## P R E F A C E.

---

THE late Surgeon-Major Bryden had, in 1880, commenced the compilation of the Statistics of the European Army of India for the ten-year period 1870-79, when, in consequence of failing health, he was compelled to go to England on sick leave. On his departure from India he hoped, after spending a few months at home, to return with renewed strength, to finish this work, and to continue his other duties. Unfortunately for science in general, and for Epidemiological Science in India in particular, his hopes were not realized, for the disease from which he was suffering increased, and he died in November 1880. As it has fallen to my lot to take Surgeon-Major Bryden's place as Statistical Officer, I have, to the best of my ability, completed the tables which he commenced. They contain the aggregate of the Statistics of the European Army of India for the years 1870-79, and are compiled on exactly the same plan as the tables which were published in 1873, giving the statistics of the European Army of the Bengal Presidency for the ten-year period 1860-69.

In the following introductory pages the experience of the Army of the Bengal Presidency, and of the Army of India as a whole, during the ten years 1870-79, is compared with that of the preceding ten years. The principal diseases which contributed to make up the sickness and mortality of the Army during these ten years are also shortly commented on, and the effect which age and length of Indian service have on the health of the European soldier in this country is illustrated by means of a few special tables.

# REPORT

ON THE

## SICKNESS AND MORTALITY OF THE EUROPEAN ARMY OF INDIA

DURING THE

TEN-YEAR PERIOD 1870-79.

THE average strength of the European Army of India for the ten years 1870-79 was 57,742. During this period

Summary of the vital statistics of the Army of India from 1870 to 1879. there were 851,564 admissions into hospital ; the average number daily sick was

3,472, and the number of deaths 11,166, giving an average annual admission-rate of 1474·8, a daily sick-rate of 60·1, and a death-rate of 19·34 per 1,000. There are no statistics in this Office of the Army of India previous to 1870, so that the health of the European Army as a whole during the period 1870-79 cannot be compared with that of the preceding ten-year period.

2. During the ten years 1860-69 the average death-rate of the European Army of the Bengal Presidency was 29·98

Summary of the vital statistics of the Bengal Army from 1870 to 1879. per 1,000. In the succeeding ten years 1870-79 (including the casualties in Af-

ghanistan in 1878 and 1879), the mortality in that Presidency fell to 21·00 per 1,000—a reduction of 8·98 per 1,000. Moreover, of this reduced death-rate a considerable portion was due to Afghanistan ; for, although comparatively few of those on active service in that country died of wounds, the mortality from disease was very great. Excluding the troops on active service during 1879, and taking into account only the men in cantonments, the average death-rate of the troops in the Bengal Presidency during the ten years 1870-79 was only 19·20 per 1,000. The admission-rate for the Bengal Presidency, which during the period 1860-69 was 1754·9 per 1,000, fell during the following ten-year period to 1522·0 per 1,000, and the daily sick-rate for the same period fell from 67·1 to 60·9 per 1,000.

3. During the period 1870-79 the average admission-rate in the European Army of Madras was 1264·4, the daily sick-

Summary of the vital statistics of the Madras and Bombay Armies from 1870 to 1879. rate was 60·2, and the death-rate 17·69 per 1,000. In the Bombay Army the average

admission-rate for the same period was 1533·5, the daily sick-rate was 57·4, and the death-rate 15·27 per 1,000.\* The average admission-rate in the Madras Army during the ten years 1860-69 was 1,396, the daily sick-rate 62·0, and the death-rate 20·27 per 1,000. In the Bombay Army during the same ten years the daily sick-rate was 59·8, and the death-rate 21·46 per 1,000; and during the nine years 1861-69, the admission-rate of that army was 1,152 per 1,000.

4. Not only have the sickness and mortality of the European troops of the

The troops of each of the provincial areas of the Bengal Presidency healthier during 1870-79 than during 1860-69. Bengal Presidency as a whole considerably diminished, but the health of each of the provincial areas into which the Presid-

ency is divided has also improved, as may be seen from the accompanying statement.

\* See the Annual Reports of the Sanitary Commissioner with the Government of India for the years 1870 and 1871.

*Statement contrasting the sickness and mortality of the European Troops in the different provincial areas of the Bengal Presidency during the ten-year periods 1860-69 and 1870-79.*

Daily sick-rate	... ...	69·6	54·3	69·5	66·3	72·8
Death-rate	... ...	29·57	14·43	28·59	20·06	26·61
	AGRA AND CENTRAL INDIA.		PUNJAB.		HILL STATIONS.	
	1860-69.	1870-79.	1860-69.	1870-79.	1860-69.	1870-79.
Admission-rate	... ...	2169·2	1530·1	1740·7	1847·2	1069·5
Daily sick-rate	... ...	74·1	61·5	56·7	62·9	49·5
Death-rate	... ...	38·48	18·41	25·24	20·71	14·78

The death-rates have thus fallen in each of the provincial areas : in the Punjab only has there been an increase in the admission and daily sick-rates.

5. Although the mortality has fallen in all the provincial areas, the diminution has been much greater in some than in others. With the exception of the hill stations, the death and daily sick-rates in the Punjab during the period 1860-69 were lower than in any of the other provincial areas, and only two provinces had a lower admission-rate. During the last ten-year period, on the other hand, the Punjab had the highest admission and death-rates, and, next to the Gangetic Provinces and Oudh, it had the highest daily sick-rate. Bengal Proper, again, which, during the period 1860-69, had, next to Agra and Central India, the highest death-rate, during the period 1870-79 had a very much lower death-rate than any of the other provincial areas in the plains. This death-rate was indeed but little in excess of that in the hill stations. Its daily sick and admission-rates were also lower than those of the other provinces in the plains. This diminution in the sickness and mortality among the troops in Bengal Proper is principally due to the great improvement that has taken place in the health of the men stationed at Fort William. Nearly one-half of the European troops of Bengal Proper are cantoned in that fortress, and there the average death-rate has fallen from 25·19 to 10·78 per 1,000. The health of the troops stationed in Dum-Dum and Barrackpore has also, however, considerably improved during the last ten years. The troops stationed in Agra and Central India have also enjoyed much better health during the ten years 1870-79 than they did during the former ten-year period. The death-rate of that provincial area is not half so high as it was during 1860-69, and the admission and daily sick-rates have also fallen very considerably. In the Gangetic Provinces, in Oudh, and also in Meerut and Rohilkund, a marked improvement has taken place, but not in the same proportion as in Bengal Proper and in Agra and Central India.

6. Although the average mortality of the Bengal Presidency for the ten-year period 1870-79 is much less than that for the ten-year period immediately preceding it, the improvement has not been gradual from year to year. The death-rate of 1879, the highest of any year during the period, was 44·15 per 1,000. This high mortality was partly due to the severe epidemic of cholera which in that year caused a mortality of 16·18 per 1,000, and partly to the excessive mortality that occurred among the troops in Afghanistan. During that year 9,500 of the men belonging to the Bengal Army were on active service in

Diminution in the death-rate in the Bengal Presidency not gradual from year to year.

