neat and compactly made, and guaranteed in every respect. For use abroad, it is made to record kilometers and Russian versts.

CHAIN-COVER CONVERT.

As a result of his visit to the Stanley Show Frank W. Wood, of the Indiana Chain Company, is a gear case convert. He reports that not only was he well satisfied with the object of his trip—the introduction of Indiana chains—but that in all probability he will begin the manufacture of gear cases in this country.

TRY OSSAWAN NET.

Undoubtedly some makers have found the dress-guard question most vexatious. The matter is so foreign to metal working that even when a lacing had been decided on, an artistic or more than commonplace stringing of it has arisen to worry him. It is to lessen annoyances of this sort that the Ossawan Mills Company, Norwich, Conn., have brought out the "Ossawan net," a ready-to-be-applied dressguard, made in many colors and combinations of lacings, which would seem to be assured of instant favor. The net is shaped for any wheel and is readily attached in the usual fashion.

SLICK AS A WHISTLE.

Prince Wells, of Louisville, has begun his annual fall crusade in the interests of the "Genuine East India Grapholine for Cycle Chains." He believes it to be the only thing, of course, and warns wheelmen and dealers generally to beware of imitations, and to accept none which has not his trademark. It is understood that he is quoting particularly enticing figures to the trade.

Semi-Pneumatic Hygienic Saddle.—P. & F. Mfg. Co., Reading, Pa.

TAPER OR OIL.

The sale of the Victor bicycle lamp is now being conducted entirely by the manufacturers, the Kester Electric Manufacturing Company, No. 640 Linwood avenue, Buffalo, N. Y. The Victor, as is fairly well known, is one of the smallest and lightest lamps on the market, weighing but four ounces. Its peculiar feature is that it burns tapers instead of oil, avoiding, it is claimed, all the discomforts of kerosene or other such illuminants. While the taper is the feature of the lamp, it will also burn oil, patents for this interchangeable feature being now in the mill. The lamp which burns oil only retails at \$1.75; that which burns either tapers or oil for \$2, which includes one dozen tapers.

AN ILLUMINATED RAINBOW.

Cyclists who admire color effect will be interested in the newest lamp brought out by the Union Lamp Company, Nos. 76-84 Market street, Chicago, the "Boulevard Special No. 4," as it is termed. The body of the lamp contains sixteen lights, ranging from one-half to one and a half inches in diameter, each of a different color. Greens, blues, reds and yellows are all there. The effect is described as "oriental."

HORN OF PLENTY.

A peculiar election bet made by a party of men in Decatur, Ill., curiously enough has resulted in one of the most novel advertising schemes on record. The wager resulted in the transportation by a crew of five men of an immense horn, constructed of galvanized iron, thirty feet in length and six feet in width at the big end, from Decatur to Canton, O., the entire distance to be travelled on foot by December 30. When the men reached Indianapolis last week the big horn created a sensation. While they were resting in the centre of the city, surrounded by a curious crowd and telling of the wager, the advertising man of the Hay & Willets Manufacturing Company passed, and hearing the story of the crew and appreciating the novelty of the thing straightway made a dicker with the manager of the crew. The result was the horn immediately became the property of the company.

Then the horn was carried to a sign painter and the words "Hay & Willets Manufacturing Company, Indianapolis, Ind., makers of Outing Bicycles" were painted on one side, while on the other side was inscribed "Outing Bicycles are Honest." After this little formality had been gone through with, the men were turned loose with the horn to do as they pleased, and in less than twenty-four hours the entire city was in an uproar of excitement. It attracted more attention than a circus in a country town. It is still to be carried to Canton, 300 miles from Indianapolis and will pass through hundreds of towns and villages. The horn is to be presented to Major McKinley on January 1. As it is too large to be taken into his house, the chances are that he will be at a loss to dispose of it. He has been advised of its coming by the Hay & Willets Manufacturing Company, and requested to lend them the horn after he has grown tired wondering what to do with it. If secured it will be exhibited at the company's stands in the cycle shows.

HOME TALENT WON.

In all, 387 designs were submitted in the prize competition for best designs for advertisements of Monarch bicycles which closed November 30. The judges made the following awards: First prize, Blinner Engraving Company, Chicago; second prize, Elmer C. Jensen, Chicago; third prize, Oscar Harter, Chicago.

The following received honorable mention: M. O. March, Lockport, N. Y.; A. E. Richards, Milwaukee, Wis.; Buckton Nendick, Chicago.

A public view will be given by the Monarch Cycle Manufacturing Company at their retail salesrooms, No. 152 Dearborn street, during the week commencing December 21.

MAKING A CHANGE.

E. J. Gulick, who for two years past has superintended the cycle department of the Fenton Metallic Manufacturing Company, at Jamestown, N. Y., has resigned that place to engage in some other important work which the Fenton company has on hand. Mr. Gulick is highly esteemed up Jamestown way.

MOVING NORTHWARD.

The Weaver Cycle Material Company, of this city, report having contracted with Carl J. Persson & Bro., of Holsingborg, Sweden, to represent them in Norway, Sweden and Denmark. The agreement carried with it a healthy order for Weaver material.

When wheelmen get left they usually shout for their rights.

VOL. XVIII., No. 19.

NEW YORK AND CHICAGO, DECEMBER 25, 1896.

WHOLE No. 401.

"TOUCHING" TACTICS.

The New Thing in League Politics. "The Campaign Committee" Resort to Them.

New York, that is, the New York Division, L. A. W., has a "Campaign Committee." It has a chairman, a vice-chairman and a secretary-treasurer.

When the committee was organized and these offices created and filled probably does not concern the ordinary untitled member of the League. It is composed of members of the holiest of inner circles, of men upon whom Chief Consul Potter beamed and brought out of obscurity or retirement. They relieve the debt and are trying to pay it in their own peculiar fashion. They are trying to make their idolized chief guilty of "doubtful loyalty" to the organization. To accept the presidency would place him in that light, Mr. Potter himself has asserted. But the "Campaign Committee" knows Mr. Potter quite well, and does not mind such assertions.

They are going right ahead in the effort to land him in the presidential chair. They have sent a notice to the newspapers announcing that they have held a meeting and decided to present Mr. Potter's name to the National Assembly as a candidate. They ask for "co-operation." If current report is true they have asked for something more—they have been "touching" the New York delegates for contributions to a "campaign fund." This probably explains why a secretary-treasurer forms one of the committee.

It is alleged that the fund is to be used in buying red lemonade and influencing delegates of other divisions.

C. G. Percival, a delegate from the Massachusetts division, who, next to seeing his name in print, loves the sound of his own voice, is in New York this week, relating how he carries in his vest pocket the vote of the Bay State, which he will very kindly cast for Mr. Potter.

BROUGHT BUT \$4,000.

Newark, N. J., Dec. 22.—Vice-Chancellor Emery to-day confirmed the sale of the Howard & Nichols cycle works at Woodside, by E. C. Harris, the receiver. The factory was sold to Numa J. Felix for \$4,000 in order to pay wages amounting to \$1,400 to the workmen. Howard & Nichols made chainless bicycles.

TRYING TO PATENT A FEATURE.

Report has it that the Sterling Cycle Works are making a strong effort to obtain patents on every conceivable form of round fork crowns.

If some of cycling's critics would think twice before they spoke, they would keep still most of the time.

BURRIS TO REMAIN HERE.

Elliott Burris, the head of Humber & Co.'s interests in America, returned from London on Saturday last. Interest attached to his return because of the report that he had been called across the pond to consider an offer to locate there as managing director of all the Humber interests. He smiled when asked about it, and entered a prompt denial. Managing Director M. D. Rucker is still on duty, he says, and has expressed no desire to be relieved, despite his recently accumulated millions.

"I expect to go over again in July," Mr. Burris remarked, "and to return again," he as quickly added.

From what Mr. Burris said it is evident that his visit was prompted by the inability of Humber's English factories to meet their orders. The orders already in hand will keep them busy until far into May, and to relieve the pressure, Mr. Burris brought back with him a commission to ship 1,500 American Humber's. The cycle boom in Great Britain will continue, he states.

Of course, Mr. Burris visited both of the English shows. It did not appear to him that the American exhibits attracted particular attention, and beyond the pneumatic brake and the Fleuss tubeless detachable tire, nothing created more than a passing impression. He thinks that of all the American seekers for foreign trade, the Western Wheel Works are doing by far the largest business.

DIFFICULTIES SOON SETTLED.

The Chancellor of New Jersey, before whom was heard the Warwick-Stockton case on Monday and Tuesday of last week, will render his decision on December 28. Dr. Chas. S. Stockton, the financial man of the Warwick-Stockton Company, and who has made a large investment in the plant, is very much grieved over the publicity which has been given the matter. Dr. Stockton states that he has filed a full statement of his side of the case, and that he has no fear that a receiver will be appointed. He denies that he is substituting inferior goods, and states that all the goods he is making (including the Gem hubs and pedals and the other products of the Warwick-Stockton Company) are being eagerly ordered by the trade.

The Warwick-Stockton factory is running overtime every day. THE WHEEL knows this to be a fact, and the financial story of this year will be a prosperous one for the company.

Dr. Stockton claims that the difficulties existing in his concern are purely matters concerning Mr. George T. Warwick and himself, and that they will be settled in due time.

A bill has been introduced in the Alabama Legislature assessing a tax of \$1 upon every bicycle owned in that State.

SELLERS COMBINE.

At Least St. Louis Thinks They Should do so for Mutual Profit and Protection.

For many years a National association of cycle dealers has been a matter of more or less discussion, but, despite the talk, nothing ever came of it. Now, however, the St. Louis Cycle Board of Trade has interested itself, and is making an effort to bring about the much-mooted organization. To that end this call has been issued to the various local boards of trade throughout the country:

Gentlemen: Feeling that the organization of a National Association of Cycle Dealers would be of great benefit and assistance to our local Cycle Boards of Trade, in dealing with the many troublesome questions, such as the trading in of second-hand wheels, selling on instalments, work done under the guarantee, etc., that confronts us in common, and are of little or no interest to the National Cycle Board of Trade, I have been instructed by our Local Cycle Board of Trade to write to you, requesting that you present the matter at your next meeting of joining us in forming a National association.

Should your body pass favorably upon the subject, kindly appoint a committee of three to represent you at a convention to be held in January, at Chicago, during the Cycle Show.

When asked for his opinion on the movement, President Coleman, of the National Board of Trade, preferred that they be not quoted for publication. He has his ideas, of course, but feels that a public expression might tend to prejudice or prejudice action on the part of the National organization.

FOWLER TO KEENE.

As was foreshadowed, Keene, N. H., will be the ultimate location of the Frank T. Fowler Mfg. Co. The first decisive step was taken on Thursday of last week, when Mr. Fowler visited Keene and completed the organization of the company by electing Frank T. Fowler president and A. T. Batchelder, W. R. Porter and Frank T. Fowler directors, and Bertram Ellis clerk. It is not likely, however, that the plant will be removed from Worcester until late in '97.

DUNLOP WINS AS USUAL.

London, Dec. 9.—The great fight between the Dunlop and Scottish Tire companies has resulted in a sweeping victory for the Dunlop company. On every point at issue the Judge—who is universally acknowledged to be the leading legal authority in this country—found for the Dunlop, and, although he allowed the decision to hang over, pending an appeal, it is more than likely that no appeal will be made.

There are many men in this world who keep themselves poor by constantly trying to get rich.

MOVED THEM FINALLY.

It seems that THE WHEEL publication of the condition of Eighth avenue, between Forty-ninth and Fiftieth streets, where the odoriferous car stables are located, and the possibility of the place being condemned as a public nuisance, awakened some one to a sense of decency. Preparations are actually being made to lay asphalt strips on either side of the avenue. This will lessen the jolting and slipping to an extent, but exactly why other railway companies are required to asphalt the entire width of their crossings while the Eighth avenue corporation is permitted to lay narrow strips, is one of those things past understanding.

NOT SO SLOW IN PHILADELPHIA.

Philadelphia has begun to work for the next League meet, backed up by the Associated Cycling Clubs and the local Cycle Board of Trade. They will each contribute strongly to the entertainment fund, and the Century Wheelmen have offered to furnish one day's entertainment, for which, it is said, the members will contribute about \$700. Philadelphia has many attractions for cyclists, innumerable clubs, several fairly good tracks, and an extremely large and hospitable cycling population.

BICYCLES IN BURROLAND.

A bicycle in Mexico must be equipped with a bell, a metal plate showing its license number, and at night a lantern. The number of wheels in the City of Mexico is increasing rapidly. All makes are represented, and the very latest patterns and improvements are demanded. There are many splendid trips to be made in the valley. In every direction extend roads that have paths made smooth by the tread of burro and barefoot native, and, while they would offer little inducement to a vehicle, furnish a good track for wheels.

THINK OF HIS EXPENSE ACCOUNT.

J. M. Hill, representing the Syracuse Cycle Company, will sail from San Francisco on January 12, making a tour round the world in the interests of the Crimson Rim. He will stop at Honolulu, Sidney, cover Australia, China, Japan, India, South Africa, Cape Town and Europe. This is doubtless the most extensive trip planned by any American cycling firm. The Syracuse Company have had a fair trade abroad, but propose to extend it.

WHEELS OUT OF TRUE

Charles E. Fowler, a middle-aged resident of Hammonton, N. J., who has been working on several bicycle patents, went daft on Monday last. He doffed most of his clothing, threw away his watch, money and bicycle and wandered out into the snow. He was raving when discovered. Overapplication to his patents is believed to be the cause of his trouble.

SIXTEEN RACERS TO ONE CLUB.

Sixteen members of the racing team of the Riverside Wheelmen, of this city, were tendered a dinner last week, as a compliment to their year's work. During the last season the men won 94 firsts, 101 seconds and 63 thirds.

HE'LL BE SORRY.

Lesna, the French long-distance rider, has left Paris for Australia, accompanied by Pogron, Huret's ex-manager. He took with him twenty picing machines, and intends to show the Australians a thing or two about paced records.

HE'LL DO.

Since assuming the management of the Worcester Cycle Manufacturing Company, George Macdonald has been making changes all along the line, and when completed there is no doubt that his staff will be uncommonly capable. Among others he has engaged James Josephi, a particularly earnest

James Josephi.

worker, who for two years past has been one of the Thinkham Cycle Company's chief aids. Josephi will have charge of the Worcester Company's uptown store in this city, where his twelve years' experience in the cycle trade will stand him in good stead.

HE'S A PRESIDENT.

The accompanying picture introduces Mr. George R. Johnson, president of the George R. Johnson Company, No. 107 Chambers street, New York. Mr. Johnson has been in

George R. Johnson.

the bicycle business for several years, but during the present year opened a sundry house, where he jobs sundries of every description, also bicycles.

LIKE A PARROT.

He was a man of active mind,
A genius, many said;
His disposition, too, was kind,
The poor he oftentimes fed;
Yet when he cycled down the street
He made the people grin—
Not head nor heart was wrong, but feet—

his
feet
turned
in.

"GOOD ALL THE TIME AND IN EVERY WAY."

Prominence is given the "White" girl in one of the two catalogues that reached THE WHEEL this week—that of the White Sewing Machine Company, Cleveland, Ohio. Those who recall the superb illustration of "the girl" in last year's handbook will recall that she was an unusually attractive personage; indeed, the White company has found the illuminated cover on which the girl is the central figure, and most of the Now and Then illustrations, worth making use of in their '97 publication. In general appearance, therefore, it does not differ materially from that of last season.

The catalogue seeks to immortalize the "White" girl in this fashion:

"The White wheel with its fair rider in white is now a familiar sight, and everywhere a warm welcome has been accorded the wheel and its dainty burden. The 'White' girl has coasted right into the hearts of riders and lovers of the wheel, and now 'The White' is known wherever the bicycle has made its way. Known as one of the few best, one that cannot be ignored where wheels of the finest grade and highest class are under consideration."

Of its policy the White company says: "In the front rank" well describes the position we have achieved, while in our service are men who have over and over again proven themselves masters in their particular line, and who in the manufacture of 'White' bicycles have demonstrated the fact that methods and men that win in one line are worthy of ample confidence in any collateral line.

"We must win in the future, as we have in the past, entirely upon the merits of our production—applying the same principles in the manufacture of wheels as elsewhere, it being our intention to adhere strictly to this rule under all circumstances, and not for a moment, allowing ourselves to be turned aside from this high aim by the temptation to follow the crowd into the delusive swamp of the 'cheap and inferior.'"

"Acting upon the presumption that the more cheap wheels sold the greater would become the demand for those of strictly high grade, we have directed our efforts solely in one direction—concentrating our forces upon one single point—the manufacture of the best that money can buy or skill produce. And we mean all that may be inferred from this statement. Our guarantee means nothing more or less. Our advertising means just that, and every statement is made good all the time and in every way.

"It is true we build two grades of bicycles: Models A and B with list at \$100, and C and D with list at \$75. Each the best of its particular class, our second grade being in no ways inferior to Models A and B in points of ease, comfort, durability and satisfaction to the rider, built as they are from the best quality of material by the same workmen and modelled after the same lines. Indeed, it is not too much to claim that our second grade might well serve as models for the so-called high grades of many manufacturers."

The company was one of the very first to make public its specifications to reprint which would be tautology. Of course, special effort has been centred in the "white and gold mounts," so called because of their finish. The catalogue fairly rhapsodizes over them. Harken unto him: "They appeal to all lovers of genuine art, and to those as well whose refined nature leads them to admire that happy combination of the strong, the delicate, the useful and the beautiful that goes to make up the fin-de-siècle masterpiece of art, architecture, literature and the products of the workshop. . . . Harmony breathes through every detail; there is poetry in every line."

MISTLETOE AND HOLLY.

CHRISTMAS and Christmastide are here, are with us—distinctively so. Pessimism hides his heavy head. His seamy face scowls not upon us in the thoroughfare.

Instead all is gayety and expectation and enthusiasm, a spontaneous emulsion of humanness. Optimism is a disease. It is well that it is so. "The Wheel" applauds the holly-and-mistletoe end of the year, and gives greeting to all its readers and peoples.

Never mind the moral side just now—nor the Christian significance of the time, either. Regard this holiday time, when we are unreasonably glad, as a welcome panacea, coming to us each year to brightly and freshly offset the tameness, the sameness and the grind of a large part of each and every one of our years. Accept it as an antidote, if naught else.

How much disturbed we are. Self-absorption vanishes through the necessity of the occasion. We are compelled for the nonce to take into our account the needs, the lacks, the aspirations of others. It is a time for the heart. It riots, unfettered, unimpeded by grind, by judgment, by diplomacy and all the rest of the social and commercial day-unto-day policies and customs—at least the organ of the soul should so pulsate, and poor is that heart which does not. It is dead. It is ashes.

We pass out on to the street, and are of the crowd. It exhales an intoxicant. It breathes an exuberant atmosphere. We walk near the woods, which outrival themselves in snowy beauty, in coated, icy silveriness, as if the spirit of the Teacher, His unruffledness, His

serenity breathed more zealously at this time.

And what does it all stand for? Why this unreasoning transformation, this universal welling up of sympathy, of best-selves, so usually latent, blatant, impoverished and profitless? The date on the calendar looks like any other date. The sun discharges its function, and the stars shine steadily or tremulously, as is their wont. It is because of the spirit of Christ, which is the keynote and the capstone of Christmas Day. Do unto others, charity, peace, good-will—such are the jubilant strains, the golden songs, which have exhaled harmony down the centuries, and which become a sort of saving grace to us, and illuminate us each year, each Christmas.

Noble figures have been there in tradition and in history. Lore of heroes, stories of great men, of men nobly great or ignobly famous, are dwarfed indeed, if we interpose between ourselves and the glaring procession the solitary, self-depending figure of Christ.

What victory so bloodless? What other triumph so lasting? Nor fire nor sword were used; only doctrine and example and a world-engulfing, never-receding tidal wave of peace, of charity. No such other victory ever was, and millions still, and always will, celebrate it.

It is this that we talk of now, this we dance for and make merry over. It is a remembrance of the One who gave to others more than any other one could ever give, a complete, unrewarded, rewardless surrendering up of self for others. And it is this great self-abnegation, it is the loftiness and beneficence of this Christ and what He meant and stood for, that touches the hearts of all men who are not wholly dead and burnt up with isms, particularly with greed and latter-day-ism. And it touches them and breathes on them and makes them relatively great and good, each one according to his stature.

THE REWARD OF ELLIOTT.

WHEN Mr. Sterling Elliott, now president of the L. A. W., bound himself to publish the official organ of the organization everybody who heard the contract read laughed at his business judgment and applauded him for his not less than Turpinistic bravado. Elliott himself, just before attaching his name to the fatuous document, would have staked his judgment on the toss of a copper, and had a straw been placed in his way he would have declined to sign.

But Elliott is a speculative enthusiast, and sign he did, and produced a League paper, and lost from \$500 to \$800 a week on it for some time. Nobody sympathetically slapped him on the back, or offered him good cigars, or told him he was a good fellow, a martyr, a League patriot. So Elliott struggled along, unnamed, unpraised and unnoted.

But times mended. The League fattened and Elliott waxed adipose with it. He shared the general growth, so that in time—not a very long time ago—he was enabled, through

sheer generosity and rock-bottom honesty, to hand back to the League some several thousand dollars, unasked, for and freely given. Yet, even this unparalleled act—when most men in high places in League service are seeking either money or notoriety, and are not giving—was stifled with faint praise. Even worse than that, the hooded and be-cloaked politicians and the press men loudly shouted to all who would listen that Elliott's action was merely a political trick. Such is the cycling Freemasonry which is named in Clause J of the League Constitution.

The foundation of the League is a spirit of good fellowship, of mutual effort among wheelmen for the good of wheeling. The man who is designated to carry on this good work is, above all others, the president of the League. He serves without profit, and usually with personal loss. Yet, strangely enough, year after year this Chief Executive is made the target of his fellows, who seem to retain membership in the organization only that they may practise politics. Year after year, able and honest League presidents have been mobbed, gouged and lied out of office, and if the rank and file knew the inside they would refuse to aid the work; would refuse to become the puppets and armor-bearers of these so-called leaders. We find this is the case in New York State. Men who do not know are hotly enthusiastic in howling and hooting at President Elliott. At a wink from headquarters they breathe fire. They are less than freemen, they are puppets, and their serfdom is a disgrace to the Division. The L. A. W. presidential imbroglio is only possible because the good faith of the Chief Consul of New York State is questioned. This Chief Consul permits the United Press, the local press and every other news-dissiminating bureau to be deluged with notices of his intention not to be a candidate. Yet he permits a campaign committee to be organized under his nose. He allows them to indorse him as a candidate, yet he is in complete power, and could suppress their act with a breath. If he is true to himself, true to his promise, he should suppress it. In public his position is widely announced. In private he expresses the hope that he may be made League president, and thus "round out an honorable career."

It is for others to judge whether a man's career is or is not honorable, and no honorable career can be rounded out with a masked battle such as is being fought by the Chief Consul of the Empire State Division, nobly supported by the army of collar-wearers who continually bear him upon their shoulders, keeping him ever so prominent, while they themselves stamp, slide and slip in muddy obscurity. To a clear and warlike mind, such as a mind as that of the Chief Consul, for instance, there is a very simple solution of the difficulty. His cohorts tell him he can be President for the asking, that they will make him President despite himself, and the like of that. If they can, why should they resort to trickery, chicanery and misrepresentation to win a victory already won? If they can so easily annex the League presidency to the

Chief Consul's other titles, why not do so without false accusation, without squirming, octopus-like, in muddy waters. It is Tommy-rot to say that they will make him a candidate against his will. Such a candidate has no will. Few men, if any, ever yet ran for office who did not want to run.

The Chief Consul of our great and growing division has an example in the great Easy Boss who, though so easy, withstood State and National pressure so successfully that his name was not even mentioned for Governor of New-York State, although he carried in his vest pocket the nomination for that exalted position, and had direct communication by wire with every other office from the exalted one down to the meanest sinecure in the State.

Some day our 20,000 State Division members will awake to the fact that its leader is professionally political. He is a polisher and trimmer of marked ability. For eight years he has been opposed to every League president, all of whom he had previously helped into office. He could have been president of the League four years ago, or two years ago, perhaps. But he never takes the big office; he seems to be too fond of chess-playing.

THE WHEEL hopes that the members of the National Assembly will delve into this matter and adjust it for themselves, and that they will elect Elliott, who is an honest, sincere, earnest, direct, simple and straightforward man, ever striving to be honorable, and whose mistakes, if any, do not spring from the heart.

The diversification of the cycle industry, the development of new conditions, the rapid transformations in methods, in advantages of position, in evolution of ideas and conceptions, and in the establishment of higher artistic and utilitarian standards, all make work and widen the already wide field for the cycle trade papers. They are equal to the task. They have developed a keen and refined sense that makes them not poor lawyers in their line, the best possible judges of human nature, good judges as to commercial ability among manufacturers, and safe advisers along the ragged edges of business. They are entitled to all they make, and to more consideration at the hands of the trade they serve than they sometimes receive.

Caesar it was, we believe, who first introduced the crown-refusing act. Thrice was the imperial headpiece offered to mighty Caesar, and as often waved aside by him. This is history, but in the end the crown and Caesar connected, and one rested upon the imperial brow of the other. From all appearances Mr. Potter is now actively engaged in the veni-vidi-vici business, while playing a continuous performance of crown-refusing, the New York Division Board of Officers, under the careful tuition of Manager Bull, packing the stage as Potter shouters in the meanwhile. Truly, a charming picture—for those who admire such stage effects.

It is an ill blizzard that blows nobody any good. Those timid souls who for the last eight months or more have taken their strolls on the Boulevard, or drive in nervous dread of the deadly scorcher, can now, thanks to a plentitude of "the beautiful" and a paucity of the white-wings, promenade where they will, secure in the knowledge that they are safe from the scorcher, unless he for the nonce has transferred his affections from the cycle wheel to the sleigh-runner.

What a void there would be if to-day every bicycle in the United States should be destroyed. The wheels of government, of business, of trade and commerce and of political activity would be so clogged that operation would be most difficult if not entirely stopped. It is wholly without the range of human conception or calculation to determine with any degree of correctness what a large place cycling fills in our everyday life and activity to-day. Never before has any single human contrivance so rapidly become indispensable to the general public as the bicycle has.

If it is untrue that the more or less amusing "Campaign Committee" of the New York Division is raising a fund to further the Presidential interests of their chief consul, the denial cannot be made too promptly. The suggestion is nauseating and fraught with dangerous possibilities. Although "League politics" have been dirty enough, they have never been made the dirtier by even a suggestion of an organized attempt to indirectly purchase influence and votes.

Sir Thomas Brown has defined laughter as "a sweet contraction of the zygomatic muscles excited by unexpected jocosities." Sometimes; but if Brown were trying it again and had had any experience with how the Magistrates fine wheelmen, and then how they fine horsemen, he'd have put down New York Police Magistrate's justice as another exciting cause.

There is a good deal of satisfaction in discussing the likelihood of the chainless's near approach after all. Nobody seems to know enough to demonstrate that you don't know all about it if you choose to assume that ground.

The difference between the divided-skirt costumes now worn by some wheelwomen and Mercutio's wound, is that the wound was not so wide as a church door.

Do you think you can talk about other people's wheels and not do them damage; a cyclone is composed of nothing but wind.

The unexpected often happens at Christmas; but etiquette compels us to state that it is always superior to what we expected.

Six-day racing is the excess of sport and the abuse of exercise.

Never look a Christmas gift bicycle in the nameplate.

WISCONSIN'S "FAVORED SON."

Very naturally the Wisconsin Division, at its annual meeting, indorsed the candidacy of A. Cressy Morrison, of Milwaukee, for the presidency of the League.

Mr. Morrison stated, after resolutions indorsing him for the presidency were passed, that as regards the sentiment that the West is entitled to a presidency, he felt that this sentiment in the West was growing rapidly and was justified. He said that he knew, however, that there was a strong desire throughout the whole country to pay the compliment of recognition to Isaac B. Potter for his eminent services to the League, and it was probable, should Mr. Potter consent to run, that this feeling would supersede the sentiment in favor of any section. If Mr. Potter did not desire this recognition he believed the time was ripe for the West to be recognized. He felt that the selection of a Western or Southern candidate should be left to a caucus of the West and South, and that he would heartily support any one whom this caucus should nominate. He said further, that should the honor be conferred upon him by the caucus he would stand as their representative, and accept election or defeat in their behalf with equal equanimity.

Racine was decided on as the scene of the next Division meet, and it was decided to continue the fight for the free transportation of wheels on railroads.

GOOD OLD JERSEY!

A flourishing state of affairs was shown by the reports read at the annual meeting of the New Jersey Division, at Newark, December 17. Ex-Chief Consul Gentle stated in his retiring speech that the membership had grown from 1,406 to over 4,600 during his administration, and that the treasury had a balance of over \$1,300. Chief Consul Kircker announced when he took the chair that the greatest undertaking of the Division next year would be to have a bill passed by the State Legislature compelling railroads to carry bicycles free. Delegates to the National Assembly were elected as follows: Robert Gentle, J. S. Dickerson, R. R. Chiswell, H. W. Knight, James Barber, Dr. A. J. Wright, J. F. Neefus, W. F. Roelker, Harvey Iredell, C. B. Zacharias and C. B. Holmes. It was mutually agreed to cast the Division's vote for Elliott's re-election.

GOING TO SUE.

It was decided at the annual meeting of the Maryland Division last week to sue out a mandamus against the Pennsylvania Railroad to compel the company to carry bicycles free as baggage. Chief Consul Sams said he and several other lawyers had carefully weighed the law on the subject and believed that the railroad company could be compelled to carry bicycles as baggage. The meeting instructed Charles W. Heulsler, as chairman of the Rights and Privileges Committee, to begin the legal proceedings necessary.

It was also decided to abandon the management of the Park cycle track, and to dispose of the property. Albert Mott, H. B. Wilcox and William Gullen were elected delegates to the National Assembly.

MR. PHINIZY NAT FAZED.

A bill declaring bicycles baggage and requiring all railroads to haul them free of charge was defeated when the question was put to a vote in the Georgia Legislature last week. The vote stood 39 for and 50 against. Mr. Phinizy, of Richmond, author of the measure, gave notice that he would move to reconsider the action in defeating the bill, he believing that with a full attendance his bill will meet with the approval of a majority of the members.

STILL TALKING, BUT THAT'S ALL.

Tom Eck visited Syracuse and New York last week. All who read the daily papers know the result. Immediately there was an explosion of Michael-Linton-match talk equal to the best efforts of the followers of the pugilistic profession. It was at first affirmed that Eck and Plummer held a secret conference and arranged the match. This Plummer denied. He announced that he wanted nothing to do with Eck while he was under the ban of the Racing Board. He did, however, long to have Linton meet Michael; in fact, Linton was fretting himself half to death over the delay, and he asserted that all the money needed to bind the match was in a stakeholder's hands.

Michael, according to Eck, will be only too pleased to satisfy Linton's longing. The little Welshman can ride rings around his countryman under any conditions, and can find backing in Chicago to the extent of \$5,000 if a match can only be arranged. But, he adds, as "the Jallu brothers, the best pacemakers Michael had, have returned to France, the latter will not ride a paced race at present. It would hardly be a fair race, as Linton would have all the best pacemakers, while Michael's would be second-raters.

And then came another bizarre sensation. Away down in Jacksonville, Fla., amid the palms and orange trees, Johnson and Michael, it has been heralded throughout the country, are going to meet during January in a series of three races, the winner of two of the three to get a purse of \$5,000. The distances are stated to be one, two and five miles. The match will be backed by the Plant system, a corporation that practically controls half of Florida. There is no controversy between Johnson and Michael. The latter has been enjoying the hospitality of the former at Minneapolis for several weeks. Michael has been using Johnson's skates and best shotgun; has slid down his cellar-door as often as he pleased, and has formed the highest opinion of Johnson as a host. So, to square matters, they will have it out on the Panama track.

It is also announced that several other events will be run at the same time, and that efforts will be made to have Linton meet his little neighbor on the Jacksonville track; in fact, Eck claims they will meet there and that the match has been made, while Plummer denies it. Meanwhile it is said that Eck's journey to New York is in behalf of the proposed Chicago six-day race and to get an idea as to the cost of transportation to Florida.

EASY TO KEEP COOL.

Efforts are being made by the managers of the Convention Hall Ice Palace, Washington, D. C., to secure about all the contestants in the recent Madison Square Garden six-day race for a similar event, to be run during New Year's week in Convention Hall. The race, however, will be run for eight hours each day. The track is to be 16 feet wide, and will extend around the inside of the skating surface. It will be banked eight feet at the curves, with a railing on the inner side separating the track from the ice.

EARLY NEXT YEAR.

New York is to be the scene of the formation of the proposed National Cycle Racing Association, the organization of track-owners and managers, an outline of which was previously published in THE WHEEL. The date set for the meeting is January 9. Representatives of all the best tracks in the country have been invited to attend.

LUMSDEN LIMPS HOME.

Disappointed, disgruntled and with a badly bruised body, J. D. Lumsden, "the Scottish champion," sailed for Liverpool on Saturday last. Lumsden is dissatisfied with his treatment at the hands of Plummer, the manager of the Simpson chain aggregation of foreign riders. He claims that he has not received a cent of salary since he arrived here, and did not have proper medical treatment after his fall in the match race with Jay Eaton. He also thinks that Eaton should have split the purse with him, although he objected to an arrangement suggested prior to the race to start over in case either rider fell. Lumsden states that Plummer told Simpson before the team started that he had completed arrangements for the men to ride at thirty meets in this country, whereas the six days' race was the only engagement arranged.

PROFIT OF PEDAL PLUGGERY.

Whether it pays physically to undergo the strain and torment of a six days' race is a much mooted question, but a premier position at the finish certainly brings fame and a small fortune. Hale's financial reward is well known to every one, and Rice, the second man, cannot complain. Besides securing the purse of \$800, he also wins a bet of \$500, on a wager with a Wilkesbarre colonel. The colonel offered to bet him fifty to one that he wouldn't finish under fifth place, of which offer Rice took up ten dollars' worth, and for which risk, it is affirmed, he will receive the \$500. The Wilkesbarre people were so tickled over Rice's showing in the race that a subscription has been started to raise \$1,000, which amount is to be presented to him on Christmas Day. When Rice returned to Wilkesbarre after the race he was treated like a prince. Five thousand people were at the

THINKING IT OVER.

I must confess I don't feel well;
The reason why I cannot tell;
I ate a most delicious dinner,
As well becomes a cycling sinner;
I had some turkey, mince pies, too—
I own the soft impeachment true;
I drank my wine "like other folks,"
I cracked some nuts, I cracked my jokes!
And then I think that I proposed
Some fifteen healths—and then I dozed!
I tried my best to do my part,
For I've an overwhelming heart!
But what I can't get through my brain
Is why I've got this awful pain!
For years I've read in prose and rhyme
"At Christmas have a merry time!"
I had it yet when I've got through it
I'm blest if I don't really rue it.

H. J. S

CASH IN ADVANCE, PLEASE.

Frederick Gerlach, the Chicago member of the Racing Board, has hesitated in sanctioning the proposed six-days' race at Chicago, and rightly. He has asked the promoters to put up a guaranty that the participants will receive their money. The manager of the proposed race has been at the game before, and needs watching. Over a dozen years ago he promoted a six-days' grind in Philadelphia, which financially was a fizzle, and those of the contestants who are still alive are waiting for their prizes to the present day. The sanctioning of the Chicago race can be taken as a guarantee that the prizes will be paid, whether the affair proves a success or failure.

Captain Mahan, the celebrated naval historian, just retired from active service, is an enthusiastic wheelman.

station to greet him. A parade was formed, headed by the best brass band in town, and seated in a handsome barouche, drawn by four white horses, he was escorted to the opera house, the streets en route being jammed with humanity. Fireworks and red fire glowed incessantly. A mass-meeting was held at the opera house, where addresses were made by the Mayor and other prominent citizens. Rice was enthusiastically received when he stepped on the stage, and when called on for a speech, said: "Thank you all. I done the best I could."

PUTTING HIM ON.

"Do you think, professor," said the musical-ly ambitious youth, "that I can ever do anything with my voice?"

"Well," was the cautious reply, "it may come in hand to holler off numbers through a megaphone at a race meet."

TWO OF A KIND.

It was a case of "dog eat dog" in the mile match race between C. M. Murphy and F. F. Goodman at the indoor meet of the Liberty Wheelmen and 13th Regiment, at the armory, Brooklyn, Saturday night last. Murphy won the first heat in 2:30 2-5 by some wide riding at the turns. Goodman took the second heat in 2:30 4-5, but was disqualified by the referee on a foul claimed by Murphy. Murphy was given the race, but Goodman's friends are dissatisfied with the result and want another race. Murphy was beaten decisively in two other events. Summary:

One mile (novice)—1, Frank Powell, Liberty W.; 2, T. R. Goodwin, Logan W.

One mile (scratch)—Final—1, Carl Sanford, jr., N. J. A. C.; 2, J. W. Judge, Riverside W.; 3, W. H. Owens, South Brooklyn W. Time—2:31 1-5.

One mile (professional)—F. F. Goodman; 2, Sam Brock; 3, C. M. Murphy. Time—2:30.

Two miles (handicap)—Final—1, T. R. Goodwin, 100 yards; 2, J. W. Judge, 25 yards; 3, W. A. Brown, 90 yards. Time—4:59.

One and one-half miles (military team race)—Won by E. C. Barnum, Carl Sanford and W. R. French, of Company K, 23d Regiment. Time—5:11 1-5.

Two miles, professional (handicap)—1, F. F. Goodman, 20 yards; 2, Sam Brock, Brooklyn, 80 yards; 3, George P. Kuhlke, Brooklyn, 100 yards. Time—5:02.

NOT SO PROFITABLE AS IT WAS.

Writing of the pacemaking game as it is carried on in Paris, a correspondent of "Cyclers' News" states that the lot of the Parisian professional pacemaker has not been a happy one of late. It is not like the "golden age" of 1895, when paced races were numerous and good pacemakers scarce, he writes. That was the time when a man at business during the day could easily supplement his income to the tune of \$15 or \$20 a week by pacing in an evening and on Sundays. Now, there are lots of pacemakers who make a business of it, and who, being all free lances, that is to say, not in the employ of any particular firm, sell their services to the highest bidder. The engagement of the teams takes place generally the day before a race, and is a curious spectacle; there is the rider or his trainer on the one hand, and the steersmen of the triplets, quads and quints on the other side; and then they haggle like fishwives. Naturally, the invasion of trained English pacers is looked on with a very evil eye, indeed, by the French pacer, who sees things go from bad to worse, and talks loudly of the bread being taken from his mouth by these foreigners.—As a result, trouble is likely to occur among the pacers before the winter is over.

FLORIDA'S PACING POSSIBILITIES.

Florida intends to make a bid for the record-breakers' winter patronage. Already Mr. Eck has scented the honey pots, and is issuing challenges to every one and everybody to race his speedmakers in Florida.

A gentleman who has spent his winters in Florida for the last twenty years declares that there is one reason why Florida should be the winter paradise of the record-breaker, which reason he has never yet seen in print. An unlimited and perfectly free collection of pacemakers can be had with but little if any trouble in the shape of the famous razor-back hog, of which animal the Floridian says:

"The Florida razor-back is a natural pacer. He never trots or runs. He paces, and when he lets himself out there isn't any dog can catch him. They have exciting races between razor-backs down there. I saw a big hog, untrained, and brought right from eating four bushels of wild oranges, pace three straight mile heats, and the slowest one he made in 2:32. I believe if they would train those hogs

they could get them down to a two-minute gait with no trouble, and the possession of a dozen of them trained to pace ambitious racing men would for once and all do away with the expensive and trouble-causing pacer-maker."

DISGRACING AN ARMORY.

Cleveland, Ohio, Dec. 21.—A. J. Benedict, of New York, representing the Cycle Carnival Company, of Minneapolis, Minn., has completed negotiations with the County Commissioners and the Republican Executive Committee whereby he becomes the lessee of the Central Armory for the week of January 4. Benedict will conduct a six-day female bicycle race in conjunction with a "cycle show." A fifteen-lap track will be constructed, and the contestants will ride two hours each afternoon and each evening, making twenty-four hours in all. There are numerous entries. The prizes aggregate \$500, divided into four purses. Cleveland has never turned out a paying crowd for a legitimate race meet; the result of the present effort seems foreshadowed.

JOYS OF RACING.

Bad spills are reported as being quite common affairs on the winter track in Paris. One afternoon recently when the track was crowded with men training, the rear tire of the quad pacing Bourillion burst. A terrific smash-up followed. Bourillion was knocked senseless and was hurt about the head and chest. The steersman of the quad (generally the one most hurt) got off safe and sound, as did the last man; but of the two men in the middle, one had his collar-bone broken in three places, and the other one had all the skin and flesh taken off his face and arms.

OFFICIAL JUDGES NEEDED.

People in those Latin countries are excessively excitable. Buenos Ayres recently had its first taste of cycle racing, and the finish of the chief event resulted in a ding-dong finish of the proverbial hair-raising kind, in the course of which the judge became highly excited, so much so, in fact, that he danced around the stand and actually forgot which of the riders finished first. He puzzled his head over the problem for a long time, and finally confessed that he didn't know who was the winner, and allowed the newspaper men who were present to decide for him.

RECORD WORK DOESN'T PAY.

John S. Johnson, it is announced, will abandon the record-breaking game next year, and give all his attention to competitive racing. Although Johnson has generally been among the "also rans" when riding in competition with the cracks, Eck, with his customary confidence, says Johnson will fool the natives next year when he brings him out. He affirms that record-breaking does not pay as well as winning purses on the circuit.

HAS A WINNING NAME.

Choppy Warburton has taken the French rider Champion under his wing, and expects to make a world beater out of him. Warburton hints that Champion will simply make rings around such riders as Michael and Tom Linton. He started his career under Warburton by winning a twenty-mile race from Collomb. The latter fell and was unable to finish.

GLAD HE LIVED THROUGH IT.

Asbury Park enthusiasts were so rejoiced that Maddox came out of the six-day race alive that he was tendered a banquet when he returned to his home in that town. He has decided to compete in the Chicago and Washington grinds.

HE IS A CREDIT TO RACING.

That all racing men are not sordid grabbers is illustrated by the action of Starbuck, after winning the match race with Linton at Madison Square Garden. Starbuck fell early in the race, and Linton stopped and started again, although not compelled to by any agreement. Starbuck won, as previously chronicled, and after the race he went down in his pocket and handed half of the purse to the Welshman.

THREES BEAT FOUR OF A KIND.

A novelty at a recent meet at the indoor track in Paris was a multicyle race between seven triplets and four quads, run in four heats. In each heat the quads were left behind by the triplet crews. The steeply banked curves were taken at a terrific pace, at which points the triplets had the advantage. The final was won by the triplet team captained by Clement.

MATCH IN MID-WINTER.

Toronto, Ont., Dec. 17.—A match bicycle race took place at the quarter-mile track in East Hamilton yesterday between Roy Miller, of this city, and C. W. Werick, of Buffalo. The race was mile heats, best two in three to be winner. Miller won two straight heats in 2:26 3-5 and 2:21 2-5, but was closely pushed in both by his American competitor.

STARBUCK SAILS FOR EUROPE.

J. F. Starbuck sailed for Europe on Saturday last on a deferred honeymoon trip. Although not announced until last week, Starbuck was married over a month ago. Mrs. Starbuck was Miss Bertha Wise, of Lewisburg, Penn. Immediately after returning to this country Starbuck will enter into negotiations for a match race with Michael and Linton.

PITY THE RACER.

Your French wheelman is deeply interested in cycle racing, and it will be no fault of his if his Government is not likewise interested. A petition signed by all the Algerian cycling clubs has been forwarded to the Governor, in which it is requested that racing men going to and from races should be carried at reduced railway fares.

A LA MILITAIRE.

A lengthy programme has been arranged for the military bicycle and athletic carnival to be held at Madison Square Garden January 11 to 16, in lieu of the abandoned eye's show. Each evening a half-dozen races will be sandwiched in between military evolutions and exhibitions, open chiefly to members of the National Guard and the Regular Army.

LOOKING THE BATTLEFIELD OVER.

E. C. Bald is contemplating a pleasure trip to London and Paris after the New York and Chicago shows. He has an idea that he can make a better showing on the foreign tracks than any of the Americans who went abroad this year, and will study the tactics of the French cracks before going into battle.

WINTERING IN PARIS.

Many of the crack London riders have migrated to Paris for the winter. Among them are Barden, Scott, Elijah Scott and a batch of Dunlop pacers and the Chase brothers.

WILL REST A BIT.

Platt-Betts, England's mile record holder, has abandoned the idea of racing abroad during the winter, and will rest until the opening of the outdoor season.

For knowingly competing in handicap race not handicapped by the official handicapper, D. F. Carmichael, St. Paul, Minn., is suspended from all track racing for ninety days from this date.

Suspended for one year from December 16, for competing while under suspension, and with amateurs after having become a professional, F. W. Lunn, Albion, Mich.

For false entry Earnest Hubler, Marshalltown, Iowa, and A. W. Dean, Waverly, Iowa, are suspended for ninety days from December 18.

Suspension placed upon John Nillson, Minneapolis, Minn., has been reduced to expire February 1, 1897.

A NEW ENGLISH TANDEM TRICYCLE.

Here is a type of sociable tandem tricycle which is attracting a considerable amount of attention. It is wedge-shaped in frame looked at from in front, and it is said to be a very easy

There are some novices who are willing to admit that they can't race, but every one of them thinks he is a good judge of a wheel.

If you compliment a school teacher upon her riding of a wheel, she will not observe the grammatical errors.

YOU CAN'T FREEZE THEM OUT.

Denver, Col., Dec. 22.—Despite the lateness of the season, J. L. Spillane, of this city, broke the twenty-four-hour road record to-day, covering 297 miles in 23 hours 53 minutes and 30 seconds. The previous record allowed by the Century Road Club was 285 miles. Several riders have eclipsed these figures, but the trials were not ridden in accordance with the rules of the Century Road Club. W. F. Sager set a new 200-mile mark for the State, making the distance in 16 hours and 16 minutes. The previous best was by Mrs. A. E. Rinehart, 16:18.

HOW IT HAPPENED.

"Take your choice," said Pate to the unborn Soul, "I have two openings left. You may be Respected or a Referee."

And the Unborn tried to borrow a quarter of Fate to flip up for it.

And his nerve so pleased the Dispenser of Destinies that he put him down for both, and the man broke the record.

PRICES GOING UP.

After December 31 the price of the Spaulding, Kensington and Buffalo pedals will be advanced. The Spaulding Machine Screw Company, which make them, say that 75 per cent of the output is contracted for, and the increase is imperative.

ONCE MORE ABROAD.

F. A. Elwell is arranging another European cycle tour. The party will sail on April 29, and visit about all the historical points of interest on the Continent and England. About 112 days will be required for the trip.

RAY HYGIENIC CYCLE SEATS.

An Aluminum Base cast from exact impressions of the human anatomy by riders actually propelling a wheel.

Padded with heavy felt, and covered with a soft leather top. Low side clamp, with or without coiled spring.

Send for samples, prices and catalogues.

THE BRIDGEPORT GUN IMPLEMENT COMPANY,

313-315 Broadway, NEW YORK.

BRITISH "FAIR PLAY."

Some Excellent Examples of It in Space Allotted to Americans at the National Show.

London, Dec. 9.—Arms and the man, I sing. Otherwise, speaking rationally, I am going to continue my tale of the National Show now in full swing at the Crystal Palace, Sydenham. I have made a tour of the American exhibitors and, without exception, all are simply disgusted with the treatment which has been accorded to them by the National Show ballot, i. e., the committee. And no wonder.

Take the case of the Rambler people. Manager J. H. Kitts, who is nothing if not energetic and pushing, had applied for one of the largest spaces in the exhibition, thus in his own judgment (and in most others also) making certain of a good position—for this, of course, goes by weight of coin offered in space. Last year his application would undoubtedly have yielded him one of the crack positions, but there are wheels within wheels in the Cycle Manufacturers' Trade Protective Association, and American makers are regarded with a jealous eye. I don't put it as a consequence that the Rambler exhibit was relegated to the comparative obscurity of the Grecian Court, but the fact remains that the demand for space was complied with, and the other exhibitors satisfied by having one of the most elaborately artistic exhibits removed from a position in which it must have simply overshadowed them. Still I am pleased to say that the "luck of the ballot," as somebody has put it, has not been quite successful as, owing to the publicity given in the cycle press that the famous jewel-encrusted \$1,000 Rambler lady's safety was in the Palace, crowds have roamed about the inconveniently narrow aisles of the Palace until they have found it.

I hope that I will be believed when I assert that I have never seen a finer stall than that which represents the trade status and general position of the famous G. & J. firm. In the centre of a star-shaped ground plan a circular temple of art stands, built up in exquisite taste with mirrors, white and gold pillars, and royal blue plush curtains, and bearing round its frieze the legend, "Gormully & Jeffery Mfg. Co., Chicago."

The Spalding is close by, abutting from under the gallery on to the main transept. The Pierce, which is hidden almost out of sight under the gallery in the theatre, and the Brownie, a Toronto machine, comprise all the American machines which I have been able to find on the ground floor. Upstairs in the gallery the Waverley makes considerably the best show to be found there, both as regards style and position of stall. The Monarch and Defiance are huddled away in a corner at the front, under the clock; the Adlake is very little better off, while I doubt if a tithe of the visitors to the Show will be able to say that they noticed the Yost-Falcon, Tally Ho, Crawford, Sterling or Kenwood machines, all of which, I can vouch for, are in energetic hands which only want a chance at once an exposition to make good use of it.

Under such circumstances there is little wonder that the American representatives are anything but pleased, and have given the secretary of the show some plain opinions on the matter, which no doubt he will color and publish to his committee.

As to the machines themselves, most of them being newcomers, I am scarcely able to express my opinion as I would wish. The Rambler I know to be a good machine, and while there are points which my insular prejudice girds at, I must admit that I am much impressed by its thoroughness and sound construction. Several English agents

have expressed to me their satisfaction with the machine, and the terms on which they are offered business, and have asserted that they will take it up and make it their leading wheel, so that I am quite prepared for a boom in Ramblers during the coming season. The Waverley is also very favorably commented upon, but to my mind the pick of the basket is the Pierce. I don't say that I am a competent critic of American machines, but I do say that were I an English cycle agent I could sell the Pierce if the terms were all right. It is a beauty. Of course, the Waverley is a fine machine, and is making friends everywhere it is introduced. The Cleveland has been improved considerably to the English eyes, since its appearance at this Show last year. Round cranks, however, are retained, and a new form of bottom bracket cone-adjusting, which permits the whole bearing being withdrawn without dismounting it. Flush joints are partly adopted, and a neat style of brake lever.

The Miami Cycle and Manufacturing Company, of Ohio, have several models on view at Stand 89. This machine attracts considerable attention, because of the extremely narrow tread—quite a novelty in American-built machines.

The Spalding is also more altered to English views than was the case last year. All tubes, however, are tapered toward extremities, where they enter the connections. The method of wheel building is also novel, as the spoke flanges are cross cut into projections, which enable a direct spoke being used in a tangent wheel. A spring-framed machine is also on view.

The Waverley people make the most effective display on the gallery at Stand 812, and show considerable improvements in their wheel from last season. A new bottom bracket, or crank hanger, which, while reducing the tread to 3 1/4 inches, also permits the bearings to be withdrawn without dismounting.

The Falcon and Tally-Ho are also on the gallery at Stand 320, and the former looks fairly much as it did last year. The Tally-Ho has several distinctive points, such as a tapered cross strut, but it is hard to see what object is gained by the device. The Crawfords are also shown on this stand. I can remember Mr. Crawford when he was a small maker of good machines at Glasgow, so was quite interested to note how he has adapted himself to his own market. His wheel looks remarkably good value at its price.

The Sterling is to be seen on Stand 325, in company with the Kenwood, and a handsome pair they are. Both are just as you have had them during the past season, and are more distinctly original in parts than any of their neighbors.

This does not exhaust America's contribution to the Show, for have we not got American automatic machinery and imitations thereof, as well as the rather elusive Kane-Pennington motor, shown in bicycle and quadricycle form? I am told that in a trial of the former one day last week on the Palace track the incautious rider—a Frenchman—turned on the speed gauge to the utmost with such immediately disastrous results that he is of the opinion that the whole show exploded, while spectators aver that he was merely tossed over the rails, while the forty-mile-an-hour motor proceeded to demolish itself very successfully.

The Twentieth Century lamp is seen in a brooding magnan reproduction, which heralds the stall; the A. L. Moore Fittings Company are also down on the list of exhibitors, but I have not yet been able to find their exhibit.

Continuing my investigation of the new notions to be seen at the Show on English

machines, I find that disk adjusting hubs are quite common. One of the most novel of these is the De Burgo, which is illustrated herewith:

A is the body of the hub. B is the adjusting disk or cup. E, the axle on which the cones F F are fixed. C, the locking ring nut, tapped conically and screwing on to the split end of the hub of course causes a jamming action on B, when C is turned home. D is the fixed cup propulsion, as the extinction of the geared Facile, worked on the same principle, goes to show, I don't suppose it would be for a moment thought of. Still by an elaborate set of comparative models working in a glass case, its advantages are displayed in contrast with the greater loss of power (sic) necessary in the use of chain gearing and rotary pedal action.

Another peculiar idea is the cam action bicycle. As will be seen, its action is chainless, and the clover leaf shaped crank wheel

actuates two connecting rods, which gives, in the illustration seen, three revolutions of the driving wheel for each full turn of the pedals. The cam runs on balls, and the idea is very carefully worked out.

Here is another idea which strikes me as having more in it than appears at first sight.

It is a sprocket designed with the idea of minimizing the chain friction evolved by engaging and disengaging with the sprocket

teeth. Figure 2 shows the principle of the idea, which is the substitution of free rollers for the ordinary fixed bearing parts of the cog teeth.

In Fig. 2, A. are the rollers working on a variable or free axis in the face of the cog teeth. Their action is that at B, where the chain commences to engage; the roller is at the bottom of its seat, i. e., nearer to B than the plan shows. At C, the action of the chain block engaging with it causes A to rise to its highest point or its seat, and it is claimed that this rocking action entirely supersedes the ordinary sliding motion between chain and cogs, which develops so much friction.

PALMER TIRES

A Christmas Greeting.

We are getting thoroughly into the new arrangement of selling our own goods, and it is meeting with unqualified success. The bicycle makers like it, the dealers approve of it, and it is a pleasure to us to get into touch with our customers.

The demand for high-grade materials is brisk, the consensus of opinion being that cheap stuff has seen its day. And yet there are a few makers to whom cheapness is everything. They do not realize that a bicycle can be made so very cheap that riders will not purchase it.

Palmer Tires do not cheapen bicycles—they mark the high-grade wheels.

133-139 S. Clinton Street, CHICAGO

IN GAY GOTHAM.

The most tickled man who has visited the shores of Manhattan Island in recent decades is L. M. Wainwright. Wainwright has been closely identified since the "first days" with Indianapolis, the Indiana Division of the L. A. W. and with the sport of racing and touring, and with the trade of his State. Therefore, it is natural that he should in time evolve from a Columbia agent into the controllership of a big bicycle factory—none other than the Central Company. He carries with him to New-York, and also showed in Boston, his chief Ben Hur bicycle for 1897. Of course he has his other lines with him, but they pale before the star of the collection. At the Marlborough (which is becoming a cosy haunt for bicycle travellers) he exposed the wheel to other men in the trade. These and others fairly watered at the mouth for joy and admiration over the Wainwright wheel. There is no use in describing it. He won't let you. Only grace is prominent, and strength is pre-eminent. Twenty-five new wrinkles are employed, all of which are not wrinkles, either. Some are important and radical departures in bicycle construction, and they seem logical and practical. It a few weeks the bicycle papers will be full of it. It will take space and many illustrations to describe all of the appealing points of the Ben Hur model of 1897, and riders and agents who want to keep posted should not fail to keep tabs on this expected description of Wainwright's wheel.

Arthur E. Pattison is in town. Dame Rumor, who does mischief when the crone has nothing else to do, has been busy with a Coleman-Pattison combination. It is rumored that the Warren street Mogul intended associating the old secretary of the Pope Company with him as chief manager. Many a shrug of the shoulder and wink of the eye was there over this choice morsel of gossip, but it is vaporous as an April cloud. The combination is not on the carpet. Mr. Pattison will receive a lump sum for managing the Chicago show, after which his connection with the bicycle business will cease—entirely so. He has purchased an interest in a shoe business in New York City, and will be a shoe merchant after show time. Pattison was with the Pope Company somewhat over ten years. He was their first traveler in the "wild and woolly," and in his travelling days it is said his great ambition was to have his name on the Pope Company's letter-heads, and, in time, it appeared there. He drew a large-salary, and owned a large block of stock which paid the usual handsome Pope Company dividend, and when he shook the dust of Hartford from his feet, he took with him, so it is written, a small fortune. He is bright, competent and experienced, and THE WHEEL hopes he will be as successful in his new field.

A Veeder man has been with us after a brief sojourn in Philadelphia, scattering Peerless Veeders in his way—no other, in fact, than David J. Post, late of Cleveland, but now indissolubly tied to Hartford. Post got his A B C of the bicycle business with the Pope Company, and grew to be an important apple in their orchard. Then he parted with them and went to Cleveland, where he made a big success as chief seller of the Peerless Company. Now he goes back to Hartford and quietly studies the Eastern half of the map of the United States, in which territory he handles Peerless bicycles. But the Peerless story is not all, much of his time being devoted to the Veeder cyclometer. This handsome little instrument is too well known to even need description. In the 1,000 or

10,000 miles form, in silver or in gilt, at a decent price, and with absolute accuracy, no wonder it has met with such startling success—a success which necessitates the employment of over 200 people to turn out the little mile-measurer. Some say its sale this season will run up to 125,000. All of which proves that it is not a bad thing to learn your lesson with a good company, and that it is not a bad thing sometimes to make a change.

Mr. Dow is in town. There is only one Mr. Dow in the bicycle trade, and he was once with the Pope Company, and is now with Smith—C. F.—of Indianapolis. By the way, Mr. Smith is here also, but Mr. Smith keeps himself quietly within the shades of the Imperial, and is not seen much in the highways, as befits the head of the concern. Mr. Smith is innately modest and gets no pleasure out of exploiting himself. Mr. Dow, however, is a managing man, and managing men must go about and be seen; must talk and be talked to. Mr. Dow is an important man in the Waverley establishment. His influence has already been felt and will be felt in the future. He is a man of much force and is reputed to be able to throw off more work than three ordinary men—even people in Boston and Hartford credit him with that. He is direct and practical. His New York visit seems principally to be on catalogue, as he is known to be haunting a certain catalogue maker for the past week.

The White Flyer has not been unrepresented on this island within the last few weeks. Its merits have been kept in mind by the presence of Messrs. Benjamin, Bald and Faulkner. Faulkner is a big, good-looking fellow with a black mustache, and looks like an able White Flyer lieutenant. Bald is just now doing the graceful society act, and is much seen in public places, usually not alone. Benjamin, than whom none of the other men is more popular, is doing the big cities in the interests of the 1897 White Flyers. His trip abroad has given him a particular flavor, which is principally noticeable in big ties and a silk tile which have been personally conducted across the water.

R. W. Slusser, one of the Fowler Cycle Manufacturing Company's chief men, was in New York on a flying visit early this week. Since becoming a Fowler aid, Slusser has developed into a sound and splendid business manager, and won the entire confidence of the firm. It is to Slusser's credit that he has won his spurs without newspaper help. Popular and widely known as "one of the boys" in Chicago, the opportunity was afforded him, but Slusser preferred to depend on his own efforts, and the way he buckled down to business and kept at it surprised many of his old associates.

The graceful and artistic Ide bicycles, and the pleasant-faced modest man who made and named them in Peoria, Ill., are represented by a quiet sort of a chap, Mr. Doubt. He is also a guest at the Marlborough, and is rated by other cycling travellers to be quietly shrewd, and more showy in results than he is in looks—which means that Doubt looks exceedingly quiet, reserved and reticent, looks like a sawyer of wood, in fact, all over. The Ide is known here, as in other big cities, and it appeals particularly to the swell trade, because of the lines, finish and general make-up.

Milwaukee's loss, for the time being, A. D. Meiselbach, is New York's gain. Meiselbach & Co. have an awful big factory with an awful big product. They work each day, every minute of the day, and sometimes far into the night. Their evolution from a small begin-

ning astonishes those who saw the first sproutings of their business. Mr. Meiselbach is a New York boy who went West to seek his fortune, and not vainly. He is freshly-faced and blue-eyedly enthusiastic, and looks like a quick mover.

Jos. L. Yost is also within the gates, sheltering himself within the Everett House, his usual haunt. The chief purpose of his visit is not revealed, but as a non-revealer Mr. Yost is a success; he can be powerfully silent where his interests are involved. He has a big eye, however, on the New York market, and realizes that Manhattan Island, with an eight-mile circle drawn around it, represents several million people. He is going especially to sow Falcon seed in this territory for next season.

R. L. Coleman is wearing his high hat these days. Whenever "Ar Ell" wears a high hat he is not working, and he intends to wear this particular high hat until after January 1. He has just returned from a hunting trip in the South, and is brimful of new "coon" stories. It is a treat to visit him after one of these trips.

BIG MEN CHANGE PLACES.

L. H. ("Baby") Bliss, the 500-pound representative of the America Cycle Manufacturing Company, returned from abroad on Saturday last, after having astonished the Britons for three months, and shown what a twenty-six-pound truss-frame America would stand. The void created by Bliss's return will be amply filled by J. W. Grimes, the Cleveland "fat boy," who sailed two or three weeks since in the Lozier interests.

GONE WITH THE FOWLER.

Adolph Stahl, one of the best-known New York clubmen, will leave the cutlery trade for the bicycle business on January 1. He will be attached to the Fowler Cycle Manufacturing Company's New York branch.

SOME FRICTIONAL FACTS.

How Various Forms of Bearings Have Been Introduced in Cycling to Avoid Friction.

(Continued from Dec. 18).

When balls are interposed between the contact surfaces of a bearing, the sole purpose, as we have said, is to substitute rolling motion for sliding; that is, when two pieces, A and C, either flat or curved, whose surfaces would ordinarily rub on each other, have a ball B placed between them, the intention is that A shall roll on B and B shall roll on C, or (better stated), that A shall roll B on C, thus:

Fig. 8

This is so elementary and familiar that to sketch it may seem idle, yet things may lose significance by being familiar, and we state this in order to emphasize the essential characteristic of a ball bearing, to wit: The ball should always roll. Here C is stationary, with A and B moving upon it; B should not stick upon C, with A rubbing along on B, nor should B stick to A and the two go rubbing along together.

Figure 9 is intended to represent a portion of a bearing on the same construction as the "double-ball" shown in Figure 6 of our article December 18; whether there are two rows of balls or only one, or whether the perforated collar is used, is only a matter of detail. In Figure 9, which is in vertical section cut

Fig. 9

parallel with the axle, C is the stationary bearing-case and AE is the revolving axle. The axle rotates upon its centre line FG, rolling the ball on the grooved path through the case C, AB being the axis of rotation of the ball. In order not to confuse the lines to the eye, a small space is left between the ball and its groove, but they are assumed to be really in exact contact and fit. Whether anybody ever did construct a bearing with the balls actually in such contact all around we do not say, although this was understood to be the general construction of the pattern in Figure 6 of December 18; but, assuming one to be thus made, how would the balls move?

All points on the "sides" of the ball—that is, all from L around to the slight opening at V left for clearance between axle and case—not only travel in circles of which line AB is centre, but travel forward along the grooved path within C; hence these points on the ball must more or less slide and rub on the sides of this grooved path. The further these points are from L and the nearer to V, the smaller their circle of rotation and the greater their rub; the portions of the ball nearest to L are thus the most "advantageous" in

action. Moreover, the ball may be considered, as respects its rolling, as a great many little disks or thin wheels mounted on a common axis at AB, as indicated by the dotted lines, and the larger their diameters the more readily these roll; so a second reason appears why the portions of the ball nearest L are the best. Again, the axle is at its smallest diameter at L and it works there on the full diameter of the ball, revolving it at a certain speed; but at K and H the surface of the axle moves in a larger circle and works on a smaller section of the ball, thus tending to revolve it faster than at L. All along from L to V, the axle is trying to roll the ball at differing speeds, which obviously cannot be done. This is the third reason why the parts of the ball close to L are best.

The movements of what we call the "sides" of the ball cannot be clearly shown to the eye without rather complex sketches and descriptions, nor are we able to show them with certainty; we dwell upon this illustrative case in order to make clear what impossible tasks are laid on the ball. What it actually does in practice under these demands we frankly say that we do not know precisely, and we do not think anybody else knows or ever did know. All portions of the ball must move forward along its path at one speed, until the weary thing splits up; meanwhile it cannot revolve on more than one axis at a time, nor can any one point on the ball avoid completing its circle of motion in the same time with all other points which are revolving about the same axis; points on the surface of a revolving sphere (say the earth, if only that were a true sphere) move at different speeds, because moving through circles of differing size, but they must all get through their circles in the same time, or the sphere cannot hold together. Therefore, in this case the ball could not roll uniformly on axis AB, as we, for the time being assumed that it would. In practice we suppose the ball would do as the demonstration shows it must, to wit, roll, slide, slip, rub, twist about around its circular track, and somehow or other "get there." More or less, we suppose, balls have been doing this up to the present hour, in even the best designed and constructed bearings; how they get on in the worse ones we shall not attempt to say, but in the "cheap" graders and in some which are not cheap there must be suffering. Competent repairmen observe the signs of woe endured.

It follows from the foregoing that all-around contact would be very bad planning; the sides must be cut away from V downward, in order to give the ball clearance for revolving. To avoid the three difficulties above pointed out, point L, which is the full diameter of the ball, should be used; the smaller the contact surface the better. Thus we arrive at the first rule in designing a bearing; but in actual construction this idea of reducing contact as nearly as possible to the mathematical "point" (i. e., position without magnitude) must allow slight modification, to avoid other difficulties.

As made in these later years, ball-bearings are classed as "two-point" or "three-point," the designation referring to the number of contact points on the balls. But a four-point is easily constructed; take two V-shaped sections facing each other, having any angle less than 180 degrees, and you have it; the bad design in Fig. 9, which might be called a bearing with an infinite or an indefinite number of points, could be turned into one of any number desired by simply notching away the curved surfaces. A very good argument, indeed, can be made for the four-point pattern, if well designed and constructed; but to show how bad designing can be, as well as to further emphasize that balls should roll and not

slide, we cannot forbear illustrating an old pattern of 1880:

This was Palmer's double-ball, which was advertised as "dust-proof and adjustable," and as "possessing in perfection every point required"; points required and perfection were not quite understood at that time—are

Fig. 10

they now? This curiosity of badness was a four-point, the balls touching at their sides as well as at top and bottom, although, as the pressure of the load was downward upon the axle, the balls on the lower side were probably a little freer in use. Since the points of contact at the sides of the balls were "neutral" (that is, having no rotary motion, because being at the ends of the axis of rotation) they necessarily rubbed on the case as they were pushed around in it, producing at least a considerable friction. There was no coned surface, and no effective provision for taking up even the vertical wear; but an "adjustment" cap was made to screw in from the front side, the effect of screwing it inward being to keep the balls pressed in contact with the four sides of the case and its separating flange, so that the sides of the balls rubbed at four places all the way around the circle. When we note that the aim was to reduce friction, the "adjustment" from below seems rather humorous, as well as queer. The intent was to press the axle and its sleeve thereon up into the case and take up wear in the vertical direction; but the ball seen above the screw was a lonely one in a square cavity, not one of a row, and if it was pressed up in contact with the flange the latter had to rub on it all the way around. The end of the set screw might have served the same purpose, only the screw was immovable, while the ball could turn over a little sometimes, when sufficiently tired.

Fig. 11

Fig. 11 is the three-point bearing, the ball pressing on the case at A and B, and on the adjusting cone at C. It is evident that under the weight of the load the ball will slip down the slope at C, and be pressed hard against the side B, as well as the bottom A. The relative pressure on these two points will depend on the flatness or steepness of the side of C, but ordinarily the two will be nearly equal in pressure sustained. The action at C tries to roll the ball on a horizontal axis, parallel with the wheel axle; the action of B upon the ball tries to roll it on a vertical axis. Moved by C, the ball may roll upon A and slide along B, or it may stick fast at C, and slide on A and B both; or stick fast to both A and B and slide on C. It evidently cannot have more than one of these movements at the same time. In practice, it is likely to mix them, possibly varying by sometimes rolling on B and "skewing about" on A and C. The only certainty is that it will move according to the least resistance, however drunken a path that may produce.

It is possible that some may think the ball is moved to roll in the plane of dotted line CD, at right angles to the side of the cone at C; in that case, we grant, the ball would roll smoothly and without slip or difficulty on the case at points A and B both, and our objection would fall. If the cut be held so as to bring the surface of cone C in a horizontal position, it seems to the eye almost as if this might be true; but there need be no doubt about it—the matter is easily put to test. It is evident that the inclined surface of the cone does not move in a plane parallel to the wheel axle, nor parallel with the flat surface of the case at either A or B, but in a direction diagonal to all three of these. Point C on the cone (where the ball touches it) moves in the plane of dotted line CC, and necessarily it tries to carry the portion of the ball which it touches in the same direction. If this is not entirely clear, suppose the ball and the cone to be toothed at the points where they are in contact, thus being gearwheels; if these teeth are spur teeth, the cone will roll the ball in its own plane of motion, to wit, dotted line CC, and the ball will roll around on side A of the case; if the teeth are in the bevel form, the cone will turn the ball at right angles to its own plane of motion, and then the ball will roll around on side B of the case. In effect, the cone tries to revolve the ball in both these directions, as we said above.

In fact, the axle and cone C upon it are stationary, the case revolving around them. For convenience, we have spoken as if they were reversed and the case were stationary, while the axle and cone revolved. The argument is not affected by this convenient assumption, for the action of the several parts upon each other remains the same.

The sides of the case and the slope of the cone may vary in shape, and may be curved instead of flat; yet, when made in this manner, so as to require the ball to roll in two directions at once, the three-point bearing must be entirely and unsparingly condemned.

But there is a way out of this difficulty, and so the three-point bearing need not be abandoned; reform it instead. Reverse the construction in Fig 11, placing contact points A and B upon the axle instead of on the case, and slant the adjustment cone the opposite way; and you have this:

Fig 12

Here the case is omitted for simplicity in the drawing. A fixed double or two-surfaced cone slopes outwardly, extending over instead of under the balls. Cone C will try to revolve the ball about an axis parallel to dotted line B B, which is tangent to the ball at the point where cone C touches it; the ball must roll on surfaces A and X both, and uniformly on both, or there will be sliding. At the points where touched by the ball, A and X are of equal diameter; the circles of revolution of the ball at the points of its contact with A and X are also of equal diameter; the ball can therefore roll on A and X at equal speeds, and no slippage will be produced. Turning back to Fig. 9, we can evolve this Fig. 12 out of that by cutting away the axle and case until the ball rests on the axle only at K K, points equidistant from L, and on the case at M; then we have the ball rolling on one large circle

and on two smaller ones of equal sizes, so that there is no conflict in speeds. If accurately constructed, there should be no sliding of the ball on A X in the forward direction, and only a minimum, at most, of the gyratory rubbing described in connection with Fig. 9. This pattern should therefore attain the desideratum of a full substitution—or as complete as is possible—of rolling for sliding motion by means of balls.

JULIUS WILCOX,
ALEX. SCHWALBACH.

(To be continued.)

DOGGING-PIN ON THE ARBOR-PLATE.

An index centre, adapted for cutting sprocket wheels and spur gears having a moderate number of teeth, and are proportioned to stand heavy cutting, is the latest production of the Garvin Machine Co., this city. They will swing a diameter of 8½ inches, and the dial-plate is large and carries index circles of 19—18—8—7 holes, and is provided with a sub-

stantial spring lock bolt. Other dials are furnished when desired. The tail spindle is moved by a quick pitch screw, and both spindles have female centres of hardened tool steel. The face-plate on the head stock spindle drives the arbor by means of a dogging-pin on the arbor-plate, and the set screws afford an adjustment for bringing the work in line with the cutter.

CURED AND KILLED.

"What has become of old Uncle Billy, who used to be always suffering from the rheumatism?" asked the returned wanderer.

"W'y," said the old resident, "it all come about this way. They got Uncle Billy to ridin' a bysickle, and dang me if it didn't cure him—cured him plumb well."

"Yes."

"An' then, as he didn't have nothin' to worry him no more after his rheumatism was all gone, the pore old man pined away and died."

NEAR NORTHPOLEVILLE.

"Oh, we had a lovely Christmas over at our house!" exclaimed the little Esqulmau girl to her nearest female friend. "And I got just what I have wanted ever so long."

"And what was it?" asked the other.

"A pair of fur-lined bloomers to wear when I'm out icel'ing."

HIS MIND FULL OF CYCLE.

"Willie, in your prayers you forgot to pray for grandmother's safety."

"Say, on the level, is that old woman ridin', too?"

FILLING THE BILL.

In a pinhole sort of a building in 1891 the March-Davis Company of Chicago first began the manufacture of bicycles. The first season but 150 wheels were turned out by the infant concern. Each year thereafter the plant was enlarged and the output increased. In '95 2,100 machines were made, and the '96 output showed a marvellous jump to 6,000 wheels. In 1895 the Chicago Wheel Works was started to make medium-priced machines, of which 6,000 were turned out this year. Now comes the consolidation of the two concerns, with a capital stock of \$100,000, fully paid in. The new corporation will be known as the March-Davis Cycle Manufacturing Company.

During the present year the March-Davis Company did not escape the effects of the general financial depression, but the company weathered the storm and came out with flying colors, to the gratification of all their creditors. The growth of the company has been firm and steady, and it now does a business of over \$500,000 a year. W. E. Davis, who owned the Chicago Wheel Works, remains the principal stock-holder and retains the positions of president and treasurer.

For next season's trade the company anticipate making 20,000 wheels. The March-Davis line will continue to be the leaders, while the cheaper trade will be catered to with the Admiral, in all eleven models, ranging in price from \$100 to \$40. All the connections of the March-Davis are drop-forgings. The hanger is of the Humber type, of special steel stock. The front fork has a solid forged crown with one-inch sides tapered. Both wood and steel handle-bars will be furnished, Vance hubs are used and the crank on the chain side is made with four arms, radiating from the hub of the crank and being dished over the hanger. The machine has standard-sized fittings all over and will be finished in black, Brewster green, maroon and royal blue. The roadster weighs 22½ pounds. The \$75 Admiral has flush joints, while the \$60 machine has outside connections. Special attention is being paid to the juvenile line.

FROM TOP TO BOTTOM.

"We are at the bottom of the cement business; our goods are at the top. We deal in nothing but cement and can quote figures to dealers and jobbers that will open their eyes." The foregoing is an extract from the catalogue of the Excelsior Cement Company, of Westfield, Mass. It is doubtful if a wealth of words could state the case plainer or in terms better calculated to interest the trade. The concern's speciality is their waterproof woodrim cement. It is in liquid form and compounded from a secret formula; is thick and full of "body," is claimed proof against water and also that it will never become hard or brittle or crumbly. Hard cement is also made. The Excelsior people also make a special cement for plugging, another for patching and a third for "touching up" worn spots on the exterior of the tire. A paste for lubricating either chains or bearings, a chain lubricant in stick form and tire tape make up the rest of the Excelsior line.

All liquid cements are put up in one-ounce tubes, quarter-pint, half-pint, quart and gallon screw-top cans; also five and ten-gallon jacketed shipping cans and barrels. The solid cement is put up in three-ounce retail cakes, one and five-pound cakes and in bulk in any quantity.

ROASTING THE LADY.

If my cook could ride a wheel
She would make a record neat,
For, to judge her by her dinners,
She's a scorcher hard to beat.

DOMESTIC CYCLE SHOWS.

January 23-30—Chicago, Coliseum; A. E. Pattison, Auditorium Hotel, Chicago.

February 6-13—New York, Grand Central Palace; Ernest R. Franks, 271 Broadway, New York.

February 20-27—Boston, Mechanics' Building; C. W. Fourdrinier, 34 Stanhope Street, Boston.

February 20-27—Philadelphia, Local Cycle Board of Trade.

February 20-27—Pittsburg, Local Cycle Board of Trade.

February 20-27—Baltimore, Local Cycle Board of Trade.

FOREIGN CYCLE SHOWS.

January 12-16—Liverpool, England.

January 16-23—Dublin, Ireland, Royal Dublin Society Building, Balls Bridge; R. Wilson, Secretary, 14 D'Olier Street.

January 23-30—Glasgow, Scotland; A. G. Rennie, Secretary, 49 Lilybank Gardens.

January 23-30—Birmingham, England, Gilling Hall; Chas. Wheelwright, Secretary, Lucifer House.

January 23—Vienna, Austria; Steiner Hoenicks, Manager.

February 1-7—Edinburgh, Scotland, Waverly Market; A. K. Dempsey, Secretary, 82 Leith Street.

February 1-15—Vienna, Austria; Winter Veldmore, 14 Kaentner Street.

February 3-6—Nottingham, England, Albert Hall; B. Richards, Secretary, Nottingham Athletic Social Club.

February 6-20—Manchester, St. James' Hall; Northern Counties Exhibition Co.

February 27-March 6—Leeds, England, Town Hall; Northern Counties Exhibition Co.

March 14-19—Glasgow, St. Andrew's Hall; Northern Counties Exhibition Co.

March 15-21—Brussels, Belgium.

TRADE CHANGES.

ALABAMA.
Roanoke—Griffin & Satterwhite, new store.

ARIZONA.
Phoenix—W. G. Getz, real estate mortgage for \$1,500; chattel mortgages for \$1,132 and \$125.

CALIFORNIA.
Los Angeles—P. L. Abel, reported gave sheriff's deed.
Los Angeles—W. T. Fleming, gives deed \$1,300.
Pasadena—Albert Palmateer sold out to J. P. Chaffin.
San Diego—George T. Lemon & Co. Mortgage, \$1,500.
San Jose—S. C. Travis, selling out.
San Jose—Harry Brown, selling out.

CONNECTICUT.
Hartford—The Monarch Manufacturing Company reported applied for a receiver.
Hartford—A. Kennedy-Child sued on a demand note for \$2,500 by Theodore M. Etting, receiver of the Curtis-Child Company.

COLORADO.

N. A. Pippin gave chattel mortgage for \$300.

GEORGIA.

Savannah—Zimmerman Cycle Company incorporated by A. A. Zimmerman, T. C. Darst and D. O. Groff; capital stock, \$5,000.
Atlanta—Atlanta Bicycle and Machine Company. Receiver applied for.

ILLINOIS.

Canton—James Donn & Bro. have commenced the manufacture of bicycles on an extensive scale.

Chicago—The Johnson Pedal Company, incorporated by W. L. Johnson, C. A. Banker and J. L. Rippey, to manufacture bicycle parts. Capital, \$10,000.

Chicago—The Traders' Cycle & Supply Co., incorporated by A. C. Barnum, E. S. Barnum and R. Paranteau, to manufacture bicycles. Capital, \$10,000.

Chicago—The American Corundum & Emery Wheel Company, incorporated by J. S. Young, E. S. Switzer and R. J. Hunt. Capital, \$200,000.
Chicago—Barker & Harris, bicycle supplies, 47 W. Washington street. Succeeded by B. E. Harris & Co. Incorporated.

Chicago—Chicago Mill & Supply Company. Application to remove friendly receiver.

Chicago—Jenkins Cycle Company. Assignee discharged.

Chicago—Kenwood Manufacturing Company. Judgment, \$1,329, entered in New York City. Execution issued.

Chicago—Fletcher, Sanger & Co., 24 Griswold street. New store.

INDIANA.

Fort Wayne—D. B. Kehler, manufacturer of wood bicycle appliances, has leased the Bruns Building, and will enlarge his operations.

Lafayette—Lindsay Bicycle & Manufacturing Company. Receiver appointed.

Richmond—Davis & Bell, bicycles, dissolved partnership. Mr. Bell continues.
Indianapolis—Indianapolis Ball Bearing Chain Company. Incorporators and directors, George L. Barney, John S. Kittle and M. B. Potts. Capital, \$10,000.

NEBRASKA.

Norfolk—A. Ellis removed to the Verges Building.

Lincoln—H. H. Pierce gave bill of sale for \$58.

NEW JERSEY.

Newark—Ellis S. Oliver, chattel mortgage for \$1,695.

NEW YORK.

Brooklyn—G. F. & W. C. Dunham. Judgment, \$302.

Buffalo—George N. Pierce Company incorporated to manufacture bicycles and road vehicles, Capital, \$280,000. Directors, George N. Pierce, Henry May, E. C. Potter, L. B. Somerly, of Buffalo, and S. J. Thompson, of Newark, N. J.

Little Falls—J. B. Donovan, new store, handling the S. & F. bicycles.

New York—Mercantile Supply Company, bicycles, No. 41 Barclay street, three judgments obtained against them, amounting to \$3,310.

New York—Max Tradelius, No. 2,013 Seventh avenue, bill of sale, \$3,000.

New York—Whitman Saddle Company, chattel mortgage to Mehlbach & Buck, merchandise, \$40,985.

Painted Post—Gaylord & Straits damaged by fire. Insurance, \$1,200.

PENNSYLVANIA.

Altoona—George F. Fresh, bicycles, damaged by fire and water.

Coatesville—James C. Pugh, bicycles and guns, burned out.

Harrisburg—Frank Calder closed on execution of \$500 in favor of Eliza D. Calder.

Philadelphia—William J. Hines Company assigned after foreign attachment.

Pittsburg—L. E. Fleming & Co., Limited, execution for \$4,836.

McKeesport—United States Seamless Tube Company incorporated in New Jersey by W. J. Curtis, of New Jersey; E. C. Converse, of New York; Joseph Claudett, of New York; Horace Crosby, of Pittsburg, and Charles M. Wood, of Brooklyn, to manufacture bicycle tubing and horseless carriages.

SOUTH CAROLINA.

Anderson—Simpson & Son. W. B. Simpson dead.

Charleston—L. W. Bicaise & Co. Judgment, \$203.

Charleston—Charleston Cycle Company. Judgment vs. E. B. Welch, \$1,329.

TEXAS.

Houston—Duerer & Depperman dissolved and discontinued.

Houston—Grant & Pearl. Mr. Grant sells his interest to A. Potter. Firm now Pearl & Potter.

WISCONSIN.

La Crosse—John C. Holte. Chattel mortgage for \$225.

MOST REMARKABLE WHEELWOMAN.

The report from Cambridge, Mass., that Helen Kellar has experienced the pleasure of bicycle riding recalls her conversation with a "New York Sun" reporter about a year ago. She was telling about her enjoyment of outdoor life, despite the fact that she could neither see nor hear. Walking, she said, was a constant pleasure to her. With that spirit of cheerfulness that is remarkable for this most interesting young woman she told what she "saw" on most of these walks. The reporter, who had been quietly testing how much she really did know of what was going on about her, asked her if she did not think riding a bicycle would be great fun and almost as enjoyable as walking. Miss Kellar burst into a ringing laugh and said:

"Me ride a bicycle? Oh, no. I am afraid I should break my neck."

Then she told of her enjoyment on a tricycle as a little girl. She rode on that about her own yard, where she knew every foot of the place. She said the pleasures of bicycle riding would never be hers. She made it plain why she said so, but there was no sign of regret or of unhappiness because of her lot. She treated the matter as a joke, and was pleased at the suggestion by the reporter.

Nevertheless, Helen Kellar is riding a bicycle about the streets of Cambridge, and another marvel in the life of this girl, still under eighteen, has come to pass. It will be remembered that at the age of eighteen months she lost her sight and hearing. She remained a mere animal in a dark, silent world, not knowing that there was such a thing as light or speech until her teacher, Miss Sullivan, came to her home. Gradually she began to master the meaning of signs and to read and study. Later she began to comprehend the meaning of sounds, and then she discarded talking with her fingers, and "listened" to others through the marks they made on the palms of her hands. Within two years she has begun to talk precisely as other people talk, and she has listened to other people talk by placing her fingers across their lips when speaking. She has astonished her friends by reading Huxley and Darwin for recreation, and only last fall she astonished the country by passing most of the requirements for admission to Radcliffe College. She passed in every subject that she took, and there was no indication that the person undergoing the examination was entirely blind and deaf.

The marked literary ability that Miss Kellar possesses has been noticed widely. It is probable that she will make literature a speciality in college. She told the "Sun" man a year ago that mathematics was a sore trial to her, and when the reply was made that she was not alone in that matter, her laugh rang out as heartily as when she said she was afraid she would break her neck on a bicycle.

The tandem bicycle has solved the difficulty for Helen Kellar. She can take her place on the rear seat, do her share in the pedalling, and let her companion on the front seat do the steering. With her quick intuitions it is probable that Miss Kellar feels the slightest pressure on the pedals when back pedalling becomes necessary to slow up, and, judging from the advance this girl has made in other matters, it is altogether probable that there is complete and instant accord between her and her companion on the tandem, a requirement by no means unnecessary even when the riders of the tandem can both see.

WITH HOLES IN THEM.

"Well, I can't wear these golf stockings again."

"Um, no; they look as if they were on their last legs."

DEPENDS.

Her dainty stocking is but small,
Her bloomers large, they say;
She wonders which she'd better hang
For presents, Christmas Day.

CHANGED PLACES.

There was a wheel girl on the Niger
Who rode, with a smile, near a tiger;
When they returned from the ride
The girl was inside,
And the smile on the face of the tiger.

BE THANKFUL.

There's no use in talkin',
Good ridin' beats walkin',—
The same as cash money beats talk;
But if your wheel it should stop,
Because your tire should pop,
Just thank God you're able to walk.

REAL RARA AVIS.

Isn't he a bird?

WANTS NO COMPANY.

There are times when man would be alone,
Far from the madding crowd,
Where he his privacy can own
And think his thoughts out loud.
One of these times, without a doubt,
Is when he first bestrides
A wheel, and neighbors all come out
To see how well he rides.

EITHER HORSE OR WHEEL.

Mankind as a whole prefers riding to walking,
And always will do so; there's no use of talking;
As a rule, when it comes to a matter of distance,
Man chooses to get there by other assistance
Than bodily power. But by way of diversion
'Tis good for one's health to make an excursion
On foot or on wheel. Hence I have a notion
We'd better catch onto the new locomotion
Because it certainly is a good plan
To cultivate that which gives vigor to man.
The varied conditions of our myriad race
Demand for both horseman and wheelman a
place
And each may regard the other with pride
While gracefully travelling side by side.

CHRISTMAS GIFTS ON WHEELS.

More men, women and children will receive bicycles on Christmas morning than ever before since the first wheel was invented, if the stories told by manufacturers and their representatives are true. Salesmen in the various cycle stores report that their rooms are frequently crowded with parents looking at wheels with a view to purchasing one or two, and in some cases more, as Christmas gifts for their sons, daughters and wards.

A father says that his boy declares he doesn't want anything if he can't get a bicycle, and before he has finished speaking a mother rushes in and declares that her daughter, who has always been perfectly satisfied with a handsome piece of jewelry or a sterling silver article for her dressing-table or desk, won't hear of having anything this year but a wheel.

Even the little children are writing letters to Santa Claus, not for dolls and drums as in years gone by, but—for bicycles. One gold-en-haired tot of eight years added a post-script to her letter to the good old Saint, saying:

"If you can't get it," meaning a bicycle, "in your pack, send it by a messenger boy, and I'll pay him out of my bank, dear Santa."

WAS TOO SUDDEN.

They had been tandem riding; they had dismounted from the wheel, and were seated on the stone parapet on the Riverside Drive, talking about the roads, the weather and the last church social, just as they had done ever since their riding school days of two years before.

Suddenly drawing the girlish, sweater-clad figure toward him he exclaimed: "Agnes, I can no longer dissemble—I love you!"

The slender frame was racked as with uncontrollable emotion. Starting from his embrace, she half rose to her feet, clutched wildly at her throat, then sank gasping to the gravel at his feet.

"Heavens!" he cried, "what means this? Art thou ill? Was my declaration too sudden for you?"

"Sudden?" she gurgled faintly as she struggled to smile. "Sudden? I should say it was. You scared me so I've swallowed my chewing gum."

The man in the moon went behind a cloud to there repress an irresistible inclination to smile which possessed him.

SUPPOSED TO BE FUNNY.

Passenger—What was that motorman arrested for?

Conductor—He ran down two wheelwomen yesterday.

"Ah, caught in the act of knocking down the fair, eh?"

BAXTER STREET TIME PAYMENTS.

"What do you want for that wheel in the window?"

"Feefty tollars, cash."

"And on instalments?"

"Von hundred tollars; half cash, balance six months."

ONLY A FEW NON-RIDERS LEFT.

"I see that some more States are talking of taxing wheelmen."

"They are, eh? Another case of discriminating against the masses for the benefit of the few who don't ride."

AS THEY LENGTHEN OUT.

"How long, O Lord, how long?" groaned the Horse, averting his eyes from the spectacle of a septette.

Nor could he longer hope to continue the unequal struggle.

Tested Bicycles

are the mounts of the future. We are not anxious to adopt a lot of new-fangled devices and have you try them for us as an experiment.

ROCKY RIDING.

How the Lieutenant, Cook and Company,
Rode Through the Rocky
Mountains.

Lieutenant James A. Moss.

Lieutenant James A. Moss, 25th United States Infantry, in his famous trip through the Rocky Mountains, from Fort Missoula, Mont., to the Yellowstone, certainly gave military cycling the severest test that it has ever received. Lieutenant Moss's command consisted of eight soldiers mounted on Spalding wheels, each wheel weighing twenty-six

"Our trip to Lake McDonald and Yellowstone Park and the work on the practice march have, I think, fully demonstrated the practicability of the bicycle for military purposes in a mountainous country. The matter was most thoroughly tested under all possible conditions—we made and broke camp in the rain; we travelled through mud, water, sand, dust, over rocks, ruts, etc.; we crossed and descended mountain ranges and forded streams, carrying our rations, rifles, ammunition, tents, blankets, extra underwear, medicine, tools, repairing material, cooking utensils and extra bicycle parts.

"Only when in gumbo mud did we find our wheels to be a hindrance; at other times when we could not ride, the wheel was a great aid, as we could roll our loads on our bicycles a great deal easier than we could carry them on our bodies.

"Our best ride was made on September 3, when we covered seventy-two miles in 8½ hours, averaging 8.2 miles per hour. That night I asked the men if they were very tired; all of them answered that they were feeling tired, but not one-half so much as they had often felt after an ordinary twenty-five-mile forced march.

"No one but a person who has had experience with troops on the march can fully appreciate the significance of a squad of nine men travelling through a mountainous country at the rate of 8.2 miles an hour for seventy-two miles, carrying their rations, rifles, ammunition, blankets, tents, etc. I do not hesitate to make the statement that we could have kept this up for five days, the weather and condition of the roads permitting.

"After being out about a week I found we would not feel the effects of a ride of forty-

our bodies. If placed on the body, in addition to carrying the actual weight of the object, the soldier would also experience some physical exhaustion from the weight resting on his body. Besides this, one falling from a wheel with much weight secured to the body is much more likely to get hurt than one whose limbs and body are entirely free and unhampered.

"We found brakes to be absolutely necessary. Going down any kind of a grade it was impossible to control, without brakes, wheels as heavily loaded as ours. Furthermore, we very often had to make sudden stops in meeting wagons along sinuous roads lined on either side with timber and underbrush.

"In all our experiments we found the wind one of the worst things to contend against.

"A wood rim is, I think, less likely to buckle than a steel one, but will not answer for military purposes, unless, in addition to being glued where the ends meet, it can also be riveted. After being out in the water and

Wheels as Breastworks.

Ready for the Start.

Command in Camp.

pounds and geared to 66½ inches. An average of fifty pounds of baggage and equipment was carried, and the average weight of the riders was 155, thus bringing the average total weight of wheel, equipment and rider up to 231.3 pounds—weights which mean considerable when they have to be carried over the alleged roads found in the Rockies. That the experiment was successful the following by Lieutenant Moss is ample evidence:

five miles or less in one day, but that anything over this would make us feel tired at night. It's true we were pretty well hardened by this time, but such would be the normal condition of soldiers in time of actual warfare. At no time on the trip was any one made sick or in any way disabled from riding.

"We found it best to carry everything if possible on the bicycle itself and nothing on

dampness a day or more the glue is very likely to wash out and the rim become loose. Unless an absolutely waterproof rim cement can be gotten, the clincher tire would answer better for military purposes.

"In all our experiments we used exclusively twenty-six-inch Spalding bicycles geared to 66½ inches. The wheels stood the severe test to which they were subjected extraordinarily well, and are, without doubt, very fine machines, especially well fitted for such rough work.

"We used single-tube Palmer tires—at first the ordinary, and then the 'Mexican Palmer.' Although the present pneumatic tires ride very easy and will answer in every respect for good Eastern roads, they will not do for military purposes. I experimented with new puncture-proof tires, but found they were not resilient enough, and had them replaced with pneumatic ones.

"The bicycle itself is now about perfect, and the all-important part of the question to be solved is—a resilient, non-puncturable tire. This, I think, will be attained within the next two or three years. Unless the military cyclist has puncture-proof tires he will, during times of actual warfare, dread the enemy's tacks nearly as much as his bullets."

CYCLE NOMENCLATURE.

What Cycling Has Been Responsible for
in the Way of Coining New
Words.

The nomenclature of cycles during the period of their development, and of things, abstract and concrete, appertaining thereto, would have made no mean addition to the English language, had it, as a whole, been incorporated therein. There has been considerable argument as to the appropriateness of certain of our modern cycle terms, but in spite of the protests of philologists, the term "bicycle" at least, like the vehicle it designates, has come among us to stay. Of all the other designations that have been applied to rider-propelled vehicles, some have now become reasonably fixed, some occupy an uncertain and precarious position, while others are mere historical recollections.

We do not know what the old Chaldeans and Romans may have called those vehicles that imaginative and cycle-enthusiastic travellers find depicted among the hieroglyphics and inscriptions of ancient ruins; nor do we learn that any special name was given by Ozanam to the pedomotive vehicle that he describes in the "Recreations of Mathematics" of 1690. Blanchard's Parisian cycle of the eighteenth century is known to us only as "a machine to go without horses;" in brief, as a horseless carriage.

The two-wheeled wonder that is said to have astonished Paris in 1816 was christened by the Parisians "Celerpede." The vehicle produced by the Baron Drais a year or so later was called by the Germans "Drais Laufmaschine." The polite Parisians honored the Baron by calling it "Draisine" and "Draisienne," and, according to Chambers's encyclopedia, "Draisine." "Draisena" was also in common use. Later, when the craze had fully seized upon Paris, the term "velocipede," the title given in Von Drais's French patents, to draft carriages, but sometimes misapplied to the velocipede.

Shrewd Denis Johnson introduced the Parisian fad to London as the "Parisian's curriole." That name, however, did not suit all Englishmen, and we find it variously called "hobby horse" and "pedestrian's hobby horse" (Repository of Arts, 1819), "speedy pace" (Gentleman's Magazine, 1819), "swift walker" and "walking accelerator" (Monthly Magazine, 1819), "accelerator" and "patent accelerator" (London Magazine, 1819). "Bivector" and "trivector" were also perpetrated by a contemporary periodical, and might, perhaps, have held the post of honor now held by "bicycle" and "tricycle," had the new vehicles been more kindly treated by George Cruikshank and his brother caricaturists. The great walking British public dubbed the new two-wheeled thing a "dandy horse," and as such, with the assistance of the caricaturists, laughed it out of existence. Cruikshank cast a keen shaft of ridicule in his drawing of the long-legged dandy on the "new Irish jaunting-car," by which you can ride at your ease and are obliged to walk in the mud at the same time. "Dandy horse" redivivus appeared in Paris in 1896, under the name "La Celerette."

It is said that Datzelle called his bicycle of 1840 the "wooden horse," and that it was known by that name all over the country surrounding his home.

In 1868 a second velocipede mania attacked the people of the United States and France. In 1869 the mania had reached its climax and had spread over England. The name velocipede affixed itself to the Micheaux or Lallement vehicle, which was responsible for the craze.

In the American Annual Encyclopedia for 1868 is found the word "bicycle." Early in

1869 the New York dailies began to use the term, the standard weekly papers took it up, and applications for "bicycles" began to pour into the Patent Office. Protests against the barbarism involved in the word bicycle were registered at once, but they could not prevent the popular acceptance of the term. Had the protestants carried their point, we might have been riding "dicycles" to-day, instead of bicycles—perhaps even "birotæ" or "bivectors."

"Bicircle" is found in an issue of "Harper's Weekly" for 1868, whether intentionally or as a typographical error is uncertain. The owners of the Lallement patent were sued for infringement by the owners of an earlier patent for a "cantering propeller," which may also take its place among the forgotten names of the past.

The word "tricycle" began to be applied to the three-wheeled velocipede about 1869. By that name a light three-wheeled coach which came into use in Paris in 1828 had already been designated.

"Monocycle" was applied to the one-wheeled velocipede in 1869. It had previously been used as a designation for a one-wheeled sulky in a French patent of 1820. The term

The rider of the "boneshaker" was sometimes a "velocipedist," at others a "velocipedestrian." In the riding schools of 1869 the fair sex practised the art of velocipede riding with ardor. The fair riders were "velocipedestriennes." After the term bicycle came into use, the words "bicyclist" and "bicyclist" were speedily coined, while in an issue of a New York daily for June, 1869, a compliment is paid to the "bicyclienne" of the Astor "velocidrome." "Tricyclist," "tricyclist," "cyclist" and "wheelman" are now current and well established in the language.

The art of riding was frequently called "velocipeding" and "velocipedestrianism;" sometimes, alas, "velocipedizing." "Velocipeditation" also found in contemporary periodicals, and "velocipedestrianism." "Bicycling," "tricycling" came rather tardily into common use. "Cycling" and "wheeling" now divide the popular favor as designations.

The mania was commonly referred to as "velocipedomania," and later and less commonly as "bicyclomania."

Instructors in the art of "velocipeding" were known, in the newspapers, at least, as "velocipedagogues." The riding halls were often denominated "velocinasiums." The Astor "Velocipedrome" was a popular riding-hall in New York. "Velocidromes" also existed. A widely advertised place in Brooklyn was the "Amphicyclotheatron." The celebrated Hanlon Brothers conducted a "gymnacyclidium," and "bicyclodromes" followed the introduction of the word bicycle. "Velodrome," like many other of our cycling terms, is an importation from France. All these are the successors of "hobby horse school" in Golden Square, London, of long ago.

The science of the velocipede has been referred to as "velocipedology." The climax of cycle terminology was reached in the word "Velocipedestrianistialistinarianologist," for which "J. F. E." vouches in his little work on the velocipede, and which he charges to this great country of ours.

In this, the era of the bicycle, the term velocipede has wellnigh disappeared except as a reminiscence of the past. The Patent Office still retains it as a generic term for all cycles, man-propelled. In addition to the above, the Patent Office sanctions in its classification, "ordinary bicycle," "safety bicycle," "tandem," "epicycle" and "dicycle," the latter term being applied to the two wheelers that have the two wheels abreast as in the Otto type, the dicycle bearing the same relation to the ancient go-cart that the bicycle bears to the dandy horse. It also sanctions "polycycle," extends recognition to "companion bicycle," "sociable bicycle," and to another barbarism in the word "quadricycle." "Sociable" and "companion" are also applicable to tricycles.

Names that have been applied to specific cycles have, in many cases, become the names of types. Lawson's safety bicycle of 1879 was called "bicyclette," the name now applied to the rear driven safety in France. "Rantonee," "ripper," "coventry chair," "American star," "extraordinary," "facile" and "crypto" have also become typical; so have certain names applied by the popular fancy, such as "kangaroo," "crocodile," "broncho" and "bantam."

An enthusiast, writing in 1890, produced a chapter on "velocipathy," a contribution to the healing art. Had this same author seen the rosy faces of the modern wheelwomen, he would, doubtless, have rewritten his chapter still more enthusiastically and would have called it "cyclopathy." E. D. S.

The greatest trouble about some of those cycling blessings in disguise is their dilatoriness about discovering themselves.

MORGAN & WRIGHT
CHICAGO

"monocycle" was unobjectionable to the philologists and rhetoricians, but they were unable to prevent the people from calling the vehicle "unicycle," the name by which it is now popularly known.

In the columns of the "English Mechanic" for 1869, we find the words "celerimane" and "manupede" applied to bicycles with hand-driving devices; also "maniveloiter" and "aëlopedes" for special forms of velocipedes. One visionary proposed to add wings to the steed of wood and iron and call it "fugepede." The "Engineer" for 1869 uses the term "Velocimanipede" for a hand and foot propelled bicycle. "Veloce" and "bicycular vehicle" were not infrequently seen in the daily papers of the period. A correspondent contributed to the "English Mechanic" for July 10, 1869, a drawing of a "safety bicycle for preventing croppers."

The posthumous and derivative name for the bicycle of 1869, namely, "boneshaker," is likely to pass into the future as its permanent name, just as the absurd "dandy horse" has clung to its predecessor.

At the present time every one who is particular to be in the latest mode confines himself strictly to "cycle" and "wheel," although it is not uncommon to overhear from the lips of some devotee a reference to "bike."

Why Buy the Barnes

When there are so many other wheels on the market that are so effusively advertised and so fulsomely endorsed?

Because the best points in many of this nondescript curod of wheels are copied direct from the WHITE FLYER Model. Because the BARNES sets the style. Because it leads, others must follow.

The Barnes Cycle Co.,

SYRACUSE, N. Y.

Kindly mention The Wheel.

HE WAS NO FOOL.

"I always thought you were a man of courage," she said bitterly.

"I am," he protested.

"You!" she exclaimed sarcastically. "You!"

"Yes," he replied, hastily. "I have proved my courage dozens of times."

"Where?" she asked.

"In the riding of a bargain-counter wheel down Broadway, everywhere that courage is needed."

"Then," she said in a tone of conviction, "you do not love me!"

"Ellen," he cried, "retract those words! You know not what you say! I love you madly, devotedly."

"So you have said before," she returned sorrowfully, "and yet—"

"Speak!" he implored, as she hesitated. "What makes you doubt either my love or my courage?"

"You have asked me to be yours," she said in a low, passionate voice. "You have said that you wished to marry me, and for two weeks we have been engaged."

"Glorious two weeks!" he interrupted.

"But during that time," she continued, "you have steadfastly refused to teach me how to ride a bicycle by letting me occupy the front seat of a tandem with you when you go up to the Boulevard."

His brow clouded instantly.

"I have," he admitted, "but that is purely a matter of discretion. I am courageous, Ellen, but I never claimed to be foolhardy."

EPHIGRAMS.

Dey ain't nuffin's 's cheap ez flattery, ner affin' ut's intinded ter buy so much in by-sicklin'.

De biggah de bysickle output de less de rebbensent wheel'll fetch; 'n' de mo' yo' tells me w'at er ha'dheaded quality niggah I is de less I t'inks yo' b'lieves in dat flatt'rin' ruf.

Ef de luffin' I does inside w'en yo's er llandishin' me tryin' to sell me one of dem jess-as-good bysickles, showed froo my skin, yo' wouldn't f'ink yo' so powful sly. Unc' lph knows de truf fum er cabbage, efe am oo perlite ter call names.

Folks is er heap mo' afeared ob er man w'at t'inks about a bysickle 'n' dey is ob er man wat talks about hit. 'F yo' keeps yo' mouf shet on'y yo' an' yo' Makah knows w'at er tawmented fool yo' is

De convussashin ob some bysickle folks leads me ter b'lieve ut all de Lawd'll hev ter do ter mek er hell fo' dem'll be ter chuck 'em in wiv er lot of deir own sawt.

W'en one dealer tell me notter trus' 'nuddah dealer an' de uddah dealer wawns me 'tiklar ter be shy ob de fus' name dealer I allus takes bofe dey advice.

SHORTNESS OF "FOREVER."

"Farewell forever, then!" cried the weeping girl. "We part, but the sorrow of this shall wear my young life for aye!"

In a paroxysm of grief uncontrollable she threw herself upon the couch as the street door slammed shut behind the haggard young man who had torn himself from her presence.

Then hastily arising she brushed away the traces of tears and went down town to secure a pair of golf stockings which would harmonize with her newly ordered riding costume.

HIS STRONG POINT.

"I'm afraid that man who aspires to your hand is too weak-kneed to make you a good husband," said her father.

"Oh, papa, he's not that! He's ridden thirteen centuries this season!"

TUBE BENDS AND ALTERATIONS.

Tubes are more or less liable to become slightly bent when undergoing brazing after making some repair. In repairing an indentation, or putting in a joint, the tubing necessarily gets heated some distance, and unless very carefully managed will bend. To overcome this trouble, a view is given in Figure 1 of a shop-made contrivance which is very simple, and which can be put into service in a few moments. Such a device is used in our shop very often and has saved many bent tubes.

Suppose that some operation is to be performed on the cycle tube at A. It may be that the tube is cracked or broken, and it must be heated, the defect remedied and the fracture brazed over. Without proper supports the tubing will get out of shape when heated. The contrivance to prevent this

sists of the cast-iron arm B, at the ends of which are the bearing with caps, C C. To put on, remove the caps and tighten to place as shown. Keep the device on until the tube is cooled off. It will never fail to hold the tubing perfectly straight.

Owners of old wheels often visit the repairers to have their machines brought somewhat nearer the times by altering the shape of the handle bars. The old form of bar as shown in Fig. 2 is crude. The same bar looks better when shaped to Fig. 3 or 4, and new handles put on. Quite a little skill is needed to shape bars neatly. Secure good forms first, heat the bars and bend them around the form slowly. Forms can be made from wood blocks and lined with sheet iron, or the cast iron slab and pin system may be used to advantage. It is popular now to have adjustable bars. An old type of bar like Fig. 2 may be changed to style 6 by separating the bars in the centre and putting a thread on an end of each, as shown at D, in Fig. 5, attaching to same the socket C.

For a stand make a piece the shape of G, shown in Fig. 7, and screw it into the tube, F, of the handle bar support. A bolt, H, will serve to pass through the hole in the socket-piece of each bar, thus bringing the handles to the position shown in Fig. 6. By loosening the bolt E, the bars may be elevated to any desired line and again fastened. Re-

pairers are called upon to do queer work at times. Riders will sometimes get the impression that the pedals are describing more of a circle than is necessary. The correct distance may be ascertained by a tangent of the arcs with a radius equal to the length of the pedal cranks, as represented in Fig. 8.

There are not a very large proportion of bevelled geared systems of power transmitting on wheels, but occasionally a bicycle thus driven is brought in with the gears grinding or out of true. A view is given in Fig. 9 of this system in which A is the connecting shaft, B B the bevelled gears, and E the gear on the crank shaft. The ball bearings are marked C C. As soon as the relationship between any of the parts is disturbed, there will be rattling, grinding and loss of power. To remedy, overhaul the bearings, see that the gears are fast, balls true and free from foreign matter and parts well lubricated.

GEORGE D. RICE.

STANDS BY ITSELF.

Two or three years ago there was a great furor over the advantages to be gained by carriage builders entering the bicycle business as manufacturers or dealers, or both, says the "Carriage Monthly." Experience has demonstrated that the bicycle business had its own requirements and necessities, and that it did not possess those easy adaptabilities that would enable a carriage builder to become a cycle builder.

The business has cut its own way through, and stands by itself—a separate industry. This was a foregone conclusion. Still, there are cases where the exception proves the rule.

This is also true in England; one of the largest carriage makers in Long Acre has laid down a fully equipped cycle plant, and it is the first carriage manufacturing firm that has attempted cycle making on a large scale. The greatest and the almost unsurmountable obstacle is that a bicycle plant is a most costly thing, and demands special skill and special business aptitudes.

SCRAP-HEAP CYCLES.

"I do not hesitate"—

With unconscious inconsistency he paused to light a very short-stemmed, grimy pipe.

"—to observe most emphatically, after a careful study of the situation and after a diligent perusal of 'Coin's Financial School,' that I"—

Leaning forward he picked up the reins and grasped firmly the remnants of what was once a whip.

"—am the only genuine buymetallist after all."

Muttering a hasty "get-up" to his horse, the junkman proceeded on down the street to a house where he knew a man had bought a bargain-counter bicycle only two weeks before, and would be ready to dispose of it to him, the only man in the world who would buy it.

SHE'S A SCORCHER.

"What do you mean by comparing your cook to a pneumatic?"

"Have to give her a blowing up about once in so often, or she's no good."

MORE SUITED TO THEM.

"Men are more inclined to pursue the narrow path than they used to be."

"How do you account for it?"

"Natural result of cycling, I suppose."

WHY, CERTAINLY.

Maud—They say that bloomers are going out.

Marie—Of course they are. What good are they in the house?

POINTER ON HILL HELP.

A Massachusetts wheelman rejoicing in the name of Coe has trained his pointer Joe to be of considerable help to his master. When Joe was a puppy his owner becoming discouraged by the many hills he was forced to surmount in his around home cycling, began considering the problem of securing some sort of motor to aid him in his hill-climbing. Being quite an expert in the handling of animals, he decided to use Joe in this capacity. He had a special harness constructed for the dog and began training him. Joe took kindly to the idea, and the exercise agreed with him. He was fed freely, and grew with great bounds, the work causing his hind quarters to increase with special rapidity till they were marked with lumps of well-hardened muscle, and appeared more after the general pattern of a small horse than a dog. Under this rigid course of cycle training the dog soon became much larger than either of his parents, and

HERE IS A TRADE-CATCHER.

Next to having a good shop is having customer. I have experimented a little in this line and have found that my business was increased when I have had something to attract attention. A new kink in wheels, an old-style bicycle, or anything odd, will draw attention. I give a sketch in Fig. 2 of a scheme which worked well for a time. It consisted in suspending a bicycle in the show window by wires, A, A, and causing the rear wheel and cranks to turn without visible means.

I bought a common fanwheel, such as is used for blowing air at a forge, and arranged this fanwheel to blow air through the pipe D and up through B against the spokes of the rear wheel of the suspended bicycle. The piping was beneath the floor of the window, and the part B did not show. The current of air made the wheel revolve with great rapidity, while passers-by would stop and wonder from whence the motive power came.

Anything mysterious and odd seems to draw. Try this idea.

GEO. D. RICE.

celebrated the first anniversary of his birth by giving his father the wallowing of his life.

The method of operating Joe is very simple. His harness consists of a breastplate, a surcingle to hold it in place, and a strap extending down the backbone and ending in a ring at the base of the tail. The rest of the apparatus consists of a strap about four feet long, with a snap hook at the further end, the strap being attached to the steering-post of the bicycle, and when not in use wrapped around the handle-bars. When a hill is reached Mr. Coe whistles to Joe, and the pointer comes up alongside and allows the hook to be snapped into the ring on his harness without compelling the rider to dismount. He then jumps forward and pulls up the hill, dropping back at the top to be loosened again.

The hundred-odd pounds of active dog is a wonderful assistance, and with a fair amount of work by the rider deprives the steepest hill of its terrors. The animal takes the hill in a strong gallop, being able apparently to use his weight better in successive lunges, and also

being evidently anxious to get his work done. In this way a hill is taken at a rate between the dog and the rider that surprises onlookers; in fact, the dog will take a hill of moderate grade alone, with the rider's feet on the coasters, though Mr. Coe rarely subjects the dog to such an uncalled-for strain.

IN SLIPPERY PLACES.

To imitate and ape the English has long been a habit with many riders. This may account for the numerous sufferers from the deadly British "side slip" seen on the Boulevard on muddy days. Another and more likely explanation is that the side-slippers are nervous, and are expecting a fall at every revolution of the wheel; they consequently grip the handles as if holding on for dear life, lose their control of the steering, and swerve from side to side; while at the same time the fear of falling causes them to pedal unevenly and become unsteady in the saddle. Of course, the inevitable result follows, and they find themselves and their machines in direct contact with Mother Earth in less time than it has taken to write this.

On the other hand, a rider of probably much less experience, indeed the absolute novice, will often steer safely over the greatest of roads, simply because he knows no fear. By-the-way, there must be a special Providence looking after the well-being of wheelwomen in their novitiate, a privilege not extended to men who have not outlived the "wobbly" period. Men fall when least expected, while women will have the most hair-breadth escapes in the place of the calamity which looked inevitable.

CURE FOR SCORCHING.

Take twelve ounces of dilute, one pound of resolution, two grains of common-sense, two ounces of experience, a large spring time and three quarts of the cooling water of consideration, set them over the gentle fire of wheel love, sweeten it with sugar of forgetfulness, skim with the spoon of melancholy, put in the bottom of your heart, cork with cork of clear conscience, let it remain, and you will quickly find ease and be restored to your senses.

Again, these things can be had at the apothecary, at the House of Understanding, next door to Reason, on Prudence street, in the village of Contentment. Cycling has no middle term; it will either save or destroy. This prescription can be easily filled by any one whose love of the wheel is great.

UNCLE SAM A CYCLER.

Before a year has elapsed it is probable that the United States will have 1,000 of her regulars mounted on wheels. There is now in preparation a bill to be presented to Congress providing each fort and military station in the country with ten machines; the ten most expert cyclists in the fort or station to be mounted on the wheels and to be drilled and used for special duties where quick transportation is required. Heretofore soldiers in the United States Army who rode wheels have been compelled to buy them themselves, but the bill proposes that the Government furnish wheels as a regular army equipment.

THE OLD, OLD STORY.

"I have finished that article you told me to write about cycle riding being only a passing fad, sir," said the assistant to the editor.

"Have you put in all the arguments in its favor that you can think of?"

"Yes, sir."

"Then add that 'other considerations will readily suggest themselves to the thoughtful reader,' and let it go at that."

Cycle Facts

It is a **Fact** that there are hundreds of wheels, masquerading under various names and disguises, sold as high-grade bicycles, which have nothing to recommend them but their fine coat of paint and enamel. Stripped of these they stand exposed as fit candidates for the junk-shop. Paint and enamel do not make a bicycle any more than paint and powder make a lady. Beauty at the best is but skin-deep. For the worth, the quality, the character, the soul, if you please, of a bicycle you must go beneath the surface. The workmanship, the material, the maker's reputation must be critically analyzed.

It is a **Fact** that in Monarchs none but the best material is used and the most skilled mechanics employed.

It is a **Fact** that Monarchs are made in the finest equipped bicycle factory in the world.

It is a **Fact** that Monarchs have for years stood the crucial test of actual use in every country in the world, under all conditions and circumstances, and are universally acknowledged as standard.

It is a **Fact** that the makers of Monarchs have achieved a success without a parallel in cycle history—strong evidence that a discerning public has recognized their worth.

It is a **Fact**, in fine, that you can't make a mistake in buying a Monarch. Monarch certainty backed by the Monarch guarantee is sound insurance against "junk-shop masqueraders".

Be safe—be satisfied—ride a **Monarch** and keep in front.

Our catalogue is yours for the asking.

HOME OF THE BELLS.

Easthampton, Conn., is a town of bells. Located there are no less than four large plants devoted to the manufacture of these sound-producers, whose ponderous clang or merry jingle is heard in all corners of the earth. Long before the bicycle was ever thought of, these factories made bells, but since the cycle became a factor, the business in Easthampton has increased surprisingly; the combined output of bicycle bells alone forms a staggering total. Of course, just now all Easthampton is preparing for '97 trade. The N. N. Hill Brass Co. have built a large three-story brick addition to an already large factory, and have in course of perfection a line of bells that are sure to command consideration. Several new designs will be shown, their "Dome" patterns being, perhaps, the most striking.

Starr Bros. have also enlarged their plant, which now occupies a generous portion of ground. They, too, have much to show for '97, although their line is hardly yet completed. Their bells have met with considerable success in past years; during '96 they report it was almost impossible to keep abreast of the orders. With increased facilities, however, the Starrs will be able to take care of all that may come their way.

Bevin Bros., an old and honored firm, will, of course, have a line that will in every way sustain their reputation. In addition to bells, Bevin Bros. are large producers of oil-hole covers, the trade in these little steel stampings having assumed immense proportions.

Easthampton is also the home of the Climax Manufacturing Co., who make the Climax saddle, which is built upon a base composed of spirally wound steel wire, that readily adjusts itself to every curve or movement of the body. For the coming year the saddles have been much improved, the detachable leather cover being a novelty that will undoubtedly "take."

STEALING THUNDER.

A case of particular interest to advertisers was settled in the Paris law courts two weeks ago. The dispute was between the Dunlop Tire Company and the Gallus Tire Company. The latter concern advertised in a Paris paper about a year ago that Huret had broken the 24-hour record with the aid of their tires. As he used Dunlop tires the Gallus company was called on to rectify the statement. This they did by saying that Huret had beaten the 24-hour record, thanks to the Gallus tires, "which were used by his pacemakers." This qualifying phrase was printed in microscopic character, while the rest was leaded out in enormous type, so that the Dunlop people urged that the intention to deceive the public was just the same, and brought an action against Gallus claiming 200,000 francs damage. The case resulted in a verdict for Dunlop. The judges, however, thought that the claim was excessive, as they held that Gallus had already repaired the injury to a certain extent by amending their advertisement, and they consequently awarded 1,000 francs damages.

ORIGINAL AS THEIR NAME.

Under the title and name plate "Cazador" the White Sewing Machine Company will next season market a line of juveniles' wheels, listing at \$40. These wheels will be made for the White Company, and not by them, the factory in Cleveland being taxed to its utmost in producing the White bicycles and sewing machines and bicycle pedals. The concern, however, during the last year found a considerable demand for children's wheels, hence the Cazador.

MISSOULA-BORN BEARING.

According to the "Scientific American," Harry A. Stephens, of Missoula, Mont., has patented a ball-bearing simple and durable in construction, designed to reduce friction to a minimum, and well adapted for use on bicycles, which bearing is thus pictured and described: Fig. 1 is a sectional view of a bicycle hub on which the improvement is applied, Fig. 3 being an exterior view of the hub, and Fig. 2 representing a novel form of bearing ring employed between the outer and inner sets of ball bearings. The stationary axle is engaged by members of the fork resting with their inner faces on nuts, whose inner faces abut against washers resting on annular flanges formed on ring-shaped bearings screwing into the ends of the hub, carrying the spokes of the wheel. The washers thus close the bearings and prevent access of dust to the inside of the hub. On the inner surfaces of each of the exterior bearings is a ball seat engaged by an outer row of balls held in a peripheral groove of an annulus or bearing ring, shown in Fig. 2, which also has an internal annular groove engaged by a second row of balls fitted onto a seat formed by the shoulder connecting the middle large portion of the axle with the other reduced end. The ring interposed between the two rows of balls does not come in contact

with any of the other parts of the device, and should a ball break in one of the rows, the other bearing would still be operative, so as not to interfere, at least for a time, with the progress of the rider. In the ordinary ball-bearings the difference in length between the outer and inner bearings causes a partial sliding of the balls, which is obviated in this case by the freely moving bearing ring, whereby the friction is reduced to a minimum.

AS SHE IS SPOKE.

Boy—Say, mom, I busted my tire.
Mother—You shouldn't say bust, John; you should say burst.

Boy—That's what teacher said, but when the principal asked me who that was, I said it was a burst of General Washington and he licked me, so I thought I would stick to bust.

STRENGTHENING DAYTON FORCES.

The force of the Dayton Bicycle Company's New York branch, No. 76 Reade-st., will be reinforced by W. A. Shepard, who has had experience with the Remington Arms Company. Mr. Shepard will talk Dayton throughout Pennsylvania and New York.

CYCLE-ACADEMY MANAGER WANTED.

One of the largest cycling academies in New-York is desirous of a good man as manager. Only a man of exceptional character and ability need apply. Address J. V. R., care of THE WHEEL.

WELL KNOWN AT HOME.

In Detroit, at No. 40-46 Champlain street, is located the Anderson Cycle and Manufacturing Company. For some time they have been building bicycles, principally for Detroit people; now, however, they are extending and reaching out for business throughout the country. A clever point is made of their having catered specially to the local trade. "We made our bicycles for Detroit people," they say, "understanding full well that each time the least thing went wrong we would hear of it; whereas, if the machine had been made by a maker in a distant city, the rider would have had it repaired and the manufacturers would have heard nothing of the case." They have made a special effort to suit their patrons, they assert, and certainly their guarantee bolsters the assertion in splendid style. For instance, they recently wrote all of their '96 patrons that if they brought their bicycles to the Anderson factory during December and January the bicycles would be thoroughly examined, defective parts, if any, replaced, and the entire machine cleaned, oiled, adjusted and overhauled generally, without charge.

The Anderson line includes the Anderson at \$100, a wheel which embodies all the up-to-date wrinkles—flushed joints, D tubing, one-piece crank-shaft, etc.; the St. Clair, at \$75; the Northwest, at \$60; the Wayne, at \$45, and the Wayne Jr., a line of juveniles, at \$35. It has been the aim of the Anderson people to do a cash business as far as possible. To that end they have offered a particularly healthy discount to all spot cash purchasers.

EIGHT-SIDED TUBING.

Hexagon tubing will be a decidedly distinctive feature of the Ideal bicycles. The Shelby (Ind.) Cycle Manufacturing Company, who make them, believe there's a future for tubing of the sort and will naturally make it, while yet offering an option on tubing of the conventional round pattern. The concern believes, too, that it is particularly strong in "options." For instance, in all machines, except the \$55 twenty-inch wheels, an option is given of three styles of adjustable handle-bars, viz: The latest style of hexagon steel tubing, round steel tubing, or wood bars; either rubber or rat-trap pedals; two lengths of cranks; two or three options of color finish; from four to six gears, and G. & J. tires or M. & W. tires. The upper and lower braces of the rear tube are made of the latest pattern of hexagon tubing, unless round tubing is especially ordered at these points. There is also an option given in the height of frames in the \$50 and \$75 Ideals. In the \$75 Ideals an option is given of either 1 1/8 or 1 1/4 inch tubing in the frame.

TO SUIT FOREIGN FANCIES.

O. B. Henderson, who went abroad in the interests of Hay & Willits, is en route home. The firm reports that his visit has resulted in the establishment of a number of desirable European connections. Outings are already being made up to meet the foreign whims. All will be fitted with steel rims, steel mud guards and brakes, and will weigh between 28 and 30 pounds. Samples of these wheels are to be exhibited at the American shows.

THREE BALL CONCERNS.

Three concerns practically control the manufacture of steel balls in this country. Some idea of the demand and the output may be gained from the fact that one of the trio, the Excelsior Machining Company, of Buffalo, N. Y., has a capacity of 150,000,000 balls per annum, having increased its capacity more than 50 per cent during the last year.

OLIVER, STRAUS & CO., 23 PARK ROW, NEW YORK.

Kindly mention The Wheel.

REPAIRMAN'S FRIEND.

Among the specialties of the New England Cycle Supply Company, of Keene, N. H., is the Half-Minute Rim Spacer, to which THE WHEEL referred a few weeks since. It is a most ingenious device, being intended, as its name implies, to space any wood or metal rim from 24 to 30 inch, for any number of spokes desired, from 24 to 40 inclusive. It

is claimed that it will do the work in a fraction of a minute, and that the price is so low that it is within the reach of the humblest repair man. With it any dealer or repair man can carry a small stock of unbored rims, and be able to fill special orders promptly, while the manufacturer himself will find it a convenience in experimental and repair work.

COULD NOT EXTINGUISH THEM.

This story comes from Bristol, Conn., where the Lucas lamp factory is located: "De Witt Page and George Burnell, employees of the Joseph Lucas Lamp Company, while testing the Lucas lamps were arrested for riding on sidewalks, they having mounted on the sidewalk and ridden off the high curbstone to see if the lamps would stand the shock. Not only did the test demonstrate that the flame of the lamp could not be jarred out without practically smashing the wheel, but the subsequent proceedings in the court showed that the law prohibiting riding on sidewalks was unconstitutional, and could not be sustained, and the alleged offenders were honorably discharged. It is not often that the law of a community and the product of a manufacturer are simultaneously tested with such good results for the lamps and the defeat of the law."

SOME BUTLER CHANGES.

Something of a change has occurred in the personnel of the Butler Co., of Butler, Ind., makers of the Record wheel, which will in no way, however, affect the responsibility or policy of the concern. Roscoe Bean, who is the manager of the Bean-Chamberlain Co., at Hudson, Mich., has disposed of his interests in Butler, and is no longer connected there. T. C. Munger has been elected president of the Butler Co.; the old Board of Directors is retained, excepting that L. C. Harding, a banker of Butler, succeeds Mr. Bean on the Board. Mr. Harding has also become active manager of the company, in connection with the Board.

ANYTHING TUBULAR.

While the production of locked-joint and brazed tubing is the principal business of the Toledo (Ohio) Tube Company, they are in position to make and estimate on handlebars, seat posts and forksides made from open hearth and cold-rolled sheet steel. Some attractive samples of the several articles are being shown.

INGENIOUS COMFORT-MAKERS.

Butler & Co., Aqueduct Building, Rochester, N. Y., manufacturers of the well-known Deitz cycle lock, are offering several novelties for '97, all worthy of consideration and examination. The adjustable wall holder shown in the illustration is a particularly commendable article. It is neat in appearance and light, weighing but 15 ounces. The body portion is finished in black enamel, while the steel spring wire is nickel plated on a base of copper. It can be adjusted at any angle and tightly clamped into position by means of a bolt on the under flange.

The Perfect Mud Guard Cleaner is also "on the list." It consists of a piece of flat steel spring, bent into shape and faced with heavy corrugated rubber, the whole mounted on a neat wooden handle. It readily adjusts itself to any width tire—a single whirl of the wheel, with the little cleaner in contact with the tire, and the machine can be trundled into the house without danger of soiling the carpets, etc. It is small enough to be readily carried in the tool bag and should be a valuable addition to any sundry dealer's stock.

The Butler Toe Clip, which, to quote their circular, "fits the shoe to perfection," while light in weight and appearance, is strong and durable, giving the utmost comfort to the rider. It is tempered in oil after being formed, thus insuring the proper elasticity.

The Handy Trouser Guard is really a clothespin in miniature, finely made and nicely nickel plated. They can be easily carried in the vest pocket.

The Deitz Cycle Lock for '97 remains practically the same. Minor improvements only were possible.

STARTED A GOOD THING.

"Barrel" cyclometers are now so popular that very many have overlooked the fact that that style of mile recorder originated with the United States Manufacturing Company, Fond du Lac, Wis. Naturally they are jealous of the distinction, and are seeking to impress it upon the public. Their '97 patterns are vast improvements over the old models. One of them—their \$1.50 pattern—records both the total mileage and single trips. They also make a smaller instrument, listed at \$1, which is minus the single-trip feature. Recently the United States people have invaded Canada, having arranged with Rice, Lewis & Son, of Toronto, for the exclusive sale of their cyclometers in the Dominion.

FROM TEMPLE TO AFRICA.

A shipment of twelve Temple bicycles to Algiers, Africa, went from the Temple factory in Chicago last week.

BALL-BEARING WRENCH.

They have now applied ball bearings to cycle wrenches. In this instance, "they" stands for the Ball Bearing Wrench Company, No. 168 Church street, this city. The illustration shows the manner in which the balls are applied, the nut revolving on the balls, and the cone friction clutch of the finest instantaneous adjustment, and, it is

asserted, avoiding slipping and wearing off of the edges of nuts. To open the jaws the nut is turned as usual. The jaw will recede with one-fourth the number of nut revolutions required in an ordinary wrench. To close the jaws the moveable jaw is simply pushed (not turned) forward with the thumb. The wrench weighs 5½ ounces, and retails for 75 cents.

GOING TO THE FRONT.

The Sherman Cycle Company of Chicago has jumped into prominence more quickly than the average manufacturer. Though their trade life is but a matter of a couple of years, they have some of the best connections in the marketing of their goods in the West. Prominent among their patrons is Farwell, Osmon, Kirk & Co., of St. Paul, the large jobbers, to whom they have just sold 1,000 '97 wheels, which is their second season as handlers of the Sherman company's goods. The Sherman company appreciates an inspection of their '97 models.

HAD A LONG HEAD.

Fred J. Titus, the well-known racing man, is in the field for an agency in New York or a first-class travelling position. Very few people realize how much Titus has come on since he quit racing, though, by the way, even as a racing man, he always had a long head and was noted for his financial acumen and aptitude. Letters will reach Mr. Titus at No. 239 West Forty-fifth-st.

GOING ABROAD BY THE THOUSAND.

While many firms have only sample wheels in evidence, the Monarch Cycle Manufacturing Company on Thursday of last week shipped from the Chicago factory exactly 1,051 bicycles, of which 488 went to Graddon & Co., Antwerp, Belgium; 430 to Smith, Patterson & Co., Boston, the Monarch's New England agents, and 133 in small lots to various other points in this country.

MET HIS MATCH.

"Been over to the Stanley Show, eh? I suppose you got pretty well acquainted with the 'tight little island.'"

"Why, no; I can't say that I did. But I got pretty well acquainted with a number of tight little islanders."

BUT WOULD LIKE TO.

Miss Kitty Scatterbrain (vivaclusly)—With all my faults you love me still, don't you, papa, dear?

Papa (grimly)—I don't know. Since you joined the scorching sisterhood I have never seen you still.

HANDY AND MUCH NEEDED.

Nearly every one who rides a wheel has at some time or other felt the need of a parcel-carrier that could be put on or taken off quickly, and at the same time be of such construction that it would afford a rigid support for whatever it had to bear. This the Hall Manufacturing Company, Wallingford, Conn., realized; they have on the market just such an article. It is made mainly of aluminum, which insures lightness; is telescopic, so that it can be closed into a small space; the strap adjustment is neat and instantaneous, and the clamping and unclamping from the handle-bar is accomplished by the mere turn of a thumb-nut. The carrier is handsomely finished, and, instead of an unsightly incumbrance, is rather ornamental. In addition the Hall Company make a line of sundries that recommend themselves to jobbers and dealers. Their Locust bicycle alarm is a decided novelty, which, to quote their catalogue, "makes more noise than a nest of rattlesnakes." The safety sprocket rack is a neat conception, and small enough to be carried in the vest-pocket. Their combination screwdriver and nipple-wrench is known and has enjoyed a large sale, while the Surprise and Springfield whistles have become staple articles in the sundry market. Wood handle-bars with a new lock-clamping device are their latest addition, the clip being so constructed that slipping is impossible. Prices to jobbers are especially interesting.

WHILE THEY LAST.

While the stock lasts, the Frank T. Fowler Manufacturing Company, Worcester, Mass., are offering the Windle bicycles on hand when the Windle factory was purchased at enticing figures—\$40 for the onyx finish, \$39 for the black.

HIGH-TONED, OF COURSE.

Very few there are who, at some one time or another, have not had the New Departure slogan, "They have a tone that's all their own," ringing in their ears for hours and days

at a time. It is almost as tantalizing as Mark Twain's "Punch, brothers, punch."

In marketing their '97 bells the New Departure Bell Company explain how the tone

is attained. Few would suppose that the raised bead around the periphery of the gong had aught to do with it; but, as a matter of fact, the bead is very largely responsible for

the "rich cathedral chime," as New Departure Company describes it. Of course, the alloy out of which the bell is made has most to do with it, but the bead plays a very important part. The beaded gongs will, of course, continue to be the company's leader, and will list at a higher price than the plain article. Incidentally, it will interest the trade considerably to know that list prices have been reduced all around, an entirely new scale having been adopted.

The bells are made with either plain or lock clamps, the latter, the New Departure people claim, being their invention. They also continue the manufacture of the electri-

cal alarm. The illustration shows the mechanism by which the continuous alarm is produced. The double-stroke bell, they say, has ever been something of a bugaboo to inventors and mechanics in general. They make a double-stroke bell, of course, and claim to have attained a perfect mechanism.

The entire line meets every possible requirement of style, size and price. John H. Graham & Co., of New York, will continue to be the sole selling agents; but for catalogues and other information the New Departure Bell Company must be addressed at Bristol, Conn.

**ECLIPSE BICYCLE COMPANY,
ELMIRA, N. Y.:**

AN IMPROMPTU SHOW.

Louisville, Dec. 19.—Louisville has held its Cycle Show, and the gentlemen of the Cycle Board of Trade will please note that no sanction was asked or allowed, nor was the affair advertised until the day before the show. Not one cent was expended in the advertising of the vent. The publicity was gained by the free and unlimited coinage of complimentary notices in the daily press. The "promoters" were a small (or "large," it may be termed in this instance) colony of bicycle salesmen who happened at the Louisville Hotel at the same time—December 18. The gentlemen were Messrs. G. W. Shroyer, representing the Gendron; J. T. Ruby, Keating; Benjamin Chapman, Columbus; Edwin Eager, Viking; J. L. Townsley, Hamilton-Kenwood; H. J. Young, Kirk Young Bicycle Company, manufacturing the Yale; F. A. Woods, Racycle; A. C. Hyde, Yost Manufacturing Company; E. L. Parsons, Columbia; Herbert Thompson, Toledo Cycle Supply Company; Charles Weaver, Vim tires; W. L. Cooper, Hulbert brake and Mesinger saddles, and J. D. Lasley, United States bicycles.

Manager Mulligan, of the Louisville Hotel, arranged a suite of rooms for the men on the fourth floor, and by mutual agreement they started their own "show," which was visited by dealers and the public, furnishing many points to the former and much education to about 500 of the latter as a result of the event.

The idea seems worthy of imitation. A circuit of these impromptu "shows," if arranged, would interest millions, who, in any event, would not, or could not, visit either of the National functions. The railway rates that could be secured by such an aggregation of salesmen would also amount to a pretty item.

W. C. & S. M. Nones will handle the Hamilton-Kenwood line. Mr. Townsley closed with them at the "show."

The Columbia people will open a branch store in Louisville, with Mr. Parsons in charge, assisted, in all probability, by H. C. Montgomery.

MAKING WATER-PROOF.

Tweed and serge, such as cycle costumes are usually made of, may be rendered rain-proof by this method: Take powdered alum and sugar of lead, each one ounce, and stir into a gallon of rainwater. Let it stand some hours, and, when clear, pour off the liquid. Immerse the fabric to be made rainproof for twenty-four hours, then nearly dry and press heavily with a warm iron. The cloth will be uninjured in color and texture and will resist any rain the rider is likely to be exposed to.

WELL, WELL, WELL!

The New-York Supreme Court last week granted a certificate of incorporation to the Lady Cyclers' Mutual Benefit Association. The objects are said to be "to encourage athletic exercises, encourage literary tastes, and promote good fellowship among its members, and to create a sick benefit fund for the benefit of worthy members in distress and want."

AN OLD-TIMER CHANGES.

Howard B. Smith has been added to the Geo. N. Pierce Co.'s travelling staff. He will cover New York, Pennsylvania and Ohio. Mr. Smith knows the business and territory thoroughly. He formerly covered it for Gormully & Jeffery.

FIRST AND SECOND.

The boasting novice is not long in convincing all who hear him tell of his wonderful escapes from accidents that self-preservation is the first law of nature, with lying a close second.

FOR SHORT-HANDLE HOLDERS.

With the adoption of adjustable handle-bars the equipment of bicycles with brakes has developed several snags. The same brake lever would not serve for both ramshorn and up-turned bars, and this has been affording opportunity for innumerable "trade excuses." It was a foregone conclusion, however, that American ingenuity would find a way out of the difficulty, and this the D. G. Bolton Manufacturing Company, Nos. 500-504 East Water street, Syracuse, N. Y., seems to have done. The Bolton brake is made in two patterns. In general appearance and application the No. 2 does not differ very materially from

the hand-brake of other days, and is intended for riders who use upturned bars and grasp the grips, but in these days of adjustable bars, when so very many riders "hold the handles short," the Bolton No. 1 would seem to fill a want. As will be noticed, the brake is operated by a crank lever which has a self-locking device. When the lever is past the dead point it meets the stop screw and remains "on" until the lever is pressed back. The hands are thus free to guide the machine, a matter of value when on a long or winding or unknown down grade. The brakes are light and neat and will fit any make of wheel. No. 1 retails for \$2; No. 2 for \$2.50.

TINY STOP-THIEF.

With a full appreciation of the average wheelman's dislike for weight, George W. Knock, No. 146 North Fourth street, Philadelphia, has combined much ingenuity with only

three-quarters of an ounce of metal into the Little Gem lock, shown in the full size cut herewith. The lock is of the combination pattern, no key being necessary, and retails for 25 cents.

AN ADMISSION.

"I wonder if there is anything personal in this?"

"In what?"

"Well, the House Committee got a fellow who knows all about pneumatics to deliver a lecture down at the club entitled 'Tire Fools.' I was anxious to help the thing along, and sent to the secretary for a ticket. Here it is marked 'Admit One.' Do you think that's a shot at me?"

KNOCKED HIS BUSINESS.

"You are fagged out, you must give up all head work."

"Why, that spells ruin! I'm one of those loaf-all-but-the-last-two-hundred-yards 'racers.'"

JUST OVER THE BORDER.

Simcoe, Can., Dec. 21.—Trade in the Dominion is daily gathering force. Many of the travellers are already on the road, and the slowest of them all will make a start within the next two weeks. Some of the houses will not send their representatives out until after the holidays, and January 2 will see an exodus of the jolliers from Toronto and other centres. The Cleveland men are all out. The same is true of the Brantford travellers. E. C. Hill & Co., Toronto, who handle the King of Scorchers and Crawford, will start their men after the holidays. The E. & D. people have had representatives out for a couple of months, and claim to have contracted for the larger portion of their next year's estimated output. They will make a first shipment on January 2 of 300 wheels.

The E. & D. makers are preparing a unique exhibit for the New York show.

The Comet people are making a wooden frame this year, and are receiving many inquiries in regard to it. There are very few changes in the '97 models. Those shown are of minor importance. Wood handle-bars will be optional on all wheels.

The price will be of the most importance, and it seems certain that 1897 will be a \$75 year in Canada. There will be twice as many wheels sold at from \$50 to \$75 as there will be at \$100. Of course, there will be a demand for the higher-priced wheels, but people have come to believe that a high-grade wheel can be had cheaply.

The Massey-Harris Co., of Toronto, are manufacturing a wheel under Columbia patents, which they sell at \$85. It greatly resembles the Hartford wheel.

The chainless gear so much talked of in the United States is an old thing here; the Wanderer cycle, built in Toronto, is of that type.

The first motor-car in Canada is now running on the streets of Toronto, having been built for A. Fetherstonhaugh, patent solicitor of that city. It is propelled by a storage battery.

CURTIS'S PLUM-PATCH.

Dealers who are looking for plums should stray into the orchard of the Kirk-Young Manufacturing Company of Toledo, Ohio. The firm makes the popular-priced Yale bicycle and says that the "plums" are ripe for the picking. They can be reached without a pole. George E. Curtis is representing the firm in the East, and has established an "orchard" in New York at the Astor House. His price list is said to have made not a few people gasp for breath, a statement that is fraught with significance.

HONEST FORGERS, THESE.

In Mechanicsburg, Pa., the D. Wilcox Manufacturing Company is forging at a great rate—that is to say, turning out drop forgings in great quantities. Sprockets, cranks, seat-posts, chain adjusters, forkcrowns and pedal-centres are included in the Wilcox production, and on these articles the concern seeks opportunities to submit quotations, confident that they mean business in nine cases in every ten.

ON THE HAPPY HUNTING GROUNDS.

Five of Hay & Willits's travelling staff are now gunning for trade. These are the men and their hunting-grounds: F. F. Fulcher, Ohio; Geo. M. Dickson, Northern Indiana and Southern Michigan; A. L. Ray, Tennessee, Alabama, Mississippi and Georgia; C. C. Tuttle, Missouri; Howard Jones, Illinois.

The doubtful man in cycling is always wanting to bet on it.

WORTHY THEIR NAMES AND MAKERS.

"A Few Preliminary Points for 1897" is the title of H. A. Lozier & Co.'s advance catalogue. Beyond specifications and illustrations of the Cleveland and the new Westfield cycles it contains but little letter-press. That little, however, is in strict keeping with the substantial character of the firm, and will impress the individual who has wearied of be-adjectived eulogies of self and goods. "The measure of the public's appreciation of the Cleveland bicycles," say Lozier & Co., "is best found in the fact that '96 sales exceed those of '95 by more than 100 per cent." The improvement and alterations that have been found possible are thus summarized:

Flush joints, making a smoother and neater effect in finish without impairing strength of frame; "D"-shaped tubing in rear stays, allowing more clearance for tire; narrower tread; new crank-axle and bearing, fitted complete before assembling with the frame; simplified adjustment of crank-axle bearings; flush cranks with new device for attaching to axle; new bearings in wheels, capable of perfect adjustment independent of the frame; improved Cleveland hardened block and pin chain; improved Cleveland detachable corrugated tires; laminated rims; Cleveland dust-proof barrel pattern pedals; flanged sprockets, detachable; new handle-bars, with improved reversible device; new saddles, two styles padded; new direct and T seat posts, with adjustments for any desired position; new brake; improved toolbag and tools.

The Burwell dust-proof bearing, in an improved form, will continue to be a valued feature of Cleveland bicycles, and in addition to standard black enamel, olive green, with silver striping, and maroon, with gold striping will be supplied.

Of the Westfield, their \$75 wheel, Lozier & Co. say: "We have conscientiously striven to make the "Swell Special" standard for excellence, and now offer, for the consideration of our friends, this medium-priced bicycle, which shall be highest type of its class. Nothing but Ellwood seamless tubing is used in the construction of Westfield frames. They have detachable sprockets, front and rear; Burwell dust-proof bearings; Cleveland hardened block and pin chain; Cleveland detachable tires, and other excellent details of equipment, as shown by specifications," viz:

Wheels, 28-inch; hubs, barrel; gear, 68-inch; tire, 1½-inch Cleveland, corrugated, detachable, cross-thread (Shraeder valve); rims, combination wood and aluminum; bearings, Burwell dust-proof; frame, 24-inch diamond, 1½-inch drop to crank-hanger; tubing, 1½-inch; crown, single drop forged; chain, Cleveland; sprockets, detachable; cranks, Cleveland; drop forged, spring tempered, detachable, 6½-inch throw; pedals, new Cleveland dust-proof, rat-trap, barrel pattern; saddles, Cleveland No. 20, "T" post; handle-bars, wood reversible; grips, cork, vulcanite tips; spokes, full nickel, tied at intersection; tool case and tools; finish, black enamel and nickel; weight, 24 pounds. Options—Gear, 64 and 72 inch; tires, Cleveland single tube; frame, 22-inch; pedals, rubber; handle-bars, full nickeled, raised or dropped; finish, maroon, gold striped, or green, silver striped.

THEN HE PROTESTS.

"A statesman's motto," said the earnest patriot, "should always be, 'be sure you're right, and then go ahead.'"

"May be so with statesmen," said Turfy, "but 'tain't my motto in racing."

"What's your motto?"

"Go ahead, right or wrong, and fight it out with referee afterward."

Idle curiosity keeps too many people busy about a bicycle.

WILL WEIGH NOTHING PRESENTLY.

Fancy a mile in two seconds! Of course it is not a human possibility, but is the test to which all Trenton cyclometers are put before

they are made ready for shipment. The test is made on a power lathe running at that speed. Of course, the cyclometers have undergone improvements during the year, but, as in the past, they will be made of aluminum and have a satin finish aluminum dial which cannot break or crack. They will make two

models—one to register 1,000 miles and which weighs 1¾ ounces; the other, the "Midget," as they term it, weighs but one ounce and registers 10,000 miles. As is very well known, they are made by the Trenton Watch Company, of Trenton, N. J.

ABSORBER OF VIBRATION.

This is the latest wrinkle put on the market by the Gormully & Jeffery Manufacturing Company. It has been christened the G.

& J. Feather Spring. It is made of second growth hickory, and practical tests prove it

to be an admirable absorber of vibration. The Feather Spring can be attached to almost any machine besides the Rambler.

AMONG THE BEANEATERS.

The New York Tire Co. has established a branch in Boston. A. G. Gillespie is in charge and will look after the firm's New England interests.

THE POET POINTED TO THEM.

Tennyson is quoted on the title-page of the catalogue of the Relay Mfg. Co., Reading, Pa.:

"These are the days of advance,

The works of the men of mind."

The inference is, of course, obvious. The men of mind in the Relay factory have been industrious during the year, and advancement in the Relay bicycles has naturally resulted.

The catalogue cover is of white and gold; between the covers there is no attempt at airy persiflage. The Relay people say they have constantly endeavored to deserve being in the van of cycle manufacture, and feel that they have enjoyed the distinction.

During the year the line has been increased by the addition of a tandem bicycle listing at \$135, a tandem tricycle at \$150, and a ladies' wheel at \$65. The \$100, \$75 and \$60 men's wheels are all retained, as is also the ladies' wheel at \$90. The serrated chain adjustment and visible ball-bearings, which enable the rider to inspect the balls and cones without removing the wheels from the frame, remain among the strong "talking points." The rear hub has been enlarged and improved, and a new bottom bracket employed; it is flush on both sides; the crank-axle is of the two-piece variety. The seat-post is new and adjustable by a movable sleeve and nut, which allows the L pin to be adjusted quickly and positively. A new head adjustment has also been adopted. It requires no lock nut, the top of the cup being serrated, and the handle-bar having a projection engaging these serrations makes it an exceedingly neat and serviceable combination.

The Relay Company is among those which have adopted the wood handle-bars as the standard equipment.

VANDERBILT HAD TO PAY CASH.

Seventy-five dollars will continue to be the price of the Elmore bicycle, but, in addition to the \$75 line, the Elmore Manufacturing Company, Clyde, Ohio, will also market a \$50 wheel and a line of juveniles at \$40. The leading Elmore has been perfected and brought thoroughly up to date. The main frame is 1¼; head, 1¾; rear braces, ¾; lower braces, ¾. Three point bearings will be the rule, those in the crank axle bearing being extra large, ¾ balls being employed. All bearings will be fitted with interior tubes, which carry the oil directly to the balls. Two-piece crank shafts will be employed.

In New York and vicinity the Elmore will hereafter be handled by the Park Row Bicycle Company, 23 Park Row. During the past year or two it has been handled locally by the Park Row people, but they have been given a larger territory and mean to work it thoroughly. E. J. Willis, the proprietor of the concern, is one of the men who made much money during the year, despite the adverse conditions which prevailed. He strictly adhered to a cash basis. His former experience as president of the defunct American Ormonde Cycle Company taught him a bitter lesson, and buying and selling for cash only has since been a guiding motive. It is related that a representative of W. K. Vanderbilt called at the Park Row store during the past season to purchase a bicycle. He found one which suited him and ordered it sent to Mr. Vanderbilt's Newport address, stating that a check would follow as soon as received. He was told that the concern did not open accounts. The young man wanted the wheel, however, and the bicycle went C. O. D.

WISHING HIM WELL.

"I was struck by a scorcher," he said, with a curse,

When the men with the ambulance found him; "And if I had my way he'd be scorching still worse,

With a strong smell of brimstone all 'round him!"

PEERLESS SPECIAL PRIDE.

One of the concerns which points with special pride to the flush joints of its bicycles is the Peerless Manufacturing Company, of Cleveland, Ohio. The cause for the more than usual pride is due to the fact that flush joints were a feature of the Peerlesses of two years ago. Their general adoption this season gives the firm a chance to score a point. And they score it. The head and handle bar and the seat-post adjustment are also matters of "special pride," while cranks and axles, crank boxes and bearings, the finish and the equipment are also matters of comment in the Peerless advance catalogue received this week.

The Peerless will be again listed at \$100. These specifications will convey an idea of its calibre:

Frame (men's), 22, 24 or 26 inches; 24 inches regular. Peerless patent flush joints. Tubing, 1 1/4 inches head; 1 1/2 inches lower front and seat mast, 1 1/2 inches top, 3/4 round upper and 7/8 "D" lower rear forks. Highest grade Shelby. Fork crown, Peerless tubular; handsome and strong. Wheels, 28 inches; 32 swaged spokes front, 36 rear. Rims, best wood—one piece or laminated. Hubs, Peerless, tubular, flanged. Crank-hanger, Peerless, tubular. Bearings, special tool steel, perfectly tempered, ground and polished. Tread, 4 7/8 inches. Chain, 3-16 inch, highest grade; Indianapolis or Perry. Sprockets, detachable, drop-forged steel, 20, 22 or 24-tooth front, 8 or 9 rear. Gear, 70 inches regular; options, 56 to 84. Pedals, record, rat-trap or combination. Cranks, drop-forged steel, 6 1/2 inches throw. Saddle, Garford, Sager, Gilliam, or "Christy anatomical." Handle bar, steel or wood; raised, dropped or ram's horn, at option; adjustable furnished only when specified. Cork grips, handsome ferrules and tips. Peerless patent stem adjustment. Brake, when specified, detachable; not for adjustable bars. Tires, League, M. and W. Quick Repair, Vim or Dunlop; League regular. Finish, black, of special lustre; bottle green or royal blue; richly decorated. Weight, with regular equipment, 1 1/2 road tires, 23 lbs. Wheel base, 44 inches.

In addition to the Peerless, the Peerless people will also market the Patrol at \$65, "a thorough high-grade in every respect, exceedingly desirable," the catalogue asserts.

ADMIRABLE AS OF YORE.

Andrae cycles for '07, manufactured by the Julius Andrae & Sons' Company, Milwaukee, will be made on the same general outlines as they were this year, although several changes will be made that will make the model a practical addition to their line. Flush joints, rear stays of D-shaped tubing and taper-drawn tubing throughout are the important features of the new model. In order to bring the rider more directly over the pedals the seatpost mast has been moved 1 1/2 inches forward from the '06 style. The tread has been reduced to 4 3/8 inches, one-piece cranks and axles are used, the head bearing ball cases, a speciality of the Andrae wheels, has been reduced in size, and a neat locking device is fitted to the wheel bearings which permits of adjustment before being set in the frame. The complete line will consist of seven models, roadster and racing machines, listing at \$100, a lower grade listing at \$75, and combination and diamond-frame tandems at \$150.

VICTOR AT THE PARK GATES.

To their own line of Tinkham bicycles, tri-cycles and carriers and the Stearns's, for which they are agents, the Tinkham Cycle Company, No. 310 West Fifty-ninth street, have just added the New York agency for the Victor. The contract was closed last week and has been a matter of some comment, although it will not affect the continuance of the Overman Wheel Company's branch at No. 23 Warren street.

COMPONENTS AND SUNDRIES.

Enter the Buffalo Metal Manufacturing Company. Bicycle components and sundries will be their line, and No. 640 Linwood avenue, Buffalo, N. Y., their headquarters. F. C. Atherton, one of the proprietors of the Buffalo Cycle Company is the senior partner, and Willis Brown, the junior. Their line has not been fully organized, but already the Victor lamp and Brownie cycle wrench have been secured, and will be vigorously pushed. The Victor lamp is one of if not the lightest and smallest on the market. It is made of aluminum, and will burn either taper or oil.

Cushman & Denison, 172 Ninth Ave., New York.

SHINING LIGHTS ALREADY.

Although but three years in business as makers of bicycles, the Geneva Cycle Company of Geneva, Ohio, has in its own quiet way secured a place on the ladder. Its lamp has ever been well trimmed, but next season the wick will be turned higher, so that the light may be seen by all men.

The company, composed of capitalists of Geneva, will stretch its arms and reach out in no uncertain fashion. Its plant has been enlarged to meet the increased demand for its product, and many new connections made.

Some two months since J. C. Carter, president of the company, came to New-York and selected A. M. Scheffey & Co., of No. 92 Reade street, as sales agent for their Eastern territory, which includes the following States: New York, Pennsylvania, New Jersey, Massachusetts, Maine, Connecticut, Rhode Island, Vermont, New Hampshire, Maryland, Virginia, West Virginia, Delaware, North and South Carolina, Georgia and Florida. This territory will be covered by five of Scheffey & Co.'s travelling men, four of whom are now on the road. A number of good contracts have already been placed.

The line for 1897 will consist of a combination and double-diamond tandem, each listing at \$100, and three grades of 28-inch wheels for both men and women, each listing at \$75, \$60 and \$50 respectively. In addition there will be a 26-inch diamond and 26-inch drop-frame machine at \$50. On the \$75 wheels the Gard divided-crank axle will be used. The company expect great results in the sale of the \$50 wheels for men and women, as there appears to be an increasing demand for this price machine.

GOES TO BOSTON TOWN.

F. C. Ferrin has been appointed manager of the Fowler Cycle Co.'s branch in Boston. Hitherto Mr. Ferrin has looked after the Fowler interests in Providence, R. I.

CYCLING TRADE REVIEW

Copyright 1896, by F. P. PRIAL Co.

VOL. XVIII., No. 20.

NEW YORK AND CHICAGO, JANUARY 1, 1897.

WHOLE No. 402.

MAY BE NO SHOW.

Such May the Future Have in Store for Poor Railway-Ruled New Yorkers.

It is given out that this year's cycle show may be the last that will be held in New York. The publication of such a possibility is calculated to create a scare, but there is really no need for serious alarm.

The refusal of the narrow-gauged Trunk Line Association to grant reduced railroad rates—which the Western lines cheerfully accorded—is the basis of the report. Referring to the matter, Secretary Franks of the Cycle Board of Trade says:

"The action of the Trunk Line Association is altogether inexplicable to the officers of the Cycle Board of Trade, inasmuch as the concession of a fare and one-third was granted last year to the annual convention, which was also held during cycle show week. The Board of Trade was under obligations to assist the Trunk Line Association in preventing the work of ticket-scalpers. Over three thousand tickets were presented for identification last year, and less than a dozen got into the hands of scalpers, and the Board of Trade redeemed all at full fare. The utmost caution was used to make sure that only those strictly entitled to attend the convention had their certificates passed. The Board has on file over two thousand business cards of manufacturers and agents who attended the different meetings held in the course of the week. The railroad authorities assert that the concession was asked for on account of the cycle show, but inasmuch as the trade is admitted free every day until 2 p. m., by which time nearly all the certificates were handed in, it is apparent the railroads are exercising an unfair and unjust discrimination against a body of men who may to-day be considered the best patrons of the railroad companies."

BLOWING WIND IN IT.

New life has been blown into the old story that the trotting associations intended to take up professional racing and prepare many of the tracks throughout the country for cycle racing. The plan, it is claimed, has been indorsed by all the prominent horsemen in the country, but it is not likely to go any further.

NO MERRY-GO-ROUND THIS.

Executions amounting to \$5,452.90 have been filed against Gillie, Goddard & Co., manufacturers of merry-go-rounds and bicycles, in Tonawanda, N. Y.

WILL BE WELL BRAKED.

Fenton bicycles will have a valuable feature all their own, the Spencer invisible coil brake. The Fenton Metallic Mfg. Co., whose factory is in Jamestown, N. Y., have purchased the exclusive right to the brake, and it will be found only on their wheels. There will be no sub-licenses.

This device, which is now very well known, appeared last season too late to be exhibited at the shows, but has nevertheless created wide-spread interest. The brake applies to the crank axle inside the bracket by means of a spiral coil, and is operated by a slight turn of the grip.

The patents are owned by the Spencer Brake Company of New York, who have also another brake on the market which also operates from the grip, but is of the plunger variety, which applies to the front tire; the only part that is visible is the spoon piece, or shoe, that fits under the fork crown. The plunger is a novelty, being a rubber-covered spoon with renewable rubber. A number of makers have adopted this device for 1897, among them the Stearns, Worcester and Tinkham people. The Fenton people, while controlling the coil brake, will also use the plunger on their drop frames and tandems.

WILL THEY EVER STOP?

London, Dec. 16.—The decision of Mr. Justice Romer in the Dunlop vs. Scottish Tire case has been appealed against, but the stay of execution has been removed so that no more Scottish tires can be marketed until the appeal is won. By the way, this also involves the Silverton tire, since the Dunlop action against its proprietors, the great cable-making firm, was stayed pending the injunction. This fight, therefore, and also the Tubeless Tire case may be expected on at any time after Christmas vacation. The opposition of the Dunlop people to the sealing of the Tubeless patent failed, though I don't know on what lines it was opposed.

DEATH OF W. H. WILHELM.

Christmas was a day of sorrow in the Wilhelm family, of Reading and Hamburg, Pa. The father, W. H. Wilhelm, expired on the morning of that day. Although not so well known as his son, W. Irving Wilhelm. Mr. Wilhelm was at one time the head of the extensive Wilhelm cycle interests in Reading. He retired from active participation in its affairs about a year since.

Motor vehicles have been ruled out of the Chicago Cycle Show.

SHERIFF IN THE SADDLE.

He Seats Himself There Until the Whitman People Can Arrange Their Affairs.

On Christmas eve the Sheriff took possession of the Whitman Saddle Company, 118 Chambers street, on an attachment for \$24,612 in favor of the Combination Cycle Company of Jamestown, N. Y. The entire claim was \$34,237, but the creditor company took out \$9,625 worth of bicycles and sundries under a writ of replevin a few weeks ago. The attachment was obtained on the ground that the Whitman Saddle Company had given a chattel mortgage on its effects in this city and at Newark, where the factory is, for \$40,989, to Mary L. Buck, wife of Henry L. Buck, President of the Company, and Lizzie Mehlbach, wife of W. C. C. Mehlbach, the Treasurer, and also had transferred the factory property and other real estate in Newark to the same parties for \$1. These mortgages were given on Dec. 14, while on Dec. 4 the Treasurer, it is alleged, had stated that the liabilities of the company were only \$7,500, and on Dec. 10 had stated that the liabilities did not exceed \$12,000, and the company had assets of \$53,000. The company was incorporated in 1880, succeeding Royal E. Whitman, and had authorized capital stock of \$100,000, owned or controlled principally by Messrs. Buck and Mehlbach.

Few concerns were better known in the saddlery trade, and the Whitmans' entry into the cycling field seemed most auspicious. They marketed the Whitman and Patriot cycles, some or all of which were made by the Jamestown concern.

GOING TO CHICAGO.

Manager Pattison, of the Chicago Cycle Show, has arranged with the railroads for the following excursion rates: West, northwest and south of Chicago, including the States of Illinois, Wisconsin, Iowa, Minnesota, South Dakota, North Dakota, Montana, Wyoming, Colorado, Nebraska, Kansas, Arkansas and O. T. Tickets to Chicago from above described territory must be purchased on dates between January 20th and 26th inclusive, and the return journey from Chicago may be commenced on any day between January 23d and February 3d. From points in Illinois and Wisconsin and within 100 miles of Chicago, the Western lines will sell tickets every day between January 20th and 30th.

LIKE A MAN.

Potter at Last Comes Out Openly in His Fight for the League Presidency.

Isaac B. Potter, Chief Consul of the New York Division L. A. W., has thrown aside his mask, has ceased to play the hypocrite and manfully done what he should have done six weeks ago—come out in the open and declared himself a candidate for the presidency of the organization.

In bringing about this happy situation there is small doubt but that THE WHEEL has been mainly instrumental. No other paper has stated the case as it was. Mr. Potter so thoroughly dominates the cycling writers of this vicinity that while his attitude was generally known, in the public prints he was made a man of silence and mystery. When THE WHEEL interviewed Mr. Potter two months since his position, while guarded, was too clear to be misunderstood, and it was then prophesied that he would become a candidate despite previous and subsequent denials, in which he went so far as to say that for him to accept the presidency would be an act of "doubtful loyalty." As weeks passed evidence in support of the assertion accumulated, and on Monday last Mr. Potter himself proved it true. On that day he issued this signed statement declaring himself:

"Responding to the apparently earnest wish expressed by many of my League friends, I have consented that the delegates of the New York Division present my name to the coming National Assembly as that of a candidate for the office of president of the League of American Wheelmen. I do this because I am convinced by recent events and by facts lately disclosed that unity of action within my own division and the harmonious working of the national body of the League can best be secured by the widest option in the selection of an Executive Board.

"In thus yielding my personal judgment to that of many delegates whose pronounced opinions have differed from mine on the question of the presidency, I am reminded that the welfare of the League is beyond and above all considerations personal to any candidate, and I am confident that no candidate will be named who cannot accept the decision of the Assembly with a feeling of fraternal and consistent loyalty. Let me now thank the many friends to whom I am indebted for kind words recently uttered and express the hope that the work of the National Assembly may be so accomplished as to bear fruit to the continued honor of our organization."

This declaration will clear the atmosphere considerably, as the L. A. W. presidential imbroglio was possible only because the good faith of the Chief Consul of New York State was questioned.

Sterling Elliott will now know exactly where he stands. It is a fair assumption that in his mail of Tuesday morning he received from New York a glorious letter addressed, "My Dear Elliott," and that Chief Consul Potter will renew his promise to individually support him. The casting of the lone ballot will greatly heighten the spectacular effect at the proper moment.

Just after Mr. Potter's declaration was distributed a very secret confab was held in the office of the New York Division in this city.

Secretary-Treasurer Bull, the gentleman who is paid \$2,500 per year to conduct the office, and who has of late been spending much of his time in "booming Potter" and "spiking Elliott," and Messrs. Belden, Batchelder and Eckert, got together behind closed doors and the profound air of mystery that resulted could not be indented with a buzz saw. In the event of a thunderous detonation it will be understood who are responsible.

During the week a report got abroad that Mr. Elliott intended "getting out of Potter's way." This he promptly denied. "Nothing has occurred to change my original de-

GOES WEST.

Portland, Oregon, is about to receive a distinct acquisition. Henry Goodman, one of the veterans of the Pope Mfg. Co.'s staff, will permanently locate there. He will have charge of the Pope branch in that city, from which four States will be operated. Goodman left Hartford for his new post on Wednesday last. He has served his time in the Pope factory

and retail establishments and on the road, and while affable and mild appearing, is none the less able and forceful. He knows the cycling book from cover to cover, both as regards the trade and sport and pastime. He has served the L. A. W. in various capacities, and until his resignation last week, was the senior handicapper in the service.

termination," he wires in response to an inquiry.

From this it seems clear that the fight will be between the Bostonian and the New Yorker. Cossum, of New York, and Conoley, of Illinois, are both splendid possibilities, nothing more. Morrison, of Wisconsin, is trying to keep his courage up to the presidential point, but as a matter of fact, he is not very particular, and indications are not wanting that he will endeavor to grasp the tail of the winning kite and land wherever he may.

Mr. Potter's campaign managers have been coquetting with Pennsylvania, and, it is generally understood, offered to give Phil S. Collins, of Philadelphia, a vice-presidency, and to throw New York's strength to the Quaker City in the balloting for the L. A. W. Annual Meet in return for the Quakers' vote for Mr. Potter. Pennsylvania declined the bait. Prominent Philadelphia delegates in-

formed a WHEEL man that they will not enter into any deal whatsoever. They will decide every question on its merits and secure or fail of the League meet by reason of superior inducements, and not by a barter or sale of votes. These delegates left no doubt of their leaning to Elliott.

If there remained any doubts of Pennsylvania's position, the subjoined letter from one who stands high in the councils of the Division will forever set them at rest:

"When Phil Collins was suggested for the Vice-Presidency by one of the Mark Hannas of the L. A. W., I know positively that he at once stated that he would not under any circumstances accept the position. As he expressed it: 'I have troubles of my own in the Secretary-Treasurership, and would hate to be troubled with a feeling of doubtful loyalty.'"

"As to the meet, if the L. A. W. meet is held here, it will be solely because the members think they will have a good time if they come. The position of the wheelmen of a city giving time, work and money to entertain a lot of people and then sacrificing self-respect and independence for the privilege of doing so has always seemed a rather poor one and no pledge for anybody or anything will be made by Pennsylvania to secure the meet."

"We have secured plenty of letters from various sources, but this you can paste in your hat—Pennsylvania has made no pledges up to date, either actual or implied, for anything."

SAME PEOPLE AGAIN.

Chief Consul Potter, of the New York Division, has made few changes in the committees appointed for the ensuing year, about all the old appointees remaining in office. He announced the personnel of the various committees this week as follows:

Improvement of the Highways—W. C. Vrooman, Schenectady; R. C. Folger, Waterford; Theodore W. Roberts, Poughkeepsie; William R. Lansing, Rochester; William M. O. Honig, Albany; E. F. Hill, Peekskill; B. H. Medbery, Ballston Spa; Marvin T. Merchant, Watervliet; Charles W. Wood, Syracuse; Goldsborough C. Smith, Auburn; G. M. Millspaugh, Middletown; Michael Furst, Brooklyn; A. A. Roullier, Flushing; William Pierson Judson, Oswego.

Rights and Privileges—George E. Miner, New York; Walter S. Jenkins, Buffalo; William W. Armstrong, Rochester.

Rules and Regulations—C. B. Benson, Hudson; J. Stuart Kelley, Buffalo; Henry W. Bullard, Poughkeepsie. Racing Board—A. D. Wait, Cohoes; Will R. Pitman, New York; Walter W. Wilson, Buffalo.

Transportation—George C. Pennell, New York; Charles A. Sheehan, New York; George C. Baker, Albany.

GO T A MAN OF THEIR OWN.

Illinois delegates to the National Assembly are preparing to surprise the Potter and Elliott factions by placing in nomination for the office of president William A. Connolly, of Danville. Connolly first gained national prominence by his brilliant oratory at Louisville two years ago, when he swung the Assembly almost to a unit for Asbury Park as the place for the League meet, completely routing the Boston cohorts. Connolly, it is stated, will be boomed for the office in the West, with the intention of taking advantage of the dissension in the East.

"All men are born equal;" but most of them degenerate when to generate cycle speed they aspire.

PLAIN TALK TO BICYCLE DEALERS.

FORECAST, SEASON 1897.

If you are looking forward to a profitable season, how have you laid your plans? Are you intending to load up with cheap wheels? Can you make a good living selling cheap wheels at the price prevailing on them during the latter half of last season? Do you know that they will not sell for more money in 1897? If they do, it will only be for a few weeks. The facilities for putting together cheap wheels in the United States are now so very great that the price on them can never rise above the level they reached last year. All cheap bicycles are made very much alike, whether they be assembled in the 20x40 foot room of the enterprising repairer, who puts up his one or two thousand wheels, or by the big maker, who numbers his output by fifty thousand. Some may be finished a little better than others and command a few dollars more at retail, but they are all imperfect in their bearings, and they all run hard. Do you not see in all cheap bicycles, and most of the so-called high-grade wheels, the stamped ball cups pressed in the bottom bracket? In some wheels this brings the balls not more than an inch and a half apart. That certainly makes harder running bearings than where the balls are out near the ends of the bottom bracket. But this is not the worst of it. These pressed-in

ball cups cannot provide a ball race that is true from the centre. Did you ever see a cheap bicycle with a ball cup cut from a solid bar of steel, hardened and ground accurately true from its centre, then screwed into an unsplit bottom bracket, like in our Gendron and Reliance Bicycles? Did you ever see a cheap bicycle with the hub cups and cones cut from a bar of the best tool steel, and ground accurately true from their threads after being hardened? You never did and you never will. It costs more money to make ten thousand bicycles like our Gendron and Reliance Bicycles than fifty thousand of those cheap wheels. Do you know that there are hundreds of thousands of riders who will buy new wheels this coming season, and they will not be satisfied with anything short of an easy-running wheel? The cheap wheels that will be advertised as startlingly low prices will have no attraction for such buyers. Do you know that there will not be—there cannot be—a glut of strictly good bicycles? There are as yet comparatively limited facilities for producing that kind of bicycles, consequently they are expensive to make and must command good prices. If you have a customer able and willing to pay for a good bicycle, will you not better yourself more by selling him such a wheel than if you sold him one on which you could not make, at the most, but a few dollars profit, and very likely no profit? Do you know that we have made a big

improvement in our three-point bearings over last year? Our last year's bearings were superior to anything manufactured in this country, and by recent valuable inventions we have improved them so much that to-day no other bearings will stand in comparison. We have adopted such an angle in our ball cups and such a pitch of cones as gives not only a pure rolling contact to the balls, but also eliminates all wedging of the balls between the cup and cones when under the rider's weight. This is but one of the many valuable improvements made in the easy-running Gendron and Reliance Bicycles for 1897.

Why is it that the arrival of our salesmen is anxiously awaited by all of our old agents, and why is it that without exception they are booking their orders for early delivery in 1897?

Why is it that scores of track and road riders are begging us to engage their services for the coming season?

Why is that our vast army of riders cannot find words with which to express their delight and satisfaction with their mount?

Why is it that in 1897 our wheels bid fair to outshine every star in the firmament of wheelhood?

Because, go where you may the world over, you will not find anything to compare in any respect with our easy-running wheels.

Remember that your success in the sale of bicycles the coming season will depend largely on the line of wheels you select.

Observe that the hub cups are not sheet steel stampings, but are cut from a solid bar of the best tool steel, and, like the cones, are ground accurately true from their centres after being hardened.

Rear Hub in the 1897 Gendron and Reliance Bicycles.

Crank Axle, Crank Spocket and Bottom Bracket in Gendron Nos. 23 and 24.

Ball Cups in the Bottom Bracket of the 1897 Gendron and Reliance Bicycles.

Observe that they are not stamped from sheet steel and pressed in the bottom brackets, but are cut from a solid bar of steel, ground accurately true from their centres, and screwed into an unsplit bottom bracket.

APPLY FOR THEIR SALE.

ONCE MORE THE NEW YEAR.

W IPE out the score and take a fresh start. That is a pretty fair working principle to begin most new years with, anyway, and it is especially appropriate to closing out such a flagrant, preposterous, ridiculous old year as that one which died on Thursday night. Give the youngster, '97, a show, a fair field, and hang all favors! Let it be seen what the infant rascal can do for himself.

Turning over a new leaf in the book of Time naturally inclines us to the mood anticipatory.

What will 1897 bring forth?

So far as the individual is concerned, this question will be answered variously; mainly in accordance with his own desires and purposes, tempered by the chapter of accidents; because, notwithstanding all the good wishes of our friends and any number of good resolutions by ourselves, every one of us will be bound to take the New Year as we have taken the old ones—just as it comes.

We need not quite accept Matthew Arnold's invitation to his fellow-voyagers on the ocean of existence:

So, messmates, leave the ropes!
And what though no one steers!
We sail no faster for our hopes,
No slower for our fears.

No, indeed; we are not going to subscribe to any such dismal formula of fatalism! Hope is not vain nor effort useless. We may be cheerful and strive even while recognizing that,

whatever the extent of our aspiration or the amount of our perspiration may be, our actual net income of all those things which go to make up the sum total of that elusive object of human pursuit called Happiness will depend, after all, on the overruling force of circumstances, 50 per cent at least of which will be beyond our control.

In fine, the New Year will be as happy as each one of us chooses to make it for himself, subject always to the limitation of "the divinity that shapes our ends, rough-hew them as we will."

There is, indeed, much moral tonic and lifting power in the hearty hand-clasp of an old friend on New Year's morning, and the cheery salutation that goes with it. Stereotyped as the custom is, there is a gracious charm about it. It answers to a real human demand; it provides a green place, full of sparkling waters in the dry desert of the round year's dull and hard routine; it gives assurance from man to his fellow-man that there is still such a thing as sympathy and well-wishing in the world.

Considered as a lubricating oil of kindly manifestation that causes all the bearings of the cycle of daily business to work more easily, makes the pedals revolve with less friction, and the whole machine to start off for another twelve months' run with an accelerated motion that suggests that it is going to be nearly all coasting, the exchange of a "Happy New Year" wishes is well worth all the time and enthusiasm we put into it.

Wherefore, THE WHEEL joins the general chorus of cheerful greetings and generous wishings, and offers to every one of its respected readers and patrons the hope that the new year will be happier than his highest expectations of it.

THE SHAME OF IT.

I T is opportune to warn the League of American Wheelmen against itself, or rather against a portion of itself—the New York Division.

Admittedly a "peach," New York has apparently come to regard itself the whole orchard. Inflated by its own undeniable importance, it believes that it can wag the whole dog; that, without its assistance, progress is practically impossible. It is a dominating belief, and the attendants who hover nearest the throne and who believe it, fancy themselves robed in such power and grandeur that all must sue for their favor. And before mere is said, let credit be given the quiet Quakers who sent the first shiver through the royal court. Pennsylvania was invited to come and exchange its vote for the favor which it most desires, the L. A. W. annual meet, and which New York stood ready to dispense.

But Pennsylvania was not dazzled by the splendor of the court and courtiers, and refused to enter into the intrigue. The Quakers preferred to act as men, not as puppets—all honor to them. Their action sent a chill through the court, but did not diminish the self-consciousness of those who compose it, as, to employ befitting, if inelegant, vernacular, the New York Division is inclined to "hog it," and is fairly convinced that without its assistance nothing can come to pass; and unless the remainder of the League is exceeding watchful and resolutely refuses to succumb to the blandishments of the Empire Division, there is grave danger that the organization may become little more than a patronage-dispensing and vote-bartering affair. New York knows what it wants, and is not hesitating in seeking to effect the needful arrangements.

New York wants the presidency. New York has a man in training for the office.

New York believes the chairmanship of the Racing Board should be a salaried office. New York has a man in training for the office.

New York believes the demands of racing require a salaried referee. New York has a man in training for the position, who will, however, be "thrown down" if circumstances require.

New York seeks the scalp of National Secretary Basset. New York has several men who would gladly fill the office. The Secretary-Treasurer of the New York Division is egging on the scalp-seekers. He is the gentleman who has been "greatly embarrassed" by Mr. Basset's mistakes. At the meeting at which this was reported the New Yorker's own report showed an error of some \$3,000.

New York believes that L. A. W. headquarters should be located in New York. New York is full of office buildings and unemployed clerical help.

All of the men whom New York has in training for the several offices are hand-in-glove with most of the cycling writers of the metropolis. The latter invariably speak by the card. They merely paint the official lilies and always in glowing tints. Therefore, look for little that is not rose-hued in New York prints or New York letters.

New York has a Campaign Committee and a campaign fund to further its "belicis." It has a number of smooth, plausible talkers who in private can place a kindly hand on a shoulder, knit their brows and talk mildly, but with logic and earnestness that is amazing, or who in public can assume theatrical attitudes, raise the right hand, roll their r's, orally wave the American flag and talk with a vehemence that will "bring down the house." Backed by a list of 20,000 members, not 2,000 of whom care a dried fig about "League politics," New York's officialdom is very happily situated. It can shift the pea under the shells with be-

fogging deftness, a point which should be remembered by rural delegates who may sue for favor at the New York court. If we mistake not, the Kentucky delegation risked a few pennies on the New York pea in February last, and were at a loss to know how it eluded them.

We are of New York and for New York within unhoggish limits, but we refuse to countenance the game that is now in progress. It is quite clear to us that than now there never was a time when the League of American Wheelmen more needed saving from its friends.

A TRAFFIC REGULATOR.

NOW that the wheel has become such a well-established means of conveyance, street railway and steam railway tariffs have to be regulated with due reference to cycling possibilities.

When the clerk or mechanic or shop girl or other person on business or pleasure bent can propel himself or herself back and forth from the suburbs to the central part of the city on a bicycle that costs nothing to keep and little for repair, he or she will not submit to high rates of fare.

Within riding radius of populous towns the man or woman who has a wheel and knows how to ride it has an option of cheap transportation that was unknown and impossible until the bicycle came into general use and favor.

And so it happens that the business of carrying must adapt itself to the new conditions, and so people who do not ride bicycles also reap a measure of benefit from their use by hosts of other people.

THROWING OFF THE MASK.

THE WHEEL felicitates Mr. Potter. One of the manliest acts he ever performed was the public declaration of his candidacy. His professions to the contrary, his avowals of sincerity to Mr. Elliott and his studied complaisance to the efforts of his closest adherent in his behalf transpiring under his very nose were too transparent, too hypocritical to merit aught but condemnation.

Mr. Potter has coveted the League presidency, and knew two months ago that he would be made a candidate. His attitude since has been despicable in the extreme. It is the sort of duplicity and insincerity which has marked his public career, and which, despite its inclinations and its knowledge and recognition of his ability has made THE WHEEL an opponent of Potter and Potterism. Nothing can better illustrate our meaning of the latter term.

In this season of merry-making when the peace-on-earth-good-will-to-men spirit is all-pervading, it is not pleasant to feel called on to criticise a fellow-man, nor is the task lightened when he who is criticised is not only no new-found acquaintance, but is one entering a new estate, which is to fill his life with the blissfullest joys. It is in this attitude toward Chief Consul Isaac B. Potter that THE WHEEL finds itself. On Wednesday last Mr. Potter took unto himself a wife. Politically our views diverge widely, but a man's a man for all o' that, and on such an occasion political strife can be forgotten and the warm right hand of congratulation be extended in hearty fashion. We extend it.

From a worldly point of view politeness is the best stock in trade that a newcomer in the cycle trade can possess. It has opened more doors of advancement than any faculty, genius or art, because for strangers there is no other way to judge another's character than by externals. Even the spurious politeness which is assumed for certain purposes, or to accomplish certain ends, has a degree of success because it overcomes prejudice and wins good opinions.

All this discussion about chain versus bevel-gear is like the currency question. There are people who understand these things, and people who think they do; and there is also a great deal of honest, cheerful and contented ignorance of both subjects.

There are more than a few people connected with the modern brand of League politics who imagine they have ideas everytime there is an echo in their heads.

The manufacturer who sits down to wait for his opportunity in the trade will some time discover that it passed that way several hours before he sat down.

It takes genius to do nothing and not waste time at it. Genius is not unknown in the high places of cycling.

It is never any trouble to discover arguments in favor of what you want to do in cycling.

The bliss of ignorance constitutes the sole happiness of the riders of bargain-counter wheels.

It is sometimes better to say three or four words, even to the wise in cycling.

A rider's cup of happiness is never full, because there is no bottom to it.

Habit is a chattel mortgage on every rider's individuality.

THIRTEEN WAS ALWAYS UNLUCKY.

Before the proposed Brooklyn cycle show can be held, a disagreement between the Cycle Board of Trade of Long Island and the Cycle Club of Brooklyn must be patched up. The only available building in Brooklyn for a show is the old Thirteenth Regiment Armory. It is at present leased for a year by the Cycle Club. Last year the club held a show in the building and made considerable money. On account of the show being turned over to the Board of Trade this season, the Cycle Club has refused all offers made by the Board of Trade for the use of the building for a week. As the armory was leased to the club by the Board of Aldermen, with the understanding that it was to be sub-leased for a week to the promoters of the cycle show, the Board of Trade will go to the Aldermen for redress. It is stated that the Cycle Club hope by stalling off the Board of Trade to cause that body to abandon its project and then hold a show and reap the profits thereof.

WILL COST A LOT OF MONEY.

Senator Guy has promised to look after the bill which is to be introduced in the Legislature shortly providing for a cycle path along Jerome avenue, this city, from Macomb's Dam to Yonkers. The project was acted upon favorably by the Board of Estimate and Appointment last week.

The road will be six and one-half miles long. The Commissioner proposes to put a macadamized strip twenty feet wide on each side of the avenue throughout its entire length at an estimated cost of \$163,000. Louis Harding, Dr. Doty and Judge Simms, in behalf of the Morris Wheelmen urged the board to order the work done.

Mayor Strong, Comptroller Fitch and Corporation Counsel Scott favored an appeal to the Legislature for the \$163,000, so that the amount could be provided out of bonds and not be taken out of the taxpayers' pockets direct.

WONDERFUL JUDICIAL DISCOVERY.

Because a Philadelphian was half-witted enough to forge his employer's name to the check he gave in payment for a wheel, the learned judge before whom he appeared for sentence was untruthful enough to declare that "it was astonishing the amount of crime that grew out of the bicycle trade; at least one-third of the business of the court was made up by persons who were led astray in some way by the bicycle."

While the half-witted one's employer determined to follow the pace set him by the judge, said he realized this fact very forcibly. He could sit at his front window and count dozens of persons riding merrily past who owed him grocery bills.

WHAT DO YOU THINK OF THIS?

If the proposed large exhibition building, to be known as Fenway Garden, is constructed in Boston, that city will have a permanent indoor cycle track eight or ten laps to the mile and thirty feet wide. It is proposed to secure funds for the construction of the building by the public sale of shares at \$10 each. The structure will be adapted for all sorts of amusements, and is calculated to cost about \$250,000. As planned, the cycle track will be constructed on the second floor surrounding a skating rink.

TOM TALKS SOME.

Says He Is Going to Pay Up in a Short Time—Other Trivial Matters Discussed.

Minneapolis, Minn., Dec. 26.—Tom Eck arrived in this city from New York this week and says that for the present the Michael-Linton match is off. He states that the fact that Plummer insists on paced races, which will entail an expense of several thousand dollars, is the chief obstacle in arranging the match. He claims that Linton already has plenty of trained pacers, while he would have to spend time and money to secure a crew and get them in shape. Then, he says, it was afterwards practically settled to run a series of unpaced races, but after he left for home he received word that Plummer declined to consider a match while he was under suspension. In Chicago Eck called on Gerlach and was informed that Michael must not ride under his management while under suspension, and that put a damper on Eck.

When interviewed, the silver-haired trainer said: "When I cannot manage and train my own men, it is time to take a rest, but I'm going to settle up with these Portland people in a short time now, and then Michael will meet any rider on earth for any distance from five to one hundred miles. When I asked Plummer about a race for one mile, any way they wanted, with or without pace, the whole crowd began talking about the Old Kent Road and 'Amptstead' Eath, and I couldn't get them to talk about racing at all. When I spoke of a race with Johnson three of 'em had faintin' spells. I am satisfied that from the way Johnson rode this autumn he will be faster than ever before. Instead of going after records next year he will start in all the big competition races. After he gets through with the national circuit we will see what he is able to do with these new crackjacks of America. His last race at Manhattan Beach showed that Johnson is still the best man in America.

"As to going abroad again, we may go over to France the first week in January and stay there a couple or three months. I don't want Johnson to do any skating after records or in races this year. Every year we have traveled about skating; so far, we have lost money, and I don't believe there is any more in it now. I want him to do plenty of skating as a matter of keeping in condition, though. I made a mistake last winter in not allowing him to skate. He rested all through the winter and it threw him so far out of shape that he never got right until just before the racing closed. We shall do our usual southern training, starting in at Hot Springs.

GOT TWO OF THEM.

C. Stuart Bolting, of Providence, has been riding against A. F. Senn's amateur unpaced records, on the New Orleans track, during the past two weeks, under sanction of the Racing Board. His efforts have resulted in securing both the ten and twenty-five mile marks. His figures, standing start, are as follows:

BOLTING.

10 miles..... 25:07 1-5
25 miles.....1:05:02 1-5

SENN.

10 miles..... 25:28
25 miles.....1:05:30

RACING BOARD'S BULLETIN.

Article IV., Section 7, of the L. A. W. By-Laws, clause (f) reads as follows: "(f) Any wheelman who has been declared a professional, or suspended for misconduct, shall have the right to appeal only to the national assembly of the L. A. W., and shall be reinstated only upon recommendation of the Racing Board, and by the unanimous vote of the assembly."

Any riders who believe they have cause for such appeal should send at once to the member of Racing Board in charge of their district a full statement of the case, giving reasons for asking the recommendation of the board for reinstatement.

PROFESSIONALIZED.

Helmer J. Johnson, Wegdahl, Minn., clause (a).

Floyd Murphy, Montidideo, Minn., clause (a).

E. A. Crosser, Sioux City, Ia., clause (b)
Theo. Myhre, Estherville, Ia., clause (g), vote of Racing Board.

David Foreman, Estherville, Ia., clause (g), vote of Racing Board.

W. M. Jenkins, Los Angeles, Cal.

Lyman Royce, Butte, Mon.

Wm. Peters, Butte, Mon.

Mm. Nagle, Dillon, Mon.

RECORDS ACCEPTED.

2 miles, professional, paced, standing start, competition, 4:13; Tom Cooper, Memphis, Tenn., November 3, 1896.

5 miles, professional, flying start, unpaced, against time, 11:42; Henry Bradis, Memphis, Tenn., November 21, 1896.

50 miles, professional, flying start, unpaced, against time, 2:16:03; John Lawson, Memphis, Tenn., November 17, 1896.

SUSPENDED.

For competing in unsanctioned and Sunday races, Carl Nichols, Lyman Royce, F. H. Cooney, Ed. Maillet, E. Shields, Brown, Wm. Peters, Charles Dell, Jack McLeod, Troy Pendleton, Butte, Mon., until July 1, 1897.

For competing in unsanctioned races, Dean Cromwell, L. B. Chandler, Morgan Galbraith, W. D. Widney, Harry Fish, Los Angeles, Cal.; Will Griffin, Herrington, Chas. A. Hall, P. C. Thede, Mills, Chas. Thomas, Merle Rush, Arch Ridenoor, Frank Fissel, Ed. Hall, Harry Thede, Earnest Blood, Madarea, Cal., until February 1, 1897.

For insubordinate conduct on the track, F. A. Bell, Los Angeles, Cal., until February 1, 1897.

For unfair riding, John Hertwick, Fresno, Cal., until January 1, 1897.

For competing while under suspension and under an assumed name, Walter L. Eckhardt, Baltimore, Md., until July 1, 1897.

SUSPENDED PENDING INVESTIGATION.

J. M. Long, Phoenix, Ariz.

Albert Cooper, Tucson, Ariz.

Charles F. Hoff, Tucson, Ariz.

IN THE BALL GROUNDS.

Work on the long-talked-of quarter-mile cement track at the Philadelphia ball grounds will be started early next spring, it is now announced. The track has been under consideration for many months.

SUNDAY RACING.

Local Option Declared to be the Solution of the Much Discussed Question.

Sunday racing is the all-absorbing talk in California. It is wanted, and wanted badly. Every one appears to believe that it will attract big gates and boom the sport on the coast as never before. This refers to the North California Division. In the Southern Division an anomalous condition exists.

While every racing man desires to be at liberty to race on Sunday, the Division organization opposes the proposition. It was the delegate from Southern California who opposed the removal of the restrictions on Sunday racing at the last meeting of the Assembly, presented by the North California delegate, yet it was in the Southern Division that was formed last summer the only organized opposition to the League control of racing ever made on the Pacific Coast. The success attending the efforts of this outlaw organization to introduce Sunday racing was of the poorest.

R. M. Welch, Chairman of the Racing Board of the North California Division, and a member of the National Racing Board, has expressed his own and the Division's sentiments on the question in his annual report. After stating that the Division will make another attempt in February to have the by-laws amended so as to permit Sunday racing, he states:

"Doubtless among racing men the desire for opportunities to race on Sunday is very generally diffused, but there are many localities where sporting events of that or any character on that day would not be countenanced. Herein lies the ultimate solution of the question if it can be reached in no other way. No promoter will offer amusement of any character to a community on a day that patronage will not be extended, but where Sunday meets can be profitably conducted they will be maintained. There is no Board of Control strong enough to subvert pecuniary interests. If the one great body which up to this time has governed the sport in the United States can not legislate for the growing requirements of every section of the country it assumes to control, then other bodies must be formed, each section to have its own. This, however, is not desired. Better results can be obtained with one governing body for the whole country. It may become advisable for the L. A. W. to surrender the control of racing to a body formed to give exclusive attention to such interests, but however this may be, there need be and should be, but one body in control of cycle racing in the United States.

"The extent of territory then wherein exists a sentiment in favor of Sunday racing is very large, but the great North-Eastern Divisions have the votes, and it is to their sense of reason and justice we must appeal for such relief as will meet our requirements and allow us to remain in membership with the one great controlling body of cycling in the United States.

NOT SO SLOW AFTER ALL.

Members of the Century Wheelmen, Philadelphia, have ridden a total of 11,098 century runs this year.

PUTS SPEED IN A TIRE.

C. E. Mark, president of the Mark Railway Equipment Company, Monadnock Building, Chicago, is about to place on the market, after two years' test, what he calls a speed attachment for racing tires. It consists of a round wood band fastened with a tapered joint, and placed within the tire between the inner tube and outer casing. The outer casing is then laced up in the usual manner and the tire cemented to the rim. The following advantages are claimed for this device: Wood being very springy, this band, when tire is inflated, adds speed and life to the tire. Another advantage gained is that the tire cannot flatten out and drag, with the consequent loss of speed as the tread on the tire has only a quarter of an inch contact with the track, and even when the tire is almost deflated the only effect noticeable is an added ease in riding, especially on a rough surface without loss of power, as in a tire without this device. This inside wood rim being a full 28 inches in diameter, there is a gain of 59 feet to the mile.

GOOD ADVERTISING.

Several large firms in various lines of business adopted a new style of advertising early in the spring that attracted marked attention. The plan was to furnish free to all stores and public places wooden cycle stands, with an advertisement painted on a slat at the top of the stand. Working on this idea the City Forge and Iron Works, Dayton, Ohio, have brought out a wrought steel stand of strong construction fitted at the top with ornamental sheet of galvanized iron, large enough for a striking advertisement, which is lettered to

order. The stand is styled the Gem. The sign is so constructed that it can be readily removed and replaced by another. The stands are made to hold eight, ten or twelve wheels, and larger sizes are made to order. A smaller stand without the top piece is also made for lawn or house use.

A CHRISTMAS RACE MEET.

San Francisco, Cal., Dec. 26.—Although the weather was anything but promising for outdoor sport, the cycle races at the Velodrome yesterday afternoon were witnessed by the largest crowd ever seen at a local cycling meet. Sensational time was made by two tandem teams in exhibition work. Dixon and Lees did a half mile in 55 seconds, cutting a full second off the amateur record, and the American record for the amateur tandem mile was brought down to 1:57 4-5 by Kroatz and Tantau.

PRETTY AS A PICTURE.

If there is a more fetching pair of tandems than those pictured herewith, they have yet to be seen. These are both Henleys, the product of the M. C. Henley Bicycle Works, Richmond, Ind. Any one with half an eye can see that they are "charmers"—the very

lines show it—but the pictures only half convey the beauty of the wheels, which are reputed as good as they are beautiful. The double drop frame for two ladies is one of the few of its kind in existence. It will list at \$160; the other at \$150. They are splendid types of the Henley line.

LOOK LIKE TRADE WINNERS.

W. H. Fauber, the clever young Chicagoan who led the way in the matter of one-piece crank axles, has just produced and is

marketing two patterns of Fauber for tandems, one of them with an eccentric adjustment. They have the appearance of trade-winners.

HARD TO TELL.

