The controversialist who should take the side of systematic proportion in architecture might be excused for confidently expecting to be allowed to insist on the well-known analogy of music; but here, again, he is stayed in his exposition, and surely to his very natural surprise, by a previous question, by what seems to have become such in this all-questioning age; whether, indeed, the proportions which are established between the notes of the accepted musical scale are not in the main arbitrary, and might not have been very different indeed, and quite as reasonably might not have been almost anything if it had happened to so please the original framers of a scale which, getting an accidental and unnatural start, has usurped authority, and imposed upon us a system which satisfies our ears indeed, but only by mere force of early and inherited habit. A suggestion such as this is serious and startling indeed. Something is here involved which affects the entire scope of art; for music is the very citadel of those who hold that the foundations of genuine art lie deep down in the ultimate unity of nature, in the established relation

between our human nature and the universe around us, the laws of nature which are not more around us than they are within us. But the detailed and specific analysis of the natural basis of the musical scale would probably be out of place in the *Builder*. It is enough that it should be well understood that there are not wanting those who, in response to a challenge, would hold themselves bound to prove that, on the simple basis of two perfectly familiar physical laws, the musical scale of civilisation is deducible as being necessarily and inevitably such as it is in every particular, such and no other.

The word "controversy" has slipped into our exposition; but the purport of this is to state the question of proportion clearly, not to argue it out. And the expression is better left aside even when argument begins; it is better forgotten in the spirit of one of those paragraphs of Laurence Sterne, which make us tender towards his many lapses in more matters than good taste:—"So often has my judgment deceived me in my life that I always suspect it, right or wrong; at least, I am seldom hot upon cold subjects. For all this, I reverence truth as much as anybody; and when it has slipped us, if a man will but take me by the hand, and go quietly and search for it, as for a thing we have both lost, and can neither of us do well without,—I'll go to the world's end with him." Whether it will be necessary to go quite so far in the search for a complete elucidation of architectural proportion may happily be doubted, but it seems premature to expect that we are at present very close to the end of our journey.

#### THE CITY OF THE CALIPHS.

THE reasons are more than historical which explain the peculiar artistic wealth and beauty of Cairo. It is not alone that Egypt in the past was, as it still continues, to a great extent to be, the centre of the Mussulman empire, India, Persia, and Spain being but its extremities; it is not alone the fact that the rule of the Moslems is still exercised by the banks of the Nile, as it has been in unbroken succession since the first years of the existence of the Mahometan religion; it is not alone this fact from which it results that the whole history of Arab art can be traced in Cairo as it can be nowhere else; it is not alone due to the splendour of the court of its Mediaeval caliphs and their wealthy subjects, or the architectural zeal of its pious rulers; Cairo, as a great rallying-point of the pilgrims who now for centuries have yearly visited Mecca, has at all times thus enjoyed the peculiar privilege of receiving within its walls, often as permanent residents, the artists and artisans of almost every portion of the Mussulman empire. Those who have closely studied the art of the Arabs, not only in its architecture but in the kindred arts, are able clearly to trace to this foreign admixture not a small influence in the artistic activity of the Egyptian capital. The Arabs, it may be remarked, have at all times been dependent on others for their artists and artisans. In the earliest days of their existence as a nation in Egypt they were entirely dependent for their architects and builders, even for their very materials, on Greek and Byzantine aid. Two centuries after the foundation of their religion, the great Mosque of Hassan, the earliest and, in its untouched splendour, the finest creation of pure Arab art, is the design of a Christian Copt. To this day, Lane tells us, the best builders and carpenters are invariably Copts, whose manual skill and superior dexterity have always been appreciated by the Arabs. But this dependence on others for their executive skill in no way thwarted, as might be imagined, the peculiarly original bent of Arab artistic genius. No art can be pointed to as more thoroughly the creation of those envying circumstances which, it has been urged, are the invariable influential factors in the art of every nation. In no feature is the originality of the art of the Arabs, acting under the influence of their daily needs, more clearly shown than in their domestic architecture, of which, after having hastily referred to the religious architecture,\* it may not be uninteresting at the present moment to speak.

The domestic architecture of the Arabs is especially well represented in Cairo, as that city was, during the most brilliant period of its

history, the capital, inhabited by a refined court. This period is contemporary with an age which we in Europe usually associate with the twilight of the Middle Ages, stretching as it does in contemporary English history over the period of the Conquest and the even ruler days of our last Saxon and Danish kings, the Crusades, and the still uncut epoch,—however exquisite may have been its artistic creations,—of the Scotch and French wars of the three Edwards. Two centuries after its foundation, that is, in the ninth century, Cairo,—or more properly, Fostat, "the old city,"—under Mamoun the learned, the son of the famous Haroun al Raschid, was an active centre of learning and refinement. Mamoun founded a famous school of *savants*, whose studies embraced not alone astronomy and jurisprudence, but the natural sciences, chemistry, and algebra, the Arab names and terms of which we have to this day retained. It was Mamoun who measured the first terrestrial meridian, and to his reign we owe those Arab translations of Greek, Hebrew, and Latin authors, without which we should know nothing but from hearsay of many of the greatest classic writers. With the conquest of Egypt by the Caliph Moezz, and his foundation, in the middle of the tenth century (A.D. 969), of the existing city of Cairo, the splendour and refinement of the capital were carried over further. Its commerce was extended to the farthest extremities of the Mussulman empire; Cairo suddenly became the most important city of the East. In their wealth the caliphs revelled in the wildest dreams the "Arabian Nights" have pictured to our Western minds. The prohibition of the Prophet respecting the representation of animate beings, respecting gambling and the use of wine, were disregarded, and to those days of Arab splendour belong some of the choicest relics we possess of the art of the caliphs. Some slight insight into the luxury of the rulers of the time has been afforded by the publication in these pages not long since, of the inventory of the Sultan Mostanser's treasury,† and this lengthy list of costly marvels was, it must be remembered, but a portion of the contents of the royal palace. In Cairo and Damietta the looms were busy with the production of the most gorgeous stuffs, further enriched with the costliest embroideries. The goldsmiths and armourers found their most exquisite products never sufficiently choice for their fastidious clients.

In the midst of such a refined existence, and with surroundings so elegant, the character of the domestic architecture, it can be imagined, was scarcely less decorative. No wealth was too great to lavish on the interiors of their homes, where gilded and painted wood-work in delicate arabesque contrasted with the deep blue of tiles of the choicest design and hangings of the richest fabrics, floors of marble and mosaic covered with thick carpets, each marvels of decorative beauty. The woodworkers exhausted their utmost art in inlaying ivory and mother-of-pearl and tortoiseshell in the most intricate incised designs; the simplest utensils were plated or damascened with gold and silver as richly as the goldsmith's art could devise. The choicest perfumes, of which the consumption appears to have been immense, were brought from the furthestmost corners of the earth, and the poets of the day, in defiance of the Prophet's commands, sang in the sweetest strains that the Arab tongue has known, the praises of love and wine,‡ while in the description of their gardens the poets have been scarcely less esthetic.‡

Sumptuous as were their interiors, no display of all this wealth was allowed to be even suggested by the exterior appearance of the house. Shrewd motives suggested this custom (one that gives its peculiar character to all Oriental cities) as calculated to allay the too familiar cupidity of the ruling powers or the violence of the populace. Bare grim walls, pierced by a few small grated openings, and, in the older houses, the doorways strongly protected by loopholes and overhanging machicolations, are all that present themselves on the exterior of many of the wealthiest and most delicately decorated of the old houses of Cairo.

Something of the splendour of the life of the

Arab caliphs,—the contemporaries of our Templars,—may be judged by the following interesting description of the visit of an embassy from the Crusaders to Cairo, a description which, taken from the pages of the faithful old chronicler, William or Gulelms, archbishop of Tyre (with whose pages Scott was so familiar), may not unprofitably be set beside the almost contemporary inventory given by us of the Caliph Mostanser's regal treasury:—"As the house of the prince is of a splendour such as has never been in our time seen, we will here relate with care what we have learnt from the trustworthy report of those who were present concerning his splendour, his incalculable wealth, and his extraordinary magnificence, for on this point it may not be uninteresting to possess some information. As soon as Hugh of Casarea, and with him the Templar Godfrey, arrived at Cairo as ambassadors to the Sultan, they were conducted to the palace by a great number of servants, who preceded them noisily with swords, through narrow passages and dark rooms, where, at each entrance, troops of armed Ethiopians loudly acclaimed the Sultan. After having passed the first and second guard, they reached larger rooms, to which the sun penetrated; porticos supported by marble columns, gilt ceilings exquisitely decorated, and walls tiled in the most regal splendour. The whole was so beautiful, both in execution and in material, that the envoys could not avoid feasting their eyes on these marvels, the perfection of which surpassed all that they had ever previously seen. There were marble tanks filled with the clearest water, birds of every species and of varieties most strange, of divers voices, forms, and vivid colours, and especially marvellous to our compatriots. Thence some eunuchs led them to other chambers which even surpassed the first in beauty as much as they had done all that they had ever seen before. Here there was an admirable multitude of different quadrupeds, such as the most capricious brush of the painter, the licence of the poet, or the mud lost in the dreams of night, could alone create, such as the South and the East produce, and the West has never seen, and of which it but rarely ever hears mention. After many windings through various rooms, each of which contained ample to stay the attention of even the most indifferent, the envoys reached at length the royal castle, where an immense crowd of armed troops and satellites showed, by their number and costume, the incomparable glory of their master, and where every feature showed the wealth and unlimited treasures of the possessor. When the envoys were admitted and introduced into the interior portion of the palace, the Sultan rendered homage to his master, in a manner such as never person elsewhere had shown. As he bowed for the third time, laying down the sword which hung around his neck, the curtains, thickly embroidered with gold and choice pearls, draped about the throne in the centre of the room, parted with incredible rapidity and displayed the Caliph. His face was unveiled, and he sat in a pomp of costume more than regal on a throne of gold, surrounded by a small number of attendants."

Our English troops have occupied the citadel which Saladin built, the scene of all the marvels above described; but of the fairy-like courts which dazzled the Crusader ambassadors nothing but the tradition remains. Successive rulers have each left their mark on the palace fortress, and hand in hand the work of time and the work of man have aided each other in their mutual task of destruction.

The wealth of Cairo and its artistic activity lasted all through the thirteenth, fourteenth, and fifteenth centuries. At the close of the fourteenth century we have the evidence of the Florentine Frescobaldo, so Ebers tells us, that there were more ships in the port of Cairo than at Genoa, at Venice, or at Ancona. The sultans of Egypt were regarded as the wealthiest monarchs of the earth. Cairo during these generations was, indeed, the city of the "Arabian Nights," whose fairy tales the *improvisatore* told about the streets. With the close of the fifteenth century the trade and wealth of Egypt received its death-blow by the discovery of the Cape of Good Hope by Vasco di Gama, and with it the southern route to the Indies. Stoutly as the Arabs fought to defend their monopoly of the Asiatic trade, the age of maritime discovery had commenced; English influence on the oceans of the world was beginning to make itself felt,—the golden days of the

\* See p. 297, ante.

† By a somewhat grim piece of irony, our word alcholi is of Arab,—that is, Mahomedan,—origin.

‡ Carpet-gardening, that modern abomination, was, it appears, not unknown to the Mediaeval Arabs, as we have mention of inscriptions being written in flowers.

\* See pp. 359, 362, ante.

classic Mediterranean were counted,—the untracked Atlantic was to draw trade into new channels, in which it has since never ceased to flow.

#### SIR EDMUND BECKETT ON ART, ARTISANS, AND ARCHITECTS.

It cannot be doubted that in many cases a discourse upon any subject whatever is liable to suffer serious injustice in a summary. Compression is apt to be destructive to gracefulness; it may even involve displacement and dislocation of the whole framework of an argument, and if clumsily performed, though with the very best intentions, may deliver it at least as incapacitated for defending and sustaining itself as if it had been systematically strained into distortion upon the rack of analytic controversy. And yet is a summary constantly no ill test of the coherence and cogency of an argument; of the validity of enunciations which are involved in the flourishes of rhetoric, or in taking plausibilities of fine writing which more bluntly challenge assent authoritatively by a string of dogmas that have as little to do with each other as with the conclusions which they profess to guarantee. It is less than usually perilous to criticise the views of Sir Edmund Beckett on science and art, reported as they are in our columns. The features of this report of what was said at a distribution of prizes to the St. Alban's School of Science and Art are sufficiently marked and characteristic to fully justify an attempt at interpretation.

When a greater novice at the Bar commenced his pleading with nervously repeating,—“My unfortunate client!” and then made a pause, a judge gave him the encouragement, such as it was,—“Go on, sir; pray, go on. So far you have the Court entirely with you.” And Sir Edmund takes us with him quite as cordially, when we read his introductory words,—“I must confess that I am in a state of extraordinary ignorance on the subject. Science is a very good thing, and art in its way a very good thing too. But I am afraid that the meaning of both words is a good deal less understood than it should be.”

After these statements of the general principle, we have not long to wait for a particular example. What knowledge of art and what apprehension of the meaning of the word “art” may we discern in talk to this effect? “Art, if it means anything, means the art to do something; it may be a good or a bad thing.” Who will not willingly make a present to the author of the definition of the art which means doing something had? We may as reasonably define surgery as the art of performing operations which either correct or aggravate deformities; or perspective as the art of putting objects into perspective, either correctly or incorrectly. We go on to read, “The word ‘art’ may come to be associated by usage with a beautiful thing, or with what people call beautiful; but it is very difficult to say what is beautiful.” So far, at least, we escape a definition of beauty to pair off with that of art. But we are left with the implication that whatever beauty may be, if, indeed, it is a reality at all, the association of the idea of it with that of art is accidental; the two have come to be associated by usage in a vague and ignorant way, no one knows why, and the speaker evidently least of all suspected that the usage was the inevitable outcome of a necessity to express in language an experienced connexion between matters of fact,—between exercise of the human faculties with a specific purpose, and a successfully-realised result in evoking the sentiment of the beautiful.

“There is no canon of beauty that I know of,—no rule except following the example of Nature. There is no unquestionable standard of beauty except Nature.” This is promising; but no nature proves as slippery as art, and the standard proposed is elasticity itself. “Nature never copies herself; there are millions of leaves on the trees, but I defy you to find two alike.” He had endeavoured to impress this lesson upon workmen at St. Alban's Abbey, and upon others whom he had found too much given to imitation, and he had advised them to use a little more freedom. The advice is sound so far as it goes, but what becomes of the unquestionable standard as provided by ever-varying nature? The workmen are at last referred to some principle of selection which is not prescribed by an external norm. If the leaves of a sculptured oak wreath are not to be repetitions of a single

model leaf, are they to be varied by copies of a number of model leaves? Even so the selection from the millions which are upon a single oak will not be guided by any standard that the natural oak supplies; the standard will be brought to the oak by the selecting artisan, and every different selector will make a different choice,—each by a standard of his own within his own mind,—better or worse; but it may be suspected that in the best wreath not a single leaf will be found to conform with preciseness to a single model among the selected. We are carried, therefore, to a very different point of view from that which confounds art with mere manual dexterity, and restricts the title artist to the ultimate manipulator of even the designs of other people. “It seems to me,” said Sir Edmund, “that an architect is not an artist. An artist must do something with his fingers; he does not work with his mind only. An architect does not do anything with his fingers; he merely makes drawings [with no help from his fingers, Sir Edmund?], and tells other people how they are to do the work.” So the architect, not without some natural surprise, finds himself landed one stage lower down than the brick-layer, or even, it may be, than the hodman, who does, indeed, do the architect's work going up and down a ladder as he pitches the artist whom the architect is enjoined to venerate as his superior,—“the man at the top who takes the bricks and does all the work.” What may have been the average age of the pupils of the School of Science and Art whom Sir Edmund Beckett was addressing we do not know, but we are glad to think that if his audience included a fair average of artisans, including carvers of the ornamental work at St. Alban's Abbey, his compliments would have been repudiated as fulsome by a silent protest of more than one or two. Speaking ever with the truest respect for the competent art-workman, the question is very unworthily revived as to the comparative merits of the composer of the overture and the conductor of the orchestra or the boy with the triangle,—between Handel at the keyboard and the indispensable man at the back of the organ doing his duty manfully at the bellows.

But, in truth, our complaint against Sir Edmund Beckett in this extraordinary deliverance is the same otter-like quality that Sir John Falstaff imputed to Mrs. Quickly: he “is neither fish nor flesh; a man knows not where to have him.” He begrudges architects their claim to be artists, and disparages the importance of their work in comparison with that of an ornamental carver. Yet what is the worth and significance accorded by him to the title after all? A number of people, we are told, claim the title of artists with much better claim than architects. “Painters and sculptors are artists,—there is no doubt about them.” Operasingers, actors, and “a little further down,” hairdressers are adverted to rather ambiguously as, perhaps, having no more claim than architects to an honorable distinction; but the claim of dressmakers seems to be viewed more indulgently, while tailors are admitted to a common guild with sculptors and painters in a tone of warm cordiality. “Dressmakers are frequently called artists, and I know also that tailors are called artists. So they ought to be, because they produce very excellent results, and I am not sure but that when they have good subjects to work upon, they produce more successful results than architects generally.” There is confusion here between “artist” and *artists*; a very different thing,—different as a commissioner from a *commissionnaire*,—but let that pass; let it pass with congratulations to Sir Edmund on his good fortune in a tailor. What it would be interesting to know is, even in this example, his precise allocation of the coveted title of artist? With the guidance afforded us this lies open to contest between the constructor of the brown paper pattern, whose function has a dangerous analogy to that of the producer of working drawings, and his cross-legged colleague of the thimble and sleeve-board.

Our interest is chiefly with art, but if we can obtain any light on science incidentally, and as correlative to art, we may give it welcome; it is in making the best of such an enunciation as follows that our chance lies on the present occasion:—

“The real distinction between science and art is that art is uncertain, while science is certain,—or ought to be certain. Science is simply a fine word for knowledge, and know-

ledge is certainty, or such certainty as is to be achieved.”

Too true it is, alas! that there is more uncertainty in matters of art than is desirable, but even in this statement it does not compare very disadvantageously with science,—with science that “ought to be certain,” that gives us, not certainty, but only the best approximation to it that is to be got,—and that, being progressive, may give us a surprise any day. When we look back through the ages and contemplate the realised wealth in art which the world has possessed, and which in such important proportions is preserved, and that we rejoice in the possession of,—Sir Edmund Beckett must allow us to say when we recall how much of that wealth of art we owe to the genius of architects,—no feeling comes upon us of the unreality of our possession, of uncertainty as to the truth and beauty of the achievements of at least our predecessors. A foolish story is told of a mathematician,—one after another great name has been belied by the ascription,—having asked contemptuously what a great poem proved. Sir Edmund Beckett, by direct implication, assumes that works of art, and of architecture especially, do not not prove anything,—are afflicted with the essential weakness of wanting that certainty which in one fashion or another he makes, to speak logically, the formal or distinguishing part of the essence of the species science. But a great work of any art,—a work which establishes and approves itself as a great work, has a value not only as art, but in science also. It does prove something, and proves a great deal. It is a phenomenon which demands, and will reward, study, a fact illustrative of mental and moral revolutions which concern us quite as closely as the theory of earth tremors or of the aurora borealis. Nor is art without a resort upon science. It is the hope and happiness of the world that the world is accumulating scientific truth as well as artistic beauty; but it is notorious, and admitted by none more readily than by the scientific, that every age achieves renown by demolishing a mass of the scientific, or rather the unscientific, fallacies of its predecessor; that it also as unfeelingly commits itself to a series of new misconceptions which only make the originators renowned to give a basis of greater renown for those who come after and expose them. One age hold as a certainty that Nature abhors a vacuum; who shall say that the men of science who laugh at this dictum will not some day themselves be laughed at for having made too much of the principle that Nature delights in differentiation?

Sir Edmund, with a candour that does him credit and a simplicity which affords others innocent amusement, professes that he does not know for what reason architects wish to call themselves artists. “I have had a good deal to do with architects,” he says, “and always found that for some reason or other they wish to call themselves artists, though I have never been able to make out why.” It is always pleasant to be able to satisfy intellectual curiosity. The reason is this: it is only in virtue of having a just claim to the title of artist that one is justified in even pretending to be an architect, as distinguished from a builder or a contractor,—creditable titles both, but by no means committing their possessors to the serious responsibilities involved in a profession of fine art. Is it necessary to render these distinctions a little clearer? It would seem so, by the strange confusion of ideas implied in setting forth art and handicraft as convertible terms. The usage of the English language provides us with the words of cognate import,—“artisan,” “artificer,” “art-workman,” “artist”; the last has superseded a somewhat awkward word, “artisan,” which was in use by Lord Bacon and dramatists contemporary,—by Shakspeare and Ford. *Artiste* also, with the French pronunciation, may be considered to have been naturalised in England under the same pressure for requirement of a special term which has given us the indispensable *envelope* and the expressive *prestige*. It would be in vain to attempt to tie down these terms to strict definitions and mutually exclusive significations,—as vain as to pretend to attach them to absolutely divided classes of individuals. It is enough that we are guided in our appropriation and qualified application of them by regard to one leading consideration, the proportion in any given case in which manual dexterity is exercised under command of prompting mother-wit, of original

creative imagination. There are, of course, gradations of skill, and therefore of dignity, among the functions which are equally remote from demands on proper invention; but a special measure is required for every particular comparison, be it of carpenter with cabinet-maker, of mason with the sculptor's assistant who reproduces in marble the clay model furnished to him with the accuracy of a cast. When a wood-carver sets up before him the most carefully-executed drawings as his model, he may still throw so much individuality into his work while still within the prescribed bounds, as to evince originating power, and so far to claim to be more than a mere art-workman,—to be to that extent an artist. It depends on the value of the result whether his claim is better or worse than that of the carver at St. Alban's, the typical artist of Sir Edmund Beckett, when under suggestion he tries his hand at making the foliage which he is at work upon less servilely imitative. Grisi, in days now almost days of yore, sang every note that the composer set down for her,—those and no more,—while Madame Persini was scarcely to be restrained in her exquisite embellishments; and yet was "La Diva" the greater artist, in virtue of the vigour of her sympathetic spirit and the unprompted graces of her expressive acting.

If the best works of architecture that the world possesses can be shown to have none of the characteristics of fine art,—to owe none of their value,—not, indeed, to owe their chief value,—to refined and appropriate expression, as graceful, as elegant, as beautiful,—nay, as sublime,—then is architecture, of course, no fine art at all, and architect and artist are interchangeable or contradictory terms. But otherwise, whatever may be the matter of fact in particular instances, and no one wishes to restrict the right of critics to have decided opinions of their own, there is assuredly the best reason in the world for that honourable aspiration to the title of artist which critics as independent as need be, and quite as disposed to be critical as they should be, are happy to think may be pronounced even in our own day to be abundantly justified.

#### FOOD FOR THE MILLION AND HOW THE PURCHASERS ARE CHARGED.

The question of the provision of sea fish for the food of the people is one that has again and again been mooted in our columns. It is the opinion of those who have deeply studied the subject that the influences which have hitherto kept down the supply of a cheap and nutritious article of food are not such as altogether court the daylight. We have heard complaints of the railway companies; complaints of the fish-curers; complaints as to the dangers of the sea; complaints as to monopoly of market. But never yet, so far as we are aware, has the matter been fully discussed on unquestionable data. The production of these data is one of the incidental advantages for which we have to thank the Select Committee on Railways. We shall be very much surprised if much of the information elicited by, or volunteered before, that committee has not a very different effect from that which was contemplated by those who offered the evidence. That such must be the case with regard to the evidence offered as to the cost of the grades and mineral stations on railways there cannot, we think, be the least doubt. In this case, however, we have to call attention rather to an accidental than to a direct outcome of the evidence.