Afghanistan, and among them there was a death-rate of 88·12 per 1,000. The year 1872 was, next to 1879, the most unhealthy of the period. In it the death-rate rose to 27·45 per 1,000, but in that year the mortality from cholera alone was 10·66 per 1,000. The year 1877 had the lowest mortality during the period—in it the death-rate was only 11·64 per 1,000—and 1874 comes next in order with a mortality of 14·62 per 1,000.

7. The average death-rate of the European troops in the Bengal Presidency

The first five-year period of 1870-79 compared with the second five-year period. during the first five years of the ten-year period 1870-79 was 19·53 per 1,000, and during the second five years it was

22·42. If the Army of Afghanistan for 1879 be excluded, and the Army in cantonments alone be taken into account, the death-rate for the second five years of the period was 18·85 per 1,000, or slightly under the average of the first five years. In the European Army of the Madras Presidency the average death-rate for the first five years of the period was 18·19, and for the second five years 17·18 per 1,000, so that in the second five years there was a diminution of 1 per 1,000 in the death-rate. The death-rate in the Bombay Army, on the other hand, has risen 2 per 1,000 during the second five years of the period; in the first five years it averaged 14·32, and in the second five 16·29 per 1,000. Taking the Army of India as a whole, with the exception of the troops in Afghanistan in 1879, the average death-rate during the first five years of the period was 18·31, and during the second five years 18·07 per 1,000.

8. Of the principal diseases which contributed to the death-rate of the

Diminution in the death-rate from cholera during 1870-79, as compared with 1860-69, greater than that from any other disease. European Army of the Bengal Presidency, cholera is the one in which the greatest diminution has taken place during the ten-year period 1870-79. During the ten

years 1860-69 the average annual mortality from cholera was 9·24 per 1,000, and during the period 1870-79 it fell to 4·18 per 1,000. During the former period about 30 per cent. of the total death-rate was due to cholera, and in the latter period less than 20 per cent. was due to that cause. Not only has the mortality from cholera decreased very much in the Bengal Presidency as a whole, but the diminution is well marked in each of the provincial areas.

*Table contrasting the mortality from cholera among European Troops in the provincial areas of the Bengal Presidency during the two ten-year periods 1860-69 and 1870-79.*

Provincial Areas.	Average death-rate per 1,000 during the period 1860-69.	Average death-rate per 1,000 during the period 1870-79.

9. Although the total mortality from cholera has thus diminished very

Although the number of deaths from cholera in the European Army of Bengal has diminished of late, the percentage of deaths to number treated has on the whole increased.

much during these last ten years, the number of deaths out of each 100 cases treated for that disease has increased. During the period 1860-69, of those

attacked by cholera 62·72 per cent. died, but during the period 1870-79 the percentage rose to 70·26. Cholera has not only become more fatal during the period 1870-79, as compared with the period immediately preceding it, but it has, comparing each ten-year period with the one preceding it, gradually become more virulent in the Bengal Presidency from 1827, the year in which the death-rate from that disease is first given, up to the present time.

\* Died out of each 100 cases of cholera treated in the European Army of Bengal from 1827 to 1880.

1870-79	8·70	...	21·74	4·34	13·04	8·70	8·70	...	8·70	4·34	8·70	13·04	100
---------	------	-----	-------	------	-------	------	------	-----	------	------	------	-------	-----

There has been so little cholera among the European troops stationed in Bengal Proper during these ten years that the above table happily contains but few data; but, as far as it goes, it coincides with former experience. Bengal Proper is in the endemic area. The spring cholera from March to May is the great cholera of the year, and 39·12 per cent. of the admissions took place during these three months. The cholera of the monsoon season from July to September is the least important, with 17·40 per cent. of the admissions, and the cholera of the cold weather from November to January takes a midway place with 30·44 per cent.

\* See Bryden's Epidemic Cholera in the Bengal Presidency, page 234.

† Only eight cases occurred in 1874, all of which proved fatal.

‡ The stations which make up this and the other provincial groups of Military stations may be ascertained in detail on reference to the tables.

Monthly distribution of cholera in the Gangetic Provinces and in Oudh.

**13. European troops of the Gangetic Provinces and Oudh, 1870-79—**

*Cholera admissions of each month for the period.*

1870-79	...	2	7	38	39	24	41	133	161	16	41	3	505

*Admitted in each month per cent. of the total admissions.*

1870-79	...	.40	1.39	7.52	7.72	4.75	8.12	26.34	31.88	3.17	8.12	.59	100
---------	-----	-----	------	------	------	------	------	-------	-------	------	------	-----	-----

The provincial area of the Gangetic provinces and Oudh is, according to Dr. Bryden, in the eastern division of the epidemic area, and the cholera of the monsoon season is the great cholera of the year. From July to September 66.34 per cent. of the total admissions took place. The spring and cold weather cholera are, however, distinctly represented, but in the spring cholera April and May take the place of March and April in the endemic area. 16.63 per cent. of the total admissions took place in March, April and May, and 8.71 per cent. in the cold weather months, in November, December and January.

Monthly distribution of cholera in Rohilcund and Meerut.

**14. European Troops of Rohilcund and Meerut, 1870-79—**

*Cholera admissions of each month for the period.*

Years.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total
1870-79	...	...	...	2	4	7	3	...	28	73	2	...	119

*Admitted in each month per cent. of the total admissions.*

1870-79	...	...	...	1.68	3.36	5.88	2.52	...	23.53	61.35	1.68	...	100
---------	-----	-----	-----	------	------	------	------	-----	-------	-------	------	-----	-----

The Rohilcund and Meerut Division is in the western division of the epidemic area. Here the cholera of the monsoon season is more distinctly the principal cholera of the year than it is in the Gangetic Provinces; for out of a total of 119 admissions among the European troops during the ten-year period 1870-79, 101 occurred in the monsoon season, from July to September, or 84.88 per cent. The cold weather cholera, from November to January, was not represented by a single admission during the period; and in the spring cholera, from March to May, there were only 13 cases, or 10.92 per cent. of the whole, 7 out of the 13 having occurred in May.

Monthly distribution of cholera in Agra and in Central India.