"Th' apparel oft proclaims the man,"
So William Shakespeare said;
But oft we find, if close we scan,
A woman there instead.

EXPORTS OF A WEEK.

Exports of cycle and cycle material from the port of New York during the week ending December 22d:

Antwerp	\$489
Amsterdam	895
Bremen	305
British Australia	18,543
British Possessions in Africa	980
British Possessions, all other	484
British Guiana	1,158

Rotterdam	548
Santander	30
Southampton	1,551
United States of Colombia	310
Vienna	2,114
Venezuela	709
Total	\$94,285

THIS STAND WILL STAND

It's a "good looker" and well made, is what the A. J. Phillips Co., of Fenton, Mich., say of their new cycle stand, and as good looks have more or less influence on the purchaser

of almost any manufactured article, the feature should not be overlooked. But that is only one of many good points. It rests on a wide bottom, which prevents it from upsetting, no matter how clumsily a wheel is thrust in the support. It has no flimsy braces, is self-locking, cannot injure the tire, and the wood is soaked in weather-proof oil, making it particularly adapted for outdoor use.

The secret of popularity is to occasionally give the other fellow a chance to tell what ails the wheel he rides.

The proper height for a woman to shorten her skirt for cycle riding purposes is a little over two feet.

WITH ICE ON THE SIDE.

Washington, D. C., Dec. 28.—Hale did not start in the six-day race, which began at Convention Hall shortly after 2 o'clock this afternoon. Although present, he declined to enter the contest, on the ground that he still felt the effects of his New York ride, and was in no condition to do himself credit. A large crowd was present when the eleven men lined up and were sent away by E. C. Bald. They will ride but eight hours each day, and as a consequence the men will not finish in such a pitiable condition as was displayed by most of the contestants in the Madison Square Garden race. The track is the same as was used in the Garden, having been brought on from New York in sections. It encircles an ice surface on which skating takes place throughout the day and evening. Ashinger took the lead at the start. He was passed on the fifth lap by Chapelle, who was in the van at the first mile, after which he dropped behind. At 9 o'clock Lawson was in the lead. Then Waller and Maddox started in and set such a hot pace that they quickly gained a mile on their nearest competitor, Ashinger, and continued in the van until the finish at 10 p. m. The score at the finish of the first day was as follows: Maddox, 147 miles, 7 laps; Waller, 147 miles, 7 laps; Ashinger, 146 miles, 6 laps; Lawson, 144 miles, 8 laps; Hunter, 144 miles, 7 laps; Foster, 142 miles, 7 laps; Ball, 142 miles; Chapelle, 141 miles, 7 laps; Shock, 139 miles 8 laps; Albert, 130 miles, 6 laps. Marks dropped out at 26 miles.

During the evening Tom Linton rode an exhibition five miles in 12:03, and Bald rode a half mile in 1:06.

Washington, Dec. 29.—Owing to injuries received by a fall yesterday, Schock dropped out of the race shortly after the start at 2 p. m. to-day, with 132 miles to his credit. Waller and Maddox continued to ride together, but shortly before the close at 10 p. m. Waller gained two laps on the Asbury Park rider. The score at the close of the second day:

Waller, 291 miles, 2 laps; Maddox, 291 miles; Ashinger, 290 miles, 5 laps; Lawson, 288 miles, 8 laps; Hunter, 288 miles; Chapple, 286 miles, 2 laps; Forster, 286 miles, 1 lap; Ball, 269 miles, 5 laps.

Linton rode three miles in 7:06, breaking the indoor record by six seconds. Bald rode a quarter of a mile in 29 seconds.

MONEY INFORMATION.

"Paw, what does it mean here when it says Mr. Eck told Mr. Plummer that when it came to making a match between Michael and Linton, 'money talks'?" asked Sammy Sprocket.

"It means," said Mr. Sprocket, after reflecting a moment, "that it sometimes helps the manager that's got it to talk a little louder than the other manager."

"Does all money talk?" persisted Sammy.

"N-No. Not exactly."

"Then money that can't talk is mush money, ain't it?"

"Er—ah—haven't you anything to do? Suppose you go out and bring my wheel in off the porch before some one steals it."

In the Supreme Court of adversity, it is not particularly hard for an unlucky rider to get a new trial.

MR. HALL'S GENEROUS OFFER.

Application for a sanction to hold a cycle show has been made to the National Cycle Board of Trade by the Chicago Cycle Racing Association, to be held in connection with the six-days race at Tattersall's, beginning February 22d. If a sanction is received booths will be arranged under the seats and a promenade will be constructed in front of the spaces. No extra charge is to be made for the show. It has been decided by the managers to add to the prize list a championship belt, which shall remain the property of the winner under certain specifications.

FOR CYCLING'S GRANDE ARMEE.

A cycle path has just been opened in Paris along the Avenue Grande Armee, built by order of the Paris Municipal Council. It is seven feet in width, with a surface of cement. It is kept entirely clear of pedestrians and vehicles of all descriptions except bicycles.

ERNEST TERAH HOOLEY.

It's Hooley this, and Hooley that, and Hooley, who is he? Who's Griffiths? Who was Cressus? and what is Lipton's Tea? What's it Never heard of Hooley? What ignorance! well—there— Why! Hooley—well he's *Hooley!!!* the famous millionaire. —Cycle.

HAS TO HAVE PERMISSION.

The paternal character of the French Government is amusingly exemplified in one of the rules of the Bicycling Touring Club of France, which, of course, bear the stamp and seal of the Minister of the Interior. No woman, either French or foreign, can become a member or tour unless furnished with a declaration, notariaily witnessed and signed by her father or husband, to the effect that she has permission.

TRIPS FOR PACERS.

Race promoters will take kindly to the Wolff idea. The enterprising firm, R. H. Wolff & Co., will build a number of triplets this season, not with the idea of selling them, but of manning them and placing them at the disposal of race promoters for pacemaking purposes free, gratis, for nothing.

HIS NEW RECORD.

McGregor, the crack English tandem rider, who, with Nelson, holds most of the world's tandem records, is laid up with a broken collar bone. He received the injury by a fall while training at the winter track, Paris.

IN THE RIGHT MANNER.

Preliminary work is being pushed with considerable energy by the Associated Cycling Clubs of Philadelphia to secure the '97 League meet. At a conference last week an Invitation Committee was appointed, consisting of prominent members of all the large clubs, to work to secure the meet by obtaining the support of the members of the National Assembly by such means as may be found desirable.

Up to the present time no pledges whatever have been solicited, but efforts will be made at once to secure a sufficient number of promises of support to insure the invitation being accepted. This support could readily be secured, it is claimed, if those who are regarded as leaders among the Pennsylvania delegation were willing to promise work for one or the other of the candidates for the Presidency or to endorse some of the various matters which will come up for action in February, but this it was decided at the outset would not be done. It has been decided that if the invitation extended is accepted it will be solely because of friendly interest towards this State, or because the delegates believe they will have a more pleasant time here than elsewhere, and the Pennsylvania delegates will not be handicapped at the annual meeting by any promises made to secure the meet.

A letter has been sent to the officers of each club in the association, asking that two members be selected from each, who will act upon a "committee of solicitation" to secure promises of donations, sufficient to defray the various expenses involved in giving the meet.

OFFICIALLY RECOGNIZED.

The following road records have been allowed by the Century Road Club of America: Fred C. Fuhrman, Buffalo, N. Y., 56:10:00, September 10, 11, 12, 1896, course record; A. G. Relyea, five miles, 11:31 4-5, October 31, 1896, New York State record; E. P. Wood, Jr., Pittsfield—Great Barrington, 1:00:30, October 10, 1896, course record; John H. George, Philadelphia, 39 centuries, 30 days, October 1-October 30, 1896, American record; John H. George, Philadelphia, 70 centuries, 60 days, September 1-October 30, 1896, American record, gold meritorious ride medal awarded; John M. Noble, New York - Philadelphia, 7:06:00, November 24, 1896, course record.

HAS TROUBLES OF HIS OWN.

Choppy Warburton was burned in effigy by a party of Dunlop pacers on one of the principal avenues of Paris a few days ago. The men accused him of being responsible for the trouble between the English and French pace-makers. The next day he mended matters by engaging them to pace his protege, Champion, in a 25-kilometre race.

SHY IN THE JACK-POT.

In order to refresh the memories of those racing men who have neglected to pay their entrance fees at various meets during the year, the Racing Board, last week, suspended about forty riders guilty of the charge. These men will not be allowed to ride in competition until they make good the amounts due. The strict enforcement of this rule by the board should have a savory effect on those riders who habitually endeavor to escape the payment of these fees. It will also do much to lighten the labors of race-meet promoters.

PALMER TIRES

The Standard of High Grade

Dozens of tire makers are appealing to the public for popularity and to bicycle manufacturers for orders. As a rule, they sing the same song and quote the same price. There is only a single exception—to prove the rule.

Palmer Tires.

Palmer Tires are in a class by themselves—the first class.

Of the highest grade, they are consequently the highest priced. It is not possible to make good stuff for nothing. We give you value for your money—good, honest **Palmer Value**.

WITH A CIRCUS.

That is the Way the Detroit Wheelmen Landed a Much-needed Bank Roll.

Detroit, Mich., Dec. 28.—Cycling clubs desirous of raising funds and handicapped by not being able to furnish schemes from which money is to be derived might, with profit, copy the methods employed by the Detroit Wheelmen in securing a bank account, and incidentally making the position of treasurer more than a mere figurehead. The club's new \$20,000 home is the direct result of these enterprises.

Among the various entertainments given under the Wheelmen's auspices is the annual midwinter circus which has been so successful financially and otherwise for the past three years, and is undoubtedly the best source from which revenue has ever been derived. Christmas afternoon witnessed the opening of this year's effort at the Auditorium. In the week following eight performances, including matinees, will be given, and if the crowd that jammed the Auditorium on the first day is any criterion of what is to follow the club's coffers will be filled to overflowing when the circus breaks camp New Year's night.

The only things that fail to fit the occasion and add to the realism is the absence of a tent and the customary menagerie which all bona fide shows are supposed to possess. The tent, however, is unnecessary, owing to the protection afforded by the Auditorium roof; aside from these drawbacks or improved method of shelter in the latter, there is nothing to shade the splendors that accompany all of the much-advertised "mammoth shows."

The side-show, which is so essential to the success of a circus, has not been forgotten, and for a nominal sum its mysteries are unveiled and explained.

The circus proper opened with an overture by the band, followed by the regulation trapeze acts and feats of horsemanship, which proved to be of interest. The usual after-concert is given in a way that reflects credit upon the committee. A decided fin de siècle method of entertainment has been found for this part of the circus, which has been named the "Amet-Magniscope," the workings being on the same plan as the Biograph, but in many respects superior. Another feature which proved to be a hit was a counterfeit of New York's "Yellow Kid," with the appropriate inscription, "Ain't dis a bute sirkus? Well, say!"

POTTER DINED AND FETED.

New York's Chief Consul, Isaac B. Potter, was dined and feted by the Brooklyn Bicycle Club, of which organization he was president for five years, in the Montauk Club, Brooklyn, on Saturday night last. As Mr. Potter was married on Wednesday of this week, the dinner was of the nature of a bachelor ceremony, and was elaborate in every detail. He was the recipient of a number of handsome wedding presents presented to him by members of the Brooklyn B. C. About one hundred persons were present, including a number of prominent Brooklyn officials. Although his friends endeavored to have him declare himself with reference to the League presidency, he made no reference whatever to League politics in his speech.

ALL CONQUERING CYCLE.

No single feature of civilization in this century has been so marked and so prominent both in its universal prevalence and in its practical results as has the bicycle, which at the present moment stands supreme everywhere among the potent and beneficial mechanisms of civilization. So rapid, so wholly unprecedented, so wonderful has been the development of cycling that it seems almost impossible that within the short period of a few years it has grown up and thrived the world over until it now has attained the pinnacle of popular applause and homage.

Like the mighty geni of fabled ages, that rose from nothing into immensities that spread their pall upon whole worlds, so this great geni of nineteenth century civilization has sprung up almost in a day, spreading far and wide the net of its influence, forcing its way into all avocations, making itself felt alike in politics and business, affecting both the individual and the community, the hamlet and the Nation.

It has changed the face of history, and bent the forces of the law to its own bidding. More potent in its infancy than any like factor of civilization has ever been, it reaches out into the great future and shapes many

MOTOR OR MAN POWER.

Here is England's latest attempt to combine an auxiliary motor with a front driver, bantam wheel.

destines besides its own. Already it has molded public opinion and changed the current of social life to a wonderful extent. Into the political arena it has forced its way and its power is seen in a score of political platforms, and it has loosed the great movement for road development in this country which in the next decade will save more cold cash to this Government than any single movement in operation to-day.

It has been able to receive the just consideration of the law of the land, and its rights are now incorporated in statutes that operate in many States. It has been incorporated in the police systems of great cities the world over, and the military despotisms of the Old World have utilized the wheel in their mighty armies. The bicycle has projected new and rational ideas for the solution of many social problems of the day. It has become a recognized factor in the business of the world. It is held in high respect in medical circles, and the earth is belted by the praises of physicians who have granted the wonderful power for good that the wheel is capable of among the sickly and the weary everywhere. In short, to state it mathematically, the wheel has added to man's usefulness, subtracted from his burdens, multiplied his enjoyment and divided his troubles.

"NOTE OF WARNING."

Sounded by a Louisville Doctor in Connection With the Errors of Youthful Cycling.

Dr. Edwin Hawes, of Louisville, Ky., has sounded a "note of warning." It concerns the rising generation and is worth heeding. Dr. Hawes writes:

"Cycling can be the healthiest or the unhealthiest of all exercise, as the rider chooses to make it.

"The abuses to which I refer are among the boys from 10 to 15 years, who are not capable of judging what is best for themselves. The fathers being ignorant of wheeling in most cases, and the agent thinking only of making a sale, allows the boy to select a machine to suit himself, regardless of hygienic effects.

"The boy invariably chooses drop handle bars and a high gear. The result will be a large crop of weak-lunged or consumptive youths with valvular enlargement of the heart and a deformed personal appearance, i. e., round shoulders and humped backs; the first and last condition being produced by the position necessitated by the handle bars (drop), the heart trouble by the high gear combined with the position of riding.

"A man's (or boy's) principal breathing is by or with the abdominal muscles, so that, when he is doubled up on the wheel, his lungs are not only compressed by the shoulders and chest walls, but it is impossible for him to inflate his lungs on account of the doubled-up condition of the abdominal muscles.

"The result of this will be congestion and consolidation of the spaces of the lungs, which will make weak lungs if not consumption. Quick motion of the limbs of a child is natural, therefore not harmful. But nature never intended that a child should be put under a continual heavy muscular strain, such as is necessary to propel a high-gear machine.

"The effects of the high gear, combined with the cramped position of the lungs, which prevents a free flow of blood through them, will most certainly produce enlargement of the valves of the heart. The result of this injudicious selection and riding will become manifest in the next two or three years. The physicians will not stop to think that this is the result of the abuse of what should be a good, healthy exercise, but will simply attribute it to wheel-riding in general, and will at once raise a great hue and cry against wheel-riding through the medical and daily press and in the families. You can judge the effect it would have on the wheel trade if the fathers were convinced by the family physician that it was detrimental to the health of their boys.

"I would suggest that you put a chapter in your catalogue incorporating these facts (and any doctor, after trying the positions and thinking in the matter will say they are facts), with advice as to the correct way to ride a wheel. I would also suggest that you instruct your agents that they advise the fathers to select high handle bars and a low gear, informing them of the evil results likely to follow to other selection. The boys would then have to make their speed by fast foot movements, which will do them no harm."

Some of the photographic mirrors which are being held up to nature by button-pressing cycle tourists appear to be blurred.

IN GAY PAREE.

Who, What and When the Exhibits Were in the Salon du Cycle.

"Salon du Cycle" is the French for "cycle show," and of course the "salon" is invariably located in Paris, in the magnificent glass-roofed Palais de l'Industrie, located on the magnificently broad Champs Elysees.

The annual function has just occurred. It opened December 12 and closed December 27, and was in truth the nearest approach to an international show that the world has known since cycling amounted to a row of beans. There were 486 exhibitors, of whom seventy-one displayed horseless carriages. France, America and England vied with each other, and all reports agree that America did itself proud; indeed, the "land of the free" commanded notice the moment the visitor entered the exhibition hall. H. A. Lozier & Co. came very near having the pride of place, their mastodonic Cleveland towering above all else and catching the eye at once. The machine is 16 feet in height and has a 40-foot wheel base. The frame is of wood; the wheels are formed with Kundtz wood rims and are fitted with Goodrich single tube tires. J. W. Grimes, the 500-pound Lozier representative, is in attendance at the stand, and, with the big wheel, has made a most effective advertisement and drawing card. The Western Wheel Works show 16 Crescents and the Spaldings have a well-staged exhibit. The other American wheels in evidence include the Sterling, Rambler, Columbia, Hartford, Barnes, Stearns, Syracuse, Fenton, Waverley, Falcon, America and Kenwood. Displays of Snell cycle fittings, Hartford and G. & J. tires and Boston and Fairbanks wood rims were also to be seen. Pratt & Whitney also have an exhibit of cycle-making machinery.

The Parisians went to the trouble and expense of creating a statue appropriate to the occasion. It was placed in front of the main entrance, and depicts Science and the New Locomotion—a goddess standing in a motor car and holding aloft a bicycle. A mammoth clock made up entirely of cycle parts was another ingenious conceit. A bicycle wheel forms the pendulum, the figures on the dial are formed of cranks, and the working parts are made up largely of sprockets and chains. Something of the same sort is shown in the shape of an immense candelabra made up of frames and parts. A tire-testing machine in operation afforded a deal of amusement. An interesting collection of pre-historic machines and "crocks" were among the other curios.

Few novelties were in evidence. The Acetene chainless cycles showed the trend of the times. They were enameled a lurid red and crowds constantly surrounded them. The Halberstadt ball-bearing bevel gear from Copenhagen likewise created no little interest. Other substitutes for chain gearing were to be found, but none left a very profound impression. A band driving gear was shown on a tricycle; a working model of a machine that is to supplant bevel gearing was also shown. It takes the form of two cylindrical discs running in perpendicular planes as a bevel gear, but which communicate motion, the one from the other, by short rods joined at right angles, each arm being carried in holes close to the peripheries of each wheel. This ar-

rangement, of course, can only be applied to equal gearing. Another arrangement was also shown for the suppression of the chain. It is formed of two tubes with semi-circular channels encircling both the chain wheels, the latter being cut with semi-circular spaces between the teeth, and these spaces of the tubes connecting the channels top and bottom be-

ing full of balls, whose travel conveyed the motion. On one machine was an interposition of two plain pulleys between the chain wheels carrying the chain, the sprocket and rear chain ring being toothed. On the bicycles on the stand of Lajoie & Co. were two extra crank brackets, making a nest of three, are formed in the place of one, the chain wheel being

connected to crank spindle by a train of three gear wheels—why, is not stated. It is described by the "Cyclist" as "practically the Boudard gear boudarded on one side, and perhaps as useful."

The Aluminum cycles were centres of interest, a sextette made of the aluminum alloy being a novelty of almost ghostly appearance. The machines were nearly all fitted with wood rims and handle-bars. A papier mache gear case was among the minor novelties.

Comparatively few drop-frame cycles were to be seen. The French wheelwoman still inclines to the diamond frame.

MORE MERRY-GO-ROUNDERS.

A six-days, eight hours a day, race will be run in Denver during February. The Arapahoe Wheel Club will promote the event. Negotiations are being made to secure the appearance of some of the best-known long-distance riders in the country.

There are many men in this world who keep themselves poor by constantly trying to get rich.

AND THE PUBLIC.

Where Was It While the National Show [Was On?—Counting Up Their Money.

London, Dec. 16.—The national show ended up in rather weak fashion, most of the principals having departed for home or the Paris show on Friday, leaving only assistants in charge of the exhibits. The public, too, did not patronize the affair towards the end in anything like the fashion observable at the Stanley show. I am told that business was good throughout, but nothing definite was vouchsafed beyond an "advertising" order for 1,250 Premiers fitted with Fleuss tires, which was adroitly utilized at the inaugural luncheon to obtain an advertisement in the reports of the function for both firms.

I do not think that I am very far wrong in surmising that there is considerable dissatisfaction in the camp of the Cycle Manufacturers' Trade Protection Association, as several members spoke very bitterly to me of the way in which the executors handled matters to suit their individual business policies, and instanced the incident at the luncheon, which I have alluded to, as one case in point out of many. There is no doubt in my mind that the Association has been worked on very circumscribed lines compared to those on which it was launched, and I fear that next year will find considerable secessions if better counsels do not prevail in the interval.

There have been a few balance sheets disclosed during the past week, chief amongst them being the Beeston Tire Co's. This discloses a net profit of £93,320 on a capital of just under £100,000. As this company was practically bankrupt less than two years ago, this must be admitted as a wonderful rescue, but all the same it is only right to point out that the trading profit proper did not reach £20,000.

The Simpson Lever Chain statement is not quite so happy, as the net loss on the year's working comes out at over £6,000, the reason given very naively being that the company was very late in starting to manufacture complete machines. I believe that we will eventually find this company making complete cycles fitted with ordinary chains its standard goods.

Singers came along with a 15 per cent dividend and certified profits of nearly £80,000, which is over £20,000 in excess of those calculated for on the prospectus. Still the shares remain just under par.

The John Griffiths balance sheet, showing a certified profit of almost £40,000, is a very different document to that which was submitted to the shareholders last year. New capital is to be inducted at a premium of 100 per cent on the face value of the shares, and the Australian business has been formed into a subsidiary company, with a capital of £110,000 stock and assets ranking as £90,000.

Joseph Appleby & Co., the famous chain makers, have declared a 10 per cent dividend on Humber. Extension, Ltd., has declared 25 per cent.

The meeting of the Beeston Tire shareholders enabled some of them to "roast" Harry J. Lawson for his egoisms in speech, but only served to show the thoughtlessness of shareholders, for no matter what Mr. Lawson is or has done for himself he has, inside eighteen months, brought a concern from the very doorstep of absolute ruin right to the front of the trade, and turned shares which were selling at one-sixth into a commercial equivalent for 60 per cent, while paying their holders a dividend of 60 per cent in the interval.

CORNAYLIA AND THE BOYCOYCLE.

"Since me Cornaylia tuk t' ridin' a boycoycle Oi've no pace av me loife," wailed the mother of Cornelia O'Sprocket. "What wid worryin' will she coom home dead, or aristed fur fasht droivin', or shleigh-roidin', or not havin' her gig-lamps loighted, me loife's not wort' shtayin' in New Yark fur, aworrukin' mesilf t' deat' kapin' a news-shtand an' havin' me marnin' papers shtole be tramps.

"She's a costoom thot wud shplit th' head av ye; fur 'tis a b'ys cap an' a man's toie an' shurt an' a fish-woife's jacked an' a poacher's breeches an' leggin's. The only thing thot wud kape ye from thinkin' ye had th' dilliryum-trimmins is her skurt; an' thot, Oi'm towld she's been sane on th' king's hoighway wid th' waisht-band av about her nick, loike th' cape av a Connemara poshtman.

"Phwat in th' wurld a daycint gurril wid two rispactable fayte on her wants t' use 'em t' push an' pull hersilf along on injy-roober whales fur, loike a cripple wid no legs, is more than Oi can till.

"Th' prouce av th' machine was sinvty-foive dollars, but Oi bought it chape av a man thot had broke his own nick wid th' thing, an' although it tuk th' savin's av a year off sody-water an' goom-dhrops t' buy it, Oi says t' Cornaylia t'other day whin she was shtartin' out, Oi says, 'Cornaylia O'Sprocket, if ivir Oi coom out on thot bullyhard some avenin' afther confission an' catch soight av ye besthroidin' thot thing widout your petticoats, bloomers or no bloomers, Oi'll make tinpinny nails av thot boycoycle, or me name isn't Anistashay O'Sprocket.'"

'97 SPALDINGS,

A MEXICAN WAREHOUSE.

Arrangements are being made for the establishment of a warehouse in Mexico where samples of American goods will be exhibited by competent agents in order to facilitate United States trade in Mexico. It is not yet decided at what point the warehouse will be located, but it will be at some central city, the idea of its establishment being that Mexican consumers may have the advantage of an establishment where they can inspect various lines of goods of American manufacture, and where they can place orders for the same through resident agents without the trouble of writing to this country for catalogues and specifications. American wheelmakers would gladly support such an institution.

TAXING MOTORS.

Regulations for the taxation of motor vehicles have just been issued in England according to which the owners of all such vehicles weighing less than one ton will be called upon to pay an annual tax of \$5 or \$3.50, according as they are used for private purposes or as public conveyances. The same rule will apply to motor vehicles over one ton in weight, the amount of taxes being \$25 and \$19, respectively. The new rule went into force on January 1.

In the list of American goods exported to Africa for the first time bicycles appear this year, \$20,683 worth being shipped to the Dark Continent during the present fiscal year.

SOME FRICTIONAL FACTS.

How Various Forms of Bearings Have Been Introduced in Cycling to Avoid Friction.

(Continued from Dec. 25.)

By an error, Fig. 10 in our last was shown as lying on its side; to be in the proper position, the set-screw and single ball should be at the bottom. In the third sentence on page 53, a slip of the pen made us say that the inclined surface of the cone "does not move in a plane parallel," etc.; as made, the statement could not be true. We should have said that the inclined surface "does not lie in," instead of "does not move in."

ANOTHER FORM OF THREE-POINT.

Turn back a moment to Fig. 11, representing the three-point bearing as almost invariably constructed; we say "almost," in order to cover the possible exceptions of which we are not at present aware. As already explained, the fault in it is that it requires contrary motions of the ball, which is expected to roll on sides A and B of the case at the same time and cannot do so; it has to slide as well as roll, and therefore this design for a bearing must be condemned. We showed in Fig. 12 how a three-point bearing can easily be made to avoid this fault; but we are not even restricted to that one design, for a slight alteration of Fig. 11 gives us another mode of escape, thus:

Fig. 13

The left-hand sketch here is the same thing as in Fig. 11, which would have the ball revolve in two directions at once, as indicated in Fig. 13 by the crossed lines. Turning Fig. 11 partly around, we converted it into Fig. 12, avoiding the fault. Turning it into another position, we have another form of three-point bearing, as in Fig. 13. Here C is a small sleeve fast on the axle; then the cones A and B revolve about the centre of axle, since in fact the hub moves and the axle is stationary; the ball will then roll uniformly on A and B without slide or twist, its three points of contact moving through the parallel circles indicated by the dotted lines. Thus we have a second form of three-point bearing in which the ball will roll.

Turning back to Fig. 12, it will be noticed that the planes of rotation of the upper ball do not lie the same way as those of the lower, as shown by the dotted lines. This reminds us to say that the lower half of the circle of balls in a wheel bearing get the work, because the weight is on them, and the balls in the upper half are in a sense neutral; that is, they are not so much rolled forward in their circular path around by contact of the cones with them as they are pushed forward by the others which are coming up from below. There is always a little space, the balls not quite filling the circle; and as each comes up and passes over the top it drops forward by gravity down the slope till it overtakes those which are ahead, making the little click usually heard more or less when spinning a wheel. However snug the fitting and ad-

justment may be in a bearing, it is not possible to have uniform pressure all around, because pressure is under the weight; hence the upper balls are in a degree "loose," and the ball at the top in Fig. 12 may pass over easily, without rolling at all at that point. This agrees with the remark we have already made, that balls probably do not invariably roll, all the way around, under the best possible planning and construction; what we are condemning is a design and construction which will not let them roll when they are under pressure and desire to.

THE TWO-POINT BEARING.

Let us now proceed to the two-point, which can be disposed of very speedily and with a single illustration, so far as showing its essence, to-wit: holding the ball between two coned surfaces and having it touch and roll on only a single point of each. Turning back to Fig. 11, if we fill up the angular space between A and B, letting the ball rest on a broad curved surface in the case, we get the trouble of "differing speeds" as in Fig. 9; so this will not answer. But we can fill up this "corner" in Fig. 9 (reshown in Fig. 13) and cut away at points A and B; then we have the two-point, thus:

Fig. 14

One of these coned surfaces, revolving in a plane at right angles with the wheel axle, should roll the ball upon the other cone, the ball running on both in planes parallel with the plane of motion of the cone, as indicated by the dotted lines. We add a cut, carefully copied from the Humber catalogue, of a complete front-wheel hub, selecting this make because it is representative in two-point bearings and is one of the most perfect in market as respects nicety of fit of parts and ease and noiselessness in running:

Fig. 15

This cut, however, reminds us of a quite common error—that of making both ends of the axle alike. The right-hand or "fixed" cone should be really fixed, or the adjustment may get moving on the right side also and the axle be worked along out of a central position between the fork ends. At one end the axle should have a shoulder, and the cone should be screwed hard up against it to stay, the cone on that side also being made with a smooth edge to distinguish it; failing this, one cone may be locked against unintended moving by the not very mechanical expedient of running a bit of fibre into the thread under it at its seat.

The plan of the two-point bearing requires placing the ball between two curved surfaces "facing," having a radius somewhat longer than its own—in section, a circle between two equal arcs facing each other, as at the left in Fig. 14. These two surfaces could theoretically be flat and parallel, as at the right in Fig. 14, and then there might possibly be less difficulty in rolling the ball exactly as desired; but it would not be easy to put the balls in

place, and they would not stay in a uniform path between the parallel slopes, unless the perforated "cage" were again used. So the curves are necessary.

THE FOUR-POINT BEARING.

Coming to the four-point bearing, we observe anew how few and simple are the elements in these matters and between what fixed and narrow limits the practical variations are confined. The essence of the four-point, as already remarked, is a ball held between two Vs facing each other. Turn back to the section in Fig. 7 (Dec. 18) and you have the old Eolus of almost twenty years ago. The four contact points are there, and in principle we do not think this bearing can be surpassed. It was not always properly made, however. Here the small V-cones on the axle-sleeve are too sharp and too narrow, and the ball does not fit them, for it rests upon rather than between their points. Nor was this an error of the draughtsman merely. Crank-pin bearings came over on the Facile, years ago, made by Mr. Bown himself, and like this:

Fig. 16

Here the balls, pressed downward under the heavy strain from the driving-lever, and not having adequate support under them, chipped and crushed the sharp edges of the groove at AA, the balls also suffering; this result was inevitable, because the balls had to bed themselves firmly somewhere, and Mr. Wilcox well remembers his strong protest against such blundering construction, probably from carelessness rather than ignorance.

This Eolus bearing was originally made for the Ordinary, and the flat piece was attached to the end of front fork. Turn the section in Fig. 7 upside down; lengthen the flat part into a connecting-rod for the lever and replace the sleeve by a grooved axle; then you have the bearing as on the Facile.

We must not fill up the space under the ball, in the Fig. 7 section, or we shall have again the "differing speeds" trouble as in Fig. 9; but we may cut away the small Vs entirely, leaving the sleeve flat, which gives us once more the three-point shown in Fig. 13. This is what could have been done to correct the bad four-point Eolus on the Facile; or that bearing could have been constructed properly as a four-point. Let us re-draw it, with slight changes to adapt it to the bicycle as now made, and we have the four-point bearing as it ought to be.

Fig. 17

Here the cones have their slope flatish rather than steep, and their surfaces, produced, make a right angle. The two contact points on each side of the ball revolve in circles of equal diameters; the planes of these circles, as shown by the dotted lines, are parallel and are also at right angles to the axle

and to their own axes of rotation. It is thus evident that the balls will revolve and travel around together. The design at the right in Fig. 17 is the preferable one; the one at the left is an alternative form, almost identical with the old Eolus of 1880, as shown in Fig. 7.

The four-point bearing does not appear to be now made in America; whether it is in England we have not data at present for judging. Here, the proportions of two-point and three-point in use are probably nearly equal. With reference to this, we have looked over some forty 1896 catalogues, some of which afford no indication whatever; as nearly as we can ascertain from the cuts twenty have two-point and thirteen three-point, but several have apparently three-point in one place and two-point in another, while some cuts are drawn so badly and inconsistently (the ball at the top not always touching in the same manner as that at the bottom, in the same cut) that it is impossible to make out what is intended. Makers' catalogues, while very particular to say that the bearings are turned from solid tool steel and are dust-proof, have rarely specified the number of contact points, and when they have done so it is not entirely certain that the statement is correct. We mean by this that the writer of the catalogue, whether outsider or employe, perhaps did not know the difference and wrote "three-point" because that seemed to sound better; or perhaps the designer or the others who did know had no share in making the catalogue; or perhaps the designer did not trouble himself about the number of contact points, being otherwise engaged; and it is no injustice to say that some designers do not understand the subject. We are compelled to doubt whether some of them could give a satisfactory reason, or even an intelligible one, why they have a two-point or a three-point bearing, or why they do things in this or that way—they do as others do, and because others do. It is impossible not to believe that bearings, like other parts, are largely constructed by a haphazard rule-of-thumb; that a steel cone is put into a cup without study or care about the curve on each and how each suits and fits the other, and then balls are dropped in for a "go-as-you-can."

CARELESSNESS ILLUSTRATED.

As a passing illustration of carelessness, we copy a cut of the front-wheel bearing from one 1896 catalogue; it does not specify the number of contact points, but here is contact nearly all-round, and balls thus misused

could not roll—they would have to slide for it. This may be by fault of draughtsman or et graver, for the cut of the other wheel bearing, on the same page, is not so and is plainly meant to show a two-point; but is it unreasonable to suspect that a maker who would let his bearings be thus misrepresented might also let them be mismade?

The habit of carelessness in factories is the more likely, because few riders are particular or take much notice so long as the bicycle goes, and because any ball bearing, unless "all

to pieces" or jammed hard, moves with a fair degree of ease. Only have it loose enough and it will "spin" freely, but for the test it must be both tight and easy; take the wheel by the rim, at successive intervals of a few spokes all the way round, and see if there is any side-shake at any point. Spinning does not prove fully, because the weight of rim and tire will push past tight spots; having taken the wheel out, spin the axle, and slowly turn it around with the fingers; this is the severe test of a bearing, and if it is even all around, with neither loose spot nor pinch spot, you may be satisfied with it.

SIZES OF BALLS.

It is obvious that large balls roll more readily than small ones; but small ones give more points of support, and therefore develop a little less friction when they do slide instead of rolling, as seen in Fig. 19, which shows $\frac{1}{4}$

Fig. 19

and $\frac{3}{8}$ balls upon central cones of the same size. The $\frac{1}{4}$ ball is miserably small, and it ought to be dropped even from its use in pedals; the Wolff-American pedal is entitled to mention as using the 3-16, and there may be a few other makes so doing, of which we are not as yet aware. Some makers use 3-16 for the front wheel bearing, which is less tried than any other except the steering; back wheels and crank brackets range from $\frac{1}{4}$ to $\frac{3}{8}$, and even to $\frac{1}{2}$ inch in rare cases in the latter. There is a reasonable limit, however. Our own preference is for 3-16 for the steering, with perhaps $\frac{1}{4}$ at its bottom; $\frac{1}{4}$ inch for front wheel; 5-16 for back wheel; $\frac{3}{8}$ inch for the crank bracket, the most trying place of all, except, perhaps, the pedal.

As to accuracy in size, .001 of an inch is a good large variation. Balls not uniform in size and hardness and not true in sphericity may greatly impair the efficiency of a well-made bearing. How carefully and scrupulously they are tested in these respects by the ball-maker or the bicycle-maker we have not recently inquired. But if one large ball gets into a bearing, nicety of fit is impossible, because the cone cannot come down to the other balls without jamming on the large one; and if there are a few large ones, they take all the pressure. A ball cannot change its place in the row after being put in; and if a pair of large ones should happen to get into the position at AA in Fig. 19—just below the centre, with small ones underneath and giving no support because not touching—the weight of the load downward and wedging outward might perhaps split one of the large pair. A split ball promptly begins breeding mischief, unless discovered and removed.

The old lubricator screwed into centre of hub is not yet past; in England, a helmet-topped cover for this piece is advertised, and there is one hub with a reservoir, so that the balls at the bottom of the rows are always in oil. In this country, the later practice omits the lubricator, and leaves the hole in hub, with a spring actuated ball for a valve. Oil has commonly been injected into the hub and

left to find its own way to the balls by gravity and centrifugal force, which it is not quite certain to do. There are several devices for channels to carry direct to the bearings, but the best is that of "central oiling." One way, used on the Sterling and others, has a ball-valve hole in each end of axle, and leading to the ball cup; still better is the Wolff-American method, the axle being hollow through and packed with wicking as a reservoir, with small holes leading to the bearings.

It would be fallacious to argue against balls because they are not used in the journals of shafting and heavy vehicles such as locomotives and railway cars. First cost and maintenance may be against the ball in such places; economy of power by reducing friction is of minor consequence there; and the pressure under heavy loads brings in another factor. More contact is required, and so the plain bearing with packings of soft metal is doubtless best. If the motor vehicle wants a better one, the roller can be revived for it, or balls can be combined with rollers to get more bearing surface. But when a bearing is properly designed and constructed, so that the balls can roll and really do so, how ought the parts to stand the moderate load of the bicycle? Under the pounding of blows, as in the hands of persons who ride off curbs and down steps, chipping and crushing of hardened parts might be expected; in ordinary use neither ball nor cone ought to crush, nor should mere rolling cut out a special ball track or even mark that by a distinct polish. But when a bearing is made like Fig. 11, so as in practice to be more or less a plain bearing rubbing around on points of balls, we must look to find grooves worn into axle cones and into sides A and B; it cannot be otherwise, when balls are put in to roll but are jammed into a corner so that they can't do it.

And if the righteous scarcely are saved, where shall the ungodly and sinners appear? What sort of work must there be in the dry-goods \$39.66 wheel, with pneumatic tires, "balls all over," and a full year's warrant? The hapless purchasers will find out after a while.

JULIUS WILCOX.

ALEX SCHWALBACH.

(Concluded next week.)

WANT THE TAX REDUCED.

A bill has been introduced to reduce the tax on cycles in France. At present every machine pays 10 francs 87 centimes, but it is now proposed to charge 6 francs on single cycles, 11 francs on machines with two seats and 16 francs on those with three or more seats. The proposal will no doubt be adopted.

REGARDING CREDIT.

In Germany it is customary to give six months' credit; in France and Denmark, four months' credit is regular; in Italy, three months; in Norway and Sweden, three months, while in Great Britain four, five and even six months is none too long to suit retailers.

SETS HIM TALKING.

In days gone by perhaps it was all right to refer to the bicycle as "the silent steed," but as things go now the possession of a new one is conducive to anything but silence on the part of its novice owner.

FOWLER CYCLE MFG. CO.,

FIGURING UP.

Aftermath of England's Cycle Shows, and the Novelties of Merit Seen in Them.

London, Dec. 16.—Turning back to the late show for novelties, I find the Doolittle brake one of the most important and deserving. It will be generally adopted by the leading makers on this side next season, and its merits are such as will recommend it to a critical eye.

Fig. 1 shows a rear hub with brake fitted complete. As the brake is made entirely on the hub and spindle, no alteration is necessary in the cycle construction, as a hub so fitted fits the rear forks the same as an ordinary hub, providing that the fork lugs have the usual flat face. The brake is also made to attach to ordinary hubs exactly as the sprocket wheel does, replacing the sprocket wheel and locking ring with a driving ring having raised shoulders whose use is described hereafter. Fig. 2 is the fixed disc which screws on the spindle, and is prevented from rotation by the projection on the spindle shown in fig. 1, which engages the fork slot; its inner face is lined with leather or other friction material. Fig. 3 shows an inner view of the lateral disc which slides on the hub nave, the latter having raised shoulders which engage in the slots in the disc ring, so that it rotates with the hub, and has a lateral, but no radial, movement thereon. The ring-like portion projecting from the inner circumference also carries double reversed cams, the shorter abruptly beveled ones forming teeth which engage in similar ones on the face of the sprocket wheel, fig. 4, by which the disc, and with it the hub, is driven forward. When the sprocket wheel is turned backwards the long cams sliding on each other drive the disc outward in contact with the fixed friction disc, the amount of pressure it exerts on the latter depending on how far the cams are reversed on each other, and this movement depends entirely on the amount of force used in back-pedaling. When the sprocket wheel is turned forward again, the lateral pressure is released, and the abrupt cams on the disc engaging

with those on the sprocket wheel, it is drawn away from the fixed disc, and is held firmly out of action. The rotary movement of the sprocket is very slight, and is not noticeable in riding. Fig. 4 shows the sprocket wheel, having openings slotted to allow it to slip on the hub end over the raised shoulders, and when in position it is capable of a slight rotary or radial movement, but has no lateral play, so that the chain line is unaltered. It has double inclined cams, the reverse of those on the lateral disc, and in driving forward these cams locking with those of the lateral disc bind them both together. On back-pedaling, the sprocket turns in its groove, and the disc is forced laterally by the long cams, the gradual inclination of the faces of which multiplies the power used by the rider in the ratio of eight to one. Fig. 5 is the locking band, which is placed between the sprocket and the hub nave or the lateral disc. By this device the sprocket cannot turn backward till a given amount of pressure is exerted, and when so turned cannot turn forward again and release the brake till the same amount of power is applied in the forward direction. Thus the brake is not applied by any irregular pressure of the foot which may occur in rotating the cranks.

This brake has so many advantages over any other that I have seen that I expect it will soon become practically universal. Its great merit is a possibility of coasting while still keeping the brake power on, and another is the non-liability to apply the brake by careless pedaling, while the absence of all springs is of course a great advance.

Last year, in my description of the various novelties to be seen at the National Show, I alluded to a couple of hydraulic brakes which the Osmond people and Mr. Terrill, Q. C.—since so well known in connection with his conduct of tire patent actions—intended to market. None of these, however, came to anything, and the idea seemed to have dropped quite out. On the stand of Messrs. Cogswell & Harrison, a noted arms manufacturing concern who have recently gone into the cycle building business, at the recent National Show, was found a really efficient brake of this description, which I illustrate. As will be seen, it is operated on by the usual brake lever acting on the piston plunger of a small cylinder, A. This similarly reflects along a minute copper connecting tube on

the cylinder B, depressing C, which is a long piece of patent leather forming a sectional part of the ordinary mudguard, on to the driving tire from the hinge D. The whole affair was neat-looking, instantaneous in action and very powerful because of the large braking surface secured.

Another point of novelty I found on the same stand was a new method of fixing disc-adjusting bearings in hub and crank-hanger, which is illustrated herewith. It is merely a small pin attached to a flat steel spring which is screwed fixed to the hub or hanger as shown. This small pin engages in slots or

grooves cut out of the outer circumference of the adjusting discs as shown in fig. 3. Of course the method is very simple, is what you would call foot-proof, but as no circumferential support is given the discs beyond that which they get from the engagement between the male and female threads, it will be found that after some months of use the discs rock

in their seats with a lateral motion corresponding to the end shocks on the axle. This of course, is a very grave fault.

In my last letter I referred to the new pattern section of tube which the Centaur Company had introduced into the front and rear forks and rear braces of their machines. The accompanying illustration will convey an idea

of its appearance, the section view being given in the centre of the triangle.

Other ideas in frames are No. 1, the Cogswell & Harrison "Armus," and No. 2, that of a small Coventry firm. Given that the chain bridge is all right, No. 2 is the better pattern.

WANT WOOD RIMS.

The Sterling Manufacturing Company No. 1 Dyer's Building, Holborn, London, E. C., England, are in the market for wood rims, and will be pleased to hear from American makers.

HOW DO THEY DO IT.

In some, to Americans, incomprehensible fashion, a cycling carnival at Johannesburg, South Africa, has been made to yield a net profit of over \$6,000 for a local hospital.

IN WINTER'S GLOW.

Clear January mornings and evenings in the suburbs have a wintry charm not easily found by the rider who confines his winter cycling in populous parts of the city or even in the real and remote country. Perhaps it is that the characteristically rural features of the suburbs are especially dear because they are constantly threatened with destruction by the advancing town. To know that beyond the mysterious horizon's edge, deep-etched with the dun of serried forest tops, lie not leagues of rural wilderness, but paved streets and huddled roofs and crowded thousands of the rider's own kind, lends to the scene the charm of the unexpected. Bits of unspoiled suburban nature yet spared by the advancing town are unique and delightful, the more so from the fact that the rider's eyes, and more especially his ears, catch ominous hints of what lies beyond and will one day drive nature from her last retreat.

These January dawns come late enough now to be seen by those who are not especially early risers, and the man who believes an ante-breakfast ride the proper beginning of the day, and who in dressing therefor finds himself staring from an eastern window half an hour before sunrise, is rewarded with a marvelous sky picture of old rose and slaty blue, with great stars lingering. But dawn, after all, lacks the charm of familiarity that belongs to sunset and the gloaming. The suburban twilight hour is strangely compact of opposites. The rider has a sense of aloofness from men and cities, with the consciousness that millions of his fellows dwell beneath the arch that has its zenith directly over his head. When the chill of late afternoon has squeezed the atmosphere almost dry and left the upper air ethereally clear and pure, the orange after-sunset fires begin to glow behind the bristling treetops that ring the suburban world. Wherever the eye reaches the horizon, there is that universal mist of treetops, leaden as seen afar, but strangely tinged with a faint neutral green where the woodland rises high, a stone's throw from the rider. Whether that faint misty green is purely an atmospheric effect, or, indeed, a dim survival, a winter memory, as it were, of the time when greenery was everywhere, it would be hard to guess. Perhaps the fact that it is noticeable only on rare evenings may suggest the former explanation.

Meanwhile the coloring of the horizon greatly varies within a somewhat narrow gamut. The after-sunset fires slowly pale from flamy orange to cold pink and dull salmon, mixed at length with a slaty hue that proclaims the approach of the hour when lighted lamp is the law's demand. These are the prevailing hues of the western horizon. Opposite are the more pronounced duns, faintly warmed with reflex pink. As the eye of the suburban rider travels either way around the horizon it notes the gradual blending of colors until the dun of the east has become the orange or salmon of the west. The dense bare beech twigs seem to be colorless flames leaping heavenward. Beside them is the tracery of lacelike white birches, the broom-like black birch, and all the varied hieroglyphs of elm, maple, chestnut, oak, hickory and buttonwood.

A few degrees lower down the orange light is shining through a multitude of Gothic

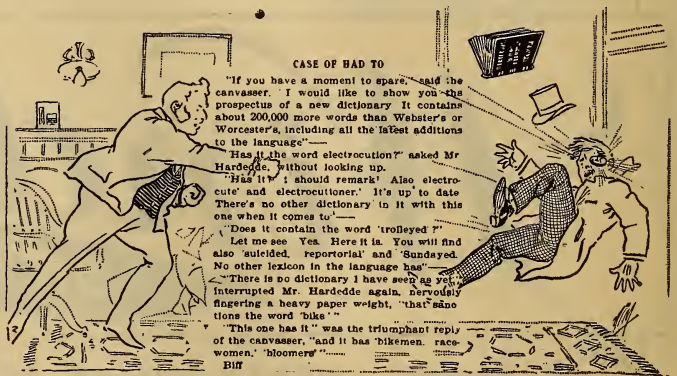

arches, while lower still the orange fires are masked in the deeper etching of the underbrush. Overhead the vault is dim and downy, with here and there a star still faint in the lingering after-sunset light. To the rider through rural lane and road, thus ringed far and near with treetops, there comes, as out of a dream or from the confines of another world, song and laughter, the barking of dogs, the lowing of cattle, the brazen stroke of city clocks, and at short intervals a cataclysmic rush that might be any mysterious thing, but is only the noise of commonplace commuters hastening dinnerward with the speed of steam.

As the evening deepens and the stars thicken and a sense of the cold settles in the rider's joints, his feeling of isolation grows. He seems shut within a world of his own against which the outside world raves ceaselessly, but in vain, kept off by that magic circle of the treetops. Looking into the momentarily deepening gloom of his horizon he feels the clutch of old superstitions, and is one with the millions that have found a mystery in the

AS OTHERS SAW HER.

The woman on a wheel, be she young or old, usually rides with an air of perfect satisfaction. This feeling is not the result of her ability to manage her wheel successfully, but of satisfaction in her personal appearance. It is a case of seeing herself as she thinks she is, not as others see her. And when she passes women on wheels she examines them with a critical eye and always thinks, even if she doesn't say it: "Well, I know I look better than she does." The chances are she looks about the same or worse. This characteristic of women in general is not confined to the adept riders who are seen on the Boulevard, but it is shown to a laughable degree in beginners at the riding schools.

A fair novice who had only progressed as far as her second lesson was so elated over "going alone" before the usual third lesson that her pride got the better of her and she fell very deep into the error of imagining she made a better appearance on a wheel than any of the other women. Towards the end of

twilight that edged their physical world, the millions that hardly suspected, in the daily spectacle of sunset fires and leaden woodlands, a trick of the atmosphere to be explained to its minutest detail by theories of reflection and refraction. Night comes with new-lit fires here and there breaking through the horizon, the street lamps of the city, advance guards of the coming civilization that is to bring ruin in its train, greet the rider as he rushes into the outlying pickets of the city's brick and mortar.

HOW LUCKY THE PROFESSOR!

Professor Max Muller can converse in eighteen different languages, and enjoys the use of every one of them. What a pleasure it must be to that man to give vent to his feelings when something goes wrong with his wheel, and the joys of a ten-mile walk are in prospect!

SORT OF A FAITH CURE.

The whole story of learning to ride a wheel can be condensed into two words: Have confidence. Believe you can ride. "He can who thinks he can," says Emerson.

the lesson she was sitting with her wheel beside her at the end of the hall away from the spectators while her instructor had gone across the hall. She watched the efforts of the beginners with high and lofty scorn, and cast many a pitying glance at the woman who sat so straight and looked so uncertain.

She was sure of her superiority, although she didn't intend it should be discovered, and so eager for an expression of praise that she decided to ask the instructor to criticize her appearance, and by way of concealing her motive she would assure him that he needn't have the slightest fear of hurting her feelings, for she wanted an honest opinion. When he returned she got as far as: "I wish you would tell me—" when she noticed he was raising the saddle on her wheel, and she interrupted herself to ask:

"Why, what are you doing that for?" and he replied:

"Well, the people over there have been talking about how badly you looked on a wheel, and I thought it might be an improvement to change the saddle. Were you going to ask me something?"

But, for once, she was speechless.

BOLTLESS

Sylph Cycles

Run Easy.

Built in various heights of frame; all models, \$100.00.

SYLPH TANDEM, diamond and drop, \$150.00

Medium-Priced High-Grade

Overland Cycles

ALWAYS RELIABLE.

The "Boltless Sylph" is a strictly high-grade, up-to date bicycle, and emulates more important improvements and special features than any other 1897 wheel.

Overlands proved themselves in '96 to be the best medium-priced high-grade bicycles made. They are greatly improved for '97; are built with 24, 26 and 28 in. wheels, different heights of frame, and list at \$40.00, \$50.00 and \$75.00.

A Distinctive Feature in our 1897 wheels will be an ORANGE CROWN

WATCH FOR IT!!

The Benson two-piece detachable crank axle and sprocket, and a new, highly effective chain adjuster—both of our own invention—together with outside reinforcements, large balls, narrow tread, ball retainers, are among our special features.

A COUNTRY WEDDING.

(Christmas, 1895.)

For more than a year Raphael and I did not venture near the old George Inn on the White Plains road.

It was a journey on the wheel which required the greater part of a day from the city, and I grew to be so immersed in business that I could not afford the time for so much cycling. Raphael went abroad to complete his studies in Paris. The affairs of George's inn were at irregular intervals communicated to me in letters from Great George himself, some of which I sent to Raphael (whose Ophelia, with the lilies, as is well known, took the 2d Salon Prix d'honneur, in 1894).

These letters were curiosities in their way—honest effusions of an honest soul, who, because of our friendliness, and fortunate rescue of the "free boarder," grappled to himself "with hooks of steel." They were badly spelled, and Great George made himself small with his little "i's." Here is one of them, written shortly after the death of that little black-eyed, sharp-tongued vixen—his wife:

HONORED SIR: My wife dide Sunday—took away from my side by god in his alswis providance. She was a noble creetur. She spoke kind words to the last. She fergiv me fer all what i ever done—such as drink, over sleep, tardyniss, and General Lazyiniss. She fergiv me fer all harsh words what i ever spoke. The free boarder she held her hand to the last. My wife she took to the free boarder. It was Liver troubles an her mighty had stomage what took her off final. I now she was going to die and i was ny maned, if i want fer the Freeborder i dono what i should done. That gerl done everything, for our Cook she left and married a peddler fell down to yonkers, jest as i needed her most at the time of the furnil yessir Bessie she done everything as was done. she's had her trouble an' the child was borned ded. But she staid with us, an' my wife she sed she was to stay always, so i guess we, i and she is to be married to stop skandle and talk an because my wife left word as it wood be greeabal. So long.

GEORGE H—

Another letter followed after a long interval. Then several more (well spelled) written in a light, delicate, girlish hand, and then this one from Great George himself:

DEAR SIR: Chrissmass day is the day set, is Mr. Rafel come home yet? Bess wants to wait till he comes home, i dunno why, but if as you rit, he is expected, then notiff yeres trooly. Bess is all prepared with new clothes, hoziery, shoes, stockings, her father come doun hansom and she's happy as a berd, i ther her a singin now. The hotel has done well an' prospects good. Cycler folks is what done it. So a weddin is expected on Chrissmass day sure, i have writ to all my old sports to come out, we'll nev a hole of punch handy, Cyclers is notified, it will be a big day, So long.

GEORGE H—

When Raphael arrived on the City of Paris, almost the first words he spoke were of George's wedding.

"You see, I feel I owe that pretty free boarder something," he said eagerly—he was the same ardent enthusiast, although he had a blase Parisian goatee and let his hair grow long in true artistic fashion. "I have painted a picture of the old inn as well as I could from a photograph and had it nicely framed for a wedding present."

I thought you would present your Ophelia," I said with a half smile. "She gave me my insight into Ophelia's state of mind," he replied seriously, "that day we saved her life—I shall never forget it—and so, indirectly, she caused me to take the prize in the Salon, and I've had lots of orders as a result. Why, old man, I'm positively rich—I insist on your dining with me at Delmonico's!"

By this time cycling had grown to be the

proper thing for everyone, old and young, in New York, and we had no difficulty in planning a large wheeling party for the Christmas wedding at the old George Inn. The day was bright and not too cold as we mounted our wheels, ten of us, lady and gentleman riders, and entered Central Park on our way to Yonkers.

It was a little after nine when we started and the Park was pleasantly free from the usual holiday tough and his "ladfiren." The leafless brown trees seemed to conceal a purple hue, while the grass was still a vivid green, and the sky a most deep and tender blue.

Yet, for cyclists, the Park is not all we could wish. The surface of the roads is apt to be lumpy, and the hills—are dreadful, as the ladies all voted. We chose for our cavalcade—though cavalcade is hardly the word—the East Drive, and turned out into the asphalt of Fifth avenue, and so on up past the pretty Mount Morris Park to Kingsbridge and Yonkers.

Outside the city the light fall of snow had not worn away. Where the sun had warmed a southern hillside a patch of bright underlying green was seen. Winter landscapes have their own peculiar beauty, and the distant white garment of the hills made them seem higher and closer to the sky. A glimpse of the Palisades across the river, their noble feet shod in ice, and their brows whitened with snow, gave them an air of dignified old age. The black Hudson River pointed northward with an austere beauty of wintry indifference. Along the fence by the road a little red chipmunk kept us a merry company and disappeared in a mass of bushes and red berries.

At last (and not a bit tired, of course—cyclists never are) we all arrived at the Inn. Here was a scene of bustle and excitement. Dozens of bicycles were stacked against trees. Groups of men were standing in the roadway. Carriages were arriving. Our party was met by Great George himself, who came out on the porch, his honest face wreathed in smiles, and his breath redolent with the punch he was concocting. He looked like a personification of Merry Old Christmas himself with his ruddy cheeks. He shook hands all around, pleased that we had brought so many friends. Raphael he hugged in his arms. "Now," he laughed, "I guess Bess'll let the ceremony go on—she wouldn't do a thing till Mr. Brown he come."

Then he led the ladies of our party into the old inn parlor, and in a short time every one was washed and dusted and ready for one of George's stiff cocktails, which he handed around on a tray. People from far and near began to arrive for the wedding—for every one had come to know honest George—farmers and their wives and daughters, horsey-looking people from Mount Morris Parkway, cyclers from everywhere—and pretty country girls galore.

Then the minister came, and certain very red-faced awkward young men bustled about with white rosettes in their buttonholes and with white ties and shiny shoes—they were so very busy doing nothing that every one guessed at once "Why, they must be the ushers!"

Then when the inn parlor was so crowded that not a single additional man or child could be crowded into it, there came a hush and a silence. The minister had taken his

stand before the mantelpiece, with Great George beaming with smiles at his side.

How well he looked! The evergreens and holly wreathed all about the room, the flowers above his head on the mantel—embowered the good fellow with a joyous, festive environment. Pretty soon there was a commotion, an old farmer, bent in frame and stern of countenance, crowded into the room with a slender girl on his arm, her head bent down, her cheeks aflame.

Indeed it was a trying ordeal to poor Bessie! The plain, homely country folk, some of them, were in broad, half-malicious grins, the flattery they paid to their keen moral sense. The girl had slipped—the affair had been a noted scandal—she had even tried to drown herself—some secretly called George a big, good-natured fool!

Shyly and with a sweet upcast of her dark eyes the girl glanced at George. There was but one expression of kindness and love in his honest face! He took his place at her side before the mantelpiece, with the brave air of a man defying his neighbors.

Then the minister began, a tall, lean Methodist, with a long chin beard, more accustomed to funerals than weddings, and with a voice attuned to funeral gloom.

Raphael stood near Bessie, and she gave him a quick, odd little look. Perhaps her heart had once gone out to him. But I think the scorcher had scorched all feeling from her breast, and it was gratitude and friendship she was offering Great George at the altar, and love had died within her forever.

Her face grew to its usual white as the minister prayed. Her dress of pearl gray—not the white of youthful brides—was touching. Indeed, the whole wedding was, to us all, a pathetic affair, until the minister by his blunt, awkward remarks turned it into an occasion for inward rage and reviling.

These country ministers doubtless mean well by the community at the expense sometimes of the poor sinful individual. The delight of pointing a moral is very great no doubt. To these folk it is a matter of habit. The Rev. Jones could not refrain on that sunny, happy Christmas wedding day from commenting upon poor Bessie's downfall, and the unusual "Providence" she had met with in obtaining, in spite of her sin, a husband.

It was incidentally shown that such "Providences" are rare.

Bessie's head drooped lower and lower, George looked defiantly at the minister. Fortunately he did not break out and stop him. Our party of ladies looked at each other with astonishment and disgust in their eyes. The pretty country girls hung their heads. A gloom, a pall, fell over the house. The Rev. Jones's voice became a melancholy wail. But at last, when the tension had grown unendurable, his "Remarks" came to an end, and the ceremony and prayer were soon over.

Then you should have seen how certain wheelwomen went to her (strangers!) and kissed and hugged her, and made much of the poor bewildered girl, and applauded George (and one actually kissed him), and the minister slunk out of the room unnoticed. Then the musicians struck up for the first time in the hallway—a jolly two-step, and the pale, sickly dismal spectre of pharisaical morality quitted the place. Then the

HOW PA GOT IT.

**It Took Some Time and Risk, Though,
to Accumulate His Boy's
Wheel.**

wedding was a wedding indeed. Hot punch was passed, hot oysters, chicken, turkey, was served. People buzzed with talk and laughter, Bessie's color mounted. How pretty she was! How proud and manly her husband looked! In another room a crowd of cyclists were giving three cheers and a tiger for Great George's sweet wife, and Great George himself.

I thought then, and I've thought since with George Du Maurier in his books—how much better hearted the wicked world really is than our moralists would have it.

Then, after a hearty luncheon, and punch so strong it made our heads buzz, the dancing began, and George led his bride in the mazes of "Old Virginia." Quadrilles followed, and a waltz.

Great George came up to me and whispered "The weddin's a success after all—ain't it!" Then his face fell a little, and a reverent expression came into it. "I guess my wife, if she's a lookin' down, is satisfied—she felt sorry for Bessie—'twas her left Bessie in my charge."

Even then the years of that petty woman's tyranny had an echo in his soul.

Then came cutting the bride cake, and the dancing stopped (such queer fandangoes and curious country steps some of us had rarely seen). Bessie plunged in the knife and her first piece was given to Raphael, the second to me, the third to her old father, and then to every one. Raphael and I were the newly wedded pair's divinities. If we approved the world might wag as it would.

So, the wedding over, at dusk we lit our lamps and rode down to the Yonkers station, not four miles. The Christmas day had been pleasantly spent. The ladies had been greatly amused. Did you see those hideous plated soup tureens, and those hideous vinaigrettes—among the presents?" they asked, "and did you see that pair of boots, and that baby's muffler, and that dreadful lithograph of 'Spring'?"

"Yes, but that handsome ladies' wheel all decked out in pretty ribbons—I wonder who sent that? There was no card."

"The scorcher," I replied, for I had learned from Great George that this was the case.

"The scorcher! her former lover? I should send it flying back," cried one of our ladies.

"Great George's wife has no need to know it—he will never tell her—and for my part—I'm glad he did send it—perhaps he hasn't such a bad heart after all—that scorcher with the dismal face!"

So, in the deepening winter's twilight we rode down into Yonkers. Afar in the west the line of red sunlight betokened happy days for George and his pretty bride. Raphael remarked as we dismounted: "After all, wheeling has its own little romances—and love still rules, even at the end of the century!"

S. M. STEVENS, in Bachelor of Arts.

TIME TO STOP.

Individual clergymen have denounced bicycle riding, the theatre, dancing, and now a Richmond, Va., minister declares that kissing must be stopped. If all these learned men have their ways the outlook for 1897 will be rather a mournful one.

The boy who cried to be put into long trousers, when he gets a bicycle regrets the loss of the girls' stockings he used to wear.

"When my little boy asked me to get him a bicycle for Christmas," said the retired burglar, "I found it impossible to give a definite answer."

"Business was bad, and I didn't feel like spending the required amount of money, but I decided to see what I could do. A bicycle is too risky a thing to push along in the streets late at night. Policemen are curious and I didn't feel like taking any chances, or I could have had the pick of the best ones in town.

"But, as luck would have it, while I was feeling my way along the hall of a house the next night I fell over something with a bang, and I wasn't long in knowing that it was a bicycle. The noise disturbed no one, and so I decided to make a beginning at my boy's wheel. Finding a wrench in the toolbag, I removed the saddle, pedals and lamp, and had no difficulty in stowing them in my pockets along with the tools. After getting a few trifles about the house, I took my de-

and went home to bed quite encouraged. I supposed the people wondered why I left the wheels and pedals behind, but although I was sorry to excite their curiosity, I was compelled to, and squashed my feelings over the matter by thinking how my boy's eyes would sparkle when he saw the bicycle on Christmas morning. The next night I stopped at the house long enough to get the frame out of the shed, and hide it unseen under the front stoop of the next house, which was closed up. I couldn't cover it up in any way, and all the next day I tried to think of a plan to get it home. As I have noticed a good many people carrying parts of bicycles in their hands of late, I finally decided it would be safer to walk along the street with it during daylight than under the cover of darkness. I was right. Watching my chance, I took it from under the stoop of the vacant house and walked down the street unchallenged, and no one paid any attention to me on my way home.

"Well, I felt happy that night. I got all the parts and put the machine together, and would you believe it, they fit as snug as a bug in a rug, for by good fortune I must have stumbled over the same make of wheel each time. I felt proud when I got it all put

A Study in Angles—The Wheeler.

parture, feeling well satisfied with my start toward my boy's Christmas present.

"The next night I visited the house again, but although I searched high and low, I couldn't find the wheel. So I left, feeling rather cast down. Later on I had more luck. In the basement of a big house I entered I found two bicycles; one of them looked about the same as the one I fell over the previous night, so I pulled out the wrench and removed both the wheels. I tied them together, and after wrapping them up in brown paper, I started for home. By good fortune my big package excited no suspicion, and I congratulated myself on the rapid progress toward my boy's present.

"A couple of nights afterward I ran across another wheel in a house I visited, and when I got through with my regular business I removed the parts I had no use for and began to think how to get the frame home. After considerable trouble I got the handle-bar separated from the rest of the frame, and shoved it up under the back of my overcoat. It made me look like a hunchback, but I decided that I could stand that, in consideration of my boy's happiness. Then I took the frame and hid it in a shed in the back yard

together. After admiring it awhile and seeing that it run all right, I noticed that I had forgotten a bell and cyclometer. As I wanted my boy to have the best in the market, I visited a bicycle store before daylight that night and had no trouble in attaching them before retiring for the night. I had been just a week getting my boy his Christmas present, and I fell asleep feeling well satisfied with my success. So you see, although working under adverse circumstances, perseverance conquered in the end. My boy got his cherished bicycle for Christmas, but he never knew of its rather heterogeneous construction, and thinks it the best on earth."

NO SUCH THING.

Salesman—Do you want to have your new wheel sent by any particular express?

Customer—Certainly, if you can find a particular express. I can't.

DEPENDS.

Teacher—What is the chief end of man?
Pupil—The barber thinks it is the head, but the bicycle-maker thinks it is the feet.

NEW YORK'S LARGEST PARK.

No more extensive and striking view of Pelham Bay Park is to be obtained by the suburban riding wheelman anywhere than that seen from the junction of the Old Boston Road with the southeastern extension of Eleventh avenue, Williamsbridge. The extension, set down on the maps as Carsa avenue, leads into West Chester village, and southeastward from the junction with the Boston Road it is a well-made macadamized highway. The point of intersection lies near the crest of the slope, overlooking a wide area of marsh and upland, water and woodland. Nearly everything in sight, save the Long Island shore and the intervening Sound, lies within the limits of the city, although it is all thoroughly rural in aspect, and much of the land and water lies within the park. To see these many hundred acres of thinly peopled country and to know that it is part of New York City helps the rider to realize that nine-tenths of the city's population occupies probably one-sixth of its area.

The view of the park from the junction of the two roads, at a point about 160 feet above tidewater, is on fine days a most charming one. The extent and variety of this, the greatest of the city's pleasure places, are clearly brought home to the rider. Central Park and all the other parks, save Bronx and Van Cortlandt, probably could be put inside the area of Pelham Bay Park in sight, and there remains unseen sufficient area to take in nearly all of Bronx River, East Chester Creek or Hutchinson River, which cuts the park in two, is visible for a mile or more of its course along with its wide mouth and the bridge that connects the upper and lower divisions of the park. Part of Pelham Bay, with its several capes, appears at half a dozen points, intensely blue, the more so by contrast with the brown of the marsh grass and the dense etching of the park's winter woodlands.

Hunter's Island Lane, on the northeastern horizon, marks the northern limit of the portion of the park in view. Southward the southern boundary of the park is in view. The park lies revealed as on a map, roads, streams and all points of interest recognizable by any one familiar with the ground. It is a noble stretch of upland and marsh, with here a bit of woodland, there a homestead with its garden, orchard and well-kept lawns, and ever-recurring, as the life and soul of the landscape, the deep blue of the salt water. It is difficult to find from any point so nearly complete a view of any other of the city's parks.

MILEAGE'S PATRON SAINT.

"Ah," observed the new shade, betraying interest, "may I ask who is that gentleman yonder?"

"That," rejoined Pluto, "is Ixion. He is condemned to remain on that revolving wheel forever."

"Oh, I thought he was one of those century fiends, or a six-day merry-go-rounder. Well, I declare! Forever did you say? Dear me, what a mileage he will have!"

THE REASON.

"Why does Wobblers follow Miss Speedmore so with his eyes?" "Because she rides too fast for him to do so with his feet."

THOUGHT HE HAD A FIT.

Out in a Western city, the other day, a young man became afflicted with that agonizing ailment known as the toothache. Nothing would stop it, and in utter despair he hastened to a dentist on his bicycle for some sort of relief from the torturing molar. Leaving the wheel in the hall of the building, he ascended to the dentist's apartments, and was speedily ensconced in a chair. The dentist began operations to remove the offending tooth without delay, while the victim gazed upon the street, through a window which faced him, with the expression of a martyr.

Suddenly the victim struggled to get his head away from the grasp of the dentist.

"Ugh, ug-glug, glug-ug-lug-mug-gug," he shouted in a muffled voice.

The dentist thought the man in the chair was having a fit. He kept his finger in the victim's mouth and a silent struggle took place. The man in the chair tried to rise; the dentist, who is something of an athlete, struggled to keep him down. This sort of thing went on for several minutes until the dentist took his finger out of the victim's mouth and let him up.

"Dad, blame you," shouted the angry victim. "Why in Sam Hill did you hold me down that way for? Didn't I tell you I wanted to get up?"

"I thought you were having a fit," answered the dentist, apologetically.

"Fit nothing," said the victim. "I saw a thief going up the street with my bicycle. I knew it by the color and the way the tool bag hung behind, and the ribbons on the handle-bar. Being up five stories is handicapped enough without having a brigand like you holding me down with his fist in my throat."

And he forgot his aching tooth and, although not a locksmith, made a bolt for the door.

FOR THE PUZZLE DEPARTMENT.

Are you clever at reconciling figures with facts? If you are, send in your answers to these:

Any rider colliding with another produces heat. Give formula for wear and tear, also reduce language used to its lowest terms.

If a given wheel paper says one thing, what do the others say?

If Adam and Eve had been scorchers, what would have been the mile record for 1896?

Who went when, round what, on a which, and in what time?

How long must you retain your friend's oilcan and wrench before they become your own property?

What inference do you draw when you notice in the advertising columns that all the makers of all wheels hold all the records for all distances?

AMPLE WARNING.

"What are bells on bicycles for?"

"Don't you know? Why the riders ring them, you know, when scorching through the streets, so's to let the people know they're going to run them down."

BOND OF SYMPATHY.

First Office-boy—You pull a big stroke with the old man, don't you?

Second Office-boy—Betcher life! Me and him ride the same make of wheel.

IN PALE GRAYS AND YELLOWS.

Even in winter a trip to Riverside Drive gives to the rider views which bring peace to the soul and rest to the eye. A few truant boys are clambering on the steps that lead up and down the steep slopes of the park beside the drive. There are always half a dozen cyclists in sight, men and women in almost equal numbers. A family carriage rolls by now and then, bearing the women and the small children of the household, and hired coaches, laden with country visitors bound for Grant's tomb and a glimpse of the view beyond, help to fill up the straggling procession. Much of the time the smooth highway stretches vacant, like a great braid, seemingly swung into a wide loop where it dips into a hollow and rises again to the hill beyond grassy slopes, and great stone houses face the drive on the east, while to the west lies the crude strip of park slowly taking shape, with the railway at its foot and beyond the river.

Midway the Drive one sees southward its own smooth curves, northward the white face of the monument. Eastward the numbered streets descend steep to the Drive. Everything in sight bespeaks the airy spaciousness of the upper city. It looks as if the Drive were wide enough itself to carry half the street traffic of the town, so that the toiling cyclist mounting a distant slope seems a mere speck upon the smooth gray surface of the roadway. Well down the slope to the west workmen are digging and hauling great stones and dumping earth, in the effort to bring that drastic strip of park into unison with the well-kept Drive and its eastward bordering lawns. Still further down railway trains are making their way back and forth.

Beyond lies the river, unsoiled and beautiful, half hidden in soft diaphanous white mist, its further shore robbed by this soft medium of all vulgarity, and altogether beautiful. The schooner tacking in the near channel seems almost under the hand of the observer, so that he might toss the traditional biscuit upon her deck. Her broad sails confess all their soil and patches, but there is fascination in the sight, and the onlooker feels the charm of a maritime park. Out of the white bosom of the mist emerge from the north and south other craft driven by wind or steam, and from the dim place of the opposite shore, plumed with steam jets, come the softened sounds of business, low-toned hoots and calls from the river craft, the dull, subterranean boom of giant powder, factory bells, the rumble of railway trains, and all the din of a busy suburb.

THEY'RE REALLY SUPPOSED TO FIT.

"Bloomers must be responsible for a great saving of time and trouble," he suggested.

"In what way?" she asked.

"Why, you wheelwomen who wear them must escape all those sieges with the dressmaker that other women are always complaining about. You can just give an order, now, and then wait for them to be sent home."

"But we have to try them on," she protested.

"You do!" he exclaimed in astonishment.

"Certainly. Why should that surprise you?"

"Well, from what little I have seen of them I had not supposed that they were ever intended to fit."

HOW FAME CAME.

He is an elderly gentleman of means.

He has a standing high in the church and has contributed to charities. In the business world he has secured an honored place for his firm.

Having resided in his native city for so many years, and having contributed generously, although modestly, to its upbuilding, it would seem that he should have a reputation. And he did have a reputation. The comparative few who knew him held him in great respect.

But he really never tasted the sweets of popularity until his son broke records.

Never until his son became a public character, with his picture in all sorts of publications and the glory of his deeds put into display type, did the father know what it was to hear people whispering to one another: "Do you see that old gentleman? Well, he's Mr. Dover, father of the great record-breaker, Ben Dover."

Never before did he have people call him up on the 'phone and say: "Congratulations, Mr. Dover. This has been a great day."

If he happens in at the athletic club enthusiastic men, young and old, seize him by the hand and tell him how he ought to be envied and want to know if he had anything up on the races.

Greatness has been thrust upon him.

The name which lay hidden in the directory for years has suddenly become a household word.

All of a sudden the father finds himself blinking in a glare of reflected glory.

His son has broken a basketful of records.

He doesn't know how or why the records were fractured, and secretly he has no concern as to the condition of his son's game ankle, but he finds that whereas he is nobody, he is now the father of a racing crack.

HE WAS ACCIDENT PROOF.

"Let me write you an accident insurance policy," said an agent to a well-known up-town wheelman.

"I don't think I need one," was the latter's reply.

"Your wife would find the weekly benefits acceptable in case you were thrown from your wheel or injured in some other way."

"I am not married."

"In that case the benefits would supply the loss of salary while you were laid up."

"I am a member of the firm and would lose nothing in that way."

"But," persisted the agent, "you would find the money useful to pay the doctor's bills."

"My brother is one of the best physicians in the city."

At this point the agent gave it up.

IN A RIDING SCHOOL.

With a low cry she buried her face in his bosom.

"Do not leave me" she cried, clinging to him frantically.

Nor did he.

If he had she would have broken her neck.

But that was only at first.

In the course of six or seven lessons she could ride her wheel with the instructor at the other end of the hall.

PLANNING A REPAIR SHOP.

Generally speaking, bicycle repair shops have flourished during the last several years. Even shops located in out-of-the-way places in which a bench and a limited equipment of tools were the chief possessions, have in most cases made money for their proprietors. But a change is taking place. The increased use of the bicycle has, of course, enlarged upon the demand for skilled services in repairing and adjusting the mechanism of wheels, and trained mechanics have found it to be profitable to engage in the work. The result is that specialists in bicycle repairing are becoming common.

Cleaning, repairing punctures, taking dents out of tubes, fixing broken forks, etc., will always be the principal work of the repair shop, but, owing to the coming of specialists, and the expansion of the cycle repair business in general, one need not travel far to discover that there is a good deal more done in the modern repair shop than formerly. All this is beneficial.

To illustrate: I recollect overhauling a wheel in 1890. A small part required plating. I sent the part off to be plated. There was a delay of several days. I had to write

about the part two or three times. The owner called for the wheel daily. I got the part finally, and, after paying express charges both ways, and bill for plating, the expense was so much that the owner of the wheel objected. Now I can step into an adjoining room, plate the part, and at so little expense that the additional charge for nickelpating a handle-bar or other part does not materially enlarge the bill for putting a bicycle into good shape for next season's use.

I present in this article a diagram of what I consider to be a conveniently planned bicycle repair shop. All is on the ground floor. The situation of everything in the main shop is marked. The windows are lettered W and the doors D. Show-windows are, of course, not necessary, but it has been my experience that more business is done when there is something shown in a window to indicate to wheelmen the character of the business. The line of shafting which serves for driving purposes in the main shop can be extended through the wall into the plating room as shown.

In the latter department, I is the scouring bench, and J and K the scrub blocks. H is a vat for the lye bath, G the hot water tub and F the sawdust box. The dynamo is

placed at A, whence it can be driven readily by a belt from the main shaft. The electrical conductor may be secured upon the wall, along the line of solution tanks, and connected with the dynamo at C by the usual lead wires. The nickel solution tanks are marked D, and the copper E.

On the opposite side of the platform are the enameling, drying and general storing rooms. I would suggest that a separate division wall be erected just inside the main entrance to the enameling and drying rooms, as shown, and a door cut at BB, to open into each. The idea is to keep these two departments exclusive, where dust and flyings cannot get in and stick to the enameled surfaces. The enameling tank can be placed at D, and a door, which leads into the drying room at D, used through which to pass into the latter with the freshly enameled frames or their parts, and which may be placed in racks at EE to dry.

All repair shops should have a storage room in which to store extras, wheels, etc. There should be a dry closet in this apartment in which to keep supplies. The rear platform is for teams to deliver goods upon.

GEO. D. RICE.

LEG-LIFTING FALLACY.

In some of the labored attempts to analyze the "stupendous" muscular exertion demanded of the winner of the recent brutal six-day race, "the raising of the foot from its lowest to its highest level" is trotted forth as an element of waste power. In reference to all of the theoretical mechanics of pedaling, let me say that this claim is extremely fallacious. A wheelman may, for example, descend a gentle incline with his feet on the pedals, simply allowing his legs to follow the crank motions inertly, and doing no muscular work whatever. The legs then behave simply as part of the mechanism, and the work done by the crank in lifting each ascending leg is restored by the leg in its subsequent descent.

The internal friction of the moving limbs under these supposed conditions must indeed constitute an addition to the resistance of the bicycle, and its amount may be properly reckoned as an element of waste work which must always be present during pedaling. But this element of waste work has nothing specially to do with "raising the foot," etc., and operates equally when the foot is descending.

If, now, we imagine the cyclist to depart from the above supposed condition, in the direction of doing work, it makes no theoretical difference whether we suppose him to use his muscles (a) to partly lift the weight of his legs on the upstroke, (b) to press down on the down stroke, (c) to push forward at the bottom centre, or (d) to pull back at the top centre, or any combination of these.

In no case will there be any waste of mechanical power applied; but the further question as to what precise combination of these actions will enable the rider to develop given mechanical power, for given time, with minimum fatigue and exhaustion in wind and pulse, depends on a number of physiological and individual considerations of which theory can take but very imperfect account.

JABEZ BEESWINGER.

The witty French wheelman refers to his rival, the locomotive, as the "big brother who smokes."

UNCLE SAM'S SCORCHER.

There is only one department of the Government at the National Capital where a bicycle is supplied by Uncle Sam for the use of a messenger, and that is at the White House. For many years the private mail pouch of the Executive Mansion has been carefully guarded by a colored equestrian named Edgar, and his horse has always stood ready saddled in a stall under the White House conservatory.

With the march of progress, however, the bicycle has well-nigh superseded the horse, and dusky Edgar, like Othello, may some day find his occupation as a mounted messenger to the President gone glimmering in the ashes of the past. With a view to facilitating the delivery of mail matter and newspapers at the Executive Mansion the Administration decided upon a bicycle for this work, and a white wheelman, named Marshall, is now the courier of President and Mrs. Cleveland.

His duties consist in carrying the private mail pouch, which formerly nestled behind the saddle of the colored horseman, Edgar. There has been a vast improvement in the service in consequence of this new arrangement, and there are more deliveries than ever before in the history of the President's house.

HANDSOME IN PRICE AND APPEARANCE.

To an extensive line of cycle specialties, the Meyer Mfg. Co., Rochester, N. Y., have added this saddle, in which, they assert the defects of other similar saddles have been overcome,

and which "combines all advantages of a cushion or pneumatic with none of their faults." Their facilities are such that they claim to be able to "do the handsome" in the matter of price.

WHERE FOOLS SLIDE DOWN.

"Coasting down Fort Lee hill is quite an undertaking," remarked the garrulous ferry-passenger to his neighbor with the hatchet-face.

"Yes, indeed, it is. Nobody knows it better than I do, either."

"Why, are you a bicycle rider?"

"No; undertaker. I bury those who coast."

BIG CHAIN CONTRACT.

The Austrian Small Arms Works, of Steyr, Austria, have contracted to supply a Vienna house with 800,000 cycle chains during the next two years. This is equal to over 3,000,000 feet of chain, most of which is intended to be placed on foreign markets.

CRANK BEARING A FEATURE.

McKee & Harrington are pluming themselves on their new crankbearing, which will be a feature of the '97 Lyndhurst. The crank axle is divided in the centre. Each section has one side cut away, so as to form a wedge when forced into the sleeve. A reference to the illustration will show that it is entirely without threads. Each crank is forged in one

piece with its own half of the axle and spider.

If occasion demands that the crank be removed, it is only necessary to unscrew the cap at the bottom of the bracket and turn the cranks until a nut comes into view. With the tool which is furnished for the purpose remove this nut, revolve the axle half way, exposing the other end of the bolt from which the nut was removed, screw the tool to this

end of the bolt and withdraw the latter. Then the crank with its half of the axle may be slipped out. The cones, balls and shells remain in the bracket.

The cones are attached to a sleeve, which fits over the divided axle. The key bolt passes through this sleeve. The two cones of tool steel are forced onto a square shoulder on the sleeve, the ends of which are tapered for the purpose. The cones thus are independent

of the sleeve and may be renewed at any time.

The shells are removed by screwing them out, and are held immovably in place by the clamp bolts on either side. These bolts have one flat side fitting into a corresponding projection, preventing their turning and admitting of their being readily removed in case of breakage. Perfect sprocket alignment, it is claimed, is thus secured. This form of bearing, it is asserted, produces the greatest rigidity, as the balls run on the extreme edge of the bracket.

LEATHER LACKS LIFE.

A journal devoted to the hide and leather interests, after conducting an extensive investigation of the leather tire, has come to the conclusion that there is no hope of a development of the leather industry in that direction. Leather is not a suitable material for tires, it finds, and the attempt to make it a substitute for rubber for this purpose has been given up wherever tried. Facts already well known to every one except the journal above noted and the inventor of the tire referred to.

FROM SEAT TO SOLE.

It is not generally known that the Sager Manufacturing Co., the well-known saddle-makers of Rochester, N. Y., are turning out

the toe clip shown herewith. It is made of oil-tempered crucible steel and the shape is such that the clip performs its mission perfectly.

LIKE A TEA GARDEN.

Two thousand five hundred Japanese lanterns, which are to be illuminated at night by electric lights, will be among the decorations in the Chicago show building. Southern silax and Spanish moss will also be employed in addition to the usual flags and bunting.

MIXING CHRISTIANITY AND CYCLING.

The cycling contingent of the Y. M. C. A., of Cleveland, Ohio, has scheduled a "cycle show" for to-day. It will be a "one-day stand," and it is stated that nearly all of the local manufacturers and dealers will exhibit.

SAT AND ACQUITTED.

The suit of H. M. Rosenblatt & Co. against Gus Boyer, tried in Philadelphia last week, resulted in a verdict of not guilty. The jury men did not leave their seats, rendering the verdict by direction of the court.

CHICAGO SHOW RATES.

Chicago, Dec. 25.—The various railway passenger agents have agreed on a rate of one fare and a third for the round trip for the Cycle Show, to be held at the Coliseum from January 28d to 30th.

A Good New Year's Resolution

For Cycle Makers and Dealers—

That before the year 1897 is a day older we will be true to ourselves and our patrons and to our good business judgment by at least securing from Oliver, Straus & Co., 23 Park Row, New York, quotations on India and Straus Tires, Cilley Chains and Haney 10,000-Mile Cyclometers, and thus proving to our satisfaction "what's what."

PROVIDENCE PREPARING FOR A SHOW.

Infantry Hall has been engaged for the Providence Cycle Show, March 2 to 5, under the management of the Providence Cycle Board of Trade. The building, one of the finest in the city, affords ample space for forty large exhibits. F. C. Ferrin, New England representative of the Fowler Cycle Company, is the originator of the show and the most ardent worker for its success. The Providence Board of Trade is composed of the following firms: Whitten Cycle Company, Congdon & Carpenter, Belch & Loomis, H. A. & W. C. Keith, Pope Manufacturing Company, Williams & Monroe, Thomas Earley & Co., Keating Wheel Company, Dawson & Co., Fowler Cycle Company, Corp Bros., and the Waltham Manufacturing Company.

MAKES THE CHAIN RUN SWEETLY.

A little device—it is but 1½ inches long by half an inch in diameter—which has gained favor, and which is designed to make the chain "run sweetly," as they say in England, is the Automatic bicycle chain lubricator, produced by the A. B. C. Lubricator Co., No. 202 Herald Building, Baltimore, Md. As the illustration shows, it is intended to be attached to the front sprocket in the manner

indicated; the wick, fitting snugly between the teeth, is kept constantly lubricated with the emulsion contained in the tube and which is in turn applied to the rivets and joints of the chain and the blocks of the chain where they come in contact with the teeth of the rear sprocket. The flow of the lubricant is controlled by twisting the small end of the wick and will last for 500 miles.

TWENTY-NINE CARS TO MOVE.

Hereafter the address of Slaymaker, Barry & Co., whose locks are known throughout the trade, will be Connellsville, Pa., instead of Lancaster, as heretofore. Formal possession of the Connellsville factory was taken on December 7. The new plant is of steel and brick, absolutely fireproof, and has a floor space of 100,000 feet. When running full time it will employ some 800 hands. Some idea of the magnitude of its equipment may be gained from the fact that it required twenty-nine cars to remove the machinery from the Lancaster location.

Some decorative crazed wheelwomen are credited with using the wheel as a wall ornament during the winter. It is about the only way it's going to it.

It is wise to pay in advance for the pleasure of cycling.

TWO DEVICES SHOWN IN LONDON.

The Foley brake, seen at the National Show in London, is one of the American inventions which have been taken up by George Salter & Co., of West Bromwich, Birmingham. Like the Doolittle, it is fitted to the rear sprocket and is applied by back-pedaling. The principle is very simple. A split ring is fitted over a collar on the outside of the sprocket, and a cap is screwed along the spindle over this split

ring; on back-pedaling the split ring is forced open and presses against the inside of the cap, thus causing friction. It weighs less than four ounces. It possesses the advantage of the strain not being a bursting strain, and no extra pressure is consequently brought to bear on the balls of the bearings or on the back forks. It has the disadvantage, however, that it will not remain on unless the rider continues to back-pedal, so that when once the pedals are lost the brake is practically useless unless they can be gained again.

The Rimington anti-friction gear wheel excited no little attention. Loose hardened steel

rollers are let into the teeth of the wheel, the apertures for same are C-shaped and open at one side. When the rollers are put in position, a plate is screwed over the side of the chain wheel, so that the rollers, while quite free to revolve, are absolutely secure. The chain links touch on these rollers, and so a rolling motion is substituted for a sliding motion in the action of the chain on the wheel. The advantages claimed are saving of power by the reduction of friction and a reduction in the wear of the chain.

AMERICAN SUNDRIES FOR AUSTRALIA.

Greville Turner, Ltd., of Sidney, New South Wales, who first introduced American bicycles into the colonies, writes THE WHEEL: "At present we have the control of as many bicycles as we want, but, as we profess to be quite as much up-to-date as any of our competitors, in the matter of accessories, we may take on some new lines. THE WHEEL has always been very interesting to us, and exceedingly useful as well."

FOR PARENTHETICAL LIMBS.

Now knickers are coming in,
I take the leave to state
A sign like this will take the tin:
"Legs straightened while you wait."

BELLIS REDUCES PRICES.

As to prices, the Bellis Cycle Co., of Indianapolis, Ind., are radical on their '97 patterns. The Bellis wheel itself, which has heretofore listed at \$100, can in future be bought on any day of the year for an even \$75, and, at that, a wheel guaranteed by the Bellis Co. better even than the '96 model. A lady's and a gentleman's model will, of course, be marketed, and will be furnished practically in any style of finish that the Bellis admirer desires. One and one-eighth inch tube, as last year, will be used. The second string in the Bellis line is the Ferris. This wheel will bear the name of the Bellis Co., as well as its more expensive brother, and will list at the practical, even and business-like figure of \$50. It will be made in lady's and gentleman's styles, one and one-eighth inch tubing and 28-inch wheels. The Ferris is meant by the Bellis Co. for the class of people who want a solid, reliable bicycle at even money. It weighs about twenty-six pounds and its frame angles are practically the same as those of the \$75 Bellis. There is, of course, a difference in equipment and some difference in the stock used. Its bearings, for instance, are standard, and are not the improved special Bellis bearings that will be characteristic of the higher-priced wheels.

NOT AN ORDINARY GRIP.

Here's a Merry grip, Merry because of the names of its inventors, Harley and Franklin H. Merry, of No. 949 Franklin avenue, Brooklyn, N. Y. It's a bit out of the ordinary, too, as the self-explaining illustrations attest.

The grips are fitted with a football or interior valve and may be inflated to any desired degree. They retail for \$1.50 per pair and are designed, of course, to avoid "tired arms, aching shoulders, jarred arms and bicycle faces."

GETS A GOOD THING.

D. J. Kennelly, Los Angeles, Cal., has secured the Pacific Coast agency for a thoroughly good thing, the Shannon Bicycle-Locking Holders and Stands, the product of the Safety Mfg. Co., of Chicago. Despite the rapid multiplication of such contrivances, the Shannon has easily held its own. Indeed, the man who values durability, serviceability, and the appearance of his establishment cannot very well afford to let the Shannon escape his consideration.

ON THE ALERT.

European buyers are on the alert for American sundries and novelties. Few meritorious articles escape them. The Hancy cyclometer, Oliver Straus & Co.'s handsome little mile-measurer, is a case in point. No sooner did THE WHEEL, in which it was first illustrated, reach the other side than half a dozen good firms bid for it.

“White-Rimmed”

C RESCENTS

FOR '97.

No. 1, for Men, 22, 24 and 26 inch frames	} \$75.00
No. 4, for Ladies, 22 and 24 " "	
Road Racer (20 pounds), 22 " "	

Some New Crescent Features.

D tubing for both rear forks and stays.

Hollow rear sprocket.

Chain adjustment, new, simple, perfect.

Handle-bars, regularly fitted with Crescent Adjustable bars in two heights and widths; options—stationary steel and adjustable steel; brakes fitted only to stationary steel bars, all fitted with white-tipped cork handles.

Spoke nipples and valve stems surrounded by nickel-plated metal thimbles.

Crescent two-piece crank axle.

Ball retainers and felt washers.

Chains, made entirely by us, very handsome; none better.

Saddles, made for us, and are right up to date, regular equipment, Crescent padded; options—Crescent hygienic and upholstered tops.

Rims, mud and chain guards enamelled in white, handsomely finished.

Every frame connection is a one-piece sheet-steel stamping (the strongest construction possible.)

We invite your special attention to our new Crescent crank-axle bracket, made in one piece from flat sheet steel, formed into shape without a seam—the most perfect piece of construction ever placed on a bicycle.

PATENTS GRANTED.

573,444. Pneumatic tire Langley Claxton, Paterson, N. J., assignor of one-fourth to William P. Herrman, same place. Filed July 3, 1895. Serial No. 554,787. No model.

573,456. Velocipede. Edward L. Evans, Malvern, South Australia. Filed April 2, 1896. Serial No. 585,947. No model.

573,469. Bicycle or other vehicle coupling. Elisha S. Keeler, New Albany, Pa. Filed March 2, 1896. Serial No. 581,557. No model.

573,482. Portable stand for bicycles. Edward L. Peisar, Aspen, Col. Filed June 10, 1896. Serial No. 595,002. No model.

573,502. Bicycle-carrier. Henry D. Cahill, Boston, Mass., assignor of one-third to James E. McCafferty, same place. Filed December 23, 1894. Serial No. 533,365. No model.

573,542. Combined Cycle Stand and mud guard. Daniel Schwarz and Guido Luxeder, Tomesvar, Austria-Hungary. Filed March 28, 1896. Serial No. 585,298. No model.

573,555. Bicycle alarm. Claude Swearingen and David S. Lemm, Milwaukee, Wis. Filed September 2, 1896. Serial No. 604,598. No model.

573,616. Tire-tightening washer. James Pollock, Millburn, Ill. Filed September 3, 1896. Serial No. 604,755. No model.

573,620. Gearing. Francis H. Richards, Hartford, Conn. Filed April 6, 1896. Serial No. 586,345. No model.

563,634. Crank-hanger bearing for bicycles. Emile Aze, Chicago, Ill., assignor, by mesne assignments, of one-half to Frank Thomas Fowler, same place. Filed March 13, 1896. Serial No. 583,049. No model.

573,666. Whistling bicycle handle-bar. Albert H. Koehler, St. Paul, Minn. Filed August 29, 1896. Serial No. 560,851. No model.

573,668. Bicycle bell. David Kohn, Paris, France. Filed September 17, 1896. Serial No. 606,138. No model.

573,671. Rubber tire. Richard A. Leigh, Boston, Mass., assignor to Frederick W. Huestis, same place. Filed February 7, 1896. Serial No. 578,326. No model.

573,695. Joint for members of bicycle frames. William A. Penfield, Meriden, Conn. Filed August 17, 1896. Serial No. 602,963. No model.

573,779. Bicycle. John Gillespie, Boston, Mass., assignor to George H. Porter, same place. Filed April 6, 1896. Serial No. 586,338. No model.

573,780. Tire tightener. Edward Gorsuch, Roaring Spring, Pa. Filed June 16, 1896. Serial No. 595,818. No model.

573,781. Tire coupling. Edward Gorsuch, Roaring Spring, Pa. Filed June 23, 1896. Serial No. 599,912. No model.

573,811. Bicycle supporting stand, John L. Benton, New Haven, Conn., assignor of one-half to Charles R. Bishop, same place. Filed June 11, 1896. Serial No. 595,061. No model.

573,836. Automatic pump for inflating pneumatic tires.

Romolo Rainardi, Cincinnati, O. Filed April 27, 1896. Serial No. 589,206. No model.

573,838. Marine Velocipede. Stiles E. Maxon, Portland, Ore., assignor of one-half to L. W. Wynkoop, J. M. Nickum and W. J. Kelly, same place. Filed June 2, 1896. Serial No. 594,011. No model.

573,838. Pneumatic tire. Charles W. Bernson New York, N. Y. Filed December 31, 1896. Serial No. 573,883. No model.

DESIGNS.

20,445. Bicycle handle. William E. Blake, Springfield, Mass., assignor to the Blake Manufacturing Co., same place. Filed July 22, 1896. Serial No. 600,170. Term of patent, 3 1/2 years.

TRADE MARKS.

29,340. Bicycles. Sterling Cycle Works, Chicago, Ill. Filed November 19, 1893. Essential feature: The words "Built Like a Watch." Used since June, 1893.

29,341. Bicycles, tricycles, velocipedes, sundries and all articles relating to a bicycle business. Hibbard, Spencer, Bartlett & Co., Chicago, Ill. Filed November 24, 1896. Essential feature: The word "Ajax." Used since January 15, 1895.

RIGHT AND LEFT.

She wears the bloomer not because
She's of womanly taste bereft,
But simply to show that she has a right,
As distinguished from the left.

RECENT PATENTS.

573,671. ROBEUR TIRE. ROBERT A. LEVIE, Boston, Mass., assignor to Frederick W. Huestis, same place. Filed Feb. 7, 1896. Serial No. 578,326. (No model)

Claim—1. A hasting ring for wheel tires comprising a band around the tire and applied in a band on the tire, whereby adhesion occurs between the wheel-rim and the ring, substantially as specified.

573,696. AUTOMATIC PUMP FOR INFLATING PNEUMATIC TIRES. EDWARD GORSUCH, Roaring Spring, Pa. Filed April 27, 1896. Serial No. 599,912. (No model)

Claim—1. In a pump for automatically inflating pneumatic tires of vehicles, an angular tubular piston rod having at one end a slip or other suitable forcing device, the opposite end containing a light-weight threaded nut or plug, a threaded tubular screw adapted to engage the said nut and having a collar whereby it may be turned into or out of the nut, the outer extremity of the said tubular screw being adapted to engage the neck of the ferrule-tube of the tire; a

pump cylinder having suitable valves and adapted to move reciprocally on the said bellows piston rod and provided at suitable points on its surface with transverse carrying friction-rollers to engage with or without the cam-engagement of said ferrule, all constructed, arranged and operating substantially as shown and described.

573,779. BICYCLE. JOHN GILLESPIE, Boston, Mass., assignor to George H. Porter, same place. Filed April 6, 1896. Serial No. 586,338. (No model)

Claim—In a bicycle, a crank-shaft made in two parts each of which has an inclined overlapping end, combined with a frictional sleeve for holding them together, one of the parts of the shaft being hollow and the other having a solid portion against which a rod may be inserted, to drive the ends apart, substantially as shown.

573,666. WHISTLING BICYCLE HANDLE-BAR. ALBERT H. KOEHLER, St. Paul, Minn. Filed August 29, 1896. Serial No. 560,851. (No model)

Claim—In an improved article of manufacture a bicycle handle-bar formed with a whistling-orifice through the end, an inclined air-chamber communicating with said orifice, and an inlet-valve through the wall of the handle-bar for admitting air to said inclined chamber.

573,796. HANDLE. FREDERICK C. ROYVAL, Hartford, Conn. Filed Aug. 16, 1895. Serial No. 590,616. (No model)

Claim—A handle material for gripping and exercising motion and implements composed of a strip of flexible non-elastic fabric with an intimately united outer layer of mottled and compressed broken particles of cork and shelled, adapted to be wound into a spiral coil and secured to a core or bar, substantially as specified.

573,664. CRANK-HANGER BEARING FOR BICYCLES. EMILE AZE, Chicago, Ill., assignor by mesne assignments of one-half to Frank Thomas Fowler, same place. Filed Mar. 13, 1896. Serial No. 583,049. (No model)

Claim—1. In a crank-hanger bearing for bicycles, the combination of a crank-shaft, a disk on each crank-shaft having an internal V-shaped groove thereon, an adjusting nut or disk screw threaded in the hanger portion with its bearing portion arranged inside of the disk and forming one part of the inner V-shaped bearing groove, a third portion in said hanger with a portion arranged inside the disk and forming the rest of the inner V-shaped bearing groove, and a series of frictional ribs in said bearing, substantially as specified.

573,642. COMBINED CHAIN-STAND AND MUD-GUARD. DANIEL SUTCLIFFE and ORRIN LUCIUS TOWNSEND, Aurora-Indiana, Ind. Filed Jan. 28, 1896. Serial No. 582,286. (No model)

Claim—A combined portable stand and mud-guard for bicycles, consisting of a frame covered with oil-cloth or other suitable material forming a pivot, which said frame and pivot are attached to the bridge of the bicycle by means of a spring-clip, the said frame being held in position as a mud-guard by a spring catch on the bridge, and as a stand, by resting the feet and on the ground, substantially as shown and described.

573,482. PORTABLE STAND FOR BICYCLES. EDWARD L. PEISAR, Aspen, Colo. Filed June 10, 1896. Serial No. 595,002. (No model)

Claim—1. A bicycle-support comprising the shaft 2, having the integral flange 7, 8, and 9, a dovetail guide 10 and 16, and vertical pin 10, in combination with the oblong nut 17 having the dovetail ridges 18, 19, the shank-screw 13 and the stud 19 provided with lever-shoe 15, the cross 14 connected to said stud, the piston 23 connected at their upper ends to the outer ends of the arm 21, the lever 24 pivoted in bracket-screw 26 to the disk and provided with lever 25, pivoted to the lower ends of the piston 23, substantially as and for the purpose set forth.

573,764. VEHICLE-WHEEL. RENESE D. GOE, New Haven, Conn., assignor of one-third to ANNE M. GOE, Norton, Conn. Filed May 4, 1896. Serial No. 592,114. (No model)

Claim—1. In a vehicle-wheel, the combination with the rim thereof, of a series of independently formed, radially arranged, substantially circular wire prongs having their ends independently connected with the said rim, a sheet metal tread applied to the outer portion of the said prongs, and having its opposite edges connected therewith at points on opposite sides of the plane of the wheel, and

a rubber cushion applied to the outer face of the tread and adapted to substantially cover the same.

573,538. PNEUMATIC TIRE. CHARLES W. BERNSON, New York, N. Y. Filed Dec. 31, 1895. Serial No. 573,883. (No model)

Claim—The combination with the inner and outer tubes of a pneumatic tire, of an interposed leather portion-preceding and strength-reinforcing strip for the pneumatic tire, said strip interposed in width to the part exposed to puncture and being saturated with tar on its inner side, and on the other side connected to the tread portion of the pneumatic tube covered by it substantially as described.

573,444. PNEUMATIC TIRE. LAWRENCE PATRICK, N. J., assignor of one-fourth to WILLIAM P. HERRMAN, same place. Filed July 3, 1896. Serial No. 584,747. (No model)

Claim—In a pneumatic tire, the combination of a series of metal strips interposed between the interior air-chamber and the tread of the tire, the said strips being arranged in layers transversely to the tire, the strips of one layer covering the joints of the next layer, and a silicon or other such non-conducting along the edges of said metallic strips but disconnected therefrom where it forms a flexible fender or cushion between the metallic strips and the other parts of the tire, substantially as and for the purpose specified.

573,811. BICYCLE-SUPPORTING STAND. JOHN E. BERTON, New Haven, Conn., assignor of one-half to CHARLES R. BISHOP, same place. Filed June 11, 1896. Serial No. 595,061. (No model)

Claim—1. A bicycle-support stand comprising a suitable base consisting of stationary section and a swinging section, a rear upright spring from the stationary section and adapted to engage the crank-hanger and a front spring spring from the stationary section and adapted to engage the foot lever bar, substantially as set forth.

573,695. JOINT FOR MEMBERS OF BICYCLE FRAMES. WILLIAM A. PENFIELD, Meriden, Conn. Filed Aug. 17, 1896. Serial No. 602,963. (No model)

Claim—1. In a joint for the members of tubular bicycle frames, the combination with the free ends, adapted in size to have their ends telescoped together, and each constructed with a transverse slot, of a segment key adapted to fit into the said slots, and engage with the side walls of locking-shoulders formed for preventing the tubes from being longitudinally displaced in either direction; and a nut and nut-washer, New Albany, Pa. Filed Mar. 2, 1896. Serial No. 594,011. (No model)

Claim—1. In a bicycle-coupler, the combination of the female coupler-end frame comprising the upper and lower parallel cross-bars, the vertical end bars partially connected to the upper and lower parallel bars, means for attaching the end bars to the frames of two bicycles, and means for rigidly maintaining the coupler-frame in its normal upright position, substantially as and for the purpose set forth.

573,602. BICYCLE-CARRIER. HENRY D. CAHILL, Boston, Mass., assignor of one-third to JAMES E. MCCAFFERTY, same place. Filed Dec. 23, 1894. Serial No. 533,365. (No model)

Claim—In a bicycle-carrier, the combination of a cross-bar and means for adjustably securing it upon a bicycle, of flexible arms projecting from the ends of the cross-bar provided with terminal slots to receive straps, and marginal apertures thereon for the reception of straps, substantially as specified.

573,656. BICYCLE-ALARM. CLAUDE SWEARINGEN and DAVID S. LEMM, Milwaukee, Wis. Filed Sept. 2, 1896. Serial No. 604,598. (No model)

Claim—1. An alarm for bicycles, comprising a spring-rod adapted to be secured to the fork ends of a bicycle, springs on said rods to an open-bottomed cylinder vertically movable on said rods above said spring, a piston movable within said cylinder, friction-wheels journaled directly in the side walls of said cylinder, and rods and said piston, and adapted to be suspended from the top of a wheel, a wheel connected to said cylinder, a post rising from the top of said cylinder, and a cylinder depressing device adapted to be secured to said bicycle and bearing against said post, but free from connection with said cylinder or post.

ONE IN A DOZEN.

Fred Van Sicklen is characteristically tart in his make-up of the Hay & Willits' advertisement in this issue, and makes a few points that are in no wise blunted. In a side note he says:

"Unlike the average maker, they do not claim their wheels to be the 'best' made, but they do claim that their \$75 line is one of a possible dozen bicycles built in the United States and absolutely high grade in every respect. Of that dozen eleven list at \$100, the Outing being the only one at a less price."

The \$75 Outing is constructed of the best Shelby seamless steel tubing. It has 1-1/4 inch head, 1-1/8 frame triangle and 3-4 inch rear forks and stays. The wheels are fitted with Fairbanks wood rims, the spokes are Excelsior piano wire, which can be twisted and tied in a bow knot and then straightened again without any damage having been done to them. The front forks are 1 inch tapered Shelby steel tubing, and the fork crown is a forging. In '97 a new dust-proofing method is used on all the bearing parts of the wheel, which is as nearly perfect as it is possible for twentieth century human ingenuity to make it. Instead of a cup cone, such as was used on the Outing last season, a cone fitting in and being flush with the upper edge of both hubs and crank hanger is substituted. This rests on a steel ball retainer washer, which is pressed in upon a shoulder in the bearing cup. Between the steel washer and the cone is an oiled felt washer. This triple combination serves to keep the dirt and dust from the bearing in a most effectual manner.

The head adjustment, which has been but recently patented, is one of the simplest on the market. The adjusting head cone does not have the usual thread and lock nut to make the adjustment. It fits snugly on a perfectly turned fork stem and the handle bar is placed on top of this. The fork stem does not reach through the handle bar by about 1-1/6 of an inch, there being a cap screw on the inside of the fork stem, which projects over the handle bar centre piece. When this cap is screwed down it forces the handle bar against the adjusting cone and makes a perfect adjustment of the head. After which, the bar is clamped in the usual manner.

VIATOR—"I SEE."

A limited number of pedals styled the Viator were placed on the market last year by the Moore Cycle Fitting Co., Harrison, N. J. They gave such universal satisfaction that the manufacturers are now contemplating working at night to meet the increasing demand. The body of the pedal is formed of two pieces, with a short axle, reducing leverage, and cones and cups turned from bar hardened and tempered steel. There are no rivets or screws to become loose, and, in short, nothing to get out of order.

HUNDRED DOLLAR TANDEM.

\$75, \$60 and \$50 will be the prices of the Wynnwood cycles. Scheffey & Co. will also continue to market the \$100 Wynnwood tandem, and to control the sale of the Miller lamp in this country.

BEN HURS' HOMES.

Ben Hurs will be handled in Boston by the B. B. Emery Co., and in Philadelphia through the Wessels & Walls Cycle Co.

THREE OUNCES FOR A WHEEL.

A. G. Spalding & Bros. have closed a deal with the Whyte Enamel Co., of Yonkers, N. Y., whereby they become the sole wholesale agents for the United States of the Whyte Cycle Enamel, which, it is stated, differs materially from all other enamels. They are put up in 3-ounce cans, for the retail trade especially, and for the rider. One can is sufficient to enamel a bicycle.

The Whyte Co. also manufacture a special hour-drying enamel for the use of repair men, which is sold in gallon cans or larger packages if desired, and which is offered as a competitor of baking enamels.

A. G. Spalding & Bros. are placing agents throughout the country for this enamel. Communications should be sent to the New York house, 126, 128, 130 Nassau street.

NAME TELLS THE STORY.

"Carrycycle" is the new term employed by the Kalamazoo (Mich.) Cycle Company to describe what have become popularly known as carrier cycles. In addition to those intended for parcel carrying, the firm will also make a man-propelled chair for invalids.

CONCERNING SPEED.

Morgan & Wright tires now hold

All world's records, $\frac{1}{2}$ to 10 miles, inclusive.

All unpaced world's records, $\frac{1}{2}$ to 50 miles, inclusive.

All American records, $\frac{1}{2}$ to 100 miles, inclusive.

All American hour records, one to twenty-four, inclusive.

All world's records (6) made on the National circuit; and 521 prizes — all other tires combined won only 174 more.

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

GOOD PEOPLE TO WRITE TO.

Admirers of the Niagara cycles, manufactured by the Buffalo Wheel Co., Buffalo, N. Y., will find much to interest them in the advance catalogue of the company now being distributed. The line includes a 23-pound roadster, 24-pound wheel for women, a trim-looking racer scaling at 19 pounds, and two styles of tandems. This concern recently built a large addition to their factory and equipped their plant with new automatic machines, making it possible to turn out \$100 machines of the highest point of perfection. Correspondence from reliable houses in towns where not represented is desired.

While their roadster and ladies' wheel will list at \$100, Arnold, Schwinn & Co. have set \$110 as the price of their World light roadster.

What a number of people seem to want is racing board reform which will not interfere with anybody's convenience.

R. H. Wolff & Co. will this season offer a choice from eight different heights of frame, from 20 to 27 inches.

NOVEL FRAME EXPANDER.

One of the most prominent English firms is experimenting with a novel device for expanding frames. The idea underlying the affair is to build bicycle frames in one size only, so that the same lugs and fitting will serve, instead of having, as at present, a fresh set of parts for each size. As shown, the patent—it is duly protected—was fitted to a lady's Swift, but can also be used on the full diamond designs. It consists, says Wheeling, briefly, of a method of telescoping the rear braces and saddle strut in such a manner as permits an expansion or contraction in the height of this portion of the frame to any required degree without affecting the rigidity of the machine. The saddle is fixed to the apex of the triangle formed by these tubes in such way that the weight of the rider is borne directly by all, the braces hinging on the saddle clip and also at their lower end on the back fork lug. This permits the angles to self-adjust themselves to the varying height. The method of securing the tubes at the telescoping point is a very ingeniously contrived stuffing-box idea in which locking discs working around the female tube jam rubber rings in such a way that all movement of the latter is impossible. We manipulated the device and found it extremely simple and easily worked. In the diamond framed machine the top rail will be fixed in the usual way, the stuffing-box locking being used for the remainder as in the ladies' machine.

"FIRST COME, FIRST SERVED."

A Sunol tandem, listing at \$100, will be a feature of the Sunol line, made by the McIntosh-Huntington Co., Cleveland, O. It will be made in both double diamond and combination patterns, and as the output will be limited it will be a case of "first come, first served."

The Sunol single will as usual list at \$100, and be thoroughly abreast of the times. Four heights of frame will be furnished for men and three for ladies. The medium priced machines, the American King and Queen of Scorchers, the Stella and the Hercules, will be retained, of course, each at \$60. Of these wheels the makers say:

"Many new and novel features have been introduced, which, together with their excellent quality and fine finish, would entitle them to a higher rank than the list price would indicate."

REGULAR THROW DOWN.

A thief is likely to have no end of trouble with a bicycle that cannot be steered by the front wheel, and realizing this fact J. P. Hummel, of Milwaukee, Wis., has marketed a patented lock working automatically at the steering head over the fork crown. By the pressure of a bolt the front wheel can be securely locked at any angle or straight. A key is used to turn the bolt back in place. The simplicity of construction and operation, as well as the neatness and durability of the device, readily adjustable to all wheels, makes it a novelty of considerable value.

NONE SO CHEAP AS THAT.

Through an error, the Shelby Bicycle Mfg. Co. announced in their advertisement that the 20-inch Ideal cycle lists at \$30, instead of \$35. The company desire it announced that none of the Ideal models list at \$30.

Stoned by Women.

An Eclipse Bicycle Rider Had a Remarkable Experience.

KURDS CALL IT THE CHOLERA

A Missionary Makes a Trip on a Wheel in Parts of Persia Where no Traveler Had Before Penetrated, and Had Many Close Calls.

The following letter has been received by the Eclipse Bicycle Company from a missionary stationed in Persia, and needs no explanation:

ROOMIAH, Persia.

Eclipse Bicycle Co., Elmira, N. Y.

Gentlemen:—The Eclipse bicycle I bought of you I have used during the fall of '94 and all of the summer of '95 in missionary tours in Persia. From June 12 to October 1, I traveled 1,316½ miles, taking the bicycle into the heart of Kurdistan. The Eclipse '94 roadster is the only wheel that ever went into these districts, and I doubt if another wheel could go there.

Lenz, Stevens, Allen, and his companions, in their remarkable trips, only skipped across the northern end of Kurdistan, and always kept on the beaten caravan roads. I, with the Eclipse, penetrated into the interior, where there are no roads, sometimes on the top of a vast mountain and again down in a stony rocky valley, where a human being could hardly go. Carrying ten pounds of baggage with me I have climbed mountain passes 10,000 feet high—some of which, even with the Eclipse, I have had to walk, but always having the advantage of the other side.

When you remember that there is not a built road anywhere in this part of the country, and that a carriage or wagon has never been through there, and that no man would ever think of picking a stone or boulder out of the road, you may be able somewhat to imagine what it meant to ride a wheel there and what the wheel had to stand that could go through.

And not only did I meet with opposition from the roads, but the people did their share; a half-dozen donkey boys attempted to play baseball with me as I passed by. There were lots of "striks," but only one "hit," and that was a "fo l," as the club missed my back, struck the end of the saddle as I dodged forward and came down on the wheel with all the force the boy (youngster) could muster.

I was stoned out of another village by the Kurdish women; surrounded by a mob of 1,500 men and driven out of their city, and innumerable other experiences, crowned, I think, by having a Kurd take down his rifle, load it, and take an aim on me as I came coasting down towards him down a mountain side.

Such names as "The iron horse," "The horse of wind," "The horse of the false prophet," "The plague," "The cholera," "The English bear," "The spook that knocks down women," etc., etc., were common titles. (Signed) Rev. E. T. ALLEN.

STEPHEN T. MOEN, 33 Barclay St.

Metropolitan Agent.

Kindly mention The Wheel.

FREE DISTRIBUTION OF BELLS.

Beginning with the year 1897 the New Departure Bell Co. will make a practice of giving away bells, one nickel-plated bell each day and a gold-plated one at the end of each month. It is the result of an idea of Advertising Manager Southwick, and will serve a double purpose. Discrimination will, of course, be used in the distribution. To secure a bell it will be necessary to cut out and mail to the company at Bristol, Conn., such advertisements and reading notices (such as this) as refer to them. Each day a bell will be sent to whoever forwards the greatest number of such clippings, and to whoever has the greatest number to his credit at the end of each month a golden bell will be awarded. Duplicate clippings will be accepted, but only in reasonable quantities.

WANTS A CHANGE.

The present system of indicating the gear by giving the diameter of the wheel to which the driving wheel is made equivalent is not satisfactory, as it takes no account of the length of the cranks.

Shortening the cranks has to a considerable extent the same effect on the rider as raising the gear, and lengthening the cranks is much the same as lowering the gear.

It would be preferable to give the ratio between the circumference of the circle described by the pedals and the distance the machine is propelled, as this would indicate the net result of the three factors—length of cranks, diameter of driving wheel, and relative sizes of the two chain wheels.

JABEZ BEESWINGER.

THE SINGLE TUBE ABROAD.

Although of English origin, the single tube tire made little or no progress abroad until last year, when the "American invasion" began in earnest, as THE WHEEL remarked a few weeks since. Of course, the Britons poo-poo the tire, and while its sale may be limited on the "tight little isle," it has certainly secured a hold on the continent. For instance, Michelin, the French tire man, has placed a considerable order for American single tubes, and Ostheimer Brothers, of Paris, who formerly sold a few, secured a license from the Hartford Rubber Works and brought over Hartford experts to direct their manufacture. The result was so satisfactory that they established a single tube plant in Belgium and are now contemplating a factory in Germany.

CHICAGO SHOW "SPECIAL."

It is designed to make one of the special features at the Chicago show an exhibit of growth and improvement from year to year in the different parts of the standard bicycle. Any manufacturer who can supply parts that will interest the public and assist in this special exhibit should communicate immediately with Manager A. E. Pattison, Room 43, Auditorium building.

POSTERS WANTED.

Makers of posters should correspond with the Sterling Manufacturing Company, No. 1 Dyer's Building, Holborn, London, E. C., England. The firm wishes to invest in posters, without the name of the machine or the manufacturer shown, i. e., with blank space for the Sterling people to insert such names as they desire.

SECURES THE SNOW HOLDER.

Foreign demands for the Snow Wire Works' adjustable cycle rack or holder, has led to the placing of an exclusive agency with S. Hoffnung & Co., No. 102 Fore street, London. E. K. Tryon & Co., Philadelphia, have secured control of the Snow racks and toe clips in all of Eastern Pennsylvania.

GOING TO MERGE.

After January 1st the "Paris Velo," the first daily cycling paper ever issued, will appear as the sporting edition of the great French daily paper, "Le Figaro."

Some New Ideal Models.

Shelby Cycle Mfg. Shelby, O.

A WONDERFUL TIRE-MAKER THIS.

From England come some wonderful stories of the capabilities of a new tire-making machine bearing the name of Brianard. It is said that with four, or, at the most, five workmen, it will do the work of 150 people. Three hundred single-tube tires an hour can be turned out by this new machine, complete in everything but the splicing, and each tire absolutely free from any variation or deviation from standard.

MAKES LIFE SMOOTH RUNNING.

To Americans who for now these thirty years have eased life's bearings with graphite, and literally made our mark with its penciled blackness, thanks to the Joseph Dixon Company, the following from the Irish Cyclist seems strange, as from it the inference is plain that the name of Dixon and the product thereof is not as well known among foreign wheelmen as the virtues of maker and product deserve. Says the Irish Cyclist:

"It is some months ago now since we first got a stick of graphite, as manufactured by the Joseph Dixon Crucible Company, of Jersey City, N. J., U. S. A., and since then we have quite discarded oil. Even with a gear case it is quite as good as oil for lubricating purposes, while for a naked chain there is no comparison. Even when smothered with liquid mud it runs comparatively smoothly, and with an entire absence of that mischievous grind which under other circumstances is never absent.

"Experiments by Professor R. H. Thurston have proved that a bearing lubricated with the Dixon prepared graphite will run for 290 minutes without squealing at a speed of 2,000 revolutions per minute, and with a pressure of 60 pounds per square inch, whereas sperm or other best lubricating grease will only run 51 minutes.

Barney Oldfield, the well-known Toledo racing man, has signed with the Miami Cycle Company, not to race, but to represent the Raceycle in the capacity of "commercial tourist."

Morrison's Bicycle Ice Creepers, for Winter use. Sample, 20 cents. Facts free. W. T. S. Morrison, M'r, Cornish, Maine.

DIXON'S GRAPHITOLEO

lubricates not only the chain and sprockets, but also the pins in the links of the chain, which stick graphite can't do and is not intended to do. For gun locks for copying presses and for office chairs it is unequaled. If your dealer does not keep it, mention THE WHEEL and send 12 cents for sample.

JOS. DIXON CRUCIBLE CO., Jersey City, N. J.

FOOT PUMP OF POCKET SIZE.

While the pump is a novelty, the mere fact that such a firm as John H. Graham & Co., of this city, have added it to their stock will commend it—the Sykl Foot Pump it is termed. Although operated by the foot it can be closed into a compass of such size as will permit its

being carried in the tool bag or pocket. Small though it is, it is asserted that it will inflate a tire in half the time necessary with a hand-pump and without the heating or blisters so frequently generated by the latter.

Imitation may be the sincerest flattery; but the modest man who controls the original, genuine, world-renowned patent on wheel or sundry has no use for that sort of adulation.

A fit of cycle abstraction—wheel thievery.

GEAR CASE MAKERS, PLEASE NOTE.

The pros and cons of gear cases for American machines is an old and oft-told story in the columns of the wheel papers. It has been alleged that American manufacturers were slow in recognizing the growing demand for gear cases. This may or may not be a fact, but what can be said when a firm stands ready to buy gear cases and equip their wheels with them, and yet is unable to purchase them?

This is the predicament the Eastern Bicycle Manufacturing Company, Amesbury, Mass., find themselves in. Therefore, if anyone wants to hasten the coming of the gear case era in American cycling, all they have to do is to drop a line to the Eastern Company telling them where the gear cases can be purchased. The American wheel with a covered chain will soon follow.

Col. D. L. Cockley has resigned the general management of the Shelby Steel Tube Co. His resignation was tendered at a meeting of the directors on Dec. 22d.

Agents, Attention!

1897 Kimball Bicycles NOW READY.

We Want a **BRANCH HOUSE** or
AGENCY in Every City.

THE PHILLIPS MFG. CO.,

307-309 WEST BROADWAY, NEW YORK CITY.

Kindly mention The Wheel.

SAT UPON.

Mary had a little wheel,
She used it as a breather;
And everywhere that Mary went
The wheel was underneath her.

WE ARE USED TO THEM NOW.

She dressed up in her brother's clothes;
A road ride she took;
And every one who knew her said:
"How girlish you do look!"

SHE WAS A WABBLER.

"Where are you going, my pretty maid?"
I asked, "and wasorry I had
For she was riding a wheel, you know,
And the question made her mad.

E. S. Edwards lowered the record from New York to Philadelphia, on October 18th, 59 minutes, with the **FORCPEDE** attached to his wheel. We offer a prize to any rider who breaks a long-distance record on any machine with a **FORCPEDE** attached. It has been done, and can be done every time, all conditions being equal. Call or address **FORCPEDE COMPANY**, 445 Broome Street, New York City. c-1f

**A LITTLE HIGHER IN PRICE, BUT—
ABSOLUTELY
THE BEST OILER IN THE WORLD.**

PRICE, 25c. EACH.

Regulates supply of oil to a drop. Does not leak. Has won every test in competition with other oils. We make cheaper oilers. Also Oiler Holders and Pump Holders.

CUSHMAN & DENISON, 172 Ninth Avenue, NEW YORK.

EMPLOYMENT COLUMN.

Advertisements in this Column Free.

Patrons of this column will please notify us when they desire notice withdrawn.

SITUATIONS WANTED.

A thoroughly experienced bicycle salesman is open for a position until April 1st; 3211-edge reference. Address J. E. B. K., care of The Wheel.

A young man with several years' experience in charge of good draughtsmen help and designing in bicycle factory, wishes an opportunity where his talent will be appreciated and a future secured. M. H., care of The Wheel.

Wanted—A position as salesman, either in New York or on the road; knows the cycle business thoroughly; four years' road experience. Address N. L., care of The Wheel.

Position wanted by a young man; thoroughly understands the bicycle and photograph trade; capable of taking charge of a repair shop or branch store; several years' experience. Address C. N. H., care of The Wheel.

Toolmaker—A first-class toolmaker is open for engagement as foreman in any department with a first-class bicycle factory, or as superintendent of small concern. Address Reliable, P. O. Box 111, Springfield, Mass.

Situation wanted by a man, 26; has six years' experience in bicycle building; will accept position either as superintendent, foreman, or any other position in factory. Address G., care of The Wheel.

Young man, thoroughly experienced through connection with several manufacturers, would make the circuit of cycle shows in the interest of manufacturer or jobber; wheels or sundries. Address H., 232 E 71st St., N. Y.

Wanted—Position by experienced young man; has had eight years' experience in the bicycle business, related to traveling, wholesale and retail business; is looking for permanent position as traveling salesman; territory no object; can furnish the best of references. Address R. A. Creek, Liberty, Ind., care of Liberty Mfg. Co.

Wanted—Responsible office position of any description with reliable manufacturer, by young man; five years' experience in bicycle business; can furnish highest references. Address Box 39, care The Wheel.

Position wanted as assembler and wheel builder; no objection to leaving city. C. E. Haynes, 122 E. 28th St., New York City.

Experienced cycle mechanic, thorough in all branches, desires position with good firm; has occupied position as factory superintendent, also foreman; excellent references; fifteen years' experience. Address F. J. M., care of The Wheel.

Situation wanted by expert electro-plater; fifteen years' experience; had six years' charge of high-grade bicycle polishing and plating; have an absolutely rust-proof nickel, 1-5 solution, 1-5 cost of old process. The Wheel, No. 26.

A NEW BICYCLE

is on the market.
It is called
the "Duquesne Special,"
and embodies many
new ideas which
will instantly appeal
to buyers of discrimination.
You want to read about it.

Corner Chambers Street and West Broadway, handsome store, suitable for wholesale or retail bicycle store.

Address

TYSEN & TOTTEN,

24 Dey Street, New York.

STAR BICYCLE ENAMEL.

It will take you but a few minutes to re-enamel your bicycle, giving it the appearance of a new wheel, from which the enamel will neither chip nor crack, by using the ready-mixed "Star Bicycle Enamel." Retail price, 25c. per can. Anyone can apply it. 28 different colors. Send for color card.

GERSTENDORFER BROS.,
17 Barclay St., New York. 67 Lake St., Chicago.

An exceptional opportunity is offered a first-class house to connect with a first-class man, acquainted with all departments from manufacture up; has had special experience superintendent and advertising manager; is fully posted on details and on generalities; would like to locate in New York City or some large New England city. Address, with full particulars, R. Y. A., P. O. Box 444, N. Y. City.

Wanted—To open Chicago store for large factory; by the best known and one of the oldest managers in Chicago; large established trade. Address C. R., care The Wheel.

Young man, now in bicycle business for himself, desires a position as manager or salesman for first-class bicycle house. Address M., care of The Wheel.

Enameler—A practical enameler (in all colors), stripper and decorator, desires a position as foreman, or otherwise, in cycle factory; first-class reference. Address W. C. L., care of The Wheel.

Wanted—Position as foreman of general machine room in bicycle plant; six years' experience. Address C. Ashley, No. 1345 Oakwood Avenue, Toledo, Ohio.

Wanted, by a boy of 17, position under good repairman; position in Iowa preferred; has had some experience in repairing. Address Box 128, Geneva, Ia.

Position wanted by mechanic; 14 years' experience; no objection as to distance. Address S. G. Shove, Harrisburg, Pa.

Wanted—A position as manager or buyer with a reputable concern in the sporting goods or bicycle business; have had 17 years' experience and can give best of reference as to honesty, good character and ability. Address Box 79, care The Wheel.

Position wanted as foreman in assembling room, tool-grinding room, or repair department; best of reference. Address C, care The Wheel.

HELP WANTED.

Salesman wanted for January, February and March. The Phillips Mfg. Co., 307-309 West Broadway, New York City.

Wanted—A man who can take charge of rent bicycles; as the work is light, would take a man who is seeking a good climate for lung trouble. Address El Paso Cycle Co., P. O. Box 406, El Paso, Tex.

Wanted—Experienced salesman with good trade connections to represent, on commission basis, Eastern manufacturers of bicycles and bicycle fittings; state with what territory familiar; references required. Address T. C., care The Wheel.

Wanted—A first-class, experienced, successful and reliable bicycle traveling salesman; one who knows the trade in the Middle or Eastern States. Apply quick to The Thomas Mfg. Co., Springfield, Ohio.

Wanted—An experienced salesman to sell patented bicycle specialty on commission. Address The Wheel, No. 59.

Wanted—A first-class cycle repairman to do general work; good wages and steady employment to the right man. Address H. M. Wieder, Lake Linden, Mich.

Wanted—A foreman for machine room, employing about 20 men; must be competent, a hustler, and good disciplinarian; must be able to take full charge of this branch. Apply with references to Universal, care of The Wheel.

VOL. XVIII., No. 21.

NEW YORK AND CHICAGO, JANUARY 8, 1897.

WHOLE No. 4 3.

CAN THERE BE SMOKE

**And Yet no Fire? That Foreign Tire Yarn
Breaks Out Afresh with New
Brands.**

Although he will not talk for publication, Charles R. Flint, Treasurer of the United States Rubber Company, practically admits that he is endeavoring to float a large company with both American and English capital, which will operate the Tillinghast single-tube tire patents abroad.

As is well-known, the first attempt at anything of the sort occurred quite recently, when Frank Morgan, of Morgan & Wright, journeyed to London to consider a "business proposition." The leaders of the plan are men represented by the New York banking firm of H. B. Hollins & Co., and the law firm of Davies, Stone & Auerbach. Mr. Edey, of Hollins & Co., and Mr. Auerbach were in London with Mr. Morgan.

About the same time that the Morgan & Wright people were feeling the English financial pulse a syndicate was organized in which Charles R. Flint, of New York and Denistoun, Cross & Co., bankers, of London, were the leading members. They took in hand the Tillinghast patent for single-tube tires. Mr. Eddy, of Flint, Eddy & Co., and William M. Ivins, a New York lawyer, were sent as their agents to London.

Thus two American syndicates entered London about the same time. The men of money in England, however, were shy of American securities last summer, owing to the Presidential canvass.

It then came about that the bankers and lawyers from America got together and endeavored to pool issues, but nothing could be accomplished, and Mr. Morgan returned, apparently disgusted and embittered with the coquettish English capitalists.

Mr. Flint, however, quietly continued at work to get all the various interests into line for a new syndicate.

Mr. Auerbach and Mr. Hollins joined him, and the Morgan & Wright Company was taken as the basis of a new syndicate that is now in process of formation. The banking firm of Denistoun, Cross & Co. became the London partner in this new combination. Lawyer Ivins is said to have been left in London to represent the American interests.

Without knowledge of the publication of the story on this side of the ocean, THE WHEEL'S London correspondent, under

date of Dec. 26, implied broadly that some such movement was under way in England. He wrote:

"I believe that a syndicate from your side of the water is about to open proceedings in England on a large scale, with a view to force the single-tube tire, specially constructed for English road surfaces, on our market. There is a tough time ahead of these invaders, but I have no doubt that, given enough money—and I am assured that on this point everything is all right—they will ultimately succeed, as the single-tube tire of to-day is very different to the single-tube tire which was a failure here in '90 and '91."

Colonel Theodore A. Dodge, president of the Rubber Tire Association, and who controls the Tillinghast patents, was in New York on Wednesday. He was quartered at the Waldorf, and when interviewed by a WHEEL man just as the paper was going to press, denied the truth of the published reports of the matter.

"You may say positively that absolutely no effort has been made to float a single-tube tire company in England," he said, with great deliberation. "All that has been accomplished has been done in this country, and that consists of having sought to harmonize the single-tube tire interests that the competition may be open and honorable, and free from 'throat cutting.' Mr. Flint is working in perfect harmony with that movement."

STRONG ON THIRTEEN.

President R. L. Coleman, of the National Board of Trade, has just issued a call for the annual meeting of the stockholders, to be held at the offices of the corporation, No. 271 Broadway, New York, on January 20, 1897, at 10:30 a. m. In accordance with the usual custom, it is expected that this meeting will be adjourned to the week of the National Cycle Exhibition that is to be held at the Grand Central Palace, this city, February 6 to 13, 1897, and it is most likely that the adjourned meeting will be held in the concert hall of the Grand Central Palace on February 10th. At this meeting, the election of thirteen directors for the ensuing year and the officers will occur. New members elected and other business of importance to the association will be transacted.

COURT ORDERS ANOTHER SALE.

Messrs. Bass & McDonald, of Fort Wayne, who bid in the plant of the Plymouth (Ind.) Cycle Mfg. Co. for \$15,000 at the receiver's sale last month, will have to try again. The proceeding was set aside by the court and a new sale ordered for January 20th. It will occur at Plymouth during the afternoon of that day. The property includes machinery, office fixtures, completed and uncompleted stock and the patents under which the defunct concern manufactured the Smalley bicycle.

CHICAGO, OF COURSE.

**When it Comes to Anything "Big" She Always
Leads, Mileage is no Exception
to this.**

"Mileage fiends" are anxiously awaiting the report of the Records Committee of the Century Road Club on the mileage records for 1896. Since the end of the old year that committee has been deluged with statements of mileage and century runs from riders in all parts of the country, but the honor of covering the greatest number of miles will undoubtedly go to E. N. Roth, of Chicago. During the 340 days from January 25th to December 1, 1896, according to his sworn statement, he rode 34,380 miles, figures which will probably make other records filed look insignificant.

His average mileage per day was 101 miles and a fraction, and in that time he rode 146 centuries, thirty-two double, and one triple century. His greatest mileage for one month was in October, when he rode over 4,000 miles. His claims, just filed with the Century Road Club, called for the annual century record, the mileage record of America and of Illinois, the Illinois State century record, the 200-mile record, made in 14 hours and 35 minutes; the 300-mile record, made in 22 hours, and the twenty-four-hour record of 300 miles.

Roth has made his business riding, and riding alone, and has followed the good weather throughout the country. He has gained ten pounds in weight, has not had a day of sickness, and has used one wheel the entire trip without an accident other than a broken rim. He used an eighty gear for the entire year, his wheel weighing twenty-five pounds.

During the year the Century Wheelmen of Philadelphia have been working for the club record for century runs. The total number ridden by members of the club during the year was 1,205, which is so far ahead of any previous record that there is little doubt but that the record claimed will be accepted. Of the individual century rides by members of this organization, "Archie" Gracie heads the list with 156, which is ten ahead of Roth's individual century record filed with the Century Road Club. John George of the same club has ridden 147 centuries and has put in a claim for records for the greatest number of centuries made in 30 and 60 days, the number ridden being respectively 39 and 70. The club holds the record for the greatest number of centuries ridden in one day, the record of 197 made in the Newark-Philadelphia run last June having been accepted. John Nobre stands third in Century Wheelmen's list with 50 centuries. He has filed a claim for the New York-Philadelphia record.

WONDERFUL WOMAN.

"Queen of the Road," Coloradians Crown Her, and with Reason—Opposed to Elliott.

Denver, Jan. 1, 1897.—Denverites believe that Mrs. A. E. Rinehart, the wife of a local photographer, has proven her claim to the title of "Queen of the road." During 1896 Mrs. Rinehart rode 116 centuries and a total of 17,152 miles, not only surpassing the record of any other woman, but earning a string of "century bars" which is equaled by but one other person in the United States.

For her the year of 1896 has been one of wonderful performances. During the fall of 1895 she first began cycling. Shortly afterwards there was a long century run out from Denver, and she essayed it successfully. Later in the year she repeated the feat. The next century ride she made was on January 10 of 1896. In April she made two more, and in May tried making two on consecutive days. In July she successfully performed the feat of making ten centuries in ten consecutive days, and on the 22d of the same month rode 200 miles within twenty-four hours. August 7 she rode another double century, and on September 27 rode a double in 16 hours and 18 minutes, which is believed to be the best work ever done by a woman on the road. The record was a State one, no man having ever beaten her time. But Mrs. Rinehart was not trying for a fast record. She rides centuries for the love of the exercise and sport. Her most marvelous ride was commenced on October 31. She rode a century on that day and on nineteen following days, making twenty centuries on twenty consecutive days. She rested one day and rode four centuries in four consecutive days. Stormy weather then intervened. But during the cold month of December she made sixteen centuries, ceasing her riding for the year on December 27. At that time she had ridden during the year 116 centuries, and made a total mileage of 17,152 miles. One of the hardest rides in Colorado is to Colorado Springs and return, a trip of 150 miles. This Mrs. Rinehart has made in a day. She rests on her record, the next best century record in the State being 92 runs. A singular part of the whole performance is that she has steadily maintained about the same weight. When she commenced her work she weighed about 140 pounds, and now weighs but 142.

Her record of centuries for the year follows, showing on what days she rode. It will be noticed that the fall months, which in other States are prolific of bad days, were the ones in which she did the most riding. The record is: January 10, April 21, 26; May 3, 10, 12, 23, 24, 28; June 3, 7, 12, 14, 17, 21, 24, 26, 28; July 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 15, 19, 22, 22, 26, 28, 29, 31, August 2, 5, 7, 7, 9, 12, 14, 16, 19, 21, 23, 25, 27; September 2, 13, 15, 20, 22, 27, 27, 29; October, 1, 4, 5, 8, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 24, 25, 26, 31; November 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 21, 22, 23, 24; December 1, 2, 3, 4, 10, 12, 14, 15, 17, 18, 19, 20, 22, 23, 24, 27.

George M. Scott, of the Denver Wheel Club, will represent the Colorado Division, L. A. W., at Albany in February. Mr. Scott will represent the sentiments of the Colorado members of the Division, which is decidedly against Sterling Elliott's re-election. In fact,

in making his annual report Charles Wilmott Dawson, Chief Consul for this State, was emphatic in his denunciation of Elliott. The latter was scored for his utterances against the silver sentiment of this part of Uncle Sam's region—not because he disagreed with the Western sentiment, but because he did not give what the West considered a "fair shake." All the schemes which Mr. Elliott proposed and pushed to assist the L. A. W. proved decided failures in the West. Mr. Scott is not pledged to any other candidate. He will also try to get a date on the national circuit for Denver, and to secure good riders for events in this city during the summer. Mr. Scott is one of the leading spirits in the association which controls the famous Denver third-mile track. The only cycling racing events which "took" during the last racing season were the big ones in which O. B. Hachenberger met and vanquished an opponent. For 1897 other big races will be pulled off.

The proposed six-day indoor race, eight hours a day, is likely to be declared off. The committee from the Arapahoe Wheel Club, which had the matter under discussion, was compelled to give up the idea of getting a hall. There is an old power-house, but it would cost \$5,000 to fit it up. Then there is Coliseum Hall, but the turns are too short and too numerous—a rider going fast would get dizzy. A proposition to build a track inside a circus tent is now being considered, but is not likely to result favorably.

The Denver Cycle Show will be held February 20 to 27. G. A. Wahlgren will have the management, under the direction of the Bicycle Board of Trade.

"Dad" Gleezen was in Denver this week, looking after a man or two to put on the Keating racing team. The Keating has not taken part in racing heretofore, but will have a team to go after records in March and to take in the national circuit afterwards.

Henry Hilton, Jr., of the Sterling agency in this city, is a Major in the State National Guard, and spent most of the early part of the winter in Camp McIntyre at Leadville. He is now at business again, booking orders for the green wheel.

O. E. Boles, the old-time State champion, and now the Waverley agent, is in Indianapolis, attending the annual meeting of agents at the factory.

STAR AND HIS "BACKER."

New Haven and Springfield papers are exposing one Jesse W. Starr, who essayed the role of promoter, and painting a glorious picture of the cycle industry, actually obtained possession of a factory in Westville, Conn., after which trouble with his Boston "backer" developed. Mr. Starr found it necessary to visit the "backer;" he departed but never returned. Before he left he executed some papers and deposited as a guarantee of good faith six \$1,000 bonds of the Edwardville, Ill., Water Co., which now repose in a Westville frame as a souvenir of the cycle factory that was to be.

HACKED BY HACH.

A. L. Hachenberger broke the 200-mile Colorado road record, on December 21st, covering the distance in 14 hours, 1 minute. The best previous was 16 hours, 16 minutes. He rode over the Brighton course.

DOWN IN DALLAS.

They Move to Incorporate and Receive Tenders to Test a Bicycle Baggage Case.

Dallas, Dec. 31.—The annual December meeting of the board of officers of the Texas Division of the L. A. W. was held to-day in the club rooms at the Oriental Hotel.

Chief Consul E. W. Hope, of Sherman, presided until he had installed his successor, R. K. Earnest, who conducted things in a business-like manner.

Changes and amendments were made in the constitution and by-laws of the Division, and local consuls, league hotels, etc., were appointed. A motion was made and carried deciding to incorporate the Texas Division as a society, the Texas League of American Wheelmen. The articles of incorporation are to be drawn up by the Chief Consul and filed with the Secretary of State in accordance with the law of the commonwealth.

It was also decided to offer cash and merchandise prizes to members sending in the greatest number of applications for membership in this Division.

Ex-Chief Consul E. W. Hope was elected a delegate to the National Assembly.

Mr. Earnest will attend the Assembly, carrying the proxies of the other three delegates.

The question arose as to whether or not it was legal for the railroad to charge extra for the carriage of bicycles, and the discussion led to the acceptance of the offer of a firm of prominent Texas lawyers, who agree to make a test case and win it for a stipulated sum, thereby compelling all roads in the State to carry wheels as baggage; in the event of their lawyers' failure the Division will assume nothing but the court costs.

The meeting adjourned, to meet again in Waco, July 4.

WINNER ALL AROUND.

Toledo, Jan. 3.—J. L. Yost is back from Europe richer by several pounds of avoirdupois, several charming French phrases, and a mind contented with his company's prospects abroad.

Mr. Yost renewed contracts with already established agents, and did missionary work for his territorial agents in fitting from one place to another creating business for his clients on the Falcon in important corners.

The Yost Co., by the way, have always been extremely conservative in talking of their European trade, for reasons which are easily guessed at, but it is nevertheless a fact that they have had a good trade there for several years. They were among the missionaries in the field, having done their European plowing over three years ago.

Robert M. Maples, 57 Holborn Viaduct, London, E. C., England, has the Falcon agency for the United Kingdom; also that for Norway, Sweden, Switzerland, Russia, Germany, Denmark, Italy and Belgium. He will cover the territory with an efficient staff of travelers. Mr. Maples' son (S. A.), who has partial executive control of his father's business, is now at the Yost factory in Toledo, acquiring a familiarity with the technical side of cycle making.

To the record-breaker a word on a check is worth two on the slate.

AS TO OUR WAGES.

WHENEVER the foreigner is driven into a corner, and forced to advance a valid reason why American-made bicycles can not be exported to his country; and sold at the same price asked for domestic machines of an equal grade, he invariably makes use of the argument that it is not possible, owing to the lowness of foreign wages as compared to those paid to American workmen. For years England has bolstered up the drooping hopes of the British cycle maker with this seemingly irrefutable argument, and yet never was theory less in accordance with fact.

Let anyone glance for himself over the weekly manifest of exports from New York. He will find from this record that bicycles, and goods and wares of every kind, pass out of the harbor to every quarter of the globe. If he will look further he will observe that not alone is it true in regard to the bicycle, but in every type of exports the wages or earnings recovered from the sale are higher in rate and more especially in purchasing power than in any of the countries to which these goods are sent. If the rate of wages were the prime factor governing the cost of production, and if upon that rate rested our power of competition, not one dollar's worth of this vast quantity of goods representing our excess of products could be sent out in exchange for

the comforts and luxuries of which our imports mainly consist.

A well-known recognized authority in mechanical matters lays down the proposition that high wages and the use in connection therewith of labor-saving machinery are the real secret of cheapness of production. The true policy of the employer of labor in his opinion is to encourage workmen of the best class by liberality in the wage scale to the most efficient use of the most perfect machinery, so that there is large increase in output, meaning increased wages for the workmen coincidentally with a decrease in the cost of production. He points out that this policy has shown in this country wonderful results, and that it may be said to be in very truth the American policy in employment of labor. He enumerates some remarkable results taken from American watchmaking and cycle building, in which the highest summit of efficiency has been reached, bringing necessarily the lowest cost of production.

Type-setting machines, manufactured by the Linotype Company, are expensive machines, of which labor counts for ninety per cent of cost. These machines being made with substantially the same machinery in Germany and in the United States, it has been found that the American-made machines cost less than those in Germany, although labor in Germany is forty per cent cheaper than in America. A better instance could hardly be found than this. Possibly more striking, however, is the statement made by Mr. Outerbridge, the authority above referred to, that the cost of an American locomotive to-day, finished and ready for use, is only a little over six cents a pound, or very little more than the cost of the raw material not a great many years ago.

Every one can draw his own conclusions from these things, but it is difficult to avoid the conclusion that there exists no possible reason why, under judicious effort, a growing and lucrative foreign trade may not continue to be enjoyed by the American maker of cycles and parts.

REGARDING IMPROVEMENTS.

BESIDES swearing off old vices on the first of the year, many are moved to swear on new virtues, a practice that also causes pleasurable emotions and leads people to proudly look at their benign countenances in mirrors. As all men, those in cycling not excepted, are by nature imperfect, all have a chance to exhilarate themselves with reforms of this sort.

But pointing out to every man who is connected with cycling what virtue he should add to his list is too heavy a task for THE WHEEL to undertake during the holiday season, and we will content ourselves with suggesting that all our readers give the matter

their earnest attention. Moreover, we will set them a good example by promising that during the coming year THE WHEEL will be improved in every way. The attractiveness of its present literary and trade features will be increased so that it will more clearly than ever stand unrivaled among cycle publications.

If you doubt this, buy the paper each week, and when we show signs of backsliding, scoff at us as your cigars do at you when you return to your cigars.

PLACE FOR CONVICTS.

THANKS to gallery-playing legislators of this State, convicts in New York's penal institutions will in future be condemned to expensive and vicious loafing, being forbidden henceforth to labor in any way which may conflict with free labor.

Penologists are vainly endeavoring to find means of employment for these thousands of convicts and it seems more than likely that were the officials of the L. A. W. to temporarily lay aside political shuffling and dealing, and go to Albany with a bill demanding the State's convicts to be employed on road building, that the bill would easily be passed to the advantage of all concerned.

But New York's League officials are entirely too busy knifing and thimble-rigging to devote any time and attention to anything outside of politics, as they are understood in the immediate neighborhood of the Vanderbilt Building.

Since the New York division has seen fit to conduct its affairs in imitation of Tammany, it would, perhaps, be well for the conductors aforesaid to remember that the importation of a "Blue-eyed Billy" from Buffalo has virtually wrecked Tammany, and the same story is likely to follow the same importation in the case of the State division. Buffalo politicians, whether real or imitation, have never been a success when transplanted in New York surroundings.

If in a discussion regarding a wheel, its riding or its manufacture, you're in the right and a man says you're as stubborn as a mule, you may safely take it he merely means to imply that your determination is equal to his own.

If you're in the wrong and a man says you're as stubborn as a mule—well, in that case, perhaps the best thing that you can do is to think as highly as possible of mules, for you're singularly like one, even though mules and cycling are not seemingly connected.

The Potterites' plan of trying to frighten Elliott supporters from their candidate by crying aloud Elliott's "dual capacity," is closely akin to the Chinese warrior's obsolete practice of burning fireworks, and whanging a gong.

Amid all the blare of Potterism has anyone thought it worth while to ascertain whether the President-that-is-to-be still maintains his belief that League control of racing is an undesirable thing? Or has Mr. Potter quietly changed his opinion regarding this as he did with his promise not to become a presidential candidate against Mr. Elliott? The King can do wrong, of course, but if we do not know what the King is doing how can the benighted public know what is right?

A ward worker who knows a thing or two about practical politics, says the New York Division's "want everything" policy is the proper caper. The greater the number of "wants," he explains, the greater the opportunities for "deals," and vote-bartering. Relinquishing a few of the minor plums in exchange for a given number of ballots, will serve as a blind and show the "loyalty" and "magnanimity" of the Empire State.

Figuratively, THE WHEEL pats Gormully & Jeffery on the back. Their catalogue illustrates all except their racing tandem fitted with brakes and the specifications make brakes a part of the regular equipment of both singles and tandems. It speaks a regard for the public and for their patrons alike that deserves commendation.

Were it possible to advise League politicians, perhaps some one might say to them: Don't persist in error—after you're found out; and don't be found out if you can avoid it by persisting in it. But there, you can't advise them; they know it all.

After a woman has been riding a bicycle for two weeks, she begins to regret the other make of wheel she did not buy when she chose the one that she rides instead.

To the dark-horse candidates for League honors and League emoluments: Don't stand on your dignity too much! Get off occasionally and fight for what you want.

A thing of beauty is a joy until the agent who sold it to you sends in his bill, with a request for the immediate liquidation thereof.

Cutting off coupons naturally helps to add to one's interest in cycling, whether the coupon-cutter be racer, maker or dealer.

Certainly money talks! Yet there are times in cycling, racing in particular, when it is both deaf and dumb.

Advice is one of the unpleasant smaller virtues that the truly enthusiastic rider forgets to condemn.

Good wheels are, in the end, more likely to be cheap than cheap wheels are to be good.

WHO IS BULL SHIELDING.

He Meddles in Politics and is Standing Sponsor for a Letter He Did Not Write.

Little by little the true inwardness of the anti-Elliott sentiment in this State is coming to the surface, and as the fund of information accumulates, William S. Bull, the salaried Secretary-Treasurer of the New York Division, is placed in an unenviable light.

Bull's is not a strong personality, but the man is so nervously fearful, and anxious to be obliging and affable, particularly to those who write for public prints, that they are inclined to be charitable and overlook his failings and faults. One of these is an apparently uncontrollable desire to dabble in politics and to pose as an assistant wire-puller and slate-maker. His weakness and consequently his readiness to do the biddings of others led to his being dubbed "Obedient Billy," and is directly responsible for the present state of affairs. When President Elliott was making up his committees last year, Mr. Bull undertook to assist him. He protested violently against the reappointment of Douglas W. Robert, the St. Louis member of the Racing Board, who had the hardihood and courage to bring to book three prominent racing men, who were afterwards proven guilty and severely punished. Mr. Elliott paid no heed to the Bull protest, and Robert was reappointed. Mr. Bull's nose was put out of joint, and an ugly letter, which gave great offense to the President, was penned. Mr. Elliott retorted with a characteristically straightforward declaration that rasped Mr. Bull's feelings. Bull vowed vengeance, and later when the relations of the two men were further strained by business differences, and Mr. Elliott came to New York and delivered to Mr. Bull personally an unvarnished opinion of him, the New Yorker frothed at the mouth and whetted his knife for gore. The fact that Elliott desired reelection and that Mr. Potter coveted the office was known to him and afforded an opportunity for an insertion of the steel. Among Mr. Bull's many good friends are Messrs. T. T. Eckert, Jr., and M. M. Belding. They spend much of their time in Bull's office, and when occasion requires, turn in and help the office boy address wrappers and seal envelopes. Bull told them his grievance and of the chance he had to "get even." They clasped hands, and mounting to the roof of the Vanderbilt Building, in which the office is located, began shouting as lustily as they could, "Potter! Potter! We want Potter!"

It happens that the newspaper offices are nearly all in the vicinity. The "cycling editors" heard the shouts, and as columns of space fillers had been distributed from the same office, they came in hot haste, and lo! the Potter boom was launched. When it was carried to him for inspection, Mr. Potter laughed in his sleeve and made a few remarks. He was pledged to Elliott, you know, and his word was as good as his bond! There were pins handy, and he could have punctured the boom with any one of them. But he didn't, you know. He really could not afford to offend his good friends Bull and Belding and Eckert, and then there was Walter Jenkins, in Buffalo, and Underhill, in Schenectady—their feelings must be considered. And they were. Potter played "tag" with Elliott for a while longer, but finally allowed himself to be

touched and become "it." And "it" he now "is."

This is the story in a very large shell. But the strangest part of the affair escaped enclosure. Bull denies the authorship of the ugly letter which originally gave umbrage to Elliott. He knows who wrote it and knows that the charge is laid at his door, but he guards the secret and is willingly proving himself a martyr in the cause.

The question that is being asked is: Who is Bull shielding and why, and what manner of hold has the unknown on Bull that the latter should act as the shield?

THE NIGGER IN THE WOODPILE.

From a source of considerable authority now comes a report of what is said to be the true cause of all this daily newspaper banging of drums and clashing of cymbals over the nomination of Isaac B. Potter for the presidency.

The story is, that two of the three putative managers of the recent Madison Square Garden six-day race who are newspaper men, have enlisted the drum-beating, cymbal-banging services of their fellow sporting editors for Potter, under the plea of fellow-craftsmanship.

The newspaper duo are said to declare that Potter is on record against the League in any way handling or controlling racing, in which anti-racing idea he is upheld by all the influential members of his kitchen cabinet, who now constitute his "Campaign Committee." If he is elected Mr. Potter will for once remain true to his declared principles, and do what he can to divorce the League from racing control.

While racing will thus be forced to look around for some one to control and govern it, the press gentlemen will step forward and offer to take the whole thing off the League's hands, in which offer they will be strongly backed by Mr. Potter, and by a not altogether unknown collection of trotting-horse men and track owners.

If straws, which are said to be token of the way the wind blows, are closely studied along the line above outlined, it will be seen that "straws" from the Potter camp show that the foregoing is not altogether an impossibility.

WHAT IS THE CAUSE THEREOF?

Politics make strange bedfellows. A. C. Willison, of Maryland, who was practically hounded out of the L. A. W. presidency last year, is now ardently supporting I. B. Potter, than whom none was more active in the hounding and in the whispering of unpleasantly personal stories concerning the Maryland man—stories calculated to do grievous harm. Willison's change of heart has amazed some of his former adherents. The suggestion of Conway W. Sams, Maryland's Chief Consul, as one of the vice-presidents on the Potter ticket may have to do with the case.

JOYS OF GLOBE GIRDLING.

Mr. and Mrs. D. H. McIlrath, the Chicago couple who are going round the world on Fowler bicycles, were in China at last accounts and having a hard time of it. The roads were ankle-deep in oozing mud, and the globe-girdlers were proceeding afoot, with the prospect of an 800-mile walk before them. They were accompanied by a native interpreter and coolies carrying their bicycles.

LOSING HIS GRIP.

Gideon Sets a Premium on Crooked Racing Practices by Imposing Partial Suspensions.

Baltimoreans are beginning to think that the hitherto relentless Gideon is suffering from softening of the heart. W. L. Eckhardt, of that city, while under suspension, rode in a match race at Cumberland, under an assumed name, and claims to have won about \$2,000. There was a time when life suspension would have about fitted such a crime, but Eckhardt, according to Gideon's bulletin, will only have to remain off the track until July 1st. From a financial standpoint the alleged venture was decidedly profitable.

It is stated that Gideon made the decision in Eckhardt's case with knowledge of the true facts. If so, local critics think the offense of which the Baltimore man is alleged to be guilty must be an insignificant one in the eyes of the Racing Board chief. Eckhardt claims that Gideon knows every detail of the affair, and this really seems to be a fact. His weekly bulletin relative to the case says: "For racing under an assumed name while under suspension." This indicates that the Racing Board was pretty well informed before the decision was reached, and in view of this, Eckhardt may congratulate himself. There are some who believe the case will be reopened. Whether this will be done or not remains to be seen, but there is no denying the fact that Chief Consul Sams is considerably worked up over the case, and has sent on to the Racing Board what facts he has gathered concerning the affair.

Chairman Gideon states on his side that Eckhardt was punished lightly because he promptly acknowledged his guilt. He states that it was a very simple affair. According to the chairman, Eckhardt entered a match race under his first two names, which, according to the ruling of the board, is an assumed name. He was accused of same and at once owned up, for which straightforwardness the chairman was much more lenient than he otherwise would have been, the suspension only being for six months.

Eckhardt, when interviewed, put the matter in these words: "I made plenty of money out of the race, and my friends did not get left, I am sure. I made more than \$2,000 out of that one snap. I got \$1,800 on that day and had a check for \$250 sent to me since I came to Baltimore.

"The matter is all settled. I wrote to Chairman Gideon, laying the facts before him. I answered all of the questions which he asked me, and I was suspended until July 1st."

Eckhardt exhibited a letter dated December 26th, sent to him by Chairman Gideon. The letter stated that in view of the fact of his having confessed that he had entered a race while under suspension, the chairman would be lenient with him and suspend him only until July 1st next. The letter did not intimate that Mr. Gideon knew the real facts in the case.

LAID OFF FOR REPENTANCE.

Fischer and Houten, the Belgian cracks, have been disqualified for the winter season for refusing to start in a semi-final heat at the Paris winter track.

RACING BOARD'S BULLETIN.

RECORDS ACCEPTED. AMATEUR.

10 miles, unpaced, flying start, against time, 25.24, by A. L. Hackenberger, Denver, Col., Nov. 16, 1896.
25 miles, unpaced, flying start, against time, 1.04.20, by A. L. Hackenberger, Denver, Col., Nov. 16, 1896.

Triplet, unpaced, flying start, against time, by G. G. Perrie, A. A. Gracey, O. F. O'Neill, Philadelphia, Pa., Aug. 27, 1896—1 mile, 2.00; 2 miles, 4.17 1-5; 3 miles, 6.29; 4 miles, 8.43; 5 miles, 10.57 1-5; 6 miles, 13.12; 7 miles, 15.28 1-5; 8 miles, 17.42 3-5; 9 miles, 19.57 3-5; 10 miles, 22.13 1-5; 11 miles, 24.28; 12 miles, 26.45; 13 miles, 29.02 2-5; 14 miles, 31.17 3-5; 15 miles, 33.32 2-5; 16 miles, 35.48 4-5; 17 miles, 38.04 2-5; 18 miles, 40.20 2-5; 19 miles, 42.34 2-5; 20 miles, 44.50 1-5; 21 miles, 47.05 2-5; 22 miles, 49.22; 23 miles, 51.37 3-5; 24 miles, 53.50 2-5; 25 miles, 56.02 3-5; 26 miles, 58.15 2-5.

26 miles 1373 1-3 yards, unpaced, flying start, against time, in 1 hour, by G. G. Perrie, A. A. Gracey, O. F. O'Neill, Philadelphia, Pa., Aug. 27, 1896.

PROFESSIONAL.

1 mile, paced, standing start, competition, 2.08 1-5, by W. A. Terrill, San Francisco, Cal., Nov. 21, 1896.

3 miles, paced, standing start, competition, 7.01; 4 miles, paced, standing start, competition, 9.30 4-5; 5 miles, paced, standing start, competition, 11.13 4-5; by Walter F. Foster, San Francisco, Cal., Nov. 21, 1896.

SANCTIONS GRANTED.

Jan. 18 to 23—B. F. Blake, Jacksonville, Fla.
Feb. 22 to 27—Chicago Cycle Racing Association, Chicago, Ill.

PROFESSIONALIZED.

A. G. Parker, Kearney, Neb., clause (a).
Lester E. Sisson, Columbus, Neb.
Joe Kinnan, Shelby, Neb.
John Fox, Shelby, Neb.
P. H. Burt, Aurora, Neb.
J. H. Snell, Bradenville, Pa., own request.

Charles River Park Track, Boston.

William Jordan, Lansingburg, N. Y., clause (b).
Chris Bohmet, Lansingburg, N. Y., clause (b).
E. C. Freeman, Saratoga Springs, N. Y., clause (b).
George Barber, Cohoes, N. Y., clause (b).

SUSPENDED.

For six months, from Dec. 30, for competing in un sanctioned races after warning, A. G. Parker, Kearney, Neb.; Lester E. Sisson, Columbus, Neb.; Joe Kinnan, Shelby, Neb.; P. H. Burt, Aurora, Neb.

For competing in unsanctioned races after warning, six months has been added to the terms of suspension placed upon Gus Gocke, York, Neb., and John Fox, Shelby, Neb., making same expire April 3, 1898, and Oct. 3, 1897, respectively.

BOURRILLON AND MORIN MATCHED.

Bourrillon has become a marked favorite with the Paris racing enthusiasts since the enforced absence of Jacquelin from the track on account of his army duties. In a mile and a quarter race two weeks ago he defeated Morin. The two Frenchmen were afterwards matched to compete against each other on January 17.

THE GLITTER OF GOLD.

Harry Reynolds, the Irish rider, who won the mile international championship at Copenhagen, has been attracted by the glitter of gold, and will join the professional ranks. He will make his debut in Australia, having sailed for the Antipodes on the last day of December.

MERRY-GO-ROUNDERS.

They Whirl, Wobble, Whiz and Fall Around a Block of Ice for Sport and Specie.

Washington, Jan. 2.—By a margin of slightly over two laps Frank Waller, the Dutchman who originally hailed from San Francisco, late of London and now of Chicago, won the six-day, eight-hour-a-day race, which ended at Convention Hall at 10 o'clock to-night. Maddox, who gave the Teuton a hard run for first money, lost several laps early in the race, through a punctured tire, which he was unable to recover. About 5,000 spectators witnessed the close of the struggle. The men finished in the same order that they maintained during the last four days of the contest and continued at the same even pace until shortly after 9 o'clock. Foster then started the sprinting, gaining almost a lap before he began to go down under the efforts of his hard riding. Ashinger then tried his hand, but proved himself unable to make any substantial gain. When the signal was given that only ten minutes still remained of the race, Maddox, who was two laps behind Waller, jumped out and made a magnificent run, and gained a lap, but Waller recovered it and led the field to the finish.

Early in the afternoon Hunter fell, carrying Ashinger with him, on account of which the former lost three laps and the latter one lap.

During the final sprinting Hunter made a desperate effort to catch Lawson, who had the advantage of a lap, and did so, but at the finish Lawson won by ten feet.

On account of the track being three and three-tenths feet longer than twelve laps to the mile it was necessary to take account of this fact in computing the result.

The corrected score is as follows:

	Miles.	Laps.	Feet.
Waller874	5	49.5
Maddox874	3	42.9
Ashinger873	7	16.5
Lawson871	10	429.1
Hunter871	10	419.1
Foster870	2	258.5

Chapple, of the English brigade, dropped out on the fourth day. All the men finished in good shape and suffered no ill-effects from the race. During the week exhibition rides were given by Bald and Tom Linton. Waller's purse was \$1,200. Maddox received \$800.

FLOYD WAS A FOULER.

Pasadena, Cal., Jan. 2.—At the New Year's Day meet, yesterday, Floyd McFarland, of San Jose, and Walter Foster came together for the first time since early last spring.

In the half-mile professional McFarland got several feet the best of the start by beating the pistol, and was able to defeat Foster in a very close finish in 1.07 4-5. In the final of the mile, Burke started McFarland ahead of the pistol again, giving him more than four yards lead. On the last turn Foster was shoved clear off the track by McFarland, who used the elbow trick. McFarland was disqualified and the Racing Board will be asked to punish him.

CONTRIBUTED \$200.

Snyder & Fisher, who make the Swell Newport bicycle in Little Falls, N. Y., have contributed a purse of \$200 for a three days' race in the Star rink in Little Falls. The event will be started January 21st at eight o'clock p. m.

THROUGH SNOW AND SLUSH FOR WINE.

In addition to the tooting of horns, the ringing of bells and the blowing of whistles, the New Year was ushered in by a score of New York cyclists by the traditional midnight ride to Yonkers and Tarrytown for the customary bottles of champagne. The race being run under no particular management, singles and tandems started side by side, and two of the contestants started ahead of the midnight hour. The roads were covered with soft snow and ice, causing riding to be anything but enjoyable. Still, as the old year gasped its last breath the twenty riders, who cared naught for chills or pneumonia, began the flounder with thoughts only for the wine. The start was made from One Hundred and Tenth street and Seventh avenue, but before half the distance was made, many of the riders became disgusted with the task and turned back.

Tomlinson and Bedell, a Riverside tandem team, started seven minutes ahead of the pack, refusing to come back when called upon to do so, and reached the Getty House in Yonkers ten minutes in advance of the party. They had "split" the prize between them before the others arrived, and denied the charge of the riders who had conformed to the rules that they had started ahead of time. However, the proprietor refused to give another prize.

F. F. Goodman and W. A. Brown on a tandem were the first to reach the Franklin House, Tarrytown. They arrived at 1.35, followed five minutes later by Schneider and Jungkind, also of the Riverside Wheelmen. The former got second prize by a few lengths. Frost, of the Harlem Wheelmen, reached the Mott House, Tarrytown, at 1.54, while the first man to reach Yonkers on a single was Chas. Fisher.

FIRST CENTURIES OF THE YEAR.

Two Buffalo riders rode century runs on New Year's Day, despite the snow-covered roads. Wm. Faulkner made the run over the Le Roy course in 13 hours and 17 minutes. Fred'k Crestlick rode from Erie to Buffalo in 19 hours and 35 minutes.

Both Faulkner and Crestlick had to walk long stretches and each had direful stories to tell of punctured tires, awful sloughs and terrible falls. Both looked like images made in mud when they finished.

Fred Spencer and Harry Brainard also started over the Le Roy course, but were compelled to quit.

COMPLICATIONS COMING.

News from Paris states that at the next meeting of the French Chamber an effort will be made to cause the adoption of a decimal subdivision of time, the day to be divided into ten hours, the hour into 100 minutes and the minutes into 100 seconds, making 1,000 minutes or 100,000 seconds per day.

When this comes to pass, and French distances continue to be measured by the metric system, records bearing the hall-mark of France will most certainly be in a class very much unto themselves.

PASSING BY.

"Dear, me, there goes our pastor on the new wheel we presented him with; how devoted he is to his charge! He can't get to church quick enough!"

"Oh, that isn't it; he has a race on with old Deacon Aimen!"

BALD WANTS GLORY, NOT GOLD.

At Washington last week Bald announced that he had decided to ride in Europe next year, although he knew he could make more money in this country. Having captured almost every American honor, he now longs for new fields and men to conquer, and thirsts for foreign glory.

"I have won nearly everything it is possible for me to take in this country," said Bald, "and though it is barely possible that I will not be able to win nearly as much money in Europe as in this country, still I wish to race there for the glory rather than the cash prizes. I will not race there, however, until I have been put in perfect condition and have become acclimated. There is no use in an American rider going over to France or England and expecting to at once start in and win races when he is in a different climate than he has been accustomed to."

"I propose to remain in France for at least six months before attempting any racing if that time is necessary to put me in perfect condition. If I remain in America this season I am confident that I can win from \$10,000 to \$20,000, but I could do nothing more than repeat my former record of last season, when I won the American championship."

WANTS TO HELP THE LEAGUE.

Bert Harding of St. Louis, and Letter-Carrier Smith are among the recent entries to the Chicago six-day race. The track will be built 7 laps to the mile. Manager Hall has suddenly taken an intense interest in the League and proposed to give a paid-up membership ticket for one year to the purchaser of every tenth, twentieth, thirtieth, fortieth or fiftieth ticket, the exact number yet to be decided on.

The championship belt, which the management will offer as a special prize, will be of silver, embossed with gold. It will be engraved with racing scenes.

GREAT EXPECTATIONS.

In anticipation of the Michael-Linton race, Jacksonville (Fla.) Wheelmen have secured a sanction and arranged a programme for a three days' meet, on January 19, 21, and 23. The club has assured the public that the crack racing men of the north, as well as a contingent of English riders, will be present and that the match race between Linton and Michael for \$5,000, will, of course, be the grand card. Six races, professional and amateur, are booked for each day.

FAVORS STATE RIGHTS.

Chairman Gideon is reported to be in favor of the proposed amendment to the racing rules allowing each State to adopt its own regulations in regard to Sunday racing. While personally opposed to sports of any kind on Sunday, he thinks that the officials of each Division should be allowed to decide the question for themselves, without their action affecting others.

ON THE MERRY-GO-ROUND CIRCUIT.

Plummer's string of English riders are booked to ride at the two days meet of the 65th Regiment, A. A., at the arsenal, Buffalo, January 15-16. The purses in each of the professional events amount to \$200.

MONTANA'S REMARKABLE AMENDMENT.

The fact that the Montana Division has but 80 members, and that a generous proportion of them have been suspended for competing in Sunday races, has stirred up Chief Consul Brock of that Division to a point of ludicrous asininity. He has sent a long circular letter to the Chief Consuls throughout the country, in which he takes up the cudgels against the Racing Board's action. In the letter the remarkable statement is made that "the question of the guilt or innocence of the offender is not a matter of consideration, the interest of the League being the only thing that should be considered." Mr. Brock wrote in the same strain to the members of the Board at the time the suspensions were announced, but that committee could not be induced to regard the matter from any such sentimental standpoint. Mr. Brock announces that to insure the interests of the League being looked after in the future he proposes introducing for action of the National Assembly an amendment allowing the Racing Board to make suspensions thereafter only when the Chief Consul in the State where the offender lives shall approve of such action as not affecting the "general interests of the organization."

CONEY ISLAND PATH RULES.

A new set of rules for the government of the Coney Island Cycle Path will shortly be drafted. Park Commissioner Dittman has asked the Good Roads Association to frame the rules, after a consultation with the cycle clubs. The force of bicycle policemen will be retained, their work during the past season having been highly commended by Capt. McNamara, of the Park force. The committee will probably recommend a set of rules substantially the same as those now in force, including the limitation of speed to twelve miles an hour.

WANT TO ABOLISH LOAFING.

Among the revised rules to be brought before the Executive Committee of the Intercollegiate A. A. is the following addition to the by-laws in regard to inter-collegiate cycle racing:

A time limit is to be fixed by the referee, and if not reached, then the heat or race to be ridden a second time, and all those not making the time limit to be barred from final heat. This rule to be put in effect even if it necessitates the omission of the race.

WILL PUSH TRADE IN FRANCE.

All of fair France will be the exclusive stamping ground—as far as Falcons are concerned—of the Franco-American Bicycle Co., 41 Rue de St. Sebastian, Paris. They are not novices, as this is their third Falcon year. They will drum La Belle France thoroughly, and have given the Yost Co. a substantial order for January-February shipment.

FIRST OVER THE CYCLE PATH.

W. H. Owen, W. K. Foley and J. Monsheimer of the South Brooklyn Wheelmen claim to be the first riders to reach Coney Island over the cycle path this year. They left the head of the cycle path at midnight and reached the Island at 12.15. C. T. Earl and Fred'k Aldridge also made the trip as the new year was a-booming.

BICYCLES TALK WHEN ALLOWED TO COAST. VICTORS TALK LOUDEST BECAUSE THEY ARE BETTER MADE.

The VICTOR Won the Great Coasting Contests in 1896.

At the New York Athletic Club Contest, May 23rd,

VICTORS won First and Second places.

At the Contest of the Associated Metropolitan Cycling Clubs, Aug. 15th,

A VICTOR made Longest Distance.

(A Victor rider was prevented from winning the final heat of this contest by interference of spectators.)

At Birmingham, Ala., Sept. 3rd,

The VICTOR won First place.

At Baltimore, Sept. 22nd,

The VICTOR won First place.

At Syracuse, Oct. 10th,

VICTORS won First, Second, and Third places.

At Springfield, Oct. 26th,

The VICTOR won First place.

At Baltimore, Nov. 3rd,

The VICTOR won First place.

IN COASTING, THE MECHANICAL PERFECTION OF BEARINGS, PERFECT ALIGNMENT, RIGIDITY, AND RESILIENCE OF TIRES, TELL THE STORY.

OVERMAN WHEEL CO.,

NEW YORK, BOSTON, DETROIT, DENVER,
SAN FRANCISCO, PORTLAND, ORE.

VICTOR VIEWS.

In the advance catalogue of the Victor bicycles the Overman Wheel Co. takes issue with the trade in general in three striking particulars: They adhere to the twelve months' guarantee; they say "nay" to one and two piece crank shafts and use barrel hubs only on their road racer. They state their case interestingly. Of the crank shaft and bearing they say:

"This feature of the machine is one of the examples of "Victor Grade." It is an extremely simple device and can be very easily dismantled and cleaned. Its present form is the result of years of development of the original idea, each year adding something of value to the device.

The 1897 improvements add greatly to the outward appearance of this machine at this point and include a dust-proof bearing in which felt washers are not required. The theory of construction involved is, that a large crank-shaft having crank sockets at right angles to its axis and detachable cranks of crucible steel best meets the requirements of a pedal driving-gear for bicycles.

"The hollow construction of shaft with large diameter gives it a greater resistance to torsional strain with a less quantity of metal. The larger bearing also makes the frame stronger and stiffer at this vital point. Detachable cranks are a feature which should not be omitted from high-grade bicycles. They are not only a convenience in dismantling and assembling the parts and in exchange of cranks to

obtain a more suitable length, but also provide a better grading of the steel to meet the requirements involved. As the crank has one duty and the axle another, the material of each should be different, and as the crank is more exposed to accident it should be detachable for easy replacement."

The subject of hubs and bearings is treated in this wise:

"This masterpiece of genius and workmanship, the Victor rear hub and sprocket, is a good illustration of the meaning of the words "Victor Grade." Here the ideal thing is made real, and the matter of expense is not allowed to prevent the conception from taking its true and best form.

"Fifty distinct operations are required in bringing the bar of crucible steel into the finished form. The result is a driving hub made

in one piece, a perfect mechanism without joint or seam. The dynamometer gives us the record whereby we are enabled to fix upon a constant size of sprocket wheel (namely, one having eight teeth) which will best convey the driving power.

"We make a forging weighing 3 pounds 5 ounces so as to be able to construct the hub and sprocket all in one piece. The waste metal machined away weighs nearly 3 pounds, the completed part weighing less than 7 ounces. This piece is hardened in oil through and through for toughness to bearing surfaces and to the sprocket teeth and spoke sockets. We grind our hardened bearings together to a perfect surface, and are enabled to do this because the material is the same all the way through."

R. N. MARTIN.

Mr. Martin is one of the Eclipse Bicycle Co.'s acquisitions. He will represent them in the South, where for fifteen years he has accumulated experience and a reputation as a

salesman of high degree. Frank Weston, the head salesman of the concern, is in the West, where several large contracts are pending.

TEXAS TRADE.

Dallas, Jan. 2.—The trade outlook throughout Texas is very bright, and a phenomenal business is expected the coming season.

Representatives of a great many concerns have been through and are now traversing the State, sowing and reaping.

Dallas has a good trade the past year and expects more for '97. The Young Cycle Co. are making very extensive preparations.

Ft. Worth had an unsuccessful year, the three most prominent cycle concerns in that city being forced to the wall, viz., Sam C. Baker, deed of trust; Miller, Cherry & Co., general assignment, and E. L. Day, deed of trust.

Jas. Braggassa is the only dealer of any note remaining, and he is preparing for a large '97 trade.

Austin dealers enjoyed quite a profitable business the past year, in spite of the hard times, Fred Petmecky doing the largest business. He will enlarge his scope for the coming season.

Bergener & Bro. and Webb & Bro. will also continue in the business.

HARD AND SOFT SHOES.

It is now five years since W. W. Shoe, 428 Walnut street, Philadelphia, Pa., embarked in the manufacture of bicycle saddles, and by quiet and conservative business methods gradually enlarged his capacity and perfected the quality of the goods, so that now the name Shoe is synonymous with all that is good and practical in this line.

For 1897 Mr. Shoe shows much that is new and of interest. The "Cushion Top" is one of the late productions. As its name implies, it is a saddle for comfort and not for scorching. The heavy, leather-covered felt top is suspended over a steel frame and backed by eight spiral springs that yield to every movement of the body, at the same time allowing a firm seat. An additional spring at the back takes up any jolts or jars from rough riding, and its shape is such as is most conducive to ease.

The model "S" is of the hygienic type, with felt top suspended on rawhide thongs. The arrangement of these thongs differ from the conventional, as they are tightly laced or woven at that point where the most strain exists. The nose or pommel is very narrow and the finish of the saddle is superb.

The model "O" is of the hard leather top pattern, but formed to obtain the best results. Made of the best oak-tanned leather, it makes a saddle of unquestionable wearing qualities.

Pat. 4-14-'96

In all Shoe saddles the various metal fittings are of the best; the two-bolt clamp that is used allows of a very low adjustment to the frame of the machine, and is fully covered by letters patent, dated April 14th, 1896.

In addition to the regular line, the Shoe Handle Bar Clamp commands attention from those who will use this style bar for the coming year; it is neat in appearance, the entire clamping device being invisible, but so effective that the bar can be held perfectly rigid in whatever position it may be placed.

ADAPTED FROM MESSONIER'S CELEBRATED PICTURE, "THE SIGN PAINTER."

The bicycle is the advance agent of good health. It is changing the habits of the people—getting them away from the crowded centers—giving them a glimpse of beautiful nature—and promoting happiness and contentment. The bicycle is a great blessing, and its usefulness and popularity is due

almost entirely to the pneumatic tire. An Irish physician made the first pneumatics, but JOHN PALMER, an American, improved and perfected them. His inventions cover several points, but the chief and vital one is in the fabric. In nearly all tires except Palmer Tires the fabric is identical with that used in making garden hose. The fabric in Palmer Tires is totally dissimilar. It exactly suits

the requirements of the rider, and that is why Palmer Tires are noted for being so fast, resilient (easy riding), and are so easily repaired. Our interesting and instructive catalogue gives complete information. It will be sent to any address upon request. Address Advertising Department

The Palmer Pneumatic Tire Co...Chicago.

**NEW YORK OFFICE,
66-68 Reade Street.**

COASTING CONTEST CAUSES CONFLICT.

A rather interesting and peculiar fight between two cycle manufacturers is the result of the Buffalo Courier's series of coasting contests, which have taken place in that city during the past few months. It all came about through the starter omitting to send off C. F. Thomas, of the Bison team, in what was to have been the deciding contest, held several weeks ago. De Temple, of the Waltham Mfg. Co.'s team, won the affair, but owing to the starter's error it was ruled by the officials that De Temple and Thomas should come together at some further day set by the promoters.

Seyfang & Prentiss, the Bison people, agreed to the decision, but the representatives of the Waltham Company refused to entertain the proposition, and went so far as to secure an injunction on the promoters of the con-

IN GREENERY, YALLERY LAND.

If a gentleman who had turned over a new leaf, and in the turning thereof barred liquid refreshers of a stimulating and alcoholic nature from his food, had been blindfolded, led into the rooms of the Architectural League,

Third National
Cycle Exhibition
Chicago January 23-30 1897

First Prize, Chicago—E. W. Girard.

and the bandage suddenly removed from his eyes, he would have gasped, "I've got 'em again!" and then promptly thrown a fit.

Second Prize, New York - Samuel L. B. sha.

And really the gentleman would not have been so very much to blame, either, because his eyes would have been blinded by the most garish collection of red, yellow, blue and green, that smote his eyes, turn them where he would. One hundred and twenty-nine exhibits of the poster-maker's attempts to win a prize for a couple of catalogues were there.

Two prizes were offered for the New York show and the same for the Chicago one. The winner of the first prize for this city is a sketch representing an old Dutch settler riding a bicycle known a quarter of a century ago as a "boneshaker." The colors, green, maroon and yellow, seem nicely blended to one who does not pose as an art critic. The second prize for this city has a tapestry background partly surrounded by a semi-frame of wheels with wings. The wheel is partly covered by a sign hanging from the handle-bars bearing the words: "Third National Cycle Exhibition, New York, February 6 to 13, 1897."

The first prize for Chicago represents a woman in long skirts leaning wearily against a bicycle. Her head is hooded and she has yellow hair. The prominent colors are red, blue and yellow. Chicago's second prize represents a Robin Hoodish sort of a chap fondling a pneumatic tire. The coloring is green and yellow.

NYACK'S JOY.

Nyack is joyful. It has offered inducements sufficient to secure the removal of a cycle establishment from the greatest city in the new world to Nyack, which everyone may not know is a nice little town 20 miles from New York, but on the opposite shore of the Hudson. The business of John Nuttall, well known to the trade of the city, will be Nyack's

First Prize, New York—E. Stetson Crawford.

test. The injunction, however, was quickly vacated by Judge Childs when brought to trial, and Saturday last was then fixed as the date for the final trial, being the first suitable day. Both firms were notified to prepare for the event, but the Waltham Company sent a letter from their attorney refusing to recognize the race on various grounds, and in which they maintained that the trophy was their rightful property.

Thomas, of the Bison firm, was on hand, and in accordance with all the rules and the proper officials, started alone and passed De Temple's mark by 118 feet. He was officially declared the winner of the trophy. An order for the trophy served upon the local branch of the Waltham Company brought to light the information that the firm had shipped the prize cup to the home office in Waltham, Mass., fearing replevin proceedings, and that the trophy would be exhibited at the Cycle Show at Chicago, but not at New York, as the property and coasting laurels of the Orient bicycle. The promoters of the contest state that no effort will be spared to put the rightful winners in possession of the trophy.

Second Prize, Chicago—E. Stetson Crawford.

gain. With Mr. Dodd, Mr. Nuttall composed the Nuttall-Dodd Co., doing business at No. 420 West 27th street. Under the Nyack arrangement, Mr. Dodd retires and the concern becomes a \$50,000 stock company, the Nuttall Mfg. Co. Mr. Nuttall will be president; vice-president, John D. Blauvelt; secretary, George T. Morrow, Jr., and John Nuttall, George R. Bidwell, J. D. Blauvelt, J. W. Dalley, George T. Morrow, Jr., directors.

Juvenile wheels and cycle fittings and sundries will be made and nickleplating for the trade be done, the latter having formed a large part of Mr. Nuttall's business when in New York.

IN THE HOME OF LIBERTY.

In the Liberty Cycle Co. all is now bustle and activity. In the factory at Bridgeport the machinery is making merry music, and in the headquarters in New York, Manager Wilson and his staff are occupied with business affairs which are now in ship shape and proceeding without a hitch or jar.

Although busy, Mr. Wilson had time to remark that the '97 Liberty "will present many new features, which will at once commend them to every careful investigator."

He supplies this additional information. The frames are of the same general outline as those of the '96 product, except in the Bogie Man, which has an eight inch head and a three inch drop to crank hanger. An improvement in the head bearings renders them dust proof. The left hand crank is new, as is the arrangement of the crank hanger bearings. The old crank key is done away with and the left-hand crank, which is slotted at the end and is so constructed that its action is most positive, is secured to the axle by means of a small bolt. The right hand crank and axle are forged in one piece. The crank axle bearings, which are simple in design, may be taken out and replaced without altering the adjustment in the least. The adjusting cup, which is on the left side, is screwed into the crank hanger and fastened by means of a lock nut which screws over the cup and against the hanger, making any accidental disturbance of the adjustment impossible. The movable cup also screws into the crank hanger on the right side, and is made with a shoulder which rests against the hanger. The cones are screwed on the axle and the balls held in place by retaining cups, secured by a sleeve. By unscrewing the movable cup, the axle, cones and balls are removed entire, leaving the adjusting cup in its original position.

The Liberty Hub, introduced in 1892, and which Mr. Wilson says has been widely copied, will remain a feature of the '97 wheel. It is made of one piece, giving numerous advantages over hubs made up of a number of parts, and the flanges are so constructed as to allow the use of a spoke perfectly straight from head to nipple. The oil cups are in the centre of the hubs, as usual, but are so arranged that the oil cannot possibly leak out of them, or the dust get in. The bearings of the hubs are the same in construction as those in the crank hanger, permitting the wheels to be taken out and returned to frame without the loosening of cones, so common in wheel bearings of ordinary construction.

The pedals have larger balls; are slightly heavier, and of improved design. The sprockets, which are nickled and polished, will be furnished with 7, 8, 9 and 10 teeth rear, and from 16 to 25 teeth front. As these are readily detachable a great variety of gears is possible.

The Kelly adjustable handle-bar, and the Sager saddles, form a portion of the regular equipment.

The men's wheels will have 22, 24, 26, and 28-inch frames and the women's 20, 22, and 24-inch frames.

The Liberty tandem which makes its debut this year will be furnished in four styles, 22-inch and 24-inch double diamond and a combination with 20-inch front and 22-inch rear frame. Also 20-inch front and 24-inch rear frame. These will be fitted with a double steering device of rod and chain, so arranged as to allow all wear to be readily taken up. An

eccentric adjustment will be in front bracket, and detachable sprockets used. The frame is so constructed that each rider has the same position he would occupy on a single wheel, and the side swing, so usual in tandems, is entirely eliminated.

All Liberty bicycles will be fitted with either Vim, Morgan & Wright or Liberty detachable tires; the last named being made with an embossed tread.

Single wheels will list at \$100. and tandems at \$150.

FOR COMFORT'S CAUSE.

In the early days of the pneumatic tire, when spring-framed bicycles were much more numerous than at present, those who had not entirely lost their heads over the then marvelous tire continued to preach the gospel of spring frames. It was as plain then as it is now that a combination of both air tire and springs would afford the most luxurious or

the Warwick Cycle Manufacturing Company, A. G. Spalding & Bros., the Richmond Bicycle Company, and others obtained licenses the preachers before referred to felt their oats once more. The firms named are making a feature of the cushion frame, and it is likely to cut no inconsiderable feature in the trade of the current year and thereafter.

The illustrations show the general principle of the frame, although they portray changes as made by the brothers Spalding, and confined to the Spalding bicycle.

Figure "A" is an ordinary bicycle frame. The front part is brazed together and the rear forks separated therefrom, showing the completed parts before they are assembled.

Figure "B" shows the rear forks brazed to the cushion and lower fittings, ready to be assembled into a complete frame.

Figure "E" shows a crank-hanger box with the rear lugs milled off to receive the forks, which are brazed into a fitting, and forms the hinged connection at the rear of crank-hanger.

Figure "C" shows a cushion separated, which can be easily removed.

Figure "D" is an illustration of a cushion, cut in section, showing the graduated sustaining spring and the three air pockets which work in conjunction therewith. The spring is intended to sustain the weight of the rider only, the downward thrust being arrested by the air pockets. In practice the cushion acts precisely the same as the pneumatic tire, only in a much greater degree. The air in the pockets that form the cushion is always normal and the device never requires recharging or pumping up. There is more than four times the amount of resiliency in a cushion frame than there is in the pneumatic tires.

The springs are furnished in four different sizes, being graduated to suit the weight of the rider.

This frame appeals strongly to conservative riders of heavy weight or those who experience any unpleasantness from continual riding over cobblestones or rough roads.

The construction of this frame will not permit the use of tires larger than 1½ inches in diameter, and experience has shown that larger sized tires, even with heavy-weight riders, are unnecessary, as the elasticity of the frame more than compensates for any decrease in the size of the tire.

HYGIENIC SADDLES FOR THE CHILDREN.

Within the past year or two, the too prevalent idea "anything is good enough for the children," has been gradually dissolving and wheels and fittings made with due regard for the youngsters' comfort and requirements have made their appearance. Even the saddle, a long-neglected but necessary and highly important accessory, is now receiving its share of attention. One firm, H. M. Rosenblatt & Co., of Philadelphia, is now marketing a hygienic saddle designed and made solely for juveniles' use—the "Stella B," they term it. Although sold at a low price, it is made of the finest quality of oak-tanned hand-stuffed leather; has padded top, with apertures beneath, which permits it to conform to the shape of the pelvis, and has fine nickled wire springs, and is, in every way, deserving the inquiry and consideration of the trade and of parental purchasers.

idealistic cycling. A bicycle is subjected to jolts and jars which no tire can substantially relieve, and the old gospel is as good to-day as it ever was. Signs that its force has not been entirely lost have not been wanting. Inventive genius has been at work, and from time to time spring or cushion frames of more or less value have cropped out. Of these, the "hygienic frame," of the Hygienic Wheel Company, of Philadelphia, made the best and most lasting impression, and when such firms as

MADE LIKE A WALLET.

With the close of the old year came the new catalogue of the Gormully & Jeffery Mfg. Co., that is, the '97 publication. It is new, however, in more than one sense. In the shape, size and in arrangement of text and illustrations does the newness enter. It is slightly longer and considerably narrower than usual, resembling nothing so much as the

leather wallet carried by so many men; it can be as comfortably stowed in either the hip or the inside pocket of the coat. The wallet effect is heightened by the cover, which is of a drab color and leathern appearance, relieved by bronze ornamentation. The reading matter runs the long or "wrong way" of the pages, and the special mechanical features of the Rambler are grouped artistically in page illustrations. Everything has been judiciously "boiled down." There is no effort at word-painting.

It is not to the firm's discredit but rather in its favor to say that the Rambler betrays fewer changes, probably, than any other wheel.

Nearly all of the alterations have been already exploited. The fact that Ramblers will be listed at \$80, and for the first time they will be gold-striped and options given on several colors, is well known. A notable change not previously remarked is in the frame construction. Instead of carrying the tubes from the rear axle in a straight line direct to the barrel hanger, these tubes are curved in towards the centre of the barrel, just in front of the rear wheel, thus enabling a larger sprocket to be used. The machines are all built with a sufficiency of clearance, which will permit the use of 2 1/4-inch tires on the tandems, 2-inch on the men's singles and 1 3/4-inch on the ladies' wheels. An innovation is the abandonment of seat posts. Instead of the usual post fitting into the seat mast, G. & J. employ a forged clamp with an arm. The clamp is secured to the seat mast, and is turned completely around, as forward or backward position of the saddle is desired. The illustration conveys the idea very accurately. Brakes are made a part of the regular equipment of all wheels, both singles and tandems.

MONEY-SAVING MACHINERY.

While the Fox bicycle has become well known, many are not aware that its makers, the Fox Machine Co., Grand Rapids, Mich., are such extensive and ingenious manufacturers of bicycle tools and labor-saving machinery, that they cannot afford to be overlooked by anyone in search of that sort of thing. Their devices are original—originality is one of their strongest claims—and are excellently portrayed in their small but effective catalogue. Rim and hub drills, filing vises, ball cup and washer presses, tube cutters and wheel assembling stands are included in their manufactures and are photographically reproduced in the catalogue.

ANOTHER M. & W. IN THE TRADE.

"M. & W." have become an honored term in the cycling world; none will confess himself unconscious of the fact nor of the firm which has made it honored. It is now to be employed by another firm, a firm of lamp makers, the Matthews & Willard Mfg. Co., of Waterbury, Conn., whose reputation is such that there is no danger that "M. & W." will ever be sullied.

The Waterbury firm will market the M. & W. bicycle lamp, a handsome article, which comes from no inexperienced hands, Matthews & Willard having been long engaged in the manufacture of reading or house lamps, and having experimented and analyzed critically before placing their latest production before the public. It embodies a number of original ideas. These are thus summarized by the makers, who, by the way, have a New York office at No. 20 Murray street.

It is impossible for the wick to drop down, due to the construction of a locking device on wick adjuster, which is a simple push button that is a positive lock; not like many other attempts in this line, which are cumbersome and have to be adjusted with screwdrivers, set nuts, etc.

The lamp is complete in itself; it requires no extra attachments. It can be fastened to

any part of the wheel, being provided with jaws to clamp to fork or steering head. The jaws are also constructed with cover, that prevents them from marring the enamel on the wheel; they are made with deep corrugations in all joints. The thumb nuts can be easily tightened with the fingers and will not jar loose when in use, thereby dispensing with wrenches or screwdrivers so commonly used for that purpose. It burns kerosene oil, and throws a white, bright and steady light one hundred feet.

Owing to the perfect combustion the lamp does not smoke, as is common in kerosene oil lamps.

It is of a desirable size, being a medium and of light weight.

It has a powerful lens and scientifically-made reflectors.

It has a large and yet symmetrical oil pot. It is easy to light, being provided with an opening on the side; also a place to strike matches.

The lens is removable for cleaning. It is provided with a lens holder that is of simple construction and readily put together without experiencing the difficulties of springs and catches so commonly used; is air-tight, etc.

HAVE A GOOD THING.

Geo. W. Cole & Co., makers of the well-known "Three-in-One," appear to have hit upon a good thing, which, now that it has been devised, it seems strange was not thought of before, a useful improvement on the ordinary collapsible tube. It consists of a patented cap to which a brush is affixed, affording a clean and ever handy means of applying lubri-

cant to the chain. Cole & Co's. new lubricant, "P-M," will be enclosed in these patented tubes. "P-M," an abbreviation of "Pace-maker," is a compound of pure graphite and Three-in-One oil, which melts after being applied to the chain and then flows into the joints; after the oil works out, a deposit of graphite remains, a virtue possessed by no other lubricant, it is asserted.

WILL TRY TO PREVENT PRICE-PARING.