The price at which railways carry fish is one of the points as to which much has been said, both *pro* and *con*. In perhaps no respect, except with regard to the carriage of passengers, is the speed attainable by the railway so directly important as with regard to the carriage of fish. Distances are long; speed, if a fall load is made up at the shipping points, may be to a great degree uninterrupted; and on all the principles which have been lately advanced by the managers of railways as arguments for reducing charge (except that of sea competition), the remunerative cost of a full fish-train ought to be as low as that for almost any article of transport.

What is actually done is this. A ton weight of fish, according to the evidence of Mr. Robert Barclay, of Montrose, is carried 526 miles by the fastest trains in the world for 3l. 15s. This is at the rate of 1.7d. per ton per mile; and considering that the fish-train must return

empty, or nearly so, is, we think, quite as low a price as any railway company can be expected to charge, unless, as in the case of the fishing-boats, a "bonny" were paid for the train by some of the capitalists interested in the trade. Between the deep sea to the north of Scotland and the London dinner-table the railway train is as essential a link in the communication as the net of the fisherman himself. And when we come down to the unit of retail purchase, the pound, we find that less than one halfpenny, or, more exactly, 13 thirty-seconds of a penny, represents the cost of railway carriage.

What do we pay for cod, for it is to cod that these calculations chiefly refer? Seldom, if ever, less, often we think more, than 1s. a pound. Towards this the iniquitous charges of the railway company make up, as we have seen, less than one halfpenny, actually 3.3 per cent. of the shilling! How is the rest made up?

The person who hands the fish to the railway company is the curer,—a small local capitalist, or, at all events, a local capitalist, whether small or large. His outlay consists in providing boxes, and boxing the fish (for which he pays at the rate of 9d. each, over a standard size), besides making an allowance, or bonny as it is called, of 1H. per boat for the season. Besides this he pays 3d. per cwt. cost of carriage across London to Billingsgate, and carriage of box to London, with a small return charge for the same. His receipt for this (of course not including the railway freight) is 5s. per cwt., or 17 thirty-seconds of a penny per pound. So railway and curer together do not come up to quite 1d. per pound for their share in the 1s. paid by the housekeeper.

The reader will now come to the comfortable conclusion that it is the fisherman, the bold and hardy manner who provides boats, mans them, goes out, often with his life in his hand, and catches the fish, who has the lion's share of the shilling. Alas, no! He only makes up the even 1d.,—only receives for his own share 5s. 3d. per cwt. or 18.32nds of a penny per pound! And so fisherman, and curer, and railway, and carriage across London, all together, only come to 1½d. per pound. Who has the other 10½d.? And what are the services that he renders to the public for seven-eighths of the whole retail price of the fish?

The reply to that question was not brought before the Committee on Railway Rates. It is one which the purchaser of fish may, it seems to us, with some reason, rather loudly demand. Who gets the 10½d. per pound? Who gets, and for what service, twenty times what the fisherman receives for his perilous toil? There is, or at all events there used to be, such a thing as a sense of justice,—as a measure of proportion, on the determination of retail prices. But here we have something so outrageous as to be incredible, on any less unquestionable authority than a Blue Book. A halfpenny out of the shilling for the fisherman, a penny more for bringing the fish from John o' Groat's to Billingsgate, and tenpence halfpenny for bringing it from Billingsgate to the dinner-table! Is this to be tolerated? Again, we know that the price of fish is subject to great and sudden rise, in case of stormy weather. Less then comes, no doubt, to the market. But does the fisherman get more? We doubt it. As far as the evidence before Parliament goes, he takes the rough with the smooth, and only gets 9d. per cod whether he brings in more or fewer. If on any of the other fishing stations there is a variation in the price, we may be tolerably sure that the fisherman gets anything but the lion's share of the augmentation. If his prices were doubled, it would not affect the cost of packing or of carriage. We should have cod brought to London for 2d. a pound instead of for 1½. But is it not out of the way for us to pay 1s. 6d. for the same, on account of stormy weather?

It really does seem as if this was one of the abuses which can hardly be maintained after it is dragged into the full light of day. We saw, some little time back, how the Londoner was benefited by the conduct,—at once businesslike and patriotic,—of a noble marquis, in selling his own coal. We should venture to suggest that any patriotic Scottish nobleman who should put himself at the head of a movement for enabling the fruit of the toil of Scottish fishermen, which comes to London for 1½d. per pound, to reach the fish-kettles of the mass of the London population at something like a proportionate price for the trouble and risk of retailing, would ensure a double popu-

larity. Whatever were the gratitude felt by the fishermen and their families,—a gratitude that might very likely be stimulated by the reception of something more than the present pittance for a perilous toil,—we think we could answer for the way in which the movement would be hailed by the London householder. Best cod at 3d. per pound would be a welcome and a health-giving addition to many a table. And who shall say, in the face of the above evidence, that 3d. a pound does not leave an ample margin for the retailer of fish?

#### CHRISTIANITY IN BRITAIN IN ROMAN TIMES, WITH REFERENCE TO DISCOVERIES AT ST. MARTIN'S CHURCH, CANTERBURY.\*

THE subject of my paper is one of no small interest in relation to the much-discussed subject of the origin of Christianity in our land. It is no less than a notice of what I believe to be the discovery of a portion of a Christian church erected in Roman times.

I propose to describe the discoveries in detail, but, before doing so, it may be well to make some introductory remarks upon the subject of such deep moment to us all,—the commencement and growth of the Christian faith in our country.

When we to believe implicitly the so-called writers of ecclesiastical history, Britain must have been well advanced in Christianity when the Saxons landed on our shores. Alas! that it has to be stated. These records,—of later date in all but every case,—bear the attendant stamp of the later date. Fact gives place to fiction, where history is lost in legends so unreal that we have to pause to consider how much is true and how much the results of the distempered fancies of men living too much alone, whose sense of the marvellous caused sober realities to be set aside, or who believed that they were rendering service to the Church by the exaltation of some dogma or some human authority.

So early a date as the year 150 is assigned by the authorities whom Bede follows for King Lucius's request to Pope Eleutherus to "make him a Christian," and this is taken as a commencement of Christianity in England. The dates given do not accord; and the existence of King Lucius at all has yet to be proved.

The Diocletian persecution is a known fact, but there are some real reasons for doubting whether or not it ever penetrated into Britain. At the time the country was under the tolerant government of Constantius, or when the usurpation of Carausius had alienated it from all central rule; and this was followed by that of his successor, Allectus. It is hardly possible that the flame of persecution would have been kindled in our land at the Imperial bidding when no other decree would have been heeded. Nevertheless, more than one chronicler relates the martyrdom of the pious Alban at Verulamium during the Diocletian persecution, when churches were destroyed and holy men were slaughtered.

Alban suffered with all the surroundings apparently inseparable from a monkish legend. The river Thames dries up at his approach to the place of martyrdom, according to Gildas, although Bede's authorities are content to make the miracle occur at the stream between the city and the hill of execution. A spring bursts forth from the spot. The eyes of the executioner fall out!

St. Joseph of Arimathea is said to have settled at Glastonbury; St. Paul to have visited Britain. The King of Britain slays with his own hand hundreds of the heathen Saxons at the battle of Old Bath Hill, his shield being guarded by a statue of the Blessed Virgin!

Thus do the histories of the times, or those written closest to the events, teem with improbabilities, and give reason for the doubt expressed by so close an observer of archaeological facts as the late Mr. Thos. Wright, who says, "We seem driven by these circumstances to the unavoidable conclusion that Christianity was not established in Roman Britain"; and again "not a trace of Christianity is found among the innumerable religious and sepulchral monuments of the Roman period found in Britain."<sup>†</sup>

These are conclusions too hastily arrived at; and antiquaries should ever remember that

\* By E. P. Loftus Brock, F.S.A. Read at the meeting of the Kent Archaeological Society at Maidstone, Aug. 2, 1882. † "The Celt, the Roman, and the Saxon," pp. 353, 355.

their facts of to-day may receive fresh additions and illustrations by the discoveries of to-morrow. The most absurd-sounding of the old legends may contain a germ of truth under their later dress. Strip it off the latter and we obtain the right view of the case. Thus, at St. Alban's we find the appearance of the country,—even to the pool of water,—agreeing with what we can trace there to-day, while the local belief in the reality of the proto-martyr of England is shown by the continued existence of a costly church on the spot named by tradition as that of the Martyrdom. A battle was fought at Bath Hill, and it is very possible that a British chief or ruler was there. The legends of St. Paul and of St. Joseph must be taken with all caution; but their remaining as local traditions for so long a period is a very noteworthy fact. The old historians render evidence, however, of greater weight and importance to our inquiry, bearing, as it does, much of the impress of reality and truth.

St. Athanasius, in the middle of the fourth century, speaks of British bishops being present at his trial at the Council of Sardis. Three British bishops are recorded to have been at the Council of Arles, A.D. 314. Their names have subjected them to questioning criticisms, which, if it stood in relation to this event alone, would be worthy of all attention. The fact remains that, as soon as history becomes reliable, we find that British bishops are actually in existence in various parts of our country. There was apparently one see independent of Rome in Cornwall up to the tenth century, when Athelstan, bishop of Bodmin, was consecrated by Archbishop Plegmond, A.D. 904, and the see became subject to the Saxon Church. We hear of bishops of the British Church early in the sixth century subject to the Metropolitan of Caerleon. The foundation of the Cambrian sees may be lost in obscurity, but their continuance is a fact to this day. From the fourth to the sixth century, when reliable history comes to our aid, is not long; and it is more reasonable of belief that the bishoprics then in existence were but the continuance of foundations of an earlier period, than that they were unrecorded foundations of the later time.

Statements by reliable and contemporary authors, rather than those of later dates, may also be appealed to in a few passages, which I will rapidly glance at. Origin, in the third century, asks, in his Fourth Homily on Ezekiel, "When, before the advent of Christ, did the land of Britain agree in the worship of Ono God?" Tertullian's well-known statement, "The parts of Britain inaccessible to the Romans are subdued by the truth of Christ," bears the stamp of true history, and is in harmony with the archaeological relics.

There is evidence of still another kind in the old histories. Incidentally, we hear of considerable intercourse between the churches of Armorica, Ireland, Cornwall, Scotland, and the north of England. We find this as soon as history becomes reliable, and we may readily believe that this too was but a continuance of something older rather than something of recent occurrence.

The two visits of Germanus, bishop of Tours, to Britain, the mission of St. Patrick to Ireland, and that of Bishop Palladius to confirm the faith of the Scots,\* all point to the existence of Christians in these countries, and at many points of them, and may be accepted as the reason for the existence of such large numbers of British Christians of the sixth and later centuries. We are thus prepared for the congregations in the Banchors of Ireland and Wales, the missions of Columba and of the Cnidas, and for the flourishing Christian churches of the land which appear to be separate and distinct from Saxon England.

The evidence of Christians at an early date is also shown by the rise and progress of the Pelagian heresy. The Church must have possessed a vast number of members, for the errors of the time to be so recruited from their midst; and it may be noted that when Germanus strove so ably to refute the evil, we hear of him not at one spot of Britain only, but at Verulam, Oxford, and in Wales.

I will now proceed to describe actual relics of early Christian times that have been revealed through the aid of the science of archaeology. It may, however, be readily supposed that the extent of Christianity cannot be judged or measured by these. The decay of time may account

for the loss of many. Many more may yet remain to be discovered. We may suppose, too, that there may have been many Christians, and but few indications of their presence that could survive to our time. Indeed, there may have been but few outward signs even at the time referred to. "Though we have known Christ after the flesh," says St. Paul, "yet now henceforth know we him no more."

The sentiment was doubtless that of the Church for a long period; and it is quite possible, under its influence, for there to be a large and flourishing congregation of Christians with but few tangible evidences of its existence.

So early as the latter part of the last century, a Roman villa was discovered at Frampton, Dorsetshire. It was evidently a building once occupied by a wealthy owner, for the pavements were of great beauty. On one of these, filling a small semicircular apse, the Christian monogram was found, worked in mosaics, forming a portion of one of the most elaborate of the pavements; while, in another pavement, there is a medallion portrait, with a mild and amiable expression which is recognised by some as a portrait of Our Blessed Lord.

The Chi-ro is an early rather than a late symbol used by the Christian Church, and its presence in a wealthy Roman villa is a significant fact. The discovery attracted much attention at the time, but being an isolated fact, it was doubted, or believed to be a later insertion. It had almost passed out of memory when attention was again called to it by my friend, Mr. T. W. Grover, in 1867.\* This was followed by the discovery, in 1864, of another Roman villa at Chadworth, in the county of Gloucester,—so favoured by the Romans. Here the monogram of Christ was found carved on two of the steps as if to mark the sure foundation of the building. A hexagonal bath, of remarkable construction, is believed, and with very weighty reasons, to have been a baptistery.

Mr. Grover enumerates, among other precious relics of early Christianity, the presence of the sacred monogram on two plates of pewter found in the Thames at Battersea, now in the British Museum, and points to the numerous coins of Constantine, having the *labarum*, and those of Magnentius with the Chi-ro. With so many signs of the Christian faith, now in the ascendant, circulating among them, our surprise would be rather if there were no Christians then in our land, instead of at their presence. It can hardly be doubted but that many of these coins were minted in Britain. In addition to these, there exists at Alwick Castle a Roman urn of the well-known Castor ware. It has the sacred monogram laid on in white slip. I am indebted to Mr. Roach Smith for the reference to this evidence, and he adds that it is the only object having reference to Roman Christianity known to him.

At a meeting of the Society of Antiquaries held very recently, a remarkable discovery at a Roman villa at Fifestead-Neville, Dorsetshire, was reported by Mr. Middleton. Among the excavated remains of the building, two silver bracelets were found. On one was the sacred monogram; it occurred again on the other in slightly different form, with two palm-branches left and right.

I have confined my references to examples that are beyond doubt or question, to the exclusion of many that cannot either now be referred to, or which are of doubtful or of Mithraic import. Time will admit only of passing reference to the Christian monogram on the tomb of Caransins, at Pen Machno, one of a long series of Christian monuments extending quite into the later Celtic style of the Welsh church; and to the Scottish series, which has exactly the same sequence. The Cornish examples go over the same ground, and prove the existence of Christianity from early to late times. The Rev. S. M. Luch-Szymra has recently called attention to the presence of a monument with Roman lettering, most probably of Christian origin, in St. Hillary Churchyard, close to another of Celtic-Christian style, with others of the Early Gothic period, as illustrative of the continuance of a Christian cemetery on the same spot from Roman times to our own day.

I have briefly scanned some of the salient points of the old chroniclers. There are others in relation to the building of churches, but it

may be needful, for brevity sake, to refer to but three of these.

St. Augustine (A.D. 602), "being supported by the king, recovered at Canterbury" a church which, he was informed, had been built by the ancient Roman Christians, and consecrated it in the name of our Holy Saviour, God and Lord, Jesus Christ, and there established a residence for himself and his successors.\* This is as direct and clear a statement as can well be desired, made by the most judicious of all our ecclesiastical historians, the Venerable Bede, and from records which are carefully noted in the prologue to this book.† "Traces of the assistance which he derived from Canterbury are perceptible in the minute acquaintance which he exhibits not only with the topography of Kent, but with its condition at the time when he wrote." The finding of a probably ruined building on the site of the intended new church could hardly have been an invention, while the fact would have been sufficiently noteworthy to be recorded. We may, therefore, conclude that the Roman origin of Christ Church, Canterbury, is an historical fact, as well made out as any fact of such a remote period can be. The men of that ancient city, the cradle of our faith, so to speak, may well congratulate themselves that the sounding forth of Christianity from the cathedral, hardly interrupted from the days of Augustine to our own, had its beginnings at a still earlier date. An historian entirely of another type,—Thorn, a Benedictine monk of St. Augustine's, at the end of the fourteenth century,—records—"There was, not far from the city, towards the east, as it were midway between the Church of St. Martin and the walls of the city, a temple or idol-house where King Ethelbert, according to the rites of his tribe, was wont to pray, and with his nobles to sacrifice to his demons and not to God; which temple Augustine purged from the pollution and filth of the Gentiles; and, having broken the *huago* which was in it, changed it into a church, and dedicated it in the name of the martyr St. Pancras, and this was the first church dedicated by St. Augustine. . . . While Augustine was celebrating mass for the first time, the devil, seeing himself driven out from the house which he had inhabited for long ages, tried to overturn from the foundations the aforesaid church, the marks of which thing are still apparent on the exterior eastern wall of this aforesaid church."

We have in this doubtful-sounding history a good example of the records of the time. The position given for the building is exact. The legend can hardly be believed, but yet it is referred to on the spot now, as recorded 700 years ago. The site is waste, and a ruin only remains there; but in the modern boundary-walls, on the north-east side, a channel in one of the stones was shown me in the summer of this year by the son of the proprietor of the site, as being the veritable claw-mark of the Author of Evil. If the legend has thus survived for so long a time since it was recorded by Thorn, who can doubt but that it may have existed long prior to his time? We owe to the zeal of the Rev. Canon Rontledge and the painstaking efforts of this Society singular archaeological evidence. The ruins are those of a Roman building.

To refer again to the Venerable Bede, and to the passage so well known to us. "There was on the east side of the city a church dedicated to the honour of St. Martin, built whilst the Romans were still in the island, wherein the queen, who, as has been said before, was a Christian, used to pray." It is in this church that the recent discovery of Roman masonry has been made, which is the immediate reason of my paper.

These three structural records have been referred to so often that I hesitated to bring them forward again. I have done so, however, since they have never been thus grouped together, and my purpose is two-fold. While they indicate the Roman origin of two of the buildings to be passed in review, they afford us evidence not a little startling of the extent of Christianity in Canterbury in Roman times. Here, in a distance hardly one mile from one site to another, we find reliable record of no less than three separate and distinct Roman churches, two being by historical evidence; the third, at St. Pancras, by that of the building itself.

\* Bede's Ecclesiastical History, ed. Rohn, p. 60.

† This has been pointed out in the preface to the edition published by the Early English Text Society. The quotation is from this preface.

\* The date is given in the Saxon Chronicle as 490.

\* Pre-Angustian Christianity in Britain.—Journal of the British Archaeological Association, 1867, p. 223.

I need dwell but briefly on Canon Routledge's discoveries at St. Pancras.\* The building has a nave, 42 ft. 6 in. long; a south transept, central with the nave, 10 ft. 6 in. by 9 ft. 6 in. Another building, of exactly the same size, at the west end, contains the entrance, an eastern apse opening into the nave, and flanked on one side, where we should look for the chancel arch, by the base and part of the shaft of a Roman pillar, evidently removed, however, from some other building. The discussion as to the age of the walling has been materially lessened from the fact that the mass of the western wall has been visible above ground for many years, and has always been considered of Roman date. Attention was directed to it by the late Mr. J. Brent, F.S.A., who has often spoken of it to me. It was pointed out to the members of the Royal Archaeological Institute as a Roman wall by Mr. J. Parker, C.B., than whom no man in England is a better judge, from his acquaintance with brick buildings so common in Rome and so unusual in England. The concrete floor, too, of the church was pronounced to be similar to what is found in Roman villas by Mr. Roach Smith, F.S.A., long before the church-like plan of the building had been developed. The walls of the church are of brick and flint, and have been altered, probably in Saxon times, the large chancel-arch having been lessened in width, and another opening made into the transept. It may be noticed, too, that the western building of brick has a straight joint where it abuts on the western wall of the church, as if the former were later in erection than the latter. Still, minute inspection will show that the walls of this western building,—tower or porch,—has been not only plastered, but painted in a bright purple-red Roman fresco. A part of it is still visible in the old west wall beside the threshold of the Norman western door leading into the church, where it was met with during the recent excavations, having been buried beneath the level of a later floor.

To pass to St. Martin's. Probably few buildings have been more frequently scanned; probably few in a more superficial manner. The result is, that its true evidences have been passed by unrecognised, the popular belief being that the walls are Early Norman, wall a later east end; the flat plaster buttress of the nave being considered as conclusive in determining the date. No statement is further from the fact, for there is nothing whatever of Norman work in the walling except very apparent insertions. We may search in vain for the inner and outer casings filled in with rubble, so common in Norman work. There are no small worked quoins, with Norman diagonal tooling; no grouted work, and no thick walls such as the Normans always built. On the contrary, the walls at once testify that they are different from those of an ordinary church by their unusual thinness,—a characteristic rather of some modern than of ancient churches. They average 1 ft. 10 in. only in thickness. This dimension must at once attract our attention, for it is very unusual in the walls of Roman villas, where we meet with it over and over again. The materials, too, are similar, resembling what we find in villas,—a mass of solid rough walling, partly of brick, partly of stone, evidently intended to be plastered originally on both sides, and in the case of the nave of the church, built with sea-shore mortar of such remarkable solidity that, although the walls are thin and lofty, yet they have sustained the thrust of the later high-pitched roof of Gothic times without injury, and they still stand solid and sound. The flat buttresses at the south-east angle, and the central circular buttress of the nave, are of stone up to a certain height, then of brick; above this they have been tampered with. Those of the south-west have disappeared during some rebuilding of early date. One only of the north-west angle buttresses remains, the other has been cut away. It is constructed for the most part of stone from some other Roman building, and roughly cut to fit into its present position. The neatness of the evenly-cut beds of earlier date contrasts with the roughness of the later work. It was within the church that the Rev. Canon Routledge's first discovery was made. His curiosity being excited, he had a portion removed of the modern wall framing near the south-east angle of the nave. Here, hidden behind it, a portion of the original plastering

\* The record of the excavations at St. Pancras is given in a paper by the Rev. Canon C. F. Routledge, in "Archæologia Cantiana," vol. for 1882.

of the walls was met with in position. It is Roman plastering formed of pounded brick. By Canon Routledge's invitation, I had an opportunity of inspecting this remarkable evidence of the Roman date of the building. I placed a specimen that I removed from the walls with another which I had brought but a short time previously from the Roman villa at Wingham. They are identical in texture, and but that I had marked the latter, which is thinner, I should not have been able to distinguish between them. This plastering has been found internally on several portions of the nave walls, both north and south, but not quite up to the west end. During a recent visit I found that the south walls of the nave had also been plastered, externally, with mortar of pounded Roman brick, in larger fragments than to the interior, and a portion of it is still firm. Its course may be traced, and this indicates the portions of walling that are original, and those which have been rebuilt. It can be traced to the lower part of the central buttress, but not to the upper, and it disappears when near the west end. The western part of the chancel wall, south side, is wholly of brick; the sea-shore mortar is not so apparent, and the Roman plastering has not been met with either internally or externally. It may, therefore, prove that this portion, like the brickwork of St. Pancras, is of slightly later date, and that we have in St. Martin's an example of a church to which a chancel has been added. Whether or not this chancel ended originally in an apse has yet to be proved, the present square east ending being of the thirteenth century, and an extension of the original building. On the south side two curious openings call for remark. One is a square opening, having a massive lintel of green stone above, and an equally solid threshold below. This had been walled up in Mediaeval times, in part, and used apparently as a low side window. Traces of wall painting were found on the later enlarged jamb on the west side. To the east of this a small semicircular arch is to be seen, recently revealed by Canon Routledge. This may be of later date than the former opening, for, while the eastern jamb appears solid, and the bricks which compose it range with the others, that on the west side is not so regular, and the arch itself, of thin stones, seems as if it had been inserted in an older wall.

St. Martin's Church consists of a nave, chancel, a western tower of fourteenth-century date, and a vestry and organ-chamber of more or less modern work on the north side of the chancel. In seeing much modern work within the building, we cannot but regret that the golden opportunity afforded by the ordeal of restoration some years ago was not taken advantage of for a thorough survey of the fabric. The Roman work is of late rather than of early date.

