**The New Works of the Metropolitan Railway Company, Neasden.**—The new works at Neasden for the Metropolitan Railway Company have been completed. The second portion of the contract was placed in the hands of the firm of B. N. Smith & Son, contractors, The Crescent, Birmingham, who commenced the work in November last year. Since that time upwards of four million bricks have been laid. The buildings, which are of a substantial description, cover nearly six acres of ground, and consist of the following blocks:—General engineers' offices, builders' workshops, permanent way and signal shops, locomotive shops, erecting, fitting, and turning shops, boiler-house, carriage and carriage-painting sheds, stores, drying-sheds, gas-house, saw-mills, &c. The whole of the work has been carried out under the superintendence of the engineer to the company, Mr. J. Tomlinson, jun., who is to be congratulated upon the quality of the work turned out under his hands; and the contractors also deserve credit for the expedition with which the whole of the job has been completed, under the sole direction of their able and energetic manager, Mr. Henry Charlton. The whole of the ironwork, viz., columns, girders, and roof-work, has been executed by the firm of Messrs. Stanley, Hall, & Co. In connexion with the above works, and to celebrate the completion of the contract, a dinner was given by the contractors at the Spotted Dog Hotel, Neasden, when about forty sat down, and a most enjoyable evening was spent.

**Fire at Clevedon-court, Somerset.**—On Monday morning the residential portion of Clevedon Court, Somerset, the seat of Sir Arthur Hallam Elton, was entirely destroyed by fire, believed to have originated with a beam in one of the chimneys becoming ignited. The Court was one of the few old manor-houses that continue to be used as such. Dating from the time of Edward III., it was restored in the Tudor period, and though it had since been restored and altered, many of the old rooms and offices were perfect. The south front, with its traceried windows, quaint gables, and variously ornamented window-shafts, has been saved, with the entrance-porches and grand hall. It is stated that the occupants of the Court had been a little alarmed for two days past by the smell of smouldering wood in some of the rooms, but all efforts to discover the cause of it had failed. Early on Monday morning the library fire was lighted, and about eight o'clock a servant went to light a fire in a spare room over the library, and found it full of dense smoke. Hastening into an adjoining room, she discovered that it was in flames. A good many of the books were saved, with some valuable title-deeds and ancient manuscripts.

**Chiswick.**—We understand that Mr. Henry Oliver Smith, C.E., has resigned his appointment as Engineer and Surveyor to the Chiswick Improvement Commissioners in favour of private practice.

**Demolition of the Camberley Obelisk.**

The *Reading Mercury* says that this obelisk, one of the oldest landmarks to be found in that part of the country, has just been partly demolished. The obelisk could be seen for miles round, and has for about a century been a guide to travellers. It appears that the gentleman who has recently hought "The Knull" on which it stands has had the building surveyed by Mr. Alcock, contractor, Camberley, who has pronounced it unsafe at a point about 40 ft. down. The owner consequently ordered its removal down to the defective part. The contractor obtained some good photographs of this interesting relic before commencing the work of demolition. Popular tales say the obelisk was built by a king for the purpose of watching fox-hunting; another similar story stating that it was put up as a landmark for fox-hunters, while other accounts declare it to have been a signal station. The authentic particulars, which are not generally known, are that it was built by a Mr. Norris (who lived at Hawley House, Blackwater), in order to communicate by flags with High Wycombe Church, in Buckinghamshire (twenty-seven miles as the crow flies), with the Dashwood family, with whom he was very intimate. There was originally a gallery round the top, and a ball on the summit. About the time when the Royal Military College was removed from Marlow to Sandhurst (in 1812 or 1813), the obelisk formed a favourite landmark for drivers after leaving Wokingham. As there were at that time few trees about, it was much more prominent than it has latterly been. Some gipsies who encamped in the obelisk, and lighted a fire, are said to have burned the staircase down.

**English and American Locks.**

The *Irish Manufacturers' Journal* says,—"An English merchant who was asked 5 per cent. advance on last year's prices for English-made locks objected, adding that 'English lockmakers would not be so ready in advancing prices if they knew what large orders I am sending to America by mail,' and admitted, on being questioned as to what advance in price those orders were subjected, that it was 45 per cent. Thereupon a local correspondent regretfully writes, 'this is not an isolated case, nor is such experience limited to the lock trade, and that it is now the fashion among certain English merchants to beat down the price of the manufacturers to a semi-starvation point and to give, without a murmur, whatever price the Yankee rival likes to charge.' Now, the fact is that for years the English locks for general use have been of the poorest kind of make, so unreliable and dear-at-any-price, that the entrance long since of the well-made and trusty Yankee locks into successful competition was easily made and has been easily retained. It is all well enough to blame the English merchant, but '44 per cent.' never suits him without a very good reason indeed for it."

**Bishop Heber's Bath.**

The neglected state of the bath at Trichinopoly, in which Bishop Heber lost his life, and the subject of the preservation of this most interesting relic, having been brought under the notice of the Government, the Right Hon. the Governor, who in July last personally visited the locality, has decided that the bath should be protected by an ornamental iron railing, placed at a sufficient distance to prevent interference with the water. The bath is to retain its original character, and arrangements are to be made for keeping it always full and properly conserved. Mr. Grant-Duff has also directed the following inscription, drawn up by the Bishop of Madras, to be carved on a slab, and erected on the side wall:—"In memory of the devoted, accomplished, beloved, and universally honoured Servant of God, Reginald Heber, D.D., third Bishop of Calcutta, and one of India's truest and most loving Benefactors; this Stone was erected in the year 1882, at the expense of Government, on the margin of the bath in which he was drowned while bathing on the 3rd of April, 1826. His body was laid under the chancel of the Church of St. John, Trichinopoly, in the hope of the resurrection of the just to eternal life through Jesus Christ."—*Pioneer*.

**The Civil and Mechanical Engineers' Society**

will hold their opening meeting of the session 1882-3 on Thursday, December 7th, when the president, Mr. R. Harkness Twigg, M.I.C.E., will deliver his opening address. This Society offers many advantages, more especially to the younger members of the profession.

**Fatal Scaffold Accident at Hungerford.**

A terrible accident which happened to a stone-carver named William Finlay, at the new London and County Bank buildings, on the 10th ult., has unhappily terminated fatally, the poor man having died at midnight on the 20th ult. from the effects of his injuries. On the 21st an inquest was held before the borough coroner. Henry Hart, stone-carver, of Clapham-road, London, said deceased was forty-two years of age, and was a very nervous man, and subject to giddiness, but he was careful, and no serious accident had previously befallen him. William Grimes, of Sunninghill, apprentice plasterer, who was at work in the top front room at the time of the accident, said he saw deceased walking timidly on two planks resting on carpenter's stools, and from these he stepped down, left foot first, to a platform about 2 ft. lower. Immediately he did so he went through and fell to the bottom, about 30 ft. He did not jump, but stepped gently from the planks to the platform. Richard Wells, labourer, who was at work on the scaffold, said he heard the crash, and on looking saw deceased disappear and strike against another platform lower down, from which he rebounded and fell to the ground, being struck in the back as he fell. Witness believed the plank to be perfectly safe, and said stones weighing 4 cwt. or 5 cwt. had been hauled up on to it. The jury found a verdict of accidental death, and that no blame attached to any one in connexion with the sad event.

**The Water Supply of Edinburgh.**

At a meeting of the Royal Scottish Society of Arts on the 27th ult., Mr. Alex. Leslie, M. Inst. C.E., read a paper on "The Water Supply of Edinburgh." Mr. Leslie, after stating that the city is now in possession of a supply of water inferior to none in quantity, quality, and cheapness, gave some particulars regarding the history of the water supply of Edinburgh, from the inauguration of the first gravitation supply in 1683, before which time Edinburgh had to rely on wells. He also detailed the Parliamentary proceedings which led up to the appropriation of the present supply from Moorfoot. Going on to describe in detail the various Moorfoot works, he mentioned that the area occupied by Gladhouse reservoir was 300 acres, and that it was capable of containing 1,700 million gallons, while Portmore had an available capacity for 250 million gallons. It was estimated, he said, that when the whole of the works were completed, there would be an available supply of 17 million gallons per day, or double what the maximum supply was before the Moorfoot water was introduced. Alluding to a prophecy that had been made, to the effect that the presence of large accumulations of water in the various districts would be damaging to the surrounding properties, by causing cold, damp winds, he stated that this view had been found to be erroneous; and that the farmers were of opinion that the land was benefited by the presence of the water, inasmuch as they found that the frost was much less intense than formerly.

**Proposed Market for Chelsea.**

It is intended to apply to Parliament for powers to erect a new market in the Fulham-road. The site lies between Sydney-street and College-street. The inhabitants ought to keep their eyes open.

**Eastbourne Proposed Town-Hall.**

If we printed what is sent to us on this matter we should be liable to an action for libel. Suffice it that the matter is at present at a dead-lock. The plans are said to have been insufficient for the quantity surveyed.

**Midland Great Western Railway of Ireland.**

Mr. G. Newnham Kelly, C.E., has been appointed by the directors as chief engineer of this company, in succession to the late Mr. R. R. Greene.

**TENDERS**

For premises in Blackfriars-street, Manchester, for Messrs. John & James Carr & H. G. Nicholson, Mr. E. S. Titmus, architect, 48, Arcade-chambers, St. Mary's Gate. Quantities supplied by Mr. J. H. Andrews:—

### German Exploration in Greece.

AVAILABLE as have been the results of the German explorations at Olympia, they are cast into the shade by the discoveries made by the same industrious archaeologists at Pergamos. And while the Berlin Museum is enriched only by casts of the Olympian marbles, it possesses, in the actual objects recovered at Pergamos, a treasure second only to the marbles of the Parthenon.

Buried in the sand, on the top of a hill covered with dwellings, the remains of the temple of Jupiter at Pergamos have been found in a high state of preservation. Some of the plaques have been discovered as perfect as if they had been wrought only yesterday. The indications recovered have been enough to justify a complete ideal restoration of the temple. Portions have been found of all the essential elements of the building; columns, capitals, cornices, entablatures, with indications of the exact dimensions of these main features, and of the position which they occupied in the building. Thus the idon has been happily carried out of making the museum for the exhibition of the Pergamos marbles a reproduction of the temple for which they were sculptured.

The plan of the Temple of Jupiter at Pergamos, according to the German explorers, differs from that of any ancient temple hitherto known. The architect has been the minister to the sculptor. Instead of having to display his figures in lofty pediments, at a distance from the eyes requiring some allowance for foreshortening, the sculptor has here produced a long internal frieze, which was brought under close observation by means of a sort of gallery, reached by a central staircase. This rose behind a central altar, situated in the centre of the uncovered area within the four walls of the edifice. The frieze is only interrupted by the staircase. Being only about 8 ft. above the foot of the spectator, it is thus admirably exposed to view. Small Ionic columns rest on the basement adorned by the frieze, and support the cornice. Metopes were also interposed, at a fair height, and well in view. These sculptures represent scenes in the legend of the Polepida. They have unquestionable merit; but they attract but little attention when compared with the noble reliefs of the frieze. This dominant feature of the temple consists of blocks of marble of a bluish-grey colour, 2-30 metres high, of unequal widths, and about 1½ metre thick, held together by tenons. The blocks were inserted rough on the face, and sculptured in position in the temple.

The entire length of the frieze is about 100 metres. The subject is the conflict between the gods and the giants. Jupiter, Minerva,

Diana, Apollo, Amphitrite, and Cybele, are assailed with the utmost fury by terrific forms, in the production of which the imagination of the sculptor has been subdued by exquisite taste. Thus the fins of the sea-horses conceal the line of junction between the body of the horse, and the scaly tail of the monster. It was one of these exquisite creations of fancy of which the beauty, when the specimen was sent to Berlin, was at once acknowledged to be so great as to decide the Government to provide funds for the continuance of the excavation. Among the giants there are great varieties of genus. Some have the human form; with faces full of youth and grace, they appear as terrestrial gods. Others are furnished with vast wings; the limbs of others terminate in the coiling tails of serpents. Others are yet more entirely composed of the elements of the lower animal life, with the neck and shoulders of the bull, or the mouth and claws of the lion. On these savage enemies Diana loses her enormous hounds. Rocks and stones are hurled by the combatants, and at the very end of the frieze an enormous serpent has just seized in his jaws the claws of the eagle of Jupiter.

The violence and force of the Titans contrasted powerfully with the calm and serenity of the gods. Severe in graceful beauty, they seem to disdain the utmost fury of their enemies. A female figure on horseback, probably Silene, who half turns to the spectator the upper part of her figure, is an example of exquisite grace. A yet holier result of the imagination of the artist is displayed in the pause, and mutual regard, of a goddess of mature and perfect beauty, and a giant of human form as young and beautiful as herself. The ancient legend, of which we have no indistinct traces in the Pentateuch, has been represented on the frieze of Pergamos, with a force and beauty difficult to characterise in adequate language. Whether we consider the grace of the nude form,—the flowing outlines of the drapery,—or the contrast between the serene calm of the faces of the gods and the hatred, rage, fear, pain, and other passions so vividly expressed of the features of the Titans,—the whole composition presents the finest specimens yet discovered of Grecian art, with the sole exception of the marbles of the Parthenon.

As yet, it is much to be regretted, the names of the sculptors of these beautiful figures are unknown. But on two fragments the word *επισημειω* has been found; and it is hoped that the names which must have preceded this word may yet be discovered. A most important result of these discoveries is the light that they throw on the special characteristics of the school of Pergamos. While presenting close analogies with the work of Phidias, the figures on the frieze of the temple of Pergamos offer also marked differences. They, moreover, recall the treatment of several well-known *chefs-d'œuvre* of ancient art; such as the figure of Victory with the Bull, on the balustrade of

the Temple of Wingless Victory, at Athens, and the Victory of Samothrace, now in the Louvre. The head of a young girl in white marble, also found at Pergamos, and shown at Berlin, recalls the very type of the Venus of Milo.

Another group of ancient sculpture, generally referred to the school of Scopas, is recalled by the figures on the frieze of the Temple of Jupiter. Such are the dying warriors of Venice and of Naples, the gladiator of the Capitoline Museum, and the well-known group of the Laocoon. Of this last group, the central figure is an exact reproduction of a young giant stretched at the feet of Minerva, in the frieze. The attitude, the details of the torso, the thighs, and the coils of the serpent around, are absolutely identical. The only difference is in the right arm. But that in the Laocoon is a modern restoration, by Giovanni Montorsoli. In the figure in the frieze the arm is at once more expressive, and more in conformity to the general movement of the figure. It is bent back on itself, and brought close to the head, as if in a movement of agony. In another figure, that of a young man, who, in the anguish of death, grasps the arm of a goddess, we have one of the most touching inspirations of ancient art. The rank and wealth of what may, perhaps, best be called the Greek schools of Asia Minor, are brought into full relief by these wonderful sculptures. After the time of Alexander, relations were more close than hitherto between Greece herself and her Asiatic daughters. The most famous sculptors of Greece,—Polyeetus, Scopas, Praxiteles,—worked for the colonial cities. An uninterrupted succession of noble monuments bordered the coast. The tombs of Xanthus, at the point of Lycia; that of Mansolus, with its colossal statues, at Halicarnassus; the temples of Diana, at Epheusus; of Athens Paliades, at Priene; of Jupiter, at Pergamos; and many others, were sanctuaries of which the artistic wealth is attested by the voice of antiquity. Scopas was a native of Paros; Apollonius, of Rhodes; as were the painters, Apelles and Parrhasius; Agasias, the sculptor of "The Wrestler," was of Epheusus; and the name of Agesandros is inscribed on a pedestal found near the statue of the Venus of Milo.

**A New Altar and Eeredos** which have just been erected in the Church of the Holy Cross, Liverpool, are stated to have few, if any, rivals in Great Britain. The group on the sinister side represents the finding of the Holy Cross by St. Helen, and the miracle by which the true cross was distinguished from those of the two thieves. This panel is 7 ft. in height and 9 ft. broad. On the dexter side, "The Descent from the Cross" forms the subject. The work was designed by Messrs. Pugin & Pugin, and has been carried out under their personal superintendence by Messrs. R. L. Boulton & Sons, sculptors, Cheltenham.

## THE GROSVENOR GALLERY.

CONTINUING the principle which was inaugurated recently, of rendering the winter exhibitions at the Grosvenor Gallery the opportunity for giving representative collections of the works of eminent modern artists, the conductors of the Gallery have this week opened to the public a collection of the works of two painters only.—Mr. Alma Tadema and the late Mr. Cecil Lawson. This tribute to the latter artist, which would hardly have been paid to him just yet as a living artist, comes very appropriately as a memorial to an undoubtedly gifted painter cut off prematurely at almost the outset of his career, to the great regret of many both among personal friends and among those who knew him only through his works; and the exhibition-room in which he made his first decided public success, by his large landscape, entitled "The Minister's Garden," is the most appropriate place in which to bring together the collected results of the labour of his short but energetic life.

Taking the works of the deceased painter first, it may be observed that while they show a surprising amount of important work on a large scale, considering the brief duration of their painter's career, it is somewhat difficult to arrive at a definite conclusion as to their precise value among modern landscape paintings, or as to the ideal, if any, which the artist had proposed to himself to follow. There are, in fact, two or three styles among this collection of landscapes, and these so much at variance with each other in regard to feeling and method, that it is difficult to understand how the same painter could have been thoroughly in earnest in all of them; and the conclusion must be that he was trying experiments, and had not fairly "come to his colours" in regard to landscape art. The "Minister's Garden" is a rather hardy painted landscape, with a much-elaborated foreground and a fine linear perspective of distance, but very deficient (as we believe we said when it was first exhibited) in aerial perspective. It belongs, on the whole, to the realistic school of landscape-painting. Shortly after this,—we are not sure if it was not in the same year,—came "In the Valleys,—a Pastoral," No. 172 in the present exhibition, in which there is a quite different method employed; even the foreground is under a misty veil of high light, and the distances are treated with much more attention to the aerial perspective of successive zones of distance, in a manner recalling some of the earlier work of Turner, of which some other paintings in the gallery (such as "Wharfedale," 143) also remind us. The painting called "The Morning after the Storm" (153), which is hardly like any effect of nature, appears to be an emulation, on the other hand, of the spirit of Turner's latest, and in a certain sense, most ideal work; while "The Cloud, Barden Moors" (163), suggests a double reminiscence, that of Crome in the manner of execution, that of Constable in the manner of composition. This last is a fine powerful thing unquestionably, although we cannot but be conscious that the effect of sunlight on the masses of cloud is enhanced by the falsity of making the landscape itself, "the ground," in fact, a great deal darker and duller than it could be under an atmosphere which threw such a mass of light on the clouds; but if we put this alongside "The Morning after the Storm," it is impossible to think that the painter of these had any fixed idea about the object of landscape art or the method of interpreting nature. The collection impresses us as being, to a great extent, a series of reminiscences or more or less conscious imitations of the style and feeling of landscape-painters of former periods. This applies less, perhaps, to the largest work, "The Minister's Garden," than to any of the others; and among the smaller paintings there are a good many of much beauty and interest. But as a whole the collection impresses us with the idea that the late artist was a gifted but also a very ambitious painter, who was anxious rather too quickly to achieve a great style in landscape-painting, and in pursuit of this aim worked rather at random on hints from existing styles, instead of endeavouring to elaborate a style of his own based directly on the study of nature. For this reason we doubt whether his works can have that degree of permanent value which some seem to anticipate for them, although they represent a good deal of effective and powerful work, and we may very well believe that had the painter lived, he would in time have evolved

out of the sum of these various efforts a distinct and original style of his own.

The collection in one room of most of the principal works of Mr. Tadema, while it brings out forcibly the splendid and constantly advancing technical power of his art, certainly at the same time illustrates its intellectual shortcomings. When we see only one of these beautifully-executed pieces of realism of antique life, we are delighted with the real picture presented to us of the facts and surroundings of that life, and the splendid execution of detail. But when we see a number of these works together, we cannot help feeling strongly their deficiency in higher human interest, or, we might almost say, in any human interest whatever. Of beauty, there is little in the figures, and where there is, it is beauty of mere material kind: hardly even the beauty of fine features, only that of surface and flesh tints. There must have been something more in ancient Roman life than mere *dolce far niente*,—mere bathing, drinking, and dancing; but Mr. Tadema's personages know no higher life than this; they seem to have no expression and character; they are outer masks of human life in which there is no informing spirit. The nearest approach to something like human interest and characteristic expression is in what in other respects we incline to regard as almost the artist's finest work, the "Sculpture Gallery." Here there is not only the artist's splendid power of painting details of sculpture and architecture shown to perfection, but there is also in the group of people collected in the gallery a degree of differentiation of personal character which makes us feel for once as if we really were behind the scenes of Roman society. The master of the house, quiet and dignified, the lady who sits by him and seems to look at the sculpture with a connoisseur's appreciation, and the other lady, who is chiefly thinking of her children, and how they are enjoying the show,—these stand out with a distinctness of character which we find in few other of the artist's figures. Mostly, they are so many figures clad in Roman costume, and that is all. The "Sculpture Gallery" also is a fine example of the beautifully clear light which Mr. Tadema throws over his scenes. One of his favourite effects, and one which is always charming, is that of displaying through a window opening or an arched way some little bit of architecture in the middle distance sparkling under intense sunlight. This is beautifully seen in the two small paintings of nearly similar motive, "There he is" (55), and "A Love Missile" (96), in each of which a woman looks out from a window (in the latter case the figure seems to look through a metope opening, the sculptured slab of which has been turned on its centre); the interior is cool and grey, and through the opening is seen a bit of Classic building glowing in warm sunlight, and every detail showing through the clear atmosphere. This clear light strikes us again with special beauty in the scene called "Hide and Seek" (120), and in "En Repos" (73). The latter is an open-air scene, in which a figure sits on a terrace overlooking the sea, the high coast stretches away to the left, and one or two white temples glisten on the height in the distance. No painter has ever gone so far in realising this aspect of Classic architecture in the days when it was to be seen in its pristine freshness, and not, as now, merely beautiful in decay; his paintings beguile us for the moment into thinking that we have really been in the land of ancient columnar architecture when it was a living art, and that it is within reach for another visit.

The dates of all the pictures exhibited, or nearly all, are given in the catalogue; it seems a pity that they were not arranged in regular chronological succession on the walls; the less symmetrical arrangement which would have been necessary would have been more than compensated for by the advantage of being able to follow consecutively the history of the development of the special qualities which now distinguish Mr. Tadema's painting. There are one or two works painted as long as twenty years ago, which belong to a very different type of subject from that which we now associate with the painter's name, such as "A Bargain" (3), dated 1860. Here we see, however, that fondness for architectural detail and surface, which increasingly distinguishes Mr. Tadema's subsequent work, in the care which is bestowed on the treatment of the brick wall which forms the principal background to the

figures. Of Mr. Tadema's treatment of Roman and occasionally of Greek architecture in his maturer style too much cannot be said; the study of his works is really one of the best of lessons in the characteristics of Roman architecture, and in correctness and effectiveness of representation of architectural detail he is beyond any other painter of the day. Among the architectural portion of his painting at the Grosvenor is an almost solitary example of a study of Gothic detail from Munster Cathedral (41), not treated, however, so forcibly or with such evident interest as is shown in the Classic architectural subjects.

Among the paintings, very few in number, in which the aim seems to have been to tell a story or raise an emotion beyond that produced by mere power of execution, the most remarkable is that of the Roman soldiers, discovering Claudius, the last member of the household of Caligula whom they had left unslaughtered, and whom they dragged out, in a sudden turn of policy, to be made emperor whether he would or no. The peculiar situation, in which the man who has been hiding imagines the worst, and that he is at last discovered only to be dragged out and put to instant death, and is met at the same time by the half-grotesque adulation of the soldiers, is so admirably suited for illustration in painting that it would be surprising if so brilliant an executant as Mr. Tadema should not have made an effective picture even by the most realistic treatment; and this picture is really effective and at the same time natural. The grouping arises out of the probabilities of the situation. The unjority of the soldier's party remain at the conventional distance in an attitude of homage to the man they have just at that moment concluded to call emperor, but it is necessary that he should be apprised of the fact, and one soldier of the party therefore goes up and drags aside the curtain which conceals him, and we have the almost grotesque contrast of this soldier bending the knees and bowing before a frightened wretch who is nearly beside himself with apprehension. That is the intention of the picture, though the expression on the countenance of Claudius does not quite explain itself; in this and other respects the smaller and more roughly executed edition of the picture (92) which seems to have been the first study for it, has more life, truth, and animation than the finished picture. But it is much to be wished that Mr. Tadema had turned his attention more often to illustrating definite scenes, historic or imaginary, and well-marked characters and actions, instead of confining himself so much to the mere portrayal of figures of Roman physique and costume, but with no story to interest us and no definite or marked character to distinguish one from another. Had he made more attempts of this kind, the interest of the present collection would have been greater even than it is. "The Widow," and "The Death of the First-born" (37, 49) come nearest to human interest of the same kind; but even in them we feel that, though the subjects are ostensibly of a very pathetic nature, the painter has been thinking mainly of his Egyptian architectural details and *bric-à-brac*, and the feeling of the situation is very secondary with him. Perhaps the best subject-picture next to Claudius is the "Fredegonda" (98), which hangs at the top of the room, and which, like the Claudius, many will remember in the Royal Academy exhibition. There is here really some pathos in the figure of the deserted queen watching the nuptials of her rival, from which the elaborate detail is not able entirely to distract us. In other cases titles are given to pictures which imply a subject, such as "A hearty Welcome" (82), in which a girl is embraced by the mistress of the garden; but the incident is completely secondary, the picture consists in the brightly-painted garden-scene with its half red and half white columns among the maze of plants, and the sunlight which sparkles over the whole. This, of course, is in itself an object quite worth painting, if Mr. Tadema were to be regarded as a painter of architecture and landscape merely; what we regret is that an artist with such power of drawing and painting the figure should put this power to so little use in regard to the portrayal of human sentiment and action.

In regard to the artist's figure-painting *par excellence*, there seems to be a constant advance in power in this class of work up to almost the present moment. If we take the

three principal nude subjects in the collection, which belong all to a recent period, we cannot but see this. "After the Dance" (105), in which a young Bacchant has thrown herself down in fit to be feared) a heavy slumber, is dated 1875, and attracted much attention in the Academy at the time. This is a remarkable and charming work, and could not be surpassed in drawing; but if we go from this to the "Sculptor's Model," painted two years later, there is a nearer approach to the real texture of the living body in this, and some portions of this figure, notably the feet, are among the most beautiful bits of painting that have ever been seen in ancient or modern work. The small picture called "The Tepidarium" (118), painted last year, is hardly to be compared with "The Sculptor's Model," as the latter is full size, and "The Tepidarium" is a figure which would only stand about 1 ft. high; but in this little work, which represents a young woman reclining in the luxurious languor induced by the warm bath and the warm chamber, the delineation of the body, both in form and colour, seems quite perfect; we can almost see her movement in breathing. We again feel it a pity that such beautiful work and such power over technique should not be employed as a means to higher aims, rather than merely as an end in themselves; but the beauty of the work is undeniable. The whole collection impresses one with a sense of having been studying paintings in which the power of representing what the painter wishes to represent is more completely within his call than, perhaps, is the case of any other artist of the day; but one is obliged to set off against this the admission that the aim is not on the whole a very high one; at all events, not the highest, and that it is possible to tire of even the most brilliant execution when it is accompanied by no attempt at emotional expression, and makes no appeal to the intellect, in the higher sense at least. What these pictures really have, beyond their remarkable execution, is the interest arising from the archaeological knowledge displayed in them, and the feeling they give us that we have really seen something, through them, of at least the external aspects of a society long since passed away; to which may be added the admirable delineation and revivifying of Classic architecture, which we especially should be ungrateful to forget to recognise.

#### OF PORTRAITS AND INSCRIPTIONS APPERTAINING.

THE establishment, and still more the apparent, though it may be only the quietly growing, popularity of the National Portrait Gallery, bear present witness to the interest which has so many other attestations, attaching to the recognition of the features of distinguished men and women, even the merely notorious as well as the admirable; curiosity will take no denial, however authoritatively assured that its satisfaction will be but futile. "There is no art," says Duncan, "to tell the mind's construction from the face"; such is his conclusion from the betrayal of his absolute confidence by the Thane of Cawdor, and his words are scarcely pronounced when they are practically illustrated, as he embraces the still more deadly traitor, Macbeth, the late warning notwithstanding, with confidence no less absolute, as his "worthiest cousin." The difficulty, indeed, is further enhanced when we have to make allowance in our interpretation of character from what at best may be a mask, for an entirely foreign intrusion of characteristics due to the style and the limitations of a sculptor or a painter. So far as a painter, — a Lely or a Vandeyck, — may be in harmony with the prevalent tone of the society which furnishes his subjects for portraiture, this difficulty is minimised. But even in such cases, it is by no means unimportant; to reduce it to insignificance as nearly as may be, it is necessary to make ourselves at home among the subjects, and very familiar indeed with numerous works of a particular painter; then his own speciality will come by degrees to be insensibly allowed for as a common difference, and will cease to overlay so oppressively the variable distinctions of his several models. We may then recognise even the bold broad lines of the nature of Oliver Cromwell, despite the dressy finishing and furbishing of a mannerist. The sophistication, therefore, of the mannerisms of the artist have to be discharged and got rid of, like the equally-confusing sophistications of the fashions of a

period. The extravagances of fashion, — of obsolete fashion, — at first render all portraits uniform; and there is really some excuse for interchanging one bewigged celebrity for another, be their personalities as contrasted as Addison and Walpole. The confusion vanishes upon familiarity, even as we learn, with prolonged intercourse, to get over our mistakes between twins, and wonder at last how any mistake was ever possible. Plato surely must have seen little of Egyptian statues, or paid little attention to them, or he never could have written down that they all conformed mechanically to a fixed hieratic model. A still more serious, if it does not prove too often a fatal difficulty in the way of obtaining a true impression of the original of a portrait, is due to utter incompetence of a painter. We may discount Vandeyck; but as "true no-meaning puzzles more than wit," and the flourishes of a calligraphist are tolerable as compared with torn copy, there is little indeed to be done with professed portraiture that finds it easier to leave out expressive forms or to substitute momentarily, than to err by exaggeration, which at least owes a departure to the original. The engraved portrait of Shakspeare prefixed to the first folio, is but a sorry production; and if, indeed, as Ben Jonson's verses assure us, — therein "the painter had a strife with Nature to outdo the life," — the painter had very much the worst of it, as has happened before and since. And yet when it is carefully collated with the Stratford bust, and further assisted by familiarity with a certain type of face and general build very of the prevalent in Warwickshire, we may be satisfied with our recovery of the genial presence of the "handsome well-shaped man," and flatter ourselves, if we please, that we can recognise in it the infallible expression of one who, by the testimony of surly Jonson himself, "was indeed honest, and of a free and open disposition." But what shall we say of the "Chandos portrait," which is installed in the place of honour at the National Portrait Gallery? Those who claim to be experts accept it, — "give it title, knee, and approbation." They even are ready to attest that its genealogy from one possessor to another is irrefragable, and albeit there are cavillers who shake the head at the ring of some links of the chain of pedigree under tap of the critical hammer, it seems that authority will not be gainsaid. But what, then, is to be said for the painter? His production is absolutely at variance with every characteristic both of form and expression, in which the bust and the engraving confirm each other, while harmonising with the authentic accounts of the nature of the man. We must be content to take warning how little faith is challengeable for the resemblance of a single portrait, at any rate, of the sixteenth century, when it is put before us, without the confirmation of a certain degree of correspondence with other representations of the original.

How many uncertainties of identification would have been, and would be saved, were the custom but universal of attaching a name to the canvas or the marble, out of sight, at least, if we are to admit and make allowance for a certain inscrutable repugnance to a frank exhibition of it. Some such aversion there certainly seems to be, and to have been as prevalent in ancient as in modern times. It is with a sense of irritation and injury that we regard the numerous fine but unidentified portrait busts that have come down to us uninjured from antiquity. It is scarcely less tantalising than to come, as we do, upon fragments of busts inscribed with historic names, but wanting the heads. A chorus of congratulation and delight has recently greeted the identification of a beautiful uninscribed bust of Theoclydes at Holkham, — perfectly certified, thanks to a bad but inscribed repetition at Naples; another has been pretty generally accepted, but, at best, it is only with trembling hope, as that of Æschylus. All over the kingdom, ancient homes contain portraits which declare themselves as ancestral by re-appearances of features in current generations, but otherwise are so far unknown as to be nameless, even by family tradition. They are shades upon the very banks of Lethe and destined sooner or later to lose their last hold upon authentic memory, and absolute forgetfulness is one day to take possession of them as they pass to Wardour-street. After this preliminary transmigration they may ultimately find themselves perchance enjoying an illusory revival, adopted for representatives of the remote ancestry of wealth

which is of too sudden and recent an origin to have authentic record, even of a grandfather; so it is that the satirist is consoled for the seeming encroachment on ideal life of a spirit of dull matter of fact:—

"Not for the age I've no alarms,  
Still bright shall glow Romance's fires,  
Whilst Herald's College finds our arms,  
And Wardour-street our pictured sires."

Friends and relatives who are interested in a portrait at the time of its production do not require a certificate of identity, and to inscribe a name upon it would naturally seem incongruous and even offensive as implying a possible failure of memory that could only be ever at fault from the dying out of affection or respect. When the interval between the ages of successive generations happens to be considerable, and especially when the transition is made further discontinuous by premature deaths or by habitual tacturnity of the elder branches, as to family matters, tradition may finally and irrevocably expire within twenty years. Let those who have had their curiosity aroused as to their predecessors declare how they have had to lament not taking timely evidence of the last survivor of a social connexion which retained vivid existence in one single vivacious memory, and with the extinction of that memory died out, instantly, entirely, irrevocably. The fly-leaves of the family Bible have ever but insufficiently supplemented that parochial record, —

"Where to be born and die  
Of rich and poor makes all the history."

The suggestion is not trivial that every family should have its book of domestic record: a primary purpose might be to verify the mere sanitary history of childhood and youth, from vaccination onward, but among other notes, — usually doubtless the briefer the better, — places might with advantage be found for securing the dates and identities of portraiture. Thus much for the satisfaction of purely domestic interest and permanence of family tradition; but even so it would be well for the attachment of permanent inscriptions to portraits to be the rule; for the portraits are many which have a public as well as a private interest, and are liable to go astray from their best associations through the accidents of dissolution or dispersion of families.

Portraits, once safe in public institutions, are pretty generally inscribed, as, for instance, the interesting series in the rooms of the Royal Society at Burlington House, or the Architects' Institute, and that which commences with Count Rumford in the ante-room of the lecture-theatre in Albemarle-street. The only suggestion to be insisted on as desirable is that the dates of birth and death should, in every instance, be added. This is an addition which should be as absolutely the rule in the case of memorials in public places, — of statues of worthies, whatever the nature of their claims to such distinction. Certainly a public statue should never be erected in honour of one whose simple name alone does not carry the justification of the honour, like Cobden or Havelock, Peel or Peabody, Jenner or Rowland Hill. Properly funeral monuments, either in cemeteries, cathedrals, or abbeys, have a traditional claim to more diffusive inscriptions. Antiquity has bequeathed us many touching epitaphs, even on the personally insignificant. Many will recall the tender lines of Martial for the tomb of "little sweet Erotion," so beautifully rendered in English by Leigh Hunt. Here is a literal translation of an Greek epitaph dug up no long time since on the Isthmus of Corinth: —

"The bonds escaped that nature held me in,  
Back to my source come I, Philostrata;  
For after four years upon ten completed  
I left the body in the fifth — a maid  
Childless, unwed, unwed; who finds a charm  
In life — may live to old age for me, — and welcome."

As regards personages more dignified we have the terse epitaph of the Scipio, — intermediately such an example as the grand four lines on the tomb of Gonzalo of Cordova, in St. Geronimo at Granada; and in our own country and later times we would not willingly be without such epitaphs as those on Christopher Wren, Goldsmith, and Howard the philanthropist, or lack even one more such an irrefragable model of a commemorative inscription as Professor Jobb provided for the pedestal of Macaulay in the ante-chapel of his college.

Any epitaph, or inscription either, to be justified must be concise, elegant, characteristic,

and true; when Prior, in his playful verses, "For my own Monument," gave notice that,—  
"Mat, alive and in health, of his tombstone took care,"  
he gave warning at the same time,—

"Then, take Mat's word for it, the sculptor is paid.  
That the figure is fine pray believe your own eye;  
Yet credit but lightly what more may be said,  
For we flatter ourselves and teach marble to lie."

Certainly his actual epitaph in the Abbey, whether entirely truthful or not, is much too diffuse. Still, it should not have provoked Dean Stanley to stigmatise his poetry as "poor," for Mat was master of his craft in a certain original style, and even in more than what Cowper affectionately calls "Dear Mat Prior's easy jingle," as surely as Swinburne is at present.

It is not so bad a fault for an inscription to be obscure and equivocal as to be false, and yet a fault it is to leave us hovering in choice between no meaning at all or too many. Such ambiguity especially besets an endeavour to be pointed as well as concise. An unlucky example of it is very frequently before us. As we enter the National Gallery we read below the bust of David Wilkie and the dates of his career, the line,—

"A life too short for friendship, not for fame."

The intended meaning is doubtless that Wilkie's life was shorter than his friends would have wished it, but long enough to enable him to attain to high celebrity; yet this meaning has to struggle through such contesting suggestions as that Wilkie had no time to make attached friends while he was making himself famous,—or even that though his friends would have wished him with them longer, it was high time for him to die for the sake of his reputation. For enquiry to be perfectly graceful it must not only be manifestly sincere, but it must be exempt from any cloudiness that invites the cynical to misinterpretation of its terms, and it must be free, moreover, from obvious liability to awaken collateral incongruous associations. Lord Palmerston, if we may trust the Annual Register for 1861, did not wind up what is declared to be an eloquent eulogium of Count Cavour, without making more than one of these mistakes. "It might well be said of him,—so runs the closing sentence of the speech, that he had lived a life,—

"To point a moral and adorn a tale,"—

and though his death was premature, it could not be said that he died too soon for his glory and his fame."

In the last clause we have a repetition of the awkwardness of the monosyllabic on Wilkie; its terms do not exclude the suggestion that in the interest of his fame it might have been as well for Cavour had he died a little sooner. This, doubtless, would be to wilfully misunderstand the orator; but eulogistic oratory, like Caesar's wife,—though Caesar himself had little right to stand on his dignity in the matter,—ought to be incapable of being misunderstood. The quotation is even more unlucky. A majority of Lord Palmerston's hearers would be certain to refer the line to its origin, Johnson's example of the vanity of human wishes in the close of headstrong ambition in humiliating failure of such a contrast to Cavour as Charles XII. of Sweden,—a celebrity only pointed at with scorn as having

"Left a name at which the world grew pale,  
To point a moral or adorn a tale."

But our concern is not with Parliamentary, but with monumental recognition of the great, the distinguished, the interesting, more especially in the form of portraiture, with identifying titles and appropriate inscriptions, and though much more might be said upon this theme, at present let this be enough.

**Christmas and New Year Cards.**—S. Hildesheimer & Co. offered 2,000, as prizes for the best designs last year, and afterwards spent 2,500, more on other than prize designs. They have sent us a sample box of the results, and we are bound to say that they are excellent of their kind. As specimens of printing they are not surpassed. Their execution is attributed to M. Hageberg, of Berlin. We praise them as of their kind, and we hope the retail dealers will look to them before they make their selections; nevertheless, we cannot help thinking, considering the enormous sums of money annually spent on such cards, that something more artistic, though possibly less attractive to the multitude, might be produced.

## THE DECORATION OF ST. PAUL'S CATHEDRAL.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary fortnightly meeting of this Institute, held on Monday evening last, Mr. Horace Jones, President, in the chair, among the members attending for the first time since their election were the President (Mr. Stevens, and Messrs. Murgatroyd and Holden, members of the Manchester Society of Architects, who had come to London to confer with the Council on matters affecting the interests of provincial members of the Institute. The President assured them that the matters in question should have the serious and careful consideration of the Council.

The Secretary announced that Messrs. E. P. Warren and Percy Hunter had passed the Obligatory Examination held in November, and the Council had awarded the Asphitel Prize to the candidate who had passed best in the three examinations held this year, viz., Mr. Thomas Purves Marwick, of Spottiswoode-street, Edinburgh. The silver medal offered by Mr. Ernest Turner for proficiency in sanitary science subjects shown by the candidates in the Architectural Examinations had been awarded to Mr. Charles Steward Smith, of Reading.

The Chairman said that it had been his pleasing duty and his high privilege to attend as the representative of the Institute at the opening of the Royal Courts of Justice that day, but in common with all the members of the Institute he could not but regret that he who had called forth the masses of stone, timber, metal, and other materials of which the vast building was composed, and had by his genius given them form and shape, was not present to see the completion of his work and to receive the reward which would have been his due.

Mr. Hebb wished, before the paper of the evening was read, to call the attention of the Council to the fact that the present Government had arranged for the re-opening of the inquiry into the circumstances attending the death of Mr. C. Chaloner Ogle, a young architect, and a member of the Institute, who was believed to have been murdered at Volo, in Thessaly, in the Spring of 1874. A previous inquiry had been held and closed without any satisfactory result being arrived at; but now that Thessaly had been ceded to Greece, the present Government had taken up the matter anew, and had commissioned Mr. Fawcett, her Majesty's Consul at Constantinople, to proceed to Volo to make further inquiry into the subject. He suggested that the Council should take into consideration the desirability of thanking the Government for the steps they had ordered to be taken with the view of vindicating Mr. Ogle's memory and of obtaining the punishment of those who had caused his death if it should be shown that his death had been caused in any felonious manner.

The Chairman said that the matter should receive the attention of the Council.

Mr. R. Popplewell Pullan then read a paper on "The Decoration of St. Paul's Cathedral." He said he hoped that his paper would be of interest to some of the members of the Institute, would excite few of them, irritate none, and be instructive to all. No question of the present day had roused so much party spirit as this question of the decoration of St. Paul's. For the past twelve years the cathedral had been the arena of a succession of fights, of the warfare of parties, and of the "Battle of the Styles." It was to be regretted that this had been so; for it was worse than perilous to bring party spirit to bear upon the solution of a problem on which depended our reputation for good taste, not only now, but in the future. The topic was a most absorbing one, and it behoved them all to watch very carefully everything that was done in the matter, lest some wrong and irremediable step should be taken. The matter was now in the hands of a sub-committee appointed by the general committee to act as an executive committee. The proceedings of the sub-committee were to be subject to the approval of the general committee, and afterwards to that of the Dean and Chapter, and when that approval had been given, the proposals were to be made public before anything decisive was done. It was thus very necessary that the public should be informed from time to time of the progress that was being made, so that when they were called upon to come to a decision they might be able to form a just judgment.

But the questions arose, Who amongst the public were qualified to decide on such a matter? Who were the men who were most likely to be competent to form a correct opinion? What was duly-qualified public opinion? The only body of men who were qualified to come to a right decision were the members of the Royal Institute of British Architects, men who were accustomed to decorative designs in connexion with architecture, and who had, by study and observation of the best works in all countries, made themselves acquainted with the possibilities and limits of decoration. It was at one time hoped that the whole matter should be officially referred to the Royal Institute of British Architects, or the Royal Academy, which would have perhaps been very much the same thing, as the Academy would have referred it to its architect-members. The matter was now, however, in the hands of a sub-committee of representative men, and from that sub-committee (Mr. Pullan) had received every courtesy when he submitted to them what was now regarded as a rival scheme, although at the time it was offered it was merely intended as a suggestion towards the solution of the problem. Soon after the report of the General Committee was presented, three years ago, he submitted to the sub-committee a scheme which was the joint production of himself and the late Mr. Heath Wilson, of Florence. Having reviewed the history of the movement for the decoration of the cathedral, Mr. Pullan described the iconographic scheme which was prepared by Mr. Burges, upon which unmerited obloquy was poured, one of the accusations made against it being that it was "Medieval." Mr. Penrose exhibited a rival design. Some of the contributors threatened to withdraw their subscriptions unless Sir Christopher's intentions,—though nobody knew what these were,—were carried out. The minority of the committee vigorously protested, in June, 1874, against the majority's decision. All these influences told against the cathedral architect, and in November of the same year the Dean and Chapter resolved to rescind the agreements made with Mr. Penrose and Mr. Burges. In Mr. Pullan's judgment, there were many good points in the designs of both, and but for the violence of party spirit the work might have gone on. After the rejection of these designs there was a truce until 1876, when Mr. Oldfield published his very able letter to the Dean, in which he revived the whole subject. Of this pamphlet, and of its hearings on the problem of the decoration of St. Paul's, Mr. Pullan gave some account. He was, however, greatly scandalised by Mr. Oldfield's last recommendation to his colleagues on the sub-committee, which they had adopted. By it they were urged to dispense with an architect, and so to save money, whilst at the same time eliminating a frequent cause of division amongst their subscribers. Having repudiated architects, continued Mr. Pullan, they sought for a design from other sources, and at last unearthed a model on which Stevens, a sculptor lately deceased, had left some rough indications of his notion about the decoration of the dome of St. Paul's. The discovery of this model at that critical juncture was most opportune for them. It was a tower of defence for them against their fees. And they further strengthened their position by forming an alliance with the two greatest English painters of our day, Sir Frederick Leighton and Mr. Poynter. With both of these eminent men they made a formal agreement, stipulating that Stevens's design should be taken as a basis; that a full-sized coloured cartoon should be placed *in situ*, one portion of which was to follow literally or with some modification Stevens's design, the other portion being of a more conventional or architectural form; but in any case Stevens's arrangement was to be worked out and the frame to be filled with pictures, the subjects of which were to be taken from those suggested by Mr. Oldfield in a second letter to the Dean,—namely, scenes from the Apocalypse. The Dean and Chapter sanctioned the experiment, reserving to themselves full power of discussing the matter and also of rejecting the cartoons if they should be unsatisfactory. Now what, asked Mr. Pullan, was Stevens's model? A half dome on which were sketched roughly Titans, Telamones, angels, and squatting figures arranged to form something like ribs, with circular medallions on a plain gold ground to receive the cartoons. The design was without any architectural character, the dream of a man who had Michelangelo on the brain, and

who was thought a man of the greatest genius, because he had executed a monument, full of fine details, to be placed in a position where they could never be properly seen. This was the Wellington Monument, a canopied tomb adorned with groups of figures so placed that little beyond the soles of their feet could be visible to the spectator. This tomb was to have been crowned with an equestrian statue of the great captain whom it commemorated, placed in such a lofty position that his soaring plumes would almost have swept the ceiling of the Consistory Court. This figure, however, the artist was compelled by public opinion to omit. The result was the leaving out of the crown of the design, which was thus made to finish in a plain tablet-top. Neither in the Wellington monument nor in the model for the dome did we recognise that perception of the fitness of things which was wont to characterise the man of the highest genius. Sir F. Leighton and Mr. Poynter, Mr. Pullan contended, ought never to have been pledged to adapt their pictures to Stevens's crude framework, which, with whatever proposed modifications, would always remain unworthy of the productions of their pencils. Mr. Pullan spoke next in detail of the design jointly prepared by himself and his friend the late Mr. Heath Wilson. The fundamental principles which guided the two friends in the production of their design\* were then expounded. According to Mr. Heath Wilson, the Court of Heaven, as described in that grand triumphal hymn, the "Te Deum," commended itself to the judgment of the two friends, as offering subjects individually graphic, appropriate, and impressive, and which, when united, might be brought effectively within the strict conditions of decorative art. They aimed at an embodiment of prayer, praise, and thanksgiving as expressed in the "Te Deum." They prepared a drawing,—one-sixth of the full size,—of an eighth part of the dome, proposing to divide the entire circle into eight equal parts by means of ribs, richly decorated and of large proportions. These would spring from eight thrones, each filled by a seated prophet, a figure which, if erect, would be 18 ft. in height. These would form noble themes for a great artist's powers of design, admitting of exalted idealism and thoughtful action, combined with religious sentiment and fervour. The spaces between the ribs were occupied in the lower portions of the curve of the dome with an architectural composition in two zones, consisting of a podium or basement, with a corridor above, intended to recall in a measure the general design of Sir James Thornhill, which may have been approved by Sir Christopher Wren. This structure, with a balustrade in each central space, was meant as a background to the figures throbbing this portion of the cupola. An Apostle was enthroned under each balustrade. The martyrs were grouped on each side and in front of the basement. The architectural forms, the ascending aerial perspective of which had been graduated with much care, were relieved against the pure azure of the whole upper curvature of the dome, on which depended, in considerable measure, the beauty of this part of the design. As the azure ascended it grew paler, till it melted into pure white. On the surface of this azure were ranged angels, excelling in brightness as they rose rank above rank.

The Chairman, in inviting discussion, said the meeting was thankful to Mr. Pullan for having put forward his views on this important question, the consideration of which was one demanding great care. It was to be hoped that all the discussion and consideration which had been given to the subject would eventuate in the happy and satisfactory execution of the work. He should be glad to hear the views of Mr. Penrose on the matter.

Mr. Penrose, Surveyor to the Dean and Chapter of St. Paul's, said he was only in a position to say a word or two on the question. If Mr. Pullan invited the members of the Institute to an academic discussion as to the best style of decorative treatment for a large domical church, he should consider the subject as being very useful for the consideration and guidance of those who had charge of the cathedral and of the decoration committee. If, however, Mr. Pullan invited discussion on the merits of a scheme put forth in rivalry with the scheme which was being prepared under the guidance

of the committee, such discussion would be decidedly premature, for the Institute had not before it the materials for enabling them to form an opinion on the subject. Only a part of the proposal which was under the consideration of the sub-committee had been seen at all. There was more to come from Stevens's designs than had yet been shown. There were, he thought, ample safeguards against anything being done in haste. The sub-committee who were charged with the preparation of a design in conjunction with the painters would have to get the approval of the general committee, and if the general committee passed the design its adoption was still subject to review by the Dean and Chapter. He did not think that Mr. Pullan had been just to the memory of Stevens, either as to the Wellington Monument or his design for the decoration of the dome. For the reasons he (Mr. Penrose) had given, he asked the Institute not to commit itself to any opinion on the subject at present.

Mr. Stannus observed that Mr. Pullan had shown by his paper that he was not fully cognisant of the state of affairs in connexion with the matter under consideration. He (the speaker) would briefly narrate his own part in the matter. He had been a pupil of Stevens, and had been elected an Associate of the Institute, when he was commissioned by the sub-committee "to prepare, in conjunction with Mr. Poynter, and subject to the approval of the committee, a full-sized cartoon." On receipt of this commission he went to France and Italy, where he spent the months of October, November, and December of 1873 in making studies of all the good dome treatments he could find, in order to the more fully fit himself for his work. When in Rome, towards the end of his journey, he made a modification of Stevens's design, which he brought back and worked out on the scale model. That design was submitted to the sub-committee forthwith, but, as Mr. Poynter was not then prepared with his version of Stevens's design, it (Mr. Stannus's design) was kept in abeyance in deference to Mr. Poynter until this year, when Mr. Stannus was commissioned to prepare an experimental full-sized cartoon, to be fixed in the cupola simultaneously with the other. Thus there would be two designs,—first, the modification by Mr. Poynter (not by Sir F. Leighton), which he (the speaker) ventured to call a painter's interpretation of Stevens; and secondly, the modification by himself, which was an architect's interpretation of the same thing. He regretted to have to give these details, and to mention his own name so much, for it would be well if all names could be forgotten, and the work judged impersonally. His own modification was really only the combination of the most characteristic portions of Stevens's design and of the rib treatment suggested in a design by Mr. Penrose some years ago. He (the speaker) placarded that design unconsciously, but the credit of the idea was due the less due to Mr. Penrose. Mr. Pullan had found fault with the sub-committee for having, as he said, "repudiated architects," and for having in their report "altogether ignored" the architectural profession. He (the speaker) did not speak of himself as being of much account; but surely Mr. Penrose was an architect, even according to Mr. Pullan's ideas. And what were the words of the committee? They said,—

"Although the adoption of Mr. Stevens's design as a basis for their operations will enable the committee to dispense with the services of an architect for the purpose of furnishing designs, it is evident they will require the assistance of some properly-qualified person, to help them with contracts, supervision, dimensions, &c.; and they, 'being of opinion that Mr. Penrose possesses all the qualities requisite for such a post, recommend his being employed to perform those duties, and generally to assist and advise them in carrying out the decoration of the dome.'"

That extract would suffice to show that Mr. Pullan's inference was unjust to the sub-committee. Further, Mr. Pullan had not been quite fair to Stevens. He praised Sir Frederick Leighton and Mr. Poynter,—and everybody wished that they might both be long spared to enrich English art with the noble creations of their pencils; but Stevens was dead, and not here to explain his intentions or defend their results. Mr. Pullan had spoken of Stevens as "a sculptor lately deceased," as if to imply that, being a sculptor, Stevens was not fitted to

decorate St. Paul's. Mr. Pullan surely ought to have known that Stevens was pre-eminently an artist,—neither sculptor solely, nor solely painter, architect, or ornamentist, but possessing that balanced mastery over all which made an artist. He was, of all Englishmen, living or dead, just the man fitted to design this work, and Mr. Pullan's want of knowledge of this greatest of English decorative artists, whether his fault or his misfortune, was fatal to his pretensions to criticise the actions of the sub-committee in working upon the design. Of Mr. Pullan's opinions about the Wellington Monument, he (the speaker) would only say that in another fifty years, when those who were there assembled had all been duly assessed and shaken down to their proper places, there would be no need to hush away any cobwebs from Stevens's name. But on Mr. Pullan's statement, given as a fact, that "the nodding plumes" of the surmounting equestrian statue "would almost have swept the ceiling," he (Mr. Stannus) might say that the full-sized figure of the Duke as modelled by Stevens (and which was in the speaker's possession) had no plumes in the hat, which was to be in the hand of the figure. And he might further state that when commissioned by Her Majesty's Office of Works to superintend the completion of the monument, he measured the vertical distance from the present summit of the monument (which Mr. Pullan had termed "a table") to the ceiling, and found it to be 18 ft. Mr. E. J. Poynter, whom Mr. Pullan characterised as one of the greatest English painters of our day, said, in a letter to the *St. James's Gazette*, in July last,— "I have never kept out of sight either the design, or my immense admiration for it and for the magnificent genius who produced it." But Mr. Pullan had spoken of "rough indication" of Stevens's "notion," and said his "crude framework" would always be "unworthy of the productions of the pencils" of Sir F. Leighton and Mr. Poynter. The quotation just made, and the manner in which these two eminent artists were content to work out Stevens's design, showed what they thought. Mr. Pullan had spoken of their sub-committee "further strengthening their position" by forming "an alliance" with Sir F. Leighton and Mr. Poynter. To any one who knew the chivalrous sense of honour of Sir F. Leighton and also of Mr. Poynter, and who knew the sub-committee, it was astounding that such an imputation should be made. The sums these "two greatest English painters of our day" were to receive, though great, were yet much below what they would receive for similar work done for private clients. It would have been only decorous on Mr. Pullan's part to have exhibited Stevens's design, or at least a sketch of it; but he had asked the Institute to confirm his judgment,—an *ex parte* statement. On the charge that Stevens's design was one without architectural character, it might be suggested that one unfulfilling test of the architectural fitness of any superadded work and decoration is, *ex origine*, a superadded work was, Did it fit on to what already existed? Let them examine Stevens's design to see. There is a peristyle below the cupola consisting of thirty-two pilasters, spaced equally, with voids at the axial points. There are windows between the pilasters arranged in eight groups of three, the groups being axial with the eight arches of the dome, and between these eight groups of windows the other inter-pilaster spaces are occupied with niches. Let it be observed how Stevens arranged an attic balustrade proportioned to the supporting order, how the balustrade was broken over the pilasters, and how by that expedient he tied the design together and fitted the superadded to the existing work. This, which was one of the features, and was a distinctly new treatment, would suffice to show whether Stevens's design had architectural character. Again, the adaptation of the circular frames, which Mr. Pullan improperly termed "medallions," was also a distinct invention of Stevens's. It was well known that every section of a sphere was a circle, and that simple fact had been taken advantage of by Stevens in his design. The large circular panels were the most characteristic feature of Stevens's design. They gave opportunity for domical panels without lines which sag in the centre, as all rectilinear panels on a concave surface must. It had been objected that they would form ellipses, owing to the perspective, but this distortion through foreshortening happened to all visible objects, and the eye was accustomed

\* Mr. Pullan exhibited a large painting of this design by the late Mr. Heath Wilson and himself.

to and allowed for it. Another advantage of the arrangement of circles was that they made a pattern, as it were, all over the dome, and gave a marvellous unity which did not exist in any other treatment with which he was acquainted. That quality of "all-overiness," if he might be allowed to use the term, was, in fact, only another proof of Stevens's subtle feeling that the cupola was a roof which covered, and not a ribbed transparency to be looked through. A further feature in Stevens's design is the arrangement of the thrones; these are combined with the balustrades, so that the capping of the pedestal forms the seat, while the back of the throne is inclosed by pilasters and a circular pediment; and the whole forms a striking central feature over each of the eight arches. Stevens might have mixed up his thrones and his ribs, and produced a confused effect in the ribs and a bald effect in the space between; but he had more architectural feeling, and he had evidently considered the view as seen by a spectator on the floor of the cathedral. Any one entering St. Paul's by the western door sees first of all the vaulting of the nave and chancel, and a portion of the podium of the "whispering-gallery"; when under the western dome he can see as high up as the middle of the windows in peristyle. He must advance one bay before the commencement of the cupola is visible, and it is only when he has arrived at the arm of the cross that he can see the entire height of the cupola. Now, this gradual unfolding or *apo-kalypsis* of the cupola was certainly one of the data of the problem, and any design must not only fill the mind when the culmination of the whole is seen, but should satisfy the eye at each successive stage. Testing Stevens's design by that canon, the decorative value of the fine group of the axial throne, with the superincumbent circle, would be recognised even before the whole cupola was visible. The placing of all the features on a ground of gold, which permeated everything, was, considering the normal gloom of the dome, not the least of Stevens's valuable ideas. Those who had seen the interior of St. Mark's at Venice would be convinced on that point. Mr. Pullan had criticised the ribs in which the telamons occur. He (Mr. Stannus) was not concerned to defend them; he fully admitted that the whole design was merely a sketch,—that the world lost Stevens before he had completed the working out of his idea; he had probably intended some modification. The ribs, however, were not the finest nor even a necessary or characteristic part of Stevens's design. The manner in which he had fitted his design to the existing architecture, the arrangement and proportion of the circles, the eight axial thrones, and the gold ground permeating all, were to be regarded as the essential features of his legacy towards the solution of the problem. These all showed subtle architectural feeling on Stevens's part. It should be borne in mind that there were such things as designs with architecture introduced, and that the former did not necessarily imply the latter. There might be, for instance, a design in which sham shelves, brackets, walls, colonnades, and ribs were shown in incongruous style; but of such an imaginary build-up it might be considered that less architecture and more architectural feeling would be desirable. With regard to the scheme of storiation prepared by Mr. Edmund Oldfield, M.A., one of the sub-committee, it was not his (the speaker's) function to defend it, but he would remind the Institute that scenes from the Apocalypse were suggested for the dome in Mr. Burges's iconographic scheme of 1871. In conclusion, Mr. Stannus said he quite agreed with Mr. Pullan as to the importance of the problem, and the necessity of preventing irremediable mistakes; but as the whole scheme was to be fully before the public after it had undergone the ordeal of discussion by the Dean and Chapter and the committees, Mr. Pullan was crying out prematurely. The sub-committee were surely entitled to a trial before condemnation, and most people were content to wait until June next for the experimental cartoons to be *in situ*. Friendly discussion and enlightened criticism would be unquestionably of great service at the proper time, but it was to be regretted that Mr. Pullan (who was so competent to enrich the "Transactions" of the Institute by dissertations on other subjects) should have prematurely brought forward the question of the designs for the decoration of St. Paul's. As Stevens's design was still *sub judice*, he hoped that neither it, nor the

action of the sub-committee in adopting it, would be prejudged.

Mr. C. Henfrey said that, as a subscriber to the decoration fund, he must express his disappointment with the proceedings of the committee up to the present time, for they seemed to have devoted the whole of their attention to the decoration of the dome. He should like to see, when he entered St. Paul's, something like the decorative effect in the body of the cathedral which he saw at St. Peter's. The subscribers would like to see something for their money. He had heard the cost of decorating the dome in mosaics put at 40,000*l.* He doubted whether, after incurring that expense, the result would be satisfactory. For the greater part of the year the general effect of the figure subjects would be indistinct, and only the intervening "sploshes" of gold would be visible.

Mr. Ewan Christian said that with regard to the view urged by the last speaker as to the decoration of the body of the cathedral, Mr. Penrose ought to be consulted before anything was done in that direction. He believed that Sir Christopher Wren never asked for any decoration for the main parts of his structure, except only the dome, and he also believed that if Wren could have lived to see the results of some modern attempts at polychromy in churches, he would not have desired to put a bit of colour on the walls of the cathedral. He believed that Wren's intentions as to the parts of the building where he intended colour to be applied were very clearly indicated. Where he had not intended the stonework to show he had covered it with plaster. It was on that account, among others, that he had objected to Mr. Burges's proposal to skin the stonework of the interior and to case it with marble.

Mr. Penrose said it was distinctly stated in the *Parthenon* that those parts of the building which were to be decorated were coated with cockle-shell lime.

Mr. Christian, continuing, said it would be a great pity if Wren's grand work were destroyed by the general introduction of colour, however cheaply it could be done; but it could not be done very cheaply, for it had cost between 6,000*l.* and 7,000*l.* simply to clean the walls of the cathedral. He did not wish to pass any opinion on the design exhibited, but, from the sketch made by Mr. Stannus upon the black-board, it appeared that the right thing was in contemplation.

Mr. Edward Armitage, R.A., said that as a painter who had had some experience in mural decoration, he might be allowed to say a word or two on the subject of the paper. He agreed that it was quite premature now to express an opinion upon the comparative merits of Mr. Stevens's design, or the modifications of it, and the one which Mr. Pullan had exhibited. It appeared to him (the speaker) that the dome did not require any decoration, for it was always lost in gloom. He would rather confine the main decoration to a frieze (such as that executed by Flandrin in the Church of St. Vincent de Paul, Paris), running round the drum of the dome. If, however, the dome itself was to be decorated, he did not think it was a matter of much moment, from an artists' point of view, whether the subject chosen was the Apocalypse or the Te Deum, for to most observers who did not know what the subject was, a large number of figures painted in the dome would merely present a succession of riddles. He had no doubt, however, that Sir Frederick Leighton and Mr. Poynter would be able to show good reasons for their proposals, whatever they were.

Mr. J. P. Seddon, in proposing a vote of thanks to Mr. Pullan for his paper, said that while he agreed that the discussion of the subject in the form in which it had been brought forward was somewhat premature, it should be remembered that the subject was one to which Mr. Pullan had devoted much study. For his (the speaker's) own part, he so greatly admired the dome as it is, as seen dimly through the hazy atmosphere, that he found it difficult to conceive of anything that would look better or more beautiful. Before anything was done for the decoration of the dome, he should like to see some experiments tried on those parts of the cathedral which were nearer to the eye, as, for instance, upon the shallower domes, portions of the chancel, and other parts which seemed to lend themselves to, and even to cry out for, decoration.

Mr. Ralph Nevill said he was very glad to hear Mr. Armitage urge that very little decora-

tion should be put into the dome. He thought that Stevens's design would be very suitable, if not filled in too solidly, and treated in a broad-way so that no part should obtrude itself upon the eyes. But the suggested ribs should be eliminated, for ribs totally destroyed all the beautiful effect which was gained by building a dome.

The Chairman, in putting the vote of thanks to the meeting, said he thought they had had a most interesting discussion, which had in a great measure served to bring the subject more prominently and more clearly before them. There would, however, be wisdom in waiting a little before coming to a conclusion on the subject.

Mr. Pullan, in replying, said his paper had been characterised as premature, but it was three years since the design he had exhibited was made, and he had waited year after year to see what the committee proposed. Mr. Stannus had made light of the ribs in Stevens's design, but they appeared to him to be the chief feature in it, notwithstanding Mr. Stannus's beautiful explanation of the circles. In the thrones in Stevens's design there were large figures seated, and those figures would appear from below to be supporting, Atlas-like, the large circles, not unlike huge spheres, above and behind them. Exception had been taken by Mr. Stannus to the statement that the committee had formed an alliance with Sir Frederick Leighton and Mr. Poynter, but he had not used that expression offensively, but simply as a statement of fact. Notwithstanding what had been said by Mr. Stannus in defence of the Wellington Monument, he (Mr. Pullan) adhered to his view that if Stevens had been a man of the greatest genius he would have seen the absurdity of cramming a monument of such dimensions into the circumscribed space which it occupied. However, on the main question, he trusted that, as everything advanced by opposition and criticism, the discussion of that evening would advance the decoration of St. Paul's.

#### PROVISION OF BUILDINGS FOR SCIENCE AND ART IN GERMANY.

The following sums have been set down for the requirements of science and art in Berlin in the budget proposals to be submitted to the Prussian Diet:—For the purchase of the Niederländische Palais for enlarging the Royal Bibliothek, 2,600,000 marks (130,000*l.*); for the acquisition of a site in the Potsdamer Strasse for the Royal High School of Music, 773,100 marks (38,955*l.*); for enlarging the testing laboratory of the Royal China Manufactory, 22,500 marks (1,125*l.*); for facing the Royal Schauspielhaus with sandstone, 135,000 marks (6,750*l.*); towards the building fund for the Natural History Museum at the Neue Thor, 500,000 marks (25,000*l.*); for the foundation of an Historical Seminary, 10,400 marks (520*l.*); for cleaning and arranging the objects found at Pergamon, 28,000 marks (1,400*l.*); for the Ethnological Museum in the Königgrätzer Strasse, 800,000 marks (40,000*l.*); towards the building fund for the Technical High School, 450,000 marks (22,500*l.*); for rebuilding the Silesian Railway Station, 150,000 marks (7,500*l.*); for the construction of a public mortuary for Berlin, 200,000 marks (10,000*l.*). Total, 283,750*l.*

#### FLOOD PREVENTION WORKS AT NINE ELMS AND BATTERSEA.

With the view of preventing the serious damage to houses and other property by the constantly-recurring overflow of the Thames, the Wandsworth District Board of Works are at present engaged in raising the river-wall at different points between Nine Elms, Battersea, and Wandsworth. These works are being carried out, amongst other places, at the Nine Elms-lane draw-dock; the entrance-gates to Downey's dock, dock-road; the public way to the river in Nine Elms-lane; premises in Albert-road; the public footpath at St. Mary's draw-dock; the footpath in front of St. John's Training College, Battersea; and the draw-dock at York-place, Battersea. The extreme abnormal height to which the river has risen within the last two or three years, during exceptionally high tides, has been ascertained, and at all the several points named the river boundary-wall at the water's-edge will be raised to a level higher than that which the tides have ever yet reached, which, it is expected, will be an effectual barrier against flooding in the event of future high tides.

## "ON SUNDRY WORKING DRAWINGS." \*

I HAVE referred to the subject of roof tie-beams, the essential necessity of which our forefathers frankly accepted, as was their wont, and tried to make the best of. The modern mind, however, seems to abhor ties, and one of the problems that I have continually had to endeavour to solve has been how to construct church roofs without any visible ties, and that often to cover walls of less than Mediaeval thickness, and of more than ordinary spans. In Kent and some other of the south-eastern counties, half-barrel shaped roofs are not infrequent, but they are generally provided with efficient supports in the shape of tie-beams with ring-posts and braces. There is one of early date, well moulded, at Salvestone Grange, near Margate.

At Eythorne, near Dover, I succeeded in reproducing all these features in the new roofs, which I found it was absolutely necessary to substitute for old decayed ones. But at Great Kimbale, in Buckinghamshire, when I put a similar roof to the chancel of the parish church, it is even now in contemplation to cut away and dispense with the obnoxious tie-beam and king-post, because it happens, from some points of view, to appear to cross the upper part of the eastern window. This leads me to notice and to utter a protest, however unavailing it may be, against the absurd modern craze for an undisturbed vista from one end to another of our cathedrals and churches. All mystery and effect is thus sacrificed, and the interiors of our ecclesiastical buildings become as bald and as bare as those of barns. In the Church of Great Kimbale, to which I have alluded, I met with the worst example in my experience of walls having been thrust outwards by the spreading of their roofs, but I succeeded in restoring them bodily to their proper upright position, without having them rebuilt, as at first appeared necessary. This I was able to accomplish by the simple expedient of having them hauled up by ropes attached to windlasses outside passing through the opposite openings, after having previously disengaged the hinges of the several columns of the arcades, and subsequently underpinning them.

It is noticeable that all these old church roofs were constructed, however rudely, in oak, and that they have owed their duration to the extreme tenacity of that timber, in spite of all the adverse circumstances to which I have called attention. They have in very many cases been renewed or altered at a far later date than the ages of good church architecture, probably in rude imitation of the former ones, but with inferior construction; or perhaps the timbers of the old roofs had become decayed at their feet only from contact with the damp walling, and their ends having been cut off, they have been re-used and re-framed, and so made to do duty again for a roof of lower pitch than the original. This may generally be discovered by finding the marks of the previous roof against a tower or the end gable, and I lately found this to have been the case at the parish church at Betchworth, in the county of Surrey. In this case, also, disused and displaced mortise-boles betrayed the fact, together with the construction being inferior to any real Mediaeval work, the struts having been only nailed to, and not housed into the rafters and collars. The roof had been covered with exceedingly heavy stone slabbing, which had been improperly bedded completely in mortar, which, by capillary attraction had rotted the lathings of the tiling and the ceiling between the rafters; these, again, being too close to each other, had left but little intermediate air-space (another frequent cause of similar disaster). The roof timbers had, in consequence, sunk under their weight, and become dislocated at their points of junction, and the walls had yielded to their pressure, and so the complete restoration of the whole had become imperative.

The present almost prohibitive cost of oak, and difficulty of getting it seasoned, import another element for consideration into this already sufficiently vexed question of restoration; for the character of construction, what was suitable to that denser material is not so when fir has to be used instead. As an example, therefore, of the manner in which I have endeavoured to solve this problem in connexion with that of the non-tolerance of ties, I may

call your attention to the working drawings which I have just prepared for this particular case at Betchworth. In the first place, I relinquished the use of the framed couples alone, which I consider is only desirable when oak can be obtained. For this treatment I have substituted one in which principals are introduced at moderate distances apart; and, to avoid the intrusion of ties, I have had to place the collars high up. I have made continuous curved braces to sustain them, and by connecting them thoroughly to the principal rafters reduced their thrust to a minimum. I find, however, in looking over my folios that in general I seem to have preferred to adopt, whenever I could, roofs with half-barrel shaped ceilings rather than those left open to the ridge, as in the last case described. The reason is that I consider the former the better adapted to maintain an equable temperature within buildings, and to give greater facilities for ventilation by means of the space there is left in them between their outer covering and the ceiling below the collars and braces, and also that they transmit better to a distance the sound of the voice. Then, again, the distance between the covering and ceiling gets rid of the danger of dry rot, already spoken of as very likely to occur when the covering is of tiles bedded in mortar or cement, and there is but little space for air between it and the ceiling, which, if of plaster, is impervious, whether this be between or below the rafters themselves. And yet the outer covering of roofs should be made impervious, or else it is but of little use to attempt to warm by artificial means the interior of a church. With the ordinary coverings used for the sake of economy, the heat evaporates through them almost as fast as it is generated, and the air of the interior, getting rapidly cooled by contact with the cold covering, descends, and causes the draughts so bitterly complained of by congregations. The least that ought to be done is to cover the rafters with stout boarding, ploughed and tongued, with asphalted felt laid upon it, and, above this, battens about 2 in. by 2 in. should be placed diagonally to brace the whole roof, and to allow any rain driven in under the tiles or slates to pass down to the eaves. The tiling or slating battens should be fixed upon these. I should even advise the boarding to be doubled, and to have plain felt between the two thicknesses, as well as the asphalted felt above them. Then the outer covering can be laid, as it should be, without mortar or cement. The construction of this class of roof will be that in which principals are used with purlins to support the rafters, and cradling to carry the ceiling; and I shall call your attention to the working drawings of several of such roofs in connexion with some of the buildings I am about to mention.

At Great Yarmouth I have had considerable experience in connexion with half-barrel shaped ceiling roofs of large spans. It was in the year 1862 that I received the commission to undertake the restoration of the noble Church of St. Nicholas in that town. This, as you are doubtless aware, is one of the largest, if not the largest, simple parish churches in existence. The special peculiarity of it is that all its aisles have the immense internal width of about 40 ft. This commission was the more gratifying to me as I had been entirely unacquainted with the place and its inhabitants until I was informed that the committee had decided upon offering the work to me. I mention this fact because, although for very many years my relations with this work were of the pleasantest, and I was permitted to control all that was done at the church, in order that one mind might guide the whole, after a time that rule became relaxed, and I resigned in consequence. I am glad, however, to learn that it has lately fallen into the able hands of Mr. Pearson, under whom I trust that the work may be satisfactorily completed. Some of the roofs and walls had fallen into a similar state of dilapidation to what I have been describing in other cases, and from the like causes. The first of the roofs that I had to replace there was that of the chancel, which has a span of only 25 ft. For this it was desired that I should, and I was able to, follow the old construction of framed couples, and to employ the same material as before,—that of oak. But when, later on, I had to undertake that of the vast south aisle of the nave, I found that practically neither was admissible, nor could I venture to introduce there any ties, as there had not previously been any. I therefore worked out the problem afresh, with fir for the material, and with principals and purlins and

cradling for the ceiling, the result of which was entirely successful.

This Church of St. Nicholas, though very impressive from its great scale, is not satisfactory, in that its nave and chancel are less in width than their respective aisles, the former having about 25 ft. span and the latter 40 ft. In the new church dedicated to St. James, at the southern extremity of the same town, which is now in course of erection from my designs, I tried, while keeping somewhat to the same scale, to correct this disproportion, and so made the width of the central compartment about 35 ft., and that of the aisles 25 ft. The site that I had to deal with in this case was almost square, and I therefore adopted the Greek cross as the type for its plan. There are but four columns in the interior, and the central crux compartment is covered by a segmental dome of concrete carried by the four large arches and four smaller ones spanning the angles of the crux in place of pendentives. This it is my intention to have decorated with Rust's mosaic. In the pulpit I used the same material of mosaic in connexion with decorative stonework from the Fulham potteries, resting on a base of polished serpentine. Such materials, some specimens of which have been sent by Messrs. Belham for your inspection, I have found to give facilities for the introduction of constructional and durable colours into buildings, the want of which I had long previously felt and deplored. The interior of this church is lined with buff-coloured brickwork, diapered with red, and its exterior is likewise constructed with considerable variety of colour in flintwork and red and black brickwork and stone dressings. The roofs are of the character of those described at St. Nicholas's; and indeed in the general size and scale of the parts I have tried to adapt in St. James's Church such of the characteristics of its mother-church as had impressed me with admiration, and had appeared to me to be desirable to introduce into the ecclesiastical architecture of our own time.

I now propose to lead you right across England to the opposite coast of Wales, where it has fallen to my lot to carry out some of the most important works that have been entrusted to me. My first introduction to that neighbourhood was in the year 1863, during which I received a commission from Mr. Thomas Savin, of Oswestry, to whom the principality of Wales owes a great part of its railway accommodation. That gentleman asked me to make a survey at Towny, in North Wales, where he contemplated laying out for building all the land lying between two of the stations of his coast line. When that was finished he desired me to proceed to Aberystwith by a morning train, so as to be able to advise him in the evening of the same day as to some additions he proposed should be made to the building in that town known as Castle House, in order to convert it into an hotel. This was, as I found it, a large and complicated collection of buildings, of which the nucleus was a triangular structure with an octagonal tower at each corner. This central portion had been built by Nash, to whom London owes Regent-street. Having taken a rapid survey, I made a sketch design for a wing to be built southward of the above-named structure, along a narrow strip of land lying between the road and the cliff. This was intended to contain a large saloon to serve as a dining-room about 100 ft. long, having eight bay windows overlooking the sea, and at the further end of this was another octagonal tower. Mr. Savin approved this design at once, and desired me to lay out the foundations of it on the following morning, ordering some thirty men to be on the spot to receive my orders. This I accordingly did, after which I proceeded to town to complete and send down the requisite drawings. In order to provide as many bed-rooms over this saloon, without interfering with its area by any supports except those afforded by its external walls, I projected the outer face of the first floor to the front of the bay-windows by means of arches spanning from one bay to another, and constructed the partitions with queen-truss framing, which permitted of openings in the middle of the transverse ones for a central corridor. The longitudinal ones again rested upon these latter, and were framed likewise with openings for doorways in the middle of each of the rooms so divided off. These trussed partitions provided also the strength requisite for a flat roof over the whole, proposed to be covered with asphalt upon concrete, and

\* From a paper by Mr. J. P. Seddon, read before the Architectural Association on the 24th ult. See p. 706, ante.

to serve as a Belvedere, whence any number of visitors congregated on it might enjoy the extensive coast and sea views obtainable from it. This flat was approached by three circular staircases within turrets, from the saloon and bed-room floor and waiters' rooms. Since the conversion of the building into a college this space has been enclosed, and provides a large recreation apartment for its students. My employer, acting as his own builder, decided, to my regret, to execute this wing in brickwork, to be covered with cement. This being the case, I designed the upper portion in timber-framed construction, with brick panels to be cemented and ornamented with incised work and coloured so as to produce effect.

During the progress of this southern wing, I one day received a summons by telegram from Mr. Savin to go down to consult with him in the evening about the construction of another wing northward of Mr. Nash's building. I was again allowed no time for the preparation of working drawings, but was instructed to proceed then and there to carry out my approved sketch, 500 men being told off to execute the work, the whole of whom I had to keep well employed. This time, however, I was permitted to have my own way as to material, and I consequently selected Bath stone for the dressings, relieved by blue Pennant stone from Hannam, near Bristol, for the columns, and a local cinnamon-coloured stone from a quarry belonging to Mr. Savin for the wall work. The principal entrance was arranged in the centre of the building, at the back, where there not being space sufficient for any porch of an ordinary rectangular form, I designed the triangular one, which was erected, and gave every facility required. Adjoining the entrance-lobby on one side was the principal staircase within the tower, the plan of which is trefoil-shaped, next the street. On the side is a special staircase to what was intended as the hilliard-room and its appurtenances. The hilliard-room is of an oval form, and capable of holding three tables with hays on either side for spectators. Underneath this apartment, on the ground-floor, is one which was intended as the bar, and whence the approaches to nearly all parts of the building could be commanded. The intermediate floor was required to be of great strength, so as to obviate all danger of vibration to the hilliard-tables. To accomplish this purpose, being indisposed to use girders, I designed a special system of flooring, in which, although the span is 25 ft., no piece of timber deeper than 9 in. was used. The joists, 9 in. by 3 in., were strengthened by struts underneath, disposed in such a manner as to carry a cradling for hoarding ceilings, with moulded ribs, which were, in fact, shallow vaultings in woodwork, and possessed of very great bearing power. This same method of flooring I afterwards used for several of the other large rooms in this building, as well as in a mansion at Abennaide, near Aberystwith. For the large saloon, about 80 ft. long, intended as a drawing-room, and a smaller adjoining one in this north wing, I adopted trefoiled shapes for the plans of the hays next the sea, and utilised an irregular piece of ground on one side of the former for a series of vaulted recesses, separated from the room by a stone arcade with marble columns; and at the end of the room is a segmental apse with a range of traceried circular windows in stone, to be filled with ornamental glass.

Before leaving the neighbourhood of Aberystwith, I may mention some particulars in connexion with the restoration of the noble cruciform Church of Llanhadern, which originally was a cathedral, and is situated about a mile from that town. This has been a work which has extended over a very considerable portion of my professional career. It has been carried out in successive portions, as the collection of the necessary funds has permitted. It commenced with the restoration of the nave, and the rebuilding of the porch in the year 1808. The tower and transepts were restored in 1878, and the work to the chancel is now in progress. The first portion was begun before the establishment of the Society for the Protection of Ancient Buildings, which at the second stage in the proceeding, though they did not honour me with any notice of their intention, sent a protest to the committee against the further prosecution of the work. Other antiquaries, however, of equal zeal and ability, and greater courtesy, had at the very commencement interested themselves on behalf of the venerable fabric, in particular the Rev. Mr. Petit, to whom

Llanhadern Church had always been dear, and who has given one of his characteristic sketches of it in his work entitled "Petit's Church Architecture." That gentleman, anxious to learn what was proposed to be done to the structure, asked Mr. F. Penrose, the architect, to confer with me on the subject on his behalf. Recognising at once the propriety of the feeling which had dictated this step, and the courteous manner in which it was conducted, I addressed myself to furnish sufficient accurate particulars to enable a fair judgment to be formed. I directed measurements to be taken at distances of 10 ft. apart the whole length of the church, from lines plumbed from the base, and those showed the precise amount that the thrust of the decayed roofs had pushed the walls outward. This, in fact, was found to be not less than 13 in. in a height of 19 ft. The consequence was that Mr. Penrose intimated to me that it was obvious that the condition of the fabric was as dangerous as I had reported it to be, and that the work proposed was necessary. The special characteristics of this church are extreme simplicity in combination with the grandeur that results from largeness of scale, each arm and the tower being 30 ft. wide externally. The only place where any richness of architectural detail had been indulged in was in the southern doorway, where the jambs were in three orders, shafted with rudely-carved capitals, and the arch was richly moulded, the details being of the characteristic Early English work of the district. All the original windows had been simply narrow lancets. These were rather curiously grouped in the west end of the nave and end of the south transept as triplets, one light smaller than the others being raised much higher. Those of the eastern end had been superseded, with an advantageous effect of concentrated light in that part, by a large Perpendicular window, with a smaller one of the same style on either side of the chancel. These, which are still dilapidated, the former having its mullions and tracery of wood, and the latter being blocked up with masonry, I propose to restore and reglaze. The original levels, or in some cases slopes, of the floors were sought for, and when ascertained were replaced. The floor of the nave was to slope upwards very considerably from the western end to the tower. In the new roofs which I had to design I adopted that character which my previous experience at Great Yarmouth had convinced me to be the best for such a span,—32 ft.; that is, with principals and cradling for the ceilings. The ceilings I have varied, increasing them in richness eastwards; and in that under the tower floor I have adopted wooden vaulting to support and make rigid the beams that existed before. In the same manner, in the chancel, its ceiling is made to serve the same purpose for its old but rude oak roof, which it proved possible to retain. In my designs for the flooring or paving and furniture, which were all necessarily renewed, I have introduced an increasing amount of richness of detail eastward, with the view of enhancing by contrast the effect of the extreme simplicity of the architectural features of the stone structures of the church, which I have not ventured to alter in any way. I may call attention to the working drawings of the pavement under the tower as being composed of the mosaic of Mr. Rust's manufacture in combination with tiles executed by Mr. Godwin, of Lugwardine, from special designs of my own representing subjects from the Apocalypse. In the chancel of Holmer Church, near Hereford, and in some other places, I have also used this same series of tiles, but without mosaic.

Having described the new Church of St. Paul, Hammersmith (of which we published the illustrations and particulars in our last), Mr. Seddon said,—In the work of building the new Church of St. Andrew, at Redruth, in the county of Cornwall, I am associated as joint architect with Mr. James Hicks, of that town. The plan is that of a very wide nave with exceedingly narrow aisles, intended to serve as mere passages; beyond are north and south transepts and the chancel and chancel aisles. The east end of the nave is polygonal below and rectangular above. The site is on the slope of a steep hill, and thus space is obtained underneath the western portion of the church, and this is utilised for vestry accommodation and for Sunday schoolrooms. The approach from the basement story to the church is arranged so that the choir may file upwards by

two staircases around the font, and then uniting pass in procession down the central passage of the nave to the chancel. The district of Redruth possesses many striking varieties of building stone, most of which we propose to make use of in the following manner:—In the first place, granite will be used for all the quoins of the main angles of the building and for the buttresses. The chief element of expense in its use is that of the labour of dressing it, and not of the material itself for the hills surrounding the town are chiefly composed of granite of the finest quality, samples of which may be seen in the halustrading of the Thames Embankment. The cost of working mouldings, undercutting, or tracery, however, renders it inadmissible for such purposes. Box-ground Bath stone, from the quarries of the Messrs. Pictor, has been chosen from among the west-country oolites, in consequence of its excellent weather quality, for the finer dressings of the outside, and Corsham Down for those of the inside of the church. But Bath stone will be used as sparingly as possible, and only for the finest of the dressings. The secondary quoins and hands shown on the drawings are of a local stone of a deep-brown colour, which when used alone for large masses of walling has a very sombre effect, but it forms an excellent hoarding to inclose panels of brighter and more cheerfully-coloured stones, such as white and red granite spalls, spar, Alvan, and other waste stones obtainable there at almost nominal cost. The above stones, which are of light grey colour, will be used for plain arches. We hope thus to show in solid and picturesque construction the adaptability of the several varieties of the peculiar building stones of the immediate neighbourhood, and I am assured by Mr. Hicks that this result will be obtained at less cost than if any one particular kind of stone had been selected for use throughout, for while all those mentioned can be easily obtained in moderate quantities, no one sort can be had in sufficient amount without special quarrying.

#### THE PANTHEON.

At the last meeting of the Architects' Society of Berlin, Herr Adler read an important paper on the Pantheon at Rome, recapitulating the latest conclusions as to the origin and purpose of that celebrated edifice. Among the numerous archaeological investigations which have of late been pursued in the Italian capital, there are few of greater interest than those connected with this building. Recent excavations have laid bare the ground in the immediate vicinity of the Pantheon, and have thereby raised afresh the question as to the object for which it was originally erected. According to one well-known theory, the Pantheon was simply a grand vestibule to the *Therma* of Agrippa, which stood immediately in the rear of it. Another view is that it was itself a great bathing-house, a swimming basin, or *frigidarium*. A third hypothesis is that the edifice was built prior to the *Therma*. It is certain that at one time the Pantheon and the *Therma* were architecturally connected. The other thermal establishments of ancient Rome all show great similarity of plan to the *Therma* of Agrippa; moreover, it is certain that the domes of the baths of Constantine and Caracalla were really employed as bathing-halls. But in spite of these facts there are technical and architectural data going to show that, originally at least, the Pantheon was not used for such purposes.

It was formerly generally believed that the architect of the Pantheon was Valerius of Ostia, and that the building was dedicated to Jupiter Ultor, but this view has long been abandoned. In the writings of Pliny and Dio Cassius, the name "Pantheon" is frequently met with, and this fact is the more important as the former author had seen the edifice in its original form as it existed prior to the great fire which, at the time of the Emperor Titus, laid in ashes a large portion of Imperial Rome, then a comparatively newly built or recently rebuilt city. We know from various inscriptions that have been preserved that the Pantheon was the place in which councils were frequently convened to deliberate upon affairs of State. We know from the same source, too, that it contained the statues of heathen deities. Moreover, Dio Cassius has recorded that Agrippa intended to erect a statue of Augustus Cæsar within the building, and to confer upon the edifice the

name of the Augusteum. This honour, however, was declined by the Emperor Augustus, but he assented to his statue being placed in the entrance-hall and Agrippa's being set up opposite to it.

There appears, indeed, hardly a doubt that the Pantheon was erected as a common divine temple for the worship of the Gens Julia. The part of the city where it stood was at the time called New Rome, and was, in fact, the scene of the great architectural creations of Augustus Cæsar. The entire structure and fitting up of the Pantheon point with almost perfect certainty to Augustus, the ruler who had given peace to the world once more, and principally concerned in its origination.

Assuming, then, that the Pantheon was a temple of the gods and heroes, the further question arises, how many statues it contained. There were eight niches in it, one of them serving as the entrance. It is probable, therefore, that the statue of Cæsar stood in the principal axis, and that ranged on either side of him were those of Romulus, Julius Cæsar, Æneas, Anchises, Mars, and Venus,—from the last-mentioned goddess it is well known that Cæsar insisted that he was directly descended. Between the chief niches there were eight smaller ones somewhat projecting, and these possibly contained statues of other gods and heroes. A somewhat surprising fact in connexion with the dome is that the axial division of the ribs of the cupola does not correspond with the arrangement of the ground-plan. It shows multiples, not of eight, but of seven, whence it appears clear that the architect deemed it proper to lay particular stress on the niches occupied by the images of the gods.

Respecting the original distribution of the space and the construction of the Pantheon, the speaker had permitted himself in the year 1871 to publish his hypotheses on the "Wüchel Programme." To his remarks then he now adds that the caryatides were erected in the interior by Agrippa, and that the interior capitals, probably for the sake of greater despatch in completing them, were of bronze. It has been conjectured that for similar reasons the caryatides, too, may have been made of bronze, and this would explain their disappearance at the time of the great fire.

At the close of the sixteenth century, Palladio, it is well known, took measurements and drawings of the Thermae that were then accessible at Rome. Unfortunately this collection, which has been preserved, is not accompanied by any text or by a statement mentioning what was really in existence at that time and what additions Palladio may have made for the sake of completeness. It is, however, interesting to find that the newest excavations have confirmed the correctness of the plan he gives of the Thermae of Agrippa. According to Palladio, there was no direct connexion between the bathing establishment and the Pantheon. The former, on the contrary, only touched the latter through a niche in which the remains of a pedestal are still to be seen, and upon which some large group or other was placed. It is established, therefore, that the Pantheon was never the vestibule to the Thermae, nor was it itself a great swimming-bath or basin, or anything of that kind.

The Thermae of Agrippa, as Herr Adler showed, contained not only bathing compartments, but all the fittings of a Greek gymnasium; and on comparing them with the Thermae of the later Imperial times, it is found that the latter are simply a variation of Agrippa's Thermae. It is, therefore, of special interest to know what was the origin of the latter. The grandeur of the dome and the monumental splendour of the entire plan of the edifice indicate at once that this cannot have been a first attempt, but that it was founded on preceding models. These were not in Rome. They belonged to a country where bricks were employed in building, a country where Oriental habits were required, and where gymnastics were practised after the Greek fashion. Hence it is probable to conjecture that the models of the Roman Thermae are to be sought for in the Euphrates Valley, and in the period after Alexander the Great. The grand ruins of the city of Selencia, which Sallust calls the greatest in the world, *maxima orbis*, have hitherto remained unexplored. But it is well known that Selencia exercised an influence on cities to the West, especially on Antioch and Alexandria. It is more particularly the architecture of the last-mentioned city that deserves atten-

tion in this inquiry, as Alexandria was well-known to Augustus and Agrippa through the struggle with Mark Antony. It was there that stood the Soma, the colossal tomb built to contain the body of Alexander. There, too, was the Panion, an artificial mound or hill built after the style of the Babylonian and Assyrian terrace pyramids, with a serpentine passage leading to its summit. Let it be remembered that the tomb of Augustus at Rome likewise consisted of a great artificial hill or mound, and, moreover, that Egypt was the original land of all associations of deities. It will then appear that the unknown architect of the Pantheon must have come or derived his model from Alexandria.

The strange position of the Pantheon before the Thermae, with that,—according to a former conjecture of Herr Adler's, a conjecture confirmed by the latest excavations,—it was connected by ten walls, is to be explained by the fact that under the circumstances it was only thus possible to erect the building at all. The old Romans hated everything Greek; they despised Greek gymnastics. It is, therefore, not probable that, after the analogy of other traditional examples, the erection of the Pantheon was in the first instance only the result of a vow,—perhaps for the victory at Actium,—and that the thermal establishment was built near it purely as a matter of chance.

In conclusion, the speaker proceeded to defend the study of the origin of the Pantheon by the fact that it exerted enormous influence on almost all succeeding epochs of architecture.

#### MR. RUSKIN ON CISTERCIAN ARCHITECTURE.

"CISTERCIAN Architecture" was the subject of which it was announced that Mr. Ruskin would discourse on Monday last at the London Institution, Finsbury-circus, in lieu of "Crystallography," as at first arranged. Anticipating a crowded audience, our reporter, desirous of obtaining a seat convenient for hearing, arrived at the Institution forty minutes before the time announced, but he found every seat in the lecture-theatre, and even the steps of the gangways, occupied at that time, and had to content himself with a standing position in the gallery, which, with the approaches thereto, was greatly overcrowded. However much this overcrowding may have testified to the popularity of the lecturer, it likewise afforded testimony as to the badness of the arrangements,—indeed, it may almost be said, the utter absence of arrangements,—made by the officers of the Institution, who, when the theatre was full, should have refused to allow more people to crowd into it and into the approaches. The pressure of the crowd was so great that the progress of the lecture was several times interrupted. Ladies who had fainted could not be got out, owing to the one exit being densely packed with people. Had a panic arisen the results could not but have been very serious, and it is to be hoped that something will be done to mitigate this danger. Mr. Ruskin (whose voice is weaker than it was some years ago), contrary to his usual custom on such occasions as this, read from manuscript, and read somewhat rapidly, so that, under all the circumstances, it was impossible for our reporter to hear and record all that the lecturer said.