Springfield, Mass., Jan. 4.—The retail bicycle dealers have organized a Board of Trade. Among its prime objects is the fixing of a maximum price for high-grade wheels taken in trade and to prevent cutting of prices. W. P. Hadley is President, Albert Stanley Vice-President and J. O. Ball Secretary and Treasurer.

The Spalding agency at 482 Main street has changed hands, M. D. Stebbins disposing of his interest to Charles C. Morgan, who has associated J. O. Ball with him under the firm name of Morgan & Ball. Mr. Morgan was engaged in New York last season with A. G. Spalding & Co.

DIRECT DEALING WITH THE FACTORY.

A. G. Spalding & Bros., who are the selling agents for the Lamb Manufacturing Company, of Chicopee Falls, Mass., the makers of the Spalding bicycle, have decided that all agency business in that line shall be conducted direct from the factory at Chicopee Falls, experience having shown that the bicycle business can be better conducted and every agent better satisfied by being in direct touch with the factory, where A. B. Barkman will be in control as manager of the bicycle sales department.

"THE MOST REMARKABLE BICYCLE."

To quote its makers, the Central Cycle Manufacturing Company, "the most remarkable bicycle on the market"—a Ben-Hur, of course—will cost \$125, a price which, while above the usual, is justified by the remarkability of the wheel. There will, however, be Ben-Hurs at \$60 and \$75 for those who cannot afford the larger sum.

BIG DEMAND FOR WOOD HANDLE-BARS.

J. T. Hildreth, a carriagemaker of Brattleboro, Vermont, has added the manufacture of wood handle bars to his business. A local authority states that Mr. Hildreth has sufficient orders in hand to require night work.

HE ASTONISHED THEM.

Some truckmen, in the usual leisurely manner of their kind, were unloading paper stock in front of a Park Place printery. The stuff was done up in 705-pound packages, each one of which seemed to tax the muscle and energy of three brawny truckmen.

A quiet and somewhat theological-looking man stood awaiting a chance to pass, which he was kept from doing by the slow transfer of the trucking trio. "Why don't you get a move on with that?" he observed to one of the paper carriers.

"See here, young feller, if you don't like the way we are doing this job, suppose you take a shy at it." The invitation was no sooner given than it was accepted. Securing a good grip on the 700 pounds of paper, the mild-looking man carried it from the wagon across the sidewalk and deposited it upon the elevator which was to carry it up to the printers.

"Hully gee!" exclaimed the leader of the truck trio, "if dat ain't one of dem Samson fellers I'll eat my shirt. Say, mister, what's your name?" But the quiet man had vanished in the crowd, and the astounded truckman received no reply to his inquiry.

It would interest the truckman, perhaps, if he knew that this unknown juggler of 700-pound paper weights had lifted 861 pounds dead lift and 1,740 pounds in harness. In odd moments he has put up a 50-pound dumb-bell 59 times in 20 seconds; broken a 3-8-inch board with his naked fist, and contested in 53 wrestling matches, winning 48 of them and getting a draw for the remaining five.

But the strong man's name, you say? Why, certainly! You all know it. It is G. Minturn Worden.

BECAUSE PENN NEVER RODE ONE.

The obiter dictum of a Philadelphia Judge to the effect that one-third of the crime in his court was due to the bicycle has not unnaturally given rise to a series of humorous—more or less—inquiries as to the effect of the bicycle on Philadelphia morals, and also as to the uses of Philadelphia criminal courts in the pre-bicycle era.

The well-known passion and fervor of Philadelphians may have caused them to lose their balance momentarily in a genuine cycle craze. But it is certainly peculiar that in all the other incorporated cities, towns, boroughs and villages of the United States, the effect of the introduction of cycling should have been in the interest of law and order, health and morality, the very opposites of the results deplorable in respect of Philadelphia by Judge Yerkes.

COME HIGH, BUT THEY ARE WANTED.

M. Leherisse a famous French military authority, has introduced a bill in the French Senate calling for the creation of twenty-five companies of military cyclists, ten of which he proposes to attach to the cavalry, and the remainder to be split up among the various army corps. Each company is to be 300 strong, and the estimated cost of creating this new arm of the service is put down at \$280,000.

AND STILL THEY COME!

Of 28,000 applications for patents in England so far this year, more than one-third are for cycle improvements.

IN THE BEGINNING

CHAPTER I.

Fondly the Knight of the Silver Shield loved the fair and noble Lady Gwendoline, and she as fondly returned his love.

She returned it because it was so nice to have him give it back to her, as he always did.

"My own," he murmured, clasping her to his bosom.

"Here, too," she whispered, as she coyly nestled her flaxen head upon the stoveld cuirass he wore over his manly chest, partly for protection and partly for revenue only.

CHAPTER II.

But the old Duke, the Lady Gwendoline's father, was opposed to the match.

He had asked the Knight to take off his silver shield and substitute a gold one, and the Knight had refused with scorn and contumely.

The Knight still owed for the silver shield, and he did not care to mortgage his Western soul for a change.

"Do as I command," sternly ordered the old Duke, "or never be son-in-law of mine."

"Well, I don't think," hissed the Knight between his set of teeth, and the strike was on.

CHAPTER III.

The Knight of the Silver Shield had told the Lady Gwendoline all.

He could not tell her more, or he would have done so gladly, so much he loved her.

"I will flee," she bravely said.

"Two flees," he replied heartily, and they packed a small luggage-carrier full of wedding things.

In half an hour they were flying from the gray and grim old castle.

CHAPTER IV.

And fast before the old Duke then
Three hours they'd fled together,
And if he'd caught them in the glen,
He would have mopped the heather
up with the Knight.

The old Duke hard behind them hid,
Should he their steps discover,
Then what could cheer the bonny bride
When he had slugged her lover?

But still, as wildly blew the wind,
And as the night grew drearer,
The Duke was coming on behind,
His puffing sounded nearer.

CHAPTER V.

A great thought came to the Knight of the Silver Shield.

"Sweet one," he said softly, slacking his speed, "wait but a little; I will be back again."

"Waiting for you," she whispered, "were such sweet sorrow that I would wait until to-morrow."

It was then 11:55 p. m., and the Knight, kissing the fair lady's hand, hurried back over the way which they had come.

CHAPTER VI.

"Saved!" he exclaimed, returning to her side and once more moving swiftly forward.

"But Papa?" she asked with anxious eagerness.

"Knocked out in the first round," laughed the Knight of the Silver Shield in loud, triumphant tones. "I filled the road with tacks, and the old man's tire is punctured so that he has to lay up for repairs."

"My hero!" murmured the fair lady Gwendoline, gazing fondly on him as they flew along the glistening turnpike.

CHAPTER VII.

Two wheels with but a single thought,
Two lovers safely carried,
Into the haven which they sought,
And so they married.

"HISTORY REPEATS ITSELF."

How the Trade and the Public Swing Round in a Cycle When Improvements Are Made.

Never was a saying truer than that "History repeats itself."

The early bicycles had solid frames and the metal was forged into such section as seemed to combine beauty and durability.

With the use of tubing came straight frames, because plain, straight tubing was most easily had.

Later, improved processes of working tubes produced taper frames, and no bicycle was considered complete unless it had taper backbone and taper fluted hollow forks, or some similar fittings.

With the advent of the safety some manufacturers attempted to introduce into the safety the lessons of experience which they had learned from the "ordinary," and built safety bicycles with flattened taper fork sides, taper handle bars and similar finery.

The rapid increase of the use of the safety brought into the ranks of the riders a vast number of people who didn't know the difference between a straight tube and a taper one, and to supply this multitude the cheaper, simpler, straight round tube frame was designed and became popular. Popular with the maker because it saved him money; popular with the rider because the other fellow rode it.

After several years, however, it became apparent that this form of frame could be improved by changing the shape of the tubing, and several varieties of section have been introduced with good results, until to-day we find makers carefully considering how they may better their next year's product so that it will meet the criticism of a more particular class of riders.

In their attempts to secure better results from these various shapes of tubing we find that they are traversing the ground which was traversed by the older makers in the days of the good old "ordinary," and at the last English cycle show such chestnuts as fluted fork sides were shown and accepted by the public as novelties.

D-shaped tubing is attracting much attention, and while retaining the appearance of round tubing, gains something in room around the tire and so had a large advantage. Corrugated tubing has been exploited by several, while half-round, pear-shaped, triangular and other odd forms have received some attention. Not only do we find that tubes vary in section according to the whims of the maker, but that they are tapered in both size and gauge.

More copies of the work of ten years ago could be pointed out, but these are sufficient to serve the purpose intended, viz., to emphasize the fact that "History repeats itself," as aforesaid, and that "Merit, like truth, is eternal, and although crushed to earth, will rise again."

There is no question but that certain shapes are best suited for certain purposes, and when once the best shape for a given purpose is determined, no further question should arise concerning that portion, until such time as surrounding circumstances change the conditions in which that particular case exists.

The forks of a bicycle, for example, have always been bicycle forks, and have always done a service differing only in degree.

Therefore the form of tubing found most valuable in a fork of the old "ordinary" of ten or twenty years ago would in all probability have proved superior as a fork for the safety.

We are as a nation too progressive—in some respects. It is right that we should "Prove all things and hold fast that which is good," but it is wrong that we should be so anxious to test new things as to be willing to drop old ones that have served us well; before testing the new, to be sure that they will serve us better.

Not many years ago we were using smaller and smaller and yet smaller sizes of balls; not because they were better necessarily, but rather because they were small, and evidently we went to the extreme. At any rate we are now calling for larger and yet larger balls, which is certainly leading to an extreme in a reversed direction.

Only a few years ago some bicycles were built with five teeth in the rear sprocket, and six teeth could be found quite often.

This was in the days when an ounce of iron

being widely experienced, they follow false prophets, regardless of results; not that they do not desire the best results, but that with their limited experience they could not select those things necessary to secure the best results. Each year, however, the proportion of new riders to those who are already experienced grows less, and each year merit will be more appreciated than heretofore. This means that those things which have proven good will be retained by an increasing number of riders, and that there will be less of faddism than heretofore.

In the more common details there will be less fluctuating, and it would seem that such mechanical certainties as the proper section of tubing, size of tube, kind of joint or quantity of material for any given purpose would become more fixed and be generally accepted.

On the other hand, since all riders differ, there will be among the increased number of riders enough who think alike to demand certain details which for some reason are better for their particular needs or at least suit their

LO, THE POOR LAUNDRYMAN!

"Law sakes, Hezekiah! What on airth do you imagine that is?"
 "Shouldn't 'zactly like to say, Matildy, but I kinder calkerlate it might be one of them bloomer bysickle girls York newspapers hez been sayin' so all-fired much about."

in a bicycle was heavier than a pound in one's pocket.

To-day we are getting very sensibly toward larger sprockets, and if we will but stop before we get to the extreme in this matter something will have been gained.

We started with 2 1/4 inch pneumatic tires, and steadily decreased in size until 1 1/2 was not uncommon. Now we find a reaction, and two-inch tires are being called for.

Whether the rage for large tires will increase until 4 inches is common cannot be foretold, but the writer would not be surprised to see such a movement as soon as the narrow-tired craze has had its day and been forgotten.

These oscillations of public opinion are like waves on the surface of water, following each other with less and less vehemence, until finally a level is reached.

The reason for this is that a multitude of new riders have come into the ranks of cycling advocates in the last few years, and not

fancies. This will give and has already given rise to quite a variety in such things as saddles or small accessories, where personal taste rather than mechanical adaptability is concerned. It seems likely that the safety has reached that point in its history where it cannot be further improved except in minor details, and it would seem that very soon the public will be ready for another revolution in cycles such as was experienced when the safety displaced the "ordinary."

This may seem preposterous, but previous to the advent of the safety the good old "ordinary" seemed positively certain of its position, and by many was regarded as the final form of cycle.

With the increase of both riders and novelties, more mechanical education is needed by the masses to enable them to select correctly and the writer is pleased to see such valuable letters by men of long observation and experience as have been appearing lately in the columns of THE WHEEL.

PROVIDENCE.

LONDON.

PROGRESS IN PROVIDENCE.

Providence, R. I., Jan. 3.—The past season has marked a decided advance in cycling matters in this State. From a business standpoint the trade has been good. The trade in the State is better organized than ever before. The racing interest has had a flood-tide of prosperity, and the clubs have greatly increased their membership.

With the opening of 1897 there are in the city of Providence six branch stores. This one fact shows that the trade here is on a solid basis, for the average branch store is located only in paying districts. That these branch houses are doing well may be seen from the fact that they are in locations where the rent ranges from \$1,200 to \$5,000 per year. Without exception they claim to have made money during the past season. There are two cycle manufacturers in this city. Their output is probably just short of 1,000 wheels, and they are sold in the local market. The largest sales in the city are made by the branch stores, but there are some eight other dealers who sell on an average more than 400 wheels each per season.

Outside of Providence the sale of wheels is limited. In the other cities, Westerly and Woonsocket, the agencies do not flourish. Newport and Narragansett Pier, the summer resorts, have been favored with agencies in the past, but at the closing of the short season the managers have set down their expenses to advertising.

The business will receive a decided boom from the cycle show, which will be held in the largest hall in Providence during the week of March 5th. Some 70 spaces are provided, and at this day half of them are taken. The show is under the management of the local Cycle Board of Trade, which has fourteen members, the largest dealers of the forty odd located in the city.

At the present time trade is absolutely at a standstill. There are a great many bicycle repairers looking for work.

The racing prospects are good. There are two tracks in the State, one at Crescent Park, some six miles from Providence; the other at Westerly. During the past season there were some six men on the track who could compete successfully with the pure amateurs who competed with them from within the one hundred mile limit. In all probability there will be a boom in professional racing here, for there are five good men, and the track managers are satisfied that the public will pay to see this class of racing.

WEST INDIAN FAVORITES.

In sending their subscription to THE WHEEL the Commercial Agency, of Barbadoes, West Indies, writes: "American wheels, particularly the Rambler, Columbia and Pierce, are the favorites in Barbadoes at present, but there is room for more, and we have been approached by several first-class makers who desire representation here. Cheap wheels are fought shy of, particularly as one or two firms here have had very unsatisfactory dealings with the sellers of cheap wheels."

Next in merit to the cheerful helper is the man who grows but helps you out of the accident that has befallen you.

FOURTEEN YEAR-OLD OILERS.

When Cushman & Denison established themselves in this city as makers of cycle oil cans the call for their productions did not require working overtime. This was not because the oiler lacked merit, but because at that time, fourteen years ago, cycle makers and riders were few and far between. As they became more numerous they recognized the value of the C. & D. oiler, and the persistence of the firm did the rest. As a result the Perfect oiler is to-day easily the best-known article of the sort before the public. Its makers assert more—that the '97 Perfect is "not only without an equal but is without even a competitor as a high-grade oiler." They have two medals of award to support the assertion, and certainly it must be considered whenever and wherever the subject may arise. Small as it is, Cushman & Denison have let no point escape them. "Not one year of the fourteen has passed without several improvements having been made," they say, "and the fact that, although costing more than double the ordinary oiler, it is used with the leading high-grade bicycles, is perhaps the strongest proof of its excellence." Their Star oiler sells for less, but in their own words: "It is well made and second only to the Perfect; in fact, were it not for the Perfect, almost any rider would be satisfied with the Star."

NOCK'S NOVELTIES.

Now that lamp ordinances are becoming almost universal, brackets of various kinds for attaching lamps to the wheel have become important factors in the sundry trade. In this respect, it is opportune to say that George W. Nock, 146 North Fourth street, Philadelphia,

will continue to market the Keystone Fork Bracket that has enjoyed a large sale in the past year, made of steel, highly polished and nickel plated, and easily attached or detached in a few seconds; it embraces points of merit that make a good-seller.

The Nock output embraces the Gem Combination bicycle lock, that while weighing but 3-4 of an ounce, fully secures the wheel; the Keystone Toe Clip, an axle lamp bracket of neat design, cotter pins of four sizes and a full assortment of steel handle bars and the well-known line of Nock bicycle bells. On all these goods money-making discounts can be quoted.

SKOWHEGAN'S PRODUCTION.

Skowhegan, Me., has brought forth a cycle stand, one that will stand and not topple over when the wheel is being put into place, a too common fault of such articles. J. N. & I. J. Smith are its producers. The stand is durable, light in weight and easily taken apart and packed for shipment. It will hold any type of wheel and is intended for either the shop, store or home. Solidity of base is one of its features. The price is such as should attract the jobber and dealer.

TOLD IN TOLEDO.

Toledo, O., Jan. 4.—The down-town sales-room of the Yost Manufacturing Company will be reopened about Feb. 1, with Alf. Gallagher as manager. This gentleman spent last season on the road for the Yost company, and was also connected for a time with the Cleveland retail rooms of the Falcon. He has therefore had plenty of experience as a salesman, both on and off the road, and will doubtless be a competent worker for the Falcon, now that he is back on his native heath.

There have been two changes at the Viking factory during the past week. E. C. Eager has assumed the management of the factory, in the place of Mr. Cornell Walbridge, and C. S. McHenry, formerly a Chicago traveling man, will have charge of the Viking sales-rooms, succeeding Captain Jack Swindeman. Walbridge left the Viking employ to accept a position as one of the firm of Berdan & Co., an old, well-established grocery house of Toledo. There are few better-known bicycle men about this city of wheels than Ed. Eager, and the Viking interests are sure to thrive in his hands. Mr. Eager has traveled for this popular wheel from Maine to Mexico, and from Florida to Vancouver. His acquaintance with the trade of the company is a personal affair, which will stand him in good stead now that he has been called to the management of the concern.

A meeting of local managers of salesrooms will be held at the Chamber of Commerce this week, for the purpose of making the project of a Toledo Cycle Board of Trade a "go." There have been several efforts in this line, but so far all have come to naught. With the matter in its present projector's hands, however, there is every reason to expect success.

The American Weldless Tube Company is now running ten benches, and three more will soon be put in place. An unexpected rush of orders has necessitated the putting on of a night force, and the running of the mill to its full capacity.

TIME TO SOW CYCLE SEED.

The hardware dealer, says Stoves and Hardware, who sees his way clear to make his contract for bicycles for next season now, and gets samples in at once, has undoubtedly a strong advantage over the dealer who does not display his 1897 models until later.

A couple of new models shown in the window now may not secure orders at once, but they will excite interest. Riders, even in the country, are thinking about their next season's mount, and they cannot help receiving a vivid impression of the first new model they see.

Get the people interested in the new wheels, get them into your store, explain the points of difference between this season's wheel and last, and sow the seed for the coming trade in every way possible.

TRITELY TITLED.

"Saddle Sense" is the title of a little handbook issued by the Garford Manufacturing Company, Elyria, Ohio. Despite the fact that it is published in the interests of Garford saddles it is an uncommonly instructive work, and may be perused with profit by anyone. It contains explanatory diagrams and chapters on such subjects as "Choice," "Hints on Adjusting," "Experience vs. Theory," and the like.

Having routed the camp, we attack the fortifications of cheap
cycles, January 1, 1897.

SOME FRICTIONAL FACTS.

How Various Forms of Bearings Have Been Introduced in Cycling to Avoid Friction.

(Concluded from Jan. 1.)

The angle of the cones is of course a matter of consequence. It is evident that the narrower and thinner the V-shaped space in which the ball is held (as in Fig. 13) the more readily will the ball slide down the slope and the greater the "wedging" tendency to force it into the smallest part of this space. Probably the angle made by the two opposed slopes should not be less than ninety degrees, and in some cases a more obtuse angle may be well; for instance, at the steering, since a heavy weight falls on the lower row of balls and there is very little motion, the cone may well be made quite "flat," as suggested by turning Fig. 13 part way around and supposing that the weight is on surface B. A slope of the bearing surfaces sufficient to yield a slight adjustment for wear is really all that is required in any case, and at the steering this provision for adjustment could be least of all. We might add that for convenience the cones in the cuts have been generally drawn with straight-line sections, without meaning to suggest that this is preferable to the curve; nor are these drawings, which of course are not suggested as for working purposes, quite perfect at every point—if they convey the idea of the text they suffice. In Fig. 15, some accident in making the block (by no fault of the draughtsman) has bent the lines of the hub and axle; the Humber is not "built that way."

Most persons, if asked to choose off-hand between two-point and three-point bearings without time for reflection, would probably name the latter, from a notion that three points of contact give more steadiness and perhaps thinking of the triangle—see at the left in Fig. 13. But there is not much in this; for the load presses cone and cup together, and although it is divided on the cup between two points it all rests on the apex of the triangle at the cone. The full diameter of the ball may be used at the axle, and this is good; yet whatever advantage there is in respect to steadiness and division of weight evidently belongs most to the four-point class.

Our own preference between the three forms can be briefly stated. The two-point, properly made, is well enough. So is the three-point, if reformed as shown in Figs. 12 and 13; but as made at present it is another heathen Chinese in mechanics that ought to "go." Between the form of it in Fig. 12 and that in Fig. 13 we have little choice, although in the latter the balls may perhaps roll more uniformly. On the whole, we incline quite strongly to the four-point as in Fig. 17, and consider that to possess the most favorable average of qualities.

But whatever the number of contact points chosen for the balls, what is known here as cup adjustment (it is called disk adjustment in England) should be substituted for the present "cone" adjustment, and this we urge most strenuously. The construction of the "cup" form is indicated in Figs. 13 and 17, but to make the distinction plainer we draw an axle with cone adjustment at the left and cup adjustment at the right, thus, each being two-point:

A year ago, Mr. Schwalbach advocated this

change in THE WHEEL and predicted that it would soon begin; Mr. Wilcox, on his part, is on record as urging it upon a certain maker, some months earlier—so it is not a new topic with us, nor is it new in any sense, for the cup was used in 1830 on the Eolus, as appears in Fig. 7. [It is hardly possible to propose anything really new in cycle construction, unless it may be from the realm of crazy freaks.] The prediction of Mr. Schwalbach is already justified, for accounts from England show that the cup form is becoming general there; it was also used in 1896 by many American makers, in the crank bracket only, and several are reported as having adopted it all around for next season. We have already seen two or three '97 samples which have it throughout and several makers will now have the cup or disk D screwed in flush with the end of hub and "back out" the axle cone C to close up on the balls; cone C has its central portion project-

Fig. 20

ing through D (not so drawn in Fig. 20) and the adjustment is locked by the fork end, which is pressed up against the projecting cone by the outside nut as usual. But this is not the cup adjustment, although a step towards that.

In the "cone" form, the cup is pressed into the hub end and stays there, as a seat for the balls, with its coned surface facing outwards; the adjusting cone faces inward and screws on the axle. The "cup" form reverses this, facing the axle cone outward and leaving it fast on axle; the cup faces inward, and adjusts by screwing into the hub end. The advantages of this method are these:

1. Dirt never enters through the thread, but only through the open joint, and this way excludes it much better, for the open joint at F is plainly a smaller circle and a shorter line than at G. If any felt or other soft washer is used, the friction of it is less at joint F than at joint G.

2. When the cup is pressed into the hub end there are chances of error in position, and it may not be quite true across the axle line—all the more if it is disturbed and replaced, as in changing the rear sprocket. Any nut, coned or otherwise, has some side-to-side movement on its thread, however nicely fitted. Hence there is always some difficulty in having the two opposed cone faces which grip the balls true and "parallel," and in keeping them so when screwed up fast. An adjustment cone may have some "work," also, on the axle from the running of the bearing, and it cannot be very firmly held by a little "dog" and screw; the grip of the fork ends, moreover, is liable to tip it to one side, to the extent of its looseness on the thread—only a trifle, yet enough to interfere with accuracy in the movement. In the cup form, on the contrary, it is plain that a thread of large diameter, as at HH, is steadier in all respects than a small one as at KK; the possible "shake" is also less at the coned face than at the thread, while on cone KK it is greater at the coned face than at the thread; moreover, the cup

form allows the adjustment to be locked more evenly and firmly. There is another reason why this is so: in the "cone" form the cone must run on the axle on the same thread with the outer nut, and that nut must have a rather coarse thread, because a fine one would not be strong enough to bear the strain of locking down the fork ends; so the adjustment has to be on the coarse thread. But the cup, when threaded into the hub as proposed, can have a fine thread, which is always less shaky than a coarse one; so it gets a steadiness from its finer thread as well as from its large diameter.

3. All who handle bicycles know that it is difficult to adjust bearings accurately with the wheel in the fork. The weight at the rim pushes past any little pinch, and allowance must be made for the slight forward movement—not always a "true" one, as already pointed out—which the cone gets on its thread from the grip of the fork when the outside nut is turned home. Whenever the outside nut is loosened for any purpose—and it must be, so long as cyclometers and lamps are attached to the axle instead of to the fork or head, where they should be—the adjustment cone is liable to get moved unintentionally. The cup plan has the obvious and great advantage that adjustment is wholly independent of the fork, being all upon the hub itself. The bearing can be adjusted with deliberation and nicety; then it will stay so indefinitely, while the wheel is handled freely and put into or removed from the frame at pleasure.

To show how readily the cup adjustment adapts itself to either, we draw a hub with a three-point bearing at one end and a four-point at the other, the two-point also presenting no difficulty:

The cup adjustment on crank axle is commonly locked by a pinch-bolt which grips the end of the bracket on the cup thread. This method would not fit readily on the wheels, but there are several others. One runs a threaded ring on the outside of the hub and backs it off against the flange of the cup; another screws a locking-ring on the hub towards the centre; another runs it into the hub

Fig. 21

on a left-hand thread. There is no difficulty in this detail.

In wheel bearings the weight rests always on the lower side of the cup; these pressure points roll constantly, and therefore the wear is distributed and uniform. The back wheel gets a heavy pressure from the chain pull on the back side of each cup and each cone, this being worse by being irregular and twisting; still, this pressure always keeps shifting, and so the wear is pretty uniform. But the axles are stationary, and the pressure on them stays continuously at the same places; hence the axle cones wear flat and out of "true." This trouble can easily be treated on the front axle by loosening the outer nuts occasionally, and carefully turning the axle part way around, so as to bring a new part of the cones—which must not be allowed to move on the axle while doing so—to the under side, where the weight comes. The rear axle can be treated similarly, unless it has an eccentric chain ad-

justment. The pedal cone and cup have to stand a rack indeed. The crank-bearing gets irregular wear on both axle and cup, and, unfortunately, does not easily admit of shifting; we recall only a single exception—the very peculiar device of the Tribune by which the cranks can be set at any position in the circle.

Perhaps—later on, when "fixity of pattern" arrives and people generally procure their mounts with the expectation of keeping them until worn out—it will be thought worth while, for the sake of retarding wear, to make all bearing parts, including even the crank bracket, so that they can be shifted in position as just explained. And possibly there may come such a re-arrangement that axles shall be fast to wheels and revolve within stationary bearing-cases, those being held by the frame, in reversal of the method thus far. We do not predict—we say "possibly;" at least, this would suit the desire for changes.

But this is in the future. Meantime, it is a practical question—much more than a mere academic and whimsical one, if real perfection is to be continually kept and pursued as the ideal—whether bearings are on the right design and are made with the right care. We fear that quite largely they are not. It is not the whole to have the lines correct, in plan and making, for a finishing remains to be done; it is not practicable to shape, drill, thread, and temper, without some departures from true accuracy, and the very nature of a ball bearing requires a hairbreadth precision, or the ostensible object is materially impaired. Grinding must come in for the final touches. Is it worth the while? Some may think that any bearing which runs and will "go" in the market sense is good enough—but consider. The poorest, if set up loose, will spin fairly when under no pressure; but when the load is on and the strong thrust comes the test comes too. It is then that the defective bearing and the too-light frame which springs out of line and therefore "binds" the bearings, get in their work; moreover, the worst is that this work is concealed, for one can't tell how much of the labor is from road and grade and how much is from bad construction—all is lumped in together. Unless we are incorrect in our statements of facts and weak in our deductions from mechanical principles, we have suggested some things at least worth considering in the construction of bearings; and if anybody thinks of us, perhaps a bit impatiently, as "fnicky" and as making a disturbance about trifles, we would remind him that cycle building and using have come through evolution down to a matter of trifles (if small matters of detail are such) and that progress always has its roots in that discontent which will not be satisfied with things as they are, because it sees there must be a better way and is bent on finding it.

JULIUS WILCOX.
ALEX. SCHWALBACH.

KNOW WHAT SHE WANTED.

The Boston youth was teaching the Chicago maiden how to ride a wheel. The lady of the lake was pretending she was timid and in danger of falling.

"Hold me fast," she said.

"Pardon me, you should say 'Hold me quickly,'" expostulated the youth from the Backbay district.

"But I meant both," Chicago-like she said. And he obeyed.

FOR A CYCLE ELEVATED ROAD.

In sketch herewith is shown a system for running a wheel in elevated tracks. Preparations are under way by me to put the system to a practical test, and other cycle repairers and builders may try it if they choose. It is proposed to build the machine with one large front wheel, a smaller rear wheel and a still smaller overhead wheel, as illustrated in the plan. These wheels will run in grooved tracks made of wood and perfectly smooth at the points where the wheels contact. J marks a section of the lower track and I the large wheel. G is a section of the top track and G the overhead wheel. The tires are of the cushion type. It is supposed that if the wooden tracks are perfectly beveled and very smooth that there will be no wear upon the tires. The lower track, H, will be fastened to posts, and the upper track, E, to brackets extended from these posts.

As an extremely high rate of speed is the aim sought in the plan, the wheel-driving mechanism is arranged for that end. This is attained by using a small gear, B, on the axle of the front wheel, and propelling it with a proportionately much larger cam-gear, A. One turn of the large gear will revolve the smaller three times, and a mile a minute can

be made easily. Running in grooves, the machine is self-steering, so that only the handlebars, K, are needed. In building a machine of this sort the gear-cogs must be absolutely perfect, to prevent grinding, jarring, etc. The extension rod, C, can be made from bicycle tubing.

GEORGE D. RICE.

SNELL DID WELL.

Samuel Snell, of the Snell Cycle Fittings Co., is never more uncommunicative than when you talk of American cycles on English soil to him. It's a subject on which he'd rather take than give. To evade inquiries he's apt to say: "No, I don't believe I know much about it. I suppose I ought to, since I was born an Englishman, was in the cycle trade there for years, and then as well as since made numerous trips between the two shores, but I guess I don't know. I've come to the conclusion that the average man who goes over there for the first time and absorbs the whole continental situation in a week, and then returns, is the man best fitted to analyze the needs of the foreign market."

But although Mr. Snell won't talk, it has leaked out that he did well on his last trip abroad; created agencies in various parts of the continent and brought home a quantity of orders that the factory is now working on.

THE OFFICE SOUGHT THE MAN.

S. C. Walbridge, who has been connected with the Union M'fg Co., Toledo, for years, in a high executive capacity, has left that concern to take a managerial position with the Berdan Co.—spices and coffees—in Toledo, in which he has acquired an interest. His position—that of manager under the supervision of Mr. Peter—has been filled by the advancement of E. G. Eager to the post. Although it's rather a bad pun there's no proof that Mr. Eager wasn't eager for the advancement. Mr. Eager should be a success in his new executive capacity. He is a tried hand at the cycle business, having been special traveler for the Viking people, prior to which he was in the employ of Lozier & Co. The advancement has fallen on deserving shoulders. His strong forte is common sense, and the desire to get pretty well acquainted with anything he undertakes. The management of the Viking retail store in Toledo for '97 will be vested in C. S. McHenry, a new man in the Viking force.

AT HOME AND ABROAD.

British Generals have privileges in the English police courts. Sir Reginald Gipps, who was recently summoned for riding a bicycle on a footpath, sent his servant to pay his fine of five shillings and to tender an apology, which the magistrate accepted.

If a New York magistrate had been trying this case, he would have invited the servant to share a seat on the bench with his magistrature, while he proceeded to fine the policeman for interfering with the pleasures of a man possessed of a pull.

SOME UNCLE EPHISMS.

Opportunities rides on one wheel; yo' mus' grab dem by de handle-bar or dah fron' wheel ah dey's done gone forebber.

Wimmen in de racin' game is like a diamond pin on a dirty sweater.

Sum riders impa't bicycle info'mashun very much like dah hedgehog sheds his quills.

De skeeter might hab been highly prized as a singin' burd if it had on'y stuck to dat business; de racin' man ort to remember dis when in de winter he covers hisself wid diamians and thinks he's a howlin' swell.

LIABLE TO BE MISUNDERSTOOD.

"Our wheels are perfection," declared the enthusiastic salesman, anxious to make a sale. "We take no chances in guaranteeing them," he added. After the customer had left without purchasing, the salesman sat himself down and pondered just which way the customer had taken that "no chance" statement of his.

BY RAIL INSTEAD OF WHEEL.

Tom Winder, who gained fame by making a tour on an Eclipse wheel entirely around the border of the United States in 1895, is to start on another tour of a similar nature in February, but this time by train. The trip is to be made in the interest of an Elmira, N. Y., paper.

MAKE WAY FOR HIM.

He comes! He comes! And cheeks are pale,
And brains with terror reel;
The Juggernaut of cycledom—
The Wobbler on a wheel!

AN OUTSIDER'S OPINION.

Mr. Editor, did you ever think of how cycling is viewed by an outsider? By an outsider I mean one who has neither a bicycle to sell nor one to buy. I don't suppose such an opinion would be considered by you of any value or worthy of print, yet there are still a few men left in the world who, like myself, neither make, sell nor yet ride a bicycle, and have no desire to deal in bicycles nor to have bicycles dealt out to them. To men of this very limited class cycling is looked upon as a disease of the brain that displays its first symptoms in an abnormal use of the feet. A diagnosis of the malady reveals in the victim an insatiable desire to travel the greatest possible distance in the shortest possible time, without care or thought of the why or wherefore of the journey.

One enthusiastic wheelman (genusscorcher) is more dangerous on the highways than a dozen rabid dogs. Stone walls cannot balk him, and steep hills are as wine to his exalted soul. On his "swift, silent steed of steel" your enthralled wheelman is unmindful of home and mother. Rent day has no terrors for him, and the fact that he may spill himself in small chunks at any moment is of as little consequence as a fly to a fly-wheel.

The enthusiastic cyclist is a living picture of monomania. He or she is a human monument to the logic of Dr. Max Nordau, whose much-questioned partitioning off of the human race into imbeciles of varying temper finds complete verification in the wheeling tribe. Perhaps, Mr. Editor, it is because I am a stickler for dignity of personal appearance that I have never yet discovered man or woman a-wheeled who looked in the slightest degree dignified.

I once owned a marvelous toy which consisted of a red wooden monkey astride a yellow wooden velocipede. I never see a bicycle rider in these later days of mine that I do not recall the painted bauble of my childhood, and I think, on the whole, the thing of wood was the cheerier sight of the two.

While I do not think that the bicycle is a device evolved by the devil, I do think the latter gentleman has the largest number of followers in the ranks of cyclists. It is too much lacking in respect for his Satanic Majesty to credit him directly with the creation of a grown-up toy that is neither a noble utensil of sport nor a manly means of locomotion. In his eagerness to murder time and bridge long distances, the average bicyclist finds the ordinary garbings of civilization irksome to his flesh, and forthwith discards as much of his clothing as the weather and the police will permit. In his striving after simplicity in dress, the cyclist takes the first step among human kind along the path of retrogression, which leads back to prehistoric days and the aboriginal ape.

A Hibernian friend of mine, in describing a bicycle, said it was "only two shmall barrel-hoops, wid rubber hose on the outside, an' bits of woire on the inside, the entire article held together wid gas-poipe, an' a place on top for to sit down on." The definition came nearer the truth than the son of Erin suspected.

I have no doubt that all I have written (if you publish it) against the sport, pastime, recreation (excuse it under any name you please) will bring upon me such anathemas as only cyclists have learned out of school. Be that

as it may, feeling as I do about the riding of a wheel, I am daily taking lessons so that I may get out on the roads next spring, when I hope to learn some new facts about this foremost of fads.

JAMES S. FERMOY.

HERE'S THE CYCLE SWEEPER.

In figure 1 of accompanying diagram is a plan for attaching a revolving brush to a tricycle for the purpose of sweeping depot platforms, large halls, macadamized streets, etc. Most any form of bicycle can be used and changed to fill all requirements by making a new rear shaft, about 36 inches long, and fitting one end to the original rear wheel of the bicycle and the other to the hub of another wheel. The additional wheel will be adjusted next to the cam, A, and outside of it. This wheel is not shown in the drawing. The regular rear sprocket of the bicycle need not be changed, except to conform to the size of the new shaft. The larger sprocket-cam, A, should be keyed to the shaft next the small sprocket,

and a chain run from the former to the sprocket, C, which is secured on the shaft, B, of the revolving brush. D. An arm, E, can be made from cast-iron and set to hold the brush in proper position. There should be a short arm on the other end, as the brush will need to be set at an angle in order to sweep the dirt to one side. The arms being pivoted, the brush can be raised and lowered at will.

An additional support for the brush and arms is obtained with a brace extending from the brush bearings to the cycle frame, as shown. A water tank may be attached as shown at F, and water distributed in the usual way by means of the pipe and connections at G.

GEORGE D. RICE.

SCORCHERS OVER SLEEPERS.

Among the schemes that are now engaging the attention of the British public is one for the conversion of the numerous canals running out of London into cycle paths. The canals are relatively but little used, pay altogether inadequate returns and are in a shocking state of unrepair.

It is proposed to let the water out and to make a track of old railroad sleepers along the bottom. It is estimated that a fifty-mile cycle path thus constructed would cost about \$50,000, and that a charge of 10 or 15 cents a day per bicycle would yield a handsome profit.

FORTUNE'S WHEEL.

Turn, Fortune, turn thy wheel with smile or frown,
With that wild wheel we go not up or down;
Our hoard is little, but our hearts are great.
Smile and we smile, the lords of many lands.
Frown and we smile, the lords of our own hands:

For man is man, and master of his fate.
Turn, turn thy wheel above the staring crowd,
Thy wheel and thou are shadows in the cloud.

HE WAS SORRY HE SPOKE.

"You are concealing something from me!" His words were bitter, his accents sharp. So sharp that the maiden whom he addressed started, as though frightened, and blushed deeply.

"It is no use denying it," he repeated, with more sadness than bitterness now; "you are concealing something from me."

The girl hung her head in silence, and made no attempt at denial.

Shortly after he left her, without the usual good-night.

Stung to the quick with his reproaches and realizing the truth of his accusation, when he called to take her riding the next evening he found her clad in a wheel costume, the component parts of which were a sweater, knickerbockers, golf-stockings and a Tam-o-Shanter.

Then he remembered his accusation of the previous evening with regret, for however true it might have been then it was no longer so.

IN VERY CLOSE QUARTERS.

"Geel"

A howl of anguish arose from the man with the pale pink whiskers.

"I've an awful stitch in my side!" The rider nearest him pulled his wheel yet further from the path.

"That comes from—"

(He helped the stitch sufferer through the throng of curious onlookers as he spoke.)

"—getting hemmed in a crowd."

The other said nothing, but silently took an oath not to ride on the Coney Island cycle path in future on either a Sunday or a holiday.

JOKED, BUT GAVE UP.

"Twenty-five cents for inflating my tires, eh?" gasped the rider as he was met by the demand of the roadhouse hostler for a quarter in payment for some alleged tire-pumping. "My, but that seems like a lot of money to blow in!"

And it was, but he paid it rather than enter into an argument with the hostler regarding the matter, because the hostler weighed about two hundred pounds, and looked as though he might have once earned honors in a twenty-four foot ring.

DOWN ON HIS LUCK.

"You ride a great deal," said the agent to a scorchor. "Why not take out an accident policy in our company?"

"No use," replied the scorchor despondently; "if I was on a club run and the whole shooting match run over a cliff or fell through a bridge, and every blessed one was killed or injured, I'd still be uninjured with that blamed policy in my pocket. There's no hope at all for me!"

MIGHTY FEW OF THIS KIND.

"I thought I saw you coming out of a dime museum yesterday!"

"Maybe you did. I'm doing a turn in one now."

"What! Why you are no freak, are you?"

"The greatest in the business! I'm the only pedestrian in the world who does not claim to have barely escaped with his life from a scorchor."

Sure 'nough Syracuse.

THAT IS THE CHOICE OF 1896 SYCAMORE RIDERS. THEY WANT CRIMSON RIMS TO CARRY THEM THROUGH THE SEASON OF 1897 AS WELL. IT WILL ALWAYS BE A CASE OF "SURE 'NOUGH SYRACUSE" WITH YOU WHEN YOU FIND OUT ABOUT

Crimson Rim Quality

IT IS THE INSEPARABLE BICYCLE SOUL OF THE SYRACUSE. WITHOUT IT, IT WOULD BE NIL, LIKE A MAN WITHOUT A SOUL. WITH IT IT IS MIGHTY IN BICYCLE QUALITY, PRE-EMINENT IN STYLE, POPULAR IN SELLING CAPACITY.

THE SHOE PINCHES.

British foreign trade must indeed be suffering severely from American competition when the Cyclist, that ardent lover of all things American, feels called upon to remark editorially, after a visit to the French cycle show:

"A prominent French journalist, who has been much concerned of late years with one of the Parisian cycling dailies, was on this side last week, and gave it as his opinion, after careful study of the general features, that our cycle export trade with France was on the wane, before the persistent competition of the American houses established and to be established in France. Of the persistency, any one who has visited the Salon du Cycle must be aware. In past years the British has been the dominating foreign element in these shows, but to-day that has to be written of the makers from the other side of the Atlantic. As M. Bruel (the French representative of the Premier Cycle Co.) assured us, the general French taste for cycles runs on American lines, and accordingly there are no prejudices to fight, as there are here. Their way is made smoother for them by this fact, and they are not slow to take advantage of it."

ISN'T THIS FUNNY?

A German cycle paper, *Der Radwelt*, is fairly frantic over the way American-made bicycles are supplanting the German ice wagons which, prior to the introduction of American machines, were formerly accepted by German riders as examples of up-to-date cycle designing and construction.

Der Rad welt damned American machines in a three-column hysterical welt recently, climaxing the welting with the assertion that the Rad's editor had taken a first-class American wheel apart, and could therefore assure his readers that neither in material, solidity, nor durability was the American wheel the equal of the German, and that "since the industry had been established in Germany since 1885, and in the United States only since 1891," it must naturally follow that the American did not possess the same experience in the art of building machines.

The list of exports do not show that Americans are shipping any fewer machines to Germany since the foregoing attack was printed.

LIKE THEM AND WANT MORE.

During 1896 a total of \$3,000,000 worth of bicycles were exported by American makers. Of this amount \$1,200,000 went to the United Kingdom, \$220,000 to Germany, \$120,000 to France, more than \$400,000 to the rest of Europe, more than \$515,000 to British North America, and \$350,000 to British Australasia. Wheels worth \$35,000 were sent to Africa. Cuba was not so immersed in war as to escape the business, and she took \$5,000 of American machines.

AMERICA WAS THIRD.

The duty paid on cycles which entered Belgium during the first six months of 1896 amounted to more than \$70,000, the total value of the imports on cycles for the period being declared \$580,000, of which \$340,000 came from England. France was next with \$107,000, and the United States showed \$60,000.

There is hope for the man who knows he is prejudiced for or against a wheel.

BREAKS AND REPAIRS.

Those whose business it is to repair and fix bicycles have many varied styles of wheels and parts of wheels to deal with. Occasionally a rider comes into the shop with a roller-bearing wheel. To get good results from these bearings, the rolls must be true and free from gummed oil and other foreign matter. Fig. 1 shows a cut-off view of the bearings, A being the axle and B the rolls. Fig. 2 is another view in which A marks the axle and B the rolls, and C the balls.

To remedy grinding, stiffness or like troubles with these bearings, take the parts off, test the rolls, and true any sprung or indented ones; see if the axle is perfectly straight, and if not draw the temper and straighten. Gauge the balls to see if all correspond; cleanse the parts in the usual way and replace.

An odd style of hot-blast brazing device which we lately built from odds and ends about the shop is given in Fig. 3. The air and

gas-feed pipes are centred at A, the gas feeding from B and the air from C, from either side, passing through the double pipes D to the nozzle E as shown. The flow is regulated by the cocks F. The blast is thus concentrated at G, at which point any part of a cycle frame or other article to be treated may be easily held or supported.

The device is handy for brazing cycle frame joints or for brazing unions which have been made in repaired tubes, while tempering, forging and other work can also be accomplished with it.

Cycle repairing calls for more or less drilling of small parts. As the modern bicycle is composed mainly of hardened parts of the firmest fibred metals, drilling is rendered difficult and the instrument used heats quickly unless the temper be drawn from the article. Even then heating occurs. To overcome this trouble I have had a set of drills made with a channel cut through the centre of each, as in-

dicated by A in Fig. 4. This channel starts at the centre at the top, coming out at the side of the cutting tool at C. A hole is also cut from one side of the drill to connect with the channel, into which is put the tubé of a rubber ball of oil, as shown at B. Thus, in drilling, it is only necessary to press the ball once in a while and the oil flows to the cutting tool, lubricating it.

A jet pump is handy in any shop. A homemade one can be erected as shown in Fig. 5, consisting of the upright pipe G, the water-pipe F, which extends to the water E, the union A, the steam-pipe D, valve C, and delivery B. Steam enters through pipe B, sucking the water along from the tank, forcing it upward through the pipe G to whatever point desired.

It is considerable of a trick to remove stubs of broken spokes from flanges or hubs. After several years of tinkering at such work, I have found that when a spoke is broken off as indicated by B in Fig. 6, the same can be readily removed from the flange A by filing the stub square and turning the part out. But when the stub is broken short off, as in Fig. 7, the problem is harder. With a cutting tool C, shape a slot, then back out the stub with a screw driver. If broken off in the hole, as in Fig. 8, drill a hole at E, and drive into it the tool D, which will take hold, being beveled, and can be turned back, carrying the piece of spoke with it.

GEO. D. RICE.

WENT LIKE HOT-CAKES.

Every one of the 173 spaces at the Philadelphia Show, which will be held at the Second Regiment Armory, February 20-27, have been taken, and the Cycle Board of Trade have already figured a net profit over all legitimate expenses, although the doors will not be opened for over a month. In the allotment of spaces no favoritism was shown. The spaces were bid for in true auction style, and the premiums reached a figure more than equal to that of the rent of spaces. There was no disposition to force a competition for the first choice of space, but by an almost unanimous, though unexpressed, consent, that choice was allowed to go to the firm that was willing to lead the bidding. The value of the other spaces was looked on as equal to that first selected, and by the same process of bidding several other spaces were selected at the same price.

FIXED THE ARMORY ROW.

Brooklyn's Cycle Board of Trade has succeeded in securing the old Thirteenth Regiment Armory and its cycle show will be held the second week in March. The trouble between the trade organization and Cycle Club of Brooklyn over the building was smoothed over by one of the city aldermen. The armory was secured for the week for the sum of \$500.

NOT RESPONSIBLE FOR THE SURGEON.

An employer who calls a surgeon to aid an injured employe is not liable for the negligence or malpractice of the surgeon, provided the latter had knowledge and skill ordinarily possessed by other surgeons, and the employer had no reason to suspect that the surgeon would fail in his duty.

A lightning calculator—the man who figured out the percentage of a wheelman's chances to be struck by a thunderbolt while riding a bicycle.

WELDING WITHOUT FIRE.

May Save \$1 Per Frame, Too—Another Novel Process of Making Brazed Fittings.

London, Dec. 26.—Now that we seem to have settled down in general lines of design, it is perhaps only natural that inventors' ideas should be directed towards more economical or more improved factory work in bicycles.

Some time ago I mentioned an idea for the jointing of tubes to lugs by hydraulic pressure, which the inventor sold to a syndicate, in which was, of course, the inevitable Hookey-Rucker combination, for the sum of £2,000. Since then I have heard nothing about the deal, but I have come across another system of frame building in which brazing is quite dispensed with, and as I know that one of the most practical and astute men in the whole of the cycle trade is at the back of the small syndicate who are working on and testing it, I give it here in a spirit of conviction that it will be brought to a successful and a public trial very soon.

Figure 1 explains the process as applied to the lower ball-head lug. The lug, where it receives the tube, is corrugated internally, as shown. Inside the tube, before it is inverted, is placed a set of expanding circular wedges formed of the discs, collars and screw stud,

shown in Figs. 5, 6, 7 and 8. The large collar, Fig. 8, fits the tube exactly, and is of such width as enables the expansion discs, Fig. 5, which are like two saucers, to be placed against it with their concave surfaces in juxtaposition. The small collar, Fig. 6, is of the same width as the large one, and through it the screw stud, Fig. 7, engages with the expansion discs only. This stud is operated upon through a small hole in the front of the

lug by a key (shown in Fig. 1). Figure 2 shows the aspect of matters after the stud has been screwed home, the expansion of the discs having forced the tube into the circular

corrugations in the lug just as does the water in the hydraulic system. Figures 3 and 4 show the method adopted with the front fork crown.

It is claimed by the inventor—J. S. Inshaw, of the Aston Engineering Works, Birmingham—that this system will reduce the cost of frame building by a matter of about one dollar a frame, while giving joints untouched by fire, and, of course, saving time by obviating the necessity of cleaning joints and truing frame after brazing. I have been shown a machine constructed on these lines, and was told that it had been in use for some months. It looked all right.

Another process which has the same end in view as Mr. Inshaw has, but attempts to arrive at it by brazing well, is the patent of Mr. Tayler, of the Shark Manufacturing Company, Birmingham. It is a system of producing tube connections out of sheet steel, in which the act of brazing to the tube also brazes the component parts together. Figure

9 shows the bottom ball-head connection as it is stamped out of the sheet and pressed to shape. The three rings are also cut out of sheet steel, and their duty is shown in Fig. 10, but those who desire to have the ordinary pattern of lug can have these rings made of metal, which disappears in brazing, the rings, of course, holding all taut for the blowpipe to get to work.

It is claimed that a perfectly brazed joint is the natural outcome of this system, as the capillary attraction of the open seams in the ring causes a proper flow of the spelter and a more general distribution of the brazing than is usual in ordinary work.

Mr. Tayler also claims a reduction of cost of building and a more perfect frame, because of the absolute accuracy of the pressed work and the extreme lightness of the connections made out of wrought sheet steel.

The most interesting fitting, however, of the group is the bottom bracket, or, as you call it, the crank-hanger, Fig. 12. It is built up in three sections around a central tube, which is screwed internally to receive the adjusting discs. As, however, these latter are unique in their way, I also give a sectional

drawing illustrating the method of fitting the adjusting cups in Figs. 13 and 14. Figure 13 shows how the bearing cups are operated upon by a collar engaging with the internal

threads in the crank-hanger, and Fig. 14 shows how this collar is operated by a special spanner fitting projections on its face. Truly, Mr. Tayler is a man with ideas, whether practical or not time will show.

Amongst the new flotations are the Non-Collapsible Tire Co., capital of £130,000, which has gone to allotment. I believe that George Singer came to the rescue of this at the last moment. The Raglan Cycle Co. asks for £170,000 in ordinary and debenture issues, while W. & A. Lloyd, a fittings firm, wants £40,000. Next week the New Star Cycle Company will ask for £150,000, while a new cycle and parts company, bearing the name of J. B. Dunlop, will also appeal for support. Not a bad crop for a Christmas week, is it, and everything frost-bound?

KINGS OF COMMERCE.

In a recently published article entitled "Paramount Control of the Commerce of the World," Mr. Edward Atkinson presents some considerations of the very highest importance, especially so to the cycle makers of this country, who have only of late made a determined and successful effort to invade foreign markets.

Mr. Atkinson's proposition may be summarized as follows: The resources of this country are such, in a natural way, that the power of production of food, fuel, shelter and clothing are unlimited, while the power of domestic consumption is limited. There exists, on the other hand, an immense potential demand for these things on the part of the other countries of the world, whose natural resources do not approach those of this country, except under conditions where the full exploitation of those resources is practically impossible. His inference is that, as the title of his article suggests, paramount control of the commerce of the world is within the reach of this country, and will actually be attained, provided that national common sense asserts itself in financial and commercial legislation.

Besides the great natural resources of this country, which alone would seem to assure the result described by Mr. Atkinson, there is to be reckoned the blessed fact that we have no standing army to support and all our people are available for industrial purposes. The tax for national purposes is not more than one-half that of the most lightly taxed nation in Europe. There is then above all the fact that the intellectual standard in this country is the highest in the world, with constant improvement in this respect. Mr. Atkinson naturally asks why, under such conditions and with proper financial laws, is it not certain that the United States will assert its commercial control over the whole world?

UP THE HUDSON.

New York's Capitol Viewed From the Standpoint of Its Cycle Trade Possibilities.

Albany, Jan. 1, 1897.—There is, perhaps, no city in the State where so large, substantial and profitable a trade in wheels has been established in so short a time as has been done in this city.

Previously to the season of 1895 the trade was in the hands of a few concerns, notably Richard Robe, who handled the Columbia since the days of the high wheel; the Albany Hardware & Iron Co. with the Rambler; Ed. Paddock and E. W. Vine. With the close of the season of 1894 these firms, with a few other progressive business men began to realize that the bicycle was fast being transformed from a plaything, or simply a means of recreation, into an article of utility almost as necessary as the street cars or the telegraph, so plans were made to carry larger lines and pay greater attention to the business. In the winter of 1894-95 the local Board of Trade decided to give a large cycle show in Harmanus Bleeker Hall, March 2, a report of which was printed in THE WHEEL of March 5, and in the meantime several new bicycle firms were started. The show, which was given under the auspices of the Albany County Wheelmen, had the double effect of stimulating trade and bringing into existence numerous other sellers of cycles, and from this show the present substantial trade may be said to have grown.

The new firms and agencies increased rapidly until there were over thirty selling bicycles, and, though it may seem somewhat odd, they all did a thriving business.

In 1894 there were from one thousand five hundred to one thousand eight hundred cyclists in Albany; there are now a few more than four thousand eight hundred, and the greater part of this gratifying increase was made during the season just past.

Although all of the concerns did a good business, as has been said, the end of the season saw many of them dropping out of business. This was due chiefly to two reasons—insufficient capital and the pernicious system of selling on time and the installment plan. The result was that when the manufacturers wanted to collect the retailers could not pay, and the natural consequences ensued; but your correspondent has not heard of one single instance where the manufacturer lost anything by these concerns who were obliged to give up. This has had a most beneficial effect on the trade, for there is no denying that there were too many in it. It is rumored that many, if not all, of the drygoods houses, jewelers and other houses which sold wheels will give up the business this year, so that the trade for 1897 will be in the hands of thoroughly competent and experienced men. As nearly as can be ascertained the dealers will make no changes in the lines of wheels they carried last season. They know them and their good points, and as long as their customers are satisfied a change would be unwise.

It will, perhaps, not be out of place to say here that Albany and vicinity has been greatly the gainer by the increase in the number of cyclists, for during the season of 1895 there were more street and road improvements here

than during the previous five years, and this was entirely due to the efforts of the cyclists' agitation for good roads. Albanians are said to be slow, and perhaps they are, but they are at the same time sure, and there are none so ready to help along a really good movement as these same slow and sure Albanians. When a thing or movement is once taken up by us it is pushed with persistence, hence the improvement of the city streets and the chief roads leading out of the city has the support of the non-cycling as well as the cycling inhabitants.

The Albany Hardware and Iron Company has done the largest business in the city for the past season. Beside its large retail trade the company has done a large jobbing business all through this State and through the New England States, its sundries trade having extended as far east as Boston. As has been stated, this firm in 1892 handled the Rambler and some of the Buffalo Company's output, but up to 1894 the sale of wheels was but a detail of the firm's immense retail and wholesale hardware business. In 1894 a regular bicycle department was established, and the Falcon and Crawford were carried, the other wheels being dropped, and W. E. Foskett put in charge of the department. In 1895 it was

ingly popular and both are enthusiastic wheelmen. Mr. Higgins having done some excellent work on the track as an amateur. They carry the Keating, Dayton, Stearns, Fearless, Imperial, Silver King, Stormer and Waverley. Their showrooms are among the largest and most attractive in the city, and in connection they have a repair shop and a rink, where customers may try their wheels and novices be taught to ride.

Another of the new firms which began business last winter is W. R. Fredericks & Company. It handles the Liberty, Ben-Hur, Bison, Lyndhurst, Envoy, Fleetwing and Majestic. Mr. Fredericks learned the business under the able instruction of Ed. Paddock, and as he is a hard worker the firm has done well.

Eugene Sanders was in the typewriter and stationery business in 1894, carrying a few wheels as an experiment. Before the season of 1895 opened the "experiment" proved such a success that he gave up everything else and devoted all his time to the sale of bicycles and sundries. In the sundries he has found the Hulbert Bros.' pneumatic brake and the Brown-Lipe interchangeable gear excellent sellers. He carries the Union, Humber, Elmore and Ridgefield, which is especially made for him, and has proven one of the best of the low-priced wheels. In addition to the retail trade he has done a large business in his rental store on Willett street, facing Washington Park.

E. W. Vine is agent for the Spalding goods, which, of course, includes their wheels, and the Credenda. Mr. Vine began to sell wheels seven years ago, the Swift being his first wheel, but three years ago he gave it up for the other two mentioned. His store is the largest and finest sporting goods store in this vicinity, and the stock of guns and rifles he carries range from the cheapest to the very best, and represent many thousands of dollars. His store is a veritable sportsman's club; nearly all the important shooting matches are arranged there. His trade, entirely retail, has been large.

Another sporting goods dealer is Ed. Paddock, who sells the Victor, Henley, Boyd, Birdie Special, March and Crescent. His trade has been retail and most satisfactory.

The Erwin Manufacturing Company, of Greenbush, on the opposite side of the Hudson from Albany, was incorporated in 1895 for the manufacture of bicycles, and is the only manufacturer of importance in this vicinity. The officers of the company are W. W. Grey, President; Frank Erwin, Secretary, and Robert J. Pratt, Treasurer. Mr. Grey is a well-known business man of this city, and manager of a large corporation. Mr. Erwin is a well-known wheelman, who rides a 92-gear and has done some good work on the track, and knows how a good wheel should be built. Mr. Pratt, the financial man, is a graduate of the Rensselaer Polytechnic Institute in the class of '83, and is a skilled engineer who has had ten years' experience in manufacturing. The company's plant is admirably located, water and rail transportation being right at hand, and is completely fitted with the most modern appliances for the manufacture of wheels. The firm believes in the best pay for the best men to be had, and the result is a superior wheel. They make the Irwin, Vindex and Rensselaer.

THE BANTAMETTE.

An English adaptation of a front driver for woman's use.

found to be necessary to increase the store-room, for every floor of the firm's large retail store was filled to its utmost capacity, so the store No. 73 State street, in the next block, was rented for the bicycle salesrooms and repair shops, and the Fenton, Eagle, World, Adirondack and Saratoga were added. There is every prospect that the business done by this firm during the coming season will be even larger than it was last season. The Hardware Company is fortunate in having so competent a manager for this department as Mr. Foskett. He is genial and energetic and knows his little book thoroughly.

Richard Robe, or "Dick," as he is better known, although a young man, has been selling Columbia wheels for years, and has never handled any other make. He began with that concern's ordinary, and was the first to adopt the pneumatic tire. His trade, which has been entirely retail, has been large and will be larger, as Mr. Robe has made a reputation for himself as a reliable and trustworthy business man. Mr. Robe is a man who has little to say about himself, but he can talk Columbia in a way that would cure the blues.

The firm of Myron J. Higgins & Company is one of the most substantial of the later comers. They started in the winter of 1895. The silent partner is William M. Honig. Both these young men are exceed-

CHICAGO, ILL.

PARIS DISPLEASED THEM.

Cold Comfort for the Englishmen at the French Show—A Formidable Black List.

London, Dec. 26.—In consequence of the season which is popularly connected with peace and good will by mankind towards mankind there is very little to record regarding the English cycle trade.

Those who have been over at the Salon du Cycle in Paris have very little in the way of praise to say of it. This may be due to the fact that the English grip on the French market is fast waning, or it may not, but in any case it seems tolerably clear that neither in point of trade interest nor as an exhibition does the Salon du Cycle compare with either of our great shows. The venue is extremely bad, inasmuch as the ground floor is of gravel, and as this is heavily wet each morning to keep down the dust, the surface lifts to an abominably disagreeable degree, rendering walking about irksome and keeping the stands in a filthy condition. Then there has been very little attempt to reproduce the sumptuousness observable at Islington or the Crystal Palace. This, possibly, was caused by the matter I have just mentioned, but all the same the absence of any real attempt to produce artistic exhibits or even ordinarily complete stands strongly impressed every English visitor, who, to a man, call down the affair as "mean-looking."

Most of those with whom I have been discussing the trade aspect of the affair agree that its most strident note is the vigor of the native trade. It is not denied by anybody that year by year the English makers are being squeezed out of the French market. Until the advent of the American-built bicycle the English article always commanded the market in which price was a secondary object. Now, however, even that is being gradually closed against them, for the French, like the Irish, have a kindly feeling as a nation for your continent, and as cyclists have no prejudices in the way we Britishers have, this is good for America and apparently not bad for France, as the French-built machines are as a rule very inferior in finish to the imported articles.

The situation as it stands has made the French trade adopt a very "cocky" tone, and French makers now confidently talk of carrying the English market. I would, however, advise them to keep their eye on Germany, where the cycle trade has made great strides of late years, and which I fancy will in a few more practically command the cheap bicycle market—and the French cycle is at best only in this grade.

The Dunlop Tire Company has just issued a blacklist to the cycle trade. This list contains the names of the firms against whom the great tire firm has obtained legal decisions and against whom actions at law are pending. It is quite a formidable list, I can assure you, and is divided into heads. The first sub-list consists of all those against whom perpetual injunctions have been gained. Number 2 embraces those who have been ordered by the court to keep an account of their sales, with the idea, of course, of assessing damages when the verdict against them is pronounced; but No. 3 is the most interesting roll of fame, as it consists of those against whom the aid

of the law has been invoked. First on it is the name of the Tubeless Pneumatic Tyre Co., Ltd., and looking it down it is almost correct to say that only about half a dozen of the most prominent firms in the tire trade have escaped so far. I am told that the directors of the Dunlop Tire Co. are meditating the repurchase of all the licenses which they have granted with a view to floating a huge concern, monopolizing the pneumatic tire trade of the country, with a capital of \$50,000,000. I may say at once that I don't accept this canard, simply because the licensees would place such a high purchase figure on their licenses that the Dunlop Co. would find it more economical to beat them out of the market by spending money in trade competition. Besides, I don't think it possible to effect a tire monopoly in Great Britain. The trading principles of this country are totally opposed to it, and the day that the Dunlop combine became a fact that same day would see a reaction in favor of such tires as the single tube Palmer, the Chase and the Morgan & Wright. It is all a question of money, and so many moneyed men are now becoming interested in the cycle trade that a tire monopoly would not be countenanced unless it was a benefit.

JOS. M. HILL.

Mr. Hill is one of John C. Bowe's right-hand men and the name Bowe, as everyone knows, is synonymous with the crimson rimmed Syracuse bicycles. Mr. Hill is just now

the centre of no little interest, because Mr. Bowe has chosen him to make a trip around the world in the interests of the Syracuse bicycle. Likening the voyage to one of Jules Verne's expeditions, a Syracuse man writes of Mr. Hill:

"Joe is just the fellow to make the Hottentots roar, just the fellow to tickle the fun-loving monarch of the Sandwich Islands, just the fellow to impress the sharp Boers, just the fellow to be received by the greatest man in China, just the fellow to teach the Japs a thing or two about cycling, and goodness only knows what he will do in Europe."

NOTICE.

Mr. D. L. Cockley having resigned the General management of this company, to take effect January 1st, 1897, he will not, in future, be actively engaged with us. All correspondence relative to the business of the company should be addressed The Shelby Steel Tube Co.

W. E. L. MILLER, President.

NO PRENTICE HAND

Was Responsible for the Inventing and Construction of this Screw Machine.

Every cycle manufacturer is interested in screw machines and will, therefore, be concerned in the invention of Geo. S. Prentice, of Worcester, Mass., the former superintendent of the Windle Cycle Co. Patents have been obtained, and it is stated that a syndicate of Hartford and Worcester capitalists is organizing to operate them.

The Prentice invention is of the automatic multiple principle and it is claimed will produce twice as many finished screws as the machines now in use. It is thus described:

The first machine, or the one intended for the manufacture of large screws, consists of a bed supported by legs like those of a lathe or machines of this type. At either end of the bed is a headstock containing three or more spindles which may be revolved at a high rate of speed.

These spindles have two motions, one on their own axis and another around a common centre. The spindles are hollow and have at the end a spring chuck for holding the wire or rods of metal. Between the two head stocks is a turret head which revolves intermittently by means of a ratchet and pawl actuated by a cam.

The tools for turning the stock to size and cutting the thread, etc., are located on either side of turret head. This turret head has a lateral reciprocating motion also and is so arranged that as soon as the tools have completed the work on the screw on the left-hand side it begins to perform the same operation on the stock held in right-hand spindle. Thus no time is lost after each lateral motion, the turret head revolves one notch, bringing another tool into place and in the next lateral motion a new operation is completed. There are as many tools in the turret head as there are spindles in the head stocks and there are as many spindles as there are operations. So at each lateral motion of the turret head after the machine is started, two complete screws are made.

Beneath the bed is a cam shaft containing a series of cams, two of which operate the cutting off devices. Two others which feed the stock automatically into the chucks, as the completed screws are cut off another operates the turret, etc.

The other machine or the one intended for small screws differs materially from the first. The wire is fed from the coil. In the first machine the stock revolves while the tools do not. In the second machine the stock is stationary while the tools in the turret head revolve. Otherwise to all practical purposes the machines are alike. Each tool in the turret head is held in a spindle to which is attached a gear, thus forming a pinion. Outside the turret an internal gear is revolved, whose teeth mesh with those of the pinions. This turret head has no lateral motion, but the stock heads have. The wire is held between three rolls which straighten it as it passes through them. The machines, it is estimated, will produce some of the smaller variety of machine screws at the rate of 100 per minute. Of course the larger ones cannot be made so rapidly.

ON LAKE ERIE'S SHORES.

Cleveland, O., Jan. 4.—The second annual cycle show given by the Association Wheels occurred New Year's Day in the Y. M. C. A. building. Owing to the non-arrival of '97 models to be handled by some of the leading retailers, the exhibit was not as full and complete as it should have been, but for all that it was a success. The bicycle exhibits were in the gymnasium, while the specialty and parts dealers showed their wares upon the third floor. Upon this floor were represented the Kundtz Bending Works, the Kelly Handlebar Company, Bordons & Oliver, makers of hubs, sprockets, cones, etc.; the Kells Saddle Company, the Tireine Manufacturing Company, H. J. Boggis & Company, makers of the Boggis grip; Morgan & Wright, and the New York Tire Company. One side of the entire centre of the gymnasium was occupied by H. A. Lozier & Company, who showed the full Cleveland family, the Westfield and the Williams juvenile line made by the Fay Company of Elyria. On the opposite side Likly & McNair showed the Hoffman, Clipper, Rambler and Ideal; also the Furlong puncture-proof tire. J. Callahan & Sons displayed the Dayton, and were assisted by Pat Hussey, the only outside factory representative on the ground. A racer labeled "1900, gear 105," was the feature of this exhibit. This wheel was fitted with a new toe clip, the invention of Hussey. The White Sewing Machine Company were in line with models of all sizes, and also showed a line of juveniles made expressly for their trade, and called the Cazador. Davis, Hunt & Collister, the Columbia agents, entertained with '97 models of both Columbias and Hartfords. The Winton Bicycle Company was also represented. Occupying one entire side of the room was the McIntosh-Huntington Company. They showed the Sunol, American King and Queen of Scorchers, Hercules and Stella. Wolverton & Drake exhibited a sample of their Perfect Bicycle Rest, an ingenious little affair to support a bicycle. Last but not least was the George Worthington Company with their numerous family well represented, viz., the Ariel, L. and B., Harvard, Worthington, Adelbert, Duke, Duchess, Prince and Princess, and also the Fay line of juveniles. All during the afternoon and evening a steady stream of humanity filled the building and put the stamp of approval upon the efforts of the Association Wheels to furnish a free and instructive entertainment.

The George Worthington Company are about to occupy their new building, which immediately adjoins their present quarters. Arches are being cut, and it is expected everything will be in running order by January 15th. The additional building, which will be used exclusively for their bicycle trade, is 33 x 100, four stories in height, and with a forty-foot square warehouse in the rear. The first floor will be used for samples; the second for a repair shop, and the remainder for storage purposes. This company has just added the L. and B., a local high-grade production, to its line, having contracted for the entire output of the factory—between 600 and 800 wheels.

Cleveland is to have a cycle show, that is, a regular up-to-date sanctioned affair. The date set is March 1st to 6th, and the intended location will be in the ground floor of the

new New England building. This block is located in the business part of Euclid avenue, and contains room in plenty for the purpose.

The six-day female bicycle race opens at the Central Armory this evening, and to the discredit of the citizens of Cleveland and the daily press, who are booming it, the affair bids fair to be a success, as there were twenty-five hundred people at the armory Saturday afternoon to watch the contestants training.

G. & J. RAISE THE LIMIT.

G. & J. souvenirs will not be so easy to acquire. More than 700 were awarded during 1896, signifying that that number of users of Rambler bicycles and G. & J. tires had ridden 3,000 miles and over, but for the current year, Gormully & Jeffery have raised the limit.

To secure one of the gold souvenir watch charms it will hereafter be necessary for male riders of G. & J.-tired Ramlers to cover 6,000 miles; 4,000 miles is the notch which women riders must reach. Awards of silver

CONCERNING SPEED.

Morgan & Wright tires now hold

All world's records, $\frac{1}{4}$ to 10 miles, inclusive.

All unpaced world's records, $\frac{1}{4}$ to 60 miles, inclusive.

All American records, $\frac{1}{4}$ to 100 miles, inclusive.

All American hour records, one to twenty-four, inclusive.

All world's records (6) made on the National circuit; and 521 prizes —all other tires combined won only 174 more.

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

souvenirs will be made to users of G. & J. tires, regardless of the make of wheel, who accomplish similar performances. There will also be a "grand souvenir" for the Ramblerite who attains the greatest aggregate mileage during the year.

Some few changes in rules have been made. One souvenir only will be awarded to each winner of a souvenir. Mileage must be measured by some standard make of cyclometer, and must be checked once each week by the local Rambler agent. Mileage only which was made upon actual roads and drives will be counted. Mileage on circular speedways and race tracks will be thrown out. These offers apply to riders in the United States only. All communications regarding the souvenirs must be had with the local Rambler agent only. Claims for souvenirs must be sworn to before a Notary Public, and also indorsed by the local Rambler agent. Souvenir applications must be accompanied also by the weekly mileage report, certified by the agent.

A thing of beauty in the line of a cycle suit is a joy until one's wife wants one exactly like it.

AS IN A BUGGY.

Companion bicycles, that is, bicycles on which two riders are seated side by side, "giving two friends the opportunity to ride as in a buggy and affording both an unobstructed view," are gaining favor. At first they were received as institutions for trick riders, but as they have become better known and better understood their field has gradually enlarged, and the current year will almost certainly mark a considerably increased sale. When the reckoning is made, it will be found that Delp & Bell, Nos. 11-15 Federal street, Allegheny, Pa., will have played a prominent part in advancing the interests of the "tandem's rival." They have assumed the sole United States agency for the Punnett Companion bicycle, already fairly well known, and do not mean to hide their light under a bushel or anything else. They will establish headquarters in both New York and Chicago, and having previously handled bicycles in conjunction with their furniture business, are not to be rated as novices. Delp & Bell have issued a pamphlet plentifully illustrated with photographic reproductions, which tell the story of the wheel better than mere words.

BACKED BY AN EX-GOVERNOR AND MILLIONS.

Not many concerns have the distinction of having at their head one who has been Governor of one of the greatest States in the Union, and who came within an ace or two of being President of the United States. In the field of cycle industry, but one concern, the newly-formed Cygnet Cycle Company, of Williamsport, Pa., can lay claim to the honor. Ex-Governor Robert E. Pattison is its president. A. P. Perley is treasurer and G. A. Wilbur, Thos. Martindale and W. J. Moore comprise the Executive Committee. The Cygnet bicycle will be manufactured, and "the guarantee is backed by \$3,000,000 of capital," says the concern's printed matter. A temporary factory is being equipped in Williamsport, although it is not yet certain that that city will be the location of the permanent plant. W. D. Carter, formerly with the Tribune and the Henley Cycle companies, has been engaged as superintendent.

RUBBER-COVERED HANDLE-BARS.

Hard rubber handle-bars, and possibly bicycles, will be the vogue if the invention and ideas of William L. Parmelee and J. A. Howe, of Derby, Conn., obtain. Their origination consists of a steel tube covered with a thick coating of vulcanized rubber which can be made up in black, mottled, or almost any color, and which takes a very high polish. The patent calls for covering all parts of a cycle, and the intentions of the inventors are to entirely cover the whole frame of a cycle with the vulcanized material. The qualities claimed for bar are that it is soft to the touch and will never rust, chip or flake, and it is very easy to keep bright and in repair. The inventors have arranged with the Housatonic Skiff & Canoe Co., of Derby, to manufacture and market the bars.

WHEN SHE DECLARES INDEPENDENCE.

The next one will probably read, "When in the course of human events it becomes necessary for women to don bloomers and ride a bicycle," etc.—

TRADE MARK
WHAT
 would you think

of a wheelman who tied stones to his bicycle so he would have to work hard? Wouldn't you say he was a little "off"? Of course, no man would do that, but there are manufacturers who are trying up their sales, trying to save a few cents on the saddle of their wheel, and there are dealers who are tying stones to their sales by not having now the moral strength to insist that the manufacturer of their wheel put on the

Mesinger Saddle.

Success is due to the **RATTAN** and the peculiar way we weave the **RATTAN** is the whole secret.

Mesinger Bicycle Saddle Co.

MANUFACTURERS OF
SADDLES AND AIR BRAKES,
NEW YORK
CITY.

Kindly mention The Wheel.

INVENTED BY A WEST POINTER.

Coasting has two elements of fascination in it—the mere pleasure of exhilaration and the spice of danger. The naked wheel mixes these with too large a proportion of spice to suit the ordinary man, and the Phillips' coaster is designed to add to the exhilaration and at the same time place the spice within control of the rider. It is distinctly novel. The larger illustration shows it as attached to the wheel, complete with brake, although the brake is merely an adjunct which can be removed when there is no occasion for back-pedaling. For city riding the brake is convenient, as it has been demonstrated that it can stop a wheel coasting down a good grade within twelve feet, thus enabling the rider to exercise a control that conduces directly to speed where vehicles and pedestrians have to be guarded against, and all sorts of inequalities of surface and grades are met.

The Phillips' coaster is the invention of Lieutenant Phillips, of the United States Regular Army, and consists of an auxiliary sprocket, which entirely replaces the ordinary sprocket. The interior of the sprocket has a series of grooves carrying balls; this seg-

ment with the balls rotates freely without moving the chain when the wheel is coasting, and when the chain is drawn forward one of the balls drops against a square shoulder (which prevents wedging), and causes the two segments of the sprocket to work together as firmly as if they were one piece of solid steel. By making the interior spaces

for balls greater or smaller than the number of shoulders in the outer rim, a differential effect is obtained, and in the form ordinarily in use, with nine balls and eight shoulders, the chain can only carry the sprocket forward one-seventy-second part of a revolution after the pedal is touched before a ball has dropped into place and the power applied to the wheel. With a 28-inch wheel this means that after power is applied to the pedal, no matter what the position of the balls at that instant, the bicycle cannot advance more than 1 1/6 inches before the application of power is effective. In other words, no wedging or other similar effect on the wheel is possible that would prevent practically instantaneous application of power. The brake acts by back-pedaling in almost as simultaneous a manner, and by the sagging of the chain,

caused by the back pressure, the point of the brake lever is caught and the full leverage brought into play in so strong a manner as to completely control the wheel even when coasting long hills, at the same time so gently that after nine months' use two sets of tires show but little effect of the brake, not being damaged sufficiently to draw attention to that cause of wear.

Under date of December 14, 1896, A. E. Williams, second lieutenant in the Third Cavalry, U. S. A., writes from Fort Ethan Allen, Vermont, that he had used this device the larger part of the year and found it exceedingly useful, as it enabled him to coast down hills at night, even, which he had formerly not dared to attempt in daytime; that the coasting with the feet on the pedals brought the centre of gravity so low as to avoid any danger on that score, and make possible much coasting that would otherwise be hazardous.

For ordinary street use it enables the rider to coast along where the grade of the pavement is practically a dead level, or just sufficient to insure drainage. On one such piece of pavement a tandem rider says he coasted three blocks with only four or five revolutions of the pedals at the start.

It is particularly desirable for ladies' use, as it largely obviates danger from skirts catching. The foot can be stopped and the wheel go ahead, or the brake may be set, just at the rider's option, as soon as the skirt catches, thus making it a sort of insurance policy on skirts.

The inventor has formed a partnership with W. H. Ballance, and the sprockets are now manufactured by W. H. Ballance & Co., Peoria, Ill., and are offered at a very low figure.

IS AN AGENT HIMSELF.

In New England the McIntosh, Huntington Company's Sunol and other wheels are being shown the trade by J. J. Williams, who, though representing an Ohio firm on the road, owns and successfully operates one of the largest cycle establishments in Vermont, in Montpelier. He had the Sunol agency last year, and sold so many of the wheels that his present "evangelistic trip" is the outcome.

CHANGED ITS QUARTERS.

No. 17 Murray street, New York, is now the address of the Worcester Cycle Mfg. Co.'s general offices and salesrooms. The concern removed from its quarters in Wall street on January 1st, and is now in the heart of the downtown cycle district, where, under its new policy and new officers, it will make itself felt.

GUARANTEED FOR EIGHT HOURS.

"The light that never fails," is the manner in which the Charles S. Caffrey Company, of Philadelphia, are heralding the Acme, the electric bicycle lamp they are marketing. The lamp is operated by a dry battery, and can be controlled without dismounting. It is guaranteed to burn eight hours without recharging.

GONE WITH COLUMBUS.

The force of the Columbus (Ohio) Bicycle Company has been augmented by W. H. Chubb, of Cleveland, an earnest and conscientious worker. He will represent them on the road.

NEW PATENTS.

573,870. Name Plate for Bicycles, etc. Arthur R. Geoffrey, New York, N. Y. Filed May 9, 1896. Serial No. 590,816. (No model).

573,907. Bicycle Tire. Lemuel C. Neal, Lewiston, Idaho. Filed June 27, 1896. Serial No. 597,268. (No model).

573,932. Ball-Bearing. Edward J. Kelly, Monongahela City, Pa. Filed Mar. 13, 1896. Serial No. 585,945. (No model).

573,997. Pneumatic Tire. Richard Patterson, New York, N. Y., assignor to himself, Patrick Bromley, and Charles A. Druechlik, same place. Filed Jan. 17, 1896. Serial No. 575,887. (No model).

574,015. Tire for Bicycles. Frank L. Woodhouse, Waupun, Wis. Filed Dec. 7, 1895. Serial No. 571,334. (No model).

572,022. Indicating Device for Bicycles, etc. Roland Conrow, Cinnaminson, N. J. Filed Apr. 9, 1895. Serial No. 545,052. (No model).

574,022. Mud-Guard for Bicycles. Charles M. Hitchcock, Utica, N. Y. Filed Oct. 14, 1893. Serial No. 488,117. (No model).

574,035. Bicycle Wheel. Edwin Neild, Laredo, Tex., assignor of one-half to A. Winslow and Henry Hein, same place. Filed Dec. 14, 1895. Serial No. 575,187. (No model).

574,100. Bicycle Support. Albert G. Olson, West Superior, Wis. Filed Nov. 8, 1895. Serial No. 568,312. (No model).

584,157. Bicycle Trainer. Francis B. Ray, New York, N. Y. Filed Jan. 25, 1896. Serial No. 576,810. (No model).

574,285. Bicycle Canopy. Alice A. Bennett, Elgin, Ill. Filed Mar. 6, 1896. Serial No. 582,134. (No model).

574,283. Bicycle Holder. Lewis K. Miller, Clarksville, Mo. Filed Apr. 16, 1896. Serial No. 587,852. (No model).

574,282. Motor Vehicle. Edward J. Pennington, Cleveland, Ohio, assignor to the Motor Cycle Company, Chicago, Ill. Filed Oct. 3, 1894. Serial No. 524,833. (No model). Patented in England Dec. 11, 1895, No. 23771.

574,286. Toe-Clip for Bicycles. Edward A. Thiem, St. Paul, Minn. Filed Mar. 5, 1895. Serial No. 540,629. (No model).

574,292. Bicycle Support. De Witt C. Wallace, Paducah, Ky., assignor of one-half to Joseph J. Bornscheuer, same place. Filed Mar. 13, 1896. Serial No. 591,950. (No model).

574,342. Bicycle Seat. Francis B. Ray, New York, N. Y., Assignor of one-half to Frank S. Ray, same place. Filed Apr. 3, 1896. Serial No. 586,042. (No model).

26,465. Toe-Clip for Bicycles. Frank K. Hesse, Boston, Mass., assignor to Codman & Shurtleff, same place. Filed May 8, 1895. Serial No. 548,603. Term of patent 14 years.

26,466. Handle Bar Head. James Edgar Lee, Chicago, Ill. Filed Oct. 6, 1896. Serial No. 608,063. Term of patent 7 years.

FOR TRADE STUDENTS.

A publication of more interest to the trade than to the rider, which arrived during the week, is the catalogue of the Cincinnati (Ohio) Milling Machine Company. It has an attractive embossed slate-colored cover, and displays the machines to splendid advantage. The contents are largely technical, of course. The milling machines, pictured and exhaustively described, are entirely new, the firm states, and possess important improvements incident to modern milling practice not heretofore introduced—a statement which should impel something of a rush for the catalogue.

WILL HANDLE KIMBALLS.

E. A. Beckwith, 800 Broadway, New York city, for whom H. Webster is manager, has relinquished the Union agency for the metropolis, and has made contracts with the Phillips Mfg. Co. to handle Kimballs during 1897. He did a large business with the Union in 1896, and as he has one of the best locations on Broadway in the heart of the downtown district, and other facilities, he is confident of a fine trade during the coming season.

DESIGNS.

26,465. Toe-Clip for Bicycles. Frank K. Hesse, Boston, Mass., assignor to Codman & Shurtleff, same place. Filed May 8, 1895. Serial No. 548,603. Term of patent 14 years.

26,466. Handle Bar Head. James Edgar Lee, Chicago, Ill. Filed Oct. 6, 1896. Serial No. 608,063. Term of patent 7 years.

TRADE-MARKS.

29,397. Bicycles and Like Vehicles. Pope Manufacturing Company, Hartford, Conn. Filed Nov. 23, 1896.

RECENT PATENTS.

573,940. WRENCH. STEW W. WARDWELL, JR., Boston, Mass. Filed May 19, 1896. Serial No. 593,671. (No model).

Claim.—In a wrench, the combination with a handle member provided at one edge with a jaw and having longitudinal channels upon opposite sides, of a movable member having two separated flutes, parallel throughout and adapted to be introduced longitudinally into said side channel.

573,932. SPRING-TIRE FOR VEHICLES. JOSEPH BROSCH, Chicago, Ill. Filed Oct. 11, 1895. Serial No. 510,773. (No model).

Claim.—As a new article of manufacture, in a spring-tire, the combination of a base-band that will encircle the rim of a wheel, and a tread of outer sheeted flexible plates, the ends of outer sheeted flexible plates.

574,154. COMPOUND TIRE. EDWARD T. WARDWELL, NEWARK, N. J. Filed Mar. 25, 1896. Serial No. 583,028. (No model).

Claim.—A compound or double wall tube made from a single strip of sheet metal, the same being bent longitudinally between two edges to produce a longitudinal channel, the metal on one side thereof being bent around into tubular form and having its edge disposed adjacent the wall of the channel, while the metal on the other side of the channel is bent around the so formed tube and has its edge position interlocked into and engaged within the said channel, substantially as described.

574,010. TIRE FOR BICYCLES. FRANK L. WOODHOUSE, WAUPUN, WIS. Filed Dec. 7, 1895. Serial No. 571,334. (No model).

Claim.—The herein described bicycle tire, composed of a heavy flexible rubber tube A, within which is placed an elastic rubber tube B, and a tube C of canvas which the tube B and a spiral spring D having flat portions C' located within the tube C, said tube being substantially circular in form and provided at its outer periphery with a narrow groove, whereby when the tube A and B are inflated an annular space E is formed between the outer portion of the cover tube C and the inner portion of the rubber tube, and as for the purpose specified.

574,154-52. BICYCLE SEAT. FRANCIS B. RAY, NEW YORK, N. Y. Assignor of one-half to Frank S. Ray, same place. Filed Apr. 3, 1896. Serial No. 586,042. (No model).

Claim.—The combination in a seat for bicycles, tricycles, &c., of a frame A extending around the periphery of the seat and having inclined springs B one upon each side of the median line

574,100. BICYCLE WHEEL. EDWIN NEILD, LAREDO, TEX. Assignor of one-half to A. Winslow and Henry Hein, same place. Filed Dec. 14, 1895. Serial No. 575,187. (No model).

Claim.—A rim for bicycles composed of inner and outer sections with an intervening space, elastic bands overlapping the sections at regular intervals, an elastic casing surrounding said sections and secured to the outer section and laced on the under side of the inner section as and for the purpose described.

574,032. MUD-GUARD FOR BICYCLES. CHARLES M. HITCHCOCK, UTICA, N. Y. Filed Oct. 14, 1893. Serial No. 482,117. (No model).

Claim.—The combination with a bicycle of a flexible mud-guard, a reel on which the guard is adapted to be wound, provided eccentrically and the leading device for the reel, substantially as set forth.

573,982. BALL-BEARING. EDWARD J. KELLY, MONONGAHELA CITY, PA. Filed Mar. 13, 1896. Serial No. 585,945. (No model).

Claim.—In a ball-bearing, the combination of a bearing flange provided with an external annular bearing flange, as 3', constituting a bearing-face, and an internal annular retaining-ridge, as 11, constituting a non-bearing face, substantially as set forth.

574,157. BICYCLE-TRAINER. FRANCIS B. RAY, NEW YORK, N. Y. Filed Jan. 25, 1896. Serial No. 576,810. (No model).

Claim.—In a ball-bearing, the combination of a bearing flange provided with an external annular bearing flange, as 3', constituting a bearing-face, and an internal annular retaining-ridge, as 11, constituting a non-bearing face, substantially as set forth.

573,870. NAME-PLATE FOR BICYCLES. ALICE A. BENNETT, ELGIN, ILL. Filed Mar. 6, 1896. Serial No. 582,134. (No model).

Claim.—The combination with a curved plate adapted to receive a name or inscription, and having a slot, of a metal with the continuous-moving bands, a distance-indicator, means for imparting motion to the distance-indicator from one of the said slots, a spiral spring placed within the cavity of the plate with one end attached thereto and with its opposite end connected with the distance-indicator and the second end of bands of the inner end of the yoke, and a latching device for connecting said into and out of action.

574,154. WHEEL FOR VEHICLES. JAMES S. COVINGS, HARTFORD, CONN. Assignor to the Pope Manufacturing Company, same place and Portland, Me. Filed Jan. 13, 1896. Serial No. 576,650. (No model).

Claim.—In a wheel for vehicles, the combination of a fixed shaft, short bearing-shelves mounted upon said shaft, a hub, interspersed between said shaft and supported thereby and forming a chamber about said shaft, a mass of absorbent material to said chamber, said mass having channels to permit the outward passage of the oil from said mass of absorbent material, means to clamp said tube and stems together longitudinally.

574,286. TOE-CLIP FOR BICYCLES. EDWARD A. THIEM, ST. PAUL, MINN. Filed Mar. 5, 1895. Serial No. 540,629. (No model).

Claim.—A toe-clip for bicycles formed of a single piece of wire comprising a 200 holding section and a toe-embracing section through the distal thereof, and provided with a lead, a locking-lever with the ends of the wire underlapping beneath the ball of the foot, means to slide on the foot and having a recess to receive the lead, a spring to hold the locking-lever normally engaged with the section, and means for coupling said clip to pedal to permit the lateral adjustment of the adjacent underlapping sections to vary the angle of the clip, substantially as and for the purpose set forth.

574,133. DEVICE FOR SECURING SPOKES TO WHEEL-RIMS. CHARLES J. CUNY, KEY WEST, FLA. Filed Apr. 15, 1896. Serial No. 584,900. (No model).

Claim.—A spoke-socket comprising a shere inserted in the rim of a wheel, a flange at its outer end constituting in the outer peripheral of the rim, sets at its inner end adapted to turn back over a washer on the inner periphery of said rim as set forth, and a sectional collar carrying a spike, said collar secured in said flange for the purpose specified.

574,032. INDICATING DEVICE FOR BICYCLES. ALICE A. BENNETT, ELGIN, ILL. Filed Mar. 6, 1896. Serial No. 582,134. (No model).

Claim.—The combination of a bicycle or vehicle, an instrument comprising a time indicator having a set of continuously-moving hands or pointers, and a second set of hands or pointers adapted to be moved with the continuously-moving hands, a distance-indicator, means for imparting motion to the distance-indicator from one of the said slots, a spiral spring placed within the cavity of the plate with one end attached thereto and with its opposite end connected with the distance-indicator and the second end of bands of the inner end of the yoke, and a latching device for connecting said into and out of action.

573,932. PNEUMATIC TIRE. RICHARD PATTERSON, NEW YORK, N. Y. Assignor to himself, Patrick Bromley, and Charles A. Druechlik, same place. Filed Jan. 17, 1896. Serial No. 575,887. (No model).

Claim.—The combination of a pneumatic tube having a thickened outer surface with an annular groove therein, with a fabric covered spring outer ring and a flexible tread having annular grooves therein said grooves or openings through the walls separating and groove, and cross corrugations on its outer surface, the said parts being mounted in each other within the groove of the pneumatic tube, substantially as shown and described.

574,154-52. BICYCLE SEAT. FRANCIS B. RAY, NEW YORK, N. Y. Assignor of one-half to Frank S. Ray, same place. Filed Apr. 3, 1896. Serial No. 586,042. (No model).

Claim.—The combination in a seat for bicycles, tricycles, &c., of a frame A extending around the periphery of the seat and having inclined springs B one upon each side of the median line

574,100. BICYCLE WHEEL. EDWIN NEILD, LAREDO, TEX. Assignor of one-half to A. Winslow and Henry Hein, same place. Filed Dec. 14, 1895. Serial No. 575,187. (No model).

Claim.—A rim for bicycles composed of inner and outer sections with an intervening space, elastic bands overlapping the sections at regular intervals, an elastic casing surrounding said sections and secured to the outer section and laced on the under side of the inner section as and for the purpose described.

574,286. TOE-CLIP FOR BICYCLES. EDWARD A. THIEM, ST. PAUL, MINN. Filed Mar. 5, 1895. Serial No. 540,629. (No model).

Claim.—A toe-clip for bicycles formed of a single piece of wire comprising a 200 holding section and a toe-embracing section through the distal thereof, and provided with a lead, a locking-lever with the ends of the wire underlapping beneath the ball of the foot, means to slide on the foot and having a recess to receive the lead, a spring to hold the locking-lever normally engaged with the section, and means for coupling said clip to pedal to permit the lateral adjustment of the adjacent underlapping sections to vary the angle of the clip, substantially as and for the purpose set forth.

A Sweeping Statement The ELMORE

It has given and will give better satisfaction than any other Wheel on the market.

For confirmation of above we can refer you to agents who have handled all the way from 5 to 5,000 of them.

We have anything you want.

\$75.00, \$50.00, \$45.00, \$40.00

WHERE GAS IS WANTING.

As a companion to their gas-steam vulcanizer, the Gormully & Jeffery Manufacturing Company have brought out the gasoline-steam vulcanizer, pictured herewith. It is intended for use where gas is not readily obtainable, and is easily handled and a convenient equipment for any repair shop or agency. It lists at \$14.

MORE APPLICANTS THAN SPACE.

The managers of the Boston Cycle Show are endeavoring to figure how they can take care of the 365 applicants for spaces when the building affords room for just 313 exhibits.

The work of allotting the space has been commenced, but will not be completed for a day or so, and then the allotments will be announced. Should some of the firms allotted space decide to withdraw their exhibits, the overflow will be taken care of in the order of their application for spaces. If it is possible to make a good exhibition in the balconies, spaces will be arranged there.

WIDE SCOPE FOR ARTISTIC FANCY.

L. C. Chase & Co., Boston, say that the colored hanger which they recently issued in the interests of their Chase Tough Tread Tire, has attracted a deal of attention, requests for copies being received daily. Among other scenes it illustrates Chase & Co's. copyrighted scene of a fox hunt on a wheel, which they say is not as far-fetched and ahead of time as many at first assumed, inasmuch as not only was a wheelman the winner in a fox hunt in England, but they know of a bona fide repetition of the case in this country, in which the successful hunter, mounted on a bicycle, distanced all of the horsemen. The hanger also illustrates in several ways the peculiar merits claimed for the Chase Tough Tread Tire. The word "Chase" affords wide scope for the artist's fancy.

SUGGESTED BY MISS SARA.

Figuratively speaking, Miss Sara Hinner-shitz, of Blandon, Pa., cracked the christening bottle across the bow of the Reading (Pa.) Standard Mfg. Co.'s high grade bicycle. In response to the firm's offer of one of their \$100 bicycles to the person who suggested the most desirable name, Miss Hinner-shitz suggested "Fascinater," which struck the fancy of the Reading people, and which has been adopted. The second prize, also a bicycle, was won by a wheelman of Rochester, N. Y., Geo. P. Rives. "Old Glory" was the name he submitted, and this is the name which will grace the company's medium grade.

The contest attracted 1,661 suggestions from 383 individuals; of the names submitted 295 were duplicates.

THEY KNOW HOW.

At No. 271 Broadway, in the centre of New York's downtown cycle colony, very convenient offices have just been opened by E. Howe & Co., dealers in bicycles, bicycle equipment and manufactures of special bicycle fittings. The firm controls quite a considerable factory on the west side of the city and their present move will bring them prominently to the front as manufacturers dealing directly with the jobbing and export trades. E. Howe, who is at the head of this new enterprise, is an old bicycle manufacturer with a very intimate knowledge of the markets, not only of the United States, but of the principal countries of Europe, and possesses experience and ability that command success.

AN ENGAGING WEBBE.

E. T. Webbe has been added to the staff of Oliver, Straus & Co., and while he will talk India and Straus tires and Ciley chains, he is particularly well qualified to advance the interests of that most attractive and salable sundry, the Haney cyclometer. Webbe had much to do in the marketing of the Standard Watch Co.'s mileage recorders, and should have the business at his fingers' ends.

TOOK WELL IN PARIS.

At the Paris show R. H. Wolf & Co. made their Duplex a drawing card. Their space was so large that they were able to have several of their two-seaters constantly circling around it. They say the Duplex has met with considerable favor, a single export order for twenty machines being in hand, giving weight to the statement.

CYCLING TRADE REVIEW

Copyright 1896, by F. P. PRIAL CO.

VOL. XVIII., No. 22.

NEW YORK AND CHICAGO, JANUARY 15, 1897.

WHOLE No. 464.

BIG DEAL IN DUNLOPS.

President Coleman Contracts to Use the Detachable Tire on His Crescent Bicycles.

Crescent bicycles will be fitted with Dunlop tires during the good year 1897.

The documents were signed on Tuesday of this week, the high contracting parties being R. L. Coleman, for the Crescent interests, and Kirk Brown for the Dunlop people. A WHEEL man saw the contract—the outside. It is a bulky-looking and ominous-looking document, and it has a right to its dignity, for hundreds of thousands of dollars are involved.

Both parties to the contract are highly elated. The Western Wheel Works is a very big concern. Some folks say that, counting all and all, they turn out a greater number of wheels than any other American concern, and when such a firm states that it will fit, recommend and push the Dunlop tire, it means something.

The W. W. W. people feel that this new move materially strengthens their line; in fact, makes it invincible. The Dunlop is a high-class, price-maintained tire, and it cannot fail to be a fine talking point with all Crescent agents.

The Dunlop factory is in New York, with a Chicago office and a factory in Toronto. In Canada, by the by, Dunlops have a very strong foothold. The firm has worked quietly, making unapproachable goods, and endeavoring to sell the rider direct rather than try for "big deals." They have been progressively successful, and their business, season by season, has shown a satisfactory and certain growth. With this season, however, they are launching out on bigger and broader lines than in the past. They have a large number of travelers out, and are negotiating with many manufacturers. They state that nearly every leading maker will prominently catalogue Dunlop tires in their this year's catalogues. The Western Wheel Works will exclusively fit Dunlops, unless specially ordered otherwise, and they will fill orders for Dunlops through all their agents.

MIXING MILITARY AND CYCLING

At the military carnival at Madison Square Garden this week, heats of short distance cycle races are run nightly in connection with athletic events. The finals will be run on Saturday night. J. W. Judge and W. H. Owen give promise of dividing honors.

A TEN-THOUSAND-DOLLAR TANDEM.

Tiffany is to be out-Tiffanyized. The Elgin (Ill.) Cycle Co. has undertaken the task.

Last year when Tiffanyized cycles were being much heralded, the Elgin concern exhibited a gold-encrusted and bejeweled Elgin King bicycle that attracted great attention at the show and apparently found the exhibit worthy of the effort as they now propose to outdo all previous records by decorating an Elgin King tandem as no tandem or other wheel has ever before been decorated or is hereafter likely to be decorated.

Every connection of the wheel will be covered with gold bands, carved in a very artistic manner and inlaid with diamonds and other precious stones. On the front drop bar the name "Elgin King" will be raised in large solid gold Old English letters. These will serve as settings for rows of the most brilliant gems. On the top bar will be represented in raised gold, a bicycle track with several racing men finishing a race in front of a grand stand. The centre upright bar will show a full nine of base ball players, playing the National game. Other conspicuous places will be devoted to the following: A hunting scene including hunters, dogs, forest and landscape, carved in solid gold, a representation of the Washington Park Race Track in Chicago on Derby Day, with horses, jockeys and all details of a horse race, a river scene showing fishing and boating; the emblem of speed, the emblem of the League of American Wheelmen, and the Elgin King Crown will all be included and be emblazoned with gems. The fork side designs are marvelous creations of the goldsmith's art, consisting of heavy wreaths, each leaf carved and colored true to nature, finished with massive gold bands, holding large diamonds, rubies and emeralds on each side. When completed the tandem will represent a value of \$10,000.

WILL RECEIVE FOR WHITMAN.

On the application of three of the directors of the Whitman Saddle Co., this city, Wm. C. Mehlbach, treasurer of the company, has been appointed receiver. The liabilities are \$66,684 and nominal assets \$41,121, subject to a chattel mortgage of \$40,989, leaving an equity of \$132. The company recently got into trouble through an attachment made by the Combination Cycle Co., of Jamestown, N. Y., for \$24,612.

HE IS WORTH IT, TOO.

A Boston paper announces that P. J. Berlo has received an offer of \$6,000 a year as chief of the mechanical department of E. C. Stearns & Co.'s works.

ANOTHER SYNDICATE.

Composed of Englishmen with a Scheme for Popularizing American Bicycles Abroad.

Thos. Warwick, once an English racing man of note who foreswore the path and settled down after marrying into the well-known Pettit family of Philadelphia, a year or two since, is again in America, this time on business intent. He has several irons in the fire, the principal one being an American Syndicate that is to be if Warwick's mission proves successful.

The avowed object of the Syndicate, according to the typewritten prospectus, is the popularizing of American bicycles in England. The plan embraces a house-to-house cleaning and repairing bureau, the establishment of rental and storage depots and of riding schools wherein only American wheels will be employed and sold and several other schemes of advancement.

Mr. Warwick states that the support of but twelve or fifteen American makers will be sufficient to ensure the formation of the syndicate. He is here to enlist this support, which does not require an outlay of money but rather an endorsement of the plans. The Englishmen who are behind the project have ample capital, Mr. Warwick states, but until success is assured they desire to remain in cog. Their position is such that they do not wish their names coupled with a failure or abortive attempt.

Mr. Warwick is quartered at the Imperial in this city.

FOR THE PRESIDENCY.

Toledo, O., Jan. 10.—Toledo has a candidate for the presidency of the National Cycle Board of Trade, in the person of George H. Fisher, of the Gendron Wheel Company. Mr. Fisher said to THE WHEEL that, inasmuch as the honor of being named for the position has been virtually " thrust upon him," he will make as good a fight for the place as he is capable of doing, believing that it would materially advance Toledo's leading position in the bicycle industry. He proffered figures to show that the board represents an investment of \$60,000,000, and a goodly slice of it is invested in this city.

GONE TO CALIFORNIA.

Loughead, the Canadian crack, has departed for the Pacific coast with Trainer Slaughter. He will ride in the California circuit now being formed.

LOZIER'S LEGAL VICTORY.

Court Decides in His Favor and Nullifies Three Claims of the Palmer Tire Patent
—Palmer to Appeal.

After disputing every inch of the ground, first in the Patent Office and later in the courts, H. A. Lozier has scored a victory over John F. Palmer that is of great import and of wide interest. Lozier, as is well-known, stood for the patent of Rudolph W. Huss, No. 539,224, filed Oct. 9 1893, and granted May 14, 1895, despite the interference of Palmer who claimed that it infringed his patent, No. 493,220, issued March 7, 1893.

Each of these patents is for a fabric consisting of parallel threads imbedded in rubber, a principle intended for use in construction of pneumatic tires. This fabric is generally known in the trade as "Palmer fabric." As both patents were for the same invention, the suit was brought by the Palmer Pneumatic Tire Co. against Henry A. Lozier for the purpose of having the court decide which of the two patents is valid, or, in other words, which party is entitled to the patent for this fabric.

The case was argued before Judge Lurton in the U. S. Circuit Court at Nashville, Tenn., December 30 and 31, 1896, by Judge L. L. Bond and Douglas Dyrenforth of Chicago on behalf of complainant, and by Wm. A. Redding and John R. Bennett of New York on behalf of defendant. Judge Lurton's opinion which has just been made public covers 25 pages of type-written matter strongly in favor of Lozier and deciding that the first three claims of the Palmer patent are void and that the Huss patent of the defendant for the fabric is valid. The decision is a sweeping one in favor of Lozier, and by it Lozier is declared to be the owner of the patent for what is known as the Palmer fabric.

The Palmer Pneumatic Tire Co. has already announced that the case will be appealed to U. S. Circuit Court of Appeal at Cincinnati, Ohio, which is the court of last resort for cases of this kind. Attorney Dyrenforth freely confesses that he was greatly surprised by the Court's decision. He claims that it will not in the remotest manner affect the manufacture of Palmer tires, as it was the fabric and not the tire that was passed upon, and that Lozier licenses would grant only the right to the fabric, excepting, possibly, in the case of the Cleveland tire.

"Coming to the particular question," says Mr. Dyrenforth, "I will say that the Palmer tire is covered by several patents besides the one in this suit, the principal one being the patent of January 10, 1893. This patent was not before Judge Lurton and it was not passed upon by him. On the other hand, we have used the Consolidated Rubber Works under this patent, also the Newton Rubber Works, and will press these two suits to a conclusion as fast as possible. The Hartford Rubber Works Company has recognized the validity of this patent, and has taken a license under it."

"If Lozier should be finally successful and can hold his own patent to be valid, he might demand tribute from the Palmer Tire Company. This is a question with which the public has no concern, except of course that it may possibly add to the cost of the Palmer tire."

According to Judge Lurton, the Huss patent is practically a copy of Palmer's, the main difference being in the described method of producing the fabric covered by the claims. This was done purposely by Huss's lawyers to ensure an interference.

Discussing the subject of patents generally, the Court remarked: "That an invention shall be novel is not enough. It must have some utility, must be capable of being put to some practical and useful purpose."

It was proven to the Court's satisfaction that in March, 1892, Huss made an experimental fabric in the Chicago Rubber Works, while Palmer did not produce his until July or August of the same year. He, however, submitted a witnessed drawing, dated March 21, 1891, but the Court said that it did not show the distinctive idea of the fabric, but was really an illustration of braided or woven threads, regardless of what "dim intellectual notion" Palmer may have had in mind.

Great stress was laid by the Palmer people on the degree of embedment. They argued that "complete and entire embedment of the threads in the rubber was essential to the fabric." Judge Lurton held that the claims were not for a process or design, but for a fabric. The way of producing it is immaterial. He characterized the stress before remarked as a very narrow contention, and resorted to Webster's Dictionary for a definition of the word "Imbed."

The ruling was against Palmer on almost every point, but that there is ample room for further legislation the Court's conclusion and decision make very plain, as follows:

"I need not discuss the effect of describing this fabric in earlier applications made by Huss for patents upon improved pneumatic tires in which this fabric was used. Whatever effect that disclosure and subsequent division of his application would have upon the patent now in question is a question to be made under some other form of litigation. The same question, too, would have a like effect upon the Palmer patent by reason of a like disclosure in an earlier application.

"Holding, as I do, that the only question properly open upon this bill is that of priority, no other question is decided.

"The first three claims of the Palmer patent must be declared void. A decree will be so drawn and taxing all costs to complainant."

These are the three claims of the Palmer patent that are nullified by the decree.

1. A fabric made of elastic and impervious material, such as rubber, having embedded within the surface threads substantially out of contact.

2. A fabric made of elastic and impervious material, having embedded and vulcanized therein, substantially parallel, fibrous threads.

3. A fabric made of elastic and impervious material, having embedded and vulcanized therein, substantially parallel, fibrous and non-extensible threads.

FOR SPEED-PRODUCING PURPOSES.

The French firm of cycle makers, Gladiador, which have become famous the world over for the perfection and expensiveness of their pace-making equipment, are building for racing purposes twenty or thirty triplets with motor attached. Unaided by human effort, the motor is capable of driving the machine at 42 miles per hour.

CROOKEDNESS CREEPS IN.

Cycle racing in Australia has supplanted all other forms of sport, with the result that racers from all over the world are flocking to the Antipodes, and those shady gentlemen who formerly leeches an existence off of other forms of sport have now affixed themselves and their attentions to cycling. The natural result has followed, an Australian paper thus picturing it:

"Here is the matter in a nutshell. Betting is becoming rampant; bookmakers giving as much attention to cycling as to horse-racing; racing men and their friends wage heavily on all events, and dishonest practices are becoming manifest. How long will the sport remain pure under this influence."

A similar, or worse, condition will prevail here when Mr. Potter, his backers and followers have succeeded in passing the control of racing from the League to the six-dayites, "lady" race managers, prize-fighting "gents," and other true cycle lovers of the same ilk.

ON THE HOG.

Huret, who is engaged by contract to ride in the forthcoming three days' race at the Velodrome d'Hiver, cannot come to terms with the French pacemakers. He publicly states that four teams demand \$200 for the job if he loses; twice that amount if he wins. As the first prize is only \$700, Huret very properly says "the game is not worth the candle, for if I lose I must pay the \$200; consequently if I win I only get \$300. Such being the case, unless they lower the price, I will start without pacemakers." This is very just, but it will mean death to paced races in France in the near future.

WHAT! A "SPENDTHRIFT"?

Where is Potter's Campaign Committee and its fund? Here's a Grand Rapids, Mich., paper actually declaring Mr. Potter to be "the greatest spendthrift that ever lived—when he is using other people's money." The committee shouldn't stand that sort of thing. The same paper further asserts that Potter's conduct of the "Good Roads" magazine emptied the League treasury in 1894, and predicts a similar state of things in the event of his elevation to the presidency. What base ingratitude to a man who passed the "Armstrong Baggage bill" at an unitemized expense of \$2,267.67!

DOING THE L. A. W'S. WORK.

Connecticut's Federation of Cyclists is after good roads. Efforts will be made to secure the construction of five lines of macadam highways, extending in various directions from one end of the State to the other. The Federation also propose to have the Legislature pass a bill taxing bicycles, the money thus raised to be used in building good roads. A tax of 50 cents a wheel would net each year \$30,000, while a tax of \$1 a wheel would yield \$60,000, or more than one-third of the last appropriation by the General Assembly. This sum, added to the amount raised by the State, would enable 135 towns to yield one mile of good road each year.

RED-HOT REASONING.

"Practice makes perfect," says the pedalerous philosopher: "but you don't need practice to drop with neatness and dispatch any lighted lamp you may have tried to remove from your wheel by grasping it by the top."

NO STAR-CHAMBERSHIP.

THE annual meeting of the stockholders of the National Board of Trade of Cycle Manufacturers will be held at the offices of the corporation, in New York, on January 20th. But that meeting will be adjourned until Wednesday, February 10th, to the Grand Central Palace of Industry, where there is reason to hope that the big-wigs and the little-wigs and all the fixed and twinkling stars of the trade of cycling will gather and make a glittering firmament.

At the February 10th meeting the stockholders of the corporation will meet and elect thirteen directors, and later, the "thirteen" will, in secret and ponderous conclave, elect officers for the ensuing year. You see, the members-at-large of the organization will have nothing to do with these important goings-on. True it is they may glide up to the door of the room of assembly and gaze with the bated breath and the blinking eye on the trade—"little" fellows and "new" fellows really more vitally interested than "big" fellows and "old" fellows—membership-at-large, bone-and-sinew of the organization will have really nothing to do with the business at hand.

And again, the stockholders of the organization, numbering some hundred and one, will have little or nothing to do with the business of the day. It is true they will have the privilege of solemnly voting for a directorate of thirteen, already prepared by a

nominating committee, and after it is all over they will probably lunch at the expense of the organization—but that is all. They can hardly get in a new good man; they can get no new light shed on old subjects, or any light at all on new phases—and conditions—automaton-like they receive nothing, nor do they give anything, at least they didn't last year or year before last.

What is wanted this year is a wide-open meeting, with plenty of inquiry, with no tenuity. Each member of the organization should have a living interest in the meeting, and should make himself heard, if he has anything worth offering. There should be no classification or differentiation whatever in membership. Any man in the trade who is eligible to membership under the scope and spirit and intention of the organization should be a full-fledged member with all privileges. Let that stockholdership be abolished. Let the shares be handed back or brought in and redistributed, or let each member hold a share of stock and let there be a thousand shares if necessary. Let the "thirteen" be abolished. The Board of Directors and the officers should be constructed after a different fashion than at present. Let there be no chance for tea-partying and intrigue. The directors and the officers should be elected from the body of members-at-large. No star-chambership, no favoritism, no partisanship, but an open opportunity to select bright men, men who understand trade and trade organizations.

Of course the "thirteen" style cannot be changed this year, and such being the case let there be some new blood shaken into it. Some of the members who consider a "thirteen" membership theirs by birthright have become shop-worn. Some strut about and posture in an atmosphere of royalty, wearing their halos always—even at breakfast. At bottom, some of them have neither raw intellect nor ready talent; in the crux, they have neither horse sense nor cleverness. So let new blood, some at least, come to the surface. Drop those who will not work, who will not attend meetings. Above all, do not elect men who are not of the trade. For instance, the present treasurer is a lawyer—a bright lawyer probably, and a gentleman surely, but none the less he is not, at a fair construction, a cycle trade man.

Make certain, before you vote their adoption, that reports are right, reasonable, honest, correct. Swallow nothing because of an official O. K. Ask and find out. Make certain that the organization headquarters will be fixed—fixed at New York and at Chicago—so that location will not be a matter of fancy with each successive president.

Such are a few brief suggestions THE WHEEL makes to the Board of Trade membership, and may the February 10th meeting be full of eloquence and good.

THE ROCK AHEAD.

TO anyone unacquainted with the dark days of its early history it looks as though the good ship L. A. W. was going to be wrecked on the rock of Racing. True, for the very first time the vessel has an officer who seeks to guide the good old craft on to the rock instead of away from it. Chief-Mate-Captain-that-wants-to-be Isaac B. Potter has pledged himself to wreck the good old ship on the rock of racing if he can possibly do so.

Back of Wrecker Potter are the six-day race promoters; the trotting horse owners and jockies; the gentlemen who promote "ladies" racing, and others of a like ilk, who are in cycling for "what there is in it," whose love for sport and for cycling is measured entirely by what they are pleased to call the "dough," derivative from their connection therewith.

A motley crew, truly! A crew which, prior to the Tammanizing of League politics, would have insured the certain defeat of any League official brazen enough to act as its leader, but which now succeeds only in getting its leader's picture boiler-plated throughout the country, and his praises everywhere sung by the Vanderbilt Building press bureau.

Despite all of this we have faith in the good old ship's ability to escape from the plans of the wreckers. All of her crew are not "dough" hunters; there are still some officers who are not wreckers, and who have neither affiliation with, nor affection for, the six-dayite, the trotting-horse jockey, or the "lady" racer gentleman. To these faithful ones, and to their friends who are neither leeches, nor panderers to a perverted public taste, must the League look for safety.

The issue is perfectly plain, and no man can say he joins either party without knowing what are its elements, its objects and its supporters.

Under the Potter flag are found all of those who, for selfish and personal ends, are bent on wresting racing control from the League of American Wheelmen. There can be no possible doubt of this in view of Mr. Potter's former effort and declaration in this same direction, and of that of his supporters who were loudest in urging his candidacy and shouting for his election. These constitute the "new" element who have lately come into cycling and into the League, whose L. A. W. membership numbers begin somewhere up in the fifty thousands.

Under Elliott are enlisted those whose devotion to the best interests of cycling and the League of American Wheelmen is best proven by their long connection with both. These are the men who have saved the League from being wrecked in the past, these the people who possess experience, and whose fealty to the best interests of the sport has

been proven. Among them there exists not a single trotting track owner, nor a six-day-race-meet promoter, nor yet anyone who has conducted a "lady" race meet. There is not a single wire-puller, press-bureaucrat, pint-pot politician, or cycling pap-sucker. Let no honest delegate, no man who loves sport for sport's—not "dough's"—sake attempt to deny the truth of this, and skulk behind the Potter banners, upon which are blazoned:

"DOUGH" OR DEATH!

SALARIES FOR EVERYONE!

POTTER, PATRONAGE AND PLUNDER!

RACING FOR, WITH AND BY THE RING!

COLEMAN WILL ACCEPT.

IT is the bald truth to apply to R. L. Coleman, present President of the Board of Trade, the "Ma Honey" song. The trade wants him, wants him very badly. Certain it is that Mr. Coleman has permitted it to be announced that under no circumstances would he accept re-election. THE WHEEL authoritatively announces that Mr. Coleman would accept a unanimous nomination and would serve the Board another year. The announcement of Mr. Coleman's refusal of a re-election has incited the presidential bee to buzz with busy insistence in the ears of certain gentlemen high in position. But all who have been stung, it is fair to believe, would not oppose the candidacy of Mr. Coleman should his friends place him in nomination.

Mr. Coleman has made a most enviable reputation. He has enlarged the scope of the Board, has harmonized its factions and has brought under the wing of the organization men who had hitherto held aloof. He now has a perfectly equipped office and a valuable credit bureau in profitable operation. His show victories are too recent to need mention. He is a man of strength. He has conferred both honor and power on the office he at present fills. He has not used the organization for personal ends. His record is too well-known and too universally admired to need recapitulation. He has been strong, so right a man in the right place that argument of his fitness is useless.

The thing is that he is not bent upon retirement; that he will occupy the office if it seeks him.

That he will succeed himself seems certain.

DODGING THE ISSUE.

INSTEAD of combatting our arguments and contentions, one of the newspapers under the hypnotic Potter influence, and at least two of whose attaches are drawing pap from the handicapping fount, contents itself by giving voice a "disappointed office-seeker's" snarl. The snarl renders it oppor-

tune to say that the newspaper in question is untruthful, and that no one connected with THE WHEEL asks or seeks or wants any office within the gift of Mr. Potter, Mr. Elliott, or anyone in power or likely to be in power in the League of American Wheelmen. We despise sham, hypocrisy, duplicity and insincerity, and refuse to join in the worship of theatrical heroes who win their way by such means. Our opposition to Mr. Potter is continued in the face of a quasi-threat that such opposition would mean an annual loss of \$20,000, a threat made when the gentleman was just becoming enlarged with his importance.

The Amateur Athletic Union and the Inter-Collegiate Athletic Association are both premature. While it cannot be denied that the election of Mr. Potter to the League presidency seems extremely likely, nor can it be gainsaid that his election means a determined effort on the part of himself and his supporters to divorce the League of American Wheelmen from all control of racing, yet all this does not warrant either the A. A. U. or the I. C. A. A. in jumping at conclusions, and at this time declaring they are each going to assume control over their particular part of cycle racing. Mr. Potter might not get elected, Mr. Potter might not be able to divorce the League and racing, even if he were elected; but granting that both of these unpleasant things, did come to pass, do the two associations named think they will be allowed a finger in the pie? Well, rather not! This control of racing is already pledged to "the gang," of which both the A. A. U. and the I. C. A. A. should congratulate themselves on not being members.

Mr. Potter earned no little of the credit which came to him after the passage of the "Armstrong Baggage bill," but it is being grossly magnified during the campaign. The wheelmen of the State were apathetic and lukewarm, and it is well known that Mr. Potter was in despair until E. J. Tinsdale appeared on the scene and opposed the measure. It was not until Tinsdale was exposed that the State was aroused and the press interested. Tinsdale, more than any other one man or cause, contributed to the enactment of the law, the gabble of the Potterites notwithstanding.

Illinois means to "voice the West" at the National Assembly, and apparently intends to vie with New York in the number of its candidates and "wants." Illinois, however, should go slow. The "demands of the West" are more or less unreasonable, and remind one of a pigmy's challenge to a champion, which is usually and rightly given a go-do-something-first reply. The West, Chicago and Illinois in particular, should do

something first. We hear much of their enormous cycling population, but see comparatively nothing of it on the L. A. W. membership roll. It suggests that there is much to do and a fruitful field in which to do it.

Philadelphia has asked and received few favors of the L. A. W., has ever been loyal and consistent, and if political jobbery does not decide the place for the annual meet Philadelphia should secure the award. Pennsylvania's growth during the year, and its location, attractions and facilities are in such striking contrast to those of the other applicants, that if the League legislators consider the greatest good to the greatest number, the matter is already settled.

Delegates to the National Assembly who are not mere puppets, but who do their own thinking with the brain God gave them for the purpose, should ask themselves: What manner of man is Potter that on six successive occasions he should work for and help elect the presidents of the L. A. W., and as regularly and as religiously turn his coat and assist in hounding them out of office?

In crying down the official organ, the "campaign committee" should proceed cautiously, else they place Candidate Potter in a "peculiar position," that is, unless they are convinced that he is used to that sort of thing. It is not so very long since that he wrote Mr. Elliott commending his excellent paper, and assuring him that "all the boys" liked it.

When the utterances of Mr. Potter during the six or more years of his League political prominence are closely compared with events which subsequently came to pass, it is but charitable to conclude that Isaac B. Potter is afflicted with acute heterophasia.

There are high-grade papers, just as there are high-grade wheels. There are bicycles made up of pretty much "any old thing" in the way of material topped off with a glossy coat. There are papers—bicycle papers, made up on the same principle.

In the cause of good roads, Mr. Potter's Highway Improvement Committee expended, during 1896, the enormous sum of 1,000 cents!

We have more politicians than statesmen in the League; but, of course, we offer greater inducements in the former line.

The trouble with the theoretical League reformer is, that, as generally constituted, he expects a cobbler to shoe a horse.

By this time most of the new year's resolutions have been amended by striking out the enacting clause.

POTTER'S PAROXYSM.

His Declaration Against the League's Kaleidoscopic and Gymnastic Department.

That THE WHEEL may not stand accused of attacking Mr. Potter unfairly in regard to his dislike of the League in any way controlling, profiting by or dealing with racing in any form or manner, here are Mr. Potter's own words regarding what he knows about the question, and what he thinks the League should do with racing. While the utterances are a year old, Mr. Potter has never retracted them; in fact, in view of the positive assertions here given it would seem almost impossible for any one, Mr. Potter not excepted, to go back of these utterances without complete stultification of himself. Said Mr. Potter, speaking of racing:

"My objection to the League's control of this branch of athletic sport is the outcome of experience, and does not reflect my own belief more fully than it reflects the belief of hundreds of loyal members of our Division, whose efforts have been exerted in the work of securing members during the last year. We began with the knowledge that the League of American Wheelmen comprised a comparatively small percentage of the cyclists of the United States, and that in seeking to be a representative body it had great need to invite within its ranks many thousands who for some reason had failed to apply for League membership. It was not difficult under these conditions, when an aggressive movement was begun, to ascertain the fact that a sentiment existed among thousands of prominent and influential cyclists outside the League that was not altogether in accord with the methods of our organization. In other words, in inviting cyclists to join the League it is not so important for us to inquire regarding our own opinion as it is to ascertain the opinion and impression of the cyclists whose membership we solicit.

"The extraordinary and fast-increased attention given by the public press to athletic sports, and the enormous field for the making up of sensational articles supplied by the kaleidoscopic and gymnastic department of the League at Philadelphia, impressed the great majority of the cycling public with the belief that the League of American Wheelmen is an organization maintained for the promotion of bicycle racing, and so general is this belief that from my own experience it is not an uncommon thing for an article on road improvement to be committed to a place on the sporting page of a newspaper by the editor, who acts upon the well-founded belief that whatever comes from the League of American Wheelmen must necessarily pertain to some sort of cycling sport.

"These facts and the fact that cycle racing has been productive of contentions, disputes, unsavory charges and counter-charges in which League officials have been in some degree concerned, and that all this has been widely published, with threats and counter-threats, and that lawyers have finally been employed to drag the League into court to answer certain iniquitous complaints, have supplied a sort of advertising which has been distinctly hurtful to the League and embarrassing to its growth.

"According to the concurrent testimony of all the workers for increased membership

whose record of success is worthy of note in our Division, the great stumbling block which has most interfered with recruiting work has been the belief generally expressed by cyclists that the League is largely a sporting organization, and that its experience is neither so attractive nor its benefits so apparent as to render an invitation to join its ranks irresistible."

That Mr. Potter was upheld in this belief by his Division Chief was clearly proven when Caucus Enunciator Jenkins introduced the following resolutions:

First.—That the L. A. W. should be so constructed and its affairs so conducted as to make it in the fullest sense a body representative of the sentiments, opinions and objects which belong in common to the great mass of cyclists within the United States; that its efforts should be devoted to the protection of their rights, the advancement of their interests and the supplying of those material needs and conveniences which make the use of the bicycle more enjoyable and more beneficial.

Second.—That the control of bicycle racing is not an object in which the majority of American cyclists have common interests, and that the experience of our League in this department of its work has not been such as to commend it to cyclists generally, but has, on the contrary, subjected the League to much adverse criticism and aroused much unpleasant and harmful contention within our own ranks.

Third.—That the experience of the League in the control of cycle racing, while being distinctly hostile to its growth in many directions, has been in no sense a substantial factor in aiding its increase of membership, even among racing cyclists themselves.

Fourth.—That we believe that the true and certain success of the L. A. W. will be found in an united effort for an enlarged membership and for the making prominent to all cyclists the announcement of all those real benefits and advantages which the League professes to supply.

These resolutions Mr. Potter moved, after their adoption, should receive the unit vote of New York's delegates to the Assembly, which vote was ultimately cast, according to caucus, ring and Potter rule.

As to Mr. Elliott's belief concerning the League's continued control of racing, it is equally as positive as Mr. Potter's. In his platform, announced Jan. 3, 1896, Mr. Elliott said:

"I am earnestly opposed to the abandonment of racing by the L. A. W. I fully appreciate the arguments made in favor of doing so, but the question can be squarely met by simplifying the racing rules so as to make them conform to existing conditions, and thus avoid much of the present adverse criticism."

Thus is Mr. Potter and his supporters, abettors, backers and campaign committee fairly and squarely on record to rob the League of all control of racing. No squirming, eleventh hour denials, verbal flip-flaps, legal turncoating, hedging, hemming and hawing, or palavering can alter this fact. Those who want to rob the League of racing must be with Potter, those who desire the League to remain pre-eminent in all things connected with cycling must support Elliott, or at least defeat Potter. Mr. Elliott has no gang behind him looking for the control of racing. Can Mr. Potter truthfully say that this is equally so in his case? THE WHEEL believes he can not.

The reports that Samuel A. Boyle, of Pennsylvania, is angling for the L. A. W. presidency is untrue. It was evidently floated for a purpose—a Potter purpose.

WITH RED-FIRE.

That and Wild Enthusiasm Said to Be The Component Parts of Potter's Warning.

One could see he was a politician of the deepest dye by the furtive and suspicious manner he glanced around, when he came into the office and inquired for the Political Editor. The office boy was going to lay claim to that honor, when he was haughtily pushed aside, and the invader sized up the occupants of the editorial room, finally settling upon the Catalogue Editor as the man he was in search of.

"Young man," he said, "you have hit this Potter idea pretty near right, but there is just one thing you are not on to and that's why I am here.

"Do you know how the final act—the crowning of the unwilling Caesar—is to be brought about? Of course you don't, and it is to tell you that very thing that I am here. You remember how ex-president Kirkpatrick, at Philadelphia four years ago, metaphorically wrapped himself in the American flag, and in rolling sentences and well rounded periods defied the universe, don't you? You haven't forgot what followed, have you? How he stampered the convention; how the delegates stood upon their chairs shouting, screaming and applauding? Remember it all, do you? Well, that's exactly what's going to be done at Albany next month.

"With Kirkpatrick as stamper in chief? No! Better than that; Armstrong, my boy!

He's to do the trick. At the proper time this introducer of the famous bicycle-as-baggage bill is to take the floor, by gradual stages lead up to the red-fire stage of oratory and laudation, in the midst of which cries for Potter will be heard, gradually growing more vociferous until the gentleman himself is upon the platform bowing his acknowledgments. Then Armstrong will apparently be swept with the tide into nominating the hero of the hour—Mr. Isaac B. Potter—for the presidency of the League. The enthusiasm and carefully manipulated hurrahing being expected to stamper the convention in his favor.

"Do I know that this is the game? Well, say, young man, do you think I am dreaming it? And, before I forget it, of course you know, whether he is elected to the League presidency or not, that Mr. Potter is going to be a member of the Assembly from George R. Bidwell's district? Never heard of that, eh? Why that's all fixed long ago. He's to be the next Republican Assemblyman from Bidwell's district, and this League presidency popularity and prominence is counted on to accomplish much for him in his running for Assembly, though it isn't needed with Bidwell's endorsement back of him."

And before he could be interviewed about himself he had gone, leaving behind him only the foregoing statements, and a mingled odor of barber-shop bay rum and cigarette smoke.

TURN THE LIGHT ON THEM.

Chester, Pa., riders are indignant over the action of a local electric light company which has strewn some of the streets with broken glass insulators, causing a boom in the tire-mending trade. The local Consul has threatened the company with prosecution unless the nuisance is abated.

KELLOW FROM THE MARK.

He Manages to Get Home in the Famous Austral, Ahead of the Long Starts.

For the first time since 1890 the great Austral wheel race, a two-mile handicap run at Melbourne on December 5, was won by a back mark man. After barely squeezing into third place in his heat from fifteen yards, Chas. B. Kellow won the famous event and the largest purse ever offered anywhere in the world for a short distance race. He owes his good fortune to the fact that the long mark riders loafed at the start, waiting for each other to set pace, during which time the back markers caught the bunch. Two hundred men started in the race, twenty-seven of whom succeeded in winning a part of the purse of \$2,815. Of this sum the winner received \$1,700, the second man \$215, and the third \$200. The heats, six in number, were run on the previous Saturday, Nov. 28, in the presence of 20,000 spectators. Prior to the Austral heats ten other events were run. In the first heat Ken. Lewis, the scratch man, was unable to overtake the long mark men and finished eighth. Boidi started from scratch in the second heat, but failed to score. The third heat had Parsons as scratch. He finished seventh. In the fourth heat Kellow was the back mark man at 15 yards. He caught third place after a hard chase, springing from the very start. In the following two heats no one started below 120 yards.

Eighteen men took their marks in the final, with Kellow at 15 yards, Walne at 20, Matersen 100 and the rest strung out to Turner at 250 yards. At the pistol the long mark men started so slowly that eight riders were bunched after going a hundred yards. Kellow and Walne went off at a great pace and exchanged pace at each lap. At the end of the third lap they caught the field and the entire eighteen riders were bunched. The men played for position until the sixth lap when Walne rushed to the front, setting a lively pace until the bell sounded. Then Clinton, a 170-yards man, worked up on the outside and made an unexpected jump, gaining a lead of ten yards. The finish is described by an Australian scribe in these words: "Clinton rode for dear life with Kellow and Jackson after him and the rest in full cry. Down the backstraight the cry went up, 'Kellow wins!' as the great rider gradually overhauled Clinton. At the corner for home he got level. The excitement was tremendous. Every person on the stand rose from their seats in wild enthusiasm. They roared and yelled, and men raved like lunatics. Those in the arena forgot themselves as they saw Kellow leading thirty yards from home, and a sure winner. The others were close handy, but the result was without doubt. Kellow crossed the line five yards ahead. Clinton still kept second position; but Walne came with a terrific rush at the last turn, and was gradually overhauling Clinton. Elliott followed on the inside. Just as the line was reached Walne shoved his machine over it at a rapid pace, and beat Clinton only by inches. Elliott was a few yards away fourth, Jackson being fifth, Turner sixth, and Shawbrooke seventh. The others followed in a bunch. When the numbers went up it showed

the judges placed Elliott third and Clinton fourth. Thus ended the Austral of 1896. Never was there a more popular win. Kellow rode a magnificent race. He and Walne paced each other up to the field, and once there Kellow's coolness won him the race. He was never in a bad position. Using his head, as few can, he always had a clear run, and he won the Austral of 1896 magnificently.

Kellow is a cycle dealer in Melbourne, and handles the Red Bird cycles, the wheel he rode, manufactured in Brantford, Canada. It was fitted with Dunlop tires.

Previous to the Austral, Kellow won the Melbourne B. C. Plate, a mile and a half handicap, with a first prize of \$200, in which over fifty riders started. He had 10 yards. This is the first time in six years that one rider has won both of these big events. In 1890 Tom Busst secured the honor. 25,000 spectators were present when the final of the Austral was run, although a hot north wind made the atmosphere almost unbearable. The meet netted the Melbourne club about \$5,000.

Summary of the principal events both days:
FIRST DAY.
Victoria Mile Handicap—Final—1 W. A. Adams, 20 yds.; 2 R. H. Walne, 10 yds.; 3 J. Hogan, 130 yds. Time 2.20 2-5.

Half Mile Flying Stakes—Final—1 W. McCombe; 2 J. B. Gargurevich; 3 M. J. McLeon. Time 1.07.

One Mile International.—1 Ken Lewis; 2 J. T. Kuhl; 3 H. J. Pither. Time, 8:41 3-5.

SECOND DAY.
M. B. C. Plate, 1½ miles.—1 C. B. Kellow; 2 D. J. Walker; 3 J. E. Clinton. Time 2.25 2-5.

Mile Handicap.—1 J. B. Gargurevich, 5 yds.; 2 D. J. Gasdiner, 75 yds.; 3 G. Carpenter 10 yds. Time 2.17.

Five Mile International.—1 K. Lewis; 2 J. T. Kuhl; 3 M. Porta. Time 12.25 4-5.

Austral Wheel Race (Two Miles Handicap)—1 C. B. Kellow, 15 yards.; 2 R. H. Walne, 20 yds.; 3 W. J. Elliott, 150 yds. Time 4.29.

DID SEVENTEEN DAILY.

Charles Sulzner, of the Century Wheelmen, Philadelphia, who started out on January 1, 1896, with the determination to ride at least five miles each day in the year, succeeded in carrying out that determination, though he often found it difficult to do so on stormy days. His daily average was about seventeen miles, riding as low as five miles on three days. His total mileage for the year was 6,200 miles.

THE PROFITS THEREOF.

Springfield, Mass., Jan. 11.—The report of the treasurer of the Springfield Bicycle Club emphasizes the fact that the big tournaments on Hampden Park are a source of large profits, as well as world-wide fame. During the past five years the club has realized \$13,000 from tournaments. Last year's receipts of \$9,158 were \$950 larger than those of 1895. The profits of the 1896 tournament were about \$2,500.

PLENTY OF RECRUITING TIMBER.

A canvass of the State has just been made by the Connecticut Federation of Cyclists. At a committee meeting on Tuesday the result was given. There are in the State 80,000 riders of bicycles, of whom more than 48,000 are legal voters, and less than 1,500 members of the L. A. W.

LIKELY TO BE DISAPPOINTED.

The Mayor and Board of Aldermen of Thomasville, Ga., have extended an invitation to the League to hold the national meet in that city in March or April.

"MIKE" SUFFERED, TOO.

Tied Up To, With And By Tom Eck, the Little Welshman Quits and Goes Home.

Michael sailed on the steamer Paris on Wednesday for his home in Wales. As an explanation for his action he states that the National Cyclists' Union has demanded his appearance in England at once to answer charges preferred by the promoters of a race meet at which he did not appear. This together with the fact that he still clings to Eck as his manager has put an end to all talk of a Michael-Linton match and the proposed meet at Jacksonville, Fla., has been indefinitely postponed. Michael affirms that after he has arranged matters on the other side he will return to this country and ride on the circuit as a member of one of the prominent teams. He claims that his return to England is compulsory and refutes the statement that he is crawling, and taking this method of dodging Linton.

He says that Tom Eck, who made the contract for his appearance at Jacksonville, knew nothing of the impending summons to England. He also says that owing to his agreement with Eck he could not have ridden in this country under any other management, and that it was out of the question to think of his renouncing Eck to take up the match at Jacksonville, as has been suggested.

B. F. Blake, who had completed all arrangements for the Jacksonville meet, will endeavor to arrange for the appearance of a number of prominent riders in that city before the end of the winter. He claims that he was unaware of Eck's trouble with the Racing Board until all arrangements for the meet were completed. He says that he entered into an agreement, signed in triplicate by himself, Ed. Plummer as manager for Tom Linton, and Tom Eck, representing Michael, by which the two riders were to meet at the Panama track, on January 19, 21 and 23, in three contests.

The contract was made by Eck without giving Blake any notice of his being under the ban of the Racing Board and that he could not participate in events on tracks recognized by the League.

The first intimation that he received of a possible failure to bring the two men together was in a telegram received by him from Eck December 29, from Minneapolis. It read as follows:

"Michael cannot race Linton. League Racing Board informs him that I cannot train him; therefore, race is off. This as information."

To this, under the same date, Blake replied as follows:

"I did not understand you were to have anything to do with training of Michael. If he does not care to meet Linton without your training, advise me here quick."

Blake received further information January 2, in the following telegram from Eck:

"Michael will not go alone. I care for my interests and will live up to my suspension and will take no chances with the L. A. W."

Blake then wrote Eck that he (Eck) knew of the position he was in when he signed the agreement to have Michael at Jacksonville, and served notice on Eck that he should hold him responsible if Michael failed to appear as had been advertised.

VICTOR BICYCLES

THE STANDARD FOR QUALITY.

You DO NOT see them everywhere, but you DO see them wherever the FINE POINTS of bicycle construction are known and appreciated.

We are the Only Makers

Who build a wheel having flush joints and all frame connections of FORGINGS.

Who build the entire wheel.

Who use sixteen pounds of crucible steel in the construction of each wheel.

ROOTING UP ROTH'S RECORD.

An attendant at a recent meeting of the Record Committee of the Century Road Club, states that it is doubtful if E. N. Roth's numerous records, reported last week, will be accepted. Although Roth has sent great volumes of evidence, some of it is faulty. He claims to have ridden centuries in and about Chicago on days when the mud and rain would render riding almost impossible. There are other doubtful claims made, which will be thoroughly investigated before any definite action will be taken. The charge of professionalism has also been made against Roth, and if this can be proved the road club could not award the record on the best evidence that could be submitted.

The carefulness with which records are scrutinized by the road club committee can be gained from the fact, in going over the claims submitted by Roth, the committee wrote to weather officials at the various places where the riding was done and secured reports of the state of weather, whether or not the centuries claimed were possible. They also secured evidence as to the condition of the roads from competent authorities. As a good part of Roth's riding was done in Texas and other Southern states it was no small job to accomplish all this. The evidence submitted by the rider himself was enough to fill a couple of pretty large volumes, but was contradictory in some of its main points, and this, together with the fact that the record claimed was such a remarkable one led the committee to go into details much more closely than is usual. It will be some time before it is known whether or not Roth is the champion rider of the country.

SHOULD HAVE BEEN SUSPENDED SOONER.

Referring to a Chicago despatch in which it was stated that the Michael-Linton match fell through on account of the Racing Board's high-handed manner of treating Eck, Chairman Gideon retorts that the only mistake made was that Johnson and Eck should have been suspended sixty days sooner.

"I wrote to both Eck and Johnson," he states in an interview, "that I should expect them to adjust the matter, but this and subsequent letters from Portland and from myself were either ignored or the matters written about evaded. I disliked to suspend Johnson at the height of the season, and believed that he would adjust the matter as soon as possible, but after it had gone on for several months I changed my opinion."

A SMALL FORTUNE IN ONE RACE.

Martin, the disqualified American now in Australia, has a great race in prospect, according to Australian papers. A Coolgardie millionaire is so confident that a local man is a world beater at heavy cross-country long-distance work that he wishes to back his choice against Martin for \$5,000 for a race from Adelaide to Melbourne. Martin is said to be quite willing, and the amount does not frighten him. The distance is about 580 miles, and in parts the road is entirely unmade. Should the race take place, it will be the greatest event of the kind ever run in the world, Antipodean papers state.

TWO GOOD ONES.

Henry E. Ducker will manage the Charles River track next season, it is announced, with Ex-Manager Corcoran as assistant.

RIVAL RACING REGULATORS.

Finding the so-called alliance between the Amateur Athletic Union and the League to be practically a dead letter, the former organization has passed a series of resolutions instructing its secretary to serve thirty days' notice that the articles of alliance are terminated. There will be no merry war over the matter as stated in some of the daily papers, or trouble whatever. The Racing Board during the past season has sanctioned cycle events at athletic games held by organizations in Buffalo and New York that were black-listed by the A. A. U. This was in violation of the alliance drawn up several years ago and accepted by Messrs. Potter and Bull in behalf of the League, but which Chairman Gideon declined to recognize, for reasons stated in a communication read at a recent meeting of the A. A. U. Athletic clubs will have to secure sanctions for cycle events as formerly and associations at odds with the A. A. U. will receive the same treatment as any other organization. The A. A. U. is in favor of a new alliance of a nature that would be acceptable to both organizations and lived up to.

THINKS A FULL SCORE.

Will C. Pelot, manager of the Morgan & Wright team, thinks that there will be no less than a score of teams on the national circuit next season. He predicts that '97 will be a record-breaking year for cycle racing, and that it will go down in cycling history as the greatest year ever known in the sport.

WILL BE A RACE, FOR SURE.

Parsons and Martin were booked to ride another series of three match races at Melbourne on Dec. 19. The distances were one, five and ten miles. In the two latter events the men were to supply their own pacemakers. In a similar series run last March, Martin won two out of three.

FOR THE PRINCE CIRCUIT.

Work on the construction of an indoor track in the Manufacturers' Building, Piedmont Park, Atlanta, Ga., has commenced under the direction of John S. Prince. It will be modeled after the Memphis track and be completed within two weeks.

WHEN SNOWBALL SEASON COMES.

"Some er dese hyere ter'ble well-dressed yung jackercrack racin' men," said Uncle Eph, after he had experienced the forty-fifth touch for a loan, "seems ter think dah winter close ain' gwinter fit 'em right unless de pockets air perfectly empty."

DOING WELL IS PORTA.

Between September 17 and November 9 Porta, the Italian rider, now in Australia, won over \$2,000 in prizes and established over a dozen records. He is described as riding much in the same style as Zimmerman.

YET HE IS ADVERTISING FOR A JOB.

Tom Cooper is to be installed as manager of a branch house of the Monarch Cycle Co., to be established at Detroit, it is reported. Notwithstanding this, he will continue his career on the race path.

COLLEGIANS LIKELY TO BE FAVORED.

President Kirby, of the Inter-collegiate Athletic Association, has been delegated by the Executive Committee of that organization to attend the meeting of the National Assembly and ask for a modification of the League racing rules in favor of college events. In speaking of the matter President Kirby is quoted as saying:

"A college athlete is allowed expenses to and from games and afforded such privileges of training that he is put in no worse condition financially than he would be otherwise. Under the present rules of the L. A. W. all such expenses are strictly forbidden. While by our present constitution we would allow our college riders to compete in college games, we think that it is only just that we should demand from an organization founded upon the same principles, and to attain the same ends, the right which will give these men the privilege of competition in games held by other than the colleges."

As Chairman Gideon has proposed an amendment to the League by-laws proposing that the Inter-Collegiate Association be permitted to frame rules for its own government, the collegians will probably secure the desired concessions.

PARSONS IN FORM AGAIN.

Parsons has redeemed himself in the eyes of the Australians. At the St. Kilda meet in November he won the mile international scratch from Pither and Boidi, the Italian, in 2:55 3-5. He pleased the spectators by winning his heat, when defeat seemed certain, by sprinting the last two hundred yards at a pace that was an eye-opener to the crowd, and won him the race by several lengths. The five-mile international race went to R. H. Walne in 12:14 1-5. A bad spill brought down six of the contestants, including Parsons, early in the race. Parsons is still riding a World wheel.

RACING BOARD BULLETIN.

PROFESSIONALS.

- W. Fred Sims, Washington, D. C., clause (b).
 Geo. S. Ball, Washington, D. C., clause (b).
 Mike Ballich, Galveston, Tex., clause (i).
 S. Sgitovich, Galveston, Tex., clause (i).

RECORDS ACCEPTED.

One hundred miles professional, paced, flying start, against time, 3:52.14, by Frank Walker, Memphis, Tenn., November 19, 1896.

SOME FOREIGN RACING PLUMS.

Money affects men and mares the same—it makes them go. If this be true, and it is, there should be some great going at Brussels this year if large prizes can produce it. For the international cycle meeting in May and the national races in July a sum of 32,000 francs is to be spent in prizes, and the grand prizes of the International Exhibition will amount to 15,000 francs.

EVERYTHING SWELLED.

Evidently the purses announced by the press boomers of the Washington six-day race were considerably inflated. Walter, who arrived in New York last week, stated that he received exactly \$294 for his week's work, while Maddox, the second man, was awarded the sum of \$184. The men were paid a percentage on the receipts, instead of the stipulated purses.

ADAPTED FROM MESSONIER'S CELEBRATED PICTURE, "THE SIGN PAINTER."

The bicycle is the advance agent of good health. It is changing the habits of the people—getting them away from the crowded centers—giving them a glimpse of beautiful nature—and promoting happiness and contentment. The bicycle is a great blessing, and its usefulness and popularity is due almost entirely to the pneumatic tire. An Irish

physician made the first pneumatics, but JOHN PALMER, an American, improved and perfected them. His inventions cover several points, but the chief and vital one is in the fabric. In nearly all tires except Palmer Tires the fabric is identical with that used in making garden hose. The fabric in Palmer Tires is totally dissimilar. It exactly suits

the requirements of the rider, and that is why Palmer Tires are noted for being so fast, resilient (easy riding), and are so easily repaired. Our interesting and instructive catalogue gives complete information. It will be sent to any address upon request. Address Advertising Department

FROM FAR AND NEAR

Come Amendments to the League Constitution Few Are Needed, Most Are Unwise.

Besides the strife over the Presidency of the League, the coming meeting of the National Assembly will be notable for the numerous changes to the constitution and by-laws—good, bad, and ridiculous—that will be brought up for consideration. Officials and delegates from all parts of the country have taken advantage of the occasion to "speak their little pieces," resulting in a wondrous display of words and ideas, all intended, presumably, to be advantageous to the good government of the League. Outside of the insane idea of a Western Chief Consul prohibiting the Racing Board from suspending riders without the permission of the Chief Consul of the Division, the amendment proposed by Secretary-Treasurer Bull of the New York Division is the most impracticable and absurd of the entire lot. Mr. Bull, it is understood, with his usual weakness has lent himself to the use of others and has put forth the amendment for another who is too timorous to stand forth and shoulder the ridicule that will probably follow the reading of the amendment—one that no man in his right senses will offer. It is, in fact, too ridiculous for consideration at all. Mr. Bull suggests, in effect, that about all the duties now performed by the National Racing Board be placed in the hands of the various Division Racing Boards, the latter bodies to impose suspensions, transfer to the professional ranks, grant sanctions, enforce punishment, etc., and practically control racing in their respective States.

It is, however, stipulated that any decision made by a State Board may be reversed by the National Committee and that "the duties of these State Racing Boards may also be performed by the National Racing Board when, in the opinion of the latter, it is necessary."

When Chairman Gideon was shown the amendment, he stated it would be strongly opposed by the Racing Board and said:

"Even under the present arrangement it has been found impossible to avoid some friction between the Board and some division officials. In enforcing the racing rules we have acted entirely regardless of any outside consideration, as was, of course, our duty. The enforcement of the rules has, however, sometimes affected men prominent in the workings of divisions in which suspensions, transfers, etc., were made, causing hard feelings on the part of division officials primarily interested in building up the membership in their States regardless of the effect on racing interests. To place these matters in the hands of a large number of Boards would result in still greater friction, for many State Board decisions would doubtless have to be reversed, and this would result in no end of complaints from division officials called upon to support their committees. Moreover, what would seem to be a perfectly fair punishment for the infringement of the rules by a State Committee might to the National Board seem unnecessarily harsh or ridiculous light.

"We have to an unprecedented extent been guided by the wishes of the State Boards during the past year, and are always

glad to avail ourselves of their help, but the imposing of the sentence of punishment should be in the hands of one committee. A better plan than the one proposed would be the appointment of such deputies as might be desirable by the Board itself. These officials would then be subject to the instructions of the Board, and greater harmony of action be secured."

W. J. Jenkins, of Buffalo, thinks that too large a proportion of the dues of members now goes to the National body and proposes that 50 cents be returned to the Divisions instead of 35 cents as at present. A Pennsylvania official has an amendment providing that all matters connected with contested election cases be referred to the correspond-

THE FOUNDER OF A GREAT RACE.

Mr. Barkman was once almost as prominent in New York State as are most of those cycling notables who nowadays figure in the public prints. That was before he married and removed to Chicopee Falls, Mass., as one of the heads of A. G. Spalding & Bros.' cycling interests. He was captain of the Brooklyn Bicycle Club, a cycling legislator and correspondent, a member of the New York Racing Board, Chairman of the Road Book Com-

mittee and a veritable human guide book; he was an ardent tourist, a "mileage fiend," a race meet official, and above all he founded the classic Irvington-Milburn road race. Since his removal to Chicopee he has not been much heard of, but the fact that the Messrs. Spalding have decided to transfer the conducting of their bicycle business to that point, with Mr. Barkman as the directing head of the department, may draw him out a little oftener.

ing division committees, and that the National committee shall have jurisdiction only in the event of an appeal from the decision of a State committee. The amendment also provides that in the event of the State committee's action being confirmed the persons appealing must defray all expenses connected with the appeal.

That well-known old-timer, Albert Mott, of Baltimore, has framed an amendment allowing the President such a sum of money for clerical expenses as shall be approved by the National Assembly, instead of a definite sum as now, which Mr. Potter for one is not likely to approve. G. D. Locke, of Chicago, thinks the bond of Secretary and Treasurer should be increased from \$10,000 to \$25,000,

and three admirers of professionalism will endeavor to have the word "Amateur" stricken out of the clause relating to the admission of members. Secretary-Treasurer P. I. Collins, of Pennsylvania, proposes that each State be allowed to select its own basis of representation on the State boards of officers, instead of one representative to each 200 members.

From Montana's Chief Consul, M. R. R. Brock, comes the nonsensical suggestion that the Racing Board be prohibited from making decisions, suspensions, etc., without the consent of the Chief Consul of the State in which the man lives. E. Kostomlatsky, Oskaloosa, Ia., has an idea that the Racing Board should consist of a chairman and the chairmen of the various State boards. Mr. Kostomlatsky may find some delegates who think differently. California as heretofore announced is out for Sunday racing and moves that it be allowed in any State where the Division officers shall sanction the innovation. D. W. Robert, the St. Louis member of the National Racing Board, seconds the motion. If it's not carried, there'll be trouble, it is hinted in the Far West.

Chairman Gideon anticipates the collegians by offering an amendment allowing college and school events to be run under the rules of the Intercollegiate Association, and at the request of Secretary Basset proposes an associate membership, the entrance fees from which shall be devoted to the uses of the Racing Board, though just what connection there could be between such a class of membership and racing interests is not explained.

Chief Consul Pattee, of Illinois, apparently prefers the old political deals and squabbles incident to the selection of a place for holding the annual meet to the present plan of a secret ballot previous to the meeting of the National Assembly, and, therefore, proposes that the old method of deciding the question by a vote of that body be re-adopted.

The question of admitting negroes to the organization, which it was thought would cause much discussion, will not come up at all, no amendment to that clause containing the word "white" having been suggested.

A few other amendments of minor importance are also on file.

WILL RIVAL OLYMPUS.

Boston, Mass., Jan. 13.—Another mammoth amusement edifice is proposed for Boston: the name, Olympian Garden, has already been selected. It will be located in the Back Bay, the portion of Boston where the elite reside. The bicycle track, the chief feature of the building, will be six laps to the mile. The intention is to make it the fastest track in the country. It will be of oval form, with the ends steeply banked, allowing the highest speed with safety; the construction will be similar to the Paris tracks. On the bicycle track it is proposed to hold races Saturday evening and holidays, while at other times the track will be used for riding and training.

There will be 1,000 lockers provided for the use of cyclists. The land has been purchased and every arrangement made for carrying out the project, which will furnish other athletic privileges.

Don't resolve your wheel club into a cycle debating society.

WORTHY THEIR NAME.

Centurions Who Have Proven that They Were So Actually As Well As Nominally.

They called it The Century Wheelmen ten years ago a handful of cycling enthusiasts in Philadelphia met and organized what was destined to become one of the largest and most powerful clubs in the country, and how singular was the spirit that prompted the name, for since its inception, and even now, with all the alluring comforts of a palatial club house, with its many comforting social features, it stands to-day at the very head of the rising clubs in the land. Year after year the total mileage amassed by its members showed an activity that was most convincing; club runs were made features, and instead of the usual heart-breaking grinds that pass as such, they were conducted on a plan that made it pleasant to all. Going to the destination, each followed his own sweet will. The scorcher could work off his surplus energy with others of his ilk, while the plodders would potter along with a few choice companions and enjoy the country to its fullest. On the way home, however, a regular pace was set and no scorching allowed, and all would come home better for their day's outing. The success of the scheme can be gathered from the fact that the average attendance on these Sunday runs during 1896 was sixty-seven.

Last year it was determined to try for the century run banner offered by the Century Road Club, and when the year '96 was rung out the riders from the city of Penn had 1,213 century runs to their credit, in cold figures as many miles as would reach five times around the earth, while the entire mileage would amount to as much more. Of the number who participated in the runs, 65 men made five or more 100-mile runs, 27 are credited with 10 or more, and three have more than 50, while two others can lay claim to 156 and 137 bars respectively.

A. A. Gracey, who will undoubtedly get the individual Century Run medal and also the M. & W. medal, is an old-time road racer, who made his debut in the '91 Irvington-Milburn road race. He led for 18 miles and then fell by the wayside. On June 20, '92, at the Pennsylvania Division met at Scranton, he won both first and time prizes, beating such good men as McDuffie, Crooks and Coffin, and winning two bicycles for his work. In many other road and track events Gracey has performed with credit. The record he made this year is most marvelous, when it is considered that Gracey is employed during the day, and, excepting Sundays and during a vacation in the summer, never neglected his business. His programme was to ride ten or twenty miles before breakfast, then to his place of business, then home for lunch and back to business, topping off the hundred in the evening. Inclusive of his centuries, his total mileage was 22,848 miles. Gracey also rode on each of the 366 days in the year.

His record by months was as follows:

January, 374 miles; February, 778 miles, 3 century runs; March, 1,316 miles, 7 century runs; April, 1,947 miles, 10 century runs; May, 2,553 miles, 11 century runs; June, 2,284 miles, 13 century runs; July, 2,293 miles, 14 century runs; August, 1,875 miles, 13 century

October, 2,655 miles, 23 century runs; November, 2,178 miles, 20 century runs; December, 1,743 miles, 16 century runs; total miles, 22,848; total century runs, 156.

John H. George is a very creditable second. In January he rode one century, and when the competition closed it saw 137 to his credit and a total of 17,300 miles for the year. During October he rode 39 centuries. Within 60 days he made 70 runs, for which he will receive a C. R. C. medal.

Compared with the other two the 50 centuries ridden by John M. Nobre seems small, yet to the average rider it is a herculean task. Two very fast long-distance trials are placed to his credit. Nov. 24 he broke the former record of 8 h. 15 m. from New York, supplanting it with new figures, 7 h. 6 m., and that under the most adverse conditions. On what is known as the South Jersey course, on Oct. 21, he rode 100 miles in 5 h. 47 m., an achievement that stamps him a man of no mean ability.

Another unique record to the credit of a club member is the riding of at least ten miles on every day of the year. Charles Sulzner, rain or shine, warm or cold, rolled up his mite on each of the 366 days, for the mere satisfaction of showing that it could be done.

HE IS IN THE GAME, TOO.

Among the other rumors regarding dark-horse candidates for League office, comes one with oriole wings and terrapin tails direct from Baltimore, which feathered and tailed story says that Albert Mott has a carefully baited line out for a Vice-Presidential bite. It is whispered that if Albert gets satisfactory nibbles he will attach a Potter cork to his line, and go bobbing for the honor with true Motterian method, but if the nibbles are faint, Albert will promptly reel up his line and pack it carefully away until '98. Cautious man is Mr. Mott!

BRIGHTENING SKIES.

They Hover Now Over the Future Outlook of Toledo's Cycling Industries.

Toledo, O., Jan. 12.—Within the last two weeks there has been a perceptible brightening of the skies about Toledo, so far as the bicycle industry is concerned. Where, up to a very few weeks ago, the factories were running office forces only, there are now full complements of men making and assembling Toledo's best-known product, and a small army of men are scattered over the world introducing the lines that will be leaders during the coming season. The Yost Manufacturing Company is now running over five hundred men, and Mr. Yost says that, as far as he can judge from the present conditions, the coming season will be much better than that of 1896. The Lozier factory now has nearly eight hundred men actively employed, and as occasion demands this large force is being added to. The Toledo Metal Wheel Company, the Kirk-Young Manufacturing Company, the Maumee Cycle Company, the Union Manufacturing Company, the Gendron Wheel Company, the Snell Cycle Fittings Company, and other well-known concerns are adding to their forces, and soon the high-water mark of other past seasons will be reached and passed.

Perhaps the busiest of all Toledo's bicycle and allied industries are the tube makers. Each plant is running to its full capacity, and part of the time night forces are employed, such is the increasing demand for Toledo-made tubing, which has already been given a high rating in the leading markets, both of this country and Europe.

During the past week the partnership heretofore existing between George Harden and August Wolfert, as owners and managers of the Harden Saddle Company, has been dissolved, and hereafter the business will be conducted by a stock company, of which Mr. Harden will be the head and manager. The new company will be known as the Harden Specialty Company; it is capitalized at \$25,000. Within the next ten days Mr. Harden will have on the market not only his '97 line of saddles, but a new line of sundries, including the pneumatic seat-post and a direct saddle-post.

One of the most important pieces of news that has developed this past week, is the fact that the old Truman plant will be put in active operation at once, with Captain T. B. Terry as its manager. The captain has organized a strong company, fully able to put the Truman and Dauntless wheels on the market in a manner that will command instant attention to these well-known makes of wheels, which a disastrous fire in the old Dauntless plant, and unfortunate investments on the part of Mr. Truman, retired from the bicycle horizon last season. It is announced that the works will be opened very soon, and that the first consignment of wheels will be on the market within the next thirty days.

SURE OF PLENTY OF CALLERS.

By having a place for everything connected with your machine and everything in its place, you can be a source of great comfort to careless riders who never remember where they leave things.

ECHOES FROM EUROPE.

Morgan & Wright's "Deal" Refuses to Down.
Dunlop Proceedings Against Inactive
Licensees.

London, Jan. 2.—We are, in a sense, "betwixt the daylight and the dawn." 1896 is just sped and the strangeness of writing '97 is still upon us. Most of the cycle factories and all of the cycle depots are once more in full swing but there is nothing in the way of startling news to retail, if I except a very positive statement made to me by one whom I have very seldom found wrong, regarding Morgan & Wright. This man assures me that the M. & W. business in Europe, passed yesterday into the hands of a privately capitalized syndicate who are about to start proceedings on a huge scale, and with the idea of possibly losing money for a year or two, but eventually controlling the market as Morgan & Wright does on your side.

In face of the denial from Mr. Morgan, which recently appeared in THE WHEEL on this point, I don't know what to think of this save that it is possible between the date of Mr. Morgan's statement and now, that the syndicate which has been treating to obtain possession of the European rights of the "Good Tires" have been able to overcome the difficulties hinted at by him. My informant tells me that M. & W. have earned a dividend of over 20 per cent on their capital this year on your side without counting on the European business as an asset.

The sensation of the week is a rumor that the Dunlop Tire Company intends disputing the validity of the licenses under which the Seddon, Turner, Preston Davies, and Bajot tire companies have been successful in resuscitating these firms. The ground on which invalidity is claimed is bankruptcy on the part of the original licensees; but even were this correct law which I very much doubt, it is not a fact that any one of the four concerns ever was wound up by the Law's officers. The resuscitations took place prior to the official Receiver in Bankruptcy compiling a report, and as a matter of fact the reconstructors by arranging with the creditors of the expiring firms were in a position to take the matters out of the liquidator's hands. As a proof of this, I may say that no report was ever published by that official, and until such a document is issued no bankruptcy is an accomplished fact. The rumor may have no foundation, but the presence of the names of the firms mentioned in the lists of which I wrote in my last letter seems ominous. If true, and as the law looks clear on the matter, I suppose the Dunlop people conceive that it is better to keep their opponents engaged in the law courts than allow them peace to work up what might be a dangerous trade opposition.

When the International Cycle Association held its last championships at Copenhagen, the club—they have no Danish union or governing body—under which the meeting was held was lauded to the skies for its lavish interpretation of the well-known and generous Danish law of hospitality. The meetings were a huge success financially, and everybody concerned, even Ireland, was looking forward to a good fat dividend for its share in the

fete. The Dansk B. C. however cut the bottom out of all those expectations by simply charging up the cost of everything—including the hospitality—to the participating bodies, so that instead of £50 or £100 each the Unions have to be content with £20. As it cost considerably more than this to send England's and Scotland's and Ireland's representatives the venture will of course result in a loss instead of the rosy profit anticipated. On these lines, I have no doubt that future I. C. A. meetings will be models of economic hospitality.

It is understood that the Great Horseless Carriage Company—the body which has been acquiring all the motor patents available during the past year is in for a long line of litigation, as the validity and claims of many of its patents are scouted by men who ought to know about what they are talking. I believe that the recent appeal for 250,000 new £1 shares issued at a premium of £2 each, was a fizzle, as the present shareholders insisted on overloading the market at £2 or less if they could get it.

CANNOT WORK LOOSE.

Something new in nuts has been evolved and patented by J. A. Fleming, a cycle mechanic of Brooklyn, N. Y. He has interested Alex Schwalbach, No. 471 Flatbush avenue, who is ready to talk shop rights to all who may desire to do so. The illustration shows

the essential feature of the nut. A bit of spring wire is inserted as shown; when the nut is secured on the bolt it engages in the thread and, while easily removed with a wrench, it cannot possibly work loose and be lost from any cause whatsoever.

SAILING OF THE VIKINGS.

Manager E. G. Eager, of the Viking, announces that preparations are being made for an extremely busy season, and a strong corps of advance representatives is now being scattered over the country. Earl B. Douglass will have Eastern Pennsylvania and New Jersey; W. F. Goudy will take Western Pennsylvania and North Carolina; A. B. Coffin, of Savannah, will have charge of a large block of Southern territory, comprising Georgia, Alabama, Florida and South Carolina. Doria Tracy, formerly of the Cleveland forces, will have Illinois and Kentucky. Mr. Eager will also keep in touch with the trade, and will personally visit the outside agents from time to time. A sample order of fifty-four Vikings has just been shipped to northern Russia. A novelty in their construction is a peculiar make of steel rims, made to special designs by the consignee, and consequently requiring a special make of tires. Dunlops will be used. The factory is also preparing to send consignments to Cape Town, Sydney, Melbourne, Australia; Birmingham, England, and Stockholm, Sweden, this week. A large consignment for Wellington, New Zealand, will go forward by the first February steamer.

SURPRISED THE SURGEON.

As the ambulance was driven up to the curb in response to a hurry call, the crowd fell back and the surgeon leaned over the prostrate body on the sidewalk. The victim had fallen from the fifth story window of the building in front of which he was lying and was apparently unconscious. But when about to be placed on the stretcher, he opened his eyes and said: "Hey there! I'm goin' to call a foul on you, you bloomin', pot-hunting wobler."

The surgeon looked at him in amazement as he muttered: "Temporarily deranged and no wonder. Strange he has a whole bone in his body."

"Say, what's all this mean?" continued the victim getting on his feet and looking around; "think I'm a subject for a funeral?"

"Why, man, you fell from the fifth story of that building and you ought to be," replied the surprised surgeon, overwhelmed with amazement at the man's vitality.

"Oh, that's it, eh! Thought I was in another spill on the track. You see, I'm a racing man and have been riding on indoor tracks. A little fall like this is nothing—just keeps me in condition. Sorry I troubled you. Good day." As he walked away, the crowd dispersed and the surgeon returned to the hospital completely non-plussed.

MEMS FROM TOLEDO.

John H. Hunter, Toledo's foremost century rider, confidently expects to be awarded the laurels in Ohio for the season that has just closed. Mr. Hunter rode 13,272 miles in 1896, making 10,400 miles in centuries alone. His confining employment only allows him to indulge his penchant for centuries on Sundays, so that it will be seen that he has achieved a wonderful season.

On exhibition at the Lozier salesroom is a new '97 triplet, which has been built to a special order from Paris. The wheel is geared to 112. It will shortly go forward to M. Bertrand, the Paris representative of the firm.

Charles E. Weaver, he of the Vim tire, was in the city last week to open a Toledo branch for his people. Weaver is well known here, and the trade would appreciate it if he were permanently stationed at this point.

The new Meilink Manufacturing Company is opening the season with a large run of work in hub making, a line in which Charles Meilink excels.

MIGHT RACE FOR HOURS.

Monte Scott's favorite manner of running match races, in which the contestants start from opposite sides of the track, was given a trial at the winter track, Paris, recently, and greatly pleased the Parisian spectators.

Another innovation that is likely to become popular, a race that will simply paralyze loafing, is the so-called pursuing match. The distance is unlimited. The two opponents start from opposite sides of the track and ride until one overtakes the other. The man first catching his opponent is declared the victor. This is the manner in which the recent Borden-Fischer match was run.

Knowledge is power, but the unnecessary display of it is weakness—common among novices in cycling.

CONCERNING CHAIN MAKING.

Chain making is an art or science or both, as one chooses. It is not every man or every concern that can follow the business with the credit to himself that the manufacture of such an all-important part of the driving gear of a bicycle demands; indeed, it was but recently that the purchasing representative of a prominent cycle concern told THE WHEEL that there were few fields in which there was room for greater improvement.

"Take a Browne & Sharpe sprocket," said this gentleman, "place in turn a hundred chains around it, draw them taut, and you will be amazed to see how few of them fit perfectly; or as another experiment, take the blade of your pocket knife and pass it between the successive links of a chain and again you will be amazed; the blade will fit snugly in some places, in others it won't fit at all, and in others there is room for considerable play."

It is difficult to attain perfection, of course, but in striving to attain it none have been more diligent than the Indianapolis Chain & Stamping Company, whose substantial stone and brick factory, operated by 20 electric dynamos, aggregating 226 horsepower, is one of the prominent industries of the Hoosier capital. The company early appreciated that the great accuracy required in each of the 250 parts of a chain, made its manufacture a most complex problem, and spared no expense to properly cope with the conditions. The machines and tools for the most important of the numerous operations were designed and built in their own shop, and many of them are marvels of ingenuity and mechanical skill, ably exemplifying that "Necessity is the mother of invention."

From year to year marked improvements have been made in their product, but this season the advance has been far greater than ever before. Advantage was taken of the quiet times of the summer and fall to thoroughly overhaul the entire equipment, and also to make some valuable additions. Probably the most worthy of mention among the new tools is a line of gauges for measuring the walls of the chain blocks, thereby insuring greater accuracy in pitch than has heretofore been attained. New cutters for making rivets have also been devised, which makes it possible to reduce the side play of the chain to a minimum. In fact, the methods of manufacture throughout have been very materially refined. The importance of the hardening department is fully recognized, and uniformity in results is greatly enhanced by the use of natural gas. Great care is exercised in the selection of material, only that being used which long experienced and exhaustive tests have demonstrated is most suitable. Each department is in charge of a mechanic of exceptional ability, and the work is given the most careful attention in every detail. An important feature of Diamond chains is the patented rivets, which are hard between shoulders to resist wear, and soft on the ends to facilitate riveting.

Their '97 line embraces a great variety of styles in both figure 8 and letter B shapes of blocks and sides. The B chains show a greater tensile strength than the figure 8 type by 400 pounds, and their leader in this shape, which is known as No. 7, is attracting widespread attention from the manufacturers of high-grade wheels. In design and finish, it

is certainly a beautiful example of the chain-maker's art.

"Diamond" chains were formerly known as "Indianapolis." The change was made a year ago to prevent confusion with the product of a newer concern, which adopted a somewhat similar name. The genuine Diamonds are all stamped with the "Diamond" trade mark and "I. C. & S. Co."

This progressive corporation ranks well up in the list of successes of the cycle industry. The officers are C. E. Test, president; E. C. Fletcher, secretary; A. C. Newby, treasurer; Humphrey Harrington, mechanical expert and J. H. Holland, superintendent.

WON'T TROUBLE THE POLICE.

Here's a scorcher which will never trouble the police or courts and which never will be written down by an indignant press—not if the Place & Terry Manufacturing Company, No. 247 Centre street, New York, can help it, and so believing can and have helped it. The Scorcher is a companion to their Pathlight

lamp, selling for considerably less money, "for the same price as the ordinary tin lamps," as P. & T. express it. They state that the Scorcher is made of brass, handsomely nickle plated, and claim it to be "jolt and cyclone proof."

The top and the oil-fount can be taken off, and the reflector as easily removed. It has a double convex glass lens, a sliding green

signal light on one side and a red light on the other side. It is a handsome and attractive article.

Another of Place & Terry's recent productions is this head-bracket, an ingenious little contrivance which will fit any wheel or any lamp, and which is novel in that it can be taken apart into three pieces and carried in the vest pocket, if necessary.

KEEPS HIM BUSY, TOO.

The stealing of bicycles has become such an industry in Washington, D. C., that one detective from the police bureau has nothing else to do but look up stolen bicycles or find owners for bicycles which have been found in the possession of thieves. Over 155 machines have been reported stolen in the past year, of which 144 were recovered.

TO SUIT ALL TASTES.

Thirteen models will comprise the Adams & Westlake line for the current year, viz.: Four roadsters, two road racers, one track racer, two ladies' wheels, three tandems and one triplet.

The specifications for all of these frames will be: Lower main tubes, 1 1/4 inches; upper main tubes, 1 1/2 inches; head, 1 1/2 inches; diagonal tubes, 1 1/2 inches; tapered to 1 1/8 inches at top; rear bottom tubes, 3/4 inch, and rear top tubes, 3/4 inch. Every joint is heavily reinforced on the inside. Forks will all have 1 1/4-inch wide fork sides, heavily reinforced 1 1/2-inch fork stem.

All single machines have the Adlake triple arch crown, which Adams & Westlake first introduced, and all tandems will be fitted with the quadruple arch crowns, and the triplets with 5-plate arch crowns.

28-inch wheels will be used on all models, except 21-inch frame, which will be fitted with 26-inch.

Adjustable steel bars will be furnished in either 17 or 19-inch widths. A large variety of ram's horn bars will also be furnished when ordered. Wood handle-bars will be furnished if wanted. Cranks will be of the best spring steel tempered in oil. All bearings will be of the well-known Adlake pattern, made from solid bar tool steel of the highest quality, tempered and drawn in the most careful manner. Every bearing is ground after nickeling.

Adlake detachable sprockets will be used both in front and rear, and the trade will have the option of either 7 or 8-tooth rear sprockets. Any gear will be furnished. The new 1897 Adlake pedal will be furnished on all machines, either rubber or rat trap, as ordered. An option will be allowed on saddles of any of the well-known makes. Any of the standard tires will be furnished, as ordered. Six standard colors will be carried in stock—black, ivory, Brewster green, olive green, royal blue and maroon—all finely ornamented and striped in gold leaf.

A new plan will be adopted for nickeling spokes which will effectually prevent rusting, a complaint so common. The Adlake rear fork end and direct chain draft over the bottom tubes will be retained, it having given the best results during the season of 1896.

The compound chain transmission introduced on the Adlake tandems will be retained, it having proved one of its strongest features.

THERE IS MONEY IN BICYCLES.

Indianapolis licenses bicycles at the rate of seventy-five cents per annum. During 1896 licenses for 11,525 machines were granted with a resulting revenue to the city of \$9,540. In 1895 only 5,019 licenses were disposed of and \$3,735.05 of revenue derived. The total revenue the city derived in 1896 from all forms of vehicle license was \$34,587.05, of which amount, it will be seen, bicycles contributed nearly one-third.

THE KING OF CLUBS.

The Century Wheelmen of Philadelphia has a membership of 455, which is said to be the largest of any exclusively cycling club in this country.

Success is a ladder that most racing men prefer to climb onto out of a balloon.

There is but one word in bicycle phraseology which is synonymous with Merit, High Grade and General Excellence—SYLPH!

BOLTLESS SYLPH CYCLES \$100.00.

TANDEM, DIAMOND AND DROP, \$150.00.

Sylphs contain more **thoroughly reliable and important improvements** than any other 1897 wheels. Nothing in '97 can be higher grade, handsomer or easier running than our Sylphs. All **patterns, all heights of frame.**

Note our sectional cuts; some will be interesting, although showing but slightly some of our improvements. Our new rear fork end and chain adjuster permits the removal of rear wheel without affecting adjustment of bearings.

OVERLAND CYCLES
ALWAYS RELIABLE.

\$75.00, \$50.00, \$40.00.

28, 26, and 24-inch patterns, diamond and drop. Our \$75.00 models are but only bicycles that may be had at the price, that are strictly **high grade** and embody **80 many 1897 reliable improvements.**

\$50.00 Overlands and Juveniles are strictly high grade, same grade material being used as in best \$100.00 patterns. We make a special point of our finish—**NONE BETTER.**

Showing '97 crank-hanger, Benson type piece crank and axle, boltless detachable sprocket, adjusting cone acting as locknut and washer.

EXCLUSIVE TERRITORY

given to the right parties in unoccupied localities. Write for catalogue and particulars.

Watch for the **∴**
∴ Orange Crown!

We are pioneers in the bicycle business. Agents should handle only goods which have an established name and reputation, made by a concern whose experience enables them to conduct their business so as to benefit their agents to the fullest extent.

'97 Rear Hub, showing dust-proofing, ball retainers, direct oiling device, method of attaching rear sprocket, 3-point bearings, etc.

CURING A CRANK.

How Barbara and His Sister Brought About Jack's Repentance and Reformation.

Mr. Editor, I see you were honest enough to print an outsider's opinion of cycling, even when that opinion was not altogether favorable to cycling. I like that spirit; it is along such broad lines that success must come to a paper. If you will pardon me for still further trespassing upon your generosity, I would like you to learn of some later cycling experiences of mine.

My wife, Barbara, and myself had finally succeeded in securing a competent cook-lady, a flat with a civil-spoken janitor, and a butcher, baker and groceryman to our liking, when my sister Matilda appeared on the scene.

Now, I love my sister as well as the average brother loves his sister. I consider her a very capable person indeed; in fact, there are times when I wish she wasn't quite so capable; but now and then, however, I confess that Matilda makes me very weary. These are the times when she wants to run not only her own very ambitious establishment (which, goodness knows, ought to keep her busy), but my modest household as well.

Matilda on this occasion announced that she was only in town for a few hours; that she would lunch with us, and that she proposed taking Barbara home with her for a week's visit. I refrained from protesting, seeing that Barbara wanted to go, and during the afternoon they departed. With the time of my widowhood this recital has naught to do. It concerns itself with Barbara's return and subsequent events. At the end of the week my wife telegraphed me that she would be down on the evening train. I ordered a nice little dinner and awaited her with impatience. She came in looking radiant. I said, "Barbara, dear, how awfully well you look."

"Yes, Jack," she replied, "and it's all that blessed bicycle Matilda taught me to ride. She has given me the loveliest wheel you ever saw, and," with some little hesitation, "a perfectly stunning costume."

Now I must right here repeat my former statement to you, Mr. Editor, that if I have a prejudice in the world it is against bicycles. I have always regarded athletics with enthusiasm, shooting and fishing with favor, and have enjoyed to the full horseracing and yachting, but I have never been able to see anything graceful, elevating or sporty in mounting a wheel and cavorting about the country or over the asphalt like a panicky straddlebug. After this exposition of my views of the subject in the abstract, it will be easy to see what my feelings must have been when the wife of my bosom reduced it to the exceedingly concrete by her announcement.

"Barbara," I gasped, "am I to understand that you propose riding a bicycle?"

"Why, of course, Jack," she responded, sweetly. "Every one rides. Matilda says that Dr. Wilkinson—"

I interrupted her here with some remarks about Dr. Wilkinson which I refrain from transcribing. In fact, the things I said about Matilda were hardly suitable for general pub-

lication. Barbara's feelings were hurt, and she retired to her room and refused to speak to me again that night. The next morning the janitor came up and said there was a bicycle downstairs which had just been left for Mrs. Fermoy. Shortly afterward Barbara came softly into my study and kissed the bald spot on top of my head.

Now this is a demonstration she knows I detest, and it is one she never makes use of unless as a declaration of war on any subject in question. I looked around and beheld my wife clad in the costume which Matilda, my sister Matilda, had given her, and in which she was to appear in public. I have never seen such an exhibition off a bathing beach or outside an opera box. The costume consisted of tan-leather leggings to the knee, knickerbockers, rather snug at that, not a vestige of a skirt unless you count the skirts of a tight-fitting coat, a white shirt front, standing collar and man's tie. A deer-stalker hat, with a single straight feather, completed this extraordinary get-up.

"Isn't it pretty?" asked my wife. "Yes," I replied, with much dignity, "pretty and suitable on a roof garden stage or in the sawdust ring, but for a lady in private life I consider it disgraceful." "Nonsense, Jack," said Barbara. "You are old-fashioned. Bloomers are hideous and skirts are a nuisance, and Matilda says—" I interrupted her again to say some unnecessary things about Matilda, and Barbara went hurriedly out of the room. She was an hour late for luncheon, but came in with a beautiful glow and a fine appetite. She came to the table in her costume, and truth compels me to confess that she looked uncommonly pretty in her boyish rig. We preserved a studious politeness, but were not voluble.

The second day Barbara went out without saying goodby to me. I heard her go, however, and went to the window to see her ride away. She rode well. I could at least congratulate myself that probably no other fellow's wife rode half as well. The third day, as I was watching from the window, my wife looked up and saw me. She beckoned me to come down, and I went. "Jack, come and look at the wheel," said she. I looked the bicycle over, and it certainly looked a very good thing of its kind.

"Jack, old boy," said Barbara, "I wish you'd learn to ride. It would do you a lot of good, and we could have such fun together."

"Never," said I, and stalked upstairs. I thought a good deal about it during the day, however, and the next day, as soon as my wife was safely out of the way, I started for the nearest riding school.

"How soon can you teach me to ride one of these abominations?" I asked an instructor. "Oh, about ten lessons, I guess," he said looking me over. "All right," I responded. "You teach me to ride in five lessons and I'll pay you double rates." I took my first lesson then and there. I broke my eyeglasses, tore my trousers and scraped the skin off an elbow. I went home disheveled, but determined. Thereafter I took a daily lesson. Barbara ceased to urge me to join her, but made diplomatic remarks about the loneliness of a solitary ride and the unsafeness of young women riding alone.

I said nothing, and at the fifth lesson I could ride with perfect safety in a straight course. The curves still caused me a feeling

bordering on heart failure. I ordered a wheel sent to my house the next morning. I bought a costume very similar to that worn by Mrs. Fermoy, and when Barbara came down to mount her wheel was waiting for her. She was delighted and came near embracing me in public. "I knew you'd come to it," she remarked, "you dear, old silly. Why, Matilda says—" "Oh, Heaven bless Matilda!" I shouted, as we whirled away together.

Need I say in conclusion, Mr. Editor, that I now look forward to the weekly appearance of THE WHEEL, and am no longer writing, expressing, or experiencing anti-cycling sentiments.

J. S. FERMOY.

HIS SHERLOCK HOLMES FAILURE.

"I feel impressed to warn you, my dear young lady, against the danger you are courting," began the good man, severely. "It is bound to prove the dethronement of respectability—"

"Sir! What do you mean?"

"Oh, it is no use to add impudence to your offending. I expect you to be ashamed of it. It is a curse. It unwomans woman. It creates a race of feminine tomboys—"

"But, sir, I—"

"Never mind! N-e-v-e-r mind! You can't explain it away. I must speak of it. You ought to be ashamed of it—indeed you ought—"

"Do you mean to insult me, sir?"

"Insult you, my dear young girl? Nay, verily! My heart bleeds for you. It is my duty to teach you ways of rectitude and social and spiritual worth and uprightness. And to think, the example of our noble mothers must be thus parodied, burlesqued, shamed—"

"But hear me—"

"Hear you! Would you dare profane reason and common decency by attempting a defense?"

"But will you listen—"

"Listen? No! Duty listens not to attempted palliation. You are flying deathward at a terrible pace, and in what a garb, too! Try to break off from them before it is too late—"

"From what?" (Screaming.)

"From those miserable, horrid, sinful, unsightly, disgusting, baggy bloomers—"

"Why, I never had them on! Never saw a pair—"

"Humph! Ahem! Yes—well, it would be just as bad if you had!"

(And the lecturer gathered his frown together and started for the next house, in front of which he had detected another woman's wheel.)

HAD MADE UP HER MIND.

"I shan't wear a skirt any longer when I go riding," said Mrs. Pushpedal, decidedly.

"For goodness sake, Marion! You don't mean you are going to ride in knickerbockers, do you?" replied her husband.

"No, I don't; but the next skirt I get will be three inches shorter, you may be sure of that."

A thing of beauty is not always a joy forever—a fine complexion on an August century run, for example.

PREPARED FOR EMERGENCIES.

The exigencies of fashion and tone have for some time since demanded that grooms, maids and nurses should be taught how to properly ride a bicycle. In consequence, during the unfashionable early hours of the day, riding schools have been filled with sober-faced men in livery and white-capped maids essaying to master the gentle art. In this way the rising 400 could go a scorching properly protected and chaperoned. Many of the grooms and nurses haven't taken kindly to the wheel, however, possibly upon the principle that whatever one has to do he dislikes, while that which is forbidden him he promptly yearns for.

There is a certain French nurse in New York who has an especial hatred for the wheel. When the subject of her learning to ride was first broached, she offered every objection, and only consented to take lessons when much pressure was brought to bear. She became quite proficient after a time, but her dislike and timidity were never overcome. She particularly hated riding in town, where one is obliged to thread her way among the throngs of carriages and carts, not to speak of cantering over cable tracks and eluding other cyclists.

"I am always afraid," the nurse would say, "that eef I am not killed myself, zat I will kill somethings or somebody." When she and her charges "took to the road" they were always accompanied by a groom, for the nurse refused to accept the responsibility alone.

The family in whose service this nurse is, remained at their country house later than usual this year. Just before the holidays the mistress asked the nurse to wheel into town and back upon an errand that couldn't wait for such tardy locomotion as railway travel. At such short notice, too, it was impossible for anyone to accompany her, as it was also impossible for anyone else to accomplish the errand. The nurse accordingly submitted to fate, donned her suit of simple serge, and set forth for town. She returned some hours later in safety, her errand accomplished.

"Well, Francoise," inquired her mistress, upon her return, "and how did you get along? Were you much frightened?"

"Oh, I was mooch frightened," replied Francoise. "But I killed nothing and nothing killed me. If anything had happened, though—voilà!"—throwing back her jacket with a melodramatic air, and there pinned to her bodice was a big card bearing the words: "My name is Francoise Daguerre. If anything happens to me, please notify Mrs. Blankie Blankie, Sunset-on Hudson, or No. — Umpty-steenth street."

SOME UNCLE EPHISMS.

De song of vict'ry in a haard-won race is allus wong an encore.

Racers who blow dah own horns seldom furnish good music fo' uddah folks.

Whad a differ'nce hit wud make ef people allus wore dah company mannaahs when dey waz ridin' a bysickle.

Hits dah rider wid de narrer min' who is generally dah mos' anxious toe gib away a piece ob hit to udder folks.

Elopmenets per cycle are still fashionable. This may be called the weak side of the wheel.

AN AVERTED TRAGEDY.

He entered the house softly and mounted the dimly-lighted stairway three steps at a bound.

Enforced absence had caused their first separation, and he imagined the surprised delight with which she would greet his unexpected return. But having reached her boudoir he paused, distracted and irresolute.

The room wore a familiar aspect. The fire flickered from the grate with a subdued gleam, while a shaded lamp near the piano lent an air of elegance and grace to every article of furniture within its radius.

The room was unoccupied, but across the back of a chair in an alcove lay a man's coat and hat. Then suddenly there flashed upon him the recollection of having stumbled over

RE FAKED IN VERSE THIS TIME.

Into the tailor's presence she came like a shot from a gun, and looked such daggers at him he felt inclined to run.

Her black eyes flashed with anger and her language was profuse, and when she raised a threatening hand he trembled in his shoes.

"You ninth part of a man!" she yelled, "I'll crush you as a fly! This earthly planet never had a greater fright than I.

"Gaze on the bloomers which I wear. You made them, sir, for me. Don't look with such a stupid stare, but scan them carefully!

"You guaranteed a perfect fit to measure, which I brought. Now, do you think it strange a bit that I am fighting hot?"

"Gaze on them well, you senseless goose. Say, am I not well? Where they are

BEATS WALKING ALL HOLLOW.

"Among recent converts to cycling, none is more enthusiastic in his admiration of the benefits of the bicycle than Chief Push-in-His-Face, the grand old man of the Dingo tribe."—*Winnemucca Journal*.—Here is the way the Chief indulges in cycling.

a bicycle in the lower hallway as he entered.

As he stood staring in dismay a portiere was drawn back at the opposite end of the room and revealed the figure of his wife. "Madam," said he, in his most injured husband tone of voice, pointing to the alcove, "what is this?"

It was not altogether grammatical, because he meant "these," but at sight of him she turned pale and trembled. "Don't look so dreadful, Will," she gasped. "I didn't think you'd mind. I won't wear them if you don't want me to, though, really, all the stylish cycle suits are made that way now."

AN IMPOSSIBLE INVENTION.

The person who will construct some phrases with which a man who has run a brand-new wheel over a broken bottle can adequately express himself without shocking the passers-by and laying himself liable to arrest, will do much to advance the cause of both cycling and civilization.

tight they should be loose; where loose they should be tight."

She slowly turned that he might scan the fitness of the clothes, and as he gazed that tailor man blushed like a red, red rose.

With laugh suppressed and bows profuse he said she'd spoken right; where they were tight they should be loose; where loose they should be tight.

"These, no doubt, are the first," said he, "the madam ever wore. You've made a slight mistake, I see. They're on hind side afore!"

A redder blush, the tailor said, he never, never saw, and as she in confusion fled, he laughed haw! haw! haw! haw!

RELATIVE TO FEMALE BLUFFING.

If you see a spic-and-span-dressed wheel-woman seek, repose on the muddy street surface through her wheel slipping out from under her, it is a proper thing not to laugh unless she laughs first. If she tries to regard it as a joke help her with the bluff.

LONDON.

WHY THE EDITOR WAS CONTENT.

An editor of a wheel paper, who had paid the debt which all mortals must pay at some time, was being taken to heaven under chap-erone of an angel specially detailed for that purpose.

"Any objection to my having a look at the other place before we ascend to eternal bliss?" he asked

"None in the least," answered the angel.

So together they wandered around the broad avenues all paved with good intentions, seeing things of interest in the lower regions.

In the course of their stroll the angel missed the editor for a short time, but eventually found him sitting in front of a huge furnace, perspiring freely, but gazing with rapturous delight at a lot of people squirming in the midst of the fire.

"Come," said the angel, sadly, "it is time we were going."

"Pardon me, you'll have to go without me," said the editor, without once removing his eyes from the furnace occupants; "watching this exhibition is heaven enough for me."

Turning to an impish attendant for explanation, the angel learned that the occupants of the fiery receptacle were on earth non-advertisers whose persistent attempts to secure free advertising, in the shape of trade puffs, had been the primary cause of the editor's early demise.

Without a word the angel winged his way upward alone.

SOME QUEER QUAKER STATISTICS.

During the year 1896 there passed through the various gates of entrance in Fairmount Park, Philadelphia, 902,267 bicycles, or more than twice as many bicycles as there were of all other vehicles combined with equestrians, the total numbers of both of which for the year being only 413,392. An average of less than one wheelman in each 400 was injured, the exact figures being 218, while the accidents to the bicycles themselves were thus accounted for:

71 broken by collision with carriages; 92 broken by collision; 13 broken by collision with bridges; 38 broken by collision with fences; 7 broken by collision with walls; 1 broken by collision with a tree; 19 broken by upsetting; 4 broken by turning short; 17 broken by unskillful riders; 1 broken by falling into a trench; 1 broken by runaway horse; 165 tires were punctured.

These figures are from the annual report of the Fairmount Park police, and afford an excellent field for the figure fiend and the statistical theorist. For example, take the proportion of punctures; there were 1,804,534 tires used here with an average puncture, so far at least as the park police knew, of only one in each eleven thousand. Surely, that speaks well for either the riders, or the tires, or both, just as you please to figure it.

EVERYTHING IN KEEPING.

"Dere vos von characteristic thing about dose amachoor racin' men at dot banquet of der Pawnbrokers' Association last nide."

"So! Vat vos dot?"

"Dey refused ter drink anyt'ing but hock."

"Tripe suppers" are a popular form of winter entertainment in English clubdom.

TO ACCOMODATE THE NOVICE CROP.

"I say, Mr. Medders, the advent of the bicycle and the consequent decline of the horse must have hurt you farmers considerably by cutting off the demand for one of your chief products."

"What product is that?"

"Why, it must be of little use to raise oats now!"

"Yes; that's so! The bicycle has done us on that; but when one door shuts another always opens. We raise the arnica plant now."

IN THE BEGINNING.

"What a terrible instrument of torture those nine-inch brake-levers on the old ordinaries must have been."

"If you ever undertook coasting with one you would think they were a torture."

"What a relief it must have been to the old-timer when he reached the bottom of a hill and could let go his brake."

"Well, I should say it was; but what of it?"

"Oh, nothing; I was just thinking that maybe that was the origin of the expression, 'the glad hand,' that's all."

IMPROVED INDOOR CYCLING.

With a home trainer, electric fan and cinematograph all the pleasures of a tour can be had in a hall bedroom.

COLD AS A SPEED-KILLER.

Every winter-riding wheelman notices that no matter how good the roads may be, or however fit for the work he himself is, he cannot ride anything like the same distance he covered with ease during the summer. The cold air uses up so much of his vitality that he has not the strength to ride as far as in the summer with its warmth.

In Dixon's interesting book, "The Migration of Birds," it is noted that nothing so interferes with the flights of birds of passage, or causes them so frequently to seek rest, as a strong cold wind behind them. That a favoring wind, even though it be a cold one, should prove exhausting sounds rather extraordinary, but the reason is plain. The wind blows up their feathers and so chills the flesh that the bird is forced to descend and recoup.

Cycling has often been compared to flying, so the foregoing regarding the effects of cold upon real flyers may not be out of place.

Whether you do or do not matters so very little to cycling at large.

AND THE GAME GOES ON.

Amid all the newspaper gabble concerning what newspaper editors do not know regarding cycling, the following editorial from the New York Evening Sun is really refreshing:

"A number of foolish persons have predicted the falling off of public interest in the bicycle in the coming season. There is no sign of the truth of this in actual facts. The weeding out of a number of manufacturers who ought never to have gone into the business is a good rather than a bad sign. The legitimate makers are showing every evidence of activity during the spring. For the general public, it is as much interested in the model of '97 as it was in that of '96.

MIXED AT VASSAR.

"Miss Milemake, what kind of a noun is a bicycle?"

"Common, professor; very common, indeed."

"Decline it."

"I? Never, if one is offered me!"

A Guarantee of Excellence.

SECRET BALLOT WILL DECIDE IT.

There will be no squabble over the selection of the place for the next League meet at the National Assembly meeting this year. The adoption of the Australian ballot system by the Executive Committee puts an end to what has heretofore been an annual opening for oratory, wire-pulling and political dickering at the Assembly meetings. The plan of deciding the issue between the cities desiring the meet has been decided on as follows:

To each member of the National Assembly will be sent a card, ruled on the plan of the Australian ballot, and containing the names of those cities which have made formal application for the meet. The voter will be asked to place an X opposite the name of the city he wishes to vote for, but the ballot will contain nothing which would identify it or show by whom it was voted. When the ballot is marked it will be placed by the voter in a plain envelope and sealed. The plain envelope will then be enclosed in another, upon which is printed a blank, the filling out of which will show the name and address of the voter. This is to be mailed to the Secretary in a third envelope, stamped and printed for the purpose. These envelopes will be opened by the Secretary on February 6, at 12 o'clock, in the presence of whoever may be interested in the count. After the outer envelopes are removed the votes will be checked up by the list of Assembly members. When this is done the blank envelopes will be taken out and mixed together, to be afterward opened and the votes counted. By this method even those making the count will not know for which city any member's vote is cast. The ballots are to be mailed to members of the Assembly in about a week.