To conclude. We have at St. Martin's the concurrent testimony of history and of the building that it is of Roman date. We have, also, the close analogy of the work with that of St. Pancras, even to the differences of construction there visible. In both buildings alike the orientation, which is perfect, points to the fact that these two Roman buildings were originally intended to be churches, and that we are not regarding the remains of buildings originally erected for some other destination, used at a later period for sacred worship.

The gratifying nature of this evidence will commend itself to many a lover of our old English churches. Probably to no one parish church has more interest been shown than to the little Church of St. Martin, on the hill side overlooking Canterbury, where at least the site and the surroundings have been recognised justly as the same as when Queen Bertha worshipped here, and St. Augustine commenced his momentous mission. This interest may now be very greatly increased when weighty archaeological reasons are thus rendered to justify our belief that the fabric is actually the same as in their day, and that we have in it, as at St. Pancras, actual remains of a Roman Christian church.

The revealing of traces of two Roman churches where none have been hitherto noticed is a remarkable archaeological fact. It is sufficiently gratifying to show that, while we are spending pleasant holiday hours, we are recovering a portion of the lost history of our land. No sooner is the subject noted than its scope enlarges. St. Pancras shows in its eastern apse that this feature was of earlier date than at first we may have been inclined to believe, and

that its presence here need not be attributed to any importation either from the Western or the Eastern Church. I have already spoken of the semicircular apse of the Roman villa at Frampton, a feature of constant occurrence in such buildings; but we owe to Mr. G. Dowker, F.G.S., evidence of its existence on an extended scale. He opened out the site of the church within the Roman station at Reculvers in 1877, and proved beyond doubt that the building in all its leading lines was Roman. It has an eastern apse, a nave, and side aisles. The walls of all are of this early date, and the flooring is so also. In the present condition of our knowledge we must believe that this is a Roman building. A basilica it may be, for we can hardly believe that in the third or fourth centuries the centre of a new Roman station could be chosen for the site of a Christian church. So church-like, however, is the plan, that it affords us good evidence that the church-builders did at once follow it as a model in Britain, as we know they did on the Continent, and we may, therefore, believe that the builders of the apse of St. Pancras had their model at hand. The plan, too, of the ancient church of Brixworth, Northants, with its nave arches neatly turned with Roman bricks, and its so-called three periods of Saxon work, is so like in its leading lines to the plan of Reculvers as to raise the inquiry in our minds whether or not we may not find there also traces of another Roman Christian church.

#### AN IRON LIBRARY.

For the last twenty-five years there has been a small literary army at work, under the auspices of the Philological Society, to compile a dictionary of the English language so comprehensive that not only every word now in use, but every word that has ever been in use, should be duly registered in it. To use Archbishop Trench's figure, the intention is to draw a sweep-net over the whole surface of English literature. Herbert Coleridge was the first editor of this coming dictionary, and under him plied about 150 volunteers of the first literary water. After his lamented death, Mr. Furnival took the helm, and was assisted by a volunteer staff as brilliant and enthusiastic. And now Dr. Murray, of Mill-hill, guides the gigantic undertaking. No fewer than 754 volunteers are now engaged in reading and transcribing, and in other ways furthering it, under his directions. When the scheme was handed over to him two tons weight of material had accumulated, and the question arose where was this amount of literary stock to be housed. In this month's number of *Frazer's Magazine* there is a minute, learned, and picturesque account of the whole endeavour, under the title, "English: its Ancestors, its Progeny," by Miss Humphreys, which tells us Dr. Murray met the difficulty by the erection of an iron library:—

"He orders an iron library, therefore; he puts it, too, precisely at his house-porch. His house,—a quaint timber-layered, white-painted old residence at Mill Hill . . . is just adled to, in this magical way, by an extra apartment, and all is complete. The bit of land thus covered was a sunny piece of garden before. It was a part of the village. The small-paned windows of one side of the house looked at it, and looked at a gate that led to an into primitive shop-keeping and close gossip, into all the hot sleepiness and settlement of comfortable and contented rusticity. But now the small-paned windows are blocked up, or nearly so, by the corrugated sides of the new structure; by its sky-lighted roof, sloping and spreading; and there is no view of opposite gable and branch-top, of loitering neighbours, of the rare interlude of a vehicle passing by. The scriptorium, become the object of the life to be passed in that tranquil suburban home, is become also the main object, in the other sense, to be looked at from the home; and there it is, in its so many feet of flat dull gray, its so many feet of flat dull brown, whilst yet the uncomely stiffness of it, the uncomely straightness of it, is just redeemed from all prosaic utilitarianism by the fringe of ferns, self-sown and graceful, that decorate its feet, by the occasional chirrup and song of free and happy birds."

In this library, or scriptorium, as it is called, which is lined with rows and rows of plain deal pigeon-holes and shelves, and furnished with plain deal tables, sit a few especial workers. The main body of volunteers do their work in their own homes, where each reader is furnished with a packet of slips printed with the title of the book that is to be perused, the date, and initials for volume, chapter, and page. About 1,000 of these slips are returned daily, filled up

with more or less neatness and accuracy. We quote the following passage with pleasure:—

"These are slips, contributed by an architect, to represent architecture, as beautifully copied,—in red ink the title, in black ink the extracts, that the contrasts may relieve the eye,—as if each were the under-writing of an exhibited design, with no item too insignificant to get reserved place upon the plan. One John Shute's book, these quotations are seen to come from, as they enforce attention:—John Shute, Painter and Archyctek; getting imprinted at London in Fleetstreet, nere to Saint Dunstan's Church, by Thomas Marshe, 1563; calling his work 'The first and chief gronides of architecture used in all the ancient and famous monuments; with farther and more ample discourse upon the same than hitherto hath been set out by any other.' It is an illustration, than which nothing better could come, of the way all artists in their own art, all scientists in their own science, are rallying round the Scriptorium and its master, pouring in his stores their own special knowledge of their own special by-ways, that what each can furnish shall have no failure, but shall help, at its best, to bring the grand outcome of modern philology to good completion. So good an illustration, in fact, is this individual contribution that, lingering over the careful file of it, turning to extract after extract (they count up nearly to a thousand), it is felt to be a pity they should lose the painstaking quality, getting worked in and woven in, and out, among the 1,100 pigeon-holes, being picked out by process and process, treated by every article of the code,—a score only, possibly, in each intricacy of letter A, a score or two in B, a score more in other divisions of other letters, and so on through,—and, some way, this pity gets itself to some expression. Yes; and Dr. Murray's words, there being quickness with him to follow the thought of it, 'these quotations are to be valued immensely. They are lovely.'"

#### THE LIVERPOOL WATER WORKS.

The giants and elfs who, in bygone days, were supposed to haunt the peaks and cymms of the Welsh mountains, had the credit of many deeds, good, bad, and very indifferent, which, however, often showed a decided taste for engineering. The erection of strange old bridges, placing huge boulders on out-of-the-way places, and mischievous tricks with water, were ascribed to mysterious powers or to the Father of Evil himself, and explanations,—satisfactory enough for an age of timid inquiry,—were thus given, that checked any research into plain and half-forgotten facts.

But, as the dreams and fables of such times were often the weird dressing of what was, or had been, a reality; so the achievements of modern times have often been truths stranger than the fictions they have more than rivalled, and in the country where the antiquity of our island has so long preserved its romance and its traditions, some of the most noted feats of mechanical greatness have been performed. The Rualon aqueduct, the Menai bridges, and the Holyhead road and rail have each their fame.

In one of the most secluded valleys of Central Wales, where road, in the usual meaning of the term, has never been, and where rail ought, perhaps, never to go, a great work is proceeding: a valley is to be flooded and a lake formed that shall rival the Llyn Tegid of Bala in size and beauty. The invisible elfs mentioned above would, no doubt, have done such a job in a night, and the first result attributed thereto would have been the discomfort of some luckless swain who had transgressed the unwritten laws of superstition; but in sober reality many days and nights, for some years, will have to be spent in very prosaic labour before the pure waters of the Berwyns and the Cynnyon can flow to be a blessing to the people of Liverpool.

For some years the question of water supply had been urgent with the authorities of that town, and had been discussed with all the various opinions and crotchets of people and parties; the advice of the thoughtful, and the clamour of the thoughtless; the opinion of the expert, and the theories of the incompetent. With some, the Mersey (like the camel to the Arab) was equal to any need. To others, a "deep well" gave hope of abundant supply, but at length the present scheme was approved and decided upon.

The western end of the Berwyn mountains, which form the great water-shed of Central Wales, separates Montgomeryshire, on its northern extremity, from Merionethshire. Shrouded in mist, and watered by almost continuous rains, the solitary peaks seem nearer akin to the clouds than to the dry land. The

Dee and its tributaries are fed from the northern slopes, and the numerous streams that run down the southern slopes find their way to the Severn. About half way along the mountain road from Bala station to the village of Llanwyddin (some twelve miles south), several of these streams originate and ripple down the cymms and hollows, joining below to form the river Fyrnyw, sometimes spelt Fyrnwy, and pronounced Fern-yw. The valley through which the infant river meanders is formed by the great spurs or outliers of the Berwyns. On the east, Cymist Nod (2,188 ft.), and other mountains of lesser height, form a vast barrier, whilst on the west Carreg-y-big (1,937 ft.) and its outliers hem in the valley, which, at its upper end is divided by a prominent mountain, Allt-yr-Eryr. From this point the valley opens out and has a level alluvial bottom covered with pasture, and in wet seasons entirely overflowed by the river. About two miles along, the small village of Llanwyddin is situated on the slope of the eastern mountains; and again, another two miles, and by the old farmstead of Cynon-isaf, the hills turn and approach each other, thereby partially closing in the valley at its southern end, and leaving a comparatively narrow opening, through which the river emerges, and where the dam will be placed.

From this point, looking northward, the view is very beautiful; the valley beneath, with the rising mountains on either side, and the prominent Allt-yr-Eryr in front; the village about half-way among the trees on the right, but otherwise scarcely a touch of art to vary the native solitude of the vale, which, reluctant as one feels to see it altered, will have a fresh charm when it becomes Lake Fyrnyw, or the great reservoir of the Liverpool Corporation Waterworks.

But the picture of solitude and seclusion is soon changed, if one looks to the immediate surroundings of Cynon-isaf. Engine-houses, tramways, navvies' huts, and spoil banks, form a strange contrast to this lonely part of "Wild Wales." The course of the river has been diverted to the west side of the narrow end of the valley, and a trench dug across to receive the foundations of the great embankment which is to reach from side to side. The bottom of the trench, upwards of 50 ft. below the surface, exposes compact strata of rock of the Sibirian series, known to geologists as the Bala or Caradoc beds, which has been carefully cleared of loose fragments and soft matter, so as to afford a clean surface for the concrete. The embankment, 1,255 ft. in length, will consist of two broad walls of masonry, with the intervening space filled up with cement concrete. The ends of the wall will be built into the slopes on either side, where huge "chasers" are being cut to receive them. At the eastern end, in the face of the rock, immediately above what will be the top of the embankment, a granite tablet is inserted, with an inscription recording the date when laid by the Earl of Powis and the names of the principal members and officials of the Liverpool Corporation who were associated with the scheme.

The Earl of Powis is the principal landowner of the district, and of course his lordship's rights, with those of his tenants and other owners, have had to be purchased by the Corporation. The various preliminary surveys, levelling, gauging the volume of the river, &c., prepared the way and gave the inhabitants warning of the great engineering invasion, and, naturally, regrets at the disturbance were modified by the prospect of making something out of it.

A story is told,—which we think has been told before,—of an old Welshman who had a small mountain farm not far off, and had usually sold her hay to a dealer at Llanfyllin. Two years ago, as the works were about to be commenced, the dealer drove over to make usual arrangements, but found the good woman unwilling to sell. Dostiring to know the reason, she informed him in their own language that she anticipated a ready sale nearer home, as a number of "navvies" were coming to the place.

The outlet for the water is in the eastern corner, where the Hiranant tunnel (two and a quarter miles long) is being driven in the direction of Oswestry. From the tunnel the water will be conveyed for some thirteen miles over rough and uneven country, intersected by numerous valleys, then through two short tunnels connected by syphon-pipes to the Oswestry reservoir and filter-beds. From this spot the pipes will be carried to Malpas, then

northwards, and under the Mersey to Prescott reservoir, near Liverpool. The total length of the aqueduct will be 67½ miles.

The height of the embankment will be nearly 100 ft. above the old river-bed, and, after allowing for parapet-walls and roadway, the water-level itself will be more than 80 ft. above the old river. At this level the lake will have an area of upwards of 1,000 acres, at a height of 800 ft. above the sea, and extend 4½ miles northward, covering the village of Llanwyddin, the roads on either side of the valley, a few detached buildings, and Eunnant Hall, a respectable mansion at the foot of Allt-yr-Eryr, where the members of the water committee find rest and refreshment after their periodical journeys from Liverpool to inspect the progress of the works.

It will thus be seen that, apart from the actual operations necessary for the water-supply, much has to be done, even in such a sparsely-populated district, to reconstitute that which must be destroyed. The old village of Llanwyddin will soon be a thing of the past,—its church, school, chapel, "hotel," and cottages, are to be pulled down, its dead will be disinterred, and new Llanwyddin he built nearly two miles on the mountain side, beyond the reach of the pent-up waters. Eunnant Hall, too, and lesser creations, are doomed, and already the new roads are in course of formation.

Near the site of the embankment are the engine-houses, workshops, &c. The engines work the pumps, by which the trench is kept clear of water; and the Siemens generators for supplying the arc-lights, by which the excavation has been continued at night. Saw-benches, lathes, &c., are also in operation. A large shed has been erected for storing the immense consignments of cement that will be required for the walls. A wise provision for the workmen has also been made in the construction of a large "cocoon-room," and near by is a school-church and a mission-hall.

In the Cynnyon valley, about a mile away, a quarry has been opened, and stone, easily accessible and of excellent quality, is being procured for the embankment walls. A railroad is laid from the quarry, from which the stone will be conveyed by small locomotives.

All other materials have to be carted from Llanfyllin (pronounced Llan-yu-llin), a terminal station on the Cambrian Railway, about ten miles distant. Costly as the haulage must be, there are good reasons for not making reservoirs places of easy resort or increasing population.

The Earl of Powis will have the privilege of keeping a steam launch on the lake, and another will also be placed there by the corporation. In case the present catchwater area should need supplementing an increased supply can be obtained by tunnelling through into an adjacent valley.

Most of the work is being carried on by the corporation, under the supervision of their water-engineer, Mr. G. F. Deacon, but the Hiranant tunnel is entrusted to a contractor, and the aqueduct generally will be let by contract in various lengths.

The navvies' huts are on the rising ground at Cynon-isaf, those for the quartermen being in the Cynnyon valley, and other wooden erections, together with some old farm buildings, are occupied by fitters, clerks, foremen, and managers.

As usual, the sudden influx of several hundred men has brought its attendant evils. Crowded together in temporary huts or roughly partitioned-off rooms, the accommodation being insufficient for the number employed, of necessity the requirements of social and sanitary well-being are neglected. The married men and their families make shift in the smallest rooms, almost compelled to take in as many lodgers as can crowd into the rest of the hut. The day and night shifts succeed each other in the same heds, and, as one heavy navy remarked, with a tone of discontent, "Yer hed's always warm, and Saturday nights, when both shifts are in, there's three on yer in a hed. A feller's got no comfort." Happily there is no grog-shop on the works, to be a constant temptation to the wasteful and easy-going navvies, although the village of Llanwyddin on Saturday night presents a painful scene of inebriation.

When one looks upon the swarm of children and the armies of men at these and many other works, and remembers that such, at one place or another, is their usual existence, it seems imperative that something should be done to

insure provision for more suitable accommodation, such as would be conducive to health, morals, and ordinary comfort; also that the children should be under the ordinary educational laws.

Some four or five years must elapse ere this great undertaking can be so far completed as to begin to be of service, and doubtless the actual finishing will require as many more years. Another generation, and the traveller who gazes upon Lake Vyrnwy will admire a scene that he will scarcely be able to realise is so largely the work of science and the doing of men.

#### THE NEW COURTS OF JUSTICE AT HAMBURG.

This structure has recently been completed in its internal arrangements, and will form an imposing feature amongst the many improvements which have lately taken place at Hamburg. The building has a south-west aspect, and looks upon a newly-laid out open space. Its length is 375 ft., and its greatest depth in the centre is 143 ft. 6 in. The underground portions are vaulted, and above the ground-floor are two main stories. The ground-floor is devoted to the civil tribunal; the first-floor to the criminal courts; and the second to the public prosecutor's offices, rooms for examinations, &c. A wide flight of steps leads up to the main entrance. This leads to a vestibule, through which a corridor passes which runs from end to end of the building, and thus facilitates communication between its respective portions. The prisoners are brought from the adjoining prison to the underground floor of the building, from which a special staircase leads to the criminal tribunal.

The fitting-up of the interior is simply, but solidly executed, all the doors and window-frames being in oak. The court-rooms are provided with high wainscoting, and with appropriate ornamentation in wood. The windows are of coloured glass. The heating of the entire building is effected by central air heating. There are also arrangements for ventilation, by means of which fresh air is supplied to the rooms as may be required. The gas and water arrangements, as well as the closets, are upon the most approved principles. The facades of the building are executed in yellowish-red brick, together with sandstone, the whole effect being in harmony with the character and objects of the structure. The roof is covered with slates, and the cast-iron lattice-work is effective. The lightning-conductors are upon an approved system.

The building is from the designs of Herr Zimmermann, who has personally supervised, in a general way, the progress of the work. The structure was commenced in May, 1879, so that the time occupied has been nearly three years and a half. The entire cost of the building is 75,000*l.*, and the furniture has cost 4,000*l.*

#### THE NEW BUILDINGS IN NORTHUMBERLAND AVENUE.

The vacant land in Northumberland-avenue is gradually being covered with new buildings, several spacious structures, most of them of a public character, being now in progress. At the south-west corner of the Avenue, extending into Whitehall, and immediately opposite to the Grand Hotel, a large and handsome block, faced with Portland stone and polished Aberdeen granite, has already been carried to a height of four stories. The ground-floor portion of the building contains nine shops, and the upper floors are intended for offices and chambers. Messrs. Francis are the architects of the building, and Messrs. Dove Bros. the contractors.

At the lower end of the Avenue a residential block, upwards of 80 ft. in height, and containing three stories besides the ground-floor, is rapidly approaching completion. The elevation is entirely in Portland stone, richly ornamented and carved. The ground-floor has a massive arched window, occupying the whole of this portion of the frontage, with the exception of pedimented entrances at each side. The first and second floors have handsome central three-light oriel windows, and to the third-story windows there are projecting stone balconies. The ground-floor is intended for offices and the rest of the building will be occupied by Mr. King, the builder, as his private residence. Mr. Groom is the architect of the structure.

Adjoining the last-named building, and opposite to the premises of the Society for Promoting Christian Knowledge, a large area has been secured for the erection of what have been designated the Charing Cross Turkish Baths. They will have a frontage of about 70 ft. to the Avenue, with a similar depth extending northwards to Craven-street. The foundations of the building are at present being got in, and the superstructure will shortly be proceeded with. Mr. Robert Walker, of Warwick-court, St. Martin's-lane, is the architect, and Mr. Woodward, of Finsbury, is the contractor. The baths are being erected for Mr. Neville, who is the proprietor.

The Metropolitan Board of Works are likewise erecting a new fire-brigade station close to the buildings of the Society for Promoting Christian Knowledge. The principal frontage of the station will be at the upper end of Great Scotland-yard, a short distance west of the Avenue. Mr. Vulliamy has designed the buildings, and Mr. Reading, of Buckingham Palace-road, Piccadilly, is the contractor.

On that portion of the land at the bottom of the Avenue, near the Thames Embankment, and bounded on the south-east side by Whitehall-place, the "Hôtel Métropole," is about to be erected. It is stated that it will not only be the largest hotel in the metropolis, but in the world. It will have a frontage to the Avenue 320 ft. in length, with a frontage of a similar length to Whitehall-place, and will occupy a ground area of about an acre in extent. The necessary excavations, preparatory to constructing the foundations of the building are now in progress.

Messrs. Perry & Co., of Tredegar Works, Bow, have entered into a contract for the erection of the "Northumberland Avenue Hotel," of which Messrs. Isaacs & Florence, of Verulam-buildings, Gray's Inn, are the architects.

It is said that the recently-erected Avenue Theatre, which, it is understood, will be taken down for the extension of the Charing-cross Station, under the South-Eastern Railway Company's Act of last session, will in all probability be rebuilt on a site adjoining the Grand Hotel.

#### THE NEW THEATRE OF ARTS, ROUEN.

The quaint old town of Rouen, which though so thoroughly French, is so intimately connected with English history, was, a few days since, dressed out in gala gaiety. The new Théâtre des Arts, which has replaced the theatre burnt down, it will be remembered, some time ago, was opened with no small degree of ceremony by the French Minister of the Interior; and the architect, M. Sauvageot, received, in the *foyer* of his new house, the Cross of the Legion of Honour. This is one of the graceful tributes which are rendered by our neighbours to the artists who have given France her honoured place in the world. It is these rewards for zeal, these incitements to labour, and this acknowledgment of merit which, it will be found, we suspect, give the French artist,—be he architect, painter, sculptor, or musician,—that sense of his position, social and professional, which can scarcely be said to exist in our country. It is no democratic custom, for we see empires and monarchies alike generous in the distribution of the honours at their disposal amongst those who maintain the artistic dignity of the country to which they belong, and who create those works which will give it a reputation with posterity.

The old Theatre of Arts at Rouen was built in 1776, and was destroyed by the great fire which devastated part of Rouen in 1876. A competition was invited, and many designs were submitted. M. Sauvageot, as City Architect, was not eligible to compete, but he nevertheless prepared a design, which has been carried out, and was opened on Saturday, September 30th, evidently without any of those imputations which in England generally follow, not without apparent reason, such an incident. Pains have been taken to provide a sufficiency of separated staircases and exits, and the stage is cut off from the auditorium by a curtain of plate iron, which is moved with great facility by an hydraulic arrangement.

The new theatre is built on the site of the old one (the area having been enlarged), and is completely isolated. We give a view of the exterior. It covers an area of 1,800 superficial metres. The stage is a very fine one, and the rooms for the artists are remarkably commo-

dious. The auditorium is elegantly decorated and contains 1,600 places. The separation of the tiers of boxes has been well studied, and a good view of the stage is afforded the spectators generally. The *foyer*, of which we publish a view, is a handsome and well-proportioned apartment, and there is a vestibule beyond. The *foyer* is adorned with pictures from the pencil of M. Baudouin, including Melody, the Lyrical Drama, Heroic Music, and similar subjects. The ceiling of the theatre shows a well-coloured allegorical picture by Glaize.

The theatre was opened with an excellent performance of the "Huguenots," seats being at a high premium.

#### LUTON COFFEE TAVERN.

This has been erected by the Bedfordshire Coffee Tavern Company, and occupies a site with a double frontage, viz., Cheapside and Barber's-lane, as shown by the plan.

There are two separate bars, divided by a manager's room and dining-room, which has also two entrances. The kitchen is in the basement, with lift to dining-room.

On the first floor is a large billiard-room for two tables, ladies' room, and commercial-room; and on the second floor seven bedrooms for letting. The whole of the building is fitted up in a pleasing and superior style. It was formally opened on October 2nd, by Earl Cowper, K.G., who was accompanied by the Marquis of Tavistock, Mr. Frederick Howard, and other gentlemen. The architect is Mr. Charles Bell, F.R.I.B.A., of Dashwood House, 9, New Broad-street; and the builders are Messrs. Smart Bros., of Luton. The contract was 1,700*l.*, and the whole outlay, including land, will be about 2,800*l.*

#### THE ZOOLOGICAL MUSEUM AT THE "JARDIN DES PLANTES," PARIS.

This striking building is erected at the end of the grand pathway of the garden at the side of the glass houses. In the centre of the façade is placed a large statue in white marble, within a niche of marble of the same colour.