Mr. Ruskin, after expressing the pleasure which it gave him to be present, said he owed an apology to his audience for changing the title of his lecture. There was, however, a most consolatory paragraph in the *Globe* the other evening, which advised him that all his titles were equally good and appropriate, whatever the subject might be. Now, the *Globe* was rather in the right, for, in truth, the lecture on "Crystallography" would have contained a good deal about Cistercian architecture, and it was only by great self-denial that "Crystallography" had been excluded from "Cistercian Architecture." Among the circumstances of his early life for which he was most thankful, and for which he looked back with more than filial gratitude, was his father's fixed habit of stopping patiently at some roadside inn on his journeys into the country, while he (the lecturer) was making himself acquainted with every feature of the castle or every nook of the cloister which existed in the locality through which his father was travelling. In his visits to those romantic buildings immortalised by Sir Walter Scott, he took an interest, as a child, which had a marked effect on his whole subsequent

life. Brought up in the strictest principles of Calvinism, however, he never heard his parents speak slightly of those to whom we were indebted for the introduction and spread of Christianity in these islands, and never heard them cast any doubt upon the sincerity of the faith of Catholicism. But, in common with most English people of their day, they were suspicious of the monastic as distinguished from the clerical power, and it was an inevitable conclusion to a visit to Bolton or Jedburgh that it should be pointed out to him how careful the monks were to secure the richest lands of the most sheltered valleys for their abodes. But, admitting that to have been the case, were the monks to be reproached with selfishness? Did they labour for themselves alone? The sagacity which discerned, and the industry which re-deemed, waste lands at riversides from inundation and fever should be remembered to the credit of the valley monks, who, primarily successful in agriculture and architecture, were to be distinguished from the higher or mountain monks, and from all subsequent brotherhoods,—whose life of meditation was inconsistent with those practical labours which are beginning to be discerned by history as being probably the most vital elements of civilisation during a period of which the lecturer could scarcely speak without sketching the rise and decline of ecclesiastical politics. There remained now only eighteen years between the close of the present year and the opening of the twentieth century, and these 2,000 years he would divide into four periods of 500 years each, which presented distinct series of phenomena. In the first 500 years we had the fall of the Roman Empire, the extinction of ceremonial paganism, the establishment of the early traditions of the Church, and the completion of the Vulgate translation of the Bible by St. Jerome. In the second 500 years the proper work of the Church began, the work of the hardworking saints, not of the St. Catherines, the St. Michaels, and the St. Cecilians,—although he was pleased to find that parish clergymen were beginning to recognise St. Cecilia, and he could not help wishing that she were a little more cared for at the "Monday Poplars." In the third 500 years we had, in no small degree owing to the energy of the Cistercian order, the creation of Gothic architecture, including the resuscitation of the art of painting, lost with Apelles. In that period there were perfect laws of honest commerce depicted on the walls of churches; there was a perfect scheme of Christian education defined for the people on the walls; and a perfect picture of civil justice was afforded when the kings and barons of England submitted their quarrels to the decision of ecclesiastics. What had we to show as the products of the present and fast-concluding vista of five hundred years? We had printing, gunpowder, steam, dynamite, liberty, science, Parliamentary eloquence, and the Parliamentary *clôture*. There were strongly marked and trenchant lines of separation between these four periods,—lines not always seen by historians, who, although they recorded the different locks of guns and links of armour that prevailed in different reigns, often seemed to regard it as a matter of no concern whether kings were enthroned under round or under pointed arches. In the year 480 there was born in Rome a boy, the son of a senatorial house, who was brought up during his childhood amidst all the pride, pleasure, and atheism of Rome, and, as Mr. Froude had said, there was no atheism like that which existed in Rome at that time. When the boy was fifteen years of age he resolved to break with these associations, and escaping from his father's house he took refuge in the hills of the Campagna. His friends made diligent search for him, but in vain. He founded, on the site of a Pagan temple, the Monastery on Monte Cassino,\* whence was disseminated the Benedictine gospel, which taught that the performance of useful labour was man's duty on earth. M. Viollet-le-Duc had given a vivid picture of things as they were at Monte Cassino; he was most careful and impartial as an historian, and he (the lecturer) owed as much of pleasure and of profit to Viollet-le-Duc as an historian as he had suffered from the quite conscientious idea on the part of that distinguished man that Gothic architecture ought to be restored to its pristine power in the cities of France. Viollet-

\* Some account of this famous abbey and of the work carried on there for centuries will be found in the *Builder* for 1879, p. 1188.

le-Duc's mistaken love for Gothic architecture had led to the destruction of many precious monuments by restoration at the hands of his assistants, and the work had been carried on since his death. He (the lecturer) was, however, glad to be able to pay a tribute to the perfect science of Viollet-le-Duc's structural architecture, and to the perfect candour of his history. We who lived in the present day could with difficulty conceive the disorder which followed the fall of the Roman empire in the West. In the midst of the chaos, the monks descended from Monte Cassino, and spread themselves through Germany and the North of Europe, founding monasteries which became centres of industry and homes of security for the peasantry. They restrained and controlled watercourses, reclaimed and cultivated waste lands, and in doing all this they set an example of self-denial which was not without its effect on the people. Before the close of the year 1000 the Benedictine order had founded no fewer than 15,700 houses or abbeys, each with its abbot, who was partly a schoolmaster, partly a bishop, and, it might be said, partly an innkeeper; in short, he was a man who was concerned for the welfare of the bodies as well as of the souls of others. He possessed power independent of, and often in rivalry with, episcopal pretensions. When Cluny was founded, its lands were given by the dukes of Aquitaine, and the walls were raised by the kings of France. Cîteaux, on the other hand, was founded in a marsh by poor monks. The lecturer next proceeded, by the aid of a plan of the Monastery of St. Gall (enlarged from Viollet-le-Duc), to explain the arrangement of a Benedictine house. As showing the importance with which the work of the gardener was regarded by the order, it was pointed out that the gardener's house was nearly as big as the abbot's house. Opposite, and in due symmetry with it, was the doctor's house, with its separate garden for medicinal herbs. Then there were workshops and farm buildings. "Work-shops" he had called them, although there was no selling here,—all was given. At Cluny goldsmiths' and jewellers' work was the leading industry followed, and what sort of work was done there in those times was still to be seen in the brooch which clasped the mantle of St. Louis. At Cîteaux and at Clairvaux other industries were followed, but in each establishment there was a monk charged with the distribution and organisation of the work. In conclusion, the lecturer observed that Cistercian architecture was kept subdued by the severe lessons of St. Bernard; and by restricting itself always to the materials close at hand, it succeeded in producing always beautiful structures; severe lessons he had called them, though they were really loving lessons in the true sense. The chief direction in which these lessons told in architecture was the forbidding of everything that was ludicrous and that was cruel. The life and labours of the Cistercian monks in building, in agriculture, and in the keeping alive of the learning of the ancients, were fraught with important lessons to the people of the present day, who were too prone to take as their motto "Let us eat and drink, for to-morrow we die." St. Bernard said, "Let us watch and pray, for to-morrow we live." He (the lecturer) felt much more like one who needed to be preached to than like one who should presume to preach to others, but he trusted he might be allowed to say, "Let us labour joyfully while we have light, for we know not what shall be ours on the morrow."

#### THE VICTOR EMMANUEL MONUMENT, ROME.

The Italian Government has determined not to carry out any of the numerous designs which were sent in early in the present year in the prize competition for the national monument to Victor Emmanuel, views of some of which we gave. On the contrary, it has decided to open a new competition. The committee charged with the supervision of the scheme held a meeting recently, the Minister of the Interior in the chair; and it was resolved that the conditions of the new competition should be as follows:—The Victor Emmanuel monument shall stand at the eastern point of the Capitol, in place of the Franciscan monastery and the barracks of the city police, occupied in ancient times by the temple of Juno Moneta, the base being equal to that of the church of Sta. Maria in Araceli. The principal subject is to be an

equestrian statue of the king. The front of the monument will look to the north and towards the Corso-street, which is to be lengthened up to the foot of the Capitol, and to be brought into connexion with it by help of a monumental free staircase. The designs are to be sent in by December 1st, 1883. The competition is entirely open, foreigners being permitted to compete with native artists on equal terms.

#### THE NEW LAW COURTS.

##### THE GREAT HALL.

THE Great Hall of the new Law Courts, which is represented in our illustration, forms a most important feature in that series of buildings, and very naturally an architect of the late Mr. Street's ability did not overlook its importance. In it he has left us a structure which must challenge much criticism. The hall is undoubtedly a noble work, and is possessed of considerable dignity; its great simplicity, solidity of construction, and refined detail, cannot but merit the approbation of all lovers of Gothic architecture. With regard, however, to its proportions we are not quite so prepared to express unqualified satisfaction. We do not for a moment suggest that they are ill-considered, unpleasing, or unscientific; but they are so far removed from those which one expects to meet with in such a building, that the mind is certainly rather surprised, and apt to question such a remarkable departure from the general usage; and the first impression is that we are in the nave of a church. It must, however, be acknowledged, on behalf of the lamented architect, that in England, at least, we are unaccustomed to secular buildings of the precise style which he has here adopted; that we have no large halls with vaulted roofs; and that, owing to the unfortunate selection of the site, the building was cramped for space, and height was a necessity for the sake of efficient lighting.

The proportions of the hall are as follow:—Length, 230 ft.; height, 80 ft.; width, 48 ft. It is divided into nine compartments or bays by clusters of columns supporting the vaulting, which is domical, the domes springing from boss to boss instead of from arch to arch, as is the more usual practice; thus the arches which separate the bays occur at the highest portion of the dome, and the boss at the lowest. This gives the vaulting a rather singular effect when seen from either end of the hall. The building is lighted by very lofty windows of two lights, having richly-shafted jambs and mullions, except the two windows at the north and south ends; the former of which is a simple Early English triplet, and the latter a composition of five lancet lights with cusped heads. Below the side windows are richly-foliated cornices, and below this again large plain spaces left for future decoration. Round the lower portion of the hall the wall is adorned by a charmingly-designed arcade, interrupted at regular intervals by acutely-pointed double doorways, which possess very rich mouldings and foliated adornments. Beneath the large windows at either end are galleries. That at the south end is supported upon three arches boldly corbelled out; the centre arch opens to the vestibule, and the two which flank it form blank recesses; the whole is of Hopton Wood stone. The gallery at the north end is supported upon demi-vaulting springing from three corkscrew columns, and below are two open arches communicating with the great corridor. There are two smaller openings above leading into the balcony from the upper corridor. It cannot be denied that there is a good deal of cleverness about these galleries, but the detail is so very singular, and they have the appearance of being a late Gothic idea translated into early work. This is especially the case with the gallery at the north end. We cannot reconcile ourselves to the twisted columns; they introduce an element of weakness just where strength is especially wanted.

The pavement of this hall, which was executed by Messrs. Burko & Co., of Newman-street, from a design by the late Mr. Street, is a very fine work, composed of marbles of various colours arranged in patterns. The windows are glazed in ornamental patterns, with shields introduced in coloured glass, the work of Mr. Bell. The iron gates and grilles filling in the entrance arches, &c., are by Mr. Potter, of South Molton-street. The clerks of the works were Messrs. Lewis & Moore. We

subjoin a list of the general dimensions of some of the principal halls in Europe, which will serve as a guide for forming an estimate of the size of the hall of the new Law Courts:—

1. The great hall of the Palazzo Ragione, Padua, erected between 1172 and 1219 (roof a century later): Length, 240 ft.; width, 80 ft.; height, about the same as the width.
2. Westminster Hall: External length, 270 ft.; \* external width, 74 ft.; height, about 90 ft.; internal length, 240 ft.; † internal width, 68 ft.
3. The Wladislawschen Saal, in the Palace of the Hradschin, at Prague, completed in 1522, but commenced half a century earlier: Length, 212 ft.; width, 60 ft. Unfortunately the floor of this noble apartment has been raised, and its original height cannot be clearly ascertained; it is vaulted.
4. The Salle des Pas Perdus, in the Palais de Justice, Paris (commenced 1622): Length, 216 ft.; width, 84 ft.; height, about 60 ft. Unlike all the other examples named in this list, it has a row of columns down the centre.
5. Guildhall, London: length, 153 ft.; width, 50 ft.; height, about 60 ft.
6. Christ Church Hall, Oxford: length, 115 ft.; width, 40 ft.; height, 50 ft.
7. The "Golden Hall," at Augsburg, Bavaria: length, 110 ft.; width, 58 ft.; height, 52 ft.
8. Hampton Court Palace Hall: length, 106 ft.; width, 40 ft.; height, about 50 ft.
9. Middle Temple Hall: length, 100 ft.; width, 40 ft.; height, 50 ft.
10. Lambeth Palace Hall (rebuilt, in imitation of the ancient one, by Wren): length, 93 ft.; width, 35 ft.; height, about 50 ft.

The only one of these halls which is vaulted with a regular Gothic cross-vault in one span is that of the Wladislawschen Saal at Prague. Its length and width, compared with the hall of the new Law Courts, are as follow:—

Law Courts: length, 230 ft.; width, 48 ft.
Prague: " 212 " " 60 "

Thus it will be seen that the hall of the Law Courts, though considerably longer than the Prague hall, is far narrower; so much so, that the entire superficial area of the Wladislawschen Saal is 12,720 ft., whereas that of the Law Courts is only 11,040 ft. †

The Royal Courts of Justice were opened by Her Majesty the Queen, with a state befitting the occasion, on Monday last. The ceremony in the great hall being concluded, the Royal procession arrived at the gate at the north-western corner of the great quadrangle, where the carriages were waiting. Here Her Majesty paused for a few moments, while Mr. Shaw-Lefevre, the First Commissioner of Works, presented Mr. A. E. Street, son of the late Mr. G. E. Street, the architect of the new Courts, and Mr. H. W. Bull and Mr. E. C. Bull, the contractors, to each of whom Her Majesty spoke a few words of congratulation. A deputation of the workmen who have been engaged on the building then came forward and presented the following address:—

"May it please your Majesty, We, the workmen of the various crafts employed in the construction of this building which your Majesty has now been graciously pleased to open, desire to take this opportunity of offering a humble expression of loyalty and respect towards our Sovereign. We are deeply sensible of the honour which has been done to the work upon which we have laboured for so many years, and our one regret is that the great master whose designs we have carried out should not have been spared to see this day.

Signed on behalf of the workmen,

THOMAS EPS,  
FREDERICK CLARK.

To this Her Majesty's gracious reply was as follows:—

"I receive with pleasure the loyal address of the workmen of the various crafts employed upon this building. I congratulate you on the successful results of your honourable toil, and I join with you in the expression of sincere regret that the designer of this noble edifice should not have lived to see the completion of his work." §

\* This includes the modern addition to the north.

† Exclusive of modern addition to north end.

‡ Mr. Street's competition design was illustrated in vol. xxv. of the *Builder* (1867), pp. 112, 645; the plan of Court Floor, as determined for execution, was given in vol. xxviii. (1870), p. 686; and a view of the Strand front appeared in vol. xxx. (1871), p. 947.

§ Mr. A. W. Blomfield, to whom, in conjunction with Mr. Arthur Street, the completion of the buildings was entrusted by the Office of Works, was unavoidably absent through a domestic bereavement, which every one who knows him regrets deeply.

Whittemore & Bass, Photo-Litho 236, High Holborn

HOUSE AT BISHOP DOWN, TUNBRIDGE

S.—MR. JAMES NEALE, F.S.A., ARCHITECT.

Wyman & Sons, Printers, G. Queen St.

CHURCH OF  
S. MARY LE BOW, CHEAPSIDE  
1674

THE CROWN OF THE STEEPLE — SIR CHRISTOPHER WREN, ARCHITECT.

Wyman & Co. Printers

THE BUILDER DECEMBER 9, 1882.

THE GREAT HALL OF THE ROYAL COURTS OF JUSTICE.—THE LATE MR. G. E. STREET, R.A., ARCHITECT

## CHURCH OF ST. MARY-LE-BOW.

This church is interesting, not only as the central church of London, but more especially for its early story and for the skill shown in it by Sir Christopher Wren. The problem of the Renaissance spire has probably never been more satisfactorily solved than in this church. In its charming detail and graceful outline, it forms a perfect dream of beauty, and a study of its construction increases our admiration of the constructive skill of its designer. The sketch we give of the spire is by Mr. G. H. M. Addison.\*

## HOUSE AT BISHOP DOWN, TUNBRIDGE WELLS.

This house is situated on the border of the common at Tunbridge Wells, and has been erected for the residence of Mr. W. Edwards.

The lower stories are built of local red bricks. The Dunton Green bricks were used for all cut sills, arches, and ornamental work. On the upper story the timbers are coated in a dark oak colour, and the panels between are filled with pebble dash, the pebbles being collected from the sea-shore at Walmer. The half-timber work of the upper story is backed with brickwork one brick and a half thick. The roof is boarded, felled, counter-raftered, battened, and hung with local red tiles.

There was no competition, but a price was obtained from Messrs. Willicombe & Oakley, of Tunbridge Wells, to whom the contract was let for the sum of 1,520*l.* This sum was exclusive of the stoves, ranges, chimney-pieces, baths, boundary-walls, and stables. After the contract was let it was decided to raise the house, so as to secure more beautiful views of the surrounding country. This added a considerable basement story. Additional bed-rooms were also provided. These works were arranged to be paid for by measurement with a schedule of prices based on the quantities.

The house contains on the basement a parish room with a separate entrance, school-room, stores, coals, &c. On the ground-floor are drawing-room, dining-room, study, butler's pantry, kitchens, stores, water-closet, &c. On the upper floors are nine bed and dressing-rooms, bath-room, water-closet, linen and house-maid's closets, and good stores.

The front side of the house facing the Common,—but not shown on our view,—has a large angle bay window, with balconies and verandahs. This arrangement was by special desire of Mr. Edwards, copied nearly in *fac-simile* from a house erected at Walmer, from the design of the same architect, and illustrated in the *Builder* of December 17, 1881.

The house is nearly completed, and has been erected from the designs and under the personal superintendence of the architect, Mr. James Neale, F.S.A., of Bloomsbury-square.

## DR. WHITE'S ALMSHOUSES, BRISTOL.

These almshouses, now being rebuilt from the design of the late Mr. J. H. Hirst, will accommodate thirty-two inmates, each having a combined living and sleeping room, 15 ft. by 12 ft., and 10 ft. high, with a separate scullery for each, and open yards with waterclosets at the back.

The walls are faced with Cattybrook red bricks, with courses and ornaments of Staffordshire black brick and Bath stone dressings from Corsham and Combe Down quarries. The roofs are to be covered with slates or Broseley tiles, gutters, and flashings of lead. In front, on the ground-floor level, will be a verandah from end to end forming a covered promenade in wet weather. Portions of this verandah will be of English oak, all the rest of the woodwork throughout the building being red deal. All interior woodwork to be varnished.

The aspect of all the houses is south, and the space in front will be laid with grass. The chief entrance is from Temple-street by a covered passage through the matron's house, which, being a modern structure, has not been rebuilt. There is also a carriage entrance from Temple Back.

The work is being carried out by Messrs. W. E. Wallers & Son, of Bristol. The contract price being 3,250*l.*

\* I send you a drawing of the spire, and will add one hereafter of the doorway.—G. H. M. A.

## SCIENCE AND ART BY THE EXTENSION OF THE EISTEDDFODD.\*

It is with considerable diffidence that I venture to solicit your attention to this paper, because I may have formed my conception of the purpose of the Eisteddfod at too great a distance, and without being fully acquainted with your views upon the subject. But it is an institution that has always deeply interested me, as it appears to be one that would admit of considerable expansion,—in fact, of being made a national instead of a local institution, such as, indeed, it was in ancient times, if the following account of it be well authenticated:—"Pliny and Tacitus bear testimony to the great knowledge which the bards brought to bear in the elucidation of the sciences of astronomy and geography; that they were masters of rhetoric and poetry; and that to learn eloquence their schools were crowded with the youth of Gaul."

To restore the Eisteddfod to its former grand proportions and wide-spread influence is the purpose of my suggestions, for the time has arrived when the assembly, even, of a divided nationality should be dismissed, and that as Englishmen we should appear to the world, in every sense of the expression, as members of a United Kingdom, and that the Eisteddfod should no longer be specially for the Welsh, but for us all. Your hardie traditions need in no wise be interfered with, but you yourselves, must be aware that the Principality can no longer claim the harp as exclusively its own. The harp is gradually becoming a national possession, and in no slight degree owing to the musical talents and pre-eminent mastery over that instrument of your Pencerid Gwalia. In like manner I would desire to see the entire Queenedom stimulated to high endeavour by a rightly-constituted and truly national Eisteddfod.

The foregoing introductory remarks must be my apology for appearing before you, and having tendered them, I will at once to my discourse.

One of the most important factors in the development of Grecian and of Italian artistic and literary excellence, was a consensus of judgment of a compact body of highly intellectual and cultivated men; the philosophers and their scholars in ancient Greece and the churchmen and the merchant-princes in Medieval Italy, by whom the ideal was held up as the golden goal of human attainment, and by whom genius was taught to disregard all lesser aims. Those compact bodies of thinkers, moreover, were perfectly aware that literature and art were the most enduring monuments and true indices of a nation's intellectual status; hence the public buildings, in ancient Greece and in Medieval Italy, became not only the shrines of religion, but of art, monumental edifices for all time. Unfortunately, however, in nations with such teeming populations as those of our own day, there is no such compact body of educated men, there is no such consensus of superior judgment, as of old time, to influence public opinion, to form the taste of the majority. Opinions are now very diverse upon most subjects, and as freedom of opinion is a primary article of the modern political creed; the aims of literature and of art are also diverse. There is no dominant influence, as there was in Greece and in Italy, tending to promote that unity of aim which is the great characteristic of the Classic and Renaissance literature and art. Unity of aim as society is at present constituted can only be looked forward to, as the outcome of a long, very long, war of contending opinions, ending in the triumph of the noblest forms of thought and of effort.

With the foregoing reflections present to my mind, it struck me that by gathering the greatest intellects of the nation to the Council of the Eisteddfod literature and art might in a short time be materially influenced by its seasonal awards, and that the Eisteddfod might thus become, in relation to the general public, a substitute for that dominant and exalted intellectual guidance for want of which, in these days, literature and art diverge into all kinds of peculiarity, every one revelling in his own idiosyncrasy and pursuing his own eccentric way. It may possibly be right to hold up freedom of opinion as the chief corner-stone of the political fabric, but let us, at the same time, thoroughly understand what that principle

\* From a paper by Mr. W. Care Thomas, read at recent Eisteddfod.

really means. And when we carefully analyse it what do we find? Why that "freedom of opinion" means nothing more than that every man shall be at liberty to think, and to assert tentatively what he thinks; for it cannot be maintained with the slightest show of reason that a man has the right to promulgate aught but the truth, aught but the right. Now, there is a certain at-one-ment or union in all that is right, and therefore in seeking the right in all things the thoughts of a nation gradually converge towards those principles that tend to unity in purpose, to unity in work. There can, indeed, be no sound health, nothing progressive, in a nation that does not strive after that oneness of thought and purpose which centres in rectitude, that does not endeavour to shake its intellect free from the upas influences of prejudice. This is, in fact, the one only way by which a nation can attain to pre-eminence in all the higher kinds of work. We by no means wish to contend that the Eisteddfod should exclusively reward works of the highest aim. One of its functions is, as we are all well aware, that of rewarding and stimulating humble endeavour,—not as a finality, however, be it recollected, but as an incentive to more advanced attempts to higher kinds of work; but even in rewarding humble effort the position of the effort in the scale of attainment should be clearly indicated.

Although, then, this institution may stoop to reward humble effort, it should be known, as we contend, that its highest rewards should be held in reserve for the highest kinds of attainment,—not necessarily to be conferred upon the authors of any works submitted in competition, but upon the authors of any great works executed within the Queenedom, and within certain limits of time. By these means a direction would be gradually given to emulation, which could not fail of having an elevating tendency on the literature and the art of the Principality,—nay, on the literature and art of the whole country. The awards of the Eisteddfod, *in excelis*, should be for the loftiest kind of effort, in every pursuit; for such a policy would have the effect of gradually developing the institution to the importance, to the proportions, of its ancient prototype: for it was by a similar policy that the Olympian festival became so great an institution. It thus rose not only above provincial, but national prejudices. At that grand gathering every kind of talent was honoured and rewarded, every new notion was ventilated. In Greece, there was ever in her best days a spirit of noble rivalry, which made city contend with city, and citizen with citizen, in order to obtain an Olympian reputation. It was thus, too, that all national peculiarities were eliminated from the Grecian intellect and physique, and from Grecian literature and art, and that Greece became the exponent of the Ideal. It was to that free emulation, so wisely encouraged, as well as the incentives offered to the pursuit of the higher forms of attainment, that her unexampled progress as a nation may be attributed. When I say that the award of the Eisteddfod, *in excelis*, should be for the highest kinds of success, I do not desire to lose sight of the fact, as I have already hinted, that this institution has two important functions to perform, viz. (1), that of promoting the highest aims in the Principality and the nation at large, in order to keep the true goal of human effort before the masses; and (2), that of lifting humble effort within the Principality itself. The Eisteddfod, too, should have its student's crown to be awarded to him who shall obtain the highest honours in any of the schools of the Principality during the year, or on any Welsh student who shall distinguish himself during the same period in any art or science, and anywhere in Great Britain. The certainty that excellence will be duly recognised is a great stimulus to endeavour in all the fields of intellect. These rewards should be simple and inexpensive,—a metal laurel wreath, if you will. It is an infatuation to suppose that a country may be developed to its best issues by routine and red-tape proceedings; under such a policy, a Chinese stagnation settles down upon it; it becomes effete. A great nation can only maintain her greatness by protecting, by rewarding, and by bringing talent to the front.

There is another point to which I would also direct your attention, a point in which your festival fails to follow the example of its great prototypes, the Olympian, viz. in its physical contests. Why should not athletic games form a part of your programme? There is, perhaps,

still a certain stigma attaching to contests of physical strength, but this is so only because they have been in some degree discarded from the rule and governance of humanity. Bring them within its pale, and they would be moderated, humanised,—encouraged only to that extent that tends to the development of health and beauty. Moreover, in encouraging athletic games, within due limitations, the Eisteddfod would set an example, not only to the country at large, but to the schools and colleges of the Principality, as to the rightful extent to which physical exercises should be permitted. The physical contests at Olympia and those which occurred in the Roman arena stand out in strong contrast, exhibiting in the one case their use, and in the other their abuse and degradation. A few years since some suggestions of mine having reference to the restoration of physical contests to the session of the Eisteddfod, were printed in several of the leading papers of the principality. It may be urged that athletic games are not required by a population so extensively occupied in mechanical and laborious pursuits, but I do not suggest their introduction specially for this class; although our experience of the customs of the counties farther north would teach us that such sports do find favour with a labouring population. With this class athletic games are frequently the first step in culture. The transition from excessive muscular exercise to brain-work is neither consistent nor healthy. A constitution of the Eisteddfod such as I propose, however, would leave it open to every man who should enter the lists of competition to exercise his own judgment, and to choose for himself that kind of complementary contest which he should deem the best calculated to effect the rounding of his own nature. No athletic exercises would be forced upon any one, but they should, nevertheless, be recognised at the session of the Eisteddfod, knowing, as most of us now well do, that they conduce to well-being, to the development of the proportion of true manhood. I may have spoken of the Eisteddfod in the plural number, but I very much question whether it is to the best interests of the Institution that more than one Grand National Eisteddfod should be sanctioned; and this great gathering should, of course, be on a scale of sufficient importance to attract competitors and visitors from all parts of the United Kingdom.

Connected with the department of athletic sports, should be your annual rifle and artillery competitions.\* We are too apt, as a nation, to persist in beaten tracks, and so we tenaciously cling, as a nation, to our old naval and military ways. The rifle, however, has more than any other weapon transformed the art of war, and we must promptly meet the change of tactics that it involves. Recollect, too, that the successful defence of a nation of expert marksmen is virtually guaranteed. The principality offers many opportunities for obtaining splendid rifle ranges, and there is no reason why Welshmen should not become first-rate marksmen. The building up of an institution like the Eisteddfod to its full proportions, and as I, and some of you may, in imagination, contemplate it, would require the united energies of several enthusiastic and hard-working men determined upon making it, not merely a local, but a national institution. It would, doubtless, require large pecuniary resources, too, but these would, in all probability, be readily forthcoming for a national, when they could only be obtained with difficulty, if at all, for a merely local project. To speak of the undertaking of so complete an organisation in the most matter-of-fact way, we believe that if it were carried out on the grandest scale it would pay a good interest on the capital invested. Prosaic minds may erroneously suppose that no solid advantages are likely to accrue to the State by creating incentives to excellence such as those I propose to extend and to improve. Such minds conclude that the benefits derivable from the awards of an Eisteddfod are merely of an unsubstantial and transitory kind. The benefits accruing are, doubtless, more of a moral and intellectual kind; but for every advance of this order, you may rest assured there will inevitably

\* It is by no means essential that these competitions should take place in the same locality as the Eisteddfod, nor simultaneously, but somewhere, and somewhere not too remote, and with the knowledge that such gatherings were special sections of its organisation, and that successful competitors would receive their reward at the Eisteddfod. These remarks are also applicable to the athletic sports.

be a corresponding advance in the arts and sciences, and, therefore, in the power to improve the material resources of the country. Depend upon it, ladies and gentlemen, you cannot throw too much enthusiasm and energy into the establishing of your Eisteddfod in its grandest proportions, and in rendering it pre-eminently complete and fit in every respect as a centre of incentive to every kind of noble and manly endeavour; and if you desire, as I know you do, that the material production of this great country should, in all departments, culminate in the highest pitch of excellence.

The foregoing considerations lead me, by way of conclusion, to touch upon the subject of the choice of a locality for the holding of the grand National Eisteddfod. I have already expressed the opinion that you should not dissipate your power by multiplying gatherings of the kind, and to this opinion I cling. Let there be but one to be looked forward to with interest, and as the occasion for a public holiday. Let it be held, too, in a locality judiciously chosen as central, and as generally accessible as possible. I, myself, believe that the primeval Eisteddfod was an echo of the Olympian festival wafted to us by the Bardic, or priestly, traveller of the Druidic times. Moreover, I believe that, for whatever other purposes they may have been used, those interesting remains at Avebury and Stonehenge, were the permanent structures that were periodically utilised for the primitive Eisteddfod, when supplemented with temporary wooden construction and a covering of either hides or canvas. But be this as it may, I would exhort the directors of this Institution to be solicitous with regard to the choice of a locality, when they shall have fully determined to awaken the Eisteddfod to its full life, and to develop it to its grandest proportions. To me it would appear to be a matter of certainty that in the course of a few years you will be in possession of a permanent structure in which the Eisteddfod shall be held, and which shall be a monument of British aspirations as enduring as those ruder remains of the primeval national spirit.

#### HOW OUR PUBLIC IMPROVEMENTS ARE CARRIED OUT.\*

LET us turn now to the larger and most important of the impending schemes of improvement, that for the building of new Admiralty and War Offices, the suggested block plan for which has been for some time known to architects and those specially interested in the subject, and has been published by the First Commissioner in his article in a contemporary periodical. The history of the scheme for the rebuilding of these offices affords the most striking example of the unsatisfactory and unbusiness-like working of our Government machinery in dealing with these matters. The operation has been under discussion for more than a quarter of a century. Commissioner after Commissioner has had his schemes, committee after committee has sat, talked, proposed, and done nothing; and the affair now culminates in a feeble make-shift "economy" plan, the economics of which have been rendered necessary, chiefly by the continual procrastination of any settled scheme for purchasing land and compiling the plan and design of the buildings. By far the best, finest, and most convenient site that has been proposed for the desired structures is that on the north side of Great George-street, parallel with the block of the India and Foreign Offices, and running up to Parliament-street, the present western boundary of which street, at that point, would, of course, have been set back so as to widen it, and carry out in this way a much-needed and long-promised improvement. Probably at the time when the idea was first mooted, the Great George-street site might have been acquired for half a million; now it is said to be worth more than twice that, and is to be abandoned from motives of economy, after nearly a quarter of a million has, however, been expended in a bit-by-bit tentative acquisition of property on the site, which, for any immediate purpose to which the Government can put it, seems to be now practically money thrown away. The present writer does not claim to be a financier, but it seems patent enough to any one that if there had been a permanent administration, combining the best surveying and architectural

\* From a paper by Mr. H. H. Statham, in the *Fortnightly Review*.

ability available, to look after these matters, instead of their being left to be the plaything of a succession of First Commissioners of Works, money and a fine architectural opportunity would have been saved. The Great George-street site would combine the public offices in one great group near the centre of Government, and would give the hint for a rebuilding of the south side also of Great George-street at no very distant date, thus furnishing a fine architectural climax to the boulevard of Birdcage-walk, and a noble approach to the Houses of Parliament from that quarter, the mean aspect of which at present contrasts sadly with the great towered building beyond.

The new scheme consists in squeezing in the new offices between the Horse Guards and Messrs. Cocks & Biddulph's bank, projecting backward over a considerable portion of Spring-gardens, in such a way that the Whitehall elevation and the Park elevations must appear almost as different buildings, and no unity of architectural effect can be realised. Here again we see the result of the utter want of continuity in what may be called building politics. Had this scheme been contemplated for any length of time, it should have been the boulder duty of some one to negotiate for the sites of the Messrs. Drummond's and Messrs. Cocks & Biddulph's banks before they were built; the existing houses between them could then have been easily acquired at no exorbitant price. But now the banks in question are built, and the cost of displacing them would be very great; though some of us may think that it would be worth while to pay a good deal merely to clear so poor and commonplace a building as the former off a fine site which it completely spoils. Had the whole fringe been secured, there would have been the opportunity of producing a fine mass of buildings in the new work, and of so arranging them as to run the line of the Mall through into Claring-cross, thus securing a beautiful as well as a much-needed new route.

The First Commissioner, however, tells us we need not mind that, as he can provide a road into the Mall by Drummond's Bank, with room for two carriages to pass; and, if we have a cab-route, what can we wish for more? Let architectural effect go; we need not trouble about that, for are we not going to save money? That is the whole of the argument that can be urged in favour of the new site; it is economical. Even if the banks were bought, however, and the entire site and its possibilities secured, it would not be such a desirable one as Great George-street on architectural grounds. It would involve the removal of the Old Admiralty and its adjuncts, which are really of some interest in their way, more so than anything in Great George-street (except one or two of the old houses west of Delahay-street), and the new building and the Horse Guards would materially injure each other. Far better, on architectural grounds, to group all the new office buildings together, and unquestionably better on practical grounds; and it may still appear that the wisest economy will be to purchase the Great George-street site, and note down the increased price at the present day as one of those pieces of experience for which we all have to pay heavily. One of the practical objections which is urged against the site, that the street is largely occupied by the offices of professional men who are under the necessity of being near the Houses of Parliament, may easily be dismissed. As soon as it was known that this site would be built, new and superior offices would certainly be built on every available plot in the neighbourhood; the demand in such a case is always met by a supply. It is worth note that the block-plan of the new buildings shows them arranged around quadrangles; this is one of the least satisfactory principles of arranging large buildings, especially where their height must be considerable, unless the quadrangles are very large; even then the re-entering angles are apt to become receptacles of stagnant air. Wherever the buildings are ultimately erected, this should be reconsidered.\*

Of other schemes that appear to be specially talked of, that of removing the houses in Abingdon-street and Old Palace-yard, opening out a

\* In cases where a quadrangle seems the only means for securing the necessary accommodation, it might be worth while to try the effect of placing the main staircases in the angles, leaving them partially open for a through current of air. This might be made to realise a new and picturesque effect, arising out of strictly practical requirements, which is just what we want to see more of in modern architecture.

view of the adjoining portion of the Abbey, and forming a new cloister for monumental erections, is an old idea of Sir C. Barry's, which was much favoured also by Sir Gilbert Scott. The throwing open of the Abbey on to what would then form a grand architectural place is a noble scheme, but I would prefer to see the new cloister, or "Campo Santo," on the space which has often been talked of for such purpose, the square plot of ground south of the Houses of Parliament, which is now laid out as a very forlorn-looking green, or (by courtesy) garden, with no flower-beds or any other adornments, and which no one seems to frequent. The new cloister would then group with the modern buildings, and the Abbey be left with its genuine Mediaevalism undisturbed by modern imitations. The idea of adding to and raising the present façade of the National Gallery, by way of increasing the architectural dignity of Trafalgar-square, is hardly to be approved. The old façade is not, as Mr. Shaw Lefevre says, without a certain merit of its own, but it is essentially a feeble piece of architecture, and nothing really fine could be added which would blend with the existing details; the choice must remain between tolerating the existing façade or replacing it by an entirely new one.

This is a very venial error, however, compared with the remarkable proposal which is seriously entertained for "treating" the Tower. The idea of that proposal is, after removing the block of storehouses which stands between the river and the Tower, and the very mean-looking building which abuts on the south wall of the keep, to rebuild the inner wall of the tower, and the lantern tower, upon their old lines, and in imitation of Mediaeval work, and thus to carry out the process (of which there is only too much done already) of producing a mock-Mediaeval tower,—as Edie Ochiltree would have said, "to make an antic of it." Mr. Shaw Lefevre is quite practical in his remarks as to the present utility of the Tower, and the necessity, after these unsightly buildings have been pulled down, of providing the same accommodation otherwise; and straightway he proposes to express this practical value of the Tower as a modern armory by giving it the aspect of an imitation Mediaeval fortress. To rebuild it, he tells us, in any way but as a reproduction of the ancient fortress, "would be to repeat the error of those who constructed the unsightly buildings now to be removed, and could not be entertained for a moment." There seems to be a curious confusion of ideas here. The removal of the buildings referred to is, no doubt, desirable; not, however, because they are modern, but because they are bad, and badly placed. The remedy is to build better and more suitable ones; nor could there be any more interesting problem in modern architecture than to produce in such a case an addition to the Tower which would be fitted for its practical purpose, would represent the spirit of the time in which it is built, and at the same time harmonise with the massive style of the old portion of the structure. That would be a thing worth doing. But if Mr. Shaw-Lefevre really imagines that Salvini's modern-antic bastions and machicolations are looked upon with interest, or that "those who reverence and respect the past" will be impressed with a second edition of the same sort of article, he must have lived very much out of the way of recent lines of thought about art and architecture. He may be assured that with the majority of those who take an enlightened interest in the subject of architecture such a proposal would only be received with laughter, as it has already been wherever we have heard it commented upon or referred to.

The foregoing remarks are not intended to disparage the acquisitions of the present First Commissioner of Works, whose capacity for dealing with architectural improvements is certainly not inferior to that of the majority of those who have preceded him in the office. It is his special misfortune to have been tempted into a much more energetic exercise of his office than most of his predecessors have thought it worth while to undertake, and to have done so under unsound official advice. The real mischief is in the system rather than in the individual. At every change of Government, the conduct of matters with which politics have no more connexion than mathematics with lyric poetry, is handed over to the bands of an official placed in his position for political reasons, who has probably given no special study either to the practical or the artistic side of architecture, and who has sud-

denly to assume a knowledge of the subject, and to appear as the arbiter of our architectural improvements. In one instance the choice fell on a person so notoriously destitute of any qualifications for such a post that the appointment was generally believed to have been a kind of grim joke on the part of the statesman at the head of the Government. One perfectly natural result of this is the want of any continuity of principle in dealing with public works.

It is the object of each successive First Commissioner to mark his temporary reign with his own individuality, and to supersede the ideas of his predecessors. This disadvantage would be much lessened if the Parliamentary official were under the advice of a really competent permanent official; and formerly this was recognised. At one time the late Sir James Pennington, a very able man, was the architectural adviser to the department. At a later period, after some changes in the administration of the Office of Works, Mr. Fergusson was appointed "Inspector of Works and Buildings," in accordance with the recommendation of a Committee of Inquiry, to the effect that, "The First Commissioner requires the aid of an officer conversant in a high degree with architecture, in reference to questions connected with existing or contemplated buildings." But we have changed all that. Mr. Fergusson resigned shortly after the appointment of Mr. Ayrton as First Commissioner, not probably caring to expose himself to the amenities of that remarkable specimen of the British edile. One or two successors followed and retired, and the present Permanent Secretary, who had been secretary in conjunction with some of the architectural officials, by a process of exhaustion of the architectural element was left apparently master of the situation. There is no wish to say anything here in the way of unnecessary comment on individual deficiencies; but this is a matter of public importance. It ought, also, to be one of public interest, and it is time that some one should say what many people know well enough, that the present permanent official has given evidence of no qualification in regard to previous training or to present knowledge of architecture, either practically or artistically, to render him a fit person to direct the architectural improvements of London, or to give advice thereupon to the Parliamentary officials, and that it is but the bare truth to say that, in any assembly of men well educated in art and architecture, his opinion on such subjects would go for absolutely nothing,—or less than nothing. As to the value he himself sets upon architectural design, Mr. Milford has been, indeed, imprudently candid. He declared before a Parliamentary Commission that any great building that was required would be most satisfactorily carried out in the offices of the Department, as it would involve

"only the engagement of a few more draughtsmen." Precisely so; and the results of that way of looking at it, where we are unlucky enough to have the results are what might be expected. The New Post-office buildings and the Bow-street Police Court are draughtsmen's architecture, and the plan of the Hyde Park Corner improvement is a draughtsmen's plan; and had at that. The direction of the architectural improvement of London is, therefore, in the hands of whatever politician it may be convenient for a new Government to nominate as First Commissioner of Works, under the advice of a permanent official, who may be an excellent secretary and man of business, but to whose opinion on matters architectural no one who really understands such subjects attaches any value whatever. It remains to be seen whether educated public opinion will not demand the appointment of a permanent and specially qualified "Minister of Public Works,"—whose jurisdiction should be independent of political changes,—or at least of a permanent architectural adviser of the highest class; or whether we are to continue indefinitely a system such as would not be tolerated in any other first-class city in Europe.

**St. George's Chapel, Windsor.**—The work of restoration of St. George's Chapel, Windsor, which has been going on for some years, has just been completed so far as the present year is concerned. The work has been carried on by the Dean and Chapter under the direction of the Chapter surveyor, Mr. A. Nutt, and includes filling the vacant niches with the statues of Royal benefactors.

#### THE BURNING OF THE ALHAMBRA THEATRE.

As our readers are aware from the daily papers, the Alhambra Theatre was entirely burned out on Wednesday night, or, more correctly, Thursday morning last. Whether anything is known as to the probable or possible cause of the fire it is impossible to say at the time of writing these remarks. The fire appears to have been first perceived by the police about one o'clock in the morning, and at two the whole place was in a blaze, throwing its light far and wide over London. Regarded from the De Quincey point of view, the fire was a remarkable success, and originated some splendid effects. In St. James's Park the effect of this lurid and unwhitened "northern light," with every branch and twig of the bare trees standing out in a black network against the light, was very remarkable, and a thing one would like to see painted; but this was surpassed by the effect in Trafalgar-square. Nothing could have been better arranged for a grand coup d'œil. Below the columns of flame and smoke lay the long dark mass of the National Gallery, all its detail lost by contrast with the glare above; while on the right Gibbs's steeple rose in a column of intense light against the black sky, glowing like molten silver; the blaze brought out other tones from the buildings on the south side of the square, and raised the whole for the moment into the region of architectural poetry. It would be worth while for any painter who may have seen it to try a picture of the effect. In Leicester-square an equally striking but more weird effect was produced by the spectacle of the burning building, the sound of the dull, heavy thuds from within as the large girders successively went down, mingled with the peculiarly unearthly noises of the steam fire-engines planted in various parts of the square. Under a canopy of smoke and sparks which spread all over the square, hundreds of people were collected to witness the sight. A picturesque incident in the scene was the aspect of the two large turrets or minarets at the extremities of the façade, which were on fire at various points, and often in the full thick of the flames, but gave evidence of the solidity of their construction by the way they retained their position. The northern minaret settled about a foot out of the perpendicular, towards the building, and one expected to see it come down every moment; but up to the time when the fire began to subside, having burned itself out (about a quarter to three) the two turrets were still standing. The house adjoining the theatre northwards took fire, and was apparently gutted, in the upper portion at least, and at one time it looked as if there were some danger of an extended conflagration; but every effort was evidently made to keep under the flames in this house, and the fire does not appear to have spread further.

This latter point, working for the safety of adjoining buildings, is evidently regarded in such cases as the best line of tactics to employ; and no wonder, considering the utter futility of the means at hand to do anything towards keeping down the main conflagration in the case of a fire on a great scale. To see the masses of flame within the theatre, and the jets of spray playing upon them (for the column of water from the hose is broken into mere spray in its passage through the air) suggested a contrast almost ludicrous, if the occasion and the possible further consequences had not been so serious. One might as well think of putting out Pandemonium with a garden squirt. Surely it is time that some decisive effort were made to place at our command a more effective weapon against fire than the fire-engine of the day furnishes, and one of which the effects should be more proportionate to the means employed. As it is, we have in various parts of London large and handsome fire-engine houses and offices, costly engines, relays of horses, and a splendid staff of fearless and daring men; but what does all this accomplish? When there is a large fire, the fire-engines certainly arrive with great dramatic effect, cawing through the streets and through crowds of people in a manner which affords a refreshing contrast to the sober everyday babble of our street traffic, and they commence snorting and belching sparks like so many demons, and floods of water are sent running down the streets; but all the result is the pumping of a few showers of

broken spray into the burning building, the effect of which upon the fire is absolutely nil; indeed, the gases into which the water is instantly decomposed seem to replenish and strengthen the flame. It is evident to any one who looked on at the fire on Thursday morning, that our present tolerably costly fire-extinction service and *matériel* is utterly powerless to produce any effect whatever in reducing a large fire. The water was duly and regularly poured through the nozzles of the hose directed up against the windows of the burning building, but for any apparent effect produced it might as well have been poured down the street-gutter. Any means which would throw water in heavier and more solid streams might be effective, but probably we must turn to chemistry for the real solution of the problem how most quickly to reduce a great fire when it has once got fairly started.

Another consideration which naturally arises in reference to this particular fire is the emphasis which it gives to the conviction which is gaining ground, both in official and non-official quarters, of the danger from fire in theatres, and the necessity of enforcing the most stringent regulations as to construction and means of exit. Several of the more self-confident of our theatre managers (a race not deficient in that same quality of self-confidence) are talking as if they were very ill-used by the Lord Chamberlain in being expected to do so much more than formerly was expected of them in regard to fire-resisting construction and safety in the plan and arrangement of their buildings. Here is one more big theatre-fire to testify that theatres, as now constructed, are exceptionally liable to fire,—places containing many lurking-spots for fire to commence and develop unobserved, and much to feed the flame when it is once started. It is fortunate that the fire at the Alhambra did not break out until some time after the closing of the house, and that nobody's life was endangered by it. But the cause of it must have been something connected with the usual operations of the theatre; something which had commenced to burn before the house was locked up, and was left smouldering unnoticed. The same thing might have taken place at nine o'clock instead of at closing time, and then it is terrible to think what the nature of the disaster might have been. Whatever efforts managers may have been compelled to make lately to lessen the risk of fire in their buildings, the burning of the Alhambra comes in as a reminder that such risk is still one which especially attaches to theatres, and that we must proceed with improving the system of construction, plan, and supervision of theatres, until we render them as little liable to risk by fire as other buildings of public resort, which at present they certainly are not.

#### A WANT AT NETLEY HOSPITAL.

THE attention which, during the past week, has been directed to the Royal Military Hospital, Netley, by the visit of her Majesty the Queen, renders timely a remark which for some weeks past we have been anxious to find an opportunity of making. It is one on the due observance of which it is possible that the saving of many a valuable life may hereafter depend.

Of the site, the plan, the service, the aim, and outcome of the hospital we do not now propose to speak.\* It is simply to express regret that in one particular item, that of the staircases, there should be a singular and lamentable shortcoming. We speak, it is true, only from the experience of few visits paid to patients in the building; but that experience is complete so far as it goes. And if there be in any portion of the noble pile a feature for which we have failed to give it credit, it is none the less true that it has not been made in any way available in recent cases of the carriage of sick or wounded men into the establishment.

We allude to the staircases. These are rather suited to a barrack than to a hospital. They are strong and substantial, floored with that compressed and indented wood with which the stations of the Metropolitan Railway have made us familiar, and quite suitable to the use of the orderlies or male attendants on the service of the establishment.

\* The plan of this hospital was originally very bad, as we pointed out in its earliest days (if not before its erection). Since then, however, if we remember rightly, improvements have been made in this vital respect.

But if regarded either as architectural features, or as means by which invalids have to walk or to be carried from floor to floor, they must be spoken of in a very different manner. They are so steep as to try the wind of any but a very hardy climber. For an invalid to walk up them would be a difficulty, and something worse. Nor are they better suited to the carriage of a patient on a stretcher. Too narrow to allow of the stretcher being carried sideways, and thus kept on the level, they enforce a very unpleasant angle on the appliance. And when, as will some times happen, and as did actually occur in a case within our own personal cognisance, the feet are carried foremost up the staircase, the strain on the patient is severe, and might not improbably prove fatal.

In a building of the grandeur of Netley Hospital,—it is, we believe, fifty yards more than a quarter of a mile long,—if erected in Italy, the Grande Scala or staircase would form of the building, but a means of access of the most admirable kind. Most admirable, that is to say, so far as relates to this mode of entrance alone. A broad flight of easy steps, as in the cases not only of the Royal Palaces of Naples and of Caserta, but even in such a building as the Palace of the Ministries at Naples, which has many features in common with an edifice like Netley Hospital, gives free access to corridors, story above story. Ascent and descent are easy to the pedestrian. And in the case of its being required to carry any one up or down, the ample width of the stairs would allow a litter or stretcher to be carried horizontally, so that the patient would not be exposed to the discomfort inflicted by a narrow stair.

But all this might have been written one, two, or three hundred years ago. Grand features as such a staircase is, it is far inferior, as matter of convenience, of safety, and especially of comfort to an invalid, to a lift. Now it is that a building of this magnitude, dating, if we remember rightly, only as far back as 1857, should be unprovided with mechanical lifts, may well be inquired. For the patients the difference would be incalculable. For the service of the house, although this is as much as possible self-contained on each floor, it would be every way preferable to steep and somewhat noisy staircases; and then, unfortunately, it is not all the patients who recover,—another obvious reason for the introduction of lifts. We beg to call the very serious attention of medical and other authorities of Netley Hospital to the strong need that exists for the introduction of mechanical lifts. Even if only one were provided at the back of the house, a branch being run from the railway to the very foot of the lift, so that with only one short cart-porth the sufferers could be at once taken from the train that brings them to the hospital to the floor on which their wards or private rooms are situated, the gain, in cases of severe illness, would be immense. In the interest of the army, in that of humanity, in that of an establishment bearing the term "Royal," we hope that we shall not have pleaded in vain for the addition of lifts to Netley Hospital.

#### MODERN SANITARY LEGISLATION.

A COMPARISON of the various legislative measures adopted by the leading civilised nations of the world for the furtherance of the cause of hygienic reform is an instructive lesson for any one interested in the cause of sanitary progress. An opportunity of this description was recently afforded by the opening paper read by Prof. Reklam, of Leipsic, at the Brunswick Hygienic Congress, in which he defined sanitary legislation as carrying out the principles which should really guide all states in the framing of laws, namely, the removal of all impediments to the corporeal and mental development of individuals, thus rendering each subject as capable as possible of contributing to the general welfare. He considered the system of hygienic legislation in France as being fairly well planned but inefficiently carried out. Much the same state of things exists in Italy and Spain, though in the latter country the Medical Boards are doing good service at present. The position of sanitary matters in Belgium be considered as exhibiting a kind of compromise between the systems in operation in France and Germany. The *Conseil Central de Salubrité publique* is there the leading sanitary authority, and although not in a position to enforce its recommendations, they are voluntarily submitted to

by nearly all the local authorities of the country. In Holland, each district has its sanitary council, but there is likewise in each case an inspector appointed by the Government, who acts as an intermediary between the local and national authorities. He considered the state of things in Holland as being relatively satisfactory in consequence of this system.

He attributed the increased attention given during the last forty years to sanitary matters in England to the cholera epidemics, and the consequent increase of mortality. The first law was passed in 1848, although efforts had been made since 1839 by private and public organisations to arouse the useful interest in the important question of hygienic reform. In Germany, he remarked, progress had been slower, but now an efficient system is provided by the Imperial Sanitary Administration, with its various local organisations. In some States the local medical bodies elect members to the Boards representing groups of districts, and these Boards send deputies to the head administration. In other States comparatively little progress has been made, on account of the apathy of those concerned, and Prussia is, more than any other State, open to such a charge, sanitary legislation being there in a backward condition. An improvement is, however, looked for ere long.

The American Sanitary Administration has the power of naming officials, and of issuing special injunctions. The adulteration of food has recently occupied much attention in the United States. In Switzerland there has been by popular desire an abrogation of some laws affecting sanitary matters.

The speaker considered that the fault of all modern hygienic legislation consists in the fact of its having been in most cases enacted at different times, and thus not forming a harmonious whole. Two sanitary codes have come into force, however, within the last year, which be quoted as models of what legislative enactments of this kind ought to be. In Finland, Prof. Hjelt has devised a law which meets all the requisite emergencies. In every town there is to be a sanitary commission, which consists of the chief of the police, the municipal architect, the local medical officer, and three town councillors. The whole *surveillance* of sanitary matters is in their hands. This law deals with town and country hygienic measures in a uniform manner, and provides for children's playgrounds in every town.

The regulations now in force in Servia place the authorities of that country, according to Professor Reklam's view, in the front rank of sanitary reformers, Servia being the only European country which has an independent sanitary budget. Its hygienic code has been elaborated by Dr. Gjorgjovitch, and although only introduced last year, is now in practical operation. There is an annual revenue of nearly 50,000*l.* devoted to sanitary measures.

#### ART EXHIBITION BUILDING, ROME.

THE permanent Art Exhibition Building in the Via Nazionale, Rome, is fast approaching completion, as also the temporary erection on the site of the future Via Genoa. By means of the electric light the work is carried on after dark, and the inauguration is fixed for *circa* Jan. 16. An illustrated journal, "L'Esposizione delle Belle Arti," will appear in Rome on the opening of the exhibition, and will be continued while it lasts; it will then probably be published under some other title. The art editor of this journal is Sig. Foli, Piazza Nicotri 23, Rome. The approaching art exhibition is to be threefold.—Modern Art, Retrospective Art, Ancient Art.—The exhibition of modern art is to comprise work done in the last decade, that of retrospective art in the epoch from Canova and Canuccini. The exhibition of ancient art will be in the Accademia S. Luca. The Italian Government has voted 200,000 *lire* for purchases of paintings exhibited; the municipality of Rome, 50,000 *lire*. The royal family will also devote a large sum to purchases, and various provinces. The exhibition of ancient art is divided into ten classes: 1, architecture; 2, house and church decoration in sculpture and painting; 3, ceramic; 4, jewelry, plate, bronzes, and other metals; 5, armour and iron work; 6, intaglio and intarsio industry; 7, historical portraits and costumes; 8, tapestry, lace, embroidery; 9, Numismatic collections, &c.; 10, ancient documents, engravings, leather, and parchment. The proposal of the Municipality of

Rome to alter the Palace Altieri by converting the ground-floor into an arcade, thus enlarging the street, has been rejected by the State Council, and the demolition of part of the palace determined on. The Palace Torlonia is to be levelled to permit a regular square at the junction of the Corso with the Via Nazionale. The Palace Strozzi and an adjoining house will be demolished, and the Via Nazionale will then be carried from the Place de Termini to the Bridge St. Angelo, traversing the Place della Valle and Place Chiesa Nuova. The Corso is also to be carried to the foot of the Capitol, and to effect this, part of the smaller Palace of Venice and buildings beyond will be levelled.

THE RATHHAUS AT VIENNA.

The "iron man" (the *Metallarbeiter* says), which has attracted much interest in connexion with the above building, is really made of copper. The figure represents a powerful warrior clad in Medieval copper armour. The energetic features of the countenance are seen through the open visor. The whole of the remainder of the body is covered with armour, coat of mail, &c. In the right hand is a banner about half as high again as the figure, which is itself 9 ft. in height. The statue is fixed on a pedestal, which is fastened by iron screws to the roof. These screws weigh, it is stated, over 2 cwt. each. As a further measure of precaution, an iron hall weighing nearly a ton is suspended from an iron bar which runs vertically through the pedestal.

MACHINERY AT THE SMITHFIELD CLUB SHOW.

ALTHOUGH there was a very large display of machinery and appliances in connexion with the eighty-fifth annual Cattle Show of the Smithfield Club, held in the Agricultural Hall this week, there were not very many exhibits which were of special and exclusive interest to the building trades. Among the exhibitors in the arcade entrance from Islington-green were Messrs. Henry Wurr & Co., of Blomfield-street, who showed a hand-feed planing-machine which will plane and true-np ready for a glue joint any piece of wood up to 12 in. wide. This is a strong and cheap machine, and likely to be highly appreciated wherever it is used. The same exhibitors show a substantial instead of a movable spindle. The "Ord" gas-engine, made and exhibited by this firm, appears to be a great success. It is simple in construction, and claims to be the only atmospheric gas engine fitted with a "governor." Messrs. Lewis & Lewis, of Cambridge Heath-road, were also exhibitors of some good wood-working machinery, including the "Westminster" hand-feed planer, which is well worthy of notice. They also showed a combined circular saw-bench and band-sawing machine, and the "Kensington" and other mortising machines. Messrs. Tushaw & Co. were amongst the exhibitors of wood-working machinery in the arcade, and among their exhibits was a very useful little machine for rapidly punching hoop-iron, and which is likely to be much appreciated by packing-case makers and others. Messrs. John Warner & Sons, of the Crescent Foundry, were exhibitors of pumps and other appliances for which they are noted. In St. Mary's Hall, among an odd jumble of things, we noticed some useful wood-working machinery shown by Messrs. Hempsted & Co. (late C. Powis & Co.), of London and Grantbam. Among the exhibitors of steam engines may be mentioned Messrs. Arveling & Porter, of Rochester; Messrs. Barrows & Stewart, of Banbury; Messrs. Clayton & Shuttleworth, of Lincoln; Mr. Hindley, of Bourton; Messrs. Ruston & Proctor, of Lincoln; and Messrs. Ransomes, Head, & Jeffries, of Ipswich. Messrs. R. Waygood & Co., of Falmouth-road, Great Dover-street, were exhibitors of a high-pressure horizontal engine, very simple in design and exceedingly well finished. Messrs. E. R. & F. Turner, of Ipswich, made an interesting display of their specialities. Conspicuous amongst these was one of their patent automatic expansion portable steam-engines, of 8 horse-power. These expansion engines are now well known and appreciated. A 4-horse-power portable engine of the ordinary type is also shown,—a thoroughly well-constructed engine, possessing several important points of merit. The "Gippseswyk,"

engine appears in two of its various forms, viz., as a vertical portable engine, mounted upon iron travelling wheels, and as a horizontal fixed engine. These engines are fitted with the new Patent Turner-Hartnell Automatic Expansion Governor, a special adaptation of the Hartnell Patent Governor. The "Gippseswyk" engine is one of the best of the small-power engines now in the market. Corn mills,—another leading speciality of this firm,—are well represented, a number of mills of different sizes being shown.

ELECTION OF A DISTRICT SURVEYOR.

At the meeting of the Metropolitan Board of Works, on the 1st inst., one of the first items of business on the agenda was that relating to the appointment of district surveyor for the district of St. James and St. John, Clerkenwell, and part of Islington, rendered vacant by the death of Mr. R. L. Sibley.

There were in all thirty-five candidates who had made application for the appointment, but the voting only took place upon thirty,—five of the applicants being struck off the list,—one (Mr. H. H. Bridgman) for not being present (his name was called); a second (Mr. F. C. Nodley) had withdrawn his application on the ground of ill-health; while two of the remaining three gentlemen wrote asking to be excused attendance on the ground of illness or domestic bereavement. The fifth candidate whose name was struck off (Mr. A. T. Taylor) was stated to be on a visit to America.

The following is a list of the candidates who were present, with the number of votes recorded for each in the preliminary voting:—

Name.	Age.*	Votes.
Ashbridge, A.	37	27
Brooks, C. W.	39	11
Buxton, W. J.	37	3
Carritt, F.	34	32
Cheston, H.	35	6
Edmeston, J. S.	38	19
Elkington, G., Jun.	31	29
Ferguson, J. M.	37	5
Grellier, W.	35	7
Hamilton J.	38	4
Hunter, F.	31	22
Inskip, G.	34	1
Jackson, G.	34	5
Karalaka, L.	38	10
Lean, G. A.	36	7
Lees, W. H.	38	18
McLachlan, H.	39	13
Marsland, E.	29	17
Munn, T. H.	37	7
Pownall, R. E.	34	9
Renton, O.	34	2
Spryngour, W. H.	39	18
Solomon, L.	34	5
Spiers, W. L.	34	10
Stanning, A. R.	37	23
Street, W. H.	39	17
Stock, H. W.	31	1
Street, E.	34	18
Tanner, A. W.	39	29
Todd, E.	38	17

The six candidates who received the highest number of votes in this preliminary voting were Messrs. Ashbridge, Carritt, Elkington, Hunter, Stanning, and Tanner. The subsequent voting was as follows:—

	Second Vote.	Third Vote.	Fourth Vote.	Fifth Vote.	Final Vote.
Ashbridge	13	—	—	—	13
Carritt	29	27	25	27	23
Elkington	17	13	13	—	—
Hunter	21	29	18	15	—
Stanning	22	23	29	23	15

Mr. Carritt was, therefore, the successful candidate, and he was accordingly appointed to the office, subject to the usual conditions.

THE USE OF CEMENT IN THE CONSTRUCTION OF SEWERS.

In commenting upon the recent utterances of various sanitary engineers on this question, the *Thonindustrie Zeitung* states that recent examinations made at Frankfurt showed that the cement, mortar, and the concrete used (nearly four years ago) in the construction of the system of drainage have completely withstood all influences to which they have been exposed, and as they get older become harder. In the case of surfaces of concrete their hardness and smoothness have been fully maintained, and in no place could any trace be discovered tending to show that they had been affected by the sewer-water. An inspection made at Hamburg has resulted in an equally satisfactory manner.

\* The limit of age fixed by the Board is between twenty-eight and fifty years.

BUILDING PATENT RECORD.\*

APPLICATIONS FOR LETTERS PATENT.

- 5,538. F. Greatrex, Uxbridge. Stoves and fireplaces. Nov. 24, 1882.
- 5,536. T. Carter, Bideford. Preventing the flow of sewer gas into buildings. Nov. 27, 1882.
- 5,680. H. Donlton, London. Construction of the steps of flights of stairs. Nov. 29, 1882.
- 5,655. F. Smith, London. Bricks. Nov. 29, 1882.
- 5,704. H. J. Allison, London. Artificial stone for vanes, &c. (Com. by W. Matt and M. Meterbach, New York, U.S.A.) Nov. 30, 1882.
- 5,708. P. Jensen, London. Manufacture of furniture, doors, window-sashes, &c., from pent moss. (Com. by T. P. Aktiebolag, Jönköping, Sweden.) Nov. 30, 1882.

NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

- Nov. 28, 1882.
- 3,487. E. Edwards, London. Apparatus for maintaining a constant draught in chimneys. (Com. by A. Marques, Bordeaux.) July 22, 1882.
- 4,850. W. Teague, Illogan. Apparatus for ventilating purposes. Oct. 12, 1882.
- 5,125. A. J. Bonit, London. Door checks or governors. (Com. by the Elliott Pneumatic Door Check Company, Boston, U.S.A.) Oct. 27, 1882.

Dec. 1, 1882.

- 3,554. J. L. Thomsson, Worcester. Ventilators. July 26, 1882.
- 3,565. H. Morris, Manchester. Apparatus for adjusting ventilators. July 27, 1882.
- 3,613. A. C. Henderson, London. Stoves for heating by hot air and water. (Com. by Besson & Co, Paris.) July 31, 1882.
- 3,816. H. J. Haddan, London. Stoves. (Com. by D. McB. Graham, Massachusetts, U.S.A.) Aug. 10, 1882.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending December 2, 1882.

- 1,740. A. Browne, London. Stove. (Com. by L. Bregha, Dresden.) April 12, 1882. Price 6d.

This consists of three cylindrical chambers, one within the other. From the fire beneath, the gases of combustion rise into the innermost cylinder, thence pass down the inner annular space, and rise again through the outer annular space, whence they pass to the flue. The air is led through pipes through these spaces to be warmed.

- 1873. H. Fokes, London. Apparatus for sweeping chimneys and flues. April 19, 1882. Price 2d.

At the top of the chimney is a pulley, round which passes a chain, to which the brush for sweeping is attached. (*See Fig.*)

- 1890. F. Kingston, London. Eye for holding stair-croquet and other rods. April 20, 1882. Price 4d.

This eye has two limbs, which terminate in chisel edges, by which the eye is secured in its place.

- 1,902. W. Selby, Manchester. Ash-guards. April 21, 1882. Price 4d.

These consist of a hinged perforated shelf, with ledges which form a toast-stand, a toaster, and a smoothing-iron heater.

- 1,916. T. A. Riggs, Aldeburgh. Combination of substances for the manufacture of bricks, &c. April 22, 1882. Price 4d.

The chief material is "coralline Craig," which is mixed with cement or lime, and made into the required form.

- 1,974. John Henson, Derby. Barns and shelters with rising and falling roof. April 26, 1882. Price 8d.

The roofs are supported by chains led over pulleys on the top of uprights, and are raised or lowered by a worm and worm-wheel, which actuates all the chains at the same time.

- 1,975. T. E. Bladon, Birmingham. Ventilating and chimney cowls. April 26, 1882. Price 6d.

These consist of two concentric tubes, on the axis of which are two sets of vanes inclined in opposite directions. As the air enters it passes through one of these sets of vanes down the annular space between the tubes, while the vitiated air escapes through the inner tube past the other set of vanes.

- 1,979. J. Beresford, Birmingham. Urinals. April 26, 1882. Price 8d.

The basins are secured on horizontal pivots, so that they can be folded up, and a small tank is arranged above, so connected with the pivot that the water is shut off when the basin is lifted, and the tank is allowed to fill, and when the basin is lowered for use the water in the tank flushes the basin.

\* Compiled by Hart & Co., Patent Agents, 156, Fleet-street.

2,006. W. Willshav, Lenton. Ventilating greenhouses, &c. April 28, 1882. Price 2d.

The air-admitting orifices have pipes, which lead the air to a trough surrounding a portion of the heating-pipe, whence the air may pass into the greenhouse warmed. (*Pro. Pro.*)

2,022. J. H. Welch, Birmingham, and B. W. Spittle, Wednesbury. Attaching door-knobs to spindles. April 28, 1882. Price 2d.

A steel tongue is placed inside the mount of the knob, to bite the corner of the spindle. (*Pro. Pro.*)

2,216. T. C. Summers, Portsea. Supplying water to water-closets. May 11, 1882. Price 6d.

The seat is connected with a double-action closing piston. When the front end of the seat is depressed the tank is allowed to fill, the exit from the tank being cut off, and when it is again raised the flush issues from the tank, shutting off the supply.

4,030. W. R. Lake, London. Impregnating mineral substances or compounds with bituminous products. (Com. by R. Michelet and L. Tescher, Berlin.) Aug. 23, 1882. Price 6d.

The stones, bricks, &c., are subjected to the action of intense heat, vacuum, and pressure, in a receptacle in which the bituminous substances are introduced with which they are impregnated.

#### HARD GLASS.

ONE of the leading organs of the German glass trade has recently called attention to the fact that, under certain conditions, the description of glass known as hard glass is liable to fracture, and in some cases is even more easily destroyed than ordinary glass. Cases occur in which glass vessels composed of it break without apparent reason, the cause being probably that the process of cooling has been too rapid, or that it has been partial and unequal in its operation, with the result of some parts of the glass being of different elasticity from others.

The invention of De la Bastie (by which glass heated to a softening point was plunged into oil, grease, wax, resinous, or bituminous substances, and subjected to a rapid process of cooling until a certain degree of temperature was attained, from which point the process was conducted at a slower rate), attracted, at the time of its being made public, a degree of attention in excess of its merits as proved by actual experience. It is no detraction, however, from the approved and tried value of this process, to record that the expectations formed of its practical value were, in many cases, of an exaggerated nature. Thus it has been stated that its resisting power was fifty to eighty times that of ordinary glass. The fact is noted that sheets of hard glass can bear the strain of weights falling on them, and can also bear the shock of being thrown down from a height. At the same time, they are easily broken, it is stated, if in their fall they come upon a piece of gravel, which cracks the glass. When hard glass breaks, it usually does so with a certain degree of violence, and falls into a number of small, sharp-edged fragments. In this respect it is not dissimilar to certain kinds of Venetian glass.

The cutting of hard glass can usually only be effected in one manner, namely, in a parallel line to the sides, this circumstance being connected, it is said, with certain facts in relation to optical science.

#### ST. PETER'S CHURCH, LEICESTER.

THE decoration of the chancel of this church is now completed, and presents a harmonious effect. The lower part of the apse is painted in a chocolate colour, with ornamental bands running across it, and the sacred Greek monograms A and O in gold; from the moulding at the top of this dado to the string-course running round the windows a greyish-green prevails, and is powdered with conventional lilies and roses, with a rich chocolate band of pomegranates at the upper part. The spandrels over the arches of the windows are filled with a conventional treatment of the vine in a brownish red, on a vellum-coloured ground, the grapes being in gold. There are also shapes containing sacred monograms on coloured grounds, and each window is surmounted by an ornate cross, the reveals being painted a warm salmon colour. The cornice running round the whole of the chancel is ornamented in gold and colours in broad leading lines. The wooden roof of the sacristy is divided into sixteen large panels in two rows, each panel being filled with an angel clothed in white, with coloured wings and gold nimbi. The upper row are playing on musical instruments; the lower holding a scroll,

with the text, "The Lord is in His Holy Temple, let the earth keep silence before Him." The two angels immediately over the altar are kneeling in adoration. At the apex where the ribs meet, the panels contain broad gold rays radiating downwards; the ribs are treated with chevrons of gold and red; some of the lesser mouldings are also coloured. The whole composition has been designed and executed by Messrs. Cox, Sons, Buckley, & Co., of Southampton-street, Strand, London, who are also painting the panels for the new reredos, which is being made by a townsman, Mr. Noble, after the designs of Mr. Turner, architect.

#### PROVINCIAL NEWS.

**Reading.**—The new block of buildings to be known as the "British Workman," in Abbey-street, Reading, was opened on the 23rd ult. The old premises, which were erected in 1872, were found to be not sufficiently large for the present requirements, the house being very largely patronised by working men and country people visiting Reading, and, by the liberality of Mr. Alfred Sutton, the new premises have been built at his sole cost. The old coffee-room has been transformed into a bar where tea, coffee, and other non-intoxicants will be sold, and adjacent is a spacious dining-room 36 ft. long and 18 ft. wide, fitted with marble-top tables and comfortable benches, and affording accommodation for about seventy persons at a time. On this floor also are scullery and kitchen, with all modern appliances, and in the latter room is a lift communicating with the first floor. The club-room, which is on the first-floor, will seat a large number of persons. In addition to the supply of refreshments, ample accommodation is provided for working men and others of limited means to lodge or live, there being on the first and top floors about twenty bed-rooms neatly furnished for single working men. In the basement of the building are spacious stores, larder, &c. The contractor was Mr. J. Bottrill, King's-road, and Messrs. Brown & Albury were the architects. On the occasion of the opening of the building Mr. Alfred Sutton invited the whole of the workmen employed in the construction of the building (numbering between seventy and eighty) to a substantial dinner. The total cost of the building has been about 3,000l.

**Tunstall.**—We learn from the *Staffordshire Advertiser* that the Tunstall Board of Health is endeavouring to retrieve the mistake it made many years ago in erecting a market wholly out of character with the needs of the town, and which has been a "white elephant" ever since. It is proposed to convert a third of the dismal waste into a structure which will supply the town with the public offices of which it is so much in want, and if the estimates of the surveyor are reliable, not only can this improvement be effected without adding to the rates, but the rearrangement of the market and the additional buildings will bring in a revenue which will go a good way towards paying the interest on the outlay. Captain Hildyard, R.E., has held an inquiry in reference to the matter, the Local Board having applied for a loan of 12,000l. for the purpose of effecting the improvement. Among the witnesses examined in support of the scheme was Mr. Wood, the surveyor to the Board, who explained his plans, and said that the present area of the market was 7,226 square yards, and the intended area would be 4,920 square yards. The present number of stalls was 130, besides 60 yards of tables. The altered market would contain 94 stalls, and tables of the length of 54 yards. The cost of re-arranging the market would be 1,450l. In the new erections (in front of the market) there would be a board-room, offices for the officers of the board and the relieving officer, and a committee-room. The inspector said he could not help thinking that Mr. Wood's estimate would be exceeded. Mr. Dutton said the Board had determined to keep within the 12,000l., and if the tenders exceeded the estimate the plans would have to be amended.

**Birmingham.**—The Birmingham Council has been occupied in considering the draft of the new Birmingham Corporation Bill for consolidating and amending the various Acts and Parliamentary Orders affecting the powers of the Corporation. These powers relate to sanitary matters, the regulation and control of the parks, municipal buildings, free libraries, and other property of the

Corporation, the by-laws affecting porters and drovers, hackney carriages, and marine-store dealers, the police regulations, the sale of coal, the duties of the fire-brigade, and the prevention of fires, the employment of children in factories and workshops, the conduct of the gas and water departments, the Closed Burial Grounds Act, and the finances of the borough, together with a number of miscellaneous regulations and provisions.

#### EDUCATION OF ENGINEERS.

SIR,—In your article in last week's *Builder* on "The Education of Engineers," you remark, "Shall the Institution of Civil Engineers remain an educating body when it becomes an examining body?" Those who favour the present movement are disposed to answer this question in the negative, and they suggest that the large number of students now under the *regis* of the Institution should be transferred to one of the junior engineering societies.

This is not the view taken by the Council of the Society of Engineers, for they aim at strictly educational work in their coming lectures, which is a totally different thing from the work now done by the Institution with their students.

As a matter of fact, the Council carefully avoided appointing Tuesday and Friday evenings, so as in no way to clash with the ordinary meetings of the Institution on Tuesdays, or their students' meetings on Fridays.

JABEZ CURCH, M.Inst.C.E.,  
President, Soc. Eng.

#### DAMP WALLS.

SIR,—We have read with much interest the article in your last issue on this subject, reproduced from the *Badische Gewerbe Zeitung*. It is quite evident that Professor Meidinger has thoroughly investigated the matter as to the different causes from which damp walls are produced.

Of the remedies recommended by him that contained in paragraph c is undoubtedly the most effectual, but it is absolutely necessary that the walls, after being thoroughly dried by stoves, should be kept heated during the application of the waterproofing liquid, and also that it be driven into the bricks or stones with the heated stoves until they become thoroughly saturated. It will take from six to twelve applications of the liquid to do this, one coat being quite useless, as we have found from experience.

Tinfoil and pitch paper have been in use for some years, but in nearly all cases failed after the lapse of a few months, when the damp from the walls causes it to come away from them, bringing the paperhanging with it.

A. DREYFUS & CO.

#### REMOVAL OF SNOW.

SIR,—About ten weeks ago the Commissioners of Sewers invited sketches and ideas for the removal of snow from the area of the City. As one of the competitors, will you kindly allow me, through the medium of your columns, to ask these gentlemen what decision they have arrived at, and when that decision will be made known? PATIENCE.

#### COSTS OF PAVING THOROUGHFARES.

AT Marylebone, the owners of five houses at Durtmouth Park-hill were summoned by the Vestry of St. Pancras for their part of the estimated expenses of providing and laying the paving on the west side of that thoroughfare. Mr. Besley supported the summons, Mr. Rotton and Mr. Lyon defended. The boundary of the parishes of St. Pancras and Islington ran down the centre of the road, and, by an order of the Metropolitan Board of Works, the upper part of the thoroughfare was vested in Islington for paving and sewage works, and the lower end in St. Pancras. Islington had been unable to recover paving demands for houses on the western or St. Pancras side of the road, although it was a portion of the thoroughfare vested in Islington. St. Pancras parish then took these proceedings.

Mr. Cooke held that a vestry could not apportion on houses in one part only of a road, but must do it on both sides of the road. One parish also could not apportion on houses in another parish. There was here a perfectly good order vesting the whole of that portion of the street in the Islington vestry, and the demands made by St. Pancras were illegal and could not be sustained. The summonses would be dismissed, with twenty-six guineas costs against the vestry.

OBITUARY.

**Miss Rhoda Garrett.**—The death is announced of Miss Rhoda Garrett, at the age of forty-one. The daughter of a country clergyman of small means, and one of a large family, she broke through the usual restrictions of home life and determined to earn for herself an honest independence. After passing through an architect's office, she set up for herself as a "house decorator," taking a cousin, the sister of Mrs. Garrett Anderson and Mrs. Henry Fawcett, into partnership, and, in spite of delicate health, soon attained a good position. Her taste and sense of fitness soon recommended her to a large and admiring circle.

DISSENTING CHURCH-BUILDING NEWS.

**Clapham.**—The new Baptist Chapel in Grafton-square, Clapham, was opened on Tuesday, December 5. It has been erected of picked stock facings, with Portland stone dressings and red-brick quoins, &c. It will hold 850 persons seated in the area and capacious galleries. There are schoolrooms in rear to accommodate on first and second floors about 500 children. The usual vestries and other offices are provided on the ground-floor. The amount of the contract was 5,572*l.*, exclusive of heating, which is on Crundy's hot-air principle, and appears to act well. The architect is Mr. W. Niven, Dean's-yard, Westminster. Mr. F. Higgs, of Loughborough Junction, being the builder, and Mr. C. Hunt, the foreman of works.

**Richmond, Yorks.**—A new Congregational church is to be built at Richmond, Yorks, from designs by Messrs. Clark & Moscrop, architects, Footmills, Darlington.

STAINED GLASS.

**Salisbury.**—Wilton Church has just received an addition in the shape of a memorial stained-glass window, the gift of Dr. Bennett, a local physician, to the memory of his wife. In the treatment of the window the greatest importance has been given to the central subject, illustrating the "Resurrection," which was, at the request of the donor, treated after a painting by Giotto. Surrounding this is a subject showing the three Marys at the tomb. The subject chosen to form the base of the window is "Our Saviour meeting Mary 'on the third day' in the Garden." These subjects are divided by a frame-work of grisaille ornament. The window has been executed by Messrs. J. A. Gibbs & Howard, Charlotte-street, Fitzroy-square.

**Chester Mendip.**—Two stained-glass windows, as memorials to the late Mr. E. B. Hippisley and members of his family, have been recently placed on the south side of Chebton Mendip Church. The designs consist of canopy work in accordance with the architecture of the stonework, and in the panels are the following subjects, illustrating the parables of our Lord:—"The Unmerciful Servant," "The Laborers in the Vineyard," "The Talents," "The Good Samaritan," "The Lost Sheep," and "The Prodigal Son." In the tracery are angels bearing inscribed scrolls. The work has been designed and carried out by Messrs. Joseph Bell & Sons, of College-green.

**Piddinghoe.**—Several of the windows of the recently-restored parish church of Piddinghoe, Sussex, have been filled with stained glass, the gift of parishioners and friends. The three lancets at the east end of the chancel represent in the centre the Crucifixion, with St. Mary and St. John on either side. These windows are the gift of Mr. R. H. Faulconer, of Lewes, and were executed by Messrs. Powell, Whitefriars, London. All the other windows are by Messrs. Wailes & Strang, of Newcastle-on-Tyne. The windows in the baptistry represent Christ blessing little children, and his own baptism. The windows of the south aisle are occupied by representations of the twelve Apostles, and one in the north aisle represents the Eastern Kings bringing offerings to the Saviour, which is in memory of Mr. Hugh, who died in 1866. Another shows Simon blessing the infant Saviour, and is to the memory of Mr. Winton Croft, who died in 1862. The third window in this aisle is to the memory of James and William Tompsett, and in the north aisle in the chancel is a stained window to the memory of William Purnell, who died in 1879.

The east window of the north aisle represents the "Ascension," and is erected to the memory of "Joseph and Mary Tompsett." One of the windows in the south aisle portrays the Resurrection, and has been put in as a memorial of Francis Tompsett.

SCHOOL-BUILDING NEWS.

**Lynn, Norfolk.**—The foundation-stone for the new Wesleyan schools has been laid. When completed, the schools will consist of entrance-hall, on either side of which are two large schoolrooms, communicating with the lecture-hall, 60 ft. by 40 ft., and 25 ft. high, adjoining which are six class-rooms and the library; there will also be a retiring-room, with lavatory and water-closets. The kitchens and other offices are detached. The buildings are designed in the Perpendicular style, with Bracknell red facing-bricks for the front, and Lascalle's concrete dressings to the windows and doors, the roof will be covered with slates. Mr. W. H. Brown, of Lynn, is the contractor, Mr. Hilliam being the clerk of the works. Mr. Hatchard Smith, 41, Moorgate Station-buildings, is the architect.

Miscellaneous.

**Conviction for Abusive Language to a Local Board Official.**—Before the Stipendiary, Mr. J. R. Phillips, West Ham, William Simpson, described as a builder, of Graydon-villa, Forest-gate, appeared in answer to a summons charging him with using abusive and insulting language towards Edmund Henry Raiman, on the 20th of November. After hearing the witnesses for the defence, his Worship said that it was impossible for him to come to any other conclusion than that the case was made out against him. It was perfectly clear that Mr. Simpson not only did use the language imputed to him to Mr. Raiman himself, but also to a strange boy. He could not understand how a person of the defendant's apparent education and status could so demean and disgrace himself in that way. He would have to pay a fine of 2*l.* and costs, in all 3*l.* 1*s.*

**Presentation.**—Mr. Renben Cull, London representative to Messrs. John Knowles & Co., of Easton-road and Burton-on-Trent, having decided to retire from that position, the staff and workmen met and entertained him at the Wrotham Arms, Camden Town, a few days ago, and amid unanimous expressions of respect and sincere regret at his resignation, presented him with a liquor-case, suitably inscribed. Messrs. Knowles & Co. have issued a circular to their customers, in which they point out that Mr. Cull's retirement is his own decision, after having filled his position faithfully and honourably for twenty years. Mr. Cull retires to the Ketley Blue Brick Works, in which he is a partner, and in his new sphere of action we wish him all prosperity.

**Architectural Exhibition, Edinburgh.**—Particulars of this exhibition were given by us a fortnight ago. Works intended for exhibition will be received at the Royal Academy National Galleries on Wednesday and Thursday next, Dec. 13 and 14. All communications connected with the exhibition to be addressed to Mr. Alfred Bryson, acting secretary, 33, Frederick-street, Edinburgh.

**Mr. and Mrs. German Reed's Entertainment.**—On Wednesday next, December 13, Messrs. Reed & Wagnin will produce their Christmas programme, comprising a new first piece, by Arthur Law, music by King Hall, entitled "A Strange Host; or, a Happy New Year," and a new second piece, by Gilbert A'Beckett, music by Corney Grain, entitled "That Dreadful Boy." Mr. Corney Grain's musical sketch "En Route," will still be retained in the programme.

**Burgos Cathedral.**—We are asked to mention, with reference to the recent competition here, that the firm who has been selected by the Royal Academy of Madrid to provide stained glass for the six large windows in the chancel is Messrs. Mayer & Co., of Munich and London.

**Leatherhead Drainage.**—Eighteen sets of plans were sent in for this work in reply to the advertisement of the Rural Sanitary Authority of Epsom Union. The first premium has been awarded to Messrs. Gotto & Beesley, of Westminster. The plans were referred to Mr. Baldwin Latham, C.E.

**The Strength of Boiler Flues.**—At a meeting of the Society of Engineers, held on Monday, December 4th, in the Society's Hall, Victoria-street, Westminster, Mr. Jabez Church, president, in the chair, a paper was read by Mr. W. Martin on the "Strength of Boiler Flues." In the construction of steam boilers, more than in ordinary engineering matters, it is of special importance, both to the engineer and the public, that the principles involved should be clearly established, since cases of failure produce such disastrous results, which, now that steam power is so universally used, may affect the safety of the public at large. In most cases, where a boiler fails simply from inherent weakness, it is usually from the collapse of its flue, since the flue of a Cornish or Lancashire boiler is, unless specially strengthened, the weakest part of the boiler. Besides being essentially weaker, the flue is the part which, more than any other, is injuriously affected by faulty construction. This, in conjunction with the consideration that, unless dangerous or almost collapsing pressures are applied, it is extremely difficult to discover their weakness by testing, makes the construction of boiler flues a matter of particular importance. Notwithstanding the interesting character of the problem, and its importance, however, the experimental data upon which our knowledge rests is insufficient and unsatisfactory. The only systematic series of experiments which have been made at all were made by Sir William Fairbairn twenty-four years ago, and the formula deduced by him from these experiments is still the one in use by engineers. The reliability of this formula is not, however, beyond question, and its application to different cases can be made to produce somewhat anomalous results. It is much to be desired that this subject could receive a new experimental investigation, and in such a case, the experiment should be with objects corresponding in shape, and conditions of strain, though not necessarily in size, to actual flues.

**Railway Hotel, Liverpool.**—The Lancashire and Yorkshire Railway Company have instructed Mr. Henry Shefferdine, of Liverpool, to carry out their intended hotel and station buildings at the new terminus, Rith-barn-street, Liverpool, which are estimated to cost upwards of 100,000*l.* He has lately carried out several extensive erections, including new Daily Post offices, Imperial Chambers, Henstock's Buildings, Castle-street, and several buildings in other parts of that city.

**Portishead Railway.**—Arrangements have been made for doubling a portion of the Portishead Railway, between the junction with the main line and Clifton Bridge Station. The tender by Messrs. J. Durnford & Son, contractors, has been accepted. Mr. F. C. Stileman, of Westminster, is the engineer.

**The Courts of Justice.**—The Citizen has issued a large and clear plan of the principal floor of the Royal Courts of Justice. It will be found useful to hang up in offices.

TENDERS

For the erection of school-rooms, class-rooms, and gallery, and resetting of ground floor, at the Baptist Chapel, Queen-street, Ilkeston, Derbyshire. Mr. R. Argyle, architect, Ripley and Derby. Quantities supplied—

Noon & Wood, Marston	£1,250 0 0
Holbrook, Ilkeston	1,172 0 0
Ford & Co., Derby	1,120 0 0
Slaw, Ilkeston	1,115 0 0
Clark, Ripley	1,090 0 0

\* Accepted, subject to modifications.

Accepted, for pulling down and re-erecting three houses at Chacewater, Halifax, for Mr. Thos. Townsend. Messrs Leeming & Leeming, architects, Halifax.—  
Fearnley & Firth (mason).  
W. Macdonald (joiner).

A. S. Blackburn (plasterer and glazier).  
Akroyd & Mills (plumbers & slaters).

Accepted, for tailors' workshops and woolshops, Halifax, for Mr. Jubal Riley. Messrs. Leeming & Leeming, architects.—

Scott & Co. (masons).	
Noble & Son (joiners).	
A. Hobson (plasterer and slater).	
J. Thompson (plumber and glazier).	

For works in connexion with building new infants' school, boundary-walls, &c., at Upper Stratton, Swinton, for the Stratton St. Margaret School Board. Mr. William Drew, architect, Swinton:—

Walls	£738 0 0
Barrett	679 0 0
Henley	659 15 0
Willshire	659 12 0
Jackson	649 0 0
Phillips & Powell	648 10 0
Looker (accepted)	625 0 0

For additional block of buildings, receiving wards, &c., at the workhouse, Sydney-road, Homerton, for the Guardians of the Hackney Union. Messrs. Lee & Smith, architects:—

Table listing names and amounts for the Sydney-road workhouse project, including Steven & Baker, Hart, Gentry, Fanner, Margt., Howell & Son, Morter, Crockett, Johnson, Boyce, Longley, Perry & Co., Kellett & Bentley, Nibblingale, Macgregor, Ewins & Co., Crocker, Merritt & Ashby, W. Shurmer, and Capew.

For town-hall and cellars, Eastbourne, Mr. E. F. W. C. Schmidt, architect (building surveyor), Eastbourne:—

Table listing names and amounts for the Eastbourne town-hall project, including Huggett & Goster, P. Cornwell, Redford & Potter, W. Hook, C. Tomkinson, James Harper, James Longley, James Farless, William James, R. Climpson, J. A. Skinner, W. Grear, Booth & Sons, Smith & Son, M. Wells & Co., Priestley & Gurney, Deacon & Co., Alfred Dore, P. Peters, Greenwood & Sons, and A. Matthews.

For extension of the Adelaide Cafe, 439, Strand, and 11, King-street. Mr. Spencer Chadwick, architect:—

Table listing names and amounts for the Adelaide Cafe extension project, including Lawrence, Bywaters, Clements, Oliver, Howard & Dorrell, Garrard, Patrick, and Langmaid & Way.

For the New Dock Inn, Rotherhithe, for Messrs. Mann & Crossmann. Mr. Augustus Walton, architect:—

Table listing names and amounts for the New Dock Inn project, including Burgen, Shering & Williams, Brightmore, Cook, Buller, Wood, Taylor, Hoben & Parker, Parrish & Hawker, Crocker, Aldridge & Gill, Cawson & Son, and Hawkins.

For the erection of new Sunday schools for All Saints' district, Leyton, Essex. Mr. Richard Creed, architect:—

Table listing names and amounts for the All Saints' district Sunday schools project, including Hunt, Arbot, Brightwell, Jones, Morter, Reed, Stewart, Bungs & Co., North Bros., and Sayer.

For the erection of West Cliff Hall, Hythe, near Southampton, for Mr. John Whyte. Mr. W. H. Mitchell, architect, Southampton:—

Table listing names and amounts for the West Cliff Hall project, including W. J. Martell.

For the erection of a temporary church, Shieldfield, Newcastle. Mr. Arthur B. Plummer, architect, Newcastle-on-Tyne:—

Table listing names and amounts for the Shieldfield temporary church project, including Walter Baston.

For the erection of nine houses in Ross-road, Beedington, Surrey. Mr. C. W. Reeves, architect, 102, Guildford-street, W.C.:—

Table listing names and amounts for the Ross-road houses project, including Howe & White.

For making new road, on Isaac Duckett's Charity estate, Crayford, Kent. Mr. C. W. Reeves, surveyor:—

Table listing names and amounts for the Isaac Duckett's Charity estate road project, including Manners.

For rebuilding No. 4, Half Moon-street, for Mr. P. De Long. Mr. D. Cubitt Nicholls, architect:—

Table listing names and amounts for the Half Moon-street rebuilding project, including Langmaid & Way.

For new lodge, and alterations to billiard-room, at Kenton Grange, near Harrow, for Mr. John Gwynne. Messrs. Dunk & Gaden, architects:—

Table listing names and amounts for the Kenton Grange project, including Various Contractors.

For the partial rebuilding of chemical works at Langbourne Wharf, West Ferry-road, Millwall, for Messrs. Conroy, McCarnie, & Co. Messrs. Dunk & Gaden, architects:—

Table listing names and amounts for the Langbourne Wharf project, including J. Rider Hunt.

For plant-houses, potting-shed, &c., at Broomfields, Eland, for Mr. Godfrey Beaumont:—

Table listing names and amounts for the Broomfields plant-houses project, including S. Leley.

For alterations to premises, Broadway, Hammersmith, for Mr. H. Newman. Mr. R. P. Whellock, architect:—

Table listing names and amounts for the Broadway Hammersmith alterations project, including J. Mears.

TO CORRESPONDENTS.

L. & L. (should send amount)—D. (illustrations of the Church of the "Secret Convent" have appeared in our paper.—R. & A. sent view, &c.)—L. J. B. (we cannot find space for testimonials)—J. R. L. B. (library inscribed)—F. B. (we are not disposed to enter into the inquiry as to where Hopton Wood stone has been used)—H. B. (send particulars of trial)—W. P. B. (adds no fact to the discussion)—P. S. & B. F. W.—H. R. O.—H. G. B. H.—S. G. R. G.—J. S. M.—R. T.—H. R. G.—H. & F.—C. & F.—M. & Co.—F. & Son.—G. R. & Co.—J. W. S.—W. D.—A. & H.—G. & B.—L. & W.—B. R.—S. Bros.—R. W. D.—C. W. O.—R. J.—E. W. S.—W. & C.—M. & G.—L. H. B.—R. K.—J. F. Jun.

Correspondents should address the Editor, and not the Publisher, except in cases of business.

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO ADVERTISERS.

Persons advertising in the Builder may have REPLIES ADDRESSED TO THE OFFICE

46, Catherine-street, Covent-garden, W.C., FREE OF CHARGE.

Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under..... 4s. 6d. Each additional line (about ten words)..... 6s. 6d.

Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

FOUR LINES (about THIRTY words) or under..... 2s. 6d. Each additional line (about ten words)..... 6s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY. \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINIER, Publisher.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied gratis from the Office to residents in any part of the United Kingdom at the rate of the per annum, PREPAID. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone. WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, And Farleigh Down. RANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [Adv't.]

SEASONED CORSHAM DOWN, FOR WINTER USE. PICTOR & SONS, BOX, WILTS. [Adv't.]

Doubling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doubling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [Adv't.]

Doubling Freestone, Of best quality, supplied from their own Quarries and Kilns by STRAPE & HAIN, Stoke, Ilminster. Agent, Mr. H. MITCHELL, 5, Augustus-road, Hammersmith, London, W. [Adv't.]

Asphalte. Scyssel, Patent Metallic Lava, and White Asphaltes. M. S T O D A R T & C O. Office: No. 90, Cannon-street, E.C. [Adv't.]

Asphalte.—The Scyssel and Metallic Lava Asphaltic Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. [Adv't.]

Immense quantities of DRY WAINSCOT, DRY MAHOGANY, DRY WALNUT, in all thicknesses. B. J. HUDSON & SONS, Whitfield-st., W., and Great Peter-st., S.W. London. [Adv't.]

The Patent Vacuum Chimney Top and Ventilator, recognised by all leading Architects and Builders as best and cheapest means for curing DOWN-DRAUGHTS as well as for Ventilation of Drain and Soil Pipes.—R. ETZENBERGER & Co., 13, St. Andrew's-st., Shoe-lane, E.C. [Adv't.]

J. L. BACON & CO., MANUFACTURERS OF IMPROVED STEAM AND HOT-WATER APPARATUS, FOR WARMING AND VENTILATING Private Houses, Churches, Schools, Hospitals, Manufactories, Greenhouses, &c. OFFICES AND SHOW-ROOMS:—No. 34, UPPER GLOUCESTER PLACE, DORSET SQUARE, LONDON, N.W. Illustrated Pamphlet on "Heating" post free.

CHAPPUIS' PATENTS FOR REFLECTING LIGHT. DAYLIGHT REFLECTORS OF EVERY DESCRIPTION, ARTIFICIAL LIGHT REFLECTORS.

WHY BURN GAS?—CHAPPUIS' REFLECTORS DIFFUSE DAYLIGHT.—They are exclusively adopted by and fitted at Buckingham Palace, all H.M. Government Offices, Houses of Parliament, H.M. First Commissioner of Works, the Metropolitan Board of Works, British Museum, South Kensington Museum, Royal Institution, Guildhall Museum, on board H.M. Ships, also Railway Companies' Offices, Hospitals, Institutions, Banks, Insurance Offices, Manufactories, Private Houses and generally from Noblemen's Mansions to Artisans' Work-shops. 30,000 in use in London alone. Patronised by leading Architects, Engineers, Contractors, &c., &c.

N.B.—For Prospectuses and Diagrams, address Stamped Envelope to P. E. CHAPPUIS, Patentee and Manufacturer, 69, FLEET-STREET, LONDON.

NOTICE.—The POLYGONAL REFLECTOR (Latest Patent) FOR ARTISTIC and PICTURE GALLERIES. Its construction allows of the angle of light being readily altered so as to reflect in any desirable direction.

### More Books on Decoration.

HE cry is still, "They come!" If we do not become a truly tasteful and decorative generation, it will not, at least, be for want of books to teach us the way in which we should walk; and the fact that publishers should be willing or able to produce so many books of the kind, and that so many persons think it worth while to write them, certainly argues a considerable degree of public interest in the subject.

The three books\* at present before us illustrate three different classes of artistic publication. The lectures by the late (we regret to say) Miss Crane attempt to deal suggestively with the whole subject of art,—what it is and how it arises,—an immense subject, of course; but there is nothing pretentious about Miss Crane's lectures; she does not profess to give any exhaustive treatment of her subject, but to throw lights upon it and awaken thought in those who have not thought enough about it. Mr. Day's book is narrowed to one branch of art,—that in which he has been so successful himself,—and goes proportionately more into detail in regard both to principles and practice. Mr. James's book (we will conclude the author to be "Mr.," in the absence of any evidence to the contrary on the title-page) belongs to a much less important and more humble class of works, those which are intended to furnish "hints to beginners" who wish to amuse themselves by trying a little amateur decoration; it has, in fact, no claim to be grouped with the other two except for the sake of convenience, and we may dispose of the few remarks we have to make about it at once. The author gives instructions for the preparation of such means of applying colour in rooms as are likely to be within the reach of amateurs of average resources, and also a few particulars as to the nature and prices of some of the most useful of the available methods of hanging or covering walls. As far as they

go, these are practical and useful; after this, the author concludes that "it will not be out of place to say a few words on the various styles of decoration." Considering (and not without some reason) that to most people of average culture their very culture almost precludes originality, and leads them to some sort of copying from the forms of other periods with which they are acquainted, therefore he says a few words as to the characteristics of various styles, and gives some few illustrations of their prevalent forms, which illustrations are mostly not good. Some attempt is made to define decorative art, but not very clearly; for instance, we are told flat and conventional design is much better suited to wall decoration than natural painting, but no reason or explanation of this judgment is given. A suggestion, that the Ogham alphabet may be used in inscriptions with decorative effect, has the merit of originality, but it hardly seems worth while to adopt an extinct character with which very few people are acquainted for the sake of the limited and somewhat barbaric decorative effect to be obtained from it. In short, Mr. James had better have published the first or practical half of the work as a pamphlet; the suggestions contained would have been useful in that form.