SIX-DAY RACE LOGIC.

"A man has no business to start twice in a six-day race within a month," said Teddy Hale, during the race at Washington last week. "If a man is riding for a prize he has to punish himself. Several persons have asked me how much flesh I lost in the week of the race in New York. I don't know myself, for I did not weigh before starting, but not over five or six pounds, as I have nothing to lose after I train down to 160 pounds. If Rice had good training and good judgment he would have forced me to ride a great deal further than I did. I could have gone a good bit more. I kept myself twenty miles ahead, and when I got any further along I knocked off for a bit of sleep. A man wants to be close on to 30 before he goes into a six-days' race. He ought to be fully matured, so that he can stand the strain. It is almost one form of suicide for a much younger man to take on that sort of punishment."

Asked when he would ride again, he said: "Probably at Chicago in February. I don't believe I will go unless I am paid a lump sum as an attraction. I don't want to go in and depend entirely upon getting only a piece of prize money. If I get into a race where I would be pushed hard enough to worry me I might get off my wheel and tell them to fight it out among themselves."

YES, HANG HIM!

Confusion to the rider who says, "Why don't you do as I do?"

BENDS, BREAKS AND BALLS.

Carelessness and bungling work have done more to injure bicycles than most anything else. Builders of bicycles have so perfected the work of construction in recent years that the average bicycle is a pretty fine piece of machinery, and if handled right will do all that can be reasonably asked of it. But oftentimes much of the delicate adjustment and correctness of fit is rendered valueless through ignorance or carelessness on the part of the owner of the bicycle.

I have seen standard wheels put out of service in an hour by the rider tinkering with some part of them he did not understand. Again, beginners have strained certain parts of their machines in such a way that considerable skill is required to get the wheel into running order again. Such experiences are frequent in the life of the bicycle repairer, and since his business depends upon wheels being broken by

accident or otherwise, perhaps he ought not to complain.

However, if a few words of advice will aid the rider in averting breakages, they should be freely given, even by repairers. I find many riders have a habit of bumping up against obstacles when there is no need for doing so. For instance, a young man stores his bicycle in a stable, and when riding in always keeps going along until the front wheel strikes against the stable wall, when he alights. Of course the contact is light, but in the end the fork will be bent, the mechanical arrangement of the fork and crown-piece bearing not being of a nature to permit such abuse, as will be observed by glancing at Fig. 1, in which a sectional view of the fork post and bearings is given.

When sent from the factory of the makers, a line, A, drawn through the centre of the post will be in line with the centre of the wheel tire at B and the balls will bear correctly in the

casings and in line with C-C. The fork is then in order, and adjusted correspondingly with a line F, Fig. 2. As soon as the fork is bent into the shape shown by the line G, Fig. 3, the relation of the cones, casings and related parts is thrown out of harmony, and the balls grind, rattle, run on pivots of their own, and become generally deficient. Usually the bending occurs at the crown at E, and although the bicycle can be used, it will steer hard and be unsatisfactory. Avoid coming violently in contact with anything that will tend to bend the fork, and when bent, have it straightened.

Numerous wheels are put out of repair by the owners trying to screw a right thread nut on to a left thread stud or bolt. Rights and lefts can be distinguished by holding them up together as shown in Figs. 4 and 5, in which it can be seen that the threads incline differently.

Cracked nuts, as shown at A, Fig. 6, are caused usually by some one attempting to force the nut down over the shoulder of the bolt, or on to that part uncut with threads. If the bolt is too long put on a couple of washers inside the nut.

Shoulders of clamps, seat-post sockets, etc., are frequently cracked at B, as shown in Fig. 7, by forcing the set screw too deep or by burring the threads on the screw and using it. When the threads are burred, as shown at C, Fig. 8, or broken, as at C1, buy a new set-screw or have the thread recut. Do not force the screw into the clamp.

Another item which I find has been the cause of cyclists condemning really good wheels at times, is when a green hand screws the cone-flanges so tight that the balls are wedged. The balls should, of course, have free play and contact at A, B and C, as illustrated in the cross sketch of the bearing in Fig. 9. When the adjustment is too tight, the balls are pressed up on the cone toward D, throwing everything out of line, producing friction and wear.

Permitting parts to run dry has also been productive of disaster. A recent case to come to my notice was in a very superior wheel, in which the rear wheel ball bearings were next to destroyed through having run dry. A grating sound was produced at every turn of the wheel, and when I took the bearing apart I found one of the cones worn flat as at E, Fig. 10. Everything was perfectly dry and the hub was covered with grindings. A few tests showed that the nature of the worn place on the cone was such that the balls would be momentarily checked there at each turn, and each form an axis of its own for a brief second before passing on. This caused crowding as shown. New cones had to be put in. The owner of the wheel claimed he oiled the bearing regularly. I found the oil channels plugged with dust and gummed oil. I would suggest that an instrument like the one in Fig. 11 be kept at hand to clean out plugged oil holes. It can be made with a steel barb, B, and the latter fixed in the wooden handle, A.

PATENT PECULIARITIES.

How They Show Up in a Study of
What Goes On in Uncle Sam's
Office.

As time passes the mechanical arts become more and more refined and improved, and one is very prone to believe that invention has nearly reached the point beyond which nothing new can be found, and to assume that the number of patents annually issued is now decreasing. Whoever reasons on such assumptions will reach a conclusion that is far from the fact, however. Instead of the number of patents declining from year to year, it has steadily increased and is likely to continue doing so.

During the year 1896 the United States granted 21,877 patents—a larger number than were ever before issued in any single year. The whole number of applications filed during the year was, in round numbers, 44,000. A comparison of the number of applications filed with the number of patents granted shows that, in 1896, the patents were about 50 per cent of the applications. Although comparatively few of the applications filed last year have yet resulted in patents, nevertheless it will be found that, from year to year, about one-half of the applications sooner or later blossom into patents. Of the other half, a small percentage are allowed, but become forfeited by reason of failure to pay the final fee, and the remainder are finally rejected by the Patent Office and become abandoned.

The percentage of patents to applications as above stated is a fair yearly average of all classes of invention. Some show a higher average of patents, as the class of harvesters, for example, while others show a lower average, among the latter being cycles.

Of all the 204 classes of invention into which the Patent Office divides the mechanical arts and among which the 44,000 applications filed in 1896 were distributed, no other obtained such a large portion as the class of "velocipedes." If the division were made equally among the 204 classes it will be seen that each one would receive about 215 applications. Yet, in the class of "velocipedes," no less than 2,680 applications were filed; and if wheels and tires be included, the number is swelled to something like 3,500. And it is to be noted that this large total includes no motor cycles, no lamps, bells, or similar accessories; nor the tubing, special cycle tools, and processes of manufacture, the invention of which is inspired by the cycle and which are themselves directly connected with the cycle trade. No other class of invention has ever shown such prolific activity. And this activity was started at a bound, as it were. During 1892, about 600 velocipede applications were filed; in 1893, about 700; in 1894, 825; in 1895, in round numbers, 1,500; and in 1896, 3,500.

These 3,500 applications relate to various parts of the cycle, the art being now so far advanced that such a thing as an application for a complete machine is unknown. The favorite subjects of invention as disclosed in the applications filed during the year were, in substantially the following numerical order: driving gear, tires, supports, saddles, handles and handle bars, brakes, frame construction, pedals, cranks and crank shafts, and spring frames. Besides these there have been many

applications for alleged improvements on the numerous and varied possibilities of the cycle.

The patents granted in any single year are not necessarily, by any means, distributed in the same proportions as the applications. Invention goes by epidemics, and for months there may be a large number of applications for adjustable handle-bars, for example, succeeded by a large increase in the number of applications for some other portion of the bicycle, such as the saddle, or the crank shaft. Since only a few of the applications become patents in the same year in which they were filed, it is more likely that the following year will find the patents distributed more nearly in the same proportions as were the applications of the preceding year.

The number of cycle patents issued in 1892 were, in round numbers, 325; in 1893, 380; in

LOOKS LIKE A HAYSTACK.

Here is something entirely new in the line of cycle construction and designing. Mr. N. Pederson, of Denmark, is responsible for it, and Mr. Terah Hooley may become owner of it, as he has of almost every other thing un-

der the sun. The frame is constructed on the cantilever principle, and consists of twenty-one perfect triangles. The total weight of the frame, seat and handle-bars is only 4 pounds, and the whole machine only weighs about 11 pounds.

1894, 380; in 1895, 370. The number of cycle patents issued in 1896, including wheels and tires, was 586. This number, it is seen, is only a small portion (less than 20 per cent) of the whole number of applications filed in 1896. This small apparent percentage of patents is due to the fact that applications in previous years have not reached to any thing like the number filed last year; and since it is the application of a previous year that becomes the patent of the present year, this fact is not surprising. Out of the whole number of 3,500 applications filed in 1896, only 70 had resulted in patents at the end of the year. The year 1897 is likely to see a considerable increase in the number of cycle patents.

In order to get a substantially accurate estimate of the proportion of patents granted to the number of applications filed in the class of cycles, it is necessary to take the applications of a number of previous years—far enough back so that all of them have been finally disposed of—and find out how many of the whole number of those applications

went to patent. By such a generalization it is found that about 36 per cent of the cycle applications result in patents. Adding to this an allowance for those applications that have become forfeited for failure to pay the final government fee, it will be found that the total number of applications allowed by the Patent Office is hardly 50 per cent of those that are filed. The remarkable popularity of the bicycle accounts in some measure for this small proportion. Seeing that there is such a demand for improvements, and such a vast amount of capital invested in their manufacture, Tom, Dick and Harry have set about inventing in cycles without much idea of the practical needs of the cyclist, or knowledge of what has already been invented.

The cycle patents for 1896 are distributed about as follows: first in numerical importance come tires, with 115 patents; then driving gear of various sorts with 90 patents; and in decreasing order, supports, 55; pedals and cranks, 52; steering heads and handle bars, 47; saddles, 47; wheels, hubs and rims, 45; brakes, 28; frame structure, 26; luggage carriers, 15; mud guards and dress protectors, 12; bearings, 11; spring frames, 9; coupling bars, 7; locks that form an attachment of the frame, 7; tandems, 4; children's seats, 4; and 12 scattering through bicycles, unicycles, axle couplings, foot rests, children's figure velocipedes, and so on.

An approximately correct estimate of the number of cycle applications pending before the Patent Office on January 1, 1897, exclusive of accessories, places them at 4,700, a number that is greater than the aggregate of cycle patents issued by the United States.

At the close of the year the Patent Office had its work in such condition that no application on which action had been requested prior to the 1st of December, 1896, remained unacted on. One month, even, is too long for an applicant to wait for a judgment on the merits of his invention; but with the present inadequate force of examiners it is probably impossible to shorten that period. Even in that single month approximately 850 bicycle cases had accumulated and were awaiting action on the first day of the year; that is to say that the cycle division of the Patent Office was one month in arrears, or, 850 cases (new and old) behind on the first day of the year, 1897.

The number of mechanical fallacies, of ingenious and at the same time practically worthless devices that find a lodgment among this mass of pending applications would astonish a practical manufacturer. Too often the ingenious, commercially inutile contrivances become patented only to cumber up the patent records and to form altogether too large a proportion of the already large class of cycle patents. E. D. S.

DOES NOT SEEM POSSIBLE.

"Broadback is the most remarkable rider I ever knew."

"How so?"

"Why, it is actually possible for him to look dignified while riding with ear-muffs on."

TIDE-STEMMING POSSIBILITIES.

One fault with the bicycle is that it will never be able to plunge into the roaring stream, stem the tide and reach the other shore with its exhausted rider safe, as the horse always does in the novel.

Red Birds of Passage.

EVERY season they come and make you happy. In huge, dense masses they ascend at a given signal by the leader from their warm nest at the "Crimson Rim" factory, and color the pearl-blue sky with scarlet flashes of their rich plumage. They descend in large flocks, and make their abode with Sycamore dealers in the cities of the world. Rip them open and you will find that every quivering crimson breast of our red birds contains a fine, big heart of registered

NOT A GOLD MINE.

Manufacturing Pneumatic Tires Is Said Not To Be the World's Most Profitable Business.

With all that has been said regarding the millions made from pneumatic tires and the possible millions yet remaining therein to be made, intending tire makers and their backers, financial and otherwise, would, perhaps, be no losers by reading what the "India-Rubber World" thinks of the wind-blown bonanza:

The season of 1896 has already merged into that of 1897, and the majority of the pneumatic tire manufacturers have balanced their books and know how much they have made—or lost. One thing has been clearly proven: the manufacture of pneumatic tires is not a gold mine. Or, to speak more exactly, it is very much like gold mining. One of the most noted statisticians of Europe once said that every ounce of gold extracted from Mother Earth had cost its full market value in labor alone. This proposition remains unchallenged; and there is a corollary to it, viz.: that if you count in the lambs who have been fleeced by gold mining sharks, every ounce so extracted has cost five times its market value. Now, in this statement there lies a moral for the tire trade. The manufacture of pneumatic tires is looked on as a gold mine, and everyone wants to have a hand in it. "Tires," say those who have not been in the business, "can be made for \$3 a pair, and sold readily for \$6. What a bonanza! Let's go in for it!" But the manufacturers who have summered and wintered the production of pneumatic tires have learned a lesson. It is true that you can make a pair of 28-inch tires for \$3—of old shoes; but if you once sell them for \$6 without a guarantee, you may be sure that your customer will never come back; if you sell them with a guarantee, you may be sure that he will—with a scowling demand for replacement. Now, no tire fit for an adult to ride on can be made for \$3. No manufacturer who works for the future can afford to make a tire that costs less than \$4 a pair. Let us see. Here are the items:

Between three and four pounds of fine Para rubber, from eighty to ninety cents a pound. Washing, drying and shrinkage of over one-quarter. Grinding and mixing. Calendar work. Preparing and weaving special cotton fabric. Labor in building up tire. Vulcanizing, testing and inspection. Loss on "seconds." Shop expenses; that is, interest, depreciation of plant, taxes, insurance, water-rates, gas, coal, oil, etc. Salaries of superintendent, clerks, engineers, watchmen and non-producers. Experimenting; a large item in these days where improvement is always sought. Selling expenses; that is, salesmen, traveling expenses, advertising, office rent, clerkage, insurance on stock, freight, teaming, etc. Interest on stock carried to fill orders promptly, and depreciation of stock. Replacing tires actually defective or alleged to be so. Bad debts; in 1896 a large item.

Add all this up and see how much your tires have cost you, not in estimates, but after you have made up your books and your bank account, and figure what divisible money is left.

To sum up the above: under the most fa-

vorable conditions, a large manufacturer can make to-day not over 20 per cent profit on pneumatic tires, and unless a manufacturer makes from fifty thousand pairs upwards during the season, he cannot come out whole. Now, on a staple which does not change from season to season, like garden hose or cotton goods, a profit of 10 or 12 per cent, or even less, is by no means to be despised—on a large production; but for a patented article, which is subject to so heavy a guarantee, one liable to so many expenses, and one so treacherously provocative of misrepresentation as a

HERE COMES THE CIRCULAR CHAIN.

Following in the train of Simpson have come a number of new-fangled, "improved" chains. Here is the Harford, the invention of Haverlock Harford, 3 Albion Terrace, South Shields, England, of which chain the inventor says:

"I claim to dispense with the frictional contact which takes place between the tooth of the wheel and the block of the chain. I overcome this by making the extreme diameter of the tooth wheel the pitch line, thus causing the chain and chain-wheel metals to run to time with each other. I claim to dispense with 50 per cent of the wear and tear on the

cross pins by dispensing with the dummy link. I can run the two chain wheels at a high speed three inches out of line without the chain climbing. This is accomplished by the chain having a clear dip into the cavity, and the driving portion of the chain being free, and shows that I have abolished side friction. I claim to do away with the bursting or undue strain that takes place on the ordinary chain wheel. This is accomplished by the driving portion of the chain always adapting itself to the centre line of the wheel, no matter what diameter the wheel may be. I also claim to get a central pull, which gives the full benefit of the metals used."

pneumatic tire, a profit of 20 per cent is quite too small. Abroad they have found this out, and tires which sell here for \$6 wholesale sell there for \$15, though they can be more cheaply made.

The concerns new in the business have not yet found all this out, but it remains true that no one, under present conditions, can net more than one dollar on pneumatic tires; scarcely any one did so well in 1896; and unless the manufacturer can market tires at \$6 in enormous quantities, there is not that much profit. The small manufacturer cannot pay for his advertising out of his gain; and yet, strange to say, some new manufacturer stands constantly ready to embark in the business of selling tires for five dollars or less a pair.

Moral: live and learn.

WHAT WOULD THE WORLD BE WITHOUT IT?

India-rubber is in a fair way to become one of the prime necessities of civilization. Numberless human beings, in the class which could not afford wet nurses, owe their lives to the feeding bottle. Everybody knows that the use of pneumatic tires for cycles and solid rubber tires for horse vehicles has enormously increased our consumption of this article; but, quite apart from that more obvious fact, India-rubber is daily introduced more and more into all sorts of machinery. Highly competent judges say that if the output could be doubled within a year, so many new applications of the material would instantly arise, that the price would not fall appreciably.

As a matter of fact, the export of Para rubber has increased within the last twenty-five years from 5,600 tons to 20,000 tons; and the price fetched by the best quality has risen from 50 cents to 75 cents a pound. It is the one jungle product which society finds indispensable. Hundreds of men have racked their brains to produce a substitute, but none has in the least degree succeeded; and such attempts must be permanently discouraged by the knowledge that India-rubber exists in limitless profusion upon known spots of the world's surface which may at any time be made accessible.

In any of the swampy equatorial regions, where vegetation grows rank and sappy, so that a knife will slash through branches as if they were made of cheese, there is pretty certain to occur some one or two of the score of trees which produce rubber. Whole forests of them are known to exist in Central Africa, only waiting to be tapped. But the regions which produce them are precisely the regions most deadly to the white man; and when the rubber is made it has to come to the coast on the heads of negroes, and will not pay the cost of transport.

When an accessible forest is discovered it pays like a gold mine. For example, a tree was discovered near Lagos which was believed to produce rubber; specimens of bark and foliage were sent to Kew Gardens, in London, and the authorities there pronounced it the right thing. In 1895 the export from this one source began, and amounted in the year to 2,263 tons, with a value of \$1,350,000 in round figures.

WHAT PRUDENCE TEACHES.

That the mission of the wheel may prosper, and be the means of bringing health and enjoyment to the doors of thousands of women it is well to lay the following maxims to heart: That the rational use of the cycle is one of the very best forms of exercise which can be obtained; that for many functional ailments it is a cure, for some organic a palliative; that if abused when the rider is in an unfit state, it can, do as much harm as over-walking, over-riding, over-climbing; that over fatigue is always bad, but much worse when the rider is out of condition; that girls and women unaccustomed to bodily exertion require a longer time to become habituated to it than a young man or boy of the same age. That condition will come by constant practice, and cannot be hurried or forced by over-work. That as condition improves so longer distances and a greater speed may be safely attempted.

In line with the policy of this Company, every
high-grade feature is added to

Crescent Bicycles

as soon as it is found worthy of adoption.

After years of experience with various forms of pneumatic tires, we are of the opinion that a superior detachable tire is the most practical, reliable and satisfactory. We, therefore, take pleasure in announcing that our '97 models will be regularly equipped with

Dunlop Detachable Tires,

which we can unreservedly recommend to CRESCENT dealers and CRESCENT riders, and which, we believe, notwithstanding its higher price, is, in the end, more economical. The extreme ease with which permanent repairs can be made by the rider, insures him against disabling accidents, and makes it unnecessary to frequently send the tire to the manufacturer for repair or replacement.

KING OF FOOLS.

There are so many kinds of fools in the world it is difficult to attempt to keep track of even a tithé thereof. Of this enormous multitude of individuals afflicted with high-g geared, untrue, craniological wheels, cycling has, from the very beginning, been afflicted with more than its fair share. It is a fact beyond contradiction that cycling has in its own case actually disproved the teachings of homeopathy, regarding like curing like, since, with cycling, wheels mechanical have but begotten wheels mental, the increase of one being followed by a corresponding increase of the other.

History has recorded many and varied cycle cranks, gentlemen in whose heads wheels whirred, whizzed and went round regardless of either rhyme or reason, but the King of all these gentlemen is unquestionably M. Paul Lemay, Paris, France. That there may be no question of M. Lemay's right to the title, the plans he has submitted to the Committee on Buildings, on the French Exposition, to be held in 1900, will at once silence all other claims for the cyclo-crankish crown.

M. Lemay proposes to have erected on the exposition grounds a Cycle Palace, which certainly will be a most unusual building. The interior will not be broken up into apartments to any extent. It will be used for the display of the wheel in all its forms, from the first crude two-wheeled draisine to the delicate mechanism which will mark the improved wheel at the close of the present century. Of course, no one knows just what the next three years will develop in the way of cycle construction and propulsion.

The exact dimensions of the palace have not yet been decided upon, but the plans outline a structure that will accommodate seven thousand persons on the ground floor. There is an aim at the Gothic in exterior appearance—that is, as far as the Gothic can be produced with the several parts of a bicycle. The ground surrounding the structure will be circular, with paths like spokes radiating from a common centre. All the windows are to be circular, with spoke frames, and with a small colored circular pane in the centre indicative of the hub.

The main entrance will be entirely of marble, cut in the form of an immense pair of front forks, while overhead will rest a huge handle bar of burnished steel. A number of smaller rooms lead off from the main floor, separated only by festooned curtains, which will be entirely of network, made from the material usually used in the mud-guard on a woman's wheel.

At either end of the main floor will be a monster wheel, with illuminated tires. These monster wheels will revolve from the time the exposition opens until its close. Apart from the light produced in this manner the only illumination will be large cycle lamps. Every seat in the building will be made of parts of a bicycle, though many of them will be so arranged as to be far more comfortable than the very latest in saddles. Curved and straight handle bars will be used for backs, and cushioned wheels in some cases for seats, while the chairs will be held up by different parts of cycle frames.

The rare exhibits will be guarded from the visitors' curious touch by a series of sprocket chains, and the lecturers, of whom there will

be a plentiful supply, will travel about the building on giraffe wheels. Refreshments will be served by a busy corps of attendants mounted on tricycles, and it is promised that the manner in which these gentlemen will conduct their evolutions will be truly remarkable.

Each pillar of the building will be decorated with sprockets and surrounded at short distances by tires. Even the floor will represent the wheel. Circular tiles are to be inlaid with spokes, and the triangles formed by the meeting of every three circles will be filled by tiles representing small cycle frames. There will, of course, be a lively ringing of cycle bells, this being the only form of signaling that will be allowed in the building. Every kind of bell, from the silver toned tingle to the ambulance-like gong, will be used.

All the doors are to be locked at night with bicycle locks, and a number of special gendarmes will patrol the grounds on wheels.

Every seat in the building will be pneumatic, and be supplied with a bell. The main floor is, of course, to be kept clear for the public performances and contests. There will be only one exhibit in the centre of the room. This will consist of a number of the very latest inventions of the bicycle world. The whole will be surrounded by a monster electric unicycle, the invention of a Parisian electrician. This feature is subject to change in case a more advanced invention is received.

The roof of the building will be festooned, the girders being made of steel, with every conceivable part of a bicycle woven into the designs. Orders have already been placed in England for the manufacture of all the pottery to be used in the building. Every piece will be made cycle fashion; cups, saucers, plates—in fact, even the forks will represent the wheel, being only two pronged and made in imitation of front forks.

Whether M. Lemay's plans are carried out matters not, the conception of them is sufficient. Of all the wheel cranks of the world M. Lemay is King.

WHISKER WEARERS VERSUS BLOOMER ONES.

The Populist Legislature of Kansas will reform the morals of the people if legislation can do it. Representative Lambert will introduce a bill prohibiting the wearing of bloomers by women and making it a misdemeanor for a woman to appear on a public thoroughfare astride a bicycle.

He says eminent physicians agree these women are ruining their health by riding the bicycle, and that the habit unfits them for the sacred duties of motherhood, and if continued will soon extinguish the race.

MONEY MAKING.

The history of money-making in rubber is more like romance than fact. No other branch of manufacture, in any country, has yielded large fortunes so rapidly as the rubber industry, a record which tire making and cycle construction has had much to do with.

THE BEST OF IT.

"Ye should have seen dther 'race betcheune Cassidy and Reagan!"

"Who got the worst av it?"

"The both av thim!"

WHAT THEY LOST.

It can not be very pleasant reading for the carriage people, when the "Carriage Monthly" thus sings to them the pleasant old song of what might have been:

"As a result of the indifference shown to the bicycle in its early days, the carriage trade has lost what might have been a valuable adjunct, and its sale and control has slipped into the hands of hardware, sporting goods dealers, special agencies and dealers, and the managers of large bicycle repositories. It is undeniable that the average carriage man is very slow to take up anything out of the usual line, either in methods, construction, form or style. We are in a position where we can learn from the bicycle incident. We have seen the progress of the bicycle, from one high wheel, and a little wheel behind, up to the equalization of the big and little wheel, in the form of the safety.

"The greatest impulse given to the bicycle industry was when pneumatic tires were proven to be a practical thing. Their heavy appearance was no drawback, when it was found they possessed so many advantages, and to-day the man with solid rubber tires on the wheel he rides is an object of pity. When Mr. Carriage Man speaks of pneumatic-tired vehicles, the first thing that occurs to him is that they are not good because they do not "look right." Let us consider their advantages. The first feature is their riding qualities, which is the first and essential quality for any good vehicle. Next, we should place the draft. Various scientific tests have placed the saving in draft, under various conditions, at from 30 to 60 per cent. These two qualities would be enough, in any other line of trade; but to continue, the pneumatic tire renders a low wheel possible, with the result of obtaining a very short turning carriage without a cut-under; also, a carriage very easy of entrance, without having to climb over the wheel.

"A further feature is in avoiding almost entirely the throwing of mud in speeding, or any kind of mud. The pneumatic tire throws no mud forward. What little mud is caught up at all falls backward, and rarely comes as high as the side of the seat.

"It is maintained that one of the chief advantages of pneumatic tires is that it permits the use of a wire, or more correctly called, suspension wheel. All the features above named apply as well to a pneumatic-tired wooden wheel as to the suspension; but the latter is undeniably the strongest wheel it is possible to make. A bicycle wheel, weighing under three pounds, carries a load of one hundred and fifty pounds and upwards safely. Compare this with carriage wheel weights and loads.

"The only disadvantages of the pneumatic tires are these: Liability to puncture—which is now practically obviated—and the expense, which, for the tires alone, is no more than for solid rubber tires on high wheels.

"The effect of the general introduction of pneumatic-tired vehicles among carriage users would be stupendous. By far the larger number of carriage users, particularly of carriages of good grade, are more or less creatures of fashion; and should the carriage trade be able to introduce pneumatic tire work, it would, in our opinion, promote an immense expansion of the carriage market.

One good turn of a wheel leads us to expect another.

FINISHES TO SUIT ALL.

When Oliver, Straus & Co., of this city, secured the output of Cilley chains, they made a good stroke. The chain soon demonstrated its worth, and has steadily grown in favor. To still further advance it, a wide range of

pattern and finish is now being offered, a range which would seem to appeal to all fanciers. Mr. Oliver expresses this very nicely:

"We are probably making a larger variety of finishes than any concern in the business," he says. "The new B block is probably the greatest novelty. We are finishing these in the ordinary blue hardened centre; we are also finishing it in the straw centre. We are polishing the side links when requested and are also polishing the centre blocks when desired. We are gold-plating the centre block; we are bluing and polishing the side link, and we are also polishing and nickel-plating the side link of all chains when so specified. We are furnishing this new B block centre with the so-called Perry-Humber side link, and this latter side link we are offering in all of our finishes. We are furnishing also, and it comprises by far the largest part of our business, the regulation Figure 8 chain, which has prevailed almost entirely until this season, when the new B block centre started in toward popularity."

CYCLE SHOW SIGNS.

Every exhibitor at the New York Show will require a sign of some sort, therefore it behooves them all to make note of the name and address, "G. P. Bofinger, No. 140 East Forty-second street, New York." Bofinger is making an active bid for the sign business, and has several reasons for preference. He is an adept, has splendid facilities, has had experience at previous shows, is located but one block from Grand Central Palace, and has been endorsed by the Board of Trade, and as there is oftentimes a kindly leaning for a fellow cyclist, it may be added that Bofinger is a wheelman, a racing man in his day and a square, manly fellow. He is in position to figure on either painted signs or electric lettering.

SELLING BY SETS.

In addition to manufacturing the Anderson and Wayne bicycles the Anderson Cycle Mfg. Co., of Detroit, Mich., is engaged in marketing cycle material, and on a somewhat novel scale. They arrange the material in sets such as their experience has shown is oftentimes called for. One set, for instance, includes the various tubes used in the frame and forks; another set includes hubs, bearings, rims, spokes, etc., and so on down the list. Prices are quoted per set or per lots of 10 or 100 sets, and as much of the material is made by themselves the concern claims to be in position to quote discounts that mean business.

A "loan collection" of frames, chains, sprockets, pedals, saddles and other parts, showing the changes from year to year, will be featured at both the New York and Chicago shows. Another collection will show the transformation which cyclometers have undergone in the last 15 years.

RESULT OF EXPERT EXPERIMENTING.

After years of experimenting by experts in the line, the White Manufacturing Company, of Nos. 40 and 42 State street, Chicago, and No. 115 Baker avenue, Syracuse, N. Y., have succeeded in perfecting a burner which will generate gas from petroleum or coal oil.

They have applied this burner to their Mammoth Hot Blast Brazier, and found it of great advantage in brazing. The same size flame produces one-third more heat than gasoline. Coal oil can be purchased at any point for one-half the cost of gasoline. Insurance companies make no objection to its use, and can be operated for one-third the cost of gasoline.

The two-burner Hot Blast Brazier has a tank made of galvanized boiler iron holding 10 gallons and tested to 200 pounds pressure. It is equipped with an indicator and metal pump attached by solid brass connections; it can thus be charged in a few minutes without

trouble. It has an adjustable hood which can be raised or lowered or extended to accommodate all kinds of work: the hood is a malleable iron frame lined with fire-brick, which retains and reflects heat, thus heating both sides of the work equally. The burners can be operated independently and regulated to any size blast; they produce solid blue flames of 2,200 degrees Fahrenheit and entirely devoid of smoke. There is a cut-off valve at the top of the tank which enables one to clean the burners without losing the pressure. To braze readily a pressure of 50 pounds is required. There are no restrictions of insurance on the use of these Petroleum Braziers. This machine is fully warranted and guaranteed to do all brazing required in the manufacture and repair of bicycles. It stands 30 inches high and weighs 90 pounds.

WHEN SPRING COMES.

The Newark (Ohio) Weldless Tube & Steel Works has been incorporated under the laws of West Virginia with a capital stock of \$500,000. The company contemplates building a factory in the spring.

HAS INDEPENDENT PADS.

Leading up to their Royal Anatomical spring cushion saddle, the Schlesinger Mfg. Co., No. 137 Rees street, Chicago, remarks: "Soft or particularly shaped pads imbedded in a frame or otherwise, do not accomplish

their purpose, as the pelvis bones will soon make an impression in the pads, and strike a hard bottom, which, after a short time, makes the saddle appear dead and uncomfortable." It is this which the Schlesinger people have striven to correct, and assert they have corrected in their Royal saddle. Their pads, made of curled hair, are independent and interchangeable, and may be moved forward or backward, as desired, and rest directly on an elastic spring, and it is claimed that sagging and "packing" is impossible.

A NIVISON IN THE FIELD.

Buyers of cycle material will do well to note that W. O. Nivison, Cortland, N. Y., is now in the field with a most extensive line of cycle components, finished and unfinished, and is in position to do the handsome in the matter of price. He controls the entire output of the Cortland Carriage Goods Co., makers of the crown barrel hub, interlock fork sides and forgings generally; he also represents the Shelby Steel Tube Co., and has one and two piece crank axles, pedals, rims, brakes, saddles and everything else required in the make-up of a bicycle.

WHEN A MISTAKE WAS MADE.

An erroneous impression, the Schleuter Mfg. Co. states, is likely to be created by this report, published last week:

"H. F. Schlueter, doing business as the Schlueter Cycle Mfg. Co., Cincinnati, and Joel C. Clore, receiver. Action for \$541.67." The company is not in the hands of a receiver and says that never were they in better shape financially. They are in a position to discount all bills when desirable.

HAS THE RIGHT RING.

There is a ring to the Rochester Cycle Mfg. Co.'s advertisement this week which seems likely to impress the average man and win over the hesitating dealer. With their line of \$100, \$75 and \$50 wheels the company is certainly in position to cater to the public, and being no spasmodic creation, knows well how to do so.

The Indianapolis Cycle Trade Association, of Indianapolis, Ind., have elected these officers for 1897: President, H. T. Hearsey; Vice-President, F. H. Henning; Secretary, Frank Staley; Treasurer, Thomas Hay.

QUITE A CHANGE FOR THE BETTER.

Anyone with half an eye and three-quarters of an ear knows how actively aggressive the Worcester Cycle Mfg. Co. has become since Geo. S. Macdonald assumed the managerial reins. The big, bold advertising of the company has caught the public eye and fancy, and those who have visited the factory at Middletown, Conn., and the New York headquarters at No. 17 Murray street know that the activity and aggressiveness is not confined to printed utterances. They must be reckoned with from whatever standpoint the cycling situation is viewed. Their facilities demand it.

The Worcester people believe they have the third largest factory capacity and the second largest factory floor space devoted to cycle building in America, but say they have made very little noise about their plant, facilities or plans, preferring to attract the trade and public by the sterling worth of their product rather than by braggadocio, believing that such a policy would in the end bring the desired volume of business. The company owns the large plants exclusively devoted to the manufacture of bicycles—one at Worcester, Mass., covering 247,000 square feet of land, and a still larger plant at Middletown, Conn. It is in the latter plant that the high-grade "Worcester" line of bicycles is made. This plant is complete in every detail, and consists of seven large, modern buildings. Without going into a detailed description of the various departments operated at the Middletown factory, and still to convey an idea of how vast and complete this factory really is it may be mentioned that the company has its own drop forge plant, its own photograph gallery, and actually do more real manufacturing than any other cycle concern with one exception. This completeness of plant and equipment is of inestimable value in a business like the cycle trade, places the company in an extremely independent position, and makes it free from the annoyance of delays in receiving partly manufactured materials.

"Fair dealing and the finest goods" is a Worcester maxim. That the latter will be tip-toppers seems certain, as the company is fortunate in having for its designer and master mechanic L. D. Munger, who is not only a veteran and widely known, but who as a designer is in the front rank. He is no longer "Birdie," the good fellow, but a man of keen industry and nervous energy, thoroughly and constantly enwrapped in his work. The factory superintendent, James Cawwood, is likewise a man of long experience in the building of fine cycles, having passed a number of years in the employ of one of the largest cycle makers in England, and has supplemented the knowledge gained there by five years' experience in this country previous to taking his present position.

The company have established their general offices and salesrooms at No. 17 Murray street, New York, and are splendidly equipped to transact a vast volume of business from this point. In establishing their headquarters in New York instead of at the factory, the company has undoubtedly acted wisely, believing that "it is better to go to a customer than to force a customer to come to you." The sales department is in charge of the well-known Leon Johnson, a product of Kentucky, and a rarity in that he is not a

Colonel. An export department is also operated, and on no small scale; the foreign mail is heavy. This department is in charge of J. Adkins Jones, who is as well-known among exporters and to the foreign trade as are his co-workers to the domestic trade. The general manager, Geo. S. Macdonald, spends his time equally between the factories and the general offices, personally looking after the detail of the vast interests entrusted to his care.

THE TRADE IN "TIRE TOWN."

Akron, O., Jan. 9.—Owing to the very unsatisfactory business of the past season, when prices were badly cut and sales made upon almost any terms, there is a feeling of uncertainty among the dealers of this city, and some of the more prominent hesitate to contract for 1897. The assignment of the Ranney Cycle Company, who were the largest dealers and who did an extensive business, has but added to the prevailing sentiment—that the bicycle business must be conducted upon a more conservative plan.

To date the only '97 model to be shown is the Columbia, by the Standard Hardware Company. Bicycle salesmen are plentiful, however, no less than forty having been in town during this week. Of the forty the number who were able to send in a satisfactory order is decidedly limited. H. J. Banta, sales-manager for the Waltham Manufacturing Company, spent a couple of days here early in the week showing the '97 Orient.

In striking contrast to the city bicycle trade is the activity in the tire factories. The B. F. Goodrich Company is running full-handed and with a night force, and the Diamond and India Rubber people are in about the same shape. Most dealers here prefer to buy machines without tires, putting on tires made up on account of the convenience of having repairs made at the factories.

Foster Bros., stationers, at No. 167 South Howard street, have handled bicycles for a number of years and are doing a good business. They retain the Premier, Apollo and Westminster, but have dropped the Monarch and added the Rambler, Quaker and Ideal, and will also have a medium-grade machine made for them under the nameplate Foster Special.

Framfelter & Whitner have succeeded Chandler & Framfelter at No. 168 South Main street, and they will continue to handle the Tribune, Waverley and Stormer. During the past season they sold a large number of Waverleys and expect to make that their leader this season. Books and stationery is their regular business, and Mr. Saunders is in charge of the bicycle department.

Last season the Standard Hardware Company accepted the Columbia agency, and under the able management of Mr. Good this department proved so profitable that they have just closed a large contract for 1897, and will make this branch of their business a special feature. Their store at No. 146 South Main street is one of the best arranged and located in the city.

The Ohio Glass & Hardware Company, No. 107 East Market street, handled the Hoffman and Western Wheel Works line last year, but as yet they have not decided on their line for 1897. Mr. West, their bicycle man, has looked over a number of different makers' samples, but says he hasn't seen just what they want.

At No. 137 South Main street the Union Cycle Company, a new concern, has fitted up a commodious store. The firm is composed of Ira O. France and a Mr. Lilly and a Mr. Armstrong, all of whom are employed at the B. F. Goodrich Rubber Works. Mr. France has sold a few bicycles every year as a side issue; the other gentlemen are wheelmen, but have never been in the business. For their line they have now selected the Barnes, Stearns, Cleveland and Geneva, and may add others later. They will have a very completely equipped repair shop, including an enameling oven, in charge of an experienced repairer.

The Collins Buggy Company began selling bicycles last season with the Union, White and Erie, and while they did a fair amount of business, they are somewhat uncertain as to whether they will continue it or not.

Ferguson & Sheppard, who run a sort of general repair shop, also sell the Gendron and Vanguard. Their specialty, however, is repairing.

Stump Bros., whose hardware store is over in South Akron, handle the Lovell Diamond, Lakeside and Duke, and sell a limited number.

Pettit & Nolle, clerks in the hardware store of May & Feilger, sold a few Relays and Crawfords last year, but have not decided whether they will continue.

The Akron Cycle Company occupies part of a tailor's shop and has the Ariel agency. They also have a cheaper machine. The Victor agency is with G. J. Snook, the photographer, whose studio is at No. 138 South Howard street. Bellow & Burr sell the Winston. John Gross, the Sunol and Royal. Kohrbach & Allen have decided that they have had enough of the bicycle business, and will confine their attention to saddlery. They handled Akrons last season.

BOSTON OWES MUCH TO HIM.

Boston, Mass., Jan. 13.—Col. Albert A. Pope, President of the Pope Mfg. Co., again proves himself a benefactor. He has given the city of Boston a dispensary for women and children, which will be known as the Pope Dispensary. It is a five-story building located in the select section of Boston.

Col. Pope's sisters, Emily F. and C. Augusta Pope, have for 25 years done most arduous and valuable services for the New England Woman's Hospital of this city. The structure is spacious and the design colonial. Scientific discoveries are looked for from the dispensary, as provisions have been made in its construction for a scientific photographic studio and chemical laboratory.

NO ONE CAN UNDERSTAND THEM.

The ways of railroad authorities are past understanding and past finding out. While the Trunk Line Association has refused concessions in the interests of the New York Show, the Western lines have accorded a special rate to the Chicago management, and only last week the stiff-backed New England Passenger Association granted a rate of one and one-third fare to the management of the Boston show.

MONEY CANNOT MAKE HIGHER GRADE TIRES THAN SAMSON SINGLE-TUBE TIRES.

NEW YORK TIRE CO.

BRANCH HOUSES:

Boston

Toronto

Philadelphia

Buffalo

Louisville

Cleveland

Chicago

Denver

St. Louis

MAIN OFFICE:

59 & 61 Reade Street, New York.

Kindly mention The Wheel.

Take a piece of iron pipe, draw an air-tight rubber tube inside, bend the pipe into circular form and join it. You then have a tire. Inflate it. The pneumatic principle is there, but you would not know it, because iron pipe is not the right material to use. You want something elastic.

Take a piece of mosquito netting, make a tube of it and use it in place of the iron pipe. When inflated, the netting will burst. This is not right either. It is elastic, but not strong enough.

These are two extremes. Somewhere between them is to be found just what is right for the purpose. You will be sure to get it in the

Flexifort
(TRADE MARK) INNER TUBE TIRE.

AND

CONQUEROR
HOSE PIPE TIRE.

These tires are the production of brains, skill and long experience.

Our Inner Tubes for all makes of tires are recognized as the very best in the market by all who use them.

MANUFACTURED BY

MECHANICAL FABRIC CO., Providence, R. I.
THE ORIGINAL MANUFACTURERS of PNEUMATIC TIRES in the UNITED STATES.

Write us for Catalogues, Samples and Prices.

Kindly mention The Wheel.

STRONG AS SAMSON, LIGHT AS ARIEL.

If it were possible to mould air as it is possible to mould clay or putty, the ideal tire would be a circular band of compressed air, fitted to the rim of the wheel. Air, however, is as elusive as it is elastic and for nearly all mechanical purposes it must be confined and restricted, and these elements enter importantly into the manufacture of tires; indeed, tires differ mainly in the material employed to effect this confinement and restriction; long since it was unanimously decided that a combination of rubber and fabric was the material best adapted to the purpose. The grade

of rubber and the wear of material are the rocks on which the tire trade split and, so to speak, go their several ways. The New York Tire Co. used pure Para rubber, of course, and a peculiar seamless thread fabric of a constrictive nature, rendering the pressure the same on every sectional part of an inch, making the tire perfectly cylindrical and uniform in diameter. The result is shown in the '97 Samson tire, illustrated herewith—a strong, light, and resilient non-creeping article, of which the New York people say they have reason to be proud; no expenditure of money can make a higher grade tire, they assert.

BELIEVES IN AMERICA.

Chicago, Jan. 6.—F. G. Burton, London, England, Managing Director of the Hawthorne & Sheble Co., Ltd., of that city, spent last week in our city arranging for 1897 business with the America Cycle Manufacturing Co. Mr. Burton speaks very enthusiastically concerning the prospects for the America truss frame in Europe. The concern has already disposed of a large number of them, and the excellent satisfaction given leads him to believe that their trade for the coming season will be gratifying. Mr. Burton came over on the steamer with "Baby" Bliss, the heavyweight. Bliss spent his time abroad going over the territory with the London firm's travelers, and, as Mr. Burton puts it, "He was a knock-down argument in every instance when anyone dared question the durability or carrying capacity of the machine. Mr. Burton is a firm believer in the fact that American bicycles, of standard and known values, will be able to maintain their position in the foreign market.

FOR MAKING WHEELS REVOLVE.

E. H. Frost has taken the mileage honors of the Harlem Wheelmen, New York, for 1896. During the year he rode 12,405 miles, 400 miles better than the best club record. Twenty-one members have received medals for riding over 3,000 miles.

MADE BY EXPERIENCED HANDS.

When any concern can lay claim to twenty-five years of experience in any one line of manufacture it bespeaks a record of success and solidity that commands the consideration of the thoughtful. This is exactly the position of the Atwood Mfg. Co., Amesbury, Mass., who for more than a quarter of a century have been engaged in the manufacture of vehicle lamps, so it is but natural that when last year they turned their attention to the manufacture of bicycle lamps their product soon gained a position in the front rank.

The Atwood Light is the fruit of nearly two years of experimenting, and naturally the '97 model is better even than its predecessors. Owing to the scientific principle upon which

it is constructed, perfect combustion is obtained, the air is admitted at the bottom and flows freely from the top, with a resultant clear white light, which is heightened by a finely ground lens of great power. A cotton-packed oil fount prevents the illuminant from "slopping." The lamp is riveted throughout, but every part is gettable, allowing thorough cleaning when necessity arises. It is made of brass, beautifully nickled, and presents a handsome appearance. In addition it has an exclusive feature in the swinging bracket that allows the lamp to be perfectly perpendicular, no matter what the position of the wheel may be, and the bracket being part of the lamp, a special bracket is not required. The Atwood burns kerosene or any other illuminating oil ten hours without refilling. The retail price is \$4.50, with solid discounts to dealers and jobbers.

AN EXTENSIVE "FEW."

Lovell Diamonds, the well-known product of the well-known John P. Lovell Arms Co., of Boston, have undergone a vigorous "refining," this enumeration of alterations and exclusive features being termed but "a few of our '97 improvements" by the makers:

Lovell Diamond frame, Lovell flush joints, Lovell two-piece crank-shaft, Lovell triple fork crown, Lovell barrel hubs, Lovell frame braces, Lovell oiling device, Lovell wheel axles, Lovell sprocket wheels, Lovell adjustable handle-bar, Lovell ball-retaining washers, Lovell seat-post clamp, Lovell three-point bearing, Lovell patent wool dust-proof bearings, Lovell interchangeable chain, Lovell barrel pedals, Lovell colored enamels, Lovell new axle nuts, Lovell frame re-enforcement, Lovell Diamond name plate.

WON ON THEIR MERITS.

E. N. Roth, the Chicagoan whose stupendous mileage of 34,380 miles during 1896 requires no comment, rode a Palmer-tired Sterling. A. J. Nicolet, who won the annual New Year's scorch of Chicago's Two-Fifty Club, was assisted by the same excellent combination.

Misfortune is pretty sure to overtake the rider who goes too fast.

HERE'S THE PAPER SADDLE.

It seems odd that it did not make its appearance sooner, but it is here now and is bound to command the notice it deserves.

The Indurated Saddle Co., of Middletown, O., are the patentees, and the saddle is composed entirely of paper, and seems perfectly practical.

The body of the saddle is absolutely nothing but paper. By a series of processes, and a high pressure, the paper is formed into shape and into a solid body. It is then rendered waterproof and receives a highly enameled finish. A novel feature of it is that the surface of the saddle is so amenable to a glassy enamel that an unequalled glassiness of

finish is obtained, the color varying to suit the taste, thus rendering possible the matching in finish of the balance of one's wheel.

Another distinctive feature is that of weight—the saddle weighs just nine ounces. The spring of the saddle is, of course, of steel.

The substantiality of paper in saddle construction was tested by a WHEEL man, who subjected a finished saddle to all kinds of rough handling without the infliction of a blemish.

The Miami Cycle & Mfg. Co., makers of the Raecycle, have adopted this saddle for their '97 output.

DIVIDE THE WORLD BETWEEN THEM.

Arnold, Schwinn & Co. now have the World territory apportioned and in nearly every case to well known and desirable firms in the respective sections. Farwell, Ozium, Kirk & Co. of St. Paul, Minn., have Minnesota, North and South Dakota and Montana; Stauffer, Eshleman & Co., New Orleans, have Louisiana, Mississippi and South Eastern Texas; Parlin, Orendorf & Martin, Omaha, control Nebraska and Western Iowa; and E. K. Tyron, Jr. & Co., of Philadelphia, Pennsylvania, South New Jersey, and Maryland.

ONE MILLION ON PAPER, LESS IN FACT.

A West Virginia corporation, known as the Standard Tire Co., manufacturers of pneumatic tires, with offices at 150 Nassau street and 123 West Thirteenth street, this city, has made an assignment to Wm. D. Goodwin. H. M. Du Bois is President of the concern and W. H. Gray secretary. The firm was capitalized one year ago with \$1,000,000, of which it was reported \$15,000 was paid in. The Sheriff has received an attachment against it for \$220 in favor of John McCormick.

SHOULD HAVE GOT MORE.

A Richmond, Va. cyclist was recently thrown from his wheel and badly injured through the miserable condition of the street. He sued the city and was awarded \$300 damages.

UNCLE SAM IS THEIR CUSTOMER.

From man-destroying torpedoes to bicycles is a great reach, but at least one concern, the United States Projectile Co., of Brooklyn, N. Y., have successfully essayed it. The concern does not make bicycles complete, but does manufacture the most vital part thereof, the tubing, which also enters into the torpedoes made for the Federal Government. The works, situated on the shores of New York Bay, are almost one-fourth of a mile in length and are naturally impressive.

The Projectile Company is one of the pioneers in this country in the tubing industry. They began their first experiments in 1892, gradually enlarging their works as the demand for their product increased, until at the present time they have one of the largest and best equipped mills in this country.

Their method of manufacture is entirely different from other makers. Instead of using the hollow billet, they make their tubing from the solid bar, the steel used coming from Sweden in bars about four inches in diameter and from six to eight feet long. The "hot process," as it is called, or the preparation of the steel for cold drawing, is conducted exactly on the same principle as they produce their projectiles for the United States Government, of which they have made many thousands. The steel is first cut into pieces weighing about twenty pounds each, which are then put into the furnace and heated to

tapered tubes, and in fact are equipped to make anything in the tubing line. The company says they have been specially fortunate in obtaining, after a series of long and costly experiments, a special brand of very high grade, high carbon Swedish steel, containing an amount of carbon that will give the greatest stiffness consistent with toughness and elasticity, and from this steel their long experience has enabled them to get most excellent results. This company has been supplying for years many of the leading makers of wheels, both in this country and Canada, and until the recent additions were completed, their facilities were entirely inadequate to care for the rapidly increasing demand for their product. The actual capacity of the mill is from 8,000,000 to 10,000,000 feet per annum.

AN EXTRAORDINARY BEN-HUR.

President Wainwright of the Central Cycle Mfg. Co., Indianapolis, has at last released some of the particulars of "the most remarkable wheel on the market," the \$125 Ben-Hur. Mr. Wainwright has shown the wheel to many but has as religiously requested that none of the details be put in print, thereby whetting curiosity the more. He is not yet ready to make all of them public. His typewriter has reeled off this much of interest:

The lines are beautiful. Crank hanger dropped $2\frac{1}{2}$ inches. Front fork is arched and D shaped. Head $1\frac{1}{2}$ -inch tubing. Main frame $1\frac{1}{2}$ and rear braces and quadrant $\frac{1}{4}$ tapered to $\frac{1}{8}$ -round, admitting a very large tire. The Central Company does not advise the use of D tubing in the rear frame.

The rear frame is radically different from the ordinary. The flush joints are a special Ben-Hur feature, and the arched rear braces

SHIPPING ROOM

COLD DRAWING ROOM

OFFICE BUILDING

ANNEALING DEPARTMENT

the proper heat; put through a series of operations, technically described as blocking, cupping and drawing; then through several series of dies until the proper diameter and thickness of the walls is obtained, after which the tube is tagged and ready for cold drawing.

All the above processes are by hydraulic pressure, the hydraulic plant of this company being one of the largest in the country, and the works, when running full, require the services of four large pumping engines of an aggregate capacity of 1,200 horse-power. Their immense plant, of which a number of views are shown, is situated at the foot of Fifty-third street, on New York Bay, and is nearly a quarter of a mile in length. The factory is lighted entirely by electricity, generated by their own plant, and power is transmitted to the various departments by means of electric motors.

The cold-drawing room, of which a view is shown, is 300 feet long by 100 feet wide, and the drawing, as will be seen, is by hydraulic pressure. The shipping and stock room, of which only a partial view is shown, is 150 feet long by 100 wide. Both of these departments are finely lighted and laid out for comfort and convenience of work.

They are also manufacturers of seamless forksides, special round and "D" tubing and lower rear forks, internally and externally

DEATH OF J. J. DAVIDSON.

J. J. Davidson, president of the Union Drawn Steel Company, of Beaver Falls, Pa., the largest suppliers of steel to the bicycle trade in America, died January 2d, at Phoenix, Ariz., of consumption. His remains were brought to Beaver Falls for interment. Mr. Davidson was still a young man—just turned 35—and a prominent figure in Western Pennsylvania business circles.

NO MORE STRIPERS.

Convict labor is to be abandoned by the Derby Cycle Co., of Chicago. Two years ago the firm contracted for 75 prisoners at the Jackson, Mich., penitentiary. The contract will expire in six months, when free labor will be employed.

NOW WITH THE RICHMOND.

H. W. Craft, formerly with the Peoria Rubber & Mfg. Co. and Indiana Bicycle Co., has been engaged by the Richmond Bicycle Co., and will represent the Richmond's interests in the Central States.

and quadrant give the machine individuality and beauty. The reversible handle bar is fitted to the stem by a taper with splines to hold in position, making a very neat connection.

The crank hanger is 2 11-16 inches in diameter. The ball retaining cases contain 15 $\frac{3}{4}$ balls each side, large heavy cones and cases; 3-point bearings throughout and ball retainers in hub cases and head. The disc adjusting cases are controlled by a dog operated from the outside which engages a ratchet or slot on the inner face of the cases in hubs and crank bracket, and by moving the case one notch the same is adjusted in or out .0014 of an inch. This device is entirely new and has much merit.

The crank axle is very simple. The right crank and axle are one piece which engages the sprocket, the sprocket in turn engages the driving sleeve, and the left crank engages the driving sleeve, all on flat tapers and held in position by one nut.

The eccentric chain adjustment is very novel. The eccentric discs are mounted in the frame, and the chain is adjusted by loosening one nut, applying a spanner to the disc on one side. The wheel remains in perfect alignment and the adjustment of the chain can be perfectly accomplished in ten seconds. The direct chain draft is very nicely accomplished, and the many improvements in detail make what is claimed by the Central Cycle Manufacturing Company the most expensive and accurate bicycle ever manufactured in a mercantile way.

\$117,596

American firms who desire to cultivate foreign trade should not lose sight of the fact that catalogues in the language of the native are a most valuable means of sowing seed. The Wheel Press has already turned out catalogues in foreign languages, and is now able to quote prices on the translation of American catalogues into German, French and Spanish. Address The Wheel Press, 88 West Broadway.

IMPRESSED BY THE CHASE.

In discussing the tire exhibits at the English cycle shows, London "Engineering," one of the standard and much-quoted publications of Great Britain, devotes nearly a column to the Tough Tread Chase tire, the production of L. C. Chase & Co., Boston. It is referred to as "one of the best examples of gaining a desired end, simply by improvement in detail of manufacture," the end being its "punctureproofness." "Engineering" was astonished by the "impregnability of the textile shield, which 'called to mind' the quilted cotton armor of the ancient Mexicans, which proved a protection sometimes even against the keen Spanish blades of the army of Cortez."

Put a pin in this prediction, said Alex Schwabach: "When the successful chainless bicycle does arrive, the gear will be applied to the front wheel."

FOR HAND AND FOR DROP FRAMES.

People troubled with perspiring hands or who are afflicted by vibration of the handlebar, have another candidate for their favor, the Ventilated Cushion Grip, the product of the Ventilated Grip and Mfg. Co., Globe Building, Newark, N. J. The new-comer is made of flexible rubber, covered with soft leather or felt, and containing a number of perforations. It fits snugly to the bar only at one point, both ends being left open and permitting free circulation of air. It is a departure from the usual, and is worthy of consideration. The grips retail for \$1 and \$1.50 per pair, but generous discounts will be quoted to the trade.

The same concern is also marketing the Eggers truss brace for drop frame wheels, either single or double. It was born of necessity, the frame of the inventor's expensive tandem having weakened and buckled until a brace of some sort was found imperative. It is attached to the lower tube of the frame and drawn taut by means of a turn buckle. It weighs less than half a pound.

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

THEY HOLD

- All world's records.
- 1/4 to 10 miles.
- All unpaced world's records.
- 1/4 to 50 miles.
- All American records.
- 1/4 to 100 miles.
- All American hour records.
- 1 to 24 hours.
- All world's records (6) made on the National Circuit and 521 prizes - all other tires combined won only 174 more.

MORGAN & WRIGHT
CHICAGO

AN ELASTIC MARKET.

Rubber manufacturers are holding off in expectation of lower values, which are expected to prevail before long on account of recent heavy receipts of rubber at primary points. During the month of December arrivals at Para amounted, in round numbers, to 2,500 tons. The stocks now afloat and on their way to this country are in the neighborhood of 360,000 pounds.

ALL EXPECT TO BE DUNLOPS.

Tires continue to monopolize the attention of inventors in the India-rubber line in Great Britain even to a greater extent than in the United States. Thus during the past three months, out of a total of 366 British applications for patents relating to India-rubber, no less than 321 had reference to tires.

EDUCATING THE PUBLIC IS EXPENSIVE.

It cost the stockholders of the Simpson Lever Chain Company a net loss of \$30,570 on last year's business, in an endeavor to make the public believe that much-talked-of invention was one of those long-felt wants, so often read about.

WHERE WAVERLEY LESSONS ARE TAUGHT.

In his school of instruction, President Smith, of the Indiana Bicycle Co., hit upon one of the happiest and most practical ideas that has been exploited in some time. There will be those inclined to belittle it but the fact remains nevertheless.

Regardless of what may be said, it is undeniable that a large proportion of cycle travelers and salesmen do not really know the wheels they are selling. They have a broad, general idea of the wheel's make-up and "talking points;" they have strolled through the factory, picked up incomplete parts, witnessed the operations of the turret machines and other machinery and departed wise in mystery, depending on their quickness of wit and their "jolly" capacity to win out in dealing with their firm's patrons and possible patrons. When they bring up against a really clever man who knows what's what and who refuses to shift the conversation, or to be turned aside, the salesman is in a bad way and has either to confess or to flounder in his own ignorance. Instances of the sort have been so plentiful that it seems rather strange that the Waverley idea has not long ago been considered the proper caper.

Each year President Smith has called his travelers and branch managers to the Indianapolis headquarters. There a general interchange of ideas and defining of policy has occurred. This year, however, the Indiana Bicycle Company, which perhaps employs as large a staff of traveling men as any house in the cycle trade, has in addition, made the annual gathering a medium of familiarizing their travelers with every feature and detail of the Waverley's construction, in a novel and at the same time eminently practical method. The Waverley traveling force is now on the road after being domiciled at the factory for a fortnight, undergoing probably the most thorough preparatory drill ever given any similar body of men.

A large room in the office building was set apart for a school room and here the twenty-four men who sell Waverleys gathered at certain hours of each day for their studies, the 1897 models of the Waverley being the text books, and the mechanical experts and designers of the company the teachers. Lectures thoroughly explaining the workings of every part of the machine were given, each man instructed how to take apart and put together every portion of the wheel and made to practice at it until he was absolutely perfect, examinations made of the relative value of various kinds of material and of the mechanical principles involved in the making of each and every part of the machine, trips taken through the factory under the guidance of expert workmen ready to explain every process of construction, questions asked and answered by both teachers and pupils, talks given by the commercial men of the house, regarding selling methods, the best means of approaching possible customers, etc., etc. In short, the travelers were given instruction regarding every point which it is advantageous for the up to date bicycle salesmen to know, not superficially, but thoroughly.

Mesinger saddles have made their appearance in England. They have been taken up by S. Buckley & Co., King Alfred's Place, Birmingham.

SATISFYING THE SKEPTICAL.

Usually when one hears of or sees illustrated an automatic saddle his curiosity is awakened. The word "automatic" conveys a something of which he would know more. He would fain see the thing in use, in operation, but as it is new to him he is seldom disposed to pay for the seeing or using.

It is evident that the Automating Cycle Seat Co., of Grand Rapids, Mich., appreciated this trait in human nature. They make and market the Amburn Automatic Saddles, and such is their faith in the "taking qualities" of the seats that they offer to supply the saddles on 15 days' trial. If at the end of that time they prove unsatisfactory they may be returned and the purchase price will be refunded.

For the current year three patterns are being made; two of them are distinctly new

Fig. 1.

patterns. One is felt-padded and the other has pneumatic cushions instead of felt, making with the hard seat three lines which are complete in detail in every way. Each is made to fill a specific purpose.

The seat is different from all others, being divided in the centre, each half working independently of the other. Each part is mounted on a horizontal steel bar, and by being fitted with adjustable steel clamps, allows of adjustment being made until the fit is perfect for the rider.

It follows every movement of the body, backward or forward, and fits snugly, thus preventing chafing.

Fig. 1 shows the pneumatic seat from the top and the manner in which it is drawn down by the buttons, allowing the pelvis bones to rest in the hollow, giving more seating or resting space to the body, thereby relieving any unnecessary strain on that particular part.

Fig. 2 shows the spring and clamp construction from the under side, and illustrates the

Fig. 2.

manner in which the adjustment may be made.

The springs are of the best oil-tempered spring steel, and yield to every unevenness in the road.

In the pneumatic seat the bar is straight instead of being curved, as in the above model, but the rest of the construction is about the same.

The leather is of the best quality soft-pebbled, water-grained, and will not crack or soil the clothing.

The soft Mexican felt used in the padded seat is the finest obtainable.

The Grand Rapids people report that many good orders have been booked, and that the trade for 1897 looks exceedingly bright.

WILL USE FLUTED TUBING.

The price of the Morado Chief will be \$110, the product of the Morado Bicycle Company, Beaver Falls Pa. It will be their leader, of course, and will be made for both ladies and gentlemen, but there will also be a second grade listing at \$85, and making its way as plain "Morado."

The more expensive model is distinguished from its less novel mate by a continuous crank-shaft, and by several minor mechanical features, but the chief difference is that the \$85 model will have a frame of the ordinary style tubing, while the Morado Chief will be of fluted tubing, an altogether different feature than any ever incorporated in a bicycle. In appearance the fluted tube is somewhat similar to the well-known corrugated, but it is vitally different in that the fluting does not extend the entire length of tube, a sufficient length of plain tube remaining to make reinforcing possible; also flush joints, both of which features are incorporated in the wheel. The tube used is 1 1/4-inch weldless, and the fluting is a process performed by the Morado Company itself by a special machine which, for reasons easily guessed, they are not anxious to exploit.

The fluted tubing is not only an extreme novelty and is extremely pleasing to the eye, but extra strength is claimed for it.

WILLIE WINDLE AS A SADDLE SELLER.

Who would ever have predicted that Willie Windle some day would become a "drummer," a vocation into which nerve and plausibility of speech enters so largely, two attributes which were never credited to the at one time unbeaten champion. Yet such is a fact. New England is to be his stamping-ground, and Person's saddles the wares which he is representing. To meet Windle is to meet one who really is one of nature's noblemen. Honest, unassuming and filled with determination, he is the sort of man who merits the utmost prosperity.

WARREN'S GRIP.

The J. J. Warren Co., Worcester, Mass., well-known to the trade as manufacturers of leather goods, are marketing a leather-covered grip that has many points of merit. The body is of wood, with a solid end, and is covered with a fine grade of leather, which takes any color desired. As the leather is worked damp, the partly finished grip is pressed in a die so that the seams present a perfectly smooth surface to the touch. The Warren Co. are well pleased at the reception the trade has accorded their newest production.

NOW A WAVERLEY COMPOUNDER.

Louis D. Quackenbush has been added to the staff of the Indiana Bicycle Co., and will hereafter attend to the compounding of the Waverley advertisements. Quackenbush was formerly with E. C. Stearns & Co., and last season followed the national circuit as the Monarch Cycle's "advance agent" for Tom Cooper.

BUY A WHEEL, GET INSURED.

The makers of the English Dunlop cycles are now giving, to every purchaser of a Dunlop, insurance policies against death, disablement, or loss of machine by either theft or fire.

A Sweeping Statement The ELMORE

has given and will give better satisfaction than any other Wheel on the market.

For confirmation of above we can refer you to agents who have handled all the way from 5 to 5,000 of them.

We have anything you want.

NEW PATENTS.

574,390. Vehicle Tire. George N. Chase, Pasadena, Cal. Filed Nov. 25, 1895. Serial No. 570,108. (No model).

574,410. Bicycle-Lock. Charles A. Gay, Seattle, Wash., assignor of one-half to John D. Atkinson and Charles E. Remsburg, same place. Filed Jan. 27, 1896. Renewed Nov. 17, 1896. Serial No. 612,526. (No model).

574,412. Tire Tightener. Grant J. Grandpre, Chamberlin, S. D. Filed June 16, 1896. Serial No. 595,819. (No model).

574,438. Pneumatic Tire. Edward Lyon, New Rochelle, N. Y. Filed Nov. 25, 1895. Serial No. 569,991. (No model).

574,440. Pneumatic Tire. Lewis J. Miller, Bergen, N. Y., assignor to Orville J. Miller and George D. Wiederich, same place. Filed Oct. 18, 1895. Serial No. 566,065. (No model).

574,443. Wheel-Tire. James H. Northrop, Hopedale, Mass. Filed Dec. 15, 1893. Serial No. 593,720. (No model).

574,453. Patching Device for Pneumatic Tires. Joseph Savoie, Central Falls, R. I. Filed May 18, 1896. Serial No. 592,053. (No model).

574,499. Wheel for Bicycles or other Vehicles. Louis B. Smyser, Philadelphia, Pa., assignor of one-half to William H. McFadden, same place. Filed May 22, 1896. Serial No. 592,630. (No model).

574,505. Bicycle-Saddle. Seymour Doss Van Meter, Denver, Colo. Filed Apr. 7, 1896. Serial No. 598,603. (No model).

574,563. Bicycle or Vehicle Lamp Bracket. James P. Place, Glen Ridge, N. J. Filed July 27, 1896. Serial No. 606,611. (No model).

574,577. Machine for Manufacturing Tubing. Vernon Royle, Paterson, N. J. Filed Apr. 17, 1896. Serial No. 587,920. (No model).

574,608. Device for Mending Tires. Frank B. Jencks, Syracuse, N. Y. Filed May 5, 1896. Serial No. 590,232. (No model).

574,621. Chain-Brush for Bicycles. Charles A. McCulloch and Maximilian F. Corneay, Minneapolis, Minn. Filed Nov. 21, 1895. Serial No. 569,663. (No model).

574,628. Bicycle Stand or Holder. Harry C. Phillips, Rochester, N. Y., assignor by direct and mesne assignments, to the Rochester Bicycle Combination Holder Company, same place. Filed July 8, 1895. Serial No. 565,309. (No model).

574,629. Bicycle Stand or Holder. Harry C. Phillips, Rochester, N. Y., assignor to the Rochester Bicycle Combination Holder Company, same place. Filed Sept. 11, 1895. Serial No. 562,145. (No model).

574,631. Bicycle-Bell. Edward D. Rockwell, Bristol, Conn., assignor to the P. & F. Corbin Co., New Britain, Conn. Filed June 1, 1896. Serial No. 530,867. (No model).

574,674. Velocipede. William A. Dryden, Sr., Chicago, Ill., assignor of one-half to John L. Davenport, Jr., same place. Filed Dec. 2, 1895. Serial No. 570,746. (No model).

574,676. Bicycle-Support. John M. Gettchell, Haverhill, N. H., assignor of one-half to William W. Crook, same place. Filed Mar. 27, 1896. Serial No. 585,110. (No model).

574,682. Elastic Tire for Vehicle Wheels. William H. Holden, Chicago, Ill. Filed Mar. 21, 1896. Serial No. 584,237. (No model).

574,689. Bicycle-Rack. Peter N. Stover and Mark E. Stover, Saginaw, Mich. Filed Aug. 13, 1896. Serial No. 602,624. (No model).

574,700. Ball-Bearing. William Aubertin, Detroit, Mich., assignor of one-half to Frank W. Weyher and

574,710. WHEELS FOR VEHICLES. JAMES S. COLEMAN, Hartford, Conn., assignor to the Top Manufacturing Company, same place and Portland, Me. Filed June 15, 1896. Serial No. 592,381. (No model).

Claim.—A hub for a wheel having a barrel with longitudinal ribs and the strips between the ribs expanded outwardly to form eyes, the end of the barrel on each side of each strip being pushed inwardly to complete the eye, substantially as shown and described.

574,673. TRANSFER SEAT FOR FOOT-POWER VEHICLES. GEORGE D. BAKER, Bingham, Minn. Filed Mar. 12, 1896. Serial No. 562,820. (No model).

Claim.—In a saddle, a curved transverse frame, an upturned resilient support secured to and adjusted in front of said frame, and a flexible mat having a fore and lateral portions, the fore and rear ends being stretched between the ends of the frame and the resilient support, substantially as described.

574,674. FLEASHER. WILLIAM A. BATES, St. Chicago, Ill., assignor of one-half to John D. Davenport, Jr., same place. Filed Dec. 2, 1895. Serial No. 570,796. (No model).

Claim.—The combination with a safety-bicycle having the tilted rear fork ends for the reception of the driving wheel axle, of a rigid transverse frame having a sliding and adjustable connection with said axle, an open rim or ring surrounding the driving wheel, and in frictional engagement therewith, said guiding and steadying ring journaled in said fork and bearing against said rim, substantially as described.

574,643. BELL. CHARLES A. THORP, Bristol, Conn., assignor to the P. & F. Corbin New Britain, Conn. Filed Dec. 30, 1895. Serial No. 572,191. (No model).

Claim.—In a bell the combination with a frame and going of a pulsing vibratory rickshaw-carrier, pivally mounted on the frame, a striker, and a fixed obstructive element in the path of the striker, which imparts the pivotal movement of the striker and rickshaw-carrier, said rickshaw-carrier is brought to bear upon the latter to cause it, in yielding to slip by the obstructive element and strike the side of the gong, substantially as specified.

574,668. BICYCLE BELLS. DAVID ROSE, Park, Fresno, Calif. Sept. 11, 1895. Serial No. 601,118. (No model).

Claim.—In signal-bells for bicycles and the like a laterally-bent metallic support, adapted to be clamped or otherwise secured to the fork of a bicycle, so upright, raised at its lower end in one of the hands of said support, said support on the upper end of said upright and terminated by a cap or rigidly held in position, a wire spirally connected at its lower end to the support near the base of the upright, the said wire bent in its middle to form a loop and provided at its upper end with a clapper and combination with a wheel having a rubber tire, adapted to rotate at the farther end of the support to consist with the rubber-wheel, a pin near the center of said wheel, a flange secured at one end to said pin, and at the opposite end to the loop of the hammer, and adapted to produce a double

574,658. BICYCLE OR VEHICLE LAMP BRACKET. JAMES P. PLACE, Glen Ridge, N. J. Filed July 27, 1896. Serial No. 606,611. (No model).

Claim.—In a bicycle or carriage lamp bracket the combination of a short gripping side piece having one or more prongs on one end, said a clamping head on the opposite end, a long gripping side piece having one or more holes near one end (corresponding to said adapted to engage the said one or more prongs) and a clamped-on head on the opposite end, a retractible spring piece that holds the lamp, having also one or more holes corresponding to the said one or more prongs and means between the ends of the gripping side pieces for gripping the said spring piece on one end and the bicycle-fork or carriage-lamp-holder between the clamping-heads at the opposite end of said side pieces, both at one operation, and substantially as herein shown and described.

574,659. BICYCLE-RACK. PETER N. STOVER and MARK E. STOVER, Saginaw, Mich. Filed Aug. 13, 1896. Serial No. 602,624. (No model).

Claim.—In a bicycle-rack, the combination of the base-pieces A, rigidly connected to each other by intermediate cross-pieces B, cross-bar C journaled in the ends of said base-pieces, parallel rods D, secured to the cross-bar C to project therefrom, and independent cross-bars E secured to the ends of the rods, together with means for adjustably connecting the cross-bars E to each other, substantially as shown and for the purpose set forth.

574,632. BICYCLE STAND OR HOLDER. HARRY C. PHILLIPS, Rochester, N. Y., assignor by direct and mesne assignments to the Rochester Bicycle Combination Holder Company, same place. Filed July 8, 1895. Serial No. 565,309. (No model).

Claim.—In a bicycle-stand, the combination of the two members loosely joined together below their upper ends and having at said upper ends devices for positively engaging two separated portions of a bicycle and preventing the movement of the members on their pivot, said pivot being located between the engaging devices, whereby the weight of the bicycle will clamp it to the stand, substantially as described.

574,410. BICYCLE-LOCK. CHARLES A. GAY, Seattle, Wash., assignor of one-half to John D. Atkinson and Charles E. Remsburg, same place. Filed Jan. 27, 1896. Renewed Nov. 17, 1896. Serial No. 612,526. (No model).

Claim.—In a bicycle-lock, the combination of a suitable clamp for attaching the lock to a frame secured to said frame, a lock secured to said frame and adapted to be turned thereon, a key or key-pin for said lock secured in the frame, and a case carried by the lock and adapted to bear upon the bicycle-wheel, substantially as shown and described.

573,609. TIRE. JOSEF EISENGARTEN, Solingen, Germany. Filed Mar. 21, 1896. Serial No. 594,848. (No model).

Claim.—A thin metallic belt provided with elastic material such as cork secured under pressure inside it and holding its walls constantly in tension, substantially as set forth.

574,705. HANDLE-BARS GRIP FOR BICYCLES. ISAAC A. FRYMAN, Ironville, Minn. Filed July 10, 1896. Serial No. 602,076. (No model).

Claim.—A handle-bar grip having a looped form and providing a continuous gripping surface extended from one side of the junction of the grip and handle bar around to the other side, substantially as and for the purpose described.

574,700. BALL-SEALING. WILLIAM AUBERTIN, Detroit, Mich., assignor of one-half to Frank W. Weyher and Frederick C. Weyher, same place. Filed July 8, 1895. Serial No. 568,392. (No model).

Claim.—The combination with a tube forming a first or integral part of the bicycle and having an air-chamber formed there-through, of a bearing tube removably secured in said first tube and provided with an exterior annular groove, with perforations at one or more points therein through the tube, said groove being adapted to register with the air-chamber in the first tube and forming an obtuse angle to the bearing and balls in the removable tube, substantially as described.

574,621. CHAIN-DRIVE FOR BICYCLES. CHARLES A. MCCULLOCH and MAXIMILIAN F. CORNEAY, Minneapolis, Minn. Filed Nov. 21, 1895. Serial No. 569,663. (No model).

Claim.—An attachment for sprocket-and-chain drives for cycles and other uses, consisting of the spring-holder, the side pieces of which are formed by spring-wire bent upon themselves to form the clamp sides or jaws with bolleys, and holders for the bolts or bushes, the bolts passing through the bolleys of said jaws, and one or more bushes loosely mounted in said holder-arms, substantially as described.

574,453. PATCHING DEVICE FOR PNEUMATIC TIRES. JOSEPH SAVOIE, Central Falls, R. I. Filed May 18, 1896. Serial No. 592,053. (No model).

Claim.—A device for patching pneumatic tires consisting of a hollow needle, having an enlarged head upon its inner end, and a series of longitudinal slots or openings through its ends extending to within a short distance of the head, and through its sides and around its ends, and which needle is adapted to receive a patch upon its end and draw it into position against the inner side of the tire after the needle has been forced through the slit against the patch, substantially as shown.

574,701. AIR-VALVE. LUIGI BAKER, St. and CHARLES D. BAKER, Bingham, N. Y. Filed July 5, 1896. Serial No. 594,583. (No model).

Claim.—A valve comprising a screw-threaded case provided with an air-passage and a suitable attaching device, a diaphragm thereon and with a diaphragm forming an outer and an inner compartment and provided with an air-passage over or around said diaphragm contacting said compartments and communicating with the above air-passage, said diaphragm being movable longitudinally to open and close said communication, as set forth and shown.

574,675. BALANCE ATTACHMENT FOR VEHICLES. JOHN M. ALBERT, Detroit, Mich. Filed Mar. 15, 1896. Serial No. 584,640. (No model).

Claim.—A balance attachment for axially-supported pedals, consisting of nuts screw-wedged on a threaded rod, whose end is bent or partially twisted to the pedal-axis or to the tubular jacket, a slotted disk interposed said nuts, and laterally-extending plates in 90 degrees in said disk-ends, substantially as described.

574,700. VELOCIPED. JACOB BARKER, New York, N. Y. Filed Jan. 27, 1896. Serial No. 592,011. (No model).

Claim.—A steering tube and handle tube each provided with non-circular eyes or diaphragms, a non-circular or non-rotary stem slipped through of fitted into said eyes to secure the tubes non-rotatively to one another, and an adjusting screw for the handle-tube made to engage said non-rotary stem substantially as described.

574,676. BICYCLE-SUPPORT. JOHN M. GETTCELL, Haverhill, N. H., assignor of one-half to William W. Crook, same place. Filed Mar. 27, 1896. Serial No. 585,110. (No model).

Claim.—A bicycle-support consisting of a bar having means for attachment to the frame of a bicycle and curved near its lower end, and a rest mounted to slide through an opening in the curved portion, and having as its upper end a lateral portion receiving the rod, substantially as described.

574,608. DEVICE FOR MENDING TIRES. FRANK B. JENCKS, Syracuse, N. Y. Filed May 5, 1896. Serial No. 590,232. (No model).

Claim.—A device for patching pneumatic tires consisting of a hollow needle, having an enlarged head upon its inner end, and a series of longitudinal slots or openings through its ends extending to within a short distance of the head, and through its sides and around its ends, and which needle is adapted to receive a patch upon its end and draw it into position against the inner side of the tire after the needle has been forced through the slit against the patch, substantially as shown.

Claim.—A re-stitching device consisting of a slotted needle, provided with a hollow shaft, and a push-rod or plunger movable in the shaft and the end of the needle, said needle and push-rod being provided with suitable handles, substantially as and for the purpose described.

Frederick C. Weyher, same place. Filed Apr. 7, 1896. Serial No. 586,522. (No model).

574,705. Velocipede. Julius Bonner, New York, N. Y. Filed June 18, 1896. Serial No. 590,031. (No model).

574,709. Means for Repairing Pneumatic Tires. Jas. H. Calkins, Wakefield, Mass. Filed May 14, 1896. Serial No. 591,470. (No model).

574,712. Wheel for Vehicles. James S. Copeland, Hartford, Conn., assignor to the Pope Manufacturing Company, same place, and Portland, Me. Filed June 12, 1896. Serial No. 595,261. (No model).

574,713. Wheel for Vehicles. James S. Copeland, Hartford, Conn., assignor to the Pope Manufacturing Company, same place and Portland, Me. Filed June 15, 1896. Serial No. 595,764. (No model).

473,734. Bicycle Construction. Ferdinand F. Ide, Peoria, Ill., assignor by direct and mesne assignments, to the F. F. Ide Manufacturing Company, same place, and Frederick D. Owen, Washington, D. C. Filed Jan. 12, 1894. Serial No. 496,578. (No model).

574,751. Handle-Bar Grip for Bicycles. Isaac A. Newman, Greenville, Miss. Filed July 23, 1896. Serial No. 600,279. (No model).

574,752. Vehicle Wheel. Henry J. Ney, Pottsville, Pa. Filed March 25, 1896. Serial No. 584,738. (No model).

574,772. Vehicle Tire-Protector. Marion A. Andrews, Syracuse, N. Y. Filed Jan. 30, 1896. Serial No. 577,351. (No model).

574,818. Wheeled Vehicle. Edward J. Pennington, Chicago Heights, Ill., assignor to the Motor Cycle Company, Chicago, Ill. Filed March 21, 1893. Serial No. 467,043. (No model). Patented in England December 11, 1895. No. 23,771.

DESIGNS.

26,487. Bicycle Cover. Horatio Ogden Nelson, Long Island City, N. Y. Filed April 23, 1896. Serial No. 588,829. Term of patent 14 years.

26,488. Bicycle Toe-Clip. William N. Beardsley, Bridgeport, Conn. Filed March 28, 1896. Serial No. 585,287. Term of patent 3½ years.

ARE NOT KICKING.

At the annual meeting of the Gendron Wheel Company last week it was announced that the business for the year had been highly successful, despite the troublesome times. Officers were re-elected as follows: President, George H. Fisher; vice-president, John Showell; secretary, John F. Vogel; treasurer, George M. Vogel; directors, P. Gendron, C. F. Adams, James Secor, G. H. Fisher, S. C. Schenck, J. F. Vogel and John Showell.

STILL EXPANDING.

The Mesinger Bicycle Saddle Company have moved their offices from 26 to 33 West Twenty-third street (opposite former location), where they have about twice as much room as heretofore. They are also in complete possession of their new factory, and now that they have enlarged their offices, are in a position to attend properly to the constantly increasing requirements of their trade.

HUNTSMAN HAY.

President Thos. Hay, of the Hay & Willits Mfg. Co., has adorned his new office in a manner befitting the name of his wheel. Outing. The walls are adorned with deer heads, snowshoes, rifles, fishing rods and the like, while the floor is carpeted with bear-skin rugs. Hay is reputed an adept with both gun and rod, most of his office adornments being trophies of his expeditions.

PRINTED IN THREE COLORS.

During the Chicago and New York shows Hay & Willits will issue their "official organ," the Outing Bulletin, daily. It will be printed in three colors, and contain all the "show gossip."

UNITED FOR WRENCHES.

J. H. Wallace and P. B. Canfield have formed a copartnership and are fitting up a factory at Cortland, N. Y., for the manufacture of a newly patented cycle wrench.

COLLINS'S GOOD CATCH.

As a result of A. L. Collins's last visit to New York, the well-known firm of Hermann Boker & Co., No. 101 Duane street, will control the sale of the Chas. H. Sieg Mfg. Co.'s Windsor bicycles throughout the States of New York, New Jersey, and Pennsylvania. It should prove a profitable arrangement to both parties in interest.

GOT TWENTY FOR ONE.

Truly, the Dunlop tire was an Irish good thing. The Emerald Isle invested first and last a total of \$1,300,000 in the Dunlop stock, receiving back on this investment, up to date, \$27,728,015. There have been any number of investments which have paid slightly smaller profits than these.

MAGNETIC ALUREMENTS.

With the new year came a change of policy in the Royal Cycle Works, of Marshall, Mich. Instead of conducting a system of agencies, the Royal people will hereafter market their product wholly through jobbers, which means a great lessening of accounts, and those few big, well-backed concerns as a rule. Mr. Palmer, representing the company, is in the East, and as his allurements are magnetic, his visit can scarcely fail of substantial results. The '97 Royal is one of the allurements, and is as ever a likely looking mount well abreast of the times. A new oval fork crown, improved crank hanger, D tubing and all other latter-day wrinkles are incorporated in the wheel, which is finished as desired in either black, maroon, olive green or aluminium.

Morrison's Bicycle Ice Creepers, for Winter use. Sample, 20 cents. Facts free. W. T. S. Morrison, M'fr, Cornish, Maine.

FOR SALE,

A Bicycle Plant Outfit, consisting of New Machinery in use but a short time, special bicycle tools, enough tubing to make 2,500 wheels, and about 100 new wheels, crated for the market.

The right party can buy this stock low for cash and get immediate possession.

BICYCLE clubs, send list of newspapers and magazines wanted and get my prices; I can save you money; lowest rate for any periodical. Hoag's Subscription Agency, 63 Hooker Ave., Poughkeepsie, N. Y. Kindly mention The Wheel. 1193 P.

WANTED.

Position in a good bicycle house, sixteen years' practical experience both wholesale and retail, by a young man of original ideas and executive abilities. One with a wide reputation as a "hustler." Will correspond with bona-fide bicycle houses. Address
MIDWOOD, care of The Wheel office.

IN THE WHEEL BUILDING,

Corner Chambers Street and West Broadway, handsome store, suitable for wholesale or retail bicycle store.

Address

TYSEN & TOTTEN,

24 Dey Street, New York.

STAR BICYCLE ENAMEL.

It will take you but a few minutes to re-enamel your bicycle, giving it the appearance of a new wheel, from which the enamel will neither chip nor crack, by using the ready-mixed "Star Bicycle Enamel." Retail price, 25c. per can. Anyone can apply it. 28 different colors. Send for color card.

GERSTENDORFER BROS.,
17 Barclay St., New York. 67 Lake St., Chicago.

THE BEST OILER IN THE WORLD.

For High-Grade Wheels.

25c. each.

For Medium-Grade Wheels, 10c. each.

CUSHMAN & DENISON, 172 Ninth Avenue, - - - NEW YORK.
Kindly mention The Wheel.

EMPLOYMENT COLUMN.

Advertisements in this Column Free.

Patrons of this column will please notify us when they desire notice withdrawn.

SITUATIONS WANTED.

Wanted—Young man, 20, well informed as to different makes of bicycles and sundries, experienced in repairing tires, etc., desires position in bicycle saleroom, repair shop, or factory; references given. L. M. N., Box 29 Lebanon, Conn.

Salesman with progressive ideas desires a position as manager or salesman; A1 references and particulars at interview. I. T. Frost, Valley Stream, N. Y.
A Hollander, five years employed in several bicycle shops of this country, intending to make a trip to Europe, wants to represent a bicycle, tire and sundries manufacturing company. Address M. M., care of H. Fis, 238 Sherman Street, Buffalo, N. Y.

Wanted—Monitor lathe and screw machine man; A1 in any capacity; at present engaged; desires change; large experience and up to date on bicycle work. Monitor, care of The Wheel.

Man about 30, who has spent his life in the bicycle trade, who is competent to design, and is equally good at the mercantile end, is anxious to obtain a first-class position; present the highest references; is only on the market because his concern has gone out of business. Address C. B. M., care of The Wheel.

A thoroughly competent and experienced bicycle instructor is open to engagement in Greater New York or vicinity; highest credentials as to character and ability can be given; terms reasonable. Address N. O. W., Box 295, South Orange, N. J.

Young man with seven years' cycle experience is open for engagement; has had charge of both workshop and saleroom; thoroughly capable and up to date; best of references or bonds. C. F. W., care The Wheel.

Wanted—By a young man (30) with good connections, a position as inside salesman with a good reliable bicycle house in the East. Address A. Fleming, 204 West 38th Street, New York City.

General foreman wants a change; fourteen years' practical experience in the cycle trade. E. Smith, 108 North 20th Street, Philadelphia, Pa.

Wanted—A situation by a young man 21 years old; three years' experience; best references. Address Box 47, care The Wheel.

Position wanted as salesman for bicycles or sundries; four years' experience; good connection and best of references; have no objection to go to States. "Tourist," care The Wheel.

Bicycle mechanic, thoroughly posted in the manufacturing and repairing of wheels, is open for engagement as manager, superintendent or foreman; unexceptional references. Address Valpey, 917 Turner Avenue, Chicago.

A young man with several years' experience in charge of help in factory, good draughtsman and designer of bicycles, wishes an opportunity where his talent will be appreciated and a future secured. M. H., care of The Wheel.

Position wanted as assembler and wheel builder; no objection to leaving city. C. E. Haynes, 182 E. 78th St., New York City.

Experienced cycle mechanic, thorough in all branches, desires position with good firm; has occupied position as factory superintendent, also for many excellent references; fifteen years' experience. Address F. J. M., care of The Wheel.

Situation wanted by expert electro-plater; fifteen years' experience; have had six years' charge of high-grade bicycle polishing and plating; have an absolutely rust-proof nickel, 1-3 solution, 1-3 cost of old process. The Wheel, No. 26.

An exceptional opportunity is offered a first-class house to connect with a first-class man, acquainted with all departments from manufacture up; has had special experience as superintendent and advertising manager; is fully posted on details and on generalities; would like to locate in New York City or some large New England city. Address, with full particulars, R. Y. A. P. O. Box 444, N. Y. City.

Wanted—To open Chicago store for large factory; by the best known and one of the oldest managers in Chicago; large established trade. Address C. R., care The Wheel.

Young man, now in bicycle business for himself, desires a position as manager or salesman for first-class bicycle house. Address M., care of The Wheel.

Enameler—A practical enameler (in all colors), stripper and decorator, desires a position as foreman, or otherwise, in cycle factory; first-class reference. Address W. C. L., care of The Wheel.

Wanted—Position as foreman of general machine room in bicycle plant; six years' experience. Address C. Ashley, No. 1315 Oakwood Avenue, Toledo, Ohio.

HELP WANTED.

An active man who has had experience in the bicycle line as indoor salesman; one who can make, himself generally useful in our bicycle department. Apply at once to I. S. Ventres, 107 Chambers Street, New York.

Wanted—Young man with knowledge of bicycle and sporting goods business, who will take a small amount of stock in an incorporated company; steady position; splendid opportunity for a bright, energetic man. Address F. R. R., care of The Wheel.

Wanted—A first-class nickel-plater, familiar with bicycle work; competent to take charge of plating and polishing plant in bicycle factory near New York; give references and experience. Address R. M., care of The Wheel.

Wanted—Foreman who thoroughly understands the manufacture of seamless bicycle tubing, and who is systematic. Address, in confidence, stating experience and references, Warren, care of The Wheel.

Salesman wanted for January, February and March. The Phillips Mfg. Co., 307-309 West Broadway, New York City.

Wanted—A man who can take charge of rent bicycles; as the work is light, would take a man who is seeking a good climate for lung trouble. Address El Paso Cycle Co., P. O. Box 406, El Paso, Tex.

Wanted—Experienced salesman with good trade connections to represent, on commission basis, Eastern manufacturers of bicycles and bicycle fittings; state with what territory familiar; references required. Address T. C., care The Wheel.

VOL. XVIII., No. 23.

NEW YORK AND CHICAGO, JANUARY 22, 1897.

WHOLE No. 465.

RELIEF FOR THE RETAILER.

The Trade Buffer May in Future Have Less to Contend With—A Movement That Way.

While bicycle and tire makers nominally guarantee their wares, every man in the trade knows that a good deal of the brunt must be borne by the agent. He acts as a buffer between maker and consumer, and in the aggregate the acting usually costs a snug sum in the course of a year. To meet competition and to hold his patronage the agent must gratuitously make numerous repairs and do a deal of tinkering, much of which would properly come within the maker's guarantee, and would be done by the maker if the owner of the tire or wheel would but possess his soul in patience, which is seldom the case.

The Rubber Tire Association has apparently recognized this state of affairs, and, as far as in their province, are seeking to afford the retailer relief. The six months' guarantee now in force was a step in that direction, but the end is not yet. President Theodore A. Dodge already has the 1898 warranty in mind, and is seeking repairers' opinions, which will be submitted and considered by the Tire Association when the subject of guarantees is next considered.

The opinions which Colonel Dodge seeks are outlined in this series of questions:

1. Do you favor a guarantee on bicycles? If so, for how long a time and why?
2. Do you favor a guarantee on tires? If so, for how long a time and why?
3. Would you prefer to have no guarantee, and to have repairmen adopt a uniform price for repairing tires? If so, what price?
4. What additional amount ought to be charged for repairing tires when you have to take them from the rim and replace them after repairing?
5. What additional amount ought to be charged if the bicycle is brought in and you have to take off the rear wheel as well as the tire?

NOTE TO THE COURTS.

Vice-Chancellor Pitman has handed down his decision in the case of Warwick vs. Stockton. He refuses the application for the appointment of a receiver, has decided that no co-partnership exists, and that the plant and property belong exclusively to Dr. Chas. S. Stockton. The case will now go into the courts.

CANADA'S ANNEXATION.

Evidently this is the season for "tire deals." It is equally evident that the New York Tire Company does not propose to lag while the deals are going on. They themselves have been handling the cards, and, although the hand was dealt some time since, it has just been exposed to the public. It makes plain that New York and Sampson tires will hereafter figure prominently in Canada. The compact was consummated with the Canadian Rubber Company, of Montreal, the largest concern of the sort in the Dominion. They have not only been licensed to manufacture the tires, but have been equipped with a practical duplication of the New York Tire Company's plant, and will employ all their plans and processes.

VALUE OF A NAMEPLATE.

Springfield, Mass., Jan. 18.—The case of Steele & Johnson against the Hendee & Nelson Manufacturing Company, of this city, was tried in the Superior Court, last week. The Hendee & Nelson Company contracted with Steele & Johnson for a quantity of nameplates, which they claimed were so delayed that they had to contract elsewhere for nameplates in order to protect their business. The Waterbury firm claimed that at this juncture Hendee & Nelson notified them to await further orders, and that as no orders were forthcoming, they drew on Hendee & Nelson, who refused to honor the draft. Suit was then brought by Steele & Johnson. The jury returned a verdict for the defendant.

CHANGED ITS NAME.

Although it was known some time since that the change would be made, the Bolte Cycle Mfg. Co., of Milwaukee, this week gives formal notice of a change of title to League Cycle Mfg. Co., which is consonant with the name of their wheel. The League people are now fully established in their new factory, and every department is working smoothly. Fifty wheels a day are being turned out, but if necessary this number can be easily doubled.

JACKSON'S ACQUISITION.

Jackson, Mich., Jan. 15.—The council will lease part of the old Purifier plant to Henry A. Christy, manufacturer of the Christy bicycle saddle, on condition that he employ regularly 75 men. Mr. Christy also agrees to remove the entire plant of the Derby Bicycle Company, now located at Chicago, employing 300 hands.

WANTS NO OFFICE.

President Coleman Decides That He Will Not Even Be a Board of Trade Director.

Many in the trade were particularly pleased over the announcement made in THE WHEEL last week, that Mr. R. L. Coleman would accept a renomination as President of the Board of Trade, provided it would come to him without opposition. THE WHEEL strongly advocated the re-election of Mr. Coleman, because of the great success he has made during his term as president of the trade's governing organization. The editorial in THE WHEEL supporting Mr. Coleman was put into type after an interview held with him by a WHEEL representative. Mr. Coleman now states that he will not accept any position in the Board of Trade, not even the office of a director, and that his position was misunderstood at the interview in question.

With R. L. Coleman positively out of the field as a candidate for President of the Board of Trade, the gossip in regard to his successor is more intrinsically interesting. Among the candidates are R. P. Gormully, of the Gormully & Jeffery Mfg. Co.; C. W. Dickerson, of the Sterling Cycle Works, and George H. Fisher, of the Gendron Wheel Co. Mr. Gormully might have been elected last year had it not been for his illness. This year he is in much better health and will be a strong candidate. Mr. Dickerson has always been a close attendant at the Board of Trade meetings, and is very familiar with the workings of the Board of Trade. The candidacy of Mr. Fisher has gone to the extent that the Board of Directors of the Chamber of Commerce of his city held a meeting on January 12 and endorsed Mr. Fisher as President of the National Board of Trade, and the Secretary was instructed to write each member asking for their support and influence.

CREDITORS GOT TEN PER CENT.

Milwaukee, Jan. 14.—The court has accepted the final account of Max Ascher and discharged him as assignee for the Moore Cycle Company. The sale netted \$9,038.22, of which the court allowed Assignee Ascher \$1,300 as his compensation and \$1,200 for attorney fees, leaving a balance, after payment of minor expenses, of \$2,165.88 for distribution among creditors with claims aggregating \$21,233.68. The dividend was 10 1/2 per cent.

NO ARTIFICIALITY.

Prefer Human Power For Pacemaking—More Than \$1,000,000,000 For Cycle-Trade Shares.

London, Jan. 9.—The question of employment of motor-pacing in contests under N. C. U. rules or in record trials is causing considerable discussion here at present, and there is every likelihood that we will maintain our reputation for conservatism by refusing to admit the very artificial if convenient aid of the new locomotive on our race paths. The immaturity of the machine is the chief plea against it, while lack of control and also speed is alleged. So far as the latter points are concerned, I am convinced that there are pacing motors against which neither of these complaints can be urged.

A few days ago I witnessed at Catford track a trial of the Pingaut electric motortandem, manned by J. W. Allard, the old-time N. C. U. champion, and another rider. After a couple of preliminary spins a test trip was entered on, and a mile was ripped off under 1.45. Then a five-mile spin was taken, and the times clocked were:

World's Cycle Records.	
1 mile . . . 1.46 3-5	1.41 Platt—Betts
2 miles . . . 3.31 4-5	3.39 1-5 Chase Brothers
3 miles . . . 5.18 4-5	5.28 3-5 Chase Brothers
4 miles . . . 7.06 3-5	7.21 4-5 Chase Brothers
5 miles . . . 8.56	9.13 1-5 Chase Brothers

The machine, which was a tandem on ordinary Humber lines, built by the New Beeston Cycle Co., was fitted with a 24-cell primary battery, and with dynamo complete weighed upwards of 650 pounds. It is capable of keeping up a maximum speed of 35 miles for 60 minutes without recharging, and seemed quite easy to manipulate, although the great weight and speed required a powerful man at the helm. The rear rider manipulates the electric current, and can moderate the speed by a resistance coil from 5 to 35 miles an hour. In order to provide a means of propelling the machine in case of breakdown or failure of current, the machine is also chain-gear, and the riders pedal as the machine progresses. They pedal a bit, but only in order to steady the steering.

The Board of Trade returns for 1896 are out, and I find that, despite all opposition from your side, as well as our nearer and, perhaps, dearer friends on the Continent, the export business of the English cycle trade has gone on increasing as steadily as its best friend could wish. Here is the rate of progress:

1892, £915,896; 1893, £1,033,896; 1894, £1,200,913; 1895, £1,386,420; 1896, £1,860,972. This shows a 24-per cent increase on last year's returns, and when we look at the fact that complaints of non-fulfillment of contracts were general in view of home demands, it is only fair to say that the result is highly satisfactory. As in previous years, France will probably turn out to be our best customer, and it will not surprise me if after all is said and done America does not rank as our second-best customer. In 1892 the States took from us cycles and parts up to the value of £200,201. In 1894 this dropped to £70,660, but in 1895 it came up again and rose to £162,437.

The Joint Stock figures for the past year show that, like the cycle exports, the public

holdings in the cycle trade has increased greatly during the last three years. The figures are: 1894, £1,435,100; 1895, £3,238,000; 1896, £24,547,315. The figures for 1896 for the United Kingdom are apportioned as follows: England, £24,547,315; Ireland, £171,625; Scotland, £319,000.

When I point out that the total amount subscribed for all joint stock companies last year amounted to £275,000,000, the proportion given to cycling is actually heavier than any other save the mining and manufacturing lines.

The next flotation which is to be made is The Rudge-Whitworth, Limited, France, with a capital of £150,000. This is to be the first of a series of similar flotations, which will include Austria, Italy, Germany and Russia. The much-delayed flotation of the J. B. Dunlop Fittings Co. is due next week, and I believe that its appearance will be the signal for the commencement of a legal struggle over the relative rights of the new concern and the John Griffiths Corporation to the use of the name of Dunlop for a bicycle. Calcott Bros. will also soon appeal for public subscription. The firm has had a great year, and undoubtedly have a large trade in medium-grade machines.

I believe that I am correct in surmising that the much-boomed H. J. Lawson has had a severe set-back and is now on his ebb-tide. It is of course a case of vaulting ambition o'er-leaping itself, but all the same it will bring a lot of trouble and no little financial loss in its train, if what I hear is true. The attempted issue of 250,000 £1 shares in the British Motor Syndicate at a premium of £2, some weeks ago, proved a terrible fiasco, and as it was a move to obtain money to push the new industry, which is said to be in want of fresh capital, it is very evident that there is certain to be a crisis before long. If any disaster occurs to this company it will be a bad thing for the motor car investing public, though no doubt a good thing for carriage builders, who are holding off because of the alleged monopoly in motor patents claimed by the company.

The "Statist," a leading financial journal, has devoted a page recently to show that Mr. Lawson is not quite so clever as his friends suppose him to be, because at the recent meeting of the Beeston Tire Co. he refused to give particulars of the manner in which certain profits gained outside the trading proper of the concern had been secured. He said that it would be inimical to the interests of the company to give the information asked, although he should have been aware of the Joint Stock Companies' Registry, which is a government institution, at which every agreement on behalf of a company must be registered and filed within a certain specified time under heavy penalty, and which is open to inspection by payment of a small fee.

By inspecting that Registry the "Statist" has become possessed of the information denied, which it now publishes. It appears that Mr. E. T. Hooley secured an issue of 8,000 new £1 shares in the Beeston Tire Co. in exchange for 65,000 £1 shares in the Humber Pneumatic Tire Co., which has not yet appeared, yet shares in kindred companies have only appeared in the Beeston balance sheet at £33,276. It also states that of the purchase price of £500,000 for the New Beeston Cycle Co. the vendors had to take up no less than £426,280 in fully paid-up shares.

FOMENTING TROUBLE.

Those Who Helped Talk One Organization To Death Making Their Voices Heard Elsewhere.

When the Cyclists' Federation, after a meiotic existence, had been talked to death, most of the doctors, lawyers and other luminaries who made the organization practically a debating society, cast their lot with the newly formed L. A. W. Consulate, composed mainly of unattached League members. They are there now, that is, all except the fiery Dr. Ottolengui, who got mad and resigned. The "fashion-plate of the Michaux Club" presides over the Consulate, and, as in the Federation, he is always a vehement and picturesque figure. But despite his picturesqueness and vehemence, there are indications that the Consulate is being infected by the same microbe that undermined the Federation. The doctors and lawyers are too fond of the sound of their own voices, and slowly but surely two factions are being developed. They will lock horns for the first time at the annual meeting this week, when an effort to unseat Townsend and his cohorts, which has been quietly making, is due for a public appearance. Some fuel has been added to the smouldering fire by a petty attempt to reject the application of M. L. Bridgman, once President of the Cyclists' Federation, who, in that capacity, incurred the ill will of some of the over-zealous and talkative gentlemen now in power in the Consulate. The manner of election to membership in this latter organization is most mysterious, and known principally to Messrs. Townsend, Belden and Frobisher. All the average member knows is that he paid 50 cents and a few days thereafter received a membership ticket. Recently Mr. Bridgman, who is a trusted member of the Pope Mfg. Co.'s staff, and who was a wheelman a decade before most of those in the Consulate became wheelmen and learned to call a bicycle a "bike," was induced to advance the 50 cents membership fee. Everything seemed lovely, when by the grapevine telegraph, he received a gentle hint that it might be well for him to withdraw his application. Someone espoused his cause, and some newspaper men got wind of the occurrence and began nosing about. The "nosing" and prospect of publicity thoroughly disturbed the inner circle. There was a great fluttering about and a great effort made to keep the matter quiet. But for all of that it is now public property, and the "inner circle" is hearing nothing pleasant about itself.

ON THE TOP WAVE.

An action which was taken legally against a tenant in the same building occupied by the H. F. Schlueter Cycle Manufacturing Company, of Cincinnati, O., was in some manner garbled and illy worded in newspaper reports so as to be confounded with the Schlueter Company themselves. The Schlueter Company have not gone into the hands of a receiver, and ask no better condition for themselves than their present thoroughly healthy state, which extends even to the discounting of all their bills.

Some of the things a man leaves unsaid at the time of accident to himself or his wheel do him great credit.

FRAGILE AS POTTER'S CLAY.

MR. POTTER is being damned unconsciously by some of his own supporters, One of them, the same that snarled at THE WHEEL two weeks ago, because we questioned Mr. Potter's good faith, now comes forward and, endeavoring to explain his anti-racing position, says that it does not, and never did, believe that he was sincere in his utterances and writing on the subject.

The Louisville Courier Journal, whose cycling editor, Geo. E. Johnson, should certainly know what he is writing about, relates another instance of Potter's "good faith" and sincerity! At Baltimore the Kentuckians approached the New York chief to enlist his aid in securing the National Meet for Louisville. The astute Potter, with an eye to his own interests—he was in charge of the good roads meeting and banquet—responded, according to the Louisville paper—and everyone who knows the New Yorker will easily recognize him—"The delegation from a city inviting the meet sending the largest number of persons to the good roads meeting, and to the good roads banquet, Monday night, shall have New York's vote. Louisville had twelve persons present at the meeting—Toledo five; Louisville had five present at the banquet—Toledo had three. Yet Toledo got New York's vote solid."

More than two months ago when THE WHEEL asked Mr. Potter bluntly if he would be a candidate for the League presidency,

he concluded an ingenious reply with the injunction: "Say that I am not a candidate, but don't say that I won't run." At the very moment the Potter press agents were dilating on his pledge to Mr. Elliott, and remarking that Mr. Potter's word was as good as his bond! And possibly they knew whereof they wrote.

ABOUT LEAGUE CLUBS.

ONE of the local League clubs has placed itself on record as favoring Philadelphia as the place for the L. A. W. meet, and instructed its representatives to so advise the powers that mold the votes of New York's National Assemblymen. Of course it is doubtful whether this comparatively wee small voice will have any effect on the vote-barterers who are manipulating things under the title "Campaign Committee," but for all that it is a good sign and points a way other League clubs should follow. The Assemblymen love to talk of "voicing the sentiments of our constituents," but as a matter of fact the "constituents" have small means for expression of any kind. The League club is really the only outlet, and if more of them would make themselves heard on matters of interest and public discussion, it would be the better, and serve to mitigate the peanutishness of League politics. League clubs have more power for good than they realize. They are free lances, and their representatives cannot be affected by the whims and displeasures of those in power in the various Divisions. These authorities can largely dominate who shall constitute the Division Board of Officers. They appoint the nominating committees, and usually "know their men," and he who during the previous year had refused to fall into line, that is, who had had the hardihood to oppose any of the official ideas, is easily crowded out and left unrenominated. These authorities, however, cannot very well reach or influence League clubs, and if the clubs realize it, they can be of real service. They should begin to realize it. They should make themselves heard oftener. In New York there are a number of League clubs. There is no shadow of doubt that 99 per cent of their membership would have the L. A. W. meet held in Philadelphia. Very many of them can and will attend. If it is held elsewhere, the attendance from New York will not amount to a corporal's guard. The New York authorities know this full well, but they are more interested in playing politics and deciding questions, not on their merits, but by a barter of votes.

TELL YOUR OWN STORY.

NOT even a good thing will bear repetition at the hands of people lacking in originality. For example, the man who

claimed to "see them everywhere" was original; he had a "good thing," and he reaped the reward thereof. But the repeater who comes along with "see them everywhere," prefixed with "don't," "might," "should," "must," "will" and such like brilliancies, simply advertises the originator's goods and "good thing," while failing to accomplish the same thing for the imitator's wares or wisdom.

When some clever man hooked on the public's eye with "See that hump!" he scored a win, but when the "also rans" trailed along with "see that——" for everything from horse-shoes to hairpins, they accomplished what? Just nothing, that's all.

There are so many smart men now in charge of cycle advertising, so many decidedly clever men employing them, and so many really original methods of calling attention to the good points of a wheel, part or sundry, that it seems strange this resorting to adaptation has ever grown to the extent it has.

We believe that imitative advertising defeats the very object for which all advertising is primarily intended, that is, the attracting of the public's favorable attention to the thing advertised, whether it be a harpoon or a coal hopper. The public is quick to take offense, often doing so where offense is not intended, and it looks upon this unoriginal appeal to it as a personal reflection upon its reading and reasoning powers. The wise man, and the shrewd one, will do nothing in his advertising to create this feeling, therefore original appeals should be the only ones made to the public.

AS TO "ENDORSEMENTS."

IT may be that certain prominent wheelmen and League racing officials are better posted, and more "on the inside" regarding the aims and methods of the mysterious National Cycle Racing Association than the public is, when these aforementioned prominent and official ones rush into print with unqualified endorsements of the mysterious N. C. R. A.

It may be that this new Boston-conceived organization is to bring about the millennium of racing; it may be that it is all its prominent and official endorsers claim it to be; it may even come to pass that the League will be called upon to thank the N. C. R. A. for the load the N. C. R. A. so generously transfers from the League's shoulders to those of this new-born Boston stripling. All this and more may come to pass, but in the meantime—well, endorsements are not in order, at least not until the N. C. R. A. comes into the open and declares itself.

When one notes how anxious the new organization is to declare that it is not antagonistic to the League, that it wants to help the older organization, and then compares

all of these protestations with the secrecy of method and object maintained by the new organization, the result will be that the cautious man will—well, not unreservedly endorse the National Cycle Racing Association, that is, unless, perhaps, he be on the “inside,” as evidently are the prominent wheelmen and League racing officials above referred to.

DEFEAT THE WRECKERS.

NEITHER Mr. Potter, his press bureau, nor yet his famous “Campaign Committee,” have been able to reply to the proofs THE WHEEL has submitted as to the belief of Mr. Potter, his Division organization, the head of his press bureau and the leading spirits in his “Campaign Committee,” that Mr. Potter and these, his abettors, are still determined to do everything in their power to rob the League of its control of racing.

As a straw which shows the blowing of the wind in this direction, it may be noted that the new Boston-bred racing organization has met with the warmest kind of endorsement from prominent Potterites, who are wont to speak always by the card. Further, the new organization has adjourned until after the date of the annual election of the League, when it will be known whether Mr. Potter and his party are in power and prepared to throw racing to the dogs, or to any old place, so long as it is no longer in League hands.

A vote for Potter is a vote for the L. A. W.'s abandonment of racing. There is no denying this, not even by Mr. Potter, his press bureau or his “Campaign Committee.”

Every member of the League who does not believe in such a cowardly and suicidal policy should vote and work against the triumph of Potterism and the principles it stands pledged for.

TIME TO STOP.

IS the League of American Wheelmen doing its duty to cycling, the public or itself by lending its name to the barnstorming aggregations of alleged racers which have of late raided the back country towns? We cannot believe so. Nor can we believe that racing is safe in the hands of gentlemen who come from the prize ring and the baseball field to promote “contests” in which alleged racing men are “beaten” in ten-mile “races” by their “trainers.” This opinion, too, with the full knowledge of the fact that a prominent League official and his fellow townsman, a crack sprinter, are reported to have been interested in the barnstorming experiment. Mr. Gideon, we believe, is too honest a man, and too true a sportsman, not to see that he is being used by the “dough hunters” in a way which reflects no credit on his office or the organization he represents.

Mr. Potter's work for the League has not been wholly a labor of love, as his press bureau would have the public believe. Within the past five years he has drawn from the treasury, in salary and “allowances,” nearly, if not quite, \$20,000 in cold cash. In addition, he has found salaried berths and “allowances” for at least four of his cronies whom he brought out of well-earned retirement when he was elected Chief Consul of the New York Division.

An unmistakable demand for convertible tandems is in the air, and those in which the removable bar is smoothly jointed are likely to prove decidedly popular. We believe that those manufacturers who make them will find it profitable to cultivate the demand and push the sale of “convertibles.”

Diplomacy consists largely in backing down with dignity when you have gone too far. Mr. Potter will exhibit diplomacy in backing down, with dignity or otherwise, from his anti-racing position of a twelve months since.

If a woman would spend as much time developing her knowledge of cycling as she does trying to save her complexion when riding, men would have to organize to maintain their hold upon wheeling.

“Do what you can to prevent the shipping here of low-grade machines, it will kill the United States trade with this country.”—Extract from a personal note from Australia, which requires no comment.

The man with the most experience in making cycle show resolutions each year turns out the poorest quality of the article when the time for keeping them arrives.

In the rounding out of a successful racing career, Ambition is Work's most cheerful companion; but they do not rank equally as collateral at the bank of Speed.

Some who pose as prophets in cycling can read its future as well as they can read its past; and their prophetic souls are constantly leading them astray, at that.

One is not long selling bicycles until he has learned that the mind of man runneth not the contrary so much as the mind of woman.

Truth is mighty and will prevail; although, at times, the Vanderbilt building's press bureau seems to be getting the best of the argument.

The lack, and not the love, of money is the root of most evils, from the fracture of amateurism to the scramble for League office.

DEFENDS HIS AMENDMENT.

EDITOR OF THE WHEEL.—Your remark anent the amendments that I have proposed to be acted on at the National Assembly, leads me to request space in your columns to elucidate them.

I think the editor of THE WHEEL was present at the meeting in Buffalo in 1885 when I proposed an amendment to admit professionals to the League. He may remember that I got one vote for my measure in an assembly of more than a hundred.

We must admit that there is a strong feeling now, as there was then, that it is not expedient to admit professionals. A great many members fear that the pros. will get possession of the L. A. W. and run it altogether in the interest of racing.

Nowhere is this feeling stronger than in New York State.

My proposition takes a middle ground, and, while it admits the pros., it does not give them a vote in the government of the body.

I propose to make them associate members.

Another point to be considered is the financial one.

If we are to make rules for and govern professional racing, we can do it in the best way only by an outlay of money. If professionals contribute money to our cause in the way of dues they have the right to expect that a large portion of the money they pay in shall be expended in the interest which they particularly affect. Professionals do not care so much for road books, for maps, for highway improvement, and the many things that are valuable to the amateur.

They do want protection on the track, and a management of affairs that shall give them the best results.

If now, as I have proposed, we give that portion of the dues that goes to the Division in the case of the amateur, to the Racing Board in the case of the professional, what may not be done?

The Racing Board will have a good working fund at their disposal. They can pay a good salary to the chairman of the Racing Board and something to the hard-working subordinates. They could hire an official referee, and they could do a thousand and one things in the interest of the racing man.

If we are going to take the professional into our family and make him pay admission, let us take good care of him and let him see what he can accomplish by co-operative endeavor.

ABBOT BASSETT.

AMONG THE TAR-HEELS.

During the present session of the State Legislature, the North California Division propose to introduce the following bill:

“Section 1. Luggage may consist of whatever the passenger takes with him for his personal use and convenience, according to the habits or wants of the particular class to which he belongs, either with reference to the immediate necessities or to the ultimate purpose of the journey. No crate, cover or other protection shall be required for any bicycle carried as luggage, but no passenger shall be entitled to carry as luggage more than one bicycle.

“Section 2. This act shall take effect and be in force from and after its passage.”

MOUTH-MADE MATCHES.

Buffalo, Jan. 18.—An outsider, accidentally overhearing the animated discussion between "Pat" Powers and "Ed." Plummer, during the frosty meet at the Arsenal on Friday night, would naturally imagine that they were discussing the merits of prize-fighters. But closer attention to the talk would show that they were not. Plummer merely had an idea that he had a rider on his string equal in speed to E. C. Bald, who, somehow or other, has become rather closely identified with the baseball-pugilistic combination of managers who have been starring Plummer's string of foreign speed merchants, rubbers and attendants, and being exasperated by the cold reception of his men, talked in this way:

"My men are crippled, cut and bruised and the people should not give them the icy grasp."

"Any way," retorted Powers, "your men are not training, and could not expect to defeat the local men. They are not sprinters, but long-distance riders. Tell the people so and it will be all right."

"Nonsense," said Plummer, "I have a man right out on the track who I will back in a sprint against any of them."

"What one?" asked Powers.

"Why, Warburton, Jimmy Warburton," replied Plummer. "I'll back him for a thousand pounds for a race when we get back home."

"Well," said Powers, "I would put Bald against him if he goes to France. I have not the money with me now but I will put up \$1,000 before you leave for home."

Plummer said that the proposition was satisfactory to him. The amount was £1,000 or \$5,000. "But," said he, "Bald may not go over to France."

"I'll see that he does," said Powers: "and if he does not I will forfeit the \$1,000."

The next night Bald, towering several feet over the rotund little form of Plummer, asked if he wanted to post a forfeit immediately, to race for anything from \$500 to \$5,000. Bald also declared that when Plummer had made a similar challenge at Washington he had backed down when confronted by the money.

Plummer now looked surprised, and declared that the challenge had been aimed at Teddy Goodman, rather than Bald. Then again Plummer had to return home and do a lot of other things before he could make a match.

Bald said that he would race either Warburton or Tom Linton for a mile in Europe, and he added that he expected to go. He would not go a longer distance.

The English manager did not warm to any of the propositions. Tom Linton drew near, and he and Bald fell into a discussion regarding the nature of the proposed race. Linton wanted each man to have his own pacemakers. Bald demurred. He said that both racers could use the same pacemakers. "Otherwise," said he, "it would be a race between the pacemakers, and it is 1,000 to 1 that you would have the best men, owing to your experience on the other side."

Linton smiled, and said that nothing could come of a proposition to race with the same pacemakers on the other side of the water, and, like most all match controversies, the matter then dropped.

THEY MUST LICK PENNSY.

Although the Pennsylvania Railroad intends to fight the New Jersey Division tooth and nail in its efforts to secure the passage of the free-bicycle-baggage law, the officers of the Division are hopeful of success. The bill has been indorsed by the Associated Cycling Clubs of New Jersey, and other State organizations, and individual cyclists have been urged to appeal directly to the member of the Legislature from their district by letter, urging their support of the bill. On Monday Chief Consul Kireker visited Trenton with a draft of the bill to be introduced. It reads as follows:

First.—That any person who shall have purchased a ticket issued by any railroad corporation entitling such person to transportation on its railroad and ferries as a passenger, shall have the right, by virtue thereof, to the transportation, on the same train or boat with such passenger as baggage, of one bicycle, to or from the places designated in such ticket, without further or other payment to the railroad corporation therefor. And no passenger shall be required to remove any ordinary or usual bicycle bell or lantern from such bicycle, nor to crate, cover or otherwise protect such bicycle.

Second.—Any railroad corporation refusing to transport bicycles or refusing to accept the same for transportation as baggage, in violation of the next preceding section, shall forfeit and pay to such passenger the sum of \$10 for each and every offense, to be recovered in an action of debt in any court of competent jurisdiction.

Third.—And be it enacted that this act shall take effect immediately.

SAILING OF THE CHAINGANG.

Plummer and his aggregation of foreign riders and trainers sailed from New York for England on Wednesday. While he declared he had nothing to complain of, his visit was anything but satisfactory. Outside of Hale's win in the six-days race, his men accomplished nothing. Tom Linton claims to have undertaken the trip solely to ride against Michael, and expresses himself as greatly disappointed over the failure to arrange a match with the little Welshman. In the only race of any importance in which he took part, the ten-mile event at Madison Square Garden, he was defeated by Starbuck. The short starring tour undertaken by the foreigners, which terminated at Buffalo disastrously to the managers, who at one time imagined that they had found a good money-making scheme, was much in the nature of a farce. Contests in armories on flat floors are not conducive to anything like sport. Hale remained behind for the coming Chicago six-days race. The object of the trip was to advertise the Simpson chain.

TRYING TO IMPROVE.

The New York Central & Hudson River Railroad is fitting its baggage cars with a new rack for holding bicycles. The wheel is held against the side of the car by a hardwood block and the handle-bar is clasped by a steel spring. The blocks are arranged in alternating rows, so that bicycles may be placed one foot apart without interference. By this arrangement, it is thought, saddles, enameled and nicked parts are fully protected and the tires only exposed to any risk of damage. It is necessary, however, to remove lamps, as they would overflow.

A dull and sickening thud was heard. It wakened everyone in the house. The tired postman had let fall the subscriber's copy of a Western cycle paper's holiday number.

TRACK OWNERS COME TOGETHER.

Representatives and owners of the principal and fastest cycle tracks in the country met at the Everett House, this city, on Saturday night last, and discussed behind closed doors the much talked-of project of forming a track owners' association. The session was a lengthy one, lasting well into Sunday. It was given out that much of the business was of a private nature, but pains were taken to have it announced that the proposed organization would not encroach on the workings of the League's Racing Board. It is probable that no direct movement will be made until the National Assembly convenes and the League decides the questions of admitting professionals and Sunday racing. A committee on rules was appointed consisting of Henry E. Ducker, of Boston; L. H. Adams, of Springfield, and L. H. Rich, of Bridgeport. After much discussion it was agreed to take no further steps until this committee reported at the Everett House on January 30th. Those at the meeting and the tracks they represented were: Charles River Park, E. C. Hodges and Henry E. Ducker; Hampden Park, C. L. Adams; Manhattan Beach track, Captain Ryan; Pleasure Beach track, of Bridgeport, L. M. Rich; Philadelphia, O. S. Bunnell; Louisville, R. F. Pelouze; Asbury Park, S. Kirkbride. W. J. Corcoran, of Boston, with whom the idea originated and who called the delegates together, had proxies from California, Washington, Texas, Rhode Island and other states.

The scope of the association as given out is to protect track owners, eradicate many of the abuses connected with cycle racing and perfect a circuit on the lines in vogue in the National Baseball League. It is proposed to handle professional riders without gloves, do away with the practice of demanding bonuses and establish cycle racing on a business basis, and run it in such a manner that the promoters will not be compelled to cater too much to the racing men at the expense of the sport-loving public—and all in harmony with the Racing Board of the League. Still a strong feeling exists that the organization's real object is to secure control of professional racing, and particularly so if at the National Assembly meeting the amendment to admit professional riders to membership is defeated. The new body will be known as the National Cycle Racing Association.

KEEP OFF THE PATHS!

At Albany, N. Y., on January 19, Assemblyman Armstrong, of Monroe, the father of the Bicycle Baggage law, introduced a measure designed to preserve sidepaths exclusively to cyclists. His bill will amend section 652 of the Penal Code. Its vital provision is:

"All sidepaths or wheelways constructed by, or for the use of, bicyclists, shall be, and hereby are, declared to be private paths, and any person who shall ride or drive any team, vehicle, cattle, sheep, horse, swine or other animal thereon shall be guilty of a misdemeanor. The use of such paths or wheelways by pedestrians shall be subject to the rights of bicyclists thereon."

UP AGAINST IT.

Tom, Tom, the pedaler's son,
Stole a wheel and away he run;
Struck a stone and the rim he busted,
Then he was caught and his jacket dusted.

FINISH OF THE BARN-STORMERS.

When Bald failed to attract a paying gate at Buffalo, his home, on Friday and Saturday of last week, the managers of the combination of barnstorming foreign riders threw up their hands in disgust and disbanded the show. The troop rode to many empty seats at Wilkesbarre, Rochester and Buffalo, and proved a losing venture. Bald, Tom Linton and Hale rode exhibitions, and the third-rate foreigners who came over for the six-days race contested in open events, and were generally shown to be mere hacks by local men.

The meet at Buffalo was held in the Arsenal on a flat track. In the professional events Chappelle, Marks, Warburton and S. Linton started in their heats, but were buried out of sight in the finals. "Teddy" Goodman and Newhouse, of Buffalo, rode the flat track admirably. In the ten and twenty-mile races Goodman lapped his nearest competitor. Bald's exhibitions were slow and devoid of interest. Tom Linton's exhibitions consisted of reeling off a mile in 2.42, and a half in 1.34. Teddy Hale, of Ireland, "champion long-distance rider of the world," wearing a green suit, finished his mile in 3.23, while the band played "The Wearing of the Green." A Buffalo paper, commenting on the failure of the combination, says:

"While Powers, Kennedy & Co. have lost on their display of foreign talent, they have displayed a remarkable disposition over the outcome and quietly enjoyed the riders' lack of interest in the whole thing, and the ravings of Plummer over the failure of his men to make a respectable showing when pitted against good men. There will be no more rubbers or pluggers engaged as sprinters and starred through the country at their expense."

The principal events of the two nights resulted as follows:

One Mile International Professional.—1 Newhouse; 2 Goodman; 3 Cleveland. Time 2.40.
Twenty Miles Professional.—1 Goodman; 2 Newhouse; 3 Davis; 4 Weinig. Time 57.54.
Five Miles.—1 Goodman; 2 Newhouse; 3 Weinig. Time 13.35.
Ten Miles.—1 Goodman; 2 Newhouse; 3 Davis; 4 Weinig. Time 28.45 1-5.

COULDN'T CATCH COAL.

It was thought by the importers of the foreign riders who returned to England this week, that a series of races at Wilkes-Barre would draw a good gate. Wilkes-Barre is the home of Rice, over whom the natives raved after he won second place in the six-days race. It is also in the heart of the coal district, and the play was made that the two Lintons were once miners themselves, in the hope of working up sympathy. But scarcely a sufficient number of Rice's admirers or curiously-inclined coal diggers paid admission to the armory to raise the amount of money demanded by Rice before he would consent to ride. The excitement incidental to the mile match race between Rice and Hale can be imagined by the time—Hale, 4.00; Rice, 4.05 1-5. Bald's exhibition was almost as bad—3.58. At Rochester in the neighborhood of 200 spectators paid admission. The track was seventeen laps to the mile. Bald braced up and rode a mile in 3.40, and Hale managed to cover a half in 2.27 2-5. Goodman won the open events. That the tour ended ingloriously is not to be wondered at.

FLAT AND SLIPPERY.

In conjunction with Company G of the Thirtieth Regiment, the South Brooklyn Wheelmen held a race meet at the regiment's armory on Wednesday of last week. Although but five riders were allowed to start in the trial heats, spills were numerous, the track being flat and slippery. But for the fact that the corners of the armory were heavily padded, it is likely that some of the contestants would have been severely injured. In many of the heats the winner only qualified for the final, causing some extremely hard-fought finishes. In the mile professional, Taylor, the colored rider, qualified, but was shut out in the final by Goodman and Brock. Jay Eaton was compelled to drop out of the race owing to a fall. In the two-mile handicap Goodman won from scratch, defeating Eaton, who was also a scratch man. Bald rode an exhibition mile in 2.41.

Summary:

One Mile Novice.—1, W. Moseman; 2, W. F. Wood; 3, W. J. Heaney. Time 2.42 2-5.
One Mile Scratch Professional.—1, F. F. Goodman; 2, Sam'l Brock; 3, "Major" Taylor. Time 2.24 4-5.
One Mile Greater New York Championship.—1, T. R. Goodwin; 2, C. S. Henshaw; 3, W. A. Brown. Time 2.26.
One Mile Handicap.—1, O. V. Babcock, 15 yds.; 2, W. L. Losee, 20 yds.; 3, H. Y. Bedell, 15 yds. Time 2.25.
Two Miles Handicap Professional.—1, Goodman, scratch; 2, Brock, 75 yds.; 3, Jay Eaton, Scratch. Time 4.55 4-5.

PRIZE-MONEY SEEMS RATHER LARGE.

Chas. Hadfield, of Irvington-Millburn road race fame, and E. S. Aker, of Philadelphia, sailed for Jacksonville, Fla., on Saturday last. They are matched for a race, January 29, on Panama track for \$500. Two Southern riders, Walthouse and Huffstetter, are also matched for a purse of \$800. A number of professional and amateur events will be run in connection with the match races.

FATHER TIME'S SIDE PARTNERS.

Boston's Chronograph Club, which undertakes the task of timing races correctly, has elected these officers for the present year: President, J. E. Savell; Vice-President, J. C. Kerrison; Treasurer, J. J. Fecitt; Secretary, C. E. Fay.

SAVED THEIR LIVES.

Despite the predictions of several followers of racing none of the riders who took part in the races at the Military Carnival, at Madison Square Garden, last week, was killed. During the week there were many exciting acrobatic exhibitions, but with their usual good luck, all the riders who took part in the numerous spills escaped with bruises and broken wheels. The track was narrow and dangerous. On several occasions some of the riders went over the embankment. The finals of the National Guard championships, run during the two last days of the week, resulted as follows:

One Mile Novice.—1, A. W. Smith, 71st Regiment; 2, L. M. Gardner, 13th Regiment; 3, E. W. Ott, 8th Regiment. Time 2.41 2-5.
One Mile Handicap.—1, Peter Engledrum, 9th Regiment, 60 yds.; 2, J. W. Judge, 22d Regiment, scratch; 3, B. J. Keeler, 22d Regiment, 15 yds. Time 2.24.
Two Miles Handicap.—1, P. J. Engledrum, 160 yds.; 2, R. A. Miller, 12th Regiment, 15 yds.; 3, J. W. Judge, scratch. Time 4.59 3-5.
Two Miles Tandem.—1, Judge and Mosher, 22d Regiment; 2, Owens and Keeler, 22d Regiment. Time 5.5 4-5.
Half Mile.—1, Owens; 2, Judge; 3, Miller. Time 1.10.
One Mile National Guard & U. S. A. Championship.—1, Owens; 2, Judge; 3, Keeler. Time 2.25 3-5.
One Mile Scratch.—1, R. A. Miller; 2, A. Garrigues; 3, J. W. Eaton. Time 2.42 2-5.

RACING BOARD'S BULLETIN.

PROFESSIONALIZED.

Bert Leslie, Chicago, Ill. Own request.
Ben Cleveland, Tonawanda, N. Y. Own request.

B. A. Stevens, Charles City, Ia. Clause (b).
Fred Beeman, Waukon, Wis. Clause (b).
Suspensions placed upon H. H. Gay and H. J. Hoffman, Bay City, Mich, have been reduced to expire February 1st.

SUSPENDED.

For knowingly competing at unsanctioned races B. A. Stevens, Charles City, Ia., and Fred Beeman, Waukon, Wis., for ninety days from January 15, 1897.

For competing in unsanctioned races, John Green, Cheyenne, Wyo., and Fred Stone, Fort Russell, Wyo., for ninety days from December 24, 1896.

The same progress in cycling which brings us to new pleasures exposes us to new pains.

THE LONG AND THE SHORT OF IT.

What happened when the proud owners of the new club centipede-cycle attempted to store it in their piece-of-pie shaped club house.—Cycling.

VICTOR BICYCLES

THE STANDARD FOR QUALITY.

You will find us at the
CHICAGO CYCLE SHOW
OCCUPYING EIGHT FULL SPACES

Near the centre of the Coliseum
WITH A FULL LINE OF
1897 VICTOR BICYCLES,

Showing all the fine points of construction that combine to keep the VICTOR
in the lead. Our representatives will be pleased
to explain to you why

VICTORS SELL FOR \$100,

And why they cost more to build than any other Bicycles.

We shall also exhibit at New York, February
6--13, and at Boston, February 20--27.

OVERMAN WHEEL CO.

NEW YORK. BOSTON. DETROIT.
DENVER. SAN FRANCISCO. PORTLAND, ORE.

SAMPLES OF GALIC GRACIOUSNESS.

Parisian race meet followers have been treated to another novelty in cycle racing. The affair was styled a "three days race," and made a decided hit both from a financial and sporting point of view. The event was run in this way: On Christmas the contestants rode 50 kilometres (31 miles, 123 1-3 yards), on the following Sunday the distance ridden was 80 kilometres (49 miles, 1,253 yards) and on the following Saturday the race terminated with a 100 kilometres (62 miles, 246 yards) ride. The result was determined by reckoning the total times of each competitor for the three races. Armstrong, a second-rate English rider took the first two events. In the concluding race of the series he had bad luck with his pacers and with his own machines, causing him to finish in fourth place, Bauge coming in first. Nevertheless when Armstrong's times were added together, he was found to be the winner, the order being as follows: 1, Armstrong, 5h. 6m. 57s.; 2, Bauge, 5h. 7m. 24 4-5s.; 3, Bonhours, 5h. 7m. 47 2-5s.; 4, Taylor, 5h. 9m. 43-5s.; S. Huret, 5h. 9m. 31 2-5s. The prizes were particularly large, first man coming in for a \$600 purse. Armstrong's victory over the Frenchmen did not meet the approval of the spectators. According to one critic they treated him in a manner that was positively disgraceful. They howled and hooted at him and kept up a fearful din right to the end, and when the Englishman had to stop through a punctured tire and lost considerable ground in changing machines, and when the Frenchmen went ahead and took the lead their joy knew no bounds.

WHAT JOHN JONES SAYS.

Michael's trainer, John Jones, who returned to England several weeks in advance of the little Welshman, is put on record as saying: "Races are spoilt in America by overcrowding the tracks. I have seen as many as twenty-five riders start in a scratch race. Accidents are therefore more numerous than in this country, and on one or two occasions I have seen as many as seven or eight riders injured in a race."

He disagrees with the method adopted in America of timing short record rides, and says: "No man can time a quarter-mile correctly who has to stand a quarter of a mile away from the starting point. I do not agree with only one time-keeper, as we often have home in England; still, I should like practical men to time."

"About our treatment, I cannot praise the Americans sufficiently; we were treated kindly everywhere by the people and by the press."

RAYMOND ADVERSE TO POTTERISM.

Ex-chairman of the Racing Board, Howard E. Raymond, says: "I should think it would be the height of folly for the League to turn over its control of racing to any other body. It has mainly been responsible for the establishment of a good form of government over this class of sport, and now that it has done this there is no good reason why its power or influence in this direction should be abrogated in favor of any other association." He is not in favor of Sunday racing, thinks professionals should be admitted to the League and believes that next to Gideon, Robinson should be the next chairman of the Racing Board.

SO VERY LADYLIKE, ISN'T IT?

Here is another unsavory chapter to add to the many, unwritten and unwritten, in the disreputable history of female bicycle racing. It is by a Cleveland sporting writer:

Dottie Farnsworth, who has been a popular favorite in the woman's six-day race, was prevented from winning last night at the finish, presumably by Tillie Anderson, but really by the worst combination of "dirty work" ever perpetrated on any track or in any race. Pearl Keys, who had openly threatened to throw Farnsworth and kill her if necessary to keep her from winning, showed all the disposition in the world to carry out her threat. She not only rode in a way that should have disqualified her at once, but put the Minneapolis girl in a position, time after time, that was positively dangerous. Then after Anderson had been allowed to pass and make a tap while Keys kept swearing to keep Farnsworth pocketed, Kalgren collided with Farnsworth, striking the latter's wheel from behind and again set her back. Kalgren fell and was carried from the track, and a serious accident was only prevented by one of the trainers, who caught Farnsworth's wheel before she was thrown.

The repeated fouling left no doubt that the deal had been put up prior to the race, and the judges, after a consultation that lasted until after midnight, called the contest "no race," declared bets off and ordered the first and second moneys, which are \$250 and \$150 respectively, divided between Farnsworth and Anderson.

And the manager of this putrid combination is continuing to arrange races in other cities.

THINKS BALD HAS A CHANCE.

Geo. A. Banker thinks that if Bald trains faithfully he will be a winner on the French tracks. The Pittsburg rider says that Bald, like others, will likely be troubled at first by the small tracks, highly banked. He thinks Bald's sprinting ability will make him capable of showing the Frenchmen the way over the tape and that he will be accorded the most polite consideration from the French riders and public. The Parisians, he claims, are partisan, but fair. Banker still holds to his position that the French do not mistreat American riders and he believes that so many American cracks were beaten in France because they did not train properly or thoroughly. Banker repeats that if Bald only trains he will be a winner.

Banker has not entirely recovered from his European fever, but is in fairly good health. He has numerous offers to return to the racing world. He rather thinks he will stick to business this summer.

PREPARING FOR RETREAT.

With the possibility of a return visit to Paris in view, Tom Eck has attempted to pave the way to Parisian respect through the press. He has written a glowing tribute to the French riders and promoters which Le Velo prints. Eck says that the numerous statements published on his return to America to the effect that he was ill-treated by the French racing men and race promoters, and that the matter was furnished by him, is erroneous. He further states that the reports coming from Kiser and Murphy that the Frenchmen adopt any means to "down" the Americans is void of truthful information.

Speaking of the treatment by the French, Eck says: "We were satisfied with the treatment we received in Paris by racers, race meet managers, race officials and the pacemakers."

NEAR PENN'S TOWN.

Frank Starbuck returned from his wedding trip abroad on Saturday last. For the present he will reside near Philadelphia.

LINTON SCORES MICHAEL.

To a Buffalo reporter Tom Linton is reported to have said: "I don't know what to make of Michael. He tells newspaper men and friends that he is more than anxious for a race, but when he is asked to put up a forfeit or make a side bet he invariably finds some way to get out of it. I was certain that we would be able to decide the question in Florida and was just congratulating myself when, to my astonishment, I learned that Michael had engaged himself for England. As an excuse Michael says that he was summoned home to appear before the N. C. U. This I know to be false. It is a most difficult matter to understand Michael. He is a great rider; I would have to be at my best to beat him, and on that account I see no reason why he does not make a match. At home he rarely showed the white feather, but since he got in the hands of Tom Eck he seems to be anxious to do anything but race against a first-class man. I'll go back to Europe and make Michael race or forever hold his peace."

STILL BITING HIS THUMB.

Tom Cooper is still anxious to settle on the track his little argument with Bald over the championship question. He puts it in this way: "If Bald goes to France, so do I, and you can put that down where they can all see it. When I deposited \$500 in Chicago for a race with him last fall, the understanding was that if the time was too short we would try again in the spring. Now I see he is going to Paris. I will go there if he goes, and he will have to race against me before he comes back." Cooper is at his home in Detroit. He is a daily attendant at the Michigan A. A. U. Gymnasium, where he uses the dumb-bells, chest weights, punches the bag and spars. He also follows a line of work to strengthen the abdominal muscles. Last year he rode at 154 pounds; this year he will try to stay around 162 pounds. He will take in the New York and Chicago Cycle shows, and if Bald does not go to Europe he will leave for San Francisco about the first of March.

ANY SPEED IN STOCK.

Racing has developed to such a proportion and become of such importance on the other side of the Atlantic Ocean, that two ex-racing men have formed a partnership and gone into business as dealers in speed, with headquarters in London. Their specialty is to furnish pace to racing men on reasonable terms. The firm will have several multicycles and keep crews in constant training. Pace will be furnished for either competition events at all distances or for record-breaking trials. They will also enter into contract to take charge of the pacing in long distance road events, or record trials, relieving participants of all anxiety by taking care of the arrangements from the inception to the completion of the event.

ONE DOZEN AND TWO.

During a race recently run in the Velodrome d'Hiver, Paris, 14 of the 18 contestants went down in a grand smash-up at one of the turns and although most of the machines were badly wrecked, none of the riders were injured.

DALMIER TIRES

THE GREATEST ROAD RIDER IN THE WORLD ON PALMER TIRES.

EDWARD N. ROTH.

Edward Roth, a Chicago boy, averaged a hundred miles a day for 340 days during 1896. He rode one pair of Palmer Tires 22,517 miles, a wonderful demonstration of the durability of the rubber and fabric in Palmer Tires. His mount was the "Built-like-a-watch" Sterling. Here is Roth's data:

- 146 Centuries.
- 4,000 Miles in One Month (October).
- 9,983 Miles Before Receiving a Puncture.
- 22,517 Miles on One Pair of Tires.
- 200 Miles in 14 Hours and 35 Minutes (Record).
- 300 Miles in 22 Hours Flat (World's Record).

Mrs. A. E. Rinehart, the famous Denver century rider, covered 17,512 miles, including 116 centuries, during the year. She used Palmer Tires on her Stearns wheel exclusively.

Mrs. A. E. RINEHART.

THE PALMER
PNEUMATIC TIRE COMPANY,

CHICAGO AND NEW YORK.

AS TOLD BY A

COMMUTER

Are you a commuter, and a married man? Do you know the delights of living "just across the ferry—and half an hour in Jersey?" If you do not, then this tale may interest you, or it may not.

I live on the outskirts of a little town on the murky Passaic. The turnpike which runs past my house has a surface on which "the chosen Board of Freeholders of Orange" have expended not less than \$80,000. It is as smooth as a board and runs that way twenty or thirty miles, a straight and beautiful piece of macadam road work, showing what ought to be done with the miry red clay roads in adjoining red clay townships.

My house—well, I rather pride myself on having the prettiest garden in Essex County—is beautified by roses in June, verbenas in July, hollihocks in August and chrysanthemums in October. It is a lovely sight in June, and my wife Kate prides herself on its being altogether the daintiest, loveliest, dearest spot in all the State of New Jersey. Oh, willingly will I be a commuter all the dreary winter months if I can have my May and June in Essex County! Willingly will I carry out groceries, market stuff, packages, handboxes, and they tea me, latterly, wheels—they never let me rest about wheels!

Yes, wheels. You see, they mend your tire better if they have the wheel and its rim, and when Kitty's tire bursts, or mine, off comes one wheel and into New York it goes to be repaired. It's a little thing to carry, and very light, and not at all in the way on the ferry-boat, and so—well, I must tell you just exactly what happened. But I get very tired when they say "wheels" to me now.

Down the street, about four blocks, there lived a very pretty and charming little widow, who, it is needless to say, was the most circumspect and self-respecting little lady that ever was known in Essex County. She is a good looker, and she knows it without being told.

She's a blonde, with blue eyes, and she wears a velvet cloak with fur collar and a great, enormous hat, with feathers. Her pretty, kitten face, in the midst of all the hat and feathers, looks like a violet, half hid in a bank of weeds—in her case, widow's weeds! You ought to see her. She always takes that early 8.05 train when she goes into New York, not because all the men are on it, but because she likes to do her shopping early!

John Varnum left the widow a nice competence, and she had everything about her in the best style—not extravagant, but "nice." When she took up cycling she rode, of course, the "bestest" wheel, and they say it was silver-plated. My! but she looked stunning in her tailor-made costume; and her leggings—all the teams in Squantumville ran away at sight of them, the highest compliment that could be paid a wheelwoman.

One day I was out snipping wormy leaves off my rose bushes, when Mrs. Varnum came

by on her wheel. She was just starting, and I could see Kate up in the window eyeing her, and with a very curious expression on her face.

I looked at the widow again, and, by Jove, she was in bloomers! Stunning!

Just opposite our house she ran over something or other and her front tire collapsed. She dismounted and sat down on the curb and, poor girl! began to cry.

"Come into our place. My wife will—will lend you—er—she can fix you up!"

I knew that there I was counting entirely without my host.

Blushing furiously, the widow hurried across into our yard and up our front steps.

I counted at least six pairs of eyes from six different houses of our neighbors leveled in our direction. This was getting to be a public event, and I felt that my wife must be called in at once. I was getting nervous.

"Kate!" I called up stairs; "Kate! come down and—bring—er—Kate, Mrs. Varnum is here!"

Not a sound in reply.

"Kate!" I called again, "are you there? (I knew well enough she was.) Kate, please hurry!"

No reply.

Hurriedly handing the widow our family photograph album to amuse herself while I was gone, I ran upstairs. I burst into my wife's room. There she was, as mad as a hatter.

"She dismounted and sat on the curb."

I ran out, offered assistance, cheered her up, and asked if I could take the wheel home for her. She only huddled herself down on the curb and wouldn't move. A beauty in distress! And there stood my wife Kate in the window staring, and watching us.

"I don't like to walk home, past all those houses!" cried the widow, drying her tears.

"Kate, you must come down!"

"I will not. What did she mean by coming into our house!"

"She is in trouble; have you no feelings?"

"Feelings, indeed!"

"Tire busted; doesn't want to walk home."

"Why did she come out looking so?"

"You must lend her a dress."

“Built Like a Watch”

One Star differeth from another in glory—
WHEELS, too.

In the very heart of the New York and Chicago
Bicycle Shows you will find the

STERLING

NEW YORK: Schoverling, Daly & Gales, 302 Broadway.
BOSTON: Dame, Stoddard & Kendall, 374 Washington Street.
FREEHOLD, N. J.: Burtis & Zimmerman.
PHILADELPHIA: Jacob Rech & Sons, Eighth Street and Girard Avenue.
PITTSBURG: Logan-Gregg Hdw. Co., Seventh St., below Pennsylvania Ave.
DENVER: Gerwing-Hilton-Kennedy Cycle Co., 1727-9 Stout Street.
SAN FRANCISCO: A. C. Nichols & Co. (Coast Branch), 400-4 Battery Street.

Kindly mention The Wheel.

"Never!"

"You must—dear!"

But reason and plead as I might, she would have her own way. Kate had a most unbounded distrust of prett' Mrs. Varnum. She always spoke of her as "that woman!"

Let me whisper, as a married man and a commuter, that women treat other women in a mysterious and devious sort of way, sometimes. There is Mrs. Brown, our left-hand neighbor, for example, who won't speak to Mrs. Smith, our right-hand neighbor. Why? Only she knows. I don't. There is Miss Swift, who is taboo, and Miss Wright, who isn't—I don't know all the ins and outs. Oh, women are queer folk, and that's all you can say about it. Sometimes I think they're idiots!

Well, my wife wouldn't come down. She said, "Wild horses couldn't drag her downstairs." So, what could I do? I was mad. Why shouldn't I be? I went down and said my wife was violently sick, and asked to be excused. Then I said: "Mrs. Varnum, you're out for a ride? Well, take my wheel; ride it all day if you want. You can, you know, with those—"

We both looked out of the window.

"I'll adjust the saddle; you'll like a man's wheel; easier than a woman's. You'll go like the wind, you know."

She murmured her thanks, with a sweet, upward glance of her pretty blue eyes.

"It's the best way all around. You can get your ride. I'll run your wheel down to your house. You are entirely welcome—"

"You're so good to me," she purred. Her Alpine hat and feather, her gloves, her boots and leggings, her knicks—the widow was very fascinating that morning.

Well, off she went. Of course I had to assist her to mount the new way, a man's way; and, of course, my wife was on guard in the upper window.

Off she sailed like a crack yacht, looking back once with a smile, as gay and pretty as a quick dip of a bird's wing.

My wife remarked from the upper window: "I can't understand the impudence of some people!"

Well, it happened that the very next day my own tire burst, and I carried it, rear wheel and all, to New York, and about a week later sent for it, got it, and caught the 5.38 boat for home.

As luck would have it there was the widow, with her front wheel in her hand, too, just repaired.

Oh, you see, all of us Jerseyites carry our wheels in and out on the ferry, and no one pays any attention to it. She greeted me very cordially, and we took seats together.

"We spoke of wheels,
And never thought of love."

We discussed pedals, saddles, handle-bars, lamps. We had our own views about tires, our especial prejudices in favor of our own "makes," etc., like every other wheel owner that has been born. I'm sure one can talk wheels and look volumes!

Right in the midst of a discussion of makes there came a crash!

We had bumped into our pier and were nearly tipped over.

People were sprawling all over the cabin. The widow clung to me in terror. (Ah, what a sweet thing she was!) We made a rush to get off the ferry-boat. We landed in a stampede. When I got home I found I had the

widow's wheel, she mine.

Now, she had burst the tire on her front wheel, I the one on my rear wheel, as I may have remarked before.

So when, my wife looking on, I foolishly pretended to put the widow's front wheel in the rear frame of my machine, she cried out, "It isn't your wheel at all!"

"Why, how absurd!" I said.

"Where did you get that front wheel?" she asked.

"At the shop in New York."

"It has silver trimmings, like Mrs. Varnum's—"

"Many wheels are made that way—"

"Not like hers—"

"Well, of course, it isn't hers."

Why I lied about it I can't tell, but I did.

"Whose is it?"

"Some mistake of the fellow at the New York store; they're so stupid in New York."

"But I'm not in New York."

"Stupid? No; you're too clever."

"Clever enough to suspect—"

"Whom?"

"You and that woman—flirting!"

"Mrs. Varnum?"

"Don't look so innocent! Of course it's her wheel!"

"Why, it may be; the store man very likely mistook, both living in Jersey, too—"

"Oh, you fraud! You've seen her; she was on the train!"

"I declare I haven't seen her in—in a week."

"You will break my heart, William!"

"Ridiculous!"

"It's her front wheel, and I—I dare say she's got your rear wheel. Oh, Will, a mutual pledge!" There were tears in her eyes.

"Don't be a goose, Kate!"

"And when I'm gone home to mamma, who—who'll get your coffee every morning and fix it just right, as I do? Boo! hoo!"

"My dear Kate!" I took her in my arms.

"Don't try to pacify me! Don't tell me any more lies!"

"But I solemnly swear—I—it's not the widow's wheel." Oh, liar that I was!

A silvery voice from someone coming up the piazza steps—"Oh, Mr. Blank, do you know, you took my wheel and I took yours!"

I rushed out and made a sign to the widow, but she continued, disregarding me. "And I'm going to return yours and get mine. We are going on a long ride to-morrow, Mr. Headlight and I. Do you know him? We (blushing and looking down)—we are to be married first, very quietly, then a wheel trip to the White Mountains."

What did my wife do but rush into her arms and kiss her.

Yes, she actually kissed "that woman!"

I stood there, looking very sheepish. The two women gossiped and ignored me. Bah! Women are so silly! Sometimes I think they're idiots!

Yesterday I bought my wife the brand-new \$100 wheel she'd been asking for for over six months, without a single word in remembrance. S. W.

Some people in cycling only recognize an opportunity by its back.

Boys will be boys on a bicycle, and girls will be if they could.

A contribution box—the waste-paper basket.

YOU CAN SEE THROUGH IT.

Toledo, O., Jan. 18.—After a series of experiments that have extended over an entire year, President Fisher and John P. Vogel, of the Gendron Wheel Company, have perfected a remarkable device, which will be seen at the coming wheel shows. In addition to the time and labor expended, the invention, now fully protected by letters patent, represents an expenditure of cash approximating \$5,000. It is a device for testing and exhibiting ball-bearings.

The Gendron people propose with this invention to fully show the operation of their three-point bearings, at the same time the machine is so built that the bearings of other manufacturers can also be placed in the machine for the purpose of making comparisons. Briefly, the essential parts of the wheel are a large cut-glass hub of beautiful design, having glass ball races with large steel balls, steel cone and axle, all exposed to plain view. The hub was prepared by the Libbey Glass Company of this city, and the mold for this one part of the mechanism cost a round hundred dollars. The crystal hub, and its crystal ball races, is set up in a wheel identical in all respects to a bicycle wheel, save that it is much larger, being forty-two inches in diameter, and provided with a two-inch pneumatic tire. The wheel is suitably mounted on standards before a large mirror, in a handsome mahogany case, with plate-glass front and sides. The wheel is rotated by a small electric motor. There are forty-eight spokes in the wheel, and the same number of tiny electric lights on the inside of the rim between the spokes. The wheel is still further ornamented by a magnificent twelve-pointed star, which outlines the spokes as they cross and recross the wheel. This star is set with costly jewels. This has greatly added to the beauty of the invention, and will doubtless serve to make it a centre of attraction at the big shows.

The importance of President Fisher's invention as a practical tester of ball-bearings should not, however, be lost sight of. It will be a complete educator in this regard, for it will show exactly how much relation there has heretofore been between theory and practice in this most essential part of wheel making. By a simple arrangement and combination of parts, any style of bearings can be fitted with glass races, using steel balls and cones applied by any maker. To further facilitate inspection of the bearings while in operation, one of the cones used is cut away, almost down to where the balls track on its face.

If a description of the '97 Viking's main bearing was asked for, one word, "simplicity," would practically express the case. The new machine is fitted with flush joints, curved ties, round-head fork, and in many other ways is fully abreast of the times, but the main bearing will be the chief talking point this season, and it is sufficiently distinctive of itself to give the Viking's couriers plenty of material. The crank-shaft is in two pieces, but is so made that when placed in the machine they fit together at once, without the taking up of any thread. The faces that meet in the centre are mortised full across, making a tight-fitting joint, that can have no lost motion. Working through the centre of the shaft is a deeply counter-sunk screw, which can be put in place

and removed by any novice in mechanical matters, with absolute certainty of effect. The ball-bearings are at the extreme end of the shaft, fitted with retainers that make it an impossibility to dislodge the steel spheres. The sprocket and crank on the right side are cast-forged together in the most approved style.

It will be seen that all this allows a material narrowing of the tread, without in any way weakening the machine, while at the same time it makes it an extremely easy machine for the owner to take down and reassemble. The Viking people will be very liberal this season in the way of saddle and tire options.

The Toledo Cycle Board of Trade was formally organized on Monday of last week, with the following personnel of efficient officials: George H. Fisher, President; George Colton, Vice-President; John Swindeman, Financial Secretary; Ed. R. Waite, Recording Secretary, and W. G. Alexander, Treasurer. Dues will be as follows: Initiation fee for manufacturers, \$10; for retailers, \$5, and for repairmen, \$2.50. Yearly dues are: Manufacturers, \$5; retailers, \$2.50; repairmen, \$1. Regular meetings of the board will be held on the evening of the first Monday of each month.

President Frank E. Southard has taken a contract to furnish a Western firm with 1,200 of their juvenile wheels, and says that the maximum output of the Toledo Metal Wheel Company for the coming year will be about 15,000.

Things are booming at the Lozier factory at present. The plant is turning out 100 wheels a day. Five hundred and fifty wheels were shipped this week, the number including consignments to London, Paris, Hamburg, Sidney, Melbourne and Antwerp. With a force of 850 men at its command, the Cleveland finds itself abundantly fortified for the spring trade.

The directors of the Toledo Chamber of Commerce unanimously passed the following resolution at their meeting on Wednesday last:

Resolved, That the Chamber of Commerce of Toledo heartily endorses George H. Fisher for President of the National Cycle Board of Trade, and instructs its secretary to write to each member of the National Cycle Board asking their support and influence for Toledo's candidate.

The Yost retail stores on Adams street will be opened shortly after the cycle shows.

Doria Tracey is now identified with the A. U. Betts Sundries Company, and starts out this week to cover the West and South.

CAPACITY FIFTY THOUSAND DAILY.

With one factory alone, that of the N. N. Hill Manufacturing Company, at East Hampton, Conn., having a capacity of 50,000 bells per day, there is small chance for a shortage of those necessary accessories.

CHAMPION TWENTY YEARS AGO.

Henry Osborne, an old-time English champion, who held the 50-mile record in 1877, committed suicide in London on January 6th, by jumping from a window.

All these proceedings have caused great animation in the cycle stock markets.

Experience is always giving some rider the lie.

SEEKING SIMPSON.

Chief Consul Hodgson, of the Louisiana Division, is leaving no stone unturned to ascertain the whereabouts of the missing Secretary-Treasurer F. W. Simpson, but up to the forepart of this week his efforts have not met with success. It is stated that detectives have discovered that his real name is Sayles, and that he left Indianapolis under a cloud, before taking up a residence in New Orleans. Just before disappearing Simpson received a check for \$168 belonging to the Division, which he cashed by paying several bills. He also had in trust \$60 worth of League buttons, but they have been found at his residence.

The matter, as sized up by the Division officers, is that Simpson fled to avoid being recognized by some one whom he had met on the streets who knew him in Indianapolis. Just why he did so is not known, but there are several opinions about it.

Chief Consul Hodgson has secured a warrant for his arrest on the charge of embezzling \$133.

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

THEY HOLD

- All world's records.
1/4 to 100 miles.
- All unpaced world's records.
1/4 to 50 miles.
- All American records.—
1/4 to 100 miles.
- All American hour records.
1 to 24 hours.
- All world's records (6) made on the National Circuit: and 521 prizes—all other tires combined won only 174 more.

MORGAN & WRIGHT
CHICAGO

CAUSED SOME EXCITEMENT.

A merry war over the presidency and other officers caused excitement at the annual meeting of the Associated Cycling Clubs of Long Island, at Brooklyn, on Tuesday night. The opposition ticket was defeated with the exception of one trustee. George Shannon lost the presidency by five votes. The ticket elected is as follows: President, John Barnett, Logan Wheelman; First Vice-President, George H. Gardiner; Second Vice-President, L. C. Hooper; Secretary, Benjamin Auchell; Treasurer, D. De F. Louderbach; Trustees, J. A. Tierney, W. T. Cowenhoven, M. A. Rice, W. A. Armstrong, C. H. Golman, and J. R. Brennan.

IN FINE CONDITION.

The Associated Cycling Clubs of New Jersey, elected these officers last week: President, G. B. Minshull, Montclair; First Vice-President, J. Barber; Second Vice-President, Dr. C. B. Holmes, Rahway; Secretary, Arthur G. Kimball. Reports show the organization to be in the best condition of its history.

MONEY IN THE BANK.

According to the annual report of the treasurer of the Associated Cycling Clubs of Boston and vicinity, the organization has a bank balance of \$2,829.63. Two tickets were in the field, but the regular one was elected throughout as follows: President, F. S. McCausland, Jr.; Vice-President, G. W. Dorntee; Secretary, A. G. Frothingham; Treasurer, Leo Abraham; Directors, H. C. Nickerson, J. W. Porter and A. D. Peck; Auditing Committee, H. Gilchrist, C. H. G. Ferguson and Warren Dow.

OF NO MOMENT EITHER WAY.

A nation which would make an Irishman of such a rank Saxon as Teddy Hale will do anything, affirms an English cycle paper. But, despite the indignation of the English scribes, Hale continues to inform each interviewer that he was born in Emerald Isle, states the town and county and gives the date. Since the matter is so galling to the English critics they might send a delegate to Ireland to investigate, and so ascertain whether or not Hale knows what he is talking about.

GOOD ADVICE FROM THE BACK SEAT.

"And now," shouted the great revivalist, "what is to be done when a man is rushing down hill, with lightning speed, along the road to destruction—"

Deacon Sleeper (between snores)—Putcher brake on hard! If yer ain't got no brake, back-pedal, and then if she don't stop, jump!

MIDWINTER MEET.

Arrangements are being made by the Associated Cycling Clubs of New Orleans to conduct a three-days meet during the Mardi Gras carnival, January 25th, 26th and 27th. Prizes to the amount of \$2,500 are offered. The races will be run on the quarter-mile cement track.

FOR COLD SCORCHING.

Why doesn't some enterprising chap or club promote a bicycle race on a frozen lake or river? The idea is so novel and so full of possibilities that the makers of cycle skates or runners and ice-creepers might use it to their material advantage.

GOOD FOR AN EASTER CARD.

The Parisians have invented a new kind of egg race, the idea for which consists in scattering a few eggs over the course, and making the competitors break them with their front wheels.

SIDE PATHS FOR CYCLISTS.

The Board of Contract and Apportionment, of Albany, N. Y., has recommended that certain specified streets of the city be paved with vitrified bricks near the gutters for the use of cyclists.

SIXTY-TWO ON THE ROAD.

A race for motor-cycles will be held on a road near Paris, on April 4, for a distance of 100 kilometres, about 62 miles. It is open to amateurs and professionals alike.

Those who want to borrow trouble about the wheel they ride, never have to ride a century to find it.

The cream of a wheel paper is not obtained by skimming it.

CURVING THE LINES.

In constructing the Duquesne Special, the Duquesne Mfg. Co., Pittsburg, Pa., has apparently endeavored to follow as far as possible the "curved lines are lines of beauty" principle. The curved or round construction is employed wherever possible—on the forks,

both front and rear, and at the bottom bracket. The frame shows this nicely. The front and rear forks as well as the rear top stays are formed of one continuous piece of tubing, without joint of any kind, and thoroughly reinforced. These are united with the forkstem, the bottom bracket and the top seat cluster rear tube by improved methods. This construction is remarkable not only for its simplicity and a reduction of the number of joints, but also for the greatly increased strength resulting therefrom, the strength of the two large tubes at the bottom bracket and top stays being markedly in excess of the two small tubes ordinarily used, so the Duquesne people claim.

The cranks used are also rather novel in that they are square at the shoulder, and are gradually rounded to the shank.

WHY NOT HANG THEM?

A bill drawn up by President Sterling Elliott, providing for the imprisonment of bicycle thieves, is shortly to be introduced in the Massachusetts Division.

KILLING OLD EQUILIBRIUM.

The bicycle and its stepmother, the inventor, have knocked out about everything in the world from commerce to pedestrians. When, therefore, new pastures are sought for the wheel and its stepmother to do the conquering act in the chances of their discovery are not great. Texas comes to the front at this juncture with that hitherto deadly foe of the novice, old Equilibrium, and in true cycling fashion proceeds to knock him out in one round of the pedals.

This new knocker of musty mechanical and scientific law is designated as a Bicycle Governor, and is the infant of a brain heretofore devoted to railroad superintending. The proud parent thus describes his child:

"The governor works on the principle of a pendulum, not allowed to vibrate at will, but operated by means of a cog attached in the rear of the front bar and immediately under the upper bar of the frame. It is the purpose of the governor to keep the wheel in an upright position all the time while being ridden, which is accomplished by the huge ball being thrown to the side in the opposite direction that the front wheel goes, thereby maintaining the equipoise, so that all that is necessary is power at the pedals to keep the machine going, providing the operator is capable of keeping out of the way of large objects. For instance: A rider just mastering the wheel encounters a stone or some small obstruction, and the front wheel is thrown quickly to one side. As the wheel turns the governor is shoved in the other direction and maintains the balance, straightening the machine again and keeping the front wheel in a plane with the rear one. In order to turn a corner or to veer to one side the rider only has to lean in the direction that he wishes to go, and when once there straighten back in position, the use of the hands on the handle-bar not being necessary.

EARN'S ESTIMATION.

In the category of cycling conveniences the Challenge adjustable handle-bar, here illustrated, must be given a place. It is the product of the Challenge Machinery Company, of Chicago, and the fact that changes of adjustment may be made without dis-

mounting and without the use of a wrench or tool of any sort, at once earns it place in the estimation of the cycling public.

SHORT ANSWER, LONG SENTENCE.

"Nay, nay," said the Eastern Potentate, who was at times given to slang and who had associated more or less with American around-the-world-on-a-bicycle-without-a-cent-and-for-a-wager tourists, many of whom had passed through the Potentate's realm and had given him pointers regarding English as She is Spoke and had explained to his ever alert mind the meaning of certain idiomatic expressions more forceful than elegant, when he was approached by his Favorite and requested that he O. K. her demand for a cycle costume that would be made in the prevailing around-the-world-tourist style so that her riding would be shown to an affecting advantage as she sped along the paths that surrounded the palace on a wheel which she had bought on the instalment plan—"Pauline."

A BUSINESS DEVIL DEFINED.

Advertising, of which the catalogue is but a form, is simply a means by which one may toot his own horn. It can be done cleverly or it can be done the other way. The clever article always sounds harmoniously and attracts attention, where the slipshod concoction too frequently repels and offends good taste. Not every one can do the thing cleverly, but among this number is not the catalogue compiler of the Julius Andrae & Sons Co., Milwaukee. He has just completed the firm's advance catalogue, and while simplicity itself, its contents are of the sort that impel one to read on.

In inviting "the curious and investigative buyer to inspect Andrae quality," he takes occasion to remark prominently that "the devil of the business world is chance," and then proceeds to state his case in this entertaining fashion:

"Education in cycle construction is so rapidly developing that the season of 1897 will establish for all time the maxim of all nations: 'You cannot have quality without cost, and that the best is always the cheapest in the end.'

"To emphasize Andrae quality let us illustrate: Here are two watches. They seem alike. Examine the works. They look alike. What is the difference between them? One is an ordinary Swiss watch, the other is a Jorgensen. They certainly look alike, yet if you want a timepiece that will prove a timepiece, the Jorgensen is worth a dozen of the other.

"Here are two yachts. One has hollow spars, a Tobin bronze hull, and every latest fad. The other may not look as gay, but it walks right away from its rival, for it represents the mathematical brain of a Herreshoff. Not mere finish or light weight, but years of experience and practical boat building.

"What the name of Jorgensen is to the watch the name of Andrae is to a bicycle.

"The Andrae represents the most advanced mechanical principles of to-day, for it represents the best brains and skill in every detail.

"The experimental stage of cycle construction has passed. The experimental stage of cycle buying is fast going. Consumers have come to realize the vast difference between a Swiss and Jorgensen movement.

"Every known precautionary measure is taken to make Andrae cycles perfect in workmanship and absolutely reliable. In their construction is represented the brains of a Herreshoff. All material is of the highest class. It is inspected in every particular and tested for all possible faults during the various stages of manufacture into complete wheels."

AUSTRALIAN TRADE OUTLOOK.

Writing from Australia a close student of the trade situation there has this to say: "Though there are no signs of any decrease in the number of wheels in use, those who are behind the scenes recognize some indications of the supply exceeding the demand. Till within the last few weeks bicycles have not been bonded in Victoria. There have always been sufficient orders on hand to make it advisable to clear the whole consignment on its arrival, and there are good reasons for thinking that the trade is not one which can afford the delay in clearing stock which is indicated by bonding."

NOT AS EASY AS IT LOOKS.

An exceedingly successful foreign representative of an American manufacturer who has made more than any other American out of the demand abroad for American wheels, remarked on his return recently from South America: "The trouble with American cycle makers is that they seem to think that foreign trade is a far-off star that can never be reached, when as a matter of fact, we can ship wheels into Mexico and South America about as easily as we can have them transported from one State to another."

But the speaker, clever as he is, misses an exact conclusion when he says: "The only reason I can discover why we have not accomplished more in the direction of securing foreign business, is that the demand for wheels at home has been so phenomenally large, that all of our time has been occupied in meeting its

WOODS ARE FULL OF THEM.

"I see by the advertisements they wuz givin' out at the bysickle show that some of them fellers what makes wheels says they have plants that—"

"Land sakes, Joshua! Yer don't mean to say they've got to growin' 'em, do yer?"

requirements. Ultimately, we must look to Europe to take our surplus cycle product, and now is the accepted time for us to get down to work in extending and expanding our foreign trade."

Foreign trade calls for a dozen requirements and conditions. Knowledge of local conditions, peculiarities, prejudices, methods, tariffs, banking, competition from other countries, details as to boxing and crating, etc. It is not a question of unloading America's wheels, except in a restricted sense. True, American cycle makers have allowed home markets to absorb their energies, but special tact and knowledge must be used to catch the foreign trade.

HOMELY AS A MUD FENCE.

Nothing will go further toward doing away with love at first sight, than for the man to make the acquaintance of a woman who thinks her cycling demands a costume largely composed of sweater, bloomers and golf stockings.

HE WON THE BET.

Your bicycle thief keeps right up with the procession. He has to, because the bicycle procession is a very fast moving one, and, like time and tide, waits for no man, nor woman.

A young man on one of the asphalted cross streets the other evening was trying the paces of a new mount, when two fellows stopped on the sidewalk to admire him. One of them asked how much the wheel weighed, and the young man said it weighed twenty-two pounds.

The smaller of the two said that was too light, and that he believed in wheels weighing at least thirty pounds. Also he mentioned that he once won a ten-mile road race on a wheel weighing thirty-eight pounds. At this the larger of the strangers laughed derisively and said: "What do you know about bicycles?"

"Why, I've rode more wheels than you ever saw," replied the other.

"I don't believe you can ride at all."

"I'll bet you \$2 I can. Le' me show him on your wheel. I won't hurt it."

He could ride all right.

He wobbled slowly on the wheel for a block, and then he swished around the corner and was away like the wind.

"You'd better chase after that fellow," said the big stranger; "I don't know him."

The owner of the wheel "chased," but the short stranger must have been a mile away by that time.

Then when the owner had come back the big stranger also had gone.

WHAT MAKE WERE THEY?

The following from a paper as conservative and correct as the "New York Journal of Commerce," means either one of two things—that the Sydney people did not get "high-grade wheels, or, if they did, that export discounts are out of all proportion to those given the home market.

"Several orders for bicycles, without restriction as to maker, were placed yesterday (January 14th), for export. One order was for Sydney, Australia, and another for Buenos Ayres, Argentina. The former, according to the buyer, was for as high-grade wheels as could be bought, guaranteed by the manufacturer for a year. They were purchased at \$29 each. The Argentina buyer, who did not care for any guarantee, but was simply satisfied to buy them as good wheels, got them, he claims, at \$22.50 each."

If the foregoing be true, the exact value to the buyer in foreign markets of a reputable maker's name, and his year's guarantee, is just \$6.50 per machine. Seems as though it should amount to more than that, even with Australians and Argentinians!

FALLEN FROM HIS HIGH DEGREE.

"Madam," remarked Rollingwheel Nomoss, "I was not always as you see me now. Once I rolled in the lap of luxury, lived on Diamond street and ate gold-fish every morning for breakfast. I was a spotless amateur those happy days, and Gideon—but no matter. It is nothing but the old story—his axe, my neck. Pardon these reminiscences. Only cold meat, did you say? Well, I suppose I'll have to go you."

'97 Crescents for January

'97-A CRESCENT Year

BICYCLE merit is best shown
by popular approval—the
continued endorsement of those
who ride.

CRESCENT BICYCLES

Increase in sales rapidly year
by year—sure evidence that
Crescents satisfy the army of
people who buy them.

1894 Sales—50,000 Bicycles

1895 Sales—57,000 Bicycles

1896 Sales—70,000 Bicycles

The '97 Crescents are not only
more beautiful than ever, but
strong, light, comfortable, per-
fectly made, fast—very fast.

Every Month
a CRESCENT Month

THE WOES AND WAILS OF ARCHIE.

In the bijou drawing-room of a Harlem flat a young lady of up-to-snuff sixteen awaited the coming of her lover. Ten minutes before she had pushed the governing button which admitted him to the vestibule, and now she had but to wait another ten or fifteen while he ascended the seven flights of stairs leading to the Fogarty domicile just under the roof.

She stood with the train of her two-dollar-ninety-eight tea-gown trailing out on the fire-escape and with one arm resting on a folding-lect which in day-time was a very good representation of an ink-stand. She was waiting. Up through the mortared well of the air-shaft was borne the sound of the voices of her mother and the janitor, engaged in a discussion about the number of scuttles contained in a quarter of a ton of coal. No other sound was heard.

Presently the door was thrown open against the radiator with a crash and Archibald Hammerdown, wild-eyed, disheveled, a mere outline of himself, burst into the room and struck the mantel-piece with his forehead.

"Mabel!" he gasped; "Mabel, my love, what is it? For well I know when you summon me by postal-card marked 'immediate' it purports some dire disaster."

"Archibald," she answered, "I will not keep you one moment in suspense. I am another's!"

"But," he shrieked, "I did not know there were others!"

"Yes," continued the fair girl, taking her gun out of her mouth and fastening it under the pedestal of the parlor-lamp; yes, he is another, and he—Archibald, how often have I told you not to try me too far?—he approves of bloomers and the diamond frame."

With a sharp, nauseating thwack Archibald Hammerdown dropped into the nearest installment-plan chair, and in another second the super-steam-heated glue had broken faith with it and he was sitting on the red table-dolly which did duty for a carpet. He would have been lying on it if there had been room.

"Miscreant!" he roared between his front teeth. "No; viper, I mean—viper! When you hear that I am no more think of this afternoon's work and weep!"

With that he dragged himself up from the floor and, with the doily still adhering to his trousers, rushed from the room. Next day he moved to Brooklyn.

HE'S IN THE ASYLUM NOW.

He was of keen creative mind,
Knocked daily at invention's door,
And often vowed that he would find
Just what all cycling was waiting for.
The wrinkles on his forehead grew
Yet deeper with unbridled thought,
And still he toiled, determined to
Discover that for which he sought.
Yet days and weeks and months sped on
And no inventive prize was won.
At last a joyous, radiant dream
Of triumph lit his sunken eyes,
And with a loud soprano scream
He yelled "Eureka!" once or twice.
"The world is mine!" he cried in glee;
"My banner is at last unfurled!
Ere yet comes the cycle show, I'll be
The idol of the cycling world!
I'll make a tire both fast and fair
Which punctures only fill with air."

HIS FIRST IMPRESSIONS.

Mr. Editor, having become a rider of the bicycle very much against my own ideas in the matter, as I have narrated in the columns of THE WHEEL of former issues, it was but natural that I should complete my fall by taking in, or I should say, by being taken in, by a bicycle show.

To an entire stranger, like myself, a cycle show baptism is an event not soon forgotten, nor yet one the baptized is anxious to repeat.

Very much like a visit to the Midway Plaisance is an evening spent at a cycle show. Everywhere there are throngs of people, everywhere is there a riot of coloring, there are varnished lights, there is the confusion of voices, and more than all else, there are wheels.

When the door first opens and the glare of the colored lights, which stud every column, outlining the different booths, there is a first short impression that the show looks very much like a church bazaar.

Every make of wheel that is displayed has its especial booth decorated in colorings to blend with the colored enamel in its frame. There are booths in pale blue, in black and

gold, in mahogany, in red and there are several gaily decorated in the colors of Old Glory, but the prettiest booth of all is the one that the women avoid.

That it was arranged by a man is evident, for what woman would have decorated a booth in the palest of gas-light green and then illuminated it with 200 incandescent green lights that fade the color from the brightest cheeks and cast horrible, ghastly shadows under the eyes?

Getting out of a cycle show is quite a serious matter. It is very much like leaving a church fair. There are so many men with circulars and catalogues and price lists and each visitor is urged to take one. Then there are a few exhibitors looking for agents and a good many agents looking for the unwary to whom they urge the superiority of their wares, and even when one is clear of the crowd within there are several little boys loitering about the doorway begging "tickets for the show."

Altogether I do not think the outsider can ever learn to enjoy the cycle show like the initiated do. It is an acquired taste and the acquiring of the taste is tiresome, or at least it was so to

JAMES S. FERMOY.

GETTING ON AND GETTING OFF.

"I don't think I could ever descend to riding a bicycle," superciliously remarked Mr. Shortley Upper-Krust."

"No?" answered Ding Bats. "You'd have to mount, you know. Later you might descend, however."

THEY ARE STILL TIMID.

To every wheelwoman the time comes when she supposes herself to be completely callous to her curtailed skirts.

"Pooh," she says to herself, "I was a perfect goose to ever mind them, when I can ride so much better with them. I really can't imagine why I should have ever felt so."

It is noticeable, however, that this peace of mind only comes to her when upon the wheel.

ILLUSTRATED TRADE NOTE.

"Our factory is now running overtime."

Let any accident or incident compel her to dismount and walk, however short a distance, in her abbreviated state, and she feels her face turn scarlet, while her self-consciousness is keyed up to concert pitch.

"I tell you how I feel when I'm obliged to walk in my cycle costume, confessed a wheelwoman the other day. "Exactly like I do in those horrible dreams that are the direct result of too much dinner, and where the dreamer finds herself upon Broadway in the full light of day, with a bathing-suit on. Whenever I dismount from my wheel and a downward glance shows the curtailed condition of things I have precisely the same emotions that I have in those nightmares."

If the truth were known, that is the way that many wheelwomen feel. Yet how well it would be if all this wasn't so, and if, prejudices and conventions set aside, cycling clothes could be worn even more than they are now. If for no other reason, it would be such a saving of time.

SOMEWHAT SIMILAR.

"Dis hyar amachoor stachus," observed Uncle Eph, "is er heap like confidence—if it iz once broken, may be yer can mend it, but if yer do, it alwus shows whar de break wuz."

Seats of the Mighty

ARE firmly secured on the Syracuse Bicycles. Celebrities in all walks of life own them. Prominent personages take their exercise, attend to their business, and win races on them. They are built of

A DRAMA IN ONE MILE.

Characters—Francis, a fellow; Annette, a girl.

Scene—Any old level country road upon a pleasant afternoon.

Properties—One pocket handkerchief. Tandem discovered traveling homeward, Francis B., Annette F.

Annette—"I'm sure this machine does not run as easily as it used to do!"

Francis—"Certainly it does. We're married now." (Remembers, after they were engaged, how he used to exhaust himself to the point of death going up hill, lest she should tire, because she was so pretty.)

"What do you mean?"

"Why, I don't work so hard." (Remembers before they were engaged, how he used to take her riding with her feet on the coasters so she might think him strong, because she was so pretty.)

"No, I think you don't; but I do." (Remembers how, when she formerly forgot to pedal, it did not matter.)

"No, Netty."

"How rude you are. I—"

"Don't try and look around; you'll have us over."

"Good gracious, shouting like that, and I know how to balance as well as you; I've been on a tandem oftener than you have."

"That's good, considering I have always taken you."

"Oh, have you?"

(Francis takes no notice, though he would like to know what she means; sees her waist and her neck and her pretty hair before him; thinks she is not so pretty as she was; thinks she does not do her hair the same; notices wrinkles across the back of her waist; is sure she never used to put on her jacket so.)

Annette (after a short pause)—"No, you didn't always take me out; someone else did. Ha-ha!"

Francis—"Yes, before—"

"No; afterwards."

"Do you mean that you let that scorching fool, Coychaser—"

"He's not a fool and he does not scorch."

"He's a bent-backed idiot."

"Now, you're angry."

"No, I'm not; I don't believe it."

"No, well don't."

"Anyhow, that does not affect the point. I often went tandem riding with—I'd better not say who."

"Oh, well, before—"

"No, not before."

"Now, you're talking."

"Am I? Did no one ever tell you about May Fletton?"

"Frank, you never took her out!"

"Be careful; you'll have us over."

"Frank, you didn't." (Tries to look around at him again.)

"Be careful, silly; yes I did."

"You shan't speak to me like that; I'll dismount."

Francis (making up the pace with a few hard strokes)—"That's what little May said, 'I'll dismount,' once, when I— But she didn't mean it." (Tandem goes at the rate of twelve miles an hour.)

"Oh! How dare you! 'Little May'; you know she's tons! Oh, I wish mamma could hear you. I'll never come out again, never!"

Francis (to himself, pedaling hard)—"Dear, dear, little thing." (Sees a stray curl and her little ear; is awfully sorry; wishes he had not vexed her; tries to see by her back whether she is going to cry or not; thinks she is.)

"Netty, you know I don't mean anything." (She does not answer; he leans forward, his face over her shoulder, instinctively, by practice.)

Annette—"Don't." (Swings suddenly aside. Tandem lurches violently.)

Francis (bracing up and recovering)—"By Jove, you nearly did it that time. It's a foolish trick. Do you want to break both our necks?" (Back pedals for all he is worth.)

Annette—"Now, you've called me a fool—yes, you did—I don't want to hear—don't—don't speak to me—I'll tell—mam—I'll nev—I'll g— (Sobs; he sees her hand come round for her handkerchief; bicycle goes very slowly.)

Francis—"My own dear little girl, you must not, really; you know I did not call you any such thing, nor ever could—you know it. Netty, I was hasty, but don't, don't; I know

RESULT OF WINTER THOUGHTS.

Certain psychologists assert that "We learn to swim in winter and to skate in summer." This is based on the theory that habits crystallize into perfection during the lapses of their exercise, and according to the theory, the majority of last season's graduates from the cycle academies, at least, are at present learning to ride.

There are a large number of persons who will dispute the theory advanced by the psychologists, but at the same time there are a few persons, who have not had experiences which would tend to indorse it and attest its truth. Frequently it is remarked by a tennis player, when he plays his first game at the opening of the season, that he plays better than he did at the close of the former season. It is so with dancing, rowing, swimming and other forms of physical exercises

HAD GREAT EXPECTATIONS.

Man with the mitts on—Where are you goin' with that pie-box?

One with the nightcap—Goin' to the Cycle Show, of course.

"What 'cher want that go-cart for?"

"To carry home the souvenirs I'm goin' to get; what 'cher think?"

it was wrong. I should not—Oh, my girl—don't cry like that, you'll make me—"

Annette—"G—go—on; I want to get home."

Francis—"No, no; we must make it up. I can't bear this" (in her ear) "dearest—all you are to me—remember—Netty—come." (He leans over and kisses her; she tries to turn to him; the tandem upsets.)

IDIOTIC AND INAPPROPRIATE.

"Is Pedalson likely to become successful as a racer?"

"Oh, I don't know; he's got one of the marks of a racer about him."

"Has he? What is it?"

"Never starts in a race without the American flag tied around him for a waist-band."

Of two evils in a wheel a great many people are not satisfied unless they choose both.

in numerous instances, and may be so with cycling.

What seems to be the most reasonable explanation for the change for the better wrought during the times when no riding is done by the society cycle school graduate, is the fact that the thought of riding is not entirely absent from the mind, and that reflection on the subject has a tendency to rectify any faults that have been acquired by habit, for in thinking of riding one naturally thinks of riding as correctly as he knows how.

Hence it is not improbable that at the opening of the riding season there will be less bowed backs, awkward poses and distorted feet, and in general a more erect and graceful carriage noticeable in this class of riders. Whether there will be any salutary effect upon the garb affected by women cannot be determined by the application of the theory, without a close study of Sartor Resartus as well.

STORY OF THE SIMPSON SLUMP.

The Simpson chainties are to sail for home! May joy go with them! Their's has been a far from successful raid on America, and the cause of the failure is not far to seek. At the bottom of it all is Mr. Simpson's (the angel in the case) well-known contempt for cycling tradition, and the cycle papers. It cost the suffering English stockholders of Mr. Simpson's company just \$30,000 last year for this loss-making crochet of their patron saint. To the same defiance of those who are nearest to cycling in this country is the present failure of the Simpsonite's raid to be attributed.

When Mr. Simpson, in looking over all the available men of Great Britain, could find none who came nearer to filling the role of manager than Ed. Plummer, he paid as poor a compliment to his own Simpson sagacity as he did to the managerial ability of Great Britain's sportsmen. America knew Mr. Plummer years ago when, with the name of "Shorty," he dallied with the sporting events upon a now defunct daily. America never then thought Mr. Plummer was either a great scholar, a clever diplomat, a representative wheelman or a likely candidate for honors in any of these directions; since Mr. Plummer has visited this country as a Simpson chain team manager he has done nothing to make America change its opinion of him. He is the same "Shorty" as of yore, neither more nor less.

Landing here with one of the greatest riders of the world at his beck and call, what does "Manager" Plummer do? Proceed to get the boom for the Simpson chain which was within his grasp? No, indeed; not he! He rushes to his old haunts and has pictures of Linton's legs published in the daily papers. Wonderful managerial ability! Great advertisement for Simpson chain!

Time passes, and the birth of a wonderful close partnership is seen, all of which proves that Mr. Simpson knew what he was about when he invaded America with his manager and methods. The component parts of this partnership were exceedingly weird, consisting as it did of a manager of prize fights, an official referee thereof, a minor baseball manager, a local official of the League and an American racing man of some note. Truly, a fine aggregation of talent to attract cycling attention to the Simpson aggregation!

That the public might not by any possibility get onto the merits of either the men or their machines, the aggregation went barn-storming. A fair sample of the profound wisdom of "Manager" Plummer and the close corporation was in billing their talent at a little coal-mining town away up in the Allegheny Mountains, where, on a seventeen-lap track, with unraised corners, a ten-mile "race" was run and won in the alleged time of 37.55, with Marks and Warburton both beating out Linton.

If all this was not enough, the public is treated to an alleged difference between "Manager" Plummer and the baseball member of his partnership, wherein "Manager" Plummer fairly froths at the mouth in his anxiety to wager \$5,000 that his man Warburton can defeat E. C. Bald in a sprint race, the baseball man almost swallows his hat in his expressed anxiety to put up the \$5,000 for Bald. Where either of the partners had suddenly become so wealthy as to back their opinions with \$5,000 no one who knows either

of them can possibly conceive. To sum up; the Simpson invasion from a racing, advertising or sportsmanship standpoint was an out-and-out failure, the direct result of an attempt to break into cycling with a mouth, a mitten and a mask, instead of through the regular channels, which lay neither through a 24-foot ring, a baseball diamond nor a Plummer-like "manager." All this and more Mr. Simpson may learn in time.

Sudden swallows swiftly skimming,
Sunset's slowly spreading shade,
Silvery songsters sweetly singing,
Summer's soothing serenade.

Susan Simpson scorched sedately,
Stifling sobs, suppressing sighs,
Seeing Stephen Slocum, stately,
She stopped, showing some surprise.

"Say," said Stephen, "sweetest sigher;
Say, shall Stephen scorcherlessly stay?"
Susan, seeming somewhat shyer,
Showed submissiveness straightway.

Summer's season slowly stretches,
Susan Simpson Slocum she—
So she signed some safety sketches—
Soul sought soul successfully.

Seven Septembers Susan swelters;
Seven sharp seasons snow supplied;
Susan's satin sofa shelters
Six small scorchers, side by side.

POLITE, BUT POSITIVE.

A cycle agent who found during the recent monetary stringency that ordinary dunning was not having any effect as a money producer, turned all the accounts on his books over to a lawyer famous for his ability to collect bad accounts. A polite notice of the transfer was sent to the slow-pays, both by the cycle agent and the lawyer. A few responded; many did not. Then the lawyer sent a notice and the result was astonishing. The note read:

"Sir, if you pay the enclosed account of Mr. Chargemore, you will oblige me. If you do not, I shall oblige you."
That did the business.

WHAT THE BUZZING WAS.

"See here, if this infernal thing does not stop soon I'm going to move. I never heard such an infernal buzzing in all my born days!" said the weary-eyed Mr. Homestay, as he thumped the kitchen table in his flat, near the Coliseum, Saturday evening.

"It's too bad, dear," said his sad-faced wife.

"I'll be dead soon, if it doesn't end," said Mr. Homestay, fiercely. "I only wish I could find out what it is that causes it. Seems to me that the machinery hall from the World's Fair, the Cable Works, the Salvation Army drum corps and the Republican primaries are all giving a concerted sort of continuous performance in this neighborhood. It will drive me to strong drink, meaning Lake Michigan aqua impura of course. I must go and find out what it is."

Mr. Homestay grabbed his hat, gave a hasty kiss to his wife and was gone. He went into a near-by saloon. He ordered whisky and took a generous drink of it, after carefully pushing aside the deadly aqua the barkeep proffered him. Then he leaned over the bar and said confidently to the barkeeper:

"Say, d'ye know what this infernal buzzing means around here?"

The barkeeper looked at him with a sort of well-he-hears-it-too expression. He pointed his finger across the street at the Coliseum and then significantly tapped his forehead. Mr. Homestay looked at him in amazement and concluded that the buzzing had driven the bartender crazy. "Poor devil, I don't wonder!" he murmured, as he stepped out.

Mr. Homestay went to a saloon on the next corner. He bought another whisky and asked the same question. This bartender pointed at the Coliseum, and tapped his forehead. He's gone, too, poor devil," said Mr. Homestay as he wiped away a tear. Then he went to the saloon across the way.

The same performance was gone through. He went to several other places, but without a variation in the programme. He was quite mellow when he got through the round of saloons, and the buzzing was worse than ever.

A Chicago policeman was standing on the corner debating whether it was safe for him to be out at that time of the evening with \$3.25 in his pocket and the town full of sand-baggers, as Mr. Homestay was making zig-zags on his way home.

"Shay, can you—hic—tell me whash cause of the buzz in the air—the buzz-buzz, off-sher?" asked Mr. Homestay.

"Why, it's wheels," replied the officer.

"Yes, I know that dam well, but whersh the wheels—whersh the engines?" was the query of Mr. Homestay.

The officer pointed his finger at the Coliseum. "Over there—the Cycle Show," he said.

"Yes, but the bicycles ain't going round, and theres no machinery there," said the triumphant Mr. Homestay.

The brave guardian of Chicago's safety looked at him pityingly. "Why, the wheels I mean are the wheels in the heads of the 20,000 cranks who are in there talking of sprockets, saddles, tires, pumps and diamond frames. That's where the buzzing comes from."

Mr. Homestay fell on his shoulders and wept. "It lasts a week, too, oh Lord!" he sobbed.

MAY BE RIDDEN DEFLATED.

As a general thing, when an inventor of a hygienic saddle makes his debut in the cycling world, his first utterance informs the public that his unknown saddle has been more or less voluminously "endorsed by nu-

merous physicians," all prominent, of course, but unnamed. In this respect the Perry saddle differs from the general run. It is not wholly new, but its makers, the Pneumatic Saddle Co., Nos. 55 and 57 West Washington street, Chicago, have written testimonials to support their assertions.

The concern is just now showing the '97 Perry. It is formed with a stamped steel base, combining lightness and strength; this base is covered by a layer of felt, to prevent friction between the metal and the rubber cushion, which is next placed in position. This cushion, by the way, is the product of Morgan & Wright, and is constructed upon new and original lines, rising but seven-eighths of an inch when fully inflated. It rests upon the solid base, and when deflated may be ridden with perfect security. The saddle is finished with a covering of the finest oak-tanned leather in black and various shades of tan. Arrangements are being made to introduce the saddle in England, France and other foreign countries; it is fully covered by letters patent.

ORDERED BY CABLE.

Few, if any, cycling accessories have scored a quicker or more emphatic success than the Haney 10,000-mile cyclometer. Although it is less than three months since the attractive little instrument made its appearance, it has won wide and substantial recognition that must be gratifying to its makers, Oliver, Straus & Co., of this city. Additional and telling evidence of this recognition came via cable last week—an export order that mounted into five figures with a contingent contract for twice as many more. Oliver, Straus & Co. are not disposed to give publicity to the figures, but there is small doubt that the order was one of the largest ever negotiated for an American accessory of the sort. The Haney is so full of "talking points," the fewness of its working parts, the entire absence of springs, and its size, weight, price and appearance, that all contributed to the effecting of the contract. As the factory has a capacity of 5,000 cyclometers per day, however, all demands will be easily met.

CASE OF FATTED CALF.

Miss Slender—Do you think there is anything wrong in wearing golf stockings in place of leggings?

Bessie Buxom—I don't think anybody ever saw anything wrong in mine.

The speed superiority of many racers is merely local. They are fast because their immediate associates are slow.

INTERESTING TO THE TRADE.

Anyone engaged or interested in the manufacture of bicycles whom J. J. Ryan & Co., of Chicago, cannot interest is a most lackadaisical individual, indeed. On the premises, Nos. 68-74 West Monroe street, Ryan & Co. claim to have the largest jobbing brass foundry in the United States—they operate 40 furnaces—but this is not the particular reason why they are worthy of general concern. It is the steel-bronze cycle parts which they manufacture that draws attention to them. This metal, they assert, does not crystallize and is more economical to work than any other. It may be nickelplated without the usual undercoating of copper, and has other advantages worthy of consideration, which must be of interest to the whole trade as before stated. Ryan & Co. are good people to have in mind in the event of a rush or a delay. Their facilities are such that they can handle almost any kind of an order for patterns or parts on the shortest possible notice. During the slack season they turned their attention to the man-

ufacture of aluminum dress-guards, illustrations of which are here shown, and are in position to dicker with all who require an accessory of this sort. The guard carries with it a new means of attachment to the frame.

AVOIDING PEDAL JUGGLERY.

If Toplift & Ely's Elyria pedal, taking its name from the firm's location in Ohio, attains a particularly wide range of popularity, there may be some grinding of teeth in the toe-clip market, as the most important talking point of the Elyria is that it is designed to avoid the use of and render toe-clips unnecessary. As will be seen, the clamps, which form a part of the side plates, are

curved inward and set obliquely to the pedal. They are adjustable to any width of shoe, and are claimed to prevent slipping of the foot without marring the uppers of the shoe or cramping or pinching of the toes, a fault of some clips. Another claim advanced is that the Elyria is as easy to "catch" as a pedal without clips, which means that there is none of the "juggling for the pedal" so usual when toe-clips are employed.

BOLTLESS SYLPHS.

"The boldest Sylph runs easy." Such is the 1897 paraphrase of the old saying that "Sylph cycles run easy." The Sylph makers, Rouse, Hazard & Co., Peoria, Ill., claim that experimentation has proven their construction

favors such running, in fact they ran a bearing like that shown on the '97 Sylph 27,000 miles under 120 pressure without appreciable wear. They control for the Sylph and Overland the exclusive use of the Benson two-piece crank, shown in the illustration, which is so simple that without previous experience and without even unbolting the chain it has been taken down in fifteen seconds. Their direct oiling device shown on the hub suggests a comparison with one of the newest 1897 wrinkles in buggy and carriage construction, which is giving phenomenal results by securing a constant film of oil around the entire surface of the rotating hub.

The cut of crank axle group also shows their form of boltless detachable sprocket, and the disc adjustment, which secures more accurate bearings than the old time cone adjustment.

STRANGE, BUT TRUE.