**15. European troops of Agra and Central India, 1870-79—**

*Cholera admissions of each month for the period.*

Years.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total
1870-79	...	...	1	...	...	44	20	20	50	35	10	...	181

*Admitted in each month per cent. of the total admissions.*

1870-79	...	...	.55	...	...	24.31	11.05	11.05	27.63	19.34	5.52	...	.55	100
---------	-----	-----	-----	-----	-----	-------	-------	-------	-------	-------	------	-----	-----	-----

In this provincial area the spring cholera is much more distinctly marked than it is in Rohilkund and Meerut, but it is later in manifesting itself than in the eastern division of the epidemic area. During the ten years under review, 24·31 per cent. of the admissions among the European troops occurred in May, not a single case having occurred in March and April. The cholera of the monsoon season is, however, the principal cholera of the year. In July, August and September there were 105 admissions, or 58·02 per cent. of the total for the year. The cold weather cholera was scarcely represented; during the ten years there was only one admission during the cold weather months—November, December and January—or 5·5 per cent. of the whole.

Monthly distribution of cholera in the Punjab.

16. European troops of the Punjab,  
1870-79—

*Cholera admissions of each month for the period.*

Years.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1870-79 ...	...	...	...	20	67	69	42	195	101	115	3	...	612

*Admitted in each month per cent. of the total admissions.*

1870-79 ...	...	...	...	3·27	10·95	11·28	6·86	31·86	16·50	18·79	·49	...	100
-------------	-----	-----	-----	------	-------	-------	------	-------	-------	-------	-----	-----	-----

16. As in the last two provincial areas, the spring cholera appears later than in the eastern areas. May and June in this area take the place of April and May, in the Gangetic Provinces. From April to June there were 156 admissions from cholera among the European troops in the Punjab during the period 1870-79, or 25·50 per cent. of the total admissions. As in the other portions of the western division of the epidemic area, the cholera of the monsoon season is by far the most important one, but it is later in manifesting itself than in the eastern districts, August, September and October taking the place of July, August and September. In the Peshawar District more especially, cholera has on several occasions been very prevalent in October. In these three months there were 411 admissions from cholera among the European troops during the period under review, being 67·15 per cent. of the whole. During the ten years the cold weather cholera was not represented at all. Three cases occurred in November, but these seem rather to have been the termination of the cholera of the monsoon season than the representative of the cold weather cholera of the endemic area.

Monthly distribution of cholera in Rajpootana, Malwa and Sind.

17. European troops of Rajpootana, Malwa and Sind, 1870-79—

*Cholera admissions of each month for the period.*

*Admitted in each month per cent. of the total admissions.*

Years.	Jan.	Feb.	Mar.	April	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1870-79 ...	...	·72	...	3·60	11·51	7·19	7·19	42·45	15·11	4·32	7·19	·72	100

This provincial area is situated to the west of Agra and Central India, and cholera has very much the same distribution in it as in that area. The spring cholera is seen in April and May, the May cholera being more severe than that of April. In these two months 15·11 per cent. of the total admissions among the European troops occurred during the years 1870-79. During the same period 64·75 per cent. of the admissions occurred during the monsoon season—in July, August and September. The cold weather cholera was more marked during this period than in Agra and Central India. From November to January there were 11 admissions, or 7·91 per cent. of the whole.

Monthly distribution of cholera in Nagpur and the Deccan.

## 18. European troops of Nagpur and the Deccan, 1870-79—

*Cholera admissions of each month for the period.*

1870-79 ...	1·08	4·87	·54	1·08	41·08	5·95	18·92	19·46	4·32	·54	1·62	·54	100
-------------	------	------	-----	------	-------	------	-------	-------	------	-----	------	-----	-----

This area extends from Kamptec in the north to the 15th degree of N. latitude in the south, but none of the stations occupied by European troops are under the influence of the north-east monsoon. Among the European troops of this area the spring cholera took the most prominent place during the ten years under review. But out of the 78 cases that occurred during April and May, 71 took place at Secunderabad in May 1871. This severe outbreak has probably given the spring cholera of this area a greater prominence than a more extended experience might do; but it shows that the spring cholera in the Deccan may be a very important one. This severe outbreak at Secunderabad also takes away from the cholera of the monsoon season of June, July and August the prominence that it would otherwise have had. During these three months there were 82 admissions among the European troops during these ten years, or 44·33 per cent. of the total number admitted. That the cholera of the monsoon season, *viz.*, June, July and August, is the most important one in this area is shown by the following table, which gives the deaths from cholera recorded among the Civil population during the same ten years :—

Monthly distribution of cholera among the Civil population of the Deccan, *viz.*, Berars, Hyderabad Assigned Districts, Khandaish, Nassik, Ahmednagar, Poona, Sholapur, Satara, Kaladji, Belgaum, Dharwar, Kanara, Ratnaghiri, Tanna, Bombay and Colaba.

## 19. Civil population of the Deccan,\* 1870-79—

*Cholera deaths for each month of the period.*

Years.	Jan.	Feb.	Mar.	April	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1870-79 ...	6,083	7,949	13,036	19,305	31,917	14,642	59,775	49,889	21,133	9,781	5,180	4,977	273,670

\* In the Hyderabad Assigned Districts the cholera statistics for the years 1870-74 were not available.

*Died in each month per cent. of the total deaths.*

Years.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1870-79 ...	2·22	2·91	4·76	7·06	11·66	16·31	21·84	18·23	7·72	3·85	1·89	1·82	100

Thus 56·38 per cent. of the deaths recorded from cholera among the civil population in the Deccan occurred during the monsoon season from June to August.

Monthly distribution of cholera among the troops on the western side of the Madras Presidency, *viz.*, Bellary, Bangalore, Cannanore, Malliapoornam and Calicut.

20. European troops stationed on the western side of the Madras Presidency exposed principally to the south-west monsoon, 1870-79—

-------------	-------	------	-------	-------	-------	------	------	------	------	------	-----	------	-----

There have been so few cases of cholera among the European troops of the Madras Presidency during the years 1870-79 that the two preceding tables are of little value. As far as they go, they seem to show that on the western coast the cholera of the south-west monsoon season, *viz.*, June to August, is distinctly marked, and that the cold weather cholera is also of considerable importance. The table for the troops on the east coast gives the spring cholera as the principal one of the year, with a distinctly marked cold weather cholera.

The two following tables give the cholera statistics of the civil population of the Madras Presidency during the same ten-year period.

Monthly distribution of cholera among the Civil population of the western districts of the Madras Presidency, *viz.*, Bellary, Kurnool, Coimbatore, Neilgherries, South Kanara, Malabar and Mysore.

22. Civil population of the Western districts of the Madras Presidency exposed principally to the south-west monsoon, 1870-79—

*Died in each month per cent. of the total deaths.*

1870-79 ...	7·62	9·27	9·84	10·13	11·34	10·51	8·06	6·28	5·81	5·02	6·33	9·79	100
-------------	------	------	------	-------	-------	-------	------	------	------	------	------	------	-----

Monthly distribution of cholera among the Civil population of the Eastern Districts of the Madras Presidency, *viz.*, Ganjam, Vizagapatam, Godaverry, Kistna, Cuddapah, Nellore, North Arcot, Madras, Chingleput, South Arcot, Tanjore, Tinnevelly, Trichinopoly, Madura and Salem.