The two other books we speak of stand on higher ground, and they deal respectively with the two leading questions about decorative art; first, what is it, why do we want it, how did it arise; all which are varying forms of the *why* which crops up in relation to all branches of art; and secondly, what is the best we can do with it now, how should we apply it, in what direction are our efforts to be made. *Why* and *how*, in short; those words sum up roughly what we want to settle about it.

Miss Crane commences her introductory chapter with a much-needed protest against the jargon use of the word art—"art-embroidery, art-colours," &c.; a piece of patter which meets us in Mr. James's book, by the way, where we come across the threadbare talk about "aesthetic colours." Expressions of this kind were, as Miss Crane says truly, "invented by shopkeepers to characterise a kind of goods got up in a certain style to please that part of the public that cares for fashion and novelty alone, and has no higher aims and desires, and wishes to have none." Miss Crane's definition of art follows a line which some other writers have followed lately,—that art is only workmanship, carried to a higher point. There is a great deal that is suggestive in this view of the matter; it is the partial expression of one side of decorative art, that it should have relation to the form or use of the object decorated; but it is a confusion of ideas after all, arising from the use of one word in a double sense. She says, "the word, in its original sense, meant force or strength, and it was applied to mechanical work, and is so still;

It is not applied in the sense of force or strength, however, but of skill. But when we talk of the art of weaving, for instance, and of the art or artistic feeling displayed in a design with which the stuff woven is decorated, we mean two different classes of human work and ability. The art of weaving, in the first sense, implies only mechanical dexterity applied to a material intended for practical use. The art of the artist, in designing a pattern to be worked on the stuff, is a talent differing not in degree but in kind; it depends upon perfectly different qualifications from that of the weaver, and it is applied to a totally different end. It is absurd to group them in this way, as:—

1. Art purely necessary and useful;
2. Art decorative;
3. Fine art; "

which is what we find done here. It is a fallacy arising from the fact that the word "art," like a good many other words in our language, has come to be loosely used with two different meanings, and people are building erroneous definitions on that fact. It sounds very practical, but it is a fallacy. As soon as the maker of a thing for practical use comes to think of something else besides its practical fitness for its purpose, to do something to it or add something to it merely because this will improve its appearance, he is coming on a different task altogether, and calling into exercise a different class of faculties. It is true that a merely well-made thing, in the highest degree fitted for its use, will often please our artistic sense by its appearance of fitness, much more so than a more ornate article illustrated with bad or common-place decoration. It is also true that some every-day articles are now constantly made with a more or less degree of ornamental treatment, even in their commonest forms, which has come to be regarded by many, from habit, as almost necessarily associated with them, and as part of their practical treatment. But those considerations do not alter the fact that ornamental art is quite a different thing in its nature from practical or handicraft art, and that the two cannot be confounded together.

This admission is, in fact, necessary to justify the position taken by both the writers whose opinions we are noticing, that the judgment in regard to what is right or wrong in decoration needs cultivating just as much as the judgment in regard to other specialties. Mr. Day boldly puts on his title-page (and we are very glad to see it) a contradiction of a well-known and continually abused proverb: he says emphatically, "De gustibus nix disputandum," and he is quite right. Miss Crane brings out the same rule with equal emphasis: "In all other human productions, an enlightened or reasonable person sees at once that it is not enough to know what he likes, but what is *worth liking*; but, respecting questions of art, he thinks himself born com-

\* "Art, and the Formation of Taste"; Six Lectures, by Lucy Crane. With illustrations drawn by Thomas and Walter Crane. London: Macmillan & Co. 1882.

"Every-Day Art; Short Essays on the Arts not Fine." By Lewis Foreman Day. Numerous illustrations, chiefly by the Author. London: B. T. Batsford. 1882.

"How to Decorate our Ceilings, Walls, and Floors." By M. E. James. With diagrams and coloured illustrations from designs by the Author. London: G. Bell & Sons. 1883.

patent to judge, no matter though he never gave an hour's patient consideration to the subject." Mr. Day has a good many observations to the same purport in his chapter on taste. "Why is it," he asks, "that in this matter of art a man, even while admitting that he knows nothing of the subject, will protest that he is none the less competent to give judgment?" It is exactly because artistic work stands on a ground of its own, different from that of any other work, that those questions have their point. Miss Crane insists also a little too strongly on the idea, in which she fortifies herself by quotation from Mr. Morris, that "nothing is truly ornamental which is not useful." That is not quite the correct way of putting it; what should rather be said is that nothing can rightly take place as decoration except what is applied to some object in itself useful. Design which exists for itself alone belongs to the category of the fine arts, and must be the representation of life of some kind, human, animal, or vegetable, or landscape generally, with that degree of completeness which will give it a life and expression of its own, too high and too complicated to be relegated to the mere office of decorating an object. That which is rightly called "ornament" is art of that degree of interest that it will add beauty or expression to some object to which it is applied, but has not a special expression which would make it an object of sufficient interest in itself. We decorate an object with a Greek fret or honeysuckle ornament; but we should not hang up drawings of these decorations for their own sake, except in an art-museum or studio. The simple object illustrated in the tail-piece at the close of Miss Crane's first chapter is an example of this. It is an antique pitcher of the simplest form, and is in itself a practical object merely, and its form, though agreeable, is so as representing a good practical shape. But the simple ornament of rings of beading round it at the top and bottom, has nothing to do with its utility; its application is a matter of taste merely. Ornament begins where utility leaves off, but it is an addition made to useful objects to give them an interest beyond mere usefulness. The moving cause of the existence of all artistic design, we should say, was creative impulse; the desire to make or create something; as Carlyle says in the passage Miss Crane quotes, "the first spiritual want of a barbarous man is decoration." The difference between art created purely for its own sake, which is what we call "fine art," and art created for a decorative purpose, is that in the former case the art is its own excuse, it appeals to us by its own intrinsic interest; in the latter case it has reference to the shape and use of the object to which it is applied, and must not clash with either. In so far as it is connected with utility; but its *raison d'être* is not utilitarian, any more than that of painting and sculpture in the higher sense.

It is this relation of the decoration to the purpose of the object which is so little understood and borne in mind, and which causes so many stumbling-blocks to those who will not take the trouble of thinking about the subject, or see the necessity of doing so if they are to avoid sins against true taste. It is this want of thought which leads to the making of and the admiration for those hosts of things in absurd imitation of other objects,—earrings like boots, toast-racks with crossed muskets as bars, and so on *ad infinitum*. People will not, or cannot, see that such productions, however cleverly manipulated, have no relation whatever to the use of the objects to which they are applied, and are therefore vulgar because unsuitable and unmeaning; besides showing an utter want of that thought in design which gives the real value to all good ornament. The production of this kind of vulgarity is tradesmen's work; the desire of the tradesman to produce something "novel," and therefore saleable, being encouraged and called on by the lamentable fact that such a large proportion of persons will purchase anything in the shape of ornament if they find that it is the fashion for the time and is purchased by others. The influence of the tradesman's spirit is probably the most deleterious of all the influences at present adverse to the production of good art; and probably there would be a much more favourable chance if we could deal more with the men who actually made the things, and less with the middleman behind the counter. This influence, as Miss Crane complains, is peculiarly prevalent in London. "It is often possible to deal

directly with the workman, particularly about country neighbourhoods, in such things as carpenter's work, for instance. In London it is hardly ever possible to get at the working carpenter, the working jeweller, the working dressmaker; there is always some very smiling and obliging shopman or showman between us and the worker, whom I for one," says Miss Crane, "most want to see." Very few people, however, share this wish; they take "whatsoever is sold in the shambles," and make a false application of the apostolic precept, "asking no questions for conscience sake." And there is, we hope, some ground for the opinion expressed on another page,—that many of the workers would not for themselves delight to make such senseless things, "useless tawdry bits of glass, china, and metal work, vases that will hold nothing, candlesticks that will not carry candles," and so on; so that one may share in the author's reflection as to "the misery and grinding poverty that alone could drive intelligent human creatures to get their living by making them." Many will have had occasion to notice the interest and pleasure with which an intelligent workman will meet half-way any one who has an original idea as to how he wishes a thing made, and shows that he really cares about it on grounds of personal taste. It is the further cultivation of this personal taste (when an uneducated one), the desire to have things in your house because you yourself care for them, not because your neighbour has them, which is one of the feelings the cultivation of which is most desirable, as both our authors observe in different words. But so ingrained is the tendency of modern society to run in flocks in these matters, that we now actually have opposition tradesmen professing good taste as a speciality, and people ready in turn to take whatever they are told is right from these marts, without any more exercising their own judgment than before. Even Miss Crane has her own little bit of artistic fetishism too, and tells us that we in the present day know all we know of art from Mr. Morris and Mr. Ruskin, who "are qualified to tell us what the arts really are, and how to think and feel about them." They are highly respectable fetichees, no doubt, but we cannot quite bow the knee in indiscriminating acquiescence even to these idols.

It is one of the little results of this worship, we presume, that we meet with the statement that cut glass cannot be in any sense an artistic treatment of the material, because glass is a light, fragile material, "capable of being tinted, blown, and moulded into a multitude of delicate forms." It is capable of all this, and these are its most beautiful capabilities; it is also capable, in heavier forms, of being cut with very brilliant and rich effect. Glass-cutting has been so often vulgarly treated that it is no wonder, perhaps, there should be a prejudice against it; but to condemn it *in toto* is absurd. It is certainly amusing, too, to find Miss Crane (quoting "Mr. Ruskin's definitions" of Greek, Romanesque, and Gothic styles as "the architecture of the lintel, of the rounded arch and cupola, and of the pointed arch." Did Miss Crane, and do her readers, really suppose that Mr. Ruskin alone invented or was able to invent that simple classification? There is, however, much that is sensible, and thoughtful in her pages, and we felt grateful for her memory for nothing more than for her recognition of that wonderful Titian in the National Gallery as "the ideal painting, as the Venus of Melos is the ideal sculpture," and the wish that she could enable any one who had not yet appreciated it to feel, once for all, what the art of painting at its best can do. "Once feel this, and you know more than all the treatises, criticisms, and lectures on art in the world can teach you." And yet how utterly hopeless it seems to attempt to explain, to any one who has not the perception of it, in what the glory of that wondrous painting consists.

Mr. Day's book goes into more subjects in reference to decoration than we have space to follow here. He has written it, he says, because he had something to say about his art, not because he had to say something. A good deal of it, in regard to general questions of taste, has been said before in various forms and by various writers, in our columns as well as in books. We notice one observation among others which should be emphasised; that, in one sense, too much is left to a decorator, too much expected of him. People who apply to him "have formed no notion what they want in the way of

decoration. They should have something more than a notion." This is almost equally the case in regard to architecture, the artistic part of it at least. In each case the employer in reality requires the architect or decorator to tell him what he wants. He possibly has some vague idea in his own mind, but he cannot define or express it. In this very common case it is certainly unfair that the artist should be blamed afterwards for not having satisfied him. But the decorator, Mr. Day says, should make it his object in such cases to find out as much as possible of the individual tastes and likings of his employer, and endeavour to show him, what he does not know himself, the best way of satisfying these. This is a much more sensible and reasonable view than that which is acted upon by some decorative artists, who will not scruple to tell their employer that he must leave it to them to do what they think fit; a verdict against which many men would rebel, quite excusably, from a mere spirit of independence and dislike to be ridden, quite apart from artistic considerations. The main point in Mr. Day's book, however, which can be laid hold of as distinctive, is his idea as to the present path of decorative art. This he suggests to be the laying hold of types and principles in former styles, and forming new combinations and new starting points from these. This he has endeavoured specially to illustrate in some cases. One of the best suggestions in this way is that in treating a particular natural form ornamentally we should compare it with its treatment in different materials in the art of different schools. Thus he gives, in regard to the rose, illustrations of Tudor, Persian, and Japanese treatment; the first an adaptation of the Tudor rose, by himself, for stained glass ornament. This is a very good hint, capable of very extensive and varied application. Another point of the highest importance, and often forgotten, which is touched upon, is that all decoration should have some definite intention pervading it, which should be remembered and carried out through every detail. "Whether the motive be unpretending or ambitious, every stroke should lead up to it. Every stroke that does not do so is ill done. The first step in design should be to determine what shall be the culminating point of the decoration; and, however lavishly the artist may distribute enrichment, he reserves for this his crowning effort, making all else converge towards it. Without such emphasis of treatment ornament sinks to the level of a dead monotony." This, to any one who regards decoration as an object of serious thought, is really almost a truism, but one which is sadly neglected.

We are not able, however, to follow Mr. Day with entire sympathy as to the question of realistic and conventional, as illustrated in the examples scattered throughout his book. These are in many cases charming, but there seems a want of a fixed opinion or guiding rule as to the treatment of natural forms. We find on one page a highly conventionalised ornament, on another a nearly natural spray treated as inlay or otherwise. Some of the latter appear to us to come more near the domain of flower-painting than of ornament, and as at the same time they are not highly finished enough from that point of view, they give some colour to the charge brought by a painter, whose name is not given, against conventionalised nature, as merely a "stopping short" of faithful representation. Of course conventionalism is really the application of thought to the evolving of a design out of a natural form; and the charge of "stopping short" is absurd as applied to such design; but we are not sure that some of these would not give excuse for it. The treatment of seaweed as ornament (page 46) we could not accept as "ornament" in the true sense; it consists of nearly naturalistic sprays arranged conventionally and symmetrically, or nearly so. A Japanese artist would have kept the natural detail and distributed it at random (or seemingly so) over the panel; a Greek artist would have evolved a perfectly conventional representation, conventionally arranged, out of it. But the example given here is neither the one thing nor the other. The illustration of the "frank acceptance of the lead-lines" in window glazing (p. 130) is what we should call frankly refusing to accept them. A floral design is drawn right through them, and the effect is not good. The "acceptance" of them would rather be the division of the design into squares varying in each pane. On the other hand, the design for door-decoration (p. 108) is

admirable, both in theory and fact, entirely based on the construction, and an instructive contrast to the fashionable way of painting flowers scrambling from one panel to another, irrespective of construction. We mention this rather in that we have seen one of these straggling door designs in another book by Mr. Day, and hope that he has repented of this sin. There is a great deal that is worth attention in the book in every way, and it is both well written and beautifully illustrated.

#### ON THE MAKING OF STATUES IN PLASTER.

It is not in respect to the use of plaster of Paris in making moulds from statues and casts from them that the following remarks are offered, but in regard chiefly to the preparing of statuettes and statues in the first instance in plaster, that they are submitted.

Clay, in a moist state, from the readiness with which it lends itself to be fashioned into form by being added to and taken from, is suitably, almost universally, in use for the above purpose; and that this was also the practice in the earliest times of art is attested by the very many ancient terra cotta and sketches in terra cotta extant, and by the various well-known records and anecdotes relating to the subject. Plaster also, by the name of gypsum, is mentioned by Pliny as having been early in use by the artists of olden times in the production of sculpture. This material is a sulphate of lime which, having been hurried to a powder, mixes readily with water to the consistence of cream, and in a few minutes sets and hardens into a firm and solid substance, whence its ready convenience and great value in the formative arts. In modern days very extensive stores of this gypsum have been discovered at Montmartre, at Paris; it has, after its due preparation, received the name of plaster of Paris; in Italy it is called *gesso*. In England it goes by the name of plaster of Paris, although manufactured from the native mineral of our own land. No examples of it, however, are quite so good, perhaps, for the finest art purposes as that of Paris, which is especially even in its working and texture, which affords great facility for the production of the small decorative works of sculpture in which that art-loving metropolis delights and abounds.

It may not, therefore, be out of place to mention the extensive and special use made of it by the late M. Pradier, who may claim the title of having been the Anacreon of French sculpture, so full are his numerous works, especially his smaller pieces, of the erotic poetry which characterised the odes of the Teian bard; not, however, that they are quite Greek, inasmuch as they all partake somewhat freely of the flavour of Parisian fancy. At all events, they will ever hold a distinguished place among the works and history of French, and, it may be added, of European, Art. On good authority, derived directly from acquaintance with the practice of this sculptor, we have been informed that he was not so much in the habit of modelling his small works and statuettes in clay as of fashioning them from the first in plaster. For this purpose, in order to facilitate his progress, he was accustomed to have a number of little heads, trunks, and limbs of the required scale, all ready prepared for him in the plaster, in a disjointed and separate state, which, when a design occurred to him, he would arrange, and dispose, and have put together with fresh plaster in such attitudes and compositions as he fancied and contemplated. As this mode is unusual, and not much accredited in this country, this example of its employment may attract and deserve some attention as affording a precedent for a mode of procedure in sculpture which otherwise might be thought heterodox.

In this case this course was evidently the more facile from the excellence of the plaster at hand; for it would only be the best kind that would lend itself readily to the much piecing together of parts which the above process of making a statuette would involve. M. Pradier had also beside him skilled assistants fully familiar with the character of the material, and the due methods of mixing it, and making the fresh plaster adhere homogeneously to the old, and the even working of the two together. In addition to this, the great number of statuettes thus produced by this master and his assistants

gave them a command of the material, such as might appear unattainable by those who have not similar opportunities of practice in the same excellent plaster.

Another instance of the execution of sculpture in this substance is to be found in the practice of the late eminent American sculptor, Mr. Hiram Powers, who was, for the most part of his art life, resident in Florence. His marble statue of the Greek slave attracted much attention in the first Great International Exhibition of 1851, and has not decreased in interest since. We have been informed that the original model from which this noted statue was pointed and wrought, was produced and worked almost wholly in plaster. Possibly there might have been a rough general mass in the first instance got up in clay, from which a mould was made, and a plaster-cast obtained out of this, to furnish a general form of material to begin upon. In such case, however, this was but for the convenience of readily arriving at what was but an inception and embryo stage of the work. But it is understood, in respect to all the completion of the statue, as a work of fine art, that this was the result of the sculptor fashioning and completing it, not in clay, but in plaster.

In considering this mode of workmanship applied to this figure, it is well to hold in mind that it is of a class which aspires to the highest department of sculptural art, namely, that which represents the most refined beauty by means of the careful selection of form, which thus becomes less individual than abstract in beauty, like that which constitutes the perennial charm of the finest antiques. Art, thus directed, labours in a region different altogether from that portrait style which in this country is most employed and encouraged, in which the somewhat hap-hazard touch of the modelling tool on the clay, or even of the chisel on the marble, may have charms for those who do not appreciate higher qualities. With these critics a little inaccuracy or shortcoming in form, or even ugliness, is no bar to admiration, so that a look of freedom and apparent mastery is thereby produced.

In considering the comparative advantages of different materials for the models for statues of the higher poetic class, it may be noted that the nature of moist clay is such as to be somewhat apt, even in spite of care, to occasion incorrectness during the progress of the work, especially when it is in considerable mass, such as is required for a figure of full or heroic size. It has been said of an arch that it "never sleeps," and the same remark may be applied, *à fortiori*, to the substance of a moist clay figure, which, though appearing stable and firm, and steadfast, is, like a glacier, in a continual condition of change and subsidence, although slight and gradual. A result of this may almost always be traced in taking down a large clay model, after the mould has been made from it, and it has to be destroyed, on which occasion it may be noticed, in the interior parts, that it has always to some extent sunk and subsided from its supports, and separated from them to the degree that slight open spaces are left beneath each transverse iron of the inner framework.

In making the preparatory models for outside architectural features, wherein general effect may be all that is sought to be attained, or for portrait statues in which vigour of resemblance may be the chief object, it may not be essential to consider their perfect permanence during the process of their execution; but in the higher class of epic and ideal sculpture, in which the most careful selection of forms and proportions is requisite, it may be well worthy of attention to entertain and weigh several advantages which plaster possesses over clay, model before it is transferred into marble.

In the case of a model for bronze sculpture these advantages may not all be so closely to the purpose, inasmuch as clay has, as a preparation of this material, a convenience beyond white plaster in the circumstance of its being nearer in tint to the tone of the metal. Most of the shades of bronze, especially those adopted for large works, are somewhat dark, inasmuch that it has been recommended in preparing models for such occasions, a clay of a decidedly dark hue should be employed. For bronze works in the open air in London, it might thus seem most in keeping to use quite black clay, seeing that is the colour which bronze metal soon assumes on exposure to the smoky and vitiated atmosphere of our great city; except

but that we cannot but cherish the hope that the exertions which are being made to mitigate these evils may be crowned with success, and that, among the consequent advantages, the bronze statues in our public places may cease to bear the appearance of mere *silhouettes* against the sky.

In returning, however, to the subject of the preparation of models for statuary marble, which may well, indeed, be said to be the one and only divine material for sculpture attaining the size of life, it may be readily recognised that the difference of tint between usual modelling clay and white statuary marble, is so great that the complete effect of a statue in the latter material cannot be fully realised in the former substance. In the usual clay, for instance, the forms of the parts in shadow are indistinct in comparison with marble, in which there is so much reflected light. In white plaster, however, on the other hand, its light tint and lucent qualities enable the sculptor to see into the undercuttings, and trace the form in all the shadowed parts nearly as well as in the future marble, and to a degree which is not possible in a heavy-colored clay such as that which is in common use; the lighter coloured clays, such as, for instance, that suited for the manufacture of delicate porcelain, not being sufficiently tenacious for large statues, and also, indeed, in a pure state, too costly for that purpose.

For the above reasons, the formative process in plaster itself, of the more refined class of sculpture, to a greater extent than has been usual here, may be worthy of some consideration, more especially when taken in connexion with the two examples which have been cited above of modern sculptors of eminence who have adopted this method, at least in some of their works. Could we unfold the serial of ancient art-processes, it seems probable the practice of these artists would find its prototype among the Greeks, both in their own country, and in Rome, where also they were so much employed in the production of beautiful statues.

It must, indeed, be acknowledged to be quite possible to execute, *ab initio*, a large statue in plaster without any preparatory clay model, although it is a process not usual in this country. The first objection which is likely to be raised against this is that it might lead to, and superinduce presumably, a certain stiffness of character; and, indeed, this remark has been thrown out in reference to the statue of the Greek slave itself in respect of its having been prepared for in this manner. If, however, this comment can in any degree justly rest on this figure, it may more fairly be laid to the account of the pose adopted, of firmly leaning on one hand, rather than to the mode in which the model for it was executed; for there exists no inherent reason whatever why plaster should not be worked as freely as clay. In this respect a reference to the practice of the decorative architectural plasterman of former days may be to the purpose. In years gone by, his art had a much freer range than at present, when it does not extend much beyond the rubbing of mouldings, and the affixing of decorative portions cast in moulds, and, therefore, often exactly repeated, whereas, in earlier dates of his practice, of which there are fine examples still extant in this country, much of these ornamental details were handwork, executed in the freest manner in wet plaster, and with excellent effect, on the walls and ceilings of which they form the decoration, and, after a fashion, which bears somewhat the same relation to the more mechanical process that ornamental works in wrought iron bear to those that are cast. These examples of the skill of the worker in plaster, may well, in their happy and free effect, bear witness to the easy and natural appearance of which this mode of working this material is capable.

More closely, however, to the subject of making statues in plaster, a sufficient evidence on this point is readily furnished by the statuettes of Pradier thus produced, among the eminent qualities of which may be recognised a remarkable freedom of line and contour as far as possible removed from any stiffness or constraint. In Florence, possibly, Mr. Hiram Powers did not find the Italian plaster tractable and compliant as that of Paris, and he had maybe a greater difficulty in producing on it a true and even surface, and accordingly he is said to have invented special tools for the attainment of this object. Of these the flat plain ends had little boles sharply punched

through them, leaving acute edges which planed off all irregularities, while their even surfaces at the same time controlled their action on the faces of the plaster over which they were worked.

However, in general practice it scarcely appears that such special implements are requisite, the usual marble rasps used for working marble statues, which are of great variety of form, being all-sufficient. And at the same time, the employment of these possesses this advantage, that, by their means, no form can be made in the plaster model that cannot with the same description and pattern of tool be exactly and faithfully rendered in the marble: which, on the other hand, is not the case with the modelling tool working on the clay, which implement is often of quite a different section and quality of form from the marble rasp, and thus this diversity has to be allowed for in the transference of the contour and surface thus produced into the marble. On the contrary, in working the plaster model with the same description of tool as that with which the future marble is to be wrought and finished, no translation will be requisite, but the exact same phrases of form will be retained. Plaster of Paris, after the few minutes which it takes in setting from its creamy state into a solid substance, may be worked much like soft stone, and if allowed to dry first, in just the same manner as Bath stone when fresh from the quarry, which, indeed, at that time is scarcely harder. At the same time, of course, it possesses this vast advantage over any kind of stone in the making of a preparatory model, in that it allows so readily and perfectly of being added to as well as reduced.

The following may be enumerated as some of the advantages presented by the process of preparing, or, at any rate, of fully completing, in plaster, a model from a statue. In the first place, it does not require, like a clay model, to be kept moist by sprinkling with water, or by means of being covered up with damp cloths after work, which are apt to injure the surface; but, on the other hand, it may be left always uncovered, and ready to be looked at and worked at at any time. A model in plaster is not liable to shrink by omission of attention to keep it moist, or to detriment by being damped too much. It is not subject to any subsidence or change or depreciation of form; nor will it suffer from frost on any chance occasion of winter rudely invading the studio in which it is being executed. It is also much less ponderous than a clay model, and much more easily moved from one part of the studio to another, so as to obtain variety of view, light, and elevation, so as to enable it to be placed under conditions similar in these respects to the position the completed marble work is destined to occupy, facilities which are of the greatest eventual value during the production of a preparatory model. All the above considerations are of practical worth, and when taken in conjunction with the fact of the light tint of plaster resembling the general hue of marble, may well invite attention to the above subject, and especially to the finishing of the plaster form completely before its transference to the beautiful material in which it may last for ages.

One objection not unlikely to present itself to those not conversant with all the qualities of plaster should not be overlooked, namely, that which may be supposed in its use to exist in the presumed difficulty in making the fresh plaster thoroughly adhere to the old, so as not to scale off in the process of after-work. To meet this comment, without referring to the success of Pradier and Powers in this operation, it may be enough to say that in the recommendation made to use sharp marble rasps in working the plaster, provision is made for exactly that quality of surface to which fresh-mixed plaster adheres most readily and tightly; and if, instead of a spatula being used to put it on with, in its creamy state, a brush is employed, and it be, as it were, painted on, it will enter readily into all the scratches made by the rasp, and become intimately united, and almost homogeneous, with the under-substance: inasmuch that when the fresh plaster is perfectly set, it will bear to be worked without any separation taking place; or, in any case, if by accident any small portion is detached, that part may be worked over again with the rasp, and painted over again with fresh creamy plaster, until the surface is quite even, solid, and satisfactory.

It has been a phrase in regard to the different complexion of the usual stages of a work of

sculpture, from its commencement to its completion, that "Clay is Life, Plaster Death, and Marble Resurrection"! and this presents a certain truth, namely, that a model has a better appearance in clay than in plaster, which, indeed, in comparison, possesses but a dry, hungry, and uninteresting aspect. It has to be remembered, however, that, while this is a flattering advantage to the clay model itself, yet, when regarded merely as a preparation for the future marble, it changes its character, and becomes, instead, a disadvantage, inasmuch as it cajoles. Whereas, on the other hand, plaster being a material which has nothing specious in its appearance to hunt criticism, and lead the eye to overlook faults, this very shortcoming in good effect is a real benefit in no mean degree, as calculated rather to invite attention to any defects which may exist in the design or execution, inasmuch that their being remedied before transference into marble becomes thereby a more likely consequence. Thus, also, it follows that if the plaster model, which palliates no errors, he wrought so as to give satisfaction, by so much the more is it likely to do so in the most exquisite natural material, statuary marble, which kind Nature has provided for the delight of lovers of sculpture.

The above remarks, which are not the result of mere hypothesis or theory, illustrate one province of workmanship which has come under the notice of the writer in actual practice, and, as such, we offer them to the sculptural world for such value as, on duo consideration, they may be found to possess.

#### THE ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.

It is almost a pity, as we have said before, that the theory of a collection of sketches and studies for the winter exhibition of this society is not carried out in practice. One may marvel, certainly, at the quantity of highly-finished work which some of the members contrive to exhibit in the year; but the result is only a repetition of the summer exhibition; whereas an exhibition really composed of studies and first thoughts would have a quite different kind of interest and instructiveness. Here and there we do find work of this kind set, but in the main the character of the winter exhibition is undistinguished from that of the summer one.

The present exhibition is not quite one of the best we have seen. There is one contributor of considerable power whom we do not remember here before,—Herr Adolf Menzel, who dates from Berlin. "The Pulpit in the Town Church at Inshruck" (28) is really an interior view of some extent, and comprising a number of figures, the whole, though on a very small scale, painted with great power and depth of effect; and the same qualities of execution characterise his other contribution, "Suspicion" (303), a somewhat melodramatic figure of a man looking up and half-drawing a dagger. Judging from these works, Herr Menzel is likely to prove an acquisition if he continues to contribute. Another rather interesting item is the appearance of an old friend,—Sir John Gilbert,—in a new line of subject,—an illustration of a scene from "Roderick Random" (178); this comes under the category of studies, and a very spirited and characteristic work it is; we may hope it is to be taken as a sign that the artist has at last recognised the fact that there may be too much of troopers and trumpeters, however dashing drawn, and is going to put his great talents to somewhat more varied use than the constant repetition of one class of subject and of figure. Among other figure subjects Mr. Walter Duncan offers his ideas of "Benedick" and "Beatrice" (162, 69), which we cannot accept as such; they are not sufficiently refined; his study of a fine, if somewhat blowsy, young woman, under the title "English Roses" (236), is marked by his characteristic power of hand. This artist contributes no less than fifteen drawings, some of them slight, all with something to look at in them; among these "In the Spring Time" (15) is a combination of a very fresh and true sketch of spring foliage and tones in a plantation, with figures of equal excellence in their way. Among the figure-subjects Mr. Radford, whose works we have generally found beautifully finished, but weak in sentiment, really commands admiration, in spite of the same kind of sentimentality, by the admirable drawing and pose of the two figures in "Sympathy"

(86). Mr. Tom Lloyd's "Harvest Folk" (230), is an example of a school in which the aim seems to be to blend the figures and landscape into a unity of tone, by way of obtaining unity of sentiment; the picture is a blending of figures and landscape. Where such an attempt is carried as far as it is in this drawing, whatever the beauty of feeling and of tone, which there undoubtedly is, the realism both of figures and landscape has to give way too much, and the result is a group of rather visionary rustic figures in an equally visionary landscape. The effect seems to be to raise an ordinary scene of field life into the region of ideal art, but we doubt if this is the way to achieve that end. The figures themselves must be striking and pathetic in character, and powerfully treated, to evoke our interest in them; here they are not remarkable in themselves; it is only the light under which the whole group is seen which seems to give them an ideal interest which vanishes when we begin to study them closely. Of course there is a value in this class of art, but after seeing a good deal of it one finds the effect weakened, and we turn rather with refreshment to a drawing like Mr. Waterlow's "Showery Weather" (173), which is real nature and real water-colour, not nature "idylised" out of all her force and freshness.

Among landscapes of a very high class may be mentioned Mr. T. J. Watson's "Silver Birches" (88) and "Cope-cutting" (105). These combine powerful and natural effect, with an entire absence of bardness or over-finish, which may be said to represent almost the perfection of style for the use of water-colours in landscape. Both these, it is true, are rather foreground landscapes (the distance being shut out by trees and underwood) than landscape in the widest sense. Mr. Thornwaite's "Sunshine" (104) is a large and highly-finished drawing, in which the landscape and figures are beautifully composed, so to speak; but, here again we feel the loss of force from the desire to blend figures and landscape. The drawing is called "Sunshine," but, really, the feeling and effect of strong sunshine are not in it. Mr. Alfred Hunt contributes eight drawings; of which the finest is "Durban" (214) seen through mist lighted by the sun, the cathedral towers and the bridge forming merely faint silhouettes in the misty middle distance. The drawings contributed by Mr. Hunt this year are all strongly-marked by his characteristic effort to render the poetry of nature, and to achieve a manipulation in which the mechanism of the brush is almost entirely concealed, and we see the results without having the method of attaining them forced upon our notice. "Warkworth Castle" (88) is a masterpiece in this way; the old proverb, *ars est celere ceteris*, could hardly be better illustrated; the drawing will bear the closest looking into; we can follow all the little details of the laying out of the farm grounds, even, in the middle distance, and yet there is not a touch of hardness or of mere realism, not a square inch of the paper in which the delicate aerial modifications of tone in nature are not remembered and brought before us. The effort to avoid mere "painting" however, leads, in some cases, to a want of force in foreground and middle distance, as in "Eastwick Mill" (150), parts of which are exquisitely delicate, but which certainly wants force. "Warkworth Castle" (101), on the other hand, is a very powerful study of a rain-cloud effect; and the comparison of this with the others before named emphasises what is one of the most delightful and remarkable qualities of Mr. Hunt's work,—the total absence of mannerism or of repetition of favourite effects. Among other landscapes, Mr. Matthew Hale's "Bolton Abbey" (24) is a triumph in its way. It is a rather small drawing of what old poets would have called "a sylvan scene," in which we follow the windings of the river and the contours of the hills and woods from point to point, so that we feel as if we could walk through it. It is a drawing that must be carefully examined to realise how true and thoroughly considered it is in every point. Mr. Eyre Walker's "Close of a Wet Day," and "Study on the Greta" (290) are both admirable, the latter especially. Among other things to be singled out are Mr. A. Goodwin's "Maidstone—Sunshine after rain" (368), a brilliant effect, recalling Turner's; Mr. Brierley's "Grey Morning at Venice"; Mr. Glennie's interesting studies of the "Arch of Titus and the Forum" (338); and the "Exterior Colonnade of the

Coliseum" (305) and other sketches illustrating the architectural topography of Rome; Mr. Norman Taylor's "Windfalls" (landscape with figures, 250); Mrs. Allingham's "Vernal Oak-leaves" (325); and Mrs. Angell's splendid studies of "Poppies," and "Hollyhocks" (122, 125).

#### TWO MUSEUMS IN ALNWICK CASTLE.

PROBABLY a very limited number of antiquaries were aware, until very recently, that His Grace the Duke of Northumberland is the fortunate possessor of two very interesting and representative museums, carefully arranged and displayed in the historic castle at Alnwick, which has been for so long a period the home of his ancestors. Now, however, that comprehensive and detailed catalogues of these two great and valuable collections have been prepared by competent authors, and printed and illustrated at considerable cost by the owner, who has enhanced his liberal patronage of archaeology by judiciously distributing the copies of the catalogue among public libraries and societies, and in quarters where they are sure to be duly appreciated, we propose to give our readers a short account of the principal contents of the respective museums. Taking the Egyptian Museum as containing the relics of the greatest antiquity, for the present, and reserving for future consideration the equally important collection of British and Roman antiquities which compose the other museum, we may compliment Dr. Samuel Birch, of the British Museum, for the very instructive catalogue\* which he has written of objects with which his long acquaintance with similar antiquities in the British Museum has rendered him perfectly familiar. This collection, probably the largest in England after that preserved in our national collection, was originally formed by Algernon, fourth duke of Northumberland, who, when enjoying the dignity of Baron Prudhoe, prior to his accession to the dukedom in 1847, had spent some years in the land of the Nile, visiting and examining most of the principal historic and temple sites and notable monuments, and giving much time and thought to the elucidation of the language, chronology, and history of Egypt. The acquisitions then made by Duke Algernon form the nucleus of the present museum of Egyptian objects at Alnwick, to which subsequent additions were made, when the opportunities afforded by the sale of Salt's collection in 1835, and Burton's in the following year arose. Some idea of the historic and antiquarian value of this collection may be gathered from the fact that the late Sir Gardner Wilkinson published several of the more important historical monuments in his great work the "Manners and Customs of the Ancient Egyptians," and Professor Lepsius drew much information from the inscribed scarabæi and other relics for his "Gnügibuch." According to the learned author, who has arranged the objects in the catalogue in a classification which enables the student to turn at once to the section which he desires to study, the museum contains several works of art of historical value and specimens of sculpture of the earliest and best period of Egyptian art, conveying an excellent impression to the beholder of their peculiarity and importance. The antiquities of Egypt, here so well and so typically represented, owe much to the fact of being under the influence of a favorable climate, which has done no harm to the most tender relics and perishable materials. These, if exposed to colder and more humid atmospheres, would long since have crumbled away and disappeared. Another fact which explains in a great degree the preservation of so varied an assemblage of artistic relics is that common objects of domestic life, as well as objects of a purely sepulchral and mortuary nature, have been deposited from three to five thousand years ago in the deep silence of rock-hewn underground tombs, which have stored up, as it were, and preserved for intelligent study to-day, not only things made of hard stone and precious metal, but even animal and vegetable substances; for instance, the dried pomegranates, and the inscribed linen mummy cloth, after the inhumation of three or four thousand years, are in much the same condition as when

pious hands first deposited them in their hiding-places. It has also to be borne in mind, we are told, that, after all, only a small proportion of antiquity of any nation, however much civilised it may have been, remains from which we may conjecturally reconstruct its domestic and political condition; and the most extensive collection of relics consists but of scraps of a vast and changing civilisation rescued from oblivion.

The classification which the author has adopted, reduces the miscellaneous objects to an order which enables the reader to form a definite conception of the correlative importance of them in regard to the reconstruction of an Egyptian era. The first, and one of the greatest divisions, is that of the figures of the deities who make up the Pantheon of Egypt's mythology. These figures consist of representations of gods, each one with his proper emblems and attributes, or in his conventional attitude, made of metal, stone, wood, or porcelain, ranging in age from the seventh to the twelfth century B.C. Many are exquisitely carved in materials of difficult manipulation, thus indicating the height to which the sculptor and carver brought their respective arts at this remote period. Some of the golden and silver figures are solid; others, made of thin foil, have rings attached to them whereby they were strung upon necklaces placed upon the richer kind of mummies. Particular substances appear to have been adopted for particular deities; thus Amen-Ra, Osiris, Isis, and Horus are rare in porcelain, but common in bronze; the triple god, Ptah-Socharis-Osiris, and Shu or Sos, occur in porcelain only. A figure of Nefer-Tum, a Memphite deity, in white stone, 7 in. high, is of great rarity (No. 43 in the catalogue), from the fact of its containing an inscription in which the names of Thothmes III. of the eighteenth, and Rameses IV. of the twenty-eighth dynasty, are found. No connexion of these two widely-separated monarchs is known to have existed, except in this one instance. The bronze figure of Osiris (No. 163); the talbot containing figures of Harpachrat or Harpoocrates and the Goddess Seshet, of Æthiopic work of the Roman period, perhaps representing an emperor adoring the goddess, in calcareous stone, 10½ in. high (No. 273); and the inscribed figure of Bes, dedicated by King Sheshank, of the twenty-second dynasty, to Isis, in arragonite, 8½ in. high (No. 313), are worthy of notice in this section.

Next to the worship of the many gods came the veneration of sacred animals, such as the cynocephalus, ape, lion, bull, cat, sphinx, jackal, calf, ram, hawk, ibis, duck, vulture, crocodile, uræa, snake, scarabæus, toad, and frog. It is curious, however, that the creature which was considered sacred in one town would perhaps be neglected or despised in a neighbouring locality. The origin of this topical worship and abhorrence of animals is undetermined, but has been referred to the archaic period of the second dynasty, when one of the monarchs is believed to have introduced it into Egypt. Some light has, however, been thrown upon the obscure question of animal worship by discoveries at the Serapeum, where the bull Apis is called the avatar or second and repeated life of Ptah, the local and tutelary deity of Memphis. These animals in lifetime were oracular in the districts where their cult was established, and they spent a happy existence in the courts of temples under the care of the prophets and priests, certain revenues being devoted to providing them with fitting sustenance, and even with suitable mates. After death they were mummied. Their figures in coloured porcelains, slate, basalt, bronze, sycamore wood, steatite, carnelian, lapis-lazuli, jasper, green felspar, and other substances have been carefully arranged in glass cases by Dr. Birch at Alnwick in the room which contains the Duke's Egyptian Museum.

The section devoted to a consideration of kings and noble personages, although not a large one in point of numbers (as would naturally be the case, for the transport of one heavy monument is manifestly more difficult than that of a thousand small objects), yields to none in point of interest, for in it are comprised most of the historical relics. Statues appear in Egyptian fine arts as early as the third dynasty, and one figure in the Alnwick collection belongs to that remote period. It has been found that the method of making metal statuettes was to cast them in moulds over sand-cores; those of stone and wood were

cut from solid blocks, and although occasionally represented completely carved, they generally have the parts between the legs and arms and body left solid, and are furnished with plinths up the back, thus partaking, in some degree, of the nature of a double bas-relief. Another remarkable feature in the art of the Egyptian statuary is that walking figures have always the left foot advanced, and all figures, except of children, are furnished with drapery. There are but few conventional attitudes, and in bas-reliefs the figures are rather salient, and nearly always in profile. Portraiture, or rather Iconic statuary, was in use at all times. Distinct canons of simple proportion are known, which furnish diacritical marks to the antiquary, whereby he may determine, within certain limits, the age of the monument. The oldest canon is in subdivisions of ½ ft. or ⅓ ft.—this is of the third dynasty; the twelfth and thirteenth dynasty made the height eighteen half-feet, and the canon of the twentieth dynasty divided the whole height of the statue into twenty-one parts. All this has been carefully examined by the late Joseph Bonomi, an architect whose love of Egyptian antiquities especially fitted him for successful research into this interesting technical subject. The stæatite monument, representing King Amenophis I. and his Queen Aahmes-Nefertari (No. 495); the imperfect figure of King Amenophis III. (No. 496); the fragment containing a likeness of Queen Hatsas, the warlike sister of the illustrious Thothmes III., marching with the victorious army of Egypt, which conquered Syria and Palestine, advanced the power of Egypt to the banks of the Tigris and Euphrates, extracted tribute from Assyria and Babylon, and visited Somali and Socotra to collect gums, spices, and cosmetics (No. 500); the statue of Ptahmeri, high priest of Anet (No. 508); the fine black granite statue of Paser, a prince, monarch, and governor of a district in the time of Rameses II. (No. 511); and some others in the section, are enriched with inscriptions which claim the attention of the historian and philologist.

Architectural objects, the next in order, are very few, but there is a remarkable bronze corbel, 1 ft. 5½ in. long, 4½ in. high, and 3 in. wide, having in front a lion couchant in niche. This has formed part of a monument, but of what kind is unknown. It is hollow inside, and was probably cast with a core. Furniture was a special development of ancient Egyptian fine art. The inscribed head-rests like diminutive crutches, inscribed legs of chairs made of ebony, and fragments of inlaid work, serve to show how elaborate must have been the movables in the rich man's house in the time of the Pharaohs. Objects of personal adornment were lavishly bestowed in the decoration of the mummy, before it was laid to its final rest in the gaily-coloured coffins, richly inscribed with extracts from the "Funeral Ritual." Head-dresses, wigs, skull-caps, collars, chains, necklaces, sashes, shoes and sandals, signet-rings in every kind of precious metal and stone, pastes, glass, and ornamental leatherwork, are found in the tombs, and many very fine examples of these objects have been secured from time to time by the late Duke Algernon for the Alnwick Museum. The necklaces are of interest for their pendants, in form of the pomegranate, figures of deities and hearts (Nos. 542-4); crocodiles, scarabæi, and fruit (No. 545); jasper beads in form of Osiris, Harpoocrates, and Bes; hearts of carnelian, sard, jasper, basalt, and steatite, scarabæi carved in many kinds of precious stone, some having a hawk's head in place of the usual insect's head; a papyrus sceptre of green felspar (No. 637); flowers, crows, cylinders, and other forms, are met with in considerable array, and of more or less rarity. Some of the precious stone rings in this class are penannular, and their use is uncertain, but judging from some of the gold rings of this shape which are furnished with a small ring at each end to admit a cord or wire, they may have been earrings or pendants of necklaces if capped with gold. Their exact use, however, does not appear in the different representations of Egyptian dress which are met with on the monuments. The signets and finger-rings include several with royal and religious names. Thus, the goddess Mut, Amenophis III. of the eighteenth dynasty; Amenophis III., Ptah or Vulkan, Thothmes III. and IV., and Rameses II. of the nineteenth dynasty, are found on choice rings in this collection (case 19). Sandals, mirrors, cases for holding stibium, which was a cosmetic having

\* "Catalogue of the Collection of Egyptian Antiquities at Alnwick Castle, belonging to His Grace the Duke of Northumberland." By S. Birch, D.C.L., LL.D., F.S.A., keeper of the Egyptian and Oriental Antiquities in the British Museum.

for its base a kind of sulphuret of antimony, employed by both sexes to impart brilliancy to the eye; combs, tweezers, razors, and other paraphernalia of the toilet abound. One fine stibium-case (No. 758) is formed from the tooth of the hippopotamus, an animal hunted by the ancient Egyptians, and at one time fairly numerous on the rocky banks of the Nile. The inscriptions upon some of these cases are of great interest.

Scarabæi, either as bezels of rings or strung on mortuary necklaces, form an abundant feature in the Museum, as indeed in all Egyptian collections; for although perhaps the most mystical in its significance of all Egyptian emblems, it is certainly the most common object of Nilotic antiquity. Hence its frequent imitation by the modern Arab, who is generally too successful in palming off his spurious manufactures upon the credulous. But the scarabæi in the Alnwick Museum were acquired before this nefarious art began to flourish, and the same may be said of the scarabæi in the British Museum, and thus a study of these two extensive repositories of inscribed scarabæi will impart a truer technical knowledge of Egyptian historic art than the examination of numberless collections formed after the practice of manufacturing antiquities had become rife in Egypt, and thus far nullified the genuine character of the collections, which they too often injure by their presence. Apart from the names of deities upon these symbolical objects, many names of monarchs of remote dynasties are found inscribed upon them. They are chiefly of the soft soap-stone or steatite of native occurrence, glazed; some, however, are of green felspar, blue glass, porcelain, and other materials. One very remarkable object in this class is like two frogs united together, and inscribed on the base with a winged uræus, the emblem of a goddess. The frog appears rarely in the hieroglyphics, and then is used as a determinative sign of the goddess Heh or Hega, wife of Khuum, the creator of mankind. This little object in light-blue porcelain is only one-fourth of an inch long. Another very archaic scarab (No. 923) is inscribed with the name of Saafra, Kefren, or Chabres, a king of the fourth dynasty, successor to Cheops, and builder of the Second Pyramid. The object is, however, not necessarily contemporary with the king whose name it bears, for priests who carried out the worship of the sanctified monarchs of the fourth dynasty were attached to these duties until a late period in Egyptian history. Another amulet (No. 925) bears the name of an early monarch, apparently of the fifth dynasty. King Tancheber, of the same dynasty, is recorded by name on the following scarab. Scarab No. 1,030 is of historical value, as affording material, by its long inscription, for placing the date of King Amenophis III. at about 1300 B.C. These scarabæi, of which we have mentioned a few important examples, number upwards of five hundred. Passing over several interesting objects, mention must be made of a fine opaque blue glass vase, nearly 3 in. high (No. 1,403), in shape of the Greek *ocybaphon*, the use of glass in Egypt being as old as the twelfth dynasty, if not earlier.

Of the class of vegetable substances, good examples are preserved at Alnwick of dates, corn, figs, seeds, barley bread, grapes, and pomegranates. The weapons in the museum consist of inscribed *batons* of sycamore wood, a dagger inscribed with the name of Thotmes III., and other daggers of bronze, a bow, reed arrows, and bronze arrow-heads. Among the writing utensils is the inscribed cedar-wood pallet (No. 1,451) of Pta-h-meri, or Meri-en-ptah, a scribe of the royal treasures; some papyrus, and a memorandum-book, or *puyllaria*, of the Greek period, are worthy of notice. The ornamental boxes of wood, thickly covered with tempera painting, are rare and choice, forming, as they do, fine examples of the joiner's or cabinet-maker's art of three thousand years ago. The use of the lock was unknown at this period, but a fastening was effected by means of two studs, one on the lid, the other near it on the box, and by tying a cord tightly round these studs, and then sealing the knot, the contents were made secure from surreptitious handling. These boxes are generally rectangular, sometimes enriched with recurved cornices, and, if used for sepulchral purposes, painted elaborately and inscribed. Ivory slips, and ebony inlaid with glass, ivory, or porcelain, are not uncommon use for boxes. One rare specimen, unlike the usual form of sliding lid, has a hinge

of cylindrical shape cut out of the solid wood, like the modern snuff-box. Of two fine boxes with pent-roofs (Nos. 1,450-1,460), Dr. Birch gives a lengthy account, the inscriptions with which they are enriched being of considerable importance.

The tools are puny and apparently of little real use as tools; it is far more reasonable to suppose them to have been made for mortuary rather than practical purposes. Still, their forms, and the inscriptions they carry, invest them with an interesting character. Human mummies do not occur in the Alnwick Museum, but there are several mummies of cats, one of the jackal of Anubis, and one of the Ibis, or messenger bird, sacred to Thoth. Some fragments of the inscribed linen bandages of mummies have vignettes and the text of certain chapters derived from the Funeral Ritual or "Book of the Dead." Many of these texts are of high value to the student of the hieroglyphics and the philology of Egypt on account of their containing variants and anonymous expressions which elucidate many obscure points in the language. The amulets and sepulchral scarabæi must be passed by in a few words, although they are of great variety. The former class comprise pendants of various forms, heads, hearts, sceptres, the *bat* or so-called Nilometer, pectoral plates, heads, flowers, cartouches, bangles, models of finger-rings, disks, vipers' heads, feathers, collars, buckles, square and rectangular tablets, pillows, and levels or squares. In size they vary from  $\frac{1}{2}$  in. to 1 in. The workmanship is fine, and so strongly marked with technical Egyptian treatment that the eye soon begins to be able to distinguish the peculiar, but undefinable, character of the work from that of any other people. The materials of which these minute objects are composed consist of glass, porcelain, steatites of various colours, felspar, lapis-lazuli, burnt jasper, black oolidian stone, serpentine, cornelian of several shades, hematite, schist, basalt, sard, and other hard substances native in, or foreign to, Egyptian quarries. The sepulchral scarabæi, of different styles and character to the scarabæi used as seals, stamps, or rings, were deposited with mummies, and are of very remote antiquity, the chapter of the ritual with which they are inscribed being attributed to the earliest period of Egyptian history, from the second to the fourth dynasty. These are generally from 2 in. to 3 in. long, and formed of steatites, felspars, jaspers, basalt, or serpentine. Many of them introduce the name of the deceased person for whom they were made into the formula chapter inscribed upon them; others, however, are uninscribed, or have the conventional name "Men," which corresponds to the "M. or N." of our catechism for an unknown name. The numerous class of sepulchral figures, found deposited in tombs, set in boxes, or strewn along the floor, is well represented in this collection, those of copper, ebony, and steatite being rare. They are generally made of glazed porcelain or clay, mostly of rude workmanship. In date they range from the eighteenth to the twenty-fifth dynasty. They are supposed to represent the deceased personage in a justified or Osirian form; the sixth chapter of the Ritual, or some portion of it, being inscribed or painted upon them in horizontal or vertical columns. Good notices of these figures, and of the place they occupy in the religious practices of the Egyptians, is contained in the "Zeitschrift für Ägyptische Sprache," 1864, pp. 89-103; 1865, pp. 4-20, to which the attention of the student may be directed. Some of these little figures appear to have been taken from the tomb of Seti I., in the "Biban-el-Muluk," or "Tombs of the Kings" in the neighbourhood of Thebes. This important exposition of antiquities concludes with a long section of about fifty tablets in calcareous stone, and a few wooden tablets, a sepulchral altar, obelisk, pyramid, sepulchral vases, cases, lamps, and miscellaneous or later objects. The inscribed sepulchral tablets are treated in the most instructive manner and with great detail by the author, who, perhaps better than any Egyptologist who has yet set his mark upon the Temple of Fame, is able to explain the minute points of domestic and religious life which they silently, but not less on this account eloquently, illustrate, when they are brought under the eye of one who can read their inscriptions and decipher their peculiar pictorial and glyptic arrangements as easily as Dr. Birch. The Duke of Northumberland is to be congratulated not only on the possession of this representative

collection, but also on having secured the services of so distinguished an Egyptian archaeologist, and the lover of Nilotic antiquities and philosophy will be, we have not the least doubt, delighted to find in this catalogue a compendious encyclopædia of a branch of archaeology for which he would have to seek in vain elsewhere.

#### THE AMALGAMATION OF THE WATER-COLOUR SOCIETIES.

A curious little correspondence has recently been taking place in the *Times* in regard to the water-colour societies, which seems to be really a larger question than it is in the opinion of these writers. It appears that some time ago the Institute of Painters in Water-colours endeavoured to procure an amalgamation with the Royal Society of Painters in Water-colours. Being unsuccessful, they opened negotiations with the Dudley Gallery, and a kind of partial amalgamation is the consequence. The desire of the *Times* and of its correspondents would appear to be that these societies should be united and should form a water-colour academy. We venture to think that the existing state of affairs is much better for artists, for art, and for the people of this country. The mere fact that there exists a chief society, honoured by marks of distinction, small in numbers, and recruited from the best water-colour painters of the day, necessarily causes artists to be put on their mettle, so as to be admitted within the charmed circle. It may be said that even if the other societies were amalgamated with this society, the chief members of the new union might be distinguished from less noticeable artists as the R.A.s are from A.R.A.s and simple exhibitors at the Royal Academy exhibitions. But one of the things which most lovers of art deplore is the amount of rubbish that necessarily gets, by hook or by crook, into a large exhibition, and overwhelms much of the best work. When a small and select society, such as the Royal Society of Painters in Water-colours, exists, the exhibitions are necessarily on a high level; for a member to exhibit bad pictures lowers the tone of the whole exhibition, and therefore it is that the exhibitions of this society form the most delightful and most instructive exhibition of water-colours in the world. Accordingly, to have an great and honoured society at the head of the water-colour societies seems to us distinctly to the advantage of English art. Of course, we by no means say that we can go only to the exhibitions of this society for good water-colour drawings, but we repeat that we think it would serve no good purpose to have this exhibition, which retains so high an average character, lowered by the inferior works which must find their way into larger exhibitions. Moreover, a certain friendly rivalry between the older and the younger bodies is in itself healthy, and the management of each is certain to be kept more efficient by such a rivalry. Further than this, when there exists an old society, filled chiefly with veterans, the younger society naturally seeks out the rising painters, so that they may, as they frequently do, render the less select exhibitions noticeable by works not only fresh and vigorous in themselves, but having fresh interest to the public, by reason that their authors are less widely known. There is also another point to be noticed, and that is that, even supposing a union of the several water-colour societies took place, there will always remain exhibitions of water-colours at the Royal Academy, at the Grosvenor Gallery, and at the Suffolk-street Gallery, not to mention the rooms of some well-known dealers in art. Therefore, when once such an amalgamation took place the probability would be that even more water-colours would be exhibited elsewhere than is at present the case. Certainly, too, regarded from the point of view of the amateur, such an amalgamation would be a distinct loss. One of the charms of the present water-colour exhibitions is that there at least some of the most refined and most characteristic specimens of modern English art can be seen in the quietness which should reign in every gallery. Nothing can well be imagined more hostile to what may be termed picture enjoyment than the throngs who crowd the rooms of Burlington House. Nor is the fact that in one gallery age, and in another youth, are to be studied, one of the least of the advantages of the present arrangement. But it is

said that what may be called a Water-colour Academy would be able to establish a school for the teaching of water-colours. It may be a conservative sentiment; but we confess that we doubt if English water-colour art would be improved by such a school. The English school of water-colour painters are supreme in their art, and we fail to see how we could gain by the establishment of such an academy. Moreover, in London at least, sufficient opportunities exist for the learning of art. There is the Royal Academy, and the Slade School at University College, and there is South Kensington, and the water-colour painter who would make a name for himself must finish his education, not in any school, but among the lanes of Surrey and the valleys of Wales. Hence we cannot regret the failure to establish one large water-colour society. It is a mistake to suppose that English art would obtain from it either an immediate or a lasting benefit.

#### THE NEW ACT ON BILLS OF EXCHANGE, PROMISSORY NOTES, AND CHEQUES.

BAREN as the recently ended session has seemed in general measures, it will be remembered as a noticeable one in regard to legal matters. We have already commented on the Settled Land Act, and shown how important a statute has thus been enacted. But there is also another act well worthy of notice, which should be welcome to all men of business. We refer to the Bills of Exchange Act—a measure of no striking general interest, but, as we have said, of great legal and commercial importance. When we consider how necessary it is that every business man should be acquainted at least with the outlines of the law relating to negotiable instruments, and when we recollect that hitherto this branch of law, like most others in this country, has had to be discovered in volumes of legal reports and text-books not of the smallest size, the cordial welcome which should be given to the new Act must be obvious. The Bills of Exchange Act, 1882, is but the short title to an "Act to Codify the Law relating to Bills of Exchange, Cheques, and Promissory Notes." The mere fact that a code of even a small and somewhat technical branch of law should at last have been enacted, would alone form a mark in our legal history, and will doubtless in the future be noted as the commencement of an epoch which will in time see the whole of our law placed in a more systematic form than that of being embedded in innumerable volumes of reports and hardly less voluminous text-books. Moreover, the fact that this particular bit of law which relates to what may be termed a limited class of negotiable instruments has been the first to be codified, shows what has long been evident to careful observers, namely, the immense effect of English commerce and business upon our laws and upon law reform in general. It has not been the criminal law,—that which affects the lives and the property of the English people,—which has been first systematised, but a technical branch of the law of contracts, which, in the main, and if we except that which relates to cheques, is almost wholly of interest to the business community. It would be out of place to specify other particulars in which this effect of English commerce is visible in the changes of English law, but we may mention one only which is connected to some extent with the present subject. Long before the provisions of the Judicature Act came into operation, by which judgment was allowed to be signed in a claim for a fixed sum if the debtor could not show a good ground of defence, this procedure had been in operation in regard to bills of exchange by the Bills of Exchange Act, 1855, which formed the model for the more general procedure introduced in 1873. Yet another circumstance stands out very clearly in relation to this new code, and of a very encouraging character. It is the effect of individual effort upon English law. Without the individual exertions of Sir James Stephen it would have been hopeless for some time to come to have expected a criminal code, without the general effect of this judge's labours and that of Mr. Pollock and others, it would hardly have been possible to have got a sufficient force of professional or public opinion in favour of the codification of English law. The triumph of individual energy is still more complete when we recollect that Mr. Chalmers, the draughtsman of the present Act, is likewise the author of a digest of the law of bills of ex-

change, which may be considered the precursor and cause of the present Act.

To discuss minutely an Act which comprises 100 sections, and which deals with a technical subject, would be impossible, but it may not be out of place to observe how far this new code conforms to the main principles which should be kept in mind by every draughtsman, namely, simplicity of language, clearness of expression, and harmonious arrangement of the subject-matter. On the whole, there is but little fault to be found with the Act, though it seems that what may be called the table of definitions might have been enlarged so as to comprise at the beginning of the code all the definitions which are required for the purpose of the Act. The definitions are mostly comprised in section 2, but we find them also scattered throughout the Act. Thus, the definition of "British Islands" occurs in section 4, and "month" in section 14. Again, "reasonable time" is twice defined, in sections 40 and 74; it would have been quite possible to have made one clear definition of this term at the beginning of the Act, in what we have already termed the table of definitions. So far as regards clearness of expression, we have hardly any adverse criticisms to make. There are many places where more happy expressions or more concise terms might have been used so as to make, if we may apply the epithet to a legal measure, the code more artistic. But the existing language is clear and not obscure, so that the same object is attained. There is, indeed, one section which will certainly puzzle both laymen and lawyers, namely, the first sub-section of section 74, which deals with cheques. It runs thus:—"Where a cheque is not presented for payment within a reasonable time of its issue, and the drawer or the person on whose account it is drawn, had the right at the time of such presentment as between him and the banker to have the cheque paid, and suffers actual damage through the delay, he is discharged to the extent of such damage, that is to say, to the extent to which such drawer or person is a creditor of such banker to a larger amount than he would have been had such cheque been paid." The sentence is a great deal too long to be read without an effort, and length in such cases is no small cause of obscurity of meaning. But if we look closely at this section it is hardly possible to understand it. The first part clearly states that if a cheque is not presented within a reasonable time, and the drawer suffers damage, he is discharged to the extent of such damage. Thus, if A draws a cheque for 50*l.* in favour of B, and B, instead of presenting it at once, delays to do so, and meanwhile the banker on whom it is drawn falls and ultimately pays ten shillings in the pound, A suffers damage to the extent of 25*l.*, having so much less cash with which to pay his cheque. Therefore, as to this amount, he is discharged as regards B, the holder of the cheque, who did not present it within a reasonable time, and who must bear the consequences of his negligence. But the customer cannot be a creditor of the banker for more than the actual amount which the banker held for him. Yet the extent of such damage is stated by the section to be the larger amount to which the customer is a creditor of the banker in consequence of the non-presentment of the cheque in due time. There, no doubt, may be some explanation of the section, but it is obvious that it is obscurely drafted, and, as we have already said, obscurity in a legal and commercial code is a grave fault.\*

**The Proposed Statue of Burns for London.**—The statue of Robert Burns which Mr. J. G. Crawford, a retired Glasgow merchant, long resident in London, is desirous of erecting on the Victoria Embankment, with the sanction of the Metropolitan Board of Works, will be entrusted to Sir John Steell, R.S.A., the sculptor of the statues of the poet recently erected in Dundee and New York. The London statue will (the *Scotsman* states) be of bronze, the pedestal being of Peterhead (red) granite, and it will be executed by Messrs. Macdonald, Field, & Co., of Aberdeen. The entire monument will stand 16 ft. high, and is estimated to cost about 2,000*l.* The proposed site is in that section of the gardens containing the statue of another eminent Scotsman,—Sir James Outram,—between Westminster Bridge and Whitehall-place.

\* It may be useful to point out that there are now several handy editions of this Act to be purchased.

#### THE SITE OF THE ROYAL COURTS OF JUSTICE.

The removal five years ago of Temple Bar gave the *coup de grace* to a third clearance that within the last hundred years has been made in the eastern portions of the parish of St. Clement Danes. Through good and evil days Wren's gateway had stood for more than two centuries. Its predecessor—a wooden postern—figures in each of the older maps, including the first, of London; in the memory of living men there remained beneath its shadow an ancient bulwark said to date from the reign of King Henry VIII. The "posts, rails, and a chain" mentioned by Strype, which separated the liberties of London and Westminster, are spoken of as "*barrae Novi Templi*" in a grant of the 29th Edward I. Thenceforward the Bar played its part in many a stirring scene of our home history. Witnessed the funeral obsequies of the victor at Agincourt and of Elizabeth of York, it has been decorated in honour of the coronation processions of Anne Boleyn and Edward VI., of Mary and Elizabeth. Its head has reared above the flames and smoke of the bonfires which celebrated the discomfiture of the Rump Parliament, and those that blazed at the Protestant riots on each anniversary of Queen Elizabeth's accession. Its pediment has frowned hideous with the heads and limbs of traitors. Nor was it without associations which appealed to emotions of another kind. Many a time in adverse days have England's sweetest poet and her rugged, albeit tender-hearted, moralist passed friendless and unknown through its portal, as often have they in more prosperous times walked through it together to or from their chambers in the Fleet-street courts or the Temple. The remains of Reynolds, Nelson, Rennie, Sir Thomas Lawrence, and Wellington were carried to St. Paul's beneath that archway, through which, to the same cathedral, went the present heir-apparent to the crown and an aged king, both to return thanks for their recovery,—the one from illness, the other from one of the most terrible of human afflictions.

The north side of Fleet-street formed the principal part of our Saxon city. In Ethelred's reign London had more buildings west of Lud Gate than were in all that portion where the "City" now is. In the year 1053 the Strand was still an open highway, having here and there a bishop's "inn" with its garden to the river's side. So neglected was the road that in this year King Edward III. made an ordinance for a tax to be raised upon wool, leather, wine, and all goods carried to the staple at Westminster wherewith to provide for its repair. But about the middle of the sixteenth century the settlement of the Court again in the west, at Whitehall, brought about a change. Houses gradually appeared at either hand and around the New, Lyon's, and Strand Inns of Court,\* though for a long period open country still lay beyond the northern side; the gardens about the old Convent Garden site were bounded by fields. St. Giles's remained a distant country village,† and the citizens would stroll in the evenings to St. Clement's Holy Well. In King Charles I.'s reign Covent-garden began to assume its present aspect. Ficquet's Croft, otherwise termed Templars'-fold, was laid out in Carey-street (*antig.* Jackanape's-lane), Boswell-court, Portugal-street, Serle-street, and New-square (*antig.* Serle's-court); whilst of Inigo Jones's more ambitious scheme there remains Arch-row along the western side of Lincoln's Inn-fields. About 1640 the space between this and Clement's Inn was covered with Clare Market, and other small streets and alleys. There thus sprang up in the last-named quarter Ship-yard, Crown-court, Crown-place, &c., with the almshouses and vestry of the parish, all of which were pulled down at the end of last century in pursuance of Alderman Pickett's project for throwing open the church of St. Clement Danes, which Pierce had

\* New Inns (where Sir Thomas More studied before entering of Lincoln's Inn), formerly "Our Lady's Inns," for travellers, was given by Sir John Fineux, Lord Chief Justice, temp. Edward IV., to the law students of St. George's Inn, Old Bailey. *Lyon's Inn* stood formerly on the northern side of Holwell-street, over against the passage, bearing a carved lion's head, from the Strand. *Strand Inn*, formerly Chester's Inn, was destroyed temp. Edward VI., for the Duke of Somerset's new palace. King's College occupies the site.

† The lord mayor and aldermen used, on the occasion of their annual visit to the conduits, to hunt a hare before dinner, and a few after it in the fields near St. Giles's.—"Picture of London," 1824.

built under the superintendence of Wren. Butcher-row, which had been a flesh-market from the days of the Tudors, was replaced in 1813 with Pickett-street. The further changes of some twelve years ago included the removal of part of Clement's Inn and lane, of much that was left of Clare Market, of Shire-lane, Boswell-court, Bear-yard, and portions of Carey-street and Bell-yard. Fleet-street has already contributed to the sacrifice, whilst the Inn and the courts to the south of King's College Hospital will not long survive.

It will be seen, then, that the Courts of Justice have arisen in a district which, in late years at least, enjoyed no enviable repute. But all the above-named places have histories of their own that are abundantly marked with names and events strikingly at variance with those which render their subsequent memorials so notorious. St. Clement's Well was one of the "excellent springs . . . whose waters are sweet, salubrious, and clear, and whose runnels murmur over the shining stones" mentioned by Fitzstephen.\* The inn represents a hostel where the penitents who, as early as Ethelred's reign, resorted to the spring, lodged. The hostel in time became a religious house, which, in its turn, was converted into an Inn of Chancery, cited in a record of the 19th King Edward IV. In 1486 we find it possessed by Sir John Cautelowe, whose interest afterwards passed (20th Henry VIII.) to William Holles, Lord Mayor, ancestor of the Dukes of Newcastle and Earls of Clare, who resigned where is now Clare Market, and of whom the second earl, removing to Drury-lane, demised the Inn to the then principal and fellows. St. Clement's Inn, where "they will talk of mad shallow yet," should divide its claims to celebrity between that worthy and Lord Chief Justice Sanders. In the garden (a charming corner of Old London) is the bronze figure of a kneeling negro supporting a sun-dial, a present from an Earl of Clare, which occasioned the stanza:—

"In vain, poor sabbie son of woe,  
Thou seek'st the tender tear;  
For thee in vain with pangs they flow,  
For mercy dwells not here.

From cannibals thou fledst in vain,  
Lawyers less quarter give:  
The first won't eat you till you're slain,  
The last will do't alive!

Gay's "Trivia" contains a lively and faithful picture of Butcher-row, which lay to the north-east of the church. Here were Betty's and Chilton's eating-houses, the latter frequented by Dr. Johnson. It was in returning from the Bear and Harrow, in the Row, through Clare Market (where one or two penthouses and the last of the hulk-shops may yet be seen) to his lodgings in Drury-street, that Nat Lee, overcome with wine, fell down and was suffocated in the snow. In the churchyard close by, where he was buried, rest another poet, Otway; Lowen, an original actor of Shakspeare's plays; Rymer, compiler of the "Fœdera"; and Monford, the actor whom Lord Mohun killed in Howard-street, at Mrs. Bracegirdle's door. Joe Miller, "a facetious companion and an excellent comedian," was buried (1738) in the parish ground over which the hospital now stands. Clement's-lane formed a fashionable quarter in the closing years of the seventeenth century. Here lived Oliver Cromwell when a student of Lincoln's Inn, as also Sir John Trevor, Master of the Rolls, who when Speaker had to pronounce his own conviction and dismissal for bribery. By the eastern end of Butcher-row was a fine old gabled house of date 1581, its front profusely decorated with coronets and fleurs-de-lis, the residence of the Count de Beaumont, French ambassador to King James I.'s Court. Johnson-court, Fleet-street, and Boswell-court are vulgarly believed to owe their styles to the Doctor and his biographer. As a matter of fact, the former was so named long before its most famous inhabitant removed thither (in 1765) from the Inner Temple-lane; the latter was so called after a Mr. Boswell, from whose house Gilbert Talbot (1589) dates a letter of town gossip to his father, the celebrated Earl of Shrewsbury. The parish register chronicles, under date September 5th, 1611, the burial of "W. Ewins, esquier, from Boswell Zowasse." The house and its courtyard were built upon as early as 1615. Sir Walter Raleigh's widow lived here, as did Sir Richard and Lady Fanshawe,

\* Temp. Henry II. The well, with its pump, was at the southern end of Clement's-lane. The new Judges' Library occupies its site.

with, in 1635, *teste* the rate-book, the Lord Chief Justice and Sir Edward Littleton, Solicitor-general. This lane (*alias* Rogue's-lane, and latterly Lower Serle's-place), at Temple Bar, abounded with reminiscences of the past. Andrew Marvell refers to the "Trumpet" in Sheer-lane, being the same tavern, at the upper end, whence Isaac Bickerstaff dates many papers to *The Tatler*, and where the *Tatler* met his club. From the "Trumpet," since known as the "Duke of York," the *Tatler* led down into Fleet-street that immortal deputation of "twillers" from the country who, as a celebrated writer observes, hardly seem to have settled their question of precedence to this hour. Moreover, in Shire-lane originated the famous Kit-Kat Club, a society of thirty-nine distinguished noblemen and gentlemen zealously attached to the House of Hanover. Walpole, one of their number, says they were "generally mentioned as a set of wits, in reality the patriots that saved Britain." They took the name of Kit-Kat either from Christopher Katt, the pastrycook, at whose house they dined, or from his excellent mutton pies which are mentioned under that name by more than one writer of the day. Their toasting-glasses, engraved with verses in praise of the beauties to whom they were severally consecrated, are pleasantly commemorated in the well-known epigram attributed to Pope, but believed to be by Arbuthnot. Besides the leading statesmen of the day the club comprised such authors as Steele, Addison, Congreve, Garth, and Vanbrugh. Of the many stories connected with the club and their meetings one alone must suffice. Hoadley, then bishop of Bangor, was a guest one 4th of November, when it was customary to drink to the "immortal memory" of William III. This toast fell to the not unwilling Steele, who had also to raise the more phlegmatic Addison to conversation pitch. John Sly, the latter of factious fame, approached the company on his knees with a tankard of ale to drink to the toast and to return in the same posture. Steele, seated next to the bishop, whispered him, "Do laugh, my lord; it is humanity to laugh," but, soon falling in Sly's own condition, he had to be put in a chair and sent home. Nothing would satisfy him but being carried late as it was to the bishop's house. The next morning his guest's displeasure was dissipated with the propitiatory couplet,

"Virtue with so much ease on Bangor sits,  
All faults he pardons though he none commits."

In Shire-lane Sir John Sedley lived, and here his son the dramatic poet was born. Antony à Wood records his having dined with Elias Ashmole at his house by the "Globe." In making the foundations of the new buildings traces were discovered of the underground passages connected with the Bible Tavern at No. 13, which, ostensibly a printers' house of call, was a favoured haunt of the lawless,—chief amongst whom was Jack Sheppard, another of whose "flash kens," the White Lion in Wych-street, disappeared about two years since. They still show in the Black Jack, Portsmouth-street, the first-floor window through which he once jumped to escape Jonathan Wild. By a singular coincidence, the branch of the Bank of England in the Courts is believed to occupy the site of "Smasher's Corner" in Shire-lane, which took its name from the coiners who here pursued their nefarious calling. Shire-lane could also boast of the Anti-Gallican, frequented by sporting men, and kept by Harry Lee, whose diminutive son was the first of the tigers made fashionable by Lord Barrymore.

The Ship Inn in the yard of that name once belonged to Sir Christopher Hatton, and adjoined another, the Drake, dedicated to the great naval hero. In Bell-yard lived Fortescue, to whom Pope addressed many letters as "his counsel learned in the law." Blackstone and Franklin dwelt in the southern side of Carey-street, so named after a house there of Sir George Carey (1635). To bring down our account to recent times, it may be stated in conclusion that an old watch-box stood in Boswell-court not more than thirty years ago.

**New Workhouse Infirmary for Stoke-on-Trent.**—In consequence of the increased pauperism of the parish, the Board of Guardians have decided to erect a new infirmary at the workhouse, at a cost of 13,000*l.*

#### HORTICULTURAL BUILDINGS.\*

The chief object I have had in view in preparing this paper has been to embody just that information and just those points relating to the construction of horticultural buildings which are outside the province of the gardener, and do not usually come within the knowledge of architects; in fact, to supply a few links which are generally missing between the architectural and horticultural interests.

I have no desire to discuss questions of architectural design or even many points of constructional detail, respecting which you probably know far more than I do. Neither do I wish to dilate upon the many methods of growing plants, fruits, and flowers; these questions we may safely leave to the gardener proper.

In order to start fairly, I will first of all draw your attention to the nomenclature of the subject. The words "hothouse," "greenhouse," "glasshouse," are so frequently used indiscriminately that a slight classification of these structures is necessary. I generally find they divide themselves into two classes, growing-houses and showing-houses. Growing-houses, again, divide themselves into three sections,—1st. Those in which plants are grown in pots on stages, or at a certain distance from the glass, comprising simple green-houses, plant-houses, houses for bringing on hedging staff, some descriptions of orchard-houses, and plant-stoves without bottom heat. 2nd. Houses in which foliage is trained along the roof, such as early and late vineries, muscat-houses, peach-houses, or similar descriptions of orchard-houses. 3rd. Houses in which root action is stimulated, such as cucumber and melon houses, pine, succession, and fruiting houses, pits with forcing or propagating beds, plant-stoves containing heated beds, &c.

Whatever classification, however, is used, must not be regarded as rigid; for these divisional sections will often be found to overlap each other. For instance, from the force of circumstances a general-purpose lean-to house may frequently be seen, in which cucumbers trained along the roof have their roots in a heated bed in front, and plants are grown in pots on a stage at the back. I shall confine my remarks chiefly to growing-houses, and then, if I have time, I will say a few words on showing-houses or conservatories.

Of heating I propose to say nothing. The subject, although closely connected with horticultural buildings, is such an important and a complicated one, that I could not possibly do justice to it in the present paper with the time at my disposal.

The peculiarly trying conditions under which horticultural buildings exist,—viz., the extremely varying temperatures of the inside and outside: the moisture-laden air of the former; the exposed character of the structures; the uncertainty of our climate; the necessity for durability, solidity, and yet the minimum of obstruction to light,—warrant every precaution being taken that the materials used be thoroughly sound; that the construction be such that there be no crevices for the retention of moisture or harbouring of insects; and that the buildings, by subsequent periodical painting and repair, be kept in a good state of preservation.

The first main point in connexion with a growing-house is to determine the pitch of roof most advantageous for various purposes. Now, I need not tell you that when the sun's rays strike a sheet of glass some of those rays cannot pass through. The more nearly sunlight strikes a roof of glass at right-angles, or within 30° of a right-angle, the less obstruction to the rays of light does the glass afford.

The next point is how to obtain the maximum impingement of the sun's rays at, or as near as possible to, a right-angle, for the position of the sun relatively to the earth is always varying. In point of fact, the sun on the shortest day, say Dec. 21st, with us in London, rises about 50° east of scuth, attains an altitude at twelve o'clock on that day of about 15° above the horizon, and sets about 50° west of south. On the longest day, say June 21st, the sun rises about 50° east of north, attains an altitude of about 62° above the horizon at twelve o'clock on that day, and sets about 50° west of north. You will therefore see that if we wish to build in the latitude of London a greenhouse of which

\* A paper by Mr. F. A. Fawkes, read before the Architectural Association on the 8th inst.

the roof shall receive the sun's rays at right-angles on December 21st, such roof would have to be built at an angle of 75° with the horizon; whereas, on June 21st, the roof would only have to be at an angle of 25° with the horizon.

If, again, for ripening purposes, we desire accuracy of the highest degree, and require the sun to strike a roof at right angles at twelve o'clock on any particular day of the year, and at any other place besides London, we only have to remember the following simple rule:—Take the latitude of the place, and from it subtract the sun's declination between the vernal and autumnal equinoxes; or to it add the sun's declination between the autumnal and vernal equinoxes, and we shall obtain the required inclination of roof. The "Nautical Almanack" gives the sun's declination for every day in the year. Of course exactly at the autumnal and vernal equinoxes, that is, when the planes of the equator and ecliptic coincide, the latitude of the place equals the angle which the roof must make with the plane of the horizon. An inclination of roof, however, founded on the astronomical problem alone, is only necessary when the sun's heat and light are required under the most advantageous circumstances, such as for ripening, on or about a certain date, fruit trained along the roof. In most cases, for plant and flower growing, purposes, especially when pot plants require to be near the glass, a low pitch economises space and artificial heat, and is really found better suited than a higher pitch. In such cases 26 degrees to 30 degrees pitch is what I recommend. I never like a lower pitch than 26 degrees, or rain is apt to drift in under the laps.

Summing up the question of the best pitch of roofs in a few words, I may state that for plant-growing where low houses are required a roof of 26 degrees to 30 degrees is suitable. For fruit growing along the rafters, when the ripening process requires the maximum sun influence from 36 degrees to 44 degrees,—say a mean of 40 degrees,—and for wall fruit, where the glass requires to be as near the wall as possible, and a specially narrow house is advisable, 60 degrees to 70 degrees may be advisable.

So much for the pitch of roofs. We have not, however, done with the astronomical part of the question. Keeping in our mind the leading points connected with the sun, where it rises, where it sets, and the altitude it attains, we will pass on to the various forms of growing-houses, and some of the reasons for their assuming these forms.

The first and most natural form is the *lean-to*. This form is used under the following circumstances:—When a wall or building already exists against which it is desired to place a glass house; when a wall is specially built in order that a house or combination of houses may face the south and have a brick protection from the north; when the maximum length of rafter for vines or similar fruit-growing is required; when out-houses, potting-shed, holler-house, gardeners' apartments, seed-room, &c., are required on the opposite side of the wall; and when, with a wall already existing, a house having a given area is required to be built at the smallest cost. Of course the best aspect for a lean-to house is to face the south. It will then catch a larger amount of sun than in any other position. Even when the lean-to faces exactly south, and the wall is consequently due east and west, part of the early morning and late evening sun will be lost, for the sun rises north of east and sets north of west during part of the year. Sometimes an existing wall against which it is proposed to build a lean-to does not face exactly south. You will then remember that by so much as the aspect of the wall deviates westerly, by so much do you lose the morning sun; and by so much as the aspect of the wall deviates easterly, by so much do you lose the afternoon sun. Again, it is as well to remember that in consequence of brick protection from the north, and glasswork facing south, a lean-to, other things being equal, is easier to heat than a house in which the glasswork is exposed in every direction.

The next form of house is the *span*. This form is used under the following circumstances:—When no high wall exists or is required; for building at right angles to and in combination with a range of lean-to houses against a south wall; when the minimum height is required, so that the houses may cause, as little obstruction as possible; when comparatively small plants require to be accessible, and yet as near the glass as possible, and

when, from local circumstances, this is not so easily effected in a lean-to house; when the sun's rays are required to reach all parts of a plant as much as possible; and when great length of rafter is not necessary; and when the length of a house requires to be in the direction of north and south, and each side requires an equal amount of solar rays.

The best aspect for a span house is, of course, for the ridge to run north and south. In this way the contents obtain as perfect a distribution of the sun's rays as possible; for as the side facing east receives all the morning and part of the afternoon rays, so the side facing west receives part of the morning and all the afternoon rays. Frequently span houses are not built with the ridge running north and south. I have even seen them purposely built with the ridge east and west. In this way the side facing south will receive a much greater proportion of the sun's rays than that facing north, so that plants requiring different proportions of sun's rays can be grown in the same house.

The lean-to and the span are the chief simple forms to be met with in connexion with glass houses; but there is another,—a sort of compromise between the two, viz.,—the three-quarter span, which will be found very useful under the following conditions:—When the back wall of an otherwise lean-to requires to be kept as low as possible, so that without departing from the main features of the lean-to, the wall may form the minimum obstruction; when it is necessary to let light in at the back or for utilising early morning or late afternoon sunlight, which would otherwise be lost; and when the maximum length of rafter is not a *sine qua non*.

It would be perfectly impossible for me to give you a *résumé* of all the combinations which can be constructed. It may be as well to bear in mind that when a number of houses are required, they should be planned so that they are compact, not straggling; so that the buildings for consecutive operations are as nearly as possible in consecutive order; so that the boiler or boilers are in a convenient position for the work they have to do; so that each separate building does not suffer from being in combination with others.

Very important points in connexion with planning horticultural structures are site and levels. The actual site may be, and frequently is, a matter of choice. When this is the case, first see that trees or other objects are not likely to obstruct the sun's rays and thus neutralise the advantages of your glass houses. Decide upon that site which will best suit the varied conditions of aspect, drainage, stoke-hole, furnace, chimney, potting-shed, fuel-shed, &c. Also, see if your ground is level; if it is not, ascertain the exact nature of the inequality. If the ground be fairly level in the direction of the length of your buildings, well and good. If, however, the ground fall in that direction, several courses are open to us. In any case, it is advantageous for the boiler to be at the lower end, when, in many instances, excavation for a stoke-hole may be entirely avoided. Even supposing the ground to be perfectly horizontal, the question of floor-levels must be considered. If there is a difficulty of drainage, or the boiler cannot be sunk as low as necessary, it is often advisable to raise the floor-level. On the other hand, it may be necessary to sink the floor-line below the ground-line, in order that the houses may form the minimum obstruction. In this case great care must be exercised in the drainage, or the houses may be perpetually flooded. It used to be the fashion, more than it is now, to sink houses in order to retain the heat, but with existing facilities for heating, such a course is now rendered unnecessary. These remarks regarding levels will equally apply to combinations as to single houses. Houses composing one range should, if possible, have their floors on the same level. Steps from one house to an adjoining one should be avoided; but, if necessary, parallel dislevels without inconvenience. In all cases there should be easy means of intercommunication between all houses for a wheelbarrow.

In constructing a glass house, several points thrust themselves upon us, especially with reference to the roof. Obstruction to the sun's rays must be avoided as much as possible, yet the structure must be durable and substantial, and lateral thrust must be avoided. The rafters

should be sufficiently deep for the purpose, yet not so deep that the solar rays, especially when they shine obliquely, will be materially arrested. Under ordinary circumstances, for growing-houses a roof well tied with light iron tie-rods will enable rafters to be much shallower than a roof not so tied. As to whether the roof shall be made of framed lights or not, I may say from my own experience a sash-bar roof, with T-iron parlins between the rafters, is lighter, has less material, is not so liable to get out of repair by rotting, and, in fact, will answer every practical purpose for such houses much better than the heavier and more substantial sash roof. The advantages of a sash over a sash-bar construction are, that the roof can be practically stripped off for cultivating purposes. The maximum amount of air is required at any season; and also that the house can be taken down without the actual necessity of taking out the glass.\*

#### ST. OLAVE'S, JEWRY.

The Ecclesiastical Commissioners are about to prepare a scheme which will involve the removal of yet another of Wren's City churches. St. Olave's, Jewry, conspicuous for the four ohelisks crowned with bells and the staff carrying a gilded vane in the form of a ship upon its tower, was built in 1673 at a cost of 5,600l. The former church, in existence more than 600 years ago and long known as St. Olave's Upwell from a well at its eastern end, was burnt by the Great Fire. Here were buried, amongst others, Thomas Morsted, surgeon to the kings Henry IV., V., and VI., and sheriff of London, with Giles Dewes, clerk to the libraries of kings Henry VII. and VIII., and French preceptor to Prince Arthur and his younger sister Mary. In the Fire also perished the neighbouring Church of St. Martin in the Pomary or Orchard which stood on the eastern side of Ironmonger-lane, near the house of Sir Thomas Chitty, Lord Mayor. This was not rebuilt and the parish was united with St. Olave's. The name of the district commemorates a persecuted and long-suffering race who gathered here until their spoliation and expulsion from England by King Edward I. The church reminds us of an earlier and more dominant occupation, being one of the four in London that were dedicated to Olaf, or Olave, king of Norway, son of Harald Grinska, the hero of many valiant exploits in freeing his country from the Swedes and repelling the Danes from our own. A convert from paganism, he ultimately fell fighting against the rebel Thore Hund, at Stickerstad, on the 31st of August, 1030, the cry of "Fram, Fram, Kristmenn Krossmenn Konungmenn!" on his lips. Enrolled amongst the martyrs and saints, his glorious end served the Faith he had espoused as much as all his previous efforts in behalf of Christianity. In his monograph upon the towers and steeples designed by Sir Christopher Wren, Mr. A. T. Taylor describes the tower of St. Olave's, Jewry, as consisting of four stories, containing, on the lowermost one, a square-headed door, with Doric side columns, entablature and cambered pediment; the second story, he goes on to say, is pierced by a circular-headed window, and emphasised by a pronounced moulded string-course; the third contains the clock and case, with pediment over, and side consoles; the heltry-stage is pierced by circular-headed openings, edged with moulded architraves having centre and cross mullions, and filled in with louvres. Though St. Olave's possesses no architectural features of unusual merit, it contains the remains of two men whose association therewith it is to be hoped will not be allowed to perish. In the old church was buried Robert Large, a mercer, the master of Caxton; in the present church are the tomb and monument of John Boydell, to whose love and practice of art, coupled with a well-nigh prodigal liberality in encouraging and rewarding the labours of others, is due our modern school of historical painting and engraving. His greatest work was the employment of Reynolds, West, Fuseli, Northcote, and other artists, to paint pictures illustrative of Shakspeare's plays. The pictures were exhibited for some years at the Gallery, afterwards the British Institution, in Pall Mall. Boydell also published a number of large-sized prints from these compositions, together with a superb edition of the poet's

\* To be continued.

works. In these and kindred projects for the advancement of pietorial art, he, with his nephew, Josiah Boydell, expended no less than 350,000*l.* But subsequent embarrassments, mainly owing to the outbreak of the French Revolution and concomitant interruption of traffic abroad, forbade the accomplishment of his original design to bestow his collection upon the nation. Within a few months of his death the pictures were sold, in May, 1805, at Christie's, realising, by reason of their abnormal proportions, a sum very incommensurate with their original cost or intrinsic worth.

Old Jewry was once famous for the stately houses built by Wren for Sir Robert Clayton, Sir Nathaniel and Sir Joseph Herne; here, too, lived William Sharp, the eminent surgeon, and Granville Sharp, the patriot. The synagogue at its northern end passed into the hands of the friars, *Freres de Sacco*, and then was used as an official residence by several lord mayors. Degenerating into a tavern, it is mentioned in the inventory of "Innes for Horses seen and viewed" in preparation for Charles V. of Spain's visit to Henry VIII. *Kitely*, in Ben Jonson's "Every Man in his Humour," is a merchant of Old Jewry, and *Wellbred* in that play dates his letter to *Edward Knowell* "from the Windmill." The magnificent house in which Sir Robert Clayton, the "fanatical lord mayor" of Dryden's "Religio Laici," entertained King Charles II. at supper, was pulled down about twenty years ago. Here, as librarian to the London Institution, Porson died. Dr. James Foster, the modest "Foster" of Pope's couplet,—and a chapel in Old Jewry; he owed his popularity to Lord Chancellor Hardwicke, who, stepping one day within the chapel to escape a shower of rain, was so well pleased with Foster's discourse that he sent all his great acquaintances to hear him.

#### NELL GWYNNE'S HOUSE IN WARDOUR-STREET.

The new street from Piccadilly to Bloomsbury hill, in traversing Soho, pass over the site of a house which is probably the last in London that can with any certainty be pointed out as a home of Nell Gwynne. Standing then in Hedge-lane by the Military-garden, it is now No. 53, Wardour-street (until recently No. 38, Princess-street), at the south-eastern corner of Richmond-street. It would seem that Nell Gwynne lived here at some time within the interval 1667-1670, for in 1667 she was, as Pepys records, lodging in Drury-lane, and in 1670 inhabited a house on the north side of Pall Mall, next to Lady Mary Howard's. In 1671 she obtained under Act of Parliament a free conveyance of the house and site on the south side of that street, which she occupied until her death, in her thirty-eighth year, in 1687. This last-named house, adjoining the Countess of Portland's, was purchased by the Waldegrave family; its site is at present occupied by the more modern premises of the Eagle Insurance Company. Buried at St. Martin's-in-the-Fields, Tension did not disdain to preach her funeral sermon, whilst the numerous London houses from Bagnigge Wells in the north to Sandford Manor, Fulham, in the west, that were associated with her memory, evince how strong a hold Nell Gwynne retained in the people's regard by her love of unaffected nature and fondness for their more harmless pleasures,—traits in her character but too commonly neglected. Those who delight in the trivial surprises of coincidence will find amusement in being reminded that the Thames at the eastern and western limits of the metropolis flows by the sites of two ancient palaces, at this day represented by national hospitals, designed by one architect, whereof the one is attributed to the large-hearted benevolence of this royal mistress, and the other testifies to the affection with which William III. cherished the memory of his consort, whose pity had been kindled on seeing the sufferings of the victors at Cape La Hogue.

**Worthing.**—A first-class club has just been established here under the auspices of the principal gentry of the neighbourhood. It joins the Royal Hotel, and is in a capital position. A fine billiard-room, 36 ft. by 25 ft., is being erected in connexion with the club from the designs of Mr. George Truefitt, under whose care important alterations and improvements are being carried out at the Royal Hotel for Mr. Young, the new proprietor.

#### EDINBURGH.

The new chancel of St. John's Church has been consecrated, and the effect of the alterations upon the interior can now be judged of. The church, as we formerly stated, had no chancel, the altar and table having been placed below the great east window of the nave. The head of this window now does duty as the chancel arch, and the chancel is projected in the form of an octagonal apse lighted by five windows, which are similar in character to, although better in detail than, those of the nave, which are of a later phase of the Perpendicular style. It is unfortunate that circumstances rendered it imperative that the chancel could not be carried further eastward, but, as it is, the improvement upon the interior is considerable. The removal of the organ from the west to the east end of the nave has opened up the arch into the central west tower, which greatly improves the perspective in that direction; and in the other, the abrupt termination has been modified by the new chancel. As regards the details, they have been carried out in a liberal spirit; the floor of the chancel has been laid with coloured marbles, and the steps are of polished white marble. The stalls are oak appropriately carved, and the ceiling is richly groined and coloured in keeping with the other decorations of the building. The central window of the chancel only is filled with coloured glass, the other four being left for future donors. All the windows in the original structure were furnished with stained glass by Messrs. Ballantyne, and the new window, which is by Messrs. Clayton & Bell, presents a marked contrast to them, both as regards colour and design, affording an example of the change in taste in this particular.

St. Thomas's Chapel has been reopened. Besides the new elevation towards Rutland-street, formerly referred to, considerable improvements have been effected in the interior. The two elevated structures which respectively served the purpose of pulpit and reading-desk at the west end, have been superseded by new furnishings, more in consonance with the present taste. The organ has been removed from the gallery at the east end and placed alongside the altar, where seats have been provided for the choir. The pitch of the galleries has been lowered, and the panelling in front improved.

At a meeting of the Town Council, held on the 5th of December, the Lord Provost gave notice of a motion that it should be remitted to a committee "to consider and report as to the most appropriate manner of recording the sense which the Corporation and people of Edinburgh have of the services rendered to the city by Dr. William Chambers, especially through the Improvement Act of 1866, and the restoration of St. Giles's Cathedral." No one now doubts the benefit which has accrued to the city from the improvements in question, both as regards the sanitary condition and amenity of the city; and it will be conceded by many enlightened citizens, that there is need of still greater improvements being carried out. Were a new scheme mooted, there would doubtless be strong opposition to it on the part of certain of the ratepayers, as there was on the former occasion, but if the like energy were displayed, a similar result would most probably follow. The restoration of St. Giles's is still in progress, but it is not in a state in regard to which anything definite can be said. The plans for the new chapter-house to the south-east of the chancel have been approved of, and to these we propose to refer on a future occasion.

The elevation of the new Conservative Club is now complete, with the exception of some slight details. The building forms a marked feature in the line of Princess-street, rising as it does to a height of 70 ft. The style adopted by the architect, Mr. Robert Rowand Anderson, is that which has been associated with the name of the brothers Adam, and it may be conceded that Mr. Anderson has given a fair interpretation of the style, but it can hardly be maintained that he has succeeded in producing an exterior capable of exciting admiration, except, it may be, amongst those precursors who delight in primness and propriety. We are given to understand, however, that it is to the interior that the supremest efforts of the architect are directed, and that it will vie with the interior of any other club in the kingdom as regards the artistic merit and richness of the fittings.

A new police-station and fire-station is to be erected at the West Port upon ground acquired

under the Improvement Act. The designs will be carried out by Mr. Robert Morham, city superintendent of works.

The Edinburgh street tramways are not carried to the north of the city, on account of the steepness of the gradients, which, it is considered, it would be next to impossible to work by horse-power. Several efforts have been made to introduce steam traction engines, but any movement in that direction has been vigorously opposed. A movement is now on foot with the view of introducing a system to be worked by stationary engines and an endless rope. It is contended that street tramways of this kind have proved successful in certain American cities where the gradients are even steeper than in Edinburgh. So long as a system of this nature is carried out in comparatively straight lines and in wide streets, it may be worked efficiently without much injury to the neighbourhood; but where there are a multiplicity of narrow turns, or much private traffic, it is manifest that the difficulties increase. This point should be carefully investigated before active steps are taken.

A new Board School at North Merchiston is nearly completed. It is similar in scale and style to the other schools designed by Mr. Wilson, the architect to the Board, but it exhibits more spirit in grouping, and better character as regards detail, than his former efforts.