Charles E. Strange, of Taunton, Mass., is preparing to market a simple and effective mud guard which was first patented in 1894, but which he has recently brought to a higher form of perfection. The guard consists of two steel spring wires, which run from the hubs to a point directly over the tires of both wheels, where they are attached to a vulcanized rubber pad. The pad comes in close contact with the tire without striking it. When the wheel is in motion it quivers, and is said to scrape off all the mud or dirt that may cling to the tire. When not in use it can be shut up against the frame where it is scarcely noticeable. The inventor has ridden a wheel fitted with the guards through the muddiest streets of Taunton without soiling his clothes in the least.

GOES WITH THE MONARCHS.

A. D. Brown, formerly associated with H. A. Lozier & Co. and the Davis Sewing Machine Co., will represent the Monarch Cycle Manufacturing Company during the present season in Eastern Ohio and Western Pennsylvania, with headquarters at Columbus.

EIGHT-SIDED AFFAIR.

The use of hexagon tubing has been extended to the handle-bars of the Shelby Cycle Mfg. Co.'s Ideal bicycles.

RING UP THE CURTAIN!

The Cycle Exhibition Season Is On—Actors in the Forthcoming Chicago Show.

When the clock marks 8 p. m. on Saturday and fairly inaugurates the Chicago Cycle Show, the second held under the auspices of the National Cycle Board of Trade, it should find the function further advanced than any

Monday and until the Saturday night following they will be open from 2 until 11 o'clock p. m. The morning hours will be reserved exclusively for the trade. Express trains operated on a twelve-minute schedule will be run frequently, and will land passengers practically at the door of the building. Writing, stenographic and typewriting rooms, telegraphic and messenger service and a branch post office will be among the conveniences provided on the premises.

MAP SHOWING THE CYCLE TRADE AND HOTEL DISTRICT OF CHICAGO.

previous exhibition of the sort. Manager Pattison has left nothing undone to assure such a state of affairs. The platforms and railings are already in place, the decorations will be completed to-night, and as the exhibitors will have had Thursday, Friday and Saturday to get their displays in place and properly arranged, there is reason to believe and expect a completeness which has not hitherto characterized an inaugural night.

The doors of the Coliseum Building, located on the site of the World's Fair at Sixtieth street and Grace avenue, will be thrown open to the public at 8 p. m. Saturday. On

The following is the full list of exhibitors and the spaces apportioned to them:

Aeac Mfg. Co., 8th and Poplar Sts., Reading, Pa. 92, 93, 160, 161.
 Adams & Westlake Co., 110 Ontario St., Chicago, Ill. 200, 201 and 216, 217.
 Aetna Wax Mfg. Co., 389 Elizabeth Av., Newark, N. J. 380.
 Aladdin Lamp Co., 518 Broad St., Newark, N. J. 118.

The Worcester Cycle Company will exhibit at the Auditorium Hotel.

ON BUSINESS ONLY AFTER DARK.

Japan having first carefully imitated the crack-brained "wise men" of America and England by having her alleged "wise men" declare cycling an unhealthy and dangerous thing, now still further imitates by tackling the speed ordinance game. Kiobe has just issued a set of regulations governing the use of bicycles in its streets. They are much the same as those adopted in this country, except that riding for pleasure is prohibited after dark. One may ride on business, then, however, provided he goes slowly and carries a lantern.

SUITED TO THE CASE.

"In this case against my client for stealing a pair of bloomers I move for a non-suit," said the famous female lawyer, who appeared for the defence.

"On what ground?" asked the judge.

"On the ground, your honor, that, even in these days of abbreviated cycle costing, a whole suit can't be made out of a pair of bloomers," replied the Portia of the pedal.

The judge believed the point to be well taken and discharged the prisoner.

CAUSE FOR EXCEEDING JOY.

"I don't see how you can smile after such a narrow escape from the horses' feet, all battered up as you are!"

"Smile! why, I can laugh! Just think, my wheel wasn't touched!"

Truth crushed to earth will, if she is wise, sue the truck-driver who run her down for damages to self and wheel.

CLEANING TANKS.

The best and most convenient tank to use for rinsing and cleansing parts of bicycles previous to plating or enameling I ever saw, was made after the following description: Length of tank 12 feet; width, 5 feet; depth, 3 feet; inside measurements. In the middle of this tank (A) (see Fig. 2) make two partitions just one foot apart, then leave on one side of the tank, and in each of the partitions, a gate-hole with a close-fitting gate. On the inside of the tank, at the bottom, make a shelf (C) six inches high. This shelf is for the inner tank (B) to rest upon as shown. Over the space, in the middle of the tank, place a small rotary pump (E) of about one foot in diameter, driven about six hundred revolutions per minute with the belt as shown. Then run a 3 or 4-inch pipe (D) from the pump to with-

in two inches of the bottom of the tank.

Now fill the main tank two-thirds full of cold water, put in enough of the salt and water until the liquor in the tank stands $1\frac{1}{2}$ degrees by the hydrometer, then add the alum water until it increases in strength to 3 degrees; then add to this sulphuric acid until the strength is increased to 7 degrees; also the regular cleansing ingredients, and the tank and bath are ready for use.

The novelty of the arrangement is that the pump (E) constantly draws the cleansing liquor into (C) and deposits it into the device again through (F), thus keeping the liquor circulating through the perforated bottom of the inner tank, and the bicycle parts which are in the tank.

It is a well-known fact that rust on any part of the machine will spread quickly, after one spot has been affected. This seems particularly so in regard to cycles. I have had many cases of spokes breaking owing entirely to the rust eating the metal as (A) in Fig. 3, or as at (B) Fig. 4. Set screws are taken off at the threads as at (C) Fig. 5. Neither air nor water causes much rust, as long as they do not act simultaneously. Metal can be preserved for months under water without rusting, provided the water has been deprived of air by boiling and further access of air be-

cut off; on the other hand, it will remain unaffected for a long time in dry air. Iron will rust very soon, though, when brought into contact with ordinary aeriferous water, which opportunity is offered especially when aqueous vapor condenses on iron by cooling, and, of course, by rain also. Painting, enameling, nickeling, etc., will, of course, prevent excessive rust of parts, but much rusting could be avoided if bicycles were kept in perfectly dry places and free from contact with moisture.

Cleaning parts of bicycles from rust, dirt, oils, etc., where oil of turpentine is insufficient, is well and quickly effected by the following solution, viz.: To 1 litre water add 180 grm. soda or 15 grm. caustic soda, and boil the solution. Pitchy small parts are thus put into the vessel, and either boiled for 2 or 3 minutes, or left in the solution 5 minutes without boiling. All dried-up oil, pitch, etc., is thereby dissolved. The parts are then rinsed clean and dried.

In order to clean parts from foreign matters which are not otherwise removable, I have made a device like that in Fig. 6. This consists of a wrought-iron cylinder 10 inches in diameter and 6 feet long, which is mounted on pairs of friction rollers (A B). The drum is revolved by suitable belting and pulleys at one end. The parts to be rattled are fed into the drum at one end. The apparatus has a downward incline from that end to the other, so when it revolves the parts move slowly from the mouth to the opposite end, where they are delivered freed from impurities. The butts (C) keep the drum in place and the shaft (D) connects the friction drive rolls. This form of rattler will also serve in a shop to rattle sand and filings from new castings.
 GEO. D. RICE.

HIS TASK AND HIS TRAINING.

No athlete, however strong and well he may be, can take part in any severe contest and escape injury unless he be properly trained. If a person rides one mile on a bicycle in three minutes he will be much less exhausted if he rides each quarter of a mile in forty-five seconds than if he completes the first three-quarters of the distance in two minutes twenty-five seconds and spurts the last 440 yards in thirty-five seconds. In the racing of to-day the time of the "last quarter" averages about twenty-seven or twenty-eight seconds.

To attain such condition as will justify a man in subjecting himself to such stress of competition the racer requires, in the first place, a thoroughly sound and healthy organization and a body that has been habituated to rational work and exercise. It is impossible to step from the armchair or desk to the training ground and get "fit" in the same time that would be required by one who had been an athlete "from his youth upward."

In the second place, even when the soil is good and well prepared, the seed sown requires a long, steady and continuous cultivation before the harvest of perfect condition blossoms forth into that "fitness" which makes contest a joy, toil a pleasure, and is the very essence of life and wine of existence to the racer.

Profanity is useful to think of when a particularly aggravating accident happens your machine or self, but it never should be mentioned, just the same, accident or no accident.

IN NATURAL GASVILLE.

Findlay, O., Jan. 17.—During the last two weeks bicycle salesmen have been as plentiful as is the odor of gas with which the air here is laden; in fact the dealers say that just about one-half of their time is devoted to the inspection of new models in the hotel sample rooms and to hearing the clever explanations of the respective merits of flush and outside joints, two and one-piece crank axles, direct and tangent spokes, and the rest of the tale that the salesman has learned by heart.

Brobst & Porter Bros. have the largest hardware store in town and do an extensive bicycle business under the management of Mr. Askam, one of the firm. Their wheels for '97 are Barnes, Fox, Ariel, Halliday, Stormer, Rochester and Featherstone. All excepting the first two were handled last season.

Next door to them and dividing honors as to business done, are Steen Bros., who also deal in hardware and sporting goods. They will continue to handle the Cleveland, Rambler, Waverley and Crescent, but have given up the Victor agency, which they held for a number of years.

Another hardware firm doing a good business in bicycles is Gassman Bros., whose line is the Winton, Falcon and Gendron. They have dropped the Remington agency.

C. C. Van Tine, who did a good bicycle business last season, does not appear to be making preparations for this season. He had the Barnes, Stormer and several other lines last year.

J. R. Bridges, whose specialty is difficult repairing and machine work, has accepted the Quaker agency.

John Ruthrauff, a hardware man, will again handle the Sunol and Hercules, but will make no special effort.

Thompson, the jeweler, who sold Outings last year, has decided not to continue this branch of his business.

Mansfield, O.—Hering Bros. have opened an exclusive bicycle store, where they will handle the Eclipse and Tribune. Their repair shop will be equipped with lathes and enameling oven.

Marion, O.—Kling & Wilson have dropped the Columbia and secured the Eclipse agency in its place.

Cunningham & Stowe will not handle bicycles any longer, as Mr. Stowe, the bicycling member of the firm, is about to retire from the concern.

Lima, O.—J. W. Rowland, a furniture dealer, has secured the Waverley agency.

WILL BEGIN WITH \$1,000.

Articles of incorporation were recorded last week of the Lock Sprocket Company, an East Orange, N. J., concern, organized for the purpose of buying, selling and dealing in bicycle appurtenances. The capital stock is placed at \$100,000, and business will be begun with \$1,000. The incorporators are Joseph Askins, of Ridgefield, and John S. Parker and Howard K. Wood, of New York.

AMERICAN WHEELS IN FRONT.

In the great Austral Wheel Race, the first and second prizes in which were \$1,750 and \$1,500, respectively, American wheels were largely in evidence. The winner rode a Canadian Red Bird; the second man, a Dayton; the third, a Barnes. At \$10 per man the entry fees netted \$1,525.

ORIGINAL CYCLE SPECIALTIES.

Frank B. Ray, of this city, who was first to mould and make saddles to fit the form of the individual purchaser, and who quietly scored a great success, has organized the Ray Cycle Specialty Co., with headquarters at No. 153 West Thirteenth street, and in addition to his saddles, will market an ingenious home trainer, a folding tool bag and several other nicknacks of his own design. Mr. Ray and his goods merit attention and approbation.

QUILTED SADDLES.

The latest productions of the Garford Mfg. Co., Elyria, Ohio.

THEY FAVOR IT.

Early in January all the retail dealers and repairmen of Memphis, Tenn., formed the Memphis Cycle Trade Association, with these officers: President, C. J. Scherer; Vice-President, W. H. Withers; Secretary, Jerome P. Parker. The association desires to be put on record as heartily in favor of the proposed formation of a National Dealers' Association, and will have representatives at Chicago during the proposed meetings.

FEATHERSTONE'S STABLE.

Alfred Featherstone, the Chicago cycle manufacturer, has purchased one of the greatest stables of first-class race horses in the West, according to a St. Louis paper. He has for several years been an admirer of horse flesh and horse racing.

Albert Ivimy, of No. 104 Howe avenue, Passaic, N. J., desires to communicate with makers of home trainers.

The Elastic Tip Co., of Boston, is being represented in New York by C. R. Moules, who will establish headquarters here.

WILL HOLD FIVE HUNDRED WHEELS.

The Tinkham Cycle Co. are entirely overhauling the salesroom at their headquarters in the Tinkham Building, 306-10 West Fifty-ninth street, New York. The salesroom, although the largest in the country, has proven inadequate for the business of the Tinkham Cycle Co., and the alterations have been made for the purpose of giving added storage space for stock. When finished the room will comfortably hold 500 wheels. This will not in any way interfere with the cycle track, twenty-five laps to the mile, which runs around the centre of the room, and is used by customers to try their mounts before purchasing. The walls are being finished in light olive green and the floor will be covered with heavy Brussels carpet of the same color, only a little darker. The pillars and trimmings will be in gold. Handsome mahogany benches are being provided for the convenience of customers, and an adjuster's bench of the same material. During the season an expert adjuster is always on duty in the salesroom, whose business it is to adjust and oil the wheels of any of the patrons of the company who may come in, free of charge.

INFLATED BY HYPODERMIC NEEDLES.

While the ball tire was one of the earliest improvements advocated on the original pneumatic tire, it was never so attractively or ably presented as it is in the '97 catalogue of the Ball Tire Co., of No. 156 Fifth avenue, this city, which concern has improved greatly on the original ball tire, and intends to push it earnestly and energetically. The name of the tire, as the "new element" may not know, fully explains its construction. It is nothing more nor less than a series of rubber balls ingeniously secured around the rim, each detachable and independent of the others, so that a puncture merely affects one ball and not the whole tire. The balls are inflated by a hypodermic needle, and as rubber only and no fabric is used, the tire is claimed to be more resilient than any other.

NEWTON DEPOTS.

Newton tires have been making such an impression in the West that the Newton Rubber Co. has found it necessary to establish a depot at Chicago, at No. 132 Lake street. H. P. Lowe is in charge. Stephens & Hickok, Los Angeles, Cal., have also been appointed distributing agents for the Pacific Coast. In the East, the Very Cycle Co., Boston, has likewise been designated a Newton depot.

STILL SELLING TUBING.

Herbert M. Campbell, formerly with the Seamless Structural Tube Co., of Brooklyn, N. Y., is now established at No. 231-235 Greenwich street, this city, as manufacturer's agent. He is, however, still handling tubing and forksides, both seamless and brazed, also saddle posts and cycle supplies generally.

WARM ARGUMENT.

When through faulty construction or lack of attention the rider's lamp becomes red-hot, is it not always correct to refer to the state of affairs as a burning shame?

A skirt divided against itself is something an artistic public will not stand.

CYCLING NOT A CLIMATIC AFFAIR.

To the man or woman who really rides a bicycle it is amusing to read the sage advice of non-riding quidnuncs regarding the off-season in cycling. According to these romancers riding a bicycle is a fair-weather, spring-and-summer-day sort of thing, that necessitates a careful and constant watch of Weather Bureau reports and results.

Never were facts more at variance with theories. Weather conditions are a factor only in a minor degree in the growth of cycling. In fact, it might almost be said the worse the climatic conditions, the greater the cycling. Vide New England versus the South in this country, or if still further proof be needed, it may be found in this: The duration of sunshine in the various countries of Europe was recently discussed at a scientific meeting in Berlin. It was shown that Spain stands at the head of the list, having on the average 3,000 hours of sunshine a year, while Italy has 2,800 hours, Germany 1,700 hours and England 1,400 hours.

To those who know anything regarding the proportionate use of the bicycle in the three countries named, it is beyond dispute that England, with only 1,400 hours of sunshine, has five times as many users of the wheel as Germany, Italy and Spain combined; while Germany, with but 800 hours more of the "glorious" than England has, outranks, in a cycling way, Italy and Spain as far as England does the trio. The story still holds good in relation to the comparison between the cycling population of Italy versus Spain.

To come to the original argument. England, the least blessed in a weather way of the four countries named, excels in cycling, while as the list of pleasant hours increases so does the cycling interest decrease, until Spain, with the most perfect climatic conditions, has the smallest number of riders of the bicycle. Facts are stubborn things to all except space-writers on cycling, who calmly ignore facts when slush is sought; to others, however, it would seem that the quidnuncs' statements about the necessary twinning of sunshine and cycling, exists only in quidnuncian noodles—that is, if anything, except a vacuum, exists there.

In taking chances when riding through crowded traffic, first look out that they are not against you.

NEFF NO STRANGER.

W. A. Neff, with headquarters in Cleveland, who has been the general sales agent for the Reading Cycle Manufacturing Company, has done so well that he has been called to the factory in Reading, Pa., where he will be installed as general manager. He is no stranger to the duties.

SHE WAS MRS. CLEVELAND.

A young man on a wheel was confidently riding up a Washington street. A heavy carriage drawn by two prancing bays came spinning up the street at the same time. The young man was fairly run into the gutter by the turnout, and to save himself from being crushed he jumped off his wheel. The bays were drawn up to the curb in great style and the lady occupant of the carriage stepped out to go into a store. She instantly took in the catastrophe. The wheel was almost a wreck and the rider was looking around for his hat. She stepped right up to him and inquired if he was hurt. Being assured that he was not, she took out a card and wrote a few lines on it and gave it to him, saying:

"Have your wheel repaired and send the bill to Mr. Thurber with this card. I am very glad you were not hurt."

The signature on the card was "Frances Folsom Cleveland."

Gormully & Jeffery Mfg. Co., Chicago, Ill.

CROCKETT CYCLERIZED.

"Be sure you're right, and then go ahead," might be a pretty good motto for some folks," said the man with a bargain-counter wheel, "but whenever I go riding with anyone, and the usual accident happens my wheel I find that 'Be sure you're left, and then go afoot,' just about fills the bill."

A ONE-DAY RECORD.

On Saturday, January 9, the Monarch Cycle Mfg. Co. shipped 1,349 bicycles, the largest number that ever went out of their factory in one day, a fact which forcefully gives the lie to unauthorized statements that the factory was not in full operation.

NOT VERY FLATTERING.

"Is that \$1.69 tire they are selling at Gracey's drygoods store any good?"

"Is it? Say, that tire wouldn't hold molasses in cold weather, much less air in any weather, see?"

STRIKES ONE THAT WAY.

The nervous wheelwoman may be quite given to wringing her hands and sadly need a bell, even though her own belleship be unquestioned.

HE IS EXTREMELY NUMEROUS.

"What's a clever League politician?"

"Oh, he's a delegate that doesn't have to stop talking in the assembly when he hasn't got anything more to say."

THE KOKOMO KORKER.

The "Kokomo Korker" is the catchy title given to a repair tool for single-tube tires of recent creation by the Kokomo Rubber Company, of Kokomo, Ind., manufacturers of the well-known Kokomo line of tires. It has the merit of simplicity, and it does the work.

It is ready for business when the cap is removed. The compound is forced into the tire by turning the button at bottom of tool (the button operating the plunger inside) two or three times to the right.

The Korker is refilled by turning the button to the left till plunger is forced to the bottom, when the top is unscrewed and the compound inserted.

WHAT THEY WILL ALLOW.

Several associations of cycle dealers in various cities have adopted the following scale of allowances on wheels taken in trade for '97 mounts:

	1896.	1895.	1894.	1893.
Class 1.....	\$55	\$35	\$25	\$15
Class 2.....	45	25	18	12
Class 3.....	35	22	15	12
Class 4.....	25	15	10	—

Class 1 consists of machines that are not sold at less than \$100, class 2 consists of machines sold at from \$80 to \$95, inclusive; class 3 consists of machines sold at \$55 to \$75, inclusive; class 4 consists of machines sold at \$50 or less.

THE NAME EXPLAINS.

In one name, at least, there is something—the Comfort Spring Seat Post Company. It tells the entire story. The device is meant to ease the jars and jolts to which cycling is heir, and its makers say that it well deserves its title.

The post may be used on any wheel, and is adjustable to any saddle or any weight. It is made of fine tool steel, nickel-plated, and it is "guaranteed to outwear two wheels." It has no grooves or slots to grind or bind or to fill with dirt, and is of neat appearance. The posts retail for \$2.50 each.

SETTING THINGS STRAIGHT.

John H. Graham & Co., No. 113 Chambers street, New York, are the sole sales agents for the Slaymaker-Barry Co.'s line of bicycle locks. In the latter company's advertisement last week a list of jobbers was printed, through an error, which rightly belonged in the America Cycle Mfg. Co.'s announcement. This statement is made to enlighten those who may have been puzzled by the unfortunate transposition of the types.

PUMP AND WRENCH COMBINED.

In addition to their line of saddles the Beck Bicycle Saddle Co., Newark, N. J., is introducing a novelty in the form of a tool in which a wrench and a tire pump are combined, and which, when not in use, collapses, and to all outside appearances becomes a neat nickled tool case about twice the length of the metal match cases carried by the average man. It looks all right, and the Beck people say that if it does not so prove in actual practice, they will refund the purchase price.

BICYCLES AND PAPER.

In addition to its other wares, the Scott Paper Co., Philadelphia, Pa., will engage in the manufacture and sale of bicycles. They will market three grades—at \$100, \$75 and \$60, respectively—all "high-class, up-to-date wheels," they assert, and proclaim an array of "attractive prices" to both agent and jobber.

'97 MODELS, PATEE BICYCLES.

Price, \$60.

Price, \$100.

Price, \$60.

PEORIA (ILL.) RUBBER & MFG. CO.

IT WILL ROIL THEM.

"Made in Germany," is a term that roils the average English merchant as greatly as the sight of an American bicycle roils Henry Sturme, of the "London Cyclist." What Mr. Sturme and the British cycle tradesmen generally will do and say now that the Fowler Cycle Manufacturing Company have taken the initiative in stamping "Made in U. S. A." on the Fowler nameplates, is a matter for interesting conjecture. Mr. Sturme, at least, will probably froth at the mouth.

PLANTING TRADE SEED.

H. G. Chamberlin, vice-president of the Bean-Chamberlin Manufacturing Company, of Hudson, Mich., makers of the Hudson bicycle, has been, the past few days, displaying goods throughout New York and New England. He established agencies in nearly all the more important cycling centres.

A MARK OF MERIT.

When an old and large concern like Hartley & Graham look with favor upon a new device, it is fair to presume that they have discerned substantial merit and selling qualities. They have just taken up the Ventilated

Cushion Grip, and in consequence its makers, the Ventilated Grip Mfg. Co., of Newark, N. J., are pluming themselves and pointing with pride to their claim that the grip is not only the latest but one of "the best and most needed improvements for cycling comfort." The article is made of flexible rubber, covered with soft leather, felt, etc., having perforations at intervals and air spaces at each end and around handle-bar. It fits the handle-bar snugly, cannot slip off nor break, and can also be used near head as well as at ends of handle-bar. It prevents perspiration, also "cramp" caused by vibration of bar.

HAS FIVE THOUSAND COMBINATIONS.

This paraphrase is seeing the light: He who steals my purse, steals trash, but he who steals my bicycle steals that which is more precious than riches. It is suspected that some locksmith is responsible for it. Even at that, it is not half bad, and leads fittingly to the most recent conception in cycle securities, the Brodie combination lock, made by W. H. Brodie & Co., Nos. 39-41 Cortlandt street, New York. While there are other such locks in existence, the combinations possible are limited in number. The Brodie article, however, vies with the burglar-proof

safe. Five thousand combinations had been figured out when the figuring ceased, but many more are possible. Each of the milled rings is detachable from the numbered tumbler, and may be given eight different shifts or changes; all rings and tumblers are similarly interchangeable, so that an idea of the possibilities is easily obtained. The lock is small, light and neat, and to all appearances otherwise all right.

Brodie & Co., who deal in contractors' supplies, also have a cycle stand under way—one embodying several new ideas. It will see the light shortly.

AND THE MORE IT COSTS.

"There's one very queer thing about record time."

"What's that?"

"The less it is the more attention it attracts".

THE LIBERTY CYCLE CO. J. H. TOOLE, Manager.

Kindly mention
The Wheel.

Take a piece of iron pipe, draw an air-tight rubber tube inside, bend the pipe into circular form and join it. You then have a tire. Inflate it. The pneumatic principle is there, but you would not know it, because iron pipe is not the right material to use. You want something elastic.

Take a piece of mosquito netting, make a tube of it and use it in place of the iron pipe. When inflated, the netting will burst. This is not right either. It is elastic, but not strong enough.

These are two extremes. Somewhere between them is to be found just what is right for the purpose. You will be sure to get it in the

Flexifort
(TRADE MARK) INNER TUBE TIRE.

PREPARED TO MEET ALL COMERS.

Before the committee now hearing testimony in Washington for the purpose of formulating a new tariff measure, many manufacturers of many kinds have appeared. In almost every instance, though, no matter whether the petitioner made mistakes or mowers, he invariably wanted his particular line "protected" against foreigners by the imposing of an advanced tariff.

Under these circumstances the testimony of H. W. Hartman, vice-president of the Ellwood Weldless Tube Company, of Ellwood City, Pa., was particularly noticeable, showing as it did, that Mr. Hartman had confidence in the ability of his concern to make tubing good enough and cheap enough to stand foreign competition without any "protection" against same in the shape of tariff discrimination. Asked by the committee what he thought the American tube makers needed in the tariff line, Mr. Hartman said he did not believe that the manufacturers of tubing asked for higher rates of duty, but they did desire a change from the present ad valorem to special rates. The industry, he said, was a comparatively new one in this country, and had been wonderfully developed in a comparatively short time. It was not a long time since bicycles and seamless tubing were imported in large quantities, but now this country was a heavy exporter, and in spite of undervaluation, frauds and other drawbacks, the output was increasing by rapid strides. If the duty, as provided by the Wilson law, could be honestly collected, the American manufacturers asked no further concessions, Mr. Hartman declared.

GO AND SEE THE "GOOD" PEOPLE.

During the Chicago show Morgan & Wright will be glad to have repairmen visit their repair department. There are several labor-saving knick-knacks that every repairman ought to see—not secret methods, but simple schemes for saving extra motions. They will show how a man can vulcanize almost any hole in an M. & W. tire without trouble, if he goes at it with both eyes open. To reach the M. & W. establishment take the Lake Street Elevated Railway to Ann street, and walk one block east to May street; or take Madison Street Cable Railway to May street, and then ask questions.

HEALING THE HOLES.

J. Stuart Robinson and Charles D. Lawrence, comprising the Lightning Puncture Healer Company, No. 59 Laffin street, Chicago, are marketing the Lightning Puncture Healer, a liquid "tonic," for injection into tires through the valve stem. The "tonic," they say, is largely an extract of the Corubaa plant, a South American growth.

The Fox Brazer—Fox Machine Co., Grand Rapids, Mich

WOLFFS ON THE COAST.

Henshaw, Bulkeley & Belcher, of San Francisco, have been appointed Pacific Coast distributing agents for the Wolff-American bicycles. The wheels have not been very well known on the coast, but under the new arrangement Wolf & Co. have good reason to expect a very much altered state of affairs.

Self-Oiling Aluminum Bearing Case used on the Bean-Chamberlin Co.'s Hudson Bicycles.

COMING WOOD ROADSTERS.

Springfield, Mass., Jan. 18.—M. D. Stebbins, for several years agent for the Spalding bicycle in this vicinity, is at the head of a company which is preparing to manufacture wooden bicycles on a large scale. Those interested with Mr. Stebbins are L. W. Spear, who will have charge of the agencies, Harry L. Burgess, who will be treasurer and purchasing agent, and G. P. Jones, an expert in metallurgy. The most radical departure of the wheel from other bicycles is the wooden frame, which is made of wood rods of rock maple or hickory, the connections being of aluminum-bronze metal. This metal is the color of 14-karat gold, light and very strong. It will not rust or tarnish, is the same color all the way through and is easily cleaned. The bearings of the wheel, it is claimed, are equal to those in all high grade wheels. The ordinary roadster will sell at \$50, but wheels with special finish will list higher. The wheel is susceptible of a high finish and its makers assert that it will stand any of the tests applied to leading high-grade wheels.

FITS ALL FEET.

Despite the multiplicity of competitors the Record pedal, which, in all truth, set the fashion to the world, or to America, at any rate, goes serenely on setting new fashions. The latest innovation which the Record Pedal Co., Boston, Mass., has introduced is an adjustability of the pedal that makes it possible to fit feet of any size. In announcing the fact the Record people state the case very logically, "When you buy a pair of shoes," they say, "you naturally expect that the shoemaker will pay a decent regard to the fitness of things. Now, why, in the name of common sense, ought not the cycle manufacturer be expected to show the same consideration? If you wear a No. 6 shoe, you certainly do not want a pedal big enough to accommodate a No. 11." And no one can say the Record people "nay."

CHIP OFF THE OLD BLOCK.

"Pa," said the cycle humorist's little son, calling his father's attention to a two hundred-pound novice who had just tumbled from her wheel; "would you call that 'a great falling off in weight?'"

That \$10,000 Gold-Encrusted and Bejeweled Tandem which the Elgin Cycle Co. will exhibit at the Shows.

TRADE CHANGES.

CALIFORNIA.
 Los Angeles.—The Sterling Cycler, discontinued.
 Redlands.—Groe & Lienau sold out to C. G. Gaylord.
 Santa Ana.—J. A. Hankey gives deeds \$2,086.
COLORADO.
 Denver.—Gerwing-Hilton Cycle Co., incorporated by Robt. Gerwing, Chas. H. Hilton, Jr. and Lynn R. Hubbard, to manufacture and sell bicycles. Capital \$10,000.
CONNECTICUT.
 South Norwalk.—H. R. Buckley & Co., reported to have been succeeded by Bulky & Wheeler.
FLORIDA.
 Daytona.—C. F. Randall Co., sold out to J. S. Herbert.

ILLINOIS.

Alton.—Hubbell & Meissner dissolved, W. E. Hubbell continuing.
 Chicago.—Field Mfg. Co., 21 Quincy St., style changed to Harder Convertible Bicycle Co.
 Chicago.—Anson V. Hales, 271 Wabash avenue, (assigned), court orders sale of assets, except book accounts, for \$1,790.
 Chicago.—John D. Toby Hay & Grain Co., sued \$600.00. Test case.
 Chicago.—Western Union Bicycle Mfg. Co., offering 50 per cent. in settlement.
 Chicago.—Comfort Spring Seat Post Co., incorporated by D. M. Martindale, Jr., R. Gill and H. H. Martindale. Capital \$2,400.
 Chicago.—The Brown-Lewis Cycle Co., incorporated by R. M. Brown, G. S. Lewis and D. R. Brown. Capital \$10,000.
 Chicago.—The Heany Cycle Co., dissolved partnership.

MARYLAND.

Baltimore.—Henry Strohmaier and Robt. L. Gill appointed receivers for Ives & McGlen. Filed bonds \$3,000 each.

MASSACHUSETTS.

Amesbury.—Eastern Cycle Co. purchased plant and business of the Amesbury Bicycle Co.
 Boston.—Frank S. Ourish reported to have recorded chattel mortgage \$1,000.
 Great Barrington.—H. J. Mignerey. Jewelry, will add bicycles.

MICHIGAN.

Kalamazoo.—G. H. Raynor & Co., file chattel mortgages, \$10,000, favor preferred creditors.
 Marquette.—Hoard & Carter dissolved, Frank Hoard continues.

NEW JERSEY.

Newark.—Ventilated Grip & Mfg. Co., incorporated by Allen M. Tarbell, B. F. Taylor, Abbey L. Gardner, Edward D. Gardner and Oscar H. Condit, to manufacture bicycle handles, saddles and bicycle sundries. Capital \$25,000.

Red Bank.—Pope & Patterson, succeeded by Geo. H. Patterson.
 Spring Lake.—S. F. Ludlow sued \$101.98.

NEW YORK.

Brooklyn.—Zimmerman Cycle Co., dissolved.
 Buffalo.—Chas. J. Heimerle. Fire loss, \$3,500.
 Buffalo.—Jackson Cycle Works, fire loss \$2,000.
 Buffalo.—Niagara Cycle Fittings Co., judgment vs. them \$45.77.
 Glen Falls.—Budd Bros. will manufacture bicycles under firm name Budd Mfg. Co.
 New York.—Hubert Bros. & Co., succeeded by new firm, same style.
 New York.—Greater New York Cycle Co., judgment \$68.26.
 New York.—Isaac P. Johnson, judgment \$97.63.
 New York.—A. Major Cement Co., judgment \$43.63.
 Rochester.—Miner & Fish Co., incorporated, directors: Albert Fish, E. L. Miner and F. T. Milbaum. Capital \$25,000.

OHIO.

Cleveland.—Stamped Steel Vehicle Wheel Co., organized by E. D. Sawyer, C. A. Post and S. W. Parsons, are reported constructing a sample bicycle.
 Cincinnati.—Tourist Cycle Co. vs. Ohio Spiral Spring Buggy Co., judgment for plaintiff, \$58.21.
 Cincinnati.—Rubber Tire Wheel Co. vs. Victor Rubber Tire Co. Amendment to answer filed.
 Cincinnati.—The Frank T. Miles Co. assigned to Frank T. Miles.
 Dayton.—Anderson & Eberhardt Co., assigned.
 Madison.—Madison Wheel Co., incorporated. Capital \$30,000.

OKLAHOMA.

Oklahoma.—Lindley & McQuown, chattel mortgage for \$141.

OREGON.

Portland.—Pope Mfg. Co., Hartford, Conn., has succeeded Habighorst Co. of this city.
 Roseburg.—Carle & Richardson, dissolved partnership.

PENNSYLVANIA.

Huntington.—H. H. Lane Mfg. Co., assignee files report. Auditor will be appointed at February term to make distribution.
 New Castle.—F. P. Dufford & Co., judgments for \$600.

Philadelphia.—Tichenor Hardware Co., confessed judgment January 9th for \$1,300.

WASHINGTON.

Tacoma.—McNaughton Gun Co. have advertised that they will sell out.

WISCONSIN.

Fond Du Lac.—Fidelity Cycle Co., canceled chattel mortgage for \$1,000.

FOR ELEVEN MONTHS.

The total exports for the eleven months ending November 30th last was as follows:

United Kingdom	\$1,233,199
Germany	233,886
France	124,714
Other European Countries	426,843
British North America	536,263
Mexico	46,778
Central America and British Honduras	63,013
Cuba	4,830
Porto Rico	8,179
Santo Domingo	1,083
Other West Indies and Bermuda	47,718
Argentina	19,967
Brazil	21,544
Colombia	19,980
Other South American Countries	34,558
China	8,213
British Australia	456,822
British and East Indies	10,105
Other Countries in Asia and Oceania	66,401
Africa	39,532
Total	\$3,408,618

ALL IN A WEEK.

Foreign exports of bicycles from New York during the week ending January 12th:

Antwerp	\$3,414	Hamburg	\$15,329
Amsterdam	226	Have	1,081
Bremen	4,379	Liverpool	940
Brit. Australia	12,272	Liege	22
Berlin	800	London	3,643
Brit. Africa	338	Mexico	456

Brazil	245	Porto Rico	418
Brit. W. Indies	4,301	Peru	59
Copenhagen	150	Rotterdam	1,617
Central America	729	Tasmania	983
Christiania	40	U. S. of Colombia	62
Dutch W. Indies	32	Venezuela	721
Gibraltar	80	Genoa	1,370
Genoa	1,755		
Glasgow	736		
Hull	200	Total	\$55,412

INVITING THE PUBLIC.

If anyone desire to see how a bicycle is made, the Kimball bicycle in particular, its makers, the Phillips Mfg. Co., Nos. 307 and 309 West Broadway, this city, will show him the modus operandi. They are extending the invitation broadcast through the daily and cycling press, a rather unusual proceeding, but one that cannot but result beneficially.

STRENGTHENING A VITAL PART.

While something of the sort has been seen on track machines, McKee & Harrington are the first to adopt this style of so-called "open steering head" for their stock roadsters and tandems. It will be made a feature of the '97 Lyndhurst and carries with it an idea of a great strengthening and stiffening of a vital

part, the fork crown. It "does not jump and shiver, is proof against vertical shock and lateral strain and holds its course like a locomotive on the track," is the manner in which the Lyndhurst people summarize the advantages claimed.

OF INTEREST TO NEW YORK SHOW VISITORS.

Visitors to the New York Show who do not care to be too close to the building, but want to remain further downtown, will find the Ashland House, Twenty-fourth Street and Fourth Avenue, a very good stopping place. The cuisine of this hotel has been a matter of note among sojourners in New York for more than twenty years. The house may not perhaps be rich in tapestry and onyx, but it has good comfortable rooms. The hotel is not more than ten minutes ride from the Show building, its prices are reasonable and quite a few who want to get relief from the noise and bustle of Show life will undoubtedly be found at the Ashland.

MERE BRITISH BLUFF.

The report that the English Government had contracted, or was about to contract, for a large number of bicycles for use in the postal service, was considerably magnified. The Monarch Cycle Company instituted inquiry and found that a small experimental order only had been placed.

IMMORTALIZING COOPER.

Tom Cooper is to be immortalized. The Monarch Cycle Co. have given the name "Cooper Special" to one of their wheels, the most expensive one at that. It lists at \$125, and these are its specifications: Monarch diamond-frame, 23-inch; 1½-inch tubing for main top, seat mast and main lower tubes, with ¾-inch tubes for rear forks and stays; 10-inch head, with 1½-inch tubing; 28-inch wheels; detachable sprockets, front and rear; barrel hubs; Kuntz laminated wood rims, fitted with nickel-plated eyelets in spoke holes and finished in rosewood; Humber pattern chains; Monarch patent crank shaft bearings; detachable, keyless, round, tapered cranks, 6½-inch throw; tread, 5¼ inches; direct seat post; cold swaged, double-butteted steel tangent spokes, tied, 32 to front and 36 to rear wheel; Monarch's rat-trap pedals; racing saddle; gear, 76; Monarch ram's horn handle bar; cork handles; Morgan & Wright or Vim racing tires; weight, 18 pounds; finish, Brewster green enamel, handsomely striped, with nickeled parts.

FOR BUSINESS OR INVALIDS.

From much quoted Kalamazoo, from the factory of the Kalamazoo Cycle Co., comes something new in the line of convertible cycles, a tricycle which in 60 seconds can be transformed from a parcel conveyance into a "carrycycle" for invalids. The tricycle has two forward or steering wheels, and a single or driving wheel at the rear; the forward wheels are 30 inches apart, and the wheel base 45 inches. Wheels are 28 inches. The frame is a new style of drop pattern, which allows either a man or lady to ride. The gear is 56, and weight 48 pounds. A light and neat willow chair with arms and foot rest is constructed to go between the forward wheels, and is attached by means of hooks to the supporting springs to rest on the axle, and a hook to go on the handle. The chair can be unhooked from the handle and tilted forward to allow the patient to sit down as easily as in a parlor chair. The chair can be detached and the box put on in less than a minute. A special feature in the tricycle, not found in any other, is the novel manner of coupling the front axle to the rear frame, which is by means of pivots at each end of the axle, just inside the wheels. By this method of construction the "carrycycle," it is claimed, runs steadier and steers easier, rather having a tendency to steer itself in a straight line.

A FIT-ALL CONNECTION.

President F. N. Stevens, of the Davis & Stevens Manufacturing Company, Seneca Falls, N. Y., and one of the most earnest advocates of a universal thread for tire valves, has been doing something more than urging on the trade. He has been "thinking out" a connection which will fit all tires with-

out the employment of an extra nipple. The result is here illustrated, and a patent is pending in Washington. It will be fitted to all of their well-known Cyclone pumps, and has been termed the "Cyclone Swivel K Connection." It is wired into the end of the rubber hose and, as stated, will fit any standard valve, such as the Schrader or M. & W., without the use of an extra nipple or without turning the pump or twisting the hose.

AS WARM AS TOAST.

In Denver, where the winds and snows are popularly supposed to rush down the Rockies as the fabled wolf rushed on the fold, the Gleim hand protector is being heralded as "the coming fad." The Gleim Manufacturing Company was last week incorporated with a capital stock of \$100,000 to further the fad. The incorporators are George W. Pierce, president; Charles H. Gleim, vice-president and general manager; D. K. Lee, secretary and treasurer.

The protector is a funnel-shaped affair of corduroy, which is secured to the handle-grips. The corduroy is of varying shades of tan, black, brown, drab, etc., and is lined with eiderdown of white, blue, cream, pink, tan or gray. When the hands are tucked in the protector, which may be removed as easily as a glove, they are kept as warm as toast, and the wind is prevented from whisking up the coat sleeves.

FRIEDENSTEIN WILL FLIT.

Since disposing of its jobbing and retail department at Nos. 105-107 Chambers street, the former treasurer C. M. Rice, of the Anglo-American Cycle Fittings Co., has established New York offices in the Home Life Insurance Building, No. 256 Broadway. J. Friedenstein will continue as secretary and general manager and will flit weekly from New York to the factory at Waterbury, Conn., where Pery chains, Excelsior brackets and the full complement of Anglo-American cycle components are made.

AT HOME IN HUNTINGTON.

Huntington, Ind., Jan. 16.—This city is the richer by a full-fledged cycle factory, the Congress Cycle Company, formerly of Hartford City, Ind. In consequence of a liberal offer by the city the company is at home in a substantial and capacious brick plant just on the outskirts of the city, and will soon be actively engaged in the active manufacture of wheels. The last batch of machinery has arrived, and is now in process of being placed. Probably two weeks will be required before all the machinery and fixtures are adjusted. Meanwhile material has been bought and stocked, so that nothing is likely to occur to prevent prompt utilization of the plant. The removal has been a wise one in many respects. Prime reasons are, the securing of a new modern factory, and the fact that Huntington is the home city of the proprietors of the company.

The plans of the factory include a high-grade wheel that will carry the name Huntington to outside markets and glory. Its mate—a woman's machine—is dubbed the Gitana. The Senator will be the second grade.

A specialty of the company will be the supplying of a still cheaper wheel to the trade, and which they will nameplate as their customers desire.

BELLS OF RAINBOW HUES.

Until the receipt this week of the catalogue of the New Departure Bell Company, of Bristol, Conn., the idea of a white, blue, black, yellow or green bell to harmonize with the finish of the bicycle never suggested itself, but now that the New Departure people have suggested and announced their readiness to cater to such whims, there is small doubt but that there will be those who will welcome the opportunity to individualize themselves by a departure from the conventional nickel-plated bell.

Enameled bells are not the only new things treated of in the catalogue. In addition to the familiar types of the New Departure ringers, a bell or gong for attachment to the rear forks of tandems, and which may be operated by either rider, and which affords either an intermittent or a continuous alarm is another novelty. Still another, is a bell affixed to the front axle exactly as cyclometers are attached and operated by a striker and star-wheel on the cyclometer principle. It sounds a note at every revolution of the wheel. New Departure cyclometers and trouser guards and the Sykl (pocket size) foot-pump are referred to in the publication, which is copiously illustrated with cycling scenes. The artist "lost a trick," however. Not one of the very many wheels which he reproduced is equipped with a bell.

CARRIES THEM COMPACTLY.

In these days when the average wheelman dispenses with a tool bag and carries the more necessary tools in his coat pocket, this little convenience made by the Sterling Cycle Works, Chicago, will be appreciated. It is a neat leather case, not much larger than a spectacle case, which holds wrench, spanner and screwdriver compactly, and in narrow and non-rattling compass. It is of pocket size.

WARRANTED TO BEAT THE SIMPSON.

Something bordering on the radical is being produced by the Aetna Hardware Co., of Unionville, Conn., the Cling power chain, which is pictured in their advertisement elsewhere. The Aetna people state their case in this wise: "We guarantee to beat the Simpson chain and give it to you at one-quarter the price. We make the following offer for all orders sent in this month: We will forward the chain and sprocket for \$5.00 cash with order. After that date the chain and sprocket will be \$7.00 per set. It's the greatest labor-saving chain ever invented and will do all we say."

A WHEEL FOR A GUESS.

At the last cycle show the Bean-Chamberlain Manufacturing Company, of Hudson, Mich., conducted a guessing contest, and were so well pleased that similar competitions will be inaugurated this year at both Chicago and New York. To whomever guesses nearest the mileage accumulated during the shows on a motor-driven wheel, which will form a part of their exhibits, they will award a high-grade Hudson bicycle.

ALL IN FOR SHOW SPACE.

Last week the formal announcement of the allotment of spaces in the coming Philadelphia Cycle Show was made. One hundred and eighty-three spaces are divided among seventy-four firms, representing nearly every prominent make of machines or sundries on the Philadelphia market.

AN OLD HAND.

C. G. Darby, an old hand at the game, has been added to the Worcester Cycle Manufacturing Company's traveling staff.

We have taken one of the finest lofts in New York City (25 x 175 feet), with electric passenger elevator at 89 Chambers Street and large electric freight elevator on Reade Street, for the city offices of ourselves and the Baker Gun and Forging Co., of Batavia, N. Y. These offices will be in charge of Mr. Charles Folsom, who has been intimately connected with our New York Agency for the past twenty-five years. As we carry but little stock in New York, we can spare about three-fourths of the whole floor. Mr. Folsom (who is temporarily at 79 Chambers Street, New York) is now ready to treat with one or more manufacturers of bicycles, bicycle sundries, or other suitable business, to furnish all the room that may be required for the storage and handling of several hundred bicycles. If desired, he can also furnish porters, and a general office force for the equipment of the business, for a specified sum in dollars and cents, thus enabling the manufacturer to enjoy all the advantages of a finely equipped city office at a fraction of what he would have to pay for a similar outfit if maintained separately. Each manufacturer will employ his own salesmen and travelers. He can have as large or as small a portion of the available quarters as he desires. Address CHARLES FOLSOM, 79 Chambers Street, New York City, or THE J. STEVENS ARMS & TOOL CO., Chicopee Falls, Mass.—Adv.

CYCLING TRADE REVIEW

Copyright by F. P. PRIAL Co.

VOL. XVIII., No. 24.

NEW YORK AND CHICAGO, JANUARY 29, 1897.

WHOLE NO. 466.

QUINCY BOUGHT.

In Zero Weather Stevens, Freeze & Co. Take Possession of a New Plant Near Boston.

Boston, Mass., Jan. 27.—Stevens, Freeze & Co., of this city, have purchased the bicycle plant of the Quincy Cycle Co., located in Quincy, about eight miles from Boston proper. The deal was made this week. They propose to continue the manufacture of Quincy cycles, and will place upon the market two grades, one to sell for \$50 and the other for \$35. It is also their intention to build a special racing wheel and a tandem. This factory has given employment to upwards of 250 men, and about the same number will be employed by the new proprietors. This year no special change will be made in the plant. Stevens, Freeze & Co. are wholesale and retail furniture dealers, and are the Boston agents for the Barnes Cycle Co. and the Syracuse Cycle Co. They paid spot cash for the plant. This factory opened business in the early part of '96, but last fall closed on account of dull trade. The present owners intend to look after the New England trade during the season of '97, and if successful will branch out more extensively in '98.

TWO NEW CORPORATIONS.

Two new cycle concerns were incorporated in Newark, N. J., last week. The first was the Howard Chainless Cycle Co., which has been reorganized to manufacture bicycles and tricycles. The capital stock is placed at \$50,000, of which \$1,000 has been paid in. The incorporators are Numa J. Felix, of Bensonhurst, and Alexander and Masse Milne, of Newark.

Articles were also recorded by the Automatic Cycle and Fitting Company, formed to manufacture parts and fittings of bicycles. The capital stock of this concern is \$25,000, and business will be commenced with \$1,000. The incorporators are Numa J. Felix, Alexander Milne, William King and George Wood.

CYCLE SHOW AT THE SIX DAYS' RACE.

The miniature cycle show planned by the promoters of the Chicago six-days' race will be held. Spaces 10x20 feet will be given free for the display of bicycles, cycle accessories and machinery. The booths will be located on the promenade under the seats. Spectators will be obliged to pass the bicycle exhibits as they enter the centre of the building to view the race.

NATIONAL RETAILERS' ASSOCIATION.

Chicago, Jan. 28.—The cry of the business world, Combine for mutual protection and profit, has found a real live echo in the retail cycle dealers, and to-day at the Del Prado Hotel will be held a meeting to form a National Retailers' Association. At the time this telegram is sent it seems certain that a strong organization will result from the call originally sent out by the St. Louis local Cycle Board of Trade. At this time the stock in trade of those outside of the inner circle of this movement is largely made up of rumors and mysterious winks and nods, but even these are interpreted in favor of the new organization and its formation.

WHAT THE LITTLE BIRDS SAID.

Those dear little birds who always sing of other people's affairs were twittering in quiet corners in Chicago during the forepart of the week that Potter's political managers had offered "Bob" Holm, the famous war-horse of the Missouri Division, a vice-presidency, and Douglas Robert a Racing Board reappointment, provided Missouri's vote and influence were flung Potterward. When the birds were asked to sing as to the acceptance or declination of the above offers, they shook their heads, said their throats were too sore or too dry for further singing, spread their wings and flew away.

BUNNELL HAS BEEN FIRED.

During the recent conflagration in Philadelphia the art novelty establishment of O. S. Bunnell was burned out. "Bunny," ever wise and far-seeing, had his place and stock covered by insurance, so the loss will not cripple the famous champion of professional racing.

Mr. Bunnell mourns among other things the destruction of the plans for the new board track which it was proposed to build in this city next season, and which plans, it is said, cost a considerable sum of money.

RATIFIED FIFTY PER CENT.

The stockholders of the Elgin Sewing Machine and Bicycle Company held a meeting last week and ratified the giving of trust deeds to secure creditors who accept the 50 per cent settlement previously agreed upon. There are some creditors, however, who have not accepted that settlement, and unless they do the plan will fall through.

THE RACE IS ON.

Contest for the Board of Trade Presidency—Garford Leaps Into the Saddle Like a Winner.

A little political brook is running as a sort of undercurrent through the show. Men are being named for the Presidency of the Board of Trade, among them Mr. Gormully, Mr. Dickerson, Mr. Redding and Mr. Fisher. It appears that Mr. Fisher is not a stockholder, however, and there is some question as to his eligibility to office.

But, according to the political magnates, none of the men seem to quite fill the bill; at least none of them seems to have enough popularity and strength to give him a marked leadership and preference, so a dark horse has come up, none other than Mr. A. L. Garford, of Elyria, O., whose claims were very strong on Tuesday night, his candidacy being backed by some big names. Mr. Garford is a safe man and a popular one, and it is predicted that before the election the majority will be swinging into line for him, and he will be tendered a well-based and well-backed nomination.

FROM DEALERS TO MANUFACTURERS.

Success as retail dealers for eight years has led Budd Bros., Glens Falls, N. Y., to branch out as manufacturers. They have leased a large factory building in that town, and under the firm name of Budd Bros.' Mfg. Co., they will construct both high and medium grade wheels, the former to be known as Budd Bros.' Special and the latter as the "D. & H." J. L. Sackett, formerly designer at A. G. Spalding & Bros.' factory, has been employed as superintendent. The firm expect to begin operations at their factory by February 1.

HAVE TAGS OF SPECIAL FORM.

The Rubber Tire Association has adopted a special application tag to be used by riders when making application for repairs or replacement under the terms of the association's '97 guarantee. Dealers and repairmen are requested to apply to the secretary of the association for a supply of them.

MAKING IT PLAIN.

The Remington Arms Company, of Ilion, have filed with New York's Secretary of State a certificate of extension of business which shall hereafter include the manufacture of bicycles.

NEW YORK'S RECORD.

It Shows That the Facts in the Case and; the Potter Interview Regarding Them Do Not Agree.

Mr. Potter returned to New York late last week, and on the day following his arrival the wheels of the press bureau revolved at double speed, the product appearing in the form of an "interview," in which Mr. Potter tries to go behind the record, and for the sake of being elected is credited with making statements which are not in accordance with the record. In the New York "Journal," a paper whose cycle editor usually speaks by the card in all things relating to Mr. Potter, the following interview with Mr. Potter appears. So that the reader may be able to see what an acute sufferer from heterophasia, Mr. Potter is, THE WHEEL parallels Mr. Potter, as quoted on January 21, 1897, and the record existing of the same gentleman and his utterances and actions just one year ago.

If there ever was a finer exhibition of blowing hot and blowing cold, of declaring one thing at one time, and denying, or seeking to evade it afterwards, than the following, THE WHEEL has never seen it in League politics or elsewhere.

Dealing with the question ex parte, with no feeling and with nothing but Mr. Potter's own words, and the record of his friends who were and are in control of the New York Division, THE WHEEL repeats its declaration that neither Mr. Potter, nor his backers, nor his division, can be classed as aught but enemies of League racing control, unless they are, one and all, sufferers from the most aggravated case of heterophemy on record, or if not that, that one year ago they stated, worked for and voted for a thing which they either knew was false or else knew nothing whatsoever about.

Under any of these conditions it is a dangerous thing for those who believe in League control of racing to elect Mr. Potter, or to place in power his party or his division vote and ring. And despite Mr. Potter's assertion to the contrary, THE WHEEL makes "an issue" of this "racing question" in perfect "good faith," and challenges Mr. Potter and his press bureau to show that it is not warranted in doing so by Mr. Potter's own words and record which follow:

"The attempt to make an issue of the racing question is not made in good faith by those who are talking the loudest about it. The racing department is a part of the mechanism of the League, and has always been loyally supported by the New York State Division and its officers."—Mr. Potter now.

Mr. Potter one year ago at a New York Division meeting.

"My objection to the League's control of this branch of athletic sport is the outcome of experience, and does not reflect my own belief more fully than it reflects the belief of hundreds of loyal members of our Division, whose efforts have been exerted in the work of securing members during the last year. * * *

"* * * These facts and the fact that cycle racing has been productive of contentions, disputes, unwelcome charges and counter-charges in which League officials have been in some degree concerned, and that all this has been widely published, with threats and counter-threats, and that lawyers have finally been employed to drag the League into court to answer certain iniquitous complaints, have supplied a sort of advertising which has been distinctly hurtful to the League and embarrassing to its growth."

How the New York Division has always loyally supported racing:

"That the control of bicycle racing is not an object in which the majority of American cyclists have common interests, and that the experience of our League in this department of its work has not been such as to commend it to cyclists generally, but has, on the contrary, subjected the League to much adverse criticism and aroused much unpleasant and harmful contention within our own ranks.

"That the experience of the League in the control of cycle racing, while being distinctly hostile to its growth in many directions, has been in no sense a substantial factor in aiding its increase of membership, even among racing cyclists themselves."

The foregoing resolution was adopted by the New York State Division, after Mr. Potter had moved for same, and for the casting of a unit vote for it by the New York State delegation to Baltimore. Which vote was subsequently cast.

"While in Philadelphia the other day I had a long conversation with Chairman Gideon, and we have had frequent correspondence regarding racing matters of a generally satisfactory character. I am always glad to sustain him in the work which he performs so faithfully and with such good effect."—Mr. Potter now.

"The making up of sensational articles supplied by the kaleidoscopic and gymnastic department of the League at Philadelphia, impressed the great majority of the cycling public with the belief that the League of American Wheelmen is an organization maintained for the promotion of bicycle racing."

Mr. Potter one year ago.

RUCTIONS IN RUCKERDOM.

Strikes in the Dunlop Works—Others Coming—Testing New Anti-Rust Metal—Scots Quit.

London, Jan. 16.—Once more we are in full swing and factories, law-courts, and company promoters are busy with the cycle boom and its works. The second of what I am afraid will prove to be a long line of strikes among cycle operatives has occurred at Coventry, in the Dunlop tire factory, over 300 men and women having struck for an increase in wages amounting to about 20 per cent. As no demand was made until the strike ultimatum was presented, the Dunlop people have refused to treat with the strikers under any conditions whatever, and have proceeded to open a new factory in Birmingham to take the place of the Coventry works. This has been equipped with such rapidity that it is expected to be in full swing next week, although the strike only came to a head a few days ago. The matter is claimed to be one of principle only by the Dunlop managers, as the increase in wages would only amount to about £2,000 over the year, but they distinctly resent the intimidation accompanying the demand.

The previous strike took place at Wolverhampton in the Star Cycle Co.'s works (Shar-ratt & Lisle) the men demanding a 10 per cent increase, simply because, as in the Dunlop case, the works had been so phenomenally successful in returning heavy dividends to the shareholders. Mr. Lisle, however, held out so successfully that the men came back on practically the same grounds as before their strike.

This situation, as it may develop about the beginning of March, is seriously engaging the attention of the cycle trade in every branch, as it is feared that a concerted action by the employees is likely to be made about that time, when if unprepared the employers would simply have to submit or have their trade paralyzed. Some makers are going to the trouble of securing premises on the Continent (France is the favorite land) and are quietly fitting up reserve factories from which in the event of a general strike in England they will be able to bring across the unfinished goods and complete them in England, so as to avoid the Board of Trade inscription "Made in France," which only goes on finished articles. The situation has its interest for

the American trade, as should any interruption take place in the supply of the home trade American cycles cannot fail to benefit largely.

The action of Mr. R. L. Philpot against the vendors of the present Swift Cycle Co., Ltd., for a sum of about \$70,000 due him, it is alleged, on the profits of the trading and sale of the company, is arousing considerable interest here in trade circles, as it is thought to create a precedent in the matter of commissions. This, however, is not true, as Mr. E. Lisle, was paid, on a similar agreement, as managing director to Mr. Philpot, the commission on the profits of the sale of his company as well as on the ordinary trading profit of the Star Cycle Co. The action will come on in the course of a month or two and will of course attract "crowded" houses."

The British Motor Syndicate had a meeting of shareholders last week in Coventry apparently for the express purpose of showing the shareholders that the whole affair was not a canard, but had bricks and mortar, lathes, and other machinery at work as well as some motors to sell. The inevitable dinner and speeches of the popular type succeeded, and the shareholders expressed themselves as perfectly satisfied with Mr. Harry J. Lawson and their property. In the meantime all advertising has stopped and the shares are dropping.

The Chillingworth system of drawing connections from weldless steel tubes has, as I anticipated when describing them recently, been made the basis of a public flotation, the company being now before the public for £160,000.

The metal, or rather alloy, alcolite, which was first placed before the public at the late Stanley Show, seems to be likely to go much nearer success in cycle construction than any of its rivals. I am in a position to say that it is a secret alloy of aluminum and cobalt, and as shown at a public exposition, it is as tough and as easily worked as the best Swedish steel, while ranging in weight about 1-3 that of the latter. The seance was quite complete in its way. The alloy was made and melted in our presence, the connections cast in sand molds. The billets from which the alcolite tubes are drawn were also cast and the tubes drawn immediately the billets were cool enough. Then the soldering together was performed, and this after being supplemented by a form of keying together.

We were invited to pound away at one of these joinings with a five-pound hammer on an anvil, and after it had been beaten flat it was shown that the brazing, as it was called, had not been fractured in any way, the joint being to all intents and purposes one solid piece.

The Scottish Cyclists' Union has embraced professionalism exactly after the style and experiences of the L. A. W. It gave the B class a run for a year, said it worked excellently, swore it was a perfect success and had performed an educative mission, but—it has dropped it just as the L. A. W. dropped it, and now not only are all the B's professors, but every racing man connected with the trade who races must race as a professional. This latter decision was secured at the recent meeting of the S. C. U. Council by the casting vote of the chairman, and may be upset at the general meeting of the body in February next.

THE LAST GUN.

DRIVEN to it by THE WHEEL, the mountainous press bureau, after much groaning and travail, has brought forth a half-hearted mouse of denial from Mr. Potter, wherein it is set forth that neither he, his administration, nor the New York Division are opposed to the League's control of racing.

In the interests of truth and fact, THE WHEEL, in another column, compares Mr. Potter's utterances of one year ago with those of his last interview. If one charitably assumes Mr. Potter to have been suffering from acute heterophobia twelve months ago, when he rabidly attacked the League's control of racing, what proof is there that he is not to-day a victim of the same disease? And even if he is not can the League take the risk involved in electing such a man to its highest office? No one knows what Mr. Potter might do with racing as President; THE WHEEL does know what he has said against it as Chief Consul, and as the future must be judged by the past, Mr. Potter must by such judgment be declared an opponent of the League's control of racing. Can anything be plainer than this? That, too, taking the most lenient view possible of Mr. Potter's actions, and crediting him with acute heterophobia.

There are those who are uncharitable enough to declare that Mr. Potter's last about-face in regard to racing is but a form of death-bed repentance; that it shows a willingness on his part to eat any amount of crow to get elected; that even the present eulogies of

what he formerly termed the "kaleidoscopic and gymnastic department of the League in Philadelphia" is only a truckling after Pennsylvania's vote and Mr. Gideon's support. These and many other uncharitable interpretations are put upon Mr. Potter's recent denials and political flip-flaps, but THE WHEEL prefers to take the more lenient view of the matter, and to believe Mr. Potter is simply a sufferer of heterophobia, as before stated.

No matter, though, whether THE WHEEL'S view of Mr. Potter be the correct one, or whether the allegations of those less charitable be accepted as true, in either case the fact remains unchallenged and uncontroverted, that Mr. Potter's former official acts and utterances were in direct opposition to the League's control of racing. If there were no other grounds than these for Mr. Potter's defeat no one could say they were not ample.

It is a dangerous experiment, this swapping of horses at stream-crossing time; there may be better horses than Elliott, there may be worse ones than Potter, but that does not enter into the present question; the League is only offered a choice between the Elliott and Potter equines, and to swap the unknown possibilities of the latter for the tried and proven abilities of the former would be suicidal.

For the last time THE WHEEL states the whole case in these words:

A VOTE FOR POTTER IS A VOTE TO ROB THE LEAGUE OF ITS CONTROL OF RACING!

IF YOU DO NOT WANT THIS, VOTE AGAINST ISAAC B. POTTER FOR PRESIDENT OF THE LEAGUE OF AMERICAN WHEELMEN.

SHOWS OF THE FUTURE.

WRITING from Chicago on Tuesday night, it may be said of the show that it is a mammoth and spectacular success. Whether it has worked any great benefit to the trade, however, can only be determined when the closing hour on Saturday night is sounded. The show is a World's Fair in itself. It is so big that it cannot be comprehended or digested in one or two days. The lessons of this the most remarkable show ever given in America must be drawn after the show has become history. That it is a success from the standpoint of amusement is already established. It is big and brilliant. That is to be expected, since it cost perhaps a quarter of a million dollars.

A big city is easily amused, and this show is amusing Chicago. Whether it is stimulating trade, either retail, locally or territorially, is a question which is yet to be decided. Even though the show is fairly well attended, it is just now doubtful whether it will return a net profit to the Board of Trade, because it was projected on a mammoth scale and the income must be in like proportion; but on Tuesday evening the building was by no means crowded.

There is no crush, merely a fair crowd of people, catalogue-burdened, moving somewhat aimlessly about, and in some cases stopping before some eye-catching novelty. But to get a crowd, real merit seems not to be necessary. The chief factor in the crowd-gatherer is simple novelty or something which includes within itself the factor of curiosity. From a mechanical standpoint, it may be written now that there is little that is radical, little that is new. The cycle seems to have reached its highest type of development, that is, speaking of its radical lines and radical features.

Weights are not even talked of, cranks have been lengthened, gears have been raised and sprocket-wheels enlarged. Outside of general tendencies, it may be said that almost the entire inventive and manufacturing talent of the trade has been concentrated on amplification of details. It may be said as a matter of truth that the designers have gone to the extreme in the matter of finesse and nicety. There seems to have been a universal impetus to get away from the past, and, since it could not be accomplished by any radical profitable device, the talent have wandered aimlessly into the highways and byways of detail; consequently, there is unprofitable over-elaboration to be seen everywhere. Numbers of the machines shown are fitted with many-pieced devices, devices which are alleged to accomplish this, that and the other thing, but in many cases even the exhibitors are at pains to clearly explain what their mission is. In brief, machines have been added to and complicated in a most remarkable way. At this first sight, the change does not seem to be in the right direction.

The aim of all cycling construction should be simplicity. Simplicity has been given the good-bye this year. From the business standpoint it may be said that there is a strong unrecurrent of feeling and opinion that it is time to make a change in some of the fashions. Discussing this matter, it is well to keep close company with logic and with common sense.

The first show was held because there were several, or a score, or forty different styles of bicycles. The forty different members of the bicycle family were gathered together for purposes of comparison, so that the rider might examine, digest and select. Among the forty bicycles there were many different methods of construction, and each one bore but little resemblance to the other. There were really tangible points of divergence; and again, in those early days cycling mechanics were in their infancy, and it was necessary to assemble the wheels together for the purpose of exhibition, comparison and elimination. But all this has passed away now; in fact, has long since passed away, and the show has grown to be a great big, unprofitable and, perhaps,

useless thing. Some say it is even worse than useless, and that it is a distinctly unprofitable function of the cycling trade this year.

This year the shows are booked for mid-January and mid-February. Yet a very large per cent of the cycle-making firms have had their product on the road since November, and the agents have been familiar with '97 models in wheels, tires and saddles and all the rest of the season's equipment. So the agents learned nothing new at the cycle show. Therefore for them the show has no real value, but the show practically retards a considerable part of the trade.

Even the firms who are fortunate enough to have a large force of travelers on the road in November and December have their efforts impaired, because, while they may close with many of their old agents, the size of their orders is reduced or they carry a condition, and in some cases orders are delayed until show time, because the agent has the natural restlessness and the speculative element which is common to all men, and is eager for an excuse to delay, putting off the order and giving the show as a reason, because there he hopes to make some sort of a more profitable deal. As for those firms who do not maintain extensive traveling forces during a large part of the season, they are distinctly hurt by the holding of late shows. They are unable to make before-hand contracts, and can form no reasonable idea of the probable output. They cannot buy their raw material or equipment in order to produce their output, and they are compelled to wait until show time before they can formulate any form or policy for the year. Such a method of doing business is not a good one, because having failed to thoroughly till the agency field, and having waited so long without any definite idea of their future plans, these firms at the eleventh hour are forced to accept almost any kind of an agreement in order to keep up the appearance of being in the business. Sales are far from profitable, because then, in order to fill show orders, raw material, parts and equipment are hastily ordered, and overtime is necessary to get the finished output on the market. The whole thing is bad business.

There are many other details which are current in conversation about the show building, tending to prove that the rank and file of the trade desire a change.

THE WHEEL has frequently urged the Cycle Board of Trade to exhaustively discuss the question of shows and show dates. A popular and much-favored suggestion is that one National Show be held late in November. Such a show should contain the first public exhibition of new models for the approaching season. This exhibition of brand-new bicycles should be further reinforced by exhibition of raw material, tires, saddles and all the rest

of the addenda and paraphernalia of the bicycle trade.

Such a show would be both timely and logical. It would serve the purpose for which shows were originally inaugurated. It would be, above all, a business show. It would hasten the trade in parts, sundries and raw material. It would enable the manufacturer to map out his campaign of operation and make an earlier start. It would enable him to renew faith with his old agents and make new connections. He would know what channels to look to and what possible output he could sensibly and profitably market.

In fact, the advantages of a show to be held at the time mentioned seem manifold, too numerous, in fact, to enumerate in this hasty bird's-eye view of the show question. This National Show, it is further suggested, should be changed from city to city, and held, in fact, wherever suitable buildings could be obtained. To further that mission which shows are supposed to accomplish—the stimulation of local trade—handsome local shows should be held.

There is no question that a local cycle show held in any of the big cities between March 1 and April 1 would be crowded with intending purchasers, who would be stimulated and interested at the very time when the feasibility of cycling most strongly presents itself to them. It is at the threshold of the season that public interest should be awakened, not in midwinter.

At any rate, there is much dissatisfaction with the present late winter shows. Severe thought should be given the question at the first general meeting of the trade.

VALE! THE SHOULDER-STRAPPERS.

NO convention of any kind can any longer lay claim to being up with the times, unless, when in "solemn conclave assembled," among the other "whereases and wherefores" adopted appears one "viewing with alarm" the spread and prevalence of cycling.

No association, organization or league ever thinks of omitting this from the important resolutions passed at its annual gathering. To swing right into line in such a vital issue as this, the National Guard Association, after the usual preliminary verbal flourishes and furbelows, has declared war on the shoulder straps and other military insignia worn by the ginger-bread brand of cycle club road officer, and threatens to prosecute under a New York State law any of the ginger-breaders aforesaid.

While undoubtedly there is a vein of selfish envy underlying this anti-shoulder-strap movement of the National Guard Association, still we cannot but rejoice that something has finally made its appearance that will rid cycling of its gold-bullioned. epauletted

cheap imitator of a military officer.

Coming from England, where everything is more or less tinged with military organization and uniform, the bicycle, when it made its bow to America, carried with it a certain tradition of the broad-braid and brass button, and the first clubs and their road officers here were duly drilled, officered and uniformed as though they were a kind of machine horse marines.

As age and experience begot wisdom and an appreciation of cycling propriety, the older and more advanced wheel clubs carefully laid aside their captains, lieutenants, buglers, color-bearers and other such folderallers, and wondered muchly why they had ever been idiotic enough to have created such childish things. When the sport increased with leaps and bounds, and new clubs sprang up and flourished like the proverbial bay tree, this bullion-bearing, high-titled club official idea took possession of the new element and their clubs until the club man without some insignia of office upon his clothing was a rarity.

Nothing short of fine and imprisonment could have stopped all of this, and now that members of the National Guard Association have promised just such a remedy, we are thankful to them for their kindness. He was a wonderful and dazzling sight, your club captain in full war-paint, but the world and ourselves have grown weary of him, and will gladly set him upon the shelf of memory, there to keep company with Santa Claus, Jack the Giant Killer and other gentlemen of that ilk and value. Vale, the gold-braider! He has long ceased to be sought but a laughing stock and an eye-sore, and cycling will be the gainer by his going.

FLAGGING OF THE FLAGGERS.

A BILL has been introduced to prohibit the use of the National flag in any other than a legitimate manner. No one can question the wisdom, patriotism or timeliness of this measure, and we hope to see incorporated in the bill a provision prohibiting the use of the Stars and Stripes as a bellyband for aspiring and perspiring racing men.

Just why every racer who thinks he can ride fast enough to get out of the way of a horse car should forthwith hie himself to a flaggery, and henceforth use the Stars and Stripes to hold up his sweaty racing trunks, is something no one, not even excepting starry and stripey bellybanders aforementioned, can possibly explain.

Metaphorically this wrapping oneself in the Star Spangled Banner and bidding the Eagle scream, is all right, that is, in its place, which is chiefly in Fourth of July orations and campaign speeches, but when the wrapping in question exists in the girding of the racer's

waist with the country's flag, it is all wrong, and, being so, should be promptly stopped.

Racing colors are not a thing to be despised nor objected to, since they add life and variety to the speed-making picture, but when the seeker after them has no more ideas of originality, or appreciation of the code of propriety, than to annex the American flag for an apron, the effort to acquire racing colors becomes far from being praiseworthy.

We sincerely hope the bill in question will become a law, but should it fail of doing so then we would like to see the League of American Wheelmen promptly lay an embargo upon such exhibitions of bad taste and feeble patriotism, as this sweaty and senseless employment of the country's flag for a racer's surcingle has grown to be.

THE TRAIL OF THE SERPENT.

RACING, like other things in life, has its merits and its defects. It is not so bad as some people would make it. It is not so good as others would have it. Once it is admitted—and it has been admitted—that even the real pure amateur collegian can get away from the ultra-pure principles of amateurism, no one should be shocked to learn that the taint runs through the whole system.

The men who go into any branch of sport and remain in it without hope of gain are few and far between. How many men are there in racing, for instance, who have continued in it or will remain in it without hope of financial reward? You can count them not on the fingers of one hand, but on one finger.

How many men are there in the game of racing who are not in it for the money they can get out of it? The racing philanthropist has not yet been discovered. There are men in cricket, in golf, in tennis and yachting purely for the sport that they can get out of it. But the most casual examination will show that, while no money is to be gotten out of these games, they afford a happy medium not to social elevation so much as progress along the social line, something cycle racing can hardly claim to offer its followers and devotees.

END OF PRICE SWELLING.

NO real value was ever created by artificial means. Hot air or gas in a balloon has a temporary sustaining power, but when the air cools or the balloon punctures something must tumble to the original point of ascension. So it is with wheel values that are unduly inflated. If the bargain-counter "high-grade, \$100 wheel" can be sold at a profit for \$29.83, then high-grade, \$100 wheels must sink in price to around \$30.

If, however, and this is much nearer the mark, wheels that are bargain-countered at

\$29.83 on the allegation that they are "high-grade, \$100 machines," are discovered to be neither high-grade, \$100 machines, or even \$29.83 machines, then comes the end of the bargain-counter cycle seller, and, if we mistake not the signs of the times, '97 will see the beginning of this much-wished-for ending of a trade leech which has fattened on cycling for the last year or so.

GOSPEL OF "GET THERE!"

IF "E Pluribus Unum" is to remain the motto of the United States it must be freely translated "Get There!" To get there, no matter where they may happen to be, is clearly the distinguishing effort of Americans. When Robert Fulton adapted steam to river travel with the power of increasing speed, he found only America ready to accept the advance. When once it was discovered that railroads would help mightily in getting there, America proceeded to run away from all the world in the rate at which railway mileage and railway speed were extended. When Mr. Morse got his electric telegraph system at work, America soon had more miles of wire in operation than all the world.

In all these and in all other means of diminishing space and reducing the time of transit America has continued to lead the world, and cycling is going to repeat the story of Morse and Fulton.

LEAGUE DEGRADATION.

WHEN League memberships become things of the chromo-and-the-pound-of-tea order; when they are rebated on a cash basis; when they are handed out right and left to negro, Chinaman, Dago and other such human flotsam and jetsam as frequent a six-days' bicycle race, then the time has come for the organization to announce that it has but one standard of membership, but one query as to an applicant's eligibility, all of which is condensed into the single question: "Have you got the price?" This once settled, then the applicant is a worthy one. We are astonished that Chief Consul Patee, of the Illinois Division, has for a single instant allowed the League's name and his own to get mixed up with a free membership scheme in connection with a Chicago six-day race, where the League already has one of its Racing Board acting as referee and holder of "commercial paper."

FOREIGN CHANCES.

AMERICAN manufacturers of bicycles, parts thereof and machinery used in their construction, will be interested in the reports of labor disturbances now occurring in the British tire and cycle trade appearing in another column of this issue. Terminate as these distur-

ances may, the friction can not but result in delaying product, increasing the cause thereof, or in future and wider-spread disagreements between employer and employee, either or all of which must work to the advantage of the American manufacturer, who will be unworthy of his reputation as a shrewd trader if he does not promptly take advantage of the existing British outlook to push his goods in foreign markets. Verily, it is an ill wind that blows no good to some one.

Few realize how extensive has become the use of rubber tires on vehicles, within the last year or two. It is safe to say that about 50 per cent. of the public hansoms and private carriages in this city are now fitted with the noiseless and anti-vibratory tires.

The knowledge of cycling drawn from experience differs somewhat materially from that acquired at the stands in a cycle show or the catalogues there collected.

Once in a great while somebody by a great stroke succeeds in dazzling cycling, but cycling never stays dazzled very long by anything or anyone.

Time works wonders, but he is a worker who never strikes for shorter hours in his battles against his business rivals, the record-breakers.

Zeal in cycling without knowledge, is like expedition to a rider with a punctured tire and lightless lamp on a strange road.

The majority of wheelmen do not ride hump-backed, newspapers and comic weeklies to the contrary notwithstanding.

Saddle soreness may be a deep-seated disease, but it cannot be properly spoken of as one of long-standing.

The maker or dealer who conducts his business in a slipshod manner naturally loses his standing in the trade.

A new rider with a new wheel and uniform is as proud as a puppy dog with a gladius in its mouth.

A combination of smoky lamp and leaky tire acts as a sure decrease of the prospective angel crop.

The word "practical" never achieved its present odium until it got tied up with cycle inventions.

Woman is always right in cycling, for she is, as Pope says, "What ever is is right."

The dangers that city riders are subject to are often over-estimated.

We all see our own faults first in the riding of the other fellow.

“IT TAKES A FOOL OR A PHILOSOPHER TO BUILD A FIRE.”

Do you think?

Do you know the difference between crucible and open hearth steel?

Do you know the difference between a steel forging and a casting?

Do you understand how a part of a bicycle made of forged steel is better than a part bent up out of sheet metal?

If you know these things, it will be easier for us to sell you a Victor bicycle.

You should know that bicycles are not advertisements, not name plates, not noise.

Bicycles are

First, Material;

Second, Work.

You can know all about your bicycle by carefully examining these two things.

Remember, most bicycles are made to sell; not to ride.

Few bicycle makers invite the rider to examine carefully into all material used before buying. We like this way of selling bicycles. The more you inquire, the better pleased we are.

Victor bicycles cost more to build than other bicycles, and they are worth more.

If you have a high-grade neck, ride a high-grade wheel. We prefer to say "Victor grade," since it means more.

Catalog on application.

OVERMAN WHEEL CO.

NEW YORK.

BOSTON.

DETROIT.

DENVER. SAN FRANCISCO. PORTLAND, ORE.

P. S. Did you know that the Overman Wheel Co. built the first bicycle in the world without castings?

Castings are one of the curses of bicycles.

Castings are cheap for the maker, but dangerous for the rider.

CANNOT STAND DEFEAT.

Patrons of the winter track, Paris, were again wrought to a turbulent pitch of excitement at the Barden-Huret match, Jan. 10. It was Barden's debut as a middle-distance rider, the event being for 50 kilometers (about 31 miles). Barden lapped his competitor at the end of four kilometers, and held his lead to the end. The excitement was caused by Barden's pacers, who, in relieving each other, followed the usual custom of waiting for their man on the inside, thus causing the Frenchman to travel outside, and each time they did this they came in for a perfect storm of hooting, the spectators being apparently oblivious of the fact that exactly the same thing was done by the French pacemakers—as, indeed, they were obliged to do. The climax came when one of the English quads went wide at one of the corners, causing Huret to go up against the barrier. Barden slipped along inside and sailed away, and for a time Huret was left without pacemakers. Instantly there was a tremendous uproar, and the public threw programmes and newspapers at Barden and the English pacemakers until the track was strewn with these harmless missiles. Matters were not improved by one of the Englishmen waving defiance at the crowd. In face of this manifestation Barden, who had taken another half-lap, slowed down and waited for Huret, so that the positions were the same as before the incident took place.

At the bell Huret went away from Barden for a few yards, but the Englishman made no effort to beat him for pace, and he won by a lap, less a dozen yards. Barden was hoisted shoulder high by the English pacemakers, who cheered him, and this called forth a counter demonstration from the gallery, where the winner came in for a good deal of hooting. The time was 1h. 4m. 53-5s.

MARTIN AGAIN VICTORIOUS.

Late Australian news via San Francisco announces the second defeat of Parsons by Martin, the American rider. The match races were held at Melbourne on Dec. 19. The distances were one mile, five miles and ten miles, the best two out of three, for a stake of \$5,000. A large attendance was on hand, over 15,000 being present. Martin won the mile and five-mile event and match. His time for the mile was 3m. 23 3/8-s., and for the five miles 10m. 23 1/3-s. Martin having won the match by finishing first in the two events named tried to lower the Australian record for the ten-mile event. He finished in 21m. 24 4/5-s. The Australian record for the distance is 22m. 42 1/5-s.

VERY "FOUL" IF TOO MUCH FOR HIM.

Choppy Warburton, says the Paris "Velo," is washing his hands of cycling. Seeing all his efforts vain, his genius sterile, disgusted altogether by the base ingratitude of his countrymen, he is about to devote his abilities entirely to rowing. Cycling has become too foul a thing for him to have dealings with.

TO BE MODERNIZED.

England's famous Herne Hill track is to be despoiled of its wood surface and recovered with cement.

GENEROUS OFFER BY A TRACTION COMPANY.

Philadelphia, Jan. 28.—Much enthusiasm was created at the meeting of the Associated Cycling Clubs of Philadelphia, last night, by the report of Chairman C. A. Dimon of the Invitation Committee. He stated that thus far he had received so much encouragement that there was every reason to believe that the meet would surely be held in this city. In addition to issuing a prospectus the members of the committee have taken the pains to ascertain the views of many of the league delegates to the National Assembly, and without a single promise or the consummation of a so-called "deal" have already received a large number of communications, not only from the delegates, but from men prominent in league affairs, in which their support and encouragement were promised.

The association has already been promised \$6,000, the Union Traction Company heading the list with \$5,000, with the proviso that the national championships be run at Willow Grove. This amount, however, is not sufficient and it was decided to carry out the original intention of appointing a Subscription Committee selected from the local clubs, not necessarily members of the Associated Cycling Clubs.

ON A "COMMERCIAL PAPER" BASIS.

Chicago is always original. Chicago could not help being original if she wanted to, and she would not want to if she could help it. Hence is presented to the world the very queer sight of a member of the L. A. W. Racing Board acting as referee in a six-days' race, the promoters of which are so little believed in by the racers that the amount of the prizes had first to be deposited with the referee-racing board official.

The prize list calls for \$2,500 in cash, to pay which there has been deposited with the referee-racing board official "\$500 in currency and \$2,000 in commercial paper." Thus does the member of the League Racing Board stand pledged to pay \$2,500 cash, with "\$500 in currency and \$2,000 in commercial paper." Rather a risk, it seems, when so much cash is represented by so vague a thing as "commercial paper." By the by, what is "commercial paper?"

ESCAPED UNINJURED AS USUAL.

As usual there were many falls during the cycle races at the games of the Seventy-first Regiment at the Armory on Saturday night last, and as usual none of the riders were injured to any extent. A. Michel broke the Armory record in the first heat of the mile handicap, riding the distance on the flat floor in 2:52, but he fell in the final. Summary:

One-Mile Handicap—1, A. W. Smith, scratch; 2, F. J. Bang, 30 yds.; 3, H. Gaupp, 40 yds. Time, 3m.

Three-Mile Handicap—1, A. Michel, scratch; 2, C. J. Webster, 95 yds.; 3, A. W. Smith, scratch. Time, 8:43.

THE WAIL OF THE RICH.

Parisian racing men are endeavoring to induce the railroad companies of France to allow then fifty per cent reduction in fares when journeying from one part of the country to another to race.

Pump your tires good and hard is excellent advice, but better advice would be, let some one else be good enough to pump them hard for you.

TRACK OWNERS STILL PLANNING.

Boston, Mass., Jan. 27.—The committee to draw up by-laws and a constitution for the proposed National Cycle Racing Association, composed of H. E. Ducker, of Charles River Park, Boston; L. M. Rich, of Pleasure Beach Park, Bridgeport, Conn., and L. H. Adams, of Hampden Park, Springfield, Mass., met in the last-named city Saturday, discussed the aims and purposes of the association and laid the foundation for its government.

It is probable that when formed the official title will be the American Cycle Racing Association, instead of the reported name, National Cycle Racing Association. Without doubt the President will be E. C. Hodges, of Boston, one of the prominent bankers of this city, and a gentleman possessing distinct executive ability. The office of Secretary will be a very important one, and possibly L. H. Adams, of Springfield, will be elected to fill that position.

There will undoubtedly be a larger number of tracks represented at the meeting in New York Saturday evening of this week than at the previous meeting, when the organization, it is expected, will be completed.

AS TO ARTIFICIAL PACING.

Commenting on motor pacing the Irish Cyclist says: "Pacing is becoming more and more artificial daily, and if motor vehicles are admitted the climax will be reached. It is not so long ago since a great outcry was raised against the first mile record of under 2 minutes, accomplished in America by J. S. Johnson, because he used trotting horses and sulkeys as pacers, and had a narrow canvas screen to protect him from the dirt kicked up by the horses' feet, which, also, of course, served as an additional wind buffer. A motor car will create a still greater draught in the rider's favor. Of course it may be urged that the introduction of the new system will simplify the pacing question vastly, as one motor-car will be able to pace right through an event. This does not get over the artificiality of the whole thing, however."

MICHAEL AGREES TO MEET STARBUCK.

Michael has cabled that he will accept the challenge of Frank Starbuck for a series of match races, to be held on the Panama track, Jacksonville, Fla., on March 8. Starbuck will compete at the Mardi Gras race meet, at New Orleans, on February 25, and will then go to Florida. The races with Michael are to be for one and five miles and for an hour, all unpaced.

MAY BE SEEN ON THE CIRCUIT.

It is announced as a probability that A. G. Spalding & Bro. will next season again be represented on the circuit by a team of crack-a-jacks. Overtures are being made to several of the top-rung riders. It remains only for an agreement of terms to be reached to settle the matter. The firm, it is stated, will endeavor to have Bald at the head of the team.

QUITE A PROFITABLE EVENT.

The Melbourne Cycle Club, who are responsible for the famous Austral, cleared \$7,500 on the promoting of this popular Australian race this year. Verily, the happy home of professional racing is now in the antipodes.

PALMER TIRES

There is not such a great difference in the general appearance of a high-grade bicycle and one of inferior quality. Shape and size are common to both. Enamel and nickel cover a multitude of defects.

A cheaply constructed bicycle may have a first-class saddle, or some other good single part, but a cheap wheel is never fitted with Palmer Tires. They are too expensive. e e e e e

The distinguishing mark of an 1897 high-grade bicycle must be apparent to the eye. That mark will be a pair of Palmer Tires. e e e e e

The Palmer Pneumatic Tire Company,
New York and Chicago.

SHORTAGE MADE GOOD.

Detroit, Jan. 20.—At the meeting of the newly elected officers of the Michigan Division, held in this city December 9, the alleged shortage of Secretary-Treasurer Frank H. Escott was referred to the Executive Committee with power to act. Yesterday Leon Caro, of Grand Rapids, the new Secretary-Treasurer, sent out a communication signed by Edward N. Hines, Chief Consul; Ervin F. Kemp, Vice-Consul, and F. C. Stillson, member of the Executive and Finance Committees, stating that the Committee had, after careful and thorough examination of the books and papers of Frank H. Escott, ex-Secretary-Treasurer of the Michigan Division, L. A. W., revealed the fact that Escott was indebted to the Division in the sum of \$125.

Escott made a prompt settlement with the Division, and Leon Caro has given the ex-Treasurer a receipt in full for all claims. The Bresler money is still tied up in the courts, but Chief Consul Hines is of the opinion that the case will be settled as soon as Joseph M. Bresler returns from his trip to South America.

The Michigan Division, through the efforts of Chief Consul Hines, will make a strong effort to punish bicycle thieves. The Division offers a reward of \$25 for the arrest and conviction of every person stealing a wheel from members of the Michigan Division. An effort will also be made to have the Legislature pass a law imposing a heavy penalty for the theft of machines.

BELIEVE THEY ARE FAVORED ENOUGH NOW.

From New Haven comes the news that some cyclists of the State are opposed to the plan of introducing a free cycle baggage bill in the State Legislature, their strange opinion being that the recent reductions by the New Haven Railroad Company fix rates low enough to be satisfactory. A majority of the wheelmen believe, however, that the railroad company will raise rates when the present Legislature adjourns unless there is some positive legislation fixing them.

JOHNSON MUST PAY HIS EMPLOYERS.

More trouble for John P. Johnson. The makers of the World cycles, Arnold, Schwinn & Co., have secured a verdict against him for \$887.50, in a suit brought in the Minneapolis courts for \$1,487.50, the amount claimed to be due for "certain wheels and parts sold to the defendant." The jury's verdict was in favor of the plaintiff, though the amount awarded was \$600 less than the claim.

HURET WANTS ANOTHER TRY.

Huret has challenged F. C. Armstrong for a race over one hundred miles. The Frenchman attributes his defeat in the recent three days' race to a lack of pacers, having to rely on second-class teams. Some critics think the long-distance champion a trifle stale.

NO RACING AT THIS MEET.

A mid-winter meet is one of the coming attractions of the Massachusetts Division. The meet will have no connection with racing, as the word implies, but will consist of an entertainment to be held in the Bijou Theatre on February 17.

Perfumed lamp oil is now offered for the delectation of the society rider's olfactorys.

LOST IT ALL.

More hard luck is being experienced by the Kentucky Division. The whole wealth of the Division, over \$900, was deposited in the German National Bank, which closed its doors last week. This is not the first time the Division has been caught in bank failures; in 1891 it had \$131.07 deposited in the Masonic Savings Bank, which failed, and so far they have recovered but 60 per cent. They, however, consider the chances bright for recovering most of their money from the German National.

O. W. Lawson, treasurer of the Century Road Club of America, also had this body's money on deposit in the German National.

ANOTHER KICK AGAINST FRANCE.

According to F. C. Armstrong, who won the recent three days race in Paris, English riders are not particularly well treated there. He says: "Yes, I have reason to complain of the treatment I received in the race, both from the riders and the spectators. Several times during the race, when passing the French competitors, they ran me as wide as they possibly could. At other times, also, the audience spat at me and threw pieces of paper, orange peel, &c., and saluted me with hisses. I am confident that there is a general aversion against English riders just now in Paris."

IN THE TWO-TWENTY CLASS.

Since Flora Temple, in 1859, first trotted a mile in 2.20, first and last, 2,064 horses have succeeded in trotting eight furlongs in 2 minutes and 20 seconds or better. It would be interesting to know just how the human racer compares with the equine one in this performance, so that the relative merits of man and machine versus those of horse and sulky might be studied to a greater advantage. But until a less complex and more complete system of keeping cycle records is adopted all this will not be possible, unfortunately.

PACED ACCORDING TO HIS CONDITION.

A motor-tricycle has been secured for pacing by Rivierre for the next Bordeaux-Paris race. The pace will be regulated to spur him on at whatever condition he may be in at all stages of the race. Other contestants will be paced by motor and electrical machines, which will inaugurate a new era in road racing, so far as pacing is concerned.

CASE OF NOTHING ALL ROUND.

The description by a countryman of the first wheelman he had ever seen, when telling about his passing him on the road, was not bad when he said: "Something riding on nothing, doing nothing, saying nothing and caring nothing."

GOLD-BRICKED.

"I hear you got a nice round sum from Bilkem & Co. for riding their wheel last year?"

"Yes, I did! A very, nice, round sum; something like this—O."

When early spring tries to carry water on both shoulders she fails, of course, and a plentitude of sloppy weather is the result.

STILL ORGANIZING.

P. Anthony Brock's plan to reorganize the Metropolitan Association of Cycling Clubs and form an organization embodying all the clubs of the metropolitan district, is still in an embryotic condition. At a meeting held last week it was reported that 20 clubs had signified their intention of joining the new association. It has been decided to call the new organization of the New York Bicycle Association. A committee consisting of Messrs. Frick, Klucker, Eberaux, Nason, Friedrick, Fitch, Kelley, Stahl, Elise and Simms was appointed to draw up a constitution and by-laws. A meeting for the formation of a permanent organization will be held early in February. The associated cycling clubs of Long Island and New Jersey will co-operate with the new organization.

BELIEVES IN THE TWO TOMS.

Henry E. Ducker believes that a man has three years of success on the track; three years when he will be seen at his best, and on that assumption he does not think that Bald will be a top-notch this season. His idea is that Tom Butler and Tom Cooper will be the men of the year, with a chance of Nat Butler getting into the game. Of course, he admits that some new man may jump in and electrify the racing world. He believes that the Butler boys worked at a great disadvantage last season. To his mind a racing man, to be prosperous, must not have anything happen him, which will in any way shatter his confidence, for that may lose him the race.

CAN'T "PLAY SOLDIER" ANY LONGER.

At Albany last week the National Guard Association met in annual session and declared war on those persons who wear shoulder straps without having the right to do so. The sum of \$250 was appropriated to prosecute, under sections of the military code, members of bicycle clubs and the Salvation Army who wear shoulder straps. As the custom has about gone out of practice among cycling clubs, the decision will have but little effect.

RACING BOARD'S BULLETIN.

Suspension placed upon E. H. Gill, Buffalo, N. Y., has been removed.

SUSPENDED.

H. G. Thompson, New York City, N. Y., pending payment of entry fees.

John S. Barber, Elwood, Ind., six months from January 23, and Jasper Parrish, Indianapolis, Ind., one year from January 23, by vote of L. A. W. Racing Board.

PATENT PATHS PROPOSED.

The Globe Bicycle Path Company, with \$100,000 capital, has filed papers for incorporation with the Colorado Secretary of State. The company will manufacture a certain material for building and repairing of bicycle paths, the secret of which material is owned by the incorporators.

MORE AUSTRALIAN GOLD HUNTERS.

A. C. Edwards and Jack Green, two crack English professionals, have sailed for Australia to join the foreign colony of riders in that country. They are under the management of E. Leitch, the old-time racing man.

GREAT TEST.

STERLING
 CYCLE WORKS - CHICAGO, ILLS.

Kindly mention The Wheel.

DECIDEDLY THE GREATEST.

NO FORMER ATTEMPT AT A CYCLE SHOW HAS EVER EQUALED THIS EFFORT OF THE BOARD OF TRADE.

CHICAGO PUTS THE MARK HIGH OVER ALL FORMER CYCLE SHOWS—MANAGER PATTISON PROMISED A PERFECT SHOW AND GAVE IT DESPITE ZERO WEATHER—WHO AND WHAT WENT TO MAKE THE EXHIBITION A SUCCESS.

The Chicago show is a revelation. It is the second Western National Cycle Exhibition held under the auspices of the National Board of Trade, but it is really the third cycle show held in Chicago. All who were in the great Western metropolis will remember the vileness of the first show, held in the old Battery D Armory, in 1895. The badness, not of the show itself, but of the conditions which surrounded the show, the narrowness, the filth, the lack of breathable air, of light and of heat. All who attended the second show held at sawdusty Tattersall's in 1896 will remember all these stifling conditions duplicated, with the addition of a sub-strata of nine inches of ice, which distributed influenza without fear or favor.

But all this is changed. It is the comparison of a June day to a raw March morning. The show this year is a thing of amplitude and beauty. The building in which it is held is an architectural marvel. It is only fair to say that it is thoroughly Chicagoesque, using the term in the sense in which it is sneeringly used by Eastern critics. It is the largest building of its kind in America, and those who know say that the only structure which surpasses it is that architectural marvel called the Crystal Palace, of which London justly boasts.

The show finds habitation this year in the new Exposition Building, the Coliseum, the same which was blown down by one of the storms of last season, but Phoenix-like, it has been resurrected with characteristic Western energy, and to-day Chicago may well be proud of the structure. It is said to be 700 feet long on the ground floor and it has two galleries. It is almost as broad as Madison Square Garden is long, and is twice as long as the interior of the Garden. The walls are substantial and are raised to a harmonic height. The place is splendidly roofed. There is an amplitude of glass and light iron structural work, giving the effect of lightness and beauty. Outside, in a detached building, is the light, heat and power house. The show is housed in a great auditorium, a room of broad and splendid proportions. Not a single stand is crowded. The aisles are wide enough for a society promenade. Twenty thousand people would comfortably sprinkle the building. Despite the fact that the Weather Bureau has done its worst in giving a nineteen-below-zero-mark for the opening day, the building is as comfortable as a dining-room. It is heated on the hot-air blast principle. Here and there are enormous shutters from which pour streams of hot air, so that fur coats and wraps are unnecessary, and one can move around in the ordinary garb of business.

The Board of Trade have taken this structure and handsomely decorated it, the National colors, of course, being most partic-

ularly in evidence. Then there are strings of incandescent lamps, Chinese lanterns, and all the rest of the paraphernalia of the decorator's art.

The building is located at Sixty-third street, a location which would be equalled in New York by Washington Bridge and vicinity, about seven miles from the Auditorium Hotel, or the main business district. But these seven miles are as nothing, since the Illinois Central Railroad, owning stock in the Exposition Building Company, runs fifteen-minute trains direct to the door of the building. It is a step from your hotel to the train, and another step from the train to the building, thus making all comfortable and pleasant. Last year the show was marked by one permanent and resonant growl. This year everybody is simply tickled to death over the way in which they are housed. This show marks a red-letter in cycle exhibitions. It completely dwarfs the possibilities offered by any building in the East, and unless Boston and Philadelphia come to the rescue and complete their proposed mammoth buildings before next show time, the East will have to step down and out so far as general ensemble and show rooms are concerned.

The show opened on Saturday night, and although it was inaugurated with a blizzard, five thousand people paid to witness the show. On Monday, up to 2 o'clock, six hundred agents had registered and passed into the building. The show was reserved for purely business purposes until 2 o'clock each day, after which the public is admitted. This rule is rigidly enforced, and in this way there is no crowding or jostling and but little confusion, so that people can talk business and make themselves heard. Taking a general bird's-eye view of the show, it may be said to closely resemble that held in the Garden last year. There is no end of tapestry and rugs and gilt and electric lights and decorations of all kinds. The effect this year is much better, because each stand, on account of the great space, is enabled to stand out by itself. In a general way the decorations may be said to be on the same level as those of last year, but in particular cases, which will be pointed out later, some firms have improved on their past efforts.

Writing Monday at noon, it may be said that the show is only slowly getting under way. Few principals will confess that they are closing up old business or opening up new fields. They say that agents are only slowly coming in, and the great impetus that the show is expected to give the agency trade has not yet introduced itself. At the present time, those who buy cycles or other material in quantity are only picking. This is the way shows always start out, but even the least hopeful expect that by Thursday of this week the trade of 1897 will have gotten

well under way; that people will know what's what, and all will have a clean idea of 1897 probabilities.

As Monday night wore on the show slowly revealed itself. As daylight faded away stand after stand was lighted. It then became plain that this show, in the line of decorations, swamps all previous cycle exhibits. The electricians say that, taking it as an electrical show, it is unparalleled in their recollection, and that as a show of electrical effects alone it is worth the price of admission.

The general expression is that this show seems to mark a climax in the cycle show business. The exhibitors seem to think they have reached their limit, both as to expenditure and as to effect, and many of them believe that it will mark the last national cycle show. This, however, is merely a sentiment and an intuition. After they become accustomed to the brilliancy of this show they will, as has been the custom of yore, begin to dream and plan for "next year." The chief eye-feature of the show is a great central pavilion, onyx-columned, and splendidly decorated with lights, the top containing a sort of electric diadem; and there are also on it and about it circles of lights, and also revolving lighted wheels.

In the whole scheme the band must not be forgotten. Situated away up aloft, it floods the whole building with excellent classical music. The band is a treat.

Some epigrammatic individual has recorded the sentiment, "The door to success is labeled Push." Some one else more waggish than this epigrammatic has gone to the trouble of pointing out that the doors to lots of other places are labeled the same way, but that, of course, is another story. The doors of the Exposition Building all bear the same word.

As the week wears there can be no doubt that the Board of Trade, through the push of Manager Pattison and his men, has resulted in an emphatic and glittering success. Usually in such immense public structures there is at least one of the belabeled "other places" to be found. That there is none here will doubtless be comforting to Mr. Stead and the other gentlemen who came, saw and endeavored to conquer Chicago. For a few short hours it did exist, but it bore no label.

The Coliseum is located in an aristocratic portion of Chicago, inhabited by those who believe entirely in water as a quencher of thirst, even when the thermometer is hovering well below the zero mark, as has been the case since the doors of the show were thrown open on Saturday night, and it is due to their kind efforts that the Coliseum thirst dispensary was so short lived. The drought that has settled down is wide in extent.

For the once the Coliseum is itself. Several hundred people, whose duty calls them hither, do not leave the place from morning until night, and on these a blight has fallen with a somewhat heavy hand. The best show work is tiring and exacting and long continued; something more than tea and coffee and drugs is required to stimulate the nerve. Of course this seems a matter of small importance to those who are not here, but take the word of those on the ground and try at least to believe that it is not as small as it may seem. The human desire to

ONCE A MONARCH ALWAYS A MONARCH

A MONARCH RIDER never changes his mount—once a MONARCH, always a MONARCH.

A MONARCH RIDER has the satisfaction, pleasure and pride in knowing that he rides the KING of BICYCLES, a standard wheel with a recognized value and a universal reputation for high grade qualities.

A MONARCH RIDER knows that he possesses the best bicycle that the trinity of mechanical skill, excellence of material and the finest equipped bicycle plant in the world can produce.

A MONARCH RIDER feels that the MONARCH guarantee insures him against misrepresentation, deception and dissatisfaction. He is perfectly safe when he has behind him the guarantee of the concern which has achieved a success without a parallel in cycle history and is backed up with a paid-up capital and surplus of a million dollars.

A MONARCH RIDER is ever a satisfied rider.

Be satisfied, ride a MONARCH and keep in front.
Our catalogue is yours for the asking.

MONARCH CYCLE M'F'G CO.,

Lake, Halsted & Fulton Sts.

CHICAGO.

83 Reade St.,

NEW YORK.

keep warm the cockles of the heart resulted in the formation of numerous hunting expeditions. They leave the building almost every minute of the day. The game sought is, to employ the Chicago description, a "blind pig." Just what manner of creature is the animal, THE WHEEL, of course, knows nothing. For some reason or other, the Eastern newspaper men have proven poor huntmen.

With the nerves right and the heart cockles warm, the show presents a really magnificent sight. It more than rivals an electrical exhibit. Some idea of the magnitude of the display may be gleaned from the fact that some seven miles of wire were used to effect the result. The centre piece constitutes the Board of Trade exhibit—a Grecian temple with Corinthian columns which support the gilded dome, on the apex of which are arrayed a cluster of electric lights, at the base of which are three illuminated and revolving wheels. Within the temple are glass show cases containing a collection of the various parts of a bicycle as they were employed since bicycles were first made, designed to represent the progression of the cycling art. These collections are so incomplete, however, and so illly represent the real progress that the least said the better. The effort was praiseworthy, that is all.

In Greens and Yellows.

The same is true of the Poster exhibit, which partly covers the wall at the further end of the hall, and which attracts little attention. The individual decorations are as elaborate as heretofore. Potted plants are not so freely used, and it is observable and worthy of comment that many of the larger firms, notably Pope, Sterling, Spalding, Barnes and Monarch, are employing many of the larger and more prominent decorative effects used at previous shows. If a vote of the public was taken it is quite probable that the Stearns stand would be voted the prettiest in the hall, although connoisseurs are inclined to award the palm to the Sterling. It is difficult to do either of them justice in print; both are models of quiet elegance, displaying sufficient ingenuity and originality and color to relieve the quietness. The Stearns, which is the largest in the show, obtains much of its beauty from the absence of railing, and the combination of yellow-green rugs and enormous potted plants.

The business department, the desk and chairs usually so conspicuous, are curtained from view. The sign is a magnificent creation. It is supported on gilded uprights, and consists of seven gilt shields or escutcheons, one each for the letters in the word "Stearns," done in ruby lights. It is probably the most elaborate sign ever seen at a cycle show, and possibly at any other similar function.

The Sterling stand is carpeted in green, a few shades darker than the olive-green finish of the Sterling wheel. The railing is a feature. It consists of olive-green Sterling head and frame tubing wrapped in red plush and topped with a fanciful golden creation, the plush being also entwined with a heavy gold cord.

The Barnes stand is all white and purple, the piece de resistance being the purple lighted revolving wheel used at last year's show, which is this year flanked on either side by two colossal doves' wings, beautifully typifying the Barnes' white flyer.

The Columbia stand is carpeted and draped with delicate white tapestry, in which is interwoven the name Columbia and the Pope nameplate. The Victor is rich in its simplicity. The centre of the stand is raised slantingly, and the whole is covered with green baize, the stand being void of all effort at display. The Western Wheel Works is illuminated by a dead white and particularly brilliant sign flanked by electrical crescents. The Monarch with its golden lions; the America with its blendings of the National colors; the Hunter with its delicate green harmonizing with the color of the wheel; the Fowler in its maroon and yellow; the Corbin with its illuminated China bells, and the Wolff with its illuminated vases, are all stands among the many which appeal to the eye. The tire manufacturers have nearly all adopted the Morgan & Wright idea of decoration, which is no decoration at all, but simply a reproduction of a high-grade business man's office or department.

Few evidences of trade are in view. They

Centre Pavillon.

no longer litter up and overcrowd their spaces, having found two or three or four tires amply sufficient for their purpose. This idea has prevailed with Morgan & Wright, Palmer, Dunlop and other makers.

The Parts People,

The Merchants' and Manufacturers' Warehouse, particularly, and Iven-Brandenburg-Burgess Co., McMullen & Co., and Chicago Tip & Tire Co., all occupy large spaces, and make displays of which they may well be proud. Their wares are exhibited to an advantage which seems hardly possible considering their nature. A leaning to reproduction of their specialties in heroic size is notable on the part of many exhibitors. The Sarus hub, for instance, is reproduced in a working model twelve times its natural size. The Racycle have a colossal reproduction of their crank hanger, with a glass hub through which the workings of the balls may be seen. A fibre buckskin grip, a Fauber one-piece crank axle, a Chase tire and a Beck hygienic

saddle are all shown in heroic size. The New Departure Bell Company and P. & F. Corbin have musical attractions, the former a set of chimes and the latter a piano formed of their bells. Human side shows are here, but in lessened numbers. The Chase tire people have a giant in red coat and hunting costume, and another concern has a freak on stilts meandering up and down the aisles; but one bloomer girl is in evidence. Practically everybody who is anybody in the trade is here; to individualize would be to slight. Souvenirs, too, are few and simple. The music is good, and once each day a gentleman with a baritone voice lifts it in song and endeavors to fill the hall. He reaches into the higher realms and does not attract a tittle of the attention given the Paradise Alley boy who warbled in Tattersall's last year.

AS VIEWED MECHANICALLY.

In reviewing the mechanical features of this show from the selfish standpoint of a cycle paper, selfish, because heretofore to the better informed cycling writer, the show has served as the straw which unmistakably indicated the tendencies of the trade. Keeness of competition and lessons of the past have so advanced the opening of the markets that it may be safely said that the '97 season was inaugurated at least a few months since. In the interim he has been dull indeed who has not been able to easily and positively discern what was to be the more important features of the bicycles of '97.

Traveling salesmen have circulated and criss-crossed the country so often and in such numbers that no town of five thousand inhabitants has had reason to be in darkness as respects these features, in a general way, at least. Additionally, all the more important mechanical designs and wrinkles have been well exploited in the columns of THE WHEEL and other cycling journals. As before stated, from the selfish standpoint referred to, the cycle show has lost much of its pith and point. Of course, it is not wholly sterile. There are exclusive features in plenty, and matters of minor mechanical details which are of absorbing interest and undoubted utility. Collectively they are intricate, but they must be delved for long and earnestly.

The casual attendant, even a tradesman, will not find them without most vigorous nosing about. They are there, and, like most good things, must be striven for. Necessarily, the parade of the principal features is perfunctory. To this is also added the aggravation known as fixity of pattern. In former shows variety of designs, while not unlimited, at least presented a number of individual fancies and ideas. At the present function, the variety and richness lie wholly in the working out of constructional details. Probably the most important part of the modern bicycle is the frame.

Frames.

The regulation diamond frame shown almost invariably carries the upper main tube perfectly horizontal. The diagonal stays and head are, however, raked less than last year, and which is a decided advantage. The greatest difference, however, consists in sizes and styles of tubing used; 1½-inch tubing for both upper and lower main tubes seems to be the most popular, closely followed by frames using 1¼-inch for the upper main tube and

1½-inch for the lower main tube. There are, however, a great many models shown having both the upper and lower main tube made of 1½-inch tubing.

Gunning & Morado use corrugated tubing all over. The Gunning people are even making their handle-bar of corrugated tubing. The greatest diversity, however, exists in the tubing used for rear forks and back stays. The majority of the makers use round tubing in these places, although a great many makers show D-shaped rear forks, notably the Crescent, Columbia, Stearns, Union and Trinity. But it cannot be truly said that the use of D-shaped tubing by American makers is as popular as its advocates predicted it would be. Its merits lie in its increased stiffness, its aid in making narrow treads; but all the American makers who use it have overlooked one of its greatest virtues, and that is the ability to use it in large sizes up to 1½-inch diameter, so that the rear part of the frame corresponds in size to the front part.

Eight-sided Tubing.

The Shelby Company use octagonal tubing for their rear fork and back stays, and also use it in their handle-bars. The rear forks of the America are made of the new form of grooved tubing, the groove being on the inner side of the fork. The makers who use the round tubing for rear forks and back stays mostly use ¾-inch and ⅝-inch for rear forks, and ⅝-inch and ¾-inch for back stays. A notable tendency is to narrow the back stays at the seat pillar cluster. The average wheel base is about 44 inches. Treads average about 5 inches. Crank hangers on all the really up-to-date models shown bear an average drop of about 2 inches. Some of the extremists, however, drop them as low as 3 and 3½ inches on their racing wheels.

About a dozen makers are showing what are called a hygienic frame, which are made under the patents of the Hygienic Wheel Company. The frame resembles the regulation frame, excepting in the back stays. These have a crown directly over the rear tire, and from there to seat pillar bracket they have a stem enclosing a spiral spring and a pneumatic cushion. The makers claim for it that it is entirely distinct from the old spring frame patterns, and that it adds to the comfort of the rider and the life of the bicycle. The popular types of ladies' bicycles are the double loop frame and a frame having the straight lower main tube and an upper curved tube. These two patterns lead all the other styles.

High Crank Brackets.

Other patterns shown have both tubes straight from head to crank bracket, varied in some cases by having the upper tube a J-shape. The Overman Wheel Company show their popular single-tube frame. Victoria, but are also showing the double loop. All the characteristic points, as regards sizes of tubing shown in the men's wheels, are embodied in the ladies' wheels. Many of the makers, however, still carry their crank brackets on ladies' wheels too high from the ground, but the popular types shown drop the crank hanger bracket about three inches. This facilitates easy mounting and dismounting, and carries the centre of gravity near the ground, and, therefore, is commendable. Flush joints are very largely seen. They are

divided, however, into two classes, one having the internal joints made of drop forgings, the other style having the internal joints and reinforcements made of stampings or tubings. The flush joint frames permit of a beautiful finish, and there is every reason to believe that if they are carefully brazed together they will stand the test.

Frame Strengtheners.

Lap brazing is still very largely used, and many of the makers use outside fish-mouthed reinforcements as an additional strengthener. Form-drawn and sheet steel stampings are more largely used than ever before for frame connections and seem to be ousting the drop forge connections from the firm hold they have had on the makers. A bamboo frame is shown which is not bolted together, like the old style of bamboo frames seen at previous shows, but has a bushing in the end of the bamboo rod, which fits into a taper expanding metal connection. The front forks are of the usual flat-side pattern, but are painted to represent bamboo.

There are three or four patterns of wooden frame bicycles shown, all having metal connections. One style shows several hickory frames covered with beautiful veneers. A laminated wooden frame is shown, which has very few metal connections, even the head and crank-hanger bracket being made of wood. There appears, however, to be no demand for this style of product, yet the makers of them keep on appearing at our cycle shows and wasting their time and money. Spalding exhibits the usual type of frame, carrying, however, a beveled gear. It is the only chainless bicycle on exhibit. There are fewer carrier cycles to be seen than at any of the previous shows, notwithstanding the fact that they have come into practical use. The Relay people show the only tricycle to be found. It is of the tandem style. Even the two companions and the duplex shown are not new. It is evident that our makers are not catering or endeavoring to build up a demand for a three-wheeled vehicle.

Juveniles.

A host of juvenile cycles are shown, two of the makers making them exclusively. Scattered throughout the show are at least six Lilliputian cycles, but which are simply shown as cunning examples of the art, and are not intended to be sold as a regular product. The most novel tandem in the show is the Crescent Model 30. It is of the combination type, but differs from all others shown in the arrangement of the seat for the male rider in the rear, who controls the steering, and is placed so high as to have an unobstructed view over the head of the front rider. The makers assert that it balances and steers more easily than the other types. The demand for tandems has been fully met, and in addition to the regular diamond frame and combination tandems there are shown a number of double drop tandems and what are known as convertible tandems, the frames being so arranged that they can be readily converted from a diamond to a drop frame tandem. Some of the makers even go further than this; and one maker shows one that can be made into a double diamond, a double drop, or converted into two single wheels. It is an astonishing mechanical product to say the least, and its liability to get out of order undoubtedly very great.

There are a number of triplets shown, one

of the most striking being that exhibited by the Wolf-American Company. Four quadruplets, one quintette, a World product, and two sextettes. Stearns also shows a septette. The real freak of the show, however, is Dr. Hall's hygienic bicycle, almost every part of it being a radical departure from the accepted standard. The front forks have a peculiar double-deck crown; the head is an open one, the handle-bar is of an original shape, the frame carries a crank-hanger bracket and a supplementary crank-hanger bracket about four inches behind the front bracket. A peculiar chain of turtle-shell back design, it being of an open box design, with the open side facing downward, leads from the front crank-bracket to the second one, and this second bracket carries an additional sprocket, which conveys a similar chain to the rear wheel sprocket, so that the inventor first gears up and then gears down and then gears up again, the result being an enormous amount of friction, and an expensive construction. The saddle and pedals are also radical departures. It is indeed a difficult machine to describe, and must be seen to be appreciated.

An Advancing Worm.

The Elgin \$10,000 tandem, aside from its expensive decoration, has only one chain, and that running from the rear sprocket. The power of the front rider is applied to a crank shaft having an advancing worm, which fits into another worm carried on an end of a shaft, which runs along longitudinally from under the front crank bracket to the rear crank bracket, where the shaft has a similar worm which engages on another worm on the rear crank axle. These worms are about three inches in diameter, about an inch thick, and carry about thirty teeth on their circumference. It is certainly a novel, ingenious and practical way of conveying the power from the front crank bracket to the rear crank bracket. Colored enamels are very largely used, as are also stripings and other decorations. New Departure bells are enameled to match these various colored enamels, and the conception of the idea is novel and should prove popular.

Chain Adjusters.

A great deal of attention has been paid to designing and inventing new forms of chain adjusters. All the single wheels shown use the rear fork end adjusters. Tandems largely employ an eccentric chain adjustment. Tubular and barrel hubs are now a fixity, the variations being method of spoking. Of course, the hooked end spoke predominates, but the direct tangent pattern having a riveted head only is gaining ground. All the Columbias shown have a new direct spoke of this pattern. The Trinity also has a new idea of using this method of spoking.

Sundries.

The variety of new sundries displayed is almost bewildering. The old patterns of black enameled lamps, burning a heavy oil, are entirely obsolete, and all the new lamps shown are on the type of the Twentieth Century model, nickel-plated and burning kerosene. Small cyclometers are now the correct thing, and are best typified by the Veeder pattern. Saddles are mostly on the hygienic order, represented by the type of Mesinger and Hunt. Pneumatic saddles are largely shown, as are also saddles on the well-known Christy model, having short pommels and pads affixed to their bases. All the makers

are prepared to fit brakes if called for. There are a number of new detachable brakes shown, two or three of them are applied when back pedaling is done only. The Spencer brake is shown by a number of makers, which operates by a turn of the grip, the only thing showing being the brake spoon. They also have a modification of it, which acts on the crank-hanger shaft, and which is wholly invisible. The whole construction of this brake is very mechanical and it is surprising that more makers do not apply it and meet the public demand for it.

A great deal of ingenuity has been expended in designing seat-posts and methods of fastening same. A number of the makers have entirely dispensed with the pinchbind and bolt and are using internal fastenings for their seat-posts.

Fork Crowns and Front Forks.

The old type of square and single one-piece fork crowns are no longer in vogue. The double-plate fork crown and the arched or oval fork crown of the Rambler and Sterling type, are very popular, the arched fork crown being largely used by the Western makers. The Union Company have a new thing in a triple plate flat fork crown. The Columbia has also discarded the single-fork crown and show a double-fork crown, but which is not remarkable for beauty of design. The Eclipse Company show what might be termed a cross between the flat double plate and the arched fork crown, the upper part of the crown having a peculiar flattened arch and the lower part being the usual flat plate. The crown is also not distinguished for its beauty.

Front forks throughout the show are showing less rake than in former years, conforming with the rake of the diagonal stay in the frame already mentioned. The forks are also wider at the crown, the point of greatest strain. The Union people show a D-shaped front fork.

Sprockets and Chains.

Detachable sprockets are seen everywhere. The usual method of fastening is to braze the spider to the crank axle and bolt the arms of the sprocket to the spider. The average gear used on roadsters is about 70. On ladies' wheels 63. Nearly all the makers use 8-tooth rear sprockets, the 7-tooth sprocket being almost entirely dropped. The large sprocket idea does not prevail as largely as it would have had its advantages been known earlier. There are, however, a number of well-known makes exhibited who furnish rear sprockets with nine, ten and eleven teeth, and front sprockets from twenty to thirty teeth.

New things in chains are scarce. The block pattern chain of 1-inch pitch, 1-4 and 5-16 in width are standard as usual. The Keating Company are using a double roller chain, which differs from the old roller chain formerly used in this country, not only on account of having double rollers, but also because it has one-inch pitch. On the Lovell cycles is shown a detachable link chain, the studs of which are not riveted. Instead of using the solid block, they use five plates, which are held together by the detachable stud. The Whitney Manufacturing Company have a novel chain, in which not only the side plates, but the blocks, are triangular shaped, and they run between rollers which

are fastened between the peripheries of sprockets having double flanges. On the Orient is shown what they call a pitch-lined chain. On the sprockets are placed, between the regular sprocket teeth, a depressed cycloidal tooth, and which receives the flat block, preventing the blocks from falling into the pit of the sprocket. The blocks and side plates are of the same length, and are 1½-inch long. In an ordinary chain the blocks are short and the plates long. They therefore have about 25 per cent less rivets and sections, but it might be urged against this chain construction that the long blocks and plates are more liable to stretch than the shorter blocks and chains. On an Envoy is shown the English Simpson chain and sprockets. It is the only one in the show.

Pedal Fixing.

The good old-fashioned way of putting cranks on with a cotter pin has departed. The two-piece crank and axle has the floor. One-piece crank axles are also very popular. They might possibly be more popular if they were not covered by a fundamental patent, and were free to the makers as the two-piece crank axle construction is. Detachable cranks and axles of the three-piece variety are still popular. The Victor have a novel way of inserting their crank through their hollow axle. There are at least fifty other makers who have various forms and modifications of bolting and clamping the cranks to the axles. There seems to be a tendency to use 7-inch cranks more largely than heretofore, although the 6½-inch crank is still the standard. Cranks on ladies' wheels have, however, settled down to six inches in length as the standard. The popular form of pedals are those modeled after the Record plan. The pedal shaft screwing directly into the crank, the shaft being of ½-inch in diameter at its butt, and having from 20 to 24 threads to the inch. The shafts bear integral arms, to which are fastened the side plates, the majority of these side plates being continuous. Detachable rubbers are furnished on all the pedals, and the Crescent models show a split cotter pin to hold the rubber in place so that no amount of vibration can jar the pin loose, as is the case where a bolt and nut is used. It is a practical thing.

The round crank is very largely used, modifications of it being oval tapered cranks, bayonet shaped cranks as used on the Trinity, and many of the makers still use the square flat crank.

The Hunter tandem has two rear wheels running side by side. They have 1½-inch tires on each wheel, the latter being 1½ inches apart and cover four inches of space on the ground. The hub is made in one piece and having two bearings, only both chains run in the centre of the frame, the rear chain running between the two rear wheels, giving a direct pull all over. It is a decided novelty.

Detachable sprockets, the rims of which are attached to offset spiders, are very popular. The makers claim that the offsetting brings the pull of the chain directly over the bearing. This is a gross and erroneous fallacy, the pull unquestionably being just where the spider is brazed to the axle, and, as a matter of fact, the offset arms of the spider are apt to add to the torsional twist which the sprocket receives.

Bearings.

In wheel bearings two and three-point

bearings are in the lead. The American style of cone adjustments are still used by most of the makers. Many of them have recognized the advantages of the cup adjustment, and use it in their crank hanger brackets only, but have not adopted it in their wheel hubs. The Fowler, America, Kenwood, and many others are using the cup adjustment on their front and rear wheel bearings. Last year none of the American makers did this, but it is safe to predict that in 1898 nearly all of them will use cup adjustments all over. The Waverley has a new thing in its crank hanger bearings.

Waverley Crank-hanger.

It has not been possible heretofore, however, to measure the friction of bearings with any degree of accuracy. In making any change in bearing construction, no mechanic has been able to say with absolute certainty whether or not he was really reducing friction. The Waverley Dynagraph, for the first time, provides a graphic and practical test by which this result may be accomplished.

Friction Measurer.

The machine is mounted on an iron frame, which in turn rests on a box pedestal. A knife-edged attachment is placed on each end of the axle of the wheel to be tested, which then rests on a hardened steel block on the top of the frame. The record card, an oblong strip of card board six inches long by one and one-fourth inches wide, is fastened by spring clamps to the moving plate in the exact centre of the machine, which is dropped by an escapement movement actuated by the rotation of the wheel whose bearings are being tested, each revolution of the wheel dropping the plate one tooth of the rack cut along its edge. The heavy dark-blue vertical line printed upon the card represents the record which would be made by an absolutely frictionless bearing, and the pencil point by which the record is made on the card would describe a line identical with this one, were there no friction in the bearings tested.

As friction is developed, the lever arm to which the pencil is attached is thrown to a degree corresponding to the amount of friction existing, causing thereby an approximately perpendicular line upon the card, being nearer or farther away from the standard line according to the amount of friction in the bearings under test. The speed of the drop of the card is indicated by another pencil point carried on a ratchet wheel, which is actuated by a pawl on the end of the pendulum stem. The spaces marked by horizontal lines across the card are made by a pencil to vary in width according to the descending plate, wider spaces indicating higher speed in the revolution of the wheel, this point being, of course, necessary to make proper comparison of friction tests.

The lines upon the card which constitute the record of the test, may be easily read. An absolute perfect and frictionless bearing would cause an absolutely vertical line upon the card identical with the dark blue line already printed upon it, and the relative amount of friction in different bearings is gauged by the relative degree of nearness with which the record line conforms to the bearings. In other words, the nearer a bearing comes to registering a straight line on the card, the better its construction and the less its friction.

On the new hundred-dollar Waverly is shown an important and radical change in construction of cone adjustments for crank hangers and hubs. By this method, threaded cones are avoided, being replaced by a sliding shell, which secures perfect accuracy and alignment. A threaded cone, even if carefully ground on its axle, when turned from position in which it was ground, is likely to be thrown out of line. In the hanger cones are ground both inside and out, and by loosening a screw in the left-hand crank arm, the crank shaft combination can be taken apart. There are very few pieces used in this construction, and the cones in both hubs are integral with the axles. In removing the wheels from the frame or in the adjustment of the chain, the axle is not loosened in the hub and the bearing adjustment is not interfered with. A small set screw behind the sliding shell locks the adjustment of bearings. This whole construction is very mechanical, indeed, and deserves particular attention by those interested in the bearing adjustment question.

Bearings.

The American Waltham Manufacturing Company use only three 7-16 balls on each side of the Comet's bearings. A ferrule having notches to fit the balls keeps them from coming in contact with each other and runs loose on the axle. Construction is of the usual three-point cup and cone order, and it looks as if it might be an improvement.

Parkhurst & Wilkinson, of Chicago, show a two-piece crank hanger which has some novel features. The cranks and shaft are removed by loosening a taper plug which screws into the end of the shaft. The end of the shaft is split and the taper plug expands the shaft and holds the crank. The bearings are adjusted by unscrewing the taper plug and sliding crank with the cone attached. No threads are used on any part of the bearings or shaft, except the taper plug.

Bearings.

Unquestionably the most novel departure from the accepted type of bearings now in vogue is the Chapman double-ball bearing shown on the Fenway cycle. They show a cycle fitted with this style of bearing at the crank shaft and rear wheel hub. Its use necessitates, however, the use of a crank hanger and a rear hub $3\frac{1}{2}$ inches in diameter, the largest in the show. In the crank hanger they use elastic hollow 1-inch balls, and in the rear hub $\frac{7}{8}$ inch in diameter. They were the only hollow balls used in the show. It is what is known as an inverted bearing. The cones are with the hub, the eighth one being

firmly fixed, the adjustment all being done from the left-hand side. The axle carries, firmly fixed upon its centre, two large cups which have two raised tracks or ball races. The radius of one, however, is larger than the other. They use three of the large balls, already mentioned, on each side separated by three $\frac{1}{4}$ -inch balls revolving in a carrier which is loose upon the axle. These small balls separate the large balls upon a dead centre line. A flanged and threaded disc bearing upon its centre. The adjusting cone is screwed into the inner shell of the hub, on the left side, and securely locked and held in position by a spanner, which clamps the thread on the principle of a three-jawed chuck.

The complete bearing is of the three-point contact order, and revolves with freedom and without play or vibration, which is remarkable even when set up closer and firmer than the ordinary bearing. This bearing is a very taking one, and the mechanical sharps of the trade who have critically examined it say that it has a great future before it.

Gear Cases.

Either the American rider does not demand the gear-case or appreciate its merit, or else cycle makers of America do not care to furnish them. There are only a few gear-cases exhibited. One is a laced leather one shown on one of the Stearns models, and even this model, a ladies' wheel, has a metal dress guard over the rear wheel and a metal mud guard over the front wheel, showing that the whole thing was evidently made up for exportation to England.

Many of our leading makers say they will be glad, however, to furnish them if desired, but at an extra cost. The Wolf-American Company exhibit a transparent celluloid gear-case, which is, however, an English product. Childs, the sundry maker, says he will have samples of his new gear-case on view before the show closes. An American gear-case shown is one known as the Frost. The case is made of pure

Frost Gear Cover.

rubber, with light metallic fittings. Frost, however, announces that in the future he will make them of indurated fibre. The case as made now is flexible and might be briefly described as being a box an inch square, through which the chain runs. At the ends, the front and rear sprockets are covered with sheets of hard rubber.

On a Ben Hur ladies' model, is shown a gear-case, the frame of which is made of wood, the whole being entirely closed, of dark brown leather and laced together.

A new American gear case is shown on the Falcon. It has an iron frame covered with a continuous one-piece sheet of leather, which is laced over both sprockets and underneath the chain, and on the outside is inserted a piece of transparent celluloid. It has an automatic oiling device, which is

placed on top of the chain in front of the rear sprocket. It is dust-proof and good.

Tires.

Only two novelties in tire construction are shown. One is a leather tire made of cow-hide, tanned by a mineral process, which gives the leather a gray color, making it hardly distinguishable from the regulation rubber tire. This tire contains an endless inner rubber tube. The outer shoe is laced all around on the rim side on a criss-cross plan of lacing. The ends of the outer cover are butted together and held in place by machinery belting studs, and which are in turn covered by a rubber strip to prevent them from chafing the inner tube. The makers assert that it is water-proof, that it does not soften when moist nor harden when dry. They also claim that it is absolutely non-puncturable. It weighs about the same as the regulation rubber tire. It looks as if it might be speedy.

The Ball Tire is an extreme novelty. Ninety separate balls made of rubber are secured to a flanged rim by an aluminum pin inserted in the bottom of the balls. The balls are pressed closely together, so that a substantially continuous tread is obtained, and when the balls are depressed by the weight of the rider, the slight intervening spaces between the balls are wholly closed. The balls are inflated by a pump similar to the ordinary bicycle pump with a hypodermic needle attached. In case of a puncture, the punctured ball is readily removed and a new one inserted.

This tire is certainly practical and should prove popular. Detachable tires of the Dunlop and G. & J. patterns seem to be regaining some of their lost ground, and with their ally, the Morgan & Wright tire, are giving their great rival, the hose-pipe tire, a close race for supremacy. So far as sizes are concerned, inch and five-eighths is the standard. All the makers of hose-pipe tires furnish a great variety of roughened, pebbled, corrugated, embossed treads. Weights have not changed since last season.

Plugs for repairing punctures in hose-pipe tires seem to be out of use, and their place is being taken by quick-drying plastic mixtures of the Vimoid type.

An aesthetic novelty in tires is shown by the Hartford Rubber Company in mixing the compounds used in the tire. Colored pigments are inserted and they are able to furnish smooth surface, highly polished tires to match the colored enamel used on bicycle frames.

Rims.

The wooden rim is absolute and almost alone, only one metal rim, an aluminum one, being shown in the whole show. The Keene Company show some very pretty hand-carved rims in about a dozen different patterns. Colored rims are very much in vogue. The Crescent show their leading models with white rims; the Rambler are showing rims stained dark rosewood. Laminated rims are used more largely than single piece rims. Yankee ingenuity seems to have been utterly exhausted in devising ways and means of joining single piece rims. A step in the right direction is the tendency to make the rims thicker in the center, the radius larger, and rounding the edges more. The tire makers will certainly appreciate the effects of the last two changes.

Wooden Dress and Chain Guards.

Very few metal dress and chain guards are shown. Wooden dress and chain guards with fancy lacings and enameled in different colors or varnished on the wood are used on the majority of ladies' cycles exhibited. The Columbia ladies' wheel is shown with wooden dress and chain guards. Aluminum chain guards in fancy designs are largely in evidence not only being used in the natural color but enameled to match the enamel of the cycles.

Handle-Bars.

Nearly every maker in the show has an adjustable handle-bar. There are also a number of handle-bars exhibited by makers whose speciality are handle-bars. Wooden handle-bars are shown in all conceivable shapes and forms. The adjustable one being the most popular. They have not as yet, however, supplanted the steel bar in popular favor. There seems to be a tendency to do away with the pinch bind and bolt as a locking device for handle-bar stems and use instead thereof internal and expanding clamping devices. Many of them are extremely practical and it can be said that they add to the attractiveness of the cycle by thus being able to dispense with the clumsy pinchbind and bolt.

Grips.

Cork grips with fancy ferrules of rubber or nickel-plated metal tips, are standard, but among the novelties shown are some having braided rattan surfaces, pearl, celluloid, fibre, and there are also shown air cushion grips and pneumatic grips.

Lamps.

Quite a number of electrical lamps are seen at the show, but their future is as dubious as ever.

Brakes.

The Phillips coaster and brake is a combination permitting of coasting while the chain and gear are at rest, and also has a brake, which is set in action by back-pedaling, in the rear sprocket. The balls lock against a square shoulder when the pedals are pushed forward. The instant the pedals are held at rest or back-pedaled the locking ball is released, leaving the outer sprocket entirely loose from a small concealed inner sprocket and the hub of the wheel, so that coasting can be done while the feet hold the pedals at rest. There is, of course, considerable back-lash to the rear sprocket, and it is possible that a sudden attempt at back-pedaling would check the velocity of the wheel so rapidly that a header would be liable to follow. A little practice in manipulating the device, however, and care in back-pedaling would doubtless overcome this last-named objection.

Freaks.

A rear driving chain safety is shown, on which the handle-bars are hinged at the stem, from which a pair of chains operate a pair of ratchets, which carry on axle a large sprocket, and which carries a chain to a small sprocket on the front hub. The ratchets and large sprocket are carried over the front forks on a pair of braces fastened thereto. The gear is 84, and corresponds in size to that used on the rear wheel. The device is operated by alternately pulling up and pressing down the handle-bars. It is therefore a combined front and rear driver, and is the only bicycle in the show combining both pedimotive and manumotive power. Hubs with direct tangent spokes.

Peculiar Construction.

The High-Speed Cycle Company carry a chain from the usual front sprocket to small sprocket, which is fastened to the bridge of the rear stay, and which, in turn, carries an axle having a large sprocket which carries a chain to a sprocket on the rear hub. It is a complicated device, adding cost and weight.

The Eclipse show a radical departure in this method of spoking. The spoke at its hub end has a T-shaped head. The hub carries three flanges on each side, the inner flange being drilled the same as the flanges commonly used. The middle flange is drilled and notched alternately. The outside flange is notched only. In spoking up a wheel all the spokes centre in the middle flange, but are alternately fastened to the inner and outer flange.

Warnings To Be Heeded.

In concluding this review of the mechanical features, novelties and tendencies of the trade, as viewed from a mechanical standpoint, it is well to sound a note of warning. Too many of the makers are following the popular fads and using the large sprockets, making them of too light a pattern. This is not only true in their peripheries, but in the fanciful and intricate designs they place between the periphery and the inner circle where they are attached to the arms of the spider. These light and fanciful designs were well enough in the old style small-sized sprockets. In using the large size sprockets, however, their weight and stiffness should be correspondingly increased or they will not stand up in use. Internal seat posts and handle-bar fastenings, adjustable bars containing a number of extra parts and complications, together with peculiar methods of adjustment. Cranks and bearings are also apt enough if well made and well tested and tried before placing them upon the market. Many of these things do not work any too well when at the show and in the hands of their inventors and designers. It follows that they are more liable to get out of order in the hands of the rider during the coming season, and plague not only the rider but also the dealer and maker.

To the makers using flush joints for the first time, a word of warning is also in order. Flush joints are much more liable to be a source of weakness and trouble than all other forms of brazed joints, and as in bringing any kind of a joint a great deal depends upon the individual skill of the operator, and much more so in making and using flush joints, so that great care must be used in properly designing and testing them.

Too many makers are apt to mistake peculiarity for originality, and are not content to let well enough alone. Many of the old and simple forms used in the detail of construction achieve the same results as well, and in many instances better than some of the new and involved methods of construction. It is not always necessary to go to a great expense in tools and machinery to produce something which is not an improvement on a device already in use, and which has proved practical. The watchword of the day should be simplicity.

EXHIBITS IN DETAIL.

AMERICA CYCLE CO., CHICAGO. AMERICA bicycles; seven models, including two tandems. Their special new features are new designs of two-piece

crank and axle joined in the centre of the bottom bracket, curved backstays, oval fork crown, with joints extending down the fork side. The crown has also an upper over-laid reinforcement. The truss-frame as used in their tandem produces a very rigid frame and also allows the placing of the front chain in the centre. Naturally enough "Baby" Bliss, with his 508 pounds, who has been so prominently identified with the America, was in attendance, dressed in all his foreign glory and a West End of London suit. The America ladies' bicycle is an entirely new design. It is now fitted with the truss-frame. They also show two straight-frame bicycles, called the Huzzar.

ADAMS & WESTLAKE, CHICAGO. ADLACE Bicycles. They show fifteen wheels, comprising twelve distinct models; three mens' wheels, two ladies', two road racers, one track racer, three tandems, one triplet. They are shown in six different colors. The single wheels have triple arched fork crowns. The tandems have quadruple arched fork crowns. The bearings and all the finishings in these wheels show the same painstaking method of workmanship for which this line is known. This company shows also the X-Rays Lamp, made entirely of aluminum. This has a metal chimney inside, and has a new feature in the way of a double wick and screw and a double locking device by which the wick is held in the position in which it is set. It has also a bracket which will fit either fork or head of any bicycle.

JULIUS ANDRAE SONS & CO., MILWAUKEE. Andrae bicycles. Ten wheels including two tandems and one triplet. For '97, the Andrae shows many decided improvements. A one-piece crank and axle is used. Also flush joints, D rear stays, and a solid seat-post cluster, internal expanders to seat-post and handle bar, and ball retainers to all bearings including the head. Cone adjusting hub bearings are used, fitted with dust proof cases and oil retaining devices. The Quad has many new and distinctive features. The

Andrae Quad Head.

arrangement of tubing at the front being designed with the right idea as to the strain that this portion of a heavy machine must stand. The lines of the Quad unlike most of the machines of this type were very graceful to say the least, and reflect great credit on the Andrae factory, where it was built. The tandems, both diamond and combination frame, are particularly stiff, the steering arrangement being distinctively effective.

ACME MFG. CO., READING, PA. STORMER bicycles; twenty-two wheels, including two tandems. A full line consisting of 24, 26 and 28 inch; also hygienic frames. A convertible tandem, a rounded fork crown, large sprockets and a center line chain tandem with bottom bracket connections of a new design are among the novelties. The wheels present a handsome appearance.

ARNOLD, SCHWINN & CO., CHICAGO, ILL. World Bicycles. Twelve wheels, including a quint, a quad, a triplet and a tandem. The quint, on exhibition is the one used by Johnson in his Parisian invasion, and is a magnificent piece of bicycle mechanism. Flush joints are not new features of this year's World and the World people are proud of it. They used them last year when they were not so common, the World, too, is flush all over, even to the head cones and cups. A triple fork crown is used and inside fastenings to both seat-post and handle-bar adjustments. Round rear stays and rear forks are used. The finish on the wheels is handsome and beautifully ornamental.

AMES & FROST, CHICAGO, ILL. IMPERIAL Bicycles. Nine single wheels, showing a divided crank-axle and the other up-to-date modifications and refinements, worthy of a conservative and non-splurging concern.

BLACK MFG. CO., ERIE, PA. TRIBUNE Cycles. Ten wheels, including three tandems and one triplet. The only sign appearing at this space is a huge sprocket of the famous cycloidal pattern originated by this firm. The sentiment expressed by riders and agents regarding the '96 model Tribunes was to the effect that there was nothing to be modified for improvement's sake and the concern is not one to change for the sake of change. Several interesting touches have been added to the details of construction, however, and the 1897 wheel is thoroughly up-to-date in all the accepted features. An enamel of robin's egg blue, which is entirely novel, is used for the tandems.

BARNES CYCLE CO., SYRACUSE, N. Y. Barnes bicycles; twelve wheels, including two tandems and one quad for '97. The well-seasoned Barnes flush joints and internal handle-bar and seat-post fastenings are retained. Large sprockets, however, are used, and a drop-forged connection on the lower rear fork offset is a very neat mechanical feature. The tandems—one a diamond frame and the other a convertible—are built on exceedingly graceful lines. The extra stay on the latter, completing the diamond frame, being a particularly ingenious arrangement. White, of course, is the leading color in the '97 Barnes, but a few black-enamelled wheels are shown.

BEEBE MFG. CO., RACINE, WIS. BEEBE Combination frame bicycle; seven wheels. The Beebe is novel in that the main portion of the frame is wood,

Beebe Drop Frame.

while the rear forks, head and front forks are of steel tubing. The line includes wheels from 20 to 28 inches. The steel connection clamps have triangular reinforcements which are forced into the wood, thus avoiding chafing or side motion.

THE BUTLER COMPANY, BUTLER, IND. Record Bicycles. Ten bicycles. The high grade Records are fitted with an oval fork crown, one piece crank and axle, and invisible seat-post binders. On the medium grades are used a single piece fork crown, and L cranks, the opposite crank keyed on, and a detachable sprocket. For the ladies' wheels, they have added a thorough reinforcement to the curved tubing, while a continuous chain guard is a decided novelty. All the Record wheels are beautifully enamelled and tastefully decorated.

BUFFALO CYCLE CO., BUFFALO, N. Y. ENVOY and Fleetwing bicycles; nine wheels for '97. The line includes flush joints, oval swaged rear forks, one-piece Fauber patent cranks and axles, with a key device for removing bearing-cases. Either single or double fork-crowns will be furnished. Something new is shown in the front hub. Wheel in the outer flange is cut down flush, narrowing the fork width at least an inch. The Envoy, fitted with a Simpson lever-chain, is an educational exhibit, and has merited lots of close inspection.

BELLIS CYCLE COMPANY, INDIANAPOLIS. It is asserted that the '96 Bellis was so satisfactory, few changes have been found advisable. The most prominent new feature of their '97 model is a two-piece crank with patent draw screw fastening.

BEAN-CHAMBERLIN MFG. CO., HUDSON, Mich. Hudson bicycles; seven wheels. The '97 Hudson has flush joints, oval rear forks, dis-adjusting bearings throughout, L-crank and axle, with a cotter-pin fastening for the off crank, and the crank-bearing group entirely removable from the bottom bracket. An oiling device, consisting of an aluminum sleeve covering the axle. This sleeve is wound with an absorbent that is saturated with oil, feeding directly the balls. Reversible front sprockets are also features of the wheels.

BUFFALO WHEEL CO., BUFFALO, N. Y. Niagara Bicycles. Eight wheels, including two tandems and one triplet. The new features are D-shaped rear forks, a very staunch and effective chain adjustment, consisting of a serrated plate, a sprocket of a new design and a single piece fork crown, something that can almost be classed in these days of two piece and round crowns. The tandems are shown with a centre-driving front chain, the clearance being effected by a forging that adds much to the stability and appearance of the machine.

BAMBOO CYCLE CO., MILWAUKEE, WIS. show four wheels in which the frame is made of bamboo rods and steel connections. Fauber patent cranks and dis-adjusting hubs with a novel twin arrangement of direct spokes are employed. The bamboo effect is thoroughly followed in enameling the metal portions of the frame, including the front fork, in imitation of natural bamboo.

CENTRAL CYCLE MFG. CO., INDIANAPOLIS, Ind. Ben-Hur bicycles. Eight wheels. Their models 25 and 26 the "Extraordinary Ben-Hurs" are listed at \$125. The frame of 1 1/4-inch tubing has flush joints. The front fork is composed of a continuous one-piece tubing of D-shape. It has an outside nickled reinforcement. The rear forks are brazed to the large bottom bracket by one large connecting tube only, thus allowing room for the sprocket without an offset. The back stays are built on a similar plan arching together from the top of the rear wheel and connected from there to the seat pillar bracket by one tube only. The handle-bar stem and seat-post dispense with the usual pinch bind bolt and clamps, being fitted

Ben-Hur Rear Forks.

with a taper internal sleeve. All of the bearings are of the new cup-adjustment style and are of the three point variety. The cranks and axles are of the L-two-piece variety. Model 26 is a duplicate of model 25 excepting that it is of the ladies' pattern and has a straight lower main tube and a curved upper tube. They are superbly finished and bear evidence of great care in their manufacture. Model 23 is of men's diamond frame pattern, having an arched fork crown. It has the L two-piece crank axle, two point cone bearing and is fitted with barrel hubs. It is listed at \$75.00. Model 24 is a duplicate of Model 23 with the exception that it is of the ladies' pattern. It is listed at \$75. Model 21, men's diamond frame, having a two-piece open fork crown. Model 22 is the same pattern in a ladies' style.

COLUMBUS BICYCLE CO., COLUMBUS, O. Columbus bicycles; twelve wheels. The particular improvement and talking point of the Columbus is the original and patented form of detachable sprocket and two-piece shaft that is used. The crank-axle consists of two parts, the hub of sprocket and lock-nut, the two parts of axle, to which the sprocket is attached with a unique fastening, viz., screwed on to the long or left end of a shaft with a 24-thread with a left pitch, are connected by milling with a double-tapered slot in ends of axle with a corresponding double-tapered slot in hub of sprocket, the wheel being fastened when fitted with a union nut slipped over right end of shaft and axle and screwed on to hub of sprocket with a right-hand thread, which draws the tapered ends of the axle together tight, making what the Columbus people believe is the simplest device in use.

CHICAGO STAMPING COMPANY, CHICAGO. United States bicycles; nine wheels, including two tandems. Among the new features is a new style of ball bearings which they claim absolutely do away with the secondary roll of the balls in making a revolution. Their arched fork crown is attracting considerable attention. They also have an improved chain adjustment and chain guard.

DELP & BELL, ALLEGHENY, PA. COMPANION bicycles. Two machines are shown, one in black enamel with nickel trimmings, the other in green. The features of the Companion are well known. The two riders riding side by side in a sociable way. The frame is constructed so that two

ladies can ride. In its construction the principal feature is the extended rear hub, which brings about a constant changing of wheel base and insures the balancing of two riders of greatly unequal weight.

DODSON MFG. CO., CHICAGO. DODSON bicycles; seven singles two tandems and one quad. a novelty. The Jenks automatic bicycle pump was also shown at the Dodson stand. It is attached to the hub of the bicycle and derives its action from an eccentric disc fastened to the fork. A safety valve is provided that prevents the over inflation of the tire.

EAGLE MFG. CO., TORRINGTON, CONN. Eagle Bicycles. Eight wheels, including two tandems. A new feature is a sprocket built on a cantilever principle, which enables a large-sized sprocket to be used with very little material, and, consequently, light weight. Other special features claimed are new disc bearings peculiarly protected from dust. In

Eagle Sprocket.

their ladies' wheels is shown what they call a "tubular frame." In place of the regulation bar tube running from the head to the bottom bracket tubes of small diameter are substituted, which run parallel to the rear forks, joining them at the intersection of the brace. As these parallel tubes pass the strut they pass through a lug, which is brazed to the strut.

ELGIN CYCLE COMPANY, ELGIN, ILLS. Ten wheels, including two tandems. Three grades are shown, and the high grade Elgin combines internal fastenings for the seat-post and handle-bar, flush joint all over, L crank axle, with tapered end and bolted on crank and disc adjusting for the various bearings and a forged crown of very neat and pretty design. The Elgin is decorated very handsomely, the lining and brush work being very effective.

ELGIN SEWING MACHINE AND BICYCLE COMPANY. Gunning Bicycles; twelve wheels including two tandems. A double, convertible tandem is a decided novelty. It can not only be converted

Elgin Tube.

from a diamond to a drop frame, but can also be separated and used as two single wheels. A new seat post and a new crank fastening, by which the crank is held on the axle by means of a locking cotter pin and large headed screw, shows practical results. Corrugated tubing and nickled frame connections add much to the distinctiveness of the wheel.

THE ECLIPSE BICYCLE CO., ELMIRA, N. Y. Eclipse bicycles. Ten wheels including 1 tandem. The high grade Eclipse is fitted with flush joints, D-shaped tubing on both rear stay and rear forks, an entirely new hub that allows of a direct pull tangent spoke. The spoke is T-headed, inserted into two small holes in a double flange, and is one of the most novel hubs exhibited at the Show. The crown is also new, being the two plate variety, with the upper plate bowed. L-shaped crank and axle, keyed on the one side, and larger balls are used this year in the crank-bearing. The lower rear stay back to and including the cross-piece is the forging, while the '97 sprocket is of a very neat design. The ladies' wheel has a double loop drop frame, with an exceedingly narrow tread for wheels of this type, and the handsome effect of the machine is heightened by the addition of a celluloid chain guard. The 26-inch Eclipse juvenile is a new member of the family, and is as thoroughly high grade as the rest.

EVERETT CYCLE CO., EVERETT, MASS. Fenway and McCune bicycles. Six wheels. One of the really new features of the show is here—a most unique three-ball bearing on the Fenway which employs three 3/8-inch hollow steel balls on each side of the bearing.

The large balls do not touch each other and are prevented from doing so by a separator which carries three small quarter-inch balls. The makers say that it is the most firmly adjusted and easiest running bearing in the show. The cycles to which these bearings are fitted present a peculiar appearance, the hubs and crank brackets being three inches in diameter.

ELMORE MFG. CO., CLYDE, O. ELMORE bicycles; six wheels. "What have we that everyone else has not?" said Secretary Becker, in reply to the question. "Well, a wheel that stands up; that's something which is not so very general." The Elmore embodies no particularly exclusive features, but for the first time is being made in fourteen models, ranging in price from \$40 to \$75. Hitherto only the \$75 wheel was marketed.

ELLCOTT MFG. CO., TONAWANDA, N. Y. Elicott and Red-Jacket Bicycles. Seven wheels. The Elicott is fitted with disc-adjusting bearings optional round or double plate fork crown swaged tubing and a clever two-piece crank that is held together with a simple clamp which is reached through a man-hole in the bottom bracket.

FOWLER CYCLE MFG. CO., CHICAGO. Fowler Bicycles. Nine wheels, including two tandems. "Nothing freakish, nothing revolutionizing, simply a general bringing of our wheels up to date," was the summary of Manager Slusser; the bringing up to date, of course, consisting of the adoption of barrel hubs and bearings in which the cups are outside and the cones are on the axles; also a two-piece crank-hanger,

Fowler Tandem Idler.

etc. An inside brake on the lady's wheel is a departure. The double drop frame tandem for two ladies, which was a feature of last year's show, has been discarded entirely and will be seen no more. The men's tandems have undergone considerable alteration. An idler adjustment has been adopted instead of the sliding-hanger used last year. The wheel base has been lengthened, and the Czár type of chain and sprocket steering gear made a part of the wheel.

FULTON MACHINE WORKS, CHICAGO. Thistle Bicycles. Three wheels and one tandem. The tandem shows a double setting of rear forks, one above the other, the lower parts of the frame running between the wheels which usually consists of two tubes, which are parallel horizontally. In this machine the tubes are parallel vertically, one above the other. The tandem is centre driving as far as the rear crank hanger. Arthur Gardiner is in charge. The main exhibit of this concern was shown at the Excelsior Supply Co. store on account of inability to secure suitable space.

FOX MACHINE CO., GRAND RAPIDS, MICH. Fox Cycles. Nine singles and one companion wheel. The Fox is distinctive in that the seat-mast tapers from 1½ inches at bottom bracket to 1¾ at the top. The bottom part being ovoid shaped, a manner of construction for which great rigidity is claimed. A new hub, a patented re-enforcement for flush joint which the Fox people are not showing to the public, a new handle-bar clamp and a grooving of the seat-post and a ribbing of the inside of head are among the '97 wrinkles. The last named of course insures the bars against twining and renders adjustment safe, straight and rapid under all conditions. The Fox people, as the originators, are also pointing with pride to their double-tube ladies' wheel, the curved upper bar of which is formed of one continuous piece of tubing from head to saddle joints.

FENTON METALLIC MFG. CO., JAMES-TOWN, N. Y. Fenton bicycles. Nothing remarkably special is their report, save possibly the bearing ad-

justment in the front and rear hubs, for which patents have been applied for. Both axles are provided on either end outside the hubs with a large and small nut, the former being inside the latter. The axle is shouldered or flattened, and the mere loosening of the small outside nuts affects the adjustment. The large nuts are not touched at all, and the alignment of the wheel in its frame and the adjustment of the

Fenton Sprocket.

chain is not affected in any way. The large nuts adjust the chain and do not affect the bearings. The Fenton people have returned to the square crank, which is split and held in place by a parallel bolt. Internal expanders and large balls (3-8) are retained. Flush joints have not been adopted nor has the divided crank axle. The Spencer brake is made a talking point. The Fenton double diamond tandem is braced after original ideas, a D-tube bridge brace running outside on top of head-post to rear upright.

A. FEATHERSTONE, CHICAGO, ILL. ROAD King and Queen, Duke and Duchess, Prince and Princess Bicycles. Nineteen machines, including one tandem, the Roundabout. For this year the Featherstone line has keyed-on cranks, a new detachable sprocket that is held in place by the crank. The tandem is entirely new, and the construction of the lower braces is different from anything yet shown. It consists of two tubes that are spread and allow of an extra brace from the head, making a very strong and rigid form. The adjustment of the front chain is effected by an idler, held in a novel clamp, that makes it impossible for the idler to slip or get out of place.

FRAZER & JONES CO., SYRACUSE, N. Y. Elgin bicycles. Juveniles exclusively, ranging from 20 to 24 inch and listing at \$40. None of the wheels embody particular talking points, the exact proportions of the wheels being one of the few features dilated upon. A handsome little tandem at \$60 is included in the exhibit.

GRAND RAPIDS CYCLE COMPANY, GRAND Rapids, Mich. Clipper bicycles. Six wheels, including one tandem. New features: Diamond-shaped cranks held in place by a nut screwing into the end of the axle, pedals having an oiling device at the end of the shaft, a seat post fastened by means of a rear bolt and shifting wedge which engage slots in the seat-post, a detachable sprocket constructed with so large an opening that it readily passes over the pedal. In the Clipper Special there is a novel hand lever fastening. It is of the expansion type, operated by means of a nut outside of the handle-bars, but is a different arrangement of this class in that it sweats only the middle of the handle-bar stem and not the end of it. This is accomplished by the cutting of longitudinal slots in them which terminate just a little short of its lower extremity.

GENDRON WHEEL CO., TOLEDO, O. GENDRON and Reliance Bicycles. Ten wheels. Of the many wheels in the Show, all bearing evidence of more or less improvement, few, if any, show greater advancement than the Gendrons, of which Model No. 23, the \$100 wheel, is, perhaps, the best representative. It is a strikingly attractive bicycle. Its lines do not depart from those in vogue but the proportions have been so nicely gauged that the wheel has "a something" all its own. It apparently incorporates all the fin de siècle in cycle construction, barring the divided crank-shaft. Cotter pins are not employed to secure the cranks, however. Instead, the crank slots and axle ends are hexagon shaped, and fit one over the other, cranks being held in place by screws and soft metal washers. The Gendron people have ever been "strong on bearings" and have fairly outdone themselves on their '97 models. Always believers in the three point bearing they have been unremitting in their endeavors to perfect it and now claim that the pitch of cone and angle of cup which they have adopted makes the

easiest running bearing human ingenuity can devise. To illustrate their claims they show the working of the balls in an enlarged glass hub, a most ingenious contrivance which meant a great outlay of money. The cups are not pressed into the hubs but are cut from the solid bar, and screw into an unsplit bottom bracket; larger balls also being employed—5-16 inch in front bearing and 1-4 in the bottom bracket.

GORMULLY & JEFFERY MFG. CO., Chicago. Rambler bicycles; nine wheels, including three tandems. Although \$20 has been pared from the price of these wheels any one with half an eye can see that neither quality nor appearance has been affected. Indeed, the '97 Rambler is the most attractive wheel which the firm has ever produced. The good features retained are the lap brazing, adjustable and reversible, dished sprocket and crank, the special barrel-crank hanger and, in their own words, "the easy-running bearings, which have perplexed our competitors in the past." Rakishness has been added to the front fork, the crank-hanger has been dropped slightly and a general tuning of lines effected. Flush joints are not features of the Rambler. G. & J. maintain that the fish-molded connections, lap-braced, without

Rambler Fork Crown.

Rambler Dished Sprocket Crank.

drilling, are stronger than the smooth joints. Their outside joints are beautifully ornamented with gold scrolls that set them off to advantage. The particular improvements for 1897 are the improved outside fish-mouth reinforcements at points of greatest strain, the barrel hubs, with solid ball cups turned in them; ball retainers, a dished and reinforced rear fork, making it possible to use larger sprockets; the rear sprocket screwed to the hub with a right-hand thread and locked by a left-hand threaded lock-washer; a reversible seat-post, the horizontal bar of which may be turned on a clamp, either forward or backward, without readjusting the upright tube of the post. This gives a forward and backward range of adjustment of almost 12 inches. Dust-proof bearings, air-tight spring oils, new designs of chains, saddles and pedals, rosewood-finish handle-bars and rims are also conspicuous features. The dress-guard cords on

Rambler Crank-Hanger and Dished Rear Fork.

their ladies' machines are laced through wire loops, preventing the cutting of cords. It is worthy of note that not a steel-rimmed Rambler is included in the exhibit. All are fitted with the rosewood rims, a particularly handsome article, to which the tires are attached so snugly that unless they were told none would suspect the tires were detachable. The new Albany tubing is employed for the first time.

GENEVA CYCLE CO., GENEVA, O. GENEVA Bicycles. Ten wheels, including one tandem. On the Geneva Special the Garde patent two piece crank is a feature; also the disc-adjusting bearings in both hubs and crank-gearing-bearing, and single piece fork crown. In the regular Geneva line a splint crank and detachable sprockets are new this year. The tandem front chain adjustment is rather novel. The crank bearing barrel slides on double rails, and the adjustment is effected by two bolts that regulate the adjustment directly from the front of the machine, making not only a slightly feature, but also one that is most effective.

HAMILTON KENWOOD CYCLES CO., GRAND Rapids, Mich. Hamilton Kenwood, Wellington and "808" bicycles. Fifteen models, including two tandems, four juveniles. Features: A seat-post fastened by a split bushing on the inside of the slat post lug

Hamilton-Kenwood Tandem.

which is contracted by means of a block drawn against the face of it with a bolt which is fixed in a clamp behind the strut. The adjustment of the front and rear hubs is made with a cone which screws in the inside face of the hub and is held in place by a

Hamilton-Kenwood Centre-Driven Tandem.

separate collar working on a reverse thread which is on the outside face of the hub. The three points of contact on the hub and one with the cone the reverse is the case. The cone is really a double cone. The face of the ball retainer receives one contact and so

Hamilton-Kenwood Handle-Bar.

acts as a part of the cone, but the balls project above it and make another contact with the cones proper. This arrangement permits of a very simple sleeve being used to retain the balls in the bracket. The divided crank axle joins in the middle on a simple wedge

Hamilton-Kenwood Crank Hanger.

principle and is held in place by being screwed into the sleeve. The cranks are removed by setting up a nut that passes through the bottom of the crank-hanger and engages a block in the center of the sleeve so as to hold it fast and permit the cranks being un-

Hamilton-Kenwood Chain Adjustment.

wound. Another novelty on these wheels is the absence of a true chain adjuster. The chain is adjusted by means of a small buck on the rear axle having a serrated face and which engages with serrations on the inner face in place of the fork ends. The tandem has a new steering device fitted with ball

bearings at the joints of the fork crown and second steering head.

A One-Piece Frame.

HOME RATTAN COMPANY, CHICAGO. Homer and Hero bicycles, the former a \$50, adults' machine; the Hero, a line of juveniles, listing at \$20, \$25 and \$30. The Hero has the distinction of being alone in its class. The entire frame is constructed of one piece of three-eighths steel rod bent to shape and electrically welded at the head and other connections. The machine is ball bearing all over, and in its antique copper finish is certainly unique. A great profusion of wood rims, bars, guards in all shapes, sizes and colors is displayed. The Home people are catering largely to this trade and claim to be in a position to quote world beating prices.

HUNTER ARMS CO., FULTON, N. Y. HUNTER bicycles; eight wheels including two tandems, enameled in the distinctive Hunter color, olive green. A new double fork crown, disc adjusting hubs, large

Hunter Crank Axle Fastener.

sprockets and a new crank fastening, which consists of a triangular dog which is held in place by a bolt, constitute the new features. The wheels are clean cut and handsome, the new name plate, typical of hunting, adding a tith to the attractiveness of the wheel.

THE HOWARD BICYCLE SUPPLY CO., CHICAGO. A new wheel geared to 112 for both racing and pacing purposes. They use a 40 toothed sprocket in front and a ten in the rear, which does away with a great deal of friction, once the rider gets under a good headway. They assert also, that it requires no more exertion to propel this high geared machine than does the ordinary wheel, geared to 80. The Howard Specials will be built entirely with large front and rear sprockets.

HAY & WILLITS MFG. CO., INDIANAPOLIS, Ind. Outing bicycles. Seven wheels, including one tandem. The new features introduced by this progressive concern are an improved method of fastening the fork stem in the head of the wheel and a handle-bar of novel construction for the tandem only. The fork stem fastening consists of a hollow lock nut which screws into the head through the center of the handle-bars and engages a thread on the inside of the fork stem proper. This lock nut also fastens the

Outing Fork Crown.

handle-bars. The handle-bars are adjustable and are given the reverse position by simply removing them, turning them around and resetting them on the head after the nut has been removed. The nut can be unfastened by hand and as soon as it is taken off the front forks with the stem can be pulled out readily. The tandem handle-bars run from end of the forks on each side up to the head with such a sweep that the tubing forms a heart. They are called the "Trilby Heart" handle-bars. This concern enameled its hubs the same color as the frame of the wheels.

S. V. HAYWOOD & CO., NEW YORK. The Johnston Two-Speed Gear. This changeable gear has many novel features. The chain is not thrown out of line in shifting, and the hub is claimed to be absolutely dust-proof and self-lubricating. The gear is shifted from high to low or the reverse, by means of a little lever fastened to the rear fork under the saddle.

HYGIENIC WHEEL CO., PHILADELPHIA, Pa. Hygienic cushion frame wheels, complete. Cushion frame adjustable attachments. An internal spring at the top of the rear stays constitutes the cushion, intended to overcome vibration.

IVER JOHNSON'S ARMS AND CYCLE WKS., Fitchburg, Mass. Iver Johnson and Fitchburg bicy-

cles. Fourteen wheels and one tandem. The flush joints and forgings that have been used for years will be retained, but there is much that is new in the Iver Johnson wheels this year. The front forkshaft and crown are made from a single forging, as is the head and head lugs. A squeeze binder or the handle-bar fastenings that is new, neat and rigid. Disc-ad-

Iver Johnson Pedal Oiler.

justing bearings on crank bearing and L-cranks with the off crank keyed on are retained. The hub cones are novel in that they can be adjusted outside the frame line by means of right and left hand axles. The pedals are of a particular stanch design, the oiling being accomplished through the cross bars, bringing the lubricant directly on the balls. A clever burlesque on Tiffanyzed wheels was shown and described by a richly worded placard in Ned Wilcox's happiest vein.

POPE TUBE CO., HARTFORD, CONN. FIFTY high carbon seamless tubes, shown in both round and square patterns. One piece measuring 1 1/2 in diameter drawn to 31 gauge and several test pieces that show some marvelous torturing without the least sign of a flaw or break.

THE INDIANA BICYCLE CO., INDIANAPOLIS. Waverley Cycles. Four models, two men's and two ladies', listing at \$100 and \$60. The \$60 Waverley is practically identical in appearance and construction with last year's Waverley sold at \$85, differing from it only in a few minor points. The \$100 model is an entirely new design. Its leading point is a new device for crank-hanger and hubs, in which the use of threaded cones is entirely avoided, their place being taken by sliding shells, which secure absolute alignment. It is a remarkably simple form. It is also fitted with a new detachable cranks-shaft device and new fork crown, has flush joints throughout and D section tubing in lower rear forks. The tread is 4 3/4, and the ball races are separated to the extreme outside of the brackets. They have a novelty in a chain adjuster device. Both front and rear sprockets are detachable, and they fit their entire product with their well-known Waverley tire. They also, however, give options on other makes of tires. They use an adjustable wood handle-bar, and are using this year a new name plate on which the familiar strip "Waverley" is placed in gilt black letters against a white background. The Waverley Dynamograph, a machine for registering friction of bearings, is shown at one of the stands and attracts a deal of attention.

IROQUOIS CYCLE WORKS, CHICAGO. IROQUOIS Cycles; six singles, two tandems and one triplet, the latter a triple drop frame for three ladies, probably the only machine of its kind in the world, although Manager Jenkins disclaimed anything startlingly original, even speaking of the wonderful triplet as if it were an every-day machine. Their Iroquois is alone and distinctive by reason of its D-shaped front fork. Tubing of the same sort is also employed in the rear frame. A gracefully rounded fork crown and internal expander in seat-post and a particularly handsome wheel enameled a royal blue with all joints and ends nickel-plated, were features of the exhibit.

KALAMAZOO CYCLE CO., KALAMAZOO, Mich. Carriers. Show a full line of children's seats, parcel carriers, baby carriers and mail carriers, which have not been changed materially from their '96 line. A special feature of the exhibit is a new tricycle with both chair and box attachments as desired, for carrying invalids, or for store delivery work. The machine has two forward or steering wheels, and a single driving wheel at the rear. The forward wheels are thirty inches apart, and the wheel base, forty-five inches. The frame is a new style of drop model, which allows either sex to ride. The machine complete weighs forty-eight pounds. It is called the Kalamazoo Carrycyle, illustrated in THE WHEEL last week.

KIRK-YOUNG MFG. CO., TOLEDO, OHIO. Yale bicycles. Six wheels, with high-grade flush joints, D lower rear fork and a two-piece crank that comes together in the sprocket barrel, and is held in place by an outside hexagonal nut. The tubular bottom bracket in which the various frame tubes meet and are brazed on the inside of the hanger, making a very strong connection at this point, is also a feature.

KEATING WHEEL COMPANY, MIDDLETOWN, Conn. Keating Bicycles. Eleven wheels, including two tandems. New features are a twin-roller chain that is distinctly different from anything at the show; a divided crank shaft held together by an effective sleeve construction, a single piece fork crown, a new pedal of feather-weight design, and a

Keating Rear Hub.

direct split seat post that allows of front and back adjustment. On the tandem, several new features are shown. In the driving gear, two chains are used, the left-handed chain running from the front sprocket to the rear, held in place by an idler. The steering device on the combination tandem is a cable fastened to the head of the machine with a short stretch of chain running over a sprocket at the end of the rear handle-bar centre.

THE KANKAKEE MFG. CO., KANKAKEE, Ill. Kankakee bicycles. Fourteen wheels, including two tandems. The few new features of the '97 wheels includes large tubing, all flush joints, expanded seat-post and handle-bar post, aluminum chain and mud guard. On their juvenile wheels they use the one and two piece crank and flush joints.

KEENE WOOD RIM CO., KEENE, N. H. Keene wood rims, of both the built-up and one-piece varieties, the former claimed to be non-splittable, and "Guaranteed Against Everything," as the Keene people put it.

H. A. LOZIER MFG. CO., CLEVELAND O. Cleveland bicycles. Sixteen wheels. Among the substantial improvements are adoption of the shaped road braces and stays, flanged sprockets and new pedals, especially a chain, but perhaps the greatest improvement of all is in the crank-hanger group and the bearings. In the crank-yoke hub is removable from the yoke itself. Both cups are formed on the solid bar which forms crank-hanger and permits the hanger being assembled entirely free from the frame. The same idea obtains in the wheel bearings. The idea is ingeniously worked out. The improved chain is in itself very much of a talking point. The rivets and centers are of hard material case hardened, while the sides are of soft steel, this construction making it is claimed a chain that is non-stretchable and therefore always in pitch. Cotter pins as crank-fasteners have been done away with, cranks now being held in place by a flush lock nut. The whole make-up of the Cleveland is of the sort which appeals not only to the eye, but to the critical inspection.

LEAGUE CYCLE MFG. CO., MILWAUKEE, Wis. League bicycles; eleven wheels inclusive of two tandems and one clean lined and bird red sextette. While a general tuning up is observable, comparatively few changes were found necessary, the adoption of a rounded fork crown and a triangular shaped sprocket center or spider, and the substitution of direct tangent spokes for the continuous spokes used last year being most conspicuous. The eccentric chain adjustment which was such a distinctive feature of the '96 League is retained and what is more it is now protected by patents. As is fairly well-known, the adjustment, which is fitted to the League singles as well as the tandems, consists of eccentric plates on both sides of the rear axles; the plates are perforated along the periphery, the adjustment being made by moving from hole to hole.

LUTHY & COMPANY, PEORIA. Luthy bicycles. Six wheels. The Luthy wheel being a new comer on the market, it attracts no more than its share of attention from the fact of being the only wheel in America listing higher than the others. It has many novel features, including an S-shaped crank, particularly fine bearings and an exceedingly high finish. An interesting crowd of listeners was ever present absorbing Chas. Luthy's demonstrations.

JOHN P. LOVELL ARMS COMPANY, BOSTON. Lovell Diamond and Excel bicycles. Nine wheels. Flush joints, continuous rear stays, triple fork crown and a two-piece crank-hanger, the parts of

Fork Crown, Lovell.

Seat-Post Cluster and Brake.

Sprocket.

Rear Adjustment.

which are fastened together from the outside, constitute the more important new features. An inside plunger brake is also new. In the Excel line, juvenile wheels are included from 24 inches up.

MARION CYCLE CO., MARION, IND. Halliday and Aetna bicycles. Nine wheels. Two exclusive features are incorporated in the '97 Halliday. On either side of the crank bearing box is fitted a milled knurl cap which when unscrewed and removed over crank exposes the balls, rendering cleaning a matter of sublimate ease. A new saddle post and handle-bar clamp is the other feature. The posts are split and an interior T headed bolt holds them straight and secure. By this mode of construction the use of a pinch bind is avoided. The seat post clamp nut is in the seat mast directly under the cluster instead of in the cluster proper. On the latest Halliday is a semigear case of the Marion people's own design. It is made of aluminum and is felt lined. The Halliday is among the few wheels which have the distinction of not being equipped with a two-piece crank shaft, instead of which, the old method, which for three years has given entire satisfaction, is retained. The cranks are tapered and are secured to a correspondingly tapered shaft held in place by a nut.

The Aetna, in the words of Head Traveller Cody, is simply "a good, strong, plain wheel." It is made for both adults and juveniles. "If you can find anything in the show to beat the latter," said Mr. Cody, "bring them to me, and I will buy them."

THE MIAMI CYCLE MANUFACTURING CO., MIDDLETOWN, O. Racycle. Eighteen wheels, including two tandems. The Racycle Special is listed at \$100, the Racycle at \$75, and Our Bicycle is listed at \$50. The main part of the Racycle Special is of the regulation diamond pattern, differing, however, in the construction of the short rear wheel base. They also use a 29 and 30 tooth front sprocket and 10, 11 and 12 rear sprocket, which are now so popular. The cranks are enabled to do this through their method of constructing the crank-hanger and bearings. By their method of construction the bearings are carried outside of the line of the sprockets and in the boss of the cranks, eliminating all torsional strain and leverage. All the balls in the crank bearing bracket are 5-16. Their Racycle Special is finished with two widths of tread, 4 5-8 and 3 5-8. Owing to their short wheel base they do not find it necessary to rake their diagonal post very much in order to bring the rider directly over the pedals. The handle-bars and seat-posts are held in place by internal lug devices. The cranks are connected by a rifled clutch and sleeve, the adjustment being made from the left-hand side. They have on their front and rear wheels a special locking device through which the wheels can be removed from the frame without disturbing the bearings. They also show a saddle of their own invention, which is made of papier mache, and which is enamelled in different colors.

One of the chief features of their display is a gigantic representation of their crank hanger sprocket and cranks. It is over 8 1/2 feet high. The crank bosses have been cut away and glass fronts substituted, thus showing clearly their method of construction and illustrating the relation the cups, cones and balls have to each other in active operation. Every part of one of the Racycle models is shown from the to the finished state.

McINTOSH-HUNTINGTON CO., CLEVELAND, O. Sunol, King of Scorchers, and Hercules bicycles, all brought abreast of the times, but containing no radical departure from standard ideas. A hundred-dollar King of Scorchers tandem is being featured. From the standpoint of the casual visitor, however, the water bicycle is by far the object of greatest interest. In the exhibit it has been vastly improved since shown last year and the Sunol people get back some of the money they have expended in perfecting the machine or craft, whichever one chooses to call it. As now made, power is communicated by chain gear. Previously a rather awkward fly-wheel performed the service.

MARCH-DAVIS CYCLE MFG. CO., CHICAGO. March-Davis and Admiral bicycles; sixteen wheels, including four tandems. "Nothing strikingly novel" is the summary of the representative in charge. One of the principle departures from last year is in the crank adjustment. The crank axle is tapered to a so-called kite shape, and fits into a correspondingly shaped hole in the crank, the latter being held in place by a single bolt. Oval rear fork legs and D-shaped rear fork braces are included in the '97 changes. The March-Davis people have discarded the internal fastening of handle-bars and seat posts after a year's trial and returned to the compression clamp. A new pedal, adjusted by an inside cup, both cones being solid on the shaft and in which no checknuts are employed, is one of the "new things."

MONARCH CYCLE MFG. CO., CHICAGO. Monarch and Reliance bicycles; fourteen wheels, including three tandems. Perhaps the most particular change in the Monarch is in the crank-axle group and crank-shaft, now being employed, the off-crank screwing into a collar on the sprocket spider. The bearings are adjusted by the cups, instead of cones, and the adoption of internal expanders in seat and handle bar posts, and of taper tubing in the frame and D-tubing in the rear forks constitute the more important alterations that have been effected during the year. Flush joints have not been adopted.

MORADO BICYCLE CO., BEAVER FALLS, Pa. Morado bicycle. Six wheels. Fluted tubing is a new and distinctive feature of the Morado and it is not nearly so odd-appearing as may be supposed. Disc-adjusting bearings are used throughout and the hubs are fitted with a clever dust proofing device, single-piece Pauber pattern cranks are used, and two-piece fork crown.

MASON & MASON, CHICAGO. SHOWING A fine line of '97 models, including two tandems and ten wheels.

NATIONAL CYCLE MFG. CO., BAY CITY, Mich. National bicycles; eight models, including three tandems. As usual the National Company show a number of distinctive features. The general construction of the hanger-bearing is retained, although the locking-nut on the crank-axle has been discarded. The sprocket-fastening device is extremely simple and has the merit of not taking up any space in the width of the thread. Other improvements shown on the single machines are a special fitting directly back of

the hanger, which perceptibly increases the rigidity of the rear frame, and a new seat-post binder which does away with the ordinary bolt for binding the post in the frame. They also show a handle-bar binder.

Hanger Bearing.

The National people have departed from the ordinary method of chaining the tandem. They state that their experience in 1896 has proven that the use of three chains, while adding somewhat to the weight, more than makes up in even running and gain in efficiency of power applied.

OLIVE WHEEL CO., SYRACUSE, N.Y. OLIVE Cycles. Seven singles, olive colored enamel. A distinctly new feature, and about the most pronounced feature in this mechanical construction is the method of fastening the two cranks to the one-piece axle. The crank-hanger is turned out with the cups screwed into it, while an inner sleeve through which the axle passes has the cones turned on it. The axle passes through this sleeve. Outside of the cones on the sleeve is a flange showing ratchets which dovetail with complementary ratchets on the eye of the hand crank and the eye of the sprocket. The sprocket slips on directly over the axle end and is, with the crank, fastened by a set-nut which screws on the right hand end of the axle. After the sprocket has been removed the axle pulls out of the sleeve, and remains in the left-hand crank, until slipped out of it reversely, which is necessary because the left end of the axle has a rivet head. The construction affords all facilities for removing axle and bearings offered by the more complicated divided axles. This firm shows also a new changeable gear patented by them.

POPE MFG. COMPANY, HARTFORD, CONN. Columbia and Hartford bicycles. Twenty-four wheels including two tandems, and the various new features of which have been so well exploited that little more than a summary is required. Flush joints are used throughout and studs which allow a direct pulling tangent spoke are a decided novelty in hub construction. The studs being on the principle of a swivel, adjusting themselves to any direction of the pull. The front sprocket is screwed on a hollow boss which is forged to the crank axle and brings the chain draft inside of the ball line. The front fork crown is of the two-piece variety, boxed in by nicked plates. The lower rear stays are D-shaped, tapered, while the handle-bar adjustment instead of being keyed on has a threaded clamp adjustment that is most effective. Oiling the bearings is performed in an entirely new fashion, the oil being fed to the balls through a series of felt washers, at the same time making the bearing absolutely dust proof. Black will be the standard and the only color used in the '97 Columbia and Hartford lines.

OVERMAN WHEEL CO., CHICOPEE FALLS, Mass. Victor bicycles. Fifteen wheels including one tandem. A large and comprehensive exhibit. The Victor of this year has many new features. There has been a decided change in the frame, giving it a far more rakish and speedier appearance, the front fork being much straighter, with slightly more head slant. Barrel hubs will also be used this year, and flush joints made with steel forging connections are something in which the Victor people take a pardonable amount of pride. They also offer a new saddle with a broad seat that can be converted into the well-known anatomical pattern that seems to be so popular at the present time by mechanically mounting a pair of felt pads. A double drop frame ladies' wheel is a decided

New Victor Saddle.

novelty in the ladies' line with a frame of very graceful design and handsome lines. The single-tube drop frame is still retained however. The wood rims like other parts in the Victor output is an Overman product and a new joint is used this year, a cross between an interlock and a splice and if solidity of appearance

Victor Crown Hanger.

counts for anything should make this rim remarkably strong where some rims are weak. As in the past the finish of the Victors is superb both as to the nickeling and the enameling. A full line of Victor sundries is shown at this stand, all made with the same attention to detail that marks their line of bicycles.

PEERLESS MANUFACTURING COMPANY, Cleveland, O. Peerless and Patrol Bicycles. Ten wheels, including one tandem. While the wheel has the same general appearance as last year, for '97 it is fitted with an L crank and axle with hexagon taper on the opposite side, the crank being bolted on with a round headed screw. Flush joints are used throughout even to the crown, which has been slightly increased in size over last year's pattern. A pretty conceit is shown in putting the letter P highly embossed on each fork side, making it a new departure in the way of a distinctive name-plate. In the Patrol, they offer an oval fork crown, keyed on cranks, and a detachable sprocket. This year, the wheel is offered in four colors, and is made of seamless tubing throughout.

PEORIA RUBBER & MFG. CO., PEORIA, Ill. Patee bicycles. Eight wheels, including two tandems. New features on the '97 Patee are an expansion fastening for the handle-bar shaft that is operated by a bolt on top of the bar, at the same time locking the adjustment; disc adjusting crank bearings, one piece crank and axle of the Fauber pattern are used. Also a new pedal with a barrel centre. In the tandem the steering is accomplished by two parallel rods with very effective mechanism and so placed that they do not touch the frame on a short turn. The decoration and finish of the machines are particularly handsome.

PENN MFG. CO., ERIE, PA. QUAKER BICYCLES; eight wheels, including one tandem. The most novel things shown on these wheels is a triangular pedal,

presenting three faces for contact with the foot, so that in whatever position it may rest it adjusts itself readily, and a detachable sprocket-wheel consists of

Quaker Triangular Pedal.

an outer rim, which is bolted to a disc on the axle, instead of being made fast to a three-arm spider, as is common in such cases. The crank-axle has triangular ends, while the cranks have split eyes and are fastened by means of a bolt.

GEO. N. PIERCE & CO., BUFFALO, N. Y. Pierce bicycles; fourteen wheels, all showing flush joints of an original design. They have an L-crank axle, with cups that screw into the bracket, face in-

Crank Hanger, Sprocket and Front Forks.

ward. The cones are threaded on the axle, face outward. A shoulder on the cone projects through the centre of the top, and the adjustment is made by drawing the cone outward. The spokes have a semi-T head, and are fitted into the hub by means of button-hole slots.

RICHMOND BICYCLE COMPANY, RICHMOND, Ind. Richmond bicycles; ten wheels, including four cushion framed machines, the Richmond people being among those who make an energetic effort to advance this latter type of bicycle. The full nickeled model which forms the center-piece of the exhibit is a strikingly attractive mount. The cushion frame is made in two models, one at \$110 and the other at \$85; and the rigid-frame Richmond at \$100 of course. The Richmond is noteworthy as one of the

Sprocket.

wheels in which flush joints have not been adopted, but it is none the less attractive by reason thereof. No very great changes have been made; of the few, the two-piece crank-axle is worthy of mention. It is dove-tailed, so to speak, the two pieces being held together by a screw which is get-at-able through a hole in the bottom bracket, the hole also acting as an oiler. By simply loosening the screw the shaft may be taken apart, the operation exposing the balls to view, rendering cleaning and flushing of the bearings a matter of small moment. The bearings, of course, are equipped with ball retainers.

ROUSE, HAZARD & CO., PEORIA. SYLPH and Overland bicycles; thirteen wheels, including one tandem. The new features in the '97 Sylph is a chain adjustment that allows the wheel to be removed from

Overland Chain Adjustment.

the frame without disturbing the nuts; D-shaped rear stays and forks; two-piece crank and axle; internal fastening for seat post and handle-bar and outside reinforcements.

REMINGTON ARMS CO., ILION, N. Y. Remington bicycles; eleven wheels, including one tandem. In these wheels a sleeve or pocket fits into the bottom bracket and is held in place by a set nut passing through the under side of the bottom bracket. This sleeve holds both sets of balls and they are re-

Remington Handle-Bar. Chain Adjustment.

moved with it. The crank and axle form three pieces and cotter-pins are used. One is turned on the axle, while the other is threaded on. The spider of the detachable sprocket is sweated on. The cranks are of the bayonet pattern, originated by this concern. The tandem is of neat construction and has a centre draft from the front to the rear crank-hanger.

THE READING STANDARD MFG. CO., READING, Pa. Reading bicycles. Eight wheels. A feature is made of the divided crank axle, consisting of a hollow sleeve in two parts, which ratchets together in the middle and is held in place by the axle which passes through the centre and is drawn upon the left side with a nut. The sprocket spider and rear crank are in one piece. The cranks are keyed on, Kelly handle-bars are used, and the wheel is decorated by hand.

RELAY MFG. CO., READING, PA. RELAY bicycles. Eight wheels including two tandems. The novel feature of the exhibit is a tandem tricycle with double drop frame. The rear handles are fastened in a post back of the rear seat and encircle the seat in a style similar to that made familiar by the upright bicycle of last year now defunct. The second rider

SYRACUSE CYCLE CO., SYRACUSE, N. Y. Syracuse bicycles, ten wheels, including one convertible tandem, one sextuplet and one single wheel, arranged to carry a fire-extinguisher. These wheels have an L-crank turned out in one piece, with the sprocket spider and a very neat improved rim for the sprocket. The cranks are split at the eyes and fastened to the cranks with binding-bolts. The convertible tandem is a novelty. The front part of it consists of a full drop-frame and a removable top bar. This top bar is fastened to the front steering-head by means of a jaw on the bar, which sets about a lug near the top of the head and has a bolt passing through it. At the rear end this bar clasps the forward seat-post mast, and passing beyond it is bolted to the upper tube from the rear frame in a similar fashion as in front. The forward seat-post passes through this removable bar. In uncoupling the machine so as to use it with the drop-frame front it is necessary only to remove the two bolts, take out the forward seat-post and lay the bar aside. The fire-extinguisher machine has a pair of braces running up from the rear axle at an acute angle with the back-stays; braces passed between the upper ends of these extra works and the backstays, and the extinguisher rests on these horizontal braces. The sextuplet is the one shown last year.

SHELBY CYCLE MFG. CO., SHELBY OHIO, Ideal bicycles and Ideal pedals. Eleven singles in-

Ideal Re-enforcement.

cluding four juveniles. The only novelties shown are Hexagonal rear forks, back stays and handle-bars.

SHERMAN CYCLE COMPANY, SHERMAN, O. Sherman cycles; four wheels. This wheel includes all the up to date wrinkles, flush joints, arched crowns, seat post holder, handle bar expander; also two-piece crank-hanger, which is the concern's special pride. Each crank and one half of the shaft is in one piece, cut diagonally, giving each half almost the full length of the shaft. As shaft has been turned true, and to fit perfectly in the center sleeve before being milled, the two halves will fit the sleeve, and when drawn together with the nut and rod, will expand parallel in the sleeve, making it really more stiff than a solid shaft. The sleeve is made of fine tool, bearing parts ground after hardening and hole lapped true to size, which will make both ball races perfectly parallel. This construction not only makes it perfectly rigid and secure when in use, but also has the great advantage that it can be taken apart instantly by the use of a wrench. No hammering or delacing of parts necessary in putting together or taking apart. All bearings have ingeniously constructed ends which act as ball retainers and which the Sherman people assert reduces the friction between hub and cone 40 per cent. An eccentric chain adjustment, a patented self-adjusting bearing washer and beaded spoke flanges constitute other talking points.

E. C. STEARNS & CO., SYRACUSE, N. Y., and Tourist Cycle Co., Syracuse, N. Y.; show sixteen Stearns wheels, including two tandems, one triplet and a septuplet and eight Tourist wheels. The features are flush joints, with cones on the axle and adjusting cups. The septuplet is a novelty. It is said to be the only machine of its kind ever made. It is claimed to be the largest multicycle in the world. It is centre-driving as far as the rear crank-axle. The hubs on this machine are unique, as they provide for a triple set of spokes. The machine has a triple head, and the trussing of its frame has a very substantial appearance. The rear sprockets are both inside of the rear forks. Amongst the Stearns wheels is a convertible single and a convertible tandem, both of which may be used either as a diamond frame or drop frame. The Tourist wheels show flush joints and all the '97 improvements. The Spencer brake is shown as a feature on both lines.

A. F. SHAPLEIGH HARDWARE CO., ST. LOUIS, Mo. Syracuse and Rugby; eighteen wheels. A line of sundries is also exhibited.

SPIERS MFG. CO., WORCESTER, MASS. Spiers Bicycle. Five wheels, including two tandems. This concern makes its debut on the open market with an exceedingly fine collection of bicycles. Oval fork crowns are used. The two-piece crank-shaft is machined down to a taper and held by a bolt, the cranks being of particularly neat design. An internal

Spier Fork Crown.

Spier Sprocket.

plunger brake is provided, and disc adjusting bearings on all parts of the wheel, also a detachable sprocket of a design that adds very much to the attractiveness of the machine. Taken altogether the Spiers people have a line that should prove a big seller during the coming season.

Only Chain-Less in the Show.

A. G. SPALDING & BRO., CHICOPEE FALLS, Mass. Spalding bicycles and a full line of sundries; fourteen wheels, including one chainless cycle, one hygienic cushion frame and two tandems. The chainless wheel, the only one in the show, is made under the license of the Pope Mfg. Co., and the parts of it are not shown. The crank-hanger construction in the single wheel and tandems is new. The bottom bracket is partially split below and is clamped together by means of binding-bolts. A sleeve containing both sets of balls fits into the bracket. The axle passes through this sleeve, which is held firm by tightening the binding-bolts on the under side of the bracket. A new hub-arranged for direct-tangent spokes, is shown. On the front hub the adjustment is made from the outside of the forks by means of a milled washer. It is on the right-hand side, instead of on the left, as usual, in order to not interfere with the attachment of a cyclometer or lamp on the left-hand side. The chain adjustment on Spaldings is original this year. The rear forks have a jaw, into which the rear axle fits. The lower arm of this jaw has a thread cut on its under surface. Depending from the axle and straddling this jaw is a clip with eyes at its lower end. A bolt passes through these eyes and the threads on it engage with those on the under side of the jaw in the frame. The adjustment is made by the fingers without the use of any tool. Another feature in these wheels is that of having the fork stem drawn from 18-gauge at the top to 12-gauge at the lower end, where it joins the fork-crown, thus doing away with reinforcements. The fork-crowns are new and exceedingly neat. They are of the double-plate pattern, made in two pieces, which fit together with a thimble socket. The Christy saddles have been considerably improved for 1897. Special springs have been placed on the under side of the saddle. They have all been cut away slightly in front to prevent chafing, and the ladies' saddles show a shorter horn.

on the machine instead of reaching out in front to the handle-bars, sits perfectly erect, reaches straight down to them. This tricycle is built low and the tube of the frame is curved so as to provide for an easy mount. In the single wheels a visible ball feature, a dust cap over the bearings, so arranged that when it is removed the bearings are open to view and can

be readily cleaned and lubricated. The rear fork adjustment consists of a slot similar in shape to a shepherd's crook cut in the flattened end of the rear forks so that the rear wheel can be slipped out without the necessity of removing the chain. Inside of the crank-hanger is a sleeve made in one piece with both cones. The adjustment is made by screwing up the cup.

A Bicycle Choice

of six makes of tire, four makes of saddle, three heights of frame, seven, eight or nine tooth rear sprockets, upwards to twenty-three tooth front sprockets, three styles of handle-bars. Moreover, 100 per cent of

Crimson Rim Quality.

That is what we give our customers, and they appreciate it. It is a guarantee that the improvements which we have adopted for 1897 have been carefully and conscientiously tested.

Makers:

**Syracuse Cycle Company,
Syracuse, N. Y.**

CHICAGO CYCLE SHOW,
Spaces 275, 276, 305, 306.

Kindly mention The Wheel.

STERLING CYCLE WORKS, CHICAGO. Sterling cycles; seven wheels, including one tandem. The models show the fine workmanship for which the product of this firm is famous. But few material alterations were found necessary. The crank-hangers have been dropped one inch in the road wheels and three inches in the racing wheels. Square cranks are used and D-shaped rear forks. Four more spokes have been added to each wheel, ball-retainers are used in the crank-hangers and hubs and oiling devices are found in the pedals. The rear forks are constructed with gear-case clearance.

SEAMAN MACHINERY COMPANY, MILWAUKEE, Wis. Seaman bicycles; four wheels. Excepting the fork crown, front and rear fork ends and seat post cluster, the Seaman is made entirely of laminated wood, with both Fauber and bolted cranks. Great strength is claimed for the particular form of lamination. The hub bearings are oiled in novel fashion by introducing the oil from the side of the hub directly on the balls.

STANDARD BICYCLE MFG. CO., CHICAGO. Standard bicycles. Ten singles, with flush joints, D tubing, arched fork crown, internal seat-post clamp, and other up-to-date features.

Free Racing Colors.

TRINITY CYCLE MFG. CO., WORCESTER, Mass. Trinity Bicycles. Nine wheels, including two tandems. The Trinity Company is simply the Frank T. Fowler Mfg. Co., under a new name; the change being well timed and calculated to prevent a deal of confusion. It is the concern's first public appearance, and in all fairness it must be said that they have put their right foot forward. The Trinity is full of new features. A rounded arch crown of tubing with a drop-forged outside re-enforcement on top is one of them. Another is a hub for direct tangent spokes. The hub bearings are novel in that they are interchangeable and may be used in either front or rear wheel, and may be adjusted without loosening nuts on axle. The adjustment consists of a toothed washer engaging in teeth in the periphery of the hubs. Excluding the sprocket but four nuts are employed on the entire machine, and these are all of the plain

Trinity Adjustment.

variety, affording a smooth and finished appearance. Among other novel features is an original internal expander in handle-bar and seat-post, diamond-shaped cranks, star-shaped sprocket spiders, swivel chain adjustment on both sides, and on the tandem a worm attachment of front chain located on underside of bottom bracket. A characteristic Fowlerism crops out in the finish of the Trinity racer. Excepting the seat-mast and the rims the wheel is enameled a bright blue. The mast and rims are striped alternately yellow and black, presenting the oddest appearance imaginable. It is Fowler's intention to make yellow and black his racing colors, and to present all purchasers of Trinity racers racing costumes of those hues. Mr. Fowler is also employing structurally re-enforced tubing, with the taper drawn on the outside. Each piece is drawn to an exact length, and being structurally re-enforced, requires no brazing re-enforcement.

RALPH TEMPLE CYCLE COMPANY, CHICAGO. Twenty-one wheels, including two tandems and four juveniles. The juveniles are an exact counterpart of the \$100 wheel. One feature is that the hubs and bearings are the same throughout the entire line, from the cheapest to the highest price. A special feature of the Temple is the crank-hanger assembly and three-point bearings with $\frac{3}{8}$ bars. A novel contrivance is a dust cap that unsews from the face of crank-hanger, thus revealing the balls and cones and rendering cleaning possible without removing the shaft or cranks. Clouser's patent chain is absolutely the reverse of other chains. The center link and side links are alike, being in the form of teeth which engage with small rollers on the sprocket.