23. Civil population of the eastern districts of the Madras Presidency exposed principally to the north-east monsoon, 1870-79—

*Cholera deaths for each month for the period.*

Years.	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1870-79 ...	79,486	56,254	42,510	33,404	44,215	48,880	73,303	65,839	44,599	24,057	24,489	41,995	579,031

*Died in each month per cent. of the total deaths.*

1870-79 ...	13·73	9·72	7·34	5·77	7·64	8·44	12·67	11·37	7·70	4·14	4·23	7·25	100
-------------	-------	------	------	------	------	------	-------	-------	------	------	------	------	-----

24. From these two tables it appears that the reported deaths from cholera

The cholera of the north-east and south-west monsoon seasons in the Madras Presidency nearly equal. among the civil population of the districts towards the west coast are slightly more numerous during the cold weather months, when the north-east monsoon is blowing, than they are during the months of the south-west monsoon. 26·68 per cent. of the reported deaths occurred in December, January and February, and 24·85 per cent. during June, July and August—the south-west monsoon months. On the other hand, more cases of cholera seem to occur among the inhabitants of the eastern districts during the south-west monsoon months than during the north-east monsoon months. During June, July and August, 32·48 per cent. of the reported deaths took place, and 30·70 per cent. during December, January and February. Civil statistics must always, however, be received with a certain degree of caution, so that these two tables cannot be regarded as giving, with absolute accuracy, the history of cholera in the Madras Presidency during the ten years 1870-79. They are, however, sufficiently accurate to show that in the Madras Presidency the cholera outbreaks of the south-west and north-east monsoon seasons are nearly equal in magnitude; that in March, April and May cholera is also frequently seen; that on the east coast the disease is least frequently seen in October and November; and that on the west coast, September and October are the months of least frequency.

Monthly distribution of cholera in British Burma.

25. European troops of British Burma,  
1870-79—*Cholera admissions of each month for the period.*

Years.	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1870-79 ...	...	...	...	43	3	14	41	4	11	2	...	...	118

*Admitted in each month per cent of the total admissions.*

1870-79 ...	...	...	...	36·44	2·54	11·86	34·75	3·39	9·32	1·70	...	...	100
-------------	-----	-----	-----	-------	------	-------	-------	------	------	------	-----	-----	-----

In British Burma the spring cholera is seen in April, as in the eastern division of the epidemic area, and, as in India, with the exception of the Madras Presidency and Bengal Proper, the principal cholera of the year occurs during the south-west monsoon, *viz.*, July, August and September. Of the 43 admissions which occurred in April, 28 took place at Thayetmyo in April 1870, so that the April cholera for this ten-year period is probably more prominent than longer experience would give it. During this ten-year period 36·44 per cent. of the admissions occurred in April, and 47·46 per cent. during the monsoon months in July, August and September. There was not a single admission from cholera among the European troops of British Burma in the cold weather months in November, December and January during the ten years under review.

## 26. In the tables of the Bengal Presidency for the ten-year period 1860-69

Death-rate from fevers as a whole nearly the same in 1870-79 as in 1860-69. enteric fever was included under "Remittent and continued fevers." The average death-rate from fevers taken as a whole in Bengal during the period 1860-69 was 3·58 per 1,000. During the ten-year period 1870-79 the average death-rate from the same causes was 4·02 per 1,000, an increase of ·44 per 1,000. Before enteric fever was recognised as a distinct disease, many cases which would now be denominated enteric fever were then more than probably called chronic diarrhoea. As the death-rate from diarrhoea has fallen from ·75 per 1,000 during the period 1860-69 to ·12 per 1,000 during the next ten-year period, a much greater relative reduction than has taken place in the case of dysentery, it is probably the case that the slightly increased mortality from fevers is more apparent than real.

## 27. Out of 4·02 per 1,000, the total mortality from fevers in the Bengal

Death-rate from enteric fever. Presidency during the ten-year period 1870-79, 2·28 per 1,000 was due to

enteric fever. In the Army of India as a whole the mortality caused by enteric fever was 2·03 per 1,000; in the Madras Presidency the death-rate from that disease was 1·42; and in Bombay 1·75 per 1,000. The enteric fever statistics are, however, probably far from correct, as what one medical officer calls enteric fever may be called simple continued fever by a second, and remittent fever by a third.

## 28. Enteric fever is either a much more fatal disease in this country than

Enteric fever apparently more fatal in India than in Europe. it is in England and the Continent of Europe, or a great many cases, which in

Europe are called cases of enteric fever, are in this country entered under some other denomination. The mortality from enteric fever in Europe is under 20 per cent., whereas out of 2,365 admissions from that disease among the European troops of the Army of India during the period 1870-79, 1,168 died, or at the rate of 43·83 per cent.

## 29. Enteric fever has been seen in all parts of India. During the last

Local causes of enteric fever secondary to a general seasonal cause. ten years it appeared in almost every station occupied by European troops. Whatever part local conditions may play as causes of the disease, these local causes

seem to be secondary to a general seasonal cause. It is more prevalent at certain seasons than at others, and these results are so constant for the different provincial areas of India that the greater prevalence of the disease at these times would appear in the main to be dependent on some common cause.

30. In the two following tables the number of deaths and the death-rates

Number of deaths and death-rates from enteric fever, month by month, for each of the provincial areas of India.

from enteric fever during the ten years 1870-79 are given, month by month, for each of the provincial areas of India. The

death-rates have been given in preference to the admission-rates, because in fatal cases the diagnosis of the disease was confirmed by means of *post-mortem* examinations.

*Enteric fever deaths among European troops in each of the provincial areas for each month of the period.*

31. The deaths from enteric fever in Bengal Proper, Burma and Pegu

and in the hill stations of Madras and

Heat the probable seasonal cause of enteric fever  
to which the local causes are subordinate.

portion of the above table of little value.

Taking the Army of India as a whole, there are seen to be two maxima—one in May and June, and the other in September. In Agra and Central India, in the Deccan and Nagpur, and in Rajpootana, Malwa, Sind and Aden, the September maximum is the higher one; whereas in the Gangetic Provinces and Oudh, in Meerut and Rohilcund, and in the Punjab, the higher maximum is in May or June. In the hill stations of the Bengal Presidency there is only one maximum—in July and August—the percentage gradually rising from February till June, with a sudden rise in July and August, and again a sudden fall in September. In Southern India there is no maximum, but the mortality is pretty evenly distributed throughout the year. This behaviour of enteric fever throughout India agrees so closely

with the periods of greatest heat, that it is more than probable that the enteric fever and the heat maxima are connected with each other. In the plains of Northern India and in the Deccan, the months of greatest heat are June, before the rains commence, and September, after the rains cease; May, June and September are the months of greatest prevalence of enteric fever in these provinces. In the hill stations of Bengal the greatest heat occurs in the end of June and the beginning of July, just before the rains commence, and enteric fever has its maximum death-rate in the hills in July and August. Southern India, again, is so near the equator, that the temperature remains very nearly the same throughout the year, and in that provincial area enteric fever has no distinct rise and fall.