Upon the upper frieze are engraved the names of those savants who have contributed by their works to the progress of zoological science,—Vauquelin, Blainville, Tonnerefort, Bernardin de Saint Pierre, Claude Bernard, and others.

#### SELWYN COLLEGE, CAMBRIDGE.

The formal opening of Selwyn College has taken place. The college has been founded to commemorate the name and character of the late Bishop Selwyn "as a loyal and distinguished son of the Church of England, as an example of manliness and simplicity of living, and as a great missionary bishop." A sum of about 33,000*l.* has already been contributed for this purpose, and the first block of the college has been erected on a plot of six acres of land at the back of King's and Queen's Colleges. This will accommodate sixty students. The thirty who will come into residence immediately will occupy the end next West-road; the master has apartments on the other side for the present. His lodge will be the next structure taken in hand, and then another block of rooms for sixty more students, as funds come in. When completed, the college will form a quadrangle, with its principal front next Graze-road. The present building, which is in the Tudor style, has been erected by Messrs. Horsman & Co., of Wolverhampton, the architect being Mr. A. W. Blonfield, M.A. The carvings have been executed by Mr. Jas. Frampton.

**The Proposed Fish-market at Shadwell.** The Act to establish a second London Riverside Fish-market at St. Paul's, Shadwell, has been issued. The former statutes to establish the London Central Fish-market, Farringdon-street, and one near the Elephant and Castle, Newington-caneway, have been noticed. The present and third Act provides for the market and the formation of a new street, and the improvement of existing streets, with "landing-stairs," near the market, which, it is declared, will be of local and public utility. Compulsory power to take property is limited to three years, with provisions as to the displacement of the labouring classes and their accommodation.

COFFEE TAVERN, LUTON.

THE NEW ZOOLOGICAL MUSEUM AT THE GARDEN OF PLANTS, PARIS.

SANDRIDGE AND WHEATHAMPSTEAD,  
HERTS.

The general meeting of the St. Alban's Architectural and Archaeological Society was held on Coleman's Green,—an open space by the side of the road which leads from Sandridge to the valley of the Lea, and thence to Welwyn. A goodly number of the members and their friends had assembled, having in prospect some visits to pleasant places thereabouts. The formal business was gone through on the green knolls, and thereafter the Rev. Dr. Griffith, the vicar of Sandridge, called attention to the only remaining portion of an old cottage, the property of Earl Cowper,—an ivy-covered chimney, propped by a brick buttress, hearing this inscription:—"John Bunyan is said by tradition to have preached and occasionally to have lodged in the cottage of which this chimney was a part." The Vanity Fair of Bunyan, and other allusions in his works, Dr. Griffith thought, brought St. Alban's to mind,—the author must have had that town in memory. The tradition with reference to Bunyan's visits to Coleman's Green comes through persons now living, who have talked with Robert Coleman, who seems to have lived in the old cottage, was buried at Wheathampstead in 1844, aged 93, and consequently was born in 1751. Bunyan died in 1688.

The ancient moat and slud were next visited, slud being a deep cutting between trees (A.S., *slud*). This deep cutting, part still filled with water, is easily followed for a considerable distance. When connected with the parallel dyke in the west of it, a space of about 180 acres was enclosed. Dr. Griffith considered this a camp of refuge, at least as old as the Saxon times, for the old parishes of Sandridge and Wheathampstead, which existed as such in Saxon times, were divided by the dyke. Long before that they may have been in existence, and used by the Britons in the tribal wars which were so frequent. It was also probably used at the time of the Danish invasions. It shows marks of Saxon occupation; the fields in the vicinity have Saxon names. Lower Beech Hyde was passed on the way to the parallel dyke, called the Devil's Dyke locally and in the Ordnance Survey, &c. Dr. Griffith explained that the word "Beech," in Upper and Lower Beech Hyde Farms, had a very different meaning from the name of "The Beech Farm" in the adjoining parish. They were probably named from the slud, for the word "Beech" was formerly used not only for the sea-shore, but for any bank. The Devil's Dyke is an artificial valley of considerable depth, width, and length, the earth taken from the cutting being placed at the sides and increasing the depth. It was nearly north and south, and divides the parishes of Sandridge and Wheathampstead, the Hundreds of Cassio and Dacorum, and the two divisions of the county of Hertford.

The next point visited was Marford Bridge, near which once stood a wooden cross with an alabaster image of St. Mary. Standing on the wooden footbridge,—across the River Lea, about half a mile to the east of Wheathampstead,—Mr. R. R. Lloyd, the honorary secretary of the society, said:—"The earliest mention of Marford in the Chronicles of St. Alban's Abbey, occurs during the Abbaey of Robert de Gorham (1151-66), when some land is described as lying 'between the stream of Marford and the land of Sandrugg' (*Gesta Abbatum*, i. 134). It is again referred to in the years 1424-5. It is in the following passage:—"In the third year of the reign of King Henry VI. (1424-5), William Marford, a tenant of the Abbot of St. Alban's, in the parish of Sandrygg, having through old age been deprived of his eyesight, caused a wooden cross to be erected on this side of Marford Brigg, near the highway, on the right-hand side going towards Codicote; this cross, with an image of St. Mary in alabaster, stands on the land of the lordship of Sandrugg" (*J. de Anundesham Annals*, i. 6). The two fields nearest to the ford on the south-east are named respectively 'Marvel [probably a corruption of "Marford"] Meadow,' and 'Crosspath Field.' Marford, which is a hamlet of Wheathampstead, possesses a name whose first syllable is a puzzle to antiquaries. Mr. J. E. Cussans, in his admirable 'History of Hertfordshire,' gives it as his opinion that it stands for *mare*, the whole word meaning 'the ford of the mare.' "The whole valley," he writes, 'was one vast lake or mere, hence the name of the manor Lamer, or Lee-mere. At certain places

this mere was fordable, as at Batford, Pickford, and Mereford, now called Marford. At its narrowest part, between the comparatively high ground on which the railway station now stands on the north, and the church on the south, it was spanned by a bridge, over which passed, and still passes, the road from St. Alban's to the North' (Part six., p. 326). Others have thought that Marford is a corruption of Mary's Ford, and that it takes its name from the image of St. Mary which formerly stood hard by. This, however, seems unlikely, since the name Marford was in use, as I have shown, nearly 300 years anterior to the erection of the image of St. Mary, the account of which, nevertheless, does not absolutely negative the possibility of a statue having been set up here in honour of the saint at a much earlier period. A third solution, which is offered with some diffidence, is that *Mar* is a contracted form of the Anglo-Saxon *Marec*, a boundary. Upon this theory, Marford would mean 'the ford at the boundary,' a term singularly appropriate, when we consider that the boundaries of the Hundreds of Cassio and Dacorum, as well as those of the parishes of Wheathampstead, Sandridge, and Ayot St. Lawrence, all meet at this spot. Marbury in Cheshire, and Marbrook in Shropshire, both of which stand on the frontier lines of the Anglo-Saxon kingdom of Mercia, are examples of the use of this word, which is found in its uncontracted form in Markyate-street." It may here be mentioned, by the way, that Mr. Cussans is seeking 500 subscribers for the fourth volume of his "History of Hertfordshire," the work to which he has already devoted thirteen years of incessant labour. The proposed volume will deal with St. Alban's, Roman and Mediæval; and contain many illustrations. The three volumes already published have entailed on Mr. Cussans a loss of about 3,000l.

The party then drove to Ayot St. Lawrence, and the Rev. Canon Davys, rector of Wheathampstead, gave a short history of the church, now a ruin, but clothed in foliage, and preserved with care and pride. The name of the place, he said, signified an "eyott," or island, as it were, of high ground, between the valleys of the Lea and Marham. The two parishes of Ayot St. Lawrence and Ayot St. Peter seem to have been one at the time of the Conquest, though divided some time subsequently. Domesday Book speaks of one Geoffrey [de Magnaville] holding "Aicete" of the Abbot of Westminster, perhaps one of those manors which, like the neighbouring one of Wheathampstead, King Edward the Confessor granted to the Abbot of Westminster. [This manor appears to have passed out of the hands of the Abbot and Convent of Westminster some time after the Domesday survey, as we find one William de Ayett holding it under the Abbots of St. Alban's in the reign of Edward I. This William de Ayett married Lettice, daughter of Sir Robert de Keynes of Dodford, in the county of Northampton, and in 1305 we find that she presented to this rectory as the widow of William. Their son was Lawrence de Ayett, who succeeded, and died in 1350. The arch leading into the northern chancel would appear to be of the period of Edward I., or the time of William de Ayett, while the latter work would bring us down to 1350, the time of Lawrence de Ayett's decease. This family held under the Abbots of St. Alban's, and those abbots were great builders. What more likely than that architects or masons from St. Alban's might have been sent to this church? The beautiful east window of the manor chancel corresponds in some details with work in Hugh de Evereden's lovely Lady Chapel at St. Alban's, and he was Abbot of St. Alban's from 1308 to 1326, when Lettice, the widow of William de Ayett, having presented to the rectory in 1305, was probably living in the manor-house, and might be employing and solacing the days of her widowhood with church building. The names of Abbots Wallingford, Mentmore, and Thomas de la Mare bring us down to 1350, when Lawrence de Ayett died, so that we may well believe that these proprietors provided the means for the beautiful work we see, and that they sent to St. Alban's for architectural advice and assistance. The Decorated church received alterations and additions during the Perpendicular period. At this time Sir Thomas Barr was lord of the manor,—the monument within the tower is believed to be that of Sir Thomas Barr, who died at Christmas in the year 1421, and his wife. That family remained in posses-

sion of the manor for some years, and we may well suppose that the Perpendicular additions were made at that time. These additions consist of the tower, inserted windows, and a doorway. The church was about to be entirely pulled down by the Lord of the Manor, Sir Lionel Hyde, when he built the new Grecian church in 1778, but the work of demolition was prohibited by the Bishop of Lincoln, in whose diocese the parish was then included.

Crossing the Lea, and driving through the charming Lamer Park, the house was reached, and the party kindly received by Mrs. Drake-Garrard. In the hall stands a wardrobe left by Queen Elizabeth when she visited Lamer, a very fine piece of inlaid work. Charles I., accompanied by his chaplain (Hudson) and his faithful friend, John Ashburnham, stayed at Lamer on April 20th, 1643, when hurrying from Oxford to join the Scottish army. As a memento of his visit Charles left behind him two portraits, those of himself and his wife. A drawing of the house as it appeared at the time of the royal visit was shown, and the position of his apartments, and the precautions taken to secure his escape in case of danger, were pointed out. At Wheathampstead House, the residence of Lord Kilcourse, a portrait of John Bunyan, by Sadler, was inspected, which was discovered by the late Rev. John Olive in the possession of a cottager at Codicote. The Church of St. Helen, Wheathampstead, was then visited.

At No-Man's-Land,—the large common, nearly a mile in length, through which the road from Wheathampstead to Sandridge and St. Alban's passes, the Rev. Dr. Griffith gave an account of the dispute between the men of Wheathampstead and the men of Sandridge as to common rights upon the manors of Westminster and St. Alban's. He said:—"The question of the rights of Sandridge and Wheathampstead over No-Man's-Land used to be much disputed both by the parishioners and their lords, the Abbots of St. Alban's and Westminster. The re-erection of gallows there by Richard Wyth, bailiff of the Abbot of Westminster, was soon followed by their destruction one night with axes and swords. This occurred in 1427, during John of Wheathampstead's abbacy. No one knew who did the deed, but the blame was laid on William Wagh, the terror of religious houses and peaceful farmers. Wyth again removed them. Abbot John, trusting to sound advice about his rights, caused them to be levelled to the ground by the hands of his officers and tenants of Sandridge, in broad daylight, one Saturday. Parish hounds used to be beaten on the Rogation days with religious and other ceremonies. Accordingly, on the next Rogation Munday, the holiday of the great apostle to the Saxons, St. Augustine, quite early in the morning, the men of Wheathampstead finished their perambulations, and then stealthily went out of their way in fear of their very skins, as the chronicler puts it, and planted a slight wooden cross on the site of the gallows. Abbot John, after due consideration, directed the Sandridge bounds to be beaten on Wednesday, after ascertaining that no force of Wheathampstead was prepared for violence. Accordingly, the vicar and men of Sandridge, in due form, singing the Psalms and reciting the Gospels, held their bounds, asserting their ancient rights thus handed down from time immemorial, and went hack unharmed to their several homes. The next year, 1428, a shepherd from Wheathampstead-hury died suddenly on No-Man's-Land while feeding his sheep (perhaps from sun stroke; it was in July). The vicar of Sandridge claimed the body for burial in Sandridge churchyard, but the men of Wheathampstead carried it off into their church, and without a coroner's inquest it was buried in the churchyard there. In 1429, St. Cutlac's Day, the Bishop of Lincoln, under the authority of the Pope and the English Parliament, came to St. Alban's to hold an inquisition concerning heresy. Wicliffism and Lollardism were giving trouble. The Abbot, ever jealous of his rights of exemption, opened St. Peter's Church,—not the Abbey,—to the bishop. On the same day a baron of the Exchequer, John Fray, accompanied by the clerk to the cellarer, made the round No-Man's-Land to examine into the question. The next day, the bishop's inquisition being over, monks, tenants, and bailiffs of the two Abbeys and Abbot John himself and the Baron met on the ground, and there on one side the documents belonging to Westminster were read, and on the other the evidence of an extremely old Sandridge man, John Adam, was given that,

while the right of pasture was common to both parishes, the actual soil was of the lordship of Sandridge. Whether the boundary stones now existing were then laid down is more than doubtful, for ten or eleven years later we find suits dragging through the courts and hints of further putting up and pulling down of gallowes, but it was at last settled by a jury of twelve men from the neighbourhood, that Robert Belamy, farmer and yeoman, and Matthew Bepsette, gentleman and sergeant of the Abbey of St. Alban's, did no wrong when, on November 24th, 1437, they again pulled down the disputed gallowes and carted away the materials.

#### THE METROPOLITAN BOARD OF WORKS AND THE LONDON THEATRES.

SIR HENRY ARTHUR HUNT, the arbitrator appointed by the Home Secretary, has made his award with regard to Drury-lane Theatre, in respect of which building the Metropolitan Board of Works made certain requisitions to the renters under the Metropolitan Management and Building Act Amendment Act of 1878. The points in dispute between the parties were confined to the construction of a new proscenium wall to divide the stage from the audience part of the house, and the provision of a second staircase to the sixpenny gallery, the other requisitions having been practically agreed to by the renters on the advice of Mr. C. J. Phipps. Sir Henry Hunt, by his award, has confirmed the Board's requirement as to the proscenium wall, as well as to the second staircase to the sixpenny gallery; but as regards this latter addition he directs that a staircase to be used in the case of emergency shall be constructed from the sixpenny gallery to the staircase now existing leading from the shilling gallery into Russell-street, instead of continuing the Duke of Bedford's private staircase to the level of the sixpenny gallery as suggested by the Board. The award further provides that each party shall bear their own costs as regards the arbitration, and that the Board shall pay the costs of the award.

#### PROPOSED NEW WORKHOUSES FOR THE METROPOLIS.

THE Local Government Board is rousing the ire of some of the inhabitants and Guardians of the Poor of certain districts of the metropolis by its insistence on the provision of adequate and healthy buildings for poor-law administration. Without committing ourselves to the expression of an opinion yea or nay in favour of all the requirements of the central authority, we are bound to say that of our own knowledge there is good ground for action with regard to at least one of the old workhouses in question. Re-building or enlargement, or removal to other sites, may, and no doubt will, involve increased demands on the pockets of the ratepayers, if only for a time; but, notwithstanding, the necessary accommodation must be provided, so as to avoid overcrowding and other insanitary conditions, with their inevitably attendant and costly evils.

At the meeting of the Guardians of the St. Olave's (Southwark) Union on the 5th inst., a letter was read by the clerk (Mr. J. G. Hawkins), which had been received from the Local Government Board, notifying that, in their opinion, nothing short of the acquisition of the whole of the tan-yard and buildings adjoining the Bermondsey Workhouse would enable the Guardians satisfactorily to carry out their scheme for the concentration of the indoor poor of the union. Mr. Bisle, one of the guardians, observed that that meant an expenditure of 200,000l. He heard that quite 45,000l. had been asked for the land. Ultimately the letter was referred to a committee.

On the same day a special meeting of the Clerkenwell Vestry was held, to take into consideration a letter lately received by the Holborn Union Guardian Board from the Local Government Board, urging upon them, in the interest of the ratepayers, to expend from 100,000l. to 200,000l. "in building large palaces for additional paupers." \* &c. Mr. Leaver moved a resolution, "That in the opinion of the Vestry the building of a new workhouse at Upton, as proposed by the Local Government

Board, for the accommodation of from 1,200 to 1,500 inmates, at an expense of upwards of 100,000l., and the closing of the Gray's-Inn-road workhouse, is quite unnecessary, entailing, as it inevitably will, a large additional burden for many years upon our already over-taxed ratepayers, and a great increase in the cost of efficient management of the several scattered institutions of the Board of Guardians." Mr. Brightly moved, as a rider to the above, "That a conference of the vestry with that of St. Luke's and the Holborn Board of Works be held to consider the subject." Mr. Ross opposed the motion in a speech of upwards of an hour and a half, after which the vestry adjourned the further consideration of the subject for a fortnight.

The Guardians of the Wandsworth and Clapham Union, at their meeting on the same day, had under consideration a letter from the Local Government Board, dated the 18th ult., sanctioning the purchase by the Guardians of a site in Allfarthing-lane for 10,000l., for the erection of a new workhouse. Mr. Barr asked if it was absolutely necessary to conclude the purchase of the site. The Clerk (Mr. Sanders) said it was. Mr. Barr said that, notwithstanding that, he should move that the new plans prepared for enlarging the existing buildings on St. John's Hill be sent to the Local Government Board for their approval. One plan he (Mr. Barr) had caused to be prepared, for constructing a ward over the stone-yard, showed that they could utilise the present premises, and provide beds for 450 extra patients in the infirmary, at a cost of 21,500l., and yet conform to the Local Government Board regulations as to the superficial area to be allowed for each patient. By another plan he proceeded, for erecting buildings in front of the present workhouse, beds for 520 more inmates in the infirmary, and 160 in the workhouse, could be provided at a cost of 26,500l. Dr. Longstaff spoke in support of the purchase of the ground proposed to be bought, and said that neither of Mr. Barr's plans would have the slightest chance of being approved by the Local Government Board. After further discussion the matter was again adjourned.

#### BIRKENHEAD NEW TOWN-HALL COMPETITION.

THE following is the order of merit of the five designs selected by Mr. C. Barry, and the names of their respective authors, viz. :—

- 1st. "Mersey."—C. O. Ellison, 62, Dale-street, Liverpool.
- 2nd. "St. Werburgh."—Henry Hall, 19, Doughty-street, Mecklenburgh-square, London; and John H. Eastwood, 16, Red Lion-square, London.
- 3rd. "Fide."—E. P. Wright, 26, Well-street, Plymouth; and G. B. Ravelife, 3, Ormerod-street, Burnley.
- 4th. "Thorough."—John Sulman, 1, Ferny's Inn, Holborn, London, E.C.
- 5th. "Fortunio."—W. Tyson Goocb, 29, Guilford-street, London, W.C.

The Council, Mr. Alfred Gill, town clerk, informs us, have selected the design "Mersey," in accordance with the recommendation of the referee.

The following resolution was passed unanimously by the Council:—

"That the cordial thanks of the Council be given to those gentlemen who, accepting the invitation of the Corporation, have submitted designs for the proposed new town-hall; and the Council desire to record their appreciation of the hearty manner in which the profession responded to their invitation, as shown by the number and general excellence of the drawings."

A considerable objection is felt to the site originally fixed on for the new building, a small piece of land projecting from one side of Hamilton-square, and it is urged, we think with very good reason, that the proper place for it is the centre of Hamilton-square itself, if the necessary arrangements for effecting this can be made within any reasonable time. The Council, at their meeting on the 6th, came to a resolution empowering them to reconsider the question of site.

**Conservation of Old Buildings.**—At the recent Congress of the Social Science Association in Nottingham, Mr. Samuel Huggins read a paper in which he contended, in answer to the question, "What are the proper limits of conservation in regard to ancient buildings?" that it has no limits.

#### NEW PUBLIC MORTUARY IN CHELSEA.

At the meeting of the Chelsea Vestry last week, it was reported that the new building erected by that body in the old burial-ground in King's-road was completed, and already in use. The walls are lined with cream-coloured glazed bricks, which can be readily cleaned, and the slabs are marble or slate, according to the various requirements. The roof is high-pitched and open; the windows are partially filled with coloured glass; and the water and gas supply, ventilation, drainage, and other matters are provided for. There are three separate rooms; the larger one has three slabs, which are provided for the reception of accidental and other deaths; another room is fitted up with conveniences for making *post-mortem* examinations, and contains a large galvanised iron air-tight coffin, with a partially glazed lid. This is intended for very bad cases, and the remains could be viewed by a coroner's jury without unpleasantness being experienced. A third room is partitioned off from the lobby, and is provided for the reception of coffins generally, and it is hoped that the poor of the district (especially where there is overcrowding) will avail themselves of this free accommodation as a temporary resting-place for their dead. The building was erected from designs prepared by Mr. George H. Stayton, C.E., the surveyor to the vestry, and has cost over 1,000l.

#### BIRMINGHAM.

At a meeting of the Birmingham Town Council on Tuesday last week, the Mayor brought forward the applications about to be made for the privilege of lighting the town by electricity by various companies, and also the offer to supply the electricity for lighting the town-hall, made by the Messrs. Winfield. As regards the latter the Mayor stated that he had caused a statement to be prepared of the average cost of twenty evenings' lighting by gas, which amounted to 2l. 18s. 3d., including attendance, whereas the cost of electric lighting on the basis of Messrs. Winfield's charges would, including attendance, amount to 12l. 10s. per evening, near as could be calculated. The whole question was relegated to the Estates Committee for their consideration and report.\* E. G.

#### DICKENS'S EXPERIENCES OF WORKMEN.†

"I AM perpetually wandering (in fancy) up and down the house and tumbling over the workmen. When I feel that they have gone to dinner I become low; when I look forward to their total assistance on Sunday I am wretched. I dream also of the workmen every night; they make faces at me, and won't do anything."

"I thought we were going backward at a most triumphant pace, but yesterday we rather recovered. The painters still mislaid their brushes every five minutes, and chiefly whistled in the intervals, and the carpenters continued to look sideways with one eye down pieces of wood, as if they were absorbed in the contemplation of the perspective of the Thames Tunnel, and had entirely relinquished the vanities of this transitory world.‡

"Foreman sweet-tempered, but uneasy. Several reams of blank papers constantly spread on the drawing-room walls and slipped off again, which looks like insanity."

"Two men still clicking at the new stair rails. I think they must be learning a tune. I cannot make out any other object in their proceedings."

"Since writing the above I have been up there again, and found the young paper-banger putting on his slippers and looking hard at the walls of the servant's room at the top of the house, as if he meant to paper it one of these days. May Heaven prosper his intentions!"

"As to the carpenters, they are absolute maddening; they are always at work, yet never seem to do anything."

"Joiners are never out of the house, and the carpenters appear to be unsettled (or settled for life.)"

"I clearly see that the workmen yet binged."