#### HALL OF THE AMBASSADORS, IN THE PALACE OF SEVILLE.

We illustrate in this week's *Builder* a work of Arabic art, which forms part of the Seville Palace, and which dates from the peaceful reign of Betis. Our engraving represents the hall in the edifice which was used for the reception of ambassadors. Almost every monarch of the Catalan and Spanish dynasties, from the period of the Conquest, left evidence of his love of art in this remarkable palace. According to extant trustworthy records, the palace was founded by the Moorish king Abdul-Hassid. It was restored by Don Fernando III. (the Holy), the conqueror of the city, and his son, Don Alfonso X. (the Wise). It was enlarged, and its preservation carefully attended to by Don Pedro I. (the Cruel), even amidst the sanguinary epochs of his turbulent reign. Subsequently it was restored by the Emperor Charles V., who here held his nuptials with Dona Isabel of Portugal. Next, in 1607, King Don Felipe III. caused to be constructed the "Apendero," or Portico of Three Naves, supported upon marble pillars. Important alterations were made in the palace at the instance of King Don Felipe V., the founder of the Bourbon dynasty; and, finally, great care was bestowed upon its preservation by Queen Dona Isabel II. and King Don Alfonso XII.

The Hall of Ambassadors is one of the principal works of the palace. Gently curving arches of a collar shape rest upon marble monoliths. Walls covered with brilliant arabesques, and windows elegantly decorated, produce a beautiful effect. Moslem friezes remind us of the Koran, while the shields of Castille and Leon are emblems of the conquest. The doors are made of the imperishable wood of the larch tree. A cupola, which is a marvel of Arabic architectural art, surmounts the whole. In fact, the hall is said to be equal in colour and vivacity to the richest Persian tapestry embroidered in gold and silk. The history of Spain records a sanguinary scene enacted in this palace. Here died, by the hand of a king's archer, the Infante Don Fadrique, second son of Don Leonor de Guzman, and brother to Enrique de Trastamara, who, a few years later, was destined to take away the crown and the life of his brother, Don Pedro I. of Castille, on the memorable field of Montiel.

The Alcázar of Seville, like the Great Alhama of Cordova and the Alhambra of Granada, is regarded as one of the best specimens of the architectural taste and the artistic delicacy of the Arabs of the Spanish Peninsula.

**Extensive Additions, Alterations, and improvements** have just been completed to Brampton Brian Castle, Herefordshire, from the designs and under the direction of Mr. T. Nicholson, F.R.I.B.A., architect, Hereford. The works have been carried out by Mr. James Chittierbuck, of Gloucester.

STOKE GOLDING VICARAGE.—MR. W. LASSETT SMITH, ARCHITECT.

ST. PETER'S CHURCH, VERE STREET,  
OXFORD STREET.

This church, after having been decorated and restored, was re-opened not very long ago, a notice of which we gave at the time.\* We now give an illustration, showing the new pulpit, lectern, and choir-seating, as being specially worthy of commendation, from the careful manner in which they have been designed and carried out. The church being the work of James Gibbs, the architect of the Church of St. Martin-in-the-Fields, one of the primary objects was to keep the new seating and other additions in perfect accordance with the style of the church. In this the architect has been very successful, as the whole of the new work harmonises with the building itself most satisfactorily.

The new work is executed in oak, and the pulpit is hexagonal, the upper part being composed of niches, flanked by Corinthian pilasters, having Arabesque panels upon their fronts, designed from natural foliage conventionalised. The niches are filled with figures of our Lord, St. Peter, St. John, St. Paul, and St. Matthew, after those by Thorwaldsen in the Church of Notre Dame at Copenhagen, these examples having been adhered to by the special wish of the incumbent, the Rev. W. Pago Roberts, M.A.

The very handsome lectern was the gift of the Lady Caroline Kerrison. The hook-board is supported by a triple arrangement of one round and two square Corinthian columns, the shafts being covered with carved foliage; from these rises an elaborate double open-work scroll supporting the front of the hook-board. The choir-seating has bench-ends, with open carved scrolls of elegant design. The type of work adopted in the carving has been mostly that seen in the oak carving of Grinling Gibbons. Nature has been freely resorted to, but rendered with that conventional delicacy which is characteristic of the best period of the Italian Renaissance.

The whole has been carried out, from full-size working drawings made by the architect, Mr. James Kellaway Colling, F.R.I.B.A., by Messrs. Cornish & Gaymer, of North Walsham, Norfolk, builders and architectural carvers, with the exception of the figures occupying the niches of the pulpit, which were the work of Mr. James Forsyth, the sculptor.

## STOKE GOLDING VICARAGE.

STOKE GOLDING is situated about three miles from the town of Hincley, in Leicestershire, with which it was formerly connected. It is now an entirely separate parish, and the present vicar has just erected the vicarage-house, a view of which we give.

The house is built with red bricks, and is covered with Staffordshire tiles. It contains drawing-room, dining-room, study, good entrance-hall, small parish-room, kitchen, and offices, and ten bed and dressing rooms; at the back there are a small stable and carriage-house, &c.

The works were carried out by Messrs. Fox Bros., of Atherstone, from designs by Mr. Wm. Bassett-Smith, architect.

The Church at Stoke is a very interesting fourteenth-century building, but is in a terrible state of decay. The chancel has, however, been entirely rebuilt, at the sole expense of the present vicar, in accordance with the old design, and every old stone that could be re-used has been replaced in its former position.

**The Site of the Tuileries, Paris.**—Says the Paris correspondent of the *Standard*, the question of what is to be done with the site of the Tuileries is being actively canvassed. It is generally agreed that it will never do to leave the ground vacant. To say nothing of the value of so large an area in the midst of Paris, some edifice, as a complement to the Louvre, and as a base to the immense perspective of the Tuileries gardens and the Champs Elysées, is held to be absolutely necessary. The *Paris*, the organ of the Elysées, insists that the obvious solution is to erect upon the ground "the palace of the modern sovereign,"—that is, a pile of Parliamentary buildings to accommodate both the Senate and the Chamber of Deputies.

## THE NEW CITY OF LONDON SCHOOL.

WE give this week a view of the interior of the great hall of the new City of London School, on the Victoria Embankment. In vol. xxxviii., pp. 602-5 (May 15, 1880), we gave a view and four plans of the building as adopted for execution, a few minor deviations from those plans having been made in the progress of the work, such as the abolition of the compartments reserved for hats and cloaks in each of the class-rooms, and the provision of a large aggregate hat and cloak-room on that ground level. The only other deviation that need be mentioned is that the library has been made twice as large as at first contemplated by a re-arrangement of the class-rooms on the ground-floor. In vol. xli., p. 495 (April 22, 1882), we gave some further particulars of the buildings, which were opened on Tuesday last by the Prince and Princess of Wales.

The City of London School was established in the year 1834, under a special Act of Parliament, by which it is endowed with an annual minimum sum of 900*l.*, payable by the Corporation out of the profits of certain lands bequeathed to the Corporation nearly 400 years before (*viz.*, in 1442) by John Carpenter, Town Clerk in the reign of Henry V., for the purpose, as his will expresses it, of "finding and bringing up of four poor men's children, with meat, drink, apparel, learning at the Schools, Universities, &c., until they be preferred, and then others in their places for ever." The land so willed to the Corporation has long since been covered with buildings, and is situated in Tottenham-court-road, close to Chancery-street. The building in which the School has been carried on ever since its establishment is situated in Milk-street, Cheap-side. It was built from the designs of the late Mr. J. B. Bunning, before his appointment as City Architect, on the site of Honey-lane Market, and the first stone was laid by Lord Brougham, in October, 1835. The position of this building is, we need not say, very confined. The superficial area occupied by it is only 9,000 square feet; it has no playgrounds, no adequate provision for natural science teaching, and no luncheon-rooms, while the general arrangements are, in some respects, below the standard now considered necessary even in primary schools. The constitution of the school has not greatly changed since the days of its establishment half a century ago. It is a day-school for the education of 680 boys between the ages of seven and nineteen. It is under the government of the Corporation, by a committee of that body elected annually. The Corporation has, for some years, paid an average of 4,000*l.* a year out of its corporate purse towards the maintenance of the school, instead of the 900*l.* a year which they are bound to spend under the Act before named.

One of the chief disadvantages hitherto suffered by the school arose from the old school building in Honey-lane Market being planned with a small number of large class-rooms, necessitating the teaching of classes numbering as many as sixty boys by one master. It is now generally held by educationists that a class of forty is the largest that can be effectively taught by one master. In the new buildings, therefore, an increased number of smaller class-rooms has been provided, and the staff of masters will be correspondingly augmented. While the old building has, owing to modern requirements, been getting more and more unsuitable for the purposes of the school, its site has become increasingly valuable as building land for warehouse purposes, it being in the very centre of what is known as the "Manchester trade." The Corporation therefore determined to erect a new building for the purposes of the school on a site an acre and a half in extent on the Victoria Embankment, and having instituted a competition, the plans sent in by Messrs. Davis & Emanuel were awarded the first premium, and those gentlemen were appointed to carry out the work. Subsequently, however, the plans had to be entirely recast, owing to changes determined upon by the Corporation in the method of laying out the whole area of the land formerly occupied by the gas works, and of which that appropriated as the site of the school formed a part. By these changes the frontage of the school towards the Embankment was reduced from 196 ft. to 136 ft., while, at the same time, the depth backwards was extended so as to make up the promised area of an acre and a half. The new

site is an irregular oblong, having a frontage of 136 ft. towards the Embankment, and a return frontage of 430 ft. towards a new street running northwards from the Embankment to Tudor-street. The site becomes somewhat wider as it extends northwards, and is bounded on the east by lofty flank wall of the Royal Hotel, and on the back or north side by some vacant building land belonging to the Corporation next Tudor-street. A large portion of the site, including almost all the ground covered by the school building, being land reclaimed from the river, is stated to be free from all taxes and assessments, under the Act of Parliament of 7th of Geo. III., cap. 37.

The surface of the site of the building was entirely composed of "made" ground, and all the foundations have been carried to an average depth of 28 ft. below the level of the playground. Large rectangular holes were sunk through the made ground to a bed of Thames ballast which was met with at that level over the whole site, and which doubtless formed at one time a part of the bed of the river. The holes were then filled in with Portland cement concrete up to a level of 2 ft. 6 in. below the surface of the playground, so that the school building may be said to stand on a series of concrete monoliths more than 25 ft. high, and ranging from 10 ft. to 15 ft. or 16 ft. square. According to a descriptive brochure issued by the School Committee, the bed of Thames ballast before mentioned is by no means thick, and an attempt was made in the first instance to reach, by boring, the London clay; but immediately beneath the bed of shingle there exists a bed of quicksand, which it would have been extremely difficult to penetrate. This quicksand, too, being below low-water mark, is always fully charged with water, and no risk to the building attends its existence unless in some future building or deep drainage works this quicksand should be cut by the excavations, in which case any heavy pumping would certainly cause risk of settlement to the school buildings, as well as to the Royal Hotel adjoining, the foundations of which rest on the same bed of ballast.

The whole of the floors throughout, except those to the porter's bedrooms in roof, are fire-proof, consisting of Portland cement concrete, filled in between rolled iron joists spaced 27 in. apart from centre to centre. The lintels throughout are of rolled iron joists. A large amount of constructional ironwork in girders and columns has been employed at the level of the ground-floor, so as to avoid obstruction in the covered playground which occupies a large portion of the basement. The block-plan of the buildings is L-shaped. The shorter arm of the L, facing the Embankment, is three stories high, and contains large and lofty covered playground in basement, administration rooms and library on ground-floor, and the great hall on first floor, with its longitudinal axis parallel with the Embankment frontage. The longer arm of the L, facing the side street before referred to, constitutes the "teaching" block, and contains lat and coat room, dining-room, and covered playground in basement (all lofty and well lighted); eighteen class-rooms on first and ground floors; a natural-science school and lecture-hall, and two class-rooms, on second-floor, besides a common room on ground-floor for the assistant masters, a kitchen, and apartments for the resident porter.

The exterior of the façade towards the Embankment is entirely of Portland stone, with the exception of polished red granite shafts to the windows. It is in the style of the Italian Renaissance, enriched with carving and sculpture. The Embankment front of the building is 120 ft. long, and is three stories in height, with a flanking tower at each corner. The principal entrance is in the centre of this front, and is approached by a wide flight of stone steps from the Embankment. The basement story, half sunk beneath the level of the pavement, with open areas in front, has large segmental-headed openings filled with iron grilles enclosing the front part of the covered playground. The ground-floor has four three-light square-headed windows, two on either side of the principal entrance. The fenestration of the front of the first floor, or hall floor, consists of five large circular-headed windows, deeply recessed. The tympana beneath these arched heads are filled in with allegorical seated figures representing various arts and sciences, while the spandrels of the arches are separated by niches containing statues of Bacon, Sir

\* See *Builder* for 1881, vol. xli., p. 618.

Thomas More, Shakspeare, Milton, and Newton. These figures and statues, together with the spandrels containing shields bearing the arms of the principal donors to the school, were all executed by Messrs. J. Daymond & Son, of Edward-street, Vauxhall Bridge-road, under the direction of the architects, Messrs. Daymond & Son being selected, in competition with other artists, by the Building Committee. This selection has been amply justified by the excellence of the sculptural work. The general architectural carving has been well executed by Mr. G. W. Seale, of Brixton.

The façade is crowned by a balustraded stone parapet, above which rises the roof of the great hall, which, externally, is high-pitched and of French character, covered with green slates, surmounted by a lofty central *flèche* of copper-work, and relieved here and there by dormers. This lofty roof has been avowedly made a marked feature in order to prevent the school building being altogether overpowered by its gigantic neighbour, the Royal Hotel. The roof is very strongly timbered, and is covered with green Westmoreland slates. The height of the hall from the floor to the springing of the roof is 40 ft. The roof is ceiled at a point 24 ft. above the springing, the timbers below the ceiling being cased with pitch-pine, stained walnut-wood colour. The principals are arranged in pairs, the tie-beams of each pair being made to range with the pilasters of the walls below. Each pair of tie-beams carries, at each end, a group of four columns, surmounted by an entablature, from which spring transverse and longitudinal arches dividing the roof into large compartments, in the manner shown in our view. It is, in fact, an attempt to treat an open-timbered roof in a Classic manner, and the attempt has been, on the whole, very successful. The hall is 100 ft. long by 45 ft. wide in the clear. The floor of the hall is of oak, and the walls are faced with Portland stone. What the acoustic properties of the hall may be we do not know. The woodwork of all the lower portions of the hall is of American walnut. The large enriched cove just beneath the tie-beams is of *canton-pierre*, coloured to match the walnut woodwork, and has been executed by Boekbinder. The body of the hall is fitted with permanent seats to accommodate 816 occupants. These, with the additional seats in the gallery and on the dais make up the total accommodation which the hall supplies to about 1,000. The seats in the body of hall have been specially made by the North of England School Furnishing Company from the architects' designs. The actual seats are balanced and hinged to fold back, so as, while accommodating the largest possible number, to leave free movement along the rows. Every alternate row of seats has a further movement by which the seat-back becomes a desk for the row of occupants immediately behind it. Thus for a public lecture the body of the hall will accommodate 816; for a writing-class half that number, 408; and for an examination, where more space is desirable, 204.

The principal entrance opens into a vestibule about 18 ft. square, and this gives access to the inner hall, about 40 ft. by 30 ft., but somewhat low for its size. The enriched plaster work in ceiling here and in other parts of the building was modelled and executed by Mr. E. T. Taylor. The floor is laid with a pavement of marble tesserae designed in panels. On the right of the hall is the secretary's room, 22 ft. by 18 ft., and the committee-room, 22 ft. by 20 ft., both with windows overlooking the Embankment. Closely adjoining these rooms is a room for the secretary's clerk, a porter's room commanding the whole of the hall, a store-room, lavatories, &c. On the other side of the hall are the Head Master's room, 22 ft. by 18 ft., and the library, 45 ft. by 20 ft. All these rooms are 14 ft. 6 in. high. The fittings are in American walnut, and "Tobin" tubes are used as inlet ventilators, outlet ventilators close to the ceiling being connected with air flues in the walls. Facing the vestibule is the grand staircase, on the half landing of which is a central niche containing the statue of the founder, John Carpenter. This staircase is mostly of marble work, executed by Mr. George Mitchell, of Brompton-road and Upper Thames-street. This comprises some fine specimens of Greek green and red Devonshire columns at the foot of the staircase, with black plinths and Sicilian bases. The stone staircase is filled in with green serpentine, which is continued round the landings,

and which forms the plinths for the black marble bases. This is grooved to receive the Sienna dadoing, on the top of which comes the moulded handrail of the stairs in Sicilian marble. The work reflects much credit upon Mr. Mitchell.

We have no space to give further details, for which we must refer our readers to the volumes already cited. We may say, however, that the arrangement of the laboratory and chemistry schoolrooms seems very good, complete provision being made by means of stink-chambers and stoneware sinks for carrying off all noxious fumes and products. The lecture-hall, 58 ft. by 48 ft., has a lecturer's table fitted with gas, water, pneumatic trough, and electric battery power, with a stink-chamber behind. Facing the table are ranges of steeply-rising seats and desks, tier above tier, accommodating about 300 boys.

The total cost of the buildings, including foundations and furniture, has been about 100,000l. The preliminary contract for the foundations, amounting to about 10,000l., was carried out by Messrs. Higgs & Hill. The main contract for the building was let to Messrs. John Mowlem & Co. (who have been represented in this work throughout by Mr. George Burt, jun.), for the sum of 76,000l. Messrs. Burt have also executed a large proportion of the fittings throughout. Messrs. Messures Brothers have supplied the wrought-iron girders, and Messrs. Rowson, Drew, & Co., the columns and heavy castings. The ornamental iron grilles at the front entrance doorway have been executed by Messrs. Jones & Willis, and the copper work of the central *flèche* by Messrs. Holden & Co. Mr. D. O. Boyd has supplied his hygienic grates for all the class-rooms, Messrs. Steel & Garland providing the grates for library and committee-room. The Coalbrookdale Company have been entrusted with the pillar lamps for the balustrade outside the principal front. Mr. Anderson provided and fixed the lightning conductors. Milner's Lock and Safe Company have supplied most of the locks and lock furniture. The School Committee obtained competitive tenders for and let separate contracts to Messrs. Herring & Son, of Chertsey, for the hot-water apparatus and fittings; Messrs. J. F. Clarke, for the gas-pipe-work and sunlights, cooking apparatus and fittings, and sundry gasfittings; Messrs. Strode & Co. and Mr. R. H. Hughes for the more important gasfitting; the North of England School Furnishing Co. for the desks and seats, not only of the great hall, as mentioned, but in the lecture-hall and class-rooms; Messrs. Story Bros. & Triggs for the general furniture; Mr. Laurie for masters' tables, blackboards, platforms, &c.; Messrs. Willis for organ; and Mr. George Spencer for the fitting-up of the gymnasium. Mr. Easley's lever apparatus is used throughout for opening and closing the windows. Claridge's asphalt is used for covering the floor of the kitchen and of the corridors in the "teaching" block. The plumbing has been done by Messrs. Matthew Hall & Co. Jennings's valve closets, urinals, and tip-up lavatories are used in the administrative or front part of the building. The boys' latrines and urinals are placed on the playground level, well away from the main buildings, but are approached by a covered way. The urinals are fitted with Messrs. Bowes, Scott, & Read's automatic flushing tanks, and for the latrines Pearson's twin-basin trapless closets are used. The lift from kitchen to playground level (where there is a comfortable dining-hall for 200 boys) is by Messrs. Waygood & Co. The slatework throughout has been executed by Mr. Bingley. Minton's white glazed tiles are used for lining the walls of school corridors, while the walls of the covered playground, dining-hall, &c., in basement are faced with some excellent cream-coloured glazed bricks supplied by Messrs. Cliff & Co., of Wortley. The speaking-tubes and electric bells are by Mr. Wontner-Smith, of Finsbury-pavement. The stained-glass work has been done by Mr. Odell. The contractors have had a very efficient general foreman in the person of Mr. John Jackson, and the clerk of works throughout has been Mr. Charles Tirl, who acted in the same capacity at the new Natural History Museum, and to whose courtesy we are indebted for many of these particulars. The architects, as before mentioned, are Messrs. Davis & Emanuel, of Finsbury-circus, who, together with the Corporation and all concerned, may be congratulated upon the completion of this very important work.

#### THE DECORATION OF CLASSIC DOMES. ST. PAUL'S CATHEDRAL.\*

THOUGH I did not take part in the discussion of Mr. Pullan's paper at the Royal Institute of British Architects on his proposed decorations of St. Paul's Cathedral dome, I have very strong opinions upon the subject, and I should be glad to say a few words on the general question at the present juncture, in accordance with Mr. Penrose's own suggestion at the meeting.

By the courtesy of Mr. Penrose and Mr. Stannus I have had the opportunity of seeing many of the various models and drawings prepared for this important work, and every one now knows the leading points in the late Mr. Burgess's scheme. As an old friend of the late E. T. Parris, I sat by his side upon the little suspended platform from which he repainted, rather than restored, Thornhill's designs, and discussed the vexed question with him.

During one of my Italian tours some years ago, I made a special pilgrimage to Parma to see the painted dome of the church there, which drew from the great Titian the exclamation,—"If I were not Titian, I would be Correggio." And in the same journey I stopped at Padua to contemplate the mural decorations of Giotto's chapel, a remarkable example of flat treatment, the walls being divided into picture-panels by horizontal and vertical bands of coloured mosaics partaking of every tint of the pictures enclosed thereby.

The result of my observations has led me to formulate for myself certain principles, which, I think, should underlie any scheme for the internal decoration of domes, to some of which I will now draw attention.

I. In the decorative treatment of the smooth concave surface of a Classic dome, unrelieved by panelling, raised mouldings, or coffers, its constructional form should never be disguised by its painted or coloured ornamentation, but only emphasised, as were the best Byzantine examples, and notably St. Mark's, at Venice, wherein the old mosaic work forms a flat treatment in colour, enhancing its beauty, but not disguising its spherical charms.

2. It follows that the so-called architectural features in the framework of any decorative composition should only be admitted in so far as it would not be inconsistent to execute the same in the solid materials they affect, provided always that they are conceived in due proportion and in entire harmony with the general design of the building. It does not follow from this last proposition that it would be desirable to introduce architectural forms in coloured decorations,—quite the contrary; but obviously they are inadmissible if they do not conform at least to such normal restrictions.

3. The preservation of the apparent and real spherical form of the dome under decoration, and the limitation of architectural details to the development and not the disguise of that form, precludes the introduction of more or less solid-looking vertical divisions of the dome, broad at the base and narrow at the apex, apparently supporting the eye thereof, as Gothic ribs sustain an octagonal lantern, or flying buttresses support a Scottish crown; the blue colouring of the interspaces giving the impression that the dome is not a solid opaque body covering a vast circular area, but is open to the air like a bird-cage or a conservatory, except where the ribs occur.

The great majority of the old painters preferred to treat the whole dome as if it were not there; that is, as if the clouds had descended beneath and filled the temple with a beatific vision of the heavenly host in glory, or strove to represent the coming of the Son of Man and all the holy angels with him. The artistic beauty of the imaginary apotheosis condoned for its structural inconsistency, and of all methods of dome decoration it was ever the most popular, especially in the more emotional eras of religious art, of which Parma is a typical specimen.

4. If any evidence were wanting as to the disastrous impolicy of introducing architectural forms that are not helpful to the spherical idea, it is found in the necessity of representing these forms in false perspective, accentuated by still false shadows on the under sides of cornices

\* The following communication has been addressed by the writer to the President of the Royal Institute of British Architects, with an intimation that it would also be sent to the *Builder* for publication.

and architraves, which, if constructed in real materials, would be the brightest portion, the light coming from below.

Impossible combinations of colonnades and pedimented compositions, with apparently projecting entablatures and ornaments of architectural details, round and square, recessed or perforated, are ostentatiously prominent in many of the designs I have seen, quite inconsistent with the fact that they are but painted decorations on a flat surface having no real relief at all.

Such misrepresentations of the conditions existing reduce the noble arts of architecture, painting, and sculpture to the level of ordinary theatrical scene-painting. But, says one, how comes it about that Thornhill's paintings, which are exemplifications of these defects, are, nevertheless, admitted by all parties to be remarkably successful? First, because the architectural framework of the pictures follows the lines of the general design of the interior, and the details are not absolutely incongruous, grotesque as they are and would be under any circumstances. And, secondly, because of their indistinctness. The monotonous in browns and greys used in these cartoons and their surroundings mingle with the murky atmosphere, and lend a dreamy dusky vision of an indistinguishable but well covered surface of the colour of which is not strong enough to upset the general effect of the hemispherical form of the mounting dome. Owing to this mysterious gloom, the dome of St. Paul's seems loftier than that of the brilliantly-illuminated and richly-decorated St. Peter's, of Rome. Had Sir Christopher Wren been unwise enough to have insisted on the bright colours being used which are now suggested, we should all have good reason to wonder how we ever admired what has really been the salvation of the dome as it is.

The last remark points to a conclusion to which I have arrived with reference to St. Paul's Cathedral in particular, and it is this, that in a building intended only to be faced with white stone, and into which no coloured marbles were to be introduced, it is undesirable to decorate the roofs in very bright colours. And if the various concave surfaces of the domical ceilings, which were originally finished in plaster, in preparation for a painted decoration, had been all covered with sepia pictures like the central dome, a very rich and harmonious effect would have been produced without the introduction of any positive colour at all. The quantity of dark wood-carving in the choir would nevertheless have warranted the employment of any amount of colour in the choir; but the nave and transepts would have been finished satisfactorily without it, and such a scheme would have had my preference.

6. As, however, it is an apparently settled thing that bright colours are to be introduced, of which the key-note has been given by the mosaic pictures which have been successfully applied to the pendentives of the dome, it is obviously desirable to complete this first series of pictures, and to support them by the introduction of coloured marbles into as many pier and wall panels as possible throughout the building. Then would there be no incongruity in lining the convex or concave roof surfaces in coloured mosaics, and even with gold grounds; or they might be painted; each shallow dome being the subject of a single picture, the breadth and scale of which should be in harmony with the massiveness of the surrounding structure. This dome, the base or drum of the great dome would come in for treatment in mosaics. A series of colossal figures in coloured mosaic in a gold ground, moving in processional order, as it were,—a glorious gallery of Biblical heroes and heroines. But I think we should have arrived at this point in the decoration of St. Paul's before we attempt to hot out for ever the now historical pictures of Thornhill. Let us proceed with the decoration of that which is not decorated before we expunge the only decoration we have. As Mr. Seddon suggested, let us try our 'prentice-hands on the minor and more manageable domes, and so make the culminating glory of the central dome the ripest, richest fruit of our labours and foregoing experiences.

7. The application of the foregoing principles to the decoration of the great dome itself, has led me to the conclusion that with brighter colouring, simpler treatment will be needed to obtain the breadth and harmonious effect required, and to avoid intricacy of details and spottedness in places. There should be no ver-

tical ribs, but there will be bands of many colours forming a framing for the pictures, if it be deemed essential that the dome should be split up into several separate pictures instead of being treated as one grand composition.

Omitting the ribs, Stevens's general framework and architectural accessories are far in advance of any other proposition for the reception of more than one picture. But a more careful study and classification of the existing mosaic work of early date, at Ravenna and elsewhere, would be interesting and suggestive. The introduction of mosaics in the pendentives comparatively near the eye, almost enforces their introduction in the dome, and if they are not too smoothly laid the light will play over the whole surface without creating that blinding glaze which all smooth surfaces yield, causing a picture to be only capable of being seen in one position.

Adopting mosaic as the inner lining of the dome, and employing light reflecting colours for subject-figures and flat foliage and fretwork of the enriched borders and framework upon a rich gold ground, a grand and noble character may be given to it, equal in beauty to anything anywhere, with the assistance of masters such as Leighton, Poynter, and Penrose.

EWING C. ROBINS, F.S.A.

#### THE DECORATION OF ST. PAUL'S.

SIR,—As you published in your last number a simple *précis* of my paper on the decorations of St. Paul's, but gave Mr. Stannus's written reply in full; as that reply is based on certain statements which he alleged were made in my lecture; and as that lecture will not be published *in extenso* for many months, and consequently those of your readers who were not present will have obtained but a one-sided view of the matters in question,—I ask you, in fairness, to allow me a little space in your columns for the purpose of correcting some errors and refuting some imputations contained in that reply.

When stating that the sub-committee had decided not to employ an architect to make designs for the decoration of the dome, I made use of the words,—“Having repudiated architects' designs.” Mr. Stannus, professing to quote my words, omitted the final word “designs” altogether, and went on to say that I was wrong in stating that the sub-committee had “repudiated architects,” as Mr. Penrose and himself were employed by them. He then made the following quotation from the report of the sub-committee, which fully corroborates my statement:—“Although the adoption of Mr. Stevens's design as a basis for their operations will enable the committee to dispense with the services of an architect for the purposes of furnishing designs,” &c. As Mr. Stannus was aware that the question was about designs, he was guilty of something more than garbling a quotation.

Had this been his only fault, I should not perhaps have taken the trouble to correct it, had he not afterwards brought a serious imputation against me personally, which nothing can justify. A mere perusal of the following extract from his paper will show the unjust nature of his insinuation:—

“Mr. Pullan had spoken of the sub-committee 'further strengthening their position' by forming 'an alliance' with Sir F. Leighton and Mr. Poynter. To any one who knew the chivalrous honour of Sir F. Leighton and of Mr. Poynter, and who knew the sub-committee, it was astounding that such an imputation should be made.”

I have to learn, sir, that the word “alliance” signifies a union or agreement in any way dishonouring to those who enter into it. Kings, states, and great men form alliances. I considered that the word alliance rendered more fully the sort of agreement by which the distinguished artists consented to make some pecuniary sacrifices for the object they had in view, in common with the committee,—that of advancing the solution of that great art-problem, the decoration of St. Paul's.

I believe these two gentlemen, and also most of the members of the sub-committee, know enough about me to believe that I should be one of the last persons in the world to use the word “alliance” in the sense to which my opponent endeavoured to twist it.

What makes matters worse, Mr. Stannus came to me privately, after the lecture, and said he withdrew what he had said about

alliance, yet he allowed his paper afterwards to be printed without expunging the paragraph which he retracted. This was, to say the least of it, disingenuous. There are other points in his paper which require rectification, but I only trouble you with these imputations, which I feel bound in honour to refute.

R. P. PULLAN.

#### PRIZE-DISTRIBUTION AT THE ROYAL ACADEMY.

SIR FREDERICK LEIGHTON presided on Saturday last at the distribution of prizes to the successful students at the Royal Academy of Arts. The Creswick prize, 30*l.*, was gained by R. O. Rickatson, Herbert Lyndon being *proximus accessit*. For cartoons of a draped figure, Bernard E. Ward took the silver medal and 25*l.*, Margaret Dicksee taking the extra silver medal. Horace B. Fisher took the first Armitage prize, 30*l.*, and bronze medal; Mary Drew a prize of 40*l.* for the fresco design, an allegorical illustration of music; William Carter won 50*l.*, first prize, for six drawings from life; Henry Alfred Pegram took the first prize of 30*l.*, for the model of the Good Samaritan; L. T. Fallon, 50*l.*, for three models from life; William G. B. Lewis, a travelling studentship of 60*l.*, for architectural design for a public library.

The President, before distributing the prizes, delivered a short address to the students. He was happy to say that, saving perhaps in one class, the general impression of the competition had this year on the minds of the Royal Academicians was a very gratifying one. The general average had certainly not fallen below that of other years, for they had felt justified, in three distinct competitions, in giving an additional award. The first of those competitions was that for the Creswick prize, in which there were several works of considerable excellence. Being a money prize of fixed amount, they could not, of course, increase or double it. They had, therefore, reserved an honourable mention, as *proximus accessit*, accompanied by a document which the student might take home as a token of his honour. The second award had taken the shape of an additional medal in the unusually large competition for the cartoon of a draped figure; while the third award was to the architects, in the shape of a third medal, in the class of drawings from an existing building,—a competition which this year had very marked excellence indeed. Amongst the other competitions, probably the most remarkable was that of drawing from the life, a competition which was very numerous, and which abundantly justified this year the third prize destined for it. For the competition of painting from life he regretted to say that the number of works was more limited than he liked, whilst he did not think they could be said to rise above the average in merit. At the same time, the increased scale of several of the studies deserved a word of special commendation. Sir F. Leighton added:—“I cannot too strongly impress upon you this year, as on former occasions, the great value and importance of carrying out your studies on a large scale. Whatever the scale at which it is your intention eventually to work, you will always be gainers by studying, in the first instance, on a large scale. In sculpture, also, we see in a very distinct manner the benefit of the new school; but I grieve to say that the pleasure with which I should otherwise have made this announcement is very considerably dashed and marred by the thought that the gifted youth to whom the second award has fallen has been snatched away from us on the very threshold of a bright career. David Wade has ceased to live, and a wreath of *immortelles* hanging in front of his successful work is a token of the respect and esteem of his fellow-students,—a feeling in which his elder brethren in art join heartily and sincerely. A prize has also been given in the class of designs for a fresco for a public building; but I regret to say that the much-coveted satisfaction of giving the higher award,—the highest honour,—of execution under the auspices and at the expense of the Academy, is not yet conceded to me. I may be permitted to say, however, that few things would give me more sincere personal satisfaction than to make that award from this place, and I hope you will not long withhold it from me. I have said just now that in one class the average is not fully reached,—that class is the competition for the Armitage Prize, in which the drawings have fallen below

the standard which we hoped and expected of you. I the more regret it on account of the great importance of the qualities to foster which chiefly that prize was called into existence, I mean the qualities of dignity and style in form and in competition. Now, these qualities are much lacking in the designs sent in; and, indeed, to speak for myself personally, it seems to me that the lack of these particular qualities is the predominant feature in all the designs and work sent in this year. The want of it is felt in the designs for the fresco for a public building; and careful, meritorious, and good in other ways as are the designs of the cartoons for the draped figure, in which categories these two prizes have been given, nevertheless they lack that style, that nobility of form, and that elevation of character which are specially and pre-eminently demanded. This is not the time, of course, to dwell at any length on this point, but I could not do less than allude to it, and I must urge you to pursue it yourselves. To aid you in that pursuit I will further and finally advise you to study constantly and with unwearied admiration the work of the greatest master of style which these shores have produced,—I mean John Flaxman.

The prizes and medals were then handed to the successful competitors.

No day could have been more unfortunate than last Monday for exhibiting the Academy students' designs to the public. Fog darkened the air so much that clear sight of the works was impossible during great part of the day. Owing to this we must express rather doubtfully an opinion which, under a better light, we might, perhaps, have felt justified in expressing more decisively, viz., that the award of the Creswick prize for landscape is questionable. The landscapes were hung in the first room, which, for some reason, is one of those which has least light in it, and the subject for the Creswick prize being an evening one, it was difficult to see into the pictures at all. But the painting by Mr. Rickatson, to which the first prize of 30l. was awarded, though a highly finished painting, and bearing a look of completeness and mastery of the tools more decidedly, perhaps, than others, struck us as hard and mannered, and somewhat artificial in its effect. The painting by Mr. Lyndon, to which the compliment of *proximè accessit* was given, seemed to us decidedly the best and most artistic in feeling; there was less of paintiness and less of manufactured effect in it. The landscapes on the whole were of a good average. The second room contained competition designs for oil-painting of heads, and for architectural drawing. The arrangement of the architecture was somewhat confused and divided; as far as one could gather from the not very explanatory wall-panels, there are three prizes or rewards for architecture, one for drawing, one for design, and one for drawings from existing buildings. The architectural drawings in Gallery II. were weak, on the whole; some of the heads very good and forcible. The prize was gained in this group by Mr. Carter, who also took the prizes for the painting of a figure from the life, for the drawing of a figure from the life, and for the set of six figures from the life. As far as execution goes, Mr. Carter is evidently a coming man. The sculpture was arranged in Gallery IV. It consisted of designs of a small group of two figures, of which a good many had been submitted, and of sets of three single figures from life, various subjects. Some of the sketches gave evidence of feeling and power of expression, though slightly executed. The larger figures showed some fine modelling, but we have seen better and more forcible things in one or two recent years than any we noticed in this year's sculpture design. The long gallery was occupied at one end with the full-sized crayon studies for a draped figure, the subject being Penelope bringing the bow of Ulysses to the suitors. Of these the prize drawing by Mr. Ward was so completely the best that the rest were by comparison nowhere, this being the only one which realised anything of the dignity of carriage and manner which should belong to Penelope. The other drawings were more or less meritorious as drawings, but utterly futile as conceptions of the subject. The sketches for the Armitage prize, which is given for the best monochrome study for a picture, were ranged down the wall of the same gallery, and formed a rather interesting, not to say amusing, collection. The subject was a certain abduction of brides men-

tioned in the history of the Israelitish nation in the Old Testament; and the various views of the designers as to the way in which the young women may have regarded the matter formed a curious medley of interpretations of the same idea. Some of the studies showed great force and spirit, and the first prize was rightly bestowed on the sketch by Mr. H. B. Fisher, a group showing energetic action and very clever foreshortening, though in this, as well as in some others, it may be said that force rather than delicacy was shown in the treatment of a subject in which it was very easy to fall into something like vulgarity. We should have preferred to see a subject which would have led to the illustration of a rather higher element in human nature and manners than a tussle for the possession of women (which is about what it amounts to), more especially as dignity and refinement of feeling seem exactly the qualities in which these student productions are most deficient. The original architectural designs were not very much; architecture, as far as we have observed, has never been very forward at the Academy; but the sketches from actual buildings made by the present travelling student, whose name we did not see appended anywhere, were very good. The travelling studentship this year is given to Mr. William G. B. Lewis, for a design for a public library, fairly good, but not showing any very marked character. Several coloured drawings for lunette designs for execution in fresco, as decorative painting, showed very good intentions and a good idea as to the right sort of thing for this class of work; that by Miss Drew, which was undoubtedly the best, had the prize. The President holds out hope of the higher honour of the execution of a student's design of this class, at the expense of the Academy, whenever one shall be produced of a sufficiently high class to justify this. The array of life studies, occupying two rooms, showed a remarkable amount of good work, on which the Academy may well look with satisfaction as an evidence of the spirit and diligence with which a large proportion at least of the students are working at this foundation of picture-making.

#### FROM HOLBORN TOWN-HALL TO THE ANGEL.\*

A STRANGE interest hangs around the line proposed to be taken by this new route, because for centuries previously to the erection of the houses now proposed to be demolished, the ground on which they now stand was one of the favourite places of recreation for the London citizens. Fitzstephen, writing nine seven centuries ago, tells us that on the north side of London there were fields for pastures and a delightful plain of meadow-land, interspersed with flowing streams, on which stood mills whose clack was very pleasing to the ear, and, moreover, that the spot abounded with springs and wells, frequently visited, as well by the scholars from the schools, as by the youth of the City, when they went out to take air in the summer evenings. In those days the clustering vintage hung in purple glory on the slopes of what is now called Mount Pleasant. Ay! and on the brow of the opposite hill had not my Lord Bishop of Ely his strawberry-garden? And did not a successor of his add a vineyard and an orchard, extending from Holborn to Hatton-wall and from Saffron-hill to Leather-lane?

In our imaginary journey, leaving the Town-hall, we pass through a network of dismantled houses and slums into Red Lion-yard, appertaining to the Red Lion in Warner-street. Would he travellers to the North, consulting the *Daily Post* of May 18, 1737, read, "For York, Newcastle, or Edinburgh, a good coach and six able horses will set out from the Red Lion, Cold Bath-fields, near Gray's Inn-lane, on Friday next, the 20th inst." Doubtless, among the frequenters of this tavern was Henry Carey, best known to the general world as the author of the words and music of "Sally in our Alley," and the writer of the burlesque, "Chrononhotonthologos." Though unhappy at heart, he was a jovial companion. In a fit of despondency he committed suicide at his house in Warner-street on the 4th of October, 1743. Only a single halfpenny was found in his pockets after death. Warner-street was named after Robert Warner, of Lincoln's Inn, esq., the partner of

Walter Baynes, of the Middle Temple, gent., who let to Oliver Humphreys, clothier, "All that messuage or tenement commonly called and known by the name or sign of Sir John Oldcastle, together with the gardens and grounds thereunto belonging." The site of the tavern is covered by the south-eastern corner of Cold Bath-fields Prison. Humphreys turned the gardens into a place of public entertainment. Many advertisements are extant in reference to them. *Daily Advertiser*, August 14th, 1744:—"Sir John Oldcastle's, near Cold Bath-fields. The gardens are greatly enlarged, the liquors of all kinds the best. The music begins at five; the lamps are lighted at seven; and the whole concludes at nine." On the 17th of July, 1746, it is announced that "A Concert of Vocal and Instrumental Music will take place. The vocal parts, with the following songs by Mr. Blogg, viz., 'Come, Rosalind,' 'Observe the Fragrant Blushing Rose,' 'The Happy Pair,' and, by desire, a song set in praise of his Royal Highness the Duke of Cumberland, set to music by Mr. Handel." Could this last-mentioned song be, "See the Conquering Hero comes," written to celebrate the victory gained by the Duke at Culloden, won exactly three months previously? Time is the winner who divides the chaff of notoriety from the wheat of true fame; "Mr. Blogg" is forgotten; "Mr. Handel" never to be. Perhaps George Frederick Handel might on this special evening have visited the gardens, for he was a member of a certain club, "The Small-coal Man's Music Club," in which he played the harpsichord to the brilliant assembly of dukes and duchesses and lesser nobilities, who thronged to the transmuted stable in which the concerts were held; the conductor, as every reader knows, being Thomas Britton, the concert-room being at the south-east corner of Jerusalem-passage.

The already-mentioned Walter Baynes in 1697 discovered a spring on the portion of the Jervoise estate which he had just purchased, and he laid out 3,000l. in erecting baths to utilise it. In 1697 he advertised,—"At the lower end of Gray's Inn-lane, in Sir John Oldcastle's field (Cold Bath-square), near the City of London, is discovered a spring of the nature of those famous cold baths St. Winifred in Wales and St. Magnus in Yorkshire, being approved of by several physicians conversant in the virtue and uses of cold bathing. There is a convenient bathing-place erected and a house built over it for privacy." The advertisement concludes, "Mondays, Wednesdays, Fridays, and Saturdays are appointed for men, and Tuesdays and Thursdays for women." The charge for bathing was 2s., and 2s. 6d. in the case of patients who from weakness had to be lowered into the bath by "the chair." Hatton, in his "New View of London," 1708, writes,—"The most noted and first cold bath about London was that near Sir John Oldcastle's," which they say is good against rheumatism, convulsions in the nerves, &c., but of that those who have made the experiments are the best judges." Hatton hazards no opinion of his own in this case, nor does he when he speaks of an opposition bath opened in Southwark in 1705,—"Here are eleven crutches, which, they say, were those of persons cured by this water."

Baynes died in 1745, leaving his name in Baynes-row or Baynes-street. The row, which was commenced about 1737, lies between the Prison and Cold Bath-square. It leads into Cobham-row, so named in honour of "the good Lord Cobham,"—Sir John Oldcastle. The Cobham's Head,\* facing the site of the Sir John Oldcastle, was a famous place in its day. The public are informed by the *Daily Courant* of April 20, 1728, that "My Lord Cobham's Head, against Sir John Old Castle's, is lately opened, and the house and gardens are made very handsome and complete, with a fine canal stocked with very good carp and tench, fit to kill. And any gentlemen are allowed to angle for their diversion. There are very good lodgings to be let, where gentlemen may board if desired." Is it possible to fancy some worthy citizen of credit and renown taking up his fishing quarters for a season at "My Lord Cobham's Head," to save himself the trouble,—it could not be the fatigue,—of walking from Wood-street or the Poultry? A writer in the *Daily Advertiser* 140 years ago mentions that "he called at the Lord Cobham's to drink some of his beer, a tankard of which is 3d.," and that he "afterwards

\* At this date there was another "Cobham Head" in John-street-road, now known as the "Adam and Eve." It had large gardens attached to it. (Roque's Plan.)

\* See p. 651, ante.

walked in the garden, when he was greatly surprised to find a very handsome grove of trees with gravel walks, &c. These trees and walks, and also the canal, are delineated in Bonquet's plan. The fire station at the top of the row covers a portion of the old tavern and grounds.

At this point the line crosses what was formerly called Coppico-row, but why so is doubtful, and entering the north-west corner of Exmouth-street cuts through John-street, Tysoe-street, and Rosoman-street, towards the drinking-fountain in the wall of the New River Works, at the head of Garnault-place.

It was not till 1818 that the houses which formed Exmouth-street received their name from Nelson's "Fighting Pellew." The southern side of the street was erected by Thomas Brayne, of whom little is known beyond that he was lessee of the ground. "Braynes-row, 1765," is cut on a stone tablet on the front wall of one of the houses. Brayne's property formed a portion of Spa-fields, named after the London Spa, a place of entertainment somewhat resembling the Cobham Head and the Sir John Oldcastle. A glimpse of its character may be got in a rhyme in "Poor Robin's Almanack" for 1733:—

"Now sweethearts with their sweethearts go  
To Islington or London Spaw.  
Some go but just to drink the water;  
Some for the ale, which they like better."

A public-house that marks the site of the Spa still retains the name.

Thomas Cromwell, the historian of Clerkenwell, writes, in 1828, "The water [of the Spa], which is a chalybeate, is now lost; though it was obtainable about eighteen years ago by means of a pump remaining in the cellar of the house, in question." Of the potency of the ale, we read that, "On Sunday, a Custom-house officer, being intoxicated with Spa ale, in a phrenical fit drew his dagger, and fancying all people that passed to be his enemies, cut and slashed several persons in a most frightful manner; for which, being apprehended, he was carried before a justice of the peace and committed to the New Prison. This prison faced the Bridewell Prison,—now the House of Detention. From the back of the Bridewell a path led northwards into the fields known as Bridewell-walk. On the west side of this walk, in 1756, Mr. Rosoman, the builder and proprietor of Sadler's Wells theatre, built 'a range of good houses,' to which he gave the name Rosoman-row, now Rosoman-street.

Of Garnault-place there is nothing to say beyond that it was so named after its builder, a worthy treasurer of the New River Company, and that for some time it was the abiding-place of "everybody's Joe;"—Joseph Grimaldi; and that, as J. T. Smith informs us, in his "Vagabondia," "Priscilla, a blind inhabitant of St. James's, Clerkenwell, was wont to be seen in the summer time seated against the wall of the reservoir of the New River Waterworks, Spa-fields, employed in the making of patchwork quilts. She threads her own needle, cuts her own patches, and fits them entirely herself."

It is not here requisite to tell the story of Sir Hugh Myddelton, or that of New Tunbridge Wells, better known as Sadler's Wells. Passing between the waterworks and the theatre, the new line, after a course of little interest, reaches the world-known Angol.

#### THE COMMISSION QUESTION.

The Chiswick Improvement Commissioners have settled the vexed question of commission on the superintendence of making up, under the 150th section of the Public Health Act, of private streets, which has recently engaged the attention of various local authorities in the country, but especially in the suburbs of London, where and is being rapidly built upon and where many new streets are being formed. About four years ago the Chiswick Commissioners passed a resolution allowing their clerk and surveyor, between them, 5 per cent. on all private street improvements which were made up by the Commissioners at the expense of the adjoining owners. The clerk received 2½ per cent. for the issue of the usual legal notices to the owners, and the surveyor 2½ per cent. for the preparation of the plans and the superintendence of the work. These commissions were, of course, exclusive of the regular salaries of these officials, and in quickly-developing parishes, where a great many new streets are in course of formation, this increment, to the

official salaries amounts to a considerable sum where the commission system is in practice. The Chiswick Commissioners in fixing the 5 per cent. were guided evidently by the consideration of what would be fair and reasonable remuneration for the work to be done, keeping in view the fact that if they were to employ professional men outside their own staff the Commissioners would require to pay more than 5 per cent. But the effect of a recent decision, or rather communication, from the Local Government Board, has been to upset this arrangement in many districts. The decision of the Local Government Board is that a Local Board is entitled to charge the adjoining owners 2½ per cent. as a reasonable and fair remuneration for the superintendence of the work, whether it be done by the Board's own surveyor or not; that it is not entitled to charge the owners anything for the issue of the legal notice and for the preparation of the plans, which, it is held, the local authorities require, under the Act, to do as part of their duties, whether the streets are made up by the owners or the local authority. These notices call upon the adjoining owners to make up the streets according to a certain plan which has been, of course, prepared antecedent to this call upon the owners. The opinions of an official may not be the opinions of the authority which he represents, but it is interesting to note that an experienced inspector of the Local Government Board, Mr. Harrison, C.E., at an inquiry at Chiswick, recently, into the application by the Commissioners for a loan of 15,000, on street improvements, stated that the Local Government Board had practically nothing to do with the manner in which a Local Authority disposes of this 2½ per cent. A Local Authority may give this commission to their officials as an allowance outside their salaries, or they may give a salary which is supposed to include this commission. In short, so long as the Commissioners charge the adjoining owners no more than 2½ per cent. for the superintendence of the work, the Local Government Board has nothing to do with the arrangement which a Local Authority may make as to the remuneration of its officials. Mr. Harrison, C.E., held further that this 2½ per cent. should not be included in the contract in such a way as not to be distinguishable from the actual cost of the work; but should appear as a distinct and separate item in the note apportionment of the expenses to the various owners.

The Chiswick Improvement Commissioners have passed a resolution to the effect that all commissions on private street improvements shall go into the coffers of the Board; and they have reconsidered the salaries of the whole of the officials in their employ. They have decided, moreover, that the surveyor shall devote the whole of his time to the duties of the parish, and not undertake private practice as hitherto, and that his salary shall be 300*l.*, inclusive of any commission from private street improvements. The surveyor, Mr. H. O. Smith, C.E., who has designed and superintended the carrying out the parish drainage system and sewage works, which are on the precipitation principle, has now resigned, feeling that he could not accept the terms of the Commissioners, and Mr. Strachan, the assistant surveyor, has been appointed to the office at a salary of 300*l.*, on the conditions above indicated. The rates in Chiswick have been admittedly high for some time back,—nearly 6*s.* annually for the district rate,—and an idea having become prevalent in the parish that the Commissioners were extravagant in their expenditure, and that this was the cause of the numerous empty houses, both old and new, in the parish, a strong and influential Ratepayers' Defence Association has been formed in the district. At the last local election they turned out, with one exception, the whole of the retiring Commissioners, and placed five of their own candidates on the Board. The candidates of this Association are pledged to exercise the strictest economy, and to effect, if possible, a reduction of the rates. By the influence of this Association, the salaries of many of the officials have been reduced. The contention of this body is that, under the Public Health Act and the Chiswick Improvement Act, from both of which the Commissioners derive their powers, the officials had no right to accept an interest, in any shape or form, in a contract under the Board with which they are connected. There was a feeling among some of the members of this Association to institute proceedings against the officials, in order, if possible, to recover this

money paid to them in the form of commission; but some of the "leading spirits" threw cold water on the idea, as departing from the objects of the Association.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of this Association was held on the 6th inst., the president, Mr. McGibbon, in the chair. The President stated that the Exhibition Committee were getting on very well with their arrangements, and there was every prospect of a successful exhibition. Promises of architectural drawings had been obtained from the principal architects in Edinburgh and London, and a large number were expected from Glasgow and elsewhere. It had not yet been quite arranged who was to open the Exhibition. The *conferenza* was to be held on the 22nd inst., and it was hoped that the President of the Royal Scottish Academy would perform the opening ceremony.

Mr. Leonard A. Wheatley then read a paper on "Building and Architecture in Bablyonia and Assyria." In the course of his remarks, he gave an account of the Assyrian people and the sources of our information as to their history and architecture. The large mounds on which the palaces were built were stated to be formed of bricks, and the inscriptions told of forced labour employed on them. The summit of these mounds was reached by the flight of steps, traces of which were found at Persepolis. The plan of this palace showed the size and number of the rooms and courts. The method of transporting stones was described, and it was explained that the cities of Nineveh and Bablyon were of such size, that gardens and parks were included within their walls, and that the temples were of great height, two mentioned by Ferguson being of seven stories. The houses were placed wide apart. The Assyrians, although conversant with the use of the arch, introduced it only for portals and smaller openings. The ceilings of their large halls were supported by wooden columns, the stone ones of Persepolis having had a wooden prototype.

#### EXPORTATION OF THE DUBLIN EXHIBITION PALACE TO ENGLAND.

THE Palace at Earlsfort-terrace, Dublin, is in course of exportation to England. The huge structure of glass and iron, now being taken down, will be re-adjusted, renovated, and given a definite purpose in the British capital. It was private property. Its sale was negotiated in the present year, and its removal has since been going on comparatively unnoticed. It was born of a noble international enterprise, the second great Exhibition in 1865. It lived a life of usefulness, sometimes achieving great results. It fell into disuse some time ago, but will rise again in England, it is hoped, to a career of greater usefulness. The site upon which the Exhibition Palace was reared had formed in the beginning of the present century a beautiful recreation-ground known as the "Cohurg Gardens." They were opened in May, 1817, but failed and went to decay. Nearly half a century passed ere the ground (the property of the Earl of Clonmel) was turned to use. Then came the time when the Royal Dublin Society, immediately after the Fine Art Exhibition of 1861, agreed that there should be a second great International Exhibition in Dublin in 1865, and that a magnificent palace should be erected in which to hold it. Mr. A. J. Jones, architect, designed the edifice, the public bought shares to provide the capital; on May 3, 1865, the building was opened, and the Dublin International Exhibition arranged therein was inaugurated by the Prince of Wales, in the presence of 10,000 visitors. The Exhibition closed on Nov. 9th, having been open 159 days and fifty-one evenings, and the admission during that period numbered about 900,000. When the Exhibition terminated, there was an unsuccessful effort made to manage it after the manner of the London Crystal Palace, Sydenham. Government was then asked to purchase and endow it as a Science and Art Institute, but that application failed also. Sir Arthur Guinness, bart., M.P. (now Lord Ardilaun), and his brother, Mr. Cecil Guinness, constituting themselves trustees for the public, then purchased the building for about 60,000*l.*, renovated it at their own expense, and procured a manager

for it in the hope of making it a place of recreation and profitable enjoyment for the people. Out of this grew the National Exhibition of 1872, held during the former viceroyalty of Earl Spencer. The Exhibition was a monetary success. In 1873 there was a miniature display of a somewhat similar sort. Since that time the palace has served as a place for public amusements. The brilliant fancy-dress ball of the Foot Guards, about 1868, the Moore Centenary celebration, and other events, are connected with it, but complaints were frequent that it did not pay. The building was last heard of, conspicuously, in connexion with the refusal of Mr. Cecil Guinness, D.L., to lend, let, or sell it for the holding of the "National Exhibition." Soon after his refusal, that portion of the edifice known as the glass building, which formed a part of the right-hand frontage, and extended as a long transept at the rear was sold by Mr. Guinness to a company of London noblemen and gentlemen, favoured with the support of H.R.H. Prince Teck. These parts would constitute in themselves a respectable Crystal Palace. They will be re-erected near Battersea Park. The intention of the company is understood to be to make this Crystal Palace an educational museum, which may be, in some degree, to the south-west of London what the Exhibition Buildings of Arts and Sciences at South Kensington are to the west end. The solid portion of the structure will remain, being an acquisition on the part of the Government for the purposes of the Royal University. At present, however, over this portion of the building there hovers the spirit of desolation, since the hammers of the workmen are clanking at the disjuncting of the iron work sections. The roof of the transept is still intact, with the columns supporting it, but the galleries and balconies, and all except the iron columns at the sides, have been taken down, and the work is proceeding. The surrounding ground is covered with huge iron girders, arches, and pillars, awaiting transport across Channel.

#### THE FUTURE OF THE ALEXANDRA PALACE ESTATE.

It is stated that there is at present a probability of the Alexandra Palace, which has cost so much money in its erection, being taken down to clear the site for building upon. Under their present Act of Parliament the Financial Association, as owners of the Alexandra Park and Palace estate, are under an obligation to keep up the Palace and grounds as a place of public entertainment. Amongst the private Bills to be submitted to Parliament next session, one is promoted by the Financial Association, in which they give notice of their intention of applying for the repeal of so much of the existing Act as prevents them from laying out the Palace and grounds for building purposes.

#### BUILDING PATENT RECORD.\*

##### APPLICATIONS FOR LETTERS PATENT.

- 5,756. W. Foot, Wellington. Bricks, blocks, and slabs for building, &c. Dec. 2, 1882.  
 5,760. J. H. Johnson, London. Bricks and blocks for building purposes. (Com. by J. Darrigan, Vazotte, France.) Dec. 2, 1882.  
 5,772. R. W. Hitchens, London. Construction of fire and sound proof ceilings and floors. Dec. 4, 1882.  
 5,778. J. D. Sprague, London. Window-sash fastenings. Dec. 5, 1882.  
 5,781. G. Crofts and G. F. Assinder, Birmingham. Joints for suspending swing fanlights, &c. Dec. 5, 1882.  
 5,795. J. Whitehouse and S. Pencock, Birmingham. Sash fastenings. Dec. 5, 1882.  
 5,848. J. W. Butler, Blackheath. Indurating artificial stone, &c. Dec. 7, 1882.

NOTICES TO PROCEED  
 have been given by the following applicants on the dates named:—

December 8, 1882.

- 3,701. C. E. Hanewald, London. Apparatus for preventing down-draught in chimneys, &c. (Com. by F. Hasselmann, Munich.) Aug. 3, 1882.  
 3,749. A. M. Clark, London. Fabric for wall-hangings. (Com. by A. Hutchinson, Paris.) Aug. 5, 1882.

\* Compiled by Harr & Co., Patent Agents, 186, Fleet-street.

3,817. H. J. Haddan, London. Apparatus for securing doors and windows against burglars. (Com. by W. Kilian, Berlin.) Aug. 10, 1882.

#### ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending December 9, 1882.

1,959. J. Noad, East Ham. Manufacture of ornamental surfaces for decorative purposes. April 25, 1882. Price 2d.

Silica or fine sand, clay, China clay, ground glass, sulphur, and boracic acid, are mixed together, then calcined, ground, and sifted. The mixture is then melted, and run into a mould. (Pro. Pro.)

2,015. G. Hurdle & W. Davies, Southampton. Opening and closing of window-sashes, &c. April 28, 1882. Price 2d.

A cog-wheel gears into a rack on the sash, and round the spindle of the wheel is a coiled spring. A stop will retain the window-sash in the required position, on releasing which the spring lifts the sash. (Pro. Pro.)

2,066. S. W. Wilkins, Edinburgh. Fireproof doors, shutters, &c. May 2, 1882. Price 2d.

These doors, &c., are made of double plates of metal, and a water-tank is arranged above, which can fill the space between the two plates. (Pro. Pro.)

2,080. W. Porter, Lee. Apparatus for testing the strength of materials, especially cement. May 2, 1882. Price 1s. 2d.

The block of cement is held by two slips, one clip being secured to a spring on a bar. As the bar is removed, the strength is tested. To secure an even strain, a piston is connected to the spring, which works in a cylinder filled with liquid. This prevents too sudden a strain being brought on.

2,084. D. Walker and W. S. Simpson, London. Window-sash fasteners. May 3, 1882. Price 2d.

The fastener is automatically locked by a lever pressed against its face by a spring. (Pro. Pro.)

2,097. R. Guelton, Brighton. Artificial marbles. May 4, 1882. Price 6d.

These are composed of superfine and coarse cements, made of alabaster combined with alum, and are coloured as required with vegetable and mineral colours. The desired shapes are then produced in moulds.

2,116. A. W. Kershaw, Lancaster. Ventilators. May 5, 1882. Price 6d.

Three sets of deflectors, circular in plan, are arranged with openings between each. The deflectors are so placed that the openings are opposite the deflectors of the next inner or outer set.

#### CHARGES FOR BUILDERS' LICENCES.

COMPLAINTS have been recently made to the Vestry of Clerkenwell of the high charges made to builders and others for licences and other fees.

Messrs. Perry & Co., of Tredgar Works, Bow, in their letter as to the charges in respect to the House of Retreat, Lloyd-square, state:—"We do not think we should be called upon to pay a licence fee in addition to a rent for the hoarding, and have never been called upon to do so in any parish in London. We also strongly object to pay for making up your roadway, which we did not interfere with, except as a right of way to our works, which we expect to enjoy in common with the rest of the public. In estimating for this work, we put your fees at about half the amount you charge, judging from what we have paid in other places." In conclusion, the Vestry were asked to reduce the amount of the account at least to the extent of the above items.

Mr. R. G. Battley, of 21, Old Kent-road, in a letter to the Vestry, states:—"The Hoarding—It is my impression that there must be a great mistake in it, as I was under the impression that our deposit considerably overpaid the amount due. I have never had similar charges from any vestry during the fifteen years I have been in business. I have inquired of other local authorities, and also studied the Local Management Acts, and can find no authority for charging per month for licences, nor for the superficial contents of hoardings. According to the best advice I can get, I ought to have covered everything; we paid 10*l.* I do not think a separate licence should have been required for each making shore, they were close against, and even formed part of the hoarding which is charged for."

The matter having been referred to the Works Committee, a report has been received from the committee, stating that they also had before them the resolution of the Vestry, directing that 2*s.* per 100 square feet be charged per month upon all hoardings, and that they do not deem it expedient to make any alteration in the charges, but suggest that more information as to the nature and extent of the charges should be printed upon the licences.

#### TIMBER.

Sir,—Will one of your readers inform me as to the best mode of crosscutting timber? I particularly wish to know whether the pure cold crosser, or the saws, which require heating, is the best; also, if it is necessary to have the wood seasoned before treatment, and if timber so treated is very much more durable for gates, hurdles, fences, &c. Are there any objections against its use, as it is not in more general demand?  
 Awaiting an acknowledgment in your next issue.  
 M. E. LARKE.

Competition.—Mr. John Bevan, of St. Nicholas-street, Bristol, has been successful in an open competition for the completion of St. Paul's Church, New Swindon, and erection of vicarage. Mr. Bevan has also recently been appointed architect for the new church in St. Andrew's Park, Bristol.

#### CASES UNDER METROPOLITAN BUILDING ACT.

##### FOUNDATIONS AND DAMP-COURSES.

At the Lambeth Police Court, on the 8th inst., Mr. H. Simpson, builder, was summoned at the instance of Mr. Parsons, District Surveyor, for doing certain work at the Station Hotel, Camberwell New-road, contrary to the Building Act, 1855.

It was alleged that defendant had erected a certain addition to the building without putting in the required concrete foundation and damp-course, as mentioned in the by-laws of the Metropolitan Board of Works, 1879. One of the offences alleged to have been committed by the defendant was that he had not separated the said addition from the main building by means of an external or party wall. The question was considered to be one of importance with regard to buildings, and Mr. Parsons pointed out that he was but doing his duty in bringing the case before the court. The sections of the Act with regard to which the defendant had been summoned no doubt were meant for the protection of the public. The great object of one clause was to prevent the spread of fire. Some argument followed with regard to the various points of law, when

Mr. Ellison, the magistrate, said he could come to no other conclusion than that the defendant had infringed the terms of the section of the Act. It was most important that builders and others in the trade should look to these matters. He did not impute anything wrong to the defendant, but still he must pay 12*s.* costs.

##### "MORTAR."

At the Greenwich Police Court, last week, Messrs. Buckingham & Martin, builders, Sydenham, were summoned by Mr. Tolley, District Surveyor, for using upon their buildings in Longton-grove, Sydenham, mortar not composed of fresh lime and clean sharp sand or grit, without earthy matter, in the proportions of one of lime and three of sand or grit.

Mr. Tolley produced a sample of the mortar used at the house being erected by the defendants, and called Charles Jennings, who had been in their employ. He deposed that the mortar was composed of garden mould, road dirt, surface soil, and soaked lime.

The defendants said they used fresh lime and grit from flint roads.

Mr. Balguy, the magistrate, said the mortar produced was decidedly unfit for use.

Mr. Tolley said the building, which had reached the second floor, was in a dangerous state, and the magistrate made an order for it to be pulled down forthwith.

#### NEW STREETS AT THE EAST END OF THE CITY.

Sir,—Will you allow us to call the attention of the authorities to the above subject through your valuable journal?

The District Railway Company are about to form a wide street from King William-street to Trinity-square. If this street were continued over the Metropolitan Railway just made, from Trinity-square to the Minories, it would greatly relieve Aldgate and Fenchurch-street of the enormous traffic going westward and down Gracechurch-street to Cannon-street and London Bridge, as drivers of vehicles would go along the broad street to avoid the constant block in Fenchurch-street and Aldgate.

Another improvement greatly needed in connexion with the above is the completion of the widening of Swan-street, from the Minories to Mansell-street as this would open another way for the traffic to and from the east.

We trust the authorities will take up these questions and not allow the present opportunity to pass without an effort to carry them out.

Two Citizens.

The Society of Engineers.—The twenty-eighth annual general meeting of the members of the Society of Engineers was held on Monday evening last, the 11th inst., in the Society's Hall, Victoria-street, Westminster. The chair was occupied by Mr. Jabez Church, president. The following gentlemen were balloted for and duly elected as the Council and officers for the ensuing year, viz.:—As president, Mr. Jabez Church; as vice-presidents, Mr. F. E. Dnokham, Mr. Arthur Rigg, and Mr. C. Gandon; as ordinary members of Council, Mr. R. Berridge, Mr. Perry F. Nursey, Mr. A. F. Phillips, Mr. W. Schönheyder, Mr. Arthur T. Walmisley, Mr. T. H. Hovenden, Mr. Henry Robinson, and Mr. John Waddington, the three last-named gentlemen being new members of council; as honorary secretary and treasurer, Mr. A. Williams; and as auditor, Mr. A. Lass.

BRITISH  
ARCHÆOLOGICAL ASSOCIATION.

The second meeting of the session was held on the 6th inst., Mr. Thos. Morgan, F.S.A., in the chair.

Mr. L. Hand reported the discovery at Seagry, Wilts, of some ancient British interments on a spot which had long been pointed out by tradition only as an old cemetery. The spot is also referred to in a charter of old Saxon times as the place of heathen burial, a remarkable illustration of the continuance of local knowledge.

Dr. Stevens announced the discovery of traces of Roman burials at Winchester, at a spot near the north gate, which would appear to indicate the position of the ancient cemetery of the Roman city.

Mr. Loftus Brock, F.S.A., exhibited a Roman vase from Colchester, identical in form to the one found at Winchester referred to by Dr. Stevens.

Mr. C. H. Compton exhibited some stained glass from Amiens Cathedral thrown out of the building during a recent work of "restoration."

Also some Roman concreted pavement from the temple which stood on the site of the present Cathedral of Boulogne. This is identical to what was found last year on the site of Leadenhall-market. Mr. H. F. J. Swayne sent photographs of the fifteenth century frescoes over the chancel arch of St. Thomas's Church, Salisbury.

Mr. Gibson Rendle exhibited some curious engravings by Heemskirk, illustrative of ancient costume; and Mr. Earle Wych described a corbel of early date recently found in London.

Mr. W. de Gray Birch, F.S.A., called attention to the Tabula Honesta Missiones recently found in Belgium, which gave the name of a governor of Roman Britain, Titus Ævidius Nepos, not previously known.

Major di Cesnola, F.S.A., read a paper on Phœnician Art in Cyprus, which was illustrated by a very fine exhibition of gold and silver ornaments found in the excavations made in the Island by the lecturer. The connexion of the Phœnicians with the country was referred to at length, and the relics of their occupation passed in review after the history of this remarkable trading race had been dwelt upon. Many of the gold objects consisted of frontlets of thin metal with embossed patterns, very similar to those found by Dr. Schliemann at Hissarlik. The personal ornaments were of remarkable beauty and elegance of workmanship.

After the chairman had passed in review the results of the recent Congress at Plymouth, the proceedings were brought to a close by a paper by Mr. C. W. Dymond, F.S.A., on Two of the remarkable Earthworks in Somerset, Dorset, and Cadbury,—the reputed Camelot of King Arthur's time.

SUGGESTED IMPROVEMENTS IN THE  
STRAND.

The Strand Improvement Association, a committee formed some months ago for promoting improvements in the Strand, appear to be fully alive to the opportunities presented by the completion of the Royal Courts of Justice. They have sent us a plan prepared by Mr. W. Milford Teulon, architect and surveyor, Upper Woburn-place, showing proposed improvements in the vicinity, one of the objects sought being the formation of a wide street approach from Holborn to the Strand, abolishing Little Tunnistie, and then proceeding *via* Gate-street, the west side of Lincoln's Inn-fields, and a short new street through Clare Market,—continued through to Carey-street (south of King's College Hospital), on the one hand, and on the other hand, *via* Houghton-street and Newcastle-street (both widened) to the Strand. This plan is a good one, so far as it goes, and if carried out it will be a great deal better than nothing; but it appears to us to possess defects which are not apparent in the Hayward plan.

Mr. Teulon's plan provides for widening the Strand without demolishing St. Mary's Church. By setting back a few houses on the north side of the Strand, westward of Newcastle-street, a wide road could be made on the north side of the church, thus giving a 40-ft. road on each side of the church. At present the traffic on the roadway between the two churches is very much blocked, and by the opening of the New Courts this traffic is likely to be greatly increased. By this plan it is proposed that the two 20-ft. streets, *viz.*, Holywell-street and Wych-street, be abolished, Wych-street being widened to 60ft.,

and the site of Holywell-street partly thrown into the Strand so as to widen it to 85 ft., leaving a large triangular piece of land for building sites in diminution of the cost of the improvement. The plan also proposes to remove the graveyard round St. Clement Danes Church: this will give a largely-increased area in front of the Law Courts. These proposals have much to recommend them.

We have received plans from several other persons, showing the interest with which the matter is regarded, but we see no reason to publish them. Before our present number is published, moreover, the Metropolitan Board of Works will probably have arrived at an opinion on the same.

HOUSE DECORATORS' CLUB AND  
INSTITUTE COMPANY.

A GENERAL meeting of the shareholders was held at their new premises, 19, Howland-street, W., on Tuesday night.

The report of the directors, showing that they had since the last meeting in July acquired the lease of these premises, and so far furnished and prepared them, that they were ready to hand it over to any committee of management that might be formed, was adopted. The thanks of the meeting being voted to Mr. J. G. Crace (Messrs. Crace & Son) and Mr. J. H. Donaldson (Messrs. Gillow), without whose aid their success so far would have been impossible.

The premises are spacious, and well adapted for the purposes of a club, there being, in addition to the rooms already fit for occupation, a large room at the back, about 50 ft. by 40 ft., fit for public meetings, and a room, of the same area, which it is proposed to use as a billiard-room.

Already one of the oldest of the trade benefit societies, the Phoenix, hitherto meeting only in taverns, has made arrangements to rent rooms of the club; and at least two more societies are expected to follow shortly.

After the meeting a club committee was formed, and about eighty names of intending members given in.

THE BUILDERS OF  
THE CITY OF LONDON SCHOOL.

SIR,—At the ceremony of opening the new City of London Schools by the Prince of Wales, I have no doubt that it was quite proper that some of the City magistrates should be introduced to the notice of his Royal Highness, and I am sure that it was equally proper that the architects, Messrs. Davis & Emanuel, should also be introduced; but why were not the contractors introduced? Surely the anxieties and responsibilities surrounding the erection of such an important building deserved some recognition in its noble hall to-day! I should say almost as much as the accidental possession of office by some of the City magistrates. If it is said that time is of importance to Royalty on such an occasion, I have not the least hesitation in replying that nine-tenths of the Lord Mayor's speech could have been omitted with ease to himself, decided pleasure to his audience, and comfort to the Prince and Princess of Wales. That afternoon was not the time for elementary mathematical calculations.

It is to be regretted that the outside world should know so little of what is involved in the successful completion of a large building. WM. WOODWARD.

THE DECORATION OF ST. PAUL'S.\*

SIR,—In Mr. Pullan's paper on this subject, read at the last meeting of the Royal Institute of British Architects, his remark that the sub-committee had "formed an alliance" with the two artists appeared at the time to convey an imputation. Probably those who know him best would not need his subsequent disclaimer; but, acting on a misconception, I commented on his words. As he afterwards explained that the expression was used without offensive intent or idea of imputation, it is due to him that I should now withdraw my hastily-formed interpretation and the resultant words. HUGH STANNUS.

CHURCH-BUILDING NEWS.

*Beymondsey*.—St. Augustine's Church, of which the chancel and a portion of the nave were consecrated in 1879 by the Bishop of Rochester, is now in a fair way towards completion. Mr. Richard Foster having, on the 18th ult., laid the memorial-stone of the remainder of the nave. The style of architecture which has been adopted by the architects, Messrs. Henry Jarvis & Son, is Early English Gothic of a simple character. The exterior is free from all unnecessary ornament, and depends for its effect chiefly on size and proportion. The whole of the walls, both inside and outside, are of red bricks with stone dressings. The building when complete will consist of chancel, nave, and aisles, and the total internal length will be 128 ft. The chancel, which is 28 ft. wide and 40 ft. long, is vaulted in red brick,

\* The following reached us after the preceding part of the journal was made up.

and divided by low stone arches from aisle<sup>8</sup> which run round it on the north, east, and south sides. The organ is in a gallery over the north aisle of the chancel, and a seat for the organist is in an overhanging balcony projecting into the chancel. The nave will be of the same width as the chancel, and divided from the aisles by an arcade of five bays on either side. The arches will be carried on red stone piers, and above them will be a lofty clearstory. The roof will be of panelled wood, painted, of the wagon form, and the height to the apex will be about 48 ft. When completed, the church will seat about 1,000 persons. The peaty nature of the site has rendered it necessary to construct a crypt under the whole of the edifice. This is 12 ft. high, and will provide accommodation for Sunday schools and parochial meetings of various kinds. The contractor for the completion of the nave is Mr. Downs, of Hampton-street, Walworth. Mr. Cotterell is the clerk of works. A view of the interior of the church was given in the volume of the *Builder* for 1876, p. 12.

*Pulmer (Becke)*.—The parish church here, having been enlarged and resented, has just been re-opened by the Bishop of Oxford. The works executed consist of a new south aisle in the Perpendicular style, with open-timbered oak roof. The old seats from the nave have been removed. The organ has now been placed near the chancel, and by removal of the gallery at the west end the tower has been thrown open to the church. All the new seats are executed in English oak; those in the tower being raised for the children. The aisles, &c., have been paved with Minton's tiles, and the whole has been thoroughly heated. Some old memorial windows had to be preserved, and some old glass adapted to the new windows, which has been done by Messrs. Egan & Fletcher, of Regent-street; and all the other works have been executed by Messrs. Passnidge & Sons, of Uxbridge, under the superintendence of Alex. R. Stenning, architect, of Fenchurch-street.

*Walkern, Herts.*—The parish church, dedicated to St. Mary, having been restored under the supervision of Mr. Hugh Romieux Gough, architect, of Queen Anne's-gate, was reopened on the 30th ult. Mr. John Lister, of Aston, Rotherham, was the general contractor. He has re-seated the edifice, put a new stone gabled roof to the south-west porch, which had long since fallen into ruins, built a new south-east chapel, and done carefully much other necessary work. The south arcade is of Norman character, and in it occurs a singular piece of sculpture. It is in clunch stone, and represents a draped figure of our Lord on the Cross. Clothed representations of the crucified Christ are exceedingly rare. The old rood-screen is of oak, and of Perpendicular character. It has recently been restored, under Mr. Gough's directions, by Mr. Harry Hems. The cost of the works has been about 1,800*l.*

*Launceston*.—A contract for the restoration of the Church of St. Stephens-by-Launceston has been entered into between Mr. William Burt, builder, of Newport, and the trustees of the charity lands of the parish, and the work will be proceeded with at once, under the direction of the architects, Messrs. Hine & Odgers, whose plans have been approved by the Charity Commissioners. The contract amount is rather under 1,400*l.*, and provides for the complete renovation of the walls, roofs, and floors of the church, but much will remain to be done by private subscription in providing suitable fittings and furniture for the fabric. This church, which is of considerable historical and architectural interest, was collegiate before the Conquest, but with the exception of an arch on the north side, which was probably connected with the college, the present structure was erected in the fourteenth century, the tower being later. In the last century it was badly treated; the roofs were then closed up with flat plastered ceilings, garnished with the rosettes of the period. The open-timbered roofs will now be restored, as will also the original battlements. Polyphant stone will be largely used externally in the new work, as it was in the old.

*Piddinghoe*.—The Bishop of Chichester has re-opened the ancient parish church of Piddinghoe, Sussex, after restoration, which was entrusted to Mr. Philip Curvey, architect, Howard-street, Strand, and the builder being Mr. Baker, of Rodwell, assisted in the masonry by Mr. Bridgman, of Lewes. Shortly after the work was commenced the foundations of the

old aisle were discovered, and the restoration has been carried out upon them; and now the church as restored consists of a tower, nave, with north and south aisles, and porch. The steeple has been re-shingled, and the tower, which is built in random flintwork, has been re-pointed. The chancel has had an entire new roof, which covers the aisles in one sweep, with small gables to allow of height for the vestry door and also of re-siding the old windows in their original position. The arcading in all cases was found built up in the old walls, with the capitals and bases of columns very much mutilated, as, indeed, was all the masonry. This accounts for the long time required for the restoration, as each stone had to be taken out and restored almost one by one on account of the weak state the fabric had fallen into. One of the principal features of the restoration is the paving with encaustic tiles executed by Messrs. Minton. The seating is of open benches of varnished pine. The materials used in building have been flints, with Bath stone dressings on the exterior of the church, and Caen stone within. The whole of the stonework has been executed by Mr. Charles Bridgman, Lewes. The porch is of oak, and, together with the new part of the main building, has been covered with red tiles, like the old ones on the nave.

## DIARIES.

Messrs. HUDSON & KEARNS (of Southwark-street) have again issued their well-bound and well-printed diaries, specially adapted for the use of architects and of builders, in addition to those prepared for the general public. These are Nos. 11 and 12, and there is a larger edition, with a double page for each day, for architects, No. 13. They have all necessary information, and are well indexed in more than one direction. As we pointed out on a previous occasion, they contain not only a diary which is virtually a day-book or journal, but a cash-book, ledger, or note-book, rent and insurance register, and the paper and binding are of unusual excellence. No. 11 is specially adapted to the requirements of those in the building trades, and contains a series of tables of a practical character. Amongst their productions for the office and counting-house, No. 8, Patent Date-indicating Blotting-pad and Book Diary, should be looked at.

Messrs. Letts have sent us some specimens of their cheaper works in the shape of diaries, pocket-books, and so on, equally important to a large number of persons. They are well known all over the country. No. 8, although called Letts's Office Diary (Svo., neatly bound, with a ruled page for each day), will be found a handy little book for those who, whether troubled with business cares or not, are in the habit of jotting down their thoughts or recording their doings.

## Miscellanea.

**The Suggested Trevithick Memorial.**—Hearty response is reported in connexion with the proposed memorial to Richard Trevithick, the engineer, and which has already been mentioned in the *Builder*. It has been thought desirable to defer for a week or two the publication of the names of those who will act as the committee, in order that there may be no appearance of giving priority. Those desirous of acting should communicate with the honorary secretary, Capt. John Davis, 2, Edinburgh Mansions, Victoria-street, Westminster. At a recent meeting of the Mining Institute of Cornwall, the President, Mr. W. Husband, C.E., said that with reference to the memorial, some friends wishing to forward the matter met together to appoint a committee. The feeling was that they should make the Trevithick Memorial as national as possible. Trevithick worked in two hemispheres, and in every part of this country; and, indeed, the most important of his experiments were made out of Cornwall. And seeing the extent of the field he worked over, and seeing the honour which was awarded to Stephenson, who had monopolised all the honours in the North, and that those who so honoured him were beginning to think that Trevithick had not been done justice to, and that these and others would come forward to assist them in this memorial, the endeavour would be to establish a strong committee in London, with sub-committees in the various provinces or in counties.

**The Coal Trade.**—A serious reaction has taken place in the coal trade. The anticipations that the advance of 10 per cent. in miners' wages would lead to a permanent increase in the price of coal have proved altogether illusory. The advance was made on November 1st, and the coalowners generally raised their rates by 1s. per ton—from 9s. to 10s. per ton. But already the London and provincial markets are over-stocked with coal which cannot be sold; and Yorkshire and Derbyshire coalowners are obliged to accept 1s. 6d. per ton less than they were getting immediately before the 10 per cent. was conceded. This leaves them practically with 6d. per ton less for their coal, while they have to pay 10 per cent. more for the getting of it. Nor is this all. North-country coal is placed on the London markets at 8s. 6d. to 4s. per ton less than immediately before the advance of 10 per cent. Yorkshire and Derbyshire coalowners are utterly unable to compete against such reductions, and the consequence is that the output of coal in these districts is now being restricted by the lessening of labour. In one leading colliery, which sends the largest tonnage of Silkstone house fuel to London, only three days per week are now being worked. Already a movement is on foot to repeal the 10 per cent. and bring wages back to the old level. Lancashire is taking the lead, and the coalowners of Yorkshire, Derbyshire, Durham, and Northumberland are also moving in the matter. There seems every prospect that the concession of 10 per cent. to the colliers will be very short-lived. It may interest London consumers to learn that the merchants have fixed their share of the reduction at 1s. per ton.—*The Engineer*.

**Dublin Sanitary Association.**—At the meeting of the executive committee of this Association, on the 7th inst., Dr. Cosgrave in the chair, attention was called to the Registrar-General's returns for the past week, comparing fifty-two large towns in the United Kingdom. The Irish towns stand first, with a mortality of 23 per 1,000, while the English and Scotch towns have death-rates of 22 and 25 per 1,000 respectively. Resolved:—

"That in the interest of the health of the public, the executive committee direct attention to the dangerous practice which at present prevails in Dublin of thawing the snow on the pavements by means of a free sprinkling of salt. By this mixture of snow and salt intense cold is produced, and the feet of the passers-by are chilled in such a way as seriously to imperil health; besides, a sheet of smooth ice is subsequently formed. The executive committee suggest that sprinkling the pavements with dry, clean sawdust, sand, or straw, will be found to neutralise the danger of slipping in time of frost and snow, and to prevent injury to health through unnecessary chilling of the feet, and the possible occurrence of fractures and other accidents."

**Proposed Industrial Exhibitions in Ireland.**—At the meeting of the Limerick Corporation on the 7th inst., the mayor (Mr. Jerome Connihan, J.P.) presiding, Mr. John Bernal remarked that in Cork great efforts were being made to hold an exhibition next year of manufacturing materials and manufactured goods, and he could not see why they in Limerick should not give their idle-stricken artisans and tradesmen the same opportunity, and put them in the same position they were trying to do in Cork. He moved that they report progress, and have the matter laid before the local committee appointed in connexion with the forthcoming show of the Royal Agricultural Society. The mayor observed there was no necessity for a formal resolution in the matter mentioned by Mr. Bernal, for he would take it on himself to have it laid before the local committee in connexion with the show of the Royal Agricultural Society.

**A Doleful Anniversary.**—Friday, December 8, was the first anniversary of the terrible fire at the Ring Theatre, Vienna. The Central Cemetery was thronged with visitors, bringing *inmortelles* and wreaths of flowers. The Vienna papers comment on the catastrophe, and most of them point out that in the year that has since elapsed no very remarkable improvement has taken place in the theatres, the fire brigade, or the police management of this capital. The manager of the Ring Theatre, Herr Jauner, and others, though sentenced to imprisonment in the great trial last summer, are still in the enjoyment of their liberty, pending the appeal they have lodged against the decision of the court that condemned them.

**"Grip" Tramways in Chicago.**—Mr. Thomas Cornish, M.E., writing in the *Mining Journal*, describes Chicago and its "grip" tramcars. He says:—"These cars run on several lines of streets without horses and apparently without any outward or visible signs of motive power; they are a great improvement on the ordinary means of street locomotion, and as there is no difficulty in working the wires round sharp turnings or for any reasonable distance, they will, no doubt, in many cases soon supplant the horse tram-cars in English cities, as I notice one company has already started to introduce the system in London. The Chicago Company have their works depot at the corner of State-street and Twenty First-street, which I had the pleasure of inspecting through the courtesy of the engineer and foreman. The cars are driven by means of an endless rope running along and under the track connected with and running over the driving-wheels at the depot. Two or more cars can be attached together, the front car is provided with gripping gear thrown on or off at the will of the driver. The steel wire rope is continually travelling over guide wheels fixed in a large groove (built under the track) at the rate of about six miles an hour. By throwing on the levers the grips catch hold of the travelling wire rope, and consequently the car travels as fast as the wire is going. The cars are stopped by throwing off the grip. This system was, I believe, first successfully introduced in San Francisco."

**Chelsea and Electric Lighting.**—This question was considered at the meeting of the Chelsea Vestry last week. The Vestry had under consideration the notices received from several electric light companies of their intention to apply for provisional orders for the district, together with an elaborate report upon the whole question by Mr. G. H. Stayton, C.E., their surveyor. The report concluded with the following recommendations, which were unanimously adopted:—1. That at present it is not desirable for the Vestry to apply for a licence or provisional order. 2. That it is not desirable to consent to any application for a licence until the draft shall have been submitted to, and has received the approval of, the Vestry. 3. That it is desirable to support the application of any company who may appear most likely to carry out the undertaking in a satisfactory manner, and who will agree to such of the suggested conditions as the Board of Trade may approve, and that the Electric Lighting Committee and the surveyor be empowered to enter into the necessary negotiations for effecting that object. 4. That the solicitors be instructed to watch the progress of the applications for provisional orders, and to take all necessary steps to oppose the same until satisfactory conditions are obtained.

**Not completing the Bargain.**—The dispute between Lord Marcus Beresford and Prince Bathyanay about an alleged contract to sell the Warren House estate at Newmarket to Lord Marcus Beresford for 12,000*l.* came before the Court of Appeal at Lincoln's Inn last week, on appeal from the decision of Mr. Justice Kay. The Master of the Rolls said that the question involved was whether the offer of Prince Bathyanay of the 2nd of January, 1882, to sell the house was accepted by Lord Marcus Beresford before the withdrawal on the 6th of January. On this point there was a distinct conflict of evidence; and the judge who had heard the witnesses came to the conclusion that Lord Marcus Beresford had not made out his case. He agreed with the decision of the Court below, and consequently the appeal must be dismissed. Lords Justices Cotton and Bowen concurred.

**The Proposed Town-hall at Hawick.**—At the meeting of the Hawick Town Council on the 5th inst., Provost Watson said it was his intention to divide the Council on the subject of erecting a town-hall. It was evident from the statements made at the ward meetings that the public did not desire the purchase of the Exchange Hall for the purpose of converting it into municipal buildings; and that heing so, it was not his intention to press the matter. Notwithstanding his views on the subject, he would be willing to proceed with the erection of the buildings on the present site, and in asking that the matter be considered at a private meeting of the Council, pointed out that it was necessary to ascertain the present and prospective burgh revenue, so that the annual charge on the buildings might be met, and the cost paid off. The suggestion was agreed to.

**Destructive Fires.**—A serious fire broke out at Hampton Court Palace, early on Thursday morning last, in one of the suites of apartments on the third story of the dwellings fronting Fountain Court. The cause assigned is the upsetting of a spirit lamp in the bedroom of one of the domestics. The apartments in which the fire broke out are described as situated over a portion of the picture-gallery. The fire was eventually got under, but it is stated that the whole of the upper part of the eastern portion of the buildings is completely gutted. Great efforts were made by the Hussars and firemen in extinguishing the fire and rescuing the pictures and other valuable property, but at the time we go to press it is reported that many pictures have been seriously damaged, whether by fire or water it is not stated. One of the domestics is reported to have been suffocated by the smoke.—The great fire in Wood-street last week followed closely on the destruction of the Albamra Theatre, and is stated to have destroyed property to the value of between two and three millions sterling. The scene of the fire must be visited to realise the havoc which it has caused in this crowded and busy part of the City, and the catastrophe gives further point to the remarks we made last week as to the paramount necessity of doing something to augment our resources for fire extinction.—A serious fire is reported from Dublin, and another one at Plymouth, where the Presbyterian church and schools at Eldad have been destroyed. The buildings were only three years old. What proportion of our churches is insured?

**Fatal Scaffold Accident.**—On Saturday last, Dr. Diplock, Coroner for West Middlesex, held a long inquiry at Toddington, relative to the death of Henry Stuart, aged 40, a slater, who met with his death from a fall from the roof of a house, Charles Barnes, a bricklayer's labourer, said that he was at work on Tuesday at a house in Royal-road, Toddington. The deceased was at work on the next house. Witness saw Stuart suddenly fall from the highest stage of scaffolding, and alight on the ground. Two boards fell at the same time. The lowest staging was composed of two boards resting on pulgots. There was only one "ledger" and no brace poles. Joseph Dorrell, a labourer, of 3, Victoria-road, Toddington, stated that the deceased was endeavouring to put the ridge-tiles on the roof of the house, when the ladder gave way and he fell to the ground. The putlogged the scaffold-boards came away from the building at the same time. The putlog was not wedged in. The rope, which should have made the "ledger" fast, was quite loose. The jury returned a verdict of "Accidental death," and appended the following rider:—"We are of opinion that the scaffolding was not securely fixed."

**The Theatre Royal and Opera-House, Bournemouth,** was opened on December 7th. The theatre was projected by a limited liability company, but the shares not being taken up, the theatre was acquired by Mr. William Stanley, of Bournemouth, a builder, who erected the theatre as a private speculation, and has since sold it to the present proprietors, Messrs. Stevenson & Nash. The works have been carried out from designs by Messrs. Kemp-Welch & Pinder, architects, of Bournemouth. Mr. W. Nittingale acted as clerk of works, and Mr. W. Hunt as general foreman. The total accommodation is for about 1,000 persons. Means have been taken with a view to ensure safety to the audience in case of fire, the staircase, &c., being of concrete, and hydrants being placed in various parts of the house. The decorations were executed by Mr. W. Bevis, under the direction of Mr. R. T. Sims, of London. The drop-scene was the work of Mr. G. Collier, of Hull. Mr. E. G. Thompson executed the gas fittings. The total cost was about 10,000.

**Assistant Engineer for the City of London.**—There were nearly a hundred applicants for the post of assistant to the engineer and surveyor of the City Commissioners of Sewers. After a rigid examination as to merits the number was reduced to three,—Mr. W. H. Copland, Mr. W. H. A. de Pape, surveyor to the Tottenham Local Board, and Mr. D. J. Ross, an old servant of the Corporation. The election took place on the 7th inst., when Mr. Copland was voted out, and the contest was between Messrs. de Pape and Ross. The latter received thirty-two votes and the former twenty-eight.

**Holy Trinity Church, Darlington,** is to be resented, lighted, and ventilated, under the direction of Mr. G. G. Hoskins, F.R.I.B.A.

**"Model Abattoirs."**—The sum needed to erect a small model abattoir having been obtained, a meeting was held on Saturday last in the rooms of the Royal Society for the Prevention of Cruelty to Animals, Jernyn-street, to "consider the practical steps to be taken." Dr. B. W. Richardson occupied the chair. On the motion of the Hon. Rolle Russell, the following resolution was cordially adopted:—"That the sum of 1,000*l.* having now been subscribed to establish a small model abattoir, the committee of the Society be empowered to take such practical steps as they may see desirable for the attainment of that object." It was agreed that the designation of the Association should be altered to "The London Model Abattoir Society"; and a resolution was also passed appealing to the public for liberal support in promotion of the objects which the Society has in view. What architect is engaged on the matter?

**Tynemouth.**—The Church of the Holy Saviour, Tynemouth, built more than forty years ago, was re-opened on Sunday, December 3rd, by the Bishop of Newcastle, after re-seating, enlargement, and decoration, under the direction of Mr. F. R. N. Haswell, architect, North Shields. The church is now arranged has a central passage and two side aisles. The benches are the work of the North of England School Furnishing Company, Darlington, from a design by Mr. Haswell. The decorative work was placed in the hands of Messrs. Laidlaw, of Newcastle. All the old paint has been stripped off, and the wood simply stained and varnished; the walls are coloured a pale terracotta. A new font, from the studio of Mr. J. Forsyth, of Baker-street, London, and standing upon fine columns of serpentine marble, has been placed at the west end. New windows of cathedral glass have been put in by Messrs. Sowbory, of Gateshead.

**Strong Rooms.**—On Saturday, shortly after the Prince of Wales visited the ruins of the fire in the City, Messrs. Foster, Porter, & Co. were able to reach their strong room, the entrance to which is secured by a pair of Chubb's massive steel doors. With very little trouble Messrs. Chubb's men opened the doors, and the room was then entered by the directors, who found all the contents uninjured. Several tons' weight of books were quickly removed, and it may be mentioned that though there were safes inside the room, the books which were lying outside the safes were uninjured by fire.

**Kendal.**—In St. Thomas's Church in this town a Caen stone pulpit has been set, of the Early English style, with red Irish marble columns supporting the upper part, and with carved losses introduced at intervals. The cornice and caps to the columns are carved with trefoil ornaments. Messrs. Jones & Willis did the work.

**Architectural Association Travelling Studentship.**—At the meeting of this Association, on the 8th inst., Mr. Cole A. Adams made the announcement that the Sketch Book Committee had given a donation of 100*l.* to the Association Travelling Studentship Fund.

**Surveyors' Institution.**—The next meeting will be held on Monday, December 18th, when a paper will be read by Mr. E. I'Anson (Vice-President), on "The Practice of Discounting the Value of Estates in Reversion."

TENDERS

For paving works, North Woolwich, at per foot run, for the Woolwich Local Board of Health. (Only part given.) Mr. H. O. Thomas, surveyor:—

Stone-road:—	
Brightmore, North Woolwich	£1 2 6

NOTICE TO ADVERTISERS.

Persons advertising in the *Builder* may have REPLIES ADDRESSED TO THE OFFICE, 46, Catherine-street, Covent-garden, W.C., FREE OF CHARGE.

Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under..... 6s. 6d.  
Each additional line (about ten words)..... 0s. 6d.

Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Competition, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under..... 2s. 6d.  
Each additional line (about ten words)..... 0s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.

\* \* \* \* \* Stamps must not be sent, but all small items should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINER, Publisher.

Addressed to No. 46, Catherine street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock P.M. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied extra from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum, PREPAID. Remittances payable to DOUGLAS FOURDRINER, Publisher, 46, Catherine-street, W.C.