TERRE HAUTE MFG. CO., TERRE HAUTE, Ind. Five Schluer separable tandems and three Demasius single wheels. The novel feature in these tandems is the facility with which they can be readily uncoupled and converted into single wheels or vice versa. They are made with both double diamond frame and with a diamond frame behind and drop frame in front. In both models the upper rods of the front and rear frame have a shoulder-joint about three inches from the head. This shoulder-joint is held in place by a binding-collar and bolt. The lower rod in each frame has a joint about two inches above the point where it joins the bottom bracket. This joint consists of complementary plates which form a foot-lock. The flanges of this foot-lock prevent any up and down play, while side play is avoided by means

of two bolts on one plate, which set into sockets on the other. These foot-locks are coupled and uncoupled without the use of any tool, and only a wrench is necessary to loosen the nut of the binding bolt in the collar around the shoulder-joint of the top tube. When uncoupled the forward bottom bracket seat-post, rear bracket and the greater part of the top bar of the front wheel are taken out and put aside. The front wheel head and forks are then joined to the top bar and stud of the rear wheel. The chain is one which can be uncoupled with the fingers, because of the rivets being set in button-hole slots. One of these tandems which has been ridden 3,500 miles, and is still perfectly rigid, is shown at the stand. This tandem aroused much attention and interest, and is not at all impracticable appearing. The equipment is of the highest grade.

E. K. TRYON, JR., & CO., PHILADELPHIA, Pa. Apollo, Tryon Special, Vesper, Cyclo, and a line of juveniles, the Fairy, in all, twelve wheels. New features in the Apollo are round fork crown, L crank and axle, fitted with a taper and the opposite crank lock with a large-headed screw, flush joints, swaged tubing, internal expanders to seat-post and handle-bar fastenings. The Apollo is finished in various colors and makes one of the handsomest medium grades in the show. The tandem is doubly braced in the lower stays and the chain adjustment is accomplished by the idler, which form seems to be the popular way of taking up the slack in tandem chains. The Tryon Special is fitted with double plate fork crown, and with this exception is built on the lines of the Apollo generally. The Fairy line consists of 20, 24 and 26-inch wheels, and with the balance of the Tryon group make a very desirable line.

THE THOMAS MFG. CO., SPRINGFIELD, O. Thomas and Springfield cycles. Show seven singles, including two juveniles. These wheels have an ingenious reinforcement from the bottom bracket outward and at the other joints. It consists of pieces of tubing joined at the center and reaching upward in four directions so as to present four different edges

Thomas Detachable Brake.

against the walls of the tubing. Each piece has the fish-tailed taper. Their crank-hanger is tubular, and has a sleeve fitted on the inside, in which the cups are sweated. The adjustment is made from the outside

with the cones. The ends of the crank axle are triangular and the cranks are keyed on. The general design shows pains-taking workmanship.

TOLEDO METAL WHEEL CO., TOLEDO, O. Favorite Bicycles. Juveniles exclusively and a talking lot at that, although embodying no particularly exclusive features.

TONK MFG. COMPANY, CHICAGO. OLD Hickory bicycles. Five wheels, including two tandems, all made with laminated continuous wood frames finished in antique oak, burlled cherry veneer and Hungarian oak. The wheels are also fitted with the laminated wood saddles and are good lookers.

"Pocket Brazing."

UNION CYCLE MFG. CO., HIGHLANDVILLE, Mass. Union bicycles; eight wheels. Flush joints form a very conspicuous talking point of the Union, and the manufacturers want it understood distinctly that in the formation of the joints they use forging, because of its uniform density, and freedom from blowholes, decarbonization and other failings. The method of making the joint is also peculiarly Union-ese. "Pocket brazing" is the term employed to describe it, and it is so well thought of that a patent has been applied for. The new method has for its principal feature the shaping of a series of pockets in the projecting ends or lugs of the brackets. The pockets are simply holes, oval shaped. Before the tubing is fitted over the lug, the pockets are filled with flux, and when heat is applied, the brass flows "astoundingly even" in the words of the Union people. This method of construction renders filing unnecessary, and little if any brass is lost.

Union Seat-Post and Brazing System.

Union cranks and crank-shafts are made in one continuous piece, varying from 11-16 at the center of the axle to 7-16 at the end of the crank. The axle is provided with two right hand threads along which the two steel cones are screwed up to shoulders and firmly adjusted there. The axle is put in place by slipping one crank through the barrel of the hanger. The ball cups are screwed into position on threads cut into the hanger. Taper adjustments are employed in both saddle-post and handle-bars. The bottoms of both are threaded and fitted with adjustable tapering ends, and are also grooved upon one side. A sleeve of tubing steel, larger in diameter, having a pocket, is then slipped over, and being slotted and tapered to match is expanded by the forcing downward of the taper.

A three-piece arched truss fork crown is employed for the first time. It is not rounded as might be supposed, but now that interest in the rounded form of crown is so great the Union Special of 1938 as used on the track by Harry Tyler, showing that form of crown, and also illustrating the seat and the rear braces on the seat post forging, another point of contention, is exhibited here, simply to prove that the Union people were first in the field with those innovations.

VAN CAMP HARDWARE AND IRON CO., Indianapolis, Ind. Seminole, Rival, Ramora, Pickwick and Roseland Bicycles. The Seminole, which is the high grade member of the family has an L crank with opposite crank held on a taper, and locked with a large headed nut, and single piece fork crown. The finishes are in various colors. The balance of the line embraces medium grades of various prices and design.

THE VANGUARD CYCLE CO., INDIANAPOLIS, Ind. Four models, one with hill climber attached, listed at \$105. One new feature for '97 is the one-piece crank. Square cranks, laminated rims and choice of saddles and tires are offered to the buyer.

THE C. H. WOODRUFF CO., ELGIN, ILL. Elgin bicycles. Five wheels. The '97 Elgins are built on about the same lines as last year's wheel with few exceptions such as two-piece crank and axle, flush joints, etc.

WESTERN WHEEL WORKS, CHICAGO. Crescent bicycles. Great as was the advance in detailed construction of their 1896 line over their former production, it is still greater in 1897. Their complete line consists of fourteen models, with a total of twenty different heights of frames. All have keyless cranks, ball-retainers and felt washers. The rear forks and back-stays are of D-shaped tubing. The new style of chain adjuster consists of a covered worm by which a round disc with a tooth edge holding the rear axle is

Chain Adjustment.

turned. Notches in the upper rim of the device make it possible to adjust it minutely. The rear sprocket is now made open, the same as the large sprocket. The crank-hanger bracket is a one-piece sheet-steel stamping, absolutely seamless, and requires twenty operations to complete it. The crank-hanger construction is new and readily removable and has a positive alignment, and the adjustment of the bearings are made by the left-hand cup, which is

Crank Hanger and Sprocket.

screwed into the bracket and held by an outside clamp under the bracket. White enameled laminated rims are used, and the valve and nipple holes are enclosed in nickled thimbles. The model No. 4 for ladies shows a method of securing pedal rubbers so that they cannot be lost. The centre piece of the exhibit is tandem model No. 3, which certainly is a radical change in combination tandems. The rear rider, who is the pilot, is seated so high above the front rider as to have an unobstructed view of the road. Notwithstanding its high frame it is asserted that it steers and balances more easily than the regulation models with the low frame. It is listed at \$125. The models 7 and 8, their baby models, have 20-inch wheels and 14-inch frames, and at the reduced price of \$30 should be great sellers.

WARWICK CYCLE COMPANY, SPRINGFIELD, Mass. Warwick and Hampden Bicycles. Twelve wheels, including two tandems and one Hygienic cushion frame. New features are single piece crank-axle and square crank beveled on the edges, flush joints and dust proof bearings; D-shaped tubing at the rear forks and rear stays and a shortening of the head to six and eight inches respectively. In the racing machine, there is a drop of three inches in the crank-hanger. On the tandem, the cable steering that operated so successfully last season is still used; the lines of the combination tandem are particularly fetching. Two piece fork crowns are used throughout in all grades, and the popular red Warwick finish still is retained.

R. H. WOLFF & CO., NEW YORK. Wolff-American cycles. Show twenty cycles, including a new triplet of original design which has attracted considerable attention from the mechanical sharps of the show. The models are enumerated as follows: No. 1, racer; No. 2, light roadster; No. 3, roadster; No. 4, heavy touring model; No. 5, ladies' double drop frame, No. 6, ladies' diamond frame, and a double frame diamond and combination tandem; also their well-known Duplex. $1\frac{1}{4}$ tubing doubly reinforced at every point is used in the frame. Tubing is used for all connections and the forksides are of the taper gauge. Both sprockets are detachable. A new method of attaching the cranks to the axle is used. The axle has tapered ends, with two parallel and two concentric sides on which the crank is fitted. The

Wolff Crank Hanger.

screws which close up the oil chambers in the hollow axle extend over the crank and help to fasten them. All the bearings are self oiling and are of the three-point variety. All their axles are hollow and contain an absorbent wick, and are filled with oil through an opening in the end of the axle. The oil is drawn out by centrifugal action as the wheels revolve, a small hole in the axle above the bearings emitting it. Their well-known eccentric chain adjustment is retained. By its use the alignment of the rear wheel is not dis-

Triplet.

turbed, as the eccentric discs do not change their positions in the frame. The pedal has been improved in design and the spokes in their wheels are of wire of their own manufacture, they being large producers of spoke wire. An improved internal roller brake is one of their new features. It is of the plunger variety and instead of the usual spoon they use a roller made of alternate layers of rubber and fibre fastened to a steel shell which partially covers it. All of their

Seat Post.

cycles have spring tempered frames, eccentric chain adjustment, self-oiling bearings, tubular hubs, tubular crank-hangers, which have been exclusive and original features of their product for several years, and are finished in either black, blue or ruby. The last two named being put on by a secret process of their own which secures a transparent iridescent effect. All their single road wheels will be furnished in eight different heights of frames, ranging from 20 to 27 inches.

WANE MFG. COMPANY, LOUISVILLE, KY. Bicycles for the jobbing trade only. Also a line of frames, fittings and sundries.

F. S. WATERS & CO., CHICAGO, ILL. Eight wheels, including two tandems and one juvenile. New features for this year are an arched fork crown, and L crank, with the opposite crank held on by a taper and large headed bolt, Waters disc-adjusting hubs with direct oilers, inside expanders in both seat-post and handle-posts, flush-joints throughout, and D shaped rear forks. A corrugated tube frame was also shown, also a complete line of sundries and fittings.

WHITE SEWING MACHINE COMPANY, CLEVELAND. White Cycles. Twelve models, all high grades except two, which list at \$75. There are a few new features, such as crank bearings and hangers and new fastener caps. The White people have lengthened the head on all ladies' wheels, which they claim gets the handle-bars up to the proper height without showing handle-bar stem.

D. D. WARNER CO., MADISON, WIS. Warner bicycles. Seven singles and two tandems. The Warner was so nearly perfect in '96 that there are comparatively few improvements on the '97 models except triple fork crowns and outside re-enforcements, internal handle-bar and seat-post clamps.

GEORGE WORTHINGTON CO., CLEVELAND, Ohio. Ariel, Halladay, Ellen B., Worthington, Harvard, Adelbert and Featherstone bicycles, in all, 30 machines inclusive of two tandems. The Adelbert line consists of juvenile wheels from 24 inches upward. The exhibit is attractively staged and well ranks as one of the largest in the show.

WINTON BICYCLE COMPANY, CLEVELAND, O. Seven Wheels including two tandems. The new

Winton Fork Crown.

features on the '97 Winton are flush joints, larger sprockets, tapered tubing, an internal handle-bar fastener, a steering head of a single drop forging, two piece crank and axle, and curved rear braces, which while insuring a very narrow tread make it a desirable width for the rear hub. The Winton tandem is built so that the position of the rider is exactly the same as two singles and practically remains the same as last year.

Tires.

AMERICAN DUNLOP TIRE CO., NEW YORK. The Dunlop Detachable Tire for '97 will be the same in its principles as in previous years. It has been changed in detail only. It still has the two wires in each side of the cover, and its inner tube and outer cover. The tube, as of old, is made of pure Para rubber. The shoe of Sea Island cotton. The rubber tread is made of the same old tough and reliable material.

BOSTON WOVEN H-SE AND RUBBER COMPANY, Boston. Vim Tires. Externally the Vim is the same as last year. Its interior construction, however, has been altered somewhat, adding both strength and life. The Vimoid Repair Kit, which is being supplied with all '97 Vim tires, is shown publicly for the first time. It really is not a "kit" as it consists solely of a plastic rubber, which hardens when exposed to the air, put up in a collapsible tube with a threaded nozzle, ready for instant insertion in a puncture. It is not to be confounded with the so-called "puncture preventatives" and "tire tonics." It is simply injected into the puncture and renders the use of plugs wholly unnecessary, a point which is not generally understood.

BALL TIRE CO., NEW YORK CITY. BALL tires. The ball tire is composed of a series of independent detachable balls made of pure Para rubber and secured to the rim in a very simple but positive manner, so that the balls may be separately inflated and can be given any desired pressure that either may require. When one of the balls is punctured it is simply removed and a new one inserted. There are ninety balls in all necessary to completely surround the rim.

A NOVEL CONSTRUCTIVE FEATURE.

The superlatively High-Grade Waverley for '97, which lists at \$5.00, contains numerous constructive features sufficiently different from those to be found on other bicycles, and sufficiently meritorious and practical to immediately attract to itself the studious attention of every one in any degree interested in the progress of bicycle building as a mechanical science. Among all these features, if there is one which deserves more notice than another, it is certainly the new device for crank-hanger and hubs originated in the Waverley factory and used exclusively in '97 Waverley Bicycles. This device introduces a principle by which all parts are readily detachable; and which for lightness, freedom from complication and simplicity of adjustment is unequalled by any similar attachment in present use. By the adoption of this principle threaded cones and cases are entirely done away with, being replaced by a sliding shell, which secures, for the first time in the history of bicycle building, perfect truth and accuracy of alignment. As every machinist knows, all fine graduating devices are a source of difficulty. A perfect thread is difficult to cut, and the hardening process increases its inaccuracy. It is a well-known fact that a threaded cone, even if carefully ground on its own axle, when turned from the position in which it was ground, is likely to be thrown out of truth. In the construction under notice, the hanger cones are ground both inside and out, and it is practically impossible to throw them out of line. Perfect bearings are of vital importance in the running qualities of a bicycle, and by the application of this principle to both the crank-hanger and hubs, a set of bearings is secured for which is claimed greater perfection than ever before attained in bicycle construction. By the use of an ordinary screwdriver, furnished in the tool-bag, the crank-shaft combination can be dropped apart in a few seconds' time, freeing every piece, including the sprocket, and leaving both rings of balls accessible for cleaning. There are few pieces, and nothing to loosen or get out of order. The cones in both hubs are integral with the axles, and being ground true with each other, absolute alignment and concentricity are secured. In removing the wheels from the frame, or in the adjustment of the chain, the axle is not removed or loosened in the hub, and the bearing adjustment is not interfered with, constituting a new and decidedly valuable feature. A small set-screw behind the sliding shell accomplishes the adjustment of bearings, which can be made either before or after the wheels are placed in position. Dust caps containing felt washers fit closely over the ends, and the Indiana Company seem to have at last a dust-proof bearing which will not prove a dust trap. The front and rear axles are made from crucible steel, and the shells from a special cone steel which has proved its reliability by extended use. The bottom bracket is drop forged and accurately machined to a degree of lightness that insures safety. A national actual width of tread of 4 3/4 inches is secured, with ball races separated to the extreme outsides of the bracket, thus decreasing the strain on the bearings to a minimum. All in all, the Waverley crank-hanger, hubs and bearings are the most simple and yet the most perfect of any ever seen on any bicycle.

THE WAVERLEY DYNAGRAPH.

Not for many years has any bicycle house brought out so distinct a mechanical novelty to be used for testing purposes as the Indiana Bicycle Company in the Waverley Dynagraph, which has just made a most flattering debut. The machine is receiving the highest encomiums on all sides, and there can be no doubt that it provides an exceedingly interesting and practical test of the relative amount of friction in different bearings. No machine which accomplishes this result has ever before been perfected, and the Indiana Bicycle Company have already found it of the very greatest value in their experimental department. Waverley Bicycles are, and have always been, built with mechanical excellence as the first and greatest consideration; and the intelligent use of such machines as the Dynagraph and many other testing devices of a similar nature that are used by the Indiana Bicycle Company alone, have done much to make the Waverley of to-day the admirable exponent of the highest type of cycle-building art which it is.

The '97 Waverley ...Bicycle...

Is the Synonym of Satisfaction.

THE THOUSANDS OF WAVERLEY RIDERS who are too well satisfied with their mounts to think of change, and who will continue to ride and recommend WAVERLEYS in '97, form a most significant testimonial. The '97 WAVERLEY is a triumph of mechanical skill, the cumulative result of years of study and experiment, fortified by the tests of actual use. It embodies all that is best and most desirable in bicycle construction. To secure for the rider the highest possible degree of comfort, safety and convenience has been the end which the builders have kept constantly in view. The '97 WAVERLEY is the result. We leave the judgment of its merits to the cycling public, confident of their unqualified approbation. *****

Indiana Bicycle Co.,

Indianapolis, Ind.

Catalogue Mailed Free.
Agents Wanted Everywhere.

NEW YORK TIRE CO., NEW YORK. Samson single tube and Ixion double tube tires. The '97 product embodies a number of improvements over the well-known '96 tires. One of the new features is a milled tread, extending over the entire wearing surface, so constructed that what looks like a thoroughly non-slipping tire is produced, without creating a suction where the tire comes into contact with the ground. Another feature is a thickened and special reinforced tread, which increases the wearing qualities, and at the same time decreases the liability of puncture, without diminishing the resiliency. They also make the Samson tire with a rough tread, which extends across the full portion of tread only and is of a beautiful design and finish. This style of tire can be had if desired. They also make a complete line of juvenile tires in 26 inch, 24 inch and 20 inch.

NEW BRUNSWICK TIRE CO., NEW BRUNSWICK, N. J. Volt, New Brunswick, Messenger, Trim and Meteor tires. A full line of single and double tube tires. The Volt with its basket tread, is of course, the leader of the line, while a heavy 2 1/4-inch single tube tire which the New Brunswick people show should prove a common-sense offering to those who desire comfort for a tandem tire, rather than a slight decrease in weight. These tires weigh from four to six pounds, depending altogether for which purpose they are to be used, and if the prediction of those who have watched the cycle trade accounts for anything, the demand for a tire of this size this year will be quite considerable.

NEWTON RUBBER WORKS, ELLIOTT, MASS. Newton tires. Show a full line of single and double tube Newton tires, in weight varying from 2 to 4 pounds per pair, also tires for Quads, Quints and Sextuplets. The Newton single tube tire is shown with an inner tube that is loose on the bottom or inside, so in case of a bad gash in the tread it is possible to cut open the tire and repair it from the inside, and afterward closing it in such a manner that it still retains the single tube feature. A line of laced inner tube tires is also shown in many varying weights and diameters.

HARTFORD RUBBER WORKS, HARTFORD, Conn. Hartford single tube tires. Show a line of single-tube Hartford tires of varying weights. An extra heavy tire for tandems and extra hard usage is an addition to the line. For repairing purposes a rubber solution that is merely injected into the puncture and which hardens after exposure to the air; a repair outfit intended for large punctures where a plug is necessary are shown. The latter consists of a simple cutter and digs a clean hole, making it an easy matter to insert a tackedhead plug.

L. C. CHASE & CO., BOSTON. Chase tough tread tires. A large exhibit of this now universally known tire is shown, and while it is by no means claimed that it cannot be punctured, yet by the use of two extra strips of duck on the tread, treated with a certain toughening compound, the chances of puncture are greatly lessened. Nothing but the finest Para rubber is used, and the roughened surface adds to the tire's non-slipping qualities.

MECHANICAL RUBBER CO., CHICAGO. Tiger tires. The tires are shown to an advantage befitting and their formal introduction, so to speak. They are as hardy, too, as the name implies. Tiger A has an extra ply of fabric on the tread for hard service, and the Tiger B intended for tandems has four extra plies on the tread.

B. F. GOODRICH CO., AKRON, OHIO. Goodrich Single Tube Tires. Made with both smooth and corrugated treads. The tire is also now being made with a thread fabric, adding materially to its life and resiliency. The Jiffy repair tool, one of the rubber injecting type and intended as a substitute for plugs, is largely in evidence.

INDIA RUBER CO., AKRON, OHIO. India single tube tires. A well made, strictly business tire, the feature of which is the peculiar narrow tread which has caught the public eye in the public prints and has been the means of exciting a wonderful amount of curiosity and attention.

PALMER PNEUMATIC TIRE CO., CHICAGO. Palmer tires. This famous hose-pipe is shown in sections and in various stages of construction. Little room for improvement has been found in this article for the last couple of years. The only change from the 1896 design has been an increase of a few ounces in the weight.

WEAVER CYCLE MATERIAL CO., NEW YORK. Kennedy and Pickwick tires. Both single tubes, which are soft-finished inside instead of being calendered, a construction which, it is claimed, affords a better grip for repair plugs.

INDIANA RUBBER CO., INDIANAPOLIS. Single tube and G. & J. detachable tires. Made with both rough and smooth treads the single tube being formed with a constrictive fabric.

Parts and Fittings.

A. L. MOORE CO., CLEVELAND, O. A bewildering array of about everything necessary in the construction of a bicycle. Steel stampings, flush joints electrically welded, D shaped rear fork end stampings, King pedals, the bearings of which are made on the same principle as those in the bicycle proper; also Spinaway and Grothe pedals, Grant hubs, Cleveland Hardware Co. forgings, Standard Tube Company electrically welded fork ends and braces, chain adjusters, brake rods, endless pedal frames, and a great display of Elwood tubing, showing the various processes from the solid billet to the finished product are included in the array. The Elwood people claim the distinction of being the only Americans who pierce their own billets. Samples of the finished tube, crumpled in all conceivable shapes and yet showing no breaks, add to the interest of the exhibit. Kells saddles were also well displayed. They show the padded article on an aluminum frame and a saddle made entirely of aluminum; also a saddle built entirely of spring steel and equipped with a novel and simple tilting adjustment. Kundtz laminated and inlaid rims, also Kundtz balls, guards, and pretty much everything else in that line generally in evidence. The Moore Company are selling agents for the Kundtz people. They guarantee the rims and will replace any that may be broken through any cause whatsoever, even by contact with a railroad train. Torrington chains of six grades also form a portion of the Moore exhibit. All are of the Figure 8 pattern. The Torrington makers do not believe in the letter B model because of its not being interchangeable.

INDEPENDENT ELECTRIC CO., CHICAGO. Parts and fittings. The brazed tubing and fork-sides made by the Standard Tube Co., Toledo, O. which is formed by a novel manner of dove-tailing and which is also lock-jointed and lap brazed, electrically brazed at that, is being made one of the leading features of the concern's stock. The Meyers adjustable chain, the Mitas metal castings and the Independent barrel pedal made to conform with the big tubing now employed and which has been vastly improved, are also pointed to with a special pride. The same is to be said of the Chantrell chains and the Page saddles. The latter deserves to be better known. It seems to incorporate a common sense compromise on the various efforts to produce a soft seat. It is padded, the pads consisting of what may be vulgarly described as resembling honey-comb trim. On the face it does not appear that it could become sodden or saggy, the form of the rubber assuring a quick return to its original shape. Lowentront's United States wrench in four patterns, Fauber and Bolte one piece crank shafts, D tubing and forgings both finished and in the rough and a plentiful assortment of rims and handle-bars are in evidence. In the profusion of material is a crank-shaft for detachable sprockets which may be used with the ordinary sprocket, i. e. that which does not require a spider, although spider sprockets are also carried in stock.

IVEN BRANDENBURG-BURGESS CO., NEW YORK, Rochester and Chicago. Brandenburg pedals, Lobdell wood rims and bars, Sager saddles, Lefebvre chains, H. D. Smith forgings, Thor hubs and crank-hangers, Scraton forgings and Morse-Keefe spokes. While very complete and affording a wide range of selection, the most commendable article, perhaps, is the Brandenburg improved pedal, the frame of which is made in one piece, without welding, brazing or riveting of any sort. The centre is turned from a solid bar and the hollow pins in the end serve as oilers. The Thor hub has also undergone refinement. The ends of the shells are spun over, and with the oil tube form the ball-retainers. The Thor crank hanger of the two-piece variety is extremely simple. It is separated and removed from the bracket by loosening one nut on the sprocket side. Sager saddles are shown in twenty-four different patterns, including, of course, the new anatomical model and the improved pneumatic seat, the top of which is now made of one piece of leather without seam. The Lobdell wares are distinctive in that the wood is compressed in the bending.

Dies for the Repairer.

C. H. BESLEY & CO., CHICAGO. BESLEY Combined Stock and Die, Helmet Oil and Helmet Bronze Metal. The first named is of particular interest to the repairer. In buying dies it is usually necessary to purchase them in sets at a cost of about \$7.00. The Besley article can be purchased separately at a price of 40 cents each, and as both stock and die are combined, and are practically sold for the price of the die, there is no necessity for constant change of dies.

The Helmet Oil is a solid lubricant, an imported vegetable substance, put up in collapsible tubes. Hitherto it has been used on machinery, but for some time this Company have been experimenting with it on bicycle bearings with such good results that they are now offering it for sale. Owing to the duty exacted, it costs considerably more than most articles, but it is claimed to be worth every cent of it.

Helmet Bronze metal, sold in sheets or wire, is designed to replace steel wherever springs are necessary. The fact that it requires no tempering, is non-rusting and can be bent into almost any shape, makes it worthy of consideration.

G. E. STRAUSS, NEW YORK. SARTUS HUBS. The exhibit consists of a mammoth fac simile of the hub marketed by this concern, built on a scale of one foot to an inch, and complete in every respect, even to the sprocket and chain. The balls are 2 1/2 inches in diameter, the bearing case 16 inches in diameter, and constructed so that the ball is visible, being illuminated by electricity from the inside. It represents nine months' work and is over five feet in height. It is turned by a dynamo, and as a working model, it is a huge success. It weighs 1,265 pounds. Although termed a hub, the hub itself differs little from the conventional, the special feature being a ball retainer in which the balls are set, each independent and out of contact with its neighbor, the retainer rotating with the balls. It is designed to obtain a perfect rolling action of the bearings, the mammoth Sartus being used as an object lesson.

MILES TOOL WORKS, HAMILTON, OHIO. Bicycle machinery. In the display are two new perfecting machines, one a sprocket drilling, tapping and forming machine, the other a hub forming machine. The sprocket machine is built in column form like a drill press. In the spindle is set a reversible chuck, into which two different tools, such as a drilling and facing tool, can be affixed at one time. In front of the table of the drill is a knee mounted with a slide into which any formed tool suited to the working of facing sprockets can be fitted. This feeds horizontally by means of a worm and gear, three changes of feed being provided. The hub forming machine is furnished with two changes of power feed driven by gearing and operated by a quick-motion hand-lever. It enables the operator to drill the hub from a solid bar at the same time that the flanges are being cut on its end. It is claimed that each of these machines gives an increased capacity of nearly 100 per cent.

Formed with Shoulders.

SPAULDING MACHINE SCREW COMPANY, Buffalo. Parts, fittings, pedals and Spaulding & Pepper tires. Flush joints formed of shouldered seamless tubing constitute their leader. The tubing is first shouldered and into the open shoulder is driven from the under side a solid reinforcement or thimble over which the tubing is slipped, pinned and brazed. It makes a smooth neat joint. These connections are made for crank-hangers, seat posts, and handle-bars. Indeed, it is the aim of the concern to supply, in their own words, "flush joints of all sizes, shapes and angles." A three piece fork crown and samples of Chantrell chains and Spaulding, Kensington and Buffalo pedals and S. & P. Tires, are features of the display. For the first time the tires are being made with corrugated treads of several designs.

NEWCASTLE TUBE COMPANY, NEWCASTLE, Pa. Newcastle tubing in all forms, gauges and sizes, including round, oval, square, D shaped and the six and eight sided article, comprises the exhibit. One of the talking points of the Newcastle people is that their tubing is drawn bright, the polish and smoothness not being acquired by artificial means. They show a sample of their round tubing which had been placed upright in a vise and crushed down until it coiled as neatly as if it had been machined in that form. Despite the enormous pressure the tubing shows no cracking, whatsoever, on the edges, proof of its toughness.

... MADE BY ...

Crosby & Mayer Co., - Buffalo, N. Y.

Kindly mention The Wheel.

THE HEATH-QUIMBY CO., MINNEAPOLIS, Minn. In addition to their already very large line of bicycle sundries, such as toe clips, pumps, locks, etc., this concern in displaying new specialties include the Harvard bicycle holder, sprocket lock, Atom cyclometer, which they claim is the cheapest, strongest and best, and is covered by a guarantee that is second to none. The Harvard holder with locking attachment is made of high grade crucible steel, properly polished and highly nickel plated. Retail price 50 cents. The sprocket lock is very neatly engraved front and back, self-locking, weighing but one ounce, having 12-inch nickel-plated steel chain attached. T. H. Cranston & Co., Chicago, are agents for their entire line.

CROSBY AND MAYER, BUFFALO, CYCLE fittings and parts representing the goods manufactured by Lewis Rasetler & Son, Hathorn Mfg. Co., P. & F. Saddle Co., Fibre Buckskin Company and Bay State Mfg. Co., Cork Specialty Works, U. S. Projectile Co., Fay and Bowen, James Duckworth, Hamilton Tube Company, Springfield Drop Forging Co., American Merchants' Mfg. Co., Cleveland Brazed Fork and Tubing Co., Morse Mfg. Co., and L. M. Jones Co., Bridgeport Chain Co., Bridgeport, Conn.; Myers detachable cycle chain in five finishes; as its name indicates it is for quick repairs. The departure from the usual is a chain with aluminum bronze side plates, the block and rivets being of tool steel drawn to gun-barrel bronze color.

SPENCER BRAKE CO., NEW YORK. INVISIBLE brakes. This well-known brake, which has created so much favorable comment and scientific discussion for the past year, is shown in two styles: the coil on the crank axle, which is entirely invisible and worked by a button on the handle-bar grip, and the plunger brake, which is invisible with the exception of the plunger, which comes down through the head tube, and is also worked by a button. The Spencer brake has been considerably improved over the original model. A new method of connection between the grip and crank axle has been arrived at, which does away with the piercing of the fork stem. On the plunger brake a new spout has been devised, which has a renewable rubber contact.

DAVIS & STEVENS MFG. CO., SENECA Fall, N. Y. Cyclone pumps of all sizes and patterns, wood bars, spokes and nipples, and a new wood grip, selling for \$30 per thousand and "going like hot cakes," as the Davises and Stevens representatives affirm, and a new lamp, the Cyclone, a kerosene burner, at a medium price. While Davis & Stevens are known mainly because of their Cyclone pumps, they are now entering largely into the sundries and fittings trade, and will shortly carry complete stocks of both. To further this branch of their business, they have established a Chicago depot at No 28 West Randolph street, in charge of O. P. Workman.

INDIANA NOVELTY MFG. CO., PLYMOUTH, Ind. Wood rims, handle-bars, mud and chain guards, in all manner of finishes, both plain and colored. A new split clip is used for the bars, wherein a single bolt clamps the bar most effectively, and allowing a sufficient space for any shrinkage in the wood. A 2 piece rattle horn bar was also shown, with metal center connections. A distinctive feature of the Indiana rim is the introduction of eyelets of nickelled steel. It is claimed that this makes the rim absolutely waterproof at the spoke holes. A full line of eyeleted chain and mud guard was also shown.

H. LAUTER, INDIANAPOLIS. EVERYTHING in the shape of wood that is used in a bicycle, handle-bars, rims, guards, and bent wood saddle cantles, all supplied in any color that fancy may dictate. A leather gear case with nickel trimmings and wood frame is one new production of the Lauter factory. Another is a dress guard made of wood and designed in fetching scrolls. Among the various finishes is one termed the "Lauter special," technically, walnut burl, but to the average eye, it resembles nothing so much as tortoise shell.

NIAGARA CYCLE FITTINGS CO., BUFFALO. Parts and Fittings. A complete line of Niagara pedals, spokes, nipples, grips, sheet steel frame connections, and every piece of metal, leather, rubber or cork which goes into a bicycle. The distinctive features of the exhibit are a pair of old Niagara pedals made in 1894 which have run 5,000 miles without repairs. This is authenticated by documents. A pair of feather weight racing pedals, made by the Niagara Company in 1895, which have been ridden 8,000 miles and are still in good condition, are also shown.

THE BOSTON WOOD RIM CO., BEDFORD, Mass. Wood rims and handle-bars, both plain and laminated. Beautiful specimens are shown in natural wood and colored finishes, also veneers of varied colored woods. A distinctive novelty in handle bar construction were those made of laminated stock, with alternate layers of maple and natural purple amaranth. In the twist that was necessary in the formation of the bar, is produced a very handsome and rich effect. Fitted with wooden grips of the same material, it made a striking departure.

I. A. WESTON & CO., SYRACUSE, N. Y. Hubs, built-up wheels, spokes, nipples, handle-bars and tires are shown. The Weston hub in various sizes and designs with a new oiling device is on exhibition; also complete line of Weston built-up wheels, likewise bottom brackets, complete with bearings and single-piece cranks and axle, and a full line of Duguid saddles in 9 styles.

BALDWIN ADJUSTABLE CHAIN CO., WORCESTER, Mass.; Baldwin adjustable chains. This chain is too well-known to require detailed description. The new connecting link in which the rivets are retained by an S-shaped piano-wire spring, doing away with both nut and bolt, has proven successful, and the chain as now furnished is as easily detached and attached as the conventional pattern.

MOORE CYCLE FITTINGS COMPANY, HARRISON, N. J. Parts and fittings, all of which, with the exception of wood rims and steel balls are the product of the concern's own factory. The stock includes everything necessary in the make-up of a bicycle, fully machined and ready for assembling. A feature of the exhibit are two display boards with various portions of a bicycle virtually dissected, and all ready for the brazing furnace.

CHICAGO TIP AND TIRE COMPANY, CHICAGO. Parts and sundries, comprising the articles made by the Elastic Tip Co., the Indiana Novelty Co., Bonsalite Box Co., Snell Cycle Fittings Co., the Wire Goods Co., Shelby Steel Tube Co., and New England Cycle Supply Co. While showing such common-place objects as cycle fittings, the exhibit was very prettily arranged.

LEWIS TOOL CO., NEW YORK. A FULL line of steel slide bar vises. A feature is the Active vise, made especially for holding bicycle frames and their tubing of all kinds, without danger of crushing or marring. These are wood-faced, and can be revolved to any desired position when gripping frame is loosened.

KELLY HANDLE-BAR CO., CLEVELAND, O. Handle-bars and parts of bars, brakes and supplies. Bar is divided and pivoted at middle where surface is serrated and locked together with a screw. Ten practical shapes may be obtained from the bar, which admits of the use of a brake. Also show a line of Kells saddles.

CYCLE IMPROVEMENT CO., WESTBORO, Mass. Janney pedals. A neat and complete line of this well-known pedal is shown in both ladies' and gentlemen's types. A particularly handsome pair, finished in gold plate, showing the possibilities in this direction, seem to be the chief attraction of the exhibit.

G. L. THOMPSON MFG. CO., CHICAGO. Stampings and fittings. A complete line of locks, adjusters, cups, cones, clamps, fork crowns, hubs, sprockets, and practically all parts of a machine are shown. The features of the exhibit are the electrically welded hangers and the head-lugs.

W. H. FAUBER, CHICAGO. FAUBER ONE-piece cranks, for both single wheels and tandems; also a line of Fauber sprockets, all time tested and true and so well known to the trade that in these days of experimental divided axles more need not be said.

FAIRBANKS WOOD RIM CO., BRADFORD, Pa. Laminated rock maple rims, guards and handle-bars, in all finishes—natural, plain and polished. A laminated bar is made with alternate layers of walnut and maple, and is about the only article which departs even slightly from the usual type.

RUDOLPH & KRUMMEL MACHINE WORKS, Chicago. Bicycle machinery. The display including a spoke header and bender, spoke threader, rim truer, chain stretcher and grinder, and a machine for making link joints.

WORCESTER FERRULE MFG. COMPANY, Worcester, Mass. Sheet metal stampings, consisting of frame connection, cups, cones, etc. Among the new features is a line of flush joint stampings made in eight different sizes.

SNELL CYCLE FITTINGS CO., TOLEDO, O. Bicycle parts. A complete line is shown including seven bicycles made from different patterns of their parts. Much ingenuity and excellent workmanship is displayed in the treatment of the parts.

REED & CURTIS MACHINE SCREW COMPANY, Worcester, Mass. Curtis pedals. Show a line of pedals of the improved 1897 pattern.

WHITNEY MFG. CO., HARTFORD, CONN. Bicycle chains and chain machinery. The new chain is called the Wizard.

CROWN ELECTRICAL CO., ST. CHARLES, Ill. Crown chains in both B and Figure 8 models.

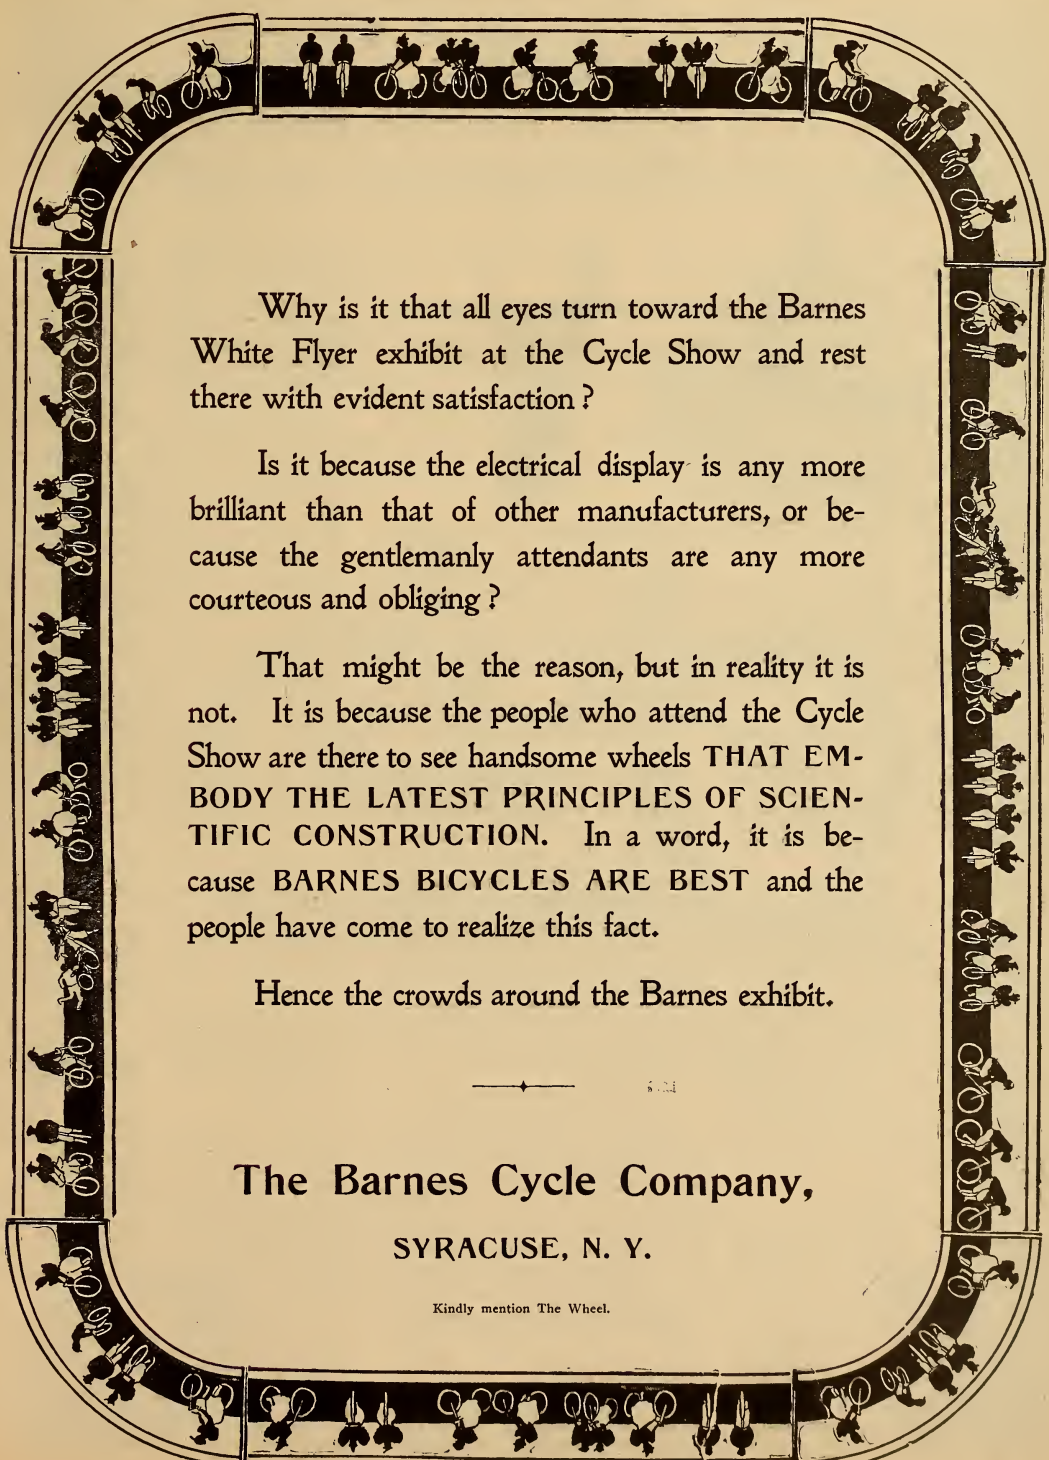

Saddles.

HUNT MFG. CO., WESTBORO, MASS. SADDLES. The Hunt hygienic saddles are shown in eight models for 1897. They include both padded and very broad saddles, as well as modifications of last year's models with minor improvements. They are very handsome in appearance, and no effort has been spared to use the very best material. Model XX has a depression of cantle, which is a distinctive feature. A neat form of adjustment cap has also been adopted. Four patterns of extra width are shown, 10 inches wide; the men's saddle being 10½ inches long and 10 inches wide, and the ladies' being 9½ inches long and 10 inches wide. In post clamps the Hunt Co. is, as usual, well to the front. The Diamond clamp shown is one of the most simple and effectual devices yet seen. One screw binds the seat to the post, bringing the seat as low down to the post as possible.

MESINGER BICYCLE SADDLE CO., NEW YORK. Saddles. The principal changes in this well-known saddle shown in the '97 model are noticeable at a glance. The V-shaped opening in the center of the saddle is narrower and longer than in the '96 pattern. The pommel of the saddle is very much narrower than in the old model, while the back is much wider. An entirely new style of forged clip for attaching the saddle to the seat post is used, in which the set screw attaches the saddle to the post, while a separate nut attaches the clip to the springs of the saddle, whereby the tilt can be adjusted without loosening the saddle from post. There is no projection in the back of the '97 saddle, as there was in the '96 model, and the tension screw, for making the seat hard or soft as desired, is in front. The main feature of the Mesinger, "the rattan base," is preserved.

BECK BICYCLE SADDLE CO., NEWARK, N. J. Beck saddles. The line comprises solid leather top pattern with extra narrow pommel, solid leather top with depressed center, the Hygienic laced and adjustable pad styles, in all fifty-one finishes of various kinds in fourteen colors are shown. The Beck Saddle Spring is novel in the fact that the front end is twisted vertically, allowing a very narrow nose and soft pommel. In the pad saddle it is possible to widen or narrow the pads to suit the requisites of the rider by means of a slotted T shaped spring.

GILLIAM MFG. COMPANY, CANTON, O. Saddles. Thirty-six models in all, "and not a freak in the lot," according to the Gilliam representatives. Every saddle is of a new pattern, that is, the tops are of new design, different from those employed last year. The Gilliam Hygienic saddle is, however, the star of the stock. It is padded and has a base of rawhide, not laced. The Gilliam low down clamp and direct seat-post, both of which are known and undeniably clever, are featured. Fifty different styles of tool bags are also included in the exhibit.

Why is it that all eyes turn toward the Barnes White Flyer exhibit at the Cycle Show and rest there with evident satisfaction?

Is it because the electrical display is any more brilliant than that of other manufacturers, or because the gentlemanly attendants are any more courteous and obliging?

That might be the reason, but in reality it is not. It is because the people who attend the Cycle Show are there to see handsome wheels **THAT EMBODY THE LATEST PRINCIPLES OF SCIENTIFIC CONSTRUCTION.** In a word, it is because **BARNES BICYCLES ARE BEST** and the people have come to realize this fact.

Hence the crowds around the Barnes exhibit.

The Barnes Cycle Company,

SYRACUSE, N. Y.

Kindly mention The Wheel.

ROGER L. McMULLEN & CO., CHICAGO, Forgings, Garford, Hunt & Brown saddles, Diamond chains, Diamond tires, stampings, special steel, etc. A new flush joint made with two pieces of seamless tubing for the head is shown in the C. J. Smith line handled by this concern. The upper and lower tubes are fitted into the head tube with a thimble piece and are spun into conformity with the interior. The Garford saddle has new pads made of felt with leather cover. The Brown saddle shows a deeper dishing and is made almost in facsimile of the cow boy saddle. A coil spring has been added in the rear of the hunt saddles. In the Diamond chains the figure 8 pattern has been done away with and a new B shaped link substituted.

BECKLEY, RALSTON COMPANY, CHICAGO, formerly Gordon & Buckley. A full line of cycle machine, among them 100 different patterns of saddles; the most prominent being the Wheeler Reform and the Gordon saddles, the latter with a padded back on a solid base and with a soft and pliable nose which is not obtained by the use of the pneumatic pad. The Church Handle-Bar Expander, which is operated by a single nut, is also a prominent feature of the line.

F. A. HOLLENBECK & CO., SYRACUSE, N. Y. Saddles. The Hollenbeck saddle, made in two sizes, 8½ and 10½, and in other styles with padded pommels. Two new patterns of springs are furnished. A new tilting clamp is attached, which allows the saddle to be placed very low on the frame, if so desired. The saddle has a perforated sheet steel foundation, ¼-inch felt pads, the whole covered with fine leather, black or colored.

BUTLER & WARD, NEWARK, N. J. BICYCLE saddles in twenty-five styles, ranging from the conventional hard-leather top to the double-pad variety. An especially desirable design for heavy riders is shown. It is fitted with heavy spiral springs at cantel. The four new clips and variety of colored tops are proof that the firm is up to date.

CUTTING & KAESTNER, CHICAGO. CUTTING pneumatic saddles, in three styles. The saddle differs from the conventional in that all pressure is avoided on the pelvic bones by cutting away the centre of the saddle, and really setting the rider on a skeleton and pneumatic saddle-shaped rim. For '97 a felt guard is placed around the bottom gear, preventing all chafing of the rubber tube on the metal base.

Saddries.

SCHLESINGER MFG. CO., CHICAGO. SUNDRIES. A line of cyclometers, saddles and handle-bars are shown. The saddles include the well-known Royal anatomical spring cushion, a saddle which has independent pads, resting on the wide, flat spring in a raised position, which permits a perfectly free action of the legs and an easy motion in every direction. Under the weight of the rider, the saddle automatically assumes the shape of the body and prevents discomfort. Provision is made for adjusting the saddles sideways, to widen the saddle or narrow it as desired. The Climax cyclometer for '97 has many improvements. It is simple and lighter; registers 10,000 miles, and also has a trip or day riding recorder. It is a midget in size and weight and a giant in strength and perfection. The Royal adjusting wood handle-bar and clip has no projecting nuts or screws at the stem.

P. & F. CORBIN, NEW BRITAIN, CONN. Bicycle Bells. In all thirty-six styles, ranging from a small single stroke to a high priced electric bell are shown. The line is too well-known to merit mechanical description, but a novelty in the shape of a pneumatic striking bell is food for the curious, and will no doubt strike the popular fancy. By pressing a bulb a small striker is forced against the gong. This principle was used in a bell-ringing piano, and attracted a large share of attention. For '97, the Corbin bell has been improved even over their last year models, and embraces a line that covers all prices. The new double stroke bell is a particularly valuable addition to the line, as it is well known that this form of bell is the most difficult of all to manufacture.

NEW DEPARTURE BELL CO., BRISTOL, Conn. Bicycle bells, Lucas lamps, Sykl footpump and trouser guards are shown, a most complete line. This well known bell is offered not only in nickel but enameled in various colors, the intention being to furnish it to match the tint of the wheel. The Lucas Lamp line this year will be kerosene burner, and with the possible exception of the cheapest pattern will be finished in nickel, thus breaking away from the English idea of an enameled lamp. The Sykl pump is a small tool bag Sundry that is used as a foot pump. It folds into a very small space and can be very easily carried on the machine in an ordinary tool bag. The New Departure Bell Line embraces

thirty-six bells, from a single stroke bell to one that is fastened to the rear stays and run by a friction of the tire. This bell is particularly adapted for tandems, and a connecting rod is so placed that it can be used either by the front or rear rider. The double stroke bell is also new this year, and is of a mechanism that does away with much of the rattle and annoyance so common to bells of this style. As always, the New Departure Exhibit is very handsome and among the most effective in the Show. A chromatic chime of bells is rung and with the assistance of two other musicians continues to attract a never-ending crowd around the stand.

EUGENE ARNSTEIN, CHICAGO, IS SHOWING an improved steam vulcanizer which surpasses anything in the market, he emphatically affirms. Also some twenty shades of baking enamel, comprising the very latest shades, such as apple green, old rose, lavender, willow green, golden tan, etc. Five sizes of enameling ovens and an entire new line of transfer ornaments, especially designed for the bicycle trade. Another special feature of Arnstein's exhibit is the showing of how transfers are applied, also the latest method of repairing tires on the Arnstein Vulcanizer. Mr. Arnstein is marketing the Kauffman Acetylene Gas Lamp. The operation of this lamp is exceedingly simple. The inner chamber is filled with calcium carbide and the cap screwed on. The outer chamber is then attached and filled with water. The gas is immediately generated and can be lit with a match. There is no possibility of an explosion. The charge of carbide lasts six or seven hours, the cost of the charge being only one cent.

Howard Raymond Interested.

CHALFANT NOVELTY CO., KENOSHA, WIS. Cycle specialties. The Clarke keyless lock, one of the Chalfant novelties is a distinct departure from the conventional. It incorporates the combination principle, but is operated by spring push buttons on the side. One thousand and thirty-two combinations are possible, any one of which may be worked in the dark after one learns the buttons. The Built-to-Reach clamp, as it is called, which enables the saddle to be secured to the frame of the bicycle, is another novelty. A baby carrier completes the line of specialties as at present arranged. The Chalfant concern is a recent institution which is apt to become more prominent by the personnel of Howard E. Raymond, Vice-President of the Sterling Cycle Works, who is largely interested.

CUSHMAN & DENISON, NEW YORK. OILERS, the Star and Perfect. A novelty is a number of Perfect pocket oilers in silver. The Perfect has been improved by a change in the packing of the valve as well as in several minor details. The Star, intended to go with second grade wheels, also shows improvement, resulting from further experience.

C. A. TAYLOR TRUNK WORKS, CHICAGO. Bicycle Trunks. To their large line the Taylor people have added a trunk for quads and tandems. They report that the demand is now running for trunks having a capacity of three and four wheels instead of for one machine as in previous years, and they are meeting the demand, of course. Their four-wheel trunk measures but 27 inches across. A special and patented feature of the Taylor trunks is a continuous malleable edge riveted along the bottom, instead of pockets. A box in the bottom is being provided for pedals and detached parts instead of the pockets as in previous models.

H. M. ROSENBLATT & CO., PHILADELPHIA, Pa. Saddles, tool-bags and handle-bar straps. The special feature of the exhibit is the hygienic saddle with patent springs. When a stiff saddle is desired, the lower spring can be removed at a moment's notice. The bicycle handle-bar strap is a novel and excellent device for carrying packages on the handle-bar. When not in use, it can be rolled up in compact shape and turned over behind the bar. Their line of padded saddles includes the "Stella B" which they claim to be the only juvenile one on the market. The opening under the pads permits the latter to conform to the shape of the pelvis.

ALBERT WILLEY, CHICAGO, ILL. ENAMELING ovens. The Enterprise oven is made of heavy galvanized steel, double seamed and riveted together. It has double walls containing a dead air space which is a good non-conductor of heat. This space contains braces, and the two walls are firmly bolted together. Another style is called the "Garden City" oven. It is similar to the Enterprise, except that it has but one wall; the door, however, is double walled. All ovens that are furnished will supply 320 deg. Fahrenheit, or more, in a few minutes, which heat can be maintained almost indefinitely. The burners can be fitted to gas or gasoline.

ALADDIN LAMP COMPANY, NEWARK, N. J. Lamps. The Aladdin lamp for '97 has many new features. The lens and oil cup are attached to the body of the lamp by a hinge, and fastened by a sliding catch. This makes it impossible for either to become loose. There are two springs on the new lamp, one above and one below, which tends to steady the lamp on the wheel while in motion. Either of the springs can be removed and replaced without the use of solder or rivets. The oil-well has been enlarged, and when filled with signal oil, will burn from twelve to fifteen hours. By means of a patent attachment the lamp may be lighted in the strongest wind without dismounting from the wheel.

Small and Beautiful, but Useful.

VEEDER MFG. CO., HARTFORD, CONN. Veeder cyclometers. At least thirty cyclometers are shown in various finishes, as silver, gold, old-copper, bronze, gun barrel, etc. The cyclometers are handsomely engraved and embossed in fancy designs, making the useful little instrument as beautiful as an ornamental watch charm. The improvements this year consist in an enlargement of the figures and the addition of a 10,000 mile instrument. By means of a small dynamo, these cyclometers are tested to a speed of a mile in three seconds, and for a few minutes some were run at the speed of a mile in one and a half seconds, speaking volumes for the efficiency of the mechanism.

TURNER BRASS WORKS, CHICAGO. CHAIN guards, hand braces, handle-bar stems, clamps, chain adjusters, lamp brackets and lacing fittings. The chain guard for '97 will be of especial interest to lady riders, as it is made of aluminum, and while very strong, is extremely light. The handbrake is an exceedingly ingenious device, and will undoubtedly find favor. Handsome souvenirs were presented to all ladies visiting the booth. At another booth the Straight-Turner brazer was exhibited. It is claimed for this brazer that it will braze the most difficult joint in less than five minutes.

N. N. HILLBRASS COMPANY, EASTHAMPTON, Conn. A complete line of bicycle bells comprising twenty-five styles ranging from the single to the electric stroke. The dome pattern is of a new design. In shape it resembles somewhat a double bell, the theory being that the point of contact with the post being further removed from the edge of the bell allows more vibration and increased sound. The bells are handsomely nickled and a gold plated line also forms part of the exhibit.

The "BOLTLESS SYLPHS."

\$100.00

Their distinctive features and improvements for 1897 are what make them the leaders of High-Grade Bicycles.

Detachable sprockets (no bolts)... New device for clamping seatpost and handle-bar... Two-piece crank... Complete new device for attaching rear wheel to frame, at the same time forming chain adjuster (see cut)... All new and patented features of our own.

Built of highest possible grade material, combined with the finest workmanship.

Guaranteed the Easiest-Running Bicycles Made.

Tandem, \$150.00.

1897 "Boltless" Sylph, \$100.00.

OVERLAND CYCLES, the most reliable, high-grade, popular-priced machines manufactured. Best material... Up-to-date improvements... All sizes, diamond and drop, \$75.00, \$50.00 and \$40.00.

A Complete Line, Established Reputation, Long Experience,
Makes our agency valuable.

We are renewing contracts and desire new agents where not represented.
EXCLUSIVE TERRITORY. Catalogue Free.

ROUSE, HAZARD & CO.,
MAKERS,
PEORIA, ILL., U. S. A.

Kindly mention The Wheel.

Factory, Peoria Heights.

UNITED STATES MFG. CO., FOND DU LAC, Wis. Sundries. United States cyclometers in two models, Model 1 with trip dial, and No. 2 without it. United States lamp brackets and United States odometers are shown. The feature of the exhibit is the trip cyclometer. The testing machine was in operation during the week, running at a high rate of speed to show how the mechanism of the cyclometer stood the severe strain. The lamp bracket for 1897 is reversible for right or left axle, and is instantly removable, leaving only a small clip attached to the axle. It has corrugations at either side which prevent the lamp from being jolted off or out of position. Odometers and lamp brackets were also shown.

H. R. HAMILTON & CO., CHICAGO. RECORD Cyclometer, brought out last year, has been vastly improved. Its special feature is a trip dial, which records up to 100 miles, and may be set back at will. On the under side is the 10,000 mile register. Formerly it was necessary to lift up or reverse the machine to read the figures. It is now being made with a hinge so that the cyclometer itself may be turned over with the finger and the total mileage easily deciphered. The two dials are perfectly independent of each other. Hamilton & Company are believers in hands; those on the Record are very prominent and render reading from the saddle very easy.

THE PLUME & ATWOOD MFG. CO., CHICAGO, lamps, show a line consisting of their three well-known illuminators, the Banner, Climax and Jim-Dandy. Radical improvements have been made in the '97 Banner, among them being removable top burner and reflector and a new wick locking device. The Climax is new this year. The Banner and Climax have a patented wick-locking device, used on no other lamp. It prevents the wick from dropping by a jolt and extinguishing the flame. They are all specially constructed to burn kerosene oil.

STANDARD MACHINE COMPANY, CHICAGO. Lamp brackets and toe clips. Something distinctly new in the former is shown in the form of a somewhat horn-shaped bracket; the horns close somewhat like a pair of scissors, allowing the lamp to be slipped over. When it is in place the horns open and the prongs securely lock it, absolutely preventing any danger of its falling or being jarred off. Another bracket may be used with equal facility on either head or fork, and two styles of steel and two of wire toe-clips are included in the exhibit.

HAYS & DILLY, MUIER, MICH. THE Dilly Bicycle Spring and wall-holder. The spring is an automatic balance device attached to the fore crown and rear lower tube. It is much larger than devices of a similar nature, and the claims for its value are many. The wall support shown is adjustable and takes up but six inches of room on the wall and can be pushed aside when not in use. It is finished in enamel and nickel.

ROSE MFG. CO., PHILADELPHIA, PA. Neverout lamps. In explanation of the name, the firm assert that it will positively stay lit no matter how much it is jolted. It burns kerosene and is warranted non-explosive. A strong point is made of its freedom from grease and its steady light secured by a properly focused, double convex photo lens, backed by a powerful reflector.

EAGLE LOCK COMPANY, TERRYPVILLE, Conn. Bicycle locks. Ten designs. In addition to the regular well-known line, five new patterns were shown. A combination lock, one that is opened by the number of clicks in turning which makes it possible to open it in the dark, is very much of a novelty. The others are all sprocket locks well made and of handsome shape.

WATERBURY WATCH CO., WATERBURY, Conn. By means of an electric-motor are running 157 cyclometers at a speed of one mile a minute, which shows accuracy of recording. Another motor runs speed indicator attached to the wheel which indicates from one to thirty miles per hour. They are displaying a full line of watches, those that can be used on the wheel, for the wrist, or for ordinary wear.

HITCHCOCK LAMP CO., WATERTOWN, N. Y. "Happy Thought Bicycle Lamps," which burn kerosene or any other illuminating oil and which have a burner that spreads the flame. One of the lamp's features is a reversible oil tank.

W. H. FROST, NEW YORK CITY. GEARCASES. Mr. Frost shows what he claims to be the only gear-case patented in America and made here for the trade generally. It consists of two discs with flanges which are joined over the large sprocket and a similar arrangement over the smaller sprocket. Running between are two compartments of elastic rubber enclosing respectively the upper half and lower half of the chain. These rubber compartments measure about one and a half inches on each surface. The outer one of the two discs enclosing the large sprocket, is detachable and slips off over the crank and pedal, so that the sprocket can be removed, the bearings cleaned, or the axle taken out. The weight of the entire device is said to be only twelve ounces.

BROOKS SPRING SEAT-POST CO., CHICAGO. Spring Seat-Posts. Brooks' Seat-Post for 1897 has been largely improved. In shape, size, width and general appearance it is similar to the ordinary solid seat-post. Running down the tube is a cleverly devised, specially tempered spring which takes up considerable of the vibration while riding. It can be attached to any saddle or any saddle-post tube. It can be adjusted to suit the weight of different riders by simply screwing nut up or down with the special key.

BETTS' PATENT HEADLIGHT CO., NEW YORK. Twentieth Century lamps, which are now made with stiffer springs. The top cap of the lamp is slightly higher, allowing of greater combustion, and a new wire lens fastening device, that does away with the retainer used last year, is employed. In addition to the aluminum and the nickel finish, they are also furnished in enamel. A tandem lamp, with a hooded lens, is a valuable addition to the line.

STANDARD WATCH COMPANY, NEW YORK. Cyclometers in four styles and a Tachometer or speed gauge. The newest form of standard cyclometer for '97 is of the barrel pattern, registering 10,000 miles. The regulation line is also shown. The Tachometer is a watch shaped instrument that fastens to the fork of the machine, and the mechanism is operated by the friction from the tire of the front wheel, telling at a glance the speed at which the machine is traveling.

RUBBER PAINT CO., CHICAGO. ENAMELS. A new line of baking, colored enamels, showing all the colors so popular last year, and a number of new colors which may be said to be practically new creations. It is shown in the booth how to test enamels to prove whether they will stand the rough usage to which they are put when applied to the frame of the wheel. Twenty frames were shown in different colors.

BROWN-LIPE GEAR CO., SYRACUSE, N. Y. '97 model Bi-Gear, shown on Barnes, Stearns, Rambler, Outing and Dayton wheels. Improvements are dust-proof ball bearings throughout, stronger axle, new spring oil cup between the spoke flanges, and improved ball cups and cones. All parts of the Bi-Gear are shown to explain the internal construction and the improvements over the '96 model.

GEORGE W. COLE & COMPANY, NEW YORK. Bicycle sundries, including 3-in-1, a brush top chain lubricant, bicycle wall stand, a wire home trainer, toe clips, etc. The home trainer is made entirely of heavy wire, the weight of the rider pressing the tire tightly to a wooden roller, the friction can be increased or decreased by lowering the roller.

THE ROCHESTER BICYCLE COMBINATION Holder Co., Rochester, N. Y., show a novelty in the form of an automatic out-of-sight parcel carrier, which is constructed of folding wires secured to head post instead of to the handle bars, as are usual. They also show the well-known Lund pneumatic bicycle grip.

MATTHEW AND WILLARD MFG. CO., Waterbury Conn. M. & W. bicycle lamps. This is a new lamp having many excellent features. A newly patented reflector and lens cause it to throw an uncommonly bright light. It burns kerosene, and the wick is locked so that it cannot drop down.

HARRIS TOY CO., TOLEDO, O. PERRY Pneumatic Saddles. The Harris people have taken over the manufacture and marketing of the Perry, formerly controlled by the Pneumatic Saddle Co., of Chicago. The saddle is one of the most radical and best-looking found in the hall.

AMERICAN CLOCK CO., BOSTON, MASS. Cyclometers. The feature is new Century Run, independent trip cyclometer for '97, with separate register for century trips. The dial can be easily read from the saddle.

ATWOOD MFG. CO., AMESBURY, MASS. The Atwood Light. This concern shows a large exhibit of lamps, both in brass and nickel finish. The '97 lamp is if anything an improvement over that shown last season, and the addition of jewel slide lights adds to its appearance. A ground lens is used. The swinging bracket that allows the wheel to be set at any angle without spilling the oil is a good feature that has been retained. An effective demonstration of the stay-lit qualities of the Atwood light is effected by means of a shaker, which jars the lamp violently without putting out the light.

S. D. CHILDS & CO., CHICAGO. FRAME ornaments and sundries. A full line of name plates, frame ornaments, aluminum chain guards, pedals, lamp brackets and toe clips are shown. The chain guards are exhibited on two Gladiator singles and a World tandem. These machines also have attached the new axle and lamp brackets and a number of frame ornaments. The samples of name plates are mounted on bicycle hubs and show a variety of design and finish.

WESTCOTT-JEWELL CO., SENECA FALLS, N. Y. Cycle holders, hangers and stands. Their most important exhibit is a hanger for railroad baggage-cars, as used on the New York Central & Hudson River Railroad. It admits of the storage of the greatest number of bicycles in the smallest amount of space and still prevents them from coming in contact with each other. Stands and hangers for the house, store and out-door use are shown in numerous styles.

MANHATTAN BRASS CO., CHICAGO AND NEW YORK. Cyclops Front Light, Unique and Dazzler Lamps, all kerosene burners. The Unique is novel in that the body of the lamp is made in the form of a sphere, opening on the diagonal in such manner that access is easy to every portion for cleaning. The line of lamps shown by this company are graded in price, affording latitude which is so necessary in these days of varied demand.

DUNBAR FOLDING CRATE CO., STOCKBRIDGE, Mass. Crates. The Dunbar folding crate is simple, strong and cleverly devised. It will fit any make of wheel. It locks firmly together with one small bolt and locking attachment without the use of any tool. When taken apart it collapses and can be folded compactly together. It is made from kindred white wood, nicely finished, and the metal part from rolled steel, japanned.

THE SOLAR ACETYLENE LAMP CO., 84 Market street, are showing a new acetylene gas-lamp, the features of which are syphon and water-trap. This is a shut-off box same as an ordinary gas-jet. The water-trap in the bottom works automatically, taking the gas back that is made a minute and a half after gas is shut off. In this respect it resembles the safety-valve of a steam-engine.

WESTERN ELECTRIC COMPANY, CHICAGO. Acme Electric Lamp. The lamp has a dry battery and a parabolic reflector. The bulb can be run from one cell of a primary battery. A rheostat on the head of the lamp regulates the current construction. It is very simple, being made of four cells, each cell burning three hours. A new set of cells can be had for twenty cents.

TRENTON WATCH COMPANY, TRENTON, N. J. Trenton Cyclometers in four styles, including 10,000-mile large, 10,000-mile small and 1,000-mile large and small. Instead of being made with star underneath as last year they are now made with worm. The Trenton's improved clip is being featured.

BRIDGEPORT GUN IMPLEMENT CO., NEW YORK. A complete line of '97 sundries, including stands, lamp brackets, pedals, saddles, lamps, locks, clips, pumps, bells, whistles, grips, and a host of others. Conspicuous among the articles displayed were the Tally-Ho lamps, Ray cycle seat, Star pedals and lantern bracket and Simplicity Stands.

ROBERT H. INGERSOLL & BROS., NEW YORK. Watches, cyclometers and sundries. The Ingersoll cyclometer registers "one thousand miles for one dollar." It is a cheap cyclometer, but none the less a good one. In watches a full line is shown, with a variety of attachments whereby the timepiece may be fastened to the handle-bar.

LATE WIRE REPORTS.

STRAUSS SPECIALTY CLOTHING CO., CHICAGO. Showing a very fine line of bicycle and golf clothing, which includes the latest styles and fabrics. In the way of inducement to the bicycle rider this concern are giving out certificates which when presented to any retailer that handles their goods will entitle the holder to a discount of 15 per cent. Patterns can be selected at the Show.

NATIONAL WHEELMAN'S SUPPLY CO. Providence, R. I. Tire repair outfit, which consists of an elastic plug that is stretched over a metal point; on its release the plug expands filling the puncture completely, forming a rubber head on the outside as well as the inside of the tire. At the same time the rubber being in a state of expansion in the puncture itself, effects a complete repair.

D. O. WALLACE CO., CHICAGO. ECLAT Cleaning Compound. A liquid preparation which the Wallace people have sold to the manufacturing trade for some years, but which this year is being offered to the general public in 25c. bottles. It cleans with equal facility all the wheel, the enamel, the nickel and the cork grips. It is also a rust remover.

J. D. WARREN, CHICAGO. SUNDRY CABINET. A convenient piece of furniture for retail bicycle store, consisting of a cabinet of different size drawers and shelves, intended to hold the various sundries that enter into the stock of a retail store. The front of the drawers are enclosed in glass, allowing a sample to be displayed.

ECLIPSE CEMENT AND BLACKING CO., Philadelphia. Wood rim cement, solid and liquid lubricants, illuminating oils, tire tape and one of the newer repair kits for single-tube tires. This consists of a tube containing a rubber substance which hardens when exposed to the air, and which is intended as a substitute for plugs.

C. M. DILWORTH, CHICAGO. SHOWS A safety rocking support of wire that permits the wheel to be stood parallel to the wall. Also a combination bicycle lock constructed on the same principle as a safe lock of an unlimited number of changes. A pneumatic pad for the handle-bar is also shown.

YALE & TOWNE MFG. CO., STAMFORD, Conn. A complete and extensive line of their well known cycle locks. The locks are shown in an infinite variety of designs, size and finish. The models for 1897 show very little change from 1896, the well-known sprocket locks being almost perfect.

CHICAGO SELF-SUPPORTING PANTS CO., Chicago, Ill. Cycling garments. Trousers have two U-shaped elastic gores over the hips, holding them in position without the use of a rigid belt. They conform perfectly to the body, yielding with every slight motion of the athlete or cyclist.

BERRANG & ZACHARIAS, ASBURY PARK, N. J. The B. & Z. brush top chain lubricant. Several improvements over the original model are shown; made in smaller sizes and with caps to protect the brush, and also in a new style to fit in small tool-bags.

F. E. MYERS & BRO., ASHLAND, O. BICYCLE stand and home-trainer. A combination article made of metal, and somewhat resembling a notched buckawag, inasmuch as it folds up in a similar manner. It is so well braced that one may mount the wheel without danger of the stand toppling over.

CUTHMAN, ULMAN & SILBERMAN, CHICAGO. Turnip Bicycle Breeches. A combination garment, i. e., which is provided with a cuff and may be worn walking length or be taken up and given every appearance of golf or riding breeches. It is cleverly contrived.

NORTH CHICAGO KNITTING WORKS, CHICAGO. Sweaters, hose and racing suits, in all sizes and colors. A double seated racing suit and a new lady's golf hose of extra length and in which the garter is woven were the new things displayed.

AETNA WAX MFG. CO., NEWARK, N. J. L. A. W. Bicycle Cleaner. "The Best" enamel polish, in three colors, red, white and black; the Bikegraph, a white chain lubricant; the Aetna tire renewer, a preparation to renew old and stockworn tires.

M. J. FITCH PAPER CO., CHICAGO. PAPER Bags for bicycles and a waxed paper for wrapping parts are the wares the Fitch people are offering to the cycle trade.

HENLEY MFG. Co., RICHMOND, IND. HENLEY bicycles. Two singles, two tandems and one triplet, a likely lot, indeed one of the tandems is a double drop frame for two ladies, and the triplet, in the words of Representative Shinn, is "the first built in the State of Indiana." No particularly radical changes have been made. The divided crank-hanger has not been adopted. The axle ends are octagon shaped and the cranks octagon slotted. In addition to the usual fastening, an additional precaution in the form of a pin in the crank which fits into a slot on the shaft is provided, and while the crank may work loose, by no possible means could it fall off or become detached from any cause. An oiling device consisting of a supplementary tube in both crank-hanger and hub, and which carries the oil directly to the balls instead of allowing it to lubricate the axles, is one of the talking points. On the tandems an ingeniously dished sprocket is employed affording the same tread both front and rear.

W. L. STEWART, WILDERMING, PA. ROLLER brakes. The essential feature of which is a fibre roller, designed to bring the friction inside the roller.

FURLONG CYCLE TIRE & SHIELD CO., ST. LOUIS. Furlong tires. The Furlong is a single tube with a ridged and flat or square tread, honeycombed to prevent slipping. It is claimed that the ridge keeps the tire off the ground at all times and as there is practically no flattening, that punctures are so unlikely as to make the tires puncture proof.

KOKOMO RUBBER CO., KOKOMO, IND. Defender and Sunlight tires. The Defender is a single tube, the Sunlight is made in both single and double tubes. They embody no material departures from the conventional, being the very best tires that money can produce, so the Kokomo people assert. They are made in both red and natural color and with smooth and roughened treads. The Kokomo concern is probably the only rubber works who make the fabric for their own tires, "an item of interest not generally known. They are seeking to avoid plugging of their tires. As a substitute for the plug, they supply a repair kit, a single tool containing a rubber substance which hardens when exposed to the air. The nozzle of the tool is merely inserted in the puncture, a drop of the composition squeezed out and the air does the rest.

CYCLOID CYCLE CO., GRAND RAPIDS. Cycloid bicycles. Five wheels. Excepting triangular reinforcements and the use of binding nuts instead of clamps in the handle-bar and seat-post, there are no particular alterations in these wheels.

MORSE MACHINERY CO., CHICAGO. MORSE Flexible Grips. A coiled spring covered with flexible rubber, designed, of course, to absorb vibration and to relieve the hands and arms.

LOVELL WRENCH COMPANY, BRIDGEPORT, Conn. Lovell wrenches, no strangers to readers of THE WHEEL. Fits any shape of nut, having one end constituting a regular sliding wrench and the other end forming a box wrench for use on hexagon or reverse nuts.

CENTRAL LAMP CO., CHICAGO. CENTRAL lamps. Unusually good value for the price, \$2.00. It is formed of solid brass, nickelled. All parts are riveted, no solder whatever being used. Has a genuine lens which really magnifies; burns kerosene, if necessary. The oil reservoir is attached to the body of the lamp by catches on the bottom in a manner which seems to effectually prevent its falling off.

CARTER & MOWELL, CHICAGO. "SPEEDER and hill climber." The contrivance is shown attached to an ordinary chain geared safety, and consists of a supplementary chain gearing running from the front hub to the head of the wheel. It is operated by a pumping motion of the handle bars, and in various designs has been exhibited at previous shows by ingenious gentlemen who have expected to revolutionize the trade or a part of it.

ALBANY MFG. CO., ALBANY, IND. SEAMLESS tubing. The Albany is the concern in which Messrs. Gormully, Coleman, Smith and other cycle magnates are interested, and this, its first formal bow to the public. The tubing looks well and is well, there is every reason to believe. It is claimed to be the only American tube, bar one, drawn by hydraulic power.

PARKHURST & WILKINSON, CHICAGO. Cycle material. Excluding the stock of forgings and fittings of all kinds which are displayed, Parkhurst & Wilkinson are making special features of the University Oscillating saddle, the two parts of which move up and down with the motion of the legs. The saddles are made of both wood and aluminum. A new clamp for wood handle-bars in which there is a circular wedge with no teeth to cut the bar, is another novelty. But of the various things that are shown, the new crank-hanger and bearings this concern are showing to a select few, is perhaps the item of most interest, as it is one of the innovations of the show. No threads whatsoever are used. One cone is solid on the axle, the other solid on sprocket and axle. The cups are solid in the hub. The right sprocket crank is placed over the axle and forced in until the proper adjustment is secured. The wheel is fastened by a taper screw or plug.

FRANK DOUGLAS, CHICAGO. DOUGLAS bicycles. Six wheels. In the larger models few changes have been made, the most important being a patented retaining ring in the bearings. Of greater import, perhaps, is the addition of a line of juvenile wheels to the Douglas output. They are good-looking and bear evidence of careful workmanship. A padded saddle of Douglas design and a direct seat-post having a flanged lip in which the wire or base plate of the saddle rests are other introductions.

HUNTER ARMS CO., FULTON, N. Y. HUNTER Bicycles. Eight singles and two tandems. A new feature is a tandem which is centre driving throughout the whole, with double wheel in the rear. This double wheel consists of two actual wheels set into one double hub, which is of one piece and has only two sets of bearings. The threads of the two wheels are about 1-2 inches apart. Its weight is about 42 pounds.

MANHATTAN BRASS CO., NEW YORK. Lamps. They show a full line, including the well-known Dazzler, Unique, the improved Cyclops and the improved Frontlight. The Cyclops is made entirely of brass, handsomely nickel-plated and will burn continuously from eight to ten hours. The Dazzler is also made of brass and is of new design.

CHICAGO HANDLE-BAR COMPANY, CHICAGO. Seamless steel tube bars; thirty shapes; both adjustable and rigid seat-posts; tubing bent and cut to length and a line of built-up wheels and frames. A novelty shown is termed a ventilated handle-bar, made of perforated tubing, with the end of the bar bent into shape to serve as a grip.

JENKINS CYCLE COMPANY, CHICAGO. Napoleon and Josephine bicycles. Six singles, three tandems, one triplet. No changes of importance, is the report. "We do not make changes simply because they are changes. We adhere to what we know has given satisfaction," was the summing up of the Jenkins people.

MESINGER BICYCLE SADDLE COMPANY, New York. Mesinger saddles and Hulbert pneumatic brakes. Six new styles of saddles have been added to this line for 1897, none differing from the main principle, the rattan top, coil springs under the rear is the principal new feature.

CHALLENGE MFG. CO., CHICAGO. CHALLENGE Adjustable Handle-Bar. A special feature of which is the ease with which it may be adjusted without the use of a tool and without dismount.

LIGHTNING CLEANER MFG. CO., CHICAGO. Lightning Cleaner. A compound put up in boxes and intended for use on enamel, nickel, chains and the leather parts of a machine.

ARLINGTON U. BETTS CO., TOLEDO, O. Red Cross rubber goods. A complete line of cements, tire-patching material, tire vulcanizers and enameling ovens.

W. J. TAYLOR, CHICAGO. SEAT-POSTS. Twin cylinder spring seat-post is a simple, durable attachment which fits any bicycle and can be attached to any saddle.

THE CO., UNADILLA, N. Y. HOLDFAST sundries: luggage carriers, bicycle hoists, trouser guards and lacing cord.

NEW ENGLAND MFG. CO., CHICAGO. THE famous bicycle oils, enamels, cements and sundries, and repair kits.

MORGAN & WRIGHT, CHICAGO. M. & W. Tires. Although it is not in evidence at their stand, the fact that Morgan & Wright are making and marketing a non-slipable rough tread tire will be of interest. It is hand made and reputed superfine. M. & W. are also doing an extensive trade in the manufacture of tires for motor vehicles. In their regular type of tire no alterations of any importance have been made. They are as "good" as ever.

MERCHANTS AND MFRS'. WAREHOUSE, Chicago. "Everything that goes into a bicycle and all kinds of everything" constituted the exhibit as the representative in charge amply expressed it. Among the "everything" were Person's saddles, Indiana chains, Winona wood rims, guards and handle-bars, Duplex saddles, the Boulevard lamp, McCool seamless tube, Brown brazed tube, Union drawn steel, Walker & Ehrman pedals, flush fittings, forgings in the rough and also machined and nickel-plated, repairers' tools and all manner and sizes of sprockets, spiders, cranks, etc. The line of sprockets includes all sizes of those technically known as "boiler-plate," most cycle fittings people carry them in specific sizes. One of the new things which the Merchants and Manufacturers are working to the fore is the Plew saddle, which has a padded base and a pneumatic nose. "Its nose is soft" is the catch phrase they are seeking to instill in the public mind.

THE AMERICAN WALTHAM MFG. CO., WALTHAM, Mass. Comet bicycles. Eight wheels, including one tandem. Of course the three ball bearing, which consists of three balls held in what is termed a "separator" and which must not be confounded with the three point bearing, is one of the chief features of this wheel. It has already been extensively exploited, but the fact that it requires no oiling whatever and that all Comets are devoid of oil holes is not generally known. Square cranks and a detachable crank shaft which is removable in a marvelously short time are departures from the conventional. The shaft consists of a solid axle with sleeves having tapered jaws on each end projecting into the cranks and which does not bottom. The whole is secured by tapered nut which screws into the axle end. One of the singles is fitted with a Simpson chain.

TERRE HAUTE MFG. CO., TERRE HAUTE, Ind. Schluer Separable Tandems and Damascus bicycles. The Schluer is, of course, a distinct novelty and attracted unlimited attention. It is not nearly so impractical appearing as one might expect of a machine which can be converted from a tandem to a single machine and vice versa, and will stand a deal of investigation. It is made in both drop and diamond frames, the material and equipment being of the very best. The Damascus wheels are of the regular type and are made in singles only.

PREMIER DISSATISFACTION.

Bridgeport, Conn., January 26, 1897.—One of the largest stockholders in the Premier Cycle Company, of this city, is dissatisfied with Receiver John C. Cassidy, of New Jersey, and has made application to have him removed on the ground of inattention to the business. Yesterday morning the attorney of Llewellyn H. Johnson, who owns a little less than half the stock, filed papers in the application to have the receiver removed, and the matter will probably come up for hearing at the next short calendar session. It is charged that Receiver Cassidy is engaged in other business and he is unable to give the bicycle business the attention it requires, leaving it in the hands of others who, it is alleged, are not capable of carrying it on.

The lances used by the German Uhlans are now made from cycle tubing, it being both lighter and stronger than wood.

Patented.

Bicycle... ...Balance.

Insures safety. Wonderful in its results. Will balance wheel perfectly and keep wheel straight ahead. Weighs only two ounces. In ordering, give size of tubing.

Price, Nickel-plated, \$1.00.
Gold-Plated, \$5.00.

If not found at the dealer's, any of the above can be sent by mail.

It excels after five years' trial. Clean to use. Best of them all. Price, Box of Red, 25 cents; Stick of Yellow, 10 cents. LIBERAL DISCOUNT TO THE TRADE.

Patent allowed.

Extra Handle Grip.

Supplies a great need. Permits rider to change position. Absorbs perspiration and preserves handle-bars. When ordering, give size of handle-bar. Price, per pair, 35 cents.

TOO BIG TO ADVERTISE.

It is an unfortunate thing when either a man or a business concern becomes possessed of the I'm-the-only-pebble-on-the-beach idea. Unfortunate for them, unfortunate for all they come in contact with. The cycle trade has more than one example of this sort of affliction, to put it not too strongly, the nearer you come to the top of the pile the nearer you come to these "only pebbles." It might not be amiss for these sufferers, and those who think of imitating them, to read carefully, and digest the following evidence in "Hardware," which, while it is directed to another line of business, fits the cycle trade's case to a T:

There are certain classes of goods which a few years ago were counted among the leading specialties and handled by every jobbing house in the country. Why? Because they were advertised in every trade journal of sufficient importance to reach the trade which the manufacturer desired to supply. During the past few years of comparative stagnation, when expenses of all kinds were reduced, the value of advertising was not sufficiently appreciated, and it suffered with the rest of the programme.

Does the manufacturer think he can say "the world is mine," even as it was only a few years ago, and that the slumbering traffic will resume the old channels without any of the previous concerted efforts on his part? If so, therein will lie his grievous error. His own particular line has probably been dropped entirely, and similar goods usurp the place he at one time held so securely. This he will find is a fact to be met only by heroic treatment.

In too many instances stocks of goods are greatly reduced under a lessening demand, assortments are decreased, corresponding goods of other makes are shipped by the jobber in place of those ordered—the wholesaler preferring to take the chances of a return, rather than the certainty of a top-heavy stock with no demand—and the retail dealer usually accepts the substitution without comment, finding a market for what he receives. Even if it displaces something previously popular, he accepts the situation because his orders were only for quantities too small to incite captious criticism.

Many of our manufacturers will find this state of affairs existing this season especially, and unless they inaugurate a "hustle" by organizing an aggressive campaign, they will have to doff their beavers to some smaller, but more energetic, competitor. One fact should not be lost sight of—we are a nation of readers. The dealers' wants are constantly augmented and directed by the well merited and alluring advertisement smiling at him from the interesting columns of his usual trade paper.

The manufacturer who has something meritorious to sell the hardware dealer—who is himself awakening from an apathy of several years' duration—and who doesn't conceive how important it is to exploit his products in the papers which touch his trade more nearly, will doubtless realize, when it is too late, that "he is not the only pebble on the beach."

CHANGING HER PEDALS.

It is perfectly natural woman should forsake the piano for the bicycle—it is merely a change of one pair of pedals for another pair of the same thing.

SOMETHING OF A GENIUS.

When but 10 years of age Sterling Elliott, now the President of the League of American Wheelmen, had the "bicycle fever," and built a four-wheel wagon that was propelled by the rider turning a crank just in front of the seat. The speed of this vehicle was about two miles an hour. Its peculiar construction attracted wide-spread attention round about the section of Michigan in which young Elliott lived.

The inventive genius of the League's President again showed itself at the close of the war, when he made a two-wheel velocipede from cuts seen in the newspapers. With this improved means of getting about he soon parted with the "four-wheeler," and every day was seen pedaling o'er the dusty roads of Southern Michigan.

When the ordinaries made their first appearance in the West Elliott was soon master of the "up-in-the-air-wheel." That was the beginning of the seventies. His bicycle mania continued to increase with age, and in '85 he built a tricycle with wooden wheels, which later emerged into the quadricycle and later into the hickory bicycle. The last-named machine had many believers on account of its elasticity and durability, but the manufactur-

STERLING ELLIOTT.

ers found that it cost too much at that time, when they had to compete with cycles costing much less and made of wire.

Sterling Elliott, or rather a youngster who subsequently was so named, was born in Michigan in 1852. His father was a miller, which may in a measure account for the naturally good-natured way in which Elliott has always accepted life. His view of life is certainly pleasant and philosophical, especially at the present time when the political smoke of the battle at Albany soars o'er Boston's blue sky.

In addition to an inherent liking for liquorice root and sweet flag, he had a natural taste for things mechanical, and no other boy in his neighborhood produced miniature water-wheels and the like in greater variety or numbers. At the age of 19 he went away from his home and kindred to learn the carriage-builders' trade. Many have been the useful machines that have been solved by him as he lay upon a restless bed with the ray of the pale moon to produce a shadow of his inventions upon the papered wall.

Offices of high degree and conspicuous prominence have been showered upon him, and still he wishes more and has good prospects of attaining them. He is not a great talker, but has the happy faculty of saying something, when he does speak, that cuts ice—if the term is allowable.

HOW IT STRUCK HIM.

After all, Mr. Editor, to the man attending his first cycle show, as I have just done, the really significant exhibit there is the enthusiasm. It goes beyond everything that any similar occasion has ever brought to light. Not only those who attend the show, but the very exhibitors, who might be supposed to have become hardened to the subject by this time, display an ardor and interest that is simply unparalleled. They sing the praise of their respective wares in no perfunctory key, but as if they really believed in what they were saying.

Never before have I been where such a display of effervescence pure and simple has been exhibited, and never before have I seen it proceed from so many different sorts of people. The cycle fever has not yet been fully diagnosed; its microbe has not yet been discovered, and no remedy has been prescribed for it, but one thing is certain, it is no respecter of persons. Even if he hasn't felt it yet himself, everyone must acknowledge its power, as I have had to do, for he is only too well aware of its effect upon others.

I know of a family, not a thousand miles from where I am seated writing these lines, that boasts of but two cyclists, yet that family is at present torn asunder by a serious quarrel, and all because one of the riders sings the praises of the "Never-say-die" tire, while the other swears by the "Can't-be-punctured." The feud began one night at dinner not long since, when the two got to discussing the respective merits of their favorites. It soon developed into a regular vendetta, that will probably only be settled at the point of the tack.

Another example of the deadly power of cycle fever was shown the other day when a heretofore non-rider announced her intention of "taking to the wheel." "Well, promise me this, Bessie," said her friend, who had not yet been conquered by the wheel, "and that is, that you won't put on bloomers." Bessie looked thoughtful. "Ah, my dear," she finally replied, "the wheel rides right away from all preconceived notions and prejudices. There's no knowing what I'll do when I once get on a wheel."

Bessie is a knowing girl, too.

J. S. FERMOY.

TAKEN LITERALLY.

"I understand that Italian wheelmen burn candles in place of oil in their lamps. Did you when you toured through Italy?"

"Certainly; in Rome do as the Romans do, you know."

"What! Burn Roman candles! Well, I guess not!"

NOT THE SAME THING.

"What do you mean by saying I wrote only tramp jokes? You know I deal with nothing but cycling subjects."

"I didn't say you wrote tramp jokes. I said your jokes were on the bum."

"Oh!"

NEW YORK.

GRANDEST OF DRIVES.

Where the Extension of the Riverside Drive Will Carry the Users of That Famous Road.

Once, many years ago, of a June afternoon, a man of the type which is called "man of the world," lay lazily in the tall grass on the slope which bends from Claremont to the Hudson, and mused: "How funny that we should run all over Europe, extol its land and waterscape, and that we should neglect this which we have here at our doorstep."

The Claremont, you know, is that hotel situated at the north end of Riverside Drive. It is on a high bluff and commands a splendid view of the Hudson and down the Hudson, while on its left is the frowning majesty of the Palisades, and to the east a totally different scene, there being here no verdure

house, and all who have read the beautiful inscription, about the flowers which, like man, cometh up in the morning and in the evening are not, will not easily forget it. The stone which marked the resting-place of "Harold a graceful child" is now cracked and broken—uncared for.

But this Claremont Bluff and this head of Riverside Drive is not all. Stretching away beyond this there is new beauty, as yet undeveloped. But far-sighted citizens are even now planning to invade this virgin territory with a new boulevard which shall stretch from Claremont, up along the Hudson to Inwood and even further. Very few New Yorkers know that this belt of country is almost primeval, that it is thickly wooded and wonderfully hilled. One can there find as much beauty, even of a rugged sort, as can be found in the conventional mountain resorts.

One brilliant afternoon, THE WHEEL scribe,

finding a direct connection with Riverside Drive possible.

Walking down from Claremont and along the Boulevard, one comes to the gateway of the proposed new driveway, at about 130th street. It would indeed be a surprise to many New Yorkers if they knew the character of this hilly country which they have so often gazed upon from the Claremont. Located there is a house which is the saddest example of the decay of former greatness at which the camera was ever pointed. Once it must have been a beautiful home; but to-day it exhales gloom. The sun strikes its floors and marble mantel through window and door cranny. The breath of a giant would blow it to ashes. Near it, the day our scribe was there, was a shabby and gone-to-seed specimen of the equine family who matched the house as closely as both had been the creation of an artist in antiques.

green, but the blinking, sparkling lights of Harlem shoddom, the backbone of the marketplace being 125th street.

This old Claremont, before it was refurbished and in the old early days before Riverside Drive was Riverside Drive, and when it was only a country road, penetrable only to those persevering ones who sought nature at her best, had an atmosphere of romance, of historic beauty. The story of this at present fashionable inn will repay the investigator. For the present it may be said that it once sheltered an English nobleman, and was long his residence. In the old days, in the tree branches in front of the hotel, was a carved wooden bust of the "Good Queen Bess." At the side of the house, overlooking the Hudson, is the tomb of a child who once smiled and made merry the

much desk-worn, and THE WHEEL artist, ever ready to seek fields and pastures new, took their cigars and their camera and strolled over this territory, which will be fresh and attractive and beautiful in the eyes of New Yorkers when the Park and Riverside Drive have become common places.

In order to start well, the scribe and the artist betook themselves to the Claremont Bluff, and looked longingly northward. Immediately above Claremont is a great dip, or valley, as is shown in the picture, and beyond that is a hill which shows the commencement of the proposed new boulevard. The valley so plainly shown in the picture is entirely devoted to business—and a poor sort of business at that. All wheelmen who have crossed Fort Lee ferry have ridden through it. It is proposed to span these two bluffs, thus mak-

Stretching away north of this is a series of old homesteads, extending from the road down to the river, many of them occupied by New York merchants. Most of the tenants have seen New York grow up to their country places, so that they have lost their privacy and their quiet beauty, for the sound of city life now surges even up to their doorways, and it would not be difficult for the majority of them to move away, especially as their land has increased enormously in value. In fact, they have formed an association for the purpose of building a boulevard through their property in order to enhance its value, and to make it of benefit to the community. At present its beauty is lost behind ramshackle fences.

A few snap shots will give an idea of the character of this territory. One shows a

Moorish summer-house built on the estate of the late Oswald Ottendorfer. It sweeps the Hudson and is a perfect gem of architecture in its way, with its many-colored tiles, its gilded dome, its wonderful tiled floors, its beautiful stained glass windows, and the splendid harmony which characterizes it, both in general and in detail. It is a Moorish palace in miniature. But it has served no purpose of enjoyment for these many years.

These homesteads or country places extend—with one or two exceptions—from 130th street to 152d street, where the road is cut off by the Trinity Cemetery. Here a detour must be made to the Boulevard. At 153d street commences Lafayette Boulevard, which extends from this point up to Inwood, and connects with Kingsbridge road, as shown on the map. Here, indeed, there is wild beauty in profusion. At every point of view one is struck with the great solitude of the place; its fresh ruggedness. At points there are great ravines; again there are glimpses of the river, and here and there are boulders of massive and grand proportions. Occasionally, a carriage containing some adventurous spirit penetrates to the place, driving along the two miles of freshly-made road; but, as a rule, New Yorkers do not know the place, or else they do not go there because they cannot "see and be seen."

One picture, showing the church, is the view where the road joins the Kingsbridge road. Another shows a palatial residence on the Lafayette Boulevard. Again is shown a splendid boulder, and north of it, the wooded hills. One other view, which riders will readily recognize, shows 155th street looking up from the river. On the right is the cemetery wall.

THE WHEEL recommends that the boulevard, and asphalt-butterflies should occasionally leave their exhibition grounds and go up to this new and unexplored territory. Here

they will see where future fashionable New York will air itself. Public attention is now being called to the possible developments of this neighborhood, and a movement will soon be

made in order to build a proper boulevard connecting Riverside Drive and the Claremont with Inwood. The proposed road will, no doubt, meet with some opposition from those who have some petty interests which are likely to suffer. But when this system of boulevards is completed, New York can point to it as being the most beautiful continuous roadway in any American city—and possibly in any foreign one, as well.

WANTED SOME EXERCISE.

A man, 75 years of age, and his wife, five years younger, in an English institution for the aged, recently requested the authorities to let them have a tandem bicycle, as they felt the need of exercise.

When the earth flies up and smites the nervous novice, he then finds out that "the world do move."

HOW IS THIS FOR TRICK RIDING?

A new number on the programme of a Berlin circus is attracting widespread attention. It is called the "Mysterious Star," and the production includes two male artists. A large disk is fastened to the ceiling of the circus, leaving but a small space for a track on top of the disk, which is invisible to the audience. On the lower surface of that disk a bicycle rider rides upside down, and holding a trapeze suspended from his mouth, a partner goes through a series of trapeze exercises at that startling height, and under very difficult conditions, for the rider continues riding around his track forward and backward, irrespective of the work of his companion.

SURELY, THIS IS HAIR-RAISING ENOUGH.

The effects of the Cycle Show are already plainly evident in Chicago. Wheels cranio-logical have begun to buzz in a most alarming fashion since wheels cyclicular have hummed in the aisles of the Coliseum. A gentleman, billed as "one of the veteran mechanical engineers of Chicago," has finished his model for a new kind of race track. The scheme, in brief, is to start a rider at an elevation of 85 feet, send him down an incline, and around the inner side of a vertical circle. The rider, in finishing the course, turns once over, hanging head down when at the highest point of the ring, and being held to his track by nothing more nor less than centrifugal force. It looks chimerical, says the Chicago critic, but the model proves the mechanical possibility of the scheme, whether men and women will ever dare try it or not.

The first hollow forks for a bicycle were made by Meyer & Co., of Paris, from the sword scabbards of the French cavalrymen.

There is something to be said in favor of indolence when a man is too lazy to scorch.

WOMAN AT THE SHOW.

From the Chicago wheelwoman's viewpoint the cycle show was an unqualified success. For weeks she had been in a state of expectancy as to what new things the show would bring out to make her favorite pastime more delightful, and for weeks to come she will talk about what she saw at the exhibition.

There are plenty of men who firmly believe, notwithstanding the popular interest taken by women in cycling, that no woman is capable of learning anything about the technicalities of cycle construction; some of them go even further and assert that she has just sense enough to learn to mount, dismount and ride gracefully, but that, if anything goes wrong with her wheel, she is as helpless as a baby.

To those poor, benighted individuals who held such opinions the cycle show was a revelation. From the time the doors opened on one Saturday night until they closed a week later, all sorts and conditions of women and girls crowded the huge arena.

The first thing that the average woman did when on the inside was to fight her way to the space occupied by the manufacturer of the wheel that she rode. She gazed at the exhibitor and his assistants as if expecting to see a crowned head and a waving sceptre; then she mustered up courage to step inside the booth and say exultingly, "I ride your machine."

The suave exhibitors after the first day learned a wrinkle or two; one was to impress every woman who made this statement that it was a great favor for her to ride that particular wheel, and the outcome was that the woman went away a lively, living, walking advertisement for the wheel and its maker.

Nearly all of the women were on familiar terms with the bicycle, and the next move was to push from booth to booth in search of novel accessories. The names of the makers and machines, tires, saddles, bells, lamps and luggage carriers fell from women's tongues with the same ease and rapidity that Mother Goose's rhymes do from childish lips. To the very few women who are yet outside the Chicago cycle cult and who went to the show on a souvenir hunt, these experts were marvels of cycle lore.

EXACTLY SO.

"The demand for legislation regulating the classification of bicycles by the railroads," remarks the New York "World," editorially, "grows out of what is virtually a public necessity of the large cities. Where railroads refuse to carry bicycles as baggage on full-rate tickets they not only work to deprive city life of one of its greatest pleasures, but themselves of a passenger trade that is capable of almost indefinite extension."

WHAT SHE WROTE AND HE ANSWERED.

After considerable hesitancy, and much tearing up of note paper, she wrote:

"Ene, mene, mine, mo."

Buy me a wheel, my good old beau."

Without a bit of hesitancy, and with a truthfulness which was almost brutal, he wrote back:

"King William was King James's son,

You'll get no wheel, for I've no mon."

And that ended it.

SUCH QUEER THINGS DO HAPPEN.

Things just happen that way. You can't explain why it is that in large cities where they have electric lights and Raines laws that such awfully weird things transpire, nevertheless they do, and they keep right on transpiring, too.

Now no one outside of New York, nor in it for that matter, at any distance from Seventh avenue, would ever have thought when she dismounted from her wheel, carefully balanced it against the curb, and vanished through the doors of a neighboring "family resort," that such a nice, refined-looking machine would become intoxicated; but it did.

The result was when she came out of the "family resort," full of hair-pins, and happiness, she had no sooner mounted and pushed

PROTECTING "COLD SPOTS."

The "cold spots," meaning thereby the surface areas of the rider's anatomy peculiarly susceptible to cold, are principally the nape of the neck and the lower part of the back of the head, the front of the abdomen and the shins. The acute discomfort and the sense of impending disaster which results from the steady play of a current of cold air upon the neck from behind are well-known.

The necessity of keeping the abdomen warmly clad is also generally carried into practice. Curiously enough, few of those who wear cycling costume are conscious of the danger they run by exposing the usually inadequately protected shins to currents of cold air. People who wear stockings, such as Highlanders, golfers and cyclists, should take

NO OTHER DRINK THAN WHISKEY.

MR. JACKSON PARKE (of Chicago)—Will you join me in a drink, Colonel?

COL. CANE-TUCK (of Louisville)—Sorry, sah, but I've quit drinking; but for sociability's sake, I might take a bottle of beer.

the wheel away from the curb, than she found that she had no control over the dissipated machine.

Up the avenue it sped in a series of devious swoops while she waded her gray bloomers and white spats in the air as signals for assistance. At Twenty-sixth street her wheel arose upon its hinder extremity, bucked twice, reared and rolled, depositing the rider in the gutter, whence the gallant policeman rescued her.

The inebriated machine lay helpless and motionless where it had fallen. To the policeman she became emphatic and sonorous in her language, so she was taken to the station house, where she told the sergeant that if he would let her go she would have her bicycle gold-plated as an insurance against inebriety. Notwithstanding her ingenuous offer she was locked up, and at Court next day the possession of a drunk and disorderly wheel cost her a \$10 fine.

the precaution of turning the thick woolen material down over the shins, the better to protect them against loss of heat, though, incidentally, the artificial embellishment of the calves may not be altogether foreign to the manoeuvre.

It is an instance of how things work together for good. It does not, of course, follow because certain areas are peculiarly susceptible to cold that a chill may not be conveyed to the rider's nervous system from other points. Prolonged sitting on a stone, or even on the damp grass, is well known to be a fertile source of disease; and wet, cold feet are also, with reason, credited with paving the way to an early grave for many a rider who boasted he was too tough to get knocked out by a mere cold.

IN THE GLARE OF PUBLICITY.

The wheelwoman is, unfortunately, not yet a private individual. She is public property. No "dark, unfathomed caves" nor "desert air" for her. Her blushing must, under existing conditions, be done in the full light of open day and under fire of many curious and inconsiderate eyes. The time will probably come when things will be different, but it is still in the future.

No matter how insignificant a woman may be, nor how inconspicuous her garb, nor how desirous she is to escape notice, she is sure to attract attention upon the bicycle. Under other circumstances, such as walking, driving or riding, no one would dare to stare at or to criticise her, and this too, no matter how gay her gown nor how demonstrative her demeanor. But cycling seems to make her open to comment of the most open sort. The entire army of pedestrians, cabmen, street car drivers and small boys feel privileged to stare at her and pass remarks.

"Her saddle's too low," she hears a critical car driver say as she speeds past; "Say, missus, hev ye swallowed a ramrod?" inquires an urchin from the vantage ground of the curbstone, while the driver of a big dray hears her conscientious "ting-ting" and observes: "Look out! Good girl!"

Non-cycling women regard her with mingled amazement and amusement. She is public property, open to all kinds of comment and criticism. The only ones who don't join in the general jeering and staring are the other wheelfolk. They, both men and women, skim past with an indifference that is oh, so welcome to the poor wheelwoman, who in her novitiate suffers the slings and arrows of such outrageous fortune at the hands of others.

Her one hope, therefore, is that the time will soon come when she will no longer be a novelty; when all the world will be awheel, and when the pneumatic tire will bind humanity together in a common sympathy greater than any yet known or dreamed of.

THE "BEAUTIFUL" AND THE BICYCLE.

If the would-be poets who perpetrate sonnets about the beautiful snow would only mount a wheel and attempt to ride it the day after a snow storm there would be more suicides and less poetry. Perhaps this would be all for the best. What a shock it would be to the tender susceptibilities of these gentlemen to behold the Dago disciples of Maud Muller heaping up the alleged "beautiful" for their cycling selves to meet disaster upon! Wheelmen have no more use for snow storms than they have for spring and snow poets. When the latter come down from their exalted perches and go to writing sonnets to the bloomer girl, and apostrophes to the racer, the pneumatic and the cycle shows, then, and not until then, will they command the attention and admiration of the wheelman.

SURPASSES THEM ALL.

It was the not irreverent inquiry of a clergyman after he had mastered the art of riding the bicycle: "Why was not man born on wheels?" This is the natural inquiry of everybody who has learned to ride well. There is no other means of travel that gives to the rider the sense of getting there in the same degree.

CYCLER AND SAMARITAN.

A certain wheelman went down the road from Jerusalem to Jericho to break a road record. He fell among thieves, who robbed him and beat him and left him for dead. A good Samaritan, passing by, mounted upon an ass, rather than a wheel, clapped spurs to the animal he rode and galloped away, lest he should be sent to the House of Detention as a witness while the thieves were released on bail.

Moral: The Perceiver is worse than the Thief.

STILL NEW-LEAFY.

"Well, here we are again! Same as last year, suppose, placed your entire surplus in Europe, eh?"

"We have shipped just ten wheels abroad, so far."

"Only ten? Things must look blue to you when compared to '96."

"No; just as bright, the only difference is that I swore off truth-swelling on January 1; that's all."

PRICE OF MISSING FINGERS.

From Paris comes a peculiar story which has been decided in court in favor of the defendant. A cyclist brought his machine to a cycle dealer to have it cleaned. In the absence of the principal, an apprentice offered to attend to it, and while doing so injured his right thumb, which had afterwards to be amputated. His father claimed 15,000 francs from the employer, a demand which, as stated above, was rejected.

DO YOU BELIEVE THIS?

India has a species of gourd—the wallyghian—which, in its green state, is often used by native wheelmen as a temporary substitute for a damaged pneumatic.

JUST SUITED HIM.

That he belonged to the first ten in Chicago's "300" there couldn't be the slightest doubt. The way he wore his soft felt hat on the side of his head, and threw wide back his long frockcoat so the electric lights could bull's-eye on the six-carat stud that reposed on his cross-barred shirt-front, all told the story. He was right in it, and he knew it, this of course having reference solely to his social "in"-ship; as to that same "in"-ship, cyclingly considered, he was only on the threshold. He strolled up to where a home-trainer was staged and opened the ball with:

"I say, there, what is that machine? Eh?"

"That's a home-trainer," replied the attendant.

"Yes? What is the price? Eh?"

"Twenty dollars!"

"Oh, that's cheap, is it not? I saw a wheel over there for a hundred, don't you know! Eh?"

"It's to ride on at home," explained the patient attendant.

"Oh, that's it? Well, I guess I'll take that one. I'll ride half a mile every day before breakfast and won't have to go out. Well, that's great! I hate this bracing morning air and I love wheels, although I don't know how to ride, you know! Send it home to me! I'm just tickled to death over it."

And before the gasping attendant had recovered from the glare of the six-carat and the yapness of the order, the swell had vanished in the murkiness over toward Grace avenue way.

WHEREON SHE IS SEATED.

In the beginning, and in fact until the present day in a less pronounced fashion, the favorite argument of the Grundytes in opposing women riding the bicycle was that it was dangerous and unladylike for women to forsake the side-saddle of conventionality for the less cumbersome pad-saddle of progressive-ness.

Not one Grundyite in a thousand knew how such an outrageous thing as the side-saddle ever came into use by women; perhaps if they had they might have been less certain that it was the only proper form of seat for women. To Anne of Bohemia, eldest daughter of the Emperor of Germany, who married Richard II., of England, must the introduction of the side-saddle be credited. Previous to her appearance, all Englishwomen bestrode their horses in manly fashion; but, on account of a deformity this German bride was forced to use a side-saddle, and the custom became general.

All which goes to prove that the pad-saddle, not the side-saddle, as claimed by the Grundytes, was the original woman's saddle. Whether this was true or not your modern wheelwoman cares not at all. She tried the wheel and its saddle, found both to her liking, and Grundyism and precedent worried her but little thereafter.

TO LIVE A LONG LIFE.

Doctor Holmes says that the lamp of man's life has three wicks—brain, blood and breath—and to turn down any one of them makes the other two get out. Breathe pure air, eat considerately and give the mind its quantum of recreation is the Doctor's prescription for a long life. This prescription is best compounded at the drug store of cycling.

FOR THE CREDIT BUREAU.

A Plea Made for Its Support and Extension
by an Able Advocate of Its
Usefulness.

It seems to me, Mr. Editor, that the trade at large does not appreciate the admirable features of the Cycle Board of Trade's Credit Bureau, for if the trade did appreciate this money-saving feature of the Board, the Bureau would be more widely patronized than it is, and would be broadened and extended to its fullest possible extent. To come to the point, and to prove that this department of the cycle trade's national organization is a much-needed one, the cycle and sundry makers of this country must learn to avoid sales, and this means the complete overthrow of the underlying principle upon which the cycle business seems to be conducted, and brings me to the only fundamental basis upon which a credit bureau may be safely successful, and that is the obligation on the part of every member to refuse goods to all those who upon inquiry are shown to be unworthy of credit.

Then comes with it the second proposition, which is to secure credit to deserving agents and others. No power on earth can increase the sales of cycles or sundries in any community beyond the wants of that community, and if we refuse to sell them to the unworthy, the avenues of trade as well as profit will be opened to the deserving agent by a law of results that requires no argument to defend.

Of course, some will say at once, if we cut off the irresponsible or the incompetent dealer, how shall we dispose of our product? But on this they forget that the wheels and equipment they sell are now virtually articles of necessity and as such will find a purchaser for value whenever they are needed, and they will surely receive the value for which they have labored, if they will stop the channel of unlimited and unwarranted credit to the dealers without responsibility, which now makes it possible for the consumer to procure their products by easy payment or no payment at all, both of which are eventually your loss.

The preservation of the deserving agent and dealer is the destruction of the incompetent and unworthy, who not only defrauds the trade of the value of the goods with which they have supplied him, but by his incompetency, his utter lack of business ability, robs the better man of his profits and prevents him from the natural growth in business to which he is entitled.

The two objects to be attained are so nearly parallel that I feel safe in saying that the accomplishing of one secures the other; and the only sure way to both is by co-operation.

To secure this, as I have already indicated, requires a reversal of what seems to be a basis of action in one department of our trade, but is not impossible.

One of our largest commercial agencies recently made a careful analysis of the causes and extent of failures among business men, which resulted in the publication of the fact that 85 per cent of the men who engage in business fail from some cause, and that 47 per cent of the causes for failures was incompetency, arising from lack of knowledge of the business in which they were engaged, lack of business training, lack of ability to discriminate in the matter of extending credits, and lack of economical common sense.

Add to this that 27 per cent. fail from want of sufficient capital to conduct business, and you have the fact that nearly three-fourths of the names which the trade places upon its books may some time be placed on the loss account for all or part of the amount which they may the owe the trade at the time of their failure.

This large body of cycle dealers are of necessity the means through whom we must market our product, and therefore we are at their mercy to the extent of our ability to acquire definite and positive knowledge of their responsibility, and it often occurs to me that we exercise less care and discrimination in the selection of the factors for the distribution of our product than we do in the much less important one of the transportation of our product, where even a slight difference in responsibility and security will weigh in favor of the best.

If in the natural course of cycle trading the buyer should come to the seller just as the borrower always comes to the lender, I could see the possibility of arranging a plan of credit upon an individual basis; but as we in the wheel trade reverse the natural order, and seek the debtor, we naturally extend credit as a means of securing business for ourselves rather than grant credit as a favor to the debtor, and therefore are blinded as to the real facts by our eagerness to secure a customer.

With this condition of business to meet it can need no argument on my part, Mr. Editor, to show that collective knowledge, based upon actual experience, is the only safeguard, and this leads to co-operation. If we can cooperate, then to do so within the lines of this association is the natural method. The National Board of Trade of Cycle Manufacturers needs to gain life by its work, or it must die its natural death.

How to do the work is only a secondary consideration, but I am free to say that a plan for successful co-operation will rapidly follow the trade's desire for it, and the proper understanding of this credit question cannot fail to create a growing demand for the Credit Bureau of the Board of Trade.

E. O. S.

"MADE IN GERMANY."

Permission has been asked of the Berlin authorities to place two hundred and fifty tricycles on hire on certain places in various parts of the German capital, for which privilege, if given for fifteen years, an annual payment of \$7,500 being offered by the petitioners. The charges for hiring these tricycles would be five pennings (one cent) per ten minutes during the day, and twice that amount at night.

TAKING OUT AN INNER TUBE.

In removing the inner tube of a pneumatic care should be taken not to damage it by pulling it too hard. If the tube sticks the tire should be kneaded to loosen the tube from the outer cover. It may even be necessary to remove the tire from the rim to do this.

TO THE KANGAROOS.

The value of the cycles and cycle parts imported into New Zealand during the three months ending with September 30 last was \$71,300.

WHEELS AND WINGS.

Wherein They Are Both Close Akin When
Weight Carrying Comes Into the
Question.

Following the theory first exploited by A. H. Overman in an interview published in THE WHEEL several months ago, in relation to the distribution of weight in bicycle construction being similar in comparison to the wings of a bird, the Overman Wheel Co. have issued a circular on the subject, in which they say in part:

Bicycles are made to go. Anything which interferes in the slightest degree with their going qualities must be rejected.

Many lessons in the A B C of mechanics are taught in nature.

If a goose were required to carry two pounds of weight to London she might readily undertake the work provided the weight was centrally located; but she would find it utterly impossible to carry two ounces of weight attached to the tips of her wings.

The same principle applies to the distribution of weight in bicycle construction. The wheels are the wings of the bicycle, their axles are the pinion joints, and their rims, the feather tips. The rims and tires travel farther, faster, and at a greater mechanical disadvantage than any other part of the bicycle; they should, therefore, be of the lightest possible construction consistent with strength. Wood rims and single tube tires make fast and easy-going bicycles.

It is probably true that five pounds of weight can be carried on the frame easier than five ounces can be carried in the tires and rims.

The most sensitive location for weight on a bicycle is at the periphery of the wheels. This is but the A B C of mechanics, and must be taken into account.

Even though a tire were punctured once in 500 miles, it would still be far better to have it run easily and rapidly through the 500 miles than to load it down with weight to prevent this puncture, and thus make it logy and heavy throughout the entire distance.

Heavy fly wheels are used in machinery, which, with a high momentum, act advantageously as balance wheels.

No such condition exists in bicycle riding. The momentum is far too low. The balance wheel is a tedious load to start, and is only useful to compensate for the inequalities of the application of power, and only useful for this owing to its great weight and high velocity.

In bicycle riding we are, if you please, continually starting the wheels, but the constant friction of their tires on the road prevents any perceptible gain from high momentum, as in the case of the balance wheel. There is, therefore, no gain but only loss from heavy rims and tires.

While the frame of a bicycle moves forward 71-3 feet on 28 inch wheels, each ounce of weight in the tires moves in a cycloid path 91-3 feet, or more than 25 per cent. farther than the frame. This work is all done by direct application of power from the leg.

Hence the great necessity for keeping the weight which is to be moved through the greater distance, as light as is possible.

The majority of wheelwomen are not young.

NEW YORK.

BOSTON.

WE ARE THE TALK

OF CHICAGO.

Fowler Cycle Mfg. Co., Chicago.

PROVIDENCE.

LONDON.

EMANATIONS FROM UNCLE EPH.

Dah ain't no heahahftah in dis hyar bysickling, chile; de prisant am etahnal.

Yo' termorrah's ride am tol'ble safe ef yo' rides terday ez ef yo wan't er gwine ter hab none.

Hit am er ma'v'lis t'ing how brazen-lak some o' we uns kin look er good reserloooshin in de face w'ile we's smashin' ob hit all ter findahs.

De rider w'at nebah takes care ob his own bysickle am de man am makes de mos' rema'ks about de condishun ob his neighbah's wheel.

Some folks goes froug cyclin on de principle ut dey's de on'y ones w'at's got any rights on dah road er any right to 'xpec' fa' treatment.

Ef some o' dese hyar racin' men was ez scrup'lis ob dah amooorism ez dey is moutfy er-talkin' about hit, dey'd hab mo' ter talk er bout—"n dey'd do less talkin'."

"Taint'n allus dem ez hab de mos' in cyclin' dat manages ter hol' on to hit de longes'. De cullud old-timer don' git bald nigh ez quick ez de white ones docs."

MERELY A PASSING EPISODE.

The "Human Balloon," who was resplendent in a cycle suit all-wool-and-three-yards wide, stood in the stand posing, and distributing catalogues, in the midst of which labors he was approached by a gent from the Stock Yards who opened up this way:

"Say, Jumbo, be you a rider?"

"Yep," replied the fat man.

"Wot d'yer ride?"

"A wheel, o' course."

"Has yer gut it with yer?"

"Not here."

"I'd give a quarter to see yer get on."

"Ah, g'way!" And the fat man became angry.

"I'll bet a half," yelled the Stock Yards gent, who was a red-hot sport when he had the telling of it, "thet yer blow the air into yer tires, fer there's no one that has a pump strong enough to fill 'em full enough to keep from bursting when you are on the wheel. I'd give seventy-five cents to see yer fall off, and then I'd give yer a dollar for the wheel. You're prunes, sure!"

Then he made his escape easily, as the Human Balloon is not good at sprinting.

ACCORDING TO THEIR LIGHTS.

Four of them went into the Auditorium to wash the soot out of their throats. After the usual preliminaries, consisting chiefly of "What'll yer have?" by all hands, a call for menus was in order to answer a "Whatcher-got?" inquiry:

"Let me see a programme?" said the racer.

"Where's your catalogue?" queried the manufacturer.

"Got a price-list?" was the way the buyer put it.

"I'll take a rate card," declared the editor. Then silence, close study and finally a half-muttered order to the attentive waiter by one of the party, followed by a chorus of "That'll do for me," from the remainder of the party.

And then the important show function of "having something" had been fairly started.

The day may not be so very far off when the world will see as many cycles upon water as it now sees upon land.

SIXTEEN TO ONE IN A CYCLE.

London, Jan. 16.—What do you think of this? It is the invention (?) of a gentleman who runs the Bennett-Scorcher Bessemer Steel Cycle Co., of St. Albans, who sell what is probably one of the lowest grade machines in England. Here are a few of his claims for the monstrosity:

"This startling invention is just such an improvement to the present cycles as the present cycles are an improvement over the old bone-shaker, or pneumatic tires are an improvement on the old solid ones. This is a cycle on rollers, with the earth as a plane. A cycle geared to 150 inches is propelled as easily as an ordinary cycle geared to 60 inches; one-third only of the power is required. A mile a minute may be accomplished with this cycle. This is practically a frictionless machine, all wheels and centres as a watch, nothing binding anywhere; chainless, whereas one set of ball-bearings were used to revolve this wheel, 17 sets are now in use to do the same work. The heavier the rider the faster he goes. The wheel is full of activity.

"This cycle is so much easier to propel than the other, because the circumference is divided into 16 parts, and is composed of 16 smaller wheels, only one of which at the same time is in contact with the ground, which offers the resistance necessary for propulsion. When the small wheel comes in contact

with the ground the ordinary propelling power obtained from the crank is augmented by the weight of the rider. The weight of the rider is perpendicular to the centre of the small wheel, which is under him. Immediately the toothed wheel is turned ever so little by the larger toothed wheel from the crank, the weight of the rider is lifted off the centre of the small wheel under him; this coupled with the power put forth by the rider onto the pedal causes the smaller wheel under him to, as it were, slip from under him with tremendous velocity (the heavier the rider the greater the velocity) onto the next small wheel.

"It is the same slipping from under your motion that a learner on roller skates feels when the hind wheels of the skate slips forward from under him, his weight goes off the centre and he loses his equilibrium and goes onto the back of his head with great force (the heavier the man the heavier he falls), but in the present instance, with my cycle, the equilibrium is maintained, and the cycle is propelled forward with the energy thus created. If the skater could have only kept his equilibrium, he would have gone forward as fast as his skate traveled, instead of being left behind on the floor.

"This slipping movement occurs 16 times to each revolution of the wheel, and a machine geared up, say to 150 inches, or 5 times, causes 80 of these small wheels to gain impetus in this way for one revolution of the crank, which will clearly demonstrate the vast speed to be obtained from this cycle. Its

value for hill climbing is obvious. Instead of having to turn a large wheel, fresh impetus is gained at each sixteenth part of the revolution, making the wheel climb a hill with great ease."

Of course the idea is practically an impossible cycle, as instead of acquiring speed it simply annihilates it, the sixteen fast-running wheels which are fixed to the solid rim of the main driving-wheel merely revolving on their individual axes without communicating any forward motion to the machine. I am told that the inevitable company has been formed to exploit it. The world is not yet barren of fools, you see.

SHORTER CREDITS COMING.

There can be no denying that, for its own good, the cycle trade has in the past been too liberal with its credits. "Hardware" comes close to the mark with this:

"We are pleased to note in the interest of the cycle trade, that an effort is being made to bring this important industry where the common methods and prevailing customs of other business ventures can be adopted by the jobbers in bicycles with some hope of profitable results. Meetings of the wholesale dealers have been held in some of the Western cities, where they have agreed between themselves that credit on bicycles should be limited to "60 days." Should this be persisted in, and adopted generally by the wholesale dealers and manufacturers throughout the country, it would assist in keeping the retail dealer's mind more constantly upon his collections than has prevailed hitherto, resulting in more cash sales being made."

PLENTY LIKE HIM.

"He says he went around the world with his wheel."

"Well, I guess he did."

"But I never knew he was much of a long-distance rider."

"He isn't."

"Then how could he—"

"Oh, he had it packed when he left New York to go aboard the steamship, and it wasn't unpacked until he reached home again. But he tells the truth when he says he went around the world with it. He wouldn't lie about a little thing like that."

LIKED THEM TO BABES.

"Remind me of a lot of babies," snorted the elderly guest at the Auditorium Hotel, as the windows in the neighborhood of the cafe rattled from the explosive cheer of a party of showites putting the finishing touches on a sour-mash fresco.

"How so?" said the man along side of him, who wanted to give him a chance to complete his story.

"Don't do a thing but yell and drink and never sleep. That's just what babies do."

IS THIS NOT SO?

If women can be convinced that wheelmen are sincere in declaring that they have found by experience that the "rational dress" uncovered a multitude of deficiencies in the female structure which, in skirts, they suspected of containing the potentialities of perfect symmetry and unattenuated loveliness—why, in that case the trousered sisterhood are doomed. For those who are quickest to adopt the new habit are least of all fitted to show off well in it.

HERE IS A HOLD-FAST.

Here is the Star bicycle vise, made by the Hollands Manufacturing Company, Erie, Pa. No repairer, or workman in a cycle factory, will need be told that this vise is one of those famous "long-felt want" fillers. Not only can

the tube or frame, by means of this vise, be held in any desired position, but the change from one position to another is easily accomplished, while at no time can the tubing be crushed or marred in any way. The vise will hold tubing $\frac{3}{8}$, $\frac{1}{2}$, 1, $1\frac{1}{4}$ and $1\frac{1}{2}$ inches in diameter. It is sold with or without the bracket, the bracket not being sent unless ordered.

NEEDS NO BRACKET.

An interesting feature of the '97 Hitchcock lamp is that it requires no bracket. Each lamp is supplied with two sets of clamps, on the head and fork, with which it is attached to the wheel by the mere turning of a screw. The clamps are so constructed that by means of a knuckle-joint the lamp can be tilted in any position. Another feature is a reversible oil-tank, which allows the rider to use the lamp on the fork and either side of the wheel, and by means of the tank being reversible the wick-raiser can always be placed on the outside. The lens has been improved in quality and is so arranged that it can be easily removed and cleaned. Attention has been directed to an improved system of draft, on which idea the body of the lamp is constructed. The company explain the lamp's construction as regards draft as follows:

By means of an outer and inner cylinder we take our draft in at the top of the lamp, bring it down to the top of the oil-tank, where it

meets another draft which comes in over the top of the oil-tank. These two drafts meet at the bottom of the flame and by means of our burner, which is particularly constructed for our lamp, the draft is forced onto the flame so that it is spread out, square topped, and by means of this forced draft, we get an extra amount of oxygen which makes the flame clear and bright.

As unwise and as dangerous as scorching is many riders still seem bent on doing it.

AN INSTANTANEOUS THREAD-CUTTER.

Some one has said that "to the writing of books there is no end;" a suitable paraphrase thereof, in cycle construction, would be "to the cutting of threads there is no end." That this may be rapidly and accurately accomplished the Geometric Drill Company, New Haven, Conn., have come forward with a machine designed for threading spokes, axles, small screws, bolts, and the dozen and one other parts of a bicycle which demand thread cutting. The cut, herewith, shows the machine.

It has a capacity of cutting threads from 3-16 inch diameter down to and including No. 17 wire gauge. The manufacturers also fit the machine with suitable equipment for other classes of thread cutting, ranging in size up to and including 3-inch diameter. The machine is fitted with the company's patent self-opening and adjustable screw cutting die head. The machine is also equipped with an

improved pattern of automatic oil pump, which insures a sufficient flow of oil at all times. The vise for gripping and holding the work while being threaded is operated by a hand lever so arranged that the operator of the machine can, by a slight downward pressure of the left hand, close the vise and at the same time carry the slide forward, bringing the work into contact with the threading dies. The thread is cut almost instantly and the dies spring open automatically, releasing the thread. The slide is then drawn back by the operator and at the same time a slight upward movement is given to the hand lever, which opens the holding jaws and allows the work to drop out. The slide is connected by a very simple mechanism with a die head, and so arranged that as the slide is brought back the threading dies are closed automatically. The right hand of the operator being free to feed the machine, very rapid manipulation is possible. The machine can be furnished with an iron column, as shown in the engraving, or for mounting upon a bench, as preferred.

BEATING AROUND THE BUSH.

Referring to cycle clubs for women, a contemporary asks: "Are women clubable?" Not with impunity in this country; they are not. Even the common law, which permitted correction by husbands with a switch not larger than the finger, frowned on employing a club for correctional purposes.

PUTS THEM IN THE HOLE.

Who has not heard of the difficulty of fitting a square peg in a round hole? Yet how many repairers and workmen attempt this very same thing every time they are called upon to grip round tubing with a square-

jawed vise. To obviate this, the Lewis Tool Company, of 44 Barclay street, New York, have brought out the Active vise shown herewith. This vise is made especially for holding cycle frames and thin tubing of all kinds without danger of crushing or marring. As shown in cut, the jaws, which are wood-faced, can be revolved to any desired position when gripping crank is loosened; as there is a hard wood plate between back jaw and face of body, the friction is sufficient to hold work firmly in position when slight pressure of screw is applied. There are adjustable spiral springs in body of vise that hold the jaws back against the wood plate when they are loosened from work, preventing the jaws from revolving too easily and adding to the friction between the jaws and the body. These vises are sold to be mounted on bench or with adjustable post. The holes in the wood faces can be bored to any size ordered.

WILL ABSORB VIBRATION.

Another spring seat post that has just been placed on the market is illustrated below, the invention of Jos. N. Smith of Detroit. It is a practical arrangement with a roller bearing, intended to impart comfort to the rider and at the same time is handsomely and well made. The relative position of the seat post brings

the greatest pressure on the back part of the post, and recognizing this fact a strong steel roller is placed at this point. The claim for the post is that there is no friction, vibration or squeak. It is owned and manufactured by Jos. N. Smith & Co., Detroit, Mich.

WHERE NEWS IS PLENTIFUL.

Toledo, O., Jan. 26.—If anyone has any doubts as to Japan's rapid strides in civilization and appreciation of the world's progress, he need only be told that the royal family of that land has ordered two Toledo-made wheels, to have such ideas dispelled. Joseph L. Yost has received an order for a special Falcon, which will be ridden by the Mikado, and within two days of that order the Lozier Company was ordered to build a Cleveland wheel for the crown prince. It goes without saying that these two wheels will be the very finest that have ever left this town of wheels, so far as elegance of mountings goes.

There is good reason for thinking that Alex. McDonald has been recalled from Australia by cable. Recent reports from the Antipodes are to the effect that McDonald has greatly disappointed his American friends and backers, and that his work, instead of improving, has been growing steadily worse for some time. It will be remembered that his work in this country was always against time, and that he made some extraordinary records, so very extraordinary, that many people are still wondering how they were made. When Mr. France made up his mind to send McDonald to Australia with a Viking mount, it was expected that he would make the people on the other side sit up in amazement, but he has done nothing of the sort.

A. J. Rummel, of the A. J. Rummel Arms Company, of this city, is arranging to put out a new wheel, to be known as the Rummel Diamond. Mr. Rummel is well known as a general agent, but up to the present time he has kept out of any of the many manufacturing opportunities that have been thrown in his path. He expects to make a high-grade wheel that will retail for \$75.

These are busy days at the Yost Manufacturing Company's plant. At present a full force is working ten hours a day, but before this week is over the number will be increased to 350. The present product a day is from 100 to 125 finished wheels. A shipment of 75 wheels will soon be shipped to Belgium. The Yost Company send their bicycles direct to Holland, Switzerland, Italy, Germany and Russia.

On Thursday last, the Viking people received an order from Adelaide, Australia, for fifty of their wheels. Fred A. Peters writes: "Had I arrived in this country six months earlier, I could have secured orders for 3,000 for this year's trade."

The new '97 Viking model for ladies is just out. This wheel is particularly attractive, the lines being widely different from last season. The frame is closer to the ground, giving far more room for the rider. A new feature is an aluminum chain guard. Other points are a round fork crown, the two-piece crank axle mentioned recently in THE WHEEL, and the flush joints. Nearly all the foreign orders are fitted with brakes.

IN LESS TIME THAN THAT.

Sarcey, the great French writer, says that in twenty years a man who can not ride a bicycle will be looked upon as a curiosity equally as great as the man who has never ridden in a railroad train.

TROUBLE IN THE HAREM.

"Your Highness!" exclaimed the Grand Vizier, as he rushed into the royal presence and flung himself at his sovereign's feet.

"Arise," was the gracious response. "You needn't prostrate yourself."

"I can't help it. This is a case of nervous prostration. Zobeide—"

"Yes—the queen of the harem—"

"Is on a rampage. She is looking for trouble with a searchlight and a Gatling gun, Your Majesty. She says that unless she is treated with more consideration she'll make Your Majesty's brow a candidate for a toupe and turn the palace into a discordant crimson wilderness."

"What's it all about?"

"That last costume you sent her from the milliner's."

"Why, it has been in style these hundreds of years. Everybody knows what a Turkish lady ought to wear. There can't be any trouble."

"Yes. She says the bloomers are all right. But what she wants is the diamond frame wheel that goes with them."

MORGAN & WRIGHT TIRES ARE GOOD TIRES

MORGAN & WRIGHT
CHICAGO

HEELING THE SALVATIONISTS.

"Did you hear about the new orders which have just been given the members of the Salvation Army Cycle Corps?"

"No. What were they?"

"All riders are to place only their heels on the pedals when riding."

"Go 'way! What was such a fool order as that ever given for, I'd like to know?"

"So they would be sure to save their soles, of course."

HIS TIME IS COMING.

Again the horse is indebted to the bicycle. A pneumatic collar has been invented for him, both wales of which are made like flattened tires and provided with a valve for inflating purposes. To view the gentle, charitable and polite truck driver road-hogging with a tire pump in one of his back-pockets, and a repair outfit in the other pocket will be worth going a long way to see.

If names went for anything, which they do not, the cyclamen would be the floral emblem of the cyclamen; but it isn't.

"BICYCLESTOPS" ILLEGAL.

A new word has been coined in connection with cycling in Philadelphia. It is "Bicycle-stop." A "bicyclestop" is the sort of stop a cyclist makes when he does not want to stop at all, but is compelled to, as, for example, at a railroad crossing, when a train is approaching. Instead of dismounting many riders circle around and keep in the saddle until they can continue on their way. This is what a Philadelphia lawyer terms a "bicyclestop," and which, according to several judges, is illegal. This fact was brought out on Monday in a decision handed down by Judge Mitchell, of the Supreme Court. The case in point was that of Marion Robertson against the Pennsylvania Railroad, and duties of bicycle riders in crossing railroad tracks are plainly set forth.

On October 21, 1893, James A. B. Robertson, while riding a bicycle, was struck and killed by a train of the Pennsylvania Railroad Company at Morrisville. His widow, Marion Robertson, brought suit on behalf of herself and children to recover damages against the railroad company in Common Pleas Court No. 2. When the case came on for trial President Judge Pennypacker entered a non-suit on the ground of contributory negligence on the part of the deceased. An appeal was taken to the Supreme Court, which has affirmed the decision of Judge Pennypacker.

Judge Mitchell says:

"The facts in regard to the deceased's negligence are not disputed. He was riding a bicycle, and when he came to defendant's road, which at that point had four tracks, a freight train was passing, for which he had to wait. He did not dismount, but made what the appellant calls a 'bicyclist's stop,' by circling on his wheel round and round at a distance of from five to ten yards from the tracks, and when the freight train had passed he started across without dismounting and was struck by a train coming in the opposite direction on another track.

"The real contention of the appellant is embodied in the proposition that the circling round and round constituted a legal as well as a 'bicyclist's stop.' No such proposition can be entertained for a moment. The law requires a full stop, not only for the sake of time and opportunity for observation, but to secure undivided attention, and the substantial and not merely perfunctory performance of the duty to look and listen.

"Considering the ease of dismounting and the control of the rider over his instrument, a bicyclist must, under all ordinary circumstances, be treated as subject to the same rules as a pedestrian.

"We do not say there may not be cases of accidents by broken gearing, or steep grade or other casualty which will require a modification of the application of such rule, but these cases will be exceptional and must be decided on their own facts when they arise.

"The general rule to be applied requires that a bicyclist must dismount, or at least bring his wheel to such a stop as will enable him to look up and down the track and listen in the manner required of a pedestrian."

DEAR LITTLE THINGS.

English juveniles vary the monotony of spitting in the faces of passing wheelmen by throwing handfuls of sand in the eyes of trustful riders.

DISGRACED HIS NAME.

Prompt action on the part of the newly organized Cycle Board of Trade of Long Island has resulted in James Egan, a former Brooklyn cycle dealer, being sent to jail for 25 days, and the discontinuation of a questionable business. Egan and his partner, H. T. England, kept a cycle store at 1130 Bedford avenue, last summer. They advertised to sell any high grade wheel for less than list price. This advertisement was injuring the trade of the credited representatives of the large manufacturers, and some steps had to be made to stop it. A deposit of \$25 was paid by a representative of the trade of Brooklyn for the delivery of a wheel in ten days. Egan gave a receipt for the money, and in a few days he and his partner left for Europe. About a month ago, Egan returned to Brooklyn. The Board of Trade took immediate action, which resulted in the arrest and conviction.

AFTER FOREIGN TRADE.

Without much hullabaloo the Warman-Schub Cycle House, of Chicago, have quietly gone into a systematic attempt to create foreign trade for their goods. They have established a London branch at 10 Manor Road, with a warehouse at 19 South Side, Clapham Commons. E. L. Warman, a brother of J. L. Warman, one of the principals of the home house, is manager. The entire European trade will be handled from this London branch.

The house expects good business will find its way to them through former customers of J. I. Warman, who, previous to his residence in America, was an important factor in English trade.

IN THE LAND OF LITTLE COST.

Anent the strike in the Dunlop factory for an advance in the operatives' wages, it is said that the number of hands employed is 1,250, making the profit for each hand \$5,000 a year. The male hands, who are skilled workmen, want an increase of \$1 on a weekly wage of \$5.75, and the women a fifty-cent increase on \$1.50, \$2 and \$2.50 a week. The men are determined and are singing that old Docker's song of "Rickety, Rackety Crew." They have a cry in "A shilling out of the £200 that we earn," which is winning the sympathy of their fellow workmen all over England, it is said.

WHEN THEY DISAGREE.

Some idea of what an important part lawsuits play in tire manufacture may be had by the record of the Dunlop Company up to date, which is about as follows: 56 decisions have been granted against infringers, 11 injunctions have been obtained, 17 verdicts are yet pending, and 70 actions entered into are yet awaiting trial. A total of one kind or another of exactly one gross of decisions, injunctions and verdicts, with other counties to be heard from.

EVERY DEALER JOINED.

Every dealer and agent in Meriden, Conn., came together last week and formed a local Cycle Board of Trade. Officers were chosen as follows: President, F. D. Smith; Vice-President, H. L. Allen; Secretary, A. W. Poundman; Treasurer, A. D. Meeks. A committee was appointed to arrange for a cycle show.

FIT FOR HEAVY-WEIGHTS.

To meet the demand for tricycles for use by very heavy men weighing from 200 to 300 pounds, the Tinkham Cycle Company have designed the Tinkham "Special" tricycle, herewith shown. The frame of this machine

corresponds to a 28-inch bicycle frame, and it is guaranteed to stand any rider that cares to get on it. A considerable number have already been sold, and may be seen on the streets of New York, Philadelphia, and other cities. Besides this, the Tinkham Cycle Company manufactures five styles of ladies'

men's, and combination tricycles of various sizes. Another novelty in cycle construction produced by The Tinkham Cycle Co., has been called the Tinkham Hansom. It is a neat little vehicle arranged something like a modern cab with room for one passenger behind and the driver in front.

CAUGHT RIGHT ON.

"Did Kolumadder have any trouble learning to ride?"

"Of course not! Ain't he an expert accontant?"

"Certainly he is, but what's that got to do with learning to ride a bicycle, I'd like to know?"

"Made him sure his first trial balance would be successful, didn't it?"

DUNLOPS EVERY SHOW.

In addition to exhibiting at the Chicago and New York shows, the American Dunlop Tire Co. will have displays at the Philadelphia, Boston, Pittsburg, Denver, Detroit, Providence and Reading shows.

GENERAL JOBBING BUSINESS.

At St. Paul, Minn., on January 16, the Windsor Cycle Co. was incorporated with capital stock of \$10,000. The company will manufacture cycles and sundries and conduct a general jobbing business in the Northwest.

AN ENTIRELY DIFFERENT ASPECT.

In the somewhat complicated case of Boyer versus Rosenblatt, one account of which appeared in THE WHEEL, December 4, '96, Messrs. Furth & Singer, attorneys for H. M. Rosenblatt & Co., state that the other, and the real facts of the case were these:

In August last Boyer, who had formerly been employed by H. M. Rosenblatt & Co., came to their factory to be re-employed, bringing with him Mr. Printz of Reading, but the latter was introduced as a customer of the house under the name of Reber. During the visit arrangements were made for the employment of Boyer for the coming season; samples were selected by him, and the entire process of the factory inspected by them. After they left the samples were sent to Boyer, who pretended to be out on the road selling them for H. M. Rosenblatt & Co., instead of which he gave the samples to Printz to manufacture like goods, and Printz used our samples to sell his own goods, with the connivance of Boyer, who not only did not sell for us, but sold for Printz, and upon demand failed to return the samples. Printz was arrested and indicted for conspiracy with Boyer to defraud us out of the samples, and to injure us in the conduct of our business, and that case has not been tried. Boyer was indicted and tried for larceny as bailee of the samples, and the case was dismissed on the ground of no jurisdiction, as it could not be proven that Boyer converted the samples to his own use in the county of Philadelphia.

FRANCE BAWLS FOR MORE BALLS.

French balls are numerous and popular in America during the social season, this whether they be terpsichorean affairs or only table-dehotishly bibulous ones. It may come to pass that American balls may become not only fashionable, but a necessity, in the French Cycle trade, which is threatened with a lack of those small but indispensable adjuncts to the smooth running machines of the present day. The price has just risen, according to a leading article in a French trade paper, from 75 cents per gross to \$1 per gross. It is further calculated that 30,000,000 balls will be wanted in France this year, all of which should prove gratifying news to American ball-makers.

MOTOR VEHICLES AT THE BOSTON SHOW.

Several leading manufacturers of motor carriages have decided to make exhibitions at the coming cycle show of the Boston Cycle Board of Trade. The spaces for the display of their being run during certain hours of the day and evening. The demands for spaces have been so great, and continue to be received in such large numbers, that it has been decided to turn the gallery into exhibition spaces.

A UNION ACQUISITION.

Plans are being arranged by the Union Cycle Mfg. Co., whereby their interests in Greater New York and the Orange, N. J., riding district will be looked after in a more thorough manner than ever before. The company has secured the services of L. H. Porter, formerly of Porter & Gilmour, who will open as headquarters a store on Warren street. Mr. Porter is well-known in the trade and is popular among the clubmen of New York and vicinity.

TRADE CHANGES.

CALIFORNIA.

Lodi.—Lillie Bros. will establish a bicycle factory. Los Angeles.—D. R. Collins discontinues. San Diego.—Hannahs & Cobb. Attached \$324. Sanata Anita.—J. A. Hankey, a bicycle dealer on North Main street, went into voluntary insolvency. His liabilities are \$2,000 and his assets \$1,000.

CONNECTICUT.

Ansonia.—The Ansonia Cycle Co. sold out to Roy Holbrook.

Bridgport.—The Liberty Cycle Co. filed articles of association. Subscribers, John Holder, Harry G. Shepard, Wm. F. Wilson, Willard I. Allen, Geo. F. Carroll. Capital stock, \$100,000.

Bridgport.—Franklin Sammis, clothing and bicycles. Assigned.

Hartford.—The Hartford Cycle Co. has erected a new building containing 2,440 square feet for enameling and another containing 1,419 feet for pickling.

Middletown.—Worcester Cycle Mfg. Co. The plant operating at Worcester will be removed to Middletown, and the entire manufacturing business of the Company will be done at this place.

Putnam.—J. E. Taylor & Co. succeeded by J. E. Taylor Corporation.

DISTRICT OF COLUMBIA.

Washington.—The Pope Mfg. Co. are erecting new three-story building on Fourteenth street, N. W. J. Hart Britain is the local Columbia agent.

FLORIDA.

Daytona.—F. C. Crandall Co. Sold bicycle business to J. S. Herbert.

ILLINOIS.

Chicago.—Auburn Cycle Co. Judgment \$186 appealed.

Chicago.—Beckley-Palstan Co. has been incorporated for \$20,000 by W. L. Beckley, G. D. Beckley and J. C. Palstan. The Company will manufacture and sell material and goods used in the bicycle trade and in the manufacture of bicycles.

INDIANA.

Plymouth.—Plymouth Cycle Co.'s plant sold by the receiver to the mortgages, Bass & McDonald, of Fort Wayne, for \$15,000.

IOWA.

Des Moines.—Kenyon-Cooper Cycle Co. Sued \$33.

KANSAS.

Medicine Lodge.—Chase & Coan succeeded by the Chase Hardware Co.

MAINE.

Augusta.—W. C. Miller. Assigned.

Bangor.—E. M. Estabrook is fitting up a salesroom for ladies' bicycles on the second floor of his place of business at 22 Harlow street.

West Paris.—The Bicycle Wood Rim Co. enlarging their business, and expect to turn out 800 rims a day within a month.

MARYLAND.

Baltimore.—J. H. Strohmeyer and R. L. Gill were appointed receivers for the firm of Ives & McClenn, upon the filing of a bond for \$3,000.

MASSACHUSETTS.

Westfield.—The bicycle factory of the Lozier Co. is almost completed, and machinery will soon be installed.

MICHIGAN.

White Cloud.—James Cycle Co. Chattel mortgage, \$4,000.

Detroit.—The Anderson Cycle Co. have opened their new store at 233 Woodward avenue. Their principal makes are the Anderson, St. Clair, Wayne, Northwest, Wayne, Jr., and the Anderson tandems.

MINNESOTA.

Minneapolis.—A. A. Hanson Cycle Co. succeeded by Wirtensohn Bros.

St. Paul.—Windsor Cycle Co. Incorporators: A. Lyon, H. C. Peterson, A. A. Moe, John Schneider, Jr., and N. F. Shabert; capital, \$10,000.

MISSOURI.

St. Louis.—The E. C. Meacham Arms Co. will handle the wheels of the Marion Cycle Co., in addition to other well-known makes.

St. Louis.—Canfield & Sachtleben. Additional suit vs. them \$1,581.

NEBRASKA.

Gering.—Burton & Morse succeeded by Burton & Pattison.

NEW JERSEY.

Newark.—Belvedere Cycle Co. incorporated by Arthur S. Baldwin and Theron Baldwin, New York; Josiah Sexton, E. Orange, N. J.; to manufacture and sell bicycles, vehicles and accessories. Capital, \$150,000.

Trenton.—Tomlinson & Stahl, manufacturers, succeeded by H. E. Stahl.

Westfield.—Scriven & Hand. Dissolved. W. P. Scriven continues.

NEW YORK.

Binghamton.—T. M. Symonds, bicycles, succeeded by T. M. Symonds & Co.

Brooklyn.—Haney Mfg. Co., cyclometers, chattel mortgage \$1,260.

Buffalo.—Wm. D. Knowles, manufacturer, chattel mortgage \$200.

Buffalo.—Johnson Cycle Works damaged by fire; loss \$4,000.

Elmira.—Francis Hurth. Five chattel mortgages filed, covering all stock, fixtures, etc.

New York.—Crescent Die & Tool Works (Wm. Bonner). Judgment \$16.50. Execution issues.

New York.—Hodgman Rubber Co. Two additional judgments, aggregating \$20,141.13.

New York.—G. S. Bothwell, 66 W. 125th street. Chattel mortgage, \$700.

New York.—Lurie & Ross, bill of sale for \$2,195.

Rochester.—The Punnett Cycle Co. has filed its annual report, as follows: Capital stock, \$20,000; debts, \$8,000; assets, \$28,000.

White Plains.—L. E. Holden will reopen the old cycle business of the Empire Cycle Co. He solicits correspondence from manufacturers.

NORTH CAROLINA.

Wilmington.—Thos. H. Wright & Co. Claims returned worthless.

NORTH DAKOTA.

Hoople.—M. A. Hewitt, hardware and furniture, sold out stock of furniture, and will hereafter devote his attention to the sale of shelf hardware, stoves, bicycles, etc.

OHIO.

Bucyrus.—T. M. Drolesbaugh. Confessed judgment \$61.25.

Cincinnati.—Frank T. Miles Co. Assets appraised at \$3,284.65, exclusive of doubtful and worthless accounts.

Geneva.—Madison Wheel Factory. Directors, C. S. Southwick, R. K. Ritscher, N. D. Bailey, P. A. Johnson, J. J. Davett, F. S. Ingersoll and Thos. Foley.

Toledo.—The Harris Toy Co. will manufacture the Perry pneumatic saddle on a large scale.

Toledo.—Toledo Cycle Supply Co. H. H. Nelson, a director, has retired.

\$75.00 AND \$50.00

BELLIS CYCLE COMPANY,
INDIANAPOLIS, IND.

Kindly mention The Wheel.

Take a piece of iron pipe, draw an air-tight rubber tube inside, bend the pipe into circular form and join it. You then have a tire. Inflate it. The pneumatic principle is there, but you would not know it, because iron pipe is not the right material to use. You want something elastic.

Take a piece of mosquito netting, make a tube of it and use it in place of the iron pipe. When inflated, the netting will burst. This is not right either. It is elastic, but not strong enough.

These are two extremes. Somewhere between them is to be found just what is right for the purpose. You will be sure to get it in the

Flexifort
(TRADE MARK) INNER TUBE TIRE

AND

CONQUEROR
HOSE PIPE TIRE

These tires are the production of brains, skill and long experience.

Our Inner Tubes for all makes of tires are recognized as the very best in the market by all who use them.

MANUFACTURED BY

- A.—Air Tube.
- B.—Circular Woven Fabric.
- C.—Outer Rubber Covering.
- D.—Valve Stem.
- E.—Laced Opening.
- F.—Showing Circular Feature of Tubular Seamless Fabric.

MECHANICAL FABRIC CO., Providence, R. I.

THE ORIGINAL MANUFACTURERS of PNEUMATIC TIRES in the UNITED STATES.

Write us for Catalogues, Samples and Prices.

Kindly mention The Wheel.

OHIO.

Toledo.—The headquarters of the Valentine bicycle concern will be removed from the Berlin Block to the old Dauntless factory. The plant will be 40x100 feet, occupying two stories.

Cleveland.—A new factory is going up on the Nickel-Plate West End. Bicycle appliances will be made.
Newark.—Messrs. F. Owens, J. Mills, F. Harrington and W. G. Taafel have formed a company here for the manufacture of bicycles and doing bicycle repair work. The building at 12 and 14 West Church street has been leased and the erection of an additional building in the rear has commenced.

PENNSYLVANIA.

Eric.—W. W. Hunt. In sheriff's hands.
Girard.—W. E. Kratzke, bicycles, reported conveyed real estate.

Harrisburg.—H. W. Techmeyer, bicycles and sewing machines. Sold out to Geo. W. Sparks, of Steelton, Pa.

Philadelphia.—Weise, Bowen & Derr. Dissolved, Weise and Bowen continuing, Derr starting separately.

Beaver Falls.—The directors of the Morado Bicycle Co. met this afternoon and decided to put the works which have been idle for several weeks in full operation this week.

Providence.—Kendall & Pownall, bicycle parts, succeeded by W. H. Pownall.

VERMONT.

Brattleboro.—T. J. Hildreth has begun the manufacture of bicycle handle-bars at his carriage factory on Elm street.

WISCONSIN.

Milton.—G. E. Osborne has purchased the bicycle business of Babcock & Son.

Antigo.—A. B. Millard will handle Monarch and Defiance bicycles for the season of 1897.

Fond du Lac.—P. E. Pope. Assigned to J. E. Reeves.

Janesville.—E. S. Babcock sold out to G. E. Osborn.

CANUCKS AND CYCLE CARRYING.

The Grand Trunk and Canadian Pacific roads have put in force a new regulation regarding bicycles and fares. In future wheelmen will be charged a tariff for the transportation of their wheels, varying according to distance, in proportion to the rate paid for the passenger's ticket. Where the cost of the ticket exceeds \$90 the fee for carrying the wheel will be 6 per cent of the ticket rate. For less distances the rate will be larger, no fare being less than 25 cents. Bicycles will be carried on passenger trains only when passengers accompany them.

PENNSYLVANIA MAKES A PLAY.

Pennsylvania has come to the conclusion that it is time that a representative of that State should be honored with one of the higher offices in the League, and accordingly Vice-Consul T. J. Keenan, Jr., of Pittsburg, is being talked of as a candidate for the First Vice-Presidency. A letter has been sent to each of the thirty delegates by Chief Consul Boyle, asking him to vote for five men, who are to form a committee to decide between the two candidates for the Presidency, to the end that the best interests of Pennsylvania shall be served in the decision.

TO CHECK BICYCLE STEALING.

While New Jersey and Michigan are fighting for the free transportation of bicycles by railroad companies, Massachusetts is working diligently for the passage of a bill that will cause bicycle thieves to repent at leisure in jail. The bill is extremely simple and to the point. It reads:

"Whoever steals a bicycle of the value of ten dollars or more shall be imprisoned in the State Prison not less than one year nor more than five years."

CAN BE READ FRONT AND BACK.

A notable change, and one that should meet with popular favor, has been made in the Record cyclometer, manufactured by H. R. Hamilton & Co., Chicago. The instrument is now made so that it may be reversed on its bracket without detaching it from the wheel, permitting the rider to examine the ten thousand miles permanent record scored on the back.

The makers claim that by putting the ten thousand mile dial, which the rider does not

often look at, on the back of the instrument, it gives them the whole face to use for the hundred mile trip record, which the rider wishes to read from the saddle. As it is only necessary to note the position of the hands, the cyclometer is easily read as far as it can be seen.

The makers have also greatly improved the appearance of their cyclometer, and state that it is one of the most handsome, as well as accurate and durable cyclometers on the market.

WANT TRIAL ORDERS.

As an inducement to secure trial orders from repairmen and those who build cycles in limited quantities, the Anderson Cycle & Mfg. Co., Detroit, are making some attractive offers. The firm carry a complete line of about everything necessary in the construction of a bicycle. A new 40-page catalogue of parts and sundries will be sent to any address.

THE FIREBULL.

This lamp is strictly a danger signal, for use either in front or rear of wheel. Made by the Cycle Danger Signal Co., N. Y.

THREE M'S IN FUTURE.

The Sheridan Cycle Company, of Newark, O., has been reorganized on broader lines, and will hereafter be known as the Morse Metallic Manufacturing Company.

DOING AWAY WITH RAGS.

Rags are all right in their way, but as a tire-cleaner they are not to be compared with the Perfect Cleaner, the handy and inexpensive little device being marketed by Butler & Co., Aqueduct Building, Rochester, N. Y. The Butler article was made specially for the purpose, is small enough to be carried in the tool bag or pocket and is meant for all time. It fits the tire perfectly, and being so conveniently carried, it is always at hand for use before the muddy wheel is trundled into the hall or room. It is made of sprung brass, nickle-plated and lined with rubber, and in an emergency may be used as a brake.

Another of Butler & Co.'s productions is their adjustable holder, designed for use in halls, stores, churches, etc. It is made of nickled copper and is secured to the wall. It will hold the wheel at any angle, and when not in use may be turned out of the way. The holder, too, is splendid value for the money.

TRIGWELL HUBS.

Trigwell Bros., No. 32 Market street, Chicago, are making a specialty of hubs, and are turning out an extra fine article in that line. The hub is made of best material throughout, with dust-proof and ball-retaining washers. The projecting ends of cones are hexagon-shaped, a point that will be appreciated.

As will be seen, the cups and cones depart from the conventional, but the brothers Trigwell warrant them to be not only unbreakable, but assert that they form the lightest running bearing that can be constructed. They say that the reception accorded their product has been not only encouraging but gratifying.

PUT THERE TO STAY.

A returning cycle tourist, who has just arrived from a long wheel trip through Japan, proudly exhibits on one arm the L. A. W. emblem, and on the other arm his club's badge, both exhibits being excellent examples of the artistic Japanese tattooer. This might be considered as an excellent example of one man's indelible devotion to cycling institutions.

IN A HAY-SEED HOUSE.

Nice progressive people, the citizens of West Virginia! A bill to limit the speed of all cycling within the State of West Virginia to a maximum of 10 miles per hour, and compelling all riders of the bicycle to dismount when meeting a horse or being overtaken by one, has passed its second reading in the State Senate, and will shortly become a law.

CLEANING OIL CANS.

In oil cans which have been long used, a gummy deposit is likely to accumulate, impairing the oiler's usefulness. This can readily be done away with by filling the can with turpentine or kerosene. If such cleaning is not done the best of lubricating oil will be spoiled when placed in contact with the deposit noted.

THOSE DEAR, DEAR CHILDREN.

The noisy and boisterous boy may be very dear to his mother, and well beloved by all the members of his family, but the public is not of his family, a fact he should remember when he sallies forth on a wheel.

BACKING UP HIS OPINIONS.

They were on a tandem, and he'd been telling her what a rider he was. Finally she said: "You think pretty well of yourself, don't you?"

But he wasn't bluffed, not he, for he came back with:

"If I Dear me, yes! I think I'm not far from an angel."

He was close enough to whisper this.

KIND OF CRUSTY IN HIS ANSWERS.

"What makes you wear those green-goggles when you are riding?"

"To protect my eyes, you fool. You don't think I wear them to prevent my getting saddle-sore, do you?"

NAMEPLATES

We are now prepared to take contracts for Nameplates for 1897.

Sketches submitted of new designs, or prices quoted on the plate you are now using.

HUMBER AND THE CYCLE SHOW.

Humber & Co., America, Limited, announce that during the progress of the New York Cycle Show at the Grand Central Palace they will hold an exhibit of their 1897 models at their uptown salesroom, Forty-second street and Fifth avenue, where Mr. A. O. McGarrett, manager of their New England sales department, with Mr. H. A. Woodward and Mr. E. W. Clement will be in attendance.

At their downtown depot, 318 Broadway, will also be held an exhibit, and in addition to their 1897 models will be shown five makes of 1897 English Cycles and one 1897 Acatene (French Chainless) purchased by Mr. Elliott Burris, at the Stanley and National Shows in December.

Mr. Chas. K. Alley, New York manager for Humber & Co., will be in charge at 318 Broadway and will be assisted by Mr. Harry Hall, Mr. George Clough and Mr. C. M. Dally, Jr.

Reputable and select agents desirous of securing the representation of Humber's would do well to call and examine their 1897 models during the week of the Show at either of the above addresses and interview the gentlemen who represent Humber Quality.

AND
CYCLING TRADE REVIEW

Copyright by F. P. PRAL Co.

VOL. XVIII, No. 25.

NEW YORK AND CHICAGO, FEBRUARY 5, 1897.

WHOLE NO. 407.

ONLY PARTLY ORGANIZED.

The Completion of the Retailers' National Association to Be Effected During the New York Show.

After several years of intermittent and sporadic talk, the retail cycle dealers of the country, or rather a fair representation, thereof, "got together" during the Chicago show, in response to the call of the St. Louis Cycle Board of Trade, a most progressive organization which has handled itself in a manner that commends it to other similar bodies.

At the Chicago meeting a good start toward the formation of a National Association was made, but the projectors wisely decided to leave the final moulding and rounding out until a meeting during the New York show, when the Eastern trade might more strongly voice itself.

The first meeting was held at the Del Prado Hotel on Thursday afternoon, with R. L. Hill, of St. Louis, in the chair and John McCargo, of St. Louis, as secretary.

After general discussion it was determined to endeavor to form a National Association, and a committee, consisting of Messrs. Roach, of San Antonio, Tex.; Hannan, of Denver; Canfield, of St. Louis; Anderson, Chicago; Schumann, Memphis, and Crowther, of Pittsburg, was appointed to draft a constitution and by-laws and report at an evening session.

The attractions of the Coliseum proved too much for a majority of the dealers, and consequently there were not more than forty or fifty persons in attendance at the night meeting, which convened at 10.30 p. m.

The Committee on Constitution and By-Laws reported, and a constitution was formally adopted, and a temporary organization effected by the election of these temporary officers:

George E. Hannan, Denver, president; George Collister, Cleveland, O., first vice-president; W. E. Roach, San Antonio, Tex., second vice-president; H. T. Hearsey, Indianapolis, Ind., treasurer; John McCargo, St. Louis, Mo., secretary.

Inasmuch as a majority of the dealers present were from the West, it was determined that this organization should be only a temporary one for the purpose of proceeding to work immediately.

At a meeting of the temporary officers, held on Friday evening, it was wisely resolved to issue a call to the dealers for a more general meeting at the New York show, and all dealers throughout the country will find it to their advantage to be present at

this gathering, which will probably be held on Thursday during the week of the New York show.

Headquarters will be at the New Manhattan Hotel, and the local Boards of Trade throughout the country, as well as those dealers who have been prominent in organized effort in the past, will be communicated with personally in an endeavor to secure as large an attendance of representatives as possible.

It is the intention to have the entire country thoroughly represented, and in order to secure this desirable result the plan of government as outlined will be arranged for by the appointment of a National Executive Committee or Board of Control. The country will be divided into six districts, as follows: New England, Eastern, Central, Southern, Western and Pacific. Three representatives will be elected from each district by the members thereof, these eighteen representatives comprising the National Executive Committee or governing body.

In the election of officers the same geographical distribution will be observed, the idea being to give each section adequate and proper representation.

The objects of the organization are mutual co-operation and assistance, looking toward the maintenance of a legitimate trade as against the curbstone broker, auction house, department store and irresponsible dealer, together with a co-operation with local boards.

So far, the large manufacturers, whose control of branch stores renders their co-operation desirable, have expressed themselves in sympathy with the movement, and the meeting in New York should result in the launching of an organization capable of effecting much good.

WILL MAKE WAR ON ALL INFRINGERS.

If you are using a cycloidal sprocket not of Black manufacture, be on your guard.

The Black Mfg. Co., Erie, Pa., who have made the cycloidal sprocket a feature of their Tribune bicycles, have won their case and will shortly start on the warpath. After three years of fighting, they have just been notified that the Court of Appeals at Washington, the court of last resort, has affirmed their patent on the sprocket.

While the struggle has been going on the cycloidal has come into considerable use, but now that the law has decided their quarrel just and title clear, the Black people propose proceeding against all who have infringed their rights. The proceedings will be instituted at once.

IVER JOHNSON, NOW.

English Capitalists Said to Have an Option on the Big Plant in Fitchburg.

London, Jan. 22.—In addition to the very persistent rumor of the sale to a syndicate of the European rights of the Morgan & Wright tire, I am now in a position to assert, that the capital of the company which has actually been formed will amount to \$7,500,000. Further, I can say that George Lacy Hillier, whose name cannot be an entirely unknown quantity in America, is even now on his way across in connection with this deal.

I have also been told, with some appearance of circumstantiality, that an English syndicate has bought or retained an option to buy the business of the Iver Johnson Co., of Fitchburg, Mass., and that in all probability Hillier has crossed with a mission to investigate matters there also. I am told that English accountants and experts have crossed to make a survey and valuation of the Fitchburg business.

Morgan & Wright reaffirm their emphatic denial of a foreign deal of any kind.

When seen regarding the report affecting his concern, E. H. Wilcox, of the Iver Johnson Co., smiled, said he knew all about it, but that he was not in a position to answer questions or give information.

If Mr. Hillier is in the country he has succeeded admirably in keeping his light under a bushel.

NEW JERSEY'S FIGHT BEGINS.

At Trenton on Wednesday of this week, a hearing was given to the New Jersey Division's bicycle baggage bill. After hearing Chief Consul Kireker, I. B. Potter and others the hearing was adjourned, despite the protests of the wheelmen, to Feb. 17, at the request of the Erie Railroad's attorney. Chief Consul Kireker's argument was lengthy and logical. His telling points were that railroad companies transport without charge 150 pounds of baggage for each passenger, and should do the same for wheelmen; that the service is charged for in fixing the rate for carrying the passenger; that bicycles are baggage, and have been so held in Missouri, while the Legislatures of New York, Rhode Island and Ohio have declared that bicycles are personal baggage.

The railroads will be given a hearing on the date above mentioned.

WILL TRY AGAIN.

An Effort to Re-establish the Sale of an English Wheel Here—Dunlop's 160 Law Suits.

London, Jan. 19.—The Rudge-Whitworth Extension in the form of foreign subsidiary companies, reported a week since, is confirmed by a circular which the company has issued to its shareholders on the subject. Among other things it states that an American company, after the style of the Humber, will be formed. The veterans of the American world will recall that the Rudge bicycle once practically controlled the American market.

It is likely that the law courts here will soon be choked with tire litigations, the Dunlop Company having issued no less than 160 writs, most of them for infringements of the various patents held by the company, but many for alleged deviation from the tires on which licenses have been granted. The Palmer vs. Dunlop case which, as I have before reported, is a matter in which the former concern claim that the latter are infringing the patent for a fabric first adopted in the Palmer tire, is expected to open shortly. All the directors of the Dunlop Company have been subpoenaed as witnesses by the plaintiffs.

The next flotation of any importance here is that of the Triumph Cycle Company, of Coventry, which has been built up by the energy and ability of two anglicised Germans, Messrs. Schulte and Bettiman, inside of five years. The present capital of the company is £50,000, and last year it paid a 20 per cent dividend. Its £1 stock stands quoted at £1 15s. as I write. The new capital will probably be £200,000, as the works have been largely extended since that dividend was earned.

Another flotation to be expected is the Cycle Components Tube Company, which Mr. Hooley bought from the Cycle Components Manufacturing Co. some months ago for £50,000, and will now seek to float for his customary quarter million, by throwing in some other business, such as another tube or fittings company.

The cycling press was circularized last week by Mr. A. W. Gamage, who is by this time amongst you, on the question of trusts in the cycle trade. He asserts that he was approached by American firms with the view to forming a trust in certain cycling accessories, but refused, and no doubt his visit to your shows has been actuated by the desire to buy for himself such American accessories as he desires to push here. Gamage is no puny buyer, so that any firm successful in securing his custom may rest assured that he won't buy lamps in half-grosses or wrenches by the dozen.

As the Duryea motor has not been, it is alleged, treated fairly by the "Automotor," a weekly periodical, published by Henry Sturmeier, its editor says, in the interests of the motor car trade—in the interests of the British Motor Syndicate, Mr. McKim asserts—Mr. McKim, who is the English representative of the Duryea Company, has commenced the publication of a new organ, entitled the "Automotor and Horseless Vehicle Journal,"

with the avowed intention of "showing up" the Lawson game. Mr. McKim asserts that he has challenged Mr. Lawson to produce a four-wheeled motor of equal horse power to race the Duryea for a stake of £5,000, but Mr. Lawson has declined, although offering £2,000 towards a prize fund for a Motor Car Derby.

The first of the big provincial shows—Dublin—opened on Saturday, the Earl of Mayo performing the initial ceremony, while, later on, the Lord Lieutenant of Ireland with Countess Cadogan were interested visitors, and ultimately purchasers. It is the third of its series, and eclipses both the previous efforts in size and success. It is held in the buildings of the Royal Dublin Society, under whose patronage the world-famous Dublin Horse Show is held each autumn at Ball Bridge.

Birmingham Show opens on Thursday next, but, in view of the slackness in the retail trade at present, as compared with last year, the trade is rather inclined to run quietly at the remainder.

COMING OF THE SIMPSON.

The Much-Exploited Chain Finally Taken Up by an American House—May be Made Here.

For such a well exploited article, the Simpson lever chain, which has disturbed England for more than a year, has been slow in reaching America. Several sample chains have been seen, but it has remained for the Weaver Cycle Material Company, No. 101 Reade street, this city, to undertake its sale and advancement. Messrs. Oviatt & Harness, representing the Simpson Engineering Works, are en route to America to perfect the arrangements with the Weaver people, who have in view the manufacture of the chain.

The chain will be in evidence at the New York Show, and is well worth close inspection. Its action is unlike any other chain in use, and is not generally understood. It will mystify the unmechanical.

Contemporaneous with this announcement, the Weaver Cycle Material Company make public that they have become a \$100,000-fully-paid-in concern. Incorporation papers have been applied for and are expected this week. The directors will be: Thomas F. Kennedy, J. A. Weaver, Sr., P. S. Tolman, J. A. Weaver, Jr., all of New York, and Mr. King, New Jersey. The officers will be: Thomas F. Kennedy, president and general manager; J. A. Weaver, Sr., treasurer; F. S. Tolman, secretary; J. A. Weaver, Jr., vice-president and general superintendent.

TALKED ABOUT GOOD ROADS.

Wine and wit flowed with the more matter-of-fact subject of good roads at the first annual dinner of the Good Roads Association, at the Clarendon Hotel, Brooklyn, on Thursday night of last week. Numerous prominent Brooklynites were present, while Albert H. Angell, the president of the association, presided. Mayor Wurster, in the course of his speech, said the work of improving Glenmore avenue and the return cycle path was largely due to the work of the Good Roads Association and to Alderman Clark. Other speakers were Park Commissioner Dettmer, Commissioner Willis, Norman S. Dike and Bridge Trustee James A. Sperry.

WANT HIGH GRADES ONLY.

The Progressive South Africans Will Have Nothing Else—Two Alert Yankees Blazing the Way.

Johannesburg, Dec. 27, 1896.—Among fields hitherto open to American bicycle builders none have been better than South Africa, a fact not unknown to some of them. It is now two years since "Tony" Affhauser, of North Adams, Mass., astonished the natives of Africa by riding a 21-pound wheel from Cape Town to Johannesburg, a distance of 1,014 miles. He was the first to undertake this ride, and to convince Colonials, Free Staters and Transvaalers of the merits of lighter wheels and wood rims and other up-to-date improvements. Yet not to his opportunities did the manufacturer pay heed, nor attempt to supply this market.

It is now about eighteen months since G. H. Clapp, of Boston, undertook to interest American manufacturers of all classes of goods in this African market, to which, to his surprise, he also found an indifferent ear. Although some were willing enough to sell him goods, they themselves did not care to come to the market, which they might have had for the taking.

One year ago it was impossible to buy here a bicycle of English manufacture of less weight than 28 or 30 pounds, unless it was a racer, and no amount of correspondence would persuade manufacturers with unlimited capital and an overproduction to come here, save through some export or commission firm, who did naught but find the customers who would have found the manufacturer without their aid.

This state of affairs has led to the formation of a company, the idea of which was to supply a natural demand for the best grades of American cycles. As might have been expected the two Yankee pioneers at once became the most interested in the movement, and thus it was that the Yankee Wheel Company, of South Africa, Ltd., with a capital of £20,000 was started. With two such men as Affhauser and Clapp holding fully one-half of the paid-up capital of £20,000, an illustration of what the company will do can be better surmised than foretold.

Already the invasion of Johannesburg has been so marked that the English houses have awakened to the demands that they have not supplied, and they are being pushed by their new rivals. The Yankee Company, through Mr. Affhauser, has established live agencies in remote parts, and Mr. Clapp is looking well to the organization of the principal cities, where the best repair shops and workmen will appeal to riders generally. This network of agencies throughout Africa means much hard work, and an overcoming of natural prejudice, for which the promoters deserve credit. The manufacturers at home have, in this connection, shown themselves short-sighted. It has come to the position where it is needless for the American builder to now come here unless he is invited, for already the country is well represented, and the market is well supplied. Only high-grade wheels will sell, because the people will have the best; and than this population, there is none who better appreciate the best in bicycles.

Johannesburg is shortly to have a new cement track, with good straights and correct bankings, but the present track, with its sucked-orange shape, is very fast.

FACTS IN THE CASE.

ON the eve of the National Assembly meet, THE WHEEL considers it a duty, even though to some it may have the earmarks of overdoing the thing, to say a final word on Potter and his creed. He is by no means a sure winner, otherwise why the bungling activity of his political bureau; otherwise why the splurge and wriggle and ink-deluge of his army of ready writers? There is a big chance to defeat him, a big chance to snuff out his selfish use of the League. Elliott's honesty and earnestness and enthusiasm are permeating factors. The work of THE WHEEL is surely making itself felt. Here and there, in the city and in the backwoods, vote-owners are looking askant at Potter, are less sure of him day by day, are more suspicious, are more fearful, are less willing to trust the League to him and to his promised coterie. Should he win he will win only by political methods, not by merit, not by character, not by service—only by promise, by purchase. His support will be paid for, his victory will be bought.

But, say you, what is the specific objection, the cognate and definite cause of THE WHEEL'S opposition? What sort of Ethiopian is really in the wood pile and, by the by, is not Potter only the greater through opposition, since to win opposition one must have some ringing and positive qualities? Unfortunately it is that opposition to Potter cannot be made specific, cannot be coined in a sen-

tence or covered in a breath. It is general. For instance, he poses as a martyr for League work when, day by day, he is advancing his personal, professional and political fortunes; while purporting to be an enthusiast for roads, for wheeling and for the League, he is simply a non-confessing soldier of fortune, who has obtained from its treasuries more money than any other one man in the organization. He wants the League, the whole League—he wants it for Potter. If he gets it—and he has a fair chance—he will show you what he will do with it. It will be the L. A. Potter, and he will put it to many uses. They will be multifarious, ingenious and unsuspected, and they cannot be catalogued here—only it will not be the same League; the chief enthusiast-for-revenue-only will have come into his own and the League will be a spoils-to-the-victor organization from Portland to Portland. It will no longer be an association of gentlemen interested in one cause and bound together for mutual interest. It will be a for-personal-profit-only organization with an admirable example of that creed at its head.

The opposition is not specific, certainly not, otherwise defeat were easy. Our hero is a chameleon, a promise-breaker, a disrupter, a hounder-of-enemies, churlish-minded, himself the whole thing, brooking no opposition, hurling defiance occasionally, but usually flattering, cajoling, coaxing, many-sided, evanescent to all, to friends and enemies alike.

The statement so often annexed to Potter—his loyalty to his friends—what rot it is! Of genuine and lasting loyalty there is nothing—only payment for service rendered and payment only so long as unquestioning service is given. He has no loyalty—he makes friends only to use them, then to drop them. Dunn, Luscomb, Burdett and all the rest of them, they are all against him—all, that is to say, except two—the one George R. Bidwell (and Bidwell is behind Potter for the present only and only for political self-interest), the other one, Willison, whom Potter dragged through fire and mire last year—of whom Potter said—well, perhaps you know the story, and if it was told of you one year you would not support that man the next year, nor would you ever support him, never at any price.

A big man, Potter? No; only a man of certain attainments in a certain place—a specialist in a suitable situation. There are in many wards, in many cities in America, droves of men who, along the lines of politics, political methods, manipulation, running the machine, easy bosses, smooth men, and that kind of thing, would so far outclass Potter—well, there is simply no comparison. No, Potter is not big; but Potter is the one particular man in the League who has made the League a business. Its possibilities (to

him) are his breakfast, his dinner, his supper. He is at the League (for Potter) all the time. Other League men pay their dues, believe in the organization, and are enthusiastic League workers, and they would go great lengths and make unrequited sacrifices to help cycling, to help the League. But they do not expect revenue for their performance. They have other interests; they gain their livelihood otherwise. The League with them is a sentiment. They pay their money and Potter takes his choice. And that is how Potter comes to have stature. In brief, he is a continuous L. A. W. performer, a vaudevillian of some order.

In conclusion, THE WHEEL reiterates its belief in Elliott's candidacy, and re-expresses its hope for his success. He is openly honest. When he goes out of League office, many things will be the better for his having been in office. When he goes out, something of the League will still be left. The same is not certain of the other candidate. The one plank in his platform is well concealed self-advancement—advancement, progress and Potter, at all cost and any cost.

And if the purple should be put upon him, what a spectacle then for the cloud of verdant assistant-wire-pullers and button-pressers who now attend him—how the truth will dawn upon them when first their Richard sneers—"I am not in the giving vein to-day."

EARLY SHOWS OR NONE.

THE WHEEL'S wired editorial bird's-eye view of the Chicago Show, as regards profits, probabilities and future shows, hit off the situation exactly, though but three show days had been counted. From Tuesday until Saturday the opinion voiced in THE WHEEL gained in strength, increased a hundredfold and finally became general.

It is now a certainty that the questions of "no show" at all, or one show only in November, will be most carefully discussed at the Board of Trade meeting held in New York next week, and decisive action will undoubtedly be taken. All that is wanted is a leader; all that is wanted is a strong few to put their names on paper, or put their best feet forward and take a vote on the readjustment of the show business.

A big majority of the trade would undoubtedly vote for no shows at all, but a very much bigger majority will vote for no shows in January and February. The trade have seen the folly of such late dates, the inanity of such an expense, the foolishness of holding up the agency trade until that time, and probably never again will shows be held as late as they were this year.

A very large part of the trade, however, will not relinquish their belief in shows, belief in their good, and in their stimulating

effects on the bicycle business. Besides, there is a general disinclination to make any radical change; that is, to go from late shows to no show at all, and next season will probably witness a compromise in favor of one National show to be held early in November. A large number of bicycle makers will support this position, and they will be reinforced and strengthened by the parts, material and specialty men, all of whom are anxious for a November show.

The impulse behind the no-show movement is based entirely on the results of the Chicago exhibition. The show practically created no business at all. Here and there agents were seen and signed, but practically the show was a non-business affair. The public were amused; the exhibitors were bored. Not only were they themselves fatigued, but their time was wasted and their pocketbooks were depleted. It was a general, all-around loss.

THE WHEEL is not in favor of passing a "no show" resolution at the meeting to be held in New York next week. THE WHEEL believes that shows may be of some advantage if held at the right time. It also believes that the trade can afford to indulge in them if the trade has done good business; and if 1897 is a prosperous season—as THE WHEEL believes it will be—a large number of manufacturers will be in favor of a show in November next. The trade should come out, to a man, and sign in favor of no more shows in January and February, leaving the question of November show to be taken up after the approaching season has become a matter of history.

WHY THIS DODGING?

"DENY everything" is now the battle cry of Mr. Potter's "Campaign Committee."

In an "official denial" they descend to surprisingly barefaced lying, and they know it. They do not deny that they raised a campaign fund, but they juggle the truth so lightly as to assert that they have no candidate in training for the L. A. W. presidency or for the official refereeship. It is true that they have very wisely called off their candidate for chairman of the Racing Board, but that they accepted the defeat of their anti-racing crusade in good faith is proven untrue by private utterances of many of the delegates, Mr. Potter's man Friday, Mr. Belding, among them. Only last week the gentleman almost frothed at the mouth when the subject was discussed, and launched into a rabid anti-racing tirade. The committee denies that they desire to affect the Bulletin contract, although Mr. Potter himself so told a WHEEL representative, and a petition to that effect was in circulation, and in another paragraph they themselves admit it. They deny that they are

after Secretary Bassett's scalp, or that they desire National headquarters located in New York, although it has been common talk in the Vanderbilt Building for months. They say that they have a "warm regard" for the "genial secretary," and then refer to him as "manager-in-chief of his neighbor and official boss."

The whole document suggests that the committeemen are in dire straits and have lost all sense of self-respect. THE WHEEL has driven them into a corner, and for men with a cocksure thing, they are squirming as few men have squirmed before.

If Mr. Potter is defeated, he will have his ridiculous committee to thank for their assistance to that end.

STAND BY THE SABBATH.

WHEN America is fifty or one hundred years older, cycle racing on the Sabbath may be looked upon as proper. We are a progressive people; changes of custom are not impossible, and it may be that it will come about.

Certain Western States, or rather certain people in certain Western States, are eager to bring it about at once. They will invoke the League of American Wheelmen to set its stamp of approval on their efforts, and failing, there is a well-defined movement to secede from the organization and attempt the accomplishment in view, a movement the depth of which is not appreciated in the East. We have small faith that the League will render the service prayed for. We have less faith in the success of any secessionist movement which has Sunday racing for its corner-stone.

Regardless of one's personal views, the League cannot afford to give more than respectful ear to those who will speak in favor of the motion; it seems out of all question that it should or will grant its approval in any manner whatsoever. To do so would endanger the peace and welfare of the organization; would bring down the righteous wrath of press and pulpit, and alienate the moral support and goodwill of the better classes, whose support and goodwill is most desirable, and will do more damage than can be repaired in a decade. The time is not ripe; the conditions are not auspicious; the motion should be crushed promptly and unmistakably. No bolt that may result can do much harm. Secession from the League has been tried time and again, and in each and every instance to no purpose. All have flashed in the pan. A like fate awaits the movement now in view.

TRADE CATCH WAS SMALL.

THE non-business character of the Chicago Show, as indicated in the first few days, was not changed throughout the week. The big men had the pleasure of meeting their

agents and of entertaining them, and there was a deal of interchange of good-fellowship among men who had never met before. In many cases old scores were wiped out and grievances were settled, very often through the medium of "hospitality." But throughout the week agents were not present in large numbers. It may have been the cold, or it may have been the lateness of the show. But, whatever it was, they were not there. The show goes down in cycling history as the top-notch function of its kind; away and beyond any other cycle show ever held from the standpoint of the spectacular. From a business standpoint it was the poorest show ever held.

It is time to let down the bar. The L. A. W. will be made none the worse by the admission of professionals to membership. The professional of to-day is not the professional of ten or even five years ago. Most of them were, until recently, members of the organization, and few have changed their skins since crossing the imaginary dividing line. If they were good enough then, they are good enough now. We hope the National Assembly will vote to admit them, and more than that, hope, if there be again in the legislative body upstairs who will make the discussion of the subject an occasion for shameless prattle of their caste or social distinction, that there will arise some champion who will mercilessly drive the prattlers from the floor.

"State rights" is an alluring term, but delegates to the National Assembly who favor transferring the control of racing to the Division Racing Boards had best look well before they leap. With thirty or forty different bodies empowered to suspend, transfer, professionalize and otherwise punish and discipline racing men, chaos seems not far removed. It is an unwise and dangerous experiment, and no man who has the best interests of cycling at heart can wish the attempt well. We cannot believe that it will attain. Racing is an affair of the nation, not of the State.

Discussing the merits of their candidates by rival supporters of Messrs. Elliott and Potter, has grown to be very much like a dog fight in a flower garden—nothing is settled but the flowers.

The man who gets to the front in racing seldom stays there long enough to wipe his forehead and look around.

Hope is a pleasant acquaintance for a racer, but is an unsafe trainer, a fair starter and a good pace-maker.

The great work of many people in cycling is to improve the methods of other people in cycling.

MR. POTTER!

Now doth the busy Isaac B
Employ each shining hour,
To try and gather voters in
To sustain his waning power.

Mr. Potter wants THE WHEEL to "let up."

For Mr. Potter's sake THE WHEEL wishes it might do so. We know that he has aspirations—that there is a political future carved out for him. We know that his cycling career is but a stepping-stone to greater things, and we dislike to do aught that will make the stone the slipperier, for when the time comes we expect to support Potter in attaining these greater things. In the field of stern politics, nearly all are tarred with the same brush and the support will come easy and graceful. In his present capacity, that of candidate for the L. A. W. presidency, we are unalterably opposed to him and refuse to "let up" or be turned from our course.

We know Mr. Potter—know him long and well, and not wholly unkindly. We know his virtues and his faults—some of them. In anger no thunder cloud is blacker; none more threatening; none gives out more vicious fire; none growls more ominously, nor bellows more vigorous defiance. In his pleasant moments or moments of regret, no sun is warmer, none mellow or more mellowing.

But Mr. Potter is a man of moods. Sunshine chases the clouds. Clouds chase the sunshine, and constantly. This fitfulness, this fretfulness, makes him what he is.

He has played the part of Caesar, but he has played Brutus the oftener.

In the present campaign he is again a Brutus. He is playing false to one to whom his word was pledged, to one who had all cause to believe him a friend and true, Sterling Elliott. But he as easily turned from Luscomb, from Dunn, from Burdett, from Willison. He smote them all. Last year we told Mr. Elliott that Potter would seek to slay him. We knew the man. We know him now. No paper crown, no flowers with which creatures of his own making may strew his path can deceive.

We know the throne upon which he is reared, the New York Division. We know of what it is constructed; we know upon what it rests—appeals to the vanities and weaknesses of human nature. He established himself with the cycling space-writers by appointments to office and with transportation at the Division's expense to a League function. He dropped them when the establishment had been accomplished. He created one hundred empty-honored consular offices where ten had served before. He created a decorative bureau, where all who wished might decorate themselves with so-called "honor badges." He touched all the chords of human vanity, and all responded to his great glorification. It is not to his discredit, but rather is tribute to his cleverness, which none can gainsay, and which has helped make him the hero which he seems to the common people.

To those with whom he has dealt longest and most direct he is no hero, but simply common potters' clay, molded largely by the public prints. His public career is strewn with broken promises, with violations of faith, with intrigues, with subterfuges, with innuendo, with insincerity, with more or less labored "explanations."

To gain his ends, to make out a strong case, he permits nothing to stand in his way.

If he does not entirely forget his promises and professions of friendliness or faith, he either uses or abuses them, adroitly, as a rule. Clever at "unintentionally" dropping a word, or belittling an idea or individual, he cares little whom or what it affects if it serves or appears to serve his purpose. Happy in expression, theatrical in pose, and equally clever at "explanation," an earnest knitting of brows, a kindly hand on the shoulder and a mellowing tone too often serve to placate those whom he has offended, if not grievously wronged. Apparently he knows his strength in this regard and depends upon it. Oppose Mr. Potter and you will feel it. Fall gracefully into his ways, gracefully accept his issues and you are his.

Warm-hearted and generous to those who serve him, he is surrounded by a corps of worshiping servitors, each ready to do his bidding and to believe their king can do no wrong. They are dazzled, but not illuminated by the glamour that surrounds him.

We have basked in the sunshine of his smiles. We have come under the shadow of his clouds. But we have been illuminated. We neither fear nor hate the gentleman. We know his ways. We think we know his place. It is not in the presidential chair of the League of American Wheelmen. We are more loyal to the organization than to the man. Mr. Potter's ways are those of the professional politician—that world meant for statesmen, but alas! filled with those who, to gain their ends, stifle all or nearly all the nobler instincts in the human breast. Mr. Potter has employed and is employing those methods in careering in the L. A. W. He is bringing them to a degree of professional perfection. We see no reason for it. We regret it. We discountenance it. Our opposition to Mr. Potter is deep-rooted because of it. He would fill offices not on a foundation of merit in men, but on a basis of a delivery of votes and by reason of political services rendered. He is a political schemer and plotter, a violator of pledges, a political Brutus.

Men's hearts are not door-mats, the League of American Wheelmen is no stepping-stone and the National Assemblyman who is true to the impulses which nature instilled within him, and to the people whom he represents, will not be deceived by the newspaper halo which hovers over the candidate from New York, and will rebuke him with an adverse ballot. He has ground his pledges of loyalty under foot, has trampled on men's hearts—his very opposition to Mr. Elliott is in that light—and has made the L. A. W. his stepping-stone; he has done this so often that a rebuke is needed and we hope will be administered.

In contrast to Mr. Potter, Sterling Elliott can well afford to stand on the platform: "I am no politician. I desire rather to be known as an honest man, striving to do right." And all who know Mr. Elliott know that it is a fitting platform.

If ever there was an honest, upright, God-fearing man who truly strived to follow the dictates of his conscience, Sterling Elliott is the man. We have never known him to engage in but one despicable act—it was during last year's campaign—and Mr. Potter was a prime factor in the case. R. G. B.

If a "dark horse" should slip into the presidential chair it need cause no surprise. The West claims to be well organized, and has an idea that it can dictate matters.

WHY THEY WERE WORRIED.

If there is anyone in the New York Division in position to enjoy the political goings-on, it is the members of THE WHEEL's staff. They are as spectres to the components of the "inner circles," and their bare presence at a League gathering is sufficient to excite rumors, and to give some of the ringsters connoption fits.

At the annual meeting of the L. A. W. Consulate, two weeks since, this was nicely, if amusingly, illustrated. The Consulate, it must be understood, is officered and dominated largely by Messrs. Belding, Eckert, Frobisher, Pitman, Townsend and others who worship at the throne. Mr. Townsend is the Senior Consul and presiding officer. Why he was ever chosen is a mystery. He is a newcomer and has rendered no conspicuous service to the L. A. W., despite the fact that he is a member of the Michaux Club, a vehement speaker, a leader of cotillions and a general all-around society man, who knows all about "chappies" and "pink teas." As Senior Consul he was simply a "figure-head," which some members of the Consulate decided should be removed. An opposition ticket was reported, and a WHEEL man, who is also a member, but who knew absolutely nothing of "who was who" or "what was what," attended the meeting. The night was very stormy and a slim attendance resulted.

When THE WHEEL man was discovered Mr. Pitman reported the fact to Mr. Townsend, and several whispered confabs occurred in the far corner of the hall. Mr. Townsend then called the meeting to order. He instructed a calling of the roll, then changed his mind and asked all present to rise. While they were standing, Secretary Frobisher counted and stated that there were forty-three members present, seven short of a quorum. The Senior Consul gave voice and announced "no meeting." One member undertook to suggest a short wait, but Mr. Townsend replied that he had already waited twenty minutes, and there being no quorum he could listen to nothing more. He put on his hat and overcoat and departed. Mr. Frobisher, with the books, followed; likewise Messrs. Belding and Eckert. Mr. Pitman remained.

"Well, we blocked your game pretty nicely, didn't we?" he said, gleefully, when he encountered THE WHEEL man. The latter didn't know what he was talking about and said so, but the rugged old veteran insisted that he was "on," whatever that meant.

After the departure of the "worshippers" several indignation meetings were held, and it appeared as if Townsend had not a friend in the hall. Five minutes after he left there were more than enough to form a quorum. Dr. R. Ottolengui, who was Junior Consul until he resigned, was present, and he did not mince matters in pronouncing the administration "dead wood." He asserted that three of the four committees had never held a meeting since they were appointed. Finally a call for a special meeting was signed by a majority of those present. It was considered by the Board of Consuls last week. At this gathering it came out that THE WHEEL's representation was an augury of ill omen for Mr. Potter, a "game" to injure his chances for the L. A. W. presidency. THE WHEEL man's club, a loyal League club for ten years, was at the bottom of the "deep, dark conspiracy!"

Accordingly, and as the Consulate is "absolutely free from politics," the Board of Consuls decided, in order that Mr. Potter's boom be given no room for damage, that the meeting and election be held in March, after the presidential contest will have been decided.

As the call for a special meeting was strictly regular, and stipulated a time—ten days—within which the meeting was to be held, it is a question if the Board is not overstepping the bounds of the constitution, but as few have seen that document little is known of its provisions. It is to be hoped, however, when the Consulate does meet, that a change of some sort will be made. It is needed sadly. Nearly all the present officials were among those who helped wreck the Cyclists' Federation, and prophecies that they will do as badly in the present instance are free and open.

MORE ANTI-POTTER RECORDS.

Boston, Mass., Feb. 2.—The "Boston Sunday Journal," of January 31, published an article in its cycling news criticising the statement sent out by the New York Campaign Committee in behalf of Mr. Potter. It says he was paid a handsome sum by the New York Division for his efforts in behalf of the Liberty Bill, that the book Potter wrote on "The Law of Cycling," originated from Charles E. Pratt, of Boston, the first president of the League; that the \$1,000 paid him by the L. A. W. for writing the volume on "The Gospel of Good Roads," was far too much, and that many Boston wheelmen say that "Good Roads," the magazine he was paid \$5,000 per year to publish was of doubtful value, and reference is also made to the \$5,000 law suit of Potter vs. the L. A. W. over the publishing of the magazine.

The "Journal" says that the so-called "Potter Guide-Board Law" was patterned after the Massachusetts law, and that the "Armstrong Bicycle Baggage Bill," in vogue in New York State, might be greatly improved.

BUT THE DOG WOULDN'T MOVE.

It is understood that Mr. Potter has purchased a commutation ticket good on any train running between New York and Philadelphia. It is also stated that his typewriter has instruction to write not less than twenty-seven letters per week informing the Pennsylvanians that New York's League meet vote is cornered in his office awaiting their "advices." New York had an enlarged idea of itself and imagined that it could wag the whole dog. It has discovered its mistake, and its consequent distress is positively laughable.

IN A STATE OF CHAOS.

Despite their campaign fund, New York's ridiculous "Campaign Committee" is pawing the air. Even on the eve of election—it occurs next week—they scarcely know where they are. A rebuke to the pretentious pretenders is almost as necessary as a rebuke to the professional pledge-breaker whom they are supporting or attempting to support.

POTTER AS A RECORD BREAKER.

If Mr. Potter should be chosen president of the L. A. W. he will break at least one of his records. When the time comes he will go out of office on good terms with the outgoing president—himself. Up to date he has "fallen out" or broken faith with every man who has occupied the executive chair since he became a factor in League politics.

MODELED AFTER MASSACHUSETTS.

Potter Goes to His Rival's State for His Good Roads Bill—Plums that He May Pick.

Be quiet there! The New York Division's press bureau is at work. In a day or two it will begin delivering grist and another paper laurel will bedeck the brow of their chief. Clever man that he is, he has begun his "driving campaign for good roads" on the eve of the L. A. W. election. The bill was introduced at Albany on Tuesday last—not to help his presidential chances—perish the thought!

The bill is practically a counterpart of the one passed by the Massachusetts Division three years ago, but, of course, the "press bureau" will say nothing about that. It would reflect credit on Sterling Elliott. Neither will the bureau say aught of how the bill is calculated to feather the Potter nest. As a Highway Commissioner at \$5,000 per year, a Republican Assemblyman at \$1,500 and an L. A. W. Chief Consul at \$1,650, all expenses paid and with time to dabble in his law practice, it will readily be seen that Mr. Potter's unselfish "cycling enthusiasm" is likely to prove an unusually profitable investment.

Mr. Potter also helped along his campaign last week by attending the annual dinner of the Brooklyn Good Roads Association. He was introduced as "the next president of the L. A. W." He had attended but one other gathering of the organization, and then only to characteristically smirch and knife a friend who had stood by him in an hour of need.

The bill at Albany was introduced by Senator Higbie. It provides for the appointment of a "State Highway Commission," to consist of three members, to be confirmed by the Senate, one of whom shall be a civil engineer. (Mr. Potter is a civil engineer.) They shall serve for three, four and five years respectively, as the Governor shall order. Each commissioner shall receive \$5,000 annual salary, and the commission shall have \$10,000 for office expenses annually.

The commission shall determine upon the best method of constructing roads, and shall advise county, city, town, or village officers of their conclusions. The commission shall hold a public meeting at least once a year in each county of the State, and co-operate with highway officers throughout the State and furnish plans and directions for improving public highways and bridges.

The road construction contemplated by this act being for a substantial and permanent roadway, the State Highway Commission shall cause plans and specifications of such roads or sections of roads to be thus improved to be made either for Telford, Macadam, or good gravel roadway or other suitable construction, taking into consideration climate, soil and materials near by where the road or section is to be built or improved, and the extent and nature of traffic likely to go upon such road, specifying in each section or subdivision the kind of road a wise economy there demands. The improved or permanent highway or roadway of all roads so improved shall not be less than eight nor more than sixteen feet in width.