*Statement showing the number of deaths from Enteric Fever in the European Army of India during the five-year period 1875-79, classified according to Ages and Periods of Indian Service.*

NOTE.—The Aggregate Strength on the 1st of July at different periods of service for these 5 years, is 288,380, and at the different ages 289,529, the strengths given by some of the corps at different periods of service being slightly different from the strengths given at the different ages.

### 32. The above table shows that recent arrival in India and youth are

Recent arrival in India and youth both power- both powerful factors in producing enteric ful factors in producing enteric fever, recent ar- fever, and at the same time it shows rival being the more powerful of the two. that recent arrival is the more power-

ful of the two. The aggregate strength of boys under 20 years of age in the European Army of India during the 5 years 1875-79 was 7,395, and of these 22 died of enteric fever, or 2·97 per 1,000. Out of an aggregate strength of 94,646 between the ages of 20 and 24, there were 407 deaths from the same disease, or 4·30 per 1,000, a much greater mortality than among those under 20 years of age. There were 210 deaths from this disease among the men between 25 and 29 years of age, out of an aggregate strength of 95,613, at the rate of 2·20 per 1,000, a mortality nearly equal to that among boys under 20 years of age. The mortality from enteric fever among men of 30 years of age and over was inconsiderable; out of an aggregate strength of 47,235 men of 30 years of age and over during these 5 years, there were only 62 deaths, or ·67 per 1,000. Hence, the mortality from enteric fever among boys under 20 years of age is much smaller than among men from 20 to 24 years of age. The mortality from this cause among men of 25 to 29 years of age is nearly the same as that among boys under 20 years of age, and after 30 years of age the mortality from enteric fever is very small. During the same five years the aggregate strength of men under one year's service was 41,852; of these, 297 died from enteric fever, or 7·10 per 1,000. The aggregate strength of the men of one year's service and under two years' was 37,669; among them

there were 189 deaths from this cause, at the rate of 5·02 per 1,000. There were 74 deaths among men who had served between two and three years in India, whose aggregate strength was 31,478, a death-rate of 2·35 per 1,000. The death-rate from enteric fever among men between three and four years' Indian service was 1·80; among those from four to seven years' service it was 1·88; and among those of seven years' service and upwards it was 1·31 per 1,000. Hence the mortality from enteric fever among men of less than one year's Indian service is much greater than the mortality from the same cause among men who have served longer in the country, and it is very much greater than the mortality among men of the age of 20 to 24, the period of life which furnishes the greatest number of fatal cases of enteric fever as shown by the statistics of these five years.

33. There were 318,493 admissions and 818 deaths from intermittent, re-

Fevers, other than enteric fever, in the Army of India and in that of Bengal. mittent and continued fevers during the ten-year period 1870-79 in the European Army of India, giving an admission-rate of

551·6, and a death-rate of 1·42 per 1,000 from these diseases. Of this number, 220,717 admissions and 631 deaths occurred in the Bengal Presidency, the admission-rate being 607·3 and the death-rate 1·74 per 1,000. These fevers are much more prevalent in the Punjab than in the other divisions of the Presidency; and in that Province the admission-rate from fevers as a whole has risen from 741·3 during the ten-year period 1860-69 to 969·7 per 1,000 during the ten-year period under review. The admission-rate is also greater in Meerut and Rohileund than it was during the former ten-year period, but in the other provinces it has fallen.

34. In the Madras Presidency there were 29,413 admissions from fevers,

Fevers, other than enteric fever, in the Army of Madras. excluding enteric fever, and 69 deaths during the ten-year period 1870-79, with an admission-rate of 266·5, and a death-rate of 1·62 per 1,000. This is less than half the admission and death-rates from the same diseases in the Bengal Presidency. During the ten-year period 1860-69 the admission-rate from fevers in the Madras Presidency was 236·3 per 1,000.

35. There were 68,363 admissions and 118 deaths from the same fevers in

Fevers, other than enteric fever, in the Bombay Army. the Bombay Presidency during the period 1870-79, with an admission-rate of 659·9 and a death-rate of 1·14 per 1,000. The

admission-rate is slightly higher than that of the Bengal Presidency from the same causes, but the death-rate is considerably less than in Bengal. During the years 1863-69 the average admission-rate from fevers in Bombay was 277·1 per 1,000.

36. During the ten-year period 1870-79 there were 12,009 admissions from dysentery and 22,683 from diarrhoea among the European troops of the Bengal

Dysentery and diarrhoea in the Army of Bengal. Presidency, being at the rate of 33·1 per 1,000 from the former and 62·4 per 1,000 from the latter disease. The deaths from dysentery in Bengal during that period were 496, and from diarrhoea 44; the death-rate from dysentery being 1·37, and from diarrhoea 1·12 per 1,000. This is a considerable improvement in the admission and death-rates from these diseases as compared with the preceding ten years. During the period 1860-69 the average admission-rate from dysentery in Bengal was 48·9, and the death-rate 2·72 per 1,000, and the corresponding rates from diarrhoea were 109·4 and 1·75 per 1,000. As stated above, some cases which were formerly called chronic diarrhoea may now be denominated enteric fever, and this is rendered more likely by the fact that, during 1860-69, 69 per cent. of the diarrhoea cases died, and during the period 1870-79 only 19 per cent.

37. In the Madras Presidency during 1870-79 the average admission-rate

Dysentery and diarrhoea in the Army of Madras. from dysentery was 76·9, and the death-rate 2·32 per 1,000; diarrhoea gave an admission-rate of 61·8 and a death-rate of 0·4 per 1,000 for the same period. Dysentery was thus much more prevalent and more fatal in Madras than in Bengal during these ten years. Diarrhoea occurred with equal frequency in both Presidencies, but was less fatal in Madras than in Bengal. During the ten years 1860-69 the admission-

rate from dysentery in Madras was 84·9, and from diarrhoea 86·3 per 1,000, so that, as compared with the previous ten-year period, taking the two diseases together, there has been a reduction of 30 per 1,000 during the period 1870-79.

38. The admission-rate from dysentery in the Bombay Presidency during the years 1870-79 was 27·6, and from Dysentery and diarrhoea in the Army of diarrhoea 60·8, and the death-rates Bombay. were .98 and .17 per 1,000 respectively.