### The Jones Collection at the South Kensington Museum.

THE collection of objects of art which has been left to the South Kensington Museum in trust for the nation, by the late Mr. John Jones, of Piccadilly, would be a remarkable one even if it came from some ancestral home, as the product of the collective faculties of

several generations of a family. As the collection of one man who had only towards middle life acquired a fortune and commenced laying it out in this way, it is probably unique. Not only is it remarkable for the extent and variety of the objects collected, and their pecuniary value, but as an example of the judgment shown in the choice of the objects purchased. There is nothing which does not represent the best class of work of its school, whatever our opinion as to the school generally may be. We make this qualifying remark, because we feel that we must distinguish between what is good of its class, what is well designed according to its style and admirable in its workmanship, and what is artistically of the best type *per se*. The compilers of the handbook to the collection speak very strongly, and, in one sense, not too strongly, of the advantage to art-workmen of having this splendid and varied collection to study from, and being enabled to see together and compare so many examples of the most admirable workmanship that could well be met with. It is natural also that the South Kensington authorities should be exceedingly gratified at being able to present to their visitors and students so complete a collection of the artistic furniture of a period which was before imperfectly represented in the Museum, and which, owing to the exceptional costliness of most of the articles, they could not have hoped for a very long period, if ever, to have been enabled to acquire by public funds. But there is another side to the matter. Splendid workmanship, which spares no trouble and no expense in attaining perfect execution, is a quality to be enthusiastic over for its own sake, no doubt; and it is of peculiar interest to have a collection which illustrates so fully one special school of work, and one which so completely dominated the taste of Europe during a very important and remarkable

period of social history. But it would be wrong for any who are aiming at guiding public taste to any degree to overlook the fact that this beautiful workmanship represents also a period of very corrupt taste, and that the collection includes a great deal which, however costly and superb in workmanship, represents a very vitiated artistic style, and is by no means to be held up as an example of what ornament and artistic design ought to be. We could have wished that there had been some recognition of this in the otherwise well-written hand-book to the collection published by the South Kensington authorities. There need have been no ungracious undervaluing of the gift left to the nation. Its interest, in more ways than one, is sufficient to justify the warmest expressions of recognition of the knowledge and care which collected it, and the public spirit which placed it where it is. But it would be by no means desirable that workmen and designers should be encouraged to look upon such a collection as a fountain-head of pure taste, or to imitate all the forms and suggestions to be found there. The work of the Louis Quinze and Louis Seize period or periods represents some of the richest, most gorgeous, and most painstaking, as well as successful work which the world has ever seen. But it also represents in many instances a most frivolous and false taste, the true indication of the likings of a society in which all was show and glitter, luxury and selfishness, and which prized richness and ostentation above the pure taste in art of which it, in fact, knew little or nothing. Of much of the work of the period it may be said, that if it represents good taste in ornament and design, nearly all that has been said by the best and most thoughtful critics on this subject must be wrong, and all our ideas as to true and false taste would have to be reviewed or discarded.

It may be useful to consider for a moment why it is that ornamental work of this school is, for the most part, so false and misleading in style. The reason is mainly to be found in the fact that the ornamentists of the period in question did not turn to nature for guidance, or even to such natural truths of form and proportion as are set forth in geometry; they turned to artificial objects and to the reminiscence of another and extinct style. Now, ornament is, in its best forms, the kind of design which results from the application of thought to the treatment of natural forms. It is not imitation of nature; it is nature taken as the basis upon which to build a new creation, a design of human invention. But there is scarcely an example to be found in the French work of the eighteenth century which comes under this definition of ornament. The ornamental detail of the period may be classed under three heads; that which is an imitation of Roman ornament, more or less modified by the taste of Renaissance artists; that which is an

imitation of artificial objects, such as wreaths, ribbons, festoons, and so on; and that which is merely play of line in the way of scrolls and other such forms. Ornament of the latter class may be very good and very interesting, so long as it is sufficiently abstract in form to appear merely as the representation of proportion in space and contour, and is treated in such a manner as to emphasise the construction and expression of the furniture or other object to which it may be applied. But the ornament of this class in French eighteenth-century work is not abstract. It looks like very corrupted forms of detail of Roman architecture and Roman design, put together without any intellectual connexion with each other, and without any clear flow of line, or appearance of what may be called constructive truthfulness; it seems to be put there because the artist did not know what else to put. This defect runs constantly through even good work of *le siècle*; ornament is added to a thing for no reason, for no love that the artist could have had for doing it (for it is impossible to suppose he could have had), but simply because the thing was to be handsome, and that was then the fashionable kind of handsomeness. The details derived from Classic work, sometimes well treated and sometimes ill, have that second-hand character and second-hand interest which always belong to imitation art; and as to the imitation of artificial gewgaws and trinkets as ornament, that is the very lowest system of ornament, being the one in which the least amount of thought is shown, and which takes as its starting point some of the most commonplace of artificial objects, instead of the suggestive and typical forms of Nature. When we find a clock-case with an imitation napkin or towel in gold or ormolu hung over it, we feel that we have got to about the greatest depth of vulgarity to which taste in ornament can go: the thing has neither beauty nor meaning of any sort; but something must be put, and this will do as well as anything else to fill up the space, and to exhibit the costliness of the material and the cleverness of the manipulator. There is little or no thought in this school of work for the most part; its good qualities are a certain elegance in the best productions, and an exquisite workmanship, in which no pains and no time seem to have been spared towards doing the best that lay in the artist's power. The richness of the materials employed adds not a little to the effect; but that is not the best thing that can be said for any school of design. The highest decorative art is that which confers a new value on the material, whether costly in itself or not. The compilers of the handbook are very anxious to show that the prices at which some of the articles in the Jones collection are estimated represent their real marketable value for the time in which they were made, or something not far from that; and when we hear of three years being

spent over a small writing-table we know that its money value for such thorough and honest work, must be very high; and that this must, of course, rise as the class of objects in question becomes more scarce, and they are more sought after by collectors. But it is necessary to say, and the South Kensington authorities ought to have said it, that collectors' value is one thing, and artistic value is another. We are told that the money value of a certain small snuff-box (No. 922 in the collection), with miniature subjects painted by Blarenberghe, is 1,500*l.* No doubt collectors would be found willing to give that price for an *objet de luxe* of this kind, so beautifully finished and so unique in its way; and we are far from depreciating the collectors' point of view. The taste for collecting serves to keep up the price of works of art, and is to be upheld on that account, at any rate. But we cannot help feeling that any man who gave that sum for the box in question on grounds of its artistic value alone would make a very foolish use of his money. The same sum would secure him things which, in the artistic sense, would be worth far more, and give far higher pleasure to any lover of art for its own sake.

It must, however, be said that the Jones Collection includes a good many things which represent the best qualities of French eighteenth-century art, with much less of its most pronounced faults than we are accustomed to see. This is the case in particular with a great many of the articles of furniture, writing-tables, and objects of that kind. These possess in a great degree the qualities both of elegance and design and of suitability to their purpose. It is, indeed, a rather weak stamp of work, and the predominance of curved lines in every direction, however remarkable as exhibiting finish and exactitude of workmanship, could not fail to produce this impression in work of which wood is the foundation. It is emphatically a *hondoir* style of furniture, looking as if only meant for occasional use by delicate feminine hands, and otherwise rather for show than for use.

There hangs about it a kind of aroma of a highly polished and artificialised society, which adds to it another and quite different interest from that which belongs to its artistic merit. Many of these delicate and feminine-looking hits of furniture have really been in the possession of princesses and other ladies of the period to which they belong. Several were the property of Marie Antoinette. We seem brought nearer to the French court of that era in looking at this collection of the kind of articles with which its sumptuous salons and boudoirs were furnished: we have a closer familiarity with the life and the tastes of the people who lived among these things.

There are things in the collection, however, which rise higher than this, such as the large *Boule* cabinet which stands in the inner gallery, and which is an astonishing piece of work in regard to execution, and certainly finer and purer in taste than a great deal of Louis Quatorze work. It was, we are told, bought by Mr. Jones from a house in Carlton-terrace, not long since, and is believed to have been made for Louis XIV. The decoration being mostly inlay, perfectly flat, the piece does not exhibit those swelling protuberances of outline which are so wearisomely repeated in much work of the same period. The execution is superb; nothing could surpass it, and its elaboration is astonishing; but, though the ornament is pleasing and far more tasteful than in many other specimens, it represents, for the most part, very commonplace forms, and there are few people in the present day with any power of designing at all who could not at least draw something better and more characteristic and interesting than this. Here and there we meet with things in which there is a curious and very unusual infusion of Oriental taste into part of the detail, greatly to the advantage of artistic effect and expression. The two small oval tables which stand near the entrance-door of the gallery, and which are not so much curved and twisted as some of their companions, are very charming specimens of elegant design and workmanship.

The collection is unquestionably a most remarkable one, and a great gain to the Museum; we have certainly no wish to at all depreciate the value of such a sumptuous legacy to the nation, and rather hope that it may set an example to be followed by others who have collections and no relatives with a

more direct claim on them. But we wish to say a word of warning against the danger of taking things as models of artistic taste, which are rather models of patient and refined workmanship, and appendages of a luxurious and not (in the best sense) very highly cultivated society. The fact that kings, princes, and nobles could be content to spend such sums on designs of this class, containing so much that is false and frivolous in taste, really does lend some colour to the idea which has been promulgated of late, that wealth and luxury are inimical to the production or encouragement of a high class of art; though, of course, the history of society furnishes other evidence to the contrary. With this reservation of their admiration, let artisans study this collection diligently and observantly, and they will learn much; and the interest which it has for all educated people as a representation of a school is, of course, very great.

We may observe that, as usual at South Kensington, the things are arranged with no reference whatever to the order of the numbers on them, or to the way in which they are referred to in the handbook; so that the finding anything which is specially mentioned in the handbook, unless it be a large and prominent object, is a mere matter of chance. A complete catalogue is to come, and this, like the other catalogues, will be practically useless for any assistance in finding the objects. The numbers appear to be affixed solely to identify the different articles in the books of the museum, and have not the slightest reference to the placing of the objects. The consequence is that the finding anything one wants to find is next to impossible. We have referred to this absurd and needless source of difficulty thrown in the way of students, over and over again. Some one who is invested with power ought to come down sharply on the authorities and compel them to adopt a more rational system of nomenclature and grouping, and to have some method of indicating in their catalogues how to find the objects. There can be no difficulty in doing this, and no excuse for continuing such an absurd and inconvenient system, or want of system.

#### THE MODERN SWORD OF DAMOCLES.

UNDER this not inappropriate title, our contemporary the *Lancet* has very effectively called the attention of the public to a daily-increasing source of danger, against which in our columns on the 19th of February, 1881, as well as on other occasions, we have felt it a duty loudly to protest. On glancing at the titles of other articles about the date in question, it becomes evident that it was the interruption of telegraphic communication caused by storm that was the immediate occasion of the warning to which we refer. At the present moment it is almost enough to glance sky-wards in any street in London to become convinced of the rapid growth of a very serious source of danger. "It would be difficult," remarks our contemporary, "for a malevolent genius to devise any more dangerous apparatus than a long stout wire stretched from house to house across a public thoroughfare. In some unexpected moment, under extraordinary pressure, perhaps a heavy weight of snow, it is not merely possible, but likely, that it will fall to the ground, and in falling must almost inevitably cut in two all it strikes." In support of this view, we desire to recall the case in which an engine-driver on the Great Western Railway was absolutely decapitated by a telegraph-wire which had become detached from its support, and was hanging over the line at the level of his neck. It is true that the speed of the train,—some thirty or thirty-five miles an hour,—was here a factor in the case; and that it was the man who struck the wire, not the wire that struck the man. But let any reader who has a turn for figures ascertain the height above the ground at which the strands of this cobweb of death are usually stretched, and then calculate the velocity that will be attained by a body falling from that height. There will, of course, be a difference in the speed attained by a freely falling wire, and by one that is attached at one end. But making all allowance, we think that a blow from a trooper's sword could not be much more formidable than that sustained by any one who was struck by such a falling wire.

And then as to probability: it is, it seems to us, only a question of time. There are no means available for testing the safety of the wires. Leave them alone long enough, and they

must snap from the ordinary effect of atmospheric corrosion; much accelerated, as it is in London and other great towns, by the sulphurous and nitrous fumes with which the air is apt to be loaded. It is also sure that such fractures will occur, when they take place, without warning; and also that it is precisely on the occasions when telegraphic communication is of most value, owing to the impeding of other modes of communication by snow or tempest, that its interruption by the failure of the wires is most likely to occur.

It should also be borne in mind that the case is one in which public vigilance is most likely to be lulled to sleep by a comparatively long period of immunity. Every wire has a certain average life, which may be ordinarily counted upon. We are not aware of any data that would allow us to calculate what that life should be. But be it ten, twenty, or any number of years, barring violence of any kind, it is clear that a great number of wires will attain a dangerous longevity about the same time. Then, according to the laws of probabilities, will occur all at once a great number of fractures, which can hardly be unattended by serious and even fatal calamities. What steps have been taken by any one, at the present time, to preserve the public from this certain, if deferred, danger?

It seems to us that, not merely with reference to this visible overhead danger, but also to some others that are silently, but rapidly, accumulating in many urban neighbourhoods, the rule of public safety is a simple one. No structure of any kind that *must* fail if left alone for a certain, though, as yet, an undetermined, time; of which the failure will be without due warning; and of which failure the results must be serious, and may be fatal; ought to be permitted in urban localities. We have forbidden, by special enactment, the storage or the carriage in and through towns of explosives in dangerous quantities. The rule is a sound one. It is demanded by public safety, and, sooner or later, unless other precautions be taken, it will be found that it ought to have been applied to our stretched wires.

For public safety, for the security of uninterrupted communication, and, ultimately, probably for reasons of economy, it is clear, in our opinion, that a subterranean channel must be adopted for the wires of the telegraph. As far as we are aware, it is not as to telegraphic wires, in the old sense of the word, that difficulty will arise, so much as to the communicating of that later born child of Hermes Trismegistus, the telephone. So delicate are the vibrations that convey a human whisper for dozens of miles, that the inductive effect of one wire on another is enough to disturb them, and thus, it has been urged, telephone wires must be aerial, as by no other mode of fixing can they be kept far enough apart not to interfere with one another by induction.

This, of course, is a point that demands attention. For our own part, we have not that feeble faith in science that should lead us to conclude that she can only, or best, be served by barbarous methods. And anything more barbarous than hitching wires to posts and pillars, to chimneys and steeples, it is not easy to suggest. Within the last few days, however, mention has been made in the public journals of a new invention (as to the nature of which silence is maintained) coming from Germany which gets over this difficulty as to induction. We are not without a suspicion that if the wire of communication be surrounded by a spiral wire through which a current is also maintained, the one induction may be found to balance the other (as in the case of the iron case for the magnetic compass in an iron ship), and that thus the whisper of the telephone may pass unimpeded through subterranean wires laid in well-fitted pipes. As to this, no doubt, we shall soon hear particulars, if the announcement be correct. But whether it be so or not, we are anxious to renew our former warnings, and to call the attention of those responsible for the safety of the public to the hourly-increasing danger of allowing all sorts of people to hang, at their own good pleasure, over the pathways of our towns and cities, a cobweb of wires along any strand of which, like an enormous spider, death may dart in a moment and make sure of his innocent victim.

The subject is one as to which, in more than one sense of the term, delays are dangerous. The call for attention is rendered all the more urgent by the competition now existing between the Post Office, as the proprietor of the tele-

graphs, and the telephone companies. Any one who has become accustomed to the use of this last and most wonderful of the methods of artificial communication, will be aware of what a vast future lies before it. That it will become a most important,—we might even say the most important,—medium of messages, whether of a business nature or of a domestic character, there can, we apprehend, be but little doubt. What may be further its public services, so to speak, as in the transmission of the music of an opera, the solemn organ-flow of a religious service, the impassioned periods of a great preacher, or the new development of that Parliamentary obstruction which has been so extraordinarily fostered by the new forty-member rule,—it may seem almost fabulous to attempt to calculate. There seems no reason why the golden notes of a prima donna should fall only on the ears of her visible audience. Without, so far as we can tell, at all denuding the acoustic effect within theatre or church, the circle of the audience may be extended to all who are in telephonic communication with the building. Unless something unforeseen occurs, the arrangements of our towns and cities, the structure of our houses, the very habits of our daily life, are likely to be transformed by this subtle energy.

To this end the companies are silently but rapidly working. And each day that they are so allowed to work, not only stretches tons of additional wires over our heads, but goes to create at least the presumption of a vested right in the use of our house-tops by the telephone companies. Let us suppose matters to go on, just as they are now doing, till the time when the earliest wires attain their natural period of durability, and that then, within a few weeks, we have a dozen cases of slaughter in the streets by the natural agency of the decaying wire. What will be the public excitement? What the demand for the immediate removal of the source of danger? What the cost of the hurried change? What the inconveniences? What the demands for compensation, to be provided by a legislature, and paid by a public, that took no heed of the growth of the mischievous and threatening mode of putting house in communication with house, until it was too late? The confusion will be something altogether without precedent. It is thus not only in behalf of the one client for whom the scientific journalist holds a general retainer (viz., the public), but also on behalf of the telephone companies themselves, that we desire to join in the remonstrances now made, and to plead for the public safety.

#### HAMPTON COURT PALACE.

"Close by those meads for ever crown'd with flowers,  
Where Thames with pride surveys his rising towers,  
There stands a structure of majestic frame,  
Which from the neighbouring Hampton takes its name.  
Here Britain's statesmen of the full freedom  
Of foreign tyrants and of nymphs at home;  
Here too, great Anna, when three realms obey'd,  
Dost sometimes counsel take—and sometimes lead."  
—*Rape of the Lock*, cæto iii.

The manor of Hampton is thus described in the Book of Domesday.—Walter Fitzthorpe holds the manor of Hamtote, in the hundred of Spelthorne, which is taxed at 35 hides . . . in the whole it is valued at 39*l.* per annum, when it came to the present owner at 20*l.* in King Edward's [the Confessor's] time at 40*l.*; it was then held by Earl Algar. After the Conquest we find it in the possession of Sir Walter de Valery, who gave the advowson to the Priory of Takeley in Essex, a cell to St. Valery in Picardy, whence the Norman sailed for his descent upon England. The manor then passed to Sir Robert Gray, whose widow, Joan, devised it to the Knights Hospitallers in the year 1211, whilst there would seem to have been a house here for some sisters of that order. About 300 years later Wolsey, struck with its pleasant and convenient situation, obtained a lease of the manor and manor-house. He then set about building the magnificent mansion which so excited his royal master's cupidity that, making a virtue of necessity, he gave it to the king, who celebrated his entry into possession with a splendid entertainment in honour of the embassy from France in 1527. A full account of the festivities on that occasion will be found in the MS. of Cavendish's life of the prelate (Earl MSS. No. 428). Twelve years afterwards an Act passed for enclosing a royal chase from out of several of the adjoining parishes. On the king's death some of the more odious boundaries were removed, in response to a petition of

the neighbours, and the chase gradually took the form, so familiar to Londoners, of Bushey and the Home Parks. The office of chief steward or feodary of the manor, together with that of lieutenant and keeper of the chase, has always been conferred upon persons of high rank, as, for example, William, Marquess of Northampton; George, Duke of Buckingham; James, Duke of Hamilton; General Monk, Duke of Albemarle; Barbara, Duchess of Cleveland; the Earls of Halifax, the Countess of Guildford, and the Duke of Clarence.

Completing his quondam favourite's design, King Henry VIII. converted the palace into one of his frequent residences,—a predilection that was shared by many of his successors. Here were born, on the 12th of October, 1537, his son Edward VI., whose mother died within two days of his birth; and in 1689 Queen Anne's son, William, Duke of Gloucester; in the chapel Katharine Parr became Queen Consort. Queen Mary and her husband kept Christmas at Hampton Court in great state in the year 1558, as did her sister on two subsequent occasions. Here met the Council to condemn Mary Queen of Scots; and with her son as moderator the conference between the Presbyterians and bishops of the Established Church, which resulted in our amended Liturgy and a revised translation of the Scriptures. In 1647 the Commonwealth men brought a prisoner to the palace that monarch who had there spent some of his less anxious days. Not disdaining to make it a home, Cromwell here caught the ague which ended his life: here too his daughter Elizabeth married Thomas, Lord Falconberg, and Mrs. Claypole died, the only one of her race whose grave remains undisturbed at Westminster.

Consisting of five courts with the leading features of a chapel, banqueting-hall, and a fine Tudor gateway, the original building, in its extent the largest of our royal palaces, underwent considerable change at the hands of Sir Christopher Wren. For the inmost three courts he substituted the present Fountain Court with the fine range of State apartments overlooking the garden and the three beautiful avenues of King William III. beyond. In the second quadrangle, (known as the Clock Court, from the curious astronomical clock over the gateway) he placed an Ionic colonnade, which, harmonising but ill with the hall opposite, leads to the grand staircase and private apartments. The Fountain Court, measuring 110 ft. from east to west by 117 ft. from north to south, has a very pleasing effect; on a summer's day the view through one of the arches is charming. The Hall was manifestly not finished before 1536 or the following year: it is not mentioned in the manuscript cited above, and is ornamented with the initials of the king and Jane Seymour tied with a lover's knot, a device which is repeated in the west drawing-room or Board of Green Cloth, a large and contemporary apartment at its eastern end, as well as on either side of the chapel doorway. The Great Hall measures 106 ft. in length, 60 ft. in height, and 40 ft. in width; its modern stained-glass windows were intended to show, *more heraldic*, the descent of King Henry VIII. and each of his six wives from King Edward III. The Flemish tapestry on the walls, its designs attributed to Van Orley, tell Abraham's history. The chimney-piece and Wolsey's portrait in the adjoining apartment are comparatively modern. The Clock Court gateway is adorned with two of the terra-cotta busts removed thither from "Holbein's Gate," which formerly stood across the roadway at Whitehall.\* By one of time's revenges the play of "Henry VIII.," with the downfall of Cardinal Wolsey, was performed in the Hall, which King George I. had fitted up in 1718 for stage plays. His successor was the last sovereign who lived here. This may be due to the circumstance involved in the following anecdote. It is related that the Duke of Sussex, passing through Queen Anne's drawing-room, said,—"I wonder in which of these rooms it was that George II. struck my father": the blow was so keenly remembered that King George III. never cared to live at Hampton Court. In his reign the private rooms

\* When Holbein's, or the Cock-pit Gate, was taken down in 1750, the Duke of Cumberland, then Ranger of Windsor Forest, intended to rebuild it with embellishments in the Louvre style. His project failing, portions of the gate were worked up in various of the park lodges. Of its eight medallions of baked clay, glazed like Delft ware, three are preserved at Hatfield, near Wilham, in Essex; they represent Henry VII. when sixteen *et al.*, and Sir Fisher, Bishop of Rochester, and were retouched by Flaxman when a youth. Two others are, as mentioned, at Hampton Court.

were divided into suites of chambers, whose occupancy is in the gift of the Queen. Faraday resided here from 1858 until his death in 1867. In the person of Tobias Rustat, housekeeper at Hampton Court Palace and yeoman of the robes to King Charles II., a singular link exists between Hampton Court and the existing representatives of two other royal palaces. He gave to the nation the two best out-door statues of which London can boast,—those of Charles II. at Chelsea Hospital and James II. at Whitehall, both the work of Grinling Gibbons. Rustat deserves commemoration for his munificent endowments to our universities and other public institutions; a rival of Colston at Bristol, he gave away as much as 100,000*l.* during his life-time to educational and eleemosynary purposes.

The state apartments on the first floor around the Fountain Court ordinarily shown to visitors, include the guard and presence chambers, King's drawing-room, King William's and Queen Mary's bed-rooms, the Queen's drawing-room and audience-chambers, the dining-room, long gallery, with others. They are approached by the King's and the Queen's staircases, whose walls are an apt illustration of Pope's couplet,—  
"On painted ceilings you devoutly stare,  
Where sprawl the saints of Verrio or Laguerre,"

being decorated with the work of those two artists. It was in a room above these apartments that the fire broke out lately which threatened to extend to the rooms beneath and destroy the pictures they contain. On a careful examination a few years ago numerous errors in the titles of these pictures were discovered. The Raffaele cartoons were not,—contrary to common belief,—in jeopardy, having been sent to South Kensington; but there remain the nine designs of Mantegna, painted upon linen, representing the triumphs of Caesar. Nys bought these at Mantua in 1628. Amongst the more valuable paintings deposited in the galleries may be mentioned some genuine Holbeins,—Henry VIII. and his family; Henry Howard, Earl of Surrey; and Lady Vaux. There are some portraits by Titian, two by Vandyc, —King Charles I. on horseback, and Margaret Lemon,—a Velasquez,—Philip IV. with his queen, and himself with his own family, by Pordeuone. By Zucchero there are Queen Elizabeth's porter (a fine work), and Mary, Queen of Scots. The marine subjects are worthy of mention, if only for the circumstance that one or two of them present curious evidences of the mode of handling our earliest artillery. One shows an engagement at which Mrs. Spragge, whose monument may be seen at Chelsea Church, fought beside her future husband for the space of six hours. In the Queen's Gallery are the seven tapestries designed by Le Brun, showing the career of the hero of Macedon. They were purchased in Flanders by General Cadogan, temp. George I. There are Venuses by Titian and Rubens, Madame de Pompadour by Greuze, Mahne's Adam and Eve, which once occupied a rather conspicuous position in St. James's Palace; the meeting of Henry VIII. and Francis I. on the "Field of the Cloth of Gold" (from which picture our sovereign's head was cut to prevent its purchase), with examples of Rembrandt, Gainsborough, and West. Some old pictures are in the "haunted gallery,"—through which Queen Katharine Howard, escaping from her chamber, ran towards the chapel where the king was at prayers. But the guards repulsed her, and though her screams resounded through the building the king knelt unmoved. Her ghost may be seen hovering between the entrance to the royal pew and a side-door on the Queen's Great Staircase! In the first presence-chamber are the celebrated Hampton Court beauties, due to the brush of Kneller. The corresponding and equally celebrated series painted by Lely, who,—

"On the animated canvases stole  
The sleepy eye that spoke the melting soul,"

and of which Walpole says,—"*the beauties at Windsor are the Court of Daphnos, and ought to be engraved for the memoirs of its charming biographer, Count Hamilton.*"\* were removed hither from the Castle, where their presence was deemed to be little in accord with the manners of a later, and, let us hope, a more moral age.†

\* "Anecdotes of Painting," vol. iii., p. 27.

† In vol. xi. of *The Builder*, p. 201 (August 27, 1881), will be found some curious information as to the erection of the Great Hall; and in the same volume, p. 445 (October 8, 1881), Hampton Court is compared with Versailles.

## CRITICAL COLUMN.

## INTRODUCTION.

The evident revival of modern Classic architecture throughout the land is a phenomenon of most serious import. Silently and steadily the decreed style is being reinstated, and the absence of organised propaganda, of powerful patronage, is of the most hopeful significance. The taste for Classic art is, in short, not being forcibly "revived"; it is itself "reviving" naturally, from grounds and reasons which have accumulated in the wake of time.

The style of the "Revived Gothic" which is just closing its remarkable career was eminently one of "restoration." It was the interest attaching to the decaying monuments of this art and the desire to see them preserved which gave the impetus to Gothic practice. Architects, draughtsmen, and mechanics soon became proficient, and if it was desirable to preserve "old monuments" of a particular style, why should not "new monuments" of this self-same style be erected? The reasoning was not illogical, but certainly inartistic. The same fault was committed which attaches to any and every "forced revival." Admirably grand and perfect as is the Gothic style in itself, and as a product of its own times, in its modern application it has failed to secure our sympathy to any large or lasting extent. For although it will lend itself readily to all modern requirements, although it is capable of much physical transformation, its *spirit* is felt to be out of time with our natures and the general temper of modern times.

Thus Classic architecture is reviving naturally. We feel it to be more "modern," more congenial; it offers at the same time many other advantages which we see and appreciate now that we have come to love it again as a style. It may seem strange to hear Classic architecture called more modern than the Gothic, and yet in spirit, if not in time, it is so. Classic art seems possessed of the spirit of eternal youth; fresh, vigorous, facile, adaptable, it is the only architecture founded upon purely æsthetic grounds, uninfluenced by dominating ideas of religion, state, morals, or physical agents. Such arts as the Egyptian, the Arabian, and the Gothic are deeply tinged and dominated by some emotional or physical influence, outside of the sphere of pure æsthetic perception; the idea dead, the style is dead, and nothing can revive it to intelligent life. We might erect ancient cities, or dress ourselves in ancient garb, and assume the corresponding manners, but this would not revive the concert of ideas and aspirations which belonged to either of the above periods of art, and gave them their character and value; we would but be "moderners," playing a poor comedy. It is different with Classic art, for, founded in its typical elements upon nature, and appealing to man's pure perceptive faculties, it is an art which rests upon a basis which never varies; it is always understood; it is living, growing, advancing with man. Hence, none of the Classic revivals have ever been sterile revivals; they have always accomplished something new and fresh, and each appears like the re-issuance of imperishable principles from the mould of advancing time.

The modern Classic revival upon which we are just entering is, it is greatly to be regretted, being pushed with a hot haste and want of preparation which will for some time jeopardise its prospects and repute. Architecture is so much of a "business," and the dictates of fashion are so inexorable, that architects and draughtsmen, builders and mechanics, are, without notice, called upon to work in a style with which many have had a most rudimentary acquaintance. And as a style of architecture is not learned (to be practised with intelligence) in six weeks, nor in six months, nor in six years, the inevitable result is that the "style" is blindly copied out of books and from existing old or contemporary works; features and details are "adopted" and joined together indiscriminately; grace, proportion, and tasteful handling of mouldings and decorative enrichments are but very rarely to be witnessed. It is in the detail, that test-point of Classic taste, where ignorance is especially displayed; the understanding for traditional types is lost, the eye and hand are unaccustomed to the nice discrimination of Classic forms and proportions. Witness, for instance, the chaste superiority of the older Classic monuments over our vulgar sprawling productions; the seriousness, the science, the

deep art-intelligence of the former are painfully absent in the others. Students could learn volumes from the vestibule of Somerset House and the buildings of the elder Cockerell in the City, and even Burton's entrance to the Hyde Park is well worth a careful inspection. In composition, pure and as arising out of the plan, fewer faults are committed. The laws of composition apply with little variations equally in all styles of architecture, and the Classic lends itself with special facility to the free and liberal development and expression of the plan in the compositional features. However, even in these matters much had work is done, but especially in the way how it is done and the æsthetic means employed, which again leads to the subject of detail in the largest sense of the word.

From this general survey, the occasion may not appear inopportune to open this column for the purpose of a more vigorous and consistent criticism of contemporary work than at present obtains. In so doing, opportunities will present themselves, according to each specific subject, to dwell at length upon the many and varied matters which make up the body and soul of Classic art. It is believed that such a plan of critical comment presents many advantages in bringing home to the student more forcibly anything which can with profit be pointed out. Many lack the inclination and also the capacity to follow abstract expositions of the principles of design; it is dry and uninteresting reading to them. But were these matters developed on the basis of criticising actual London buildings, which the student would be very likely to go and see, these lessons would be conveyed in a manner more interesting and more direct. Architecture is, indeed, largely a contemplative art; it is nowhere learned so well as from a loving observation of its great monuments, provided we have in our souls the chords to be struck and the sentiments to be evoked. It would not be difficult to show that some of the greatest architects of all times, certainly all the really original and striking men, were not book-scholars. They studied, certainly, many deeply, all that can and must be learned from books, but they did not try to find in books what they can never contain,—living art. For real genius is too powerful a force to be long satisfied with the descriptions and definitions of beauty as distilled through the long-channelled funnel of reflective philosophy. Art and beauty, natural or created, are not reflective in character. They are contemplative, impressing; they appeal to emotions, temper, feelings, rather than to reason. It is the "picture" which fascinates our soul, and demands not what it is for nor what it is made of. Hence the way to really learn art is to "see and be instructed," to see with an open heart the beauty of nature and of man's creations, and to deduce from that your own philosophy. This is and must be the course of every architect's education, and those of superior gifts will find the path for themselves; but there are others, and many who enter our profession, with whom the thought and qualification for art are not the leading motives. To such, "art" does not come naturally, and they trust to learning what should be a matter of natural gift. It is those who, if not possessed of genius, may yet possess ability to do good work, who require guidance in their studies. They require their interest and sympathy to be enlisted, to receive hints and directions to enable them to feel their way in the right path, to form their taste on sound lines, and to exhibit it at last in good work according to their own individuality.

Some parts of the crowd which is to be preached, and upon which the criticisms will be founded, have already appeared in the foregoing remarks. In all its details and bearings it can only develop itself in the substance of the specific articles, for it is well nigh impossible, as every writer knows, to state views on art in an exhaustive manner in the shape of a programme or abstract dissertation. The writer, however, thinks it well and also possible to declare himself somewhat more on the general tendency of his thinking. In the first place, he believes that there is too much licence, irrational toleration and want of harmony, in regard to architectural ideas and practice generally; a want of settled, positivist views in regard to the direction in which architectural work should move. This shows itself especially in the widely divergent views on architectural style. We have the Classic, the Gothic, the Renaissance, the Romanesque, the Japanese, the

Constructional, the Eclectic, the Queen Anne, or specially-patented Æsthetic, all in vogue at one time, and respective adherents combat one another with vigour, sometimes with animosity. There are, on the other hand, those who have no definite sympathies of any kind, and who will, with the greatest alacrity, follow any and every style as fashion or business interests may dictate. This state of things shows, to the writer's mind, that the whole question of architectural style is deplorably misunderstood. The fight is about the shadow, not the substance, the shell and not the kernel, although it is that kernel which, like the soul to the face of man, gives life and intelligence to a style of art. A style should be regarded as the outcome of a variety of elements, some traditional, some original to the particular time in question, combined and moulded according to the spirit and temper, moral, religious, and political, of a time or race, and additionally influenced by climatic, material, and technical factors. Accordingly, there are elements entering the substance of a "style" which are not connected in any way with the attainment of physical or æsthetic beauty, nor with wise and economic construction, nor with practical convenience, but elements of sentiment and ideas, powerful forces of religious and moral tendencies, of political aspirations, of greed and conquest, of remarkable individualities like Alexander, Pericles, Catherine of Medici, Louis XIV., Napoleon the Great. Hence, a "style" is really more a matter of "interest" than one of abstract "beauty"; the attainment of æsthetic beauty may predominate, but need not; any one or any distinctive combination of the enumerated "possible" elements of a style may be the "sleeping," the life and character-giving force.

The æsthetic element certainly runs through all styles, but we find it strong and clear in the one, partly subdued and secondary in the other; in one it is the soul and all the melody; in the other but like a faint accord to accompany the dominating force. We see, therefore, that certain forces of architecture are essential ones, always present, more or less, in every style, while others are incidental ones, and, therefore, those which must account for the differences which we know as the distinguishing features of styles. These latter, though, are beyond our conscious control; no people and no time have ever consciously controlled the character-giving elements of their style. We cannot judge, or certainly not apply and direct, these forces to our own work, simply because we do not clearly know them ourselves; we lack control and survey over them because we stand within them. No people have, therefore, ever known, nor ever will know, "what style" they are working towards. For the attainment of the style, clear and well defined, is the very last result of years and centuries of half-conscious endeavour, of instinctive aspiration.

What we can and must do is to study and master thoroughly the "stationary" elements of style, which are nothing else but the principles of design as they run like a silver thread through the entire field of art. These principles are unchangeable, they rest upon man's intelligence and observing faculties; they exercised themselves first and attained high perfection in the practice of the many technical pursuits, and from which they were engrained upon architecture as well-understood types of æsthetic expression. Joined to these there are those practical points of plan, construction, &c., which enter largely always, though in varying degree and manner, in the compositions of architectural art. If we could well study and master these matters,—if we could with intelligence gauge their proper positions and power in the various part styles, and arrive at a more correct understanding of the same,—we might push on our own work with confidence that we too were working towards a style which, judging from the general cast of modern man, we might reasonably hope will be no mean or insignificant one. This is the point of view which we must all reach, all deeply possess, before we can hope to work with promise toward a style of our own. We must become less of antiquaries and more of artists; devote our time less to the copying of the sterile forms of dead styles and more to the study of the continuous elements of design; we must, above all, become fully possessed of the fact that a style cannot be forced on, nor consciously developed. We can but carefully prepare and advance those elements which we

can control; the rest must be left to the womb of time. Why then, it may be asked, should the Classic form of art be advocated in preference to any other? The reasons are two, clear and forcible, and which no amount of argumentation or individual sympathies can overcome. First, in periods of artistic or rather stylistic stagnation and collection, man requires to return for instruction to the spring of art-language,—to that art which illustrates in the most forcible, most direct manner, the great principles of design and æsthetic expression which run through and must form the basis of all styles. Second, that form of art is the Classic as it had filtered itself down to typical perfection from the work of ages in the styles of ancient Greece. The Grecian is the only purely æsthetic style in which "heaviness" alone is the shape and character-giving element. It has crystallised down to tangible perfection for the purpose of architectural monumental use the variety of forms and types of art and design as they first exercised themselves in the technical arts and early forms of architecture; and it can be no accident that this work was done by the race who in every other respect excite our profoundest admiration. These types are like the imperishable stock-in-trade of every art; they are like the language with which we speak and must retain if we wish to be understood.

This is the spirit in which the writer advocates the study and resumption of architectural work on the Classic basis. He does not wish that either of the various forms of Classic or Modern Renaissance art be "taken up" and "developed"; such would be as contrary to his ideas as the taking up of any other style; he wishes to see Classic studied because it is the true monument of art, the best school to teach the materials required for a style. Every race or period must find its work on that model; in times of architectural exhaustion, of beginning fermentation, man must return to that fountain to refresh his spirits, revive his æsthetic faculty, and to collect materials and power for new work. Architecture is an art of re-issues, of re-developments, of traditional types and stationary perceptions founded upon man's general nature, which is unchangeable; they live in his recollection, now vividly, now obscured, but always the same, allowing but of slight modification. And, as nature, in all her variety and wealth, shows but very few distinct forms and types of expression, so true art is not founded upon multiplicity of means, eccentricity of invention, or studied variety, but upon wise intelligent combination.

The writer, therefore, welcomes the Classic revival, not for its immediate results, but for its opportunities. In taking it up we shall all, artists and public, go through a wholesome and promising course of instruction. In addition, there is something more congenial in the general temper of this art; we all feel instinctively that it is free from dominating influences, like the Gothic style reveals, and which are antagonistic to the cast of mind of modern man and his institutions.

We know that Classic, as the freer, more natural, more purely æsthetic style, offers less resistance to our attempt to engrave our own individuality upon the same, to vary the use of its features, to apply it to unusual or entirely new conditions. All these are matters which the electric spark of accident often shapes into unexpected revelations, all elements for a future style. In regard to compositional design, the writer would throw open the entire range of styles we know for eclectic application,—all those features, at least, which have force and reason independent of any particular detail, features, for instance, arising out of the liberal penetration of the plan into the composition. In general, composition is regarded too much as linked to particular detail; it is rather the detail which, while retaining its traditional character, may yet be modified to suit the requirements of compositional features. This was the process in Gothic architecture, also in Arabian, Moorish, &c. Composition is therefore really the free, nay, the very freest, factor of architectural design. It is, in addition to the previously-mentioned influences, the most powerful shaping-force of style. Composition, however, should, while offering every inducement to the imagination, retain the character of reasonable necessity, of exuberance tempered by at least the semblance of requirement. The plan and constructional matters intimately affect composition and style, but this influence must be sub-

ordinate to, and he dominated by, the general laws of design if we wish Architecture, and not mere prosaic building. The theory of modern times, that architecture as an art is the outcome of practical requirement and constructional necessity only, is radically wrong, most inartistic, unsupported by ancient art, and doomed to failure wherever consistently applied. Architecture is something besides "constructed art"; it is also æsthetic, also sentimental art, and its grandest productions are those which show its various possible elements combined by the spell of some dominating idea to a beautiful harmony.

It is precisely with the view to a tasteful future style that the position of the plan and of construction as elements of style should be rightly understood, for no time has been so fertile as our own in new developments, applications, and inventions bearing upon these matters. It will require all the study and skill we are capable of to enable us to master and solve, as true artists, the complicated task before us, and if we proceed to work on wrong lines and in a wrong direction, but shame and chaos can be the result.

As has been pointed out at the beginning, it is in the detail, elementary and compositional, where the contemporary-revived Classic falls short. The understanding for the traditional types of æsthetic expression, for mouldings, conventional ornament, &c., has been lost; the right use and function of many features, the value of proportion, the use and position of colour, &c., are to many a chapter of mystery, and it is believed that much light may be thrown upon these matters, and the general interests of real art-progress be advanced by the introduction of this "critical column" on the lines laid down in the opening statement.

SEMPERIAN.

#### AMERICAN ARCHITECTURE IN ITS CONSTRUCTIVE AND SANITARY ASPECTS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary meeting of this Institute held on Monday evening, December 18, Mr. Ewan Christian, Vice-President, in the chair,

Mr. A. J. Gale, the holder of the Godwin Bursary for 1882 (the first year of its award) described what he had seen during his tour in the United States. He observed that at the invitation of the Council he ventured to bring before the Institute some account of his tour as holder of the Godwin Bursary for 1882, the first year of its existence, although he was obliged to admit his inability to do justice to the subject on account of its extent and varied nature. The tour covered a great deal of ground, and that he had been able to see so much as he had seen was due to the great kindness of many American architects. The tour occupied exactly three months, of which ten weeks were spent in America,—five weeks in New York and the remainder of the time at Philadelphia, Baltimore, Washington, Chicago, Detroit, and other cities. In New York at the time of his visit there were many vast building schemes in hand. Prominent among the matters to which he turned his attention was the work being done by the New York City Board of Health with the view of improving the tenement-houses with regard to drainage and other sanitary arrangements. He had, however, dealt somewhat fully with these matters in the report which he had previously presented to the Council. Vast buildings let off as offices formed one of the sights of New York. Such blocks were continually being erected, and the most recent one generally managed to outshine its predecessors in some particular or other. Foremost amongst the works of this kind at the time of his visit was that known as the Mills Building (from the name of its owner, Mr. D. O. Mills), having frontages to Wall-street, Broad-street, and Exchange-place. The building, of which Mr. George B. Post is architect, was five stories high above the ground level, with a cellar or basement story below. The basement, ground, first, and second floors contained strong-rooms for the deposit of books, securities, and other valuables. All the floors were intended for suites of offices, divisible by means of partitions into holdings of any required size. The lighting throughout he considered good and sufficient, though, judging from the plans, some of the rooms only had "borrowed light." The large entrance-hall

was two stories in height, and it contained elevators or lifts constantly conveying passengers up and down, although the building was only partially completed and opened at the time of his visit. The entrance-hall, which contained a well-hole for lighting the basement, had a glass roof. The offices derived their light partly from the street frontages and partly from the lighting space or area over the roof of the entrance-hall. The height of the cellar or basement story was 9 ft., that of the ground-floor 13 ft. 8 in., that of the first floor 17 ft. 8 in., the height of the stories gradually diminishing from the second to the ninth story, which was 10 ft. in height. The walls were of brick, with red brick facings and stone and terra-cotta dressings. The general design consisted of a simple combination of vertical and horizontal lines, very effective and suitable for the purpose, the treatment of the detail generally being Classic. The roof was flat, constructed of rolled iron joists filled in with terra-cotta bricks in the form of voussoirs, and covered with cement. Roofs of this construction had been used upon almost all recent buildings of large size. The main stairs were entirely of cast iron, with the exception of the treads, which were of slate,—ironwork taking the place of wood in the construction of newels, strings, risers, balusters, &c. The internal partitions between the offices were built of hollow terra bricks corrugated externally to receive the plastering. To preserve the handsome hard wood dados from decay through damp from the washing of the floors, marble plinths were provided. He understood that the drawings for this building were prepared, and the building completed ready for occupation, within twelve months from the time that the architects received their instructions,—an illustration of the great rapidity of performance which was characteristic of American building operations. The heating of the building was effected by steam, on the direct radiation system, and the coils of steam pipes standing in the rooms formed by no means inelegant features. The system of steam heating by direct radiation seemed to find more favour amongst American architects than steam heating by indirect radiation, or heating by hot water or hot air. With regard to the apartment-houses of New York, Mr. Gale said he had entered somewhat fully into details in the report which he had presented to the Council. Many of these blocks of buildings in flats were eight or nine stories high, and those for the middle classes were constructed in the most elaborate manner, and provided with all the conveniences that modern construction could command. The construction of the tenement-houses or flats for the lower classes was under the supervision of the New York City Board of Health, who were empowered, under an Act passed in 1867, and amended in 1879 and 1880, to regulate the construction and sanitary arrangements of these dwellings, and the results which had been obtained under this administration were very satisfactory. Plans of all proposed tenement-houses had to be submitted for the approval of the Board, and careful attention to the observance of the Board's requirements with regard to construction and materials was enforced by a staff of inspectors. The higher class of houses in flats, known as apartment-houses, were subject to corresponding restrictions. These buildings were provided with handsome entrance-halls and elevators, continually running up and down. The best arrangement of plan for these buildings was obtained by grouping round a compact central hall,—not too large, in fact, hardly more than a large lobby,—four or five dwellings or suites of apartments. The servants' rooms were kept quite apart. An entrance-court, formed in the basement, and easily entered by tradesmen's carts, gave access to the servants' elevators. This court, which was well lighted and ventilated, was for the most part covered with a substantial roof, the top of which formed the court-yard or carriage-entrance for the residents. The floors were mostly of fire-proof construction, consisting of iron joists filled in between with hollow arching blocks, the ironwork being protected above and below, and joists being laid on the top surface of these fire-proof divisions. Most of these buildings were constructed externally of brick, with stone dressings. The roofs were flat and of fire-proof construction, and the heating was effected by steam on the direct radiation system. Fire-places were, however, provided as well. The wood-finishings were generally

gods. Some of these blocks of apartment-houses were built by associations of intending occupiers, who were thus able to provide themselves with exactly what they wanted, and at the same time to be able to choose their neighbours. The plumbing and house-drainage arrangements of New York were also under the control of the City Board of Health. Under their Plumbing Law, dating from 1881, all plumbers had to register their names and addresses, and had to submit sketches and details of all works proposed to be executed by them. The chief point in which the regulations differed from the most advanced English views at the present time was in regard to the material to be used for soil-pipes, which in New York were required to be of iron, which must be properly jointed, and coated inside and out with coal-tar pitch applied hot, except where enamelled surfaces existed. The other rules insisted upon by the Board did not differ much from those observed in the best English practice, but there was a thoroughness about the inspection, and an amount of attendance to minor details, which were far in advance of the supervision of an average English local board. Every precaution in the way of ventilation and the prevention of siphonage was rigidly insisted upon. The Durham House-drainage Company, of Chicago, contend that as it is worth while to convey coal-gas in wrought-iron mains with screw-joints in order to prevent leakage, so it is worth while to prevent the escape of sewer-gas by the same means. This Company uses wrought-iron pipes with screw-joints for soil-pipes, which are strong enough of themselves to carry the entire weight of the closet apparatus without any support from the building. By this means, it is urged, all danger of leakages owing to settlements is completely avoided. For the horizontal or drain-pipes, this company uses cast-iron socket-jointed pipes, the joints being made with lead. These iron drain-pipes could be, and often were, suspended from the under-side of the ground-floor of a building, and were provided with movable caps to allow of inspection or cleansing, if necessary. This system of house sanitation had been adopted in a town built by Mr. Pullman, of sleeping-car fame, for his workpeople. In Chicago and Boston, as well as in New York, great attention had been paid of late years to the ventilation of public buildings. The Fifth Avenue Presbyterian Church, New York, better known as Dr. John Hall's Church, was one of the most successfully-ventilated buildings in the world. It was erected from designs by Mr. Carl Pfeiffer, and was pronounced by Captain Douglas Galton to be the best ventilated church he had seen.\* The Madison-square Theatre (of which Messrs. Kimball & Wisedell were the architects) was also very effectually ventilated on the same principles. The most important work now in progress in Philadelphia was the immense block of public buildings to contain the various municipal offices. The buildings occupy a nearly square site, the two frontages from north to south measuring 486 ft. 6 in. and the two frontages from east to west measuring 470 ft., the area of the site being 4½ acres in extent. The offices are grouped round a huge quadrangle. The large tower in the north front was 90 ft. square at the base, and it was proposed to carry it up to a total height of 555 ft., it being surmounted by a statue of William Penn 36 ft. in height. The following were some of the other dimensions:—Height above pavement-line to centre of clock-face in tower, 361 ft.; diameter of clock-face, 20 ft.; height of upper balcony, 296 ft.; total number of rooms, 520; total amount of floor area, 1¼ acres; height of each centre pavilion, 210 ft. 10½ in.; height of corner towers, 161 ft.; height of basement story, 18 ft. ¾ in.; height of principal story, 33 ft. 6 in.; height of second story, 35 ft. 7 in.; height of third story, centre pavilions, 26 ft. 6 in.; ditto, wings, 24 ft. 3 in.; ditto curtains, 20 ft. 5 in.; height of attic of centre pavilion, 15 ft.; height of attic of corner towers, 13 ft. 6 in.; height of figures on centre dormers, 17 ft. 6 in.; height of figures on corner dormers, 12 ft. 10 in. The substructure was of fine white granite, the superstructure being of white marble. The tower was to be built of squared dimensioned stones, weighing from two to five tons each. It had not been attempted

\* See *Builder*, vol. xxiv. (1876), pp. 193, 195, for view and plans of this church, together with description of warming and ventilating arrangements.

to make the building fireproof in the sense of protecting all the constructional ironwork. The building was being erected from the designs of Mr. John McArthur, architect, under whose superintendence the sculpture and carved work in general were executed after models prepared on the spot. Mr. McArthur's designs were selected in competition in September, 1869, and the building was commenced early in the following year. The total amount spent upon the building up to 1879 was \$5,000,000, and the estimated total outlay was \$10,000,000.\* The new Post-office at Philadelphia was next described in some detail by Mr. Gale. It is being erected under the superintendence of Mr. James G. Hill, Supervising Architect to the Government. The drawings for this and similar buildings were made in Washington, where architectural matters formed a branch of the Treasury Department. Mr. Hill's last annual report showed many court-houses, post-offices, custom-houses, and the like, in course of erection, each under the care of a competent official architect. The essayist then proceeded to say a few words as to the Johns Hopkins Hospital, Baltimore, which he said was one of the most interesting buildings of its kind in the world. This building was the result of a study and examination of all the chief hospitals in Europe, by Dr. Billings, of the United States National Board of Health, who was selected for that purpose under the will of the founder, the late Mr. Johns Hopkins. The architects were Messrs. Cabot & Chandler, of Boston, and Mr. Niernsee, of Baltimore, the last-named gentleman being the consulting architect. Mr. Gale, in conclusion, noticed the methods of constructing iron-fronted buildings, and described the precautions which were being taken in Chicago, Boston, and other large cities against the recurrence of such disastrous fires as those cities had experienced of late years. Several methods of fireproof construction were described, including the one which is being applied by a company under the management of Mr. Wight, formerly an architect.

The Chairman, in inviting discussion, said he thought Mr. Gale had shown that he was a very proper holder of the Godwin Bursary, and he had given them a large mass of information which it was not easy to digest all at once. When Mr. Gale was describing the immense public buildings of Philadelphia, and the enormous scale upon which everything was being carried out in them, he (the Chairman) felt very much like one of the inhabitants of Lilliput. He was reminded of what Professor Cockerell was very fond of dwelling upon,—the description of the stones which were used in the building of Solomon's Temple,—“great stones,” “large stones,” “costly stones.” The new public buildings in Philadelphia resembled Solomon's Temple in another particular, viz., in the fact that every stone and every part was prepared ready for fixing before coming on the site. There was a great deal to be learned from the doings of American architects, as detailed by Mr. Gale, and from personal observation during a visit to America he (the Chairman) could fully confirm a great deal that had been said by the essayist.

Mr. John Slater said it seemed to him that America was the country, *par excellence*, where suggestions were to be picked up by architects. To put the matter colloquially, it was the great place for an architect to visit than the States, after studying on the Continent of Europe the artistic and archaeological sides of his profession. The Americans were, in fact, so ingenious that their ingenuity was catching, and it appeared to be impossible for any one to visit the States without deriving much instruction. As a proof of this assertion, he mentioned that some time ago he was superintending some work where the builder's foreman was a man who had visited Chicago, and spent some time there in working at his trade,—that of a carpenter and joiner. A very excellent foreman he was. Like Ulysses, he was fertile in resource, and altogether he was a very different sort of man to the average builder's foreman. It appeared to him (the speaker) that builders and builders' foremen were the most conservative men that it was possible to come across. They seemed, almost without exception, to think that what was good enough for their fathers was good enough for

\* A double-page view of this building, and some additional particulars, will be found in the *Builder* volume for 1876, pp. 712, 715.

them. As a rule, they had very little idea of the scientific principles of building construction. The consequence of this state of things was that if an architect wanted to do anything out of the ordinary way it was very difficult to get it done properly. It resulted from this, again, that architects were, in a measure, in danger of confining their work too much in one groove. For these reasons he looked with great delight upon the institution of the Bursary which Mr. Godwin had been good enough to endow, for by its means they would be enabled to get a practical knowledge of a great many of the constructive and other details of the architecture of other nations, and should be taught the wholesome lesson that everything English was not necessarily the best. It was only with regard to what might be called the constructional part of an architect's profession that he made these remarks, for he thought that the attempts which had been made of late years to evolve what had been called a “Victorian” style had not been very promising. The chief points observable in American architectural practice were the means that were taken for economising labour and for utilising waste products. Of course, those results were largely due to the fact that in a new country, where labour was scarce and therefore costly, it was necessary to devise labour-saving machines. To take the use of the telephone as an instance, he believed that in America there was hardly a town of 6,000 or 7,000 inhabitants that was without its telephone exchange, and the amount of time and labour saved by that one appliance alone was prodigious. With regard also to electric lighting, the practical adoption of that means of illumination was very much more largely developed in America than in this country. Then again with regard to the utilisation of waste products, great strides were being made in the United States. He was reading only last week in an American scientific paper how a large manufacturing firm had hit upon a means of condensing the smoke from their furnaces, with the result that from a million cubic feet of smoke they had been able to extract 4,000 lb. of acetate of lead, 70 gallons of alcohol, and some other useful products, the gain achieved representing not only the value of the products so saved, but including, of course, the preservation of a purer atmosphere. These were only a few of the ways in which the Americans were turning their ingenuity to account. He should have been very glad if, among the other subjects which Mr. Gale had been able to study, some mention had been made of the educational buildings of the States, to which great attention had been paid. A few months ago he (Mr. Slater) received from the Educational Bureau at Washington a treatise on rural school architecture, showing the best means of planning, building, ventilating, and warming such schools, on which, as a rule, only a very limited outlay was possible. In the treatise the scientific laws of ventilation were precisely laid down and illustrated, and altogether the little book was one of the most useful of its kind that could be conceived. If in this country our own Education Department would issue such manuals great good would be done, if only in preventing School Boards from laying down such absurd conditions as were sometimes imposed by them upon architects whom they invited to send in competitive designs for schools. The treatise to which he referred was issued in 1880, and it was stated in the preface that it was hoped to issue further publications dealing with the construction of high schools, academies, and colleges,—in short, with buildings for what we called secondary education. He begged to move a vote of thanks to Mr. Gale for his paper, and he thought that the Institute might be congratulated upon the first results of the Godwin Bursary.

Mr. H. McLachlan said that as an unsuccessful competitor for the Bursary last year, he had much pleasure in seconding the vote of thanks to Mr. Gale, who had evidently made good use of his time and opportunities. It appeared that in America there was great variety of materials; for, besides stone, brick, and wood, iron was also used for the fronts of buildings. It would be interesting to know a little more as to the manner in which buildings of iron and wood were protected against injury resulting from the extreme climatic changes experienced in North America. How was it possible to warm the buildings which were constructed on what had been spoken of as the “iron shell” method? If he understood that

mode of construction, the front of the building consisted for a large part of its surface of a mere skin of iron, which would afford little or no protection against extreme external cold or heat. It was well known that the old abbeys of Britain, where the walls were very thick, were warmer in winter and cooler in summer than buildings whose walls were of the thickness now commonly used. With regard to the methods of fireproof construction which had been described, it appeared to him that there was danger in covering up the structural ironwork in the manner described, inasmuch as iron was, as everybody knew, liable to decay by rust, and it was, therefore, advisable to be able to get to the ironwork to inspect it occasionally, so as to judge of its condition. But by the means of covering-up which had been described, such inspection would be impossible. Mr. Gale was to be congratulated on having got together so many drawings explanatory of what was being done in America.

Mr. W. Woodward expressed the hope that, as the paper was one of great interest and practical value, the Council would publish an adequate number of the illustrations to accompany it in the "Transactions."

Mr. Andrew T. Taylor said that as he had just returned from a visit to the United States and Canada he should have much pleasure in supporting the vote of thanks. He could heartily endorse what had been stated by Mr. Gale as to the activity and energy which prevailed in America with regard to architectural and building matters. Great progress was being made by the architects on the other side of the Atlantic. A few years ago it was the habit of all architects in this country to say that no good thing architectural could come out of America, and the works of American architects were, as a rule, looked upon with contempt. But that feeling was fast dying out, for within the last three or four years the strides that had been made by American architects on the artistic side of their work were something wonderful, especially in regard to private residences. Within the period named there had been built in Boston, New York, and elsewhere, houses which, from an artistic point of view, it would be difficult to surpass, even in London. The Americans spent large sums of money on the interior finishings of their houses. They frequently spent 60,000, or 70,000, on the interior of one house. The fittings and joinery were generally of hard and costly woods, and the buffet was very often a part of the construction of the house. Two of the most noticeable and costly houses which had lately been erected were those of Whittier, the poet, and Mr. Vanderbilt. A visit to the mansion of Mr. Vanderbilt, he was bound to say, was somewhat dazzling, so costly and rich were all the finishings and "appointments." Indeed, it was said in New York that several tradesmen had made their fortunes simply out of the furnishing of this mansion, which, by the bye, had for its principal entrance the famous of Ghiberti's celebrated gates of the Baptistery at Florence. As the cast-iron construction of house-fronts, he (the speaker) had been much disappointed with it. He was in hopes that the Americans would have succeeded in evolving a style which would have been suited to the characteristics of the material, but all their attempts seemed to follow more or less closely the lines of stonework, and being shams, they were, of course, failures. One of the most striking features to be observed in connexion with the lofty buildings of New York and other American cities was the very general use of "elevators," or lifts, as we termed them. One or more of these elevators was to be found in every building, and being always in motion there was no waiting by passengers who wished to ascend or descend. The more general adoption of elevators or lifts in London buildings could not but be attended, in his (the speaker's) opinion, by great advantages, foremost amongst which would be the realisation of rents for the upper floors of lofty buildings almost equal to the rents now obtained for ground or first floor suites of rooms. With regard to the Philadelphia public buildings, the lofty tower described by Mr. Gale was not yet built, and it was doubtful whether it ever would be built. The buildings themselves were very French in general massing and grouping, and their architect had evidently made particular study of the Tuileries, Louvre, and the new Hotel Dieu. The detail, however, was indifferent, though not so very bad for America. The detail of the

new Post-office at Philadelphia, and of some other Government buildings in the States, was very poor, showing great poverty of invention. The explanation of this would appear to lie in the fact that all these large buildings were designed at head-quarters in Washington. He agreed with Mr. Gale that many of the large apartment-houses of New York exhibited great ingenuity of planning, and he was able to corroborate all that had been said as to the use of the telephone and other labour-saving appliances.

Mr. Gordon Smith, architect to the Local Government Board, said, with reference to the way in which things were managed in New York and other cities with regard to plumbing and drainage, that he thought it just possible that if all regulations for such works in London were administered by one central authority, such as the Board of Works, we might be able to do better than we now did. But he should like to know from Mr. Gale whether the Boards of Health of New York and other cities were harassed by the operations, just beyond the confines of the areas under their administration, of such a being as our own "jerry" builder?

The Chairman, in putting the motion, said that, having had the advantage of travelling in America, though only for a short time, he was very much impressed by the "go-aheadness" of the Americans. If a man in the States brought out a good invention connected with building or anything else, it was straightway adopted all over the country until something better was produced, when that, in its turn, was taken up. The Americans did not wait, as we in England did, for things to be perfected before they used them. The telephone, for instance, had been in common use in Detroit for two or three years, and householders who needed the services of butcher, baker, or doctor could, by making their desire known to the officials at the telephone exchange, be "switched on" to the wires connected with shop or surgery, and so could give their orders or ask for advice without leaving their houses. Take, again, the electric light, which had been in general use in Detroit for years, although the English were still waiting for it to arrive at perfection before adopting it. With regard to the subject of ventilation, as carried out at Dr. Hall's church, he (the chairman) could fully confirm what had been said by Mr. Gale. The only quarrel he had with the church was that it was too luxurious, for every person was provided with an easy chair. Not only in regard to ventilation, but in the matter of acoustics, Dr. Hall's church appeared to be perfect. It was built for a congregation of 2,000, but in a building of the same size we in England would pack at least 3,000 people into it. As to iron for the fronts of buildings, he was sorry to hear that his nephew (who was his pupil twenty-eight years ago) had become such a heretic as to adopt iron fronts. He had not done so when he (the chairman) visited Detroit. Long ago, in New York, the enormous store belonging to A. T. Stewart & Co. was entirely built of iron, and it was the most horrible and bald-looking building that could be conceived. With regard to comfort in dwelling-houses, in the coldest weather the indoor temperature was equally maintained at from 65° to 70°. The walls of the houses were so constructed that the occupants did not suffer from changes of temperature, as we did in this part of the world.

The vote of thanks having been agreed to unanimously,

Mr. Gale, in reply, said he was unable to say whether there were jerry builders round about New York. If there were, he did not seek out their works as objects of study. As to iron buildings, it should be remembered that there were two methods of using it, one of which was seen in Stewart's store, where the entire front was of iron treated in imitation of stone, having columns of Classical character and elliptical arches,—the whole design being as unsuitable as it could be for iron; but in New York and other cities a better method of treating an iron-fronted building had sprung up, and he might plead for Mr. Gordon Lloyd to Mr. Christian and others that Mr. Lloyd's iron-fronted buildings were not attempts to reproduce architectural features in an unsuitable material, but they consisted in a combination of vertical and horizontal lines, with ornament which was suitable to cast iron. With regard to the beating of buildings, it was effected in various ways, as by direct and indirect radia-

tion from steam pipes, by hot air, and by hot water. As to the heating of the iron shell buildings to which Mr. McLachlan had referred, there was no difficulty whatever, for between the external skin of iron and the internal walls air-spaces existed, forming, in reality, a kind of hollow wall. Buildings, of course, suffered from great extremes of temperature, but so far as he could judge, the joints were so well lapped and checked in various places that they effectually resisted changes of temperature. With regard to the fire-proof encasement of iron columns and girders, the enclosing materials hermetically sealed up the ironwork, it being believed that where the air could enter fire could also make its way. Hence the ironwork in buildings so fireproofed was not likely to suffer from rust. He was not concerned to defeat the detail of the Post-office at Philadelphia, but it ought in fairness to be said that other Government buildings erected under the superintendence of Mr. J. G. Hill displayed an amount of artistic taste considerably in advance of some of the buildings put forward as specimens of Government architecture. In conclusion, Mr. Gale said he agreed with a former speaker in commending the ingenuity of plan shown in the New York apartment houses, which were well worthy of study in this country.

#### THE LARGEST GREEK TERRA COTTA.

It was announced some time ago that the Russian diplomatist, M. de Saburoff, who is noted as one of the most successful collectors of ancient Greek works of art, had come into possession of a terra-cotta statue of unusual size and value. At a recent meeting of the Berlin Archaeological Society, M. de Saburoff showed two photographs of the relic, one of them representing the entire statue, and the other only the head; and the celebrated Greek scholar, Professor Curtius, availed himself of the opportunity of pointing out the peculiarities and value of the original work. This terra cotta is quite unique, both in its dimensions and in point of artistic execution. It was obtained from Corinth. It is one-third of life-size, and represents a youth leaning at ease, like the Satyrus of Praxiteles, on the trunk of a tree. The statue is treated quite after the terra-cotta style. At the back there is the large opening which is commonly found in such works, and the purpose of which was to allow the escape of the excessive heat during the burning process. The whole stamp of the work strongly reminds us of the manner and style of Praxiteles. On the whole the statue is well preserved. The left shoulder is elevated, and the right hip and leg stand forward as in the *Hermes of Praxiteles* found at Olympia. The figure, too, shows the same inclination of the head, and the countenance the same expression of rapt enthusiasm or reverie. Not only does the general treatment of the body remind us of the *Hermes*, but also many of the details, particularly the short hair growing up over the brow and the treatment of the drapery falling down in perpendicular folds over the support on which the left arm rests. There are still clearly preserved many traces of the original colouring of the statue. The nude body was flesh-coloured. There are remains of the dark colouring of the hair; and in the hair there are still traces of a wreath, though its particular botanical character is no longer ascertainable. What name the statue bore, or what it is specially intended to represent, is also as yet a secret. As compared with the *Hermes*, the figure impresses us with its exceeding softness, with the almost feminine character of the pelvis formation, and the position of the feet. It is certain that this terra cotta belongs to the period immediately following the great statuary works of the fourth pre-Christian century, and it shows clearly how the spirit of Praxiteles had stamped itself on the succeeding age.

**Lifts and Grilles.**—Messrs. Clark, Bunnett, & Co. (Limited), of Rathbone-place, have instructions from the committee of the West London Hospital, Hammersmith, to fix one of their patent direct-acting hydraulic lifts to the new wing of the hospital now in course of erection; and this company are also fitting wrought-iron grilles to the whole of the internal shops, and large portcullis gates, weighing about 3 or 4 tons, to the main entrances of the new Central Fish Market, Farringdon-street, the latter being worked by hydraulic power.

THE FOUNDATIONS OF ART IN  
ARCHITECTURE.\*

It is said of the greatest living master of military strategy, that he is "silent in seven languages,"—a pretty plain suggestion that, in military matters at least, he who speaks the least is likely to know the most. In matters architectural there is some analogy; for at this moment the architects who are producing the best work in England seldom or never make a speech or deliver a lecture about the things they know so well. Among such I could mention several able to tell you more than I am likely to do to-night. But you have chosen to invite me. Your excellent secretary conveyed your wishes in so exceedingly graceful a manner, that an immediate refusal must have savoured of churlishness. I afterwards failed to frame a sufficiently polite "No," and, further, I felt that if the architects of Leeds wished to hear a word of warning and encouragement from a brother North-Countryman, it became, in some sense, a duty to give it. I stand before you, therefore, with some reluctance. I have always grave doubts whether silence and close devotion to work are not the architect's true course. He speaks best through his works. I never heard that Giotto made a speech or wrote anything about architecture, although in his works he is one of the greatest preachers that ever lived. If the attainment of the highest excellence in art be our goal, the race is certainly not to the talker, though from time to time prizes and popular favour be won by him of the greatest noise. He, indeed, may secure temporary fame, and leave bags of money to his heirs. The patronage and applause of the ignorant should never be the architect's aim. He alone wins who has done his work right well,—who leaves behind a record of lofty thought in buildings, and who has succeeded, during his short span of life, in carrying the principles and practice of his art one step forward.

There is another side to the question. Something is due to our brethren,—something necessary towards the public. The aid of language and of public speech cannot be denied to any of the arts, and in reference to architecture it is perhaps essential. Our honest British public cannot read fine art in architecture, like the old Athenians, partly (as some snarling critic will say) because they are not accustomed to have such fine buildings set before them. At any rate, at present they must be instructed through the ear, or their eyes will admire the things they should not. And none but architects can give such education, or can help forward a public desire for better buildings fitly allied with painting and sculpture.

The present time is peculiarly one of talk, rather than of literature, especially so far as we are concerned, for little of it smacks of letters. The whole status of architecture, as a profession, and as an art, has probably suffered from the too great reticence of its leading members. It is fair to judge of this by public estimation, and if we compare the position of architecture with other professions, Law or Medicine, we have cause to deplore it. No man of rank, however poor, has thought it desirable to join this the oldest profession, which ancient Egyptians allowed none but nobles to enter. We have no representative in Parliament. No living architect carries the honour of baronetcy. One only that of knighthood, for political reasons. On the other hand, architects have allowed the hulk of the ordinary buildings to drift into the uncontrolled and vulgar hands of speculative builders, and, on the other, into the hands of special constructionalists, eschewing art and calling themselves "engineers." There is no reason why the best architect should not also be the best engineer of his time, like Leonardo, or, at least, why more constructionalists, who have no higher aim than the desire to exhibit mechanical skill, should not be allied to men possessing knowledge of art.

Now, if we wish to raise the whole tone and status of the profession, how is it to be done? Surely, first of all by becoming better architects and artists ourselves. If we wish to see art advance in our own case, what should be our first step? Surely to abandon copyism. When we have done ever so little a bit of true designing by ourselves, we are in a fair way to do better. So long as we merely copy the productions of others, our life, as true artists, has

not even begun. This may sound hard. But it is true. For well-nigh two centuries we have accustomed our British public to the spectacle of unblushing copyism, and now it is taken for granted. Modern architecture has scarcely yet awoken from its condition as a daily lie, and the world has not yet begun to suspect it of truth. When a new building is finished, architects and newspapers unconsciously assume its pinchbeck qualities, and speak of it as "Gothic of the thirteenth century," "Greek," "Elizabethan," "Queen Anne," &c. Turning over the pages of a dictionary, one of the best in the language, I recently came upon this definition: "An architectural construction, in the artistic sense, must possess not only utility, but beauty, and also unity; it must be suggestive of some idea, and referable to some model." Thus, after pretending to describe architecture "in the artistic sense," good sirs, it finally, and in five words, denies it all position as a living art. When a man asks me what style such and such a building of mine is in, I know that he means,— "What past style have I been copying?" So I generally tell him I do not know, for, in his frame of mind, he cannot understand any other reply. Copyism in architecture is just as worthless as it is in pictures. Neither more nor less. Style, as applied to modern work, always means copyism. Our first step must be to set our faces like flints against it.

My hope for the future of English architecture really lies in the younger generation who are coming on. Their life is before them. Let them begin at the beginning. Let them know their construction and the right use of every material with which they have to deal. Let them always, from their outset, work in a true, honest, simple, real way. Let them study sculpture in its relation to buildings, and even essay to do some themselves. Let them cultivate an eye for colour. Then, perhaps, in course of time far hence, style may have come to mean, as it should, a thing of the past, and the day of truth may have dawned. If every man were working in this spirit, by degrees the public might perchance take an intelligent interest in new work, now unfortunately diverted to the damage and destruction of old, and in course of time, a real school of English architecture might again blossom into life.

Thoughts like these were passing in my mind when asked to fix the title of to-night's address. And it appeared to me that I should rather say something to set you thinking, something having for its object rather the kindling higher of such fire as may be in you, than to rattle the T-square and compasses in the approved method of the British architect; most lectures about architecture are either purely historical, and, therefore, consist never have been written, or, they consist of well-worn platitudes which, also, you can string together for yourselves out of any architectural library; I have elected to forget technicalities and to avoid the usual architectural jargon. You shall hear nothing of antæ and responds, triglyphs, or tracery from me. Of bewildering and fruitless theories as to this method of construction, or that style of architecture, I shall say nothing. Whether I care most for Greek or Gothic, Queen Anne or Chinese, you shall not know. For the study and dissection of any of the past styles of architecture, I leave you to Vitruvius or Pergusson, Viollet-le-Duc, or Burckhardt.

The title I have chosen is far-reaching, and might be made to cover much more than the limits of a short address will allow. It is not, however, the material "foundations," the concrete and footings, which will claim your attention, however necessary these be to good building, but rather the higher things on which good art must rest when more building begins to be architecture. In a word, my aims are directed towards the future. The dead past may hurry its dead. Let us study the past, diligently and laboriously, so far as we can learn from it. I should be sorry to be misunderstood on this point. The most scholarly architect is likely to be the best. But when we come to our own work, after having studied well the past, let us abandon copyism and apply living principles. In this view I have for some years urged the importance in architecture of three things, viz., good form, good proportion, and good colour, and, I am fully to believe, not without some results. These standards or tests, by which we may from time to time judge our own work and see wherein we have failed, are of more practical use than thousands of pompous platitudes. It is our business first of all strenu-

ously to lift higher and higher our ideal of art. If we are honest workers, our own judgment unflinchingly given on our work should be the only one we really care for. What are loosely called matters of taste are clearly and definitely matters of knowledge, hotter known to the artist than to the critic. To-night, therefore, in the hope that what I have to say may be of some use, I propose to set before you three other things of great moment to architecture, over which you may chew the cud, and by whose aid you may hold the mirror up to nature. In the modern rush of thoughtlessness, commonly called progress, they are apt to slip out of sight. I name them Truth, Intention, and Rigidity. The first is the starting-post. The second marks the course. By the third you must be judged in the race as by your conscience.

It is over to be remembered that we, as masters in our craft (I dare not say masters of our craft), are exponents of the age in which we live as well as of the art which we practise. The history of architecture is the history of the world, unbiassed by the leanings of the partisan. It is the handwriting on the wall. He who would know his history aright should also learn to decipher the lessons of contemporary buildings. At the present moment each of us in his own way is unconsciously writing chapters in the history of England. We speak in different languages, some Gothic, some Classic, others perhaps, only a lingua-franca, or even broken English, and frequently fail to grasp one another's full meaning. But what we have to say is recorded in brick, or stone, or marble, and we can never escape the responsibility which attaches to this kind of public writing. It must stand as a monument illustrating the condition of art at the time, and, in its knowledge or ignorance, must either lend additional lustre to a country of which we are all proud, or stamp it with more or less of degradation.

I. TRUTH.

This brings me to the consideration of my first principle, Truth. Whether we speak merely of the right use of material in building, or carry the principle further, truth, all-pervading truth, is as essential to good architecture as it is to moral character in the man. It lies at the root and foundation of all things in architectural art. At the risk of exciting a suspicion that, after all, I am about to deal in concrete and footings, I must first emphasise the importance of truth in the treatment of every separate material with which you have to deal. I do not mean that you are to reveal all the anatomy of your buildings, exhibit all your ugly beams, and notch and stop-chamber the edges of your doors. Some methods of early workmanship in England have become obsolete. The craft of the joiner, for instance, has certainly made progress since the thirteenth century. I fear I cannot be so sure about that of the stonemason. Our work, or the study of any branch of it, can never be so humble as to be unworthy of being done rightly or studied completely. Old George Herbert well expresses the principle when he says, "Who sweeps a room as in Thy sight, makes that and the action fine." It is in this conscientious sense that I wish to bring you down first of all to the artificer's level as to a foundation, and to impress upon you the importance of knowing some of the secrets of each trade. If you wish to design in stone or brick, wood or iron, brass or leather, silver or gold, you must first learn to be, to a considerable extent, at home in the true workmanlike treatment of your material. Without knowledge of these and adherence to their truth as to a sheet-anchor, there can be, in point of fact, no true design. Your most brilliant ideas, your most beautiful thoughts, can never be grammatically spoken into life and given to the world. The words halt, the speaker stutters, the point of the discourse is lost, and even wanders into quite other themes. I say emphatically that all our beautiful drawing and designing will fail in the final result unless we take heed to this. If ever we are led to admire a noble work belonging to ancient times (I leave the choice to yourselves), and are thinking of the higher qualities of the art displayed, let us pause and look deeper. We shall always find this principle lying at the base. It implies the matured skill of the craftsman possessing traditional knowledge of his material. It involves the incapacity for lying, for torturing the products of nature, or for pretending that your work is something better than it is. In modern times workmen have lost it quite, while many architects only grope

\* An address delivered before the Leeds Architectural Society by Mr. Edward Robert Robson, F.S.A., December 4, 1882.

after it. I have occasionally, in out-of-the-way villages, found workmen who had not lost the traditional workmanlike instincts of their craft. But they have been rare. Nearly two centuries of deadness in art, the introduction of the system of building-contracts, and the development of trade-unions, founded only on greed and not to advance knowledge, have done their deadly work. And it is sad to reflect that the English handicraftsman is no longer what he was. In each walk it had taken generations of workmen, in the various trades, to arrive at their extraordinary skill. From time to time it was no uncommon thing to find that one of the more specially skilful had imbibed so large an instinct for first-rate work and love of his craft that the power of design seemed to come to him and he often carried his work into the very realms of art itself. Times are now changed. The workman so little understands the position, and the imminent danger he runs of being superseded on all hands by the foreigner, that he now does not even see the importance of his soul serving a regular apprenticeship to his trade. Some attempts are being made to counteract this evil, and technical schools will, doubtless, soon be found in every centre of population in England. With all their value they can never supersede the necessity of apprenticeship, and the imperative duty of acquiring that intimate acquaintance with craftsmanship which is never acquired except through the fingers' ends.

I am scarcely prepared to assert that every architect of the future should enter the portals of the profession through the builders' shops, as I myself have done, though I am ready to admit that it is a very good way. Nor am I prepared to lay down that good architecture can alone spring from the artistic instincts and skill of the workman. There must ever be the controlling mind. There is so much, beyond the workman's knowledge, to be acquired in our profession, that a man's life seems all too short to compass the wisdom of the ancients, the cunning of the craftsman, and the habit of creative design. Our art cannot in these days be left to workmen. The time is yet far distant when architects can be dispensed with. But there is no hope of seeing penal laws in force against the speculative builder or the slovenly workman until every architect in the land himself knows his work and has made himself worthy of his name. Of one thing I am sure, viz., that a much more intimate, close, and accurate knowledge of materials is a vital necessity to architects themselves if the workman in his work is to be lifted higher and higher, so as to become a true exponent of artistic thought in building. When we once fully realise that, for the most part, the British workman seeks to get through his work as quickly as possible, with no higher aspiration than the slave at his task, it behoves architects to use their influence to help, to encourage, and to point the path by every means in their power. And before they can truly help, they must themselves know. How many of us know his brick, his stone, his iron, his plaster, his glass, his woods, &c., in the same intimate sense that Pallissy, or Wedgwood, or Robbia, knew his pottery; Cellini his brass, silver, or gold; Carpaccio his paints; or Matsys his iron? Few indeed. We see on all hands designs falling in perfection at some point or other, from want of full knowledge of the proper use and capabilities of the material. The usual examples of this ignorance were, I am happy to think, more common a few years ago than now (for I am dwelling on no new subject), such as stone moulded and jointed as though it were joiners' work; wrought iron designed as though for casting; cast iron or bronze designed oblivious of the mysteries of the foundry's trade; brick-work, with no care about squareness or colour of brick, the laying, bonding, or jointing; joiners' work wrong in every possible way, &c. If say I am happy to think these more glaring defects are less common. They are still seldom entirely absent, as they ought to be, from modern work. Indeed, the instinct which in old times caused men to use materials truthfully seems not only to have died a natural death, but to have largely been replaced by another and singular instinct for doing things wrongly by preference. In the thousand and one small matters which go to make a fine building, this is peculiarly, universally, and painfully true.

If you will accept and act persistently upon the principle of "truth," even at first but in the

treatment of material, you will be astonished to find the length to which it will ultimately carry you. If it appear to lead you astray, it can only be because you have not fully understood it. The student of English Gothic work has the advantage at starting, because he cannot have studied well any of the grand specimens of our Mediæval architecture without imbibing, perhaps in spite of himself, some sense of the elementary portion of the principle. It forms one of the finest fields in the world for such study. The principle, however, in its broad aspect, is common to the really good art of all time,—I care not whether it be called Greek or Gothic, or is produced in Italian marble or English brick. It leads the mind more and more closely to the full meaning and beauty, the expression and musical rhythm of every detail, every cornice, and moulding, and carving of the work, and, finally, in its complete mastery, forms the groundwork on which alone noble architectural works can be conceived and carried completely through.

To their intimate knowledge of stone as a building material it was owing that the workman-architect of the Middle Ages could shape the lofty vault, and build the marvellous tracery, which delights us at Amiens, Lincoln, or York. Without it, the "*Majestier Lapidaire*" of Cologne Cathedral, the "*Ingeniator*" of the Galilee at Durham, and the "*Premier Masson*" of Notre Dame must all alike have failed. To our ignorance of the same thing is due the incessant tinkering found necessary upon the stonework of the Houses of Parliament. Similarly, the cause is not far to seek when the church-destroying restorer pulls a stone from its resting-place of 500 years, and finds, at the end of twenty more, his brand-new stone in a far worse state. We can the less afford to be ignorant; for we have no race of Freemasons working shoulder to shoulder in mutual instruction, and able to bring the special knowledge of their craft to him who would proportion a building. In these days he must know it intimately and thoroughly himself, learning, like any other subject, from the bottom upwards. We can never design with a perfectly free band and merring eye; never be more than poor imitators of a bygone time; never infuse into our work real life, without this kind of knowledge.

Another reason, and likewise of the practical kind. Look at the general condition of things in the nineteenth century. The age of despots is past. Englishmen are never in the future likely to live under any worse grinding tyranny than the catenacs. Workmen are no longer slaves, even though they care quite as little, or less, about their work. The days when the prelates of powerful churches, or the despots of petty kingdoms, could employ the untold labour of their serfs in carrying out the architect's dreams have gone for ever. As Mr. Ruskin has said, "For us there can be no more the throne of marble,—for us no more the vault of gold; but for us there is the loftier and lovelier privilege of bringing the power and charm of art within the reach of the humble and poor; and, as the magnificence of past ages failed by its narrowness and its pride, ours may prevail and continue by its universality and its lowliness." Here and there an exceptional building falls to the share of an architect,—as a Parliament House at Westminster, a cathedral at Truro, or Law Courts in the Strand. But, as a rule, we must be content to do simple things, and to do those simple things as well as in us lies. Buildings of unlimited cost are now out of the question. Every one who wishes to build wishes also to build with due economy. Be it our aim to help him to build with art also. The time of the workman now means,—to put it in one word,—money. We have to produce buildings simple and good. And the importance to the architect, who would succeed, of knowing precisely how and where to place rightly every shilling of expenditure on his building, whether of moulding or ornament, sculpture or painting, has increased of late a hundredfold.

I am well aware that all this is rank heresy. I shall be told that I am endeavouring to reduce architecture from its lofty position as one of the fine arts down to the level of mere building or of ornamented construction. Not so; not so. Architecture comes after. Get your dictionary definitions out of your heads as fast as possible. You cannot write poetry, or even respectable prose, till you have absolutely and completely mastered your spelling, your verbs, and your syntax. And if you would attain to

the greatest mastery, you must also know your Greek and Latin derivatives. Architecture has its grammar, its common verbs, its tiresome syntax, and its derivatives. You must know the several trades involved in building; recognise how one works with and fits into another; harmonise the several parts, like Beethoven's chords, and work like scholars knowing the past history of their art, and having distinct aims for its future,—I say you must learn all these, if you would speak the language fluently or perchance write sonnets in it.

Unlike the painter, who places his creations at once upon the canvas, or the sculptor, who petrifies his ideas direct into the marble, the architect has to produce his ideas first on paper, and then to influence his obstinate materials by the hands of others. We cannot send houses and churches to the Royal Academy; and the architectural room there would be a more direct exhibition of architecture if it consisted of photographs of executed buildings. Drawings of the best actual works are constantly rejected, because not drawn or coloured as pictures. The rage for competitions encourages further the habit of showy and deceitful draughtsmanship rather than the serious pursuit of art. Under the presidency of Sir Frederick Leighton, sculpture has made great progress. Never before has there been so good an exhibition as that of last year. We may look hopefully to some similar improvement in architecture.

I fear I have said so much about the prosaic concrete and substratum of my subject as to try your patience. I must pass over the treatment of artistic truth in buildings entirely. That branch of the subject is tempting, but would lead me too far afield. The lower suits me better, to-night, and leads on sufficiently to what I have further to say. A diligent study and constant practice of truth will be found to influence your work so as to give it individuality. Having once mastered your materials in the close, intimate sense which I have urged, methods both of treatment and of construction which before seemed well-nigh impossible will grow easier. Brick and stone, iron and granite, become supple to your hand. Your study of historical architecture will acquire a further meaning. The higher thoughts of art in architecture will by degrees be spelled out. Your own standard will grow loftier and yet more lofty, till at length you may become incapable of doing or suffering ignoble or foolish buildings.\*

#### THE FIRE AT HAMPTON COURT PALACE.

The inquest touching the death of the servant who lost her life through the fire at Hampton Court Palace was held on Saturday last, when Mr. Edwin Chart, resident Clerk of the Works to her Majesty's Commissioners of Works at Hampton Court, produced a plan of those portions of the palace affected by the fire, and gave a detailed account of the damage done to the various rooms. None of the works of art in the galleries below had received any permanent injury.

Mr. Mitford, C.B., Secretary to her Majesty's Commissioners of Works and Buildings, said that about six years ago the system for extinguishing fires at the palace was entirely reorganised. A brigade was formed of fifteen persons, of whom four were resident in the Palace. There were monthly drills, and they were periodically inspected by Superintendent Palmer, one of Captain Shaw's officers. There were fifty-five hydrants on the main, which were constantly charged. In addition, there was a fire-main laid on the roof behind the parapet, which would enable the firemen to deluge the whole of the roofs with water, and to the existence of this main he attributed the prompt extinguishing of the recent fire. There was a steam fire-engine of 30-horse power, capable of pumping about 700 gallons of water per minute, and of throwing six large jets to the highest part of the palace. Besides, there were two manual engines and a fire curriole, three hand-pumps, a hose truck, seventy-five fire-luckets, and a fire-escape of Capt. Shaw's pattern. In the picture galleries were fourteen internal hydrants and twenty external hydrants. Six new corridor engines and two hand-pumps full of water were kept in the landings. Printed instructions, with full information for

all persons about the palace, were hung in prominent positions near the hydrants. With regard to the suggestion of placing a tank on some part of the palace, it appeared to him that the main laid along the roof really gave greater security, for with the powerful engine to charge it, there was practically the supply of the Thames. He could not suggest any additional measures that would be an improvement on those already provided for dealing with fires.

Having heard evidence as to the cause of the fire, the jury returned the following verdict:—

"The jury are of opinion that the deceased met her death by being suffocated by the smoke and gases arising from a fire caused by the accidental upsetting of a mineral oil heating-lamp. They wish to add that they think the speedy extinction of the flames and the prevention of extensive damage was due to the excellent apparatus for extinguishing fire at the Palace, and to the exertions of the Palace Fire Brigade, assisted by the officers and men of the 4th Hussars. And they would like to recommend that regulations should be made preventing the storage or use of mineral oils within the Palace."

Mr. Mitford revives an old suggestion by writing to say that every landing of every house in which mineral oils are used should be furnished with a scuttle or bucket of sand. Sand, if thrown upon burning oil, disintegrates it and puts out the flames, which water used in small quantities tends only to spread.

#### THRONDHJEM CATHEDRAL, NORWAY.

THRONDHJEM CATHEDRAL, of which we give an illustration in this week's *Builder*,—as it will appear when the works of restoration, which it is now undergoing, are completed—is an edifice the history of which is so closely interwoven with that of the city of which it forms such a prominent feature that we may be pardoned if we briefly trace the outlines of the records of the latter. The city of Throndhjem occupies a prominent position in the present day among the towns of Norway. It is the third city, as regards population, in the kingdom, and, as the coronation town of the kings of Norway and the site of the Bank of Norway, of great importance to the country. It ranks even higher in the history of the Norwegians, for, independently of possessing a magnificent cathedral, it was the residence of the old kings and archbishops of Norway, and the scene of many remarkable events. The name of the town was originally "Nidaros," Throndhjem being the name of the "fyker," or shires, bordering on the arm of the sea which is now known as Throndhjem Fjord; the present name of the city dating from the fifteenth century. Nidaros was founded by Olaf Tryggvesson, who, in 996, after vanquishing the mighty Jarl Haco, of Hlade, the ruler of Throndhjem, built a royal castle and a church, dedicated to St. Clement, here. Those buildings soon fell into ruins; here, however, restored by Olaf Haraldson, surnamed the Pious, between 1016 and 1028. Olaf Haraldson died for his faith in the battle of Stiklestad; but his death was destined to become an ultimate victory to the cause he fought for. He was buried in the sand on the banks of the Nidelva, and on his body being afterwards exhumed, it was found to be in a remarkable state of preservation. As it was asserted that hair and nails had grown after death, he was declared a martyr. The probable cause may, perhaps, have been the character of the soil. Olaf was afterwards canonised by the Pope as the patron saint of the North. The shrine containing the body was placed on the altar in the Church of St. Clement, and miracles, it is reported, then became frequent.

After several changes from one church to another, the shrine was at last deposited in the first cathedral of Norway, that of Nidaros, which was built by Olaf Kyrre on the original site of the grave of the saint. This was the beginning of the "Domkirke," or cathedral, of Throndhjem, which was consecrated about 1093, and received the name of "Kristkirke" (Christ Church). The shrine with the body of the saint was placed on the altar erected on the exact spot where it had previously lain. This church has, through many architectural changes, blossomed into the present cathedral.

The original church was simply a nave 150 ft. long and 40 ft. wide, with a semicircular choir. For sixty years the church was left thus, and three kings were buried there. In 1151, the first archbishopric was established in Norway, and Nidaros made the cathedral city, its church

possessing the national relic. It was now decided to improve and enlarge that church and make it worthy of this honour; but it was not until 1161 that the work was taken in hand by Archbishop Egstein Erlandsen, who added a transept below the great tower, and also the chapter-house. Another king was buried in the cathedral, and the bodies of two others removed there; but since then no more sovereigns have been entombed there. In the year 1200 a fresh period of reconstruction and building commenced, which lasted until 1240. During that time the whole eastern part was reconstructed, and the dome elevated and covered in with slates. From this period, also, dates the Early English apse. It is surmised (for there are no records to guide us) that this addition was the work of English architects, sent by the then Bishop of Winchester, the cathedral of which the Norwegian edifice is said in parts to resemble. The last and final period of construction began in 1248, building operations continuing till the close of the century, during which the western wing was added, and the steeple probably raised. By the end of that century, the edifice stood in its most complete form. The large sums required for completing the great work, as well as the considerable funds the cathedral possessed, were contributed by pilgrims who came from all parts of the then Christian world, even from the Holy Land, to offer their prayers and obtain absolution at the shrine of St. Olaf.

The cathedral of Nidaros was the largest and most magnificent ecclesiastical building in the three Northern kingdoms. Its length from east to west was 325 ft., and its western front, imposing by its images of saints, finely carved in stone, and its rich ornamentation in gold, was 124 ft. long. A lofty tower and spire rose from the centre, and a number of smaller ones from several parts of the building. The interior was largely ornamented with beautiful columns and pilasters of sandstone and marble of various hues, detached, engaged, and clustered. The windows were of stained glass. The nave was in three stories of different heights, two galleries running completely round the church. There were twenty-four altars richly adorned with precious stones. Shrines of saints,—St. Bernhard, St. Eysteine, and St. Olaf, the patron saint,—were raised above three of them. The shrine of the last-named saint was placed on the principal altar, the body resting in a silver chest weighing 220 lb., which was enclosed in two cases of choice wood, the outer one being curiously carved in the same manner as the old wooden churches of Norway, and covered with gold and silver.

The cathedral did not remain long in this magnificent state. Fires destroyed one part after another, the last taking place in 1531, when the western end became the heap of ruins it is to-day. The union with Denmark, which destroyed all vitality in the Norwegian people, blunted also the interest in the preservation of the cathedral. The Reformation played further havoc with the interior. The altars with their ornaments were removed, and with them the shrines of the two minor saints. They went to fill the pockets of some Danish potentate. At last the silver chest with the valuable exterior case went also to Copenhagen, all trace of them being lost; the body of St. Olaf alone remaining in its plain coffin. During the Northern Seven Years' War it was carried to Stockholm, but again brought back to the cathedral in 1568. The coffin was now concealed in the church, and has not been found, in spite of the most careful search. Its discovery would be of great interest. Popular tradition has it that the coffin was also to be forwarded to Copenhagen, to rob the king saint of his valuable shroud, but the vessel which was to hear it thither foundered in Throndhjem Fjord with its treasure. Thus, tradition says quaintly, the saint refused to leave the soil whence he had sprung.

By the terms of the Norwegian Constitution of 1814, the kings of Norway must be crowned in Throndhjem Cathedral. Four coronations had taken place before that time,—those of Haco V., the last male descendant of Harald the Fairhaired and the Norse kings; the Swedish protector, Karl Knutsson; and Christian I. and Hans, two Danish kings. Since 1814, three more coronations have been held at Throndhjem, those of Carl XIV., Johan Carl XV., and Oscar II., Oscar I. never being crowned as king of Norway.

With the revival of Norwegian national feel-

ing during the last sixty years of constitutional and personal liberty, a strong desire sprang up amongst all classes to save, from utter destruction the few architectural remains bearing witness to former greatness, and naturally the first to be taken in hand was the old cathedral of Throndhjem. It was found to be in a most shocking state of ruin. Time and fire, of course, had done much; but at the hand of man the noble structure had fared worse. It was, for instance, discovered that at one time or another the walls with their beautiful stone carving,—maybe to hide from view defects or idolatrous images,—had been coated with several inches of plaster. The principal work of restoration consists now in removing this covering, and laying bare the original surface without injuring the carving, a most laborious task, requiring much care in its progress. Of other improvements contemplated, we may mention the raising of a lofty steeple on the present stunted walls of the old tower, now merely covered by a gable roof, and eventually the rebuilding of the ruined western portion of the cathedral,—a work which will not be completed for some years.

Of interest in the cathedral is a sacred well on the southern side of the choir, called "St. Olavs Brønd," said to have sprung from the grave of that saint, and in which visitors are wont to drop coins, which resound at the bottom as if the latter were of metal. Another remarkable feature in the church is the obliquity in the foundations of the eastern portion of the cathedral. The great altar has been left untouched during the various restorations, from regard for the traditions attaching to the spot. The church contains figures of the twelve apostles by the famous Danish sculptor Thorwaldsen. Divine service is now again performed in the cathedral. The latter has been the scene of many historical events in the Norse age, and in it have been laid many of the best scenes of the dramas of Henrik Ibsen, Norway's Shakspeare.

The architecture of the first church was Norman, or, more correctly, Norse, the architecture which the Norsemen cultivated in Normandy. The later additions, particularly that made towards the end of the thirteenth century, are Early English.

The work of restoration has now been in progress for nearly twenty years; at times, however, ceasing from want of funds. Some of these have been contributed by the people, but the largest sums have been given by the present king, Oscar II. It is worthy of notice that no funds can be spared by the Norwegian Storting for the restoration of the finest monument extant of the former greatness of the nation.

The present architect directing the works of restoration is Mr. Christie. A Royal Commission has just been appointed, consisting of the best architects of Norway, to report on and draw up further plans for the work.

#### SWIMMING BATH: UPPINGHAM SCHOOL.

This swimming-bath has been built this summer, at a total cost of about 1,350l. The plan is arranged to meet the special requirements of a public school, as it is proposed to add five courts at the back. The buttresses have been regulated by the Eton sizes. Lawn tennis courts are now being laid down in front of the building.

Local materials as far as possible have been used. The rubble walling is of Old Uppingham stone. The dressed stone used is the Casterton grit, and the roofs are covered with plain red tiles from Lord Aveland's yard at Luffenham.

Concrete has been used for the bath itself, composed of Barrow lime and the local hard blue rock, faced with Portland cement mixed with an equal quantity of Derbyshire spar. The colour of the cement has proved satisfactory.

The heating apparatus, by Messrs. Herring, of Chorley, answers well, and utilises the exhaust steam from the waterworks engines; arrangements also being made to supplement this supply by green steam from the boilers direct when necessary. The condenser contains about 600 ft. of pipe, and the disposition of the flow and return pipes to the heating chamber distributes the heat well over the whole bath.

Mr. John Woolston, of Stamford, has carried out the building in a satisfactory manner, Mr. John Brown acting as clerk of the works. The architect is Mr. Arthur Young, of 19, Queen Anne's Gate.

ST. MARY'S, WATERLOO, LIVERPOOL.