The commission shall designate what road improvements shall be subject to State aid. A Board of Supervisors, by a majority vote

or upon the receipt of a petition representing two-thirds of the value of property, shall determine whether roads approved by the State Commission shall be improved. Upon the receipt by the State Highway Commission of a board's approval of any road improvement there shall be advertisements for bids.

This proposed law is to take effect immediately, and provides for the levying annually of a State tax of one-tenth of a mill, to be known as a State highway tax. The money thus raised is to pay the State share of the expenses of highway improvement. The tax provided in the bill would raise annually \$436,000.

AN ESSENTIAL POTTERISM.

No galled jade ever winced worse than Mr. Potter since THE WHEEL turned the light on his anti-racing attitude and brought his own utterances to bear on the subject. He is squirming and wriggling in a manner painful to behold, and his "press bureau" is working overtime in order to make the public believe that after the defeat of his anti-racing amendment last year, Mr. Potter believed the matter settled forever and aye. Unfortunately Mr. Potter made an address immediately after the tremendously adverse vote had been announced, in which he publicly predicted the growth and return and eventual triumph of the idea. A convenient failure of memory is an essential Potterism.

WHAT MR. POTTER REALLY DID.

The New York "Campaign Committee" says that Mr. Potter's election means "a driving campaign in behalf of good roads." Measured by what he did in New York during the past year, this means that the driving will be done without horses. In this State he did nothing tangible—his Good Roads Committee spending the enormous sum of \$10. As chairman of the National Committee, we believe he did less. It is stated that he did not have even letter heads printed until six weeks ago. Another weighty reason for his election, according to the committee, is that Albany County, in which the contest will be decided, is Mr. Potter's "native heath."

SHOULD NOT BE REPEATED.

Whatever they may do at Albany it is hoped for the sake of the Empire State that New York's National Assemblymen will not repeat the shameless tactics of their predecessors. The spectacle of a body of men, supposed to represent the brains of the Division, blocking a meeting by leaving the hall that they might wrangle among themselves and then sending to Mr. Potter for instructions, was a sorry if not ludicrous sight, not easily forgotten.

A MUCH PEDDLED OFFICE.

To be a vice-president on the Potter ticket will be in the nature of accepting "leavings." Despite the flamboyant spreadeagleism and cocksurenness of his campaigners, they have been peddling the offices from one end of the country to the other. Conolly, of Illinois, Holm, of Missouri, Collins, Boyle and Keenan, of Pennsylvania, Spencer Williams of Massachusetts, and the Lord only knows who else have had opportunities to refuse it.

The aristocracy of cycling is the Swiss rider—coasting down the Alps makes them men of long descent.

VICTOR BICYCLES

THE STANDARD FOR QUALITY.

Do not miss our exhibit at the
NEW YORK CYCLE SHOW.

WE SHALL OCCUPY SIX FULL SPACES

Near the centre of the building

WITH A FULL LINE OF
1897 VICTOR BICYCLES,

Showing all the fine points of construction that combine to
keep the VICTORS in the lead. Our representa-
tives will be pleased to explain to you why

VICTORS SELL FOR \$100.

And why they cost more to build than any other bicycles.

We shall also exhibit at the Boston Show in
Mechanics' Hall, February 20-27.

BUTLER BANGS BALD.

Tom Butler has picked up the gauntlet flung down by Bald and awakened from the state of dormancy that has seemingly enveloped him since he returned from France. Bald's talk has roused his ire, and, like Cooper, he is now after the Buffalo rider's scalp. The repeated assertions by Bald that he was willing to ride any man in the world for a series of three one-mile heats, paced or unpaced, for \$1,000 or \$5,000, has set Butler's tongue wagging in thorough pugilistic style. He says:

"I have read Bald's challenge and will accept at once. I have the money and think that I can win with comparative ease. I am willing to meet him on any third-of-a-mile track in the world and run the three heats in one day, paced or unpaced.

"In my mind, Bald has done a vast amount of boasting which he cannot back up. Right away a letter goes from me to accept Bald's challenge, and I will begin training soon for the race, as I think he will take me up. I have no preference, and if Bald desires to race me in Jacksonville I am willing. The sooner the dispute over the '96 American championship comes to a definite head the better. It is my hope that I am the first to accept this challenge. When on the circuit last season it did not seem very difficult to win from him when we raced for blood. My experiences abroad have proved valuable to me, and if this match comes off, you can bet your life I will make use of some of the points which came to my notice while I was on the Paris race-tracks."

PRINCE'S PRODIGIOUS PLANS.

John S. Prince has succeeded in organizing a company at Chattanooga, Tenn., for the purpose of constructing a coliseum and he announces that his Southern circuit scheme will now be consummated. The circuit has been arranged to open at Memphis, the dates being as follows: April 2 and 3; Nashville, 5 and 6; Chattanooga, 7 and 8; Atlanta, 9 and 10; Montgomery, 12 and 13, and then around again, two days in each city for seven months, closing the latter part of November.

From sixty to eighty people will follow the circuit from city to city, he asserts, and at each meet in every city purses aggregating \$400 will be put up, making a total of \$40,000 for the season.

SHOCKED THE CHICAGO MANAGERS.

Albert Shock's entry in the Chicago six-days race has been refused. It is alleged that Shock made a proposition to Hale and others who are named as starters in the race to agree to ride in the contest, but at the hour of starting, when the expected crowd assembled, to demand of the management that 50 per cent of the receipts of the race be given to them for riding. This came to the knowledge of the promoters, and the game was promptly nipped in the bud by returning to Mr. Shock his entrance fee and blank.

BANKER WILL SELL WHEELS.

Geo. A. Banker has renounced the race-track. He will remain in Pittsburg and devote himself to business. He has secured the agency for the Humber cycles, and with his brother Arthur will push the sale of those machines in Western Pennsylvania.

CORONER WITH AN EYE TO BUSINESS.

Plans are being arranged at Nashville, Tenn., for the erection of another Coliseum. The track will be six laps to the mile and have an asphalt surface. Coroner J. C. Lambeth is the moving spirit behind the enterprise. The track and building are to be constructed upon his residence site, directly opposite to the Centennial grounds. The idea is to use the residence, which is a large two-story frame, for club-rooms and training quarters for the riders, trainers and patrons of the track. The Coliseum building is to be so constructed as to take in the residence as a portion of it, thereby rendering it convenient and easy of access both to the riders and the public. A large lawn in front, with numerous shade trees, provides an excellent promenade ground and will be a pleasant retreat from the amphitheatre during the hot weather.

PHYSICIANS WILL ATTEND.

An effort will be made by the promoters of the coming Chicago six-days' race to minimize the objectionable features, from a humane point of view, which marked the New York race. The right will be reserved to remove from the track, at any time, a rider who is thought to be unfit to proceed further. Physicians will be constantly in attendance to care for the riders, and, in addition, Dr. C. E. Greenfield and Dr. Paul Bloomer, two eminent practitioners, will make personal examinations of the contestants' vital organs—hearts, lungs, kidneys and livers—before the race and during its progress. These examinations will be of interest to the medical profession, and a number of prominent physicians have signified a desire to assist in them. The exact effects upon the riders in a six-day race will in this way be determined scientifically.

EARNED HIS MONEY.

Stanley Barrows, the Denver man, who claims to have ridden a mile by the aid of a gale of wind in something like a minute, has received \$500 from Gormully & Jeffery Manufacturing Company, offered to the promoters of the race meet at which the fastest mile in competition should be ridden by an amateur. At the meet promoted by Barrows, A. B. Hughes rode the mile in 1 min. 47 4-5 secs. Barrows, fearful that he might lose the cash, succeeded in having Hughes "thrown" into the professional class shortly afterwards, together with several of the pacers. He kept this up, and effectually prevented any one from equaling the record.

IS AN OLD HAND AT THE GAME.

Although C. M. Murphy, the Brooklyn professional, has been an active follower of the race-track for seven years, he has announced his intention of again entering active competition. He proposes to follow the circuit this year and thinks he will occupy a high rung on the ladder at the close of the season.

TAILS TO THE COMET.

Negotiations are being made by the American Waltham Mfg. Co. to secure Sanger, Gardner and Miller, the Chicago indoor rider, to ride the Comet next season.

OWEN HAD HARD LUCK.

As a direct contrast to the recent "frosty" meet at Buffalo, arranged by the managers of the barn-storming foreign riders, over 2,000 spectators attended the Rambler B. C.'s indoor meet at the Arsenal, Buffalo, on Saturday night last.

In addition to the numerous Buffalo riders, several Brooklyn and New York riders were present. The sensation of the night was contributed by the Parkside Wheeling Club, whose champion, Duer, was barred from the five-mile race because his chain broke in his heat. The accident happened outside of the ten-yard limit, so the men were not recalled. Although Owen, of Brooklyn, stopped, thinking the start a false one.

When the final was called a cry was started for the introduction of both Owen and Duer, and it gained in volume until the rafters were shaken with the shouts. No heed was paid to this. An instant after the start without the two men the sound of the Parkside drum and fire corks was heard, and the members of that club proceeded to march out of the Arsenal in a body.

In the final of the mile both Owen and Duer went down in a spill. Hard luck also followed Owen in the final of the two-mile race. In attempting to overhaul Denniston in the finishing spurt his wheel came in contact with the Buffalo rider's, and Owen went down. Owen claimed a foul, but it was not allowed. Denniston afterwards proffered the prize to Owen, but the latter refused it. The final of the five miles resulted in a see-saw for position until the last half, when the New Yorkers, Brown and Henshaw, secured it and held it until the end. Summary:

One Mile Novice.—1, W. Ray; 2, P. L. Hagen; 3, F. Aiple. Time 2:53.

One Mile.—1, W. A. Brown; 2, W. D. Cleland; 3, E. E. Denniston. Time 2:40 2-5.

Two Miles.—1, Denniston; 2, C. P. Henshaw; 3, E. D. Stevens. Time, 5:37.

Five Miles.—1, Brown; 2, Henshaw; 3, Dennison. Time, 14:12 2-5.

One Mile, 2:40 Class.—1, E. C. Haynes; 2, W. M. McHatten; 3, W. G. Webster. Time 2:42 3-5.

PONTECCHI PLUCKED THEM.

Last season Pontecchi, the Italian racer, was accused of crooked riding by some journal or other. Pontecchi, Italian like, waxed exceedingly wrath at this, and brought the writer of the accusation up before the courts. The following astounding sentence has just been passed on that very unfortunate reporter by his judges, or whatever you may call them, viz., seven months' imprisonment and \$150 fine. This kind of thing is very liable to discourage free criticism of Italian racing men by Italian papers.

MORIN VANQUISHED BY BOURRILLON.

At the Veleddrome d'Hiver, Paris, Sunday, January 16, the long-talked-of match between Bourrillon and Morin took place in the presence of 10,000 spectators. In the first heat (1,000 m.) Bourrillon won moderately easy by about a length. In the second series (2,000 m.) Morin was proclaimed the winner by inches only. In the run-off (1,000 m.) Bourrillon again scored, amidst the greatest of applause. The racing all the way through is described as straightforward, and undoubtedly the best man won.

PALMER TIRES

There is not such a great difference in the general appearance of a high-grade bicycle and one of inferior quality. Shape and size are common to both. Enamel and nickel cover a multitude of defects.

A cheaply constructed bicycle may have a first-class saddle, or some other good single part, but a cheap wheel is never fitted with Palmer Tires. They are too expensive. • • • • •

The distinguishing mark of an 1897 high-grade bicycle must be apparent to the eye. That mark will be a pair of Palmer Tires. • • • •

The Palmer Pneumatic Tire Company,

• New York and Chicago. •

DIFFERING DOCTORS.

Rival Physicians Treat California's Sabbath Day Racing Disease in a Variety of Ways.

California is divided on the Sunday racing question. While the members of the Northern Division are clamoring for State local option, the Southern Division is opposed to the whole idea. A month ago Robert M. Welch, the California member of the Racing Board, issued an open letter in which he plead for Sunday racing in the strongest language and now comes C. C. Monaghan, Chief Consul of the South California Division with a communication, which he has sent to all the Assembly delegates, in which he earnestly urges that the League should maintain its present position on the question. He explains that he wants the situation of South California understood so that an intelligent vote can be taken. His letter reads in part:

There has been in circulation during the past two months a rumor to the effect that all of the Western divisions, particularly California, were very desirous of Sunday racing. We will state that at the annual meeting of the Board of Officers of the South California Division, held December, 1896, at which the entire board were present, a resolution was adopted declaring that the Board of Officers were unalterably opposed to the granting of local option for Sunday racing, and that we use our best efforts to defeat such an amendment at the coming National Assembly.

The League is organized primarily to protect wheelmen and to secure better roads. And one of the greatest inducements held out to the people for membership is that even if the League controlled racing, it never sanctioned Sunday racing or allowed pools to be sold on its tracks. The strength of the organization depends, not upon the amount of racing that we have, but upon the amount of work that is accomplished for the benefit of wheelmen and League members particularly.

The League of American Wheelmen was not organized, nor is it continued to make money out of racing. They simply control racing to give to the people of this country a sport free from all stigma.

It matters not what personal feelings we may have on the subject, whether we would attend a race meet or not given on that day, the fact remains that to a large percentage of our membership the granting of sanctions on that day would be obnoxious. And whether in Maine or California the same broad rule should govern our organization.

There was organized in Southern California last summer what was known as the Wheelmen's Racing League, for the purpose of giving Sunday race meets at Santa Monica, a seaside resort of Southern California. But, notwithstanding the fact of the immense advertising of these races, the largest paid attendance on any Sunday was 250.

If race-meet promoters and racing men desire Sunday racing, there is nothing to hinder them from riding on that day without the sanction of the League. Let them give Sunday racing on their own responsibility and if it proves a success it will then be time enough for the League to legislate on the subject.

If the settling of the Sunday racing proposition by local option is a good plan, why not

settle all matters in such a way? For instance, why not allow a division that so desires to draw out entirely from the jurisdiction of the racing board? Or allow each division the right of deciding whether the race-meet promoters should be obliged to go to the racing board for sanctions? Or allow those Divisions that desire it to have race-meets at which women are allowed to compete? Or allow negroes to join any Division desiring them?

In fact, if the project of local option is carried out, of which Sunday racing is the opening wedge, there is no need of the national organization whatever; allow each State or division to run its own business without regard to the others, and you have the project of local option carried to a logical conclusion.

This is in direct opposition to the prevailing opinion in San Francisco, as will be seen from the following from a correspondent in that city:

"Nothing proves the fact that Sunday racing is the only loophole out of the racing difficulty in this State better than the history of the Velodrome in this city. The track is, without a doubt, the best track of its size in the world, and fully as good as the best four-lap tracks in the country, and yet, despite the fact that the racing has been of the top-notch order, the race meets that have been held on the track have been financial failures. And why? Simply because Saturday afternoon is the busiest of the seven in this city, and the middle classes, from whom race promoters derive their patronage, cannot get off on that day to attend the meets.

"It is on Sunday that Californians take rest and recreation. Church in the morning (for many) and pleasure in the afternoon (for the majority) is the usual observance of the Sabbath in this great State. Baseball, cycling and other outdoor sports attract the people. A baseball game in this city between teams of little known ability have been known to attract 20,000 people on Sunday afternoon. Why should not a first-class race meet, with such cracks as Terrill, Wells, Foster, Jones, Downing, Zeigler and a host of others almost equally as well known advertised to appear, get some of this patronage?"

POOR ROADS, NO TOLL.

A test case is to be made by Baltimore cyclists as to the right of the toll roads to collect fees, when the surface of the roads are not kept in proper repair. The charters of the roads provide that unless the roads be kept in good condition for traffic no toll may be collected. The wheelmen will urge that as the Reistertown pike is not fit for cycling, the company should be instructed by the Court to collect no further toll from wheelmen until the road is repaired.

NO ROOM FOR WABLERS.

Ex-President James R. Dunn has written to General Porter in regard to the participation of cyclists in the inaugural parade. General Porter replied that the difficulty of assigning cyclists to a position will be too great to overcome in a marching parade.

A general "moving-up" and renumbering of League membership is in view, to fill the gaps caused by failures to renew.

LONE STARS.

They Will Still Twinkle in the Texan L. A. W. Firmament, Sunday Racing or Not.

Dallas, Tex., Jan. 28.—The local correspondent of some of the Western cycle papers has undertaken to express the sentiment of the L. A. W. members and riders of this State on the Sunday racing question, and has led the public to believe that Texas must have Sunday racing or the Division would secede. This correspondent affirmed that a long list of signatures had been secured to an independent organization if this was not carried in their favor, but the writer has been unable to find any of these intending secessionists, other than those for whom the writer in question is tooting a horn. The cyclists who started this hoax are interested in a track built during the past year, and which has not proven a paying investment. The investors want Sunday racing because they believe it will help their pocket-books. They are also vexed at the L. A. W. because the racing rules have been enforced at quite a cost to themselves; they are now agitating the riders to organize independently.

While all admit that Sunday racing will draw larger "gates," yet not many are in favor of it, and none are so determined as to drop their membership in the L. A. W. in the event this privilege is not granted the States desiring it.

This Division has in the past few months grown from 200 to over 500 members. Mr. Potter is hardly likely to get the Texan vote at the National Assembly. Chief Consul Earnest will cast the entire vote of the State.

PLANNING TO BE REAL GAY.

Philadelphians have what they think is a big scheme for an entire week of sport. The National Regatta is to be held on the Schuylkill River Friday and Saturday, August 13 and 14. In anticipation of securing the League meet, the Quaker enthusiasts are figuring on holding the meet during the same week, from Monday to Thursday, thereby permitting the cyclists and oarsmen to enjoy each other's sport. The Philadelphians, or part of them, look at it in this light:

"The meet will draw many thousands, and so will the regatta. Many's the man who would like to see both. Oarsmen coming from distant points can put in the entire week, and what is more, can get used to the course. But take the visitors in general, and it will be found that the two big events will be a greater attraction than a championship in one particular line of sport.

There is another happy way of looking at this arrangement. August is a popular vacation month, and the second week particularly so. Attendance will be greatly increased by this alone, and many a true-blue sportsman would experience thrills of delight at the thought of taking in both meetings during his vacation.

WILL QUITE NATURALLY WIN THAT WAY.

The mail vote to decide the place for the next League meet will be counted to-morrow in Boston and the result at once announced. Despite New York's attempt to coerce the Quakers it is the general belief that Philadelphia will "win in a walk," to use a race-track term.

Kindly mention The Wheel.

DENVER HEADS THE LIST.

Gormully & Jeffery have finally announced their '96 awards, the richest ever offered, as follows:

For the fastest mile by an amateur on a G. & J.-tired Rambler, A. B. Hughes, Denver, Col. Time, 1.47 3-5. Prize, the \$1,000 Tifanized Rambler bicycle.

For the promoter at which the performance was accomplished, the Silver Wheelmen, Denver, Col., \$500 in cash.

For the greatest mileage on Rambler bicycles, the Rambler Bicycle Club, Detroit, Mich., \$400 in cash. Record, 400,000 miles and over. Second, Lincoln Cycling Club, Chicago.

For the greatest individual mileage on a G. & J.-tired Rambler, \$200 in cash; in dispute and to be settled by a special arbitration committee.

For the greatest individual mileage on a G. & J.-tired wheel other than a Rambler, A. Phillips, Lincoln, Neb., \$200 in cash. Record, 10,012 miles on an Imperial bicycle. Mr. Phillips weighs 240 pounds and is upward of 50 years of age. Second, W. M. Townsend, Syracuse, N. Y., on an Ideal, 9,000 miles.

Two-minute souvenirs for doing a mile inside that time will be awarded to A. B. Hughes and W. W. Ondkirk, both of Denver. Of the 3,000-mile gold souvenirs nearly 900 were awarded, practically every State in the Union being represented in the distribution.

AND HE WAS PAID FOR IT.

Mr. Potter's "Campaign Committee," none of whom, by the way, can point to any particularly noteworthy accomplishment except nominating themselves for office, has issued an "address." It itemizes ten cycling occurrences in which Mr. Potter rendered more or less service. The committee, however, very conveniently fails to state that the unselfish Mr. Potter was paid handsomely for doing much of the work, or that he has drawn from the L. A. W. in salary or "allowances" more than any other one man in the entire organization.

THANKS TO THE WATER BOARD.

For the convenience of cyclists the Jersey City Street and Water Board have laid asphalt on various streets from the Pennsylvania Railroad ferry to the Kill Von Kull, at Bergen Point, making a continuous stretch of smooth riding to the Hudson County Boulevard. The route is from York and Hudson streets, through York to Mercer to the Viaduct, which connects with the Boulevard.

REGARDED AS UNCONSTITUTIONAL.

Macon, Ga., has a bicycle tax of \$1.00 per annum. The wheelmen of the city have organized to fight the ordinance on the ground of unconstitutionality. The case will be tried in the Superior Court.

TRYING TONAWANDA.

The Ellicott Mfg. Co., formerly of Buffalo, N. Y., have moved to Tonawanda. Their line consists of the Ellicott at \$100 and the Red Jacket at \$75.

GOT MIGOTTI.

The Weaver Cycle Material Company have contracted with Migotti & Co., No. 3 Elizabeth street, Vienna, Austria, to represent them in Austria, Austria-Hungary, Roumania, Bulgaria and Turkey.

ANOTHER ANTI-ECKITE.

Another blow for Eck! Weing, of Buffalo, one of the crew that went abroad with him, is berating him now. "I think," says Weing, "that all my chances for making a reputation in foreign countries were shattered by Eck. He let me go just when I was negotiating to have a match race with Cassac, the French crack who defeated Platt-Betts. I felt perfectly confident of being able to defeat the Frenchman. Eck gave me no credit for my work abroad. Really, I did better than either Johnson or McDonald. I won all of my match races, and they cannot say as much. Then I was getting into the best possible form when Eck threw me aside. I think that Johnson will do better to get away from the manager as soon as he can."

FREAKS TO BE FEATURED.

Some queer sort of racing will be seen at the French Racing Men's Syndicate meet to be held in Paris this month. Among the proposed events is a handicap for all machines and multicyles, a high wheel race, motor tricycle contest, bone-shaker race, one for mixed quad teams, two men and two women on each machine, and a match between J. Grimes, the Cleveland heavy-weight, and a five-year old boy. Several other novelties are to be added to this programme.

THE FINAL SPLUTTER.

New York, February 1, 1897.

There will be a meeting of the League of American Racing Cyclists at the New York Show during the week of February 8th. The object of the meeting is to wind up the affairs of the organization. A large and full attendance is earnestly desired.

Very truly,

W. H. KIRKPATRICK,
Secretary and Treasurer.

HAVE BEEN "MATCHED."

Louis Gimm and Teddy Hale have been matched to ride a 100 mile race at Cleveland, to-morrow night. They will then proceed to Pittsburg and take part in the six days' race which will start on Monday.

ANOTHER SICKENING SIXER.

Beginning February 8 a six-days' race will start in the Grand Central Rink, Pittsburg, under the same management as promoted the recent grind at Madison Square Garden. The contestants will ride from noon until midnight each day, 72 hours in all.

INDUCER OF SWEDISH TIRED-FEELING.

W. F. Sager, of Denver, and John Lawson, of Chicago, known as the "terrible Swede," have arranged a 25-mile unpaced match race, to take place at Denver in May. The race will be for \$500 a side.

TWENTY-FIVE HUNDRED CAPITAL.

The Chicago Cycle Racing Association has been incorporated with a capital stock of \$8,500. The incorporators are Bernard Stein, M. D. Thackaberry and L. M. Courter.

MAY THEY BE EVER HAPPY.

Many of New Jersey's prominent cyclists will visit Trenton on February 10th, to attend the wedding of Secretary-Treasurer James C. Tattersall to Miss Ida M. Dunbar.

BRAVEST OF THE BRAVE.

Talk not to me of heroes who've achieved fame with the sword,
Of the Spartan chief Leonidas, who braved the Persian horde.
Nor yet of Arnold Winkelried, who bared his dauntless breast,
And gathered in the foe-man's spears, while his comrades did the rest.
Speak not of bold Jim Bludso, who held the bow ashore,
While the passengers were landed, and then fell to rise no more;
Dwell not on ancient martyrs, who faced death unflinchingly,
For when it comes to courage, they're not a patch to me.
The gallant deed that I'm to do will ever live in fame,
And countless millions yet to come will reverence my name;
A more courageous act than mine the world will never know,
For I've promised to criticise exhibits at the coming Cycle Show.

A CHANGE OF BASE.

Charles Barnes, who has for a long time been connected, in an executive capacity, with the Merchants' & Manufacturers' Warehouse, and previously with Parkhurst & Wilkinson, has become connected with R. B. McMullen & Co. Mr. Barnes will travel in this connection, and will take care of Syracuse and adjacent territory.

WILL BE STAMPED WITH APPROVAL.

At the New York Show the New Brunswick Tire Co. will give away as souvenirs a pocket stamp box, large enough to hold 20 or 30 stamps in such a manner that they cannot become stuck together. It is finished in enamel, green, gold and silver. On the back is given the postal rates for the United States, Canada and Mexico.

ECLIPSING THEIR RECORD.

A full complement of men are working day and night, six days a week, at the Eclipse Bicycle Co.'s works, Elmira, N. Y. The company is busy with foreign orders, and have sent 475 machines to Australia, 50 to South Africa, 340 to England and smaller shipments to other countries during the past few days.

GOOD TIRES SELL WELL.

It is a pretty thoroughly established fact that Morgan & Wright last year sold 65 per cent of all the tires sold in America. While all of the manufacturers' orders are not yet placed, Morgan & Wright state that their addresses show they will again obtain that percentage of all the tire business.

SPECIAL PHOENIX SHOW.

The Stover Cycle Manufacturing Company will not exhibit their well-known Phoenix line at the New York Cycle Show, but it can be seen at their salesrooms, Nos. 575-577 Madison avenue, during the Cycle Show week.

HANEY'S NOW ON HAND.

The Haney cyclometer factory is now turning out the instruments at the rate of 5,000 per day. Oliver, Strauss & Co. desire the fact made generally known, as they say interested parties have been zealously spreading reports of non-deliveries.

AT THE CHICAGO SHOW.

The modern cycle show is such an all-embracing affair, that only a bicycle of the most signal merit can attract to itself any marked degree of attention. The great kaleidoscopic drama at Chicago contained so many bicycles worthy of commendation, and the general standard of excellence was so uniformly high, that for any one bicycle to enchain special and careful study from the throng of visitors was to be counted as a striking testimonial of that wheel's worth.

This fact forms, perhaps, the strongest evidence yet offered that the new models of the Waverley wheel are, both in appearance and construction, to be counted among the finest examples of cycle-building art ever placed before the public. The debut of the 1897 Waverley at Chicago was a most successful one in every respect. The \$100.00 Waverley was one of the most admired bicycles at the show; and the interest and intelligence with which hundreds of people each day examined its novel constructive features plainly showed that it is certain to win great favor with the very best class of buyers. And it is, indeed, from any standpoint viewed, a wonderful machine. No bicycle was ever placed upon the market which embodies in its construction so much that is entirely novel and distinctive, and at the same time thoroughly practical. There are no "faddy" or freak points about the new Waverley. Every feature is constructed upon logical, mechanical principles, with the object of promoting the comfort and durability of the wheel to the highest possible point. Exceptionally fine in grace of appearance and excellence of finish, it is not one of those bicycles that strikingly illustrate the old adage that beauty is only skin deep. There are too many bicycles to-day in which correct construction is sacrificed in favor of external beauty. But the makers of the Waverley believe that a graceful and handsome exterior should be but an earnest of superior internal worth. Fine enamel was never intended to cover a multitude of constructive sins, but to enhance the effect of high quality material conscientiously and effectively used in the construction. In the Waverley, mechanical and artistic excellence go hand in hand. Neither is sacrificed to the other, each being as it should be, the other's logical corollary. Waverley worth certainly speaks for itself and in no uncertain tone.

One of the chief factors in the constructive worth of Waverley wheels is to be found in the fact that from the greatest part down to the least, every portion of the bicycle is built in the Waverley factories. In these days, when so many much vaunted bicycle plants are little more than extensive assembling rooms in which the bicycle turned out is simply an agglomeration of parts, collected from the four quarters of the globe, such a fact as this means much to the buyer. It is most certainly impossible to attain the best results in this kind of bicycle building, unfortunately but too prevalent. A bicycle should be a harmonious whole; not a haphazard combination of more or less discordant parts. Each part of a bicycle, no matter how small and apparently insignificant, must attune and harmonize with every other part, if the highest type of mechanical and artistic construction is to be achieved; and no one can critically examine the new Waverley models without realizing that each part of these superb machines is so well proportioned with the others, that the completed bicycle is the essence of well balanced strength and un-demonstrative taste. It is a familiar saying that the really well dressed man is he whose costume is not a contrast of incongruous details, but a blending of harmonious details into a finished and tasty whole. In somewhat the same way it might be said that the Waverley bicycle is a harmonious blending of fine constructive features into a machine, every part of which is in full accord with every other part. Tires, chains, saddles, pedals, spokes, handle-bars, tubing, in short, every portion of the Waverley bicycle, is built expressly for this use in the Waverley plant. The construction of each and all is supervised, watched and tested by the same mechanical expert. Each part is made to work smoothly and in conjunction with every other part; and their combination into the completed Waverley bicycle gives to the public the most thoroughly and carefully built wheel in the field to-day.

THE MAN OF MODEST MEANS.

There is more and more attention being paid each year to the buyer of modest means, who desires a thoroughly high-grade wheel at a price within the reach of his purse. And for this class there can be no better mount than the new \$60.00 Waverley, a near relation of the 1896 Waverley, differing from it only in a number of minor improvements which make it even a better machine than that sold last year for \$25.00 more. Such value as is found in this wheel is rarely offered, indeed, for so small a sum. It is not necessary to dilate upon the merit of last year's Waverleys. They have won a reputation of their own, and one of which their makers have no need to be ashamed. It is practically this machine, which can now be built more economically on account of the fact that no new machinery is needed in its construction and that the workmen in the Waverley factories have attained great facility in its manufacture through a season's experience, that is offered at \$60.00, and it should find a wide field of action. No better wheel for the money was ever built.

TRADE CHANGES

CALIFORNIA.

Los Angeles.—The Gomer Agency Co., has attached for \$138.

Los Angeles.—Geo. W. Tower, sold out by the sheriff.

COLORADO.

Colorado Springs.—Dr. W. W. Arnold, reported withdrawn from the Colorado Springs Cycle House.

CONNECTICUT.

Bridgeport.—L. H. Johnson petitions for removal of J. C. Cassidy as receiver of Premier Cycle Co., on the ground that he is diverging from the business for which the Company was organized.

Bridgeport.—The Vulcanized Bicycle Handle-Bar Co., new establishment at 465 Water street.

DELAWARE.

Wilmington.—Receivers of the McDaniel & Merrihue Bicycle Co. filed inventory showing value of stock and fixtures to be \$3,800. Chancellor Nicholson orders sale of goods and chattels.

DISTRICT OF COLUMBIA.

Washington.—Geo. W. Riffe, W. James Slater and John Waerner, Jr., composing Enterprise Cycle Co., have dissolved partnership. Riffe and Slater retiring. The business will be continued under the old name, by Mr. Waerner and Louis J. Driggs, at 812 Fourteenth street, N. W.

Washington.—M. A. Tappan, who handled Spalding athletic goods at 1013 Pennsylvania avenue, has sold out to A. G. Spalding & Bros. About February 15th, Mr. Tappan will open a new store at 1339 F street.

GEORGIA.

Augusta.—Gus Beall. Damaged by fire, \$1,000; insured.

ILLINOIS.

Chicago.—John Grant Co., assigned. Correct assets, \$20,000; liabilities, \$4,000.

Kankakee.—Kankakee Mfg. Co., judgment rendered favor of Phoenix Trimming Co., of Chicago, \$228.89. Also sued in Chicago for \$1,000, by Albert N. Funke.

INDIANA.

Indianapolis.—W. R. Watson & Co., dissolved.

Marion.—Allen Bros. Purchased by Halladay Cycle Co.

Plymouth.—Smalley Bicycle Works. Sold to Boss & McDonald, of Fort Wayne, for \$15,900.

IOWA.

Cresco.—Graf Cycle Co. Purchased by J. L. Y. Henley.

Oskaloosa.—A. E. Colwell has succeeded to the entire bicycle business of Colwell & Thomas.

MAINE.

Saco.—The Newell Mfg. Co. organized to manufacture and deal in bicycles; capital stock, \$500,000, \$30 paid in. Officers: Pres., Charles A. Meserve, of Boston; Treas., Otis K. Newell, of Boston.

MASSACHUSETTS.

Hudson.—Alfred E. Prescott. Chattel mortgage, \$1,000.

Quincy.—Quincy Bicycle Works. Purchased by Stevens, Freeze & Co.

MICHIGAN.

Detroit.—Acme Safety Emery Wheel Co., notice of dissolution.

Jackson.—Derby Cycle Co. have moved into their new quarters on North Jackson street.

MINNESOTA.

Minneapolis.—A. A. Hansen Cycle Co., reported succeeded by Wirtensohn Bros.

Minneapolis.—P. J. Donohoe & Co. closed on an execution for \$2,740.

MISSOURI.

Kansas City.—M. W. Hatch gives bill of sale to his interest in the business of Hatch Bros. for \$3,000.

St. Louis.—The St. Louis Bicycle Exchange (E. and A. W. Pequegnat) will commence the manufacture of St. Louis Special bicycles in the Charles Building on Mill street.

NEBRASKA.

Wakefield.—N. E. Lingren gives a chattel mortgage for \$100.

NEW JERSEY.

Newark.—Automatic Cycle Fitting Co., incorporates same as Howard Chainless Bicycle Co. Authorized capital, \$25,000.

Newark.—Max Bros., burned out; insured.

Newark.—Ernest H. Towle, bicycles, reported moved to Washington, D. C.

NEW YORK.

Amsterdam.—Farnsworth & Wilson Machine Co. sold out to Budd Bros. Mfg. Co., of Glens Falls.

Canandaigua.—John N. Willys, sold out at auction.

Columbus.—Richer & Pope, new firm.

New York.—Patrick Donnelly, judgment favor of Spalding-Bidwell Co., \$102.54.

New York.—Liberty Cycle Co. Auxiliary receiver discharged, the affairs of the receivership having been settled, the entire assets having been sold to John Holden. Receiver has a balance of \$1,422 on his hands.

New York.—Chas. K. Starr. Judgment, \$1,031.

New York.—New York Sporting Goods Co., incorporated by R. Nelson and S. B. Snyder, of New York; T. B. Tilton and J. E. Murray; to manufacture bicycles; capital stock, \$5,000.

Niagara Falls.—R. Smith & Co., of Cleveland, contracted for a new \$18,000 bicycle factory on Cleveland avenue. The building will be four stories high, and work will be begun at once. Cheap bicycles will be made.

Rochester.—Mayer Mfg. Co. Judgments aggregating \$1,700 and chattel mortgage \$2,000, filed against Chas. W. Mayer.

OHIO.

Circleville.—The Pickaway Wheel Co., new concern. Cincinnati.—Western Wheel Works against Frank T. Miles, assignee. Judgment in favor of plaintiff.

Cleveland.—The Winton Bicycle Co. will be reorganized for the manufacture of horseless carriages, etc. Capital stock will be \$1,000,000.

Toledo.—The Oak Cycle Co. (G. Vosburg and W. N. Boyle) has established itself at Oak and Earl street.

Toledo.—The Truman Cycle Concern, now in the hands of its new owner, H. Smith, with T. B. Terry as manager, has settled down to active business, and will turn out about 500 bicycles by February 10th.

Toledo.—W. H. H. Smith is being sued by the Brewer & Ward Co., of Newark, N. J., for \$406.43, claimed to be due for goods delivered to the Truman Co. Payment was guaranteed by the defendant; hence the suit.

OREGON.

Roseburg.—Carl & Richardson, dissolved. Business continued by T. K. Richardson.

PENNSYLVANIA.

Erie.—Erie Cycle Co. sold out by sheriff.

Pittsburg.—P. J. Donohoe & Co., closed by sheriff.

TENNESSEE.

Nashville.—The Lowndes Mfg. Co., new store at 314 S. Cherry street.

TEXAS.

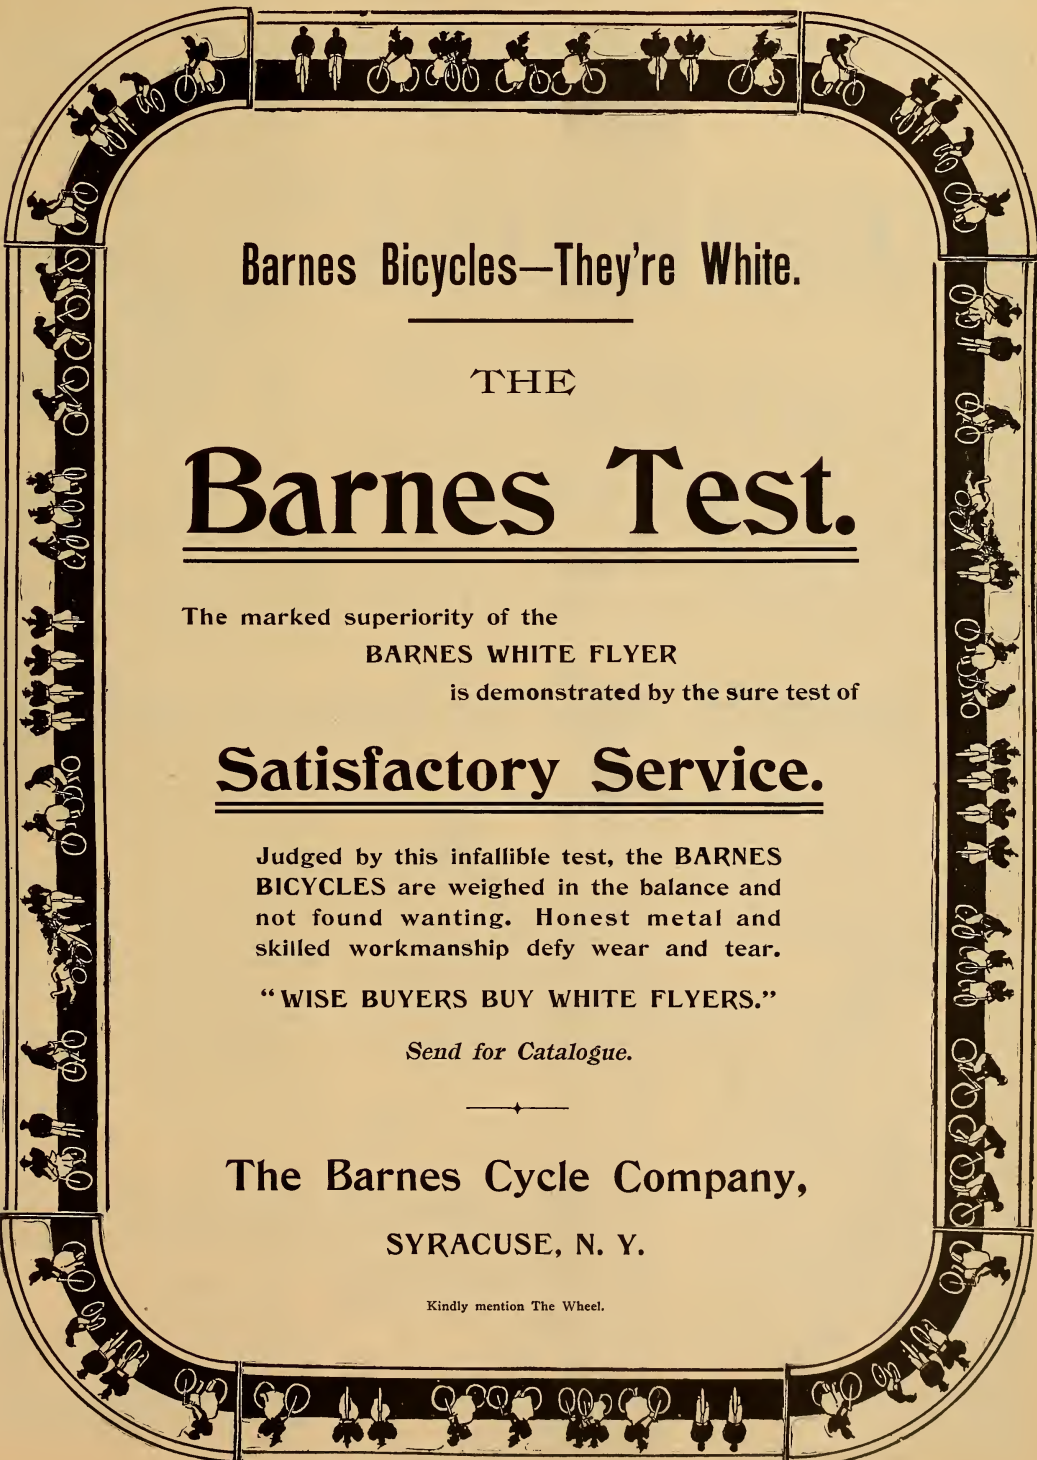

Denison.—The Texas Bicycle Co., incorporated by R. S. Legate, J. B. McDougal and A. Zingraff.

Waco.—Woodworth Cycle Co., name changed to Southern Cycle Co.

WISCONSIN.

Milton.—M. C. Whitford and L. P. H. Rood; new partnership.

Milwaukee.—E. S. Potter & Co., dissolved.

CYCLERIZATION OF CINDERELLA.

Cinderella was sad indeed. The tears coursed down her cheeks as note by note she picked out her piano lesson. She stifled sobs now and then, and vainly tried to think of the lesson only, and not of her great disappointment. She was young, with a complexion as fair to look on as any ever seen. Her voice was as a wild bird's, and her words were wise. Yet she was sad.

She had two sisters—mean, hateful things, who, though exceedingly comely to gaze upon, were selfish and little inclined to give Cinderella a taste of the pleasures to which they were accustomed. They cast scorn and derision upon poor Cinderella when she asked if she, too, might go to the grand parade opening the new cycle path from King Solomon's mines to Damascus, which they were to attend.

"The idea; you!" said they. "What would you wear? What would you ride?"

Poor Cinderella burst into tears. It was too true. She had neither wheel nor becoming costume. But the tears did not melt the sisters' marble hearts. They had merely smiled and gone.

Scarcely had the echo of the door slamming died away when "Ting, aling, aling, aling," rang the little electric door bell, and a moment later a maid came into the room with a card on the silver plate. Cinderella hastily brushed a tear from her eye and read:

MISS NEW FAIRY.

A minute later Miss New Fairy was shown in. Miss Fairy was different from anybody that Cinderella had ever known, yet she was not different in a describable way.

"Cinderella," said the visitor, in a voice sweetly baritone, "Cinderella, you are sad. You need not tell me why, for I know. You dropped a penny in my tin cup the other day when I mutely begged behind a wheezy lay hand-organ. I am a fairy—an up-to-date one—and as I know your wish—Presto! Change!"

The footstool and a china vase with a piece chipped out of it became a bicycle, the song that Cinderella sang became wheeling songs, and leggings lay where a pair of gloves had been.

"Ah!" exclaimed the fairy, as she looked over the newly created wheel, "that missing bit of china has caused a missing part in the wheel made from it. See, there is no pedal here! But no matter; here is an extra one that I brought in case of accidents. Now go to the parade."

Joyfully Cinderella sprang away, and only a few short minutes had elapsed when she came back with her hateful old spirits discarded and arrayed in lovely style—a style that outdid her sisters for splendor—with a wheel that outshone theirs and a grace that none could equal. With a merry laugh she sprang lightly into the saddle, for she had ridden her sisters' wheels on the q. t., and away she scorched up the asphalt pavement toward the new cycle path. A warning voice came floating after and whispered in her ear: "Stay no later than 3 o'clock, lest a greater sadness overtake you."

A wondering populace paused to gaze after the beautiful Cinderella and her magnificent equipage. The parade that was to open the path was about to start, and a hush fell over the throng as the grand marshal, the greatest

of the great riders, stood up on his wheel's handle-bars and looked the paraders over, a way grand marshals have in Damascus. Who was to ride by his side and lead them all? Who but the prettiest and most handsomely arrayed girl there? For a moment a look of dissatisfaction dwelt in the great rider's eyes, and then he smiled. The two sisters of Cinderella found themselves observed by the marshal, who gazed upon them favorably. Still he was perplexed, for the two sisters were equally beautiful, and he could not choose. At this moment a vision, approaching at a two-minute gait, swung around a far corner as if winged, and rode straight at him. Without a pause or a glance to right or left Cinderella, for it was she, rode up to the marshal and gazed shyly into his eyes.

"Ready! Forward!" shouted the marshal, and the parade began, with Cinderella in the place of honor. The sisters were filled with envy.

On and on rode the mighty host, Cinderella in a heaven and the marshal in a sea of bliss. All went well until, snap! and a pedal parted from the crank on Cinderella's wheel.

STICKS TO THE SADDLE.

How Wyndcifer makes sure no one will ride off with his machine when he leaves it for a minute.

The very pedal, too, that the fairy had given her after she had found the magic wheel was incomplete. Into the dust knelt the great rider to repair the break, and, as he held the pedal in his hand admiring its beauty and the smallness of its size, the clock in the old church tower began to strike three.

"Zip!"

Cinderella fled, cycles, across the vacant lots, while the bewildered marshal stopped and looked about him, seeking the beautiful creature who had been riding beside him. At last his glance fell to the ground, and there lay the fairy's extra pedal, which was not enchanted, like the gloves, the song, the china bowl and the footstool. Picking up the one memento of his late beautiful companion, the marshal resigned then and there, and went disconsolate to the city, proclaiming through the evening papers that she whose foot fitted that pedal he would marry.

Myriads came, but went away again. The two sisters came, too, hoping that they might win the greatest catch of the age, but alas! As for Cinderella, she wept and wept, and the tears made her cheeks fairer than ever. One day, as she was riding in an elevated

train, a tear coursed down her cheek. It was at a dull hour, and few were in the car, but it happened that among the passengers was the late marshal, on his way to the West to begin life over again. He saw the tear on the maiden's cheek, and his heart was softened. He folded up his newspaper and shoved it under his satchel strap. He was picking a bit of lint from his coat sleeve when the guard stuck his head in at the door and shouted: "Slimspity-umst!"

A moment later the car gates slammed back and the guard shouted:

"Step lively, lady. Can't wait all day."

A wrinkled, decrepit old woman limped into the car and sat down beside Cinderella. Presently she leaned toward Cinderella and looked beseeching.

"What can I do for you?" asked Cinderella.

"Return me that extra pedal I lent you."

Cinderella knew then to whom she was talking and burst into tears. The great parade leader divined the situation instantly. Unstrapping his satchel, he yelled:

"I've got it!"

The other passengers thought so, too, though of course they did not know what he referred to, but Cinderella brushed the tears from her eyes and the fairy smiled. The parader did not go West. Cinderella has the finest bicycle in America. The fairy is a frequent visitor at her flat, and is always warmly welcomed, whether she appears as a beggar or a bloomerite. As for the two sisters, they have lived unhappily ever since.

MULTUM IN PARVO.

It is a mistaken idea in these days of wheel touring that a woman can never go any place without a trunkful of clothes. Your wheelwoman has long since proven this a fallacy. A young Normal School graduate, who went on a European cycle tour last summer, thus tells what her luggage was, and how it was carried:

"We purchased half a yard of black silesia and two yards of half-inch-wide ribbon. Then we returned to our hotel, put four clean handkerchiefs in the toe of one bedroom slipper and into the same at the other end an extra pair of stockings. In the interstices we put a comb, a tooth brush, a nail file, a small piece of soap and a portion of tooth powder. Then the full slipper went inside the empty one and a nightgown was tightly wrapped about both and tied with a shoestring. One or two post-cards and a washcloth completed the tout ensemble, which was then pinned in the aforesaid black silesia and tied with part of the ribbons, the rest serving to secure the bundle to the handle-bars."

It may, perhaps, not be necessary to state that a steamer trunk containing a few more articles than the above enumerated ones was kept ahead of the Normal School party, and usually overtaken every second or third day.

SNUBBING A BUSYBODY.

"Short of wind, eh?" said the man on the sidewalk to the wheelman who stood panting beside his wheel at the top of the long hill on Riverside, which he had just ridden up despite a half-deflated rear tire.

"No; nothing of the kind, I assure you. There's plenty of wind here—always is in winter, but I've left my pump home, so I can't force any of it into this tire of mine, where it is most needed."

SOME SWEATER STATISTICS.

Showing How That Now Universally-Worn Garment Came Into Popularity and High Favor.

It is difficult to tell just where the sweater originated. THE WHEEL man has made diligent inquiry among the large dealers in New York, and has not found one who would venture a positive statement. They were as bad as the naked soul of Tomlinson, whimpering before the gates of hell. They had "read, and thought, and heard," but none of them knew. Most of them said that sweaters were first used in England. They are a development, two or three thought, from the big heavy guernsey that sailormen wear. One man said they came from Germany, where they were commonly used as wraps in cold weather.

But wherever they came from, it was generally agreed that they developed from the old jersey. The jersey is a mighty serviceable garment, and is occasionally in use yet among the breed of cyclists that gloats over the glories of the old ordinary days. But it is made of woven goods, whereas sweaters are knitted. It was but a step from the one to the other, and the man who first took it must have made a very great fortune if he had had any suspicion of the popularity of his device.

Primarily, of course, the sweater is an athletic garment. Its main service is to prevent taking cold. When a man has done "stunts" on the track until he is in a lively perspiration there is nothing so handy as a sweater for his cooling off. It takes up the perspiration and it prevents him from getting cool too quickly. Everybody who has ever seen a football game knows how it works. The use it gets on a football field is a type of the cycling uses to which the sweater is put. In cycling it keeps a rider warm on a cold day and cool on a hot one. In fact, in any athletic sport it plays an important part. But the fact which explains the great sale of sweaters is that the garment has got beyond the point where it is worn by athletes and wheelmen only. Now everybody who has to work in the cold uses a sweater. You see half a dozen sweaters in crossing City Hall square once if you go in the morning or evening.

The man selling peanuts from a pushcart has one on under his coat. The newsboy who trots along ahead of you jamming an extra into your eyes wears one. The bootblack who stands on the corner has a very heavy one, to keep him warm with his much standing still. The gripman on the cable car, and the conductor, too, under the waistcoat of his uniform; even Col. Waring's white-duck-clad street sweeper wears one. A man sitting on the big flagstone sidewalk, chipping it full of grooves to keep the footing good, wears a sweater to keep him warm. Part of the padding under the big blue coat of the policeman is a heavy sweater. Mail-cart drivers, truckmen, plumbers, gas and steam fitters, carpenters, masons, housesmiths, beggars, and organ grinders all wear sweaters. A man found by a policeman lying dead drunk in the gutter in a Harlem street the other day wore a big dark blue sweater over his vest.

This general use of sweaters is a thing of recent growth. Just as it took a long time for cyclists to appreciate the availability of the garment for their purposes, so it took a longer time for the common run to understand that

a sweater might have some practical use besides its value as a wheel garment. Twenty years ago sweaters were unknown almost in this country. They came in gradually, and the stocks imported by the big sporting goods houses were sold to the larger colleges. Then the price was high, and there was practically only one kind. As the college men spread their use, and the wheelmen found out what a good thing a sweater was, the imports grew until it began to be profitable to manufacture them here. At first they could be imported for less than it cost to manufacture them in this country. But with the growing demand new machinery was devised for knitting them, and now there is almost no importation. They can be made cheaper, more serviceable, and more suitable by American workmen in American shops. The largest shops are in Brooklyn, and there are probably more sweater knitters there than in all the others combined. One factory alone employs 300 hands and the machines are kept constantly busy. The sweater has done much for the health and comfort of the cyclist; by the same token the cyclist has done much for the popularizing and increased use of the sweater.

AN ULSTER AND BLOOMERS.

The bloomer question has at last begun to agitate the minds of the more advanced persons of rural neighborhoods. The editor of an esteemed contemporary, devoted solely to local interests, published weekly in Ulster County, New York, dismisses the question in this way:

"Some of our readers must put some faith in what the 'Southern Ulster' says, by way when they want me to explain through the paper, we are always willing to meet the desired mind to what little we know about everything that is manufactured in this world, some say they never see bloomer them some live back in the country so we will try and illustrate the bloomer so the many readers of the 'Southern Ulster' can form some idea how they work, so we will use a few technical or Mode de Paris terms in describing the bloomer dress thus: 'It is a pair of trousers very baggy at the knees, abnormally full at the pistol pockets, and considerably full where you strike a match. The garment is cut de-collette at the south end, and the bottoms tied around the ankles or knees to keep the mice out. You can't put it over your head like you do your shirt nor around you like a corset, but you must sit on the floor and pull it on just as you do your stockings, one foot at a time in each compartment. You can easily tell the right side to have in front by the buttons on the neck band.'

"Them that has used them say they are most elegant in all out door performances the bloomers has come to stay we rather should think by what we have heard from the bloomer girl. We should think they would knock the spots out of a dress in riding down hill, skating, jumpin' in snow banks all out door sports."

SCARED OF MICROBES.

It's queer how the average wheelman, who takes all sorts of chances around cycle show time with the miscellaneous drinkables which the bar affords, is the very man who worries dreadfully when off on a summer day's ride if he thinks the water he gets isn't absolutely pure.

DR. KATHERINE'S COMMENTS.

Whenever woman wishes to have herself, her belongings or her possibilities passed upon by a supreme court, the bench of which is filled with learned Portias, she has the Sorosis give a verdict, which verdict is forever final. If it be favorable, nothing can ever afterwards occur to make woman doubt of its merits; if unfavorable, the thing condemned crawls promptly out of sight, dies in disgrace and is never henceforth heard of. All of this, and more, too, is the opinion of the members of Sorosis. Under these circumstances this learned and autocratic organization's opinion of the bicycle is worthy of due notice and some attention. At the annual meeting on Tuesday Dr. Katherine G. Townsend championed cycling thusly:

"I speak of the bicycle," said Dr. Townsend, "both as an enthusiastic wheelwoman and professionally. It has seized upon all classes of society, upon all ages and conditions of men, women and children. It is used by the sick to make them well, by those who are tired because it rests them, by the rested because it tires them, by the fat because it makes them thin, and by the thin because they want to get fat. The bicycle is a favorite in this world, and it has come to stay. 'Physician, wheel thyself,' is what the makers tell us; and the general opinion of the medical profession is that it is one of the most healthful exercises, not only for the muscular system, but that it is equally good for heart and lungs. No person with a cardiac affection should ride a wheel unless advised by a doctor, though many heart diseases are benefited by the exercise. It also aids digestion, stimulates nutrition, and cures nervousness in many forms. As yet no perfect saddle has been made for a woman. Most women ride with their saddles too low. If the leg does not have full reach the faulty movement of the sewing machine is the result. The erect posture is the most graceful and natural, and the only one that allows the heart and lungs to act naturally. The wearing of a corset on a wheel should be denounced in the strongest terms. A corset waist is permissible, or a band; but to mount a hill in a tight corset is courting death. Women should learn to glide off and not jump from a wheel. They should not ride when tired or ride until tired out; they should eat frequently on long runs, and avoid alcoholic stimulants. Wheeling, if properly taken, is an excellent means of mental and physical diversion, and is an agent in moral culture that answers the place of beer gardens, saloons, and similar places where companionship is sought."

FOLLOWING HIS LEADER.

One of those mysterious somebodies who are continually popping out from somewhere, saying something smart, and then popping back into nowhere in particular, has said: "True happiness is found in pursuing something, not in catching it." All this may be true, but it would be difficult to convince the scratch man in a mile race with the limit man on the 200-yard mark, that this idea of happiness is a correct one.

A LA MODE DE TROTTER.

"I don't like cycling," said the unconverted trotting horse worshiper, "and it is very lucky I don't; for if I did like it I should indulge in it, and I can't endure it."

American Beauties grow here—bloom everywhere.

A plant that IS an American Beauty.

IN
REALITY

THERE'S
NOTHING
OF THE

WONDERFUL

IN OUR
SUCCESS
WITH THE

WINDSOR, \$100, AND PACIFIC, \$60....

Why? There's too much young blood, energy and determination to excel in the make-up of the manufacturers to be contented to assemble old-fogy ideas and call it a wheel. Every part that enters into the construction of a "WINDSOR" is the best, and is always just a little "ahead of time." "WINDSOR" features are invariably a mark for others after the "WINDSORS" get into the market. "WINDSORS" are in front, not in ranks.

"Imitation is the highest recognition of superiority."

NEW '97 "WINDSOR" FEATURES

(WE NAME ONLY TWO OF
MANY NEW POINTS):

The New Fork Crown—Solid, oval (arch), drop forged, re-enforced—the acme of strength, beauty, and the practical solution of the fork-crown problem.

The Watch-Case Dust Caps cover the bearings with the nicety and exactness of the finest watch-case fitting; easy to remove; adds 50 per cent to the life of a wheel.

HIS PIGEON-TOE THEORY.

The Learned Doctor and the Beautiful Young Woman were standing all equipped for an afternoon's ride, while they waited for the second assistant janitor of the flat to appear with their wheels, which were stored in the subterranean caverns where janitors have their lairs, and from whence the grocery boy starts his wild yell up the speaking-tube to the suffering tenant five floors above.

The Learned Doctor had a theory—whoever saw a doctor who didn't have one of some kind or another?—that riding a bicycle was productive of pigeon-toed pedal extremities. This theory the Learned had just been expounding to the Beautiful when she and he reached the sidewalk, there to await the slow and stately movements of the second assistant.

"But I was thinking of adopting rational dress," stammered the Beautiful Young Woman. "There, now, you know it all, and I never, never will wear bloomers if I am going to display my two feet inclined toward a fixed point."

"Pshaw!" said the Doctor. "What is the difference if everybody's feet look that way?"

"The difference is the odds," was the somewhat abrupt reply. "But tell me, why is it that people ride pigeon-toed?"

"My theory of the matter is this," said the Learned Doctor. "New riders are instructed to use only the ball of the foot on the pedal. The heel is never to be employed. Were the heel to be pressed on the pedal, exactly the opposite would result, and the feet would be inclined to stick out at right angles. However, to return to the subject, people are instructed to pedal with the ball of the foot. By and by the foot gets tired in one position, and the rider shifts it a little. Ninety-nine times out of one hundred he shifts the foot so that the pedal is nearer and nearer to the ends of the toes. Now, the nearer the toes get to the pedal the more pigeon-toed you will become. If you try to ride a wheel by using the toes alone you will be surprised to see that you cannot keep it going more than a minute or two without having your feet turn in amazingly. At least that is my experience and the result of my observation.

"This, in part, is due to the fact that you try to evade the joint where the pedal is fixed to the wheel, and thus save scraping your ankle. Often there lodges considerable grease and dirt around the pedal at that point, and no rider wants to ruin clothing. So far as men are concerned, I am firmly of the opinion that all who try to ride a bicycle in long trousers pave the way for becoming pigeon-toed. Women are prone to ride with their toes turned in, because of the shape of their legs and the further fact that few of them are seated properly upon their wheels. I have had young women tell me that they felt themselves becoming pigeon-toed, and the only way they could prevent it for the time being was to stop and reset themselves. As soon as they got back to the old position on the saddle they found their toes as bad off as ever."

"It's all very horrid," said the Beautiful Young Woman.

"I assured you of that before I began," was the reply. "Now notice these two ladies coming directly toward us. One of them wears the rational costume. Do you observe the way in which her saddle is pitched forward and the fact that she almost hugs her handle-

bars, and, too, note her feet. The tendency to turn in the toes is not as strong as it is with some, but a slight fault is manifest. See that man across there? He is trying to ride his wheel home without soiling a pair of trousers. See how badly his feet are turned from their natural position."

"It's really too bad," exclaimed the Beautiful Young Woman with something like a sob in her voice. "It's the best sport that ever was devised for woman, and now look at it. First, the newspapers, who have nothing else to write about, tell us about the bicycle face, then the bicycle nod and bicycle hypnotism and bicycle bloomers, and bicycle neck, and now bicycle feet, and I'm sure that I wish I

ENTER THE POOR BASEBALL PLAYER.

Is there anything in the world the bicycle hasn't either ruined, killed or injured? If there is let it be promptly trotted forth to become the ninth wonder of the world. Here comes the baseball player, or rather his manager, who deposes as follows:

"No batsman can hit so well if he rides a wheel. It is also said to be injurious to the base running. Fielders are also more faulty in their judgment on fly balls. The constant strain to which the eyes are put in watching the movements of the wheel and in looking out for pedestrians and wagons and all obstructions, it is said, blurs the vision to an extent."

APPEALED TO HIM.

"Hockstein! I show you der vinest ding in der show, ain't it? A dree-ball bearing, eh?"

was a man, and then I wouldn't care what it was, for men are thick-skinned old things."

"True," said the Learned Doctor, "true, true—that is, all except the man part. It is just as I told you. If bicycle riding keeps on growing in popularity, it will come to pass that ye shall know the riders by their overlapping feet."

Then the Learned Doctor and the Beautiful Young Woman rode away, and the Learned Doctor made a heroic effort to keep his feet at a proper angle, while the Beautiful Young Woman—she covered hers with her skirts and kept one hand on the skirts so they couldn't fly up, while the second assistant janitor wended his way to the corner, there to invest in a couple of beers the ten cents the Learned Doctor had given him as a tip.

How very interesting! Likewise how very idiotic! Baseball managers will do well to leave arguments of this kind to gentlemen a trifle more erudite than they are likely to be.

SUED THE FAIR LILLIAN.

For a long time it has been understood by the chappies that Lillian Russell owned some sixteen bicycles, including a gold-mounted one, and that every firm in the trade had made her a present of one of their own make in return for the advertising the gift would yield them. Unfortunately this story has been punctured in one instance. Lillian has been sued in the Eleventh District Court for a bicycle sent her by a local manufacturing firm, who wanted either \$100 or the bicycle.

TELLING IT TO HER FRIEND.

"Did I ever tell you about the last time I rode a wheel without a brake?" asked the girl with the mouth full of hair-pins, as she gave her hair a final twist, and then began filling it pin-cushionwise from the hair-stickers between her lips.

"Oh, I don't know," said her friend with the fashion magazine, "you've told me so many things about your wheel experiences that really I can't be expected to remember all of them."

"Well, this is funny, and I'm just going to tell it to you again, that is, if I ever did tell you of it before. Charlie Spoonmore took me out to try a new tandem he had just bought, and for some reason or another the brake wasn't just what it should be, so he took it off, and we went for a ride without it.

"Going down the long hill on Riverside Drive Charlie couldn't back-pedal strong enough to hold us, while I had my feet on the coasters. The first thing I knew we were going down that hill a mile a minute.

"I don't know how we ever reached the bottom alive, but of course we did, or I wouldn't be talking to you now. When it was all over I fainted. Charlie, man like, rushed over to one of the drinking fountains, filled his cap with water, ran back to where I was, and threw the water all over me, just ruining my new hat, and making me look like a drowned rat. I was so mad at him that I just insisted on going right home, and I never spoke a word to him the whole time we were riding back.

"When we got back to the riding academy I went up stairs to change my soggy riding costume for my street dress. When the colored woman who has charge saw me she said: 'For de law's sake, Miss Nellie! what'cher bin doin'?"

"I told of the accident, and explained the cold-water cure I had experienced: 'Bless yer, chile, dat is too bad!' she protested. 'Didn't young Mr. Spoons done do nothin' else fo' to cure dat faintin'?"

"When she learned that the extent of the cure was condensed into the cold-water shock she took me to one side and confided to me the following remedy for future faints: 'Well, now, it is jes' too bad dat dey don't know nuff to get de right stuff. De nex' time dat you is faintin', honey, you jes' tell dem to sen' to de drug store and get five cents' worf ob de romantic spirits of pneumonia, and dat'll stop de faints jes' as shore as you is a livin' woman.' Now wasn't that funny?"

But the girl with the fashion magazine was sound asleep and did not answer.

TOEING THE MARK.

"I want to marry your daughter," said MacSprocket to old Coynchaser, the ex-champion hundred-miler. "Can't you give us a start in life?"

"Sure!" said the old pro., carefully opening the front door, after seeing that the heavy boots he wore were ready for action. "How would you like a flying start?"

But MacSprocket did not wait to answer.

RARELY COMBINED.

A union of energy and wisdom, with an unflinching determination to excel his fellow speedmen, is what is necessary to make a great racer.

TWISTED INTO CYCLE FLAVOR.

Perhaps you may want to show your intimate acquaintance with the Poets, and prove same by quoting from them allusions to the wheel. If such be your vanity the following may come in handy:

We'll guard your person while you take your rest, And watch your safety.

—Tempest.

I like the new tire—excellently.—Much Ado About Nothing.

Out of this nettle danger we pluck this flower, safety.—I. Henry IV.

Speak, brother! hast thou hurt thee with the fall?—Titus Andronicus.

Let a post angel start with thee And thou the goal of earth shalt reach as soon as he.

—Titus Andronicus.

Ring your bells.—King John.

Turn, turn, my wheel! turn round and round Without a pause, without a sound.

So spins the flying world away.

—Longfellow.

Patchin' our patent self—blow up again!—James Russell Lowell, Biglow Papers.

I would give all my fame for a pot of ale and safety.—Henry V.

Your firm, elegant rascal, that can rise and stoop almost together,

Shoot through the air as nimbly as a star;

Turn short as doth a swallow;

And be here and there and here and yonder all at once.

—Ben Jonson.

WHY HIS THREAT WAS HARMLESS.

They were out riding together.

"Will you marry me?" he asked.

"No. Why should I?" she replied.

He could not answer this, and they rode on in silence. After a few blocks this became monotonous, and she said:

"I will leave you here." Her intention plainly being to give him the shake. He wanted to argue the case, regarding shoo-ness and himself as not being on speaking terms, but she was obdurate and declined to arbitrate. Then he hissed:

"Going to shake me, eh? Well, I guess not. I'll follow you to the utmost ends of the earth!"

"No, you won't," she replied, getting a firmer grip on her handles, and carefully scanning her toe-clips to see that they were ready for prompt service.

"I won't, eh? Well, why not, I'd like to know?" queried he.

"Because I'm not going there," she said, as she shot down a side street, turned into the cycling throng on the Boulevard and was there lost to sight.

IT ALWAYS WINS.

The politician shook his head emphatically. "There's no use getting up a platform, as far as I am concerned," he said. "I shall not run for office on a platform this time."

"But, my dear sir," protested the party manager, "it is necessary in order to get the votes."

"Nonsense," replied the politician. "Not any more it isn't. I shall make my race this time on a pneumatic tire, capturing the wheelmen's vote with a good-roads cry and a bicycle-as-baggage shout."

And history proved that that was exactly what he did do.

SOMETIMES HE IS PREJUDICED.

If you really want to know what an ice-wagon the wheel you are riding really is, take it to the rival agent for valuation.

UNCLE EPH'S LITTLE LESSON.

I haint no b'leiver in dis goin' to dah ant fur wisdom. If us folks what rides de by-sickle, and wese puty much all de folks dey is dese days, wants to study things fur our own good, we doan' have to go foolin' 'round no ant-hills; deed we don't, chile, we kain git our teachin' right round near to de stable. Fur instance:

Fum de hoss: Not to be mo' afearid ter kick fo' good reason 'n yo' is ter plow yo' furrer. Hit am all in er day's work.

Even if yo' does feel balky, yer better git outen de way o' public opinion 'fo' dey builds er fish under yo'.

Fum de cow: Allus ter keep yo' face towa'd er man wa't yo's afearid on; 'cept in de case ob bein' in a race wid him; den yer had bes' turn yer back on him, hump it, an' nebber let him see yo' face no how.

Fum de dawg: Ter love yo' fricen's, but ter sleep wiv one eye er-jah, jus' de same.

Fum de roostah: Even if yo' doan' know who's licked, ter crow just de same.

Fum de tomcat: Ter keep de hours ut soots yo' callin'.

Fum de mewl: Ter do nuffin' hasty, but we'n yo' does anyting ter do hit all-fiahed quick.

Fum de rabbit: En case o' doubt, ter run fer cover fus' and ax yo' questions ahtah-wa'd.

Fum de bevah: Ter tell de truf I doan' think anybody could learn much from him. He do mo' useless dam buildin' 'n I ebah cud see mawtal use fo', an', sides, he wuk w'en 'e don' hev ter.

PUNISHING WHEEL PINCHERS.

A bill introduced into the Massachusetts Legislature makes imprisonment for from one to five years the penalty for stealing bicycles. No doubt the luckless wheel owner who finds that a thief has eloped with his machine feels as if the rascal ought to have not less than twenty years in jail. But that is scarcely a good reason for singling out wheel thievery as a crime to be treated in distinction from any other larceny.

If the laws of Massachusetts which are designed to prevent stealing do not provide sufficiently severe penalties to discourage the crime, then they ought to be amended so that all classes of property shall have equal protection. Far-seeing wheelmen will distrust special legislation to fit special cases in their behalf, when a general law ought to answer all reasonable requirements.

THIS BRAND IS NUMEROUS.

Two of a kind—both fools—the man who rides upon the steps of another's wheel, and the man who is seated in the saddle of the machine upon whose step the first fool is riding.

LOOKING FOR A DECISION.

"I say, Tellem, I'd like to ask your advice about my racing next season."

"Well, what do you want me to do, per- or dis-suade you?"

RUNS INTO MONEY.

It has been estimated that the enormous sum of \$157,000,000 will be spent on bicycles and bicycling in Great Britain alone during the present year.

Kindly mention The Wheel.

MAHOMET NO ANTI-CYCLIST.

The culminating triumph of the wheel will come when it has divorced the Arab from his steed of poetry and romance—his "stallion shod with fire." The Paris papers print news from the French Soudan to the effect that the bicycle is making its way there, and that it has impressed the natives more than any other article imported into that country from Europe. The Mahometan member of the French Chamber of Deputies was interviewed about the matter and said that the Koran had nothing to say against the wheel, as the Prophet had not foreseen its invention; but he did not think the Arabs would ever dream of forsaking their fine horses for it.

OF, FOR, AND BY THE PEOPLE.

In all the jubilation over cycling's greatness let no one forget one important fact, that it was the masses, the toilers, the warp and woof of the nation, who have popularized it.

Cycling is the pastime of the people. They adopted it at sight, and made it possible that the millions of dollars invested in this interest, should every dollar of it receive its just reward.

CERTAINLY NOT FLATTERING.

The Rev. Dr. A. C. Dixon, in his sermon on Sunday last, said:

"In my boyhood I thought the most beautiful sight was a beautiful woman on a beautiful horse. There are degrees of ugliness, but I think the ugliest sight is a woman on a bicycle. Nevertheless, my daughter rides one. If she wants to be ugly, why I am willing she should be. If you young women want to be ugly in the fresh air don't let my opinion interfere with your bicycling."

There have been many things said about cycling which contained less truth than some of the words of the Reverend Doctor above quoted.

THE ACME OF PROGRESSIVE WOMANHOOD.

Elkhart, Ind., has probably one of the most successful women managers in the country. About a year Mrs. Otis D. Thompson was elected by the directors general manager of the Acme Cycle Company, and at once assumed the management of the plant, which is a large one. She was new to the business, but was energetic, and it did not take long for the directors to find out that under her management business was rapidly increasing, and that the success of the company was assured. Mrs. Thompson has many admirers in Elkhart, is prominent in society and is considered a remarkable woman.

GIVING THE JONAHS A CHANCE.

Englishmen take their pleasures sadly. A British wheel club, in arranging for its list of annual prizes, included a medal for the member who succeeded in accidentally puncturing the tires of his wheel the greatest number of times. Here would seem at last to be one prize-winner whose winnings will not be blazoned on the advertising and trade-puff pages of the wheel papers by the maker of the tires the winner won on.

FLEEING HAYSEEDS NOW.

During the year 1896 19,551 stolen bicycles were reported by one cycle protective association against 13,068 in 1895—an increase of nearly 50 per cent. A noticeable feature of the stolen wheel reports by this association is that in 1895 91 per cent of the thefts were committed in the largest cities of the United States and Canada, while in 1896 51 per cent occurred in villages and towns.

ONE THEORY, PLUS ONE TRIAL, EQUALS ONE ASYLUM.

"This beats having to time scorchers."

"Well, I don't know."

"Multiplying!" "Revolutions!" "Approximately!" "Help!"

GIVING A HOT ARGUMENT.

"Are you superstitious?" asked a racing man on meeting another of his kind at the cycle show.

"Well, I didn't use to be, but I am now, when it comes to believing in dreams," answered speed-maker number two.

"You do; why what makes you believe in anything so foolish as that?"

"I dreamed night before last of a conflagration, biggest one you ever saw, and I'll be blessed if next morning I didn't receive notice from my tire people that I had been fired from their team, and everyone I met roasted me besides."

BEATS WALKING ALL TO PIECES.

Depending upon the riding of a bicycle for one's living, may not be a very high calling for the one dependent, as those who object to professionalism have stated, but certain it is that it can not be correctly classed as among the lower walks of life.

ONE NOCTURNE OF THE NILE.

"Ah! my Toney, you will always love me, won't you, dearest?"

Notwithstanding the fact that Cleopatra's taper fingers were tight-held in his strong right hand, and her brick-bronze hair floated around him like a lurid dream, a shadow of annoyance flitted across Antony's cameo-like profile.

"Yes," he said, when he had banished the shadow, "I shall always love you, unless"—Pattie gazed up at him with there's-a-trouble-coming look in her eyes.

"—you become, as of course you will, addicted to that bicycle riding game, and wear

But he stopped there, reassured by her expressed belief that she was taking no chances with the Egyptian Charlotte Smiths, and then together, through the long, dusky twilight, they sat in happy silence, drinking in the lotus-laden breezes from the sleepy Nile.

The value of cycle exports from Great Britain, whole or in parts, amounted last year to \$7,500,000.

HORSE AND HORSE.

"Why on earth do you spend so much time going from stand to stand collecting catalogues and asking the price of the wheels when you have no intention of buying a bicycle?" said Mr. Snorter to his better half.

"For the same reason," she answered, "I suppose, that you sit around the house every evening reading the sporting extras and figuring out how much you might have won if you had only bet. It is a sort of mental diversion."

RASPING REPARTEE.

She came down like a thousand of brick; it was a clear case of side-slip.

"Did you fall?" said her escort as he dismounted, and proceeded to help her up.

She was mad clear through; who wouldn't have been? With a voice like one-half of a saw and file duet she said:

"Oh, no. I always sit down here to rest."

TRADE TO THE NORTH.

Vancouver, B. C., Jan. 19.—Cycling news in general being at a premium at this time of the year, a few remarks on the trade will probably not be amiss. In Vancouver, the event of most importance and interest, so far, is the opening of a shipping depot by the Good Bicycle Company, of Brantford, Ont. Two hundred Brantford bicycles, now on their way from the factory, are to be placed in stock in this city. The expected arrival, daily, of these machines has necessitated the removal of the Brantford representatives from their present quarters into more spacious warehouses. This shipping depot will supply all British Columbia, the interior in particular, and, if urgently required, wheels will be shipped to Australia from this point. Chas. Kendall, their agent for the past two years, will, as manager, still continue to further the "Redbird" interests.

F. E. Gould, assistant treasurer of the March-Davis Cycle Manufacturing Company, of Chicago, was recently in this city, and re-appointed C. Cocking agent for their machines for this season.

A. J. Dallain, of Victoria, B. C., has been appointed agent for the Province of British Columbia for the Sterling bicycles for '97.

Mr. Spera, of Messrs. Cornell, Spera & Co., wholesale bicycle jobbers of Winnipeg, Man., arrived this year on his annual business trip to the coast much earlier than in previous years, and is now going gradually from town to town, traveling eastward again. Mr. Spera had no cause to complain at the volume of business he transacted with the various agents of the wheels he represents throughout this Province.

Thomas Dunn & Co., Ltd., hardware merchants, of Vancouver, are agents for British Columbia for the Evans & Dodge bicycles. R. H. Casswell, their traveler, reports having appointed agents in nearly all the cities and towns of the Province.

The Cleveland Swell Special, which was received this week by M. W. Waitt & Co., the Cleveland agents in the capital city, was the first '97 model to arrive in Victoria. That it attracted great admiration goes without saying. Deane & Woods have the Vancouver agency of Messrs. H. A. Lozier & Co.

J. Z. Hall, of this city, will again this season represent the New Barnes Bicycle Company, for whom Lee & Co., of Woodstock, Ont., are the sole selling agents. Mr. Hall expects the '97 samples next week.

J. Stafford, traveler for the Welland Vale Manufacturing Company, who returned from the Antipodes on the Australian lines S. S. Warrimoo, on her last voyage to this port, reports having made a most successful business trip.

Charles F. Barker, holder of the half, one and five-mile amateur championships of British Columbia, has entered the cycle trade of this city with J. Williams, an old Stearns factory employee, under the partnership name of Williams & Barker. They have obtained the agency for the mainland of British Columbia of the Welland Vale Manufacturing Company, and have now a number of machines on the way from the factory. Mr. Barker will, consequently, ride as a pro. this year.

The monkey-wrench took its name from Charles Monckey, of Williamsburg, N. Y., who was the wrench's inventor.

AS IT IS UP TO DATE.

C. Murray Rice has purchased the jobbing department formerly conducted by the Anglo-American Cycle Fittings Co., at No. 105 Chambers street, New York, and the latter company has opened offices in the Home Life Insurance Building, No. 256 Broadway, in charge of J. Friedenstein. Last week it was inadvertently stated that Mr. Rice had established offices in the above mentioned building. Mr. Friedenstein will devote the forepart of each week at the company's plant at Waterbury, Conn., and the remainder of the week at the New York office.

SOME IDEALIZED FACTS.

"Ideal Notes" is the title of a new monthly publication, issued by the Shelby (O.) Cycle Mfg. Co., in the interest of Ideal cycles and their agents. It will be sent without charge to any dealer upon request. The company state that in their testing department two '97 Ideal frames, with the head and rear fork ends resting on a solid surface, and weight applied on the crank hanger direct, stood tests of 2,787 and 3,150 pounds before the frames commenced to bend, and even then they did not break.

HANDY AND LIGHT.

This is the Climax bag holder and package carrier. It can be attached to the head and handle-bar automatically, and weighs but an ounce. It is free from straps,

screws or fastenings of any kind, and can be carried in the pocket or toolbag. The Climax Bell Co., Boston, make it.

TELLS AN INTERESTING STORY.

Few states have done more for good roads than New Jersey, and few men in New Jersey more for improved highways than State Commissioner of Public Roads, Henry I. Budd, whose annual report of his labors is just to hand. Few people interested in good roads, and how to get them, can afford to be without Commissioner Budd's report, which same may be had by addressing the Commissioner at Trenton.

GETS ONE THOUSAND FOR A LEG.

Richard Howell, a one-time champion of England, and now proprietor of a Coney Island cycle checking stand, recovered in the Supreme Court, Brooklyn, on Monday, a verdict for \$1,000 against Henry M. Henderson, of Coney Island. Howell was walking in front of Henderson's property and fell, owing to the poor sidewalk, and broke his leg.

PROVE YOUR CLAIMS PROMPTLY.

Notice has been given to the creditors of the Niagara Machine Company, Buffalo, that all claims must be proven before the permanent receiver, Henry Ganson, at the office of Lewis & Lewis, No. 14 Court street, Buffalo, on or before July 19, 1897, pursuant to an order of the Supreme Court.

A PLEASANT SORT OF PUNCTURE.

Punctures received in the manner described below by a Cape Town, South African paper, would be welcomed with pleasure by the average cyclist. The South African writer puts it this way: "It is not usually considered a fitting opportunity to indulge in the wildest flights of exhilaration whenever one's tire punctures. There is one individual, however, who has cause to do so, for a puncture has been in truth a veritable gold mine to him. The gentleman in question is Mr. J. O'Donnell, of Kalgoorlie. One day recently when riding into Coolgardie, he found his machine settling down, and dismounting found that the embolus effecting the tire disaster was nothing less than a slug of gold over an ounce in weight. He wisely refuses to disclose the exact locality, probably seeing in this lucky contretemps a splendid opening for promoting a Something Gold Mine (Limited)."

A MUCH SOUGHT-AFTER WORD.

The word "Zimmy" is the cause of a law suit in England. Mr. Gammage, of Holborn, is endeavoring to obtain an injunction restraining the Wildless Steel Cycle Co., of Liverpool, from using the word in connection with the Zimmy toe clips. Mr. Gammage sells a toe clip bearing the same name. Justice Romer, before whom the case was heard, said the word "Zimmy" was not the sort of word that two firms would hit upon. The lawyer for the plaintiff said the genesis of the word was a familiar name for the great cyclist Zimmerman, and his client, being a very scrupulous person, went to Zimmerman and got his permission to use the word "Zimmy" for his toe-clips. After some discussion, the counsel for the defendant undertook not to use the word "Zimmy" until the trial of the action.

WILLIS GETS LIFE.

Taunton, Mass., Feb. 1.—Herbert A. Willis, who murdered Frederick N. Strange in this city in June last was taken into court this afternoon, where, by agreement of counsel and the State a plea of guilty of murder in the second degree was accepted and a sentence of life imprisonment imposed.

The murder is widely known as the "bicycle murder." Willis was concerned in several county store burglaries, bicycle thefts and other lawless deeds, which culminated in his jumping through a window of a Providence cycle store, where he had been trying to sell a stolen wheel. He fired several shots at his pursuers, knocked a young man off his wheel and rode to Taunton. Subsequently he confessed to murdering Strange.

ONE OF THE STRONGEST.

One of the victims of hasty presentation of unfinished news is the Schlueter Manufacturing Company, of Cincinnati. The widely published item was that a receiver had been appointed, the amount involved being \$500. The firm is one of the strongest in the trade, and to all those who were disturbed by the rumor they quickly showed their financial strength. Had there been any feature of weakness in the concern—and not all the firms in the bicycle trade are over strong at this period of the year—great harm might have been done the Schlueter company.

THE FINISHING CHARGE OF THE KNIGHTS OF THE HONEST WHEEL UPON THE REMNANT OF THE SHODDY FORCES. THE SUN OF PROSPERITY SHINES IN THE UPPER LEFT-HAND CORNER OF THE PICTURE.

IVER JOHNSON'S

General Agent
New York, New Jersey and Pennsylvania.

Kindly mention The Wheel.

PUMP AND REPAIR TOOL COMBINED.

There is a prevailing impression that firms confined to the manufacture of sundries occupy, as a rule, but a comparatively small portion of the factory building in which they are located. While this is true in many cases, there is an exception in the Buescher Mfg. Co., of Elkhart, Ind. This firm occupies entirely a large two-story factory, with several outbuildings, and in the busy season are rather crowded for space. Their line of sundries is varied and lengthy, but their specialty is the Buescher pump, made in numerous designs and improved forms. The latest addition to this line is a combination hand-pump and repair tool, similar to the "Jiffy" which they make for the B. F. Goodrich Co. The tool has been highly indorsed by one of the largest single tube tire makers, and a brisk demand is anticipated. Toe clips, lamp brackets and valves are also among their particular specialties.

CAN'T BE BLOWN OUT.

A new repair tool and outfit for single tube tires, which, it is claimed, will repair a puncture or cut from a pin hole to a cut more than an inch long, is being marketed by the Wexler Metal Goods Mfg. Co., New York.

The tool is formed by a handle and three telescoping ferrules made of drawn brass and nickel-plated. They form a casing in which is contained patches of three sizes, a collapsible tube of the firm's Tireoid cement, a sharp-pointed nipple, adhesive tape, a pair of steel pinners or tweezers adapted for any make or size of rubber patches, and an inserting pin or prod. By using their patented ferrules a patch can be inserted three times the size of the puncture, making a repair that cannot be "blown out."

LUCKY "PREFERREDERS."

Preferred creditors of the Greyhound Bicycle Manufacturing Company, of Boston, insolvent, will receive one hundred cents on the dollar. The assignees, Frederick Harris, of Springfield, and Robert F. Herrick, of No. 40 Water street, Boston, have notified all creditors whose debts have been proved and allowed as privileged, for labor, cost, etc., to be paid 100 per cent. No dividend has yet been ordered for the benefit of ordinary creditors, a meeting of whom will be held on February 16th, at Worcester, Mass., at 2 p. m.

NAME-PLATE PIRACY.

Clever conceits in name-plates are features of this year's bicycles. Many are painfully alike, but the worst piracy is a close counterfeit of Adams & Westlake's well-known "mark of high degree." It is not on a \$100 wheel, either, and a Chicago concern is the offending party.

WANT THREE THOUSAND WHEELS.

H. Scherer & Co., dealers in carriage material in Detroit, Mich., are about to enter the cycle jobbing trade, and are in the market for 3,000 wheels if they can get "the right article at the right price."

SWEATER MAKERS, PLEASE NOTE.

THE WHEEL can place business in the way of New York manufacturers of sweaters and golf hose, and would be pleased to have the addresses of such manufacturers.

WANT THE WHOLE THING.

Taken in connection with THE WHEEL'S London letter, appearing elsewhere in this issue, the following from the London "Financial Bulletin" is suggestive: "The Dunlop Company, not satisfied with the control which it at present possesses over the cycle industry, has under consideration the question of raising the capital from £5,000,000 to £10,000,000, with the object of getting the entire trade in its hands."

'97 ADLAKES.

Adams & Westlake Co., Chicago.

FOR THOSE WHO LIKE FIGURES.

Cox's Cyclist's Distance Computer, a cardboard disc device, designed to show the distance traveled by a bicycle, with any number of revolutions of the pedal and with any gear, and also the number of revolutions of the pedal required to cover a mile or other distance, is a little novelty issued by the Joseph Dixon Crucible Co., Jersey City, N. J.

WILL CARRY TWENTY-POUND BUNDLES.

H. C. Dare & Co., Patchogue, N. Y., are manufacturing a novelty for cyclists known as Dare's Patent Automatic Parcel Holder. It is simple, easily adjusted to handle-bars and ornamental. The holder is made of a nickel tube about five and one-half inches long and in diameter about as large as a five-cent piece. It has a cord attachment which is wrapped around the parcel or package desired to be carried, and the ends of the cord are then hooked over two small hooks, thus requiring no knots or buckles. It will carry packages weighing over twenty pounds. One of the features of the holder is that the further the cyclist rides the tighter the cord draws on the package, thus keeping the package from constantly slipping.

AGREED ON PRICES.

All the dealers and repairmen of Binghamton, N. Y., have agreed on a schedule for repairs and the rental of wheels. The charge for rental is based on the rate of \$1.25 per day. The price list for repairs embraces every conceivable part that is likely to need replacing or repairing, running from \$3.50 for enameling a frame to 10 cents for adjusting a chain or bearing or oiling a wheel throughout.

WOMAN'S LOGIC.

"What do you want a bicycle for?" said he, grumblingly. "Do you know what one costs?"

"I can not help what they cost," answered she, in woman fashion. "I picked up the loveliest cycle suit at a bargain to-day. I can not afford to let it go to waste, now, can I?"

WILL BE SEEN AT THE SHOW.

Interest in roller chains is on the increase. Several new ones have made their appearance, the latest being the production of Brown & Wales, Boston. It will be shown publicly for the first time at the New York Show.

GOING FOR THE FERRIES.

There has been a bill introduced before the New York Senate which if it becomes a law will permit any wheelman, when a passenger upon any ferry-boat within the jurisdiction of the State, to carry a bicycle with him free of charge.

FIGURE IT OUT.

On one of the trans-continental railroads eighteen tons of steel disappear daily by wear and rust. Taking this as a basis, how much does the would-be seller of a second-hand wheel lose by allowing rust to accumulate upon it?

SLOW, BUT SURE.

At the Philadelphia show the local branch of the Keating Wheel Co. proposes to distribute as souvenirs passes or tickets good on any street-car line in the city during the show week, February 20-27.

LOOKING FOR GOOD THINGS.

A. W. Gamage, London's most prominent dealer, is in this country on his annual hunt for American novelties and specialties of merit.

NEW YORK'S TURN NOW.

"EASTERN NATIONAL CYCLE EXHIBITION," THEY TERM IT, AND IT PROMISES TO BE WORTHY OF ITS PROMOTERS AND THE INDUSTRY WHICH IT REPRESENTS.

The doors of the Eastern National Cycle Show will be thrown open at eight o'clock to-morrow evening. It will be held at the Grand Central Palace of Industry, Forty-third street and Lexington avenue.

The Palace will present an unusual appearance, since the Show will not be on one floor but on several, immense elevators carrying one up or down if he does not care to walk.

some respects; some of the more important rules provide that division of spaces will not be allowed, and that spaces must be paid for on or before February 8th. There will be a bureau of information at the main entrance, a bureau of registration and a restaurant and cafe. Goods must be plainly marked with the name of the exhibitor, and the number of the space, and must be addressed to the Grand

upward. Any space not occupied within twenty-four hours after the opening of the Show will be forfeited.

The appended list of the exhibitors and the stand numbers attests that there are a number of firms at the New York Show who were not represented at the Chicago exhibition and that the latter has not wholly robbed the displays of interest even to those who were in attendance at the Western function.

LIST OF EXHIBITORS.

FIRST (OR GROUND) FLOOR.

Buescher Mfg. Co., 373.
Builder's Iron Foundry, 428.
Burke, Roberts Co., 430.

GRAND CENTRAL PALACE, FORTY-THIRD STREET AND LEXINGTON AVENUE, NEW YORK.

It is expected that the Show will look rather cut up, but nothing will be left undone to agreeably disappoint the public. A map published elsewhere in THE WHEEL shows that the building is well located. It also gives the location of the prominent hotels, although the Hotel Marlborough, Thirty-sixth street and Broadway, which is sure to be very popular with the trade, has inadvertently been omitted from the list. The building is immediately around the corner from the Grand Central Depot, and as every man, woman and child in New York knows the location of that railroad centre, strangers will have no difficulty in finding the quickest way to reach the Cycle Show.

Some of the exhibitors may find it of value to re-peruse the rules which are radical in

Central Palace, Forty-third street and Lexington avenue, New York. Goods will be received and delivered only at the Forty-third street entrance of the building, but no goods will be received upon which there are any charges. Goods can be removed only after 11 p. m. on Saturday, February 13th, and the door-keeper must be presented with a written order from the exhibitor for the removal of the goods.

Any regular bicycle agent, manufacturer, exhibitor, or employee of any of them, will be admitted free of charge from 9 a. m. to 1 p. m., after proper identification. Exhibitors will be allowed the following discounts on admission tickets: 20 per cent. on lots of 100; 30 per cent. on lots of 200; 40 per cent. on lots of 300; 50 per cent. on lots of 500 and

MONARCH QUALITY

IN THE MONARCH lexicon there is no such word as "SECOND." In quality of product we yield the premier position to no one. Out of the trinity of mechanical skill, excellence of material, and the finest equipped bicycle factory in the world, we have evolved a bicycle that is recognized the world over as standard. "Monarch Quality" is the climax of perfection in bicycle manufacture. ❁ . ❁ ❁

YOU can't make a mistake in buying a Monarch. Our Guarantee, backed up with a paid-up capital and surplus of a million dollars, insures you against any possible dissatisfaction. Be satisfied, ride a Monarch and keep in front. ❁ ❁ ❁ ❁ ❁ ❁ ❁

Our catalogue is yours for the asking.

NEW PATENTS.

575,692. Bicycle. Colin S. Buell, New London, Conn. Filed May 14, 1895. Serial No. 549,223. (No model).

575,693. Drive-Chain. Philip Burns, Norwich, Conn. Filed May 25, 1895. Serial No. 539,051. (No model).

575,712. Bicycle-Pedal. Richard F. Hamilton and Julius Wodiska, New York, N. Y. Filed February 10, 1896. Serial No. 578,683. (No model).

575,717. Lamp-Bracket. William C. Homan, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed December 10, 1895. Serial No. 615,089. (No model).

575,718. Screw-Lock. George W. Kammerer, Norwich, Conn. Filed October 11, 1895. Serial No. 565,431. (No model).

575,719. Bicycle-Lock. Franklin H. Larrabee, Hutchinson, Kans. Filed February 19, 1896. Serial No. 579,812. (No model).

575,746. Adjustable Handle-Bar. Orrin A. Wheeler, Chicago, Ill., assignor to the Indiana Novelty Manufacturing Company, Plymouth, Ind. Filed May 6, 1896. Serial No. 590,454. (No model).

575,783. Wheel-Tire. Edward E. Quimby, Orange, N. J., assignor to the North British Rubber Company, Limited, Edinburgh, Scotland. Filed December 1, 1894. Serial No. 530,563. (No model).

575,787. Attachment for Bicycles. John S. Voitek, New York, N. Y. Filed June 26, 1895. Serial No. 596,982. (No model).

575,798. Ball-Bearing. Joseph B. Baker, Naples, Texas. Filed November 10, 1896. Serial No. 611,632. (No model).

575,815. Bicycle. Walter Todd, Paterson, N. J. Filed June 29, 1896. Serial No. 597,329. (No model).

575,817. Valve for Tires of Velocipedes. Friedrich Veith, Offenbach-on-the-Main, Germany. Filed October 2, 1896. Serial No. 607,644. (No model).

575,879. Adjustable Handle-Bar. Frank K. Dunn, Chicago, Ill. Filed May 18, 1896. Serial No. 591,976. (No model).

575,880. Differential Gear. Rudolph Eickemeyer, Yonkers, N. Y.; Rudolph Eickemeyer, Jr., executor of Rudolph Eickemeyer, deceased. Filed September 10, 1894. Serial No. 522,599. (No model).

575,889. Apparatus for Repairing Pneumatic Tires. Calvert C. Hines and James A. Willard, Baltimore, Md., assignors to the New York Bicycle Equipment

Co., New York, N. Y. Filed February 12, 1896. Serial No. 579,192. (No model).

575,910. Bicycle. Willis M. Sherman, Chicago, Ill., assignor of two-thirds to Martin W. Sherman, and Frank M. Hoyt, Milwaukee, Wis. Filed April 11, 1896. Serial No. 587,161. (No model).

575,912. Bicycle-Skirt. William E. Smith, Birmingham, Ala. Filed July 6, 1896. Serial No. 598,067. (No model).

575,936. Combined Adjustable Handle-Bar and Brake for Bicycles. Manuel A. Rosso, New York, N. Y. Filed January 24, 1896. Serial No. 576,710. (No model).

575,938. Bicycle-Brake. William L. Stewart, Wilmerding, Pa. Filed July 15, 1895. Serial No. 599,083. (No model).

575,987. Ball-Bearing. William C. Quigley, Marion, Ohio. Filed April 20, 1896. Serial No. 588,853. (No model).

576,002. Bicycle-Supporting Stand. Theodore Terrill, Yonkers, N. Y. Filed February 21, 1896. Serial No. 580,161. (No model).

576,070. Bicycle-Saddle. Martin L. Deitzler, Harrisburg, Pa. Filed June 9, 1896. Serial No. 594,828. (No model).

576,071. Bicycle-Support. Albert E. Holiday, New Haven, Conn., assignor of one-half to E. J. Eves, same place. Filed January 7, 1896. Serial No. 574,582. (No model).

RECENT PATENTS.

576,002. BICYCLE-SUPPORTING STAND. THEODORE TERRILL, Yonkers, N. Y. Filed Feb. 21, 1896. Serial No. 580,161.

576,092. BICYCLE. COLIN S. BUELL, New London, Conn. Filed May 14, 1895. Serial No. 549,223.

575,797. ELASTIC TIRE. GALELLI E. WILSON, Greenville, S. C. Filed Aug. 1, 1895. Serial No. 554,978. (No model). In England June 2, 1894. No. 10,719; in France Sept. 2, 1895. No. 262,021; in Belgium Sept. 4, 1895. No. 117,946; in Italy Sept. 15, 1895. No. 39,167; and in Denmark Sept. 8, 1895. No. 732.

575,529. BICYCLE. JOHN C. STEPHENSON, New York, N. Y. Filed Jan. 15, 1896. Serial No. 595,758.

Claim.—A bicycle-stand comprising a suitable base, as by a right-angle triangle, and the upright in position to support the crank-hanger of a bicycle, the stand being adjustable to the upright in position to engage the seat-post tube and lower from the tube of the bicycle-frame and means for clamping the brace to the upright, substantially as set forth.

Claim.—In a device of the character described, an ordinary bicycle-frame, a supplemental frame adapted to be secured thereto, a fork journaled in the supplemental frame and means for connecting the fork of the supplemental frame to the fork of the ordinary frame, so that both forks will work in unison, as and for the purpose described.

Claim.—In an elastic tire, the combination with an outer cover, of an inner tube containing jelly in the like reticulated substance, and an elastic chamber or chambers containing said outer pressure and operatively to put the jelly under compression, substantially as described.

Claim.—In an attachment for bicycle: the combination of the table 8, pivotedly connected with the frame of the machine, the steering V, two or more lateral brace-rods, 11, pivotedly connected to said frame, the rod M, provided with the collar or the roller E, and the links L, connecting said traveler with the brace-rods K, substantially in the manner and for the purpose described.

575,745.7. LANTERN-BRACKET. SHERRY L. SAY, Jordan, Mass. Filed Feb. 10, 1896. Serial No. 578,783. (No model).

575,529. BICYCLE. JOHN C. STEPHENSON, New York, N. Y. Filed Jan. 15, 1896. Serial No. 595,758.

575,717. LAMP-BRACKET. WILLIAM C. HOMAN, Meriden, Conn., assignor to the American Tire Company, same place. Filed Dec. 10, 1895. Serial No. 615,089. (No model).

575,712. BICYCLE-PEDAL. RICHARD F. HAMILTON and JULIUS WODISKA, New York, N. Y. Filed Feb. 10, 1896. Serial No. 578,683.

Claim.—In a device of the class described, the combination with the shell or casing, of the thumb-bolt arranged therein, the sliding nut carried by said bolt, and a chain or metal band having its opposite ends attached to said sliding nut, for the purpose set forth, substantially as described.

Claim.—In a cycle-saddle attachment, the combination of the head-clip as provided upon the inner adjacent face of its free ends with inclined planes of the cross-pieces passing through said ends of the clip and provided with nuts tapered over its ends for drawing the ends of the slip toward one another, means for attaching a saddle-frame to said clip, and a pressure-block or cord by said cross-pieces and provided with inclined planes which are engaged by the inclined planes of when the ends of the clip are clamped and the pressure-block thereby caused to grip the saddle-support, substantially as described.

Claim.—In a lamp-bracket, charging arms carrying a bearing-plate, said plate being adjustably connected directly by one of said arms, an intermediate block, and a clamping-block.

Claim.—A tire, comprising an inner air-tube, a textile tube extending over said inner tube, said textile tube consisting of a self-healing tube composed of two unequal segments, the larger segment having its greatest length at mid-width, and its minimum length in its marginal portions at both sides of each length, and an elastic shoe or cover which incloses said textile tube, and above or over comprising of a self-healing tube split longitudinally, and composed of two unequal longitudinal segments, the larger segment having its greatest length at mid-width, and its minimum length in its marginal portions at both sides of each length, and having five folds, which are inverted between the edges of the rim and the textile tube, to secure the tire to the rim, substantially as set forth.

575,634.4. PNEUMATIC HUB. HARRY R. COLLINS, South Bethlehem, Pa. Filed Jan. 16, 1896. Serial No. 579,700. (No model).

575,536. BICYCLE-TIRE. HENRY SHUGALL, Melbourne, Victoria, Australia. Filed Aug. 4, 1896. Serial No. 591,918. (No model).

575,655. BICYCLE LUNCH-BOX. EDWARD M. LORAN, Mount Vernon, N. Y. Filed July 9, 1896. Serial No. 598,801. (No model).

575,725. CHANGEABLE GRAB FOR BICYCLES. CHRISTIAN A. METZ, Allegheny, Pa. Filed Sept. 14, 1895. Serial No. 582,814. (No model).

Claim.—In a pneumatic hub for wheels, the combination with the hub proper, of spaced radial members surrounding the same and rigid thereon, pneumatic tubes extending around and seated on said radials, spaced spoke-rings arranged outside of said pneumatic tubes, transverse flanges rigidly connecting said spoke-rings, and an arm rigidly connected to the hub proper between the saddle and having its outer end hooked, whereby it is adapted to straddle and adjustably engage one of said tire-braces, substantially as described.

Claim.—In a bicycle or other tire, the circular cover 17 having the circular lips 16 and 19, in combination with the foundation 67 and the fracture-hold 12 1/2, said foundation and fracture-hold each having recesses with which said lips engage, all substantially as described and for the purposes set forth.

Claim.—A rigid open-top box or receptacle having therein a log and catch located below it for the retention of a dish in the lower part of the box, and provided with a rigid gasket cover having holding-ribs, and box being actuated by a handle or rod extending extended below the bottom of the box so as to form a lower compartment, and for padding the box being extended through the bottom with the lower compartment to form a slot top for the latter, said casing having flaps for covering the cover and a side of the box, and for closing the lower compartment, said casing having attaching straps or loops at its top and front, substantially as described.

Claim.—In a bicycle, the combination of a frame having a vertical brace-bar, the lower end of which is forked and provided with a perforation extending through it, a driving-wheel having sprocket-wheels at opposite sides, a crank-shaft mounted to turn in the lower end of the forked end of the vertical bar of the frame and having pedal cranks, sprocket-wheels loose on the ends of the crank-shaft and provided with clutch-teeth on their inner sides, said cranks passing over the sprocket-wheels on the crank-shaft and drivingly, the sprockets at opposite sides of the bicycle being inversely proportional, a clutch-shoe key-rod and a clutch-rod which cross each other between the sprocket-wheels and provided at its ends with clutch-teeth, arranged when the device is moved to engage the clutch-teeth on the inner side of the sprocket-wheels, said shoe being provided with a central circular groove, a collar loose in said groove, said projecting beyond opposite sides of the collar, a lever extending up along the vertical brace-bar of the frame and having its lower end engaging one pin, said lever being provided with a pin-joint extending through the perforation in the frame, and its own end pivoted on the side of the frame, opposite to the lever, said arm being arranged to move with the lever and being in engagement with the other side of the sprocket; the upper end of said lever being elastic and being provided with a handle arranged to be held by the elasticity of the lever in contact with the sprocket side of the vertical brace-bar of the frame when the lever is moved pivotedly, substantially as set forth.

575,634.1. CYCLE-SADDLE ATTACHMENT. JOHN B. BROWN, Birmingham, England, assignor to the J. B. Brown & Co. (Incorporated), same place. Filed Sept. 10, 1895. Serial No. 606,319. (No model). Patented in England May 28, 1896. No. 10,253.

575,613. PNEUMATIC-TIRED WHEEL. WILLIAM MARION MARTIN, New South Wales, assignor to John King, Sydney, New South Wales. Filed Oct. 1, 1896. Serial No. 607,584. (No model).

Claim.—In a pneumatic-tired wheel, the combination with an annular elastic tire, the tire being provided with a main outer loose upon said axle, and a wheel-hub provided with a circular perforation or opening surrounding the axle, of an air-pump cylinder mounted on and communicating with said elastic tire pump-cylinder being also in communication with the pneumatic tire, the pump-cylinder being a piston-rod extending to the said main outer contact with the axle, a spring surrounding the piston-rod, and a rod for said spring, substantially as described.

Claim.—In a bicycle-seat consisting of a frame or rim adapted to be set into the seat and comprising a back portion downwardly inclined toward the front portion of the seat to downwardly the back-portion of the sides, and the said front portion consisting of arcs extended inwardly from the back portion and to advance and rearwardly inclined over and the rear portion of the said seat, substantially as described.

Claim.—In a cycle-saddle attachment, an adjuster or brace the combination of the spring-clip provided on the adjacent inner face of the ends with two of the pins 11, which extend to and engage the ends of the said clip, and which are arranged on the ends of the pins in juxtaposition to the side of the said inner surface, where the spring-clip is attached to the saddle, a clamping groove formed on the ends of the said adjuster, and, means for clamping the saddle and the ends of the clip on said pin, substantially as described.

Claim.—In a velocipede-frame, a joint between two tubular struts comprising a tubular socket to receive one of the arms of the frame, each socket being partly cut away to taper it and to diminish its area gradually toward the end; and provided with an integral narrow rim extending in a plane transverse to the said end, and then formed the latter near the end of the taper, substantially as set forth.

Claim.—In a pneumatic-tired wheel, the combination with an annular elastic tire, the tire being provided with a main outer loose upon said axle, and a wheel-hub provided with a circular perforation or opening surrounding the axle, of an air-pump cylinder mounted on and communicating with said elastic tire pump-cylinder being also in communication with the pneumatic tire, the pump-cylinder being a piston-rod extending to the said main outer contact with the axle, a spring surrounding the piston-rod, and a rod for said spring, substantially as described.

Claim.—In a bicycle-seat consisting of a frame or rim adapted to be set into the seat and comprising a back portion downwardly inclined toward the front portion of the seat to downwardly the back-portion of the sides, and the said front portion consisting of arcs extended inwardly from the back portion and to advance and rearwardly inclined over and the rear portion of the said seat, substantially as described.

SAMSON TIRES

GOST AND PRICE...

are much-mooted questions with some makers. We will say, however, that you can secure wheels equipped with SAMSON Single-Tube Tires **without extra cost**, and that with us cost and price are secondary considerations. Quality is our first requisite. That is why

Samson Single-Tube Tires

Are the Highest Grade Tires Ever Made.

At New York Cycle Show, Spaces 281, 282, 295 and 296.

"DISTINGUISHED FROM COMMON CYCLES."

"As the swan is more graceful than the stork, so the Cygnet Cycle is more graceful and artistic than the diamond frame," says the Cygnet Cycle Company, in introducing their new wheel, here illustrated. That it is "readily distinguished from the common cycles," as the makers assert, is apparent at a glance.

The concern, which is a recent institution in Williamsport, Pa., has Robert E. Pattison,

ex-Governor of the State, as its president, and conspicuously prints that the wheel is "backed up by \$3,000,000 of capital."

Durability and simplicity is claimed for the Cygnet, the frame consisting of but two continuous sections of half-round tubing and having eight less tubular joints. It is claimed to be stronger than the ordinary, because it is built so rigid laterally that it cannot twist or get out of true. It is resilient vertically, the spring frame affording greater comfort for the

rider, and the fact that the gearing is entirely out of the way and protected by the lacing, is pointed to as an added element of safety and cleanliness. The lacing is such that it may be tightened or loosened in a moment, rendering the frame as stiff or as springy as may be desired.

Among the other novel features is an ingenious cyclometer, which forms an integral part of the wheel. It is built in the fork

crow, as shown, and "cannot be lost, broken or stolen."

The Cygnet people say that "over three hundred (300) professional riders, mechanical experts and other critics have pronounced the Cygnet Cycle a complete success, and so far in advance of the ordinary constructions that the demand for them during the season of '97 will no doubt be far greater than it is possible for the manufacturers to supply," and that "patents are being secured on the Cygnet in all civilized countries on the globe."

AN APT PUPIL OF AN EXCELLENT TEACHER.

Frederick S. Dickinson, formerly of the Henley Bicycle Works, is now connected with the Thomas Mfg. Co., Springfield, O. Besides going on the road, he will act in an executive capacity with the Thomas people. Dickinson is acquainted with every feature of cycle making and repairing, securing his schooling with A. Featherstone, the Chicago maker, years ago.

AND THE JACKS ARE GREAT!

For nine two-cent stamps the Monarch Cycle Mfg. Co., Chicago, will send to any address a pack of their Monarch playing cards. The cards are unique and serviceable and free from advertising matter. Lillian Russell's face does service for the queens, while Tom Cooper's countenance adorns the kings.

"Runabout" is the title which A. Featherstone & Co. have chosen for their new \$100 tandem.

HUMBER AND THE CYCLE SHOW.

Humber & Co., America, Limited, announce that during the progress of the New York Cycle Show at the Grand Central Palace they will hold an exhibit of their 1897 models at their uptown salesroom, Forty-second street and Fifth avenue, where Mr. A. O. McGarrett, manager of their New England sales department, with Mr. H. A. Woodward and Mr. E. W. Clement will be in attendance.

At their downtown depot, 318 Broadway, will also be held an exhibit, and in addition to their 1897 models will be shown five makes of 1897 English cycles and one 1897 Acatene (French Chainless), purchased by Mr. Elliott Barris, at the Stanley and National Shows in December.

Mr. Chas. K. Alley, New York manager for Humber & Co., will be in charge at 318 Broadway, and will be assisted by Mr. Harry Hall, Mr. George Clough and Mr. C. M. Dally, Jr.

Reputable and select agents desirous of securing the representation of Humber's would do well to call and examine their 1897 models during the week of the Show at either of the above addresses and interview the gentlemen who represents Humber quality. ***

Challenge Adjustable Handle-Bar.

Patented
Dec., 1896.

The most perfect adjustable Bar yet invented. Handles can be raised from lowest to highest point without dismounting. No tools required. Grips retain the same alignment at all times.

Insist on the Challenge Bar. You can get it free on your '97 wheel if you demand it.

Sent on receipt of Price, \$5.00

CITY CONVENIENCES IN THE COUNTRY.

A country clubhouse that will be specially adapted for cyclists of both sexes has been secured by the Sewanhaka Country Club, of Brooklyn. From a large number of properties offered, the Baldwin estate at Millburn, Long Island, has been selected and bought. The mansion is on a slight hill in the midst of a grove of old trees, and, lying directly between the house and the road, is a fine lane, one of a chain of three on the premises. The house contains seventeen large rooms and all modern conveniences. Two wings will be built before it will be opened to the members. One of these wings will contain the main dining-room, capable of seating about 400 persons at once, while the other wing, together with the present house, will have a women's dining-room, parlor and retiring-room and a private dining-room for small parties of friends wishing to dine together, and away from the main room. Men's parlors, reading-room and smoking room will

be in the main house. There will be tub, needle and shower baths and some sleeping accommodations. Tennis courts, golf links and ball grounds will be laid out. The house is easy of access, being on the Merrick road and close to a railroad station.

CYCLE PATH FOR THE QUAKER

At Harrisburg, Pa., last week, a bill was introduced in the Legislature providing for the construction of cycle paths along public highways. It provides that whenever the Commissioners of any county, or a majority of them, shall, with the approval of the Grand Jury, relocate, open or improve any road or highway, they shall have the power to lay out a suitable road or path for the use of bicycles, tricycles and other vehicles of similar character, or vacate so much of any road as may be rendered unnecessary and useless, and it shall be the duty of the county to maintain and keep the same in repair. As a punishment for throwing or placing anything on or over this road, the first offense is a fine of \$5, and each subsequent offense is \$10.

The Commissioners are also authorized to spend an amount not exceeding 10 per cent of all taxes now levied for road purposes in the maintenance of these bicycle paths.

A Maine man, who earns 90 cents a day, has nine children and five dogs, is saving up to buy a bicycle.

**Bicycle...
...Balance.**

Insures safety. Wonderful in its results. Will balance wheel perfectly and keep wheel straight ahead. Weighs only two ounces. In ordering, give size of tubing.
Price, Nickerled, \$1.00. Gold-Plated, \$5.00.
If not found at the dealer's, any of the above can be sent by mail.

It excels after five years' trial. Clean to use. Best of them all. Price, Box of Red, 25 cents; Stick of Yellow, 10 cents. LIBERAL DISCOUNT TO THE TRADE.

Extra Handle Grip.

Supplies a great need. Permits rider to change position. Absorbs perspiration and preserves handle-bars. When ordering, give size of handle-bar. Price, per pair, 35 cents.

VOL. XVIII., No. 26.

NEW YORK AND CHICAGO, FEBRUARY 12, 1897.

WHOLE No. 468.

GARFORD IN THE SADDLE.

He Will Control Cycle Board of Trade Affairs For a Year.—New Blood Introduced.

The National Board of Trade stockholders held their meeting on the glass-roofed garden of the Grand Central Palace on Wednesday, at 10.30. President Coleman was in the chair, flanked by Secretary Franks and Treasurer Redding.

Reports were read by various committees, nothing of interest transpiring in them, and A. G. Spalding moved a unanimous vote of thanks to the retiring president. Mr. Spalding eulogized the outgoing president, and spoke high praise for him, as he well deserved.

The other chief business was the election of officers. The Nominating Committee, Col. Ben Lovell, chairman, which was out seventeen minutes, reported in favor of the gentlemen whose names follow:

President, A. L. Garford, Elyria, Ohio.
First Vice-President, Geo. H. Day, Hartford, Conn.
Second Vice-President, C. W. Dickerson, Chicago, Ill.

Treasurer, W. A. Redding, New York.
Secretary, E. R. Franks, New York.
Directors, Messrs. Garford, Day, Dickerson, R. L. Coleman, New York; J. L. Yost; A. G. Spalding, New York; Walter Measure, Boston; L. M. Wainwright, Indianapolis; R. S. Crawford, Hagerstown, Md.; Kirk Brown, New York; C. H. Funnell, Buffalo; A. R. Peck, Syracuse; C. S. Dikeman, Torrington, Conn.

There being no other nominations, it was moved that the secretary cast a unanimous ballot, and the ballot was cast, and there was not a sound and everything was smooth as graphite.

Please note that there is some new blood in the Board, including Walter Measure, the Union man; Charles S. Dikeman, the Eagle A. R. Peck, the Barnes White Flyer man; R. man; L. M. Wainwright, the Ben-Hur man; S. Crawford, the Crawford man; C. Atherton Funnell, the Envoy and Fleetwing man, and Kirk Brown, the Dunlop man.

The treasurer's report was very interesting. It showed that some \$35,000 was made on last year's New York Show, and \$8,000 odd on last year's Chicago Cycle Show. The Credit Bureau has collected \$86,000 odd. The Board owns \$7,000 worth of Coliseum stock and \$13,000 worth of Government bonds.

Then came up a good fight on the show question, with much discussion pro and con, the prominent men being A. G. Spalding, W. W. Stall, R. S. Crawford, Kirk Brown and J. A. Carter. There was some feeling in favor of no show at all; quite a big feeling, in fact, but it was thought best finally not to tie the

hands of Board, and so a resolution was adopted to the effect that the sense of the meeting was that there be no show held, but that the matter was left entirely in the hands of the Board.

The Executive Committee will be Messrs. Garford, Spalding, Coleman, Day, Dickerson, Dikeman and Redding.

The resolution as made by A. G. Spalding and as amended and adopted, is as follows: Resolved, That it is the sense of this meeting that the National Board of Trade of Cycle Manufacturers discontinue its Annual National Cycle Exhibitions, if deemed advisable by the Board of Directors, and that in place thereof it encourage and sanction local cycle shows under terms and conditions prescribed by the Board of Directors, upon the following general lines: Sanction and encouragement to be given first and preferably to Local Cycle Boards of Trade.

A percentage of the gross receipts of all local cycle shows to be paid to the National Board of Trade of Cycle Manufacturers for its maintenance and increase of its usefulness.

The conduct and terms of such local cycle shows to be in conformity to such rules, regulations and provisions as the Board of Directors of the National Board of Trade of Cycle Manufacturers may prescribe.

Sanction to be granted only for such local shows as commence not earlier than the last Saturday in February and terminate not later than the first Saturday in April of each year.

Spaces to be of uniform size and no exhibitor permitted to occupy more than two spaces. Price of space to be adjusted in accordance with location.

VICTOR FIVE THOUSAND GUARANTEE.

All Victor bicycles will hereafter be covered by two guarantees—one, the regular 12 months' document, the other, something decidedly original and peculiarly Overmanesque, incorporating, as it does, some of the pet ideas of President A. H. Overman, in the matter of cycle construction. It reads:

Victor bicycle No.— is guaranteed to contain no castings, no sheet metal frame joints, no lap brazed joints, no case hardened cones or balls, and— is insured in the sum of \$5,000 against any personal injury which may occur on account of such material or construction in this bicycle as delivered by the Overman Wheel Co.

THREE NINES STILL LIVES

The dissolution of F. X. Muller & Co., is followed by the announcement of a partnership between Messrs. F. X. Muller and Peter Lang, who intend to make the well-known Empire State 999 cycles and Boston Special cycles, the style of their firm being the Empire State 999 Cycle Works, with headquarters at Herman street, Buffalo. They state modestly that "with our own hard labor we have gained a start and have made additions to our factory, and put in the latest and most improved machinery, which will enable us to build a fair output for 1897. We have models ready and have already shipped samples to Europe. We have also added a line of boys' and girls' juveniles.

PHILADELPHIA'S PLUM.

She Draws the League Meet Prize Without Half Trying.—Some Queer Post-marks on Ballots.

Boston, Feb. 6.—Prepare to jubilate! Philadelphia's won the plum—in this case the next National meet of the L. A. W.

The vote was canvassed at high noon to-day and while prophets had picked Philadelphia for a certain winner few had any idea that the vote would be so tremendously one sided. The Quaker City received 223 votes; Columbus, Ga., 34; Nashville, Tenn., 10; Thomasville, Ga., 0.

The ballots were sent out from the secretary's office January 12 and as soon as they were returned were carefully laid away and not opened until to-day at 12 o'clock, noon. They were enclosed within three envelopes, so that it was impossible to tell in advance who or how any of the National Assembly men had voted.

The counting was done by Secretary Bassett, assisted by two of his competent office employees, Mr. J. Fred. Adams, chairman of the National auditing committee, President Elliott, and A. D. Peck, secretary-treasurer of the Massachusetts Division. There were also present, H. C. Nickerson, chairman of the L. A. W. transportation committee, J. C. Kerrison, official handicapper of New England and G. W. Tarbell, of the Boston Globe.

Mr. Peck was present as the representative of the Pennsylvania Division and as soon as the result was announced he wired his Quaker friends the glad tidings. In return he received a dispatch requesting him to go to Philadelphia and attend the celebration over the honor bestowed upon the Quaker City.

The canvass developed some interesting information. Some thirty-eight votes from New York delegates bore Philadelphia post-marks. This might lead one to suppose that about all the New York delegates had gone to the Philadelphia post-office for specific reasons. Even one of the votes from good old Puritanical Massachusetts was cast in an envelope bearing a Philadelphia postmark and all the way through it was strange to find so many of the delegates in the Quaker City, seemingly, if letter post-marks were accepted as evidence. Only seven of the votes from New York delegates came in envelopes bearing New York postmarks.

It will be seen that not all the delegates entitled to vote cast ballots, as there are 298 delegates and only 267 voted.

Congratulatory telegrams were sent to the Philadelphia people after the result was announced.

HOOLEY STILL AT IT.

**He is Buying Everything in Sight Abroad—
Racing Legislation and More
Tire Suits.**

London, Jan. 30.—G. L. Hillier has not yet left England for America—if he now ever intends to—on the matter to which I directed attention in my last.

It is freely stated, and I am in a position to say, with truth, that an eminent financier—E. T. Hooley, to wit—has had his eye on the Osmond Company for some time, and has even gone the length of making an offer. As, by the time this will appear in print, the matter will have been settled, there can be no harm in stating that it would, if consummated, make the shares worth over £3, it seems difficult to see how it can be refused, but as F. V. Osmond is in rather frail health, and as the concern seems to have more work than it can put out, perhaps the directors will temporize. The man who wants to buy the Osmond must be prepared to pay a stiff figure, but unless greatly developed it would not be worth the while of E. T. Hooley to re-float.

The Birmingham and Glasgow shows both close to-day, and between Birmingham and Dublin a keen rivalry has sprung up, each claiming that its show was the larger. Both were very fine shows, no doubt, and quite as large as was the Stanley, in '94, but of the two no doubt American makers will give precedence to Dublin, where the Stars and Stripes were much more largely represented than at Birmingham. This, of course, was quite natural, because Irish cyclists have a natural weakness for everything American, while Birmingham, as the Gibraltar of the English cycle trade, could scarcely be expected to view the invasion of its keenest rivals with equanimity, not to say pleasure. Glasgow's was a parochial sort of show—got up with Scotch caution, and managed with one eye always on the money in hand. Still, in its own way it was a success.

The N. C. U. Council meeting at Birmingham during the progress of the Birmingham show was remarkable for three things. It was the last council of the '96 government; it was governed by the provincial votes, it over turned the system of dealing with the trade licenses which has held for the past three years. The two former have no great bearing on matters, but the latter will probably convulse the N. C. U. from end to end between this and March. The Trade Licensing Committee has been abolished, and by some inexcusable blunder no substitute was appointed, so that its functions will in natural order revert to the centre licensing committees, whose partial administration of the law caused the formation of the body just dissolved.

Still the flood of law suits connected with the tire question. The Dunlop Co. have an average of a dozen per week disposed of in their favor, the latest being an order of the court on the Tubeless people to keep an account of all tires sold in view of the coming action. The appeal of Gormully & Jeffrey against the North British verdict came on yesterday, and is being heard as I write. It is

not expected here to cause a reversal of Mr. Justice North's verdict, but one never knows.

LOOKS PRACTICAL.

London, Jan. 26.—Here is the Rudge-Whitworth crank bracket, one of the most unique brackets, or hangers as you call them, on the English market. It is of the cup or disc adjusting variety, but there are no projections from the face of the bracket nor any bushing or jaming studs to secure the adjusting discs in position when the necessary adjustment has been made. To adjust the bearings either side can be operated with by unwinding very slightly the outer cap or disc A or A₁. Then a C spanner is inserted through the A.A. Outer Cup, with Felt Dust Protectors.

B.B. Inner Cups.
C.C. Adjustment Slots.
D. Body of Bracket.
E.E.E.E. Balls.

F.F. Crank Keys.
G. Nut for ditto.
H.H. Cranks.
K.K.I. Oiling Channels.

slot C or C₁, cut in the bracket barrel and the inner cup B or B₁ is moved so as to take up the looseness. Then without releasing this C spanner, the outer disc A is by a similar tool jammed back in position against B, and the bearing being made with left and right hand threads, these bearing caps cannot move under the grinding action of the balls when the bearing is running. This is a very ingenious and neat fitting which has come well through the ordeal of a season's use.

IN SPITE OF TABOO.

Although without the pale, and having lost their inning, like the small boy who put the ball where he hadn't ought to, Humber cycles were under the Palace roof. Because of having exhibited at tabooed shows, Humber & Co. have been bar-sinistered. But, of course, E. R. Esmond, stand manufacturer, had to display his bicycle-holding device, so having an undeniable right to selection, he chose Humpers. Strangely enough, he had just enough stands to fit each one of the Humber line, so that the entire Humber family were very much present at the New York Cycle Show. So Humber & Co. have, during the past months, exhibited at more shows than any other American maker, and the fact that they were able to be in line at the National Cycle Show, though under taboo, proves that there is ingenuity even yet in Westboro.

WAIL OF A HOT ONE.

Tom Eck was at the show and unburdened himself to an interviewer as follows: "I've been in the game a long time, and never before have I found the manufacturers so cold as they are at the present time. I turn up my collar whenever I get near one of them. But I've got something up my sleeve, and can see several things in sight. The makers need the racing men, and the advertising obtained from a team is too valuable not to be appreciated by the progressive manufacturer."

HO! FOR HIGO!

How Americans Can Get a Chance at the Japanese Cycle Trade if There is Any.

An additional opportunity is now offered Americans for increasing their Japanese trade, at least so Hon. Jas. F. Conley, United States Consul at Hiogo, Japan, informs the government, for at Osaka, the great manufacturing centre of Japan, containing 600,000 inhabitants, and only eighteen miles distant from the port of Hiogo, a commercial museum has been established where natives and foreigners are exhibiting their products. The Consul states that this is an excellent opportunity to advance American manufactures in Japan. The object of the exhibition is to "increase the exportation of home products and manufactures and to facilitate importation, at the same time to stimulate domestic trade and advance domestic industries."

The section allotted to importations will be devoted to samples, patterns and raw materials and includes twenty-two groups. The section allotted to bicycle manufacturers is Group 12, which also includes all manufactures of metal. To each of the articles on exhibition will be attached an explanatory card containing the following information: Name, Number, Place of Purchase, Date of Purchase, Place Produced, Nature, Quality, Use, Size, Market Price, Discounts, Amount of Import, Places from which or to which Imported, Annual Amount of Consumption and General Remarks.

The Consul advises American manufacturers in order to protect their goods, to precede their exhibit to Japan and register all their product in the Patent Office, after which a competent agent should be secured to represent the goods. It is suggested that several firms might form a syndicate and employ one special competent agent. The museum is intended to be a permanent one and exhibits may be kept there for from three to six months or longer. Information as regards prices and the like may be obtained by addressing the Consul as mentioned above.

NOT FOR IVER JOHNSON.

"Rubbish!" "Rot!" "Absolutely not a word of truth in it!" Such is the denial of Mr. Johnson and Mr. Wilcox, of the Iver Johnson Arms & Cycle Works, as regards the rumor that their plant is now being investigated by an English syndicate, with the probability of purchase. Both of these gentlemen are emphatic in stating that, no matter what ear-marks of truth the rumor may bear, no matter what foreign correspondents may cable over here, so far as they are concerned they have not negotiated, nor do they intend to negotiate with any English syndicate or any other investigating or promoting English correspondent or individual, and that their works are not for sale either for English money or American money. In view of this decided negation on the part of this American firm, the rumors which are going about the trade as regards the sale of other American bicycle plants should be taken and liberally sprinkled with pepper and salt.

A good machine wants humoring very much like a really good horse does.

BUSINESS.

THE New York Show swamped? Yes, from the standpoint of Pee Tee Barnum, Augustin Daly, Kiralfy, and from the standpoint of every other show-monger and show-master, swamped indeed was the New York Cycle Show, spectacularly eclipsed, buried by the mighty Coliseum, and upon Chicago's head is placed the laurel.

The Western Show stretched away for hundreds of yards, and had length, breadth and elbow room. Not so the Eastern Cycle Company, the New York Show. For it is spread over four floors, has no magnificent distances, affords but little opportunity for lavishness, and is dissipated in many a nook and many a corner. Bar the main floor, where the Grecian temple, minus its steps, perpetuates its beauty, and which beauty is added to by the surrounding exhibits of some of the big makers, such as Columbia, Stearns, Sterling, Cleveland, Monarch and Pierce, there is little which calls forth "Ohs!" and "Ahs!" nothing which calls forth open-mouthed epithets of admiration, astonishment, or, let it be said, even of strong commendation.

But let us mourn not. There is only one Rome—only one Coliseum. If New York has no Coliseum, and if the New York Show is not royally housed, it is going to prove itself to be a show in the literal sense of the word. As early as Tuesday morning it may be prophesied that the New York Show will

not be all pagodas and potted palms. Briefly, there is business in the air. Business is being done and business will be done; and where all was emptiness in Chicago, here the head of cycling commerce is raising itself up; it smiles; it promises. The cycle trade is taking heart of grace, is patting itself on the back, is shaking hands with itself, is telling itself that perhaps, after all and in spite of all, notwithstanding tariff for revenue, or tariff for expenditure, or whether there is reform or no reform, that the cycling business will be all right, that the people, all the people, all the time, are going to buy bicycles and are going to use them. Even though ribbons be scarce and lights be not multiplied, business is the real business of a show. So let the good work go on; let there be joy in Gotham.

The New York Show is located at the Grand Central Palace, occupying its four floors, covering some hundred thousand of square feet. The main floor, to the eye, is passable. It is a faint reminiscence of Chicago, and some further effect is given by the broad gallery, around which are placed the stands of Morgan & Wright, Western Wheel Works, New York Belting and Packing Company, A. G. Spalding & Bro., and other firms of prominence. But this is the only part of the show which appeals to the eye, for all the rest is tucked away, is hidden away, is placed away. And, ludicrous as it may seem, the army of uniformed attendants appears to be of much service in directing the public into the proper places. And this, as THE WHEEL predicted, has some advantages. It prevents the crowding which is very noticeable in a one-floor show. In such a function the crowd is attracted to certain particular points, and there it remains and new-comers have no chance. Here, however, the public has a chance to study novelties. It has time to examine. It's ribs are not poked out until it loses all interest and goes away before it has been taught the things the exhibitors want to teach it.

DOES IT PAY?

AFTER nearly a month or more of cycle-show reporting, interviewing, hobnobbing, slate-making, trade-politics and such like diversions, the participant, if he be a thinking man, must, in the privacy of his own office, put to himself this question: Does the race of business competition, as at present conducted by the cycle trade, pay those who are competitors?

There will be those who argue that this question has no connection with the business of building, buying or selling bicycles; it is a moral question they will declare, and hence has no place upon the pages of a trade paper. But morality enters into trade as it enters into the creative force of the universe. Any

other argument is superficial and not creditable to either observation or analysis as reflected in the proposition that morality is outside of business.

Does it pay to make the race of competition with nostrils dilated and the full energy of the individual expended in the effort to beat out your competitors, with no strength reserved for anything else? Surely, no such proposition or supposition can hope to be maintained. The natural reason suggests that it is wrong. The man who makes his success in trade his sole ambition, shortens his life and dies without leaving a lasting impress upon the world in which he has not really lived. All can prove this proposition by recalling instances of its truth in other branches of endeavor, cycle trading being yet too young to furnish many examples of its own; a youth which, by the by, is fast passing and being replaced by that premature age which invariably marks the declining years of those who have gone the pace.

We want healthy competition in the cycle trade, and a proper ambition to succeed therein; but we do not want that unhealthy competition whose motto is Win, no matter how; nor an ambition to surpass your competitor regardless of all consequences. Let us live and let live. We cannot get the universe in our grasp, for even at the moment we are ready to attempt it, death steps in and cuts us off in the act of grasping. Business is a normal occupation for man, and it should be carried on rationally, with a due regard to the rights and privileges of others.

Much of the competition seen in the cycle trade, and which becomes more evident at such gatherings as the one which has just closed in the Grand Central Palace, is of a kind as suicidal as it is murderous. The picture is not a pleasant one, as it could not well be if it were at all a true one, but it is a picture which should receive close study on the part of those who occupy prominent positions in its make-up and foreground.

HERE TO STAY.

IF those alarmists who constantly stand up and cry out that cycling will pass away from the public's good graces, as the roller-skate has done, would stop to think, if either stopping or thinking is possible for them, they would realize what is true of cycling, as it is of no other sport, that the more it is indulged in the more fascinating and attractive it becomes. The reason of this is obvious. After a very short season of athletics, boating, boxing, swimming, golf and baseball, the athlete grows weary and overcome with ennui, looks longingly abroad for fresh fields and pastures new.

Why this is true is that the generality of all other sports and pastimes are confined to one

locality month in and month out, and are characterized by the same surroundings and the same routine of performance. This all conspires to put a damper upon the participant's enthusiasm, since human nature is usually well endowed with a craving for variety.

Cycling first creates this demand, then satisfies it. Day after day the rider mounts his wheel, and each day will bring its variety of scene and incident. Constant changes, fresh acquaintances, and the thousand and one excitements and pleasures of the road, all combine to increase the rider's love of the wheel, and in place of tiring him he imitates Oliver Twist by demanding "more."

If for no other than the above reasons the passing away of the bicycle's popularity is yet a thing of the very distant future, and calamity howlers would in consequence do well to eliminate cycling from their pessimistic lists.

THE CONVENTION HABIT.

FROM the National Undertakers' Association and the Launderers' League to the Christian Endeavor tournament and the National Assembly of League Delegates, the convention bestrides the world with vociferousness. The silence that descends from the hills is filled with its ceaseless din. The smallest hamlet in the land has learned to listen reverent from afar to its vast, insistent roar, as the voice of the spirit of the times. Every idea we have is run into a constitution. We cannot think without a chairman.

Our whims have chairmen, our fads by-laws. Literature is a club, philosophy a society. Our reforms are mass meetings. Our culture is a summer school. We mourn our mighty dead with forty vice-presidents. We remember our poets with trustees, and the immortality of a genius is duly arranged by a Standing Committee. Charity is an association. Theology is a set of resolutions. Religion is an endeavor to be numerous and communicative. We awe the impenitent with crowds, convert the world with boards and save the lost with delegates; and how Jesus of Nazareth could have done so great a work without being on a committee is beyond our ken.

What Socrates and Solomon would have come to if they had only had the advantage of conventions like the one which has just terminated in Albany, it would be hard for us to say; but in these days when the excursion train is applied to wisdom—when, having little enough, we try to make it more by pulling it about—when secretaries urge us, treasurers dun us, programmes unfold out of every mail—where is the man in cycling who, guileless-eyed, can look into his brother's face, who can declare upon his honor that he

has never been a delegate, never belonged to anything, never been nominated, elected, imposed on, in his life?

When the disciple of new journalism fails to evolve from his inner consciousness some blood-curdling, hair-raising impossible story, and tack same on to cycling, he is promptly called before the powers that think they be, told he is no good on earth and his name is stricken from the new journalistic pay-roll. So far none of the disciples have so suffered; they have been equal to all requirements, and the new journals have fairly bristled with fool-killer invitations in consequence.

The American cycle trade has cause to plume itself over something more than the stupendous exhibits of the industry in Chicago and New York. That in two short years its export trade has grown from practically nothing to a value of \$1,898,000 during the year 1896, and in the face of studied opposition and belittlement of the American bicycle, amply justifies the trade's shaking hands with itself.

It is difficult to determine who suffers the most inconvenience from cycle shows. The award should be made to either the exhibitor, the show reporter or the reader of the show issues of the wheel papers, but which of the three is most entitled to it is difficult to determine, especially as each one of the three named absolutely refuses to consider the claims of the others as worth even listening to.

A ghost in bloomers has appeared in San Francisco. Thus there are those as devoid of good taste in the other world as there are in this. More so, indeed; for the garment so called is certainly more appropriate to the dead than the living. You get only fleeting glances at the garments of ghostliness, and the less you see of the bloomer the better it looks.

Experience with both the Chicago and New York Cycle Shows seems proof positive that in both cases the management neglected to send complimentary tickets to the clerk of the weather, since by no other course of reasoning can his displays of meteorological misfits be accounted for.

When in the course of cycle show reporting, existing or exhibiting the argumentative individual begs leave to differ with you regarding something or another, you might just as well grant his request. He is going to do it anyhow, whether you give him leave or not.

If riders saw the blessings of a wheel as often as they see the sorrows thereof there would be more pleasant touring companions than there are.

Many of the so-called "improvements" to a wheel are very much like the home-made shirt—useful enough, maybe, but certainly not ornamental.

The pages of to-day's wheel papers are but mirrors of the gigantic shadows which cycling futurity casts upon the present.

Honest professionalism and honest amateurism travel the same track—the reward at the finish of the race matters not.

When a man sees he is being driven to despair, that is the very time he should give up driving and take to cycling.

Many a racer gets the idea that Fame has her eye on him, when she is only gazing over his head at some one else.

In the sifting of evidence for and against cycling there is always considerable dust thrown into people's eyes.

Wheels have now grown so plentiful that if one cannot get a wheel to ride he immediately develops one in his head.

To love to preach the gospel of cycling is on thing; to love all those to whom we preach is quite another.

One swallow don't make a summer, and thirty thousand electric lights don't make a bicycle show.

Fame in racing consists in being known of and known by more people than you know or know of.

It takes a manufacturer who is a philosopher to reason out the faults of the wheel he builds.

A contented spirit may be all right, but no man afflicted with it ever broke a record.

The less a man prates of his ability as a rider, the better every one likes him.

Confidence is the ability to ignore the mistakes you make in cycling.

With some people obstacles form a great incentive to laziness.

Epigrams are tacks in the carpet of trade journalism.

Enough exceptions make a new rule in cycling.

IN THE METROPOLIS OF TEXAS.

Dallas, Tex., Jan. 26, 1897.—More traveling bicycle salesmen have visited this city during the past few days than were ever here before during the same period of time. Many left without placing agencies, as a number of the dealers of the past season have gone or are going out of business, and it is yet too early for new firms to think of making contracts.

The most recent visitors were those representing the Iroquois, Crawford, St. Joe Special, National, Victor, Clipper, Williams, Simmons Hardware Co., Shapleigh Hardware Co., Luthy and Gendron.

The past season was one of the most prosperous in the history of the trade in this city, and a number of dealers netted a good profit on their year's business. The outlook for this year is even better, but the dealers are all conservative and not buying heavily.

The seeming great demand for bicycles early last season caused a number of firms to enter the business later in the year, the most of whom for various reasons made a failure of it. The number of firms in the trade at one time last year numbered over twenty-five.

The leading firm doing an exclusive bicycle business is the Young Cycle Co., which is a branch house of the same firm at Joliet, Ill. E. S. Reader is the manager. They will continue to make the Sterling their leader as in the past, and have contracted for the line of wheels handled by Geo. Hilsendegen, of Detroit. They handled numerous other makes last year, but state that this season they will relinquish a number of them. The firm has the best equipped repair shop in the city and occupy one of the best and oldest stands for the bicycle business, having succeeded to the retail business of Aultman, Miller & Co., the Covey Bros. Cycle Co. and the Dallas Cycle Co.

Fred Appel, successor to Edgar Boren & Co., handled the Winton and Crescent during '96, and will continue to represent these lines only. He has received a full line of samples of the '97 Crescents, which, with the '97 Columbia and Hartfords, sold by Allen & Glenn, are the only '97 stock that has yet reached the city. Appel does an extensive rental and repair business.

The sporting goods firm of Allen & Glenn, the leading house in this line, took up bicycles last season with the Columbia and Hartford, and did a good business. As it was their first year they did not give this department any special attention, but this season are making preparations for a large trade. They have engaged the services of Edgar Boren, Dallas's most prominent racing man, to look after the department, and have turned the second floor of the building they occupy into a repair shop and ordered a full equipment of machinery. Their lines will consist of the Columbia, Hartford and the Simmons Hardware Co.'s goods. Extensive preparations are also being made for a large renting trade.

J. Peyton Hunter, electrical supply dealer, has done about the cleanest business of anyone, carrying over fewer wheels than any other dealer. He sold the Meteor and Adlake last season, and will continue these lines, and in addition handle the Hamilton-Kenwood.

T. J. Hines & Co. were also engaged in this line for the first time last season. Mr. Hines carries on a jewelry business on the same street, and Mr. Smith, his partner in the

wheel department, looks after that end. They had the Fenton in '96 and sold quite a number. The principal business, however, was renting and repairing, but they will push their sales department more aggressively. Fenton, Gendron and Iroquois are their wheels.

The oldest stand in the city is the one now occupied by Chas. Ott, in which started the late firm of Ott & Trieller. Upon the death of Mr. Trieller in '93, Chas. Ott took charge of the business for the purpose of winding it up and settling with the heirs of his late partner, but as yet has not made any settlement with them. The matter has been in the courts for some time, the administrator of the estate having brought suit asking for an accounting. Ott's line is very numerous, including the Victor, Cleveland, Rambler, Monarch, Defiance, World, Gladiator, Crawford and others.

POPULAR ANATOMICALS.

The popularity of the anatomical, or hard base saddle, has directed the inventive mind to many improvements in this type of seat, and from a very crude article originally, has been developed a number of saddles that cater to every taste. F. A. Hollenbeck & Co., of Syracuse, are putting on the market a special design of saddle with a soft, pliable pommel, which, in addition, has a covering of chocolate brown ooze leather. This lat-

ter feature makes a very desirable improvement, as the natural grain of the leather has just enough grip to enable one to retain a firm seat. The new clip used on these saddles is also very neat and effective. It is made of steel forgings, while the shoe, or upper part, is spring tempered, making it almost an impossibility to break. The entire line of Hollenbeck saddles exhibit a high class of workmanship, while the designs are graceful and the weight brought down to a minimum.

Aultman, Miller & Co. started in '95 to do a jobbing business in bicycles with the Sylph, Overland, Cleveland and America, but the past season have given this branch no special attention, and reports are that they will discontinue it this season.

The large saddlery and harness dealer, G. H. Schollkopf, undertook to sell bicycles to the trade last season, but it is doubtful if he will continue. He contracted for the Niagara for the State and placed a large order, which he proceeded to at once sell, and was most successful, although the machines were very late in reaching him. In the meantime his customers grew tired of waiting, and many canceled their orders. Many of those that he

shipped reached the dealers too late in the season to make any sales and were returned to him. In the interest of his main lines he was unable to refuse to receive them, and now has a few bicycles on hand.

Merchant & Manning, State agents for the Remington type-writer, have sold a few Remington bicycles.

Another electrical goods firm, Lipscomb & Hummell, took up bicycles last year, handling the America and Overland, and conducted a rental and repair business. They did fairly well, and for '97 have contracted for the Alki wheel, made by the Stephen Ballard Rubber Co., of New York.

A. E. Bateman, doing business in the name of the Dallas Cycle Co., opened in '96 with the city agency for the Niagara, and placed a number of these wheels. Renting and repairing was also done. Owing to a long spell of sickness the business did not receive his attention, and consequently he did not do as well as he might have done.

Luckamp carried on a renting and repairing business during the riding season of '96, but has closed temporarily for the winter.

C. F. Wilson has succeeded to the firm of Wilson Bros. They had a fully equipped repair shop and had a successful season.

The Metropolitan Cycle Livery, renting and repairing bicycles, went out of business last fall.

Doolittle & Simpson, known as the Arcade, a department store, carried a line of Strauss bicycles, which they still have on hand.

The White bicycles are in the hands of the Dallas Installment Company, but they have placed but few.

Walker's China Hall have a number of Moon wheels, made at St. Louis and taken on consignment; the same wheel under another name was placed with another firm and advertised at \$39.50, but the latter succeeded in placing but few of them.

J. S. Witwer carried the line of the St. Louis Cycle Co., and has carried over a few.

The only failure of any firm handling wheels was that of Heatherington & Nason, machine supply house. They had the State on Hamiltons and bought fifty. Last fall they were compelled to make a deed of trust, but may come out all right.

Fife & Miller sold the Columbus, but will abandon the business entirely.

Parlin & Orendorf Co., one of the largest implement firms in the city, had a number of Dauntless wheels early last year, but made small effort to sell them, and will not continue this year.

Only one new firm has been heard of contemplating embarking in the wheel business this year. The Trice Saddlery Co. and N. H. Kuch, Vice-Consul of this Division, have secured the agency for the Pattee wheels, and will do a sundry and repair business.

The worst overstocked firm is the Emerson Mfg. Co., who, late in the season, bought fifty Phoenix bicycles just before the fall in prices. It is stated they have forty left over.

Willink & Hunter and Moses Weber are two firms doing a repair business.

The department store wheel has not met with favor here, and the trade has not been demoralized either by this class of wheel or by the auction sale.

One dry goods firm carried a few of the former class of wheels and advertised them quite extensively, but seem not to have found many customers. The Midland Cycle and Supply Co., of Kansas City, Mo., sent a lot of machines and undertook to have an auction sale, but on the dates advertised it rained heavily and only three or four were sold. They then packed up and returned their stock.

MAKES HIS PLEA.

One of the Cycle School Instructors
Claims Salesmanship Honors
For His Craft.

Editor of THE WHEEL:

Dear Sir:—Kindly accord me the favor of a few lines in your columns, in which to protest against the discriminating obtuseness manifested by the cycle manufacturers, whereby they engage well-dressed, "bluffing," "jolliers," of cycle-sense ignorant, for their sales departments, to the exclusion of the practical, wide-awake and up-to-date cycle instructor; not so well dressed, and totally devoid of "bluff." Most manufacturers, and all ex-hardware salesman, ex-baby-carriage and hobby-horse salesman, and ex-saddlery salesmen, who were "cast up on the shore" as useless driftwood, owing to the depression in their several lines induced by the cycle tidal wave of '95, have sneered at and doubted the selling ability and knowledge of the internal mechanism of the bicycle displayed by the cycle instructor, and with the public in general have consigned the missionaries of the cycle-riding gospel to the category of the "seen-better-days" type.

Now, Mr. Editor, in refutation, give space to my little wail. The cycle instructors of New York are, as a rule, well-educated, intelligent chaps, for whom the cycle and associate trades have proved an irresistible fascination. As a natural sequence, they are devoted to their duties, taking keen pleasure and interest in studying the bicycle and its component parts; in fact, many valuable improvements and additions which manufacturers have hailed as "just the thing," have emanated from the active and ingenious brain of the despised cycle instructor.

One of the most justly popular hygienic saddles on the market was due to the creative genius of a cycle instructor. An adjustable bar, which met with a large sale, was the invention of another of the fraternity. Other useful devices for fittings and sundries are to his credit. Being so clever in the inventive direction, cycle instructors may be depended on to execute their own repairs, with neatness and despatch. That their designing and constructive ability is not of an altogether low order, has been proven by the adoption of a cycle instructor's design for a fin de siecle 1897 model by a New York manufacturer of a hundred dollar wheel.

I trust, Mr. Editor, that I have so far established, even if in an uncertain fashion, some idea of the cycle instructor's practicalness; now, a word or two as to his selling ability. The progressive manufacturer who opened selling depots in conjunction with cycling academies, realizing the ability of the instructor to educate the possible purchaser to the sublime possibilities of any standard wheel, as a stimulus to renewed endeavor in the proselyting line, offered commissions during '95 and '96 to all cycling instructors disposing of the manufacturer's wheel. Did we make any money? Who among us does not realize with mingled joy and regret the palmy days of March 1st to June 1st, when our weekly incomes averaged from \$50 to \$100.

If an intending purchaser successfully resisted well-backed arguments, personal magnetism, that most priceless of all salesmen's attributes, "did the trick." Mr. Editor, there

are now in New York some forty of the veteran instructors of the first rush of the cycling army of '94 and '95. The others, who are few, are connected with the few manufacturers who realize a "good thing" before it is obliged to cross their path constantly in order to attract attention. We're longing, oh, so anxiously, for the end of the snow season, but in the meantime we are, one and all, open for an engagement in any branch of the industry. We are the ones who, when the cycle salesmen were dumb, through ignorance, discussed during the slack season of '96 flush joints, one and two-piece crank-hangers, ball-retaining cases, arch fork-crowns, direct spokes, the sad fate of the wood handle-bar, and all the other improvements and changes for the '97 model.

Yours, Mr. Editor, in the bonds of fraternity,

E. V. H.,

(Cycling instructor.)

MICHAEL TOLD OF AMERICA.

In an interview upon his arrival in London, Michael stated that in his consideration American pacers had a great deal to learn before they equal their brethren of the Old World. He states that in his opinion American racing men are not quite up to the English standard. Bald, Johnson, and Cooper, he considers the best three. American machines, in Michael's opinion, are much the same as English, with the exception that the enamelling is more elaborate and finer. Michael will state that "English manufacturers will have to carefully watch cheap American machines, one make of which is produced at twenty dollars; these look all right, and that is all I can say about them." Questioned about his future movements, he stated that if matters relating to the N. C. U., etc., could be adjusted, he did not intend returning to America; otherwise he should.

DIDN'T BELIEE HIS NAME.

Twelve triplets and eleven quads, the whole force of the French and English tandem pacing teams, were brought into service during the "Four Kids" race at Paris, Sunday, January 24. The race was so designated on account of the diminutive size of the four contestants, Collob, Champion, Taylor and Lartigue, all of whom are mere youths greatly resembling Michael in build. The distance was 50 kilometers (31¼ miles). From the start Champion, Warburton's latest protege, took the lead and followed as fast a pace as his men could give him, and won by nearly two laps in 1 h. 3m. 7s. Lartigue, Taylor and Collob finishing in the order named. In the hour Champion covered 29 miles, 800 yards, 200 yards better than the indoor record.

AFTER ALL, HE FAILED TO WIN.

A wealthy Russian noble, anxious to win a race he was entered in, telegraphed a French cycle maker for a light racing wheel, ordering it to be sent by mail, the quickest means of delivery. The order was promptly filled, and postage to the amount of \$10.38 paid for the machine's transportation as mail matter. In the end the wheel arrived all safe and sound, and in time to employ it as had been its purchaser's intention, but a missing nut made it unfit for use, and all the haste and expense went for naught.

POPE MOTOR PLANS.

What the Columbia People Are Doing With
Their Electrical Driven
Motor.

During the temporary lull in the line of calls upon Colonel Pope in the Columbia stand at the Cycle Show, a WHEEL man found an opportunity to ask the ruler of all Columbias what he considered the chances of motor vehicles were in the near future in this country.

"As certain of success as the bicycle was at the same stage of its career."

"Will the Pope Company push the motor vehicle along the same lines they have the bicycle?"

"Not exactly along the same lines, but with just as much energy, and with quite as much success as they have bicycles. You see that in the beginning motor vehicles, just as bicycles were, will be the toys and luxury of the rich; when this stage has been passed then will come the light delivery wagon, the heavy draught vehicle, and last, perhaps, some sort of motor driven cycle suitable for individual transportation."

"Will some sort of petroleum burning engine be the power employed?"

"In our experiments, extending over several years now, we have passed the petroleum stage, and reached that of storage electricity for motive power, finding it cleaner, safer and less objectionable in every way."

"What will the new machine weigh?"

"Our experimental motor vehicles show that applying all we have learned in cycle construction to motor car work, we can get strength and rigidity enough for all purposes at about 1,800 pounds. Light weight, you must remember, is more to be avoided than sought for in motor carriage building."

"How long will your motor carriage run on one charging of the storage batteries?"

"About thirty miles at present, but that will be greatly increased in the near future."

"What will it all cost?"

"What machines we have built or will build in the near future, we will sell at \$3,000 each." "Seems rather high priced alongside a bicycle."

"Yes; perhaps by that kind of comparison it does, but I don't want anyone to decline to buy a motor vehicle simply on account of the price, so I'll be liberal and make intending purchasers this offer: I'll sell them one or all of the machines we have built at exactly what they have cost the Pope Company."

"And how much is that, Colonel?"

"About \$6,000 each, as near as can be figured out. Why do I list them at \$3,000 apiece when they have cost me twice that amount? Because we must sow before we can reap, and the crop which will spring from these seeds at \$3,000 each will be well worth reaping in the very near future."

"How many——" But the WHEEL man's intended query as to the number of Pope motor vehicles which would be put on the market this season, was cut short by a charge on the part of those who wanted to take the WHEEL man's place near the papal throne, and the output question and a number of others he wanted to ask about this new move of the Pope Company remained unasked and unanswered.

ATLANTA AGITATED.

Atlanta, Ga., cyclists are stirred up over a threatened cycle tax of \$1 a year for each bicycle owned by a minor.

The Art of Bicycle Building.

The man who can to-day deny that bicycle building has reached the basis of an art has surely no conception of the vast strides made in this line within the past three or four seasons. Time was when the making of a bicycle was a comparatively simple matter; but as riders themselves have become better posted regarding construction methods, the old hap-hazard ways have gradually disappeared and been replaced by a broader, better and more scientific school of builders, the products of whose arts rank high as mechanical achievements.

There is no bicycle on the market to-day which is more truly an artistic product than the "Waverley." As an example of the best grade of bicycle construction it ranks extremely high; and its mechanical prestige is without doubt largely due to the studious care expended upon every detail; every process; every part; every line which enters into its construction. It takes brains to build a good bicycle; and the staff of mechanical men and designers who originate all the ideas employed in building the "Waverley" and supervise every feature of its construction are brainy men in the best sense of the word; men who have learned their trade in the school of practical experience and are fully entitled to be termed masters of the art of bicycle building.

Conscientious study of construction principles and an earnest striving after constructive ideals has been the keynote of "Waverley" success. The makers of the "Waverley" are never content to rest on their oars. A better wheel each year and a higher place in public favor is their simple platform. They believe that the cycling public is a discriminating and enlightened one, quick to recognize and applaud real excellence; and equally ready to cry down and condemn sham and shoddy wares; and to such a public it will not do to offer aught but the very best bicycle that can possibly be built. The "Waverley" is such a bicycle, and upon its merit its builders are content to rest their case.—Adv.

Kindly mention The Wheel.

The Fat Purse and The Thin Purse

Each receive equivalent worth in the purchase of a WAVERLEY BICYCLE. For those who will have nothing but the best, and are willing and able to pay the prices which the best can command, the superlatively high grade WAVERLEY at \$100.00 offers the finest product of mechanical skill obtainable—a bicycle that in every line, move and motion proclaims its worth as clearly as a blooded racehorse, the acme of strength, durability, comfort and elegance. For a buyer who desires a thoroughly high grade machine at the lowest price at which it is possible for such a machine to be built, we offer the improved WAVERLEY at \$60.00, a bicycle that is even better in construction and appearance than our 1896 WAVERLEY, and without doubt the best bicycle ever offered for so small a sum.

READY FOR BUSINESS.

After several months of diligent work and numerous confabs and meetings, the cycle track owners have succeeded in forming the organization so long contemplated. The finality of the scheme came about on Saturday evening last, at the Everett House, this city, when the National Cycle Track Association was formally organized with these officers: President, E. C. Hodges, Boston; vice-president, R. F. Pelouz; secretary, H. E. Ducker; treasurer, L. M. Rich. The tracks located at Charles River Park, Boston, Manhattan Beach, Asbury Park, Philadelphia, Springfield and Louisville were represented. A constitution and by-laws were adopted in which the objects of the association are set forth:

"The improvement of bicycle tracks, the advancement of cycle racing, methods of conducting race meets and all other interests which would mutually benefit the association, the racing men and the public."

The by-laws provide for the creation of four racing districts, as follows:

District No. 1, eastern district, composed of the New England States, the States of New York, New Jersey, Pennsylvania, Delaware and Maryland and the District of Columbia.

District No. 2, central district, comprising the States of Ohio, Indiana, Illinois, Michigan, Wisconsin, Iowa, Minnesota, Kansas, Nebraska and the Dakotas.

District No. 3, southern district, comprising the States of Alabama, Virginia, North Carolina, South Carolina, Georgia, Louisiana, Kentucky, Mississippi, Tennessee, Missouri, Arkansas, Texas and Florida.

District No. 4, western district, comprising the States of California, Oregon, Nevada and all the Territories and States west of the Rocky Mountains.

Each district will arrange a circuit and name dates for annual National circuit meetings. Amateur prizes will be given at these meetings, of the value allowed by the League of American Wheelmen, and professional prizes of money, of such amount as each member of the association shall determine, not exceeding in value the amount allowed by the L. A. W.

No bonus will be given to any racing man, trainer or manufacturer or dealer, and nothing more than the advertised prize will be given in any race. Violation of this is punishable by a \$100 fine for the first offence and \$200 for the second. Failure to pay fine is punishable by expulsion.

The election of officers will take place at the annual meeting, and each representative will be entitled to one vote. Track owners, or those controlling the tracks, are eligible for membership on payment of \$25, and the annual dues are put at \$10. Districts wanting dates for the National circuit meetings must forward requests for same before February 15 in each year, and such dates will be assigned by the secretary not later than March 1.

HOW SORRY THEY WILL BE!

A misguided Albany athletic organization believing that the delegates to the National Assembly will jump at the opportunity to witness a long-distance race, have arranged to hold a 72 hours' continuous grind, starting Wednesday, February 10, the opening day of the session. The race will be run on a ten lap track in an army. Short distance races will be run each night.

RACED AT LAST.

After three postponements, the much-talked-of race meet at Panama Park, Jacksonville, Fla., was held on February 3, with an attendance of about 500 spectators. The small coterie of Northern riders in training at the track divided honors with the Southern champions in the open events. The five mile match race between Charles Hadfield, Newark, N. J., and E. S. Akers, Philadelphia, starting from opposite sides of the track, resulted in a victory for the former. Hadfield finished 75 yards to the good in 12:29. Akers' time was 13½ minutes. The purse was \$100. Walthour and Huffstetter, two Southern riders, competed in a five mile match race. Walthour finished in 11:43, winning by a good margin. The open events resulted as follows:

Two miles—1, Akers; 2, Huffstetter; 3, Hadfield. Time, 4:31 1-5.

One mile—1, Walthour; 2, Hadfield; 3, Akers. Time, 2:07 1-5.

A GLOWING TRIBUTE TO MARTIN.

A splendid eulogy of the prowess of Wm. Martin, the American rider, who recently defeated Parsons in a series of mile match races at Melbourne, is printed in the Australian Sportsman. The account of the match starts off in this way:

Martin!

Bill Martin!

Plugger Bill Martin!!!

It's all Bill Martin now.

In house, street, tram and train.

And there is no doubt the iron-jawed Yank, is a world wonder.

The iron-framed.

Romps over the Australian.

"I guessed Parsons would have made a better show," said Bill, after the race.

"What I'm looking for," continued the Yankee peddler, "is a man who'll bet me I can't do five miles in ten minutes, and ten

HALE BOWS TO GIMM.

"Teddy" Hale, the winner of the New York six-day race, had his colors lowered by Louis Gimm, in a hundred miles race at Cleveland, O., on Saturday last. The riders rode in an uninteresting manner and jockeyed for position for ninety-eight miles before getting down to work. Then Gimm started the sprint. Hale hung on like grim death, but all his attempts to pass the Cleveland rider were futile. In the last two laps Gimm increased his lead a little, finishing twenty feet or so ahead of Hale. The official time was 4 hours and 56 seconds. The last mile was made in 2:39. The race was for \$250 a side and a percentage of the gate receipts. Both riders rode Peerless wheels.

E. C. Bald has signed with the Barnes Cycle Co. for another year and so will again be seen astride the White Flyer. He has given up his proposed European trip and now intends to depart for California, where he will begin training under Asa Windle.

If you ever go to Heaven you will see yourself as others have seen you, and then you will wonder how you got there.

miles in twenty-one minutes. It's a soft snap for somebody, but I guess I'll hustle him some."

The American papers say—"Martin is a first-class man among third-raters."

If they are right, and he is only a first-class man among American third-raters, then American first and second class men must be all "white flyers" in the skies. There is no living class ahead of Bill.

Great lightning may be faster than Bill Martin in a short sprint, but the Yank would beat the sky-flash out of sight for staying power. And he ain't so slow either. He has the speed of a race-horse the strength of a working ox, the determination of a bulldog, the physique of a prize-fighter, and the jaw of a railway steak tester. Taken as a whole, he is a zoological collection whom it would be hard to equal, and perhaps impossible to beat. * * * * *

The result of the match proves one thing, and proves it conclusively. It is that Martin is a world's wonder, and that he is undoubtedly the best man we have yet seen in Australia—always excepting the great Zimmerman himself, who was the best rider who ever bestrode a wheel.

DALMIER TIRES

There is not such a great difference in the general appearance of a high-grade bicycle and one of inferior quality. Shape and size are common to both. Enamel and nickel cover a multitude of defects.

A cheaply constructed bicycle may have a first-class saddle, or some other good single part, but a cheap wheel is never fitted with Palmer Tires. They are too expensive. * * * * *

The distinguishing mark of an 1897 high-grade bicycle must be apparent to the eye. That mark will be a pair of Palmer Tires. * * * * *

The Palmer Pneumatic Tire Company,
* New York and Chicago. *

HELD IN A PALACE.

THE CYCLE BOARD OF TRADE PROVES IT CAN SUCCESSFULLY CONDUCT
ITS OWN SHOW AFFAIRS IN NEW YORK.

A CYCLE SHOW WHERE BUSINESS WAS DONE, WHILE A MULTITUDE CAME TO LOOK ON
AND PRAISE. MANY NEW EXHIBITORS SEEN IN NEW YORK. TRADE
PROSPECTS BRIGHTEN IN CONSEQUENCE. HEAVY ORDERS.

Of course there are faint echoes as to the utility and beauty of Madison Square Garden. If we look back at the Garden function of last year, we remember that only the Big Six were well located, and that the smaller Six Hundred were scattered around narrow galleries, located on isles which would not permit of two persons of much avoirdupois to pass each other. Then, an advantage of the Palace over the Garden is that the trade was gouged at the Garden, whereas, this year they own their own souls, make their own profits and put said profits in their own pockets. They are not held up and taxed every time they sniff or sneeze or wink. In brief, the Garden this year was impossible because of avarice. The Garden folks have been taught a lesson, and next year—well, next year, perhaps, there will be no show, or if there should be, it may be only one, and the Chicago Coliseum will do for that. And yet, again, if it must be held East, Boston is putting under way her new building, and Philadelphia, also, has her plans for a mammoth exposition structure. As a matter of fact, it might not be a bad kind of thing to take the show out of Gotham and change around to the City of Culture or to the City of Peace.

The exhibits at the New York Show, pictorially speaking, fall, in many cases, below those seen in Chicago, because of lack of room and because of the impossibility of obtaining effect. This seems to be not so very important, for it saves the exhibitors money, and the public seem to be crowding the Palace just the same as if it were ten times as brilliant as it is.

Speaking technically, the New York Show

opens up to the public two hundred exhibitors who were not seen at Chicago; whereas, about three hundred and fifty Chicago exhibits are reproduced almost exactly at the Eastern function. Except in small things, there are no very great novelties, the only sweeping departure being the exhibition of five chainless safeties, each one of a radically different type. Chicago showed only one, and that was only put up as a matter of curiosity, whereas, these five New York Chainless Safeties are offered to the public as practicable bicycles. But of this more later in the detailed report appended.

On Saturday, the opening night, 11,000 people rushed by the gates, although the night was marked with a mixture of rain and snow, and, in fact, there has been but little sunshine in Gotham until Tuesday. But the Denverish sunniness and dryness of Tuesday obliterated any mental recollection of the previous discomfort. Of the 11,000 people, 4,000 were exhibitors and their attendants. On Monday 14,000 people were in evidence, and the early morning hours of Tuesday showed that Gotham was keenly aware of the fact that a show was being held in its midst. In brief, it may be said that the Eastern National Exposition furnishes no pins or pegs upon which to hang pictures or the picturesque, but the Eastern Show starts out bravely in point of attendance and in point of business. Everybody is talking satisfaction. It would not be surprising if this satisfaction, toward the end of the week, approached even the point of elation.

The exhibitors state that there was a lack of smoothness about the preliminaries of the New York Show, and that there is a deal of

bungling and hustling and the like. But then Chicago afforded big facilities, and, under the circumstances, Secretary Franks did wonderfully well.

THE GIST OF IT ALL.

Chains and Sprockets.

The Simpson lever chain and sprocket are evidently a great novelty to the American rider, judging from the crowds that surround the stand of the Weaver Cycle Material Co., who exhibit them detached. As a curio it is a success, but commercially it has not caught on as yet, only the Envoy and World makers showing cycles fitted with it.

The Brown roller sprocket has a double flanged periphery, in which are inserted hardened steel rollers $\frac{3}{4}$ of an inch in diameter running on hardened steel bushings, which in turn revolve on heavy steel rivets. The chain, which is reversible, is 3-16 of an inch in width and $1\frac{1}{4}$ inches in pitch, the side links being longer than the blocks, which are diamond shaped and which in action ride over the rollers and, in so doing, reach from one roller to another, thus preventing the side links from touching the periphery of the sprocket and thereby overcoming some of the friction caused by the chain dragging on a toothed sprocket. The principle of the improvement is diametrically opposed to that of the old style, for, instead of the sprocket pulling the chain it rolls off the sprocket. There is no back-lash perceptible, as the distance between the roll never changes, the rollers in action only revolving 1-64 of an inch on their fixed axles. The sprockets and chains do not weigh more than the ordinary chains and sprockets, as they use only 36 links as against 52 on the regular pattern. The sprockets and chains shown are superb in finish, workmanship and material, are mechanically practical and must give good results in use. Their construction marks another step forward in improving the details of an up-to-date rear-driven bicycle.

The Baldwin sprocket is a sprocket having an involute curve between each pair of teeth, the method of construction being to cut away the sprocket where the chain block rubs, increasing the diameter of the sprocket accordingly, and producing a peculiar octagon-shaped sprocket which pulls on only three links of the chain at one time. In furnishing these sprockets for use, the system above described is inverted; thus, on the front sprocket the cutting away is done behind the tooth, and on the rear one, in front of the tooth, the object being to relieve the friction in going on and leaving the sprocket. Theoretically the principle seems correct, but as the sprockets are not mounted, only use can determine if they are an improvement. Any regular block chain of 3-16 inch width and 1 inch pitch will fit these sprockets.

"Built Like a Watch."

The Wheel Has Come Full Circle!

Could Shakespeare have foreseen, when he used this expression,
the perfection reached in the '97

Sterling Bicycle?

We use only the best material and most skillful labor. These,
backed by experience and capital, make a machine that lasts.

Kindly mention The Wheel.

Another "novelty" is the lever-driving shown on a single machine at the Winton stand, fitted up by an agent and not included in the regular line. The peculiarity is simply a pair of long and rather slender levers, hinged at the rear to short rocking arms which are, in their turn, hinged on the ends of the rear axle. The levers are attached by pins to the ends of the crank, and project forward some four inches, bearing the pedals on their extremities. The lever has an irregular travel, and the foot describes a sort of oval instead of a circular track, with some slight inequality in speed. The claim made for this revived device is the familiar one of avoiding dead centre.

The rapid driving rotary gear, so-called, is misleading in title. The front sprocket is provided with a coarse square-section internal thread, matching a fellow-thread on the axle, the connection between axle and sprocket being solely through this thread and thus being capable of being either fast or loose. While pedaling forward the two parts move together as one; as soon as the pedals slow up, the sprocket runs ahead, unscrewing itself from the axle, which it is enabled to do by having space provided for it to slide an inch or so up towards the bracket. The pedals then "become foot rests," after another old notion. As soon as the axle is driven forward faster than the sprocket is running (the wheel having exhausted its momentum) the end of the right-hand thread on the axle slips into the sprocket and screws itself up to a stop again. Of course this freak absolutely sacrifices back-pedaling, under all circumstances, and necessarily widens the tread.

A very frantic freak attempts anew to utilize the enormous power imagined to be stored in the arms and shoulders and not ordinarily put into requisition. The handle-bar is pivoted on top of the head so as to work up and down at will, just like a see saw, the grips working in the arc of a circle, in a plane at right angles with the frame. Each half of the bar pulls up on a strap, which is hooked to a second strap at right angles to it, the second strap working on a hollow drum on the front wheel axle. This drum works with a clutch after the manner of the old Star, so that pulling up the strap shoves the wheel ahead, the movement winding and unwinding the two drums alternately. The straps run over idle wheels carried at the ends of a bracket fastened below the fork crown, and the extra width of front hub is accommodated by enormously bowing out the front forks. This device can be locked out of operation, but while in use the front wheel cannot be moved backward. Of course a spring must be wound up, by expenditure of some arm power, in order to return the straps and handle-bar to normal position. The "harmonious" working together of these separate methods of driving, one for each wheel (as to which the inventor is enthusiastically sure), will be appreciated upon trial. Yet it may be found to resemble, in action, a horse so geared up as to have a separate rate or mode of travel for each pair of legs.

Possibly under the head of novelties in frame construction may be included the following bicycle, the only one of the sort shown. A peculiarly long hinge is formed through a tube extending from the top bar to the lower tube, the top bar having its continuity

of line interrupted at the point of the hinge. At the junction of this vertical hinge with the lower tube, a short piece of tube runs horizontally to the seat tube, appearing like a brace when the frame is in normal position. This apparent brace contains the "lock," which is a tapered round bolt, held into place by a spring. The forward portion of the top bar extends, beyond the hinge, for a few inches under the after portion of the bar, where it also locks into place. By pushing back the bolts at this point and below, the front portion of the frame and of the bicycle swings around upon the rear portion, the two wheels coming close together side by side, when the whole is ready for carrying or storing, thus becoming the "Flat-Dweller's Delight." On swinging the forward portion around again, the two catches snap automatically into place, thus locking the frame into normal position.

As a device for removing the pressure and friction between the sprockets and the ends of the chain links, at the point and time of leaving the tooth on the rear one and entering into contact with the tooth of the front one, the Hendee & Nelson Company have cut away their flange on the sprocket so as to relieve the end of the link from contact and give it free room to bend in. The claim is that 20 per cent of chain friction is thus done away with. The device is a modification of the shroud—which has been quite a point of contention in England—and at first sight seems to have some value. Flanged sprockets (called "shroud" in England) are not generally used, but are found on quite a number of makes, among them the Racycle, Cleveland, Remington, Warwick (one pattern only) and the Orient, the last named being constructed by inserting pins in the sprocket rim.

A peculiar but very simple device for accommodation in the way of gear ratio is the twin-sprocket shown on some of the Sterling wheels; the driving wheel can be taken out and turned around, to bring into use the sprocket on the other side of the hub, thus shifting the ratio.

New Frames.

Only two novelties are shown in frame construction. In the one known as the Circle Cycle, the regulation front and rear forks and back-stays are retained, but the two main tubes and diagonal tube are displaced by a circle of 1½-inch tubing, 21 inches in diameter, and which is connected to the head by two short parallel lugs, and also by a lug underneath the seat pillar bracket, and one on top of the crank-hanger. Its faults lie in its extra length of wheel base, and lack of stiffness at the crank-hanger. And there seems no reason for its existence excepting the desire to produce possibly something novel.

The other novelty in frame construction is the Cygnet frame, which is built of two pieces of D-shaped tubing, brazed together, and which, in the ladies' frame, is curved from the bottom of the head to the crank-bracket, where it becomes D-shaped again and bifurcated, and carried in a loop around and over both sides of the top of the rear wheel, and back again to the front of the rear wheel, there taking the place of the usual diagonal stay, and joining the lower tube again in front of the crank-hanger, and rising from there to the top of the head. The rear wheel and crank-hanger lugs are brazed to this loop. This same construction of frame is used for

the men's model, excepting that the main upper tube runs almost horizontally to the seat-pillar cluster. The men's model is not a taking one, looking as if it might be too springy for hard use, but the ladies' model follows the lines from the front part of the frame of the popular double loop frame, and, taking it all in all, is very graceful in design. The strongest point mechanically is that the chain runs inside the rear forks, and that the crank-axle bearings are outside of the sprocket, and that chain and mud guards are not necessary. The front fork, which is of the usual type, has a cyclometer built directly in the crown.

Tires.

A new leather tire, the Curtis, is shown. It is made of horsehide, tanned by a slow process, and is light brown in color and waterproof. The joint is a long lapped skived one, cemented and stitched. The edges of the interior faces of the outer shoe are stitched together leaving a projecting ridge, from which also projects four brass oval-shaped tongues, 1½ inches long and ¼ of an inch deep, and these tongues and the projecting stitched ridge fit into corresponding depressions and a groove in the rim and hold the tire in place by inflation. The inner tube is a continuous one of rubber, and in event of puncture, the stitching in the ridge is cut out, and after repairing the tube the stitching is replaced by using cobbler's needle and thread, which is furnished with the tire. Whatever claims to merit it may possess, the method of attachment is weak, as a slow leak will detach it and the system of repairing is also peculiar, and the use of a special rim is a drawback to even those who may wish to try it on a cycle already in use, and which is fitted with plain rims. The rim must also be weakened by so much cutting.

Another tire novelty is called the Para Punctureless. It is a hosepipe tire, having an extra flap loose on the inside of the tread, but vulcanized to the sides, the theory of construction being that the puncturing object will not penetrate the tough, loose flap, being able only to push it backwards, and that the fast, thick sides of the flap will prevent the air from escaping. It is, of course, not as resilient and weighs more than the ordinary tire.

Another new tire shown is known as the Deering Duplex tire. It is a hosepipe tire, having an inner inflatable tube that can be inserted and removed through an opening in the outer shoe, which is hermetically closed by a steel clamp. This inner tube is designed for use in case the outer shoe is punctured. When not in use it is drawn tightly around the rim side of the shoe, and is held out of harm's way by a tape that is made in the tube. In this position it takes a U shape. If the outer shoe or hosepipe tire is punctured the tire is immediately made fit for use by inflating the inner tube. The outer shoe has its own valve for inflating, and the valve for the inner tube is placed directly opposite in the rim, the object of this construction being, of course, to avoid the necessity of immediately repairing the puncture in the hosepipe part of the tire. Should the reserve tube when in use also become punctured, it can be readily removed through the hermetically sealed opening, and replaced as in the method used in the ordinary double-tube tire.

Have you seen the Victor Road Racer?

The date on it is January 20th, 1897. You will appreciate this date and its newness after you have seen the wheel.

It not only contains "Victor grade" material and "Victor grade" workmanship all the way through, but it has all the latest little touches which bring a bicycle up to date.

It has the latest fad—the new thing—which not only gives all that the past has suggested but many points which are found nowhere else.

Expert road riders will fall in love with it.

In looking at it remember that the Company invites you to examine it bit by bit. In fact, this is our favorite way of showing Victor bicycles.

We believe in making riders intelligent concerning that which they are to buy.

See the Victor Road Racer with both eyes, both hands, both feet, before you buy a bicycle for '97. If you do, you will be glad of it.

P. S. Did you know that the Overman Wheel Co. built Safety Bicycles in '87, which was one year sooner than any other American bicycle maker? The Victor Road Racer is the concentrated experience of ten years in safety construction.

We are the oldest American makers of Safety Bicycles.

Bearings.

A novel four-point bearing, the Evans & Dodge patent, is shown by the Canadian Typograph Company, Limited, of Windsor, Ontario, Canada, who are the only Canadian exhibitors in the show. It is of the cup adjacent order. Two fixed cups are placed, one on each side of the hub shell. The right cone is fixed on the axle, the left one sliding and adjusting on it and held in place by a spline. These cones are of a right angle V shape. The cups are screwed into the hub-shell and held in place by a fitted external locking ring. All of the cones and cups are ground at an angle of 45 degrees, and the bearings run with a degree of smoothness and accuracy that is remarkable, ten single wheels with these bearings attached being suspended on a stand in pyramid shape, and revolved by a single thread of No. 100 sewing silk, the finest spooled. The good points of this bearing are that the axles of balls and hub are at all times parallel, and that the points of contact on the bearings are flat and expose the smallest possible surface to the ball, and that all the balls bear an equal portion of the load at all times. Another good point about this bearing is that the oil is retained in the pathway and cannot escape, and the points of support are on each side of the point on which the load is carried, putting a perfectly equal strain on the balls. This bearing is undoubtedly one of the most novel of the show, and from its mechanical construction must prove satisfactory in use.

The Fairmount bicycle, with peculiar bearings and exceptionally narrow tread, while not now absolutely new, appears in a form somewhat modified. The crank bracket is 4 inches in diameter, and appears to the eye even larger, being very thin or short, as it contains only a single row of balls. The lower main tube joins it near the bottom of the curve, while the diagonal tube attaches directly on the top of the circle, so that the bracket may, in a somewhat unusual sense, be called a "hanger." So large is the circular opening that, by removing a single nut, the entire axle, with the cranks, bearings and pedals, undisturbed, may be passed out. The bearing is a four-point one, having six $\frac{3}{8}$ -inch balls, held apart in place by a "star separator." To put the bearing together, the axle, with its large thin disc with coned edge is put in, the separator is dropped in, the six balls are placed between the arms of the "star," the other coned disc is screwed on with left hand thread, and a single right hand nut outside fastens the parts; then a thin flat dust-cap goes over, which is held by a spring wire that snaps into a groove. The wheel bearings are similarly constructed, the bicycle having only eighteen balls in the three bearings. The rear fork is carried to the crank bracket by the single neck stem which is now becoming somewhat familiar.

The rear hub is a pair of open-sided or skeleton steel discs, or flanges, flat and parallel to each other, 5 inches in diameter and an inch and a half to an inch and a quarter from each other, the latter distance being on racing wheels; the space between these discs is also boxed in. The spokes run from this peculiar hub and are one-cross tangent, the object being to produce a narrow wheel, in conformity to the narrow tread, without having insufficient "dish." The narrow tread is indeed narrow, being

only $3\frac{1}{2}$ inches, the universal aim to separate the ball cases on the crank-axle as far as possible being here abandoned for a single row of balls. In favor of this form of bearing, for which the claim of unapproached ease of running is made, is certainly the large diameter of the circle in which the balls move. Whether this form of bearing will stand for all-around use may be questionable, but for the track it gives the utmost that "narrowness" contains.

Circle Cycle Frame Construction.

The Circle Cycle Co. show a lady's model, with the upper arc of the circle is cut away entirely and in which a straight lower cord, running from the lower one of the upper connecting head-lugs to the top of the crank-hanger bracket, is inserted. This construction is considerably weaker, however, than when the circle is left intact and it does not produce a graceful model. They also show a combination tandem which has the lady's pattern above described in the forward part of the frame, and the man's pattern in the rear part.

It makes a rather pretty tandem, but judging from a careful inspection of it the frame will not be noted for its stiffness.

Chainless Cycles.

The Spalding cycle fitted with a bevel gear is not alone in its glory, as it was at Chicago. A number of chainless cycles are shown, among them being six historical models on the stand of the Howard Chainless Cycle Co., and their exhibit of this type is noteworthy as showing the evolution of it from 1892 to the present date, a period of renewed interest, not only in this, but in other methods of transmitting power from its source at the crank axle to the rear hub, and the bevel gear may be said to be one which is likely when perfected to share in the future a large part of the popularity now enjoyed by the catenary method of power transmission. Not but that the chain and sprocket method are good enough, and although even at this stage of improved construction, the makers have not reached perfection in chain

and sprocket making, and have even not yet formally adopted the gear case as an aid to this stage of perfection, but are simply looking for new methods of power transmission in order to meet the incessant demand of the American rider for novelty and change. The 1892 model shown is a ladies' model, having a single-loop drop frame, fitted with one inch cushion tires, has an eight inch tread, and tips the scale at the astonishing weight of 75 pounds. The 1893 model is a diamond frame, having double tubes from the lower part of the head to the crank hanger bracket, and also double diagonal stays. It is fitted with pneumatic tires (as are all the models which follow it) and has a $7\frac{3}{4}$ inch tread, and weighs 45 pounds. The '94 model is of the same frame construction, having, however, a high frame, and the tread is reduced to 7 inches, and the weight to 32 pounds. The '95 model is a high frame, single tube one, excepting the double diagonal stays, and has $5\frac{1}{2}$ inch tread and weighs 30 pounds. The '96 models shown are a lady's

double-loop drop frame, full nickel, and a man's diamond frame, both having $5\frac{1}{2}$ inch treads, and weighing 24 pounds. Both of the '96 models carry the large front driving gear on the centre of crank axle, and between the bearings, the teeth facing outwardly, instead of inwardly as in the earlier models, thus admitting of a narrower tread and a stiffer frame construction at this point. The '97 models are not yet ready for exhibition, but the claimed new features are a still narrower tread, a new rear hub, and still lighter weight; but this last item is one which is certainly uncalled for, the changes in constructional design which are really needed to meet the lateral strain and thrust upon the rear part of the frame where a bevel gear is used, being a stiffening up of the rear forks and back stays by making them double, as practiced by Pope and Spalding in their tandem frames. The teeth of the gears are cut by a special process, and are of a pitch to give the required strength. The largest qr driving gear is se-

curely fastened to the crank-shaft by means of a taper pin, and also by a key brazed onto the shaft to prevent the gear from displacement, either by sliding or turning on the shaft. The rear driving gear is screwed into the hub of the wheel by a right hand thread, and is there securely locked. The front and rear pinion gears are independent of connecting shaft, and are adjustable at either end, sliding back and forth as the case may be on a key which is brazed to the shaft. This adjustment is obtained by means of ball bearings, upon which the gears revolve, and are locked by check-nut with right hand threads screwing on the connecting shaft, and also secured by a flange screw with left hand thread entering the end of connecting shaft, and sinking into recess on back of locking nut. The connecting shaft is one piece of solid steel, of 9-16 inch diameter, passing through rear fork tube of frame, of $\frac{3}{8}$ inch diameter, giving an inside clearance of shaft of $\frac{1}{8}$ of an inch.

A peculiar little Bantam enjoys the distinction of being at once the only front driver and the only English wheel in the show. It was made by the Crypto Cycle Works, of London, and was recently imported by Alex Schwalbach. The head of the Crypto Company is I. W. Boothroyd, the builder of the old Facile, and famous also as being the originator of the hosepipe or single-tube tire. The Bantam has a 26-inch front wheel and 20-inch rear wheel, fitted with Hartford cor-

wooden tire on the front wheel and a cushion tire on the rear wheel, the deviser not having been able to get quite ready.

Far the most notable of the American examples of chainless bicycle shown—the English Bantam is solitary in being a front-driver—is the Bayvelgere. The crank shaft, as usual, carries a large bevel-toothed gear with 53 teeth on its face; the rear hub has one of 22 teeth, thus making the gear ratio, which is 63, 68, 72 and 76. Connection between the two is by a shaft passing through the rear fork tube on the right side, and having at each end a beveled pinion with 14 teeth; all four beveled wheel-faces have their teeth cut on what is known in the shops as a 10-pitch. The connecting shaft is supported at each end in ball bearings which have the peculiarity of being adjustable, not only longitudinally (in the direction of the shaft), but laterally as well (in a direction across the plane of the frame); they have 13 5-16 inch balls in front and 16 1-4 inch at the rear. The re-

such conditions of imperfect alignment, were the shaft continuous and rigid from crank axle to rear hub. In both design and carrying out, this device is thoroughly mechanical and admirable for the purpose. It is far the most decided step yet made in the direction of rear-driving without chain. The ordinary frame, however, is not quite well adapted to chainless driving, and something apparently remains to be added to that—for instance, in strengthening by a double rear fork tube, as has been shown lately in England on bicycles of the usual type.

The Gentry spur-gear is the "freak" chainless of the Show. The idea is not new, for to bridge the distance and carry the power between pedal and rear axle by a series of spur-gears has been often publicly proposed, and if the concrete expression in metal were as good as the abstract idea on paper nobody could complain. The front gear (representing the usual sprocket) is six inches in diameter, with 68 teeth, which mesh into a train of seven small intermediate gears of 3 inches diameter and having 27 teeth each, the seventh meshing into a gear on the rear hub. All these gears are $\frac{1}{8}$ inch wide and have teeth of what is known as 12 pitch. The train of 7 intermediate gears is borne upon a flat and flanged steel plate, placed longitudinally, this plate being at about the level of the lower side of the chain when the chain is used. This plate is held by a clasp around the rear axle and in front

Suggestions in Sprockets.

markable feature is that this shaft is not continuous. At each end, two short pieces about three inches long are borne in the bearings and are directly attached to the two pinions; the long middle portion, front and back, terminates in four short pins with rounded and slightly enlarged ends. These four pins enter corresponding holes in the two short pieces just described, and can slightly work in those holes somewhat after the manner of a ball-and-socket joint; more exactly, the pins and holes together form a semi-universal or toggle joint, or (as it is technically called) a "four-pinion toggle." When the long middle portion is put in its place, joining the two ends of this device, the connection between the bevel wheel at the crank bracket and the bevel wheel on the rear hub is complete. The operation is that if the shaft should get sprung "out of line" the little toggles will yield and accommodate themselves so that the power is carried without twist or bind, as would inevitably be the case, under

over the rear fork bridge. Just as Abraham Lincoln is reported to have defined the proper length of a man's leg to be long enough to reach from his body to the ground, so there must be a total gear diameter enough to reach from crank axle to rear axle; there must also be an odd number of gears, because each gear turns its neighbor in a direction reverse from its own and only the odd-numbered gears, counting toward the back, run toward the front. In this case, the little gears, like the little child in Wordsworth's verses, pipe plaintively "we are seven." Each one of them, borne, of course, upon its own stud and having support only on one side, runs on a four-point bearing having fifteen 3-16 inch balls. The plate which carries the whole has a slot allowing the entire seven to be moved toward the crank axle for adjustment purposes, or either end of the plate can be slightly lifted for the same purpose, the other one serving as fulcrum in so doing. An enclosing metal plate is made to fit over the train of gears to exclude dust.

This contrivance can be applied to any bicycle, at a cost of \$15. As to whether it is likely to be so applied to many, that depends upon the "catching" quality of a most hopeless freak. The chain is abolished, it is true, but at the cost of a train of gears and ball bearings which cannot possibly be operated. Spinning freely without load, these little jokers move quietly and easily, to the delight of

rugated tires and Plymouth wood rims, and the rear part of the frame is connected to the head by a rather long curved backbone, after the manner of the old ordinary. The front forks are perfectly vertical, the cranks are on the front axle and the ratio of gear is 2 $\frac{3}{4}$, making this wheel run as a 72 gear. A set of small spur or improved epicyclic gears are enclosed from sight in the front hub and in the small circular case underneath the front fork on the right-hand side, and are the only noticeable peculiarity excepting that the front wheel runs faster than the pedals. Advantages claimed for it are perfect safety, the rider being nearly midway between the wheels, ease of mount and dismount, the seat being down low, riddance of the chain, without any complicated features in its place, its hill-climbing ability, ease of steering, upright normal position of the rider, and last, but not least, its cleanliness in use and the entire absence of the mud-throwing habit of the chain machine.

One of the most pronounced novelties is an attempt to put, at one fell swoop, an end to punctures by transferring the tire from the rim to the hub. The transfer is quite literal as well as figurative. The rear hub consists of two flat discs, including a pneumatic tire, provision for movement under compression being made by having a pin in one disc movable in a short slot in the other. The tires are to be of wood, if the reader can credit it, but the specimen on view is fitted with a

Who Sets The Pace?

You can answer this query to your own satisfaction by observing the number of bicycles at the New York Cycle Show with flush joints, and making note of the fact that the

Barnes White Flyer

WAS SHOWN IN 1895 WITH

FLUSH JOINTS

and has ever since been made in that way.

*You will always be correct if you buy or sell
the master bicycle.*

The Barnes Cycle Company,

SYRACUSE, N. Y.

Kindly mention The Wheel.

the inventor, who then has his day of triumph; but when the load is put upon them, the drag and jam will tear the train to pieces. This contrivance supplies only one more example of the folly of the non-mechanical multitude, who imagine they know mechanics, and ho believe they can devise improvements over the head of practical experience.

The Reading Standard Manufacturing Co., have a chainless wheel in preparation which is not shown, nor are the parties interested willing, for business reasons, which can be readily understood, to disclose the exact method of its construction. They say of it now simply this:

"This is a chainless bicycle with mitre gears at the rear wheel, which gears are operated by a single-bearing eccentric device on the crank shaft and a connecting rod combining them. It is so constructed as to permit a continuous motion and no dead centre at any point. The gears are neatly covered with an aluminum case and the bearings are perfectly dust-proof. This device is free from side strain and friction, as found in bevel gearing, and is claimed to be easier running than the ordinary chain. It is the invention of Mr. W. Diebel, of Philadelphia, and the Reading Standard Manufacturing Co., are the sole makers."

This is all that can now be furnished in the way of description, except that the movement is rotary with pedals in the usual manner, and that the connections are such that control over the wheel for back-peddaling is had in the customary way. Of course, nothing can be said at present as to the practical value of the invention.

EXHIBITS IN DETAIL.

Bicycles.

YOST MFG. CO., TOLEDO, OHIO. SIX FALCON bicycles; same as at Chicago.

MIAMI CYCLE MFG. CO., MIDDLETOWN, Ohio. Racycles; nine wheels, including two tandems, and, of course, the giant sprocket and crank bracket, with the glass hubs showing the workings of the balls, which was such a conspicuous feature at Chicago.

PARK ROW BICYCLE CO., NEW YORK. Royal, Elmore and Ferris bicycles. Thirteen wheels, including two tandems and four juveniles. The Royal and Elmore line is the same as seen at Chicago. The Ferris is an up-to-date wheel for the jobbing trade listed at \$60.

JENKINS CYCLE CO., CHICAGO. FIVE singles, two tandems, including the \$1,500 Tiffanyized tandem shown at Chicago. The stand is finished in blue in keeping with the color of the wheel, and was one of the few in an entirely completed condition before the doors were opened. The line shown was the same as at Chicago.

A. M. SHEFFEY & CO. NEW YORK. WYNNEWOOD bicycles and a complete line of sundries. Few changes in the Wynnewood are found necessary, and few were made, a new crank locking device, a new adjustable handle-bar clamp for wood bars and other minor alterations being the only respects in which the '97 wheel differs from previous models.

READING STANDARD MFG. CO., READING, Pa. Six Reading bicycles, including two not shown at Chicago. These are fitted with the Diebel single bearing crank bracket, containing six $\frac{3}{8}$ balls held by a retaining separator and which permits of a tread of $2\frac{1}{2}$ and $3\frac{1}{2}$ inches. The use of this bearing entails a new method of spoking in the rear wheel, short spokes being secured to a much enlarged flange centered on the rear axle. The bearing itself was exhibited by Mr. Diebel himself at last year's show.

BERNSON MFG. CO., NEW YORK. BERNSON bicycle, a special with nickel-plated outside frame connections, single-piece cranks and an eccentric rear chain adjustment, and internal connections for the seat-post. The Cosmic Puncture-proof Tire was also shown on this wheel. It consists of a continuous strip of leather, chemically prepared, and attached by a patented treatment to the inner tube, making an exceedingly tough tread while adding but six ounces to the weight. The resiliency of the tire seems in no way impaired, and from some of the tests made, it appears to fill the niche for which it was intended.

WORCESTER CYCLE MFG. CO., MIDDLETOWN, Conn. Royal Worcester and Middletown bicycles, twenty wheels, including two tandems. This is the first appearance of the Worcester concern under its new management. It is fair to say that the wheels do the management proud. The Worcester embodies several decidedly distinctive features. This applies specially to the bearings, of which those in the bottom bracket will serve to particularize. The sprocket spider and axle are formed of one forging. The spider being recessed permits of the ball retaining cup fitting into the recess, and brings the bearings directly in the line of pull. Instead of being cut on the flat side, the cups are cut on the edge, rendering grinding possible, an item of importance that is aimed at but seldom obtained by many of the cleverer people in the trade. Flanged sprockets, a hollow box fork crown, hollow axles and bolts and universal nuts, which will fit any part of the machine, are employed. The pedals are formed of the Carbondale anti-rust metal. Tapered tubes and flush joints—"royal flush," they are termed—are also featured, the method of making the latter being considered so good that the Worcester people are disposed to keep the process to themselves. The Middletown, the Worcester Company's second string, looks prodigious value for the money, \$60 to \$40. It includes both adults' and juvenile wheels, made of $1\frac{1}{2}$ -inch tubing, with flush joints at all except the head connections, and with ball retaining bearings, keyless cranks and the like.