\* In the report of Dawson's Memorial, instead of "canopy cast in bronze," read "statue cast in bronze."  
† Hereafter I forward certain extracts which I have taken (after a careful reading) from the published letters of the late Charles Dickens.—F. B.  
‡ Written to H. Austin, October, 1851.

\* We quote from one of the newspaper reports, but we do not suppose that these expressions were used in the letter referred to.

ing in the yard must be squeezed out by bodily pressure, or they will never go."  
 "Three paving blouses came to work at the corner of this street last Monday, pulled up a bit of road, sat down to look at it, and fell asleep. On Tuesday one of the blouses sprang on his hands, and seemed to be going to begin, but didn't. The other two have shown no sign of life whatever. This morning the industrious one ate a loaf. You may rely upon this as the latest news from the French capital."\*

**BUILDING PATENT RECORD.**

**APPLICATIONS FOR LETTERS PATENT.**

- 4,524. J. S. Willway, Bristol. Gas and oil cooking and heating stoves, &c. Sept. 22, 1882.
- 4,550. J. Shaw & F. Milan, Loxwood. Apparatus for indicating the presence or absence of water in cisterns, &c. Sept. 25, 1882.
- 4,592. H. Blair, Glasgow. Ventilating appliances for soil-pipes, &c. Sept. 27, 1882.
- 4,600. W. R. Lake, London. Devices for the suspension of pictures, &c. (Com. by H. R. Heyl, Philadelphia, U.S.A.) Sept. 27, 1882.
- 4,618. E. Whillier, London. Firegrates or stoves. Sept. 28, 1882.
- 4,647. R. C. Thompson, Sunderland. Fasteners for window-sashes, &c. Sept. 29, 1882.
- 4,652. T. Young and G. C. Wood, Sheffield. Appliances for securing windows and doors. Sept. 30, 1882.
- 4,655. R. Hudson, Gildersome. Construction of metallic staircases. Sept. 30, 1882.
- 4,670. J. D. Lampard and F. Coppen, London. Hack-cut for protection of bricks from rain. Oct. 2, 1882.
- 4,700. S. Sturm, Cologne. Apparatus for use in connexion with stoves, fireplaces, &c., for economising fuel. Oct. 3, 1882.
- 4,715. J. Bateman, London. Stoves and fireplaces. Oct. 4, 1882.
- 4,726. W. A. Barlow, London. Door lock or latch checks. (Com. by F. W. Holdt and P. C. A. Vogel, Hamburg.) Oct. 4, 1882.
- 4,727. W. A. Barlow, London. Trapping sewers and drains. (Com. by L. Henry, Brussels.) Oct. 4, 1882.
- 4,731. J. Drewitt, London. Connecting spindles to locks and latches, &c. Oct. 4, 1882.
- 4,739. A. Gandebeben, Brussels. Ventilators. Oct. 5, 1882.
- 4,743. H. Hameock, London. Fasteners for doors and window-sashes. Oct. 5, 1882.

**NOTICES TO PROCEED**

have been given by the following applicants on the dates named:—

Sept. 26, 1882.

- 2,395. H. Greenhouse, Worcester. Fireplaces. May 29, 1882.
- 2,477. J. Smith, Liverpool. Domestic fireplaces. May 25, 1882.
- 2,530. H. Bamford, Brighton. Domestic stoves or fireplaces. May 27, 1882.
- 3,340. A. Drummond, Edinburgh. Appliances for securing glass to astragals and sash-bars. July 14, 1882.

Sept. 29, 1882.

- 3,832. L. Dove, London. Self-acting steam traps, &c. Aug. 11, 1882.

Oct. 3, 1882.

- 2,590. T. H. P. Dennis, Chelmsford. System of glazing, &c. May 1, 1882.

Oct. 6, 1882.

- 3,028. C. A. Jones, Gloucester. Steps or ladders. Aug. 16, 1882.

**ABRIDGMENTS OF SPECIFICATIONS**

Published during the Week ending Sept. 30, 1882.

- 537. B. Vority, London. Burners for gas fires. Feb. 3, 1882. Price 6d.
- These are made of fire-clay and silicate, and have two horizontal chambers, in the lower one of which the gas and air are mixed and heated. This lower chamber communicates with the upper one at both ends, and in the perforation of this upper chamber the gas is burnt.
- 746. T. F. Wintour, London. Ventilating apparatus. Feb. 16, 1882. Price 6d.
- These ventilators are made in a conical form, of perforated metal or wire gauze, and placed in the window or chimney-shaft, &c. The amount of air allowed to pass through is regulated by a disc of metal or mica placed inside the cone.

847. W. Meakin, London. Sash-pulley. Feb. 21, 1882. Price 4d.

The frame is cast solid, and in each of the sides is a slot, in which the axis of the pulley revolves. The pulley and its axis are also cast in one piece.

850. J. Everard, Birmingham. Raising and lowering bins. Feb. 21, 1882. Price 6d.

A lever is eccentrically suspended below the pulleys of the hind cords, and a horizontal slot is formed in the frame opposite the lever. The cords pass between the lever and the frame. When it is desired to hold the cords, the lever is pulled so as to join the cords in the slot; and when the cords are pulled, the lever falls down, and the cords are free.

875. J. Slater and R. Pollock, Edinburgh. Shoring or supporting buildings in course of alteration. Feb. 23, 1882. Price 2d.

Instead of using horizontal wooden beams, &c., a series of iron loaves are inserted at intervals into the wall, which project outside the same. These outer ends are supported by dumb screws. The masonry can then be removed, and the new beams inserted. (Pro. Pro.)

888. H. Sutcliffe, Halifax. Manufacture of apparatus connected with water-closets, &c. Feb. 23, 1882. Price 8d.

These are all made in two halves, and cast in permanent moulds or patterns, and then are joined together by bolts passing through lugs cast thereon.

893. A. Jamieson, Blantyre. Apparatus for mixing concrete. Feb. 24, 1882. Price 6d.

The materials are passed through a revolving horizontal cylinder, in which is a shaft with helical or screw blades, which revolve in the opposite direction.

895. C. Hibbs, Plaistow. Decorative coverings for walls, ceilings, &c. Feb. 24, 1882. Price 2d.

These consist of pieces of glass of various shapes, accurately fixed together, and coloured as required. They are secured on the wall, &c., by a fine cement. (Pro. Pro.)

925. W. H. Lascelles, London. Earth-closets. Feb. 25, 1882. Price 6d.

A rotary receptacle is provided for the soil. Each compartment of this receptacle as it revolves is filled with earth, and, after using, is again revolved, when the earth and soil fall into a suitable pit, the earth being uppermost.

934. J. Carpenter, Southampton. Apparatus for opening, closing, supporting, and locking window-sash frames, &c. Feb. 25, 1882. Price 2d.

The sash has a rack, with ratchet teeth on its side, and bolts pass through a plate on the frame, and engage these teeth. These bolts are pressed out by springs, and held back by cords and levers. (Pro. Pro.)

861. H. J. Haddan, London. Closet valves. (Com. by W. Rudiger, Berlin.) Feb. 22, 1882. Price 2d.

To prevent the valve closing suddenly, a piston is mounted on the valve spindle, which is movable in a cylinder to which water is admitted, and only allowed to flow out slowly. (Pro. Pro.)

Published during the week ending October 7, 1882.

911. J. Parker, Kilmarnock. Manufacture of bricks and tiles. Feb. 25, 1882. Price 6d.

The bricks, after drying, but before firing, are passed through an apertured sieve so as to remove any excess of material or inequalities.

914. S. S. Helyer, London. Water-closets, urinals, &c. Feb. 25, 1882. Price 6d.

The overflow trap of a valve closet is connected with the vent-pipe of the valve box above the level of the valve. The inlet pipe of the basin is connected with the overflow pipe thereof by passing it inside in the basin. The siphon trap of a urinal basin is made in one piece with the back of the basin.

918. H. J. Haddan, London. Ventilators. (Com. by P. Mihan, Massachusetts, U.S.A.) Feb. 25, 1882. Price 6d.

These have a mouth on one side of the hood, and the entrance or exit of the air by or from this mouth is governed by two hinged deflectors.

950. W. P. Borwick, London. Window and other fastenings. Feb. 27, 1882. Price 6d.

A short vertical bar is placed in the end of the lever arm of the fastener, which drops down in a slot or beyond the plate of the lower sash when the fastener is closed, and locks the same.

956. C. D. Abel, London. Ventilating apparatus. (Com. by E. Oehlmann, Berlin.) Feb. 27, 1882. Price 6d.

A turbine carries on its shaft helical blades or vanes, by the rotation of which the air is propelled as required. Two jets of water are used to turn the turbine in the different directions required.

967. F. Wirth, Frankfurt. Stoves for warming rooms, &c. (Com. by E. Schouberg, Brockenheim, Germany.) Feb. 28, 1882. Price 2d.

These consist of a pedestal within which is the fire receptacle surrounded by a fire-brick ring with circular holes, through which the gases escape and are consumed by the heated air inside the pedestal. (Pro. Pro.)

980. T. le Poidevin, Guernsey. Machinery for moulding bricks, &c. Feb. 28, 1882. Price 6d.

The pug-mill has discharge orifices in the bottom, and the moulds pass in succession under the pug-mill and receive the clay therefrom. In these moulds the bricks are pressed.

990. G. Wilson, New Cross. Apparatus for fastening scaffold-poles, &c. March 2, 1882. Price 2d.

Two jaws are hinged together, and inserted under the lashing of the scaffolding and a wedge-shaped piece is driven in between the two jaws. (Pro. Pro.)

2,794. C. Hulsberg, London. Boilers for heating buildings, &c. June 14, 1882. Price 6d.

For heating buildings, &c., by hot-water boilers are used of a saddle-shape, which are divided into two separate parts along the crown. Flues may be made through the crown and the internal shell may be corrugated. Each half is used or wrought separately and placed together in the usual brickwork. When the boilers are cast, the outer side plates are made separately, and secured to the internal shells of the two separate halves.

**CASES UNDER METROPOLITAN BUILDING ACT.**

**WOODEN CONSTRUCTION.**

Mr. HENRY JARVIS, District Surveyor of Camberwell, on the 4th inst. summoned Mr. Robinson, of 23, Peckham-grove, builder, before Mr. Ellison, at the Lambeth Police Court, for having erected a building enclosed on three sides with wood and glass, which was not in accordance with the Building Act.

The defence set up was that the erection was only a shed and not a building, and was exempt from the operation of the Act, and that the defendant was induced by the District Surveyor to give notice under compulsion.

The District Surveyor urged that the building was a workshop with two work-benches in it, and that the defendant used it as a workshop; that upon the first discovery he acquainted the defendant that he had subjected himself to a penalty for not having given notice, and that unless he took down the building, or gave due notice, and amended the irregularity in it, proceedings would have to be taken to have the penalty enforced; and upon this the defendant gave notice.

After examining the drawing of the building, and hearing further evidence, the magistrate made an order for the building to be pulled down at once, or walls to be built to enclose it, and for the defendant to pay 32s. costs.

**WILKINSON'S GRANITE CONCRETE PAVING.**

Sir,—With reference to an article in your paper of the 9th ult., re "Cement, Vulcan, and Asphalt Floors," it mentions that a great difficulty is experienced in finding a material to construct tanks for acid.

We may state that our material is extensively used for tanks in the chemical works on the Tyne and Wear; it is an economical material, and thoroughly resists the action of the acids where brick, lead, zinc, galvanised iron, and other materials have signally failed. W. B. WILKINSON & Co.

**SEWER VENTILATION.**

Sir,—The Littlehampton Local Board of Health has lately completed a system of sewerage said to be on a "very scientific principle." There are a considerable number of manholes with "patent charcoal ventilators" connected with the sewers, but lately the authorities caused these scientific ventilators to be stopped up with street mud to prevent them from stinking the visitors out of the town. I should like to know where the sewer-vapours and gases go when the sewers are tidelocked? I am so ignorant I cannot see wherein the scientific principle lies. A POOR BUFFER.

**FINCHLEY SCHOOL-BOARD COMPETITION.**

Sir,—In the *Barnet Press* of last week the report of a Finchley School-Board meeting (extract enclosed) states that a letter was read from me, "offering to assist the Board gratuitously in taking into consideration the erection of the new Board schools."

This statement is erroneous. As a resident, and otherwise interested in the parish, I addressed to the Board a letter, suggesting that, in the conduct of the competition (in which individually I should take no part) they might adopt the principal recommendations made by the Institute Committee, of which I am a member, viz.:

1. To appoint an experienced architect as assessor, to advise in drafting the conditions of the competition, and selecting the best designs.
2. Instead of premiums to award each selected competitor a sum of money, to compensate him for time and costs.
3. To engage the authors of the chosen designs to carry out their work.

The foregoing (in brief) is a summary of my proposals. To offer gratuitous or other services was never in my mind; indeed, to have done so, under the circumstances, would have been in such bad taste, if only the least, that I will ask you to give me space in your columns for this disclaimer.

SAMUEL KNIGHT.

## SEWERAGE WORKS.

**Harrow.**—Mr. J. Thornhill Harrison C.E., one of the inspectors of the Local Government Board, has held an inquiry as to the propriety of granting permission to the Local Board to borrow a sum of 6,500l. for the proposed sewerage works for Roxeth and Sudbury Hill. The number of inhabited houses with which it was proposed to deal under the scheme was 486, with an estimated population of 2,500 at the outside. The acreage of the land which it was proposed to purchase was 28½ acres. It was intended to deal with the sewage by irrigation on that land. The drainage of the district at present was disposed of by four outfalls. The northern portion of Harrow was drained to the Greenhill Irrigation Farm of 17½ acres, near the railway station. On the south there were some tanks at Sudbury Hill, which were partially affected by the present scheme. On the east there were some other tanks at Sheepcote, where the sewage was treated. The western and south-western districts were those affected by the present scheme. There was there a system of sewers draining into the natural watercourses in the low-lying part of the district. Those watercourses discharged into a brook called the Yedding, and so into the Thames. That state of things had, for a long time, caused many complaints to be made to the Local Board. Mr. Alfred Williams, C.E., is the engineer of the scheme.

**Burslem.**—At a monthly meeting of the Burslem Town Council on the 4th inst., Councillor Ball, in proposing a resolution of which he had given notice, for sub-letting the sewage-farm, said the farm, under the management of the Farm Committee, had, up to the present time, been worked at a loss, although he wished it to be distinctly understood that he did not blame the committee, who had striven hard to win success, and it was their misfortune and not their fault if that had been denied them. The impoverished condition of the land when the farm was entered upon, the drainage and other works required to be done, put any immediate pecuniary benefit out of the question, but when the loss in a single year doubled the estimated amount it looked as if there was something radically wrong. The estimated loss for the year ending March 25 last was 499l., but the actual loss was 988l. 6s. 6d. If they added to that, as they were fairly entitled to do, 101l. 9s. 6d. as interest on 2,029l. 11s. 4d. sunk in stock, for which they got no return, they had a total loss of 1,090l. 15s., representing a rate of 34d. in the pound. Alderman Hulme supported the resolution, and said something like 3,000l. had been lost on the farm, and he contended that there ought to have been no loss. It might have been sub-let for the rent they paid,—many farmers not so good were let at 50s. an acre. Councillor Maddock said he did not believe the actual loss on the farm had been so great as had been represented. They had not stocked the farm, and grass was rotting for want of cattle to eat it. The resolution was adopted, and the best mode of carrying it into effect was referred to the committee.

## PROVINCIAL NEWS.

**Booth (near Halifax).**—On the 30th ult., a "rearing supper" was given to the men employed in the erection of the new co-operative store here for the Luddenden and District Co-operative Society, on the completion of the roofing and closing-in of the building. Mr. Patchett, of Halifax, the architect, has paid great attention to the lighting and ventilation. Each floor is fitted up with special inlets for fresh air, and outlets for foul. The drainage of the new store, as well as that of the houses adjoining, recently purchased by the society, is arranged externally on the intercepting principle for the prevention of sewer-gas entering the interiors. The masons' work has been carried out by Rowland Gaukroger, the contractors for the other trades being J. & S. Murgatroyd, carpenters and joiners; Jonas Anderson, plumber, glazier, and gas-fitter; and J. & T. Alderson, slaters and plasterers.

**Waterloo (Liverpool).**—Seafield House, situate on the sea-coast between Seaforth and Waterloo, has lately been opened as a marine hotel and hydropathic establishment, under the auspices of the International Marine Hydropathic Company. The building has a frontage to the sea of 659 ft., and stands in extensive and beauti-

fully laid-out grounds, attached to which are conservatories, winter gardens, vinerias, and fruit-houses, under glass, designed by Mr. Ed. Kemp, landscape-gardener. Between the house and the sea, and parallel with the promenade, is a large lake, 650 ft. long, containing many million gallons of pure filtered salt water, which is brought from the Perch Rock, constantly pumped in at one end, the outflow being at the other. The depth of the lake is 5 ft. or 6 ft., and in summer it is intended to utilise it for bathing on the American and Continental system. The grounds in front of the house include accommodation for lawn tennis, archery, bowls, quoits, &c., and there is, besides, a music pavilion. The chief entrance to the building is from the Waterloo-road, to which it has a frontage of about 653 ft. In this part of the estate there are ten acres of lawn, intersected by finely-gravelled walks, gay with neatly-kept flower-beds, and the trees which border the grounds amply shelter the house from the east wind. On the extreme south-east are extensive stabling, coach-houses, slippon, fowl-houses, and other accessories, all of which are constructed of Yorkshire and Stourton stone. Messrs. W. H. Weightman & Sons, Liverpool, are the architects of the north wing. Messrs. John Collin & Son, of Warrington, have executed the entire contract for the building; and the other contracts for the various work in connexion with the establishment have been performed by the following firms:—Messrs. Homan & Rodgers, Messrs. G. Atkin & Co., Messrs. Bennett Brothers, Messrs. T. Jones & Co., Messrs. S. Moss & Son, Messrs. G. H. Whitaker & Co., Mr. Robt. Pitt, Mr. John Wallace, Messrs. J. Bramhan & Co., Messrs. Mee & Co., and the Gas Fittings Company, Liverpool; Messrs. Laird & Son, Glasgow; Messrs. Alex. McIntosh, Kirkcaldy; Messrs. Kendal, Milne, & Co.; Messrs. Parker & Brown, Messrs. W. & J. Openshaw, Messrs. Richardson, Tee, & Ryeroff; Messrs. Brown, Davies, & Co., and Mr. W. Wilson, of Manchester. The engineering work was entrusted to Messrs. Bradford & Son, Crescent Ironworks, Manchester, whose representative on the works was Mr. Alfred Giles. Mr. Miller was the clerk of the works.

## THE WAY WE CONTRACT IN ASHFORD.

**Srs.**—The first three undermentioned were invited to tender for sliding into our gasworks, oak girders on brick piers. After our tenders were sent in, another was invited and accepted at 10s. above the lowest one invited at first; but why we have not the pleasure of knowing, after the time and expense of estimating:—

Edwd. Dryland.....	£196 8 0
Steddy & Co.....	195 8 0
Jas. Wood.....	192 10 0
Howland Bros.....	193 0 0

EDWD. DRYLAND, Builder.

## CHURCH-BUILDING NEWS.

**Northaw.**—The dedication of the new parish church of Northaw, Herts, which has been erected in place of the one burnt down on the 20th February, 1881, took place on the 28th ult. by the Bishop of Colechester, acting for the Bishop of St. Albans. The new church having been built on the site of the old one, in the centre of the village, consecration was not necessary. The destruction of the old building was caused by some defect in the heating apparatus, in which a fire had been lighted on the Saturday evening in preparation for the Sunday morning service. The style of the new building is Decorated Gothic of the fifteenth century, and it consists of a nave, chancel, north and south transepts, and south aisle, with porch, and a substantial square tower 84 ft. high. The exterior walls are of Ancaster stone, rock faced, the roof being covered with green slates. The tower—which contains a clock-floors, ringed-chamber and heltry, on three floors,—has four pinnacles, with carved crockets and carved finials to the gables. The east window and that in the tower are filled with stained glass by Messrs. Ward & Hughes, of Soho. The open roof is of stained deal in two shades, while the whole of the seats are of oak, those in the chancel having carved ornamentations. The floor is covered throughout with Minton's tiles. The altar is approached by three tiers of steps formed of Derbyshire marble, while columns of the same kind of marble support the arcade by the transepts. The south aisle is divided from the nave by an arcade of moulded arches and columns, in five bays, all the walls being of plaster stucco of

natural colour. The pulpit, the cost of which was defrayed by subscriptions raised by Mrs. Bonsey, is of Ancaster stone, and contains elaborately-carved figures of the four Evangelists standing in canopied recesses. The door are of oak, and the church will be heated by Gill stove, by Barton, of Boston. The organ, built by Willis, of London, has been presented by Mrs. Kidston. The interior fittings of the church are mostly of brass, and are the gifts of different members of the congregation. The architects are Messrs. Charles Kirk & Sons, of Sleaford, the diocesan architects for Lincolnshire; and the builder was Mr. John Bentley, of Waltham Abbey. The church is intended to seat about 250, and the cost of it has been, in round figures, 7,000l.

**Essendon (Hertfordshire).**—The Parish Church of Essendon is about to be renovated, under the direction of Mr. Wm. White, F.S.A. The whole was completely modernised some years ago, and it is at present a wonderful specimen of what church arrangement ought not to be. The tower was rebuilt some 210 years ago.

**Newton (Exeter).**—The Bishop of Exeter has just consecrated the new Church of St. Matthew, Newton, Exeter, which has been built as the first instalment of a work of church extension in the city resolved upon some two or three years ago. The building is not yet completed, the chancel and upper part of the tower having to be added hereafter. In a competition confined to the Exeter architects, the plan of Mr. R. M. Fulford was selected; and subsequently the contract for the erection of the first portion of the building was given to Messrs. Luscombe & Son, of Exeter, for 6,000l. The memorial-stone was laid on June 9, 1881, by the Mayor (Alderman Pring). The style of building is Early First Pointed, and the material chiefly local red brick. The brick walls are relieved by string-courses and bands of Doric ground Bath stone and deep-red moulded brick, while the dressings of the windows are of Bath stone. The chief ornamentation is on the west front, which faces the roadway. There are double western doors, composed of oak. Above them is a traceried tympanum, glazed with coloured glass, and small windows on each side of the doors to light the entrance-lobby and the gallery. The arch of the dome over the doors is composed of Bath, Pocombe, and Linton stone, while in the head of the gable over the door is a Bath stone niche, in which, at some future date, it is intended to place a figure of the patron saint of the new parish. At present the tower is only carried up to about the level of the nave-roof, and to complete it 1,000l. more will be required. The shafts of the columns of the nave are of grey granite, with carved bases and caps of Hamhill stone. From the pillars spring pointed arches. The vousoirs of the arches are alternately of Pocombe and Corsehill (Dumfries) stone. The east end of the nave is hacked with a temporary arcade which will remain until such time as the chancel, the foundation of which has already been laid, shall be completed. The chancel stalls at present project into the nave, from which they are divided by a temporary wood screen. Above the arches in the nave, light admitted by means of small pointed windows fitted with cathedral glass, with coloured lead. The transept arches are of Hamhill stone, with Hampshire brick moulding and a Hamhill base outside. The roofs of the nave and transept are barrel ones of pitch-pine, and the same material is used for the lean-to roofs of the side aisle, around the walls of which a dado of coloured tiles is to be fixed. The clerestory windows, six on each side, are two-light ones with small quatrefoil and trefoil lights above. In the western tower, immediately over the entrance-lobby, is a gallery approached by a newel staircase. The front screen of the gallery is of carved Hamhill stone, supported by Corsehill stone columns on Hamhill bases. The gallery is lighted by a large west window already described, and a small side window. On the west side of the tower is the baptistery. The bowl of the font is of Caen stone, and the base of Corsehill, surrounded by six columns of Devonshire marble. The base is of Caen stone resting on two hinc-lia steps. The hull of Mr. Luscombe has had all the carving executed by his own workmen. The floor in the chancel and entrance-lobby under the gallery is paved with the same material. The rest of the floor is laid with wooden blocks. The whole of the glazing has been done by Mr. F. Drake, of

Cathedral-yard, while the lighting and warming was being entrusted to Mr. F. M. Rice.