This church is in course of erection in Waterloo Park, one of the new and rising suburbs of Liverpool. It is in the form of a Latin cross, with a low tower and shingle spire rising at the intersection. It is constructed of the reddish-brown local stone from Bootle, in random courses, and the freestone dressings are of Corn-grit from Bath. The interior is lined with dark crimson bricks with red bands interspersed with stone, and all the piers, arches, and mouldings are of Corsham stone. The woodwork is entirely of pitch-pine, and of massive character, with open-boarded roof, lined with felt. It will seat about 800 persons, and the total cost, including tower, will be 3,000*l.* Messrs. Habershon & Fawcener are the architects.

RESIDENCE, GOFF'S HILL, CRAWLEY.

The residence here illustrated, recently erected at Goff's Hill, Crawley, for Mr. Edwin Henty, from the designs and under the superintendence of Mr. William Buck, architect, Horsham, stands on an elevated site, and commands exceedingly fine views of the picturesque town of Crawley and the surrounding country, extending as far as the Surrey hills. It is approached from the main road on the south, and contains an entrance-porch, hall, three reception-rooms, and the usual offices on the ground-floor, six bedrooms and two dressing-rooms on the first floor, and six rooms on the second floor. It is faced with red kiln bricks with Bath stone dressings, and the roof is covered with red local tiles. The contract for the house has been satisfactorily carried out by Messrs. Peter & Redford, builders, of Horsham, whose tender was 3,750*l.*, Mr. Tanner was the clerk of the works.

ORGAN-CASE FOR ST. MARGARET'S, WESTMINSTER.

The organ in the above church is being completely rebuilt and enlarged by Messrs. W. Hill & Son, and when the work is finished the instrument will be one of the finest in London. The church, having been greatly improved and refitted of late years, from the designs of the late Sir Gilbert Scott, is now an extremely fine one, and it was thought advisable that the organ should be enclosed in a case of sufficient architectural importance to be worthy of the church.

The selected design, of which we give a reproduction, was prepared by Mr. Arthur G. Hill, B.A., F.S.A., and will be executed in oak. The details of the work are in accordance with the ancient examples that can still be seen at Tirklemont in Belgium, and elsewhere.

The organ will stand at the western extremity of the north aisle, and there will be one front facing west and another looking through an arch into the choir.

HERTFORD CASTLE.

The Castle of Hertford not only is of high antiquity, but the date of its foundation is on record. The Saxon Chronicle relates that in the year 913, Edward the Elder, son of Alfred, threw up two Burghs at Hertford, one at Martinmas, on the north bank of the river, and, later on, one on the south bank, between three of the rivers which here unite. The former of these works has long been laid low, and no trace of it is visible, but the latter has been preserved by its incorporation into the later castle. The mound, standing on the edge of the river Lea, is indeed shorn of its original dimensions, but it remains, and attached to it is the base court with its exterior ditch, once of great breadth and depth, the invariable accompaniment of the mound, and with it constituting the Burgh.

Edward's Burghs may have been preceded by an earlier earthwork, for Hertford is reputed to stand on the site of a chief town of the Trinobantes, the British occupants of the district north of this part of the Thames. The Britons, however, if they here established a stronghold, are more likely to have placed it upon one of the adjacent heights, where are several excellent positions for an entrenchment. Probably the existence of a British settlement in a neighbourhood so well protected by its water-courses attracted the invading settlers, for here the East Saxon kings are said to have had a residence, and to this place Archbishop

Theodore, consecrated in 668, convened a synod of the National Church in 673.

The Danes overran this part of England more than once, and the camp at Danesbury was probably their work. Also, they are thought to have had a camp upon Port-hill, of which, however, it is said that no traces are now to be seen. It was upon the river Lea, between Hertford and Waltham, that Alfred rendered the Danish fleet useless by blocking up the river, and so preventing their return. It is, however, on record that this was effected, not by actually throwing a dam across the stream, but by the far more scientific process of cutting a number of channels for its waters, each too shallow to allow the vessels to float down. By this means the retreat of the Danes to the Thames was cut off, and they were fain to march inland to the Severn at Bridgnorth.

In 913 the protection afforded by the Hertford Burghs seems to have attracted inhabitants, who occupied both banks of the river Lea, and the town thus situated was raised by Edward into a royal Burgh, held of the Crown by Burgeage tenure. Hertford was so held of the Conqueror, and so accepted by the Conqueror, and entered in Domesday, which, however, as was not uncommon, makes no mention of the castle, nor, indeed, of the churches. William is said to have strengthened the castle, and he gave it in charge to Peter de Valoignes, one of his followers, who transmitted it to his son Roger, and he to his two sons in succession, Peter and Robert. The male line closed with Robert, whose daughter and heiress, Gunnora de Valoignes, married Robert FitzWalter. The charge of the castle does not seem to have descended, but to have been resumed, possibly as a male fief, by the Crown.

King John, that most erratic of monarchs, held the castle, and visited it in 1212, 1213, and 1216. In this latter year, however, it was attacked by Lewis of France, who laid siege to it from St. Martin's (Nov. 11) to St. Nicholas Day (Dec. 6), and finally took it. Robert FitzWalter, an adherent of Lewis, took the opportunity to revive his wife's claim, but without success. It was finally recovered by John, and transmitted to his son Henry III., who placed Richard de Argenh in charge of it, and

expended 20*l.*, and probably other sums, in its repairs. It 1226 it was held by Hubert de Burgh, on whose fall Henry granted it to be held "in capite" by Wm. de Valence, after whom it was held by his son Aymer, Earl of Pembroke.

Edward III. resumed possession in 1327, and granted the castle to John of Gaunt, his son, from whom it finally passed into the Duchy of Lancaster, to which it is nominally attached. Henry VI. kept his Easter here in 1429, and Henry VII. continued to appoint a constable and a porter. It is described as "castrum non immensum sed pulcherrimum." Hertford far exceeded better than most royal castles, possibly from its convenient position as regarded London, for in the reign of Henry VIII. it contained lodgings suitable for the King, and Edward VI. and the Princess Elizabeth were both here. By the latter, when queen, it was alienated to Sir William Harrington, who built a large brick house on the site of the inner gate-house, which still remains. In the time of James I. the castle is described as covering 7½ acres. The ditch then extended to the roads or streets now known as the Mill Bridge, the Wash, and Castle-street. The mill was upon the Lea just below the castle mounds. The Church of St. Andrew stands about 150 yards from the remaining mound, beyond the river. There was a second mill, probably that on the river above the castle. The castle was finally acquired by Mr. Secretary Cecil, in whose descendant, the Marquis of Salisbury, it remains. It is remarkable that Hertford Castle at no time belonged to the earls who bore the title of Hertford. They were, of course, earls of the county, though this is not specified in the peerages. Their principal eastern seat was at Clare in Suffolk, round which they possessed considerable property.

The strength of Hertford as a military position was very great, and depended upon the low marshy ground by which it was almost surrounded, and which was liable to be flooded by the waters of three, or rather four, considerable streams, "flumina non profunda sed clarissima." Of these, the Lea, flowing from the west, received, a few yards above the castle, the Minram from the north-west, while a little

below the castle the combined stream is swollen by the waters of the Beane from the north, and the Rih from the north-east, the combined volume flowing forward under the name of the Lea. Below, or south-west of the castle, along the course of the Lea, is a wide heathland of lowland, which even now is occasionally flooded, and which in former days must have been an impracticable morass. In the other direction the ground, though built upon and forming a part of the town, is for some distance around but little higher than the meadow, though here and there, elevated 4 ft. or 5 ft., appear small deposits of gravel. The castle stands upon the right bank, south-east of the river, and its extreme limit, within the counterscarp or outer edge of its main ditch, included a space of about seven acres and a half, something in the figure of an ear, the river forming the shorter side or concavity. In length, north-east and south-west, this space measures 234 yards; its breadth varies from 100 yards to 200 yards, with a mean of 140 yards. The ditch, now almost filled up and in part built over, was about 30 yards broad, and no doubt filled from the river with which it communicated at each end. Within the ditch, taking the line of the old bank or of the present wall, the area is about three and a half or four acres. The mound is placed on the edge of the river, at the north angle of the enclosure. The bank does not include it, but points to its centre, so that the mound, as was not unusual, forms a part of the enclosing defence. The proper ditch of the mound has been filled up.

Of the Mediæval castle there remains only a considerable part of the wall of the *enceinte*, and, it may be, some ancient masonry built up into Sir William Harrington's house, which is still inhabited. This is said to have been the gate-house; if so, it was that of the northern ward, and was upon the line of the wall dividing the one ward from the other. The curtain wall is about 7 ft. thick, and 25 ft. to 30 ft. high, and composed of flint rubble. The battlement is gone or nearly so, and there remains but a part of one mural tower, circular in plan, which capped the south-east angle of the wall of the northern ward. The wall covers the northern and most of the eastern sides of the area. There is no trace of it along the western or river side. No doubt it was less substantial on that side, upon which the natural defence was strong. The south or smaller ward does not appear to have been walled in. It was covered on the three sides by the river and the marsh, and may have been palisaded only. The wall evidently crossed the ditch of the mound, and shunted upon it, or possibly upon the shell keep, all vestiges of which are gone.

The present entrance to the castle is at the eastern angle of the ditch, which is traversed by a road leading to a small and apparently modern doorway in the wall. There is no trace of a main entrance in this direction, but it must be confessed that if the main entrance lay to the south of the gatehouse, it must have been difficult to approach, save by water.

G. T. C.

#### FIRES AT COUNTRY MANSIONS AND SOME SUGGESTIONS FOR THEIR PREVENTION.\*

THE announcement that a country mansion has been totally or partially destroyed by fire has come to be recognised as one of those inevitable contingencies that are bound to occur at intervals comparatively of short duration. A fire, no matter where, is a disastrous occurrence at any time, although there may be occasionally some consolation in the fact that it paves the way for much-needed improvements. The Great Fire of London was considered at the period of its occurrence an almost unparalleled calamity, but we have no doubt now, that it was, on sanitary grounds alone, productive of the greatest possible good. But the destruction of some rare specimen of ancient domestic architecture, containing, perhaps, an invaluable collection of art-treasures, and itself rich in historical associations, has no redeeming feature, and when such a calamity occurs on a large scale, we cannot but feel that a national loss has been sustained.

Although there is no doubt that the destruction of many old country mansions is the result

\* From a paper by Mr. Thomas Potter, read at the meeting of the Clerks of Works Association on the 4th instant.

of carelessness, or at any time might have been avoided with the exercise of some care and forethought, yet the greater portion have, I think, come to an untimely end from causes which it was very difficult practically to provide against. I am led up to this remark by a paragraph in *Baily's Magazine* for November aent the loss by fire of Everleigh House, in Wiltshire, in which, with the best of intentions, it is suggested with the view of preventing conflagrations, to have every fire-place, flue, and hearth examined and all timbers too near the fire removed. If a mansion is undergoing thorough reparation, there would be, perhaps, no obstacle in the way of taking up all the hearths, removing all the grates and chimney-pieces, stripping the plastering off walls in the line of flues, and making a general search for wood beams, wood bricks, wood bond, and joint wedges; but I submit that in an inhabited house, the occupier, as a rule, would prefer the risk of a fire rather than have every room reduced to a state of chaos, and the fittings, perhaps, irreparably damaged. Nothing short of what I have described would render it certain that dangerous wood had been removed, and even then the flues themselves might be defective. I grant that no very great danger should be anticipated from the proximity of wood to the chimney-flues, between the top of the wainscoting or skirting and the ceilings or under-side of cornice, but the element of danger exists all the same, for wood blocks have been found inserted over the fireplace for the purpose of fixing a chimney-glass or overmantel thereto, and wood blocks also for securing the bell-pulls, or hell-cranks, and I have myself seen a block of wood removed from a chimney-breast about midway between floor and ceiling, which went into a flue, and the existence of which can only be accounted for by assuming that it was placed there for one of the above purposes, or was the end of a putlog inserted at the time of building, and for some reason or other sawn off instead of being withdrawn.

The destruction of old country mansions may be traced usually to one or another of the following causes:—First, lightning; secondly, conflagrations, that is, those which originate from improper construction, and which can only be ameliorated, viz., defective flues, fireplaces, and hearths (so called, but more truthfully bad carpentry in fixing wood contiguous to or into chimney-stacks and fireplaces), timber-beams under hearths, or wood-bearers for supporting the hearths, and carelessly-arranged heating apparatus, hot-air flues, hot-water pipes, and iron-stove pipes; thirdly, spontaneous combustion; fourthly, accidents,—or, more properly speaking, carelessness of a more or less positive order, such as dropping lighted tobacco on carpets, smoking where there is straw from packing-cases and wine-bottle covers, shavings or firewood, or, in the lamp-room, overturning of oil-lamps, setting light to window-curtains reading in bed, insufficient control of lucifer-matches, carelessness with gas, leaving fires unprotected in the grates at night, carrying lighted benzoline or oil-lamps and candles where straw or shavings accumulate from the unpacking of goods, and some others that would appear to rank next only to incendiarism.

With regard to lightning, this may be considered as one of the causes of fire, the danger from which may be reduced to a minimum by the use of lightning-conductors. But these may be rendered useless if not properly constructed or fixed, or if the area to be protected is guarded by only one conductor. The general rule appears to be to place a single lightning-conductor on the top of the highest chimney, and this is assumed to be sufficient to protect the entire building, no matter how large, from the electric fluid, but the Lightning-rod Committee appointed by the learned societies to investigate the subject came to the conclusion that, although the highest point attainable was the proper one to fix a conductor, the area of protection was limited, and the line of limitation was obtainable thus:—"From the point of the conductor draw an imaginary line at an angle of 45 degrees till it reaches the ground. The latter is on the circumference of a circle of which a perpendicular dropped from the point of the conductor would be the centre." The figure, in fact, would be a cone, the conductor-point being the apex, and all the buildings standing on the base of the cone might be considered free from danger; of course there would be as many conductors needed as the magnitude

of the buildings required. Where there are lightning-rods it is essential that all underground gas-pipes, water-pipes, or metals of any description are kept a respectful distance from the ends of the rods which are buried in the ground, or the electric fluid, instead of passing harmlessly away in the great storehouse of electricity, the earth, may get transmitted where least expected. With regard to defective hearths, fireplaces, and flues, it is estimated that about three-fourths of the conflagrations in town and country arise from these causes. But the description of the cause of such fires is varied; sometimes we read of overheated flues or defective flues; or, as at Ingestre Hall, from timber beneath the hearthstone. Practically, the fault is not that of the flues themselves, but of the careless manner in which timber is brought into almost direct communication with them. What is known as a "defective" flue may arise from various causes. It must be remembered that when the chimneys of old country mansions were built, climbing boys were their scavengers, and the conditions under which the soot was removed were far more favourable to that process than by the sweep's machine. Many of these flues are irregular in size, and usually much larger than the present ordinary house-flues, and the result is that the sweep's brush, being too small for the opening, only dislodges such portion of the soot as it happens to come in contact with, and another disadvantage is that the sweep's brush is round, while the flues are square, so that the corners or angles of the flues seldom get thoroughly cleaned out. Still other disadvantages arise from the fact that these old flues, while they often travel for some distance in a perpendicular direction, suddenly go nearly flat, and form what the sweeps call "dead slants," and as the elastic rods of the machine can only head to a certain curve, the angles of these "dead slants" remain unsweped, and, in addition, afford receptacles for an accumulation of soot, which, becoming heated, takes fire and smoulders for a considerable time. Occasionally there are in some chimneys what appear to be recesses made at the sides of the flues, probably as resting-places for the climbing boys, and these recesses and the "dead slants" are the points of danger, as the brickwork becomes hot, while the parging of the flue having probably been scraped away by the periodical application of the sweeping-machine, the mortar-joints of the brickwork get, in course of time, partially disintegrated. As an instance of the danger from these places, I remember some years ago a case where a strong smell of smouldering wood pervaded a bedroom of a mansion. After searching some considerable time without success for the origin of this smell, smoke was seen to come up between the joints of the flooring, and on tearing up the boards the mortar-joints of the bricks between the floor and ceiling were found to have disappeared. On cutting a hole in the brickwork, a large quantity of soot in a burning state was found in a flue of which these loose bricks formed a portion of the side wall. Of course the inevitable shavings were discovered below the floor-boards adjoining the flue, and these were in a charred condition, and evidently on the point of bursting into a flame. Now, had a general search been made for wood, no one would have thought of looking below the skirting-board for danger, especially as this flue appeared to pass in quite another direction. Another source of danger in old mansions is the existence of bond timber in walls; this is practically unknown now in new buildings, but the builders of old were apparently profuse in their use of wood bond, and, unfortunately, they often, with the view of rendering it efficient, built it in the middle of the walls; and I have found, during some alterations, bond in the centre of a wall within a few inches of a chimney flue and blackened from heat. No search could possibly have detected the existence of this element of danger. Cliveden mansion, near Maidenhead, was destroyed by fire in 1849, attributed to wood bond-timbers running into a flue. Chimney beams consisting of oak timbers 9 in. or 12 in. square were usually employed, instead of what we know now as the "chimney-har." I can find no record as to when chimney-hars were first used, but wood beams are known to exist in houses less than 150 years old. All chimney-beams that I have come across appear to have been fixed about 5 ft. from the floor; and in many old mansions, I have no doubt, these beams still exist, a chimney-har having been

subsequently employed without removing the beam, and a course of bricks built in between the bar and the beam, which would give about the right height for a modern grate. Now, when this beam is plastered on the outside and hidden from view, and a grate is, perhaps, badly fixed, leaving flat ledgments for soot to accumulate on the inside, we may guess the amount of risk incurred. Loughton Hall, burned many years ago, is an example of a mansion burned through the chimney-beam taking fire. An instance of the difficulty of being able, no matter how careful a search is made, to find out and remedy the danger existing from imperfect flues occurred some years ago at a large public building in the North of England, I forget for the moment where, but at the time the hall was occupied by a number of people, when smoke was seen issuing from behind the architrave of a door, and on removing the same, what is described as a "cavity" was found, into which burning soot had dropped, not, I believe, from the flue, but from a "pocket" in the chimney, the soot, it appears, having got there through the "with" or division between the flues and pockets having either got damaged, or been improperly constructed. I think, therefore, we may safely assume that chimneys which have been built perhaps hundreds of years cannot, under any circumstances, be vouched for as safe, at least, not from any amount of external examination; and this was my view when, some years ago, it became absolutely necessary to take preventive measures with regard to some suspicious flues. My first idea was to cut away the breasts in the line of flues, and insert terra cotta or fire-clay pipes the whole of the way, but the damage that would ensue in the execution of this project to costly-finished walls rendered it practically out of the question. I found, however, that the flues, although irregular in sectional dimensions, were in no case less than 18 in. square, and that they went much straighter than ordinary modern house flues, and with these two advantages, ascertained in some trouble, I determined to try and put a new flue into an old one, by commencing near the top of the chimney. On the upper or attic floor, therefore, making sure there was no timber above that point, I cut a chase into the flue 5 ft. in length, and large enough to admit a flanged flue-pipe of 9-in. bore. Two pipes were then cemented together with a quick-setting cement,—Roman, I think,—so as to have them in lengths of 4 ft. each. A long rope was passed through the pipes, and attached to an iron bar made to securely clip the bottom of the pipe. The 4 ft. of flue-pipe was then passed down the brick flue, and another 4 ft. having been cemented thereto, and allowed to get thoroughly firm, the 8 ft. of flue was gently lowered, when another 4 ft. was added, and the *modus operandi* was continued till the throat of the fire-place was reached. The rope had, of course, to be passed through each additional 4 ft. of flue, and secured over an iron rod fixed in the brickwork above, while the cement joint was hardening. When an unfortunate "dead slant" was reached, there was no choice but to cut out the brickwork, have another start with the pipes, and make the connexion between the upper and lower portions of the new flue sound and perfect with similar pipes,—which was, of course, no great deal of trouble. On the face of it this would perhaps appear anything but a feasible project, but the actual result was a great success, as the breasts that had to be cut open were fortunately in rooms where it was but a little consequence. One flue I was enabled to pass down through a room, whose height was 24 ft. from floor to ceiling, without disturbing the wall—a great piece of good fortune, as it was lined with marble for a considerable distance above the fire-place. Several chimneys were treated in this way, and all successfully. The Act of Parliament had occasionally to be evaded, as a boy was sent up if needed, to "enso" the pipes whenever they took to lodging on any "set-off." It was, of course, necessary to allow the cement-joints to get thoroughly secure before sending the flue on its way, and also to well secure the pipes at the bottom, otherwise the sudden appearance of the chimney-flue tumbling into the fire, might at some future time create some astonishment and alarm. The grates necessarily had to be taken out except where they were not enclosed over the fire-place. This work was done ten years ago, and no bad result has followed; in fact, an advantage arose, inasmuch as the draught was increased. Before leaving this portion of my

subject, I might mention with regard to flue-pipes, as an instance of the difficulty with which any improvement is forced upon public notice, that the original inventor and patentee of pipes for use in the construction of flues found his invention so little appreciated, that after persevering for some considerable time he was obliged at last to sell his stock for drain-pipes at a very reduced cost. Some discussion has taken place at times as to whether flue-pipes cause the soot to drop into the fire, and I find this is so, unless a good long easy bend is given to the line of flue, and very much so if the flue-pipes are glazed. It is for this reason, I assume, that flue-pipes are now made unglazed. Circular or elliptical flues are necessarily much more efficiently cleaned than square or rectangular brick flues, and the up-draught is much greater. It is obvious that circular-pipe flues require sweeping oftener than the ordinary kind, at least where they are swept, for I know of a number of cottages built in a country village thirteen years ago where not one has ever been cleaned, for the occupiers, to show their confidence in the fire-resisting properties of their pipe-flues, simply push up an armful of shavings occasionally and burn them out, and the flames coming out at the top pretty regularly is considered by the neighbours as evidence of the tidy habits of the respective occupiers. A good deal more might be said as to flues and flue-pipes, but not connected with fires at country mansions, and, therefore, inadmissible; but I have no hesitation in stating that the whole-socketed terra-cotta or fireclay flue-pipes, well jointed together, and encased in the ordinary brickwork of a chimney and the cavity between the perimeter of the pipes and the brickwork filled in with concrete made of coke and cement, are, as far as danger from fire is concerned, like "Casar's wife,"—above suspicion. Butt-joint pipes and socketed pipes with two sides cut off, cannot, I think, be considered so safe as whole socketed pipes. In connexion with brick flues there is another point as far as regards mansions in some parts of the country, viz., that a great deal of wood is often burned, and that flues get foul much quicker therefrom than when coals only are used, and also that the resins contained in wood appear to create flakes of soot of large dimensions, and more readily inflammable than those engendered from the use of coals alone. Having made the flues all right, if the grate has to be removed for the proper fixing of the first flue-pipe, it will be well to search the fireplace opening for wood plugs, and at any rate to well parge or plaster both sides and back with Portland cement and sand made from crushed coke or broken bricks, a material which will stand heat as well as any I know of, and if a chimney-beam is found to exist, to have it out at any cost. Hearth slabs, if cracked or showing danger, may have to be taken up, but I suggest that a marble or stone curb, just now in common use in good houses, can be fixed, and if the hearth-slab be of ordinary stone or other material of common character, which it would be no loss to lose sight of, a tile bearth on half an inch thick of Portland cement bedded on the slab would render any danger from wood which may be beneath practically out of the question, and the inch higher which the hearth would be above the floor should not be noticed. As the fireplaces are mostly in or about the centre of the walls, and as the beams to carry the floor joists are usually also in the centre, it follows that the ends of the beams often run into the chimney, and should always be looked upon with suspicion, for they have, in fact, been the origin of many conflagrations. Wood chimney-pieces and overmantels, even wood coal-boxes, are all more or less "little belps" to a big fire, although not to be classed amongst the dangerous factors; so are wood dados, wainscoting, and skirting, not necessarily of themselves so much as the fact that they conceal the brickwork contiguous to chimney-flues, and render the discovery of possible danger thereabouts difficult to detect. The battening and plastering or, as is to be found in many old houses, battening and canvassing, of brick walls is fraught with danger, as not only are the walls most likely plugged with wood in all directions, but the battens, being fixed vertically, form so many swallow flues, up which and behind the plaster the flames have no check whatever. Had the battens been fixed horizontally, this evil would, to a great extent, have been avoided. Fixed marble or stone curbs in place of fenders are an element of safety, as the danger of pieces of burning coal or wood falling

out of the fire and lodging beneath the ordinary metal fender and igniting the carpet is avoided, so also are the slow-combustion grates, with the fire-boxes resting on the hearth, as the burning embers cannot, by any possibility, fall outside the fender curb. With regard to heating apparatus of all kinds other than the ordinary fireplace grate, old mansions stand at a disadvantage, inasmuch as no provision was made in the more ancient ones for anything of the kind. Heating stoves, whether of iron, fire-clay, or terra-cotta, are safe enough in themselves if care is taken that they stand clear of all combustible materials; but it is the iron flue-pipe, necessary for carrying off the products of combustion, which must be recognised as the dangerous element. If the iron pipe is led into a brick flue, the point of connexion made sound, and no inflammable material within some feet allowed, they are of course fairly safe; but in Brecknockshire some years ago, according to a newspaper report, a fire broke out in a country church and was discovered to have been caused by a bird having built its nest at some point contiguous to an iron stove pipe, which, when heated, set the nest on fire; here, however, wood must have been not far away; possibly the flue-pipe was carried up through the roof between the rafters, and the nest might have been in the roof and out of sight. Hot air and hot water appliances are necessarily and usually indirect causes of fire, inasmuch as the heat from the pipes and flues parch all woodwork they happen to be near, and render it therefore ready to ignite with the smallest provocation. In new buildings, of course, wood is kept a respectful distance from any danger points. In old buildings this is impossible, and walls, floors, and ceilings have to be cut away wherever required, and contiguous woodwork protected in such manner as seems most desirable. The small hot or high pressure hot-water beating pipes must be, I think, more dangerous in this respect than the large ones. The question was raised some years ago, and it was attempted to be proved that wood might be ignited by being placed for some considerable time against a hot-water pipe, but this is not, I believe, now considered probable.\* Hot-air flues should be constructed of some unflammable material, but I knew of one some years ago made of wood, but lined with the thinnest sheet-iron, and which joined the heating chamber. When a "high heat" was got up it was almost impossible to bear your hand on the wood casing. No expense should be considered in making the room where the heating furnace is placed and the adjoining fuel-room perfectly fire-proof. In old mansions these are generally placed in the basement, and often near the centre of the building, so that there should be as little loss of heat as possible from long flues or pipes.

Having travelled over most of the ground relative to fires which originate from constructional causes, and which probably are the origin of four-fifths of those which destroy country mansions, we come to spontaneous combustion. Although in warehouses and shops where oils and general merchandise are kept, spontaneous combustion is recognised as an occasional cause of fire, it can scarcely be considered as a very dangerous one in the case of country mansions, and probably there are only two ways in which it might occur. The rays of the sun on a hot day have been known, where the windows face the south, to become focussed sufficiently to ignite woollen materials lying on dressing-tables. This is, of course, not a usual circumstance, but it has been the cause of fires, and at any rate might be avoided in hot weather by covering up the dressing-table with some less inflammable material. But where spontaneous combustion is more likely to occur is in the lamp or oil-room, where lamp oils, oils for domestic use, cotton waste, lamp wicks, and oily rags predominate, and where the lamp-trimming business is performed. Here, of course, the lamp-room should be fireproof in all respects, and have an iron door leading therefrom, nor should it communicate with any other apartment. No more rags, dusters, or cotton waste should be kept than necessary, and the lamp oils should be kept in closed iron tanks. An instance of the possibility of a fire from spontaneous combustion I take from the *Builder* of 1854:—"Shortly before the fire at Gloucester Cathedral, the workmen who had been engaged in polishing the throne, and other carved wood-

\* Fires have been so caused.—Ed.

work in the choir, left off, it being six o'clock. Three hours afterwards the fire was discovered in a pew in front of the throne, where they had left their tools and materials. The men had been employed in applying boiled oil and turpentine in equal proportions to the woodwork, rubbing it with dry cotton rags, chiefly portions of old cotton stockings. These, after use, were placed in a rush basket, and set on the pew in front of the throne. This was exactly the place where the fire broke out three hours afterwards. Experiments have been with the view of ascertaining distinctly whether the fire might not have been caused by spontaneous combustion. The men employed placed their rags, saturated with oil and turpentine, in a rush basket as before. In an hour the outside of the basket was found to be warm, and soon after the rags began to smoke. In two hours a continuous and strong cloud of smoke escaped from the basket, and in three hours the whole burst into a flame. This experiment, we are told, was tried twice, with the same result, and it fully accounts for the fire at the cathedral on the 8th inst., and doubtless for many others. Assuming this to be substantially correct,—and there is no reason to think otherwise,—but little more need be said as to spontaneous combustion, except that when the origin of a fire is attributed to some unknown cause, this may have had something to do with it. With regard to accidental causes of fire at country mansions, these range from causes beyond personal control, such as stumbling and upsetting oil-lamps, to those that come almost within the range of incendiarism, and at any rate are cases of gross carelessness and want of common sense. What, for instance, can be said of a man who would blow out a gas-light and leave it not turned off in an unfrequented place? But I have known this in a mansion; and, unfortunately, we read of many accidents from people who will take a lighted candle or lamp to find out the cause of a gas escape. One of the leading insurance companies stated at a meeting of the shareholders soon after the introduction of lucifer matches that that invention cost them 10,000*l.* a year extra for compensation. But the danger from lucifers might be almost entirely avoided if the safety matches only were used, those which are stated to "light only on the box." Rats will run away with lucifers if they find them, and in their progress through small apertures it is not at all unlikely they may rub against a piece of wood and ignite the phosphorus, which would cause the rat to drop it at once, and leave it burning. Wax lights are worse still, as to an enterprising rat they are objects of special research, and afford him quite a banquet.

The introduction of dinner-lifts and luggage-lifts into old mansions,—some of them reaching from the basement to the attic floor,—are dangerous should a fire break out in the former, as nothing better could be devised to rapidly carry the flames from the lower to the upper regions and all intermediate combustible spots. Iron flap doors should be adapted to each floor to close the well-hole of the lifts, but I believe this is very rarely done. Gas meters should be attended to by day, and the gas at the meter should of course be turned off at night, and, in case of fire, notice conveyed to the gas-house at once that it may be shut off there also. Plumbers on roofs, using fires for their hot metal, are credited with being the originators of many fires,—Canterbury Cathedral a few years since to wit.

From the prevention we now come to the extinction of fires, which must be, of course, a matter entirely different from the system adopted in towns. A large cistern or cisterns on the roof, from which iron mains shall lead through the building, and to which hose-pipes placed in convenient positions can be attached, say in every corridor and on every landing, has been recommended; but this cannot be considered sufficient, for old mansion roofs were never made to carry a heavy additional weight in the shape of tanks of water sufficient to put out an extensive conflagration. Every 1,000 gallons of water weighs 4 tons, and nothing less than 20,000 gallons of water should be available for fire purposes; moreover, the friction, and consequent loss of head or power, would render the fire hose of very little avail in the upper story. Fire hose or hydrants inside a mansion, no matter how supplied with water, would, I think, be unsafe to rely upon entirely; for instance, assuming the fire to break out in the night, and to have gained some

headway, the half-dozen or so indoor men-servants would probably think more of their own safety than in forming themselves into a temporary brigade, or the state of terror which such a disaster would occasion in the dead of the night would entirely prevent them doing what was most needed and at the precise place, while those outside who were brought to the building by the alarm of fire would be quite incapable or unwilling to thread their way through the intricacies of winding passages and corridors. A considerable amount of public attention was some years ago given to a means of stopping a conflagration by the use of vessels containing certain chemicals, which, on becoming mixed by means of a blow given to a spring attached thereto, generated a powerful gas. This was proved to be far more effectual in arresting a fire than water; but, unfortunately, the effect would be as fatal to the user as to the fire, and to remedy this, goggles have to be put over the eyes, and a shield tied over the mouth; the vessel is then strapped on the back, knapsack fashion, and with the nozzle and diminutive indiarubber tube in hand, the process of fire-extinguishing is performed. Although, no doubt, effectual at the commencement of a fire, it is apparent this can be of no use if the fire has assumed serious proportions, and the dangerous nature of the contents would prevent many from having such a fatal material strapped to them. Still, it is a useful machine, a "little help," and might, and perhaps does often, prevent a "bigger help" being needed. A suggestion was made in one of the journals at the time, when it was thought that this gas was going to prevent all extensive fires in the future, to confine it in tanks at various points, and lay it on to every room of every house, to be turned on with a tap where required as with ordinary gas or water. Possibly the householders of the period thought it was quite as pleasant to run the risk of being burnt to death as to be asphyxiated by any slight escape, or accidental turning on of the gas; but this perhaps was quite as sensible a suggestion as one given by another writer, who, after a large fire in London, seriously proposed that all the water-mains might be laid along the streets on the top of the houses, so that some one had only to go on the roof and turn on a large tap, and what at the commencement was a fire would in the end become a deluge. Equally useful are the small hand-engines on two wheels, which can be carried or wheeled through any door, but must necessarily be supplied with water from the nearest taps by means of buckets. The advantage of these little engines is that the water can be directed to a considerable height, where perhaps it would be impossible otherwise to reach, or the heat would be too great to approach with ordinary hand-buckets. It is needless to say that where a smell of burning wood is discovered and cannot be detected, the spot should not be left night or day, for it might smoulder for many hours, and that water should be got ready for immediate use if required. But there are many mansions where scarcely any facilities exist for the extinction of fires; and, on the other hand, there are many where every possible means within reason are adopted, and if I describe the means at one of the latter class, that comes within my knowledge, it will answer the purpose as well as any other I can adopt.

My typical mansion stands on an eminence, miles away from any fire-engine. Below it there runs a river, and behind, but about half a mile distant, the ground rises very considerably. At the river side, and at some little distance from the mansion, is a water-wheel, and formerly this wheel was the motive power which forced the water from a shallow well near the wheel to a cistern on the roof of the mansion. At present an artesian well near to the water-wheel supplies the water, which is forced by the wheel and a treble-barrel pump through a 4-in. cast-iron main, to a tank made in the ground, holding 20,000 gallons, on the distant hill, three-quarters of a mile away, and 40 ft. above the level of the highest part of the mansion. About half-way between the water-wheel and the tank, and at the nearest point to the mansion, a 4-in. branch is taken off the 4-in. main, and carried first all round the mansion, and then in the building, to ordinary domestic service cisterns on the roof. On its way to the roof 2-in. brass pipes are taken off, and to these branches are attached hydrants at various landings and accessible parts of the building. On the outside hydrants are placed in the

grounds, about 60 ft. apart, attached to the 4-in. pipe. The underground tank, holding 20,000 gallons, in addition to serving the mansion with water for domestic use, supplies also a farm and all the buildings which the pipes pass on their way from the pumps. But as the water in this tank is being continually drawn for general use, a larger open tank, holding 100,000 gallons, has been made near thereto, the water in which is entirely reserved as an auxiliary supply, in case of fire, and is prevented from entering the main by a stop-cock placed on the same; 300 ft. of fire-hose, with nozzles already attached, hang on pegs, just within the building, for the outside hydrants; and other hose-pipes are suspended over each of the inside hydrants. Here, then, is every facility for discharging an immense quantity of water on the highest part of the building as soon as the hose can be attached to the hydrants; but, in addition, fire buckets hang in a row in the hall, electric alarm-bells are fixed to each external doorway, a fire annihilator stands ready to be buckled on any one who has no fear of being asphyxiated, telephonic communication exists between the mansion and the stables, the home farm, and the clerk of works' house, so that help could be obtained quickly; also telegraphic communication to the nearest town; a watchman perambulates outside the building all through the night, whose movements are known by a toll-take clock, the register of which is carefully taken every morning, and fire-ladders also hang up adjoining the house and which will reach to the roof. Of course, in case of accident, there are stop-cocks at different points of the main, but these are usually kept open, and, at any rate, a white post is placed against each, on which is distinctly painted, "Fire-cock, turn left to right," and the keys for these hang at the nearest convenient place, well known and constantly in sight of all whose business brings them near thereto. It is obvious that in the case described the conditions are favourable for an efficient supply of water at high pressure. Were no such facilities available, a steam-engine would, of course, be necessary to pump the water, and a water-tower built, having a large iron tank on the top. I am told that the cost of maintenance of the whole system of water supply and distribution described does not exceed 100*l.* a year, excluding the wages paid to the watchman, which are not taken into account, as his functions are more especially to arrest the progress of any one having burglarious proclivities. I may incidentally mention, with regard to the appliances in use for the protection of mansions from fire, that both leather and indiarubber hose are unsuitable, not only on account of their weight and cumbersome nature, but more especially because they are liable to crack when not in pretty constant use, and that the best for the purpose is "Vaucher's Canvas Hose," which is light, economical, and capable of standing a high pressure of water. The water in iron mains should not be allowed to remain there more than a month, otherwise the oxidation of the iron has an injurious effect upon the hose when the fire appliances are all under trial, which, of course, should be at stated intervals. But there is a weak link in the chain, even in the arrangements I have just described, for should a fire break out in the night, some considerable time would elapse before sufficient help could be obtained, and in the meantime, unless kept in check, an uncontrolled fire raging in the midst of a mass of parched timber and other combustible materials would probably defy the endeavours, no matter how energetic, of men with no experience as firemen. This is a difficulty not easy to cope with, although I believe an instructor is sent from the London Fire Brigade to many private residences in the country at a low charge to give instructions how to act in case of fire. It is a well-known fact, however, that many persons when called upon in an emergency at a moment's notice to assist at some sudden calamity, for which they have had no intimation and no previous experience of a similar character, "lose their heads," and some extraordinary tales are known and told of the doings of people placed in that position. Incidentally, I might mention that formerly the members of fire brigades in country towns, and London also most probably, were selected from mechanics and others employed in building operations, probably because they were more accustomed to "man ladders" than any other class, and I believe this system still obtains in some parts of Germany and other portions of the Continent. It

is passing strange to note the money expended in ways and means for the prevention of fires, and the actual money lost sustained through fires, and yet to find that nine-tenths of the buildings erected appear to be built expressly to be burned. Let the casual observer take his stand in an ordinary building when "in careass," before any plastering or flooring is laid, and look round him. He will find the wood very fairly distributed for a good fire, or rather a bad one; and then let all the wood that is to come in for finishing be distributed about,—plastering-laths, floor-boards, doors, stairs, skirtings, fittings, &c.; then add the wood furniture, and he will behold "wood to the right of him, wood to the left of him, wood in the front of him, wood everywhere." I find in an ordinary house just erected, and standing on an area measuring 56 ft. by 36 ft., that the actual weight of wood of all description used in construction thereof is about twenty-nine tons. Now, what chance is there of chocking a fire which, unobserved, has made considerable headway in an area of 224 superficial yards, in which there is heaped up as much wood as took twenty-nine horses to draw there, and no means of obtaining water except as much as can be pumped up by an ordinary hand-pump from a well?

A writer in the *Manchester Courier* some years ago stated that in Japan the law was that the occupier of every house burned down, whether accidentally or otherwise, should be beheaded; and the same writer follows up this statement by gravely remarking, "there are very few fires in Japan." Now, this law might be profitably copied in this country, with certain amendments,—for instance, transfer the onus of responsibility to the builder; make the law provisional, say for the next twenty years, and to apply only to buildings erected after the passing of the Act. This would do more towards rendering our habitations fireproof than all the moralising and preaching that has taken place these last forty years, and, when once fireproof buildings were found to be as easy to erect as combustible buildings, no one would be found to occupy one of the latter with the chance at some future time of being roasted alive. I grant, builders would raise personal objections to an Act of Parliament that would virtually hang the sword of Damocles over their heads for the rest of their days; but every national benefit must of necessity press heavily on an infinitesimal portion of the population for a time.

Seriously, the saving of valuable property and valuable lives, simply by making our habitations to all intents and purposes fireproof, will not be accomplished until it is made penal to build them otherwise. The thin end of the wedge has been inserted in certain rules and regulations laid down by the municipal authorities in large towns with regard to the use of wood in buildings; but beyond this, with our national disinclination to do matters different from our forefathers, no further steps will probably be taken to prevent loss of life and property from fire for the next century or so.

I must plead in extenuation of all weak points contained in this paper, that it is a subject upon which, compared with many others, but little has been said or written; on that account, however, perhaps it may be the more interesting to the members of this Association; at any rate, if it be the means of helping to prevent in the future such losses as have lately occurred in the burning of Ingestre Hall and Clevedon Court, my time will not have been wasted in drawing attention to "Fires at Country Mansions and Suggestions for their Prevention."

At the conclusion of the paper a hearty vote of thanks was accorded to Mr. Potter for the very able manner in which this subject had been brought before the members.

The discussion on the paper was postponed until the next monthly meeting.

**Taunton.**—The fifteenth-century nave roof of Thorne Faulcon Church, near Taunton, has just been substantially strengthened and repaired, and re-covered with Delabole slating. The lath-and-plaster ceiling has been removed internally, the old oak ribs repaired, renewed, and brought to light again. A curious oak cornice of the middle of the seventeenth century was found concealed under a much later plaster ceiling. English oak boards in narrow widths replace the lath-and-plaster ceiling. The work has been executed by Mr. Hawkins, of Glastonbury, under the superintendence of Mr. B. Edmund Ferry.

#### BUILDING FRONTAGES ON THE THAMES EMBANKMENT.

We regret to hear of a proposal by the City Lands Committee of the Corporation of London to let the vacant land adjoining the City of London School, at the Blackfriars end of the Thames Embankment, for building purposes, without any restrictive conditions as to the line of frontage to be adopted in the new buildings facing the Embankment. A board has been set up on this vacant land showing the proposal of the committee of the Corporation.

Mr. H. W. Brewer writes to the *Graphic*:—  
"I venture to suggest that the proposal of the Corporation of London, if carried out, will, to my mind, quite ruin the picturesque effect of a large portion of this fine esplanade, viz. the part which extends from the Temple Gardens west to the City of London School east. The proposal in question is to bring forward the houses erected upon this site to the line of the street, or rather footway, instead of keeping them back to the inner line of the Metropolitan Railway. The effect of this will be to make the Embankment look very narrow, and the fine view of the Temple buildings and their beautiful gardens will be entirely built out when looking from the City end or from Blackfriars Bridge, while the noble gable of the City School will be locked out when looking from Westminster. Unless the matter is brought to the notice of the Corporation in some of the papers, this plan will be carried out, and the opportunity of making a really grand thing of the Embankment lost, and this after many thousands have been expended upon it. . . . The ground does not appear to have been sold at present, and it is not impossible that an appeal to the Corporation upon artistic grounds might cause reconsideration of the present scheme. Although setting the houses back would cause a certain pecuniary loss, yet I believe that the City authorities would be willing to make the sacrifice, if they could be convinced of its extreme advisability. If, however, the question is not taken up at once, it will be too late, and the opportunity of reserving this fine open space, with its remarkably picturesque outlook, will be for ever lost."

We agree perfectly with those views, and it only needs a visit to the spot to see how the general appearance of the Embankment would be damaged by a number of ordinary house-fronts coming right up to the line of the footpath. If ever there was a good opportunity for creating a shady boulevard or garden, with advantage to the public, it is here. There is every reason why the building line should be set back at least as far as the front of the City of London School, leaving as an open question the method of dealing with the land immediately on top of the Metropolitan District Railway tunnel, whether by forecourts or gardens attached to the houses, or by a shady public walk planted with trees. If the Corporation of London, through the City Lands Committee, could be persuaded to set back their frontage-line as far as the south end of the buildings in King's Bench-walk, the artistic effect would be greatly enhanced; but we fear this is too much to hope for. We are informed on good authority that the retaining-walls of the railroad beneath this land are certainly not strong enough to carry the superincumbent weight of lofty buildings; and the presence of two ventilators in the top of the tunnel renders the land still more difficult to deal with as ordinary building land. Can it be that the Corporation of London, which through one of its committees has behaved so generously in giving to the London public the costly land and buildings of the new City School, will stultify itself by allowing another of its committees to spoil its own work by letting this adjoining vacant land without restriction as to building-line, in order to obtain a few hundreds a year extra income in the shape of ground-rent? Surely any private land-owner owning this land would insist upon a set-back line; and, if so, should not the Corporation (who are, in fact, trustees of the public) deal with this land in the most liberal spirit? Has the Superintending Architect of the Metropolitan Board of Works no power to define the line of building frontage along the Victoria Embankment (the finest road in London)? Or is it the voice of the Press only, and public opinion at its back, which shall prevent this great mistake?

**The Electric Light at Brighton.**—After a long discussion, the Brighton Town Council on Wednesday resolved to apply for a provisional order under the Electric Lighting Act. The draft order provides for the compulsory lighting of a considerable area of the town.

#### WEST LONDON SCHOOL OF ART.

MR. MUNDELLA, M.P., ON ART-TEACHING.

The annual presentation of prizes to the students of the West London School of Art took place last Monday evening in the large room of the School, Great Fitchfield-street. The Right Hon. A. J. Mundella, M.P. (vice-president of the Committee of Council on Education), presided, and was supported by Mr. F. Davison, Mr. J. D. Crace (hon. sec.), Mr. Robert W. Ellis, F.S.A., Mr. W. J. Holland, Mr. G. A. Thrupp, &c. There was a very large attendance. The walls were hung with some excellent drawings and paintings executed by the students.

Mr. Mundella, M.P., who was warmly received, said:—Ladies and gentlemen, it is my first duty to call upon your head-master, a very old friend of mine, whom I am glad to see at this West London School of Art, to read the annual report. Mr. Rawle, I may assure you,—and I dare say most of you know,—is a gentleman who acquired a very high reputation for what he had done in a provincial school with which I for many years was connected. His exertions in the town of Nottingham are remembered with gratitude, and the trade has flourished in a great measure from the impulse he gave to art-teaching there.

Mr. John S. Rawle then read his annual report, from which it appeared that 558 students attended the school, showing an increase of one on the previous year. The day classes were attended by 160 students, and the evening classes by 398. The school fees show the highest amount ever received, namely 868l. 8s. 7d., giving an increase of 42l. on the year 1881, and an increase of 110l. 5s. 2d. on the fees for 1880. The Government payments on results amount to 437l. 4s. 11d. "Last year we received 440l. 13s. 4d., and in 1880, 347l. 3s. 3d. We sent 3,896 works, executed during the year, to South Kensington, for examination, against 3,888 in 1881, and 2,577 in 1880. We have, this year, taken exactly 25 per cent. of the National Competition Medals, &c., awarded to the thirteen Metropolitan District Schools of Art. In the highest, or 'Third Grade Government Advanced Examinations,' this year, we have reached our highest point of success, twenty-nine students having gained twenty successes, against eighteen last year, and fifteen in 1880. Forty-eight works were considered worthy of 'Government Third Grade Prizes' in the advanced stages of study. Twenty-seven gained this distinction in 1881, and twenty-two in 1880. Nine students gained 'Government Free Studentships' against eleven in 1881, and two in 1880. In the Elementary, or 'Second Grade Government Examinations,' in freehand, geometry, perspective, and model drawing, we gained thirty-two prizes and 105 certificates, total 137 successes. In 1881, there were twenty-two prizes and ninety-seven certificates, total 119 successes. In 1880, the number of successes was 101. With regard to the 'Government Payments on Results,' in 1881, the West London School gained a higher grant than any other school in the kingdom. The payment on results is the best testimony as to the general quality of the whole work of the school."

Mr. Davison then submitted the financial statement, from which it appeared that last year there was a deficit of 1,305l. An appeal had been made, with the following result:—The Duke of Westminster, 100l.; Mr. Tarn, 100l.; Mr. Crace (hon. sec.) and his father, 100l. In all 769l. had been collected, thus enabling the school to discharge a considerable portion of its liabilities.

Mr. J. D. Crace, hon. sec., said that in regard to the travelling studentship, he believed this was the only school which possessed one, and in future the committee would be obliged to demand very close attention to the conditions attached to that prize, viz. the study of ornamental and applied art, the value of which could not be exaggerated.

Mr. Mundella then addressed the students at some length on the subject of art education. He wished, he said, first to explain the reasons which induced him to come amongst them that evening. In the first place, he had a very cordial invitation from the committee, amongst whom he found the names of gentlemen who had won for themselves a very high and an honourable distinction in connexion with art industry and art manufactures in this great metropolis. In the second place, when he submitted the request of the committee to the

authorities at South Kensington, the Art Director was as pressing as Mr. Grace that he should pay a visit to this school, which, he said, was one of great promise, and one of the best of its kind in the metropolis. Moreover, it was pointed out that the school contained the right elements, and on that account especially deserved encouragement and support, for it was composed in a very large measure of two classes,—of the employers of art workmen, and of those employed in connexion with industrial, decorative, and ornamental art. He had spent a great part of his life as an employer of labour, to a very large extent, in one of our provincial towns, and at the head of their school of art they had that excellent master, Mr. Rawle. He (Mr. Mundella) consequently wished to be present to see what progress had been made. If he wished to point to a successful school of art he should choose that at Nottingham. The lace-manufacturers of that town had thrived and were aggressive against the manufacturers of the whole world, and they were now competing most successfully against France, mainly because they had applied good art to manufactures. Then this school, it was pointed out, was composed of the two elements which wanted bringing together in order to place England pre-eminent in art,—the art-employer and the art-workman. Of the 550 students, he believed considerably more than half were so employed daily. It was precisely the object for which the Government originally founded and subsidised schools of art. The first grant,—1,500*l.*,—to encourage art as applied to industry, was made through the Board of Trade in 1836, and that body administered the gradually increasing grant down to 1854, when the duty was transferred to the Science and Art Department. The object of the Government was not to create producers of "pot-boilers"; not to increase the number of pictorial artists who every year found some thousands of pictures rejected by the Royal Academy. Their object at South Kensington was not to double the number of these rejected pictures,—that was the work of the Royal Academy. If, as had been said, the South Kensington School contributed 25 per cent. of the students who entered the Royal Academy, they contributed too many. A jealousy had been assumed by some people to exist between South Kensington and the Royal Academy, which was a pure fiction. There could be no jealousy or conflict, and he was fully convinced that South Kensington had been eminently successful in accomplishing the object for which it was established. Speaking on that occasion, as Vice-President of the Council, he was only expressing the opinion he, himself an employer of art-labour, had long since formed, when he stated that South Kensington had been eminently successful in accomplishing the object for which it had been established. Art schools had accomplished their original purpose. He had already shown that the first grants in aid of technical art-training had been very small at the commencement. But in 1851, the first Great Exhibition was held. Perhaps but few present could remember that exhibition, but he remembered it well, because he had not only been an exhibitor in it, but he had been a commissioner for his own locality. He had, moreover, a very lively recollection of the character of British art which was shown at that exhibition. It appeared to him in 1851, and he held the same opinion still, that if all the British art work of the first half of the present century, in its wall papers, its decorations, its hangings, and its very heavy furniture, had been collected in one vast pile and burned up, the world would not have been any the worse for it. Of one thing he was quite satisfied, and that was, whatever fashionable craze might prevail in the future, no one would ever dream of making a collection of the furniture and other works of decorative art of the first half of this century. We might well look with pride upon the productions of the days of Queen Anne, which had been designed by men who, although they made furniture,—like Chippendale,—were great artists; and when the architect designed for Wedgwood; and when the architect left the impress of his genius, not only on the structure of the house, but upon its very door-knocker. It was impossible to compare those beautiful works of art with the clumsy productions of later times without astonishment that the taste of this country could have so immensely degenerated. Our deficiencies having been made

very plain to us in 1851, they owed the greatest debt of gratitude to the late Prince Consort for the stimulus he had given to art and to art manufactures and industries in this country. The effect had been seen in the last thirty years' subsidy of art in educating, first the customer, then the producer, and then in the increasing art merit of the productions. In his own town thirty years ago, if a designer was wanted they sent to France for him,—to Paris,—Englishmen being considered as destitute of originality; while now, so totally had things been altered, it was thought that Englishmen had more originality and feeling for art than Frenchmen, in spite of their great advantages of living constantly in an atmosphere of art, amid art classes, and with an enormous demand for art productions. Every exhibition which had taken place since 1851 had shown the enormous strides England had been making, until in 1878 the French had fairly stood aghast at the products of some of our London furniture houses, for instance, as also in the case of the marked advance shown in every article exhibited by British manufacturers. Where, now, was to be seen our heavy and inelegant mahogany furniture, our carpets, with their lions and tigers and impossible animals, our hideous wall-papers, with their baskets of fruit and gandy colours? These atrocious productions had all disappeared, be hoped never again to return, and their place had been taken by works of art of the graceful design and exquisite workmanship which now gave us so much pleasure and enjoyment as we saw them in our shop-windows in walking along the streets of London. While, however, we had undoubtedly achieved a great success in the cultivation of a taste for applied art, we could not afford by any means to rest content with our present advance. It was true that this development of artistic taste had enormously increased the demand for our art products throughout the world, and had given as great a stimulus to our export trade, but we must not forget that we were about to be exposed to a very severe competition. Let them see for a moment how this great advance, of which he had a right to be proud, had been brought about. The amounts spent by South Kensington since the Science and Art Department had taken up this branch of instruction were as follow:—In 1862, the total grant made to schools of art in England was about 12,000*l.*; in 1871, 30,000*l.*; in 1877, 62,000*l.*; in 1881, nearly 70,000*l.* As to numbers taught, in 1857 30,000 children had received instruction in free-hand drawing in the elementary schools of the country; in 1862, 71,000; in 1871, 166,000; in 1877, 541,000; and in 1881, 850,000. The art classes had gone on increasing from about 3,000 or 4,000 in 1857 to 23,000 in 1881. The provincial and metropolitan schools of art, including the National Art Training School at South Kensington, had, in 1857, 11,000 students; in 1862, 13,000; in 1871, 21,000; in 1877, 29,000; and in 1881, about 32,000. The total numbers taught and aided by the State, under the Science and Art Department, were as follow:—In 1857, 43,000; in 1862, 87,000; in 1871, 212,000; in 1877, 610,000; and in 1881, 917,000. So it would be seen we were doing something considerable in the way of teaching art, but they might be sure that at South Kensington they would not rest content until there was a new departure and a real improvement. He would give his reasons. In the first place he was surrounded by prizes. Prizes were all very well when students had to be bribed to come and be taught, but he was doubtful whether it was the best way of giving rewards. About 10,000*l.* a year was spent in this way. He thought the students would be aided more by giving them better examples, by giving free scholarships, and by assisting travelling studentships. It was the mark of merit that was wanted. The soldier died for a little iron cross, and the artist would be just as well content with the certificate which marked his progress as with a prize which had a certain money value. This was one of the subjects which was occupying his attention at the present moment. He believed that sufficient stimulus and emulation might be created by other means, and that the money might be employed better than as at present. The reason why Englishmen must not rest content was because they were threatened with a competition impossible to describe, and hardly, if possible, to exaggerate. He had spent some time in learning what was going on in France in the direction of encouraging instruction in art, and he was astounded at what

he had seen. In every *arrondissement* he found placards offering gratuitous instruction in art to any person employed in this or that trade who would accept it, and he saw schools of art everywhere thronged by hundreds of students. Now this was done by the municipality; it was actually out of the rates and taxes that the Parisians paid the cost of the whole of the art education of the artisans of Paris. In the coming year the municipality of Paris would spend in this way 32,000*l.*, and the following year a much larger sum. From the budget of the city of Paris he learned that for 1,900,000 inhabitants education next year would cost more than double the amount expended for the four millions of people of London. These facts ought to be known, for their effects would have to be met. Last year a commission had been appointed to inquire into technical education throughout Europe, and when the commissioners came home they would pour into his ears the different facts in relation to the subject which they had collected, and he was astounded in regard to the tremendous energy and the lavish expenditure now going on in Continental countries, which had been stirred up mainly by what they saw England had been doing, and next by rivalry with each other. Professor Roscoe had told him of a visit made to an Art and Science School of Rouen, where amongst the scientific and art collections to aid in the work of teaching was found a Prussian spiked helmet, or *Pickelhaub*, used by the teacher to stimulate the students when they gave any signs of flagging by producing it, and crying, "*Travaillez, travaillez, messieurs*;" France was humiliated and we also in this city of Rouen, because our enemies were better instructed than we were." That was the kind of impulse that was being given to instruction to every department of industry in France, because they felt they had been left behind somewhat in the race, and they were now looking to education in every department to place their country in its old position of renown. Thank God, we had nothing to fear from the invader, but what we had to fear was lest by lack of enterprise we should fall back in our industrial career. There was nothing which would do so much to keep our manufactures, and every product on which the impress of art could be put, as thorough art-teaching. If Englishmen wished to hold their own as art-workmen they must be prepared to compete with a race in France, in Belgium, in Munich, and in Dresden, who had the advantage of generations of art-traditions, who lived in an art-atmosphere, and who had always before them the best forms and examples of art-work. At Rouen artisans might be seen in large numbers working at their studies at night, with their coats off, for two hours on six nights in the week, diligently improving their minds and acquiring skill at the conclusion of a hard day's work. At Liège, in Belgium, with its population of 100,000, 6,000 young men were at work in the Art and Science Schools every night. Only recently in Paris 300 artisans engaged in a competition in modelling, and were at work from nine in the morning until five in the evening. In these circumstances, we ought to fear lest by our own negligence we should hold back, for nothing would so much keep our industries and manufactures to the front as art-teaching. There was another point to which he desired to refer before he sat down, and that was with regard to the feeling that was too apt to be entertained in this country that decorative and applied art was degrading to the artist. He trusted that before long we should entirely get rid of that false notion. John Ruskin, who knew something about this subject, wrote the following: "The only essential distinction between decorative and other art is the being fitted for a fixed place, and in that place related, either in subordination or in command, to the effect of other pieces of art. And all the greatest art which the world has produced is thus fitted for a place, and subordinated to a purpose. There is no existing highest-order art but is decorative. The best sculptor yet produced has been the decorator of a temple front, the best painting, the decoration of a room. Raffaele's best-doing is merely the wall-colouring of a snite of apartments in the Vatican, and his cartoons were made for tapestries. Correggio's best-doing is the decoration of two small church cupolas at Parma. Michelangelo's, of a ceiling in the Pope's private chapel; Titian's, of a ceiling and side wall belonging to a charitable society at Venice; while Titian and Veronese threw

out their noblest thoughts, not even on the inside, but on the outside of the common brick and plaster walls of Venice. Get rid, then, at once of any idea of decorative art being a degraded or a separate kind of art. Its nature or essence is simply its being fitted for a definite place, and, in that place, forming part of a great and harmonious whole, in companionship with other art; and so far from this being a degradation to it, so far from decorative art being inferior to other art because it is fixed to a spot, on the whole, it may be considered as rather a piece of degradation that it should be portable." It must not be forgotten that the Italian artists of the Renaissance began their careers in the workshops, and that it was only by degrees that they developed into the skillful men they became. So much for the work which art-training produced; but they must not lose sight of the enormous advantage it was to the worker himself. Possessed with a knowledge of art, he felt his work cease to be a mere dull mechanical drudgery, and his labour in producing that of which his mind could appreciate the beauty became a pleasure instead of a toil. In conclusion, Mr. Mundella said they had a good deal to do in the future, and he was glad the London School Board was about to begin by engaging Mr. Bradford to put drawing in elementary schools on a better footing.

The right hon. gentleman, who was frequently applauded during the delivery of his address, then proceeded to distribute the prizes.

Mr. Turripp then proposed a vote of thanks to the masters of the teaching staff.

Mr. Davison seconded the motion, which was carried.

Mr. Rawle briefly returned thanks.

Mr. Edis, in proposing a vote of thanks to the chairman, said that they all appreciated the address just delivered, which he hoped would be read throughout the country. He trusted the Vice-president of the Council would lend them some of those wonderful treasures that were stored at South Kensington, so that they might have before them to copy the highest types of art.

Mr. Donaldson having seconded the vote of thanks, it was also carried.

Mr. Mundella replied, and the proceedings then terminated.

#### HORTICULTURAL BUILDINGS.\*

No paper on horticultural buildings would be complete without a reference to glass and glazing. As you are aware, for clear glazing, 21-oz. English sheet is generally used. Thinner than this is not advisable; neither is Belgian glass so desirable as English. Wavy speckled glass is apt to scorch plants. For a semi-obscure glass, Hartley's rolled plate is generally used.

Touching the mode of fixing the glass, I have unhappily come to the conclusion that for use in purely growing horticultural houses, no system hitherto invented is more advantageous than putty glazing. I say "unhappily," because putty glazing is by no means perfect: the putty is apt to peel off, crack, form crevices for the retention of moisture and insects, and cause the woodwork to rot. Then it is troublesome, to a certain extent, to renew putty-glazed glass when necessary, as well as to put it in in the first instance. There can be no doubt that horticulturalists generally would welcome any advantageous method of superseding putty glazing; but there can equally be no doubt that for use in purely growing horticultural structures, putty glazing yet holds its own.

I will briefly run over some of the characteristic features of mechanical glazing. In some systems the glass is held in its place by metallic clips; in others by compressible metallic bars; in others, between wedges of lead; in others, between strips of vulcanite or other elastic substance (the glass and such elastic substance being held in their position by wood or metallic capping and screws); in others, the glass drops into grooves prepared to receive it. Now in all of them the glass comes in contact with either a metallic or an elastic substance. In the former case, there must be a sufficient amount of "play," or the glass will certainly break; in the latter case, the elastic substance is found in practice, chiefly in consequence of internal moisture, excessive variations in temperature, and atmospheric influences,—to give

\* A paper by Mr. F. A. Fawkes, read before the Architectural Association on the 8th inst. See p. 774, ante.

far more trouble to gardeners than putty properly made and applied. If, on the other hand, there be any "play" between the glass and whatever it touches, hot air has abundant opportunity for escape; such a house cannot be properly fumigated; crevices for the retention of water by capillary attraction abound; subsequent freezing of the water and breakage of the glass are liable; and the same crevices which hold the water will harbour insects,—all most serious disadvantages from the point of view of a horticulturalist. Of course, for other than strictly growing glass houses, mechanical glazing may frequently be employed with benefit.

The most usual form of ventilator is a framed light, hinged at the top, and opening from the bottom outwards. Sliding sashes for roof ventilation have almost gone out of fashion, except for simple frames, low pits, and houses in which the roof requires, at certain times, to be practically stripped. For any other purposes sliding lights are cumbersome and unmechanical, and a roof in which they are fitted requires to be abnormally heavy, and affords great obstruction to the solar rays. Both top and bottom ventilators should extend along the whole length of a house, except, perhaps, in the case of the top ventilators of a span or three-quarter span, which may often be arranged alternately on each side of the ridge. Continuous ventilators, then, being necessary, consecutive lights may be made to open simultaneously, or each can be arranged to open separately. Unless, however, there are a great number of lights to manipulate, or unless they are not easily accessible, it is generally advisable to adopt the latter course; for, obviously, it may not be advisable to have exactly the same area of ventilation along the whole length of a house. At one part there may be lights which require a more constant and copious renewal of air than at another part. If lower vertical lights or ventilators are opened separately, then the ordinary notched hand "set-opens" may be used. If top-roof lights are opened separately, then a quadrant bar terminating in an eye may be fixed to each light, and actuated by a cord held by a counterbalance weight or a hook in an adjoining wall or mullion. When, however, to save time, the large number of ventilators to open, or from inaccessibility,—as, for instance, when a vine-border or a great width of staging in front of the ventilators necessitates their being opened simultaneously, the best gear to use is that consisting of a pair of double-jointed arms attached to each light and keyed to a bar held in blocks fixed to the mullions. The partial rotation of the bar and opening of the lights may be effected by a handle keyed on to the bar at any part moving in and pinned to a quadrant or half circle; or the motion can be conveyed by a connecting-rod to some distance. Similar apparatus may be used to actuate top-lights. These double-jointed arms are better than any other form, for they never offer an obstruction to pots, plants, foliage, &c.

Roofs have occasionally to be wired, in order to support foliage trained near them. In practice I find the best way to wire roofs is as follows:—Suppose we have a lean-to to deal with: take two flat bars turned edgewise, and suspend them at back and front by holdfasts, bolted at back through the wall, and at front into the mullions. Then at the necessary intervals stretch wires by means of *raidisseurs* to these two bars. Intermediate parallel bars, dependent upon the length of rafter, may serve to support these wires. The wires can thus be at short, long, or irregular intervals, or at any time, and as frequently as required, the distance apart of the wires may be altered. In this way they help to tie in the roof, enable painting and repairs to be more easily effected, and are more easily adapted to the wants of the gardener than fixing wires permanently and separately at right angles to the rafters. The wire I generally employ is galvanised iron about No. 12 B.W.G., each spaced say 10 in. apart, and 10 in. from the glass.

Soon after commencing this paper, I mentioned that growing-houses might be divided into three classes,—those adapted for plants, those for the cultivation of roof-fruit, and those having heds for bottom or root heat. In planning the staging in a house of the first class, the points to observe are facility of drainage from pots, economy of space, accessibility, proper distance from glass, depending upon the height of plants to be grown. A house about 11 ft. wide is a very favourite form with nurserymen.

So far as the materials are concerned of which stages are composed, for ordinary plant-growing the usual lattice-wood stage, composed of 3 in. by 1 in. laths with  $\frac{1}{2}$ -inch spaces between them, is very suitable. When, however, the pots or plants require to be planted in damp moss, sand, shingle, &c., then carefully drained concrete, slate, or zinc-lined wood stages may be necessary. The chief characteristics of a house of the second class are, framing wires along the roof, a prepared border about 3 ft. deep, and provision for thoroughly draining this border, and for preventing the roots of vines planted in it from penetrating to the subsoil. If the subsoil be of a retentive nature, then you must have concrete or other impervious base, on this, rubble; then turf, grass downwards; then the compost forming the border proper. If the subsoil be of a porous character, then the concrete base may be omitted. It is generally considered best for the border to run outside as well as inside; therefore the front wall should be built on arches, or composed of iron uprights filled in above the ground-line by slabs of slate. The total width of a border should, if possible, equal the width of the house. A forcing-pit may be taken as an example of the third class of growing-houses. The chief characteristic of this class is an arrangement of hot-water pipes for heating the soil of which the hed is composed, supplementary to and independent of the pipes for atmospheric heat. The pipes may be carried through the actual bed itself, or, what is better, they may be carried through an air-chamber under the hed. In this position the vapour troughs with which they may be fitted are more accessible, and the whole arrangement is certainly better than the previous arrangement, which necessitates water passing through the bed before it can be vaporised by the pipes. Although it is advisable to keep these three classes of houses distinct when treating of them, yet it is sometimes necessary to effect a compromise and grow grapes and plants, or plants and cucumbers, in the same house. For instance, a lean-to house may have a vine border in front and a tiered stage at back; or a span-house may have a forcing-bed on one side of the path and a stage on the other. Of course it is understood that when the functions of different classes of houses overlap one another, a high degree of cultivating efficiency is apt to be sacrificed.

I have hitherto been speaking of growing-houses. I should like, in conclusion, to say a few words upon conservatories or showing-houses. By these I do not mean winter gardens, in which palms and other large specimens of vegetation are permanently planted, but just ordinary conservatories, with numbers of which architects may expect to come in contact in the course of their professional work. At the outset several points must be kept in view. 1. A conservatory must be treated as one of the reception-rooms of the dwelling-house. 2. Without departing from its strictly horticultural character, we must endeavour to make it approximate architecturally, both inside and out, to the other portion of the dwelling-house. 3. This being so, we must regard the functions of growing and showing as quite separate. I am perfectly aware that many cases exist in which it is necessary that growing and showing be accomplished in the same house. In such cases a compromise must be effected, for if all the conditions of growing be complied with, the conditions of showing will suffer, and *vice versa*. Let us endeavour to crystallise these abstract ideas into a few concrete facts. In a house in which plants are grown, it is generally essential, as you have seen, that they be not at a great distance; therefore low eaves, say, 5 ft., and interior high-tiered staging, may be not only desirable, but necessary. In a conservatory the eaves have frequently to be from 9 ft. to 12 ft. high, and interior staging dispensed with. We generally have a choice of aspect for a growing-house; the site of a conservatory is generally dependent upon proximity to a drawing-room or hall, where frequently the sun cannot reach it. A growing-house may have scantling as light and unobstructive to the solar rays as possible; a conservatory may require to have heavier scantling, and to a certain extent, obstructive ornamentation. In a growing plant-house, path area is generally economised as much as possible, in order to obtain the maximum growing area; in a conservatory a different disposition of paths is necessary. Summing up the chief points to be

observed in designing a conservatory, I would say,—Construct it in harmony with the adjoining or surrounding architecture. Give as much light as you can. Ornament the construction: never construct the ornament. Interest and pleasure should be excited by the broad lines of a conservatory rather than by meretricious ornament and fussy detail. When will the world, especially the architectural world, recognise that art and simplicity do not form an irreconcilable combination? Touching the interior, I would say,—Throw away stages, bide the pots, and let us see natural beds and hanks of foliage and flowers massed with artistic irregularity. Let there be an ample paved space,—not a mere path,—but a space so that a table and a chair or two may be placed in it. Let the conservatory be regarded more as a lounge than a mere place to walk round in single file. If the size and nature of the conservatory permit, then rockwork, a fountain, or sculpture may find a place in it. Baskets of hanging foliage look well. Bare walls, as well as other parts of a conservatory, may have creepers upon them. A grass mat or two may be thrown down here and there, and a parrot advantageously introduced. Sometimes an awkward space in the brickwork may be easily turned into an aviary. In fact, while not sacrificing the strictly horticultural *raison d'être* of the structure, a judicious combination of art with nature may intensify the enjoyment derived from a conservatory, and the beauties of the plants and flowers may be absolutely enhanced by the introduction of such artistic accessories as I have mentioned.

#### NEW SUBSTITUTE FOR GYPSUM.

A substance has been introduced in Germany for industrial uses which is alike applicable to castings of figures, ornaments, &c., instead of gypsum, and also in the form of paint to the impregnation of tissues and wood. Its resisting properties are stated to be equally effective against the influences of weather and of fire. It is described in a German technical journal as being capable of taking a high polish. It is composed principally of fluor-spar or chrysolite, in combination with fire-proof white sand, zinc-white, hydrate of lime, sulphate of baryum (natural and artificial), silicate of magnesia, powdered quartz, &c., together with moderately-concentrated soluble silicate of potash. This mixture is carefully stirred together, and is cast in gelatine or other moulds.

#### STEVENS AND ST. PAUL'S.

Sir,—In a recent issue of your journal you give a report of a paper read by Mr. Poppowell Pullan on the Decoration of St. Paul's Cathedral.

Mr. Pullan expresses, at the outset, the hope "that his paper would be of interest to some members of the Institute, would excite few of them, irritate none, and be instructive to all." That the paper was instructive to all, few who have read it can, I think, question; for it revealed, apparently, a good deal that was new,—not to say novel,—to the general body of the profession. Judging, however, from the comments made by some of the speakers in the discussion which followed, it can hardly be supposed that his hope as to an absence of excitement and irritation was fulfilled. One cannot but sympathise with the author in that his "suggestion towards the solution of the problem" did not meet with that approval which, no doubt, he would have desired; but my sympathy does not go so far as to lead me to concur in the wholesale denunciation which he heaps upon the memory of "Stevens, a sculptor lately deceased." It might have occurred to the lecturer, one would have thought, that most of his auditors knew what Stevens was; and, had they not heard of his decease, might fairly have inferred that he was hardly in a position to come forward and reciprocate the kindly and generous sentiments expressed towards him by Mr. Pullan.

I do not desire to occupy your valuable space with any lengthened discussion as to the rival schemes; but, with your permission, to say a few words with regard to one of the subjects touched upon on the occasion alluded to. I refer to the Wellington Monument.

It has always appeared to me that the Wellington Monument, though in itself a work of great merit and beauty, cannot by any chance

be a "joy" to any one, and certainly not "for ever," unless removed to some place where it can be properly seen. What is the impression on first catching sight (and ever after) of the monument? It is that its nature and proportions are totally unfitted for the position it occupies. The wonder is how it got there. The work is full,—perhaps a little too full,—of fine detail (which, if I may so express it, appears rather inclined to run to seed); but when walking round the monument the eye is satisfied. Supposing, though for a moment, the details had been inferior, the general outline remaining one of marked excellence, would not the structure have been so denounced as to have forced the authorities to have removed it long since? I venture to hope so; for then nothing in the shape of beauty could have been seen, a good view of the whole structure being unobtainable. I believe I am correct in saying that Stevens designed the monument to be placed between two of the nave piers. Nothing of this is said by Mr. Pullan; on the contrary, he points to the want of the sense of fitness shown in designing such a monument for such a site as evidence of Stevens's incapacity to conceive a suitable scheme for the decoration of the dome. But who, it may be asked, was the adviser of the Dean and Chapter as to placing the monument in its present position? Perhaps,—and I trust it was so,—the Surveyor to the cathedral entered a protest. Could he, however, have represented to the Dean and Chapter the grossness of the blunder they were making?

We talk, sir, very much in these æsthetic days about the value of educational influences, especially in matters of art. Is not this one of the most charming examples? What can be the impressions in the minds of the thousands of visitors to the cathedral, as you see them, guide-book in hand, craning their necks in the futile endeavour to catch a glimpse of the fine sculpture which adorns the monument?

Those who wish to know how great an artist Stevens really was would do well to pay a visit to the Architectural Court in the South Kensington Museum. That the original conception of the artist was a noble one, evincing a splendid mastery over the style, we have only to study there the original model. There, also, are to be seen the models of "Truth pulling out the Tongue of Falsehood," and "Valour spurning Cowardice."

In reply to a statement that the nodding plumes of the duke would have swept the ceiling, Mr. Stannus stated that it was not intended to have any plumes in the hat; they are not likely, therefore, to have swept the ceiling. He also says that it is 18 ft. from the platform (upon which the equestrian statue of the duke was to have stood, and at present the summit of the monument) and the ceiling. Are we to regard this as a defence of the placing of the monument? But the work is not complete; nor does it look so; and should there be surprise, the crowning feature of the structure being absent?

It would be interesting to learn, had the artist's design been carried out in its entirety, what space there would have been from the ceiling of the Consistory Court to the topmost point of the statue.

We have here a costly monument to the memory of one of our greatest men, a monument of considerable size and richness (and therefore, no doubt, to the ordinary mind, the more worthy of study), situated in a conspicuous position, near the principal entrance of our metropolitan cathedral,—a monument of unusual merit, and yet the whole affair a bungle. Where is our "Incidity"? Can we hope to advance as we should if we permit such errors to pass almost unnoticed? Errors have been so common with us in matters of this kind that we have come to regard it as a surprise to have the right thing done. Is not this another notable instance of the need of our having some tribunal to which matters of this kind might be submitted, and whose language should be law?

No doubt, if the monument be permitted to remain in its present position, it will soon be regarded as a fitting precedent for the exercise of a similar piece of good judgment elsewhere. Sir, I have seen such abominations erected that I believe the very winds of heaven would have blown them down in disgust had they not been shielded by the all-protecting mantle of precedent. Are we here to record another decision against the "reason of mankind," and call it a precedent?

CHARLES E. DYER.

#### OBITUARY.

Mr. J. M. *Blashfield*.—We bear with regret of the death of one of our oldest subscribers, Mr. John Marriott *Blashfield*, of No. 17, Great College-street, Westminster, and late of Stamford, Lincolnshire, which took place on Friday morning, the 15th inst., after a short illness, of bronchitis, followed by paralysis. The various architectural works in terra-cotta dotted about London and elsewhere, executed by him, are familiar to many, and testify to his great zeal and successful industry in the advancement of art-industry. The care and truth displayed by him in all his manufactures have admittedly been one of the causes of the present great development of terra-cotta as a building material.

The *Commandatore Virginio Vespignani*.—At the meeting of the Royal Institute of British Architects, on Monday evening last, the Secretary announced the decease, on the 3rd inst., of the Conte *Commandatore Virginio Vespignani*, Architect to St. Peter's, and Honorary and Corresponding Member, of the Vatican, Rome.

#### SHORTCOMINGS AT NETLEY HOSPITAL.

Sir,—I had occasion to visit Netley Hospital recently, and your remarks, in your issue of the 9th inst., on the lamentable shortcomings as regards lifts for the service of the hospital, were brought home to me very forcibly. The whole place was alive with men laboriously carrying large boxes of seals up the staircases and along the corridors. The boxes were made of iron, and were furnished with two handles, and were thus able to be carried by two men, one holding each handle. Filled with coals, as they were, they seemed just as much as some of the men could manage to carry up the steep staircases. Coals were unavoidably dropped about, and, of course, a good deal of coal-dust was mixed with the air. I was told they were carrying the week's supply for all the wards of the hospital and for all the offices of the establishment, as well as for the quarters in which the sick officers and some of the medical officers resided. This coal-carrying is a regular weekly performance, and when I mention that the lines of wards open upon corridors, each over a quarter of a mile long, and that there are three tiers of them, one above another, while the central part of the building is four stories in height, you may readily conceive what the work is, and what the effect is on the sick attendants who have to do it, and on the place itself. However clean the staircases and passages may be at its commencement, they are left in a condition that, as a matter of necessity, requires scrubbing and cleaning afterwards. To any one who knows what the uses of mechanical lifts are in our great hotels and other lofty public buildings, it is quite beyond comprehension that such a state of things should be permitted to last a day in our great military hospital, with its Royal foundation and national associations. It is stated that the Queen at her recent visit remarked on the chilliness of the corridors, and no one who passes along them on a cold windy day can be at all surprised at such an observation. How some of the patients can brave with impunity the cold currents of air that sweep along them is a mystery.

A CASUAL OBSERVER.

#### THE STONE QUESTION.

Sir,—Mr. Cross, in his letter of December 2, tells us that it is "a marvellous thing that the stone used in London buildings perishes so quickly"; but those who have considered this subject at all know that it is not in the least degree surprising. It is simply a matter of cause and effect. It is not to be wondered at that the cementing ingredients of stone,—hard or soft,—are destroyed when the chemical constituents of the abnormal atmosphere of London are considered. Carbonate of lime cannot long exist in the perpetual presence of hydrochloric acid, carburetted hydrogen, sulphurous gas, ammonia, and other corrosive agents, which are greedily absorbed by all free-stones. And Mr. Cross's panacea of careful "selection" at the quarries would only have the effect of retarding decay, even admitting it to be practically possible to carry it out. But I may ask, what owner of any well-known quarry would permit Mr. Cross or any one else to pick out the best stone on the spot for one particular building? Then, if architects, proprietors, and

committees are obliged, in nine cases out of ten, to study right economy, it is not likely they will bear the cost of the salary of a competent man to hang about the quarry decided upon—say, for a year or two,—just "to select" their portion of stone only. The owner would necessarily have to attend to the wants of many other customers, and therefore the above competent man would spend many idle days doing nothing for his employers. With the poisoned air of London it is only a question of time how long this is that stone will resist the powerful acids,—a few only of which I have named above. Owing to various causes, some stones will last longer than others, and, in my own experience, it is not always the quality of hardness that increases durability. One of the softest stones I ever used has proved, after thirty years' exposure to country air, absolutely durable. But we are talking of London,—abnormal London,—and there is only one stone, so far as my own experience goes, that will not decay, viz., Craig-leith; but as it contains 79 per cent. of silica it is so expensive to work as practically to be out of the market. Indeed, it is rather to be classed with the granites.

On the whole, then, I venture to think that Mr. Cross's proposal of "better selection" of stone at the quarry would not prove a remedy for the decay of stone in London, and is impracticable. H. T.

THE DECORATION OF ST. PAUL'S.

Str.—Permit me to point out to Mr. R. P. Pullan that the published reports of the meeting at the Institute contain the sentence "Having repudiated architects," exactly as quoted by Mr. Stannus, it may be possible that the latter gentleman was not "guilty of something more than garbling a quotation."

Referring to the rest of Mr. Pullan's letter, I would wish to express sincere regret that he should have been so sensitive to adverse criticism as to imagine that a person so well known for his geniality and fairness in discussion as Mr. Stannus is, could possibly desire to convey an unjust imputation against an opponent.

J. OSBORNE SMITH.

VARIORUM.

THE "British Almanac and Companion," 1883, holds its own, and seems to be the library almanac *par excellence*. The "Companion" has, as usual, a number of well-written essays on subjects of the day, including a section on architecture and public improvements. The writer, we are glad to see, confines entirely to the scheme determined on at Hyde Park Corner, and the removal of the arch.—The *American Bookseller*, besides giving full information as to works published and promised, includes some incisive and pregnant notes on passing events of cognate interest.

Miscellanea.

**The Regent's Canal and City Railway.**—The Regent's Canal, City, and Docks Railway Company, who obtained their Act last session, have commenced the purchase of lands along the line of route, with the view of immediately entering upon the construction of the line, and have just completed an important purchase in the neighbourhood of Aldersgate-street. The project includes the construction of a station in that locality, not far from the Aldersgate-street station of the Metropolitan Company, and for this and the general purposes of their undertaking, the company have just purchased a large area of land on the boundary of the City in Golden-lane. The land, which has for some time past been vacant, and which contains 45,396 ft., has been bought from the local authorities for the sum of 80,592l. It is stated that the rate of nearly 2l. per foot. It is said that the purchase money is intended to be applied to the erection of artisans' dwellings in Petticoat-square.

**The Bethnal-green Museum.**—The Marquis of Bute has followed the good example of Sir Richard Wallace, Mr. Frauds, and other possessors of celebrated collections, and has lent the greater part of his pictures to the museum at Bethnal-green. They have been arranged in the South Gallery, which they completely fill, and the collection was opened to the public on Thursday morning.

**Royal Academy.**—The private view of the works of Old Masters and deceased British Artists will take place on Saturday, the 30th of December. The exhibition will be open to the public on the following Monday.

**Manchester School of Art.**—After twenty-one years' sojourn as a public officer in Manchester, Mr. W. J. Mackley has resigned his post as director and principal of the School of Art in this city. Up to the last eighteen months the Manchester School has never had a building of its own, and hardly any school of art in the kingdom has had to work under difficulties so great as it has done, notwithstanding its success. At the present moment Manchester may be justly proud of having the finest art school in the kingdom. The prize fund of 650l., which is connected with the school in perpetuity, was solely obtained by the retiring director. Mr. Mackley now wishes to pay more continuous and immediate attention to his own work as a painter in the metropolis,—to which place we understand he is about to remove,—as well as to other matters connected with industrial art, and in which he has been very successful of late years.

**Masters and Men.**—The fifth annual dinner to the employes of Mr. J. Hill, 37, Upper Thames-street, was given on Thursday at the Holborn Restaurant, the chair being occupied by Mr. Hill, and the vice-chair by Mr. Ritchie (of Mossrs. Stevon Bros. & Co.). The usual toasts were given, and in reply to that of "The Chairman," Mr. Hill gave an interesting sketch of a three months' tour which he and his wife made this year in the East; passing in review his impressions of Italy, Greece, Palestine, and Egypt, his remarks on Egypt being all the more interesting from the fact that he had been in Alexandria and Cairo shortly before the war broke out. In the course of the evening Mr. Hill's manager, Mr. King, was presented by his fellow employes with a silver biscuit-box, as a mark of their esteem and in commemoration of his recent return from a tour of inspection of the leading lock manufactories of the United States.

**New Shoreham, Sussex.**—This once important port is now showing signs of returning life, and is likely to make its title of being the "Liverpool of the South" a reality, applications from several eminent manufacturing firms in the Northern and Midland Counties, London, and Germany being on foot for information as to land or buildings available with easy railway and port access. And as rents are at present low, and the prospects of another railway to Brighton, in competition with the London, Brighton, and South Coast Railway, are in active promotion, the busy hum of commerce is likely soon to be heard there. The Local Board, anxious to see brighter things, have already approved plans prepared by Mr. Arthur Loader, architect, of Brighton and Shoreham, for extensive buildings for the manufacture of soap, which, if carried out at a cost of 6,000l., will employ a considerable number of workmen.

**The New City of London School.**—Reverting to the particulars given us last week of this building, we find that the whole of the stone carving to the interior, and the greater portion of the foliated carving to the exterior, were executed by Mr. J. W. Seale, of the "Apollo" Works, Walworth, and not by Mr. G. W. Seale, of Brixton, as formerly stated. We may also mention that the parquet floors and the marble mosaic pavements in the entrance-hall and elsewhere were laid by Mr. Ehnor, of Clerkenwell-road; and that "Linernsta-Walton," supplied by Messrs. Fredk. Walton & Co., Limited, was used in the head-master's room, the secretary's room, and also in the library.

**Social.**—Mr. W. W. Gwyther, F.R.I.B.A., was on Monday evening last entertained at dinner at the Café Royal, Regent-street, by his assistants and pupils, past and present. Mr. J. W. Stevens occupied the chair, and proposed the toast of the evening; and Mr. C. J. Jones, as senior assistant, presented to Mr. Gwyther a handsomely-bound morocco album, mounted in silver gilt, with arms, monogram, &c., thereon.

**Damp Walls.**—Those who are afflicted with the nuisance of damp walls might find it worth while to make use of the "Crown Damp-Resisting Fluids," manufactured by T. F. Chambers & Co., of Hull, and which are getting into use for the suppression of damp. The Midland and other railway companies, we are told, are using them largely.

**Monumental.**—On Saturday, the 23rd inst., at three p.m., Messrs. H. Young & Co., Pinlco, purpose casting in bronze the statue of the late Earl of Beaconsfield, K.G. (by Mario Raggi, sculptor).

**Pumping Machinery.**—We notice that at the Cornwall Mining Institute Exhibition, held last week at Camborne, the well-known firm of John Warner & Sons, of the Crescent Foundry, Cripplegate, were awarded a silver medal for their exhibit of mine pumping machinery and pumps, and mining tools.

TENDERS

For the erection of infants' school, for the Carshalton School Board. Mr. J. D. Hayton, architect, Whitehall. Quantities by Mr. C. H. Gough:—

For the erection of new greenhouse and vinery, at Castleford, Yorkshire. Messrs. Wm. Lewis & Son, architects, 46, Stonegate, York. Quantities by the architects:—

T. B. Wilson, Castleford	£160 0 0
--------------------------	----------

For the erection and completion of cemetery chapels, entrance-roads, boundary-walls, and laying-out the grounds, at Caswell, near Selby, Yorkshire, for the Selby Union Rural Sanitary Authority. Messrs. Wm. Lewis & Son, architects. Quantities by the architects:—

T. Hingley, Selby	£2,000 0 0
-------------------	------------

For the erection of cottages and stables, at Castleford, Yorkshire. Messrs. Wm. Lewis & Son, architects. Quantities by the architects:—

J. Spears, Castleford	£1,000 0 0
-----------------------	------------

(Lowest estimate of twenty.)

For the erection of new drying-kilns, at Castleford, Yorkshire. Messrs. Wm. Lewis & Son, architects. Quantities by the architects:—

J. Spears, Castleford	£600 0 0
-----------------------	----------

(Lowest estimate of fifteen.)

For proposed new shoe manufactory, at Kettering, Northamptonshire, for Messrs. Percy, Mr. Thomas Whitney, architect. Quantities supplied:—

Roberts & Sons, Stratford-on-Avon	£1,800 0 0
Bennett, Rugby	1,775 0 0
Wingrove, Northampton	1,621 0 0
Jaw, Northampton	1,556 0 0
Waring, Northampton	1,649 0 0
Daniel Ireson, Northampton	1,598 0 0
Gims, Kettering	1,494 0 0
H. J. Henson, Kettering	1,483 0 0
Sherran, Kettering	1,469 0 0
G. Henson, Kettering	1,391 0 0
Coltman, Kettering	1,359 0 0
Barlow, Rothwell	1,337 0 0
Manby, Kettering	1,335 0 0
Briggs, Kettering	1,325 0 0
C. & F. Henson, Kettering	1,321 0 0
Margetts, Kettering	1,246 0 0
Fayne & Son, Kettering	1,248 0 0

For the erection of four houses at Woodford, Northamptonshire, for Mr. Zachariah Gunn. Mr. Thomas Whitney, architect. Quantities supplied:—

Ireson	£576 0 0
Johnson & March	670 0 0
Costes & Son	640 0 0
Lowell & Adams	635 0 0
Sherran	620 0 0
Margetts	573 0 0
Fayne & Son	565 0 0
Halford	564 0 0
Waring	520 0 0
Henson	520 0 0
Tarrant	480 0 0

For proposed additions to the Montpellier Tavern, Montpellier-street, Waltham, for Mr. Tanner. Messrs. Murgerside & Powell, architects:—

Fisher	£139 0 0
Castle	45 0 0
Taylor	430 0 0
Burnam	397 0 0
Tyeman	376 0 0
B. Cook	373 0 0

For proposed new church for the Committee of the Reformed Episcopal Church, Hemel Hempstead. Messrs. Coe & Robinson, architects:—  
 Young & Co. £3,133 0 0  
 Ireson 3,945 0 0  
 Howe 2,640 0 0  
 Cook Bros. 2,614 0 0  
 Monk 2,257 0 0  
 Honour & Sons 2,373 0 0  
 Sears. 2,089 0 0

For new farm buildings, at the Sewerage Farm, for the Corporation of Northampton:—  
 Waring, Northampton £388 0 0  
 Ireson, Northampton 350 0 0  
 Dunkley, Fife-shans 340 0 0  
 Clayton & Sharman, Brayfield 317 0 0  
 Wingrove, Northampton 296 0 0  
 G. White, Northampton 239 0 0

For alteration at Police-station, Fish-street, Northampton, for the Corporation of Northampton:—  
 Ireson, Northampton £148 15 0  
 G. White, Northampton 123 10 0

For alterations and additions to No. 147, Gloucester-road, for Mr. E. Wriglesworth. Mr. George Edwards, architect. Quantities by Mr. H. Lovegrove:—  
 Aldin & Pator £1,798 0 0  
 Martin Wells & Co. 1,780 0 0  
 Craske 1,688 0 0  
 Dyer 1,679 0 0  
 Tuten & Sons 1,665 0 0  
 King & Co. 1,635 0 0  
 Scrivener & Son 1,650 0 0  
 Pain 1,648 0 0  
 Stimpson & Co. 1,520 0 0  
 Lucas & Son 1,445 0 0  
 Sharen & Williams 1,444 0 0  
 Green 1,430 0 0

For new roads, sewers, brick culvert, and surface water-drains, &c., for the British Land Company, Limited, on their estate at Basing Park, Middlesex. Mr. Henry B. Michell, surveyor:—  
 McKenzie & Williams, London £7,123 0 0  
 Bloomfield, Tottenham 7,101 0 0  
 Crockett, St. Pancras 6,920 0 0  
 Nowell & Robson, Kennington 6,975 0 0  
 J. Jackson, Leyton 6,943 0 0  
 Rizzer, Hornsey 6,920 0 0  
 Dunmore, Hornsey 6,920 0 0  
 Harris, Camberwell 6,115 0 0  
 Keeble, Regent's Park 5,804 0 0  
 Wilson, Walthamstow 5,498 0 0  
 Pell & Sons, Bromley, Kent\* 5,325 0 0

For three houses in Cliff-road, Dovercourt. Messrs. Whitmore & Reeves, architects, Chelmsford and London. Quantities supplied:—  
 H. Gozzett, Woodham Walter £2,450 0 0  
 J. Grimes, Colchester 2,380 0 0  
 J. W. C. Butcher, Harwich 2,370 0 0  
 S. J. Newton, Harwich 2,340 0 0  
 R. Girling, Ipswich 2,263 0 0  
 F. Dupont, Colchester 2,219 0 0  
 R. S. Smith, Ipswich 2,188 0 0  
 G. Dobson, Colchester 2,175 0 0  
 W. Wood, Chelmsford 2,120 0 0  
 H. Everett & Son, Colchester 2,100 0 0  
 Y. Saunders & Son, Dealham 1,834 0 0  
 H. Wright, London, 1,642 10 0

For reinstating, after fire, cigar and tobacco factory. Half-moon-passage, Whitechapel, for Messrs. B. Morris & Son. Mr. J. Hudson, architect:—  
 Read & Son £2,373 0 0  
 Little 2,239 0 0  
 Earle & Son 1,452 0 0  
 Gould & Brand 1,459 0 0  
 Cox 1,455 0 0  
 Roberts (accepted) 1,253 0 0  
 Barnett 1,170 0 0

For rebuilding No. 207, Pentonville-road, for Mr. H. Hoar. Mr. D. North, architect:—  
 Batchelor £1,158 0 0  
 Gould & Brand 1,097 0 0  
 Burman 1,077 0 0  
 Langmead & Way 1,025 0 0  
 Anley 1,014 0 0  
 Hayworth 1,011 0 0

For internal plumbing and hot-water work to new house, Caterham, for Mr. D. Birt. Mr. J. Sulman, architect:—  
 J. Knight, Westminster (accepted).

For alterations and additions to the Wallace Head, Blandford-street. Mr. Applin, architect:—  
 Langmead & Way £760 0 0  
 Golden 709 0 0  
 B. T. Wood 705 0 0  
 W. Shurmur 689 0 0  
 J. Harper 663 0 0

For alterations and office-fittings, at No. 20, King-street, E.C., for the Cheque Bank, Limited. Mr. Chas. Poindar, architect:—  
 W. Shurmur (accepted).

For alterations, &c., at the Russell Arms, Bedford-street, Seymour-street. Mr. J. R. Furniss, architect:—  
 Jackson & Todd £274 0 0  
 King 246 10 0  
 Toms 239 0 0  
 Anley 215 10 0  
 Lambie (accepted) 209 0 0

Accepted for St. Michael's Church, Ford, Cornhill-on-Thames, for Rev. H. M. Neville, M.A. Mr. Walter B. Thomas, architect. Quantities by the architect:—  
 Henry Ainsley (Contractor).  
 Locks & Brown (Masonry).  
 R. & J. Steel (Carpenter and Joiners' Work).

For new shop-front and shop-fittings, at No. 180, High-street, Camden-town, for Mr. Stade:—  
 Gould & Brand (accepted).

For shop-fittings at No. 3, Prospect-place, Edgware-road, for Messrs. E. & C. Mathews:—  
 Gould & Brand (accepted).

TO CORRESPONDENTS.

W. J. M.—B. B.—R. C.—A. T. T.—H. & K.—H. H. C.—M. & C.—T. F.—J. M. A.—T. W. & C.—W. S.—W. M.—D. J. R.—F. W. & Co.—L. G. & Co.—W. D. C.—H. T. M.—A. L.—H. S.—W. L.—W. E. M.—J. G.—M. & Son.—W. S.—S. R. L.—L. & Son.—E. van P.—H. B. M.—W. B. T.—J. W. & H. Y. & Co.—G. & B.—Munich.—H. A.—Paddington (such a plan has been published).  
 Correspondents should address the Editor, and not the Publisher except in cases of business.  
 All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.  
 We are compelled to decline pointing out books and giving addresses.  
 Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO ADVERTISERS.

Persons advertising in the Builder may have REPLIES ADDRESSED TO THE OFFICE 46, Catherine-street, Covent-garden, W.C., FREE OF CHARGE.  
 Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.  
 Six lines (about fifty words) or under ..... 4s. 6d.  
 Each additional line (about ten words) ..... 6s. 6d.  
 Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.  
 SITUATIONS WANTED.  
 FOUR Lines (about THIRTY words) or under ..... 2s. 6d.  
 Each additional line (about ten words) ..... 3s. 6d.  
 PREPAYMENT IS ABSOLUTELY NECESSARY.  
 \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOTHERDRINKER, Publisher, Addressed to No. 46, Catherine street, W.C.  
 Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.  
 The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.  
 TERMS OF SUBSCRIPTION.  
 "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum. PREPAID. Remittances payable to DOUGLAS FOTHERDRINKER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.  
 WESTWOOD GROUND,  
 Box Ground, Combe Down,  
 Corsham Down,  
 And Farleigh Down.  
 FANDELL, SAUNDERS, & CO., Limited,  
 Corsham, Wilts. [ADVT.]