MCKEE & HARRINGTON, NEW YORK. Lyndhurst bicycles; ten wheels, including two tandems, the latter being the first that the Lyndhurst people have produced. "One cannot live with the devil without learning his tricks," says the firm, in leading up to the statement that the Lyndhurst is the product of "specialized skill," and, truth to tell, the wheels look what is claimed for them. They embody a number of special features beyond the matters of large sprockets, D-shaped rear forks, etc., the crank axle group among them. In this, the crank axle, sprocket spider and right crank are forged in one piece. The left crank is detachable with a wrench, all crank keys being thus dispensed with. The tool steel cones are attached to a sleeve which fits over the axle, the cones being held up to a square shoulder on the sleeve, the ends of which are tapered for the purpose. By this manner of construction, the axle may be removed without disturbing cones, balls, or shells, and the cones, being independent of the sleeve, may be removed at any time. It also permits of a wide separation of the ball races, a feature much sought after, and which adds to the rigidity of the machine, which is heightened by the adoption of the triple steering head, another Lyndhurst speciality, which undeniably adds strength to a weak point. The bracing of the Lyndhurst tandems is claimed to be the stiffest in existence, and constitutes another fitting point. One of the two-seaters is of the convertible type, the removable bar being very snugly fitted.

ECLIPSE BICYCLE CO., ELMIRA, OHIO. Seven Eclipse bicycles, same as at Chicago.

HENLEY BICYCLE CO., RICHMOND, IND., Henley bicycles; four wheels including one triplet.

AMES & FROST, CHICAGO. TEN IMPERIAL bicycles, same as at Chicago.

BUFFALO WHEEL CO., BUFFALO, N. Y. Four bicycles, including one tandem; as at Chicago.

UNION CYCLE MFG. CO., HIGHLANDVILLE, Mass. Six Union bicycles, as at Chicago.

PEERLESS MFG. CO., CLEVELAND, O. Seven Peerless and Patrol bicycles; as at Chicago.

PENN MFG. CO., ERIE, PA. QUAKER Bicycles; seven wheels including two tandems, same as at Chicago.

SPEIRS MFG. CO., WORCESTER, MASS. Five wheels, including two tandems, same as at Chicago.

NATIONAL BICYCLE MFG. CO., BAY CITY, Mich. National bicycles; eight wheels, including two tandems, same as at Chicago.

JULIUS ANDRAE & SONS CO., MILWAUKEE, Wis. Andrae bicycles; nine wheels including four tandems and one quad.

WESTERN WHEEL WORKS, 36 WARREN street, New York. Crescent bicycles; seventeen wheels, including three tandems, as shown at Chicago.

IROQUOIS CYCLE WORKS, CHICAGO, ILL. Iroquois bicycles; six wheels, including one tandem and a drop frame triplet; the same shown at Chicago.

THOMAS H. STEWART, NEW YORK. Falcon, Alcazar, Seminole, Rival, Romana, Pickwick and Roslin bicycles; also the Speeder fitted with the Speeder changeable gear, in all eleven wheels.

ELGIN CYCLE CO., ELGIN, ILL. ELGIN, King and Queen bicycles; eight models, including two tandems and the famous \$10,000 bejeweled tandem; as shown at Chicago.

G. R. JOHNSON CO., NEW YORK. WHEELS for the jobbing trade, including Keystone juveniles, in which line is included three tandems—20, 24, and 26 inches. Twelve wheels in all are shown, including three tandems. The side show of the exhibit is the Fire Ball lamp. The Johnson people deal only with the jobber and do not sell at retail.

DWYER FOLDING BICYCLE CO., DANBURY, Conn. Six Folding bicycles, among them, a lady's wheel, the first of its kind manufactured in the world, it is asserted. The Dwyer wood bar is being featured. The bar itself does not differ from the ordinary, the clamp being the talking point. It is operated by a lock nut, which forces upward a movable clamp. An option is also given on the Ryan folding bar.

STODDARD MFG. CO., DAYTON, OHIO. Tiger and Tigress bicycles; six wheels. The high grade Tiger is fitted with outside frame connections, dust-proof, disc-adjusting bearings, large sprocket, arch crown, split cranks, keyed on a triangular ended crank axle, while taper-tubing is used throughout. The medium grade line is practically the same, with the exception of a two-piece fork crown and a slight difference in the finish.

ROLLINS & DOBYNE CO., HARVARD, ILL. Shenandoah and Crusader bicycles; five wheels, in-

cluding one tandem. The Shenandoah line is fitted with outside frame connections, one-piece crank and axle, and a very symmetrical triple fork crown. The tandem is of particularly handsome lines, the chain adjustment being accomplished by an eccentric in the front hub, doing away with the idler. Both lines are beautifully finished and handsomely decorated.

GLOBE CYCLE WORKS, BUFFALO, N. Y. Globe and Mascot bicycles; nine wheels. The Special Globe has flush joints, inch and a quarter for the main frame tubes, D section tubes for the rear forks, internal fastenings to the handle-bar and saddle-post, Baldwin chain, single piece fork crown, and a two-piece crank axle, which is held together by a bolt, passing through from end to end, making an effective and secure joint. The Mascot line has outside joints, a single-piece crank and axle, while the finish and decorations for the leading grade wheel are superb.

HEINZ & MUNSCHAUER, BUFFALO, N. Y. Heinz and Sphinx bicycles; three wheels. The leader, the Heinz Special, a highly finished machine, in which flush joints are used, while the rear forks and stays are round, tapering to oval at the rear axle. The seat-post cluster is particularly attractive, the rear-stays being drawn together for about six inches from the top of the frame, and while joined, still preserve their round form. A one-piece crank is used, also a strong single-piece fork crown, and a clever internal fastening for the saddle-post. The wheel is highly ornamented, and presents a handsome appearance. A line of high grade juveniles is included in their product.

MANUFACTURERS' LEAGUE CYCLE COMPANY, Potter Building, New York. Seven models; three Brightwood and four Black Diamond cycles. The Brightwood is made with a wood frame, ash, oak, hickory or maple, finished in natural colors, chemically treated, making an extremely pretty appearance. The joints are effected by a patented flange clutch, the external part of which is highly nickelled. The use of wood does away with brazing in the frame construction. The frames are guaranteed to be as strong as those of steel tubing. They are listed at \$60. The Black Diamond is a \$100 machine, built on the regulation lines with steel tube frames. Its features are a two-piece crank shaft, simple eccentric chain adjustment, expansion seat post, flush joints and ball retaining bearings.

PACKER CYCLE Co., READING, PA. PACKER and Albert bicycles; seven wheels. The high grade Packer has outside reinforced joints, large detachable sprockets, a single-piece fork crown of neat design, L-shaped crank axle, with the crank on the sprocket side, held on by a taper and a large headed nut. A flat key is inserted in the crank, parallel to the taper, and has a corresponding groove milled on the axle. The axle is externally threaded, and a nut draws the crank securely on a taper, making a very strong and neat fastening. A happy combination of colors is effected by enameling the wheels in light green and striping them with a darker shade. The single rear lug crank-hanger which, while appearing a novelty, has been used by the Packer Co. since '95, is still retained. Instead of having the customary parallel tubes with a cross brace directly back of the bottom bracket, a large tubular construction is used, and the rear stays branch out from this. It gives the advantage of using a very narrow thread besides adding much to the appearance of the wheel. The medium grade Packer resembles the higher grade, and is practically the same, excepting small details.

SHELBY CYCLE MFG. CO., SHELBY, O. Eleven Shelby bicycles, as at Chicago.

GENEVA CYCLE CO., GENEVA, O. Fourteen wheels, including two tandems; as at Chicago.

EAGLE BICYCLE MFG. CO., TORRINGTON, Conn. Eleven Eagle bicycles, as at Chicago.

STANDARD BICYCLE MFG. CO., CHICAGO. Seven Standard bicycles, as shown at Chicago.

ROUSE, HAZARD & CO., PEORIA, ILL. Ten Sylph and Overland bicycles, as shown at Chicago.

ELLCOTT MFG. CO., TONAWANDA, N. Y. Five Ellicott and Red Jacket bicycles; as at Chicago.

COLUMBUS BICYCLE CO., COLUMBUS, O. Columbus cycles; eight models. Same as at Chicago.

OLIVE WHEEL CO., SYRACUSE, N. Y. Seven Olive bicycles, including two tandems, as shown at Chicago.

ADAMS & WESTLAKE MFG. CO., CHICAGO. Eleven Adlake bicycles, including two tandems and one triplet, as shown at Chicago.

TRINITY CYCLE MFG. CO., WORCESTER, Mass. Seven models, including two tandems, and a display of parts; as shown at Chicago.

WINTON BICYCLE CO., CLEVELAND, O. Nine wheels, including two tandems. The racer is the only machine not shown at Chicago.

BUFFALO CYCLE CO., BUFFALO, N. Y. Envoy and Fleeting bicycles, including the Envoy fitted with a Simpson chain, as shown at Chicago.

E. C. STEARNS & CO., SYRACUSE, N. Y. Nineteen Stearns bicycles, including two tandems, one triplet and one septuplet, as shown at Chicago.

IVER JOHNSON ARMS & CYCLE WORKS, Fitchburg, Mass. Iver Johnson and Fitchburg bicycles, eleven wheels, including one tandem, the same as shown at Chicago.

R. H. WOLFF & CO., NEW YORK. American bicycles, fourteen wheels, including two tandems, one triplet and oneduplex, identical with those exhibited at Chicago.

INDIANA BICYCLE CO., INDIANAPOLIS, Ind. Three Waverly bicycles, as at Chicago. The Waverly dynamograph, for measuring friction, is in evidence and attracts much attention.

GEORGE WORTHINGTON CO., CLEVELAND, O. Ariel, Halladay, L. & B., Worthington, Harvard, Adelbert and the Featherstone line. Thirty wheels; same as at Chicago. The Worthington exhibit is so large that it was necessary to split it into two separate exhibits on different floors.

GENDRON WHEEL CO., TOLEDO, O. Fourteen Gendron and Reliance bicycles, as shown at Chicago. The Gendron glass hub, showing the workings of the bearing, is the conspicuous feature of the exhibit.

WHITE SLEWING MACHINE CO., CLEVELAND, O. Fourteen White and Cazador bicycles, as shown at Chicago, excepting the Cazador, the White people's juvenile wheel, a likely machine, embodying no exclusive features.

GORNULLY & JEFFERY MFG. CO., CHICAGO. Eight Rambler bicycles, including two tandems, all except one the same as shown at Chicago, the exception being the \$1,000 Tiffanyized Rambler, which had just returned from its tour of the foreign shows, and which is making its final appearance here before delivery to A. B. Hughes, of Denver, who won it by riding the fastest mile during the year 1896 on a Rambler.

WARWICK CYCLE MFG. CO., SPRINGFIELD, Mass. Warwick bicycle, fourteen wheels, including three tandems. The exhibit is a duplicate of that at Chicago, excepting a cushion frame tandem, which is the first of its sort ever produced.

E. HOWARD & CO., BOSTON. HOWARD bicycles, eight wheels, including two tandems. The most striking feature of the wheel is still retained, that is, the carrying of the lower tube of the frame below the crank bracket. The Howards have been tuned up wherever possible, but embody no very distinctive changes.

SCHLEUTER MFG. CO., CINCINNATI, O. Norwood bicycles. Sixteen wheels, including two tandems, an attractive lot. The tandem is a new addition to the Schleuter line, as also are the juveniles, listing at \$50, \$45, and which, by the bye, are made of seamless tubing, many of the parts being identical and interchangeable with those on the larger and more expensive models. The Schleuter people have not adopted flush joints. They have plumbed for outside reinforcements, believing them stronger and safer than the others.

GLADIATOR CYCLE CO., CHICAGO. FIVE models; two Gladiators, two Spartacus, one Commodore. For an \$85 wheel the Gladiator is one of the trimmest and best appearing wheels at the show. It is fitted with an original two-piece crank, consisting of the two axle ends having six corrugations which fit into a rifled collar, and in turn are pulled flush by a right and left thread cone barrel, thereby insuring a shaft as rigid as a solid piece. The cups are screwed into the crank-bracket from the outside and are fitted with ball retainers, making them adjustable without disturbing axle or bearings. A new and original sprocket which can be detached without removing either crank or pedal and a new crown are also shown. Tapering rear-stays, a new oiling device for both hubs and flush joints, complete the new '97 features.

LIGHT CYCLE CO., POTTSVILLE, PA. Light cycles, ten wheels, including one convertible tandem. To quote the Light people, "The curse set on man when thrown out of the Garden of Eden was work." With this in mind, and while they have adopted flush joints and in other respects brought their wheels up to date, they have centered most of their energy on the perfection of their bearings. The result is best shown in the crank axle group, although it applies to both front and rear wheel bearings as well. Perhaps the chiefest feature is the use of a ground cup. It necessitated a squaring of the cup corners, it being impossible to grind a perfectly round cup. The grinding, however, has given them, they assert, a long lead over all others. They claim to be the only bicycle concern grinding their cups; all others merely polish them. To better illustrate the advantage and smoothness of running thus gained, one of the wheels is mounted on a hinged upright, permitting it to be placed at any angle, and proving that the valve stem has nothing whatsoever to do with the perfect balance of the wheel. The Light people also believe they are exclusive in the use of a continuous crank, which they desire not to have confounded with a one-piece crank axle. The exclusiveness of this feature is heightened by the fact that it may be removed through the crank bracket without disturbing any other portion of the wheel. It is not even necessary to remove the cups, as is usual. This result is obtained by increasing the size of the bottom bracket to a diameter of 2½ inches. The balls are protected by a cap, which, when unscrewed, exposes the bearings, and enables them to be cleaned or flushed without removal. The Light flush joints are novel in that each section and shoulder of the inside joints are themselves reinforced.

Crimson Rim

Syracuse Bicycles

for 1897 are

Wheels of High Repute.

Built of the finest quality of material throughout, and constructed with infinite care and painstaking workmanship, together with its national reputation for improved features, all combine to make the Syracuse a fast seller for the agent.

Kindly mention The Wheel.

NEW HAVEN BICYCLE WORKS (Formerly New Haven Chair Co.) New Haven, Conn.—New Haven and Elm City bicycles. Eight wheels, including one tandem. The Elm City is a \$75 addition to the line, and the New Haven is practically new, having been entirely re-modeled. As now made, they incorporate flush joints, divided crank-shafts, and bearings, the V-shaped cones of which are formed on the axle. The right hand position of the shafts screws directly into the solid cones, while the left is drawn into place by a collar-screw or bushing, the two parts being so beveled that they wedge together when drawn into place. A new arch fork crown has been adopted, and something entirely new in handle bar and seat-post clamps has been designed. The clamps are made entirely separate from the forging, and in two pieces besides the nut. These two pieces are milled so that when brought together the circle is a trifle smaller than on the post. When the nut is tightened, the post is not only wedged by the two clamp pieces, but is also bound tight against the front of the hole in the forging. One side of the clamp is flushed with the side of the frame, while only the fancy nut projects on the other side. As the hole in the forging is perfectly straight, the clamp can be put in from either side. This method of construction avoids the necessity of splitting the seat-post for an internal expander, or of splitting the frame for the old method of clamping the post.

HENDEE & NELSON MFG. CO., SPRINGFIELD, MASS. Ten Silver King and Silver Queen bicycles. Ever since the establishment of the concern at least one radical departure from the conventional has marked their career. Last year it was their bearings, this year, the innovation is in their sprockets. At first glance they look odd, but clever argument is not lacking to prove their superiority. The flange is retained, but has been widened, and in front of each tooth on the rear sprocket is a cup or milling directly into the face of the sprocket, and of the width of the center chain. Back of each tooth the flange is milled out on each side, so that the center block supports the side links, relieving friction on the flanges. On the front sprocket the process is reversed. It is claimed that there is less friction and a higher gear is possible with these sprockets than with the common kind. Another feature of the Silver King lies in the construction of the rear fork stays, which are brazed to a solid forging, three or four inches from the bottom bracket. Two smaller tubes being secured to the latter. Still another distinctive and important feature is the Bullard brake, consisting of four cams, enclosed in a drum on the rear hub. The mere act of back pedaling generates friction, and the harder the back pedaling, naturally the greater the friction. When the pressure on the pedals is released, the brake releases itself. It looks well, and if usage should demonstrate its practicability, it will go far toward settling the much mooted brake question.

PHILLIPS MFG. CO., 307 AND 309 WEST Broadway, New York. Five Kimball bicycles. About the most conspicuous feature of the exhibit is the rather unusual sign inviting the public at large to visit the Phillips factory and witness the various processes in the manufacture of the Kimball bicycle. The Phillips people are pursuing a conservative plan. They have not adopted either flush joints or divided crank shafts, for despite the very general acceptance of those innovations, there are still to be found many who believe that they will not be of a lasting nature. The Kimball wheel does not suffer because of the fact. It is a trim-looking mount, embodying no particularly radical departures, but having been refined wherever experience has proven it desirable. Among the refinements is a new arch fork crown, and a

rather novel crank key or cotter-pin. The key is provided with a jamb-nut on the larger end which when screwed down forces the key out. The Phillips people also devote great attention to the finish of their wheels, their white wheel, for instance, being given eight different coats of enamel to insure what they term an ivory finish.

WICKWAR CYCLE CO., NEW YORK. Five Wickwar bicycles. The product of this concern is limited, and the result of this concentration is shown in their wheels. They are handsome creations, and embody several original ideas. The rear stays and forks, for instance, are each formed of one piece of curved tubing, one piece, lap brazed, carrying the rear stays to the bottom bracket, two narrower tubes connecting with the seat-mast. The bottom bracket is also formed of tubing lap brazed. The outside lugs or reinforcements are likewise of tubing, handsomely nickeled. Included in the Wickwar line is a juvenile Wickwar, an exact reproduction in design and material of the adults' wheel. It is a question if it is not the most attractive youngsters' wheel in the Show, and at \$50 and \$40, the best value.

ZENITH CYCLE CO., BINGHAMTON, N. Y. Zenith & Zenda bicycles, five wheels, including two tandems. Outside joints, the same as last year, are retained; double plate fork crowns; a trifle more drop to the crank hanger; large balls in all the bearings, ball retaining devices, reversible handle-bar, held in place by a single lock nut, a clever L-crank attached on left hand side on a taper and secured by a large headed nut, constitute some of the '27 features. A specialty is made in the ornamentation of the wheels shown, the work being highly artistic and adding much to the appearance of the machine.

CYGNET CYCLE CO., WILLIAMSPORT, PA. Cygnet bicycles, six wheels, the frame constructions of which are entirely different from anything at the show, being made of two strips of D-shaped tubing, bent somewhat on the shape of a tennis racket dropped, however, so as to allow for skirt clearance in the ladies' wheel, while in the men's pattern an extra bar is introduced. The sprocket is on the inside of the frame. As if this were not enough novelty for any one machine, every bicycle is furnished with a cyclometer and a compass, both of which are imbedded in the fork crown.

AMERICA CYCLE MFG. CO., CHICAGO. America, Hussar and Tunnix bicycles; nine machines, including two tandems, one of them a double diamond, not shown at Chicago, and which gives evidence of considerable improvement over the '26 model, with an extra brace, more room between the seats and a single steering rod instead of two as heretofore.

LEAGUE CYCLE MFG. CO., MILWAUKEE, Wis. Formerly Bolte Cycle Co. Nine League bicycles, including two tandems and the League sextuplet which was used for pacing last season. The exhibit is the same as at Chicago, except for two machines for exportation, fitted with gear cases, mud guards and brakes.

WILLIAM REED & SONS, BOSTON, MASS. New Mail, Templar, Atlanta and Hanover bicycles; eight wheels, ranging in price from \$85 to \$40—a good-looking up-to-date lot, embodying no particularly exclusive features, but appearing splendidly for the price asked.

FRAZER & JONES CO., SYRACUSE, N. Y. Elfin cycles; ten models, including three tandems and one triplet. All these wheels are for juvenile riders. The exhibit is substantially the same as shown at Chicago.

AMERICAN SEWING MACHINE CO., PHILADELPHIA, show six American Travelers. The feature of this wheel is the drop forged crank, axes and sprocket spider, which is in one piece.

CIRCLE CYCLE CO., NEW YORK. CIRCLE cycles; one wheel and one of the distinct novelties of the show at that being an entirely new departure from the conventional frame, a perfect circle being used as the center or foundation, otherwise the wheel

is not unlike that in common use. Added strength is claimed for this type of construction. A lady's wheel is to be added to the exhibit. In this, the upper part of the circle is cut away, giving the frame a crescent shape.

SEYFANG, PRENTISS & CO., BUFFALO, N. Y. Bison and Stag bicycles, the latter a \$75 and \$60 addition to the line. Six wheels including one tandem with a centre driving front chain, shown for the first time. Excepting flush joints no material changes in the Bison were found necessary. The firm was one of the very first to adopt a one-piece crank shaft of their own design. It is a genuine article, not only the axle, but the cranks being formed in one piece. It has been considerably improved during the year, the adjustment of the bearings being now effected by means of a collar on the sprocket side, the cones being held on the shaft by pins. The means of oiling are particularly novel. A toothed washer on the hubs is perforated and oil may be applied through any of the holes. While the wheels are practically duplicates Seyfang & Prentiss list the men's Bison at \$100 and the ladies' at \$85.

READING CYCLE MFG. CO., READING, PA. Vindex and Nonesuch bicycles; six wheels, including one tandem. The '97 Vindex has outside frame connections, two-piece fork crown, L. crank and axle, the right crank fastened with lock nut on triangular shaped tapered shaft. Large sprockets are used, also an internal brake rod of neat design. The wheels are finished in royal blue, red and black, also a peculiar shade that they call Quaker green. The Nonesuch is a rich-looking machine for a medium grade, with external frame connections, single piece fork crown, and an L. crank keyed on right hand side.

GEORGE N. PIERCE CO., BUFFALO, N. Y. Ten Pierce bicycles; including one tandem, which was not shown at Chicago. The bracing of this two-seater is peculiarly Piercishi. It has a three-plate fork-crown, full nickeled front forks, eccentric front-adjustment and is made in both double diamond and convertible patterns.

RICHMOND BICYCLE CO., RICHMOND, Ind. Six Richmond bicycles; including three fitted with cushion frames; as at Chicago.

CENTRAL CYCLE MFG. CO., INDIANAPOLIS, Ind. Six Ben Hur bicycles; including the Ben Hur Extraordinary; as at Chicago.

ACME MFG. CO., READING, PA. FIFTEEN Stormer bicycles; including two tandems; as at Chicago.

THE BAYVELGERE CYCLE CO., NEW YORK. The Bayvel bicycle; a chainless wheel, for which much is claimed. It is of the bevel-gear pattern, in which the connecting shaft is supported near the points of contact by means of a ball, and socket joint; the crank of the pinion gears extends toward the

connection shaft about three inches, and an extra row of balls is placed at the connection end, acting as a guide under undue strain. These parts are amply arranged for adjustment. Flush joints, large tubing, and spokes of the pull tangent type are used throughout.

BEAN-CHAMBERLIN MFG. CO., HUDSON, Mich. Eight bicycles; including one made with arch fork crown in contrast to the double flat crown on the other Hudson models; as at Chicago.

THE DAVIS SEWING MACHINE CO., DAYTON, O. Dayton bicycles, eleven wheels, including four tandems and one triplet. Naturally, as one of the very first wheels in which large tubing; i. e., 1 1/4 inches, was employed, that feature is retained, the Dayton being further distinguished by the use of that size of tubing in all portions of the frame, including the steering head, and excepting, of course, the rear forks. Dayton bearings, too, are still being prominently featured. They are of the three-point variety, the cones having a straight bearing surface

instead of the curved surface, which the Dayton people affirm is the "attempted application of an impractical theory." The cones and cups are hardened and drawn to the proper temper, and before being polished to a glazed surface, are ground true on special machines made in the Davis factory. In the crank bracket group, considerable alteration and improvement has been effected. The right crank, crank shaft and sprocket flange are forged in one piece, permitting the shaft, sprocket flange, cone seats and

the tapered seat for the left crank to be turned and machined on the same centres. The detachable left crank is attached by a tapered fit on the shaft, and is kept in line by a straight screw, held in place by a finished screw flushed with the outside of crank, the whole being perfected by the addition of a nut back of the crank, which acts as a lock nut for the adjusting and a draw nut for removing the crank. The flange which carries the sprocket is recessed to fit perfectly over a flange on the crank hanger ball cup, adding to the dust proofness of the bearing. A minor

but ingenious feature is the provision for oiling and cleaning the bearings. The screw in the sprocket flange on the crank axle permits the oil to be applied directly upon the balls, the same result being effected on the opposite side by means of an oil hole in the adjusting cone. The crank shaft is enclosed by a brass tube connecting the ball cups in the bracket, and by placing the wheel on one side the bearings can be thoroughly flushed without disturbing the adjustment or any part of the bearings.

C. J. GODFREY, 11 WARREN STREET, NEW YORK. Iver Johnson and a complete line of Featherstone bicycles, as shown by the manufacturers themselves at Chicago.

SNELL CYCLE FITTINGS CO., TOLEDO, Ohio. Four Snell bicycles and a full line of stampings and parts; as at Chicago.

TONK MFG. CO., CHICAGO. OLD HICKORY bicycles, five wheels, including two tandems, the same as at Chicago.

QUEEN CITY CYCLE CO., BUFFALO. ERIE bicycles, four wheels, as shown at Chicago.

OVERMAN WHEEL CO., CHICOPPEE FALLS, Mass. Ten Victors; as shown at Chicago.

HOWARD CHAINLESS CYCLE CO., NEWARK, N. J. Six wheels; of which two are '97 patterns, while the others constitute an interesting historical exhibit of chainless wheels, including the original League chainless, made at Hartford in 1891. The gear-

ing is of the direct bevel variety, and is thoroughly adjustable. The teeth on the bevel are cut from tool steel, by special machinery, while the various gear covers are of such a size that the wheel presents a most attractive appearance.

KEATING WHEEL CO., MIDDLETOWN, Conn. Keating bicycles; eleven wheels, including two tandems and one wheel not shown at Chicago, a Keating that had been ridden nearly 19,000 miles by one of their wheel-testers, and which was displayed with mud and dust intact.

RELAY MFG. CO., READING, PA. SEVEN Relay bicycles; including one tandem bicycle and one tandem tricycle, as shown at Chicago. In addition, there is a Relay fitted with pneumatic hubs and wood tires, but which the firm do not father. They simply built it to the order of a gentleman with a "large idea."

H. A. LOZIER & CO., CLEVELAND, OHIO. Sixteen Cleveland and Westfield bicycles; including two tandems and a ladies' 26-inch diamond frame bicycle, not shown at Chicago.

MARCH-DAVIS MFG. CO., CHICAGO, ILL. March-Davis and Admiral bicycles; fifteen wheels, including four tandems; as at Chicago.

MONARCH CYCLE MFG. CO., CHICAGO, ILL. Thirteen Monarch and Defiance bicycles; including two tandems; as at Chicago.

LUTHY & CO., PEORIA, ILL. SEVEN \$150 Luthy bicycles; as shown at Chicago.

WHAYNE MFG. CO., LOUISVILLE, KY. Gem wheels; as at Chicago.

THE BIGELOW & DOWSE CO., BOSTON. Crawford and B. & D. bicycles; eight wheels including two tandems. The B. & D. differs in few respects from the accepted '97 model. It is shown in

two grades, one listed at \$85, and the other at \$125. The Crawford, at the reduced price of \$50 has made itself felt and is great value at the price.

F. H. BRENNAN, NEW YORK. ONE GO-AS-YOU-PLEASE tandem, one of the separable type, which may be converted from a double to a single. A system of knuckle joints is employed to effect the result.

UNION MFG. CO., TOLEDO, O. VIKING Bicycles, eight models in two grades. The '97 Viking has flush joints, D-shaped tubing to both rear stays and forks, curved braces, an arched fork crown, internal fastenings to seat post, while a handsome gold-plated spiral name plate adds much to the beauty of the machine. In the Viking crank hanger, the balls are brought directly under and in line with the cranks. The axle is hollow and of the two-piece

variety, the parts being held by an internal bolt that is completely hidden from sight. The balls are held in place in the cups, and the bearing can be removed from the yoke without removing chain or changing adjustment when replaced. The medium grade Viking resembles the other model to a large degree, but has outside connections, two plate fork crown and keyed-on crank and is in every way a staunch and substantial looking wheel.

THE CANADIAN TYPOGRAPH CO., WINDSOR, Ontario, Canada. E. & D. bicycles. This is the first Canadian wheel that has ever been seen in an American show. It is the highest priced wheel in Canada, and is said to find a large sale, not only at home; but abroad. The feature of the wheel is the bearings. They are of the four-point syle. The cones, when put together, form an almost perfect square, the ball touching each one of the four sides. The opening between the hub and axle is made dust-proof by a felt washer. The ends of the axle have a rank taper on the four sides, and the fork is correspondingly tapered, thus getting the strength of tour cotter pins. In other details, the E. & D. wheel differs little from its American competitors. It lists at \$125.

A. G. SPALDING & BROS., NEW YORK. Spalding bicycles, Christy saddles, handle-bars and a line of sundries and accessories. Sixteen wheels including two tandems, two cushion frame, one chainless, and eleven singles, in drop and diamond frames, the same as at Chicago.

KNICKERBOCKER CYCLE CO., NEW YORK. Five Knickerbocker bicycles.

FOX MACHINE CO., GRAND RAPIDS, MICH. Six Fox bicycles; as shown at Chicago.

THE KIRK-YOUNG MFG. CO., TOLEDO, O. Four Yale bicycles, as shown at Chicago.

FOWLER CYCLE MFG. CO., CHICAGO. FOWLER bicycles; seven wheels including two tandems. Same as at Chicago.

D. D. WARNER & CO., MADISON, WIS. Warner bicycles; five wheels, including one tandem; the same shown at Chicago.

POPE MFG. CO., HARTFORD, CONN. Columbia and Hartford bicycles; ten wheels, including two tandems; same as at Chicago.

VICTORY CYCLE CO., PHILADELPHIA. Seven Victory bicycles, "at \$50 each, as good as any on the market," as their representative asserts.

HAMILTON-KENWOOD CYCLE CO. GRAND Rapids, Mich. Hamilton and Kenwood bicycles; fifteen wheels, including two tandems; as shown in Chicago.

SCHOVERLING, DALY & GALES, 302 BROADWAY, New York. Gales, Duane and Gotham bicycles; their own manufacture; and the Sterling, for which they are agents; eleven in all. This is the first year the Gales has been made by S. D. & G. themselves, and good though it may have been in the past, it now easily ranks as one of the most wonderfully improved wheels of the Show. There are certainly few, if any, that appeal more quickly to the eye, and the make-up of the wheel bears out its appearance. It incorporates several novel ideas, among them a front fork in one piece of tubing, structurally reinforced at the crown and at the fork end; also a chain adjustment of new design. It is in the axles, however, that great distinctiveness is embodied. Both the crank axle and front and rear wheel axles are of the divided pattern. In the former, the crank and one-half the axle is in one piece, fitted into a sleeve. To take the mechanism apart, it is only necessary to unscrew either of the bearing cases, when the two halves of the axle may be drawn apart, the crank, one-half the axle and the bearing case and cone coming out together in the operation. The cones may be unscrewed from their respective parts

of the axles and the balls loosened if desired. In the hubs, which are barrel pattern, one portion of the divided axle screws into the other. Adjustment of the bearings is obtained by loosening the axle nut and applying the wrench to the end of the axle, which is square. The ball-cups are screwed into the hubs. The gold striping of the wheel is uncommonly handsome.

E. K. TRYON, JR., & CO., PHILADELPHIA. Apollo bicycles, as at Chicago.

REMINGTON ARMS CO., ILION, N. Y. NINE Remington bicycles; also one tandem; as at Chicago.

JOHN P. LOVELL ARMS CO., BOSTON, Mass. Seven Lovell Diamond bicycles; as at Chicago.

STERLING CYCLE WORKS, KENOSHA, Wis. Six Sterling bicycles; including one tandem; as at Chicago.

M. D. STEBBINS MFG. CO., SPRINGFIELD, Mass. Five wood frame Chilion bicycles; same shown at Chicago.

THOMAS MFG. CO., SPRINGFIELD, OHIO. Thomas bicycles; ten wheels, including four juveniles; as shown at Chicago.

LIBERTY CYCLE CO., NEW YORK. LIBERTY bicycles. Twelve wheels, including two tandems, as shown at Chicago.

ARNOLD, SCHWINN & CO., CHICAGO, ILL. Ten models, including two tandems, one triplet, and one quad; as shown at Chicago.

FENTON METALLIC CO., JAMESTOWN, N. Y. Same as at Chicago, with the addition of a Fenton, with the tubing cut away to show the working of the Spencer brake, which this firm has the sole control of for 1897.

MASON & MASON, CHICAGO. SOUDAN, Nile and Pyramid Bicycles; ten wheels. Including three tandems. Same as at Chicago. In reporting that function, however, notice was not made of the new fork crown used on the Nile. It is round and hollow, being formed of a solid forging, drilled out,

the lugs of the forging forming practically a reinforcement of the fork. The crown was patented, and adds to the appearance of the wheel. The diamond shaped crown employed on the Soudan is peculiar to the Mason establishment, and is fairly well known.

VANGUARD CYCLE CO., INDIANAPOLIS, Ind. Vanguard bicycles; three wheels. Same as at Chicago.

HOME RATTAN CO., CHICAGO. TEN HERO & Homer bicycles, also wood rims and wood handle-bars, as at Chicago.

EVERETT CYCLE CO., EVERETT, MASS. Two McCune and two Fenway wheels are shown, the latter having novel double ball bearings.

PEORIA RUBBER & MFG. CO., PEORIA, ILL. Eight bicycles. Including two tandems, four diamond frame and two drop frame; as at Chicago.

E. I. HORSMAN, NEW YORK. SIX HORSMAN bicycles; no substantial changes reported, and none made, as the Horzman people were satisfied to let well enough alone, the wheel having given satisfaction in the past.

GILMOUR MFG. CO., NEW YORK. SAGAMORE bicycles; two models. The chief noticeable change over the '96 model is an outside reinforcement, nickel-plated. They also show a perfect running model Sagamore one-quarter the size of the regular wheel.

LEAGUE CYCLE CO., MILWAUKEE, WIS. League bicycles; eleven wheels, including one sextuplet and two tandems, as exhibited at Chicago.

ELGIN BICYCLE & SEWING MACHINE CO., ELGIN, Ill. Elgin and Gunning bicycles; six wheels. Same as at Chicago.

WM. MILLS & SON, NEW YORK. WASHINGTON bicycles; four models, ranging in price from \$75 to \$40. One of the talking points of these Washington is a divided crank axle which allows the sprocket to be instantly removed separately, so that all parts can be readily cleaned, the balls being held in place by retainers. A single adjustment for the bearings, necessitating only the loosening of a nut and then the momentary use of a screw-driver, is also a feature, as well as well as flush joints and large tubing. The highest price wheels are known as General Washington and Lady Washington. Other models are styled George, Martha, Little Hatchet and Martha. The machines are adorned with a particularly striking and original name plate.

F. J. TITUS CO., NEW YORK. WARNER, 3:10, Silver Kings and Queens, Titus Special and Tally-ho Tandem. The Titus Special has a one-piece fork, the sides and crown of which are made of a single piece of seamless tubing, especially reinforced rear fork, Baldwin chain, flat cranks and weighs from 17 to 21 pounds. The frame connections are handsomely nicked, and present a very tasty appearance.

HAMPSHIRE CYCLE MFG. CO., NORTHAMPTON, Mass. Nonatuck, Katrina and Hampshire wheels; six machines are shown. The three lines are shown in two grades: Hampshire and Hampshire Special at \$60 and \$100; Katrina and Katrina Special, at \$80 and \$100. The feature of the '97 models are larger balls, larger crank-hanger, a new hub, a new seat-post, and a new shape of cranks. The cranks are of the beveled triangular order. A new tangent spoke hub is used, and a new oiling device. The sprocket is one of the hand-somest in the Show.

Sundries, Specialties and Supplies.

UNION SUPPLY CO., NEW YORK. SPECIALTIES. The principle exhibit is a combination home-trainer, stand and truing device, made of spring steel. The home trainer has been highly endorsed by E. C. Bald. Enamels in all colors, tire and wood rim cements and the Union single tube tire are also shown, as well as handle bars, hubs, fittings and the Shannon holder. A novelty shown at this exhibit is a hand and foot power bicycle built by the Mears Cycle Works, Brooklyn. The hand power is supplied by two leather straps running from the bars to a ratchet arranged on the front axle on the old Star principle. Both front and rear wheels are geared to 90. When power is applied to the front wheel the handle-bar is pushed in an up or down motion. It is claimed that the double power accelerates hill climbing and speed. The wheel shown with the device attached weighs 30 pounds.

B. F. GOODRICH MFG. CO., AKRON, O. Goodrich tires, pedal rubbers and rubber goods of all descriptions. A steam pump, manufactured by the Goulds Mfg. Co., Seneca Falls, N. Y. with an enormous capacity was a feature of the exhibit. Any number of tires can be blown up at the same time, the only limit being the number of connecting tubes. In other respects, the exhibit is the same as at Chicago.

MORGAN & WRIGHT, CHICAGO. Morgan & Wright tires; as shown at Chicago. The booth attracted an unusual amount of attention by its artistic simplicity, which was the more striking because of the gorgeoussness of the neighboring stands.

CHICAGO STAMPING CO., CHICAGO. United States bicycles; five wheels including one tandem, same as at Chicago.

BOSTON WOVEN HOSE & RUBBER CO., Boston. Vim tires and Vimoid, as displayed at Chicago.

PALMER PNEUMATIC TIRE CO., CHICAGO. Palmer tires, as shown at Chicago.

AMERICAN DUNLOP TIRE CO., NEW YORK. Dunlop tires, as at Chicago.

THE LAVIGNE & SCOTT MFG., CO., NEW Haven, Conn. Pedals and wrenches. The combination pedal while not exactly new is interesting. By simply pressing the upper sides it collapses, the centre of gravity changes, and it is transferred from a rat-trap to a rubber pedal or vice versa. It is attractive, convenient and serviceable. The axles, cones, and balls are made of the finest steel and are guaranteed. All parts are interchangeable. The bearings are dust proof, and it is claimed that one oiling suffices for six months' riding. An extensive line of wrenches is shown, in five styles; the Sandow, the Featherweight, the Superior, the Samson and the General.

PRATT & WHITNEY, HARTFORD, CONN. Component parts of bicycles which were produced on Pratt & Whitney machines, making a specialty of those parts formed on screw machines; also a representative display of small tools, gauges and T. & B. self-oiling drills. While coming directly through the lathe, the articles exhibited show a wonderfully smooth finish.

NEW YORK TIRE CO., 59 AND 61 READE street, New York. Samson single tube and Ixion double tube tires, with both milled and smooth tread; also a line of tires for juvenile wheels.

DEERING MFG. CO., NEW YORK. DUPLEX Hoosepipe tires. This is really a hosepipe tire with two valve stems, having an inner inflatable tire, which can be inserted and removed through an opening which is hermetically sealed by a steel clamp. The inner tube is designed for use in case the outer tube is punctured. When not in use it is drawn tightly around the rim side and held out of harm's way by a tape that is made in the tube. If the hosepipe, or tire proper, is punctured, the extra inner tube can be inflated, and the punctured tire simply becomes a shield, or shoe, and the supposition is that the hosepipe tire should also be punctured, it is possible to remove it and a repair be made as with any other inner tube tire.

M. & H. MFG. CO., BOSTON, MASS. LEATHER tire. The tire consists of a rubber interior tube encased within two layers of leather. This leather is made of a special mineral process which causes the fibres of the hide to contract, thus making it waterproof, while at the same time it does not soften when moist or harden when dry. The advantages claimed for it are that it is non-punctureable, will not slip and will out-wear rubber. It is made for racing and road riding.

STODDER PUNCTURELESS TIRE CO., NEW York. Stodder tires. A single tube tire fitted with a chemically treated fabric, which renders it impervious to glass, nails, thorns, pins, etc. At the same time the point is emphasized that the fabric does not lessen the resilient qualities. The claims for the tire are that it is puncture proof, light, resilient and durable.

BROOKLYN RUBBER CO., BROOKLYN, N. Y. Bernard tires. This concern is a comparatively newcomer in the tire trade, although they have been making rubber novelties for many years. The tire has a pure gum inner tube and the fabric used is specially woven of long staple Sea Island cotton. It is made in two styles, smooth or corrugated threads, and in all sizes and weights. The tandem tire weighs four and a half pounds. Universal valves are used.

IDEAL RUBBER CO., BROOKLYN, N. Y. Ideal tires, the ribbed tread of which is a feature. They are made of pure rubber and the finest Sea Island cotton fabric. To test the strength of the tires, they are subjected to an inner hydraulic pressure of 330 pounds to the square inch, without any perceptible give in the fabric.

NEWTON RUBBER WORKS, NEWTON Upper Falls, Mass. Newton tires; as shown at Chicago.

NEW BRUNSWICK TIRE CO., NEW BRUNSWICK, N. J. Shows the New Brunswick, Volt and Messenger tires, manufactured by them, as exhibited at Chicago.

BROWN-LIPE GEAR CO., SYRACUSE, N. Y. Bigears, as at Chicago.

MAJOR CEMENT CO., NEW YORK. RUBBER cement.

VEEDER MFG. CO. VEEDER CYCLOMETERS, as at Chicago.

GRISWOLD MFG. CO., GRISWOLD, MASS. Polishing cloths.

YALE & TOWNE MFG. CO., NEW YORK. Locks, same as at Chicago.

MORSE MACHINERY CO., CHICAGO. MORSE Rubber grip, "as at Chicago.

SHERWIN-WILLIAMS CO., CLEVELAND, O. Enamels, as shown at Chicago.

REED & CURTIS MACHINE SCREW CO., Worcester, Mass, as at Chicago.

FAIRBANKS WOOD RIM CO., BRADFORD, Pa. Rims and handle-bars, as at Chicago.

BOSTON WOOD RIM CO., BOSTON, MASS. Wood rims and handle-bars, as at Chicago.

A. SCHRADER'S SON, NEW YORK. SCHRA-DER Universal Valves, as shown at Chicago.

BETTS PATENT HEADLIGHT CO., NEW York. Twentieth Century Lamps, as at Chicago.

NEW DEPARTURE BELL CO., NEW HAVEN, Conn. New Departure bells, as shown at Chicago.

G. E. STRAUS, NEW YORK. SARTUS SHUBS, including the gigantic working model shown at Chicago.

I. A. WESTON CO., SYRACUSE, N. Y. SHOW a one-piece crank hanger and a line of hubs, spokes and nipples.

CROSBY & MAYER, BUFFALO, NEW YORK. Parts and supplies. The exhibit is precisely the same as shown at Chicago.

MOORE CYCLE FITTINGS CO., HARRISON, N. J. Forgings and parts. A variety of their specialties in this line; as shown at Chicago.

LUDWIG HIRSCH, NEW YORK. SAFETY oiler, the feature of which is a curved spout which may be drawn out some two inches.

CLIMAX BELL CO., BOSTON, MASS., CLIMAX bells, ice skates, adjustable handle-bars, luggage carriers and Climax chains, as at Chicago.

AMERICAN WELDLESS STEEL TUBE CO., Toledo, O. Tubing, forksides, rear-stays and a full line of tubing of all descriptions; as at Chicago.

GARVIN MACHINE CO., NEW YORK. Cycle machinery. The firm's wares are not exhibited, their space being tastefully fitted up to receive customers.

SCHLESINGER MFG. CO., CHICAGO. ROYAL handle-bars, Royal anatomical saddles, Climax cyclometers and a line of specialties and sundries, as at Chicago.

H. O. NELSON, NEW YORK. CLIMAX BICYCLE protectors, a canvass duck hood or cover for entirely enclosing the wheel. The material is chemically treated and water-proof.

WESTCOTT-JEWELL CO., SENACA FALLS, N. Y. Wood stands, steel wire wall brackets which may be pushed upward and out of the way when not in use, and a bicycle hanger for use in baggage cars.

M. ARNHEIM, NEW YORK. CYCLE GARMENTS. A specialty is made of a combination suit, including knickerbockers and leggings in one piece, which, has taken two prizes in recent parades in New York.

THE FRASSE CO., NEW YORK. CYCLE FITTINGS, repairers tools, brazers, enameling ovens, forges and a combination crank and cotter pin remover, an ingenious little device which is meeting with considerable favor.

BRIDGEPORT BRASS CO., BRIDGEPORT, Conn. Searchlights. The '97 model is beautifully embossed, has a larger reflecting surface, a match scratching strip and a new device for facilitating the removal and attaching of the oil well.

BROSNAN CARRIER CO. SPRINGFIELD, Mass. Folding luggage carrier; it consists of a wire frame and a series of straps, attachable to the center of the handle-bar. Will carry a package of almost any size. When folded it can be carried in the pocket or tool bag.

P. A. FRASSE & CO., NEW YORK. MACHINISTS' supplies and tools; a great variety of lathes, taps, etc., for repairers' use. Superior brazing compound and every conceivable article for repair work. They are sole agents for the Morse lathes, Black Diamond File Co. and Adams & Westlake's X-Ray lamps, all of which are shown.

H. C. DARE & CO., PATCHOGUE, N. Y. Dare's automatic coat and parcel holder; a simple device for carrying anything from a coat to a 20 pound package. It consists of two straps which fasten to the handle-bar; regulated by a cord. A pull of this cord will release a bundle instantly and the straps will reel up of their own accord.

P. F. CORBIN, NEW BRITAIN, CONN. Corbin bells. Bells were strung all over the stand on shields, on strings, along the railings, up the posts, and underneath the central signs was a line of huge white glass bells containing electric bulbs, practically a reproduction of the Chicago exhibit.

A. J. RAYMOND, NEW YORK. BICYCLE locking device, consisting of a tubular lock that is intended to take the place of the usual brace in the lower rear stays of a bicycle. The lock is furnished with a bolt that can be thrown out to engage with the teeth of the front sprocket, thereby making it impossible to move the wheel. The lock is susceptible of many key changes, and two keys are furnished with each one, and it is undoubtedly a good thing to make the machine thief-proof.

Silver Nickel sprockets

W. LIGGINS & CO., COVENTRY, ENGLAND. Liggins Patent Detachable and Adjustable Ladies' Dress Guard. This consists of a knotted cord guard, that is attached by small hooks to the mud guard and quadrant. The network is part elastic cord, which makes it adjustable, and keeps the network at one even tension in either wet or fine weather. It is very effective in design, easily attached or detached, and what is very important, reasonable in price. It is furnished in many colors, and well made.

THE WARWICK & STOCKTON CO., NEWARK, N. J. Hubs, pedals and chains. No changes have been made in the Gem hub, which has been a feature of this company's business for years past. It is made from a solid steel bar, the bearings and cones being also turned from tool steel. It has a ball bearing device and has a reservoir of oil in which the balls continually revolve. The Earleka hub, a cheaper ware, is also shown, likewise the Gem pedals and Gem chains, which are too well known to need description.

OLIVER, STRAUS & CO., NEW YORK. India tires, Cilley chains, Worcester pedals and Harvey cyclometers, a well known quartette, the newest of which is the Hanev, which is none the less well known because of its newness. As nearly everyone is aware it is of the barrel pattern registering every mile and tenth of a mile up to 10,000 miles with no springs and but nine working parts. It is dainty and added largely to its adherents.

UNION CYCLE SUPPLY CO., CHICAGO. Tools, stands, and shop appliances. The Wizard stand is decidedly novel in construction. It has an adjustable hanger support with an attachment for fastening the bicycle firmly in the stand. It is made of copper, handsomely polished and nickled. The wood parts being given a mahogany finish. The re-

pairing and truing stand and the lacing and truing clutch embody many novel features. In addition, a tube straightener, a frame straightener, and a crank and axle straightener, a rim spacer, a repair jack, and an enameling frame stand are shown.

J. J. WARREN & CO., WORCESTER, MASS. Leather goods. The thing that interested the trade most in the exhibit was the line of leather handle-bar grips. They are made of various kinds of leather, pressed into shape, and stitched together by hand over a hardwood core. This; it is claimed, makes them practically indestructible, furnishes a most agreeable surface for the hands, and certainly makes a fine appearance on the wheel. They are made of russet, orange, olive, black, brown, or maroon-colored leather, in smooth, rough, or alligator skin, as desired. Nearly one hundred shapes and styles of tool bags are articially arranged in the booth; also a line of luggage carriers, belts and saddles.

HERBERT G. STREAT, NEW YORK. STREAT Collapsible bicycle crate, is so constructed that it may be taken apart and folded into a very small space in a few moments. When collapsed, it makes a bundle five inches high, nine inches wide and twenty-four inches long and weighing but thirty pounds. It is handsomely made of basswood, neatly finished and varnished, the angles being made of steel finely japanned. The springs are of the best quality of spring steel, oil tempered and protected, so that it is impossible for them to get out of order, while the bicycle is held firmly in place by straps which fasten around the tires and head. It is furnished in four styles, with or without a covering of canvas.

BILLINGS & SPENCER, HARTFORD, CONN. Drop forgings, wrenches and drop hammers, all so well known that little description is needed, changes in detail only having been possible. The striking feature of the display is a miniature drop hammer, which is perfect in every detail, and is in operation most of the time. It is run by a tiny electric motor. In another space Billings & Spencer erected a skeleton, eight feet high, built of forgings of all descriptions, the backbone composed of bottom bracket forgings, the fingers and limbs of crank forgings, and two red electric bulbs furnish light to the spectre's eyes. It attracted a great deal of attention throughout the week.

INDIANAPOLIS CHAIN AND STAMPING Co. This concern has a much-inspected exhibit of their famous Diamond chains in the McMullen booth. The extent and variety of their business may be judged from the fact that they display ninety-five different styles and finishes. The large facilities and long experience of the company have made possible a wonderful perfection of finish. It is undisputed that this company have the largest chain factory in the world. The especial claim which they put forth for the Diamond chains is their perfect accuracy of gauges, and an attention to minor details which they state is often neglected in chain-making. During the six years of their life, they have developed a great number of new special machinery, especially adapted to the making of accurate chains, and the testing of them. Interesting statistics are the figures of the '96 chain output. Stretched together, end to end, their last year's output of chains would amount to 482 miles, 1,562 yards or 30,595,752 inches. This amount consumed 30,595,752 centers, 63,191,504 side plates and 63,191,504 rivets; in all 156,978,760 pieces.

BUESCHER MFG. CO., ELKHART, IND. Cycle sundries; several novelties are shown, of which a combination pump and cement repair tube is one of the neatest. This pump is made on the telescopic principle, and closes up into an exceedingly small compass. Screwed into the top is a small, rubber-containing syringe, constructed on the lines of the well known Jiffy. In its entirety it is about the same size as the usual pump that is furnished with a tire, and it is undoubtedly one of the best things of its sort. The Buescher foot-pump is fitted with a special double plunger that is a decided improvement on the ordinary weak leather washer so much used, while the valve-coupler consists of a clamp that secures to the valve, and an air-proof joint is effected by screwing a plunger tightly against the valve-lip. A new toe-clip is also shown that, instead of passing over the toe, securely locks the sole of the shoe to the pedal by means of two small ear-shaped projections. Another good feature of this clip are two small points that prevent the clip from turning sideways. A line of regulation toe-clips is also included in the Buescher exhibit. The combination lamp brackets are also novelties that allow the removal of the clip without disturbing the wheel fastener. What is claimed to be an unbreakable tire valve is also shown, and a regular line of well known Buescher pumps completes the display.

ALLERTON LUBRICANT CO., NEW YORK and Chicago. Mica chain lubricant, as exhibited at Chicago.

PETERS & DRAKE, NEW YORK. PUMPS; A full line of pumps of every description, from the small hand article to the largest foot pump; also tanks with crank attachments for store use.

MAJOR CYCLE CO., NEW YORK. MAJOR'S cement; manufactured for "stick things." Exhibit includes a rubber cement for repairing tires or anything in the rubber line. Put up in collapsible tubes.

WHITE MFG. CO., CHICAGO, REPRESENTED BY C. H. BESLEY & CO., NEW YORK. Brazers and enameling ovens in several styles, duplicate of the exhibit at Chicago. A small brazer shown in full operation.

ODDIE MFG. CO., BROOKLYN, N. Y. PUROL compound; a lubricant, preservative and an illuminant all in one. It is shown in its various uses; it undoubtedly eases the running of the wheel, polishes very brightly and it burns with a bright, white light.

J. H. WILLIAMS & CO., BROOKLYN, N. Y. A forging for every part of a bicycle that can be formed is in evidence. Some particularly handsome sprocket forgings are among the number and a specially intricate piece of work, consisting of two cranks and crank hanger in one piece.

ERIE MALLEABLE IRON CO., ERIE, PA. Bicycle fittings; castings for cycle parts made of a metal developed after a deal of experimenting, that is particularly suitable for cycle parts. It is claimed for the metal that it has all the properties of steel, so far as tenacity and ductility are concerned, and brazes as well as wrought iron.

CYCLE FORGE & PUMP CO., LOWELL, Mass. Brazing furnace; a very neat and substantial furnace, using gas as a fuel. Has an iron stand and a top is made of five section plates, either all of which may be removed, allowing the work to pass through the flame. This allows of economy in the different sizes of work to be brazed.

G. E. ADAMS, NEW YORK. L. A. W. LUGGAGE carriers. The L. A. W. carrier differs from the ordinary inasmuch as it is constructed to be attached to the rear fork. It will carry any size package, as the strap can be furnished of any desired length. It is made of good quality of leather, in russet or black, and weighs but three ounces.

SEAMLESS STRUCTURAL TUBE COMPANY, BROOKLYN, N. Y. Structurally reinforced tubing, fork-sides and handle-bars, as ever a most impressive exhibit, the various tubes being reinforced at the several necessary points in the drawing and requiring no brazing. The most recent production is a one piece arched front fork, which gives evidence of attaining some popularity.

VULCANIZED HANDLE-BAR CO., BRIDGEPORT, Conn. Handle-bars in four styles, made of Swedish steel, covered with a thick coating of hard rubber, highly polished in an eye-catching manner. Visitors to the stand are told that the rubber is superior to nickle, inasmuch as it will not rust, chip, flake, and is soft and warm to the touch. An adjustable steel stem, forged in one piece, is also shown.

CYCLE COMPONENTS CO., NEW YORK. C. C. C. Pedal. An extremely neat-appearing fitting, made up of two halves and stamped from a flat piece, allowing a decidedly strong form of construction. The barrel is of a large diameter, so as to conform to the style now generally used. It is highly nickelled, smooth of finish, and the rubbers are bolted on in a manner that makes them singularly firm.

WEAVER CYCLE MATERIAL CO., NEW YORK, tires, sundries, parts, and fittings; the feature of the exhibit was, however, the Simpson lever chain and sprocket. A complete line of Kennedy and Pickwick tires, Weaver pedals, Weaver bottom brackets, which are designed as separable, and an enormous line of rims, chains, tubing, forgings, grips, lubricators, and, in fact, almost everything necessary in the construction of the bicycle was included in the display.

ALUMINUM BELL CO., BALTIMORE, MD. Bells and trouser guards; the aluminum double gong bell is attachable to the front or rear wheel and is sounded by being pressed against the tire. It is operated from the grip on the handle-bar by the touch of a button. The gongs are supplied in various tones. The trouser guards are made from spring wire and are so constructed that the trousers can be folded and held fast at the top of the shoe without creasing.

H. LAUTER, INDIANAPOLIS, IND. WOOD rims and bars; as shown at Chicago.

D. WILCOX MFG. CO., MECHANICSBURG, Pa. Cycle forgings. Full line of forgings of every description.

R. H. INGERSOLL & BRO., NEW YORK. Cyclometers, bicycle watches and holders, substantially the same as shown at Chicago.

SIDWAY MFG. CO., CHICAGO, ILL. S. & G. spring grip, intended to overcome cramps of the hand, owing to the surface being cool, dry and soft. Shown at Chicago.

M. GARLIC, PHILADELPHIA. TRAY LUGGAGE Carriers. In addition to the carrier, which fits within the frame, Mr. Garlic is showing one which is attached to the head of the wheel, and which opens downward. The articles are made of a fibre which is claimed to be waterproof and unbreakable.

ARTEMUS PLATING WORKS AND BRASS Foundry, Chicago. Handle-bars and wheels plated in gold, copper and silver, and two machines, tandem and diamond frame single, on which the pedals, fork crowns and hubs are gold plated, while the frame is plated with alternating stripes of gold and silver. The exhibit being made to show that the Artemus are masters of their art, nickle plating for the trade.

BALDWIN ADJUSTABLE CHAIN CO., WOR-

cester, Mass. Baldwin adjustable chains, as exhibited at Chicago.

F. J. WERNETH, BALTIMORE, MD. WERNETH'S Automatic Bicycle Riding Instructor. With this appliance, the inventor claims, riding, mounting and dismounting can be taught in sixty minutes to ninety per cent. of the novices. The device can be attached to any ladies' or gentlemen's wheel without alteration. It consists of two small wheels between which the rear wheel of the rider's bicycle is clamped. The wheels prevent the bicycle from falling.

UNION MFG. CO., NEW YORK. LATHE and drill chucks of all kinds. Among them, a chuck with a side-bearing screw, which leaves a clear hole through the chuck itself. It is made with both false and solid V-shaped jaws, and in sizes from 1/2 to 1 1/2 inches. No other concern, it is stated, manufactures chucks of this sort over 7 inches. Another special article is a reversible chuck in two sections, the upper revolving on the lower, no loose rings whatsoever are employed. A geared scroll chuck, an adaptation of the last mentioned article, is also shown.

Johnson Two Speed Gear.

THE WHEEL AND CYCLE BAR CO., WASHINGTON, Conn. Wood handle-bars. In addition to the regular type a novelty is shown. A bar with auxiliary grips, about two inches on either side of the stem, to allow those riders the use of a very narrow bar, and, at the same time, allowing a comfortable grip for the hands. Another feature is the self-locking stem, which consists of a two-piece clamp, recessed so as to take a small pin that is driven through the bar, making it impossible for the bar to move. However, by a simple loosening of the clamp, and changing the pin so as to engage in a different hole, the bar can be readily adjusted at any angle.

NEW YORK STANDARD WATCH CO., NEW YORK. Standard cyclometers and speed indicators. The cyclometers are shown in three styles, including the new barrel type, and the Standard midget and the '95 Standard. The tachometer is an instrument to indicate minute variations in the speed of a bicycle. The instrument is attached to the right-hand fork by a clamp that can be swung in or out of position while riding. The small wheel is brought in contact with the center of the tire, and operates a hand on the dial which shows the rate of speed in miles per hour.

TRENTON WATCH CO., TRENTON, N. J. Trenton cyclometers and a line of their well-known watches. Same as at Chicago.

EUGENS ARNSTEIN, CHICAGO. ENAMELING ovens, enamels, cements, vulcanizers, brazers and a line of sundries, same as at Chicago.

F. E. WRIGHT, NEW YORK. Bicycles, sundries and enamelling. Samples of enamelling and striping and nickelling and other methods of decorating were shown.

W. J. SMART, NEW YORK. HOLDFAST cycle racks, the Holdfast locking devices, the Gem wall brackets, and the X. L. C. R. spoke wrench in which no change has been found necessary from the '96 models.

E. F. WILLIAMS, NEW YORK. SEAT-POSTS. The seat-post is of the spring variety, with an attachment running from the saddle-post tube up between the rear forks to the post, with a hinged spring in the center, which yields to pressure.

J. F. McCAFFREY, PAWTUCKET, R. I.—The Savoie repair kit, which consists of a needle-pointed nozzle and a tube of cement. The kit is of the anti-plug repairing type, and is very effective and neat, the demonstrations showing effective results.

FRED HAWLEY, 42 GOLD STREET, NEW YORK. Eureka Bicycle Stand. The Eureka stand is made of seven uprights and two simple cross pieces, with a base that folds up and can be put in a small space. It is a simple, cheap and useful rest for a cycle.

N. B. LEFEVRE, LITTLESTOWN, PA. LEFEVRE, cycle stand consisting of an upright sliding tubular bar with a cross-bar at the top, so arranged that a wheel can be held in forty different positions. It is particularly handy for repairsmen, manufacturers and salesmen, and can be converted into a home-trainer.

GENTRY MFG. CO., BROOKLYN, N. Y. GENTRY gear, fitted to a bicycle having a train of seven spur gears, arranged is a straight line, immediately beneath the right hand lower stay. The advantages claimed for this form of gear are that it can be applied to any bicycle, provided regular ratchet gears are used in place of the front and rear sprocket. The whole is arranged in a covered case, and presents rather a neater appearance than might be supposed.

SPECIALTY SUPPLY CO., NEW YORK. BICYCLE balance, handle-bar grips, and chain lubricant. The balance consists of two springs running from each side of the front fork at the crown, to the lower stay of the frame. It is intended to hold the wheel steady while the hands are removed from the bar. The grips are intended for attachment at the centre of the bar, permitting the rider to change position from the end grips without rusting or tarnishing the nickle plating.

WESTON-MOTT CO., JAMESVILLE, N. Y. Line of axles, cups, sprocket set nuts, steps, cones, octagon nuts, crankpins, spokes, hubs and bottom brackets complete; also built-up wheels, both with steel and wood rims. The Weston hubs are made in many distinct styles, of any width, and the line shown certainly displays a careful mechanical insight into the manufacture of these necessary adjuncts to the present day bicycle. All hubs are turned from the bar, as are both cups and cones. A novelty is shown in a ball-retaining, dustproof washer that also allows the entrance of oil directly on the balls from the side. A full line of guaranteed spokes is also shown, and a line of steel tire wheels for hose carts, hose reels, handcarts, wheelbarrows, etc.

HORTON & WOOLSON, NEW HAVEN, Conn. Bicycle sundries, consisting of a light telescope luggage carrier, made of aluminum, that is easily detachable from the wheel. A sprocket lock, made entirely of steel, so small as to be easily carried in the pocket. A combination screw-driver and nipple wrench, folding up like an ordinary pocket knife. A noise-producing alarm, called the Locust, making a sound that resembles the ricket made by its namesake. Also the well known line of supplies and accessories. The II. & W. enamel polish is also shown, and its good qualities amply demonstrated. This polish imparts a rich lustre not only to wood rims, handle-bars, mud guards, etc., but puts a lasting shine on all colors of enamel. A combination compound, known as the Big Four, shows what it is possible to do with the right mixture. This not only cleans all parts of the bicycle thoroughly, but can be used as a lubricator, and acts as a rust preventative, and also as a remover of this obnoxious coating.

LEWIS TOOL CO., NEW YORK. VISES AND wood-face jaws; as at Chicago.

W. L. STEWART, WILDERING, PA., STEWART roller brakes, as shown at Chicago.

ROGER B. MULLEN & CO., NEW YORK. Tires, forgings, saddles and chains; as at Chicago.

NORTH STAR SHOE CO., MINNEAPOLIS, Minn. Cycling foot wear in all styles, including several patterns of ladies laced boots or semi-leggins.

TROUSER GUARD CO., FALL RIVER, MASS. Trouser guards formed of metal clips and black braid and designed to hold the trousers smoothly and in "walking shape."

T. H. BEDELL & CO., CHICAGO. MACKIE-Lovejoy hubs and pedals, Ryan chain guards, American wood rims and bars, challenge adjustable steel bars, Standard lamps and Dodge wood grips, as exhibited at Chicago.

E. P. GLEASON MFG. CO., NEW YORK. Pumps. It has not been found necessary to make any change in the details of construction of this well known line. Foot, hand, power and storage pumps, in all styles and sizes, are shown.

WATERBURY WATCH CO., WATERBURY, Conn. Cyclometers and watches; the same as at Chicago. The exhibit shows 126 cyclometers, driven a mile a minute by an electric motor, attracted as much attention as it did in the Coliseum.

THE A. L. MOORE CO., CLEVELAND. CYCLE materials, parts and fittings; a line of sheet steel stampings, electrically welded hangers, pedals, hubs, fork sides, tubing, wood rims, handle-bars, drop forgings, chains, and crates; same as at Chicago.

DAVIS & STEVENS MFG. CO., SENECA Falls, N. Y. Grips and a big line of sundries; as displayed at Chicago, excepting a power pump in operation, run by a gas machine; also a new model of the Cyclone pump, made of a cheaper material and lower in price.

THE FORCIPEDE CO., NEW YORK. THE Forcipe, a device attached to the rear of the saddle post and designed to aid riders hill-climbing by furnishing a brace for the body. The firm also shows a new saddle having a wood base and carefully upholstered.

PALM, FECHTELER & CO., NEW YORK. Transfers, name plates and frame ornaments. A particularly attractive display of transfers was shown on a number of dress guards. Frames in sections and frames complete, covered with transfers in an infinite variety of colors and designs were in evidence.

S. T. LEVERING, BROOKLYN, N. Y. SIMMONS body rest, a pneumatic buffer or cushion, secured on one end of a rod, the other being attached to the upper bar of the wheel, near the head. It may be set at any angle and plodders and others who desire to rest their chests against something soft.

UNITED STATES PROJECTILE CO., BROOKLYN, N. Y. Tubing, fork sides and tapered tubes. For '97 this firm are making special shapes of tubing, such as square, octagon, triangular, in fact, they will draw a tube in any shape the purchaser desires. The line of seamless fork sides is a particularly interesting one, in the variety and lengths and curves shown. A feature of the exhibit is a row of the projectiles that the company manufacture for the United States Government.

UNITED STATES CYCLE FITTING CO. Cycle fittings, among them the Carbondale anti-rust cycle fittings, for which the company is sole agent. All the component parts of a bicycle are shown in this metal, which is a recent discovery. It is claimed that it will not rust under any circumstances, and that it is stronger than steel. A piece of the Carbondale metal rolled into a sheet which was submerged in Long Island Sound at Race Rock lighthouse, New London, Conn., is on exhibition, and is said to be absolutely unchanged from its original condition. The Baldwin sprocket, which has a tooth of a new design, is also included in the firm's wares.

ELASTIC TIP CO., BOSTON, MASS. CYCLE materials. To describe this exhibit in detail would fill a good-sized book. Every inch of space has been utilized to show in an attractive way some part or accessory of a bicycle. The line of enamelled lamps was particularly attractive. They were shown in green, yellow, blue, brown and other colors. A complete line of cork and cowhide grips, chains, spokes and nipples, lamps, wood rims and guards, repair tools and repair kits, bells, locks, pumps, cyclometers, drop forgings, stands, lubricants, and so on, surrounded the spectator on all sides, and the array was bewildering.

E. R. ESMOND, NEW YORK. WALL BRACKETS and stands in a variety of designs and finishes, enamel, nickel, bronze, brass, and antique, the whole forming an exceedingly attractive exhibit.

TACA-MAC CHEMICAL MFG. CO., BROOKLYN, N. Y. Puncture preventative. Taca-mac is a semi-fluid chemical compound composed chiefly of pure rubber, and is said to contain absolutely nothing injurious to vulcanized rubber. Its purpose is to repair automatically and instantly punctures and cuts. It is applied internally and forms a flexing lining on the inside of the tire.

BROWN BICYCLE PUMP CO., NEW YORK. Foot-pumps in three styles. The Brown pump consists of a heavily nickelled, cylindrical barrel with a cylindrical conical piston, having a spiral spring for the return stroke, provided with a leather cup-shaped valve on the bottom, held in position by a screw and washer. When in operation, the foot is pressed on top of the piston and forced down into the cylinder, contracting a heavy spring. When the pressure is removed, the piston returns. The pumps range from three inches to four inches in height, and from 1½ inches to 3 inches in diameter. No. 3 can be used as a hand or foot pump and will inflate a tire in half a minute.

HALL-MOORE MFG. CO., CINCINNATI, O. Roller sprocket and chain. The Brown roller sprocket is constructed in such a manner that dirt does not in the least affect the running. Instead of teeth, the sprocket is fitted with revolving discs or rollers.

The chain is of such a shape that it is unable to ride over the rollers and reaches from one to another, thus preventing the chain from touching the periphery of the sprocket, and overcoming all friction. The sprocket for the rear wheel is made on the same principle.

THE VENTILATED GRIP & MFG. CO., NEWARK, N. J. Handle-bar grip made in rubber and rubber covered with soft leather. This grip is perforated and with the outer end left free from contact with the bar, allowing of perfect ventilation and a complete air circulation from both ends and through the perforations, preventing perspiration of the hands, and also making it soft and velvety to the touch. They also showed the Eggers Samson Truss Brace, for drop frame bicycles and tandems. This is a steel rod, connected to the head of the machine and the bottom bracket, and screwed tight to the head of the machine and the bottom bracket, and screwed tight by means of a right and left hand truss bolt. It weighs but a few ounces, and is very easily attached or detached.

P. T. WALL, NEW YORK. RAPID-DRIVING rotary gear. A term which conveys small idea of the nature of the device, which looks all over a money-burner. It consists of a cork-screw shoulder on the axle, over which the sprocket fits. The mere act of back pedaling throws the wheel out of gear, unlimbering the pedals and allowing them to run free. According to Mr. Wall, the invention is designed to save the rider's energy; that is, in coasting he may rest his feet on the pedals without having his legs go around, the pedals becoming, to all intents and purposes, coasters, much on the principle of the two-speed gear, as the gear is "unlimited," however, by the slightest back pedaling, the element of danger enormously outweighs any saving of energy which may be obtained.

NILES TOOL WORKS, HAMILTON, O. Presses; Chicago exhibit.

G. A. HOSMER & CO., NEW YORK. SUNDRIES, lubricants, and cements; as at Chicago.

C. H. LAMSON, PORTLAND, ME. LUGGAGE carriers and package-holders, as shown at Chicago.

BERRANG & ZACHARIAS, ASPURY PARK, N. J.—Brush-top Chain Lubricant Co., as at Chicago.

ECLIPSE CEMENT & BLACKING CO., PHILADELPHIA, Pa. Cements, oils, graphites, etc.; as shown at Chicago.

UNITED STATES MFG. CO., FOND DU LAC, Wis. Cyclometers and lamp brackets; same as shown at Chicago.

ROCHESTER BICYCLE COMBINATION Holder Co., Rochester, N. Y. A display of this specialty, as shown at Chicago.

GOODENOUGH & CALLENDER, ROCHESTER, N. Y. Spring handle-bar and seat post; a patented specialty, the same as shown at Chicago.

GEORGE L. THOMPSON MFG. CO., CHICAGO. Electrically welded parts and stampings, wood handle-bars and a complete line of fittings; as shown at Chicago.

H. M. ROSENBLATT & CO., PHILADELPHIA, New York, and Chicago. Saddles, tool bags, luggage-carriers, and boxes in a variety of styles, as shown at Chicago.

TURNER BRASS WORKS, CHICAGO. Turner brazers and blow-pipes "which produce the greatest heat with the least fuel," duplicates of which were exhibited at Chicago.

SCHAUM & UHLINGER, PHILADELPHIA, Pa. Hickory handle-bars; with a patented key adjustment, locking the bar in six different positions. Bars are shown in enamel, pyroline, and natural finish.

FERRACUTE MACHINE CO., BRIDGETON, N. J. Foot and power presses for general bicycle work, among which is a press capable of cutting three hundred chain links per minute. The presses are shown in operation.

NORTH AMERICAN INVESTMENT ASSN., New York. The Harrell adjustable handle-bar; it can be adjusted to any width, height, or position desired by the turning of a nut. It is made of high-grade material, and has been patented in many countries.

M. CULLEN, HARTFORD, CONN. ENAMELING oven, of all sizes, made of sheet metal and which may be taken apart at will. An automatic lighter which lights one or all of the holes, and a patented mixer devoid of stop cocks and designed to produce perfect combustion, are the special features of the ovens.

HALL & DOWNING, NEW YORK. SPECIALTIES. A line of sundries for which this firm are manufacturers' agents, including Leimer's tire and chain brushes, Elyria spring clamp pedals, Perfect hygienic saddle, Simm's pneumatic saddle, Tally-ho dial cyclometer, Hampton folding stand and Richard's metallic saddle.

WALTER H. FOSTER, NEW YORK. BARR universal cutter and reamer grinder, for which the firm claim that, with three attachments and a pair of centers, will enable the operator to do all the grinding common to tool-room practice in the least possible time, owing to the fact that the internal and external spindles are always ready for use, the various changes can be made in a few seconds.

AUTOMATIC CYCLE FITTINGS CO., NEWARK, N. J. Fittings, hubs and bottom brackets. Among the fittings is a bearing which can be adjusted without the use of tools, the adjustment being accomplished by pressing a small plug that fits a recess in an internal sleeve with cone surfaces on both ends, obviating the loosening of the hubs in the frame. The bottom brackets are furnished complete with bearings, axle, and cranks, ready to be brazed to.

M. E. DUNBAR, STOCKBRIDGE, MASS.—Dunbar Folding Bicycle Crank, a strong, practical and simple article having no separate or detachable parts, and which will fit any make of bicycle. It locks firmly together with one simple bolt and special locking attachment, putting crank and tool box securely under lock and key at one operation, without the use of tools of any kind. It is made of kiln-dried white wood, nicely finished, the metal parts are made of rolled steel, japanned. Crates for tandems and even larger machines are made to order.

BALL TIRE CO., NEW YORK—BALL TIRES, as at Chicago.

SHELBY STEEL TUBE CO., SHELBY, O. Tubing. As at Chicago.

WIZARD MFG. CO., CHICAGO, ILL. WIZARD gas lamps; as at Chicago.

WHITNEY MFG. CO., HARTFORD, CONN.—Clouser and Whitney chains, as at Chicago.

WORCESTER FERRULE & MFG. CO., WORCESTER, MASS. Fittings and parts; same as at Chicago.

BRIDGEPORT CHAIN CO., BRIDGEPORT, Conn. Myers cycle chain; the same as shown at Chicago.

BROOKS SPRING SEAT POST CO., CHICAGO. A spring seat post to prevent jolting or jarring; as shown in Chicago.

THE TIE COMPANY, UNADILLA, N. Y. Lacing cord, luggage carriers and the Holdfast sling; same as at Chicago.

GEORGE W. COLE & CO., NEW YORK. Three-In-One and P. M. Compounds, of which 20,000 samples will be given away.

WHITEHEAD & HOAG, NEWARK, N. J. Badges and buttons; the same as displayed at Chicago. A specialty is made of race meet badges.

NEWPORT BICYCLE CHAIN CLEANER MFG. CO., NEWPORT, R. I. An attachment for cleaning the chain, consisting of two stiff brushes operated from the contact with the tire.

H. G. SHEPARD & SON, NEW HAVEN, Conn. Wood rims and adjustable handle-bars, which the type originated by the firm. A true ram's horn wood bar termed "Shepard's Latest," is one of the novelties exhibited.

INTERNATIONAL CYCLE FITTING CO., New York. Cycle supplies of every description, from nuts and bolts to saddles and wood rims. They manufacture in addition a special hub and a pneumatic saddle post, designed to overcome vibration.

LEIBE, HALL & DROEGE CO., NEWARK, N. J. Sundries. Full line of luggage carriers, foot brakes, coasters, lamp brackets, nipple wrenches, bicycle locks, automatic whistle, blown by the front wheel at the will of the rider. The whistle fits directly in front of the head of a bicycle, and is operated by a small wheel revolving on the front tire, by pressure of a rod at the handle bar.

NEWPORT BICYCLE CLEANER MFG. CO. Newport, R. I. The cleaner consists of two brushes affixed so that they revolve one on each side of the chain, when fastened by a clasp to the centre stay, close to the crank-hanger. The brushes will remove all particles of dirt and grit from the chain, and burnish it if desired. Connected with the brushes is a metal wheel which will remove all dirt and dust from the tire at the same time. The device is particularly intended to be attached and used on returning home after a muddy ride.

AMERICAN CLOCK CO., BOSTON, MASS. American cyclometers. Two styles, and for 24, 26, 28, and 30 inch wheels. The No. 3 is fitted with a special century run trip register, making it possible to register, making it possible to register a single trip and at the end of the run, turning it back to zero, the total number of miles, however, being included in the grand total of the upper register by an ingenious mechanical device, and the century trip can be set back to zero at any time without interfering with the ten thousand mile register. The No. 1 style is of the 10,000 mile type, but without the trip dial arrangement. The cyclometers are very light and with the figures of a size so that they can be easily read from the saddle.

W. H. BRODIE & CO., NEW YORK. The Little Wonder combination sprocket lock and Standard Bearer bicycle stands. The name "Little Wonder" is apropos the lock of over 5,000 different combinations. It has four rows of figures, and is so constructed that the rider can change the combinations at will. It is small and light, making it very easily carried in the pocket or toolbag, and nicely finished in nickel. The Standard Bearer bicycle stand is composed entirely of strip sheet steel, and constructed so that it can be instantly taken apart and packed into a very small space. The weight is taken entirely from the wheels by holding the machine by the bottom bracket and the fork, leaving the wheels free to revolve. All parts that come in contact with the enamel of the bicycle are protected by rubber cushions; the stand makes a neat device for cleaning or show window purposes, as it takes up but little room. It is finished in nickel, black, maroon, or dark blue japan; it weighs three pounds.

STRIEBLY & FOOTE CO., NEWARK, N. J. Forgings. A full line of forgings for every conceivable part of a bicycle.

KOZY CAMERA CO., BOSTON. KOZY BICYCLE camera. A handy little pocket camera, but two inches thick. It takes 12 pictures on a bull's eye film $3\frac{1}{2} \times 3\frac{1}{2}$. It is designed particularly for touring cyclists.

GRISWOLDVILLE MFG. CO., GRISWOLDVILLE, Mass. Wheel cloth. A specially finished cloth intended for cleaning and polishing all parts of bicycles. It is guaranteed not to scratch or tarnish the most highly polished or enameled metal surfaces.

THE COLUMBIA CORRUGATING MFG. CO., Niles, Ohio. Cold drawn tubing, with wheels made of the same. This firm cuts tubing in lengths to suit purchasers. The firm claims that, in many tests for strength, they have exceeded seamless tubing over ten per cent.

THE BOWERS MFG. CO., NEWARK, N. J. Gear case coverings, mud guards and wood handle-bars. The articles are made of veneer, plain, decorated or scrolled. The wood handle-bars are adjustable to any position, and are brought out very pretty colors in natural wood.

Snyder and Fisher

BISHOP & BENTON, NEW HAVEN, CT. Bicycle stand. The stand is made of Bessemer steel wire and weighs less than four ounces. It supports the machine with both wheels suspended from the floor, upright and so engages the steering wheel that turning sidewise is impossible. It brings the wheel in easy access for repairing or cleaning.

GRATON & KNIGHT MFG. CO., WORCESTER, Mass. Saddles. Made with a padded top, longitudinally divided, on hygienic principles. The pads are made of hair felt, covered with soft leather, placed upon a flexible base, in several styles. They also show a variety of saddles of the regulation type, with perforated leather tops, also a line of tool bags.

Cutting Adjustable handlebar

S. T. LEVERICH, BROOKLYN, N. Y. SIMONS' body rest attachment. A device composed of a very soft cushion upon the end of an adjustable rod, which can be adjusted to any height or angle, serving as a rest for the body in long-distance rides. When in use, the cushion rests against the rider's chest, where it is held in position by the rod attached to the frame near the head.

THE BALL-BEARING WRENCH CO., NEW YORK. Wrench, manufactured on a new principle, with a sliding jaw. The jaw will recede with one-fourth the number of revolutions required in the average wrench. The nut revolves on chilled balls, and a cone friction clutch holds it at any point, admitting a fine adjustment, and avoiding slipping and wearing off at the edges of nuts.

Grand Union Hotel Exhibits.

W. C. BOAK, BUFFALO, N. Y., ROOM A-2 Sundries, parts, fittings and wheels. Everything from a wheel complete, to the tiniest nut used on a wheel was shown. Two grades of cheap wheels in drop and diamond frames were shown, same as at Chicago.

HERMANN BOKER & CO., NEW YORK. Room 62. Windsor, Pacific I. X. L. wheels and sundries; eight wheels are shown. Four Windors listed at \$100, two Pacifics, listed at \$60, and two I. X. Ls, listed at \$50. The line of lamps sundries parts and fittings was an extensive one. All three of the wheels shown are modern in all details. Peculiarities are arched fork crowns and enameled rim.

MARTIN & GIBSON, BUFFALO, N. Y. Exhibited their line at the Grand Central Hotel. One of the principal features of the '97 Kensington is a square crank in one piece. In the rear stays and forks, D. tubing is used. One of the most telling features of the model is the double, oval fork crown, which is handsome and strong. Interior fastenings are used in the steering head and seat-post. The cones and cranks are fitted with dust caps, and have ball retainers throughout. One of the prettiest name plates on the market is shown by the Kensington, the plate alone being handsome enough, almost, to sell the wheel even if the latter had not an abundance of merit to accomplish the same thing for it independent of its good looks.

THE TINKHAM CYCLE CO., NEW YORK. This company was unable to secure a satisfactory space at the Grand Central Palace, and decided to show their exhibit in their establishment at 306, 308 and 310 West 59th street. Besides their regular lines of steams, Victors, Tourist, Crawford and Tinkham bicycles they show a most complete line of tricycles and carriers, including the Tinkham hansom which has been seen frequently in front of the Grand Central Palace during the week. The firm has sent carriers to all the principal cities in Europe and only last week shipped a dozen tandem carriers to Liverpool, England. Among the many foreign ports where Tinkham carriers are being extensively used is Honolulu where they bring the fruit down to the vessels for shipment.

DUQUESNE MFG. CO., PITTSBURGH, PA. Parlor 542. Duquesne bicycles. A single model of the Duquesne is shown, that is a radical departure from conventional frame construction. Semi-fish joints are used. Also, an arched front fork of one continuous piece, reinforced on the outside at the bend. The rear stays and rear forks are constructed on exactly the same principal, this allowing single tube of large diameter extending from the places where braces are usually placed in the usual design of bicycle frames. D section tube is used for the rear stay and oval tube tapering to D section on the rear forks. A divided crank shaft held by an end to end bolt and secured by a lock nut on the left hand side seems a strong type of the two-piece crank; while internal taper fastenings are used on both handle-bar and seat-post. A peculiarity in speaking is shown in using a single piece of wire for two spokes, merely bending the middle, the yoke being of a heavier grade at this bend. The Duquesne color is royal blue, and as they are nicely ornamented, they present a handsome appearance.

Murray Hill Hotel Exhibits.

GRAND RAPIDS CYCLE CO., GRAND Rapids, Ind. Parlor 388 Clipper bicycles in four grades. The high-grade Clipper is a beautiful machine. Has flush joints, internal expanders on seat post and handle bar; arched crown, Baldwin chain, large detachable sprockets, of a neat design; diamond shape cranks which are fitted to the axle on a taper and locked with an end nut; D lower stays and a new pedal fastening which makes it utterly impossible for the pedal to work loose, a bolt is inserted from the inner side of the pedal, this bolt fits into a female thread in the hollow pedal axle and can be jammed up so as to make an exceedingly tight fit. The medium grade Clipper has cone-adjusting bearings, pinch binders to seat-post and handle-bar and in other respects resembles the higher priced wheels.

The high grade ladies' Clipper has a single tube frame, reinforced by extra arch tubes at both head and crank hanger. The tandem shown is a graceful design. In the drop frame tandem additional strength is gained by continuing the loop bar straight through to the rear crank-hanger. The front chain adjustment is accomplished by an eccentric, which, however, is so neatly made that it lacks the clumsy appearance so often noticeable in this style of construction. The wheels are beautifully finished, dark green being the favorite color. However, they are shown also in maroon and black, nicely decorated.

Lamps.

PLUME & ATWOOD MFG. CO., NEW YORK.
Banner Lamps, as at Chicago.

HITCHCOCK LAMP CO., WATERTOWN, N. Y.
Hitchcock lamps; shown at Chicago.

MANHATTANBRASSCO., 338 EAST TWENTY-
eighth street, New York. Lamps. The Cyclops,
Dazler, Unique and Front Light, in several finishes;
as at Chicago.

BRIDGEPORT GUN IMPLEMENT COMPANY,
Bridgeport, Conn. "Everything for bicycles," as they
express it. Saddles, lamps, pedals, lamp brackets,
toe clips, bells, stands and the same extensive line
of sundries as displayed at Chicago.

ATWOOD MFG. CO., AMESBURY, MASS.
Lamps; the same line as exhibited at Chicago. The
"never-go-out" feature of the lamp is illustrated by
a "shaker" machine, on which a lighted lamp is kept
continually bobbing up and down without effect on
the flame.

MARKT & CO., NEW YORK. LAMPS. RANG-
ing in price from \$4 to 50 cents. Including, of
course, the World, which is literally built like a lo-
comotive headlight. It is a miniature of that article,
and it is doubtful if any lamp on the market throws
a more powerful light.

HOWARD & CO., NEWARK, N. J. HOWARD
bicycle lamp; novel in that it has a removable top
that may be used as a tire vulcanizer, the heat from
the lamp making it possible to vulcanize rubber in four
minutes. Of course, under ordinary conditions, this
top is carried in the tool-bag, and the regular top
substituted, converting it into a lamp of conven-
tional design.

CENTRAL LAMP CO., NEW YORK. CENTRAL
lamps. A brass lamp, highly nickel plated fitted
with imported lenses and side jewels. The lamp is
riveted throughout and it is guaranteed that the light
will not extinguish, no matter how much it may be
shaken or thrown about. A point made is that the oil
tank cannot become loosened or lost under any cir-
cumstances.

WHEEL-LIGHT MFG. CO., PHILADELPHIA.
Beauty Folding Lamp. A much written of article,
shown publicly for the first time. Every part of the
lamp is on a hinge, so to speak, and may be folded
into an extremely narrow compass, of a size to fit
either tool bag or pocket. The oil reservoir is a
separate part, and is intended to be permanently at-
tached to the front fork. The lamp is neat, light,
and in every way seems surprisingly practical.

ROSE MFG. CO., PHILADELPHIA. THE
Never-out Lamp; a non explosive kerosene-burning
lamp, guaranteed to remain lit despite the most vio-
lent jars and particularly praised for its cleanliness.
It is free from springs, instantly attachable by means
of a reversible rigid bracket; has a rear danger signal,
automatic wick lock; and gives a steady and piercing
light. It is made of brass throughout and riveted
in all its parts.

MATTHEWS & WILLARD MFG. CO., WATER-
bury, Conn. "M. & W." lamp; an exceedingly clean
out and well designed lamp with all the qualities of
excellence that '97 lamps are heir to. It can be at-
tached to either fork or head, is a non-smoker, throws
a light a hundred feet ahead, burns kerosene, is all
brass, riveted, and is guaranteed not to rattle or
disturb the risibilities of the rider by going out at
a time when most wanted, as some lamps, like some
servant girls, do. The lamp is unquestionably one
of the neatest shown at the show.

STARLIGHT LAMP CO., NEWARK, N. J.
Star and Excelsior lamps. The Star lamp makes a
claim for originality in a new hub-bracket, preventing
the lamp from becoming dislodged; automatic spring
for use on head-post, preventing it from jarring out,
perfectly focussed lens, ventilating flue, oil fount, and
graceful lines. It is made of brass, nickel-plated, and
is firmly riveted and sealed. The Excelsior is much
the same in construction as the Starlight, but is con-
siderably smaller. The former is sold for \$2.00, the
latter for \$3.00.

ACME ELECTRIC LAMP CO., NEW YORK
City. Acme electric lamp, which, since its introduc-
tion, has met with much favor. The lamp has an ab-
solutely dry battery, which can be controlled without
dismounting, and is so simple that no knowledge of
electricity is required to use it. With one charge
the lamp will burn from twelve to fourteen hours.
The lamps cannot be jarred out, and give a bright and
intense light.

C. T. HAM MFG. CO., ROCHESTER, N. Y.
Ham's Diamond bicycle lamp. A sheet steel, nickel-
plated, tubular principle, kerosene-burning bicycle
lamp. It is claimed that by making the lamp of steel,
it can be kept much cooler, than if constructed of any
other metal. It is fitted with a double convex lens, a
two inch reflector, colored sidelights, and the tubular
principle of draft, allowing a very bright, clear and
steady light. The weight is fourteen ounces, and
while presenting a rather unconventional appearance,
it is pleasing to the eye.

BEHREND & ROTHCHILD, NEW YORK.
Strauss, Sacks & Co., sole selling agents, New York.
Magic cycle lamps. Attractive in design, burns kero-
sene, has a cotton stuffed fount and is warranted
non-explosive. A patented collar lock device makes
it impossible for the fount to become detached from
the lamp. A spring regulator makes it impossible
for the wick to be jarred down. Made of brass
throughout and without solder. It is claimed that
the lamp will not smoke or jar out. Weight twelve
ounces.

JOHN S. LENG'S SONS & CO., NEW YORK.
An extensive line of lamps, bells, cyclometers, saddles
and all sundries, forgings, stampings, tubing, fittings and
supplies, Plymouth wood rims and bars, the Forsyth
Mfg. Co. products and the Fauber crank. The feature
of the exhibit is an enormous reproduction of the
Fauber crank-hanger and cranks. The hanger is a
foot and a half in diameter, and the cranks when
placed in a vertical line stretch nearly five feet. The
model is perfect in every detail and attracted a great
deal of attention. The exhibit is one of the most
complete in the Show.

PHIL S. MOSHER, 621 BROADWAY, NEW
York—Perfection Lamps, the body made in two
pieces and with a locking collar and spring attach-
ment which prevents the wick from dropping. The
lamp is fashioned with a detachable hinge. Special
brackets with a shoulder which prevents the lamp
from jarring off the bracket are furnished with each
lamp. A clock spring is a novel feature of the at-
tachment device. Twenty-one lamps, including gold-
plated, silver-plated and jeweled headlamps, are
shown on an all-nickel wheel decorated in gold.

SPAULDING MACHINE CO., BUFFALO, N.
Y. A full line of stampings, pedals, Chantrell chains
and parts. The Bell electric lamp was shown for the
first time. It is novel in construction, as compared
with its electrical competitors, and is listed at five
dollars, recharges costing five cents. It is claimed
that the lamp will burn fourteen hours, and a contin-
ual light for eight hours is guaranteed. There are
no wires necessary to connect, no plates to be re-
charged and the liquid used in the lamp does not de-
stroy cloth when spilled on it. The arrangement of
zinc sticks and pencils is novel.

L. P. ROSE & CO., NEW YORK. IMPORTED
bicycle lamps. The Comet, a full nickelled lamp,
with a double lens, with an effective locking device to
prevent hinging on the side, admitting of thorough
and easy cleaning. This lamp is of handsome design,
and follows out very closely the English ideas of lamp
construction. The Tom Thumb is of the shape
already so well known, but is further improved by
having the lens hinged and the top removable. The
Rover, Forward, Racer, Original Tom Thumb, Invicta,
Little Gem and Ghostfinder embody a line of japan-
ned lamps of varying prices and finishes. They are
all well and substantially made, being riveted through-
out, and presenting a graceful appearance.

STORY, BARBER & CO., NEW YORK. VENUS
lamps, Ideal toe-clips and saddles; the primary
claim for the Venus lamp is that it will not go out
through any shock or wind. It burns kerosene, is
smokeless, odorless, and throws a light forty feet
ahead. It is constructed in such a manner that the
draught, instead of entering from the sides, comes
from below the lamp. It is fitted with a four-inch
convex lens. The Ideal toe-clip is made to fit the
foot. It has arms extending outward on each
side, bent to conform with the shape of the shoe, be-
sides a prong reaching to the instep. The saddle is
constructed on hygienic principles. It is made so
that it will tilt forward or backward in conformity
with the rider's position. It has a small pommel
and in some respects resembles a cushion.

EDWARD MILLER & CO., MERIDAN, CONN.
Miller bicycle lamp, a nicely nickelled, kerosene-bur-
ning lamp, fitted with a double convex lens, and pro-
tecting glasses, which prevent the smoking of both

the lens and the reflector. It has a clever, inter-
changeable grip hanger, fitting either fork or head of
wheel. It is constructed of brass throughout, riveted
together, and so made that it can be very easily taken
apart and thoroughly cleaned. The sidelights are
red and green jewels, set in slides which lift to allow
lighting. A feature that can be appreciated by those
riders who use the lamp on the fork will be found in
the reversible front, which allows the wick screw on
either side. The lamp is filled from the outside, and
the filler cap is filled with a cork bottom, making the
fount oil-tight, while the wick is held at any desired
height by an end-bearing drag attachment that pre-
vents jarring down of the light. The lamp is beau-
tifully finished and highly ornamental in appear-
ance.

LECOL STORAGE BATTERY CO., CHICAGO.
III. Illumino bicycle light. The Illumino light
consists of two parts, the battery or source of power,
is carried in a handsome leather case that is hung from
the top bar of the diamond frame, and as it is not
much larger than a toolbag, is entirely out of the
way. The lamp proper is a very small, heavily sil-
ver-plated reflector, mounted on a swivel support
and connected by a slender cord with the battery.
The light is obtained from a small incandescent globe,
which, being mounted on a cartridge-shaped base, ad-
mits of being pushed into the back end of the re-
flector. The current is turned on or off at the switch-
key in the battery. The battery can be charged by
connecting it with any direct source of electricity,
such as the direct incandescent lighting system, and
will run eight hours with one charge, and it is possi-
ble to economize, as when it is turned off, the
charge remains undisturbed. The lamp is very nicely
gotten up and is small and compact, while the leather
case holding the storage battery is gotten up in a
shape and in various colors that make it quite attrac-
tive.

PLACE & TERRY MFG. CO., NEW YORK.
Pathtlight and Scorcher bicycle lamps; also the P. &
T. reversible fork bracket. Place & Terry lamps for
'97 have been much improved even over last year's
patterns. The top has been changed, adding to the
beauty and symmetry of the lamp, and to give better
ventilation. The oil fount has been provided with
a wick-raising button on each side, and is packed
with absorbent cotton. A new sliding window has
been put on each side, with red and green front
jewels. The reflector has been improved by adding
a new strengthening frame, and is set back from the
burner, giving more room for the flame, and making
it less liable to be smoked, while an extra reflector is
added to the lamp, in case the original one should be
dulled by exposure to the heat. It is kerosene bur-
ning, and gives a large, bright light. The Scorcher is
a cheaper lamp, and yet is finished in fine nickel,
made entirely of brass, and will burn either kerosene,
or ordinary bicycle lamp oil. It has a removable top
and oil fount, removable reflector, removable glass,
that is held in by a screw opening into the oil
chamber of the lamp. Through this tube or burner,
a sliding window fitted with red and green signal
jewels, while it is very light, weighing but twelve ounces.
The reversible fork bracket can be used on either
side of the wheel, and as its name indicates, is rever-
sible in every way.

TWENTIETH CENTURY MFG. CO., NEW
York. The Paramount Bicycle Lamp and Universal
Jointed Handle Bar Grip. The Paramount is a kero-
sene-burning lamp with a very novel wick arrange-
ment. Instead of burning the end of the wick, the
wick is run through a hollow tube, shaped like a
horse-shoe, with both ends opening into the oil
chamber of the lamp. Through this tube or burner,
a flat ordinary felt wick is run, both ends of it
in the oil, and the manner in which it is adjusted
makes it impossible to shake down. Not having a
feed wheel, the light is lessened by closing together
two automatic shutters, which meet in the middle of
the flame, and of course these are also used for extin-
guishment. By this means the necessity of filling the
wick is entirely done away with, as it always remains
at one height. The feed wheel used is merely to
shift the flame to another part of the wick, the wick
being burned on the edge instead of on the ends,
as in all other burners. The lamp has a reflector
made on the locomotive headlight or parabola type.
It is made entirely of brass, thoroughly riveted and
handsomely nickelled. The Universal Jointed Grip
is a grip fitted with a ball and socket, allowing the
hands to rest at any angle, and it should be a de-
cided addition to the adjustable handlebars so much
in use at the present time.

SADDLES.

BUTLER & WARD, NEWARK. B. & W. SADDLES, as shown at Chicago.

E. CROSSINGHAM, NEW YORK. SPECIAL built bicycles and the semi-pneumatic ball bearing saddle, the two balls being of rubber and not of steel as might be inferred. They are encased in felt and form the pads. A solid rubber strip is enclosed in the edge of the saddle.

KING MFG. CO., NEW YORK. KING CUSHION saddle; one of the anatomical type, which has a paper fiber base, filled with curled hair, and two coiled springs acting as a support, making it much like a pneumatic, both to the touch and to the eye. The saddles are finished in three colors, russet, chocolate, and black, and are furnished with both flat and forked springs.

LUXURY SADDLE CO., NEW YORK. LUXURY and Arab saddles. The chief claim made for the Luxury saddle is that it will adjust itself to the rider. The frame and supporting parts are made from a single piece of tempered spring wire, the end overlapping each other and secured by a clamp under the seat. The saddle can be adjusted to the width required by operating this clamp. An opening through the center of the leather top relieves all danger from pressure at these points. The top is formed of two layers of leather with felt padding between. The Arab saddles are made on the same plan, but have a harder seat.

CLIMAX MFG. CO., EAST HAMPTON, CONN. Saddles; six models. Last year this firm manufactured but one style, but six models are now on the market. The mechanical principle of the Climax saddle is an endless steel frame, covered from pomel to cantle with an endless spiral spring wire cord. These cords are elastic and conform to the rider and are sufficiently open to admit of perfect ventilation, preventing perspiration and chafing. All models are covered with detachable laced leather covers, perforated with numerous holes for ventilation. The six models are varied in shape to meet all demands.

BECK SADDLE CO., NEWARK, N. J. SADDLES; two new saddles not seen since at Chicago. Both are decidedly novel. The new racer has an unusually long pomel, but the objection racing men have to the long pomel, its hardness, is avoided. By twisting the spring that runs into the pomel and by a clever arrangement of the leather, the pomel is soft to the point. The other novelty is a hygienic. It is similar in shape to the Beck, adjustable, but a V-shaped section is cut from the back and prevents any pressure on the base of spinal column. The new hygienic met with much favorable comment.

CRAIG CYCLE SADDLE CO., LAWRENCE, MASS. A variety of the Craig pneumatic saddles in several styles. The saddles are made on the principle conceived by Mr. Craig, that the weight of the rider should be carried on two cushions above the pomel and center line of the saddle. The cushions are made of the best rubber in two sections connected by a rubber pipe, so that both can be blown up at the same time by one valve, permitting also the air to circulate from side to side with weight of the rider's body, thus preventing rolling from side to side. The air cushions are covered with black or russet leather, bound or stitched in a particularly neat manner. The saddles are endorsed by physicians on account of their hygienic qualities.

PERSONS MFG. CO., NEW YORK. PERSONS saddles. This exhibit was one of the most artistic in the Show. The stand was draped with tapestry and Bagdads, and one corner was curtained off as a private office, which was set off by oil paintings, antique firearms and swords, and curiosities of various kinds. A special feature of the Persons' saddle for '97 is the leather of which it is made. It comes from England, and is prepared by a special process. Over twelve months are required for tanning, and the result is a pliability and strength that is very valuable in the construction of a saddle. The steel wire springs used are tempered with special reference to the exact requirements of this parts, and are drawn with a very fine finish. A new clamp is shown, which consists of three steel forgings and one screw. The principal forging is in the form of two discs, containing grooves to receive the four wires of the saddle frame, and the other two forgings serve to hold the wires in position against the grooved discs. The whole is firmly held together and the clamp fixed on the seat-post by tightening the screw. Other saddles are shown in an infinite variety of style, shape and finish.

CUTTING & KASTNER, CHICAGO. CUTTING pneumatic saddles; same as at Chicago.

MESINGER SADDLE CO., NEW YORK. MESINGER saddles, as at Chicago, also the four models of the Majestic bicycles, which contain among other improvements a new crank hanger and roller chain, added.

HILL & DOWNING, NEW YORK. TOPLIFF & ELY adjustable pedals, Tally-Dial cyclometers, Richard's metal saddle, Leiner tire cleaning brush, Hampton folding stands and Sims pneumatic edge saddles. The seat portion of which is felt and the edge a continuous air tube projecting slightly over the base.

MISCELLANEOUS.

MULLER MFG. CO., NEW YORK. SADDLES. They are shown in fifteen styles; coil spring saddles, racing saddles, hygienic saddles and padded saddles. The line is high grade throughout, no cheap saddles being shown. A new feature for '97 is the straight spring, used in connection with the new, patent, universal clamp. The Muller saddles are particularly popular with long distance riders. They are made of an exceedingly fine grade of English leather, specially tanned and prepared. The padded saddles are filled with camels' hair, not with felt as is usual. This, the manufacturer claims, gives a much softer surface for the rider to rest on. All colors and shapes are shown.

DEAN TIRE CO., NEW YORK. SINGLE tube pneumatic, the air chamber protected by a series of overlapping steel scales 6-1000 of an inch in thickness, and $\frac{3}{4}$ of an inch wide. There are 239 of these shields in every tire, and yet it adds but eight ounces to the weight. These scales are fastened by the rivets being countersunk so as to give each shield a bed of rubber of its own to work on, and this bed prevents any friction or cutting on the inside, and the air chamber and steel are distinctly separate. The tires are put to a severe test by riding them over pieces of broken glass and sharp-pointed nails without any apparently disastrous consequences.

NEW YORK BELTING AND PACKING CO., NEW YORK. The League Embossed single tube tire. It was a happy thought which suggested the catch-phrase "Get there and back," and when it is applied to a pneumatic tire it means all that is desirable in this very necessary adjunct to the wheel of to-day. New York Belting & Packing Company show a beautiful line of their League embossed single-tube tires, in whose construction is used nothing but the best Para rubber and long staple Sea Island cotton, and as in their method of manufacture, care is taken that the workmanship shall be equal to the materials, the result is sure to be an article that is a credit to the makers and a boon to the trade. The embossing that softens the tread is of a handsome design, and makes the tire rather ornamental in appearance. However, catering to a certain class of tread, a smooth treated tire is also shown, and a full line of racing and tandem tires. A complete line of various rubber cements, patching rubber, tire tape, pedal rubbers, pump tubing, etc., forms a part of the exhibit, and the crowd-attracting feature was "Teddy" Hale mounted on a home trainer.

RAY CYCLE SPECIALTY CO., NEW YORK. Bicycle sundries. The Ray Folding Toolbag is a handsome, handy device, folding up into a small compass, and at the same time on unrolling, the tools are left free to be removed, each tool being held in an individual pocket. The bag is made of Pantasote, a very tough fabric that is guaranteed not to crack, peel or roughen, and to stand all climatic influences. The Ray Coat and Luggage Bag, made from the same material, is a handy addition to the wheelman's outfit. It is fastened to the handle-bar by what are called "cinch cords" another little appliance marketed by the Ray Co. The bag folds into a very small space, and can be tucked to the handle bar, entirely out of the way. The well known Ray saddle is also shown, and is of the anatomical type, with a base so perforated as to allow an easy seat. The Ray Home Trainer is also a feature of the exhibit. The rear wheel is securely clamped in the frame, friction being derived by the bearing of a roller on the tire. Any kind of wheel can be used, and any desired pressure can be instantly applied without leaving the saddle, by means of an anti-friction roller brake. It is handsomely finished in nickel and enamel, takes up but very little room, and does not require to be screwed to the floor, also, what is very important, makes no objectionable noise.

DELF & BELL, PITTSBURG, PA. THE COMPANION bicycle; same as shown at Chicago.

PERRY PNEUMATIC SADDLE CO., CHICAGO, ILL. Pneumatic bicycle saddles. Same as at Chicago.

GILLIAM MFG. CO., CHICOPEE FALLS, MASS. S. & P. tires, in four grades. Same as at Chicago.

HARTFORD RUBBER WORKS CO., HARTFORD, Conn. Hartford tires and repair kits. Same as at Chicago.

ANGLO-AMERICAN CYCLE FITTINGS CO., New York. Parts, sundries and cycle fittings, are shown in an exhibit that is artistically arranged, and is most complete in all its details. This line differs but very slightly from the firm's '96 line.

IVEN-BRANDENBURG BURGESS CO., CHICAGO, ILL. Forgings, spokes, nipples, chains, wood rims, handle bars, mud and chain guards, hubs crank-hangers and a very extensive line of parts, accessories, sundries and machinery. Same as at Chicago.

SAMUEL HALL'S SON, NEW YORK. BICYCLE wrench. The novelty in this wrench is a swinging jaw, with the opening set at an angle to the wrench proper, making it possible to grip any shape metal, making it particularly invaluable in case of nuts and rounded corners. It weighs six ounces, and is nicely finished in nickel.

MONARCH RUBBER CO., CAMPELLO, MASS. Monarch Puncture-Proof tires. A rough tread tire with extra thick tread, which consists of several layers of chemically prepared fabric, making it very durable and non-punctureable tread. The tires are handsome and symmetrical in appearance, and should ably fill a niche of their own in the bicycle trade.

DEFENDER CYCLE CO., NEW YORK. DEFENDER bicycles; six machines are shown, five diamond and one drop frame. The Defender differs in a few points from the up to date '97 wheel. It has an inch and a quarter tubing, flush joints, D shaped rear stays, Fauber cranks and crank-shaft, large sprockets, wheels finished in green, yellow, blue, black, red, and white enamel, and make a startling exhibit.

WYTHE ENAMEL CO., YONKERS, N. Y. Enamels. Samples are shown in all colors. The enamels are made in two styles, one which dries with a gloss finish and the other with a dead finish. They dry in one hour, in a warm place, after being applied by a brush, which can be used by anybody, and are claimed to be equal to the finest baking enamels in appearance and durability.

NEW CASTLE TUBE CO., NEW CASTLE, PA. Cold drawn weldless steel tube. A very comprehensive display of tubing from the billet to the finished product. This tubing is made entirely from imported Swedish stock, and a high quality workmanship is shown, as it is polished perfectly on the inner as well as the outside. It can be furnished in any shape, square, hexagon, and in the now much used D section.

PARA RUBBER TIRE & MFG. CO., WILLIAMSPORT, Pa. Para Punctureless Tread Tire. This tire is so constructed that the inner tube is separate from the tread. The tube is covered with a layer of fabric chemically treated, that while not affecting the resiliency makes the liability to puncture very slight. On any sharp object entering the tire this inner tube is simply depressed, and on the sharp object being removed, resumes its normal condition. The tire is tested by riding it over sharp pointed nails, and it apparently comes out of the ordeal as full of air as before. Nothing but the best Para rubber and Sea Island cotton is used, and the quality and workmanship is thoroughly guaranteed.

SIDWAY MFG. CO., CHICAGO, ILL. THE S. & G. spring grip is constructed of a series of springs so curved as to give it a cylindrical form, making a grip the entire length of which, including the end, yields to the pressure of the hand, and taking up very effectually much of the vibration of the handle-bar. The springs are covered with a specially tanned buckskin which absorbs the perspiration, without in any manner affecting the softness or durability of the leather, and are ventilated by two eylet holes in the end, which produce a constant circulation of air, keeping the grip cool, dry and soft. A screwdriver only is required to secure the grip to any handle bar, by means of an expansion bolt and plug of wood. They weigh but a few ounces and as they can be covered with any color leather, present a slightly appearance. Loyal hubs are shown. They are made from specially selected tubing, and can be turned out with rapidity. The manufacturer claims that they are as strong as a hub turned from solid steel, and are much cheaper.

EAGLE LOCK CO., NEW YORK—EAGLE locks, as at Chicago.

N. N. HILL BRASS CO., EAST HAMPTON, Conn.—Sterling Bells, as at Chicago.

W. H. FROST, NEW YORK GEAR CASE. The same as shown at Chicago.

EASTERN RUBBER MFG. CO., BRENTON, N. J.—Common Sense Tires, as at Chicago.

KANKAKEE MFG. CO., KANKAKEE, ILL. Four Kankakee Bicycles, as at Chicago.

KEENE WOOD RIM CO., KEENE, N. H.—The Keene non-splittable built-up rims, as at Chicago.

CYCLE IMPROVEMENT CO., WESTBORO, Mass. Janney pedals, in variety of styles, as at Chicago.

VANGUARD CYCLE CO., INDIANAPOLIS, Ind. Vanguard bicycles, three wheels, same as at Chicago.

BLANK MFG. CO., ERIE, PA. NINE TRIBUNE bicycles, including two tandems and one triplet, as at Chicago.

BARNES CYCLE CO., SYRACUSE, N. Y. TEN Barnes bicycles, including two tandems and one quad, as at Chicago.

PALM BROS. & CO., CINCINNATI, O.—Transfers, on tubes, panels and frames complete, as at Chicago.

ELGIN BICYCLE & SEWING MACHINE CO., ELGIN, Ill. Elgin and Gunning bicycles, six wheels, same as at Chicago.

WALTHAM MFG. CO., WALTHAM, MASS. Six Orient bicycles, including two tandems and one quad, as at Chicago.

EXCELSIOR SUPPLY CO., ROOM 290, CHICAGO, Ill. Thistle bicycles; seven wheels, including one tandem, same as at Chicago.

SYRACUSE CYCLE CO., SYRACUSE, N. Y. Syracuse, Empire and Princeton bicycles; ten wheels, including one tandem and one sextuplet.

AETNA WAX MANUFACTURING CO., NEWARK, N. J.—The "Little Aetna Wonder," "The Best" Enamel Polish, the "Bikegraph," as at Chicago.

McINTOSH-HUNTINGTON CO., CLEVELAND, O. Sunol, Hercules and American King of Scorcher bicycles; twelve wheels, including one tandem; also one hydrocycle.

AMERICAN WALTHAM MFG. CO., WALTHAM, Mass. Seven Comet Bicycles, including two tandems, all fitted with the now well-known three-ball bearing, as exhibited at Chicago.

ARMSTRONG CORK CO., NEW YORK—CORK grips, complete line, made of various grades of cork, tipped with celluloid and other compositions, and finished in a variety of styles.

HUNTER ARMS CO., FULTON, N. Y. PARLOR A. Hunter bicycles; eight machines were shown, including two tandems, three drop frames and two diamond frames. Same as at Chicago.

SPENCER BRAKE CO., NEW YORK—SPENCER Brakes, two styles, axle coil and plunger, same as at Chicago, with the exception that a skeleton frame, in the Fenton booth, shows the interior mechanism of the coil brake.

HAY & WILLITS MFG. CO., INDIANAPOLIS, Ind.—Outing Bicycles. Eight wheels, including one tandem, among them the Outing Racer, with supplementary heart-shaped steering-head, on which the grips slide up and down, and may be used as coasters if desired. The exhibit is identical with that shown at Chicago.

SELF-HEALING PNEUMATIC TIRE CO., NEW YORK—Self-Healing Tires. No claim is made that the tire is puncture-proof. The healing ball is enclosed between two layers of vulcanized rubber on the tread. It is claimed that the ball at all times maintains a pasty consistency and that climatic changes have no effect on the composition.

WESTON MOTT CO., JAMESVILLE, N. Y. Specialties, crank-hangers, tubes, spokes, built-up wheels and ball-bearings. A new single crank-hanger with a pyramidal-hubbed sprocket and new oiling device is particularly noticeable. Five patterns of hubs are shown of the barrel variety, ball retaining and dust proof. In these hubs the ball cups and cones are turned, not stamped, from special high carbon steel and the axles are of fine rolled steel. Spoke nipples, wood rim washers, balls, wood and steel rims are shown in a profusion of styles.

W. W. SHOE, 428 WALNUT STREET, PHILADELPHIA, Pa.—Shoe Saddles, in four models: hard tops, hygienic, cushion and juvenile, all of them with the patented two-bolt seat-post clamps as a feature. The cushion saddle is a decided novelty. It has eight coiled wire springs running from the pommel to the cantle, on the metal frame. The body of the saddle

is heavily cushioned and is attached to the frame by two strong wire coils which can be furnished in any desired strength for any weight of rider. The hygienic, with its well-known method of lacing brought out prominently, and a number of very handsome hardtops in alligator skin are shown.

SYRACUSE SPECIALTY CO., SYRACUSE, N. Y. Frontenac cycles; five wheels, including one tandem. The models in general outlines and construction are the same as last year. The new features are D-shaped rear stays, flush joints, detachable sprocket and a lowering of the crank-hanger. The number of balls in the bearings are increased and the size decreased.

Esmond Spur Gear.

A. A. ZIMMERMAN MFG. CO., FREEHOLD, N. J.—Six Zimmy bicycles. The great Arthur A. himself was in charge of the stand, and reported a general refinement of the stand, and the adoption of D tubing, ball-retainers and such other minor improvements as had proven themselves sure and safe. Flush joints are not among the adoptions. Zimmerman believes they are experiments pure and simple, and will have none of them yet awhile.

DEMOREST MFG. CO., WILLIAMSPORT, PA. Demorest Bicycles. Seven wheels, including one tandem. Undoubtedly the most distinctive feature is the front forks, which, crown and all, are formed of one piece of tubing. They are particularly clean and attractive. Tapered tubes are used in the frame; all bearings are ball-retaining, and are provided with oilcups which hold sufficient oil for three thousand miles, feeding it as may be required.

Shepard's Wood Handle-bars.

L. C. JANDORF & CO., 321 BROADWAY, NEW YORK—Two exhibits. Linwood, Halladay, Stormer, March-Davis, Metropolitan and Metropolis wheels. Twenty-five machines in all are shown, including two Linwood and one Metropolis tandems. Their own wheel, the Linwood, is a thoroughly up-to-date wheel, listed at \$100 and having flush joints, "Thor" cranks, large detachable sprockets, large tubing and all the modern features. Choice of saddles, pedals, tires and handle bars is given.

WESTON MFG. CO., CORTLAND, N. Y. LOYAL bicycles, Loyal hubs, mud and chain guards. The Loyal wheel is one of the many in the Show that are described as being up-to-date wheels, differing in no detail from the accepted model. It has 1 1/2-inch tubing, single-piece fork crown and is first-class in construction, and material throughout.

HODGMAN RUBBER CO., NEW YORK—Hodgman Tires in six colors: blue, yellow, green, red, pink and brown. The color is paint, but it is embodied in the composition of the rubber, and runs clear through to the fabric. A novel feature is a tire with a fleur de lis tread, an exceedingly handsome and non-slipable article. All weights and sizes, from an eleven ounce racer to a four and a half pound quad, tire are shown. The Hodgman people are in line with a puncture solution, and exhibit a novel form of puncture plug that prevents bubbling.

BEVIN BROS. MFG. CO., EAST HAMPTON, Conn.—Bells and specialties. In addition to their single stroke, double stroke and electric stroke bells, a number of novel, continuous ringing bells are shown, also a big line of spring oil-hole covers, trouser guards and clips, combination trouser guards, and bicycle locks, lamp brackets, toe-clips, foot-brakes, nipple grips, lubricants and illuminating oils are shown. Lamp brackets are shown in a great variety of styles, some of them having very novel devices for attachment to different parts of the frame.

SCOTT PAPER CO., PHILADELPHIA, PA.—Great Scott, Clarence and Scotia bicycles. This is the Scott people's debut as cycle makers and they make it auspiciously with wheels embodying several new ideas, among them a semi-diamond fork crown, an oil sleeve in the bottom bracket, an L crank-shaft, divided and dovetailed and held together by a flush nut in the axle, an expanding and contracting seat-post adjustment, which is regulated at the top of the seat-post and not on the seat-post, and a patented cotter-pin, which is removed by drawing out by means of a nut and washer, and which requires no hammering.

W. H. COLE & SONS, BALTIMORE, MD.—Unique, Marvel and Pearl bicycles. Six wheels, ranging in price from \$75 to \$40, and embodying flush joints, keyless cranks and other latter-day ideas, none of them, however, of an exclusive nature. "On the side" the Coles showed a toothed coaster, for attachment to the lower bar of a tandem or single wheel; also a hygienic saddle, which impresses one very favorably. It is made of a slightly concave shape, to throw the weight of the rider where it should be thrown, and to prevent slipping. The base is one piece of sheet steel, the nose is dropped, and the stuffed or air-pads are removable by the turning of a thumbscrew on the under side. It is also provided with a peculiarly shaped spring, secured at three positive points, and yet yielding slightly.

STANLEY CYCLE MFG. CO., TWENTY-Seventh street and Ninth avenue, New York—Stanley Bicycles. Nine wheels, among them two tandems, one triplet and a ladies' Stanley, made specially for exhibition purposes, the latter representing an outlay of some \$500. More than 36,000 pieces of genuine mother-of-pearl and sixty coats of enamel are employed, requiring 750 hours work. Perhaps the most radical change in the wheels is the adoption of half-inch balls. Among the minor changes are keyless cranks on a tapered axle, no cotter pins being employed; also an inside clamp for head and seat-post fastening, both posts being split, and so old that the adjustment is always straight and positive. The use of the forkside as a matchbox is a minor conceit and innovation with the Stanley folks. The top of the fork crown is arranged on a pivot, the matches being stowed away in the top of the forkside.

SNYDER & FISHER BICYCLE WORKS, LITTLE Falls, N. Y.—Ten Newell Newport and S & F. Bicycles. A separable bicycle is the feature of the display. The front portion may be detached from the rear, enabling the parts to be hung up on a clothes hook in a match-box flat if necessary. No extra bars or braces are employed; the joint is particularly clean and effective appearing, as far as the eye can see, the wheel not differing at all from the outside reinforced article, the joint being concealed by a sleeve which appears as such a reinforcement. Another departure is the adoption of an L crank-shaft and inverted bearings, the latter screwing into the crank-box or shoulder on one side, and into the recesses sprocket spider on the other, the bearings being removed when the cranks are removed. The S & F. improved adjustable bar, in two pieces, and the usually large head-bearings, 2 3/8 inches, containing 35 3/16 balls, are distinctive features which have been retained.

The Bicycles having the most important features and practical improvements for 1897 are

Kindly mention The Wheel.

NEARLY TWO MILLIONS.

In One Year America's Infant Industry Gathered in that Amount of European Gold.

Washington, D. C., Feb. 6.—As an "infant industry," the American cycle trade has reason to kick up its tootsies and to crow in sheer delight. The annual report of the United States Treasury Department's bureau of statistics is sufficient reason for this joy. The report has just been made public and shows that in the matter of cycle exports the "infant" has come into possession of ten league boots with tops of a lurid scarlet.

EXPORTS.

CANADIAN POLITICS.

Much Like Those of Our Own L. A. W.—Strife For The Presidency and For the Meet.

Simcoe, Canada, Feb. 6.—George H. Orr, chairman of the Canadian Wheelmen's Association, has expressed his intention of retiring to private life this year, but the announcement has not been received graciously. On the contrary, there has arisen a cry from all portions of the Dominion that Orr be honored by election to the presidential chair before he is allowed to retire from the C. W. A. Councils. Mr. Orr has declined to be a candidate, but the chances are that he will be forced into it.

At the annual business meeting of the C. W. A. an amendment to the by-laws will be submitted making the chairmanship of the Racing Board a salaried office. It is also likely that the gold and silver bar scheme for amateur prizes will also be reviewed.

Nearly all of last year's racing men are in the trade this winter, either working in the offices of the manufacturers or on the road selling wheels. McColl and McCarthy are out for the Gendron people, Blayney is selling the Perfect and Dominion for the Welland Vale people and a score of others are in the business in Toronto.

The Welland Vale people will likely have a team on the track this year. Heretofore they have stood aloof from racing in any form, not even mentioning the wins of the top-notch amateur, Blayney, who rode a Perfect nearly all last season. Lately, however, they have mentioned in their ads. the fact that Blayney won 21 firsts in 23 starts, and it is understood that the firm will have Blayney and Frank Moore riding their wheel the coming season as cash chasers.

Vice-President Hurst has been booming himself for the C. W. A. presidency for several months past, but he is not a likely candidate. There are a heap of men in the association that should be honored by the highest office before Mr. Hurst, and I understand that he will retire in favor of Beament, of Ottawa, who is an old worker in the ranks and would have a strong following. George Orr, however, will in all probability be the next president of the C. W. A.

The Brantford clubs have expressed their willingness to subscribe to the association an amount sufficient to cover the expenses of their boy amateur, Ralph Axton, to the International championships in Scotland this year.

If R. O. Blayney does not turn pro. he will probably cross the pond too. H. B. Donly, secretary of the C. W. A., will likely be the delegate from Canada, and will present the claims of the C. W. A. for the championships in 1898. Winnipeg is after the Dominion meet that year, and it has been suggested that he be given it and that Toronto have the I. C. U. races. Another plan set forth by your humble servant is that the I. C. U. and C. W. A. meets be held together and let the town have it that will pay the most for it.

Monster petitions will be sent in from all parts of the country to the House of Commons at its next session praying that a law compelling railroads to carry bicycles as baggage be enacted.

The C. W. A. will receive about \$75 as its share of the profits of the '96 meet at Quebec. This is a very poor showing, but still it is \$74 more than was expected.

The scheme for holding provincial meets on Dominion Day and a Dominion meet on Labor Day has been brought to life again, and is receiving a great deal of attention. This motion was defeated last year, but it had not been discussed enough to show the merits of the case. It is different now, and there is a strong probability that it will be adopted.

The meet fight wageth merrily between Chatham and Brantford, with odds favoring Chatham. Brantford is the home of the Gould Bicycle Company, and they are doing all they can to secure the prize. Other manufacturers are inclined to favor Chatham, so that the Goulds will not have any undue advantage over them in the way of advertising. Both towns are on the alert, and the winner is hard to pick.

LIKE UNTO HIS NAME.

"What'cher mean by naming your bicycle 'Circumstances,' Wabbles?"
 "Because I haven't learned to ride it yet, and the wheels are something I have no control over."

It requires one-third more power to stop a wheel than it does to start it.

STORY OF MAMIE'S MISFORTUNE.

Thus softly sang to herself the Beautiful Young Woman as she joined the crowd that was slowly forcing its way into the Grand Central Palace. The rhythm was bad, and the rhyme was faulty, yet the sentiment expressed was not her's alone since every man, woman, and child in her immediate neighborhood was possessed of exactly those same ideas.

"I don't care a cent for the latest plays;
I really don't care much to hear
De Reszke, or whoever's the latest craze,
Unless there's a souvenir!
I don't care a bit for the cycle show;
I don't think I'd melt into tears,
If I found I was unable to go,
If there weren't any souvenirs!
I'm sure life isn't worth living unless
You have what to me most endears
An existence of really sublime happiness,
A trunk full of good souvenirs!"

When at last the Beautiful Young Woman had presented her complimentary ticket at the door, and had it accepted as a good and valid reason why she should enter the happy souvenir hunting grounds, she started in to business at once. She was not alone in this and in consequence the gallery observer witnessed a fine display of the souvenir-seeker's strategy.

One of the exhibiting firms was giving out a rather neat and ornamental pin—of course, not to every Tom, Dick and Harry, but to persons who had the proper official backing. But the stock ran out, and even the most influential were refused. To this stand the Beautiful Young Woman finally fought her way. She evidently was an acquaintance of the salesman. She had heard of the pins and seemed bound to secure one. The more the stand attendant assured her that he couldn't get one for love or money, the more intense grew her pleadings. At last she struck her colors and drifted away with the crowd, her parting shot being:

"Don't you ever speak to me again, Mr. Stungy. I mean that, too."

The attendant looked very unhappy and a fellow-clerk took compassion upon him. Taking one of the souvenirs from his pocket he handed it over to the crestfallen gallant, saying:

"Here, Fred, take this one. I was saving it for some one, but you can have it."

Fred took the pin with a happy smile, and, standing on tip-toes, yelled excitedly:

"Mamie! Mamie! come here. I've got one for you."

The Beautiful Young Woman had been carried with the tide about twenty feet away, but as she heard her name called she turned and saw the pin in the attendant's hands.

At the same moment a dark-haired damsel, about ten feet to the left of the Beautiful Young Woman turned and saw the attendant gesticulating. It is possible her name was also Mamie, for she stopped in the way of the torrent and, after a moment of indecision, braced herself for an inevitable struggle.

It was about this time that the onlookers had their attention drawn to the football tactics which followed. The new comer in the game had a little the worst of positions, her rival being almost on a straight line with the pin.

The Beautiful Young Woman's first effort was to buck the line, but she was thrown back with a loss of a yard by a stout, determined-looking woman, who adjusted her bonnet

and said: "The ideal Don't try that again, young woman!" The souvenir-seeker gasped, recovered her breath, and seeing that she was being carried away from the goal, made a wild plunge for the left end. She made about two yards, and seeing an opening between a colored lady and her escort, abandoned the end-running and plunged fiercely between the two. The colored gentleman's silk hat went into the air, and his companion's satchel of souvenirs was lost forever. "Drat it," remarked the colored lady, and her escort said something else.

The Beautiful Young Woman didn't stop to reply, but, seeing a weak spot in the line in the shape of three young children, carefully guarded by their mother, plunged through, and her gain of three yards was followed by much wailing and a demand by an irate parent for a policeman at once.

In the mean time her would-be rival had been very fortunate. Her first signal called for an attack upon the centre, and she went full tilt at a fragile, auburn-haired young woman, who fell back with a hysterical shriek upon the people behind her. A short, stout young woman saw her coming through

MORGAN & WRIGHT TIRES

an opening in the line, and, seized with a great terror, she turned and fled. It was great interference, and the Beautiful Young Woman's rival was within five feet of the goal.

Here she collided with the Beautiful Young Woman, and while the two Mamies were struggling with might and main a tow-headed, freckle-faced, snub-nosed girl reached over their heads and took the souvenir from the absorbed attendant with a cool:

"Thanks, awfully. I've been hunting for this all week to complete my collection." And she was gone before he could say her nay.

HANDS OFF AND IDIOCY.

Many a rider might pass by without other users of the public streets ever suspecting him of being an idiot, did he but proceed on his way without removing his hands from the handles.

CORRECT ANSWER.

A few alarmists still try to scare wheelmen by declaring that excessive riding produces curvature of the spine. To all such the wheelman has but one reply, "Humph!"

WAR HORSES OF THE FUTURE.

When France calls on her cycling cohorts for war she should expect them to respond in a way creditable to their country and themselves. The reason why such an expectation would be reasonable on her part is found in the care she shows in selecting her cycle corps recruits and the training they undergo after they are chosen. The "Velocipedists Militaires," as they are officially termed, are trained soldiers before they are chosen for the cycle corps, being only taken from the reserve.

They are medically examined, special attention being given to the heart and lungs, and to any predisposition to hernia. The candidate is next examined orally as to the distinctive signs used in maps, flags, lanterns, and badges of the different commanders. He is also given a route to cover a wheel, and according to the distance and time of his ride the candidate is allotted the position he is to occupy. His name is then registered, and his uniform received. The cyclist uses his own machine for the use of which the State pays 50 cents per day when in barracks, and 25 cents per day when in use at manoeuvres. His principal weapon is the revolver. Each military gymnasium in France is supplied with a few machines, upon which the soldiers are trained.

An experimental company of sixty men has been formed by Capt. Gerard, who has invented for their use a wheel which folds in two by means of a hinge, so that when folded the two wheels are side by side, and the machines are readily portable on the men's backs. The company as at present organized consists of four sections, twelve men each, commanded by one sergeant and two corporals, thus making up a total of forty-eight rank and file, with four sergeants and eight corporals. The folding wheel is provided with leather braces, to enable the men to carry it on their backs.

The uniform is a blue jersey, a loose cloth jacket, like a pilot coat or an open Norfolk jacket, red trousers, close fitting from the knee, leggings, and boots ankle high. These latter are the worst part of the equipment, and verify the proverb that the French soldier is the worst shod in Europe. The equipment consists of the regulation belt with three pouches, each containing forty rounds of ball cartridge. In the pouch carried at the back there is room provided for the pump and the usual repair tools. A canvas bag is also provided to hold a spare jersey.

The armament consists of a Lebel rifle and bayonet. Two expert repairers are attached to the company. They ride a coupled bicycle and carry spare nuts, tires, files, hammers, and other articles to repair the machines. A wagon is attached to the company containing a portable forge, a box of ammunition, and spare wheels, together with the men's knapsacks and officers' valises.

BEFORE THE FALL.

"You're too fresh!"

Thus spake the smart rider to the newly-sprinkled road.

"Maybe I am," the accused replied, "but before you get through with me, your name, like mine, will be nud."

And after the subsequent side-slip, this was literally true.

MICHAEL AND THE MOFFATT,

It was later than usual when the Liar walked into the club room. With a nerve and accuracy which awed the New Member, he seized an arm-chair and wormed himself into the best place, flanked by the heating apparatus and within convenient range of the cuspidors.

"Well," grunted the Old Member, "anything new?"

The Liar filled and lighted a pipe, and stretched himself like a contented cat.

"There is nothing new under the sun," he replied, "which mossy proverb, by the way, is an excellent example to prove the fact—but that is another story. I was thinking as I came along the street of the tragic end of a wheel which was familiar for many years to the cycle trade of this town. You must all remember the Moffatt bicycle built at Chicago in the early '90's—rather advanced as compared with its contemporaries—fitted with an ungainly clincher tire, heavy as lead and resilient as so much gas pipe—the builders fizzled out in some kind of a legal wrangle and their phoenix-like successors now build a cantilever frame—I think that's the word—

wings and a sufficient momentum was obtained on a grade, the power, transferred to the wings in imitation of the motion of a bird, would cause the machine to rise and fly, thus solving the problem of aerial navigation.

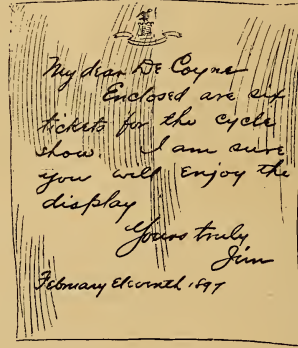

"Following out this idea he rigged the old Moffatt at considerable expense, and one

"I was up that way a few days ago. There in the little country church-yard, where in the summer-time the forget-me-nots and other garden truck wave tenderly over the emerald mounds, loving hands have raised a slender shaft. I drew near and read with a curious eye these lines graven in the eternal stone:

'MICHAEL WATKINS, AET. XXIV.

This modest stone, kind stranger,
Do not stop to sneer or cough at,
For 'neath it are the tangled frames
Of Wilkins and his Moffat.
The two hundred odd component bones
Of our lamented Michael,
His jacet miscellaneous
With equal parts of cycle.
We left it to the angels,
At last, in desperation,
Who only have the ample time
To make the separation."

—the Liar paused. The New Member rose and walked toward the windows. "I think we need a little air," he said.—From Tales of the Inkeytanker, the cycling authority of Maine.

THURSDAY.

OFTEN NOT PLEASING.

Well! Suggestions for improvements in wheel-women's costumes come and go, but the memory they leave behind them depends upon the figure of the individual woman.

FRIDAY.

well, one of these Moffatts entered the second-hand market here, and in the course of several following seasons figured in so many sales and barbers that there was not one dealer within a radius of fifteen miles from the city who had not experiences to relate concerning that machine. The young cycling ideas taught to shoot; the trees, noses and shins barked; the scriptural English provoked, on and by that mount, would, if recorded, fill many bulky tomes.

"There was one remarkable feature about the wheel, however; it showed no signs of dissolution at any time in its career; it was as unbreakable as a ten dollar bill in a convention of ministers and I, for one, felt sure, that each part was 'uz strong uz the rest,' and therefore anticipated an end similar to that of the Wonderful One-hoss-shay. But the fates willed otherwise. A light-headed fellow named Wilkins appeared—"

"Seems to me I bought that machine once," mused the Club Idiot.

"Then Wilkins was light-headed No. 2," said the Liar, and continued—"This fellow carried off the wheel for use in crazy experiments. He had a theory, which kept him awake nights, that if a bicycle was fitted with huge

SATURDAY.

bright day tested the device in the presence of his sisters and his cousins and his aunts, by blood and marriage. Sure enough, the contrivance rose and sailed gallantly for awhile, but, alas for the ambitious inventor, he had failed to provide for either balancing or steering, and the whole outfit thumped ignominiously against a stone wall only a quarter-mile away.

"Did it kill him?" said the Club Idiot.

"Dead as Julius Caesar. You see, the force of the impact was such that man and machine were inextricably mixed. They persuaded the clergyman to read the burial service over the whole shooting-match, as the only rational way out of the difficulty.

HE WAS A RIDER HIMSELF.

Employer (kindly)—You are becoming very round-shouldered, Mr. Pending. Bookkeeper (with hopes of an extra holiday)—Yes, sir. I fear that I am.

Employer (solicitously)—Hadn't you better raise your handle-bars a couple of inches? When I passed you on the Boulevard Sunday I thought you were riding a bit too much a la scorcher, for either health or comfort.

QUOTH SHE.

"Miss Birdie," faltered young Moore from the rear seat of the tandem, after he had finally nerved himself to propose, "is there any hope for me? Do you think you could ever learn to—"

And Birdie, flippantly replying, said: "Never, Moore!"

And the poor youth went ravin' mad.

A CYCLE SHOW ECHO.

The Souvenir pin, big and bright,
With many show defenders,
Is now completely out of sight—
It fastens his suspenders.

"American Beauties" grow here—bloom everywhere.

A plant that IS an American Beauty.

Send 2-cent
stamp
for the

WINDSOR WALTZ.

It is the
rage in
Chicago.

Everyone is enthusiastic
over the 1897 "Windsor"
—everyone but the repair-
man.

The record of '96 "Windsor" Wheels, as compiled at the factory, was enough to discourage repairmen. Of the 13,500 wheels sent out to July 30, 1896, only 18 were returned for repairs, and *not one of the 18 had a broken fork, defective tubing or bearings.* Naturally, repairmen have no love for the "Windsor"—but "there are others," and the repairman's business goes merrily on.

WINDSOR, \$100.

Has more new, original, *practical* improvements for the '97 riders than any two other wheels made.

PACIFIC, \$60.

Is the equal of the great majority of so-called \$100 wheels made by many of the best (?) manufacturers.

New York:
HERMANN BOKER & CO.,

Kindly mention The Wheel.

HAS A COTTON STUFFED FOUNT.

A lamp that attracted considerable attention at the show is the Magic, manufactured by Behrend & Rothschild, of 355 and 357 Broadway, New York. The Magic burns kerosene, or any good bicycle oil, has a cotton stuffed fount and is warranted absolutely

non-explosive. It has a patent collar lock device that makes it impossible for the fount to become detached from the lamp and the burner is so constructed that the lamp will not smoke and cannot be jarred out.

GONE TO GLENS FALLS.

Glens Falls, N. Y., will hereafter be a city of cycle manufacture, for Budd Bros. Mfg. Co., manufacturers and jobbers of bicycles, of that city, have purchased the entire plant and good will of the Atlas bicycle from the Farnsworth & Wilson Machine Co., of Amsterdam, N. Y. The entire plant has been removed to the Budd Bros. Co.'s factories at Glens Falls, and is being set up this week. The firm will immediately commence to manufacture bicycles. Their designer and builder will be J. L. Sackett, formerly of A. G. Spalding & Bros., of Chicopee Falls, who has been engaged in the cycling trade for many years. Budd Bros. Manufacturing Company have long been interested in the cycle trade.

OVER IN JERSEY.

At Trenton, N. J., Feb. 6, the Deering Mfg. Co. was incorporated to make and sell bicycles and bicycle equipments. The capital stock is \$200,000, of which \$1,000 has been paid in. The stock is held by John R. McPherson, of Jersey City; George E. Coney and Charles T. Carl, of Orange; Mark L. Deering, of Brooklyn, and Daniel A. Carpenter, of New York.

FROM FAR OFF FINLAND.

The Ralph Temple Cycle Co., of Chicago, received a cablegram from Ulaborg, Finland, this week, requesting a quotation on the entire Temple line of wheels. All of which goes to show that this talk about a country doesn't go, since, if the Temple line was not favorably known at home, it certainly would not be cabled for from abroad.

FOR PEDAL BALANCING.

A late wrinkle is the Perfection pedal balance, weighing two ounces. One is attached to each pedal and it keeps it always level. It will especially appeal to users of the toe-clip and also racing men. The balances are being manufactured and marketed by the Perfection Pedal Balance Company, Daytona, Fla.

No sooner does a local rider excel in speed a few fellow riders than at once he assumes the title of some kind or other "champion."

HINGED LIKE A WATCHCASE.

Beauty of design too often takes the place in lamps of practical light-giving qualities, a fact which makes all the more welcome, and like unto its name, unique, the Unique lamp, turned out by the Manhattan Brass Company, No. 338 East Twenty-eighth street, this city, who seem to have solved in their lamps the very difficult problem of successfully wedding beauty of design to practicability of light-giving. As will be seen by the cuts herewith, the Unique breaks away from the conventional, taking unto itself a new and pleasing form of design and construction. Made entirely of brass, heavily nickeled, the lamp,

an all-riveted one, is built to stand wear and hard usage. Two parts, hinged like a watchcase, make the wick, reflector and lens always accessible without taking the lamp apart. Covering the openings through which the wick is lighted are jewel side-lights visible from both side and rear. The entire lamp weighs but ten ounces, despite which it gives a large amount of illumination; burns kerosene, neither blows nor jaks out, is easily cleaned, regulated, and taken apart. Altogether the Unique is a most promising addition to the not too long list of successful lamps.

CHANGING OF THE TIMES.

Bicycles have found their way into Arabia, so that hereafter when a son of the desert is quoted as apostrophising
My beautiful, my beautiful, that standest meekly by,
it will require a footnote to explain whether he refers to a milk-white steed or a pedaled wheel.

NEITHER LEND NOR BORROW.

Not like a book is the bicycle, a thing to be loaned or borrowed. When once you have the saddle and handle bars in correct position for your riding, it is annoying to have them altered, even by your friends. It is a more than ordinary, unobserving rider who can not instantly tell when any one has been "monkeying" with his machine.

FRIENDS AND ENEMIES.

The dead-heat between those who say that riding a bicycle causes all the known, and several of the unknown, complaints, and the others who as positively declare that cycle riding will cure everything, results in cycling being to-day the best boomed thing in the world.

FLAMES VISIT McCLUNE.

Fire, originating in the plating and polishing department of the McClune Cycle Co's factory, Everett, Mass., last week, damaged the building to the extent of \$2,200.

QUICK DELIVERED FORGINGS.

With the development of the bicycle, many staple industries have found in this and kindred lines a profitable addition to their business. In no one case has this been so apparent as with the various drop forge concerns who were making carriage forgings. Richard Eccles, Auburn, N. Y., for many years well known to the carriage trade, is to-day among the largest forgers of bicycle parts in

the country. Forgings of every description are of course counted in their output, but special attention has been paid to the manufacture of cranks, both square, round and made in various carbons of steel. A large stock is always kept on hand, and in the standard sizes deliveries can be made very quickly.

WORDING A COMPLIMENT.

Too often when an agent or salesman has been called a "hustler" he feels there is nothing in the cycle world or any other, left to strive for. This term seems to him to be the very acme of complimentary ecstasy, utterly regardless of its usual bestowal upon every lop-eared, ugly-mugged loafer, in every town from Maine to Mexico, who is credited with rapidity, whether that rapidity be in stealing hogs or evading the sheriff, matters not.

What the deceived agent or salesman usually wants to do when he has been accredited a "hustler" is just to lie down and die, trusting, of course, that the word will be part of his epitaph. It would be an excellent thing if "hustle" was hustled out of cycling diction. Compliments are well enough, but when no other words but "hustle" can be found to express them, then they should be laid aside until fitting terms are found for them.

TIRE MONARCHS THESE.

The latest firm to enter the tire field, is the Monarch Rubber Company, Campello, Mass. This concern has been manufacturing rubber goods for the past three years, and is a substantial firm. The officers are: President, W. Rapp; treasurer, Z. C. Keith; manager, J. T. Robinson. Their tire is called the Monarch of all Tires, and is made of the best quality of rubber.

LAST OF AN EXTINCT RACE.

Novice Amateur (sizing up the prizes)—Are you a good judge of diamonds?
Old-Bird Brand Amateur (absent mindedly)—No, but I have an uncle who is.

LIABLE TO BLOW HER AWAY.

"Maud Thvnnne says she never could dare to face the world in bloomers."
"The world? Pshaw! She meant the wind more likely."

MORE TUBE MAKING.

Cleveland capitalists are reported to be preparing to erect a factory at Sharon, Pa., for the manufacture of weldless tubing of brass and copper for bicycle frame construction.

ONCE ON A TIME

a notion was started, that if all the people in the world would shout at once it might be heard in the moon. So the projectors agreed it should be done in just ten years. Some thousand shiploads of chronometers were distributed to the selectmen and other great folks of all the different nations. For a year beforehand, nothing else was talked about but the awful noise that was to be made on the great occasion. When the time came, everybody had their ears so wide open, to hear the universal ejaculation of "Boo"—the word agreed upon—that nobody spoke except a deaf man in one of the Fejee Islands, and a woman in Pekin, so that the world was never so still since the creation.

February 22-26—Binghamton, N. Y.; W. F. Cady, 187 Water Street, Chairman of Binghamton Athletic Association.

March 1-6—Omaha, Nebraska; W. L. Burgess, Secretary, Omaha Cycle Board of Trade, 313 So. 14th Street, Omaha, Neb.

March 1-4—Syracuse, N. Y.; H. E. Maslin, President, Cycle Board of Trade of Syracuse, care E. C. Stearns & Co., Syracuse.

March 1-4—Cleveland, O.; George Collister, President, Local Cycle Board of Trade 317 Superior Street.

March 2-5—Providence, R. I.; W. W. Whitten, President, R. I. Cycle Dealers' Board of Trade; W. W. Whitten & Co., 143 So. Main Street.

March 2-6—Detroit, Mich.; Wm. E. Metzger, Vice-President, Detroit Cycle Board of Trade, 253 Woodward Avenue.

March 2-6—Reading, Pa.; John W. Spangler, Secretary, Reading Local Cycle Board of Trade, 600 Penn Street, Reading, Pa.

March 6-13—Baltimore, Md.; Alfred Ely, President, Local Cycle Board of Trade, 8 W. Baltimore Street.

March 6-13—Brooklyn, N. Y.; A. M. Franklin, Secretary, L. I. Cycle Board of Trade, 6 Third Avenue, Brooklyn, N. Y.

March 8-13—Rochester, N. Y.; Joseph J. Mandery, Secretary, Rochester Local Cycle Board of Trade, 93 East Main Street.

March 18-20—Williamsport, Pa.; A. H. Andrews, Melbourne Cycle Co., Williamsport, Pa. (Williamsport Cycle Dealers' Cycle Show.)

FOREIGN CYCLE SHOWS.

January 23-30—Glasgow, Scotland; A. G. Rennie, Secretary, 49 Lilybank Gardens.

January 22-30—Birmingham, England, Bingley Hall; Chas. Wheelwright, Secretary, Lucifer House.

January 23—Vienna, Austria; Steiner Hoenicke, Manager.

February 1-7—Edinburgh, Scotland, Waverly Market; A. K. Dempsey, Secretary 82 Leith Street.

February 1-15—Vienna, Austria; Winter Velemond, 14 Kaentner Street.

February 3-6—Nottingham, England, Albert Hall; B. Richards, Secretary, Nottingham Athletic Social Club.

February 6-20—Manchester, St. James' Hall; Northern Counties Exhibition Co.

February 27-March 6—Leeds, England, Town Hall; Northern Counties Exhibition Co.

March 14-19—Glasgow, St. Andrew's Hall, Northern Counties Exhibition Co.

March 15-21—Brussels, Belgium.

TRADE CHANGES.

CALIFORNIA.

San Diego.—Hannahs & Cobb, declared insolvent. Liabilities \$4,620, assets \$2,281.

CONNECTICUT.

Danbury.—Folding Bicycle Co. transferred to P. O. Dwyer under bill of sale; \$2,000.

DISTRICT OF COLUMBIA.

Washington.—W. R. Mitchell sued for damages.

GEORGIA.

Brunswick.—The Brunswick Bicycle Co. has been organized and will open new store.

ILLINOIS.

Chicago.—Comfort Spring Seat-Post Co., bicycle sundries, incorporated by D. M. Martindale, J. R. Gill and H. H. Martindale. Capital, \$2,400.

Chicago.—Pneumatic Handle-Repair Co., bicycles, incorporated by H. E. Kimball, F. V. Phillips and Edwin W. Olds. Capital, \$2,500.

Chicago.—Armstrong & Jamison, dissolved.

Chicago.—Fowler Cycle Mfg. Co., increase directors from three to five.

Chicago.—Henry Sears Co., assigned. Assets \$80,000, liabilities \$50,000.

INDIANA.

Seymour.—Timms Mfg. Co. organized to manufacture bicycles. Officers, M. S. Blish, J. Blish, W. C. Humbert and C. L. Thomas.

IOWA.

Des Moines.—Perkins & Perkins, assigned.

MAINE.

Nobleboro.—E. L. Dunbar will make bicycle saddles.

MASSACHUSETTS.

Bridgewater.—Chas. Perkins sold out to Whitcomb.

Hyanina.—Hallett & Eldridge, chattel mortgage, \$3,000.

Leominster.—J. T. Burns Cycle Co., succeeded by Iver Johnson Sporting Goods Co.

Worcester.—Frank T. Fowler Mfg. Co. changed style to Trinity Cycle Mfg. Co.

MINNESOTA.

Crookston.—Hawkins & Co. have arranged to handle the Fowler bicycle next year.

Pine Island.—A. H. Irish sold out to R. S. Swarthout.

NEW JERSEY.

Jersey City.—W. L. Darrner, chattel mortgage, \$125.

Trenton.—Steel Tire Wheel Co., incorporated for \$4,000,000.

NEW YORK.

Brooklyn.—Amphion Cycle Mfg. Co., bill of sale, \$450.

Brooklyn.—I. & H. Silberstein, bill of sale, \$1,500.

Brooklyn.—Joseph Dennis, judgment, \$447.78.

Buffalo.—William D. Knowles reported recorded chattel mortgage for \$185.

Buffalo.—Electric City Wheel Co. open salesroom at 600 Main street.

Buffalo.—George B. Salisbury opens salesroom, Main and Chippewa streets.

New York.—The Porter Cycle Co. incorporated by L. H. Porter, J. D. Tatem and W. A. Belcher.

New York.—The U. S. A. Export Co. incorporated by R. A. Strong, G. A. Smith and W. G. Chittick; to export and import bicycles and supplies; capital, \$2,500.

New York.—The Berson Mfg. Co. incorporated by H. Berson, Joseph C. Savage and C. A. Loughlin; to manufacture bicycles, etc.; capital, \$10,000.

New York.—Fifth Avenue Cycle Co. incorporated by E. S. Johnson, E. O. Jacobson and E. M. Sanger; capital, \$20,000.

New York.—New York Horse Co. incorporated to deal in horses, bicycles, vehicles, etc.; directors, B. T. Rhoades, Jr., Leopold Wormser, William A. Hern, E. A. Miller, George F. Vetal, George W. Bush, and George W. Lynch; capital, \$50,000.

New York.—Weaver Cycle Material Co. file certificate of incorporation in Hudson County, N. J.; capital, \$100,000.

New York.—B. J. Raynor & Co. damaged by fire; \$500.

New York.—The Walton-Tinkham Cycle Co. discontinue manufacturing tricycles and carriers; the Tinkham Cycle Co. will continue.

Rochester.—Bicycle stock of C. W. Mayer, 308 Central avenue, levied upon Tuesday afternoon.

Rochester.—The Shone-Hanna Mfg. Co. opens branch store at 29 S. Clinton street, and will carry full line of bicycle supplies and bicycles.

Rossville (S. I.).—George Merrick sold out to William Vaughn.

OHIO.

Cincinnati.—Herbig & Rick assigned to B. L. Murtry. Assets and liabilities not stated.

Cleveland.—The Century Novelty Co. incorporated by E. S. Page, J. W. Laughley, C. S. Howe, J. M. Anderson and W. H. Mason. The company will manufacture and deal in bicycles.

North Star.—A. Davis and F. A. Curtis have commenced the manufacture of a patent bicycle lock.

Toledo.—Nelson-Hubbel Cycle Supply Co. dissolved; E. P. Hubbell retiring.

Urbana.—Sims Cycle Co. succeeded by Smith & Franza.

OREGON.

Riddle.—Carle & Richardson dissolved; T. K. Richardson continues.

PENNSYLVANIA.

Philadelphia.—F. M. Dampman, bicycles, damaged by fire and water.

Reading.—The Globe Cycle Co. have opened their new store at 846 Penn street.

SOUTH CAROLINA.

Columbia.—J. W. Gibbs Stationary Co. has assigned to Hassell Thomas.

VIRGINIA.

Richmond.—The Brannan Circle Cycle Co. incorporated by E. I. Brannan, pres. and gen'l. mgr.; F. Sitterding, vice-pres.; J. Clements Shafer, sec'y-treas.; to manufacture the Brannan Circle cycle; capital stock, no more than \$20,000, nor less than \$10,000.

WISCONSIN.

Madison.—D. D. Warner Co., Chicago Cycle Show exhibit attached for \$470.32; claim paid and goods released.

Manitowoc.—E. S. Baer & Co. will begin manufacture of bicycles and bicycle supplies on February 15.

Palmyra.—H. Colton will open bicycle store.

WILL GO RIGHT ON.

On Friday of last week, the Syracuse Specialty Company, Syracuse, N. Y., manufacturers of the Frontenac cycles, went into the hands of a receiver. The company was reorganized on the following day and business will be continued as heretofore. At the show it was stated that the failure would have no effect on the business whatever.

ADDITIONAL DETAIL SHOW REPORTS.

MECHANICAL FABRIC CO., PROVIDENCE, R. I. Conqueror and Flexifort single and double tube tires. Practically these tires are the same as last year. A circular woven fabric is used which in the single tube tire fits with a smooth surface to the rubber. The Thillingast Tire Welder is also shown.

NATIONAL CYCLE SUPPLY CO., CLEVELAND, O. Lantern and lubricating oils, and chain grease. It is claimed for the illuminating oil that it will not smoke, char the wick, gum or emit a disagreeable odor, while the flame is brilliant and unaffected by motion or jar. The chain grease is a new ingredient, put up as a paste instead of in stick form. The point is made that it will remain longer on the bearing points and will not wash off. The line is known as the "Yellow Kid" each box being adorned with a likeness of that famous youngster.

WM. F. NYE, NEW BEDFORD, MASS., Lubricating oils and chain lubricants. Coming from the former home of the sperm oil industry, Mr. Nye is in a position to market the purest oils obtainable, in fact he offers a large sum of money to any one who can equal them by a chemical analysis. His specialty for this season is the Crystal Sperm Chain Lubricant, and the Lily White oil put up especially for high-grade bicycle use. It is non-drying and non-congealable. The stand is ornamented with a collection of realistic pictures relative to the whaling industry.

NORTHAMPTON CYCLE CO., NORTHAMPTON, Mass. Bicycles; eight wheels. One of the talking points of this firm's output is the adjustment of the handle-bar and seat-post. By a half turn of a nut the handle-bar can be swung in any position by means of an eccentric bolt, obtaining the greatest rigidity when locked in the position desired. Dust proof bearings, colored enamels, wood or metal handle-bars, flash joints, and a variety of tires, are other features. The chain adjustment is especially simple. The chain is tightened or loosened by merely loosening the nut on the right side of the rear hub and turning a small disc with the fingers either forward or backward. Felt washers are used in the hubs, which are so arranged by an internal brass tube that two drops of oil will lubricate the bearings thoroughly.

ALADDIN LAMP CO., NEWARK, N. J. ALADDIN lamps, same as shown at Chicago.

ERWIN MFG. CO., GREENBUSH, N. Y.—Erwin and Raensselaer bicycles; five wheels. The Erwin Special at \$100; the Erwin Roadster at \$80, and the Raensselaer at \$75. No particularly special or exclusive features are embodied in the wheels, which, however, incorporate flush joints, divided crank shaft, external expanders and other latter day kinks.

RACING BOARD'S BULLETIN.

Suspended, pending payment of entry fees—W. S. Paige, Brooklyn, N. Y.

SUSPENSIONS RAISED.

A. H. Stewart, Chicago, Ill.; Fred B. Thompson, Canton, Ill., and H. G. Thompson, N. Y. City, N. Y.

SUSPENDED.

For one year from February 3, for competing in a novice race after having won a prize, also competing while under suspension, D. Meyer, Chicago, Ill.

Suspended pending payment of entry fees: F. W. Hearne, New York City, N. Y.; C. W. Gagne, Brooklyn, N. Y.

DECLARED PROFESSIONALS.

H. B. Scott, McDonald, Pa., own request; C. C. Aughenbaugh, Beaver, Pa., clause (c); Frank A. Coty, Pasadena, Cal., clause (a); Myron A. Hill, Pasadena, Cal., clause (a); Freeman Parker, Ukiah, Cal., clause (a); J. M. Long, Phoenix, Ariz., clause (c); J. Y. Hill, Tusculumbia, Ala., own request.

Y., clause (b); William Dell, Minden, N. Y., clause (b); Harry Fisher, Little Falls, N. Y., clause (b); S. Hodge, Fonda, N. Y., clause (b); Wm. Jensen, Morristown, N. J., clause (b); F. L. Harris, Seatonville, Ill., clause (a); John Rowe, Tiskilwa, Ill., clause (a); H. J. Webber, Ladd, Ill., clause (a); C. R. Reed, Providence, Ill., clause (a); Geo. L. Banschbach, Princeton, Ill., clause (a); W. W. Ingram, Rutland, Ill., clause (a); H. J. Bailey,

Princeton, Ill., clause (a); Max Schultz, Ottawa, Ill., clause (a); Chas. H. Eby, La Salle, Ill., clause (a); Frank Linnig, Peru, Ill., clause (a); S. E. Geiger, Peru, Ill., clause (i); W. C. Black, Mendota, Ill., clause (i); M. Knaff, La Salle, Ill., clause (i); H. C. Uthoff, Peru, Ill., clause (i); A. Weberling, Peru, Ill., clause (i); Henry Fraser, La Salle, Ill., clause (i); L. Morrow, Peru, Ill., clause (i); C. Edwards, Tryo Grove, Ill., clause (i); E. Samen, Peru, Ill., clause (i); A. B. Porter, La Salle, Ill., clause (i); E. Gross, Peru, Ill., clause (i); C. F. Sherrard, Ladd, Ill., clause (i); Dan Stipp, Princeton, Ill., clause (i); Dan Price, Mendota, Ill., clause (i); J. Dow Hopkins, Mendota, Ill., clause (i); F. Ladd, Peru, Ill., clause (i); Frank R. Daft, Peru, Ill., clause (i); F. Horton, Princeton, Ill., clause (i).

Suspended for one year from January 26 for competing in unsanctioned Sunday races after warning:

Frank R. Daft, Peru, Ill.; F. Horton, Princeton, Ill.; F. Ladd, Peru, Ill.; J. Dow Hopkins, Mendota, Ill.; Dan Price, Mendota, Ill.; Dan Stipp, Princeton, Ill.; C. F. Sherrard, Ladd, Ill.; E. Samen, Peru, Ill.; A. B. Porter, La Salle, Ill.; E. Samen, Peru, Ill.; C. Edwards, Tryo Grove, Ill.; L. Morrow, Peru, Ill.; Henry Fraser, La Salle, Ill.; A. Weberling, Peru, Ill.; H. C. Uthoff, Peru, Ill.; M. Knaff, La Salle, Ill.; W. C. Black, Mendota, Ill.; S. E. Geiger, Peru, Ill.; Frank Linnig, Peru, Ill.; Chas. H. Eby, La Salle, Ill.

For competing in unsanctioned Sunday races after warning: Max Schultz, Ottawa, Ill., and H. J. Bailey, Princeton, Ill., are suspended for one year and six months from January 26, and W. W. Ingram for two years and six months.

RECORDS ACCEPTED.

Professional, unpaced, flying start, against time, by Arthur Gardiner, Denver, Col., December 4, '96:
½ mile, 26 1-5.

¼ mile, 57 2-5.

Amateur tandem, unpaced flying start, by George E. Dixon and Charles Kraft, San Francisco, Cal., December 5, 1896; 2 miles, 4.21 2-5; 3 miles, 6.38 4-5; 4 miles, 8.55; 5 miles, 11.09 4-5.

One hour professional record 29 miles, unpaced, flying start, by Jimmy Michael, Memphis, Tenn., November 21, 1896.

EVERY TIME

A BICYCLE dealer sells a wheel equipped with SAMSON SINGLE-TUBE TIRES, he adds to his reputation and prestige.

Wheels equipped with

SAMSON SINGLE-TUBE TIRES

will be supplied by any bicycle
manufacturer without extra cost.

Money cannot make higher grade tires than **SAMSON SINGLE-TUBE TIRES.**

At New York Cycle Show, Spaces Nos. 281, 282, 295 and 296.

NEW YORK TIRE CO. Main Office, Nos. 59 and 61 Reade Street, NEW YORK.

BRANCH HOUSES: BOSTON, TORONTO, PHILADELPHIA, BUFFALO, LOUISVILLE, CLEVELAND, CHICAGO, DENVER, ST. LOUIS.

Kindly mention The Wheel.

DIFFERS FROM THE ORDINARY.

The hub machine made by the Davis & Egan Machine Tool Company, Cincinnati, and shown herewith, differs from others now on the market, in that it forms and drills the hubs simultaneously, which greatly increases the output. In a test recently made on rear hubs of the Marion Bicycle Company's design an average of ten hubs per hour was main-

tained. On front hubs the average was fourteen per hour. The hubs were formed, drilled all the way through, counterbored on one end. It is not a special machine, but can be used for making cones, cups and other parts. It is a very powerful machine, being driven by a large two-step cone, with a 5-inch belt. It is furnished with a geared friction head, so that the back gears may be thrown in and out without stopping the machine.

PROPOSED PACIFIC PLANT.

The president of the Los Angeles Board of Trade is in receipt of a letter from Llewellyn H. Johnson, president of the Premier Cycle Manufacturing Company, Bridgeport, Conn., who states that he is arranging to establish a bicycle factory on this coast, with an annual capacity of not less than three thousand wheels, and that Los Angeles has been suggested to him as a good location. The first season he would employ from 250 to 300 hands. A plant such as this would mean the annual expenditure of \$75,000 in wages and local salaries, and a business of about \$200,000 per year. In Los Angeles Mr. Johnson's offer is regarded as an opportunity for its enterprising citizens to secure the establishment of an enterprise that would be of great value to their city. Oakland, Cal., already has the matter in hand, and is trying to secure the location of the factory.

ON A ROYAL MOUNT.

Lee Richardson, who, as a fancy rider, won his spurs almost as soon as he left his cradle, is going abroad to astonish the Europeans. He will sail for Paris on the 17th inst., and should do well. His foreign trip is not nearly so surprising as is the fact that he has left his first love and will use a Royal Worcester bicycle in all of his exhibitions.

INSURANCE COMPANIES TO PAY.

"Dear old Tom, he is so considerate, and so thoughtful of my happiness," confided Mrs. Scorchmost, to her dearest friend.

"What has he done now?" queried the one confided in.

"Doubled his accident policy, and now I don't have to worry the least bit when he goes out every night and scorches over those miserable roads around here, refusing to use either a brake or a lamp on that new \$34.83 machine he rides."

PRESS FOR HEAVY WORK.

Modifications recently made by the E. W. Bliss Company, No. 25 Adams street, Brooklyn, N. Y., in their standard No. 5 Stiles Geared Press, in order to give more rigidity to this press when heavy work is done in it, are outlined in the illustration. By means of these stay-rods the press is made to combine the advantages of the overhanging frame with those of the straightsided pattern. These stay-rods can be removed when using the press to cut out of the full sheet, when they would be in the way; they are, however, especially desirable when the press is used for embossing, heavy stamping and shaping. This machine is otherwise provided with the well-known features of the "Stiles Presses," namely, the Stiles Graduated Eccentric Adjustment and the Stiles Clutch, and is built in an exceedingly solid and accurate manner. Its principal dimensions are as follows: Size of opening in bed, 11 x 14 inches; distance back from centre of slide, 10½ inches; distance

from bed to bottom of slide when stroke and adjustment are up, 9 inches; standard stroke, 1½ inches; weight of fly wheel, 900 pounds; proportion of gearing, 1 to 7; speed of fly wheel per minute, 175 revolutions; floor space over all, 52 x 86 inches, and weight complete, about 9,000 pounds.

The range of work for which this press is adapted covers nearly every kind of blank cutting, punching, perforating, forming and bending, including a large portion of the operations needed in the manufacture of bicycles and bicycle parts and fittings, such as frame connections, crank-hangers, pedal parts, chain sides, and other articles formed of sheet metal. The "Stiles Patented Graduated Eccentric Adjustment" is an especially valuable feature of this machine, the graduation being marked 1-100 of an inch on the eccentric disc, enabling the operator to keep an exact record of the dies and to set them without loss of time.

Count Kumoff is president of a newly organized Russian wheel club.

RECORDS MILEAGE BY TRIP AND YEAR.

A 75 cent cyclometer, which will register 1,000 miles and repeat is one of the specialties of the Flash Light and Cyclometer Co., of Tilton, N. H. This firm has succeeded to the business of the Tally Dial Cyclometer Co., and has been incorporated with a capital stock of \$10,000. Two other models in the cyclometer line are made, Model C, which is illus-

trated, registers a season's riding up to 10,000 miles and repeats, as well as individual trips up to 50 miles. Model B is the same, except that it registers only 1,000 miles before repeating. They are small, accurate, and weigh but two ounces. The instruments are put up in an easel-shaped case, holding twelve, four of each kind, making an ornamental appearance in the show case or window. The company also controls the novel Flash Light sign, which is being largely used by cycle dealers for night and day store advertising.

DONE WITH ELECTRICITY.

This is the era of electricity, and the wonder is that electric construction does not enter into the bicycle more than it does. However, Angell & Sumner, Buffalo, N. Y., are marketing a full line of stamped bicycle connections, electrically welded, making them practically one piece. In addition, they handle a full line of parts that help constitute the bicycle, tires, pedals, wood rims, saddles, etc., and at prices that make them interesting to the trade.

A new flush joint, rear-fork end with lugs for the adjusting bolt is novel, while a complete set of head and adjusting cones and cups are quoted at figures that make one marvel how it can be done at the price. A seamless crank hanger is also something that will be thoroughly appreciated by the trade, and in fact, the whole line of goods handled by this concern can be quoted as being strictly high grade at reasonable figures.

GRINDERS AGAIN.

At noon on Monday a six day's race began in the Central Rink, Pittsburg, Pa. The ten riders who started out to ride twelve hours each day, from noon to midnight. The track is 12 laps to the mile. At the close of the race on Tuesday the score was as follows:

Waller, 437 miles 4 laps; Gimm, 437 miles 2 laps; Schock, 416 miles 4 laps; Reukel, 259 miles 11 laps; Hall, 408 miles 5 laps; Foster, 378 miles 10 laps; Denche, 402 miles 4 laps.

OPERATING UNDER THE SLOPER PATENT.

The Erie Cycle Specialty Co., of Erie, Pa., who manufacture the X-Ray Plugger for single tube tires, are authorized for the manufacture of the same by M. E. Griswold Co., under the Sloper patent.

MORSE MFG. CO.,
TRUMANSBURG, N. Y.

WIN ON THEIR MERITS.

It is a large number of bicycles, 1,316, yet that was the number of wheels exhibited at the Chicago Show, and of these, Morgan & Wright, after a careful canvass, report that 341 were shod with Morgan & Wright tires. The other 975 bicycles were divided among 41 different makers, so that Morgan & Wright averaged 341 machines, while the average for the other 41 makers was only 24 each. Morgan & Wright add that they wish it known that not a finger was stirred to cause the removal of other tires from wheels during the show. It is their policy, they state, not to buy business by any other means than merit and courtesy.

INCREASED NEWTON BUSINESS.

The Newton Rubber Works, of Newton Upper Falls, Mass., have been compelled, through increase of business, to open a branch at No. 132 Lake street, Chicago, which will be under the management of Mr. F. H. P. Lowe. This company has also opened distribution depots with repair shops with the Very Cycle Company, Boston, and Stephen Hickok, Los Angeles, Cal., from which latter point the very far West will be taken care of.

ANENT ELECTRIC LAMPS.

Regarding a recent paragraph in THE WHEEL connecting the Eclipse Cycle Company with an experiment in electric lamps—which lamps, by the way, proved to be unsatisfactory—the Eclipse Company state that they have never been connected with any experimentation with or the marketing of electric lamps, and that they were not interested in the old Eclipse electric lamp.

FROM FAR OFF FINLAND.

The Ralph Temple Cycle Company, of Chicago, received a cablegram from Ulaborg, Finland, this week, requesting a quotation on the entire Temple line of wheels. All of which goes to show that this talk about a prophet being without honor in his own country doesn't go, since if the Temple line was not favorably known at home it certainly would not be cabled for from abroad.

RACING WITH COMFORT.

The Springfield Cycle Club Company, hailing from Springfield, O., is the name of a new stock company incorporated under the laws of Ohio for the purpose of giving cycle races and the general promotion of cycling interests. They have their clubhouse in the heart of Springfield, a fine residence, furnished up to date and fitted with the ordinary club comforts.

READY FOR CALLERS.

After spending seven or eight years with Hulbert Bros. & Co., E. P. Ryder has signed with Geo. N. Pierce & Co., and will have charge of their Broadway and Fortieth street, New York store. Mr. Ryder is spoken of as being able, genial and valuable. He invites all his friends to call upon him.

CHANCE TO BUY EFFECTS.

The effects of the Lindsay Bicycle Manufacturing Company, of Lafayette, Ind., will be put up at private sale at the office of the receiver, Jos. W. McCrea, No. 77 Main street, on March 1st.

PA'S POINT WELL TAKEN.

"I don't object, Alice," said the patient father, "to your selecting a cycle costume to make you look as much as possible like a man on the wheel. But I do object to the kind of man you succeed in looking like."

SOMETHING TO SEE.

"I suppose I wouldn't know Fawlaugh on his wheel?"
 "Why, you wouldn't know him away from it. Haven't you seen him since he tried to ride down Broadway on a wet cable-slot?"

LAMSON'S

**Luggage
Carriers.**

The No. 10 or Featherweight is the lightest carrier we make, but yet it is very strong. It presents a very neat appearance on the wires.

**CARRIER No. 10.
PRICE, 75c.**

**CARRIER No. 1.
PRICE, No. 1, \$1.00
" 1 1/2, Lighter, .75
" 2, .50**

Has long been the most popular carrier on the market. It does not interfere with the use of lantern or brake. These carriers may be put on reversed as to project behind the handle-bar.

Rests on the handle-bars and is fastened around the head. Will carry a large bundle or package. The construction of this carrier forms an elastic rest for the package, preventing undue jar to the contents. The best all-round carrier made and one of the best sellers.

**No. 4s.
PRICE, \$1.25.**

**No. 4d, LOADED.
PRICE, \$1.50.**

Will carry a small camera and tripod, or anything else. The main bundle need not be disturbed until the end of the day, as the upper part will carry the cost, etc., independent of the lower frame. Unusually light and strong and will not sag.

**Price, No. 4d, \$1.50.
Larger Sizes, No. 6, \$2.00.
No. 8, \$2.50.**

For sale by all Dealers, or by Manufacturer,

OF ROYAL LINEAGE.

Not "Worcester" now, but "Royal Worcester," is the name by which the Worcester Cycle Manufacturing Company will make their product known. They had in mind the celebrated English potteries, whose wares are known throughout the world, and whose reputation for premiership in porcelains the Worcester Company will strive to emulate in cycles.

Besides the Worcester line, there will be a second string, called "Middletown," thus making a line ranging in price from \$40 to \$150, thereby giving a choice of selection to the attenuated purse or the plethoric pocket-book.

These Worcester wheels are manufactured in Middletown, Connecticut, and the aim of the Worcester Company is to make them high-class from the ground up. They start with the keynote of all success by using the best material, and, being located in the mechanical centre of America, they are easily able to draw all the skilled workmanship they require. At present, this skilled workmanship has caused the drafting of four hundred of New England's best mechanics to Middletown.

The Royal Worcester line will comprise five singles and two tandems, all high grade, the family being the Light Roadster, the Racer, the Ladies' Model, Special Light Roadster for men, and Special Light Roadster for ladies, built to order; these latter being enameled in purple with gold stripes. All the bright parts, usually nickelled, will in these specially-built wheels be gold-plated. There are also Double Diamond and Combination Tandems. The company will also put out a Racer, weight 17½ to 18½ pounds, finished in royal purple, the frame and rims striped with gold, with which combination they can scarce-

Royal Worcester, Ladies' Model

ly escape a rich effect. The Light Roadster will weigh 21 to 24 pounds, with grass green, dark blue, Denver blue and ox-blood red finishes.

Royal Worcester, Roadster.

The Ladies' Model will show an entirely new design, whose symmetrical lines will be sure

Royal Worcester, Racer.

to win appreciation. The Light Roadster is made in three heights of frame, 22, 24 and 26 inches.

The Worcester Company invite close inspection on the part of riders. They claim beauty in line and merit in detail and general construction. Above all, they base their chief talking-point on ease of running, for a wheel that runs hard, even on the first trial, is a hard nut for the prospective buyer to crack. All Royal Worcester cycles are fitted with Palmer tires, Persons saddles, Fairbanks selected wood rims and Spencer brakes. The tire options include either Vim, League, Goodrich or Dunlop. There is also an option in saddles on the Garford, Hunt or Brown. Handle-bars are in three styles, at option, drop, upturned or ramshorn, and may be had in either wood or steel. All Royal Worcester cycles have tapered tubes, hollow bolts and universal nuts. The Royal Worcester line is listed at \$100, and the tandems at \$150.

The company's factory at Middletown, Conn., includes seven large buildings in the heart of the city, the area being about five acres. The factory is entirely modern in construction, and is equipped with labor-saving devices and automatic machines of the latest invention. The factory equipment is so complete as to even include a photograph gallery.

The man at the wheel is George S. Macdonald, who holds forth at the head office, 17 Murray street, New York City. Mr. Macdonald is well known in the bicycle trade as a man who understands it both as to factory and office. He is an all-around, well-equipped man, and capable of turning out oceans of work, and the company's headquarters, although but freshly opened and newly painted, presents an inspiring scene of industry. The company seems to possess all the factors of a big success.

TRADE OUTLOOK FOR 1897.

Cycle trade forecast for 1897? How easily asked for, and how difficult to fill the commission, since the cycle trade itself, whose bread and butter and bank account depend on how well it hits off the situation, is even now lame and halting and indulging, not in any prophecy or in any well-supported policy, but is adrift in speculation and unadulterated guesswork.

AT THIS TIME OF THE YEAR

the trade has usually known where it was at or had some inkling of where it was going to be at. This year, however, barring one or two rich concerns which have capital—and the product of capital, which is courage—to go ahead and get ready, very few firms have yet put their best foot forward. Their earliest models have only just peeped forth from the cycle works. They are showing them timidly, yet hopefully. They pursue the necessary agent's order eagerly. Aside from the firms indicated, a great many houses know not how large their output is to be or where it is to be placed.

This is not to intimate that the bottom has fallen out of the bicycle trade or that it is full of holes as a sieve. Here and there are holes and there are bad spots, but during the past season the trade has been purified as by fire, in this case through failure after failure, and much weakness has been knocked out of the trade, so that it is healthier and more normal than it ever was. But the cycle trade, healthy and normal though it may be, clear-headed and clear-minded as it is, moves slowly and haltingly. It has not yet got its man's legs on, but is faltering uncertainly, scarce trusting itself.

LEAVING GENERALITIES,

the cycle trade is the marvelous commercial growth of this generation. Within the lives of men who are not yet twenty, people have been arrested for venturing to ride a bicycle. Just fancy the possibility of such a thing! Yet to-day legislators and officials crowd the dockets with bills providing accommodations for those who ride bicycles. Even those who are in the bicycle trade have only just begun to comprehend what a remarkable expansion the trade has gone through, how big it has gotten to be, and how universal the use of the cycle is. The cycle trade, on a small scale, is like many other things in nature which have grown too rapidly. It has taken on somewhat of the nature of the weed and the reed, and has something of rank growth. It is much like the '49 mining movement, like the growth of some border cities, a sort of miniature South Sea bubble in its way. While the trade has not burst like a bubble, it has during the last year become much less in size, much less brilliant in coloring. A deal of wind has been taken out of the enormous cycle trade globe, so that where it once threatened to burst, it is now getting neither larger nor smaller, but is at a standstill.

IN 1880 THE NUMBER

of makers could have been tabulated on the fingers of one hand; to be exact, 6 in number; in 1890, they numbered nearly 200, in 1895 nearly 500—that is, more or less big makers, with a countless number of small makers and assemblers. In 1893 the trade met its first Waterloo, for in May of that year, a prominent firm was compelled to overload its stock,

and it cut the price on 10,000 bicycles to half and dumped them on the market. This came upon the trade in the manner of a drastic pill. From June 1, 1893, to October 1, the commercial records showed at least one bicycle failure each day. The year 1894 was a season of reception, with a girding up of loins for new victories; and this season of preparation was not wasted, for the year 1895 proved the great climaxial year for the bicycle trade. Everybody in the world seemed to have a mad desire to be mounted on wheels. Factories were run day and night. Plants were enlarged and the output was enormous. This prosperity caused overstimulation, overexpectation. The story of that year was a luscious and irresistible invitation to capitalists and manufacturers to turn out countless bicycles. It must be remembered that since the general business panic in 1893 many manufactories had remained idle, and those who were wont to produce steel, metal, and other products converted their plants, either in whole or in part, into bicycle factories. The net result was that 1896 saw the production of nearly a million wheels, with only six or seven hundred thousand buyers. The result of this disproportion is fresh in the minds of all cyclists and in the minds of the public. Early in the season of 1896 cycles were dumped into the department stores and auctioneers' rooms in quantities, and wheels with fine names which once brought a clean \$100 were passed over the counter for as low as \$24. The whole trade was overstocked. Those who were at the drowning point clutched the last straw of sacrifice at any price, and perhaps saved themselves for better days. Those firms, however, which had both pride and money carried over stock, and are still carrying some of it.

A FORECAST OF THE TRADE

One hesitates to risk a prophecy, but these things may safely be said of the approaching year: First, demand. The demand for cycles will undoubtedly be marvelous. During the past year cities have constructed asphalt streets and asphalt strips and counties have constructed smooth roadways, the total being many, many thousand new miles of pleasurable riding. These asphalt streets make great numbers of riders. They are the kindergartens of cycling. Timid persons who will not venture into a riding school or on the public road have, under cover of night and upheld by some friendly arm, gone through the A B C of cycle riding in front of their own doorsteps, with nothing worse to bother them than the eyes of some curious or kindly neighbor. That is only one factor. The chief basic reason for big expectations is that the cycle has now become the vehicle of pleasure to many and the vehicle of use to all. It has become an extremely popular method of locomotion to and from school and for shopping, and for the mechanic between his home and his factory, and all the rest of it. Any one who has given a close eye to cycling cannot but draw the conclusion that 1897 will show a very great public demand.

SUPPLY

If the output of cycles equals this demand, we should expect a perfect business condition, but perfect business conditions are very rare, and seldom do supply and demand balance the scales. This year supply will be small. For the proportion of perfected wheels

offered for sale one must go to the men who make tires and tubing and saddles, and to whom come the first orders for product. These men all agree that manufacturers of all kinds of bicycles, barring one or two more adventurous spirits, are going very slowly, and their opinion is that the output of 1897 will be from 40 to 70 per cent. of the output of 1896. Signs of the times indicate that the majority of makers are working their factories slowly, are taking no big risks, are not overloading on material, are getting up what product they are certain to sell, and are getting themselves in position to produce additional product if it is needed. This year it will not be a case of filling the factory up to the roof and then starting out to market, as has been the custom in previous seasons. The stockrooms will be kept fairly clean this year, so it seems probable that the supply will be very late in being offered to the public—so much so, in fact, that it is not improbable that there will be a wheel famine this year, as there was early in 1895; not an actual famine, perhaps, but for the best styles part of the public will undoubtedly have to wait. Thus it may be assumed that the possible output, even if the factories started up in full blast at this time, cannot be more than 60 or 65 per cent. of that of 1896, so that at the present time possibilities of a bicycle glut and sacrifice, life-saving prices seem remote.

METHODS OF SALE.

The cycle trade, both maker and agent, will remember the bitter scorching they received in 1896, and bicycles will be sold more sanely and sensibly and profitably this year than ever before. In many cities the number of agents who will offer wheels for sale has been greatly reduced. For instance, in New York last year cycles could undoubtedly be purchased in at least 2,000 stores. The drug-store man showed them in his window, labeled "a panacea for every ill." The furniture man added them to his line. The carriage man thought them necessary to fill out the gap in his declining business. But all this has passed and is yet passing away. These "outsiders" found out to their cost that cycles do not sell themselves, that the bicycle is an article which must be talked up, that a sale is a matter of some skill, and that it takes a bicycle man to sell a bicycle. So these side-line people have withdrawn from the trade in disgust and have left the sale of bicycles to the legitimate bicycle agent. Thus the number of cycle sellers has been reduced perhaps by 40 per cent. throughout the entire United States, and the business will not be so thinly spread out and the profits will be concentrated.

AGAIN, THESE AGENTS

are doing business on a much better basis than heretofore. In many cities they have organized boards of trade, which have curtailed many of the abuses in cycle selling. They have taken up the matter of installment, exchange, rental, and other phases of the business, and have adopted codes carrying with them certain penalties. In this way much of the cut throat in the business is being eliminated. The agents come in contact with each other and learn not to abuse each other, which only profits the public and hurts themselves, and they have also stimulated a mutual confidence which has enabled them to carry on business on a better plan. Even these same agents are also now deriving increased revenue from the general increased sale of general cycle material, and increased revenue from repairs and care of cycles. For the army of cyclists is now so great that the small contributions it makes for oil, wicks and the rest of the ordinary paraphernalia of cycling comfort, make up millions in the aggregate.

IT MAY BE CONCLUDED

briefly that the cycle trade is in better shape than it ever has been, that wheels will be more used in 1897 than ever, that less bicycles will be produced, and that they will be more profitably placed; that there will be a less number of agents and a larger number of profitable agencies.

F. P. PRIAL, in N. Y. TIMES.

WHERE EVEN JUSTICE SLEEPS.

Judge Finletter, of Philadelphia, is another one of that city's magistrates whose mental equilibrium appears to have been seriously disturbed, if not completely upset, by the advent of the bicycle and the persistency with which as a vehicular appliance it not only holds its place, but steadily grows in popular favor. There are many localities in which the bicycle is regarded as an impertinent intruder, and not a few dispensers of alleged justice have laid down antediluvian law in deciding cases involving the rights of wheelmen.

Everybody who has any acquaintance with Philadelphia knows that good order is maintained on her streets. Although her trolley poles and wires offend the eye and endanger life, fast riding or driving are not permitted, and even walking is, by general consent, managed with a decorous dignity quite incompatible with rapidity of motion. It was natural that the introduction of the bicycle into such a community should have created a profound sensation. It was a rude shock to rock-ribbed and everlasting conservatism. It collided with cherished traditions and seemed to threaten the demolition of domestic tranquility.

But the wheel, in spite of the chilling reception which it had encountered, had come to stay—to perpetuate its inhabitancy of the metropolis of the Keystone State. It won favor with the young people, and when haled into the courts, even into the Supreme Court of the Commonwealth, it gained a notable victory, being set down as a vehicle and entitled to all the rights of a vehicle on the highways, even to the not particularly sought for right of paying toll on turnpikes.

But evidently Judge Finletter still regards the wheel as an intruder, and although he cannot banish it from the streets in opposition to the court of last resort, he does his best to make its riders unhappy. A young man who had been arrested for fast riding—and fast there would be slow in other cities—was arraigned before Finletter. This incident afforded an opportunity for the Judge to free his mind of an accumulation of anger against the hated innovation. Instead of condemning the single instance of fast riding—the only case before the court—he let loose on cyclists indiscriminately, declaring that they acted on the streets as if they owned them. Now, the truth is that in Philadelphia, as in all other cities, the "scorecher" is an outlaw among wheelmen, and such offenders are no more numerous than reckless drivers, but Judge Finletter lacked both the judicial firmness and acumen to discover this, hence his outbreak.

WHEN BRAIN IS TIRED AND HEART IS SICK.

It is pleasant to know social strife can be forgotten and the cares of the affluent person can be put under foot by the bicycle, but it is also pleasant to think of that other large class of women who ride the wheel, and all of whose pleasures are sometimes encompassed in the circlet of shining spokes. She is probably a woman who works with her mind and soul and body—this type of cycle maid. She may be delving in humanity down in the slums or trying to bring people back to the faith of their childhood in some forgotten, thriving mission in the heart of the "tough quarter" of the city; maybe she is merely a

prosaic teacher in a public school, where the widest scions of Italy, Ireland, Greece and Sweden clamor for liberty and education, fortune and civilization from 9 a. m. till 3 p. m.

But no matter who she is, she gets weary and wishes that she lived in any age but this, does this wheelwoman when she gets discouraged. She thinks the game not worth a penny dip and sorrowfully comes to the conclusion that all the rewards in this world are dead sea fruit, and she is quite sure that they have given her dyspepsia. So she goes cycling.

THOSE DEAR FRENCH!

"Now, perhaps madame, who takes so much interest, would like to see the newest bicycle corset," suggested the little French saleswoman, bringing down a wonderful pair of white linen ones, caught, as all modern corsets are, with strap and buckle over the front and laced to meet behind, and a set of double line on to the bust, by way of a support, while the rest of the corset was merely corded for stiffness.

"These are made to wash," she explained, "for, after riding, the natural moisture of the body will wet them through and through. Then see! Cut but four little threads, lift out the bones, and drop your corsets in the wash-basin with a bit of soap. After a rub or two they are clean and sweet, in about an hour they are dry, and this rough creped coarse linen needs only to be buttoned on to the figure to put it at once into shape."

WANTED SOME FACTS.

"Yes," said the manufacturer of the Getthere Gazelle, as he lolled back in his seat in his cycle show exhibit and pointed at the bejeweled racer who posed in the front of the stand, as a rider from choice of the speedy Getthere Gazelle, "that young man's salary from my concern is exactly \$250 per week, and all his expenses besides."

"Indeed!" languidly responded the tired show reporter. "But on the level Mr. Blowermore, do you mind telling me how much he gets?"

Coolness and silence then fell in alternate chunks.

HER DRYGOODS TRAINING TOLD.

"I admire the machine very much," she said, as the agent trotted out a new '97 model for her inspection. "It matches my riding costume splendidly."

"Yes," responded the dealer, who had sold women's wheels before, "our concern rather prides itself upon the enameling of its machines."

"Well, I'll take it, if you will guarantee me one thing."

"What is that?"

"That the color won't fade."

After some thought he gave the guarantee, and she gave up \$100 therefor.

HIS BIG FOUR.

"What does an old man like me mean by riding a bicycle?" queried a recent age convert to the wheel. "For just four good reasons: My head is clearer, my health is better, my heart is lighter and my purse is heavier. Isn't that quartette sufficient?"

HER TEACHER IS A CONVICT.

Barnstable, Mass., felt called upon to experience a shock when the wife of the jailer was seen taking cycle lessons in the public streets. It was not the lessons, however, which caused the sensation, but the teacher thereof, who was clad in prison stripes, an adornment he was condemned to wear for five years because he made away with the funds of a Springfield bank. Barnstable believes, quite correctly, that cycle teaching should be free from cheap prison competition.

THE SAME OLD STORY.

"I hear you saved a young woman's life on the Boulevard, yesterday."

"That's right. Her machine slipped and down she went right in front of a coal cart. I just managed to drag her from under its wheels."

"What did she say when she found she was safe?"

"Oh, the usual thing."

"Well, what is that?"

"'Oh, dear me; is my hat on straight?'"

COMING UP WITH THE TIMES.

Fatima, the favorite, laughed shrilly and called the other ladies of the harem to her side.

"Didn't I tell you girls Mahomet's most glorious representative on earth had wheels? Look!"

Peering cautiously through the casement they saw that Fatima was nearly right.

Their Sultan was dicking with a cycle agent, trying to trade three blue-blooded Arabian steeds for a '97 light roadster.

RUN OVERS AND FIVE HUNDREDS.

A Hartford legislator, by the name of Griffin, has introduced a bill in the Connecticut Legislature making it a misdemeanor for a person riding a bicycle who shall ride over another person and refuse to give his name, or who gives a false name, shall be punished by a fine of not less than \$10 nor more than \$500.

HARD TO PLEASE THEM.

When a young man takes a girl out riding and does not compliment her on her appearance on a wheel, she thinks he is mean; when he does both one and the other, she says she does not believe a word he says.

AN EXCELLENT BIT OF ADVICE.

The Italians have a proverb, which is worth remembering round cycle show time. It runs: "Hear and see, but say nothing if you wish to live in peace."

FEAR OF GETTING THE WORST OF IT.

The sensation a man experiences after the buyer has accepted his figure on his last year's mount, is that perhaps he put too low a price on that second-hand wheel after all.

THERE ARE OTHERS.

A cycling maid down in Atlanta Has curls and a red Tam-O-Shanter;
And she captures the hearts
Of the men, when she starts
To pedal her cycle instanter.

A WONDERFUL CYCLE FACTORY.

An installation interesting to bicycle manufacturers in particular and to all other manufacturers in general, is now under way at Middletown, Conn., where the Keating Wheel Co. have just completed a factory unique in its construction and in the application of its motive power. When complete the factory and offices will cover a space of 168,250 square feet, of which about 150,000 square feet will be devoted entirely to the manufacture of the well known Keating bicycle. The factory is situated on the West bank of the Connecticut River, between the river itself and the Middletown branch of the New York, New Haven & Hartford system. The establishment is divided into three buildings of brick and stone. The main building is 1,000 feet long, 50 feet wide and two stories high. Projecting from this on the river side are six L's, each of which is devoted to some special operation. Reference to the plan shows the different departments which occupy these L's. The main L, 200 feet long, 50 feet wide and two stories high, is the repair department and the store room. The others are respectively, the blacksmith, brazing, polishing, plating, and the enameling shops, each about 100 feet long and 50 feet wide. The North East corner of the plot will be occupied by spacious offices, 100 feet long by 50 feet wide and two stories high, entirely separate from the factory, and yet in sufficiently close touch to make it an integral part of the main factory building.

The unique feature of this plant is that it will be entirely operated by electricity, not an engine or main belt coming into the factory proper. The system chosen is the three-phase system of the General Electric Company, which is now in use in a large majority of power-transmission and distribution plants in this country. The engine and generating plant are located in the southeast corner of the plot in a two story brick and stone building. Steam is generated by a Babcock & Wilcox boiler of 250 H. P., separated by a brick partition from the engine room. The engine, a Cross Compound Condensing Greene engine of 500 H. P.—the high pressure side only of which is installed—is erected upon the second floor upon brick and stone cap piers built up from the ground. On the same floor is a General Electric three-phase generator, known as an A-T 16 pole, 250 Kilowatt, 450 revolution, 60 cycle machine, also placed on piers carried up from the ground. The main belt from the engine and fly-wheel passes down to the ground floor, where a countershaft runs in bearings set upon brick and stone piers. The shaft is carried the entire length of the room and from it will be driven eventually another three-phase machine, probably of similar capacity, as well as a set of lighting machines, which are to be erected at Middletown, as

soon as they can be removed from the present factory of the Keating Wheel Co., at Holyoke. This countershaft is arranged with couplings so that any portion may be cut in or out as may be required.

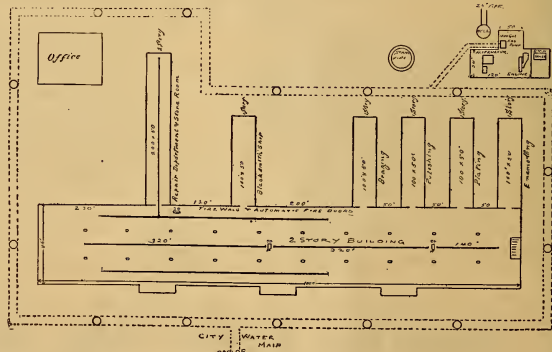

The exciter for the generator is a $4\frac{1}{2}$ Kilowatt machine of the I. B. type, run from a pulley on the shaft of the three-phase machine. Facing the generator is a Vermont marble switchboard carrying packed card rheostats, current indicator, volt meter and the necessary switches for controlling the exciter and the generator. From the switchboard, six wires, forming two circuits, issue from one of the windows of the power house and pass to the main factory, supported on one pole only. They are carried above one of the windows on the second floor of the factory, and there three of the wires terminate, while the other three, which constitute the circuit in service follow the center of the roof of the second story for about three-fourths of the length of the whole building. At the proper place they are tapped off, descending their respective pillars and passing through the floor of the second story to the motors suspended from the ceiling of the first story.

The main building, 1,000 feet long, is one great hall, supported on rows of pine pillars set ten feet apart. It will be seen by the dia-

building are two 50 H. P., while the line of shafting running through the repair shop is driven by a 20 H. P. motor, secured to the ceiling of the first floor in the main building.

All of the motors are equipped with two pulleys on each end so that four independent shafts can be driven from each motor. The extent of this shafting and the method of driving the motors can be gathered from the illustration made from a photograph taken from one end of the main building. There is about 160 feet of shafting on the other side of the far motor shown in the picture; this will give some idea of the extent of the installation. There is no bicycle machinery in the factory at the present time, the construction work not being sufficiently advanced to enable the Keating Company to undertake its '97 production there. The 1897 wheels are being manufactured at Holyoke, and as soon as any piece of machinery can be dispensed with there, it will be shipped at once to Middletown. The entire factory has been laid out by Mr. R. M. Keating himself with all the care which a man can bestow upon a child of his own creation. It is protected from fire by a system of sprinklers located in the building. Furthermore, a water pipe, shown in the diagram, surrounds the entire factory, and is connected with an eight-inch city water main on one side of the building, and with a 1,000 gallon fire pump on the other. Into this water pipe are let hydrants at intervals through which, should a fire occur in any part of the factory, water can be immediately turned upon it. The wall between the L's and the main factory is a fire wall, fitted with fire doors automatically closing in case of conflagration.

In order that the factory should not be dependent entirely upon city water, Mr. Keating has sunk upon the side of the power house nearest the river, a deep well into which the water from the river runs through a 24 inch pipe. In addition, a stand pipe will also be

gram of the building that the main shafting is about 800 feet long, and runs down the central aisle, being divided into three sections, between each of which is a 50 H. P. G. E. induction motor of the inverted type. There are other shorter lines of shafting which are about 350 feet long, one on each side of the main shafting in the north part of the building. Still another line of shafting, about 200 feet long, runs through the repair department. The motors driving the shafting in the main

erected between the river and the main building. The Keating Factory, when in running order, will be one of the most complete and modern cycle factories in the world. Nothing has been left to chance. It is the outcome of two years close study, and we may be excused if we say that the engineering talent which developed the "curve" in the bicycle diamond has found ample and sufficient scope in the magnificent factory which has been erected at Middletown.