**London.**—Extensive alterations are being made in the Church of St. Savonar, St. George's-square, S.W. In the nave the unsightly galleries have been removed. The caps, label terminations, and bosses supporting the roof have been elaborately carved. The latter form an "angelic choir." A wooden floor has been laid under the seats, and two parish rooms are being constructed in the tower. In the chancel a canopied reredos, with central group of the Last Supper and side figures, is being erected. The arcades on the north and south sides contain bishop's throne, sedilia, and piscina, with credence. The walls and roof are being richly decorated by Messrs. Clayton & Bell, and the floor relaid with polished marble slabs and encaustic tiles from the architect's design by Mr. J. C. Edwards, of Riahon. A brass corona is being made by Messrs. T. Potter & Sons, of South Moulton-street. With the exception of the corona, tiles, and mural decoration, Mr. Thomas Earp, of Lambeth, has executed the whole. The entire work is from the designs, and under the superintendence, of Messrs. Romaine-Walker & Trauer, architects, 19, Buckingham-street, Adolph. During the past few weeks workmen have been employed in making some welcome and much-needed improvements in the church of St. Mary Alderman, which will tend greatly to the comfort of the congregation worshipping there. For some time past it had been observed that the north and south walls of the church had become damp and greatly disfigured, especially in the winter season. Accordingly it was resolved to thoroughly dry the walls and line them with an oak dado; and the work, which is now nearly completed, has been carried out by Mr. Howard, builder, of Upper Gloucester-place. The dado is of Gothic design, surmounted by a cove-cornice with drop-tracery, and is enriched with mouldings and carved work.

**Bury (Lancashire).**—On the 7th inst. the memorial-stone of the new Church of St. Mark, Bury, now in course of erection, was laid by the Rev. Canon Hornby, Rector of Bury. The new church is being erected in the midst of a dense population, to take the place of a school-room which is at present used for public worship, and is from the designs of Mr. J. Wreghitt Connon, of Leeds, and Mr. James Demaine, of York, architects. The cost of the building, exclusive of the tower and spire, is £7,500, and the contract has been let to Mr. Charles Myers, of Leeds, for that sum, being nearly 2,700*l.* less than the tenders from Bury.

#### DISSENTING CHURCH-BUILDING NEWS.

**Abingdon.**—On the 5th ult. special services were held in the Baptist chapel in Ock-street, in the occasion of the re-opening of that place of worship after being closed for seventeen weeks, during which period the exterior and interior have undergone thorough renovation. The work has been carried out by Messrs. Buckell & Wheeler, builders, and Mr. D. Stroud, painter and decorator, of Abingdon, at a total cost of something like 700*l.* The whole of the outside of the building has been overhauled, the stonework repaired, and the woodwork painted. The interior, with the exception of the gallery, has been entirely re-seated with low stained pews. It is heated with hot-air apparatus furnished by Haden, of Trowbridge.

**Crewe.**—A new chapel and school are about to be built at Hightown, Crewe, for the trustees of the United Methodist Free Church. The chapel will seat 700 adults, and the school 250 scholars. Suitable vestries, class-rooms, and a detached lecture-hall, &c. The builder is Mr. T. Daxid, of Southport; and Mr. S. Hurst, of the firm of Maxwell, Take, & Hurst, architects, Southport.

**Hornick.**—Extensive alterations and additions are being made to the Wesleyan Chapel, Hornick, Southport. The additions comprise a large class-room, a library, and a detached lecture-hall, &c. The builder is Mr. T. Daxid, of Southport; and Mr. S. Hurst, of the firm of Maxwell, Take, & Hurst, Southport, is the architect.

**Drumbo.**—The new Drumbo Presbyterian church, just opened, has been erected on the same site as the old edifice (which dated from

1660). The plan of the new church comprises a nave, 68 ft. long by 27 ft. wide, and two side aisles, each 14 ft. wide, with a height of 33 ft. to the plastered ceiling, which is flat throughout. The columns dividing the aisles are of cast-iron, of such dimensions as to avoid the usual attenuated appearance of columns of that material. Five semicircular arches on each side spring from the capitals of the columns, and are enriched with a moulded panels, above which project corbels carrying the roof timbers. The galleries are pitched at an angle which enables every one to have an unobstructed view of the platform. The principal front of the church is broken by a slight projection with pilasters at each angle, and terminating in a gable, with elaborate finish. At each side are placed wings containing the staircases. A group of three large semicircular-headed windows is placed in the upper part of the gable. These are enriched with pilasters with moulded caps, on which rest a richly-moulded arch. The side buildings have parapets with blockings, broken with pilasters with ornamental terminals. The sides of the building are treated in harmony with the front. On each side of the platform are doors opening into a spacious session-room, below which is placed the hot-water apparatus, which was supplied by Messrs. W. McNeill & Co., Corn-market, Belfast. The church contains upwards of 980 sittings. The work has been executed by Mr. Hutcheson Keith, Glenravel-street, from the designs and under the superintendence of the architects, Messrs. Young & Mackenzie, Belfast.

**Bulwell (Notts).**—The memorial-stone of a new Wesleyan chapel and school at Bulwell was laid on the 20th ult. The new building will include a chapel, designed to seat 685 adults, and a school-room with six class-rooms, which will accommodate 500 children. There are also to be a minister's vestry, and a complete provision of lavatories and other appurtenances. The edifice is designed in the Gothic style of architecture of the twelfth century. Bulwell stone, rock-faced, will be used throughout, except in the dressed and weathered parts of the building, where Matlock stone will be utilised. The site required that the schoolroom should be under the chapel, but it will be entirely above the level of the front street, and the access to the chapel will be by flights of steps right and left. The building is estimated to cost 3,500*l.* The architect is Mr. John Wills, of Derby, and the contractors are Mr. Thomas McCulloch, of Bulwell, and Mr. Joseph Monks, of Hucknall Torkard.

#### Books.

*Tenth Annual Report of the Local Government Board, 1880-81.* London: Eyre & Spottiswoode, 1882.

Thus, which is a volume of considerable thickness, consists mainly of a Report and papers submitted by the Board's medical officer, Dr. Thorne Thorne, on the Use and Influence of Hospitals for Infectious Diseases, and contains so much that is of interest to architects that the profession will be doubtless glad to know it is published. Dr. Thorne Thorne has been engaged for a considerable period in examining the various hospitals for infectious diseases throughout the provinces, and has embodied in his Report a vast amount of valuable information relating to sites and soil, general arrangement of infectious hospitals, their construction and details, as well as cost of erection, management, &c., and the effect of hospitals on the localities in which they are placed, that cannot fail to be of interest and assistance to all who are immediately concerned in the erection of such hospitals. And although the Report relates only to infectious hospitals, it is, we think, one of the most valuable additions to the literature of the subject since the important Report by Holmes and Bristowe nearly twenty years ago.

Referring to that Report, and bearing in mind the vast changes and improvements that have taken place since it was issued in the construction of hospitals generally, both on the continent of Europe and in America, it would be of great advantage, as it seems to us, if steps were taken to procure complete information upon the subject up to the present day in the form of a report like that of Dr. Bristowe and Mr. Holmes, and it is to be hoped that before long such an investigation may be ordered.

#### Miscellanea.

**A Migration of Railway Workpeople and its Consequences.**—Most of the workmen at Crewe works who some months ago received notice to take up their residence in or nearer Crewe have left Nantwich. Some few exceptions have been made in the case of those who have families engaged in manufacturing establishments and others who have leases of their premises. One consequence of the order which has been enforced by the railway company is apparent in the large number of empty cottages in various parts of the town. It is stated by one gentleman that, taking a walk a few days ago through Beam-street and Volunteer-terrace in the direction of the Barony, he counted no fewer than fifty houses to let. This number might be almost trebled if all the tenanted houses in other parts of the town were included, and the wholesale deportation of workpeople and their families to Crewe and elsewhere cannot fail to have a disastrous effect upon a certain portion of the shop-keeping community as well as upon many property-owners whose houses have been emptied wholesale.—*Chester Courant.*

**Pontefract Castle.**—The ruins of this historic structure, and the land around them, have recently been excavated and explored, with the object not only of finding some relics of the warlike past, but of converting the place into a pleasure-ground for the inhabitants of the town. During the exploration many interesting discoveries have been made. Old armor has been dug up, as well as cannon-balls, bullets, coins, and pottery. The foundations of the drawbridge and the remains of the Constable's Tower are (according to the *Daily News*) now indicated, and near the ruin hitherto supposed to be St. Clement's Chapel, six skeletons were unearthed. One of the most historic parts of the castle is the ruin of the Swillington tower, in which Thomas, Earl of Lancaster, passed the night prior to his sorry ride up the hill of St. Thomas, on his way to the block and the headsman's axe.

**Neath Harbour Works.**—These new works are making rapid progress. The contractor, Mr. C. E. Daniel, having invited the commissioners to go over and inspect the works, they, together with the engineer, Mr. W. Wilson, C.E., and other officials, went from Neath on the 5th inst. to Court Sart-road, and were met by the contractor and others. They proceeded along the junction with the Great Western Railway across the Neath Canal, Lord Jersey's and the Groll Marshes, to the Navigable Cut, which they inspected minutely, together with the whole of the plant, and expressed their satisfaction with the progress made, as well as with the quality of the materials used. There are about 500 men on the works, and others will at once be employed, so as to proceed as rapidly as the nature of the works will permit.

**School of Art Wood Carving, Royal Albert Hall.**—The school has re-opened after the usual summer vacation, and we are requested to state that free studentships in both the day classes and the evening classes are at present vacant. These studentships are maintained out of funds provided by the City and Guilds of London Institute for the Advancement of Technical Education. The school is open to amateurs as well as to those who intend to make wood-carving a profession. To those who are unable to attend the classes information can be given by letter and examples supplied. Information, with forms of application and prospectuses of the school, may be obtained by personal application, or by letter, addressed to the manager, School of Art Wood Carving, Royal Albert Hall, Kensington.

**Pictures at Manchester.**—The annual autumn exhibition of paintings at the Royal Manchester Institution, now open, is once more spoken of with confidence as the last that will be held before the Institution becomes the property of the citizens and the exhibitions pass under the control of the municipal authorities, who will have 2,000*l.* a year to spend in purchases, and a committee of connoisseurs to advise and assist. The matters of difference which for some time hindered the acceptance of the gift of the Institution from its proprietors are reported to have been finally arranged. Taken as a whole, the present exhibition is not of so popular a character as last year's.

**The Pollution of the Thames.**—At the meeting of the Court of Common Council on the 5th inst., Mr. Stoneham asked whether the chairman of the Port Sanitary Committee could give the Court any information as to the progress made by his committee in the matter of the prevention of the pollution of the river Thames. Also whether the chairman could tell the Court what progress had been made by the floats placed in the river at Crossness and Barking, nearly three weeks ago, and how long, judging by the test, it takes for the sewage to reach the sea. Mr. Davis (chairman of the Port of London Sanitary Committee) replied, that they were taking very active steps in this inquiry, but it was impossible at the present moment to give any decided answer to the first question. As to the second question, regarding the floats, there was, unfortunately, some little delay. The floats were not quite suitably constructed, and they were replaced in his presence on Sunday. This was a continuous work, and if they lost one tide the experiment would be worth nothing. The float that had reached the furthest point towards the sea was at Shortley battery, about two miles below Gravesend. Only three floats reached there within from seventeen to nineteen days. There was only one float up the river towards Richmond, which had got as far as Chelsea. One float, of some extraordinary circumstance which had not yet been explained, had never left Barking, but was still in the neighbourhood of the sewage.

**Notes from Rome.**—A new quarter of handsome villas is being built in that portion of the gardens of Salustiana which formerly belonged to the Barberinis and now belongs to Spithover, the librarian. A correspondent of the *Athenum* says,—"Many works of art and remains of buildings have been found in cutting and levelling the new streets. Near the junction of the Via Venti Settembre and the Via Salaria the temple of Venus Erycina, otherwise called "Venus bortorum Sallustianorum," has been found, an imposing structure, some 100 ft. long and 50 ft. wide. Only the foundations remain, made of rubble work, so hard and strong that dynamite has been used to blow them up. The walls are 8 ft. thick, and are sunk to a depth of 45 ft. Such an excess of solidity is not out of place, as the temple stood on the embankment or agger of Servius, made of loose earth. Of the thirty-two columns of the peristyle, and of the marble cella, steps, and entablature, not a trace, not an atom, has been discovered, an example almost unique of wholesale destruction. Sixty-four feet below the platform of the temple, at the bottom of the fosse or moat which protected the agger from the outside, a statue was found, representing Endymion dozing on the Rocks of Mount Latmos. It is of natural size, of good, if not perfect workmanship, and in a wonderful state of preservation. The attitude of the warlike huntsman is graceful, and must have pleased Diana, whose figure, however, is still missing.

**York.**—The memorial and monumental cross to the late Provost Rendar has been fixed in its position at the Cemetery, York. The height is 13 ft., the tomb is 7 ft. 6 in. long, 3 ft. wide, and 2 ft. 6 in. high. The cross is richly foliated, and springs from a moulded and carved capital. The design was furnished by Mr. G. Goldie, of London, the architect of St. Wilfred's (R.C.) Church, York, the erection of which was mainly due to the exertions of Provost Rendar. At the foot of this monument is a tomb (also designed by Mr. Goldie, more than thirty years ago) under which repose the remains of Dr. Rendar's immediate predecessor, the Rev. Thomas Billington, who died a martyr to clarity in the year of pestilence, October 1st, 1547, aged 53. This tomb, which had suffered considerably from the weather, has been taken down and refixed during the past week by Mr. G. W. Milburn, by whom the design for the memorial cross for Dr. Rendar was carried out.

**Typhoid in a New Building.**—Typhoid fever has broken out among the men of the Metropolitan Police located in Portsmouth Dockyard. Two fatal cases have occurred; a third serious case has been taken to Haslar Hospital, and several milder cases are reported. The police are quartered in a new pile of buildings, which has been erected in the Extension Works, and the outbreak is attributed to defective drainage.

**Lace and Fan Exhibition at Brighton.**—On Saturday last a loan-exhibition of laces and fans was opened at the Brighton Aquarium. Lady Brassey is an abundant contributor, and to her kindly aid the success of the exhibition is largely due. The articles her ladyship has sent occupy a prominent place in the centre of the entrance-hall, having a whole case devoted to it. The most curious specimen Lady Brassey has sent is an antique piece of old Flemish lace, representing in crude eccentric figures what the work tells us is the "Nativite dus enfant Jesus." There is a good display of fans, for which there are three divisions, for which the directors offered a series of prizes. In the first, for modern hand-painted fans, the first prize (five guineas) was awarded to Mons. M. Mace; the second (three guineas), to Miss Dawes; the third (two guineas), to Miss Edleston. Miss Alice Grant, Miss Ada Moore, and Miss M. J. Jones were commended in this class. For hand-painted designs or mounts, Miss A. J. Edleston takes the first prize (3*l.*); Mrs. L. C. Arthur, the second (2*l.*); and Mrs. Freeman Gell, the third (1*l.*). Miss Mina Parks-Smith was highly commended. For collections of antique fans, the first prize, the company's gold medal, was awarded to Mr. Edward Joseph, for a set of ten fans, illuminated with historical subjects. Lady Brassey was awarded the second prize, the company's silver medal, for a collection of seven antique fans,—French, Maltese, and Chinese,—most elegantly fitted. Mrs. Cooper was commended for her collection of five antique fans, including Italian and Chinese specimens. The work of judging was entrusted to Mr. John C. Jackson, M.A., F.R.A.S., and Mr. Clem. Lamhart. The exhibition will continue open until Saturday, October 28th.

**Railway Servants' Congress and Exhibition at Darlington.**—On Tuesday in last week an exhibition of models of improved railway wagon couplings and other railway apparatus was opened in the Volunteer Drill Hall, Darlington, and almost immediately afterwards the annual sittings of the representatives of the Amalgamated Society of Railway Servants, over whom Mr. MacIver, M.P., presided, commenced in the Mechanics' Institute, in the same town. The object of the exhibition was not pecuniary gain. All that the committee desired in this respect was to realise a sufficient sum to meet the expenses incurred in carrying out their work. The primary object the promoters had in view was to assist in insuring a greater degree of personal safety for workmen engaged in the dangerous vocation of manipulating railway traffic. The special feature of the exhibition was the large display of models of couplings used for connecting vehicles. The reason given by the committee for making couplings of new and improved design their speciality, is that those now in use entail serious risk to the men who manipulate them, and it is stated that "they are of primitive design, and almost the only appliances connected with active railway work which have escaped improvement tending to facilitate work and at the same time to promote safety." Comparatively few railway men are regularly engaged in the operation of coupling and uncoupling railway vehicles, but, notwithstanding this fact, during the five years ending with 1880 no fewer than 206 men were reported to the Board of Trade to have been killed, and 1,614 more or less seriously injured while engaged in these operations. To accomplish their work the men thus employed have to get in between the vehicles, and the society, in seeking to do away with this risk, needs no justification.

**Brownhills Water Supply.**—At the meeting of the Brownhills Local Board on the 4th inst., a letter was received from the Local Government Board with regard to the water-supply, stating that a very great many of the wells in the district are contaminated with sewage matter, and that a pressing necessity exists for a pure and abundant supply of water. The letter pointed out that it is clearly the duty of the Urban Sanitary Authority to take immediate steps for providing the district with a sufficient and wholesome water supply. A discussion ensued, and eventually the Clerk was instructed to write to the Local Government Board stating that the Local Board were having the waters from the wells analysed, and were calling upon the property-owners to have their properties adequately supplied, being resolved, in default, to take proceedings to have the premises

**Profits of Parochial "Dusting."**—At the meeting of the Mile End Old Town Vestry on the 4th inst., the Dusting and Cleansing Committee reported that they had for some time past been considering whether, if an eligible site could be obtained, it would be advantageous to the ratepayers for the Vestry, by their own workpeople, to sort the dust and rubbish collected by the Vestry's carts, and to make it into a merchantable commodity. Mr. Cushen, as chairman of the Committee, negotiated with the Great Eastern Railway authorities, and obtained a site at the Devonshire street Depot. He said the Vestry were recommended to adopt the proposed plan, and to authorise all the necessary steps to carry out the scheme. What the committee designed now was to undertake the sorting and sale of the refuse for the ratepayers' profit. Estimating,—as there was good reason to do,—the profit at 1*s.* a load, the amount obtained for the 16,000 loads removed from the parish per annum would be something like 800*l.*, and other sources of revenue which would follow would, it was hoped, bring them in as much as 1,000*l.* a year, instead of letting it go to a middleman. The recommendations were unanimously adopted.

**A City Tavern.**—The great fire which more than a year ago consumed Messrs. Foster & Co.'s and other neighbouring premises in Chespiado did considerable damage to the Bull's Head Tavern, Bread-street. It was deemed advisable, instead of merely restoring the building to its former condition, to rebuild entirely, and plans for the new building were prepared by Mr. B. Tabberer, architect, Coleman-street, and tenders invited. Mr. R. Conder proved the successful competitor, and at once proceeded with the work. The premises have been reopened for business. They are four stories in height above the street, and have a basement and sub-basement. The front elevation, which is of Corshill and sandstone, on the ground-floor, and Chilmark stone above, is of Italian character, with large window-openings. Mr. Porter of Cullum-street, and Mr. Cohen, of Chiswell-street, have supplied the gas-fittings, and the painter's work has been done by Mr. South, of George-street, Blackfriars-road.

**A Brighton Concert Hall Burned Down.**—Late on Saturday night last the West-street Concert Hall, Brighton, was discovered to be on fire. Despite the efforts of the firemen, the flames spread to an adjoining hotel, five stories in height, which, together with the concert hall, was gutted. Another hotel on the other side of the hall escaped, but it was not until four o'clock on Sunday morning that the fire was got under. Hamilton's panorama had been shown in the building on Saturday night. The fire broke out some time after the audience had left. The damage is estimated at about 50,000*l.* The hall was built some fifteen years ago. The entertainment on the night of the disaster concluded with a mimic representation of the bombardment of Alexandria, and it is conjectured that a spark from the fireworks must have lodged on some of the canvas and smouldered unobserved.

**Fall of an Iron Curtain in a Berlin Theatre.**—A few minutes after the doors of the Royal Opera House, Berlin, were opened on the evening of the 4th inst., an accident occurred which produced an intense panic, the house being already crowded. Since the catastrophe at the Ring Theatre, Vienna, the stage of the Opera House has been divided from the auditorium by a new iron curtain. Suddenly the whole of this arrangement fell with a fearful crash amongst the footlights. The audience at once rushed to the door, panic-stricken, and in a few minutes the house was cleared. Although a good many people were severely crushed there was fortunate no life lost. The cause of the accident, it was afterwards ascertained, was the snapping of the chain by which the iron curtain was elevated and suspended.

**Provincial Theatres.**—Mr. Edward Franke has written an alarming letter to a theatrical contemporary. He speaks of provincial theatres as eminently unsafe, and says that not until great fire has occurred, "as one soon will," many lives have been lost, will the authorities awake to a sense of duty. One of the leading provincial journals contends that this sweeping condemnation of provincial theatres is unreserved, and that in Manchester, Liverpool, Leeds, and other large centres of population the theatres will compare favourably with the best of such structures in London.

**The Sanitary Exhibition at Newcastle-on-Tyne.**—This exhibition, of which we have already given some particulars, remains open until the 21st inst. The judges (Professors Corfield, Mr. W. Basso, C.E., F.L.S., F.G.S.; Mr. Rogers Field, B.A., C.E., and Mr. Wallace Peggs) have issued their report, in which they award prizes and certificates. For the first time for four years, the Richardson gold medal, for "an exhibit of pre-eminent merit" is awarded, the exhibitors who receive it being Messrs. Mather & Armstrong, of Newcastle-on-Tyne, for their exhibit of a Siemens regenerative gas-burner, which is stated to save 50 per cent. of gas. Medals were also awarded to Messrs. Hayward Tyler & Co., of London, for "full-flush" valveless closet; to Mr. C. D. Ward, of London, for a household closet; to the British Sanitary Company, Glasgow, for a dry earth closet; to Messrs. Wilkinson & Co., Newcastle-on-Tyne, for damp-proof concrete pavement; the French Health Society, for an exhibit of books on hygiene; Messrs. Manlove, Allott, Fryer, & Co., Nottingham, for appliances which destroy or convert garbage, house refuse, and contents of ash-pits into charcoal; Messrs. T. Bradford & Co., for washing machines; Mr. J. Scott, of Oldham, for mercury gas governor; the Wilson Engineering Company, for improved Wilson range; and Mr. A. J. A. G. Ross, Newcastle-on-Tyne, for patent silicate cotton wool. There were also many articles certificated.

**The New Central Fish Market, Farringdon-road.**—This building (recently erected as a fruit and flower market in lieu of the dirty and forlorn Farringdon Market) having, by an Act of Parliament obtained by the Corporation, been set apart for the purposes of a fish-market, the necessary works to fit it for its altered uses are in progress. The paving of the area is complete, the gates and gullies to enclose the market and interior shops are in hand, and all other arrangements are being pushed forward so as to open the market at the earliest possible period. The City architect (Mr. Horace Jones) is in communication with the railway authorities in reference to the utilisation of the easement for market purposes. The buildings comprise a market area surrounded by shops, the whole being enclosed by iron gates at the various entrances, while externally, and with access from the public roads, there are shops surrounding the market.