SEASONED  
 CORSHAM DOWN,  
 FOR  
 WINTER USE.  
 PICTOR & SONS, BOX, WILTS.  
 [ADVT.]

Doubling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doubling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES THASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.]

Doubling Freestone, Of best quality, supplied from their own Quarries and Kilns by SPAFFA & HAYS, Stoke, Thimister. Agent, Mr. H. MURCHELL, 6, Augustus-road, Hammer-smith, London, W. [ADVT.]  
 HAM HILL STONE,  
 BLUE LIAS LIME  
 (Ground or Lump),

Asphalte.  
 Seyssel, Patent Metallic Lava, and White Asphaltes.  
 M. S. TODART & CO.  
 Office:  
 No. 90, Cannon-street, E.C. [ADVT.]

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. [ADVT.]

Immense quantities of  
 DRY WAINSCOT,  
 DRY MAHOGANY,  
 DRY WALNUT,  
 in all thicknesses.  
 B. J. HUDSON & SONS,  
 Whitfield-st., W., and Great Peter-st., S.W.  
 London. [ADVT.]

The Patent Vacuum Chimney Top and Ventilator, recognised by all leading Architects and Builders as best and cheapest means for curing DOWN-DRAUGHTS as well as for Ventilation of Drain and Soil Pipes.—R. ETZENBERGER & Co., 13, St. Andrew's-st., Shoe-lane, E.C.—[ADVT.]

J. L. BACON & CO.,  
 MANUFACTURERS OF IMPROVED  
 STEAM AND HOT-WATER  
 APPARATUS,  
 FOR WARMING AND VENTILATING  
 Private Houses, Churches, Schools, Hospitals,  
 Manufactories, Greenhouses, &c.  
 OFFICES AND SHOW-ROOMS:—  
 No. 34, UPPER GLOUCESTER PLACE,  
 DORSET SQUARE, LONDON, N.W.  
 Illustrated Pamphlet on "Heating" post free.

# CHAPPUIS' PATENTS FOR REFLECTING LIGHT.

## DAYLIGHT REFLECTORS OF EVERY DESCRIPTION, ARTIFICIAL LIGHT REFLECTORS.

WHY BURN GAS?—CHAPPUIS' REFLECTORS DIFFUSE DAYLIGHT.—They are exclusively adopted by and fitted at Buckingham Palace, all H.M. Government Offices, Houses of Parliament, H.M. First Commissioner of Works, the Metropolitan Board of Works, British Museum, South Kensington Museum, Royal Institution, Guildhall Museum, on board H.M. Ships, also Railway Companies' Offices, Hospitals, Institutions, Banks, Insurance Offices, Manufactories, Private Houses and generally from Noblemen's Mansions to Artisans' Work-shops. 30,000 in use in London alone. Patronised by leading Architects, Engineers, Contractors, &c., &c.

N.B.—For Prospectuses and Diagrams, address Stamped Envelope to  
**P. E. CHAPPUIS, Patentee and Manufacturer, 69, FLEET-STREET, LONDON.**

NOTICE.—The POLYGONAL REFLECTOR (Latest Patent) FOR ARTISTIC and PICTURE GALLERIES.  
 its construction allows of the angle of light being readily altered so as to reflect in any desirable direction.

# The Builder.

### New Forms of Old Materials of Industrial Art.

REMARKABLE feature of that application of science to enlarge the resources of industry which characterises the activity of the present phase of manufacturing development is the application

of substances so newly discovered, or so remarkably transformed, by the skill of the chemist, as to assume the aspect almost of new creations. It is now a considerable time since the discovery of the phenomena of allotropism taught us that there were more secrets in chemistry than could be explained by the scales, the blow-pipe, and the test-tube. The most remarkable, at all events for its magnitude, of these new developments of industrial science has been the mode in which steel can now be produced at far less than the cost of iron forty years ago, by the process invented by Bessemer. Steel, under his influence, has become almost as new a material for our industry as if a wholly new ore had been discovered and brought into use, and, in the great majority of cases, is driving iron entirely out of the field. Hand-in-hand with the discoveries of what we may call the industrial chemist have marched those of the scientific analyst. The reduction of the rarer and more perishable metals from their earths, as in the case of sodium, potassium, and their neighbours, has been accompanied by the discovery of other metals so absolutely new to chemistry as to take the names of, or those imposed by, their discoverers. And now we hear how the means have been perfected of reducing one metal which, half a century ago, may almost be said to have had only a theoretic or potential existence, not only into workable form, but into marketable condition. Among the most abundant mineral substances which form the crust of our globe in its common form of earth, aluminium has been for some time known to possess qualities of extreme value, as, for example, lightness almost unrivalled among metals, and as little disposition to oxidise as gold itself. The barrier to the introduction of aluminium into industrial art has been the great cost of its reduction from alumina; and its chief use, so far as we are aware, hitherto, has been for optical instruments, in which the advantage derived from the combination of strength and lightness that

it afforded was enough to enable the optician to overcome the disadvantage of its cost.

A new process, we now hear, has been lately perfected, by which aluminium may be produced at about the price of copper,—that is to say, at 100*l.*, instead of at the present cost of 1,000*l.*, per ton. Should this prove to be correct, the effect of the discovery is not easy to anticipate. To the architect one of the first suggestions will be that it will provide a material for roofing which shall possess all the great superiority of lead over cheaper materials, while avoiding both the great weight and the comparatively perishable character of that time-honoured roofing metal. If cost permit, and if durability be assured, the advantages of large sheets of well-joined metal, of very low specific gravity, over the heavy and clumsy structure of tiles and of slates, the numerous joints of which often admit wind or rain, and hardly ever wholly exclude drifting snow, will be very soon appreciated by the householder.

Another comparatively new invention,—perhaps we should rather speak of it as quantitative than as a qualitative discovery,—is that of asbestos. Asbestos, indeed, has long been known, and its indestructible nature has pointed it out as an invaluable material for not a few purposes. But, unless we are much misinformed, the industrial use of asbestos is about to receive a very remarkable development. A mountain or rock of pure asbestos has been discovered in the United States, and purchased by an English proprietor. Hydraulic machinery has been provided for the crushing of this rock between rollers; but the result of the crushing process is not dust or grit, but natural fibres, such being the intimate structure of the rock itself. These imperishable mineral fibres are treated much like the fibres of animal or vegetable origin, wool, silk, and cotton. They are spun into cords, they are woven into cloths, and, in fact, assume the position of a new textile material. Already we are told that curtains of asbestos cloth are provided, or are in course of provision, for theatres. The utility of such a screen, if dropped between the stage and the auditorium, in case of any alarm from fire is obvious, being, in fact, equal in exclusive power to an iron screen or blind, without the ponderous and unmanageable weight of the latter.

Again, regarded from the *Builder's* point of view, sash-lines that can neither rot, fray, nor perish in any other manner, form a desideratum of which we have little doubt that the trade will largely avail themselves. The not inconsiderable number of accidents, and the very great amount of inconvenience and of cost, arising from broken sash-lines, may thus be removed from our host of petty troubles. Most unexpected to ourselves,—while far from being of the most trifling importance,—is the use of asbestos, in the form of a kind of mineral tow, for the packing the glands of steam engines; a

service in which the material is said to show itself both convenient and imperishable.

That side by side with, or following in close sequence after, these two new gifts to industry, are many more inventions in a more or less ripe etato of advance, we can hardly doubt. With each new material, new forms will insensibly make their appearance; and there is thus good reason to anticipate that the influence of the change may extend itself to the elevations of the architect, as well as to the structural outline of the engineer. Our planet is a world of change, but the changes in its physical condition, in so far as they are effected by man, that have already taken place within our own century are probably greater in amount than the sum of those contained in the whole range of antecedent history. And of these changes the cases of steel, of aluminium, and of asbestos appear to us to prove that we now witness only the commencement.

By a coincidence which is almost startling in its aptness, the foregoing lines were written (at a distance of some 150 miles from London) at, or very shortly before, the hour when the outburst of that destructive element as to which we have so often to bewail the want of ready means of extinction swept before it the Alhambra Theatre, as commented upon in our number of the 9th inst. (p. 761). The usual lamentations, the usual wonder, the usual want of any practical lesson taught by the fierce destruction, were resounding over England the next morning. Is it always to be thus? Are we always to give testimony that we are descendants of a people who might have been appropriately reigned over by Ethelred the Unready? or, at least, into whose habits unready enters as a main and dominant element? In the present case there were, we are told, a fireman on the premises. Of what use a fireman was supposed to be on the premises if he were not also a watchman,—that is to say, a man properly paid for wakefulness and activity when others sleep, which is the time when long-smouldering combustion usually bursts into flame,—we are at a loss to understand. It was possibly one of those compromises between the two antagonistic prudences,—the prudence of the pocket and the prudence of keeping up appearances, or at least descriptions, to the public, from which misfortune is pretty sure to result. Visitors might feel reassured at being told there is a fireman on the premises. But if they are not told at the same time "And he is on the watch, or in some way engaged by day, and has to rest, like the remainder of us, by night," the announcement of the presence of such an officer is hardly of that definite nature which perfect candour would demand. So it is, however, and so it always is. It is just the one little thing that is unexpectedly out of order that is usually the cause of all destructive fires. Crystal

Palace, Alexandra Palace, Ring Theatre: how many more conflagrations can we recall that were only just not prevented?

The remarks that we just made on asbestos thus assume a new importance. True, this was not a case in which an asbestos curtain, or an iron shutter, or any thing but a curtain of water (such as may be witnessed in the quaint old Palace of Cintra), would have saved the building. But does it not seem that we have in this fierce fire but one more of those stern lessons which ought to teach us that buildings where many human beings are in the habit of congregating, under circumstances which would render an alarm of fire as fatal as an outbreak of fire, ought to be composed of incombustible material?

We are not about, at this moment, to express any opinion as to the value of this or the other process for rendering wood incombustible. It is enough to say that there are processes known to science which profess to attain this end, and further, that if they do not actually attain it, it is high time that better means of preservation should be invented. One way or another, we will not allow ourselves to doubt, wood can be rendered incombustible by the chemist, and when to this consideration we add that which ensues from our preceding remarks, to wit, that drapery of all kinds can be so produced as to be not only non-inflammable, or non-combustible, but absolutely indestructible by fire, what excuse is there for futuro catastrophes in church or theatre, stately mansion or rich museum? Our readers may remember,—alas! it is many years since,—the start that was given to fireproof warehouses. The plan, if we remember rightly, was protected by a patent. The form in which it is most familiar to our memory is that of a building enclosed with stone or brick walls, in which the floors were supported by cast-iron columns, and consisted of cast-iron girders, with brick arches in cement, turned between them. Cold and stern these buildings looked, no doubt, but the stranger who entered them when nearly finished would be apt to say, "At least, they are incombustible." So, no doubt, they were. But incombustibility,—that is to say, unfitness to become supporters of combustion,—is a very different thing from indestructibility by fire. And thus when, under the supposed protection of incombustible roofs and floors, great warehouses were filled with oil, tallow, petroleum, wood, or other combustible materials, it was not the building, but its contents, that burned, on the fall of a careless spark. The building acted as a kiln. And under a fierce heat cast-iron cracks, especially if water is thrown on it; stone cracks; bricks crumble, and the destruction of the kiln itself completes that of its contents. And thus, not without some reason, the name of a fireproof building has fallen quite deservedly into disrepute.

Far different is the case in a theatre or a church. There the only combustible materials, except such as form part of the structure, are the clothes,—we might almost say the persons,—of the frequenters. In these there lurks no danger of spontaneous combustion, of ready catching fire from a spark, or of any of those numerous and often mysterious causes that lead to the inflammation of inflammable stores. Here the source of danger, then, lies in the building itself, and more especially in the linings and decorations. A theatre or church built of stone, brick, and iron, in which, if wood is introduced, it is in the form of those masses which, whether vertical or horizontal, are less destructible by fire than hollow cast-iron columns or delicately-calculated girders, will be, in itself, indestructible, provided that linings, fittings, seats, curtains, and decorations, are made of indestructible materials. Without, at this moment, assuming the responsibility of sponsors for *Carton Pierre*, we may mention that as a decorative material which at least claims to be unflammable. Of lithicised wood, or by whatever name the precautionary treatment of wood may be called, we have just spoken. Here comes in asbestos to complete all that is needful for decoration. Is there any danger of destructive fire breaking out in a theatre or church laid down on these lines? And, if not, is it too much to demand that legislative sanction should be appealed to, and that the building, the fitting up, and the frequentation of buildings that now too frequently act as fire-traps, panic-traps, and death-traps, should be sternly and completely prohibited? What is the good of Building Acts, and

inspectors, and the whole machinery in which we put our trust, if it do not, in the first place, grapple with the question,—“Shall buildings, that may prove the source of such frightful catastrophes, be suffered to rear their roofs in what calls itself a civilised country?”

We spoke a few paragraphs back of coincidence. Little did we think, while writing these words, that at the very moment thirty fire-engines were playing on the scene of the most terrific fire that has for a long time been witnessed in London,—a fire which at one time seemed as if it were the commencement of a sweeping destruction like that of the Great Fire of 1666. The description of the scene as given by an eye-witness in the columns of the *Morning Post*, is at once graphic and awe-striking, to the verge of sublimity. The fire seems wholly to have obtained the mastery,—so much so, indeed, that the quantity of water poured on the blazing mass from the engines seemed to have no effect on the flames. The case was precisely one of the kind in which the buildings acted as kilns, within them, until kiln and contents were overwhelmed in a common destruction. How or why the fire was ultimately got under seems as yet unexplained, but that the utmost gratitude is due to the firemen there is no reason to doubt. One large brick building, unconnected structurally with the burning mass, was attacked by radiant heat and flying sparks, and, in spite of a good supply of water, finally succumbed to the attack from without. A case of this kind, which we take to be rare, if not almost without precedent, shows how tremendous was the heat of the combustion, and how vain are our best appliances, steam-pumps, fire brigades, and what not, to oppose the destructive element when once it has attained a certain fury. Had the wind been high and steady we apprehend that nothing but an extensive demolition of neighbouring buildings by gunpowder could have arrested the devouring progress of the flames.

The extremely combustible nature of the stock which filled both warehouses,” says the eye-witness before referred to, “supplied enough fuel to keep the interior in one tremendous blaze.” The fire “furnished a spectacle such as few people are likely to see twice. No words can adequately describe its terrific grandeur. . . . The eye saw nothing but an enormous sheet of flame swallowing up everything as it rose in mighty volume to the sky. The windows of the basement were furnished with iron bars, through which an artificially-created draught rushed and roared, just as it does through the furnace of a foundry, or of a great steam ship. The idea most forcibly conveyed to the mind by this sight was that of irresistible power. The copious streams of water incessantly poured on to the front of the building did not produce even the slight effect of darkening its glowing surface.”

The above description suggests, among other things, the mischief of the prevailing plan of dispensing with shutters. Not in London alone, but in many of our provincial towns, the time-honoured appliance of the window shutter is replaced by plate-glass windows protected by iron bars,—and not infrequently the gas is left burning all night. How far this may be a protection against burglars may be in doubt. But that in any case of fire the substitution of a glass for a solid wood or iron shield is enough to supply at the critical moment the very draught that turns a casualty into a calamity, we think there cannot be a moment's doubt. As to the police part of the story it is for others to decide. For ourselves, we cannot but see, in these naked temptations to the nightly prowler, an outcome of that miserable spirit of skimping economy which has rendered window-shutters obsolete in our bedrooms. A miserable economy involving great loss, first of warmth, then of quiet and of sleep. To say that in a closely shuttered apartment nine people out of ten will enjoy more peaceful and unbroken slumber than in the cold and naked room, with, maybe, a Venetian blind, maybe an ordinary linen blind, and perhaps a curtain of some sort behind that, to shut out the cold of night, and the awakening beams of the morning sun, is to say little enough. The value of such a protection to the repose of the brain was adequately regarded by the great Napoleon, whose first care, on entering on any new quarters during his campaigns, was that his bedroom should be so situated or so provided as to be inaccessible to external light, except by desire.

We opine that, as people are always ready to find an excuse for stinginess, it is nothing but the desire of saving that has first banished the bedroom window-shutters, and then replaced the shop-shutters by a contrivance which, in any fire, acts immediately as the flue to a furnace, and we suggest for consideration the propriety of forbidding this kind of encouragement to calamity.

As to the effect of lofty buildings and of buildings of large internal area, unbroken by solid partitions, in increasing an ordinary fire to a terrible conflagration, we think there can be little doubt. We are apt to think that we have made great advances on the small thatched houses of our ancestors. We can well remember, now many years ago, a fire in a Devonshire town, where the houses were thatched, and where the flames crept from roof to roof; but with this facility for the spread of flames there was connected no irresistible march of a great volume of fire, such as that witnessed at Wood-street. The fire more easily spread, but it was also more easily extinguished. Two or three hand-pumps were enough to ensure safety. But with increased command over building materials has come increased size of building. It is impossible to tell what will be the thorough outcome of any great architectural change until it has been thoroughly tested. But a test has been now applied by fire. The stores of a fancy stationer, for such we take the account to indicate,—are, no doubt, combustible enough. But they are by no means so inflammable or so inflammatory as those to which we before referred, tallow and combustible oils. It is a matter for consideration whether there should not be some limit fixed, as in the case of gunpowder, to the storing in a town of materials of this nature, and further, whether there should not be a limit imposed as to the size of buildings which, in an urban locality, are used as store-houses or warehouses, determinable with reference to the nature of the articles collected in masses.

One thing is certain. We have of late made great strides in our power of extinguishing fires. Water supply is very generally abundant, and has sufficient pressure very often to throw a good jet at once from a hydrant on to the roof of the neighbouring buildings. Steam fire-engines are made of great power and great hardiness. Warnings are given by telegraph. Of our firemen, we have no hesitation in saying that they form the noblest and finest army that the world has ever seen,—an army exposed to little, if any, less danger than the troops of the line, an army that knows no time of peace, no furlough of absolute rest, an army that contends, not in mortal struggle with their fellow men, but in mortal struggle with that terrible element which is either the most obedient and useful slave, or the most ferocious and unsparring tyrant of mankind. But with all these great advances, fires are far more terrible, far more destructive than they were before this great army was organised. Why is this? The architect can answer the question. But it is of little use to answer it, unless it be with the view of adopting measures to prevent the accumulation in cities and towns of combustible materials in such places and in such quarters that, if they do catch fire, the fire is pretty sure to become irresistible.

#### A NEW LIFE OF RAFFAELLE.

THE earnest and hardworking students of Italian art-history, to whom we owe the general “History of Painting in North Italy,” and the admirable Life of Titian, Messrs. Crowe and Cavalcaselle, have now turned their attention to the task of tracing out, more completely and exhaustively than has yet been done, the facts of the life of Raphael (we adopt their mode of spelling).\* One volume only is as yet before us, for biography produced in the spirit in which Messrs. Crowe and Cavalcaselle work is not produced in a day. The scope of this volume, and the manner in which it has been produced, may be stated in the words of the authors in their preface. “They hope to have done something to shed a new light on Raphael's career. In the volume which they now offer to the public, they have shown how they ventured to explore and attempted to illustrate the

\* Raphael: his Life and Works; with particular Reference to newly-discovered Records, and an exhaustive Study of extant Drawings and Pictures. By J. A. Crowe and G. B. Cavalcaselle. Vol. I. London: John Murray, 1882.

Period of Raphael's youth, which had hitherto been comparatively neglected. They have tried to prove how he was taught under his father and Perugino; and they have looked at every drawing as well as at every picture to trace the road which led him devoutly to fame; they point out, it may be not unerringly, where he copied the antique, where his professional rivals or precursors; how he digested and assimilated after learning the lessons of all the masters of his country. Little or nothing, indeed, has been added to the documentary evidence which has been stored since the days of Vasari, but all the materials in existence have been used, and neither time nor travel has been spared to study personally every example, in whatever part of the world it was deposited."

The present volume only extends, therefore, as far as Raphael's removal to Rome about the age of twenty-four. But one of the most interesting portions of the book is that in which the authors endeavour to throw more light on Raphael's boyhood and the period of learning his art. Though no name is so widely known in connexion with painting as that of Raphael, no reputation so wide-spread and so universally admitted and revered, we have for the most part little conception in our minds as to how Raphael grew up and developed his genius. We are most of us in the habit of looking on him as an accomplished fact among great painters; we think of him as the author of the Stanzas and the Cartoons and the Transfiguration, without troubling ourselves much to go back in mind to the antecedents of this remarkably complete and perfect artist and inquire whence came he, whence he obtained his almost unequalled power of invention and expression in figures, what was his childhood, and in what light he was known among his contemporaries in the boyish period, before his genius was matured and his fame acquired. That he was a native of a country village who ended his days as the central figure of the artistic world in Rome, or at least holding a place disputed by Michelangelo alone, is the familiar aspect of his life; and of the years between his infancy and maturity, and the manner in which they were passed, we shall never now know very much. But in proportion to the meagre materials for knowledge is the necessity of amassing and making the most of these before they are yet further disintegrated by the action of time.

The first popular idea which the authors find reason to combat or to question is that Raphael was formally and from the first the pupil of Perugino. Raphael's father died when the boy was eleven; the terms of Giovanni Santi's will, in which Raphael Santi was left heir, under the guardianship of his uncle, "tend to prove that Raphael was at Urbino at the time of his father's death," and he had probably begun to learn drawing and painting, as children in the present day would begin to learn to read and write, at a much earlier age than this. "It was not to be expected that he should progress much beyond the simplest elements during the short space of time that elapsed from his first initiation to the death of Santi. But in that short span he received impressions which many years failed to obliterate, and it is curious to observe that as late as the opening of the sixteenth century" (when he was seventeen years of age) "his memory was still stored with typical forms inherited from his father." In his childhood he was "in daily contact with the tools of the painter. He watched the labours of Giovanni at his easel, and saw him send forth to admiring patrons those quaint but characteristic Umbrian altar-pieces in which he depicted the majesty of the Virgin and Child, and the admiration of attendant saints; or the meditative devotion of lay and church men at the Virgin's feet." There seems to have been another and even closer hereditary affinity between the art of father and son; for it would seem, from what the authors tell us, that we are to accept it as a fact that Santi actually made the infant Raphael and his mother the subject of a study executed on the wall of his house, just as Raphael himself studied his Madonnas from the simple nature of a mother and child, such as he might find in his daily walks and persuade within his doors, if necessary, as the model to be subsequently elevated and refined into the divine mother and child.

In questioning the idea of an early apprenticeship to Perugino, and suggesting that Raphael had no other teacher than his father during the lifetime of the latter, the authors, however, do

not by any means question the generally-received idea in regard to Raphael's close relation to Perugino, and the influence of the older painter upon his style, after the death of Giovanni Santi. Perugino, say the authors, had evidently a domicile both at Perugia and at Florence. The history of Raphael's youth between 1494 (the year of his father's death) and 1504 is a blank, which, however, our authors suggest may be filled by circumstantial evidence, and this evidence, the main heads of which are given, leads to the supposition that Perugino, even after the commencement of his labours and his partial residence at Florence, was also much at Perugia, and resided there for tolerably long periods at intervals; so that the regular tuition of Raphael under him was quite possible without the supposition of Raphael having gone to Florence at that time. Concerning the evidence of style in regard to the artistic relation of the two painters, the words of Messrs. Crowe and Cavalcaselle are worth quoting:—

"No pursuit of more absorbing interest can be found than that of following what may be called the trail of a great artist, when, knowing that he has accomplished his task, we still remain uncertain as to the age or direction of the track. At one time the trail looks broad and worn, at other times it becomes a mere scent or vanishes altogether. In Raphael's case, as in that of Masaccio or Palmezzano, a great source of difficulty lies in the frequent diversions caused by deceptive cross scents. Perugino is so like Raphael that we are almost doubtful of the evidence of our senses. Masaccio is so like Masolino that we are lost in a maze of uncertainty. The skill of an expert would be required to tell where Melozzo ends and Palmezzano begins. But though Raphael and Perugino may at one time blend their forms to confound us, there is a time when each of them is so prominent and distinct. They both ascend in the orbits which nature has created for them. Those orbits cross, and at the point of contact their bodies seem lost in each other. But when they emerge, a curious phenomenon appears. Not only is Raphael Peruginesque, but Perugino is Raphaellesque. The work which Perugino accomplished from 1490 to 1500 is indelibly stamped with the impress of Raphael's genius. That of Raphael from 1502 to 1504 is equally influenced by Perugino's example. Both reveal a constant interchange of thought. If, however, Raphael was a master practising on his own account in 1502, how did he rise to the eminence from which he already looked down on his contemporaries? If Perugino was Raphaellesque in 1500, how long had he been under this new spell? We can trace Perugino's career from Perugia to Rome and Florence, and observe how steadily, but how gradually, he was influenced by Tuscan example. After 1496 a new element contributes to the manifestation of a change. Raphael's course is that of a sensitive and conservative mind, always intent on steady and unbroken progress, ever acquiring, inwardly digesting, and assimilating. Is it possible that his nature before 1502 should have been in contrast with his nature afterwards? Is it not clear that he enjoyed under Perugino a long and uninterrupted course of artistic teaching, and that he rose to the station which he occupied in 1502 by measured steps?"

That Raphael, coming as a junior assistant to Perugino, if not as a pupil, should nevertheless have had power enough to influence and, to some extent, transform the style of the older artist, transferring into it his own delicacy of taste and sentiment, is not in itself improbable when we consider how Raphael had contrived to fill all the world with his art before his early death at the age of thirty-seven. Raphael's fame, indeed, and the work he accomplished, form a phenomenon which is quite astounding when we remember the brevity of his life and the youthful period at which his work in earnest had begun. As one of the examples of work by Perugino in the spirit of Raphael, the authors mention the Madonna from Pavia in the National Gallery. "Here, again, are the lakes, the hills, the sparse-leaved trees, and the serene sky; here, too, the Raphaellesque combination of beautiful grouping with youth and strength and delicacy of line, of dreamy depth and brilliant light, and soft luscious colour. In the landscape is a stillness so profound that one listens for the hymn of the seraphs to come down from the sky. The whole picture is so redolent of Raphael, that his name rises involuntarily to our lips, and yet we are still far away from the time when Raphael could have shown such mastery." The conclusion is, that the youthful spirit and new feeling of the pupil had inspired the technically more accomplished master. It is a charming idea, so much so that we dwell upon it, and like to think it true, even if we hardly accept it as certain or proven. Perhaps

a little of the sentiment of the description is from the feeling of the writers rather than from what was actually intended in the picture. The "stillness" in the landscape may be rather the result of inability to treat landscape in a more moving and lifelike manner, than of a set purpose of the artist resulting from an inner feeling as to the poetic suitability of such a quiescent treatment. We think this is a probable though a less interesting explanation. But the idea that Perugino, while teaching Raphael technicalities, was dipped into a *fons juvenutis* under the influence of his pupil's genius, is a both pleasing and probable idea of their mutual action upon one another.

It is noted as not uninteresting that Perugia stands on high ground whence, at a distance of twenty miles, Florence can be discerned, and young Raphael would have before him the distant sight of the city which was the centre of the greatest Italian painting that had been or was to be. The next step which the authors trace in the history of Raphael's studies is in the fact,—revealed, or at least rendered very probable, by a certain sketch-book preserved at Venice,—that Raphael copied carefully the designs of other painters of the period, including Signorelli and Mantegna. It is suggested that Perugino, who knew every town between Venice and Rome, had great opportunities of collecting drawings, and that his store of collections would not unnaturally be open for the study of his pupils or assistants, who would even be recommended to make copies from them. In the fact of Raphael thus closely studying the works of other painters we have a parallel to the line of study of Mozart, the creative artist who in another line may be most likened to Raphael, who stated in one of his letters that there was not a contemporary composer of any note whose work he had not closely studied; and in Raphael's case, as in his, the result of this eclectic study of other artists of varied manners and styles seems to have been the formation of a style of his own in which all the best qualities of his models were extracted, and assimilated into his own style.

The second chapter goes through a number of miscellaneous works in various places, some of which are known to be, some believed by the authors to be, examples of Raphael's work at this period. The chapter is evidently the result of laborious and careful research, and we must refer the reader to it for further information. In Chapter III. the same history is continued, and among other things the suggestion is made of the co-operation of Raphael with Pinturicchio and Perugino in the painting executed by those artists at Sienna in 1502; and the notes on various sketches by Raphael for the subject of the flight into Egypt, and the alterations which took place in his arrangement of the composition, are of great interest, as is, indeed, the whole of this chapter, which traces step by step some of the stages of Raphael's art from known examples, and attempts to show the various influences, from nature and from contemporary artists, which were more or less affecting his style, though never over-riding his own genius and individuality. The chapter is so full of matter, however, that to give any synopsis which would convey an adequate idea of the nature of the facts successively marshalled before the reader would be almost to reprint great part of the original in *extenso*. It strikes us as curious, it is at least unexpected, that in the commencement of the following chapter, speaking of the "Sposizio," the authors characterise this picture as one which, though it reveals a capacity for refinement on the style of Perugino, is, nevertheless, one of the designs in which Raphael shows "absolute disinclination" to forget the lessons of his master. This is a conclusion that we must turn over in the mind, to say the least, before we can accept it. That he may, as the authors suggest, have drawn upon Perugino for the general idea of the composition of the subject (one upon which the master had not long before been engaged) is likely enough; but certainly we should have said that the pose and manner of the principal figures in the "Sposizio" were essentially Raphaellesque.

In this same chapter (IV.) we have some remarks on Raphael as an architect. He and Perugino were not architects, in the strict sense of the word, but they were, in a sense, architects in their pictures, in addition to the practical architectural work which fell to Raphael's lot in a later period of his career. "But Perugino

and Raphael started from different goals. The first acquired from the Florentines the traditions of Brunelleschi; the second was guided, we should think, by the lessons of Bramante. Perugino copied the Florence Baptistery in his picture of the "Delivery of the Keys," and in his "Sposalizio" at Genoa he introduced an octagon building with domed porticos. Raphael, say the authors, broke away from his master in the matter of architecture; he made the octagon a sixteen-sided polygon, with a sixteen-sided colonnade, and crowned with a low entablature. This does not seem, however, so much "breaking away from" as developing the architectural idea of Perugino; at least, the transition from an octagon to a sixteen-sided figure is a natural and obvious one. As a matter of fact, however, Raphael's pictorial architecture is not good; it is wanting in breadth and solidity, and these deficiencies are the more conspicuous because there is an evident intention of making something good and probable out of the architecture, but neither Raphael's knowledge of construction, nor the principles of the styles from which he derived his architecture, served him sufficiently for the production of a really satisfactory result. His sketch-books, from the authors' account, appear to show evidence of his having frequently sketched, not only landscapes, but buildings in combination with landscape, and these were sometimes introduced with good effect into his pictures; but when he takes Classic architectural forms, they are generally constructed and made out in a way of his own, not always in accordance with true architectural proportion and stability.

The subject of Raphael as architectural designer is, however, dismissed very briefly by the authors, nor is this element a very prominent one in any part of his artistic career, in spite of his subsequent appointment as architect of St. Peter's. Following his further development as painter, we are called on to notice in the course of a very few pages no less than three other partial and passing phases in the style of Raphael. In his "Three Graces" he was realistic, and made three drawings from the same pretty model, happily grouping them so as to give varied movement, expression, and pose. In his "Apollo and Marsyas" he "worked almost entirely in the spirit of the antique." And immediately following on this we have the account of his going to Florence in consequence of the fame of Angelo's and Da Vinci's large cartoons, and becoming "enthusiastic for the style of Leonardo da Vinci." The quotations given from various maxims of Leonardo, in his tract "De Pittura," are very interesting, and they serve to show how minute and careful were the considerations into which the great painters of that day went in their works. "Temper the sun with a haze which shall interpose like a veil between the object and the luminary. You shall then have breadth of light without excess of shadow." "Never paint foliage when the sun is shining so as to throw light through the transparency of the leaves; for you shall then breed a confusion which an artist ought to entirely avoid." This is very characteristic of the period when figures were the main object of the painter, and landscape only a secondary matter, to be studied so far as was necessary to give effect to figures. The difficulty which Leonardo advises the painter to abstain from encountering is just one which a modern landscape-painter, in earnest about his art, would feel pride and pleasure in meeting and vanquishing; nor does it seem to have occurred to Leonardo what an exquisite effect that is in nature which he advises his reader to avoid trying; it merely occurs to him as tending to create "confusion." He has, it must be admitted, a saving clause on the other side: "Shun, however, the mistake of Botticelli, who thinks that a sponge, moistened with colours, thrown at a panel, will produce a landscape at one stroke;" an instructive sentence for the fashionable adorers of Botticelli. Another precept of Da Vinci the authors find to be decisively followed in some of the portraits by Raphael, that of Maddalena Doni, for instance; though the precise meaning of Da Vinci might be capable of different interpretations. "If you see a figure standing in a dusky room, and look at it from the outside in the line of the light (?), the shadow will be dark and swimming. Paint that and you will have great relief and great softness." We should question whether this represented the precise meaning of the original, or whether (if it does) Leonardo himself had not used a word carelessly and not exactly convey-

ing his meaning, which, it must be admitted, it would be rather difficult to convey in words, though most of us will understand what it amounts to. The passage illustrates the keen and searching way in which Leonardo regarded the conditions of objects in reference to their capacity for treatment in painting. The authors more especially instance the "Madonna della Cardellino" as exhibiting in detail the results of Leonardo's teaching, in the drapery "with grand simplicity and sweep of fold," and the pyramidal composition, to which the Virgin's face forms both apex and focus. "All the affectation and conventional grace of the Umbrian has vanished, to make room for something better and more refined."

The present volume of the "Raphael" is deficient in one addition, which goes far towards the popularity of a biography of this kind,—it has no illustrations. Perhaps it is intended that these should be added in a future volume, or the authors may have thought that most persons who would appreciate the book would be sufficiently acquainted with Raphael's works to follow the remarks, or would know where to look for drawings and engravings. Even to such, however, facsimiles of some of the more rare class of studies would be of high interest, more so perhaps than to the general reader. The book, however, is not for "the general reader," who will probably not understand its interest, its line of argument, and its deductions. It is a book for those who take art and art-history seriously, as a subject worth careful thought and study. The number of these, in proportion to the mass of readers, has undoubtedly increased of late, and to all these Messrs. Crowe and Cavalcaselle's "Raphael" is a necessity,—a book which their library "cannot be without." We have seen few books of biography containing such an amount of solid information as this. There is no padding in it; every page must be read; and considering the amount of information compressed into it, the book is not only clearly arranged, but remarkably readable; and though the style must necessarily, in such a case, be a little dry, as reading, every now and then it is brightened up by a little outbreak of enthusiasm, just sufficient to show that the writer's heart as well as his head is in the work. In the midst of the more serious details, too, little traits of Raphael's habits in working come out, as in the mention of one of the sketches for the pathetic subject of the Entombment, in the midst of which it seems that "a gayer spirit comes over him, and on the back of his paper he gives in sprightly lines a concert of antique figures, a woman with a harp, a youth playing the viol, and a satyr blowing a trumpet."\* In these and other such incidents we seem for the moment to be brought more nearly face to face with that wondrously-endowed worker of the cinquecento period; we come near him and look over his shoulder in his moments of relaxation, and recognise the healthy playful human nature which enabled him to give to his Madonnas that combination of spiritual feeling with human grace and motherly tenderness which we find, in the same balance and completeness, in no other sacred art but that of Raphael.

#### PUBLIC WORKS AND BUILDINGS IN LONDON AND SUBURBS,

IN THE SIXTEENTH, SEVENTEENTH, AND EIGHTEENTH CENTURIES.

AMONG the numerous interesting manuscripts preserved in the Public Record Office we have recently discovered a remarkable and unique series of accounts relating to money expended on the royal palaces and other state buildings and works in and about the metropolis, and other royal seats in the country, such as Windsor Castle, &c. These curious, voluminous, and instructive documents exhibit the materials, quantities, and prices of the articles used; also the workmen's wages per day; and in the case of "task-work," the sum paid for a specific job is duly set forth. These MSS., extending over 300 years, commence in the reign of Queen Elizabeth, and are carried down, year by year (except during the Commonwealth, when they do not appear to have been kept), to the reign of George IV. Our first transcript relates to the Tower of London, in the year 1563-1564, when 153. 10s. 10d. was incurred for materials and wages, for "repayinge and mendynge of the

windowe of freestone in the p'sonnes there; repayinge of floores, and the wharffe at the Iron gate nexte Seynte Katherins and otherwise," viz., for:—

Timber, 12s. the load; quarters, 3 load at 12s.; rafters, 1 load, 12s.; quarter-boards 2,506 at 2s. 4d. the hundred (q<sup>m</sup> 1<sup>5</sup>, vj foote at ij<sup>5</sup> iij<sup>5</sup> C.); eves hordes, 1 hundred at 3s.; elm planks at 11s. the load; alder poles, 3 loads at 6s.; laths, 2<sup>1</sup> loads at 10s.; billets and talwood, 2 loads at 6s. 8d. Bricks, 15,000: 11,000 at 10s. and 4,000 9s. the thousand; tiles, 28,000: 18,000 at 10s., 10,000 at 9s.; "roufe & hyvo tyles" [qy. roof and eve tiles] at 8s. and 8s. 4d. the hundred; tile-pins, 15 bushell, 15s.; lime, 3,400 [cwt.] at 6s. the hundred [qy. cwt.]; hair, 8 quarters at 2s. 8d. the quarter; sand and loam, 38 load at 10d.; lead (cast) 1,400, at 12s. the hundred [cwt.]; solder, 2<sup>1</sup> cwt. (cc di) at 5d. the pound; wax and rosin, 14d.; Spanish oker, 4 dozen, at 4s. the dozen; oil, 4 dozen, at 1s.

Timber at 10s., 11s. 6d., 12s., 13s. 3d., and 14s. the load. Boards of divers sorts, as Ealm boards, "Plaunch boards," quarter-boards, inch-boards, deal boards, and plane boards, provided and hought at the several rates and prices of 4s. 6d., 3s. 8d., and 4s. the hundred, and at 3s. 4d. the board.

"Quarters and pouncheons pyryvid and hought at the severall Rates of xij<sup>5</sup>, xij<sup>5</sup> iij<sup>5</sup>, and xijij<sup>5</sup> the lode hestowed and employed at the Tower of London," &c. Planks at 6s., 5s. 6d., 7s. 6d., and 8s. the hundred. Rafters at 12s. the load. "Jeists" at 11s. and 12s. the load. Wayncots at 5l. 10s. and 7l. 10s. the hundred. "Tallewood, Bylett, and Fagott, viz., Tallewood, at 2s., 3s. 6d., and 4s. the load. Bylett and Fagott at 7s., 7s. 10d., and 10s. the thousand." Laths at 16s., 18s., and 22s. the load. Hardles at 5s. and 5s. 6d. the load. Tilepins at 10d. and 12d. the bushel. Poles and masts for scaffolds at 5s. 6d. and 8s. the load. Four ladders cost 14s. 10d. Nails of sundry sorts, viz., "dohle tennes," at 10s. 6d. the 1,000; "single tennes" at 5s. 3d.; sixpeny at 3s. 4d.; fourpeny at 2s. 10d.; "Russe nayles at xijij<sup>5</sup> the sume" (the lot); the bagge and twopenny nails at 12s. the lot. Iron work, viz., locks and keys, at several prices; hooks, hinges, &c. 5l. 19s. 8d.; baskets, spades, shovels, and other small necessities, 1l. 9s. 8d.; glazing at 6d. the foot, and repairing of glass at 2d. the foot.

The wages were as follow:—Masons at 1s., 11d., 10d., and 9d. per day; carpenters at 1s., 11d., and 10d.; bricklayers and tilers at the same rate; plasterers and plumbers at the same rate; sawyers at 1s. 10d. the couple; paviors, for paving 80 yards, at 2d. the yard; common labourers, 8d.; and "John Swythen, clerke of the cheeke and Ovs<sup>r</sup>secr of the worke-men and labourers, xlvj dayes, at x<sup>d</sup> per diem," 35s. 4d.

Carpenters serving in the said works at the several rates of 8d., 9d., 10d., and 12d.,—664l. 4s.

Joiners at 9d., 10d., 11d., and 12d.,—85l. 8s. 6d. Masons at 9d., 10d., 11d., and 12d.,—98l. 7s. 8d. Bricklayers and tilers at 8d., 9d., 10d., 11d., and 1s.,—419l. 0s. 8d.

Sawyers at 1s. 8d. and 1s. 10d.,—174l. 8s. 8d. Plasterers at 9d., 11d., and 12d.,—105l. 18s. 11d. Plumbers at 9d., 10d., 11d., and 12d.,—112l. 5s. 8d.

Founders at 8d., 10d., and 11d.,—1l. 2s. 2d. Matlayers, 8d., 9d., 10d., & 11d.,—22l. 15s. 10d. Painters "sarvinge in the said works by greate, viz., at West'm, for payntinge of my dozen Treynne platters at iij<sup>5</sup> the pece, xij<sup>5</sup>, and for payntinge the fountayne at Windsor Castell, by greate,\* xx<sup>5</sup>, amountinge in the hole to xx<sup>5</sup> xij<sup>5</sup>,"—20l. 12s.

Scaffolders at 8d., 9d., and 10d.,—8l. 3s. 2d. Sklaters (qy. slaters) at 9d. and 11d.,—7s. Smiths at 8d. and 10d.,—2l. 8s. 8d. Carvers and cutters in stone and wood at 8d.,—9l. 10s. 2d.

Paviors "for the wages of 10d. the day as after the rate of 2d. the yard by reate,"—45l. 5s. 7d.

Limeburners at 9d. and 11d.,—30l. 12s. 8d. Butmakers at 8d. and 11d. the day "in mendynge and makinge buttes at Windsor Castell, amountyng in the hole to 1l. 14s. 10d. Mesers-cowmers at 9d., 10d., 11d., and 12d.,—20l. 5s. 10d.

Gardeners at 3d. and 12d.,—107l. 16s. 4d. The surveyor of the works and buildings was allowed 6s. 6d. a day for his travelling

\* To work by *greate* is to work by quantity instead of by day. What are "Treynne platters"?

\* One of the Oxford drawings.

expenses by land and water; the comptroller, the master carpenter, the master plasterer, and the master planer received 2s. a day for the same purposes.

The following account of works and buildings done in, upon, and about Whitehall, "alias the New Palace of Westminster and divers other places belonging or neigh adjoining thereto," during the year 1582-1583, exhibits the cost of building materials and workmanship in the metropolis 300 years ago. On this occasion the sum of 572l. 2s. 4d. was expended upon those buildings for "taking up and laying again with Mechow deals the terrace, about the preaching-place; mending a great bay window in the Lord Chamberlain's lodgings, making a door in the Lord Treasurer's lodgings, and a new partition in the standing wardrobe, mending the gallery assigned to the physicians for their medicine-room, and repairing the two pair of stairs belonging to the same; as also for new working of a frame to enlarge Mr. Henry Sackford's and the Clerk of the Spiceries lodgings;" making and setting up rafters for a shed on the gallery next the privy bridge; making a new cistern-frame in the well ladder, enlarging the office of the chandlery, together with making new doors, and a window for the same, new joisting and boarding the roof over the porter's lodge, mending the great gate towards bakehouse, setting up a pole 20 ft. long in Scotland-yard, repairing a well of the crane there, as also of the store-house in the timber-yard, laying new planks and festooning the old upon Westminster Hall bridge; making a new chimney in Mr. Sackford's lodgings, and a chimney and furnace in the chandlery, rising a new chimney in Mr. Field's chamber, mending sundry bake-hearth, ranges and ovens; "laicinge of divers ground silks, underpinning of ground plate;" paving not only of the gallery in the passage to the Earl of Leicester's lodgings, but also of the hoiling-house and of divers kitchens where need was; working and setting of old and new crest, as well in sundry battlements, as also in other places about the house fallen into decay; taking up the fountain-steps in the garden, laying them again, and filling up the joints with cement; hewing a heartstone grate, and sluice for the bridge at the entrance in St. James's-fields; new slating the side of the hall-towards the Thames, and repairing the other side in places needful; lothing, ripping, and tiling in divers rooms, as the privy lodgings, the silk house, the gallery towards the park; the Earl of Newcastle's lodgings, the side of the roof next the porter's lodge, the still-house, the postries, the workhouse in the tilt-yard, and at St. Stephen's in the lodgings of the officers of receipt; covering with lead the roof on the porter's lodge, making two new pipes of lead for conveyance of water from the tower, mending the lantern in the hall, the leads on the standing wardrobe, and certain leaden pipes in the orchard; soldering faults and frets not only in divers places of the said house, but also on the leads in the St. Stephen's, and the leads and gutters at St. James's, and stopping pipes there, cleansing the sluice in Scotland-yard, and divers sinks and valves about the house; new lathing a ceiling near the jewel-house; repairing, lothing, and laying divers walls near the same; new matting the Lord Chamberlain's, the Lord Admiral's, the Earl of Warwick's, Mr. Middlemore's, Mr. Haward's, and Mr. Chaworth's lodgings, together with mending and piecing old mats in sundry loopings about the same court, and for the attendance of sundry artificers, officers, and others, with divers necessary provisions for the performance of the said works, which in their several natures, quantities, and prices are expressed in money and form following, viz.:-

Timber, 5½ loads, 9 ft., viz.:-27 loads, 4 ft., at 10s. the load; 10 loads, 17 ft., at 11s.; 2 loads, 20 ft., at 13s. 4d.; 5 loads, 25 ft., at 14s.; 4 loads, 4 ft., at 25s.; and 2 loads at 14s. Rafters, 12 loads, viz.:-7 loads at 12s., 3½ loads at 13s. 4d., and 1 load, with carriage, 14s. Quarters, 6½ loads at 12s. Joists, 2½ loads at 12s. Planks of breadth, "ij. at vii," the piece (beside one load spent of y<sup>e</sup> Remayne). Boards, 5,625 ft. ("viii. vii. xxv. f. 11"), viz.:-4,075 ft., at 3s. 4d. the hundred; 1,550 ft., at 4s. Deals, or "mebrow deal boards," 830 ft., viz.:-800 at 6l. the 100, and 30 at 12d. each. "Dressers of benches," 1, 7s. Tallow, 6 loads at 4s. Billets, viz.:-13,500 at 6s. 8d. the 1,000, and 1,404 at 10s. the 1,000. One lever, 16d. Hardies, 4 dozen at 4s. per dozen. Bricks, 32,500, at 10s. per thousand. Tiles, 24,000,

viz.:-23,500, at 10s. per thousand, and 500 after, 12s. the thousand. Roof-tiles, 350, at 10s. per hundred. Slates, 25,000, viz.:-5,000 at 10s. the thousand, with carriage, and 20,000 at 9s. ditto. Laths, 6½ loads, viz.:-1½ load at 20s., 5 loads at 17s. per load. Lime, 3,500 (cwt.) at 6s. the cwt. Loom, 17 loads at 8d. the load. Plaster of Paris, 2 tons, at 12s. per ton. Hair, "xxij. bwz. at vii" the bwz." (qy. bushel). Ragstone, 2 loads at 3s. the load. Rigatestone, 4½ tons and 2 ft., viz.:-2½ tons at 12s. 10d., and 2 tons at 14s. per ton. Watertable stone, 3 ft., at 10d. per foot. Wrought-face stone, 8 ft., at 12d. per foot, with carriage. Mats, 40 dozen, at 4s. the dozen. Packthread, 16 lb., at 8d. per lb., and for brown ditto, 10d. Soder, viz.:-"cc. q<sup>r</sup> xiiij" at vii q<sup>r</sup> lb., vii xiiij", and for fionnders" Soather and eiment vii viij", in all vii xix viij" (283 lb. at 6d. per lb. = 6l. 13s.). Lead, "iijijb ix q<sup>r</sup> v. 10" (4,933 lb.), at 12s. per cwt. Coals, 30 casks, viz.:-25 casks at 4s., and 5 ditto at 8s., per cask. Sand, 4 loads, at 6s. per load. Clay, 4 loads, at 10s. per load. Gravel, 1 load, 8d. Hay, 2 trusses for 16d. Nails, of sundry sorts and price, 19l. 12s. 0½d. Brooms, of divers scantling, 16l. 2s. 8d. Bast rope, 3 pieces, at 15d. the piece. Canvas, 10 cils, at 1s. 2d. the cill. Tape, 1 ell, 2s. Water-tubes, 2, viz.:-1, 2s., and 1, 2s. 6d. Hogsheads, 2, at 16d. each. Hoops, 18, at 2d. each. Palcs, 8, at 6d. each; 1 file, 10d.; 1 hammer, 12d.; 1 pair shears, 10d.; 3 shovels, at 8d. each; 2½ dozen haskets, 2s. 4d. per dozen; 1 lantern, 2s. Joiners' work, viz. a "wainscot outbord" to keep books, 15s., a small wainscot casedment 16d., another "wainscot eubbord" for the office 8s., ironwork, viz. plate-locks, staples, keys, sockets, "crosse-garnets," bolts, hooks, casements, together with sharpening, and "battering of tools," and attendance, 14l. 4s. 1d. Brasswork, viz. one brass cock at the Star Chambers, 3s. 6d.; one cock and a masher in a cistern there, 6s.; 3 cocks in the removing and withdrawing chambers, viz. 1, 3s. 4d., 2, at 3s. 6d., and 1 at 4s. Glass and glazing, viz. new glass at 6d. the foot, new setting in and leading old glass at 3d. the foot, mending panes and casements at 4d. each, and setting in quarrells at 6d. each. And several small necessaries, viz. 1 buckram bag 20d., 5lb. of wax at 8d. per lb., 3lb. rozin at 6d. per lb., 8 huz. of slate-pins at 3s. 10d. per huz., 6 huz. and one peck of tile-pins at 12d. per huz. [The abbreviation "bwz." in this instance apparently means bushel.] 2 doz. wooden buttons at 8d. per dozen, 8 links at 8d. each, 29lb. of candles at 3d. per lb., 1 cast of counters 20d., writing-tables 1 pair 2s., 3 reams of paper at 8s. per ream, pay-books 12s. 6d., 1 "pottle" of ink 3s. 4d., 1 brass dst.-box 4s. 6d., 1lb. of pin-dust at 12d. per lb., and for leather 6d.

Workers' daily wages included, carpenters at 12d., "and prentices" at 10d., joiners at 12d., masons at 12d., tilers and bricklayers at 12d., slaters at 12d., plumbers at 12d., plasterers at 12d., "and their prentices" at 8d., matlayers at 12d., tentmakers at 12d., mazerskouers" at 12d., labourers at 8d., and sawers at 22d. the couple. Painting, viz. to George Gower ("s'fant"), sergeant painter, for painting and guiding a new lion and the old "Phane," and the Crown supported by the said lion in oil colours to garnish the lantern over the hall 4l. Prurveyors, Griffith Jones 16d. and 12d. per day. Storekeepers, viz. John Whitwell of his pains in taking the note of the receipt and delivery of the said provisions at 12d. per day and John Marshall of his like service at the same rate. Clerks, viz. John Marshall, John Thorpe, and Mathew Swetzer, for ingrossing the pay and signed books and attending on the office, at 12d. each per day.

Taskwork.—Henry Deacon, sergeant plumber, for casting lead, was paid at the rate of 20d. per cwt. Richard Dickson, carver, "for portraying and making of a new lion of ij foote highe for the Lanterne over the hall," 20s. William Phillips, turner, for turning 18 lanterns at 4d. each; Francis Rench and other slaters, in part payment, for lathing and tipping the hall, 5l., and to them, in full payment, for finishing the said work, 11l. Richard Steppes, pavor, for 51 yards of ragstone paving in the Lord Chamberlain's lodgings, at 2d. the piece.

\* Fodder, a weight for lead or other metals, usually about 2,600 lb.  
† Quarrell.—A square of window-glass, properly one placed diagonally; anciently, a diamond-shaped pane of glass. Hence the cant term, *quarrell-poker*, a glazier. The word was applied to several articles of a square shape, and is still in use.

yard; Henry Holton for 12 yards of paving work at 2½d. the yard. Thomas Graves, surveyor of her Majesty's works, for his attendance, diet, and boat-hire and riding charges, at 4s. per day; and to the Comptroller of the said works, 2s. per day.

Turning to the account of the works and buildings at the Banqueting-house, the cost of materials, wages, &c., is much the same as above transcribed. Thus, John Wattingey, joiner, for "four great wainscot doors 7 ft. high and 4 ft. 2 in. broad, being whole wainscot thickness," was paid for them 25s. each. George Gower, sergeant painter, for laying all the windows and joint-pillars with white lead, oil, and russet, consisting of 604½ yards, was paid at the rate of 16d. per yard. "As also for laicng y<sup>e</sup> armes on y<sup>e</sup> porch in oil mixt w<sup>th</sup> white v<sup>th</sup> blacke, cont<sup>g</sup> xij y<sup>ar</sup>des d<sup>at</sup> at xiiij<sup>d</sup> y<sup>e</sup> y<sup>ar</sup>de, xvj<sup>d</sup> viij<sup>d</sup>." For laying sixty-three great casements in white lead and oil 40s., and for painting all the outside walls of the Banqueting-house, embracing 868 square yards, cost over the said work after the perfecting thereof, at 9½d. the yard, 34l. 15s. 2d.

Upon Westminster Hall 10l. 1s. 6d. was laid out for working new corbel stone for the more safe supporting the closet of wainscot near the King's Bench, on the side towards St. Stephen's, somewhat inclining to ruin, flooring the said closet and boarding it again, "as also takinge downe and yotting with cramping the grate betwixt Scotland-yarde and Charinge-crosse;" viz. 100 feet of boards, 3s. 4d., Castlesone (qy. Caen) 13 ton, 11 ft., at 15s. per ton; 1 cwt. lime, 6s.; 3 load of sand, 16d.; nails of divers price, 5s. 8d.; 15 crampins of iron at 4d. each; and carriage of boards, stones, and scaffolding stuff, 6s. 4d. Wages of masons and carpenters were at the rate of 12d. per day; scaffolders got 10d., and labourers 8d. a day. Richard Dixon, carver, for carving the royal arms in stone, received 13s.

In St. Stephen's 2l. 5s. 1d. was expended in making a new way for the Lord Treasurer to pass to the Court of Wards, viz. for framing a great new door next the Town Court-house, with necessary posts to it, and making two bridges, one in the said Court-house, the other in the said yard at St. Stephen's, as also posts and rails about the bridge, "and of a greato slattinge of hoordes with twoleaves"; 2l. 9s. 8d. was also disbursed for work and labour done in the said Court-house, for making new windows, shutters, and doors for the better preservation of the wines kept therein, viz. 300 ft. of boards at 3s. 4d. the 100; nails of divers price, 6s. 4d.; 6 pairs of hinges, 1 great plate lock with vice, a close box for the door, and 7 black bolts with keepers and staples, cost 31s. 8d.; 8d. was paid for lead carriage of timber stuff, and for the wages of a carpenter at 1s. a day, 11s.

In St. James's Park 15l. 4s. was expended for certain young elms, viz. for searching in divers places about the country, and conveying them thither, to be set for a walk to be made for her Majesty, viz. for purchase of 300 young elm trees at 7l. the 100, and labourers for their travel in seeking them about the country, 10s.

At Queen Elizabeth's favourite seat,—the royal Palace at Greenwich,—the large sum of 3,151l. 6s. 2½d. was laid out in works and buildings done there during the year 1582-83. The cost of the materials, workmanship, &c., are much the same as those above mentioned, and do not call for a detailed transcription. It may, however, be noted that two new windows were made in the Queen's apartments "for her Majesty's better viewe into the orchard"; followed by a long entry for "new mattinge not onlie of the previe Closset, the privie Chamber, y<sup>e</sup> standinge bead chamber, and the gallerie next adjoininge, but also of the lorde Treasurers, y<sup>e</sup> Earle of Leicesters, the Earle of Warwick, y<sup>e</sup> lorde Howardes, M<sup>r</sup>. Vice-Chamberlaine, M<sup>r</sup>. Comptrolours, M<sup>r</sup>. Secretaries, and the Gromes of the Privie Chambers lodgings, siting other aboute y<sup>e</sup> house, together with taking up, mendinge, cleansing, and laicng againe sondrie decayed mats, both in her Ma<sup>t</sup>, and in noblemens and officers lodgings and rooms, with divers other charges incident to the said works." A subsequent entry shows that 134 dozen of mats cost 4s. a dozen, and that 735 yards of "fyne mats" at 8d. per yard, amounted under this head to 48l. 4s. 9d. Three prurveyors,—Walter Jennings, Griffith Jones, and Thomas English,—had respectively 17½d. 16d., and 15d. per day. For taskwork, William Tucker, carpenter, obtained 6l. for timber and

workmanship of six new "cleare storie windows"; and John Atsilde, carpenter, for "making clearestory windows, boaring, joisting, and quartering divers floors and partitions, and making stairs," received 33l. 13s. 4d. William Phillipps, turner, for turning nine great posts for the terrace at 5s. 8d. each, and for turning 105 balusters at 5d., received 4l. 6s. 1d. William Kirwin and John Ashton were paid 3d. per foot for laying 400 ft. of old stone in the kitchen and in the Lord Treasurer's Walk; "as also for cleansing of lights, and y<sup>e</sup> stones of the Fountain," 4l. 10s. 6d. George Gower, sergeant painter, received 287l. 13s. 11d. "for laying of all Timber windows and their harras aboute her Ma<sup>y</sup> and Noblemen's lodgings in white leade and oyle, for Moulding of Corniches, Archtraves, gable-ends, Porches, dores, Balasters, Raills, Pari-stalles, and boultelles in the Conduit-courte, and two other Courts, and in the Hall, conteynynge M<sup>y</sup> vij<sup>e</sup> vij<sup>e</sup> yards di at xvij<sup>e</sup> the yarde [1707] yards at 16d. per yarde; and for leicng of other clearestorie windows, upright harras, peristalles, trimm piece, perapments, cements, and lettice, &c., partelie with white leade and oyle, in distemp<sup>r</sup>, and partlie w<sup>th</sup> Russet, in all ciiiij<sup>e</sup> vij<sup>e</sup> xiiij<sup>e</sup> xjd." John Ashton and two other paviors were paid at the rate of 2d. per yarde for paving the Conduit-courte and other places thereabouts with ragonstone. And William Palmer, founder, for casting four brazen pallies and supplying 20 lb. of new brass, received 16s.

#### CROYDON PALACE AND THE ARCHBISHOPS OF CANTERBURY.

"Feci quod potui, peti quod, Christo, dediisti."

As the current lease from the Ecclesiastical Commissioners will shortly expire, the inhabitants of Croydon intend to purchase the remains of the ancient archiepiscopal palace and devote them to some philanthropic project, in memory of the late Primate.

Many antiquaries would identify this town with the Noviomagus of the Romans. It is certain that to the end of the last century traces were visible at Broad Green of the Roman or British road from Arundel to London.\* Cited in the book of Domesday as Croindene, containing twenty plough lands, the manor belonged to Lanfranc soon after the Conquest, and has been ever since annexed to the Metropolitan See. Under the Commonwealth, however, it was let to the Earl of Nottingham for an annual rent of 40l., and then to Sir William Brereton, Colonel-General of the Cheshire forces, who being a notorious *gourmand*, turned the then chapel into a kitchen.† The manor was valued temp. King Edward the Confessor at 12l. per annum, and in the Conqueror's time at 27l. to the Archbishop, and 10l. 10s. to his men. In the Parliamentary survey of the year 1646, its yearly value is scheduled as 274l. 19s. 9½d., exclusive of the timber. Croydon Park, of which William Walworth was once keeper, had been given to King Henry VIII., by Cranmer, but was returned to him by King Edward VI.

The palace or manorial house‡ formed for several generations a residence of the archbishops of Canterbury, of whom but few have not dated some of their public acts therefrom. Here in great solemnity Courtenay received his pall (1381), and here Arundel, Chicheley, and Stafford, his successors, in turn chiefly lived. A prisoner in England, King James I. of Scotland dates from Croydon, anno 1412, a charter of the barony of Drumlanrig to Sir William Douglas, he being there in Arundel's custody during that prelate's second tenure of office. Parker, so celebrated for his learning and virtues, entertained Queen Elizabeth and her court for seven days at Croydon. It was on this occasion that the queen, taking leave of the first Protestant archbishop, and acknowledging his hospitality, turned to Mrs. Parker with the words:—"Madam I may not call you, mistress I am loath to call you, but I thank you for your good cheer." A similar visit was contemplated, if not actually accomplished the next year. A memorandum exists

\* See "Archæologia," vol. ix, p. 104.

† See "Mysteries of the Good Old Cause," a 12mo. Pamphlet, 1823.

‡ The term "Palace" strictly appertained to a bishop's residence within his own cathedral city; all others were styled "houses." Lambeth Palace was known as Lambeth House until the present century. Letters of Juxon are extant, dated from his palace in London and his house at Fulham.

of the allotment of their several chambers, in many cases their "old lodgings" or "where he was," to the lord chamberlain, the lord treasurer, the lady of Warwick, the "gentleman hussers," the "physycyons," the "Queen's waytigers," the "Queen's robes," the groom-porter, &c. It is amusing to read of the perplexities due to the expected arrivals of my lady of Oxford, Mr. Hatton, and my lady Carewe (from Bedlington), for whom no rooms with chimneys could be assigned.\* Whitgift, whom she used to call her "little black husband," entertained the Queen frequently, the last time she dined with him here being within three years of her death.† Sir Christopher Hatton was made Lord High Chancellor at Croydon in 1587, Whitgift having declined that honour. This archbishop, together with Tenison and others, was a magnificent benefactor to the town. He founded during his lifetime the schoolhouse and hospital to which Dr. Tait referred in one of the last of his recorded utterances. It is a good, though plain, Elizabethan building, at the north-eastern corner of the High and George streets. In the chapel are preserved the founder's portrait, inscribed with the quatrain of which the opening line stands at the head of this article, with one said to be of his daughter, and a curious representation of the "Dance of Death." The hospital possesses three old wooden cups, whereof one, with a capacity of three pints, bears the legend:—"What, sirrah! hold thy pence, thirst satisfied cease." Abbot, who seldom left Croydon, gave great offence by forbidding the reading in the church of the proclamation for sanctioning certain sports and pastimes on the Lord's Day; he scandalised the clergy in accidentally killing a keeper when hunting at Bramshill Park (1621). Clarendon describes him as "a man of very morose manners and sour aspect, which in that time was called gravity." After Land's execution the see was vacant for a space of sixteen years. Juxon, who must ever be remembered as the repository of the last injunction of Charles I., was appointed thereto at the return of King Charles II. He carried out many repairs in the residence, and rebuilt the chapel that Brereton had profaned. His successors continued to live here until the translation of Hutton from York in the year 1757. Twenty-three years later, during Cornwallis's primacy, the untenanted buildings were sold for 2,520l. to Sir Abraham Pitches, knight, and the proceeds applied towards the cost of Westminster Bridge. Stafford's hall (of date 1443), the guard-chamber (built by Arundel), and other premises, except the chapel, have lately been in the occupation of a bleacher, whose drying-ground is the garden and vineyard, of which a record exists temp. Edward II.

In the year 1808 Archbishop Manners Sutton purchased Addington Manor for a summer residence. This his successor, Howley, adopted as his chief abode, laying out the present park because he found that his own garden at Lambeth suffered so much from the neighbouring kilns and factories. Of the two ancient manors at Addington (antiq. Edintoune), that which passed to the archbishops was known as Aguilon's or Bardolph's. At the Conqueror's survey it was taxed at eight hides, and held by Teclun, the king's cook, on grand serjeantry, to be enjoyed by the tenure of presenting to the sovereign upon his coronation a dish or mess of gyron,—when marrow was added thereto, mauppygeron,—a custom observed to a comparatively recent age. Sir Robert Aguilon received a patent in the 54th Henry III., to fortify and embattle his house at Addington. That house, on Castle Hill, was pulled down and a second built at the foot of the hill, bearing the inscription,—

"In fourteen hundred and none  
Here was neither stik nor stone;  
In fourteen hundred and three  
The goodly building which you see."

This again made way, about 100 years ago, for the present manor-house, which embodies

\* The paper is bound with a MS. history of Croydon in the Lambeth Palace Library. It is signed by Bowyer, gentleman of the black rod, and is entitled, "Lodgings at Croydon, the Bushops of Canterbury's House, bestowed as followeth [Here follow the names with their respective apartments] the 19th of Maye, 1574."

† See "Sydney State Papers," vol. ii., p. 210.

‡ In Howe's "Year Book" for 1843 will be found an interesting engraving of a carved stone escutcheon and canopy from the eastern wall of the palace which fell to pieces in June of the preceding year. The shield, supported by winged and crowned figures, bears the arms partly per pale of Edward the Confessor dexter and sinister quarterly those of France and England.

the chapel, library, and other rooms added by Archbishop Howley. A fine avenue leads to the site of the former structure.

The disastrous fire of 1867 destroyed nearly all the monuments in old Croydon church. These comprised those of Archbishops Grindal (1583) and Whitgift (1604), with the fine tomb and recumbent figure, in full canonicals, of Sheldon (1677),—the work of two obscure English artists,—Latham, the City architect, and Bonne. Relics of the two former monuments lie in a vault beneath the organ. In this church, which, with the exception of the tower, was rebuilt by the late Sir G. Scott, on its former plan, were buried Archbishops Wako (1737), Potter (1747), and Herring (1757), each having held the see for ten years. Herring expressly forbade the erection of any monument above his grave. Abbot died at Croydon on the 4th of August, 1633, but in compliance with his will was buried at Guildford.

#### CRITICAL COLUMN.

THE NEW ARMY AND NAVY HOTEL, VICTORIA-STREET, WESTMINSTER.

This striking erection, which has, no doubt, been noticed by many engaged in the profession, is not a had subject with which to open the critical column. Any one passing down Victoria-street, and having an eye to architecture, will have his attention arrested by the manifest peculiarities of this design. Its main characteristic is power in the composition, joined to boldness, extravagance, and sensationalism in the detail. As a composition, this design has great merit. The bold entrance-doorway, the large and massive stone angle quoins, the windows down the side, the dormers, and main cornice treatment, all work together to an effective and well-balanced whole. The projecting bays are well conceived compositionally; they balance the very massive doorway treatment; the same applies to the stone treatment up to the first-floor cornice, by which the colour is carried uniform around a series of features meant to combine to a united artistic effect. Any introduction of brick in the lower portions of the design would compositionally have been a great mistake, solely on account of the colour-contrast. On the side elevation, where brick has been introduced presumably for reasons of cost, there is no objection to its use, and the idea of the "stone composition" up to a certain level has been very cleverly retained by the manner in which the windows of several stories are drawn together into one continuous stone composition. This arrangement is compositionally of great merit; for not alone is the idea of the stone treatment up to a certain level very clearly expressed, but the opportunity is also afforded for making of this treatment striking individual compositions which, tall strongly when seen in perspective with the doorway and projecting bays of the front elevation.

The faults of this design, as with most modern Renaissance works belonging to the present London revival, are mainly in the detail. The detail is very bold, which is well in accordance with the composition, but it is also vulgar, extravagant, sensational, which need not be, which is not artistic, and which spoils what might otherwise be a highly successful design. There is a studied attempt in the detail to do the unusual, the extraordinary, very likely with the view of creating a harmony with the strong lines of the composition; but it should be well borne in mind that extravagance of invention and large scale alone will not make a detail powerful, and certainly not artistic. Power is the result of relative rather than of absolute proportion, and as to good taste in Classic detail the same general lines must be followed for large detail as for small.

To begin with the doorway, the pedimental composition is too much pictorial and too little architectural. It reminded the writer strongly of the "painter" as an architectural designer, and called to his mind the book on designs by "Düsterlin, of Strasburg." The freedom with which the foliated composition runs away with the moldings of the pediments is too great; the approved way of stopping pedimental members where a central composition is introduced is to roll them up into a scroll or else to return them. This practice satisfies both pediments and centre feature. The entire ornamental compositions, the detail of the foli age, &c., are very vulgar and sprawling, and the

oblique lines running down to the capitals are extremely ugly. As to the scroll into which the archivolts lines are rolled up immediately above the capitals, the lines simply defy all architectural understanding, and require to be seen to be laughed at. The column, with its capital, shows great lack of skill; for, given its dwarfed shape and the general composition of what it carries, much more might certainly have been made of it; by the adoption of a powerful scroll capital of the Grecian Ionic type (modernised), and by the introduction of a few square or octagonal bondstones to break the short circular shaft, a feature much more effectively expressing its apparent function would have been obtained. The Ionic scroll pattern (Grecian type) is precisely the form of capital most aesthetically appropriate in such cases, where the weight visibly acts in the direction of the scrolls, and it is capable of great variation and most original treatment. As to the doorway proper the sunk moulding running around it in the form of an architrave looks a little weak and tame in such close proximity to its powerful neighbours; as to the immense tea-urn-shaped vase in the circular opening above the doorway, it is to be condemned from every possible point of view; it is not required, and is very ugly as a detail.

The bay-windows are supported on a corbel, the carving of which is of the same coarse character as all the foliated ornaments throughout, much too realistic or naturalistic in connexion with other details and features, many of which breathe an air of genuine Classic. The detail of the mullion is very original, and contains much merit; but the manner in which the architrave mouldings are stopped when they come above the mullions is somewhat weak. This device, wherever and whenever it may occur, of introducing a carved boss or ornament of some kind to stop or cut off mouldings which otherwise might become troublesome, is very weak, and to be rigidly condemned; it is not an "architectural" solution of the difficulty, and especially not in any kind of Classic. If such mouldings cannot be taken down, nor up, nor returned in any way, they should be abolished altogether; and where they must be retained, the best thing to do is to cut them off square, neo-Grecian fashion. The panels between the two stories of the bays would have been far better sunk than raised. The angle-quoins treatment of the basement or ground-story is weak in appearance as an aesthetic substructure to those which follow in the upper floors. The grey granite in which they are built, and which is lighter in tint than the freestone above, does not excuse this; for art does not appeal to the reflective faculties in the first instance, but to the contemplative faculties, in this case to the eye; and the great strength of this grey granite corner should have been expressed by a quoin treatment more strongly marked even than that of the upper stories, not because it is required absolutely, but relatively, as being the aesthetic base of the upper quoins. These upper quoins are, with their rounded corners and deep joint mouldings, a very meritorious detail, but they have one great fault,—they do not tongue into the brickwork. This fact, joined to the contrast of the colours which here obtains, "isolates the corners," cuts them off aesthetically from the general wall work. It is a great defect, brought about mainly by the colour and the small-jointedness of brickwork; for were the wall adjoining the quoins built in stone, the defect would disappear at once, as the uniformity of the material, assisted by the faint joint-line running into the body of the wall, would at once reveal the structural unity of the wall in a manner satisfactory to the eye. Where quoins of stone are used in connexion with brickwork, they must be toothed into the brickwork in alternate courses, otherwise they will never realise the very idea they are applied for,—additional expression of the structural solidity of the corner. In this case, and therefore in every similar case, the quoins stand like an isolated stone pier at the corner, and completely fail to express their structural connexion with the body of the wall adjoining. As to the treatment and application of quoins, no portion of past architecture is so instructive as the Italian Renaissance. The palaces of Florence, especially, are a distinct quoin-style, and should be closely studied, for this feature of modern Renaissance art is capable of much extension. The writer believes that much progress could be made in this direction, as quoins admit of endless variation, and their application usually leads to

a holder and more original Classic treatment than follows in the path of the column or pilaster. This fact has long been recognised on the Continent; and, not to mention the Louvre, very effective work in this direction has lately been done in Paris and Vienna.

To return to our design with which we have now arrived above the stonework level, we perceive the painful bareness of the three brickwork stories. This is really the only compositional fault in the design. The brickwork portion is so bare and starved looking, so devoid of every attempt at architectural connexion with the remainder of the design, as to greatly spoil the design as a picture or impression of harmony. A string or band in stone or some stone treatment around the windows would greatly help the design as a balanced composition. The centre feature has certainly been carried up in stone, but compositionally it is a bad feature on account of the solidity of the centre line, presumably caused by a wall behind. Such centre walls should be avoided if it possibly can be done, but where it seems necessary to have a centre wall the difficulty in the façade is best overcome by introducing niches, or "recessed" panels with sculptured compositions. The idea is to "obliterate" the objectionable solid centre by setting it back, and thus visibly throwing out the adjoining window features. In point of detail the centre composition above the doorway feature is somewhat out of keeping with the remainder of the work. It is both finer and smaller, and should have been more on the lines of the side window compositions, previously referred to. The dormer windows are of a very squat appearance, with tremendous stonework heads, and the irrepressible tea-urn vase of gigantic proportions. They are extremely ugly, whereas the chimney must be pronounced a highly meritorious feature.

The roof shares the same fault which applies to all French roofs in London; it is set too far back from the wall face, which is caused by the gutter being formed behind a thick parapet. The character of the French roof seems entirely misunderstood in London. The French roof is an ornamental "continuation of the façade," and its plane should therefore be set as far front as possible, otherwise it will be lost to the view, especially in our narrow streets. This object, which is well understood in Paris, is accomplished by the roof being set on the cornice-stone, the gutter being formed in lead on top thereof and fastened into the stone. The gutter is highly effective, and, from its position, can, in most cases, be run in front of the dormer windows in a continuous fall, with down-pipes at the eaves. This gutter can also be made a highly ornamental feature, as *vide* the hotels and other public buildings of Paris. The point here at issue is an essential one, which architects should take note of. We deceive ourselves in this respect with our drawings, on which the French roofs, starting up from behind the parapets, look well enough. As at present treated, all we usually see of French roofs of ordinary height is the top of the crestings, the dormer windows standing out in hard bare lines against the sky.

In conclusion, one point must be mentioned in regard to the design here criticised. It must be admitted that with all the faults of detail pointed out, the design has a redeeming feature which is absent in but too many modern works. This design, and also the detail in particular, has a great deal of character, the essential element of style. There is an idea at work in it, the idea of conscious striving after something unusually grand or striking. The remarks also show how subtle is the difference between good and bad in art, a line more here, one less there, is capable of making a vast improvement. As stated in the introduction, it is the detail which presents most difficulties, and which is capable of making a work one of merit or one of mediocrity, and it should therefore be deeply studied by the modern Renaissance designer.

SEMPERIAN.

**The Royal Courts of Justice.**—The whole of the roof of the Central Hall of the New Law Courts, as well as the roofs of the other portions of the buildings, have been covered by Messrs. Ashton & Green (Limited) with their "Permanent Green Slates." A very excellent job of slating it is, as we have previously had occasion to say. The colour and quality of the material are admirable.

## PROJECTED NEW PUBLIC WORKS.

RAILWAYS, DOCKS, HARBOURS, &c.

The list of private Bills for the session of 1883 is of a formidable character, and includes several projects involving a heavy outlay in construction in connexion with railways, tramways, docks, harbours, town improvements, and other undertakings. Of the total number of 275 Bills in respect of which notices have been given, 125 are in connexion with proposed railway undertakings. Of this number thirty-six of the Bills are promoted by companies proposed to be incorporated for the construction of entirely new lines in different parts of the country. Of the proposed new undertakings six are for the construction of additional railways in and immediately around the metropolis. These include a project designated the East London, Crystal Palace, and South-Eastern Junction line. The undertaking embraces a new line from the Ladywell Station of the Mid-Kent section of the South-Eastern Railway, terminating in the grounds of the Crystal Palace. Another project, called the Mid-Metropolitan, is for the construction of a new underground railway from Lancaster-gate, Uxbridge-road, to Aldgate and the Minorities, passing through the parish of St. George, Hanover-square, and continuing eastward along Holborn and Newgate-street, to its terminus in the Minorities. A third project,—the London, Hendon, and Harrow Railway,—is a new line which, commencing at Harrow, and passing through Pinner, Kingsbury, Hendon, Enfield, and Hornsey, forms a junction with the Alexandra Palace branch of the Great Northern Railway, and thence proceeding north-west, terminates by a junction with the authorised Metropolitan Outer Circle Railway, in the Edgware-road. The Greenwich and Northern Lines Connecting Railway,—another of the new projects,—commences by a junction with the London, Blackwall, and Millwall Extension Railway, and, passing under the Thames to Greenwich, forms a junction with the Blackheath branch of the London, Chatham, and Dover line. Another branch from this point at Blackheath proceeds in the direction of Lewisham, terminating near the Lewisham Station of the South-Eastern Railway. The Kent and Essex Junction line is likewise a new undertaking, commencing at the St. Mary Cray Station of the London, Chatham, and Dover Railway, and thence proceeding on to Plumstead, Blackheath, and Woolwich, where the proposed line passes under the Thames, emerging from the river about 200 yards from the North Woolwich Gardens. Proceeding from this point the line terminates in the parish of West Ham, by junctions with the authorised Regent's Canal, City, and Docks Railway, and the Metropolitan Outer Circle Railway. The Poplar and Canning Town Railway is a further new project for the construction of a railway commencing near the Poplar Station of the London and Blackwall Railway to Canning Town, the line proceeding north-eastward, and almost parallel with the East and West India Docks on the south side. By the construction of this line the circuitous route by way of Stratford and Bromley will be avoided, and the distance between the City and Canning Town will be reduced by several miles.

The metropolis and immediate neighbourhood is likewise affected by thirteen of the railway Bills promoted by existing companies. The South-Western Company, in their general Bill, seek powers to effect a junction with the Metropolitan District line at South Kensington; also powers to widen the line between Waterloo and Westminster Bridge-road; and similar powers to widen the Hampton Court Junction line. The Midland Company's Bill includes powers for the construction of additional works at their new large depot and dock at Poplar, which involves the purchase of land near the East and West India Dock station of the London and Blackwall line. For other works the Bill likewise seeks powers to purchase land and property in Whitechapel, near Royal Mint-street. The London and North-Western Company's Bill contains clauses empowering the company to construct a new street near the Euston station by a junction with Drummond-street, and to stop up a portion of Cardington-street. The Bill likewise contains powers to purchase the burial ground attached to St. James's Church, Hampstead-road. The Metropolitan District Company's Bill provides for the construction of a new line in Hammersmith. The Great Eastern Company promote a Bill specially

for the construction of a line from their station at Chingford to High Beech, Epping Forest. The projected line will be three miles long, and its estimated cost is 70,000*l.* About six acres and a half of the forest are proposed to be taken for the purposes of the line. The Charing-cross and Waterloo Electric Railway Company, which obtained its Act of Parliament last session, now promotes a Bill for the extension of the line in several directions. Powers are sought in the Bill to construct one of these proposed lines under King Charles's Monument and Cockspur-street; another line from the terminus of the authorised line in Waterloo-road to the subway leading from Blackfriars-road to Holland-street. In continuation of the line from Holland-street the Bill further seeks powers to carry it forward into the City, passing through the parish of St. Saviour, Southwark, and thence into the City through the parishes of St. James, Garbickhithe, and St. Martin Vintry, near the junction of Upper Thames-street and Queen-street, terminating in Cornhill, close to the Royal Exchange. The Bill authorises the Company to appropriate "to the under-surface of the river Thames, or of any street, road, or lands traversed by or situated near the intended railway or works." The Hounslow and Metropolitan Company promote a Bill for the construction of a branch from their present line at Hounslow to the Mill Hill Park Station of the Ealing extension of the Metropolitan District Company. The London, Chatham, and Dover Company's Bill contains clauses empowering them to purchase land and buildings in St. Sepulchre's parish, and also at Herne Hill, for extension works; and the North London Company apply for similar powers as to the purchase of land and buildings at Poplar and Bromley. The London, Tilbury, and Southend Company's Bill contains powers to make new branch lines at East Ham. The East London Company promote a Bill for the purchase of additional land and buildings in White-chapel for carrying forward works in progress; whilst the Metropolitan and Metropolitan District Companies jointly promote a Bill for the purchase of additional land and buildings in Abchurch-lane, Eastecheap, and other parts of the City.

The additional powers sought for by several of the great companies in their respective Bills for extended works, are of considerable magnitude, more especially the projects of the London and North-Western, the Lancashire and Yorkshire, and the Great Eastern Companies. The General Powers Bill of the last-named company involves the expenditure of no less than 2,000,000*l.* It contains clauses authorising the construction of several new lines, many miles in length, in different parts of South Essex, including lines from Brentwood to Shenfield, Maldon, Burnham, and other districts not hitherto supplied with railway communication. The estimated cost of these several lines is upwards of 500,000*l.* Another line proposed is one down to Tilbury, forming a communication there with the new docks of the East and West India Dock Company, now in course of construction. The estimated cost of this line is 150,000*l.* The Bill also takes powers for the purchase of land at Harwich for the purpose of making a graving-dock, at a cost of 40,000*l.* Likewise powers to construct a large cattle-market at Stratford. Other clauses in the Bill provide for a very material enlargement of the Liverpool-street Station. In reference to this intended enlargement the chairman of the company stated at a meeting which has just been held, that the suburban traffic had developed to an extent largely exceeding the expectations of every one connected with the company, and a considerably larger station than they now had at Liverpool-street was necessary to carry on the traffic. He added, that unless they went to the enormous expense of buying up all the property lying between Liverpool-street and Bishopsgate-street they would only meet the requirements of the traffic for the next ten or fifteen years. The cost of the work from first to last would be from 1,000,000*l.* to 1,500,000*l.*, and they proposed to take powers in the Bill to raise an additional 1,500,000*l.* by shares, and 500,000*l.* by borrowing. It was no use "nibbling" at it. At 4 per cent. 2,000,000*l.* of capital would mean 80,000*l.* a year, but he ventured to say there was more than 160,000*l.* a year additional traffic to be gained by the expenditure. The Bill, amongst other things, asks for powers enabling the company to have six lines from Romford up to Bethnal-green and Liverpool-

street.—The Bill of the London and North-Western Company seeks for extensive powers for new works at Liverpool, and also at Preston. Powers are also sought for constructing a sea-wall at Llanrhos in Carnarvonshire, and also for the construction of a wharf, a sea-wall, and dock, with entrances and basins, on the River Conway.—The Lancashire and Yorkshire Company's Bill contains clauses providing for the construction of several new lines and other works in Wigan, Manchester, Liverpool, and other parts of Lancashire. The clauses in reference to Liverpool provide for considerable alterations in the railway levels in connexion with the widening of the line and other works for the large new station about to be erected near the Exchange. There are also clauses with reference to buying up houses and closing streets and the construction of new streets in lieu thereof consequent upon the erection of the enlarged station.

The tramway projects, including Board of Trade applications for Provisional Orders, are sixty-one in number, of which twenty-two are for proposed new tramways in the metropolis, eight of these being promoted by new companies. Two of the proposed undertakings, the Highgate-hill Extension and Archway-road, and the Haverstock-hill and Hampstead projects, are for the construction of tramways on what is known as Halliday's steep-grade cable principle.

The Bills in respect of gas and water supply are considerably below the average of former years, being limited to sixteen in number, which, with seventeen Board of Trade applications for Provisional Orders, bring the entire number up to thirty-three. Included amongst them is a Bill promoted by the Southwark and Vauxhall Company, seeking powers for the extension of their limits of supply to include the districts of Wimbledon, Putney, Barnes, Mortlake, Roehampton, Sheen, East Sheen, Kew, Richmond, and Petersham. The Lambeth Water Company likewise promote a Bill for the purchase of additional lands in the parish of St. Mary, Lambeth, and also in Norwood.

There are twenty-two Bills having reference to the construction of docks, piers, bridges, and the improvement of harbours and rivers, fifteen of these Bills being in connexion with proposed new works. Amongst them is a Bill incorporating a company for the construction of a promenade pier at Torquay, 430 yards in length, together with a sea-wall 270 yards long, and other works in connexion therewith. Another company promote a Bill for the construction of a pier, pier-head, and landing-places, at the end of the Chain Pier at Brighton.—There is likewise a Bill empowering the construction of railways and storage-sheds around the Bute docks at Cardiff.—The Tower Subway project is for the incorporation of a company with powers to construct a subway under the Thames, commencing at Great Tower-hill, and terminating in Southwark near the site of what was formerly Barclay & Perkins's Brewery.

—A Bill promoted by the Thames Conservators empowers that body to erect works and buildings on the banks of the Thames, and also in the bed of the river. The Bill also gives powers to the Conservators to compel the owners and occupiers of manufactories on the banks of the Thames to take steps to prevent smoke and other noxious vapours.—The Portlethen Harbour Commissioners promote a Bill for the erection of a lighthouse at the mouth of the harbour.—The Bill for the construction of a ship canal between Liverpool and Manchester, with docks at Manchester, is also amongst the undertakings in this class.—A company proposed to be incorporated apply for powers to construct a wharf and other works at Portsea, close to Portsmouth Harbour.—The Penzance Corporation apply for powers to construct a new dock and to make alterations in the existing harbour and docks.—The Southend Local Board promote a Bill to extend and improve the existing pier by lengthening it to the extent of 330 ft., and at the end constructing a pier-head running from east to west 300 ft. and from north to south 120 ft.—The Tower (Duplex) Bridge project incorporates a company for the construction of a bridge, with loop bridges thereto, and a swing-bridge therein, with road approaches, over the Thames, from Free School-street, Horselydown, to Little Tower-hill. The swing-bridges are stated to be for the passage through of ships and other vessels.—The Corporation of Preston to promote a Bill for improving

the navigation of the River Ribble, and constructing docks at Preston.—The Newport Dock Company promote a Bill for the construction of a new lock and entrance to the company's dock.—A Bill promoted by authorities at Great Yarmouth seeks powers for the construction of a tidal harbour six acres in extent, together with locks, quays, docks, and piers.—A company to be incorporated seeks powers to construct an opening bridge over Langston Channel, between South Hayling Island and Southsea.

Bills in respect of town and street improvements are numerous, and many of them involve works of a comprehensive and costly character. The Metropolitan Board of Works promote a Bill in which extensive powers are sought for street and other improvements in different parts of the metropolis. The powers include the construction of a new street from the Holborn Town-hall to the Angel in Islington; the widening of Upper-street, Islington; Green-street, Bethnal Green, and Little York-street, Bethnal Green; also a new street from Trinity-square to the Minorities; a new street in Hampstead, from High-street to Church-lane; a new street in Bermondsey, from Abbey-street to Rothsay-street; and a new street from South Lambeth-road to Walton-terrace. The proposed new street from Holborn to the Angel will be carried over the Metropolitan Railway near Farringdon-road, and also over a portion of the site of the New River. The Metropolitan Board have also a separate Bill conferring upon them new powers as to the accommodation to be provided for the labouring classes. Amongst other town improvement Bills are those promoted by the Corporations of Liverpool, Nottingham, York, Birmingham, London, Barnsley, and other places, all of which have reference to extensive street-construction and largely-increased sanitary powers. The Liverpool Bill likewise contains clauses as to the control of street musicians, the control of juvenile traders, the pulling down of notice-boards, and the regulation of bicycles and velocipedes. The Nottingham Bill embraces powers for the removal and re-internalment of bodies and the construction of recreation-grounds. The powers sought by the Bill promoted by the Birmingham Corporation include the building of a school of art and science, and also the erection of new assize courts, either for the borough or for any assize district.

A special feature amongst the several applications consists of the Bills seeking powers for the construction of new markets in different parts of the metropolis. There are four Bills of this character.

The South Kensington Market Company apply for powers to erect a market, with shops and other buildings for the sale of hay, corn, and other cereals, fish, meat, poultry, fruit, and vegetables," on a site bounded on the north side by Fulham-road, on the south-west by Sydney-street, and on the south-east by Cale-street, formerly Bond-street.

Another Bill seeks powers for the erection of a similar market in Paddington, the site being between North Wbarf-road, Harrow-road, and Church-road.

There is likewise a Bill incorporating a body under the designation of the Mid-London Market Company, which seeks powers to construct a market of an underground character in the neighbourhood of the Thames Embankment. The site named in the Bill is in the parishes of St. Martin-in-the-Fields, St. Clement Danes, and the Savoy, the areas named being westward from Savoy-street to Savoy-place and Savoy-hill, bounded on the north by Messrs. Rimmell's; also a site extending to Carting-lane, bounded on the south by the Thames Embankment; and the lands between Adelphi-terrace and the Embankment. The Bill asks for powers for the erection of an hotel, shops, warehouses, offices, and subways in connexion with the Metropolitan District Railway. It also takes powers to use the landing-place at Waterloo Bridge. The Fish Exchange Company have a Bill applying for powers to construct a fish-market on the banks of the Thames at Blackfriars, and for this purpose to purchase property including Maggeridge's granary, the City Flour Mills, Vulcan Wharf, Victoria Wharf, and St. Andrew's Wharf.

It will thus be seen from the above particulars that the private Bill legislation of next session is likely to occupy a considerable portion of the time of Parliamentary Committees.

NEW PUBLIC OFFICES AT  
TEDDINGTON.

MR. WALTER TAYLOR, one of the members of the Teddington Local Board, has undertaken to erect public offices for the use of the district, under the following circumstances. At a special meeting of the Board held last week, Mr. Taylor offered to let on lease to the Board, for 99 years, a piece of land, at a ground-rent of 1s. per annum, on which the Board were to build new offices. At the meeting a pen-and-ink sketch, together with tracings of a handsome block of buildings which Mr. Taylor was in favour of seeing erected on the land, was submitted. In the course of a discussion which took place on the subject it was unanimously admitted that Mr. Taylor's offer was of a very liberal character, but that there was a difficulty in accepting it on the ground that the site would be less than half of a freehold, and that in consequence the Local Government Board would probably not allow the Local Board to build upon it. On Mr. Taylor being asked to sell the freehold of the land to the Local Board, he replied that he thought he had made the Board a liberal offer. He had heard it again and again expressed that the time had arrived when Teddington should have a suitable place in which its local affairs could be transacted,—a building suitable to the wants and requirements of the parish,—and it was this fact that had induced him to make the offer. He felt that he was in reality making the Local Board a present of 1,000l. at least, and he might tell them that if they rejected the offer it would be largely to his interest. He might also inform them that if they did not carry out the project he should do it himself according to the plans before them. He added that the proprietors of the bank were anxious to take a portion of the premises, and that two banking firms had made applications to become tenants. Ultimately, the Board resolved that they could not see their way to accept Mr. Taylor's liberal offer, the result being that Mr. Taylor will himself at once proceed with the erection of the new offices.

RECENT DISCOVERIES OF  
ANTIQUITIES.

THE poetry and art of modern times have enjoyed no doubt advantages from the influences brought to bear on them by the discoveries which have been made, since the Renaissance period, of relics which tend to increase the knowledge which has come down from past ages, of the main features of Hellenic art.

The German nation claims in a special manner the merit of having, by the co-operation of its *savans*, and by means of the money granted by the State (more than 30,000l.), brought to light at Olympia objects not only of antiquarian interest, but also, to a great extent, of artistic value as models of antique workmanship. In a work on the subject of the explorations at Olympia, Herr Adolph Boetticher, who acted during several years as the accredited representative of the German Government at the Olympian excavations, has recorded (according to the *Cologne Gazette*) a number of facts which tend to illustrate, and in some points to modify, the description of Pausanias, which is contained in a manuscript discovered in the earlier part of the fifteenth century, and which was translated into German by Johann Jacob Fugger. The subject of inscriptions is fully dealt with, and several new theories are propounded with respect to the architectural and plastic arts as practised in ancient Greece. Several plates illustrate the details given on the various subjects indicated.

Although the main facts of the progress of the Austrian expedition in Asia Minor have been from time to time recorded by the European press, yet the details of the sculptures and other objects acquired have only recently been published; in fact (according to the *Hamburger Nachrichten*), only since they have arrived in Vienna, and have been deposited in the museum of that city. The sculptures of Gjölbaschi were described by Schönborn many years ago, that German traveller having visited the spot in 1841; his attention having been specially attracted by a rectangular *peribolos* (measuring twenty-five to thirty paces) with an entrance on the south side. Before Schönborn's time English explorers had been on the spot, and had removed some stones. Their attempts to bring them in an uninjured condition to the sea coast,

had, however, proved unsuccessful. Since that time these reliefs would seem to have been left undisturbed until 1881, when Professors Bernsdorf and Niemann, in company with other *savans*, made a journey of investigation to the spot in question, and found the works still in a good state of preservation. On their return to Vienna they had no difficulty in organising a society for the purpose of raising the funds necessary for obtaining possession of these treasures. The nodular *firman* having been granted by the Turkish Government in Constantinople, Professor Bernsdorf went in April to Gjölbaschi for the second time. The reliefs that he has brought home fill more than 100 cases, and as an illustration of the practical difficulties which have been overcome, it is recorded that the wood for the cases had to be conveyed on the backs of camels to the spot, and that roads had to be made for the subsequent transport of the packages.

Notwithstanding the undoubted artistic interest of the reliefs discovered, it is remarked that their historical application is not at present quite clear. A naval battle, the storming of a fortified city (supposed by Schönborn to represent Troy), and a chase, are described as being amongst the subjects delineated. The hope is expressed that the artistic value of these relics of antiquity may shortly be defined in such a manner that the learned world at large may have an opportunity of becoming acquainted with them, by means of an accurate and intelligent description of their special features.

ARCHITECTURAL EXHIBITION OF THE  
EDINBURGH ARCHITECTURAL  
ASSOCIATION.

The exhibition of drawings and paintings brought together in the rooms of the Royal Scottish Academy under the auspices of the Edinburgh Architectural Association was inaugurated by a *conversations* on the evening of Friday, the 22nd inst., when the rooms were crowded by a brilliant assemblage. Mr. MacGibbon, the president of the Association, in the course of the evening, delivered a brief address to the assemblage, in which he referred to the cordial support the Association had received, not only from eminent living architects, but from the representatives of others whose earthly course had run, as also by public bodies who were possessed of works suitable for the exhibition. He added that the result had exceeded the expectations of the committee, and referred to the collection which covered the walls of five of the Academy rooms in proof of the success of the undertaking.

The exhibition is, we believe, the first of the kind in Scotland. It contains about 1,200 works, embracing portraits of deceased architects, drawings in colour and monochrome from ancient and modern buildings, designs for buildings completed and for others contemplated, or which were put forward in competitions.

Working drawings form no part of the exhibition. Interesting and instructive as such may be to an expert, they are to the general public a dead language difficult to translate. Almost every architect must have felt how difficult it is to explain his plans to a client, and he must have found that to most a section is an enigma ineapable of solution. It is not to be wondered at, therefore, that at the completion of the work he is met with the remark that the result is very different from what was expected.

The drawings exhibited, however, are instructive as well as interesting, showing, as they do, not only the changes which have taken place in taste as regards style, but various modes of representing architectural subjects whether in actual existence or in contemplation.

The simplest mode of treating such is by means of black lines more or less strongly marked, in some instances the openings being filled in with India ink and the mouldings shaded. Then an attempt is made to give a feeling of reality to the elevation by washing it over with burnt sienna and tinting the windows with indigo, adding, perhaps, crimson curtains, a blue sky with white rolling clouds, and sapphire foliage.