During the period under review dysentery was thus less prevalent and less fatal in Bombay than it was either in Bengal or in Madras. The admission-rate from dysentery in the Bombay Presidency during the years 1863-69 was 19·1, and from diarrhoea 45·7 per 1,000. Both the diseases have thus increased in frequency during the last ten years.

39. In the European Army of India 28,780 admissions and 1,267 deaths Hepatitis in the Army of India and in the Army of Bengal. were recorded under "Hepatitis" during the ten-year period 1870-79. This gives an admission-rate of 49·8 and a death-rate

of 2·19 per 1,000. In the Army of Bengal the admission-rate was 47·1 and the death-rate 2·04 per 1,000. In the preceding ten-year period the admission-rate was 59·2 and the death-rate 3·31 per 1,000. A considerable reduction has thus taken place in both the admission-rate and the death-rate, and the diminution has been pretty evenly distributed over the different sections of the Presidency.

40. There were 7,417 admissions and 349 deaths from hepatitis in the Hepatitis in the Madras Army. European Army of Madras during the years 1870-79, an admission-rate of 67·2, and a death-rate of 3·16 per 1,000—much higher rates than those for Bengal. During the immediately preceding ten-year period the admission-rate from hepatitis was 70·2, so that very little diminution has taken place in the frequency of this disease.

41. During the period 1870-79 there were 4,234 admissions and 177 Hepatitis in the Bombay Army. deaths from hepatitis in the European Army of the Bombay Presidency, the admission-rate being 40·9, and the death-rate 1·71 per 1,000—slightly less than the corresponding-rates for Bengal. For the years 1863-69 the average admission-rate from this disease in Bombay was 26·6 per 1,000. Hepatitis thus appears to have been more prevalent of late in the Bombay Presidency—an experience opposed to that of Bengal and Madras.

42. In the European Army of Bengal there were 30,578 admissions and 455 Respiratory diseases in the Bengal Army. deaths from respiratory diseases during the years 1870-79, an admission-rate of 84·1, and a death-rate of 1·25 per 1,000. Of the 455 deaths, 123 occurred in 1879, and 85 of these took place among the troops on active service in Afghanistan. Excluding the troops on active service in Afghanistan, and for 1879 taking account only of the troops in cantonments, the number of admissions for the ten-year period in Bengal was 29,326, and the number of deaths 370, an admission-rate of 82·9 and a death-rate of 1·05 per 1,000.

43. As might be expected, the admission and death-rates from these diseases Respiratory diseases very prevalent in the Punjab. are much higher in the Punjab than in any of the other provincial areas of the Presidency. In the Punjab the average admission-rate for these ten years was 100·7 and the death-rate 1·59 per 1,000.

44. That cold is not, however, the only cause of the greater frequency of respiratory diseases in the Punjab is shown by the fact that the hill stations of the Bengal Presidency give an admission-rate of 82·6 and a death-rate of .84 per 1,000—lower rates than those for the Punjab; and yet the hill stations have a lower temperature than the plains of the Punjab. Malarial fevers are much more prevalent in the Punjab than in the other provincial areas of the Bengal Presidency, and certain forms of pneumonia seem to have an intimate connection with malarial fevers. During the period

Respiratory diseases closely connected with malarial fevers.

1860-69 the admission-rate from respiratory diseases in the Bengal Presidency was 74·7, and the death-rate .99 per 1,000; so that, even excluding the Army of Afghanistan, these diseases have become more prevalent and fatal during the last ten years. The increase in the mortality is, however, entirely due to the increased death-rate from these diseases in the Punjab. In the Punjab the death-rate has risen from .89 to 1·59 per 1,000, and in all the other provincial areas of the Presidency it has fallen. But during the last ten years the admission-rate from fevers has risen in the Punjab, and fallen in all the other provincial areas, with the exception of Meerut and Rohilkund. It is also worthy of remark that the admission-rate from respiratory diseases has also risen in Meerut and Rohilkund, though the death-rate has fallen. These facts are brought out in the following table:—

*Statement contrasting the admission-rates from fevers (chiefly malarial) and the admission and death-rates from respiratory diseases in the different provincial areas of the Bengal Presidency during the ten-year periods 1860-69 and 1870-79.*

PROVINCIAL AREAS	TEN-YEAR PERIOD 1860-69.			TEN-YEAR PERIOD 1870-79.		
	Fevers.*	Respiratory diseases.		Fevers, excluding enteric.	Respiratory diseases.	
		Admission-rate per 1,000.	Admission-rate per 1,000.		Admission-rate per 1,000.	Admission-rate per 1,000.
Bengal Proper ... ...	567·5	71·2	1·07	406·8	48·8	.32
Gangetic Provinces and Oudh ...	467·0	64·5	.93	341·0	65·6	.43
Rohilkund and Meerut ...	410·4	72·0	.88	551·4	78·8	.63
Agra and Central India ...	995·7	78·4	.99	690·6	71·5	.74
Punjab ... ...	741·3	80·2	.89	964·9	100·7	1·59

\* This includes the admission-rate from enteric fever.

45. In the European Army of the Madras Presidency there were 6,338 admissions and 35 deaths from respiratory diseases in the Madras Army. Respiratory diseases during 1870-79, an admission-rate of 57·4, and a death-rate of .32 per 1,000. These are very much smaller than the corresponding rates in the Bengal Presidency. The higher temperature of the cold weather months, and the comparatively low admission-rate from malarial fevers, probably account for the comparative freedom of Madras from respiratory diseases. During the ten-year period 1860-69 the average admission-rate from these diseases in Madras was 43·2, so that they have increased in frequency of late years.

46. In the European Army of Bombay the admissions from respiratory diseases during 1870-79 were 6,614 and the deaths 72, an admission-rate of 63·9, and a death-rate of .70 per 1,000. During this period Bombay has thus held a midway place between Bengal and Madras as regards these diseases. The admission-rate from respiratory diseases among the European troops of this Presidency during the period 1863-69 was 23·0 per 1,000.

47. The admissions from venereal diseases in the European Army of India during the ten-year period 1870-79 were Venereal diseases in the Army of India. 117,485, an admission-rate of 203·5 per 1,000. The admission-rates of 1878 and 1879 from these diseases were considerably above the average rate of the period.

48. 75,811 of the admissions from venereal diseases during this ten-year period occurred among the Bengal troops Venereal diseases in the Army of Bengal with an admission-rate of 208·6 per 1,000. In the immediately preceding ten-year period the admission-rate from these diseases was 265·5 per 1,000—a very much higher admission-rate than the average of the last ten years. Although the average admission-rate of the ten years 1870-79 is thus less than that of the preceding ten-year period, the

diminution has not been gradual, but the rate has varied very much from year to year, as may be seen from the following table :—

*Table showing the annual admission-rate from venereal diseases in the European Army of Bengal for 20 years 1860-79.*

Year.	Admission-rate from venereal diseases.	Year.	Admission-rate from venereal diseases.	Year.	Admission-rate from venereal diseases.	Year.	Admission-rate from venereal diseases
1860	338·0	1865	227·2	1870	202·7	1875	212·4
1861	369·1	1866	217·7	1871	208·8	1876	194·7
1862	318·1	1867	170·6	1872	190·7	1877	202·5
1863	281·7	1868	199·2	1873	167·0	1878	288·8
1864	254·9	1869	200·3	1874	200·1	1879	270·3 *

\* Excluding the troops on active service in Afghanistan.