**National Portrait Gallery.**—A complete re-arrangement of the pictures and sculpture in the National Portrait Gallery has been resolved on, and will be commenced forthwith. The portraits formerly in the British Museum and Hall of Serjeants' Inn will no longer be kept apart, but incorporated chronologically in general series. Every picture will have, according to rule, a distinct statement on the frame of the donor's name. It is not intended to close the whole of the gallery during the alterations, but one portion or another will always be open to the public.

**Glazing.**—Messrs. William Edgumbe Rendle & Co., of Westminster, have been selected by the Directors of the Great Northern Railway Company of Ireland to glaze their new terminal passenger station in Amiens-street, Dublin, on the "Acme" system of glass roofing. We are informed that the company have used Rendle's method of glazing solely for the last three years on their new stations and goods sheds.

### Old Buildings and New Decorations.

It is an obvious fact that many buildings in occupation must require a renewal of their internal decoration much oftener than the building itself requires renewal. There are cases in which the decorations of a building, the main portions of which were completely finished from the first, have never been completed at all, and have still to be carried out when a new interest is imparted to the building from its passing into the hands of a new proprietor, or from any other reason. In such cases is it *de rigueur* to comply with the style of the building itself, whether we admire it or not? Or may we not

decorate from our own point of view, and in accordance with our own taste?

The question is sometimes suggested by the sight of a proposed scheme for decorating a building under such circumstances. We have, perhaps, a church which belongs to what we will call the Late Classic period of English architecture, which has been left, as so much of the said Late Classic architecture actually was left, in a very half and prim state of adornment. A new incumbent or a new churchwarden desires to raise the building from this pristine state into one of comparative beauty and magnificence, and asks for a scheme of decoration. The purist system is to decorate the building as those who built it would have decorated it. The intending reviver of the glory of the structure will, in that case (supposing still that it is Late Classic), receive a scheme for his consideration embodying among its details many wreaths and festoons, some hanging vertically, some horizontally; ribbons will appear here and there tied in knots and with the ends fluttering away in plaster; puffy little cherubs (so called, of course, because they are in a church, but looking much more like Cupids) will sprawl on various surfaces that may appear open to receive them. If colour is introduced, it will not be such as we, since our partial enlightenment in regard to colour, could approve of; it will be such as is found in decorators' sketch-books of the supposed period, showing strange and awful combinations of pink and green, such as we know to be contrary to all the law and the prophets. Yet these sins will be proposed, because it is known, and we

cannot deny it, that the original architects of the building would have done thus if they had done anything.

The case was, occasionally still is, the same when the question is of a Mediæval building, supposed perhaps to have been once coloured, or once meant to be coloured. The unfortunate example of a certain ancient church near Winchester is a conspicuous one, known to most people who have interest in such matters. There are other examples from our cathedrals that might be quoted, in which decoration of a very violent and glaring kind has been introduced, with much raw primary colour, offensive to the delicately-trained eye, but introduced, because certainly the Mediæval decorators would have worked in these strong colours, and perhaps have left faint but readily comprehensible traces of the fact that they did so. Our taste of late years has been trained to dislike masses of primary colour, and at present the prevalent taste is, in fact, towards an over-fondness for weak and often nearly colourless tones; yet if we decorate a Gothic church we are ready, or some of us are, to throw overboard all this certainly more refined (no doubt sometimes over-refined) taste for pale tones, and adopt the taste of the Mediævalists for strong colours.

Now we wish to suggest that when an architect or decorator is called in to design or advise upon the new decoration of an old building, it is not necessarily his part to reproduce something like what the original architects would have done, unless this happen to be in accordance with the best taste in decoration as understood and believed in his own innermost artistic conscience. If the building had altogether decayed, and had to be removed and a new one built, no one would say that it was the architect's duty to build a new one exactly like the old one. On the whole, he would rather be blamed for doing this, as producing a sham. Nor is it any more his duty, if the decoration of the building be decayed, whitewashed over, or non-existent from the first, to produce new decoration which shall be an imitation of the old, or of what it is presumed the old would have been if it had ever been executed. This is as much a sham as the new building.

But is he not bound, it may be replied, to consider the style of the building, and harmonise his decoration with it? Yes, in a sense, undoubtedly; but not necessarily in the precise manner in which the original artists would have done it. That is not harmonising; that is merely mimicry, and may often involve the throwing away of an excellent opportunity to improve an old building and to set up a new standard of taste, or the commencement of one. It is surely a very poor course for a modern designer to take, to say practically, "The people who erected this building knew nothing of colour, and had very vulgar ideas about the motifs and

the execution of decoration, and therefore in decorating their building I will reproduce all their deficiencies and vulgarities faithfully." What we should rather endeavour to do should be to devise a scheme of decoration which, while avoiding the errors and shortcomings of the style of the original building, should yet harmonise with its general lines and with the general purport and feeling of its architecture. To attempt to decorate in that spirit would render the task worthy of being called an intellectual one, which the mere correct reproduction of a bad or vulgar style certainly is not. It would be a matter of serious interest to devise a style which should retain sufficient suggestions and reminiscences of the kind of decoration originally belonging to the architectural date of the building, and which at the same time should show that the modern decorator is not in the trammels of his perhaps less cultivated predecessors. His decorative scheme should seem in itself to say to the spectator, "We know how the original architects would have done this, but we also know better than to fall into all their weaknesses and vulgarities of style."

These few remarks, partly suggested by a certain design, never mind where, in which all the weaknesses and tawdrinesses of the Wren school of ornament, with Cupids, ribbons, and what not, have been deliberately reproduced for the edification of the present generation, out of an over-acted desire for "harmony," fortunately seem about to receive illustration in the opposite direction by what is being designed for the decoration of St. Paul's Cathedral. In that scheme there certainly seems to be the attempt to produce something which shall be sufficiently in relation to the architectural style of the building, and sufficiently suggestive of what would have been Wren's decorative idea if he had ever had it carried out, while avoiding any of the more prominent faults of the Wren school of detail and of ornament, and suggesting something much superior, in fact, to what would have occurred to him or his contemporary artists. And fortunate indeed it is that this is so, and that no misguided attempt has been made to produce exactly what would have been done in Wren's day had the funds for decoration on a large scale been forthcoming at that time. The mere idea of St. Paul's Cathedral so bedizened as it would have been with Cupids' and clouds and ribbon-knots, ought to be sufficient to convert even the most ardent adherents of "truthfulness" in such matters, and certainly suggests a powerful, even a formidable, illustration of our present observations.

**Public Works in India.**—Strong statements as regards the evil of the system under which public buildings are erected in India are being published. We have before now pointed this out at some length.

## THE WEST FRONT OF RHEIMS CATHEDRAL.

"The west front of Rheims Cathedral," says M. Viollet-le-Duc, "is one of the most splendid conceptions of the thirteenth century." As such, no one who has the smallest interest, whether as a professional or an amateur of art, should fail to visit it. But if there is one absurdity more common in these days than another it is for persons to stare for two or three hours at a building such as Rheims Cathedral, which it is impossible to appreciate without some thoughtful and careful observation. We should hope that all architectural students who may visit this, or indeed any other European, cathedral will never give way to this "return-ticket fashion;" if we may so say of seeing notable works of art. Those who do so, whether they be students of architecture or ordinary tourists who go to work in this hasty manner, are simply throwing away their money. Of course, numbers of the latter, at any rate, daily do so, but the actual pleasure obtained by merely seeing a new sight may in their case seem to them a sufficient recompense. But it cannot be one to the visitor with more serious motives. We have no intention of writing a description of the splendid pile so historically interesting also as the crowning place of the kings of France. The architectural student has no need to go beyond several well-known and standard works for a careful account of this splendid church. It may be useful, however, if we make mention of a local handbook to this building of a much higher class than is usually the case with works of this kind. It is entitled "Description Historique et Archéologique de Notre Dame de Reims." Par M. l'Abbé V. Tourneur, Vicaire-Général de S. E. Monseigneur l'Archevêque de Reims, 4e. éme. édition. Reims: E. Deligne, Libraire de l'Académie. 1880? It is, in truth, a much more thorough work than its author's modest preface would lead one who had not perused it to suppose. It may be asked, if we are not going to describe Rheims Cathedral, what, then, have we to say about it? Our answer is, that the west front cannot be studied without two very important conclusions being formed in the observer's mind, one of which, at any rate, is both interesting and important in regard, not only to the study of architecture historically, but to the practice of it as a profession. These two points, if we may so term them, are, firstly, that this west front shows at once the limits beyond which elaborate sculpture, as an architectural adornment, is more or less useless, and those within which it is not only a real addition to the architectural beauty of an edifice, but also valuable for its own sake as sculpture; secondly, in no building is there more discernible the loving study bestowed on large portions of Medieval work, the way in which the whole design is governed by one central idea, and the skill and purity of Medieval sculpture, as well as its unequal character.

The correctness of these positions when once formulated can be easily judged of by any one who visits Rheims; it is difficult, on the other hand, for any one who has not before his eyes the elaborate details of the great west front either to agree with or to dispute them. Take, however, the flat portion above the arch which, in its turn, surmounts one of the chief glories of Notre Dame at Rheims, the large rose-window, full of glass of the mellowest and most harmonious colours. This flat space forms the background for sculpture which, on the right, shows David casting the stone at Goliath of Gath; in the left, the future king of Israel with outstretched arms about to sever the head from the body of the giant. Trees, sheep, and dogs are the accessories of the main part of the sculpture, and the whole forms a very elaborate graven incident of Holy Writ. But the careful work is more or less thrown away, the distance of the picture, as we may be allowed to term it, from the spectator prevents the figures from having greater importance in the design of the whole front than the finials, for instance, which surmount the pinnacles on either side of this scene, and a somewhat larger and more elaborate arch to have filled up most of the space occupied by this sculpture would probably have been more architecturally effective. Again, too, the careful workmanship of the smaller statues which fill the gable of the doorway is to a great extent labour in vain. The converging lines for the sake of architectural effect necessarily cause the figures to be

in various degrees away from the perpendicular. There are, in fact, no less than seventy-five statues to bring before us the saints of heaven, who may be said to prepare the mind of the worshipper as he enters to observe with due reverence the Coronation of the Virgin, which in large sculpture in the round fills the extreme angle of the arch. On the other hand, let us take as instances of the effective use of statuary as showing the limits within which it adds to the beauty of an edifice, and can be, for its own sake, appreciated,—the large figures which guard the three doorways. For example, the centre doorway is double, and is divided by a statue of the crowned Virgin, who stands, so to say, on a pedestal some 4 ft. from the ground, and consequently watches, as it were, the worshippers who enter the church which is dedicated to her. Nothing could be more effective, and in no way could sculpture be more properly utilised. It is impossible to enter without every fold of the dress, every feature of the face, being seen. The same may be said of the four statues on either side of the double doorway, past whom any one who would enter the church must go. They lead up to the central figure of the Virgin, and they depict, on the one side, the Annunciation and Visitation; on the other, the Purification; and let it be borne in mind that the open space in front of a great cathedral was a spot much thronged in bygone days, and then it will be obvious that the use of sculpture in such a way as this would doubtless have a powerful effect on the minds of the uncritical people who thronged the portals of the church. But even for secular purposes groups of sculpture adequately treated and used in this manner cannot fail to be effective. Many of our readers can call to mind the sides of London University which face to Burlington-gardens, or of the Glyptothek at Munich, both of which have statues of great men placed at certain distances along the wall, duly "labelled" with the names of those whom they are intended to represent. Architecturally this arrangement is quite ineffective: the statues do not at all enter into any design, and the monotonous array is far from beautiful. Neither have they the finish and the life-like character of really good works in marble, so that, to some extent, it is degrading sculpture to use it in such a manner. The most ridiculous instance, however, of this which we can call to mind are the figures on the new Knightsbridge barracks of cavalry soldiers of the olden time, in costumes which are much better left alone in old prints, and which certainly should not be perpetuated in stone in the most crowded drive in the world.

It may almost be gathered from what has already been said, how immense a quantity of reverent thought must have been bestowed, extending over a number of years, upon this front, and how carefully and clearly the main object was kept in view, namely, to honour the Virgin and to make her story stand out conspicuously. What we would, however, more particularly point out is the manner in which the Rheims sculpture exemplifies the sculpture of the Middle Ages. We need go no further than the chief doorway for this purpose. The figure of the Virgin in the visitation is full of womanly dignity. Technically the garments are draped in admirable lines, but it is more especially the quiet dignity, not only of the features, but of the whole figure, which renders this statue noticeable as showing the excellence to which some Medieval sculptors attained. Many, too, of the smaller figures about this porch, such as those fragments which depict Adam and Eve in Paradise, show a remarkable amount of technical skill. On the other hand, the figure of the Virgin who stands between the two doorways is, as regards the face, quite wanting in all the finer attributes which distinguish the secondary figure. Her features are disfigured by a silly and an affected simplicity; the statue which should be most impressive accordingly loses most of its effect upon an educated observer. Here, therefore, we have visible, without moving a step, examples showing what we have already mentioned,—that is, the skill and purity of Medieval sculpture and its unequal character. If the main statue had been like that on the right hand of the entrance, it would have been even more impressive than the womanly figure which we so much admire. In the same way the nude and almost grotesque statues in the right portal, depicting, it has been supposed, some of the chief persons of the Old Testament, are in strong contrast with many of the digni-

fied and lifelike figures which are so numerous in this west front. We might have fortified our positions with more detailed descriptions, and more elaborate arguments; but we desired rather to suggest these points to any one who might be about, either professionally or as an amateur, to study Rheims Cathedral, or who might in these recent summer and autumn days have visited this splendid church. Possibly there may be some who will not agree with these views; but they appear to us to be logical conclusions from a careful observation of this west front. And the other portions of the building,—the mass of sculpture, for example, in the interior above the main west door,—would, we are sure, serve further to uphold these views. But whatever opinion may be held, nothing can diminish the value of the west front of Rheims Cathedral to those who prize architectural and artistic masterpieces.

## CONTINENTAL GATHERINGS.

In spite of the large governmental and private encouragement which French art yearly receives, it seems to some critics that French art is not in a very hopeful condition, and this view comes not alone from outside. Only within a few weeks past the late Henri Lehmann founded, by his will, an annual prize to be awarded to the author of the work which, by choice of subject,—composition, style, and execution,—shall be deemed to have indicated most strongly a protest against the decline of classic art, the exact opposite of which, the realistic tendency now in favour, M. Lehmann desired by this means in some measure to counteract. There might, at first sight, perhaps, appear to be no very great ground for deeply-expressed grief on our part as outsiders at a possible period of calamity overtaking our French artistic brethren. There is, however, another side to the question. France still remains, it cannot be denied, the great arbiter in art-matters; even were its powers to fail, it would still continue to retain its influence, for no other country is in a position to take upon itself such a heritage. Italy, Spain, Germany, Holland, Belgium, in spite of all their artistic talent, would be unequal to the task. Recently discussing this somewhat problematical subject, our New York contemporary, the *Critic*, has not hesitated to assert that the future possession of the artistic sceptre "lies more in the way of Great Britain or the United States. It cannot be denied now, however, although a few years ago those who had the nerve to prophesy in that direction were promptly laughed down, that the chances of supremacy in the fine arts are noticeably tending towards America. If the Parisian critics are alarmed at the excellence of American pictures whom Paris and Munich have educated, they would be more alarmed could they know that the United States have other more original, more thoughtful, and more modest artists in reserve whose peculiar qualities will not soon be appreciated by Europeans, but of whose future eminence there can be no doubt." There is one view of this threatened downfall of French art, which is far from encouraging, however pleasing may seem the prospect of the lead being taken in this direction, either by us or by our American kinsmen. And this view may be said more particularly to regard American artists than ourselves. Paris, for many generations, has been their great artistic school, and of late years even more so than in the days when young Americans were to be found scattered about at Düsseldorf, at Weimar, and at Munich. Paris has of late carried off the palm as the art-teacher of the rising American painters, in spite of the fascinations of the modern Italian schools of Milan and Florence. That the chief source, therefore, of American art-study, and indeed for the matter of that, of the study of a number of young artists of almost every country should be corrupted, is a serious outlook. Parisian art-teaching, as it stands at present, has spoiled more than one clever young artist, not alone American, it may be observed. Be this as it may, whatever are the faults of French art, we are sadly afraid that we, however much our cousins may feel inclined to take upon themselves the inheritance, are scarcely in the position to set up our school as a model to the world. Our neighbours having taken from Italy three centuries ago the lead in artistic matters,

have wisely adopted measures to ensure the continuance.

An insight into the nature of these means is afforded by the announcement of the recent enlargement of the national Conservatoire des Arts et Métiers,—an admirable institution, a counterpart to which, though we are essentially a practical nation, is almost absolutely wanting in this country. It is, it may be observed, one of those numerous educational institutions which the French wisely throw freely open to the public on the Sunday afternoon. The Conservatoire des Arts et Métiers is justly credited with possessing probably the most extensive collection of industrial and scientific objects in existence. The lectures, open freely to all comers, and embracing the most comprehensive elements of artistic and industrial education, from chemistry and natural history to mechanics, weaving, printing, and political economy, are delivered by the most eminent French professors, while each year the collections are carefully enriched with models and specimens of the latest advances in art and industry. Intended, in fact, to spread among the dependent classes popular and thoroughly practical notions of industrial education, the Conservatoire des Arts et Métiers merits, it can be understood, no small amount of praise for its share in the modern artistic and commercial supremacy of France. It would be difficult to find any branch of industry, either purely scientific or connected with the arts, not adequately represented in this admirable institution, and not alone by modern models, but by, in many cases, historical objects. It would require somewhat more than the limits of a paragraph to describe, even hastily, the contents of the Paris Conservatoire des Arts et Métiers, a building in itself of no small antiquarian interest, established as it is in the Gothic priory of St. Martin des Champs, of which there still remain many beautiful details. It is one of the sights which no traveller should fail to see, a Sunday afternoon at the Conservatoire des Arts et Métiers, when the models are in motion, and, amidst the crowd of visitors, the more practical listen to the explanation of the good-natured keeper in charge of the various machines. The recent increase of the already large building by the addition of two wings, is a proof of the value which the Government rightly attach to the instructive value of the Conservatoire, one of the characteristic, but not sufficiently well-known, Government institutions of France.

This interference, as we should call it, of the State in all such institutions is, of course, peculiar to France, where, it must be remembered, incomes being much more equally distributed than with us, and where the labour of the family depends far more on the labours of its head than as with us on accumulated riches, the aid of the State is almost everywhere necessary. The immense wealth of so many of our great families is, fortunately for us, not infrequently exercised with the utmost intelligence, and with a not ungenerous desire to satisfy the needs generally of the community, as also is the case in America, where it is no rare matter to meet with millionaires scattered over the whole country. France, however, does not belong to a limited landed aristocracy,—there are, if we mistake not, hard on 20,000,000 of landowners in France,—while, active as is its industry, it cannot be said to offer so extended a field for enterprise as the great continent of America. It can be understood, therefore, that, when a special Minister of Agriculture was appointed not so long since in a country where agricultural products are one of the chief sources of wealth, the promise of the institution of a regular system of State insurance against the possibility of loss by inundation, frost, &c., has been hailed with delight. The Chambers have annually to vote large sums to indemnify the farmers for such accidents. The amount of damage which is yearly worked among the crops and vineyards by the weather by hail and frost, is no small matter. Hailstones will ravage in a few hours a fourth of the country. The injury worked is variable, but always considerable. Damage to the extent of over ninety-one millions of francs (hard on four millions sterling) was the result of hail alone in 1876. A frost has been known to inflict a loss of over three millions sterling on the country; a recent authority has estimated the mean annual loss at about 350 millions of francs, or about fourteen millions sterling. In cases of this kind, where no system

of insurance exists and the small capitalist is ruined, the aid of the State, it is urged, can be most efficiently introduced. By the formation of a Government insurance company, with no exorbitant shareholders to satisfy, and no dividends to declare, the premiums will be naturally small. Loss, while it will diminish the general public fortune, will not totally ruin the small capitalist. Taxes will he necessarily lightened, as the Chamber has annually to vote large compensations to the unfortunate farmers. At a moment when, in our country, the land question is being daily agitated, and the proposal has gone forth to appoint a special Minister of Agriculture, such a scheme as this of our neighbours is worthy attention.

What may be done by enterprise towards reclaiming from the effects of nature whole tracts of rich land, has been shown the world by Holland. The old traditions are worthily kept up there. The work of reclaiming the southern portion of the Zuider Zee may be said to be almost terminated. On the limits of the reclaimed land a huge cement-cased reservoir is now being dug in the sand. This reservoir,—some 25 miles long,—will be about 6 ft. above the highest tide of the Zuider Zee; the work, it is estimated, will occupy seven to ten years.

In the excavations necessary for this immense undertaking we have not heard of any archaeological discoveries having been made; the ground is not so fertile in possible finds as Mexico would appear to have proved to M. Charnay, who has lately sent home a most glowing account of his recent discoveries in Central America. M. Charnay, it may be remembered, we announced some time since, had been specially despatched to the New World to explore the peninsula of Yucatan and those phantom cities which, half a century ago, Stephens described so graphically. Leaving Talasco, M. Charnay organised an expedition to Frontera, went up the Ocuon Macintia to a point where his further advance by water was arrested by the floating mahogany set adrift by the lumber-men, but continued his movement eastwards by means of a caravan, and before long, on a strip of land claimed by Guatemala, M. Charnay had the joy of discovering a series of ruins covering a space of over a mile in length. The monuments are in the style of those at Palenque. Unfortunately here, as there, the decorations being in stucco, most of the bas-reliefs are in terrible condition, only five having remained intact. From the *Courrier des États-Unis* we learn that the casts of these are already on their way to Paris. In the decoration, the cruciform symbol has been found, but in no way resembling the Christian cross, but rather the Bouddhic; the possible connexion between the art of Central America and that of Java has, it may be remembered, been pointed out in these pages. M. Charnay saw also a number of vases which served for the religious sacrifices that half a century ago the people still offered up on this sacred spot, a fact which brings us to a period much nearer than was at first believed. The ruins of Yucatan must, in fact, be considered as the ruins of quite modern monuments. Out of gratitude to Mr. Lorillard, of New York, who so generously assisted the expedition, the ruins discovered have received the name of "Lorillard City." M. Charnay is now in Mexico, where he has been busily obtaining casts of the principal monuments in the museum of the city, with a view to enriching the Paris Museum of the Trocadéro with some interesting specimens of the native art of the New World.

Each year, as we have more than once explained, the French Government devotes a very generous sum to the restoration and maintenance of its historic monuments. This sum, on an average about 60,000*l.*, is applied to a certain number of works, which, as they are completed, are replaced by others on the list. The programme for 1883 of the Commission which is entrusted with the supervision of the historic monuments has just been published, and the list, filling half a column in small type of the *Journal des Débats*, embraces the whole country from the Ardennes in the north to Vienna in the south, the château de Coucy, the cathedral of Laon, the ramparts of Carcassonne, the amphitheatre of Arles, the cathedral of Lisieux, the château of Blois, the château of Pierrefonds, the Chazy Museum, the Abbey of St. Denis, the chapel of the château of Vincennes, the Tour de Montiéry, the antique theatre of Orange, being the more familiar features mentioned amidst a crowd of most

interesting architectural monuments. A large number of new works is projected, together with the restoration and maintenance of a number of mosques and Roman monuments in Algeria, and megalithic remains scattered over Brittany.