Then appears the artistically got-up water-colour perspective, "suffused with a light *ne'er* seen on land or sea," and finally the vigorous etching, which often displays great power of draughtsmanship, and which is now most highly appreciated. Of the last class of drawings,

the most remarkable is the bird's-eye view of the Law Courts by the late Mr. Street, which we take to be the most skilful specimen of draughtsmanship in the rooms. Of the water-colour variety, we single out the competitive designs for St. Mary's Cathedral, Edinburgh, by the late Mr. Burgess. Here the interior is bathed in sunshine from floor to ceiling, each detail standing out in bold relief, the massive open-timber ceiling glowing as brightly as the many-tinted stained-glass windows. We look at this design with a loving eye, and cannot help thinking that had it been realised it would have been more interesting and beautiful,—albeit, more strange,—than the more proper and correct work of Sir Gilbert Scott. We have again an opportunity of looking at Sir Gilbert's design, and it occurs to us that in execution the entasis of the central spire has been exaggerated, not with the happiest effect.

A screen is devoted to a series of delicately delineated views in pencil of buildings, chiefly Medival, by Mr. MacGibbon, the president; and there are more of a like description by other architects. The system of merely washing in the colour is chiefly followed by the architects of the Classical revival, of which there are excellent examples by Hamilton of Edinburgh, and others.

We shall revert to this exhibition.

## THE NEW HOSPITAL AT RUGBY.

ON the 19th inst., "in the faith of Jesus Christ, and for the healing of the sick," the foundation-stone was laid of the Hospital of St. Cross, Mr. Bloxam, Mr. Wilson, and a few others being present, the founders, as we have before mentioned, being Mr. and Mrs. Wood, of that town. A scaled bottle was deposited in a cavity, containing a copy of each of the Rugby papers, a series of silver coins, and the following inscription on vellum,—*"In fide Domini Jesu Christi, anno ab incarnatione Domini, MDCCCLXXXII, Die XIX, Mensis Decembris, primum lapidem huius domus Hospitalis Sancto Crucis apud Rokeby Ricardus Henricus Wood, Armiger et Elizabetha uxor ejus, Fundatores posuerunt. Hiis testibus Mattheo Holbecho Bloxam, generoso, Henrico Wilson, architecto, cum aliis."* A handsome silver trowel was presented by the architect to the founders. In former days this was not an uncommon name for a hospital, and some of our readers will, no doubt, remember the beautiful Hospital of St. Cross, near Winchester, founded by Bishop Henry de Blois, in 1136, and which still exists for the charitable purpose for which it was founded. The late severe weather has brought building operations to a stand, but they will soon be resumed with renewed vigour. Meanwhile the endowment fund grows apace. One lady, whose name we may not mention, but whose life has been one round of kindness and sympathy to those about her and to her poorer neighbours, has intimated her intention to make a not inconsiderable addition to the fund; whilst another lady, moved by her good example, has promised to contribute the same amount. As we mentioned, Mrs. Hall has most kindly undertaken to obtain 1,000l., and further benefactions will, no doubt, continue to flow in from the charitable throughout the district.

THE LATE MR. ALFRED CROSS,  
ARCHITECT.

IT is with regret that we have to record the death of Mr. Alfred Cross, of the firm of Cross & Wells, architects and surveyors, Hastings. The deceased gentleman had not been ailing for long, and we have no doubt the announcement of his demise will be a great surprise to many. Mr. Cross was not a native of Hastings, but for the past twenty years he has resided and carried on business in Hastings, and during that time has won for himself many sincere friends. He was born at Bristol, where his father was a contractor in a large way, in 1830, and was thus fifty-two years of age. He was educated at the Royal Naval School at Greenwich, and was afterwards articled to his uncle, a solicitor, in Bristol. He had no love for the law, however, and so he went to London, and entered the office of Mr. J. Shaw, one of the leading architects of the day. Afterwards, he went to the office of Mr. P. Hardwick, R.A. Mr. Cross commenced practice when he was a very young man, his first public building being the well-

known Ship Hotel at Greenwich. He was, we believe, only twenty-two years of age at the time. A few years later, however, he had to leave London in consequence of his wife's health, and he then came to Hastings. He practised both here and in London for a long time, and in 1872 he became associated with Mr. Wells. Since then the firm has been carried on in the names of Cross & Wells.

Messrs. Cross & Wells were, in connexion with Messrs. Jeffery & Skiller, the architects for the baths; and they also, in connexion with the same gentlemen, obtained the first premium in the public competition for plans for the new town-hall which it was at one time proposed to erect in Hastings. Messrs. Cross & Wells were also the designers of the Albert Temperance Hotel; and, more recently still, of the new Gaiety Theatre. There are several building estates in the neighbourhood which they have laid out, and they have also been architects for a number of private and business houses. It may be mentioned, further, that Mr. Cross was for some time connected with the Duke of Bedford's estate in London. In Lewisham and the neighbourhood he built several houses. Mr. Cross was an active Freemason.

Most of the members of the profession in Hastings attended the funeral, which took place on Saturday, the 9th of December.

#### OBITUARY.

*The late Mr. Chas. John Dimond.*—The members of the Artists' Benevolent Fund amongst others will lament the death of Mr. C. J. Dimond, which took place at his residence, 50, Leinster-gardens, on the 17th inst., at the age of 61. He had suffered for some time from a distressing complaint, but this had been much subdued when an unfortunate chill brought on congestion of the lungs, which caused his death after a few days' illness. Mr. Dimond succeeded his late father as honorary secretary of the Fund, and the success with which he devoted himself to its interest, aided by Mr. Lambton Young, secretary, is shown by the satisfactory position the Institution has attained. Not very long ago Mr. Dimond was deeply gratified by the receipt of a charming collection of drawings by members of the Fund, with folio and stand, in acknowledgment of his life-long labours in its service. He had the advantage of a devoted family, who grieve his loss.

*Mr. W. J. Boys.*—On the 21st inst., Mr. W. J. Boys, who has been borough surveyor of Walsall for about seventeen years, died very suddenly, at the early age of forty-two. It appears that deceased, who had control of the fire brigade, was excited by an alarm of fire, which proved to be false, and was suddenly taken ill and died in a very short time. Deceased entered the service of the Council under Mr. Clarke, the late borough surveyor, as a boy, and won his way to his position by his own merits. He was one of the most respected and esteemed of the officials in the borough.

#### GROWTH OF WIMBLEDON: EXTENSION OF THE SEWAGE FARM.

IN consequence of the continued increase in the population of Wimbledon, the Local Board have found it necessary to extend the area of the sewage farm, and also to carry out further sanitary improvements. Last week Mr. Arnold Taylor, one of the inspectors of the Local Government Board, held an inquiry at the offices of the Local Board in reference to an application from the Board to sanction the purchase of nine acres of land to extend the sewage farm, and also to borrow 10,500*l.*, of which 6,000*l.* are for works of surface-water drainage; 4,000*l.* for works of private street improvements; and 500*l.* for the erection of cottages at the sewage farm.

Mr. Whitfield, the clerk to the Board, in addressing the inspector on the proposed powers as to the purchase of land, said that the very extraordinary and rapid increase of population in Wimbledon necessitated, and would from time to time necessitate, further provision for the disposal of the sewage of the district. The Local Board had come to the conclusion that it was now necessary for them to acquire further land in the immediate neighbourhood of the present sewage farm. This land was nine acres in extent, and was the

property of Mr. Beaumont, a large landowner in the district. The Local Board had naturally been anxious to deal with the matter without troubling the Local Government Board to make a provisional order, but there appeared to be no probability whatever of coming to terms.

It is understood that the provisional order asked for by the Board will almost immediately be issued.

#### THE ARTISTIC TREATMENT OF EXISTING DOMES AND CUPOLAS.

Sir,—A lengthy essay might be written on the above subject, but, at the present moment, I should merely like to say, if you permit, that I think there appear to be several Renaissance examples by artists of the highest class which justify Mr. Robins's suggested treatment of the dome of St. Paul's Cathedral. Guido, Correggio, and Cignani have all painted domes, and each selected a subject,—the Assumption of the Virgin,—which the spherical form upon which they were about to work doubtless suggested to them. They appear to have thought that to divide the surface into a number of vertical parts, by means of ribs, would sacrifice the opportunity for a grand and magnificent effect.

As the principle of composition is the same in all three, a brief description of Correggio's, which was executed at Parma between 1520 and 1530, will suffice, and perhaps be acceptable. The painter imagined the drum from which the cupola arises to embrace the earth on which stood the sepulchre of the Virgin. At each of the angles of the octagon rises a candelabrum, with a number of boys engaged in lighting tapers and burning incense. On the base of the cupola stand the twelve Apostles, of heroic size, looking upwards in astonishment, and as if dazzled by the great light of the celestial host who transport the Virgin above. Heaven appears open to receive her. The angel Gabriel descends to meet her, and the different hierarchies of the blessed circle round him. In the pendentives below are the four protectors of Parma,—St. Hilary, St. Bernard, St. John, and St. Thomas, attended by angels symbolical of the virtues of the saint.

The fresco is very spotty from decay, and is otherwise difficult to study, but there are excellent copies in the Pinacotheca, by the late Professor Toschi and his pupils.

May we not consider that in the spherical arrangement,—on the flat,—of Sandro Botticelli's grand picture, recently acquired by the nation, we have this great artist's idea,—in fact, a design by him for the treatment of a dome? In this there are no vertical lines, though it is evident that Botticelli considered symmetry was necessary; for he has placed the front row of figures equi-distant, and made them correspond with one another. Pietro da Orvietto painted spheres, the empyrean and the celestial hierarchies in his allegorical representation of the Creation, in unbroken circles, on the walls of the Campo Santo at Pisa; and the same idea was adopted by Bernardo Luini at Milan.

Does not the fact that Sir Christopher Wren left to the painters of the future a perfectly plain smooth sphere, without any vertical ribs or mouldings, indicate very decidedly that he disapproved of any architectural,—imitative or real,—subdivision of the surface of his dome? Does it not seem to prove that he had seen and admired Correggio's cupola at Parma?

Whether the life of St. Paul would lend itself happily to this mode of treating the dome of our cathedral can easily be determined by the talented men particularly interested in a successful result.

H. DE SIVART.

#### THE NEW "POUHON DE SPA."

IT is to the spring called Pouhon that Spa owes its existence. It is, in fact, near to it that an inhabitant of Breda, called Colin Wolf, or Leloup, laid, in the fourteenth century, the foundations of a building on some ground that he had obtained by concession from Adolphe de la Marck, Prince-Bishop of Liège. Other springs were successively discovered, and it is owing to them that the insignificant little village acquired a prosperity that led to the saying, "One sees at Spa Europe in miniature."

The spring in question is situated quite in the middle of the town, and was covered over in

1820 by a building in the form of a pagan temple, erected by the orders of William of Orange in commemoration of the euro of Peter the Great. This portico has been replaced this year by a proper monument, where visitors find a spacious and comfortable pump-room, a vast saloon, a well-lighted promenade, and in the upper part a glass rotunda, a half-circular gallery, and a large estrade for an orchestra; in fact, there is every comfort that can be desired. The edifice designed by the architect, Mr. Besme, and constructed by M. Peret, presents an aspect equally agreeable and imposing.

#### ENTRANCE HALL TO A HOUSE IN RATISBON.

MANY of the old houses in Ratisbon still retain their vaulted entrance-halls. Some of these are beautiful examples of architecture, and date from the thirteenth and fourteenth centuries. The example we give is (or was) in the Goliath Straze; we say "is or was," because, when we sketched it, four years back, we were informed that a plan for widening the street had passed the Town Council, and if this plan has been carried out this very interesting house has been "improved" off the face of the earth! This is a great pity, because it was one of the most perfect examples of a fourteenth-century house in Germany. The detail of this hall was rather English-looking.

What was the object of these vaulted entrance-halls, once so common at Ratisbon, it is difficult to say. Some people have supposed that they were the places where the merchants stowed away their goods, and were for that reason vaulted in order to render them fireproof. What seems rather to tell against this theory is the fact that these halls are found in the Street of the Ambassadors, attached to houses which are known to have been inhabited by the nobles of the empire; then, again, the fact of their being almost peculiar to Ratisbon, which never was a commercial city, would lead to the supposition that they were never intended as places for storing goods. They also seem far too handsome for such a purpose. In one house which we saw the hall was divided into a kind of nave and aisles by two rows of columns; and in another the hall, which was used as a circulating library, had thirteenth-century vaulting of a very acute form, with singularly rich bosses at the crossings of the ribs. In another of these halls we found three canopied stone seats, looking very like the sedilia of a church. It is by no means impossible that these halls may have served the same purpose as the halls of our old English mansions, i.e., they may have been used for the meals of the family, which would account for their being treated in such an ornamental manner. Every example which we saw was on the ground-floor. How many of these interesting halls exist in Ratisbon it is impossible to say, but probably they are very numerous, as in two cases we found them existing, although the whole of the rest of the houses had been rebuilt about a century back.

The great rage for "improvement" which has set in in all German towns, will probably in a few years sweep away these interesting structures, and many beautiful features of Mediaeval Domestic architecture will have ceased to exist.

#### THE SACRISTAN'S HOUSE, ST. JAMES'S, ROTHENBURG.

THE pretty little dwelling which we illustrate is situated just opposite to the doorway of the great Church of St. James, at Rothenburg. It probably dates from the end of the sixteenth century, as it will be noticed that, although the traceried panel under the window is quite Gothic in character, there is some thoroughly Renaissance panelling between the window and the doorway.

The mullions of the windows are of wood, and the original glazing, which still remains, adds greatly to the picturesque appearance of the building. From the very solid way in which the basement is constructed, we are inclined to think that it was intended to support a much more lofty structure than that which at present exists; probably, also, the window is rather later in date than the other part of the work.

We have, in previous volumes, given illustrations of the Church of St. James and other buildings in this most interesting old town.

DOORWAY, LONDON SCHOOL BOARD OFFICES, VICTORIA EMBANKMENT.—MESSRS. BODLEY & GARNER, ARCHITECTS.

MONUMENT FROM THE CATHEDRAL IN BREDA, HOLLAND: SIXTEENTH CENTURY.

#### COUNTRY RESIDENCE, GOLDER'S GREEN, FINCHLEY.

This residence has just been completed under the direction of Mr. John Birch, John-street, Adelphi. Considerable difficulty was experienced in finding a firm foundation, owing to the nature of the ground, but this was overcome by a judicious use of concrete. The walls are carried up of red brick, and pointed with a black mortar joint, and the roofs are covered with red tiles laid upon boarding.

The principal rooms are on the ground-floor, and disposed towards the south and west, and consist of dining, drawing, and morning rooms, with low windows opening on to a lawn; the entrance-hall, offices, and servants' wing are towards the north and east.

A projecting porch, glazed with lead lights, encloses the front entrance, and the tradesmen's entrance adjoins the road.

The first-floor contains six bedrooms, dressing-room, and bath-room, with other necessaries, and above the floor are two attics and a box-room.

The internal fittings throughout are of yellow deal, and the floors are partly deal, oak parquet, and pitch-pine.

Special attention, it is said, has been given to the drainage and ventilation of the building.

#### HEPTONSTALL OLD CHURCH, YORKS.

This venerable ruin is situate on the summit of a commanding eminence, in a district noted for its picturesque beauty. It dates from the thirteenth century, and was originally dedicated to St. Thomas of Canterbury. A few years ago the edifice, being considered in a dangerous condition, was unroofed, and a new church was created on the adjoining site.

Since the drawing was made, a portion of the south aisle wall has lately fallen down, and the tower will doubtless ere long share the same fate, a great mass of masonry having fallen out at one of the angles. It is to be regretted that so fine a specimen of a double-naved church should become so absolutely a prey to the ravages of time.

A. W.

#### THE DOORWAY OF THE LONDON SCHOOL BOARD OFFICES.

This is the entrance to a modern building, which has much in it deserving of study; especially by those visitors to our metropolis having a taste for the pleasant pastime of reflecting philosophically on the ebbings and flowings of architectural taste in our day.

Messrs. Bodley & Garner were the architects.

Great care has been taken to reproduce the features of that period of the past chosen for revival. The style is the style *par excellence* for joinery, and certainly there is this to be said in favour of its resurrection,—that this elaborate introduction of joinery lends itself well to the making-up of a comfortable structure.

#### MONUMENT AT BREDA.

The beautiful but sadly neglected old cathedral at Breda, in Holland, is rich in monuments of every description. The brass font, the choir-stalls, and the noble monument of the Nassau family have been already illustrated in this journal, and we now add a drawing of a very remarkable example of a mural tablet monument. This work is interesting, as showing the thoroughly Italian character which the Renaissance assumed in some parts of Holland.

When we say that these monuments are Italian in character, we must not be understood to suggest that they are the work of either Italian architects or workmen. The dates of their creation would preclude the possibility of their being so. The larger monument now given dates from the year 1536, and is to the memory of the Count de Bourneval.

## THE FOUNDATIONS OF ART IN ARCHITECTURE.\*

## II. INTENTION.

TURNING to the next fundamental principle, I find its absence to be the root and cause of so much bad architecture, — viz., "Intention." In all walks of life "good intentions" are slightly spoken of as implying the want of any clear and decisive intent. We are even sold of a place, far beneath our ken, significantly paved with some peculiar tesserae of irresolution. Here is a pivot on which much must turn. Have we no clear light for our future work? Then are we groping, and our buildings are either borrowed from the minds of others, or bear the marks of infirm purpose. In modern architecture, want of intention can easily be identified. Buildings which neither fit their purpose, express their use architecturally, nor give pleasure to the beholder. Buildings formed neither to educate, to amuse, nor to adorn. Composition, grouping, massing, proportion, and general result, all in haphazard or by mere accident. Detail, so far as detail can give expression to a definite, real design, unmeaning as the monkey's chatter. A prevailing sense of stupidity and uninterest. An air of struggle in some cases equally aimless and resultless. The greater the visible struggle, of course (as in all art matters) the greater the failure. This presence of apparent effort in the designs of modern buildings is always one of the worst symptoms, and calls to one's mind the fable of the frog and the bull. It tells of ignorance, vanity, irresolution, and want of power. He who works in fullest truth, without pride and with simple aims, works naturally. He who knows and loves his art works easily, with much suggestiveness of pleasant inner thought, and of more pleasant things to say by and by. Though aware that the highest art is that which conceals art, no architect (if he happen to be an artist) can help revealing his mind in his work. These idiosyncrasies, indeed, form part of the pleasure to be found in it. But, when he indulges further in all kinds of personal conceits and self-glorifications, his peculiarities become more objectionable than in private life, for in architecture they are indulged in to the misery of mankind at large; and we see the absence of Intention.

In beholding the finest buildings, we think least of their architects. Our joy is more akin to that which we feel at the sight of a glorious landscape; and the less we intrude self in our own work, the better the work will assuredly be, as having been studied and produced for its own sake, and been a sharer in our own delight. Modern personal literature is bad enough; the architectural degeneracy which causes people to murmur noisily on their buildings "Smith," or "Brown," or "Jones," is worse. The greater historical knowledge of architecture, arising from the increase in the number of books and the invention of photography, has undoubtedly increased our want of right "Intention." It has given rise to more and more downright copyism, some clumsy adaptation, and a serious amount of architectural muddle in building. Rightly used, books and photographs ought to produce a greater consensus of knowledge, and should enable men to think more freshly and design more freely. Mere "eclectic" building, however clever, only renders more conspicuous the absence of the designing and creating power, and the want of a clear artistic intention. On the other hand, when we come to look attentively at really good architecture, — I leave you to choose the country, the period, and the building, — there is no vagueness, no indecision, no doing of things by accident, no drifting helplessly from one idea to another. The artist first grasped his building comprehensively as a whole, with a clear definite intention of what he meant to say; he then proceeded to say it; and he conveyed his very meaning and purpose on the face of his work, every moulding and member, window and door architrave, cornice and sculpture, being, in his hands, so many opportunities for proclaiming his Intention. If you wish to produce and intend to produce good art, you must endeavour to understand, first of all, that you will never get paid for it. The pleasure you have had in it must be to yourself, all the reward you will ever receive. You will, of course, be paid your percentage calculated on the sum which the builder has

received for his part of the work; but you will receive this all the same if you work with the mind of the tee-square and compasses, and not in the spirit of the artist. The art in your work depends wholly upon the pleasure you have taken in it, and has no market value.

When, in the year 1270, Cimabué, uniting the idealism of the old Greek with the poetry of human life in a religious picture, painted his celebrated Madonna, now in the Church of Santa Maria Novella at Florence, the whole populace rose in triumph at the revelation; the picture was carried in procession to the church, and the street in which the painter lived was called ever after "The Joyful Quarter" (*Borgo Allegri*). These were times when an enthusiastic people were enthusiastic about art. Our public, on the contrary, judge it all by the standard of £, s. d. Fancy the design for the Albert Memorial or the Griffin carried in state through London, or the designs of your Cloth Hall paraded down Briggate!

It is, in spite of public apathy and ignorance, that you have now to work and think. Your deliberate "Intention," therefore, is by no means a trivial matter, and can only come from such inner light as you may yourselves have. Suppose you change places for a moment, and form one of the public looking at a new building. The first question you have to ask is, "What did that man mean?" Until you have answered it, all criticism must be vain. Often you will be disappointed, and find that nothing of good was carefully and deliberately intended. When you recognise true intention, you will always find more and more interest in the building, though you may not find, as our friend the dictionary-maker would expect, that the design is "preferable to some model," or copies the silly fashions of the day. This change of places may perhaps bring vivily to your minds the immense difficulty of forming true architectural intention. It presupposes a long hard course of study, extending over many years (for no man is an architect under forty), and a ripe judgment. You may ask what that course of study should be. Beyond the usual course of study, I should say, "Study the works of Christian times, when faith was simple." Ponder your Greek by all means, though the work of heathens; no people are more clear in their intentions or more perfect in their works. Then study Christian art while the faith was young. Skill is less; intention quite as clear; suggestiveness everywhere. Go to St. Trophimus at Arles, to St. Ambrogio at Milan; Trent, Spilato, and Ancona will each repay you; drink in the history, antiquities, and mosaic pictures of that stranded city of the sea, — the unique Ravenna; and see what may be yet left of St. Mark's at Venice. We are apt to be blinded, or at least dazzled, by the splendours of the Renaissance in Italy, and I should be the last to say that they have nothing to teach of architecture; yet, judged by our somewhat severe test, we may, on the whole, be content to leave them all to the painters and sculptors. Painting and sculpture, when attained to a high pinnacle in skill of execution. In point of fact, we have more of fine art in architecture to learn from the Greeks, and more of single-minded clear intention from the early Christians, who, like Cimabué attempted in their way to combine the two.

If I wished to instance, perhaps, the noblest examples of clear high-souled intention, I should point to the frescoes, paintings, and architecture of Giotto, at Florence. These will merit and repay any amount of careful study. What they all meant in those days by the cavernous ugliness of the interior of their cathedral, reserving their most splendid marble and decorations for the outside, nor why they allowed Brunelleschi, after the death of Giotto, to exhibit his mere cleverness in construction by planting a dome on the crossing for which the building was never designed, I will not pretend to say.\* But the pride of the Florentines of that day is surely the key; and, if we look to the instructions given to Giotto about the Campanile, we read it plainly. It was "to construct an edifice which, in height and in richness of workmanship, should surpass any structure raised by the Greeks or Romans in the most palmy days of their power." But Giotto happened to be a true artist; he

\* I am well aware that Michelangelo greatly admired this dome, and made it the foundation of his dome at St. Peter's. This would naturally be so in an age of little constructive knowledge, as a delight in mere "tour de force," so common in the times of the Renaissance.

happened to possess some of the divine afflatus without which there is no art; and he made his work all that, and much more. I do not praise Giotto because in his works he constantly preaches the truths of the Christian religion. After all that has been said on the subject, I do not feel sure that he considered it any part of his business to teach religion at all. We only know that his clear, vivid perceptions are never dimmed by any doubts about the doctrines of the church; and, having poetry in his soul, he set himself to represent, in a true poetic spirit, both in painting and sculpture, the prevailing beliefs of the time. In his Campanile at Florence, the result of his "Intention" is form, proportion, and colour of the finest, — sculpture of the noblest, most interesting, and most instructive. No tower and no building in the world brings home to one's mind so clearly Schlegel's description of architecture as "frozeu music."

## III. RIGIDITY.

In ordinary language, as you all know, rigidity means merely stiffness or want of pliability, and in connexion with building it might at first seem to allude only to the material quality of strength. In the arts, however, the word signifies something more than the starch to your shirt-collar. It has a meaning distinct from that in common vogue, and is used to express a particular aesthetic quality or value opposed to easy softness, incoherence, or languid beauty, and having for a result the stamping of the work with vigorous character. We recognise it in fine sculpture constantly, especially where it suggests imminent or actual action of the figures. To carve men and animals in marble at the moment of action or impending action was always the sculptor's highest aim in the time of Pericles. When they succeeded, as they often did, the test was rigidity, with often an admirable choice of the decisive moment. What we admire in the Elgin marbles, after satisfying our minds as to the action of the horses, the grouping, &c., is this subtle quality of rigidity, involving choice of moment. Do not be led away by the notion that good sculpture requires the portrayal of actual action. The suggestion of some impending action is often better, for, in all the arts, works which do not suggest something new are always the dullest. Thus, when Michelangelo stood, as is related, before Donatello's St. George (which is equally poised on both legs behind his shield) and, after studying it for some time, exclaimed "March!" it was the quality of rigidity and suggested movement which excited the admiration of the great master. The "Wrestlers" and the "Knife-thrower" of the Uffizi, both in vigorous action, have it. But so also has the immortal Venus of Milo in every line, despite its comparative repose. In architecture we have no other word to express exactly the same artistic quality. If we knew anything, we unconsciously know it when present. It is a kind of backbone. And, if I were asked to define the precise quality in which the best work of my friend, the late Mr. Street, excelled, I should say "Rigidity." I should hold the same with regard to the works of the late Mr. Thomson, of Glasgow.

Let us see whether we can learn anything from the sculptor and this element of his work. Now sculpture is the art of graving or cutting hard materials, — so far as we are at present concerned, — hard marbles. In all the best times of sculpture — only the hardest marbles were used, such as would bear the finest incising in the flat, or the utmost finish in the round. Witness any fine old Greek statue, or study the tombs in the floor of Santa Croce. It has been reserved for degenerate Pisans and Florentines to produce every year thousands of worthless copies of fine things in the softest marbles of Carrara, easily sold to the Cockneys of all nations.

The great period of Greek sculpture may be said to have begun with the birth of Phidias in 484 B.C. It is instructive to note in passing, that not only did all kinds of artists and artificers work under the orders of Phidias, but also the architects. In his hands, figures are always draped with studied grace, lofty purity of intention is never forgotten, and the subtle element of rigidity is never lost. Others were led away by the pursuit of mere beauty, first by showing the whole female form through closely clinging draperies, and then (as by Praxiteles) entirely nude. This led soon to the expression of sensual beauty, and Greek art step by step declined. Truth, purity of intention, both gone, a sure degradation set in, till in the later Greek,

\* An address delivered before the Leeds Architectural Society by Mr. Edward Robert Robson, F.S.A., December 4, 1882. See p. 806, ante.

and the Roman done by Greek hands, we forget even to look for rigidity.

Our buildings must ever be treated as wholes, to be seen from every side with a sense of unity, just as sculptors treat their subjects. No ostentatious fronts of stone and shabby backs of bricks. Even, indeed, when wedged between others in a street more closely than the statue in its niche, the stone and the brick must receive equal attention. Just as the best sculptors of old selected the best materials in their neighbourhood, the hardest marbles, difficult and laborious to work, but able to carry well the imprint of art, so we in our buildings must not use the badly-made or hurried brick, the stones unfit for our climate or laid in improper positions, the unseasoned timber, or the thousand other bad things which, in this ingenious age, are thrust upon us.

I have already endeavoured to point out how Truth must always be your basis, and Intention, clear, definite, and always pressing upward, should guide you artistically in all your works. This third principle should form the natural result. When you have achieved a noble work in which rigidity is present without struggle, repose without inanity, and the more usual qualities of architecture are not violated, you may know that your building will give pleasure or instruction to others. On the contrary, the absence of rigidity will mark it as a dull uninteresting one. In a word, if you wish to ascertain whether you have any real perceptions of art in architecture, you may measure yourselves up by seeing whether you can judge of its presence or absence in buildings.

I do not say that the principles I am laying down are the only ones needed, or that their practice will give the artistic power of creation to him who has it not. But they form leading elements easily remembered. They will bring independent thinking, thinking with knowledge, and will help our emancipation from the monkey-like habit of imitation, the modern curse. A little honest thought of them would have rendered impossible the "battle of the styles" which raged a few years since. That battle was waged by every one who took part in it on the unconscious assumption that, in the nineteenth century, English architects could do no more than imitate the art of some past time, formed for another age, and perhaps grown in a different climate and country. If a man be working honestly and truthfully, he need not fear conflicting styles. He is not hard at work copying the productions of deceased artists. He has learned, or is learning, that to do fine work he must maintain a lofty ideal. He takes a great and real pleasure in his labour, which is itself the surest way to stamp his productions with the Hall-mark of art.

It is not given to every man to be an inventive or creative genius. Such a man as Leonardo da Vinci is only possible when the universal impulse and struggle of the time acts upon a man of rare gifts, intuitions, and deep knowledge. Rules are necessary in architecture, as in the sister arts, and can never be abolished without loss. Yet their observance without thought, or without a knowledge of the bases on which they were founded, can only be at best a superstitution. Rules may be said to formulate the accumulated wisdom of generations of artists who have preceded us. In regard to what may generally be styled Classic architecture in England, the slavish following of rules gradually became, in the later years of the last century, the ruin of the very thing they were intended to sustain. By a strict adherence to the letter only, the spirit of academic rules was gradually lost, new buildings wore a certain air of artificiality, they ceased to speak as man to man, or to give pleasure, and the evil increased step by step till it reached the blank respectability to be found in Gower-street, and the solemn inanity of the Cannon-row Civil Service building. But for this decadence, and the inevitable striving after novelty, it is fair to assume that the Gothic revival, which the nineteenth century has lately seen, would have been confined to church building. So far as its constructive teaching went, it did noble work, and has laid the foundation for further progress. So far as it copied the language of a warlike age, and taught the sermons of a monkish life, it was out of harmony with the time. In this sense, our Palace of Justice, noble as it is, is an anachronism, or at least records the awakening half-knowledge of the time.

Creative art can never be produced by rules, however necessary. We cannot always be

repeating the wisdom of the ancients. Even Shakespeare may be quoted too often, and the Bible itself degraded by misuse to an ignorant fetish. Times change. New wants of the time arise. The artistic perceptions in relation thereto grow clearer. There is no rule without an exception. And he who has passed into the inner sanctuary behind architectural rules and canons may sometimes break them with advantage. This advantage can never lie with the ignorant. With him "what is new is not true, and what is true is not new." With him originality is but another name for bad architecture. You may know all about architecture and construction, may be splendid draughtsmen, even able, like the old Greeks, to portray the human figure in action, and yet fail to be architects in the one great sense which, rightly understood, is the only sense. When you are worthy exponents of "*truth in the treatment of material*," when a clear, vigorous, and decided "*intention*" marks every movement of your pencil, then I may safely leave you to the study of the higher things of architecture. Possibly your buildings may come to be as full of rigid life as the Elgin marbles, and we may discover the presence of that little spark of the divine afflatus which indicates true poetic art, and which, all the world over, and in all time, marks out clearly and plainly, to all who can see, the difference between building and architecture, between him whose eyes are opened to art and him from whom the scales have not yet dropped.

I ought, I think, to give some examples of rigidity in architecture. It is no new-fashioned thing brought down fresh from London. You may find it all over Europe, and easily in any of your own Yorkshire abbeys. English works of the twelfth and thirteenth centuries never lack it. When we come to flowing tracery, the pursuit of mere beauty sometimes dimmed it, and in the Perpendicular work of Somersetshire it still survived.

In Italy the study of architecture must ever be pursued from a different standpoint, yet I am content to judge it by this test of rigidity. There, after the early Christian art, I greatly prefer the architecture of the twelfth century to that of the thirteenth. This, not from any preference on my part for the round arch over the pointed, but because of the greater amusement and instruction derived from the work, and because it is the suggestive point after which, to my mind, architecture in Italy went astray. This west front (or what in England would be the west front) of the cathedral of Lucca, of which I have here some large photographs, is a good illustration. I select it chiefly because it is something you may not have seen. First notice the amount and manner of the stiling to the arches. The three larger arches of the lowest store are round, that on the right hand being considerably smaller, a difference so cleverly masked as to be far more apparent on the photograph than on the building itself. Then, observe the treatment of the various orders of the arch. They are narrower at the springing, and much wider at the crown. The round arch of the opening becomes embraced in the either elliptical, or (as my own opinion inclines), hand-drawn forms of its outer orders. What would otherwise be great clumsiness just above the capitals is entirely avoided; and a singularly beautiful effect in expressive rigidity is attained. The side walls of the church of Early Gothic lose the treatment altogether, and are lifeless and uninteresting by comparison. I commend to your notice this union of the circle and ellipse, especially when the aid of splendid sculpture can be obtained. I commend also to your attention the especial sculpture of this facade at Lucca. Photographs can never do justice to the loving thought or the lavished labour to be found all over it, in capitals, columns, and, indeed, everywhere else. I should unhesitatingly pronounce the building to be the design of a sculptor, if it were not characterised by so many of the higher and rarer qualities of architecture. Can it be that it was, after all, designed by a sculptor, and that his knowledge of rigidity in sculpture led to freer handling in architecture? I leave you to settle this for yourselves. One thing I know, viz., that if you wish to discard style and copyism, and to produce real work of your own, you may find all the necessary principles, including the proper union of sculpture with architecture, at Lucca. When you wish to study only form and proportion, you can study the Greek; when you go to

colour you must go to Giotto, who settled the school of colour for all Italy and the world. When you want to look at a fine church interior in Italy you may like to Florence and St. Croce. And when you want to fathom rigidity you may wind up at Lucca. Like charity among the virtues, this quality is in architecture the last, the greatest, and the rarest. There are some other photographs here of about the same time, chiefly doorways of churches at Lucca and the neighbouring towns. And, in Italy, the work of this period all shows the use of the still, and of the circle within the ellipse. In the later times of the round arch it disappears. Then comes the Italian method of giving pointed arches from different centres, a period when in Italy sculpture stood far higher than architecture, and when the best works therein were done by painters and sculptors.

In conclusion, I would point out that spasmodic effort must always, in the nature of things, fail to produce new and living kind in architecture. If in the past architecture has faithfully recorded history, so must it in the future, if there be worthy architects to bear their part, and honest workmen to carry out. And the future of architecture concerns every man. We have entered upon a period of English history when the wants of the many have for ever superseded the luxuries of the few in the aims and efforts of men. The old governments by despots and priests are gone; let us beware that they are not replaced among the people by governments of the ignorant. The age of costly luxury, which threatened the health of Old England, as it terminated the career of old Rome, is probably passing away. Few among us here will be called upon to build cathedrals or palaces, or any works other than those which spring from peaceful industry and pleasant life. Let us see that the aims of newly-enfranchised masses are directed towards the arts of peace. There is work for all in this direction, and architecture must have its place. The future time will tell whether the present has its architects able truly to write history on the wall. The palmy days of Greece contrasted the perfect beauty of the Temple in its noblest architecture with the hovel of the peasant in its lowest squalor. In this England of ours to-day, power is passing from the noblesse to the masses. Art, if any is to be left at all, must belong to the people, and form part of the people, powerfully influencing by its universality their homes and lives. If once this be the case, we may be content to let the costly finery and oppressive negligences which mark the "drawing-rooms" of the middle classes die a natural death. The mission of the architect is no longer to give expression to extravagance; to the insolence of caste, on the one hand, or of ignorance on the other, but rather to educate by the truthful, intentional, rigid houses of the poor, and to ally honest, substantial art to simple wants. If, in the immediate future, architecture is to be more than a merely curious and interesting form of past history, it must enter largely into the lives of the masses, must rear and decorate their simple homes. He who most truly reads this is most in harmony with the spirit of the age. He who succeeds best, and without affectation, in producing simple artistic work fit for the humbler domestic life in England, does most to discredit the modern shams and petty pretty trumpery which beset us on all sides, and best paves the way for a new era in English architecture, in English life, and in English greatness.

Thirty years ago the writings of Mr. Ruskin first called attention to the decay of the arts in Europe generally. His voice was the trumpet-blast which called upon men to neglect the false and follow the true. He tore to tatters the pratings of pedants, lifted the wheels out of their ancient ruts, and prepared the road for those about to enter on the journey. Above all, he taught us that the degradation of art begins exactly where the use of machine-made ornament begins. From that day to this every single architect who has produced a fine building owes its high quality (if he will but confess his indebtedness) to Mr. Ruskin's teaching. On the other hand, at no period in the history of England has there been let loose so villainous a flood of cast-brick, terra-cotta, &c., to the degradation of honest building. Now, if I have not led you into architectural technicalities, neither am I about to discuss theories, some of which, it may be, Mr. Ruskin does not now himself hold. I cannot fail to see that in these

days no writer on art neglects at some point or other to quote this great authority.

Architects alone do not, and profess to regard him as an amateur. Let us admit that fact, and yet learn from him. To his words modern architecture, I maintain, owes what little of artistic life it has. It is not necessary to take sides on the relative value of Northern and Southern Gothic, nor to agree in the utter condemnation of such buildings as Sansovino's Library at Venice. Mr. Ruskin does far more for us. We wish to see more vitality in architecture. He takes us with the most winning and musical language to Nature as our teacher. We desire a new style of architecture which shall fitly represent the spirit of the age and the wants of the time. He discusses fundamental laws which set us all thinking, thinking, thinking, yet narrows not our liberty, but leaves us to fashion our works as we ourselves may think best. We wish to know, in broad sense, the precise position and prospects of architecture now as compared with the old days of cathedrals and palaces. His living words bearing on this you may all read. They are as true now as thirty years ago. And they would be specially instructive to architects in their daily work if they would keep them in mind.

Architects read Mr. Ruskin only as an amusement, or because of his fine language and glowing periods: they revel in the colouring of the word-painter, but disdain the lessons of the teacher. They dislike him because he has an unpleasant way of plunging them out of their depth on the subject which they regard as their own. They shudder at his disrespect towards Vitruvius, Palladio, and the T-square, and at his refusal to accept the Gold Medal of the Royal Institute of British Architects; and they hold up their hands in horror at a man who has said that all good design must come from the workman. For all that, he it is who has awakened England to the dawn of a brighter day, and to whom all architects owe a deep debt of gratitude. He has much to teach. If what I have said lead to a deeper and closer study of his mind, I shall not have visited Leeds in vain.

#### ARCHITECTURAL SOCIETIES.

**Edinburgh Architectural Association.**—At a meeting of this Association on the 21st inst., Mr. McGibbon, who presided, reported upon the preparations for the architectural exhibition, elsewhere noticed. He said that, while they had expected to fill three rooms with exhibits, in point of fact they had filled the whole available space, and had been obliged besides to reject some works for lack of room. A paper by Mr. Andrew Kerr on "George Kemp" was communicated by Mr. McLachlan. Kemp's career was traced from the cradle to the grave, and an interesting description given of his connexion with the proposed restoration of Glasgow Cathedral, together with the particulars of the competition for the Scott Monument, when success crowned the design of the unknown "John Morow." It was also shown that Kemp secured his position by dint of study, hard work, and perseverance, and in evidence of this an interesting portfolio of his drawings was exhibited.

**York Architectural Association.**—A meeting of this society took place on the 21st inst. in the Saloon, Victoria Hall, Goodramgate. There was a large attendance of members to hear the first of a series of papers, contributed by members of the association, bearing upon the art and science of architecture read by Mr. J. Perry, on the "Present Aspect of Architecture in England." Mr. Walter G. Penty, the president, occupied the chair. Mr. Perry, after referring to the position of architecture as a liberal art, and assigning to an architect the title of artist and craftsman, defined art as the visible or perceivable expression of the creative faculty of the human mind and imagination; and in referring to the architecture of York, said, "We need only take a few minutes' walk from where we are to one of the oldest buildings in our land built by natives, and look upon a piece of undoubtedly genuine Saxon architecture." He alluded to the tower of the Church of St. Mary, Bishophill Junior. In another ten minutes, by crossing the new bridge, we can, at St. Denis and St. Margaret's Churches, see Norman work of a pure and richly decorative character; and wandering leisurely on we can in the various churches of the city see specimens of the Early English, Decorated, and Per-

pendicular, the Tudor, and Elizabethan styles, while in the glorious Minster we can, by careful and painstaking survey, study specimens of its numerous styles in their purity and richest beauty. On the motion of the President, seconded by Mr. Wm. Brown, a hearty vote of thanks was unanimously accorded to Mr. Perry for his paper.

**Leeds Architectural Society.**—This society held its annual *conversazione* on the 19th inst. It was largely attended, and there was a good display of pictures, drawings, &c. The President, Mr. J. B. Fraser, in the course of a short address, said:—"The society is now in the seventh year of its existence, and though comparatively young, I am happy to say it is vigorous and flourishing, in spite of many difficulties, one of which has been the want of a permanent home, which we have now acquired. And we now hope that our future will be one of extended usefulness, mutual help, and prosperity. Although for many years past the medical and legal professions have had their societies and associations for instruction and social intercourse, the architectural fraternity have only recently (at any rate, in the provinces) made an effort at combining for their mutual benefit as members of the same profession. Short as our existence as a society has been, we are already beginning to feel the benefit of it, and to find that, principally through its means and that of kindred associations, the public are taking more interest in the doings and sayings of the architectural world. The recent revival, or rather I should say the birth, of what is popularly known as art-feeling in this country, and which no doubt owed its origin in a great measure to the International Exhibitions of 1851, 1862, and 1867, has not only led to improved taste in the matter of dress, furniture, and other surroundings, but it has awakened a keen interest in the queen of all arts,—that of architecture. So long as an intelligent and discriminating interest is taken in our art by an educated public, so long shall we be obliged, for our own good fame and honour, to do our utmost to act up to the highest traditions of our art. Before distributing the prizes, the drawings for which are placed in the adjoining room, I feel it is necessary to point out that the want of a settled habitation has also told very seriously against the classes, and, consequently, the work produced by the students, which I feel confident will be remedied in the future, as we shall now be enabled to enter into a more systematic course of instruction under the guidance, help, and encouragement of the senior members of the profession.—The prizes were six in number, and were as follows:—A prize of two guineas, offered by the President for a design for an hotel and drawing of an old house at Shipley, was awarded to Mr. A. Gant; Ruskin's "Seven Lamps of Architecture," offered by Mr. John Tweedale, was awarded to Mr. Alfred Williamson for designing work done at the class meetings of the Society; an album, offered by Mr. J. R. Watson, was awarded to Frank B. Howden for designs for a settle and two chairs; Sir G. G. Scott's "Lectures on Mediaeval Architecture," offered by Mr. Cribb (of the firm of Marsh, Jones, & Cribb), was awarded to Mr. J. H. Hoodhouse for design in colour for the decoration of the side of a room. Two volumes on "Building Construction," offered by Major R. W. Moore, were awarded to Mr. G. Stevenson for an interior perspective view, in colour. The Science and Art Department's volume on "Building Materials," offered by Mr. W. H. Thorp, was awarded to Mr. Alfred Williamson for measured drawings of the old oak screen, St. John's Church, Leeds.

#### VALUE OF PROPERTY IN MAYFAIR.

LAST week, at the Auction Mart, the mansion, No. 8, Bolton's-row, Mayfair, together with other premises at the rear, known as Bolton's-yard, were offered for sale by Messrs. Debenham, Tewson, & Co. The entire area of the property is 4,080 square feet, the premises in Bolton's-row being leasehold, for the residue of a term of 973 years from Michaelmas, 1749, with an apportioned ground-rent of 5s. per annum. Of the remaining portion of the property a portion is leasehold under the same lease, the residue being freehold. On the property in Bolton's-yard there are two dwelling-houses, four coach-houses, and stabling for thirteen horses, in addition to harness-rooms. The auctioneer, in sub-

mitting the property, observed that the existing buildings were ill-adapted to the requirements of so fashionable a locality, and said that the value of the property would be very considerably increased if the present structures were taken down, and a more modern residence, with good stabling, erected upon the site. After a brisk competition, the property was sold for 8,000l.

#### ART IMPOSTORS.

SIR,—The *cause célèbre* which is at present attracting so much public attention, and more particularly the attention of artists of every kind, is, I think, one that cannot fail to be productive of some good, and, whether or not the gentleman whose artistic merit is called in question deserves the unavailing epithet which has been applied to him, the result of the trial is likely to be wholesome and purifying. That some so-called artists and authors contrive, by a judicious application of the persuasive guinea, to secure the honours and rewards due to works which they have not executed, and could never hope to, is a fact, pretty well known to most of us who make our living by our art, and that this state of things is an institution as old as it is ugly, were told in Isaac Disraeli's "Curiosities of Literature," where some very startling instances of literary imposture are revealed. Indeed, it is pretty certain that matters have been in a much worse state than they now are, though their present condition is far enough from being a satisfactory one.

Such a trial as that now pending is probably a great surprise to many of the general public, who would scarcely expect to find the huckstering spirit rife among artists, and would never have looked for such evil-smelling reports among men of eminence and fame. To them this case will come like a revelation; and if, as will most likely happen, it determines them in future to bestow their commissions more warily,—to patronise, not the painter, but the artist,—the consummation will be a happy one.

The reason of the existence of such a state of things originates, I think, with artists themselves. It is, unfortunately, the case that business men is but seldom the companion of excellence in art. The artist is too often thriftless, generous, and careless in matters mundane. With the gifts of a Turner for painting, or a Foley for sculpture, he is in business affairs likely enough the inferior of any solicitor's office-boy. This fact is only too readily and joyfully grasped by those who atone for a lack of artistic merit by a decided mercantile talent, and a not too nice sense of honour,—the middlemen, in fact, whom the public so bountifully fees, and would so willingly dispense with. It is to be hoped these gentry will receive a blow where they feel it most, namely, in their pockets.

In our own profession, by which I mean architecture, middle-men are not unfrequent. By these I do not mean men who allow important work to be done by an assistant; for it is obvious that an architect may, and must receive, a far greater share of skilled assistance than would be becoming in a sculptor or painter. But I have known, and know now, of men who are utterly destitute alike of practical knowledge and artistic talent,—men who are incapable of doing anything on their own responsibility, and who yet enjoy not only a lucrative practice, but the fame which of right belongs to some retiring artist in their office, whom they in turn remunerate sparingly enough. The practice of men like these cannot but be ill-conducted in the main, and they reflect little credit on our profession as a body. Dirt, we are told, is matter in the wrong place, and these gentlemen are certainly in their wrong place. I cannot help thinking that it would have been not only better for us, but better by far for them, had they made choice of some other calling; for surely their talents are thrown away in a poor profession like ours, when, had they elected to be butchers or hucksters, they might soon have had both hands deep in the pockets of the public.

There are again within the pale of our profession men who, on the strength of knowing one or two clever draughtsmen and designers who are glad of any employment, will advertise themselves as ready to undertake any kind of work on moderate terms. Having thus obtained an order, they snub-it to the artist upon considerably more moderate terms, and so realise

fat commission at the expense of the profession to which they cannot properly be said to belong. It would surely promote a healthier state of things if employers would endeavour to make sure that they are dealing with the artist at first hand, and so dispense with these agents, barnacles who stick to the bottom of the architectural craft, and who might be cleaned off with much advantage.

"The middle-man," said that aggrieved individual to Mr. Fun, in one of the clever series of sketches signed "J. S.," "must live." "Je n'en vois la nécessité" is Mr. Fun's rejoinder; and so say I, and, I think, so say all of us.

W. M.

## LONDON ITEMS.

Sir,—Although for many years I have scanned my *Builder*, almost before my *Times*, I sometimes miss numbers when absent from home, &c.; therefore, if these items have been noticed or discussed before in or by your issues, I ask pardon:—

*Item*.—There is an original building of brick, stone faced, in Victoria-street, called the "Army and Navy Club,"—an ornament to the district, worth looking at. The giants,—shall I say "caryatides"?—which support the doorway arch are unique.

*Item*.—There is a very effective structure in Cannon-street, City, used by Spiers & Pond, in *à la* Bush-lane, with a "minaret tower" (?), and they have "vandalised" it by about half a dozen railway electric wires on its final! Phuh!

*Item*.—There is a coping stone to the railings of a comparatively new hospital in the Barnsbury-road, perfectly soft like sand,—all friable,—so that the socketed ends of the rail irons are left high and dry! It is a curiosity. What stone can it be? It is not artificial, I know. Why, this beats new quarry Bath stone!

*Item*.—When will they do away with that "eyecore" opposite the Mansion House, Lord Mayor's, i.e., the projecting tavern "Europeau"? Been so forty years!

*Item*.—Why will not the Metropolitan Board of Works pull down that cruelly dangerous corner and block of old houses between Islington Church and Islington Green?

*Item*.—What wonderfully deep foundations they are digging at the site of the hotel opposite the "Grand," Northumberland-avenue!—about 30 ft. deep,—and by a steam crane or derrick (*sic* ?), like you described on the Canal, in Holland. We have magnificent hotels in London now; second to American; equal to Paris. It should seem strange, but the "wealthy world" is migratory "all the year round" in 1882.

*Item*.—I note that the wonderful "copper man," of the Berlin Rathhans roof is fixed exactly on your description of the system of Japanese houses on "volcanic" soils, i.e., as "a movable fixture," similar to the old mail-coach centre of gravity, below the centre; stability and movement combined "midships."

*Item*.—What a splendid piece of ironwork that is, the railing (wrought) in front of the New Law Courts! Quite "Spanish-Moorish." *Appropos!* What a disgrace it is that the big clock of the tower is still unfinished!—the clock of the Courts, I mean,—and this after the Queen has opened them! It has been over four years in the same condition!

*Item*.—Pray, sir, what are fireproof building materials? Wrought-iron twists any way, cast-iron melts right away; brick and stone are cracked, powdered, and literally "licked up," like Elijah's sacrifice, when the intense heat of white heat of great fires happens, and subjects them to only thirty minutes' calcining. I believe nothing is fireproof at highest temperature of incandescence; not even tale, asbestos, or even crucible clays, &c.

*Item*.—I saw the last of the old "Roman wall" (four yards thick) picked away in Broadway, Ludgate-hill. The stone actually broke in bits before the Roman cement or concrete, and I noticed there were curious wooden wedges of very "tarry" pinewood driven into the joints, in perfect preservation, after, say, 2,000 years,—kind of antiseptic action?

*Item*.—Nearly all the large fires of late have been at handsome, large, new buildings, i.e., in London, and out of the metropolis the eight "stately homes of England" have had a "cycle" of, as it were, epidemic-burning of old, dried, scorched beams of wood let into the solid masonry, and all close to enormous fire-grates. What folly! Let us hope a lesson has

been learned for thorough universal scrutiny and also alteration in the mansions. Excuse long letter, my last to you in 1882. Adieu!  
LONDON ARGUS.

## MANAGEMENT OF COMPETITIONS.

Sir,—Seeing that the Cheltenham Gas Company are again advertising for tenders for new offices, I enclose lists of Tenders which I obtained for the directors for the carrying out of my design for the same building (which was accepted in the first competition), trusting that you will publish them for the benefit of the contractors who again meditate tendering.

I have given my reason for resigning the position of architect at the foot of the list of tenders.\*

A. SMITH.

## First List.—Dated the 26th day of May, 1882.

For the erection of offices, with residence, at Cheltenham, for the Cheltenham Gas Light and Coke Company. Quantities by the architect, Mr. Alfred Smith, Mitchell-dean, Gloucestershire:—

Bennett, Birmingham	£13,840	0	0
Wingate, Gloucester	13,875	0	0
Jones, Gloucester	13,750	0	0
Bowers & Co., Hereford	11,500	0	0
Bradney & Co., Wolverhampton	11,380	0	0
Yeals, Bristol	11,340	0	0
Smith, Leamington	11,330	0	0
Scamell, Cheltenham	11,035	0	0
Coleman Bros., Chaxhill	10,935	0	0
Forse, Bristol	10,775	0	0
Howell & Son, Bristol	10,750	0	0
Collins, Tewkesbury	10,680	0	0
Billings, Cheltenham	10,625	0	0
Foster, Abergavenny	9,400	0	0
Miller, Carr, & Co., Birmingham	8,405	0	0
Pickthall, Bromsgrove	8,340	0	0
Inwood, Malvern	8,441	0	0
Architect's Estimate	9,162	0	0

## Second List.—Dated the 2nd day of June, 1882:—

Bennett, Birmingham	£9,278	0	0
Smith, Leamington	8,807	0	0
Scamell, Cheltenham	8,554	0	0
Yeals, Bristol	8,552	0	0
Forse, Bristol	8,475	0	0
Coleman Bros., Chaxhill	8,354	0	0
Foster, Abergavenny	8,260	0	0
Jones, Gloucester	8,147	0	0
Billings, Cheltenham	7,718	0	0
Collins, Tewkesbury	7,670	0	0
Inwood, Malvern	7,091	0	0
Miller, Carr, & Co., Birmingham	6,838	0	0
Pickthall, Bromsgrove	5,940	0	0
Architect's Estimate	7,921	0	0

## Third List.—Dated the 1st day of July, 1882:—

Bennett, Birmingham	£7,893	0	0
Bowers, Hereford	7,800	0	0
Jones, Gloucester	7,550	0	0
Bradney & Co., Wolverhampton	7,430	0	0
Smith, Leamington	7,167	0	0
Forse, Bristol	6,825	0	0
Foster, Abergavenny	6,350	0	0
Coleman Bros., Chaxhill	6,249	0	0
Yeals, Bristol	5,994	0	0
Scamell, Cheltenham	5,964	0	0
Billings, Cheltenham	5,965	0	0
Miller, Carr, & Co., Birmingham	5,961	0	0
Architect's Estimate	6,141	0	0

## FIREPROOF WAREHOUSES.

Sir,—Soon after the great fire in Tooley-street I showed to Alderman Humphrey, the Editor of the *Builder*, and others, the model of a warehouse that could not possibly burn down. The name adopted was that of "the tank warehouse." A brief description of the idea will, I imagine, suffice to prove its inderstructibility by fire, however numerous the stories or floors of such building. All openings to the floors should be elevated a foot or a foot and a half above such floors, where goods are taken in or where staircases open. The floor would then form a shallow tank, so that each such floor could be filled with water to the depth of a foot or more that could not run away. In the walls of the building, round holes might be cut covered with thin glass, where there are no windows. Now, in case of fire, the engines would pour water into every floor, and there would be so many tanks of water to prevent the spread of fire, provided the floors were properly constructed. The water from the fire-engines would, of course, be poured into the building through the windows or holes. In such buildings where there are hollow columns of iron, these should be always kept filled with water, having a small hole near the top fitted with a wooden plug. If in a fire this column became heated to excess it would act as a common boiler, generate steam, and thrust out the plug mentioned. It is evident that so filled with water such column could not become red hot and so add to the fire. I am neither builder nor architect, but simply an amateur in these matters, and, therefore, for

\* Mr. Smith resigned the office of architect in consequence of the directors refusing to accept any tender after putting the contractors and himself to the trouble of supplying and obtaining three separate estimates.

the sake of preventing the recurrence of such terrible fires as we have recently witnessed, and without any *arrière pensée*, I beg a small space in your highly scientific columns.

J. J. LOCKHART.

## PROTECTION OF IRON GIRDERS.

Sir,—I have taken out a provisional patent for the purpose of protecting iron girders from fires. The recent fires in Wood-street have shown that the expansion and distortion of the iron girders as there used have been the cause of upsetting walls and of rendering it perfectly unsafe for the firemen or the salvage corps to get about after the fire had got any hold of the buildings. If you have seen the ruins after the fire you must have noticed that many of the iron girders are positively burned in two and part consumed. Now, as the greater part of these Manchester warehouses are built in the same way, I am desirous of bringing my patent before your readers that the professional men employed to rebuild may know that in a simple and inexpensive way the girders can be constructed so that in case of fire, no matter how fierce, the girders can be kept cool and in their places, steadying the party walls (even should the roof and all the woodwork of the floors have been consumed), and not acting as levers to throw them down, as appears to have been the case in the fire referred to. The specification herewith will, I think, show tolerably clearly what is intended.

I propose all the girders are to be box-girders communicating with each other, that a main should communicate with the girders and fill them with water, that perforations are made in the side of the girders to allow the water to pass through, and so a continual running stream of cold water from the main in the street is passing through at a rapid rate and keeping the girders cool. Should the usual matchboarded partition be under the girder the water would prevent its burning as freely. The iron doors in the division walls I propose to protect by having smaller girders for lintels, and allowing a stream of water to constantly pour down on each side of them. JOHN M. HOOKER.

## FIRES IN THEATRES.

Sir,—I should like to suggest a remedy for one of the chief difficulties to be contended with in extinguishing fires, viz., the immense quantity of gas which is escaping through the broken pipes, &c. If in the pathway outside every theatre and large public building a stop-cock were fixed on the service gas-pipe, encased in a locked box, but easy to get at, the fire brigade men would be able to turn the gas off effectually. ERNEST VAN PUTTEN.

**The Proposed Roman Catholic Cathedral of Westminster.**—At length it would seem (says the *Times*) that there is some prospect of the erection of this long-contemplated edifice,—one on which Cardinal Wiseman set his heart,—being realised under his successor, Cardinal Manning. It is only just and right, however, to say that when urged, on his accession, to take steps for inaugurating such a work, Cardinal Manning steadily refused to do so, saying that he would be content without a sumptuous edifice of the kind as long as there was a want of schools to receive the little ones of his flock. Even this result he has not yet beheld, though year by year he is able to boast that he has done something towards overtaking the deficiency. Some six or eight years ago, however, the site for the intended cathedral,—about two acres and a half,—between Vauxhall Bridge-road and Victoria-street, was purchased, with a view to future building operations, and Mr. Henry Clutton was commissioned to make a design for the cathedral. But within the last few months it appears that a further step has been taken in the matter. Sir Tatton Sykes, of Sledmere, a wealthy Yorkshire squire, has been seeking to be received into the Roman communion, and has notified to Cardinal Manning his desire to mark his reception into the Church by the spontaneous offer to build the new Westminster Cathedral at his own cost; and it is understood that he has chosen as his model the votive church of St. Saviour at Vienna, erected to commemorate the escape of the Emperor of Austria from an assassin's hands.

## LIBELLING A BUILDER.

At the Central Criminal Court, on the 15th inst., Henry Ashford, 44, a builder's clerk, was indicted for publishing a malicious libel of and concerning Mr. Edward William Bradwell. The case was reported in the *Builder* on the occasion of the initial proceedings at the Police Court (see p. 635, ante).

Mr. Grain and Mr. J. Watson prosecuted; Mr. Montagu Williams, Mr. Lynch, and Mr. Goodrich defended.

In opening the case for the prosecution, Mr. Grain said that, justification having been pleaded, the trial would turn out one of considerable importance and gravity. The prosecutor carried on business in Great Portland-street, and was well known in the theatrical world as a builder and decorator of theatres. In 1878 the St. James's Theatre became the property of the Earl of Kilmory, who was then Lord Navvy, and he employed the prosecutor to alter the theatre, and practically to rebuild it. At that time the prisoner was a clerk in the prosecutor's employ. Who the work was completed, it cost nearly 3,000*l.*, and, deducting the sums paid upon the certificates of the architect (Mr. Verity), there remained a balance of 3,000*l.* due from the Earl of Kilmory. An action was brought to recover the money.

It was referred by the Lord Chief Justice to Mr. Doxey to investigate the facts, and accounts. Prosecutor's books were time after time examined, and it was ultimately arranged by the experts appointed by Mr. Dowdeswell to take the prime cost of the materials and labour, adding 15 per cent as a proper percentage for the builder, and it was upon this basis that Mr. Dowdeswell eventually made his calculations, which were a considerable sum. The Earl of Kilmory had brought a counter-claim against the prosecutor for 1,000*l.* or 2,000*l.* for the delay in completing the building, but this was dismissed with the nominal damages of 4*s.* and no costs. Judgment was given for the prosecutor in August or September last year, the amount and costs being all in his favour. Nothing further was thought of the matter until September last, when the prisoner left the prosecutor, and, applying for a situation with another builder, the latter wrote to the prosecutor for the prisoner's character. What the prosecutor considered to be a fair and honourable character was given, but, further explanation being required, the prisoner threatened that unless he gave him the character he would say that he (the prosecutor) had falsified his books in the matter of the Earl of Kilmory. The prosecutor took no notice of this, but, to his surprise, he received from Mr. Dowdeswell a copy of the letter he had received from the prisoner, in which he charged him with falsifying his accounts of the prime cost of the building for the purposes of the arbitration. A similar letter was sent to the Earl of Kilmory and to others.

A number of witnesses were called, and after an intimation from the Recorder, the prisoner pleaded "Guilty," and was bound over in his own recognizances in 100*l.* to come up for judgment if called upon.

## CAUTION TO BUILDERS.

## BAD MORTAR.

At the Worship-street Police-court, on the 21st inst., Mr. Bushby gave judgment in a case between the Metropolitan Board of Works and S. Muncney, builder, Hackney Wick.

In August last, at the same police-court, proceedings were taken by Mr. Alexander Payne, the District Surveyor of East Hackney (South) and North Row, against the defendant, for using mortar not composed of good sharp sand without earthy matter, as required by the By-laws of the Board, in which case the defendant was fined 6*s.*, as reported in our columns; but the defendant continued to use inferior mortar, and proceeded to complete the buildings without pulling down any of the condemned parts. The Metropolitan Board of Works was therefore driven to take proceedings under the Metropolitan Management and Building Acts Amendment Act, 1878, for an order to pull down the houses. The case first came on on the 2nd of November, and was adjourned several times on technical points raised by the defendant's counsel. On the 30th of November the case for the prosecution was heard. Mr. Besley appeared on behalf of the Metropolitan Board of Works, and stated that the Board, having regard to their duties to the public, felt that the sum of 6*s.* already imposed was not sufficient to ensure the use of good mortar in the future; it was, therefore, necessary for them to ask for an order to pull down, under sec. 17, Act 1878. He then called

Mr. A. Payne, the District Surveyor of the district, who produced specimens of the mortar and material used for sand, and gave the dates of his various inspections of the buildings. The mortar was not such as is required by the By-laws, as it was not composed of clean sharp sand, and was full of earthy matter; it easily crumbled, and did not adhere to the bricks, and when put into water dissolved into something like mud. There had been no improvement in the building, nor had any part been pulled down.

Mr. Blashill, District Surveyor of the adjoining district, was then called, and stated that he had inspected the buildings with the last witness on the 27th of November, and took specimens of mortar from the back addition. The mortar was not in accordance with the Board's By-laws. There was some gritty substance in it, but there was also earthy matter, and it did not hold together nor adhere to the bricks; houses built with such a material would be more damp and unhealthy than if built with proper mortar.

This concluded the case for the prosecution. The defendant's counsel, Mr. R. B. Muir, then asked the magistrate to take down the following objections:—(1.) He maintained that proceedings could not be taken against the builder after he had completed the work; they should be taken against the occupier; (2.) That the By-laws were *ultra vires*, as under sec. 12 (1855) the Board had no power to make By-laws about mortar; (3.) That the notice of the District Surveyor was not explicit enough in specifying what part of the buildings was to be pulled down. He then said he would show that the mortar was in accordance with the Board's By-laws.

Mr. Uriah B. Broadribb was called, and said he was a surveyor, and agent for Messrs. Reddall & Sons. He had superintended the building of the houses on this estate; he had no fault to find with the mortar from these houses. He produced a sample taken from the back addition; the quality was rather variable. He should say that, according to the cottage sort of property, they were of first-class construction.

Cross-examined by Mr. Besley.—He said he had no specimens on that day from the main building; he had given evidence on the former occasion when he had given evidence on the 20th inst. In his opinion that was a wrong judgment, and no part of the buildings had been taken down. Mr. Muncney only found the labour on this job, the freeholder found the materials. Witness saw a large load of sand brought to the job; this was at the beginning of August; the main walls were then up. Being asked as to where the sand for this mortar was obtained, he said he saw a lot of concrete that had been taken from various roads; it was of his province to superintend the mixing of the mortar.

Being asked by the Magistrate, he said the name of the freeholder was Mr. J. F. Raw.

Mr. S. Muncney, the builder, was called, and stated that the mortar was composed of Thames sand, mixed in the proportion of two or three of sand to one of lime; there was also a small portion of sifted ballast mixed with it. He was finishing these houses by day-work; the money was advanced by a solicitor, Mr. Raw, at so much a week; he had given notices to Mr. Payne, as builder; he was fined 6*s.* for this mortar, but had not pulled down any part of the buildings; he had had four barrels of sand to these houses; there was no perceptible loss in the mortar.

Several workmen were then called, and deposed to having mixed the mortar and carted sand on to the job, but they could give no dates.

A local builder was called, who produced a specimen of the mortar, which he said was good. In cross-examination, he stated he had served his apprenticeship as a carpenter, but had had a great deal of general experience, and had been the foreman of large works.

The District Surveyor was then recalled, and said he had examined the specimens submitted for the defence, and that they contained earthy matter, nor was there any evidence of good Thames sand about them.

Mr. Blashill was re-examined, and said that these specimens did not contain Thames sand, and that there was dirt and earthy matter in them.

The local builder was called, who produced the specimens and gave judgment on that day week (December 21st).

Mr. Besley, for the Metropolitan Board of Works, said that if his worship liked to call in the assistance of a professional adviser, he would agree, on behalf of the Board, to pay half the expense whichever way it went.

On December 21st, the magistrate said that an analysis of this mortar would cost 21*l.*, and that if either side were willing to pay for this he would have it adjourned to see the result; otherwise, he was willing himself to give judgment from the evidence and from the specimens he had seen.

Mr. Barton, who appeared on behalf of the Metropolitan Board of Works, said he was quite willing to accept his worship's judgment.

Mr. Raw, on behalf of the defendant, said he was perfectly willing to accept the magistrate's judgment, presuming that if he decided in favour of the Board he would allow the points he had raised to be brought before the superior Court.

The magistrate then referred to the points, namely, as to whether the builder was the right party to proceed against, and whether the By-laws were *ultra vires*, and thirdly, whether the notice was vague. He said he could not grant a case upon them. He did not like to send up to the Court of Queen's Bench points which they would pooh-pooh at once. The defendant would have to apply for a *mandamus*. The magistrate (Mr. H. J. Bushby) then delivered judgment. He said he had heard the evidence and had examined the specimens of mortar produced; some of these crumbled in the hand. It was no answer for the defendants to bring

other specimens which did not crumble, unless they could show that the specimens brought by the prosecution were not taken from their houses which they never ventured to do. Therefore, he ruled that these buildings had not been constructed of solid strong mortar according to the meaning of the Act, and he gave the order as prayed for.

Mr. Barton then, on behalf of the Board, asked for costs.

The magistrate said he was not in the habit of granting costs, except where there was something like willful misfeasance; but in this case there really was something like that, because there had been a previous order and fine inflicted in consequence of this mortar having been adjudged to be bad; but not the slightest action had been taken by the defendant, thus compelling the Board to take fresh proceedings. He should therefore grant the costs, but they would be limited to the costs of one day.

## RIGHT OF BUILDINGS TO SUPPORT BY SUBTERRANEAN WATER.

## WARNING TO THE PANDORA THEATRE COMPANY.

In this case, which came before Mr. Justice Fry (Chancery Division, December 21st), the plaintiffs were the owners and tenants of a house, No. 3, Leicester-street, which is situate next to property on which the Pandora Theatre Company have commenced building their proposed theatre. The plaintiffs sued in respect of danger and injury to their house by the abstraction of water from under their foundation.

This was a motion for an interlocutory injunction to restrain the pumping of water from excavations which the defendants' builders have made. No complaint was made in respect merely of the excavation, but the evidence showed that, owing to the abstraction of water, the house had already greatly cracked and was dangerous, and it was sworn that, in the opinion of the plaintiffs' witnesses, if the pumping were continued it must soon prove dangerous. Mr. Norton, for the defendant company, insisted that they were, on the authorities, acting within their strict rights, drawing a distinction between a right to support from adjoining land and from water.

Mr. Justice Fry said a curious and interesting question was raised as to whether or not the right which the owner of an old house had to support from the adjacent land extended also to water. He was not going to decide that question on the present occasion, but, on the balance of convenience, he was of opinion that he must grant an injunction on an undertaking by the plaintiffs as to damages. He thought if it were not granted the houses would undoubtedly suffer great injury; on the other hand, he thought he had sufficient acquaintance with building to know that if this mode of proceeding was stopped, some other mode of constructing these works would be found and adopted by the defendants' architects and builders.

## PROVINCIAL NEWS.

*Leeds.*—Since the Town Council sanctioned the project for providing Leeds with a new cattle-market at Copley Hill or Whitehall-road, the necessary preliminaries have been going forward. The land has been bought and paid for by the Corporation, and the authorities are making the best terms they can with the owners and occupiers of the property which will be required. When the contracts are to be let is said to be a matter which will be settled before long. In the meantime, the butchers, slaughter-house proprietors, and others who have from the outset resisted every proposal to take the market away from North-street, do not seem to be relaxing in their endeavours to thwart the proposals of the Town Council. The more prominent opponents of the scheme are said to have come to the conclusion that the attention which the Markets Committee and its sub-committees have latterly been paying to the slaughter-house branch of the question means that the new market will prove to be the thin end of the wedge, and that the addition of an abattoir may very soon be regarded as inevitable.

*Manchester.*—The Corporation of Manchester having obtained power, by an Act passed last session, to acquire and maintain an art gallery, the Royal Institution has passed into the hands of the Council. The managing committee will consist of twenty-one gentlemen, of whom fourteen are to be elected annually by the Corporation and seven by the governors of the Royal Institution. Various alterations will be made in the interior of the building for the purpose of increasing the space, and when those are effected a second art gallery or museum will, ere long, be provided in Queen's Park, an offer having been accepted by the City Council from the Manchester Art Museum Committee of

pictures and works of art valued at about 5,000l.

**Whitchurch (Salop).**—The new workhouse chapel was opened on the 1st inst. The building, which is situated on the north side of the workhouse, is described as having been built in the old English brick and half-timber style. It is made to accommodate 130 persons, and is 60 ft. long and 20 ft. wide. The building comprises porch, nave, vestry, chancel, and baptistery. It has an open roof, which is constructed of pitch-pine. The principals are framed into upright pillars brought down to the ground; against these pillars corbels are placed to receive the moulded circular ribs which span the nave. The seats are framed with simple ornamental ends in pitch-pine. The pulpit is framed oak upon a plain base of Caen stone; the centre panel is curved, and the corners contain portraits of the four Evangelists, painted on china. The bowl of the font, it is said, was originally used at the old church, Middlewich, and was presented to the workhouse some time since by Mr. B. L. Vawdrey, of Tushingham Hall, and has been mounted on a suitable base and pedestal of statuary marble. In the chancel is a stained glass window, the subject treated being our Saviour restoring the sight of the blind beggar on his way to Jericho. This is the gift of the Rev. J. H. Brooks, of Steeple Aston Rectory, who entrusted its execution to Mr. John Davies, glass stainer, Shrewsbury. The building itself, erected at a cost of about 700l., is the gift of Mr. Wm. L. Brookes. The chapel was designed by and carried out under the superintendence of Mr. Walter Webb, architect, of Shrewsbury. The builders were Messrs. Corfield & Dodd.

#### CHURCH-BUILDING NEWS.

**Christchurch, Hants.**—A new roof has just been placed over the north transept of the Priory Church, Christchurch. It is open-timbered, and in character with the other later Mediaeval roofs in the building, i.e., of tie-beam construction with moulded purlins, plain in design, but with very substantial timbers of English oak, and covered with 8 lb. lead. The parapet on the west side has been taken down where necessary, and the old stones carefully reset, as well as the internal stone cornice, which has now been properly bonded. The work has been under the superintendence of Mr. B. Edmund Ferrey, and carried out by Mr. William Howe, of Christchurch.

**Whalley Range (Manchester).**—The new Church of St. Edmund, which has been erected in the Alexandra-road, Whalley Range, was consecrated by the Bishop of Manchester on the 20th inst. The foundation-stone of the building was laid by Mrs. Fraser on the 29th of July, 1881. The church is built of brick, with Yorkshire stone facings and white stone dressings, and is in the Early English style of architecture. It consists of a nave, 100 ft. by 36 ft., and two aisles, each 95 ft. by 13 ft. 6 in.

Vestries for the clergy and the choir are situated on the south side. The chancel, which is lighted by seven tracery-headed windows, is 38 ft. long by 25 ft. wide, and has a tiled floor. There is an organ-chamber on the south side of the chancel, with which it is connected by a large moulded archway. The chamber is a spacious one, and is lined throughout with boarding. The tower, which is situated at the north-east corner of the church, and the lower part of which forms one of the principal entrances, is at present incomplete, owing to lack of funds. When finished it will rise to a height of about 170 ft., and terminate with a wrought iron finial. There is another entrance to the building at the north-west corner. Each entrance has a spacious vestibule, and is furnished with two pairs of swing doors, which prevent the possibility of inconvenience arising from draughts. Two extra doors have been provided, but these will only be used for exit purposes. The nave arcade, which is lofty, is supported on polished granite columns, with Yorkshire stone caps and bases. The side aisles are lighted by means of two tracery-headed windows, and the nave by twenty-eight similar windows. At the west end there is a large and very handsome six-light window, with a rich tracery head. Special attention has been given to the important matter of ventilation. The font, which cost 40l., and was specially designed by the architect, has been presented to the committee by Miss Lees, of Whalley Range. The lectern,

consisting of brass and iron scroll work, was given by the members of the Iron Church congregation. The pulpit and the reading-desk consist of pitch pine, the panels being filled in with open tracery resting on stone bases. The seats, which have been designed to accommodate 1,000 worshippers, are also constructed of pitch pine. The builder was Mr. James Herd, and the whole of the work has been carried out from the designs and under the superintendence of Mr. Henry R. Price, architect, Cross-street, Manchester.

**Whitworth.**—A new Mission Church is in course of erection in St. Bartholomew's parish, Whitworth, near Rochdale, and is expected to be ready for opening early in the ensuing spring. Messrs. Cheetham & Dunnean, of Rochdale, are the architects.

#### Books.

*A Series of Twelve Sheets of Pen and Ink Sketches of the Old Domestic Architecture of Oxford.* By H. W. Moore, 6, Beaumont-street, Oxford.

THESE sketches are published with the view of preserving a memento of the picturesque examples of old work to be found about the streets of Oxford. They are of the style which has recently become fashionable after entire neglect for years, and some of the subjects, though originally public-houses in back yards, will probably be adopted as types for residences in fashionable localities.

#### VARIORUM.

*The Estimator's Journal*, published by Batsford, High Holborn, is a Monthly List of net cash prices for building materials required in estimating, net trade lists, &c. Whether changes often take place in a month we are not prepared to say, but they may, nevertheless, occur often enough to justify the trifling outlay involved. It is edited by Mr. George Stephenson, of Hampstead.—A bundle of Diaries and Calendars come to us from Charles Letts, and very good and various in character they are. They must be distinguished in ordering from those of Letts & Co.—"Whitaker's Almanack," 1883, includes such a body of original information as is scarcely to be found elsewhere. It grows in size every year.—Amongst the Diaries comes one in connexion with the *Sanitary Record*, intended specially for the medical practitioner. The blank space left for each day must be ridiculously too small for a medical man in good practice. The introduction of advertisements on the blotting-paper (chiefly of wines and spirits) is an abomination that cannot be too soon pronounced against.

#### Miscellaneous.

**Fire at Gunton Hall.**—On the 18th inst. Gunton Hall, the seat of Lord Sufield, was to a large extent destroyed by fire. The hall was a handsome white brick mansion standing on a slight eminence about midway between Aylsham and North Walsham. It had been enlarged by successive generations of the Harbord family. Before the engines of the local fire brigades began to play upon the burning pile, much time had been lost, and the flames had acquired such a hold upon the mansion that the utmost which could be done was to save a portion of the building. Most of the pictures were removed in safety, and a considerable portion of the furniture was also rescued from the flames, but some was destroyed. The new front of the hall was destroyed, and, in fact, the greater part of the mansion became a mere wreck. The damage done is roughly estimated at 30,000l.

**Preservation Casket for Lord Wolsley.** The General Purposes Committee of the Corporation selected the design submitted by Messrs. George Edward & Sons, of the Poultry, from among those sent in by the leading goldsmiths of the City and the West End. The casket is of gold, and both in its shape and ornamentation is Egyptian in style.

**Chief Assistant in the Engineer's Office, London.**—We are asked to mention that, although on the first show of hands, the numbers were: Mr. De Pape, 28; Mr. D. J. Ross, 33,—as stated in our paragraph,—at the ultimate voting the numbers were: for the first-named gentleman, 13, and for Mr. Ross, 35.

**The Fatal Accident on the Site of the Wood-street Fire.**—On the 20th inst. Mr. Payne resumed the inquest on the body of John Turner, aged 34, a locksmith in the employment of Messrs. Chubb & Co. On the 12th inst. he, with other men, went into the ruins of the great fire in Wood-street, with the object of opening the door of an iron safe which had fallen from one of the upper floors of Messrs. Rylands's warehouse. Just as they ceased hammering at the door of the safe, a huge wall fell a depth of 30 ft. on the deceased, crushing him to death. The witnesses, in reply to inquiries by the Coroner and the jury, stated that they received no caution of any sort from anybody as to the dangerous condition of the ruins. Mr. William Wollett, architect and surveyor, employed by the fire insurance company in such cases as these, said, if he saw any one going into a ruin of the kind in Wood-street, he should warn them, as it would be sure to be dangerous. In reply to Mr. Nicholls (who appeared for Messrs. Rylands), the witness said no one was absolutely in charge of the ruins of the fire until a surveyor had been appointed by the Fire Insurance Company. Up to a certain time the premises on fire were in charge of the Fire Brigade and the police. The Fire Brigade would give notice to the District Surveyor if the structure was dangerous. Replying to Mr. Farrar (who appeared for Messrs. Chubb), the witness said he had ordered that no one should be allowed to go into the ruins except the Salvage Corps, the police, and workpeople. The Coroner.—In your judgment, as a practical man, do you think the hammering at the safe on the Monday and Tuesday affected the wall in question in its then weak condition? Witness.—Of course it would. The least touch would tend to bring it down. Police-sergeant Phelps said he admitted Messrs. Chubb's men within the boarding at the end of the street on one of the men's producing a card of the firm. The police had no power to keep the workpeople out of the ruins, although the walls were dangerous. The men, they assumed, knew the risk they were running. Mr. D. Cameron, representing Mr. Woodborpe, the District Surveyor, said that when it was known that the walls of the premises were dangerous, a notice was sent to the Commissioners of Sewers for a hilder to go and do what was necessary,—to first see to the outside walls. The jury returned a verdict "That the deceased was accidentally killed by the falling of a wall. They added, as a rider, "We wish to express our strong disapprobation of the absence of necessary precaution in regard to the dangerous character of the buildings."

**The Birmingham and Aston Seam Tramway.**—The new line of tramway which has been in course of construction during the last few months between the centre of Birmingham, and Aston, by way of Corporation-street, Aston-street, Aston-road, and Lichfield-road, has now been completed and opened for traffic. On the 22nd inst. the official inspection by Major-General Hutchinson, of the Local Government Board, took place. The company have determined to use steam-power for working the line instead of horses, and for this purpose have already purchased two engines, one by Messrs. Kitson & Company, of Leeds, and the other by Messrs. Wilkinson & Co., of Wigan. In many other towns where tramways have been more extensively brought into use than in Birmingham, steam has been adopted as the motive power with varying success.

**Disastrous Fall of a Chimney in Bradford.**—On Thursday morning the high chimney of a mill situate in Spring Mill-street, Bradford, fell upon the adjoining building, where a large number of persons were at work. It is reported that at least twenty-four persons were killed, and that forty were seriously injured. The chimney is stated to have been built in 1861, on the site of some coal workings, which were filled in with stone packing and concrete. It was 255 ft. high. Signs had exhibited themselves of weakness at the base, and men are said to have been engaged in trying to remedy the defects when the disaster took place. Was this work, affecting the safety of so many poor factory "hands,"—many of them women and children,—being done under competent advice and supervision?

**"Land Surveying and Levelling."**—Mr. A. T. Walmsley will deliver the opening lecture of his course of eight lectures on this subject, in connexion with the Society of Engineers, in the Hall of the Society, 6, Westminster Chambers, on Monday, January 8.

**Work and Wages in the Brassfoundry Trade.**—It is stated that for some time past the National Society of Amalgamated Brassworkers have been endeavouring to induce the employers to advance the wages of the operatives, and to restore the bonus which was formerly paid to the workmen. During the depression in the trade two or three years ago the 15 per cent. bonus usually paid on the list prices was reduced to 10 per cent. by the arbitrator, and the men on the revival of trade last summer asked that the bonus should be fully restored, and also that a general advance of 10 per cent. in wages should be conceded. An alteration in the minimum prices of the casters in the general cabinet department was also asked for. The operatives contend that from time almost immemorial it has been the custom in the trade to consider that casters should receive one price for their work, this price being regulated by weight. Gradually this custom has been encroached upon, they say, and for many years past different prices have been paid at various firms for the same class or work. In some instances casters employed on light work have been paid less than others who produce heavier goods. Their greatest claim for a levelling-up of prices paid to the casters, however, is that for the last twenty-five years patterns have been considerably reduced in weight by the coring of work which was previously cast solid, also by the patterns being reduced to meet manufacturers in competing with each other, or to conform to the fashion in the more artistic branches of the trade. This process of lightening patterns has, they urge, considerably reduced the earnings of casters. The increased number of cores has also had the same effect, inasmuch as journeyman casters fail to obtain help unless they are prepared to give at least 50 per cent. more to their under-hands than formerly. After a careful consideration of the claims of the operatives the representative employers in the brass cabinet department have agreed to the requirements of the men for raising the minimum price paid to the casters, and they also promise to favourably consider the question of the bonus. It is thought that the decision will give satisfaction to the men affected. The question of a general advance of 10 per cent. to the whole of the brassfounders has been deferred, the employers being desirous of waiting till the turn of the year in order to see whether the state of trade will justify any advance of wages.

**A Large Ocean Dock.**—The City of Adelaide, South Australia, has (according to an exchange) taken steps for the construction of an ocean dock of nearly 30 acres in extent, and 30 ft. deep at low water. The site is said to be excellently chosen, and the approach will be of the easiest character. The dock will afford harbourage for vessels of the largest class, and will be provided with the most modern appliances for docking, loading, and discharging vessels in all states of the weather. Railway communication between Adelaide and Melbourne is being established, and already a line of rail connects the capitals of Victoria and New South Wales, so that within a few years passengers and mails will be landed at Adelaide for all parts of Australia, and will reach their destination by rail, whilst the goods for other colonies will be discharged into intercolonial steamers of a class much superior to those now running. The capital for this enterprise, amounting to nearly a million, is to be provided by private persons.

**Fall of a Mill Chimney at Batley.**—On the 19th inst., about half-past eight o'clock a.m., a chimney in course of erection at New Brighton Mill, Carlinhow, Batley, the scene of the disastrous boiler explosion which occurred on January 19th, 1881, whereby sixteen persons lost their lives,—fell to the ground with a loud crash. The chimney had attained a height of 114 ft., and is described as being substantially built of brick, the work being carried out by Mr. John Mortimer, contractor, Batley. It was intended to carry it to 150 ft. in height, but a few days ago it was noticed that the chimney was losing its perpendicular, and in consequence work was suspended. Fortunately, no one was injured, although several workpeople were near at the time.

**The Belt Libel Case: Verdict.**—This prolonged case, which has occupied forty-four days, was brought to a conclusion on Thursday, when the jury returned a verdict for the plaintiff, Mr. Belt, awarding him 5,000*l.* damages. The judge refused to stay execution.

**A Leviathan Lathe.**—Messrs. Smith, Beacock, & Tannett, of the Victoria Foundry, Water-lane, Leeds, have just completed a large treble-gear crank axle lathe, which has been made for a marine engineering firm in Marseilles, where it will be used for turning marine cranks, shafts, &c. It is (says the *Yorkshire Post*) probably the largest piece of work of its kind which has ever been constructed in Leeds. The height of the centres above the bed is 5 ft., so that an article 10 ft. diameter can be turned with the lathe. The face plate, which is 10 ft. 4 in. in diameter, is provided with jaws for gripping the work. The lathe-bed is 9 ft. wide, and is sufficiently long to allow a space of 34 ft. between the centres. There are two saddles, each with compound slide-rests, hack and front, and having self-acting motions in all directions. The latest improvements have been adopted in the construction of the lathe. Amongst these may be mentioned the introduction of two screws within the bed, the advantage of this over the ordinary system of traversing the saddles by one screw or by a toothed rack and pinion, being that, with so wide a bed, the saddles slide more smoothly than they would otherwise do. Both the saddles and the loose headstock are moved quickly on the bed by a separate strap from that which drives the lathe headstock, and by this arrangement the necessity of running the driving-gear of the headstock to move the saddles and the loose headstock to their places for commencing work is obviated. Some idea may be gathered as to the immense proportions of the lathe when it is stated that its total weight is about ninety tons.

**Italian Art Loan Collection at Glasgow.**—On the 22nd inst. the Italian Art Loan Exhibition, in the Corporation Galleries, Glasgow, was opened by Lord Balfour of Burleigh. It is one of a series of exhibitions held under the auspices of the Corporation. The Queen has lent a number of valuable objects, including a shield by Benvenuto Cellini, which is valued at about 5,000*l.* Mr. Gladstone has sent three large glass cases containing fine carved ivories and beautiful examples of Italian jewellery. The Duke of Buccleuch has furnished a rare lot of prints by old Italian masters, Marc Antonio Raimondi, Agostino Veneziano, Agostino Caracci, and others. From the Marquis of Lothian has been received a collection, which comprises some specimens of Italian furniture and pottery. By Mr. J. C. Robinson, her Majesty's Surveyor of Pictures, there has been contributed a series of Italian medals, including examples of the work of Pisano, Pasti, Guaccolotti, Sperandio, &c. Messrs. Elkington & Co., London, have lent the well-known Helicon Vase, which, although produced by the French artist Ladeuil, is entirely in the style of the Italian Renaissance. Composed of repoussé silver and steel, damascened with gold, the vase represents the work of several years, and is valued at 6,000*l.* Perhaps one of the most interesting features of the display is a set of fifty drawings by old masters,—many of them preliminary studies for famous works of art,—from the gallery of Mr. J. Malcolm of Portalloch. Sir Noel Paton, Sir W. Pettes Douglas, and a large number of other collectors have also sent contributions.

**The Proposed Riverside Fish Market at Saadwell.**—At the last meeting of the Limahouse District Board of Works, Mr. Potts asked Mr. Dunch, the surveyor, what was the present position of the Shadwell Fish Market Scheme, as he thought it would be well that the public should know how the matter stood, and whether the difficulty that had arisen in regard to the financial part of the scheme would be such as to prevent the formation of the market. Mr. Dunch said the Board would remember well the difficulties that had to be surmounted in obtaining the Act authorising the establishment of the market, and knowing what influence was brought to bear, it was not likely that the parties who opposed the measure would desist from their efforts to discredit it, and thus prevent the market being carried out, or cause the absorption of it by the City authorities. This objection, combined with the circumstance that mistakes had been made in drawing up the prospectus of the company, had prevented the subscription of the whole of the capital. But the project to establish the market had not collapsed. It was not intended that it should collapse, and other steps would be taken to give effect to the London Riverside Fish Market Act, 1882.

**Institution of Civil Engineers.**—The sixty-fifth annual general meeting of this institution was held in Great George-street on the 19th inst., Sir William Armstrong, C.B., F.R.S., the out-going president, being in the chair. The report of the Council on the proceedings of the Institution during the past year congratulated the members on the steady progress of the Society, which showed no signs of diminution. Since the close of the last official year 238 candidates had been elected, ninety names had from various causes disappeared from the register, leaving a net gain of 148, which had increased the aggregate of all classes to 3,385, irrespective of the students, who numbered 707. The publications had been continued on the same liberal scale, four thick octavo volumes having been issued during the year. Some interesting particulars were given of the growth of the publications, special reference being made to the development of the "correspondence" appended to the report of the oral discussions. The proceedings recorded the work of twenty-five ordinary meetings. There had also been twelve supplemental meetings exclusively devoted to the reading and discussion of papers by students. But it was to be regretted that there was some falling-off in the quality of these communications, of which two only had been deemed worthy of a place in the printed proceedings, as against six last year. One, however, had been of sufficient merit to obtain for its author the Miller Scholarship. During the recess the premises had been entirely redecorated, ten years having elapsed since similar extensive repairs had been undertaken. The library continued to augment in an increasing ratio, and contained upwards of 18,000 volumes. Lastly, the Council referred with satisfaction to the financial condition of the Institution. The income for 1882 had amounted to 12,898*l.* 10*s.* 11*d.*, while the capital and trust-fund receipts were 3,527*l.* 9*s.* 6*d.* and 431*l.* 5*s.* 6*d.* respectively. The expenditure had reached 12,788*l.* 5*s.* 7*d.*, and 3,350*l.* 13*s.* 6*d.* had been invested in London and North-Western Railway Debenture Stock. After the reading of the report, the medals and premiums awarded for 1882 were presented, and votes of thanks were passed to the president, council, and officers. The scrutineers announced that the following gentlemen had been elected to serve on the Council for the ensuing year, viz.:—President, Mr. J. Brunlees; Vice-Presidents, Sir J. W. Bazalgette, C.B., Sir F. Bramwell, Mr. G. B. Bruce, and Mr. E. Woods; members, Mr. B. Baker, Mr. J. W. Barry, Mr. G. Berkeley, Sir J. Coode, Mr. E. A. Cowper, Sir J. N. Douglass, Mr. A. Giles, Mr. H. Hayter, Dr. W. Pole, Mr. R. Rawlinson, C.B., Mr. A. M. Rondel, Dr. C. W. Siemens, Mr. D. Stevenson, Sir W. Thomson, and Sir J. Whitworth.

**The Progress of the Free Libraries Movement.**—At a meeting of the members of the Metropolitan Free Libraries Association, held on the 22nd inst., Mr. Edward J. Waterston in the chair, the chairman said that, although the association could not record any success in the metropolitan area, yet, within measurable distance of that area, notably in Richmond, Kingston, Twickenham, and Reading, the movement had taken root, and not only had all opposition to it ceased, but old opponents were now found among its warmest supporters. As Londoners they could but deplore the fact that at present the ratepayers declined to avail themselves of a beneficent Act of Parliament, which permitted them to co-operate, by means of a single penny in the pound upon their assessments, for their mutual benefit. The worst feature of this failure to adopt the Act was to be found in the fact that, thereby, the youth of both sexes in London were handicapped in competition with their provincial rivals, who, being better educated as a result of the advantage of their local free libraries, were naturally selected by London bankers, merchants, manufacturers, and others for the more responsible, and, therefore, most lucrative appointments in their respective businesses.

**Eyburgh Church, Eakenham.**—The lighting up of this church has been carried out by the use of handsome coronas and pendants, which are fitted with the patent three-wick Hesperus lamp of Messrs. Jones & Willis, of Birmingham and London.

**Mr. Guthrie Lornie,** of Birnam, has offered a free site in one of the best parts of the village of Birnam for a public hall and institute, together with a subscription of 100*l.* towards the cost.

TENDERS

Table of tenders for building schools for 612 children, and masters' residences, at Grays, for the Grays Thrurock School Board. Mr. E. C. Ailam, architect. Includes names like G. Seager, T. Boyce, North Bros, Higgs & Hill, etc.

Table of tenders for the construction of a concrete storm-water conduit at Abbey Mills, for the West Ham Local Board. Mr. Lewis Angell, engineer. Quantities by R. L. Curtis & Sons. Includes names like Vernon & Ewens, Marshall, Mowlem & Co., etc.

Table of tenders for building imberie wards at the Union House, Milton, for the Portsea Island Board of Guardians. Messrs. Bervis & Hill, architects, Southsea. Quantities by Mr. G. Kake. Includes names like F. White, Landport, W. Wain, Fratton, etc.

Table of tenders for new Wesleyan Chapel at Gainsborough. Messrs. Parry & Walker, architects, Doncaster. Quantities not supplied. Includes names like Davies & Hewett, Kelsey, Riggall & Hewins, etc.

Table of tenders for alterations, repairs, and forming gateway through the house, No. 84, Paradise-street, Rotherhithe, and the erection of stabling, &c., at rear, for Mr. F. D. Collier. Mr. E. Crosse, architect, 32, Bermondsey-square. Includes names like Bullers, Winsor, Wells, etc.

Table of tenders for the construction of sea and retaining walls, esplanade, roads, and other works, at Weston-super-Mare, Somerset. Mr. T. J. Scoones, Bristol, engineer. Quantities by Mr. Barratt, Bristol. Includes names like T. Small & Son, Lean & Sons, A. G. Beaver, etc.

Table of tenders for new roads and sewers, &c., at Forest Gate, Essex, for the Land Investment Company (Limited). Messrs. Whitmore & Reeves, surveyors, Chelmsford and London. Quantities supplied. Includes names like T. G. Dunmore, Hornsey, T. Adams, Hackney, etc.

Table of tenders for the erection of new offices in connection with the Chelsea Workhouse extension, King's-road, Chelsea, for the Guardians. Messrs. A. & C. Harston, architects, 15, Leadenhall-street. Quantities supplied. Includes names like Le Gassick & Co., Besch, Nightingale, etc.

For detached villa-residence at Friern Park, North Finchley, for Mr. A. Conder. Mr. W. S. Wheeler, architect. Gregory & Benne (accepted). £1,400 0 0

TO CORRESPONDENTS.

B. & H.—S. F. C.—G. T.—J. F.—E. W.—G. M.—A. P.—A. & G.—E. C. A.—T. B.—P. G. S.—E. S. R.—S. A.—E. C.—T. J.—G. & R.—H. M.—G. H. P.—A. & C. R.—Y. & Co.—G. & Co.—H. H. (bankers). Correspondents should address the Editor, and not the Publisher except in cases of business. All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO ADVERTISERS.

Persons advertising in the Builder may have REPLIES ADDRESSED TO THE OFFICE 46, Catherine-street, Covent-garden, W.C., FREE OF CHARGE. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under, 4s. 6d. Each additional line (about ten words), 6s. 6d. Terms for Series of Trade Advertisements, also for Special Advertisements on Post, under Conditions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher. SITUATIONS WANTED. FOUR Lines (about thirty words) or under, 2s. 6d. Each additional line (about ten words), 5s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. Stamps must not be sent, but all small ones should be retained by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINER, Publisher, Addressed to No. 46, Catherine street, W.C. Advertisements for the current week's issue must reach the Office before THREE O'CLOCK, p.m. on THURSDAY. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

Best Bath Stone. WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, And Farleigh Down. RANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [ADVT.]

SEASONED CORSHAM DOWN, FOR WINTER USE. PICTOR & SONS, BOX, WILTS. [ADVT.]

Douling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Douling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.]

Douling Freestone, Of best quality, supplied from their own Quarries and Kilns by STAPLE & HANS, Stoke, Ilminster. BLUE LIAS LIME Agent, Mr. H. MITCHELL, 9, Augustus-road, Hammersmith, London, W. [ADVT.]

Asphalte. Seyssel, Patent Metallic Lava, and White Asphaltes. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [ADVT.]