49. Thus the admission-rate from venereal diseases was very high in 1860 and 1861, and gradually fell from 1862 to 1867, in which year it reached the rate of 170·6 per 1,000. The rate again rose nearly 30 per 1,000 in 1868 to 199·2 per 1,000, and remained about the same from that year to 1877, with the exception of 1873, in which year it fell to 167·0 per 1,000, the lowest recorded admission-rate. There was again a sudden rise in 1878 and 1879, the average admission-rates from venereal diseases in these two years being nearly the same as the rate in 1863.

50. There were 21,874 admissions from venereal diseases in the European Army of Madras during the ten years under review, giving an admission-rate of 198·1 per 1,000—a little under the average admission-rate in Bengal. During the period 1860-69 the admission-rate was 236·6, considerably <sup>over</sup>under the average of the following ten years. As in the Bengal Presidency the admission-rate from venereal diseases has varied much from year to year during the 20 years 1860-79, as may be seen from the following table :—

*† Table showing the annual admission-rate from venereal diseases in the European Army of Madras for 20 years 1860-79.*

Year.	Admission-rate from venereal diseases.						
1860	267·0	1865	227·7	1870	165·9	1875	208·6
1861	293·3	1866	234·7	1871	180·3	1876	184·4
1862	304·5	1867	208·5	1872	164·6	1877	231·8
1863	257·3	1868	250·5	1873	152·2	1878	250·2
1864	269·2	1869	192·8	1874	188·9	1879	261·6

† The admission-rates for the years 1860-69 have been taken from the Madras Sanitary Reports.

51. In the European Army of Bombay there were 19,800 admissions from venereal diseases during 1870-79, an admission-rate of 191·1 per 1,000, slightly less than the admission-rate from the same causes in Madras. The admission-rate from venereal diseases in Bombay during the period 1863-69 was 127·5 per 1,000, very considerably less than the average rate of the succeeding ten years.

The following Table gives the admission-rates year by year from venereal diseases in the European Army of Bombay for 15 years 1865-79 :—

\*Table showing the annual admission-rate from venereal diseases in the European Army of Bombay for 15 years 1865-79.

Year.	Admission-rate from venereal diseases.	Year.	Admission-rate from venereal diseases.	Year.	Admission-rate from venereal diseases.

All causes	...	100·00	100·00	100·00	100·00	100·00	100·00	100·00	100·00	100·00	100·00

\* Included with dysentery.

† Of these, 71 were killed in action or died of wounds received in battle.

Excluding cholera, hepatitis was the principal cause of death in the European Army of India during the ten-year period 1870-79, 13·59 per cent. of the deaths being due to that cause. Enteric fever and suicidal deaths and other deaths by violence come next on the list, causing respectively 12·59 and 11·79 per cent. of the total deaths. Next come apoplexy, dysentery and fevers, not enteric; about 9 per cent. of the total deaths being due to each of these causes. After these come heart diseases and plthisis pulmonalis, each contributing over 7 per cent. of the death-rate; and then follow respiratory diseases with a percentage of 6·02.

53. The two following tables give the statistics of regiments in the first year of their Indian service for the ten-year period 1870-79 as compared with the experience of the Army generally:—

*Table giving the admissions, number daily sick, total deaths, and deaths from the principal diseases among regiments in the first year of their Indian service and in the Army generally for the ten years 1870-79.*

The above tables show that, as a rule, regiments in the first year of their Indian service have a higher mortality than the Army generally. Enteric fever is by far the principal cause of this higher death-rate. Fresh arrivals also suffer more severely from heat apoplexy than more seasoned men do, and their death-rate from fevers, other than enteric, and from dysentery and diarrhoea, is also slightly higher. The death-rate from hepatitis, on the other hand, is higher in the Army generally than it is among men in the first year of their Indian service.

54. The following tables give the number of deaths and the average death-rates of the men composing the European Army of India at different ages for the nine years 1871-79, as well as the corresponding deaths and death-rates in the separate European Armies of Bengal, Madras, and Bombay :—

*Distribution according to age of the aggregate strength of the European Army of India during the nine years 1871-79.*

*Deaths of the nine-year period 1871-79 and the death-rates at the different ages.*

55. The number of boys under 20 years of age, given in the foregoing

Boys under 20 years of age have a lower death-rate than the rest of the Army.

would have been had the numbers been larger. As far as they go, these tables, however, show that the mortality under 20 years of age is small, and probably very much smaller than at other ages. Were these boys to be exposed to great hardships, such as are experienced on active service, the result might, however, be very different.

56. In the European Army of India as a whole (excluding boys under 20

Mortality among men over 30 years of age very high.

years of age), the men from 20 to 24 years of age had the smallest death-rate during these nine years. Men from 25 to 29 years of age, however, had nearly as low a death-rate, and the great mortality was among men of 30 years of age and over. Thus it appears that there is no great increase in the mortality up to 30 years of age, but beyond that age the effect of climate begins to tell, and among men of 30 years of age and over the death-rate rapidly rises. The experience of the three Armies in this particular is the same as that of India taken as a whole; the death-rate remains comparatively low up to 30 years of age and then rapidly rises.

57. As was first shown by Dr. Bryden, the principal cause of death among young soldiers in India is enteric fever. In the Army of India, excluding cholera

and deaths by violence, during the nine years 1871-79, 34·85 per cent. of the deaths among soldiers of 20 to 24 years of age resulted from enteric fever, and in the Bengal Army for the same period the percentage was as high as 36·12. Men from 25 to 29 years of age suffer to a much less extent from this disease. In the Army of India, excluding deaths from cholera and violent deaths, 15·60 per cent. of the deaths among soldiers at that period of life resulted from enteric fever. In the Army of Bengal the percentage was 16·85, in Madras 12·09, and in Bombay 14·19. Among men of 30 years of age and over, enteric fever is an uncommon cause of death. Excluding, as before, deaths from cholera and violent deaths, only 2·69 per cent. of the deaths among soldiers of 30 years of age and over, during the nine years 1871-79, were due to enteric fever; in Bengal the percentage was 2·99, in Madras 1·36, and in Bombay 3·42.

58. Excluding boys under 20 years of age, the young soldier suffers rather more from fevers, other than enteric fever, than the older soldier, but the

Hepatitis the principal cause of death among soldiers over 25 years of age.

difference is slight. Hepatitis is the most frequent cause of death among soldiers of 25 years of age and over—a disease which comparatively seldom attacks men under 25 years of age. Apoplexy, delirium tremens and heart diseases are also much more fatal among men over than under 25 years of age. Dysentery, diarrhoea, and phthisis pulmonalis also cause a greater mortality among men over 25 years of age, but the difference is not so great as in the case of hepatitis, apoplexy, delirium tremens and heart diseases.

59. The following set of tables gives the death-rates among the men of

Death rates at different periods of service.

the Army of India as a whole and of the separate Armies of Bengal, Madras, and Bombay at different periods of residence in India for the three years 1877-79.

60. These tables show that for the three years 1877-79, the death-rate from

Death-rate in the Army of India greatest in first and second years of Indian service due to the excessive mortality in the Bengal Army at this period of service.

disease in the European Army of India among men in their first and second year's of Indian service, is greater than at any of the other three periods of service given in

the tables. This is due to the excessive death-rate in the Bengal Army among men in the first and second years of their service. Up to two years' service the average death-rate in Bengal during these three years was 23·60 per 1,000; among men in their third to sixth year of Indian service the death-rate was 14·05; among men in their seventh to tenth year it was 12·90; and among men of ten years' service and over, the death-rate was 17·22 per 1,000.

61. The experience of the same three years in Madras and Bombay is

In the Madras Army death-rate highest among men of ten years' service and over.

different to that of Bengal. In Madras, excluding deaths from cholera and violent

deaths, the death-rate among men in their seventh to tenth year was 17·19 per 1,000, and among men of ten years' service and over, 20·43 per 1,000; whereas the death-rate among men in their first and second year's service was only 13·46. In this Presidency during the three years 1877-79, the men in their third to sixth year of service had the lowest death-rate; among them it was only 10·45 per 1,000.

62. In Bombay, again, during the same three years the men under two

Death-rate in Bombay also highest among men of ten years' service and over.

years' service had the lowest death-rate. The rate of mortality remained nearly the

same among the men from their third up to their tenth year of service; among those in their third to sixth year the death-rate, excluding cholera deaths and deaths by violence, was 11·49; and among those in their seventh to tenth year it was 10·44 per 1,000. Men of ten years' service and over suffered much more severely, the death-rate among them being 24·56 per 1,000.

63. Enteric fever is by far the most frequent cause of death among

Enteric fever the most frequent cause of death among recent arrivals.

soldiers in the first and second year of their Indian service. Excluding deaths from

cholera and violent deaths, 34·54 per cent. of the deaths in the Army of India during the years 1877-79 among men of two years' service and under was due to enteric fever. In the Bengal Presidency the corresponding percentage was 37·00. Among men in their third to sixth year of Indian service in the Bengal Army the percentage was 15·79; among those in their seventh to tenth year it was 11·33, and among men of 10 years' service and over, only 2·42 per cent. of the deaths was due to enteric fever.

64. These tables seem to show that recent arrival in India plays a more

Recent arrival a more powerful pre-disposing cause of enteric fever than youth.

important part in the pre-disposition to enteric fever than youth does. Taking

the Army of Bengal, which suffers most from enteric fever, the percentage of liability to enteric fever during the years 1871-79 among boys of 20 years of age and under, was 31·14, among men of 20 to 24 years of age 42·34, among those of 25 to 29 years of age 20·92, and among those 30 years old and upwards 5·60. Hence the liability among those under 20 years of age was very much less than among those between 20 to 24 years old, and the liability among those between 25 and 29 years of age was still considerable. On the other hand, the percentage of liability of the soldier in Bengal in the first and second years of his Indian service is as high as 68·05, whereas it falls to 17·30 among men in their third to sixth years of Indian service, and is only 11·38 among men in the seventh to tenth year of their service. The soldier in the first and second years of his Indian service falls a victim to fevers other than enteric fever, and to apoplexy more readily than the man who has passed a longer time in the country, and he also suffers very severely from dysentery and diarrhoea. The diseases which produce the greatest mortality among men of ten years' service and over are hepatitis, heart diseases, dysentery and apoplexy.

65. In the above tables are given the total invaliding rates and the invaliding rates at different ages.

Invalding rates at different ages. European Army of India as a whole, and of the Armies of Bengal, Madras and Bombay separately during the years 1871-79. In the Army of India the invaliding rate among men of 24 years of age and under is comparatively low, being 25.33 per 1,000. The rate among men of 25 to 29 years of age is very nearly the same as that among men of the age of 30 to 34 years, being 36.86 per 1,000 among the former, and 37.59 among the latter. Among men of 35 years of age and upwards the invaliding ratio during these nine years amounted to 98.15 per 1,000. Although the amount of invaliding varies a little in the Armies of the different Presidencies, the relative amount at the different ages is nearly the same in all as in the Army of India, as a whole, except that in Bombay there is rather less invaliding among men from 30 to 34 years of age than among those of the age of 25 to 29.

66. Palpitation is the most frequent cause of invaliding among men of

Palpitation the most frequent cause of invaliding 24 years of age and under. The next among young soldiers; anaemia and debility the most frequent causes are anaemia and debility, and after them hepatitis, phthisis pulmonalis, and dysentery and diarrhoea. Among soldiers of 35 years of age and upwards debility and anaemia are by far the most frequent causes of invaliding; 40.01 per cent. of the cases of invaliding in the Army of India at this age, during the years 1871-79, were from these causes. After these, Hepatitis and rheumatism are the most frequent causes of invaliding among old soldiers.

*Distribution by length of residence of the aggregate strength of the European Army of India during the four years 1877 to 1880.*

Army as a body.	1st and 2nd years.		3rd to 6th year.		7th to 10th year.		10 years and upwards.

67. This table gives the invaliding rates in the European Army of India during the years 1877-80 at different periods of Indian service. The average during the first and second years of Indian Service was 31·00 per 1,000. Among men in their third to sixth year of service the rate was 38·31, and among those in their seventh to tenth year it was 40·72 per 1,000. Among men of ten years service and over the ratio was 76·01 per 1,000—nearly twice as great as that among men in their third to tenth year of service.

68. The principal causes of invaliding among men in their first and second

Anæmia and debility the most frequent causes of invaliding at all periods of service, but much more frequent among men of ten years' service and upwards than among recent arrivals.

were much the most frequent causes of invaliding. During the years 1877 to 1880 these diseases caused 44·10 per cent. of the total invaliding at that period of service. After debility and anæmia, hepatitis was the most frequent cause of invaliding among men of ten years' service and over, and after it rheumatism and fevers; but the numbers invalidated from these latter were comparatively small.

*ERRATA.*