#### THE JARDIN DES PLANTES.

WE have recently given, in these pages, a view of the new Zoological Museum erected in the Jardin des Plantes at Paris.\* As in the case of our own Natural History Museum,—as, indeed, in that of all the great national collections of the present day, the necessity for an extension of premises is continually making itself felt. Although the large new Natural History Museum in Cromwell-road has allowed the British Museum authorities somewhat more room for the disposal of their collections, and only a few days ago the first stone was laid of a new wing to accommodate the Print Department, yet still the Great Russell-street institution will be far from sufficiently supplied with space to display its yearly increasing treasures.

It is the same with the venerable Jardin des Plantes, which, from the humblest commencement, has concurred a foremost place among the scientific institutions of the world. It has long been one of the most characteristic features of the French capital, and in the midst of the modern improvements which are sweeping away in every direction the Paris of the past, the Jardin des Plantes still retains in its aspect something of the air of the century in which it was founded. Its importance as a scientific institution may be judged when it is stated that, in itself, it in reality combines all the features of our Zoological Gardens, our Natural History Museum, our Kew, our Botanical and Horticultural Gardens, the Museum of Economic Geology, our College of Surgeons, and, in a manner, our London University and King's College.

Officially known as the "Museum of Natural History," it numbers among the professors who compose its staff and deliver the nineteen different courses of gratuitous public lectures, the most distinguished savants of France. Its past history is no less connected with names, many the most revered in the progress of modern science; the memory of the learned Buffon, of the gentle Bernardin de Saint Pierre, the author of "Paul and Virginia"; and of that master-mind, Cuvier, the Owen of France,—all directors of the Museum, suffice to give something more than an ordinary interest to the Jardin des Plantes.

Far from the bustle and roar of Paris, in a remote corner of the busy metropolis,—the finest view of the cathedral of Notre Dame, with its delicate flying buttresses, is to be obtained on the way to the Jardin,—the garden, with its prettily-broken ground, its menagerie, its hot-houses, its scattered and beds of flowers, is a sight which no visitor to Paris should fail to see. The air of the seventeenth century, when the garden was first organised, seems to linger about the spot. Originally intended by its founder, Guy de la Brosse, as a garden like our own Botanic Garden of Simplex at Chelsea,—which Evelyn mentions having visited in 1685, August 7,—for the cultivation of medicinal herbs, Louis XIII. in 1626 gave his protection to the undertaking of his doctor in ordinary. From this simple commencement, and on some broken ground belonging to the convent of St. Victor which the garden occupies,—to the existence of which it owes not a small portion of its present charm,—grew the existing Museum of Natural History. A school of botany, chemistry, natural history, and astronomy was founded, and when, in 1641, Guy de la Brosse catalogued his collection, it was found to contain 2,360 specimens of plants.

Under the beneficent rule of Colbert,—whose Scottish origin we should never forget,—the Jardin des Plantes was essentially one of those national institutions such as the great Minister of Louis Quatorze loved to encourage. In 1700 Toumefort, whose bust appropriately figures on the façade of the new museum, travelled for the Jardin, in the Levant, with Aubriet the painter. In 1708 two hot-houses were built, and the brothers Jusseu brought home from the furthest corners of Europe and Asia fresh rarities to enrich the collection. The sturdy old cedar-tree, the first brought to

\* See pp. 492, 503, ante.

Europe, which still rears its now diminished head,—snapped off by lightning some years ago,—was planted as far back as 1738. In the botanic garden at Chelsea, the solitary cedar which remains still standing, picturesquely breaking from the river the long line of the Embankment, was planted fifty years earlier (1683).

With the year 1739 Buffon, of memory ever fresh to young and old alike, became director of the Jardin des Plantes. A fresh impulse was given to the establishment under his energetic management, and the Rue Buffon of to-day fifty marks,—in accordance with the excellent custom of our neighbours, by which the boundaries of the extended ground by which the great naturalist succeeded in enlarging the Jardin des Plantes. Specially interested as Buffon was in the natural history department, which he largely increased, the botanical and mineralogical sections were not allowed to suffer. From China the Jesuit missionaries sent home rare plants, the King of Poland presented to the museum his invaluable collection of minerals. The professors forming the staff were the most illustrious French scientific students; the Jardin des Plantes formed, in fact, the great scientific centre of the world. From a simple garden of medicinal herbs, the Jardin des Plantes became under Buffon the home of a representative collection of the riches of the whole realm of nature, while the garden was entirely remodelled on the plan that exists in the present day. Such was the work of the great naturalist whom tradition has represented as writing his well-penned pages in court attire, sword by side, wig duly powdered, and lace and ruffe on neck and hands. Buffon was a *savant* who was also man of the world enough to appear in society without making himself conspicuous by any affectation of carelessness, or studied indifference to what he felt was none the less than science an element of agreeable existence.

To Buffon, who died in 1788, succeeded in 1792 Bernardin de Saint Pierre, the charming writer whose "Paul and Virginia,"—"the swan song of old dying France," Carlyle has termed it,—was, so Humboldt tells us, his most constant companion in his tropical wanderings. Here, in the Jardin des Plantes, all through the wild days of the Revolution, Bernardin de Saint Pierre retained his post, and in the quiet of the picturesque ivy-covered house which still stands in the midst of the garden toiled to enrich the collection under his charge. The National Convention favoured the museum; twelve new courses of lectures were founded of mineralogy, general chemistry, ceramic art, botany, as studied in the museum, and botany as studied in the country; agriculture, zoology, human anatomy, animal anatomy, geology, and iconography; while a new scientific library was open to the public in 1794. In 1802 commenced the publication of the "Annales," continued to this day as the "Mémoires du Muséum." The collection continued to increase with rapidity. Humboldt's famous collection of plants was added to the botanical department, while among the distinguished professors on the staff of the institution, Cuvier was at the head of the department of comparative anatomy, a science of which he may be almost said to be the creator.

From time to time during the present century the Government has voted large sums towards the enlargement of the ever-increasing museum.† Since 1793 fresh chairs have been established, of comparative physiology, applied physics, anthropology, paleontology and vegetable physics. The lectures, it may be remarked, like those of the Collège de France, are all entirely free to the public, not even the formality of cards or tickets being enforced; and many are the pleasant recollections that any one who has resided in Paris,—especially if he be a stranger,—must retain of the facile elegance of diction, the clear exposition, of the professors of the museum.

If the zoological collections have not, so far, been lodged as sumptuously as are now ours, yet probably their scientific value is, if not superior, certainly equal. The collection is, indeed, reported to be the richest in the world. There are more than 2,000 mammalia, over 3,000 birds, over 18,000 fish, 25,000 articulated

animals, and an incalculable number of molluscs and zoophytes. The library contains some 20,000 volumes, and the collection is rich in original botanical drawings; the botanical galleries contain about 35,000 specimens of plants, not including fruits and woods; the geological gallery, with its 60,000 specimens, is one of the richest collections in the world. The gallery of comparative anatomy, if it falls, perhaps, short in interest of our Hunterian Museum, contains none the less over 25,000 prepared specimens, 6,000 dried, 5,000 in spirits, the rest in wax and plaster.

In the garden itself, where still may be seen, as a relic of the original foundation, the section of medicinal herbs, all carefully labelled and arranged in beds in strictly scientific order, the menagerie offers freely to the stranger, and the children who always crowd the walks, all the pleasures of our own favourite Zoological Gardens. Science, in fact, at the Jardin des Plantes is placed before the public in its most attractive and agreeable aspect. Severe research, however, is none the less pursued by the learned professors, revered *savants* of world-wide fame,—such men as Milne Edwards, De Quatrefages, the veteran monogamian chemist Chevreul, and Bequerel, who only within a few weeks past has succumbed to a life of constant toil; professors whose labours hold high in the history of the scientific progress which marks in our century the reputation of the Jardin des Plantes.\*

#### AN ARITHMETICAL DETERMINATION OF THE DEMAND OF TRADE FOR A BRIDGE EAST OF LONDON BRIDGE.

It may, or it may not, be desirable to erect a permanent crossing of the Thames eastward of London Bridge, at the cost of two or three millions of money. The subject is a grave one. It has been long before the public. Much has been said on both sides. Much more, no doubt, remains to be said. But the recent report of Sir J. W. Bazalgette, compiled with the statistical information published "by authority" on the following day, is certainly calculated to support the view taken by Mr Barlow, rather than that of the advocates of bridge or tunnel.

Sir Joseph puts the case that London extends, as the crow flies, four miles to the east, and six miles to the west, of London Bridge. On the western six miles area, he says, twelve bridges, which have cost, or will cost, 6½ millions sterling, paid by the rates of the whole metropolis. To spend another four or five millions in providing, also out of the rates, an eastward crossing, would, Sir Joseph thinks, be fair to the East Londoners. If we were looking at a design for a city to be built, there would be some force in that symmetrical view. But as it is, the first point to decide is, whether there really is a want for the accommodation that looks so fair upon paper.

East London, north of the Thames, Sir Joseph puts at 894,000 souls; south of the river, at 655,000. But the fact that these two immense districts have grown up without either establishing a communication across the river, or making much use of the communications already provided, certainly looks as if the course of trade naturally ran east and west, and not north and south, in this end of the town. And, if this be the case, it is hard to see how the building of a high-level bridge, or of a tunnel, would do much to facilitate trade.

A high-level bridge at the Tower, a tunnel at Shadwell, and another at Blackwall, at a total cost of 5,200,000*l.*, is the magnificent project now proposed! As this involves a rate of 1*l.* in the pound for sixty years, the ratepayers ought to have full information as to the utility of a scheme involving such a call on their purses.

Over the twelve bridges now existing (taking no count of the railway bridges, or of Putney and Hammersmith bridges) 371,057 pedestrians passed, on an average, during twenty-four hours in August last, being a little under 31,000 per bridge per day. But Westminster, Lambeth, and Vauxhall Bridges, which gave passage to 72,288 pedestrians, or one-fifth of the total

\* At the opposite end of Paris, and nearer the fashionable neighbourhood, the Jardin d'Acclimatation has, within late years, sadly robbed the old Jardin des Plantes of its vogue. The aims of the younger society, however, are very different from those of the grave museum. It is intended merely to introduce into France, for purposes of profit or pleasure, whatever foreign animals, birds, dogs, and plants may be found to thrive in the climate.

number, accommodate, not a north and south, but an east and west traffic. Chelsea, Albert, Battersea, and Wandsworth, again, which complete the twelve, are rather suburban than metropolitan bridges, giving passage to only 34,794 passengers between them, or about 8,700 per diem each. Our investigation of traffic, as an indication of call for accommodation, is thus confined to the five eastward bridges which span the Thames within the distance of one mile and a half, although Charing Cross Bridges as fair for the east and west as for the north and south traffic, and is comparatively insignificant as a crossing.

Over these five bridges, then, on the day taken, passed 264,175 pedestrians, being at the rate of 52,835 per bridge, or almost exactly 100 passengers per yard of the centre line of the river crossed. The distance from the middle of Charing-cross Bridge to a point halfway between London and Southwark bridges is 2,400 yards; and the traffic per yard of river over the four bridges comprised is sixty-four passengers per diem.

London Bridge, on the other hand, has to be credited not only with half the distance from its own position to Southwark Bridge, but with the traffic from four eastward miles for which it is now proposed to build bridges. At this rate, only 15·2 passengers per yard of river to be crossed make daily use of London Bridge. Draw the eastward line where we will, the proportion of traffic to area that necessarily seeks London Bridge is very much less than that which seeks either of the great bridges westward. Thus the zone served by Blackfriars Bridge, if we take it to points equidistant between that structure and Southwark and Waterloo bridges, is just 800 yards. This gives almost exactly 100 passengers per yard per diem, which we before found to be the mean for the five bridges. This, therefore, may be taken as a fair test of the proportion of passengers to bridge room. At the same rate, the traffic over London Bridge will all come from a district reaching 800 yards to the east of it,—that is to say, to the Tower. If the district between Allhallows and the Tower has as much north and south traffic as the Blackfriars zone, and if all this traffic seeks London Bridge, not a single passenger from North or South London, east of the Tower, now seeks to cross the river at that point.

This is, no doubt, a new way of looking at the matter. But it is a mathematical way. And the outcome is, that the actual trade east of London Bridge is not demanding bridge accommodation. What may be done, by providing such accommodation, to create a trade is another question. Is it worth the outlay of 5,200,000*l.* to solve it?

The above was in the printer's hands before the appearance in the *Times* of the letter from Sir J. W. Bazalgette, of October 13th, in which he says that "the existing traffic between Hammersmith and Battersea Bridges is 332,000 foot passengers, and 65,000 vehicles."

These figures mean, and how they were arrived at, Sir Joseph will no doubt explain. According to the "official statement," the daily traffic over Battersea, Wandsworth, Putney, and Hammersmith Bridges, all taken together, amounts to a total of 25,145 pedestrians and 4,302 vehicles, so that there must be some strange error somewhere. We would be the last persons to make much of a clerical error in figures, knowing how easy it is to substitute a wrong column in the copy prepared in haste for the printer. But when an argument is based on a great error of figures the case is different.

Sir J. W. Bazalgette's argument is, that the existing traffic over the bridges from Hammersmith to Battersea (nearly four miles by water), indicates a minimum for the future traffic over a bridge or bridges for four miles east of London Bridge. Taking this to be a sound inference, we really obtain only about 1·13th of the traffic of 332,000 foot passengers claimed by Sir Joseph. Further, the four existing bridges are on levels convenient for road traffic. A very great reduction (no one can say how great) on a normal amount of traffic would be due to the physical difficulty of rising to a high-level bridge, or descending to a tunnel. And if, on Sir Joseph Bazalgette's own argument, only about 8,000 pedestrians per day are to be expected to use each of the three new crossings, which are to cost 5,200,000*l.*, the disproportion between cost and estimated utility becomes absolutely ludicrous.

\* Excursions out of Paris, under the direction of the professors, are often made during the summer months.

† Only a few years since, the Chamber voted a grant of six millions of francs (24,000*l.*) for the rebuilding of the museum.

## THE END OF THE CHANNEL TUNNEL.

HIS ROYAL HIGHNESS THE DUKE OF CAMBRIDGE has done good service to the country. He has put in a few nervous and well-balanced sentences the case of the Channel tunnel as regarded from a military point of view. We shall not attempt to abstract this authoritative counsel. It ought to be read and re-read by any who have yet a lingering idea that a tunnel, if possible, is desirable. For ourselves, as our readers are aware, we have all along doubted the first of these points, and disputed the second. We have seen no reply attempted to the remark of Mr. Bateman, that all the river valleys in England are marked by faults, and that no explanation of the existence of the Straits of Dover, except by the occurrence of a geological fault, has hitherto been attempted. And the ignored fact that the dip of the Straits on the French coast is twice as sharp as that on the English, seems to us to be only one of those which strongly confirm the view of Mr. Bateman.

But while we are content to admire, and to ask our readers to admire, the treatment of the military part of the question by his Royal Highness the Commander-in-chief, we cannot but note how much the commercial question is illuminated by his remarks. How many millions will the works of defence that all military men admit to be necessary, if a tunnel be made, cost? What will be the annual cost of the fixed garrison of 7,000 men, who will have nothing to do but to watch the newly-created danger? Who, on any showing, is to be benefited by the large outlay? It has been suggested (mischievously enough) to the unemployed workmen that they would find their account in the scheme. Far better would it be for the country to set them to work in reclaiming Irish bogs,—or in digging sand from the sea-shore to be replaced by the next tide! As to paying traffic,—the projectors of the scheme have never replied to our challenge on that point. We have shown that the coal for ventilation alone would cost about a third of the largest net earning that could be anticipated; let alone all sorts of unforeseen expenditure. Cost of transport through the tunnel would be three times that by sea, for working expenditure alone. The vast question of interest on outlay is untouched in that calculation. It might be difficult to point to any scheme, brought forward at any period of our history, the results of the accomplishment of which would be, in the opinion of most of those competent to judge, so disastrous. We may safely challenge the records of human folly to show any project which has received so much attention, not to say so much ill-informed approval, while so utterly unsupported by statistics, or by any commercial reasons. We hope that this report will finally extinguish this mischievous project.

## THE POVERTY OF THE WORKING CLASSES.

UNDER this title some letters have recently been published in the *Times*, which cannot have failed to interest those who are heedful of the social improvement of the English people. Mr. William Hoyle, of Bury, commenced the correspondence, which was continued by Mr. George Potter, the Rev. S. A. Barnett, and others. But, in truth, though important phases of a social problem of high importance are brought into prominence, these letters do not produce any conclusion which was not already more or less obvious. The point which, as we understand Mr. Hoyle, he desires to establish is that, since large numbers of operatives are thrifty and well to do, and a large number are quite the reverse, the latter are in this position because they squander, or, at any rate, do not save some part of their wages. "The question," he says, "then presents itself, how comes it to pass that one section of the operatives of the country are found in such poverty and misery, while another section, earning no better wages, are living in peace and plenty? It is all owing to the way they spend their wages. If those who are in misery begin to live and act rightly, to shun the public-house, and spend their money properly, they soon rise out of their misery and degradation, and, like the others, become happy and comfortable." The writer then shows how money earned by large numbers of operatives has been wasted, and how a thrifty workman may save,

and in time place himself above the reach of want, and that the chief channel of waste is intemperance. So far as we understand Mr. Potter, he desires to show that the thrifty workmen as a rule form the bulk of the members of our trade and friendly societies, and that as much money is wasted by those in higher grades of society as by the operatives. There can be no question that both Mr. Hoyle and Mr. Potter are more or less correct in the positions they have taken up. No one can doubt that if the thriftless workman would follow the example of his economical brother, he would be better off and that less wealth would be wasted, nor, on the other hand, that the trade-unions and friendly societies contain a great proportion of the thrifty operatives, so far as they are members of large trades in large towns. On the other hand, the great number of workmen in small provincial towns, and who work at what may be called miscellaneous trades, must not be left out of account. Moreover, we have no manner of doubt that the workman who puts his money into a savings-bank or invests it for himself is more worthy of imitation than the man who puts it by as a subscriber to some trade union, whereby he puts himself under various restrictions. The Rev. S. A. Barnett, the well-known Whitchapel clergyman, points out that the workman who earns 30s. per week, and who spends of this sum 20s., and puts by 10s., cannot live in comfort and happiness. Further, that the mere saving of money is not sufficient; that the man who barely exists and saves money, leads "as mean and low life in one way as a drunkard or a spendthrift in another." In this statement there is a certain amount of truth; the workman who leads a joyless existence, though he may have money in the bank, cannot be considered as living a desirable existence, but the mere fact of self-denial and of thought for the morrow forming part of his life, necessarily raises him to a higher moral and mental place than that of the workman who spends his surplus earnings in self-indulgence. Moreover, Mr. Barnett seems to overlook what may be termed domestic joys, which must exist in any well-ordered and thrifty home, even though in that home there is not "a easy chair," and though the operative "cannot have books nor send his family for change of air." That he cannot have books we deny, because it is absurd to suppose that, with the abundance of cheap literature which exists, a workman who earns thirty shillings per week, and as the typical workman of Mr. Hoyle's letter does, puts by, as a rule, ten shillings, cannot now and then afford sixpence or a shilling for a book, a newspaper, or a periodical. At any rate, where free libraries exist the workman always can obtain books when he wishes them, and it is because free libraries, museums, and exhibitions, open both on week-days and Sundays, are so unbounded a boon to thrifty working men and help to attain that object which Mr. Barnett rightly considers so necessary, namely, the making of "life fuller, happier, and more worthy a man's manhood," that we have always advocated them so strenuously.

To return to the question of the poverty of a large section of the workmen of this country, where, as Mr. Hoyle shows, the population of the United Kingdom have in ten years spent 1,364,000,000. In drink, there cannot be a doubt that the happiness and comfort of this section will be largely increased by an increase of sobriety in the country, and by a smaller expenditure in intoxicating drinks. That, we take it, is evident, and that also is about the only distinct point which can be laid down. For an increase in economy and in happiness of those poor and miserable workmen who spend their money in follies or do not put it by for a rainy day and for old age, can only be obtained by the general improvement of all classes in thoughtfulness and self-restraint. We then are face to face with all sorts of social problems, the marriage of healthy couples, improvidence in marriage, waste of money in female dress, the effects of the poor-law, and numbers of others, which there would be no difficulty in enumerating. But there can be no doubt that correspondences such as that to which we have alluded, and which affords ground for more comments than we have here made, although it does not or cannot lead to any immediate and practical result, shows not a little where the error lies, how possible it is for operatives to be thrifty and to cease, in their days of age or sickness, to be burdens on those of the community who have money in their hands. It is abundantly clear

that vast numbers of our operatives are spend-thrifts; it is equally clear that equally vast numbers are men who show forethought by not living up to their incomes, and we can but hope that the "lucidity," if we may use Mr. Matthew Arnold's latest phrase, which is now so much more apparent in regard to sobriety, to poor-law relief, to improved dwellings, and to art for the masses, as well as to scores of social problems, will, as the years go on, gradually increase that already large section of the operative class who are sober and temperate in all their ways.

## HANSEN'S POLYCHROME PROCESS.

IN the opinion of some German critics the art of polychrome decoration, as employed by the ancient Greeks and Romans in their wall paintings and ornamentation of public buildings,—an art which had hitherto been lost,—has been rediscovered by the Austrian artist Hansen. M. M. A. Turner, of Munich, takes advantage of certain works exhibited by French artists in the present Vienna International Exhibition to contrast them with the polychromes of Herr Hansen in the New Parliament Houses at Vienna. He speaks first of the polychromes of M. Dubocq, representing his ideas as to how the Parthenon should be restored. According to this French artist, the surfaces of the walls between the columns both on the inside and outside of the Parthenon are blue, and covered with warlike scenes; the columns are of a yellowish red tone, while the bases of the temple and the pediment are painted red with ornaments. The triglyphs are blue, and the reliefs of the metopes white upon a red background. Such is the general combination of colours in M. Dubocq's project of a restoration. The interior is treated in a manner analogous to the exterior, only in the entablature parts the colour is more intense. In the centre there is an Atheno with yellowish drapery, and with the vermilion Medusa head on her bosom. "The ensemble," says M. Turner, "is a polychrome, than which it would certainly be impossible to imagine anything less prepossessing." The colours here stand out hard and inharmonious from the body of the work, instead of infusing life into it, nor is there anything at all in the way of a harmonious blending or equipose between the colour and the light and shade. Another example of the same view of antique polychrome painting is seen in a second work which has been sent to the Vienna International Exhibition from the Spanish Academy at Rome. It is an imaginary restoration of the Temple of Antoninus and Faustina. The only difference of importance between this exhibit and that of M. Dubocq is that the ground colour between the columns is red instead of blue. The mere fact that the ornaments appear painted on a coloured background with colours that fail to blend harmoniously, or compensate one another, is the source of much unkindness in both cases, and accounts for the lack of those soft and gradual stages of transition which are absolutely requisite as a set-off to the contrasts of light and shade. In this connexion a fine opportunity is offered in the Parliament House in Vienna for making an instructive comparison.

In the polychromes executed by Herr Hansen, that artist has carefully avoided bringing together too many colours. Generally with him the ornamentations and ornamental constituents in gold stand out from a coloured background, and do so sharply enough to bring out the division, and yet so as to complete the whole in a perfectly harmonious manner without those harsh and ugly contrasts seen in the French projects above mentioned and in other instances that might be quoted.

It is, indeed, a surprising spectacle which presents itself to us in those decorative paintings which are already finished in the interior of the Austrian Parliament House, although as yet not a single room is perfectly completed. The effect is finest in the chief apartments of the House, which are all connected together,—we mean the two halls of session, the assembly-room, and the peristyle; their plastic elements are composed right up to the ceiling of pure marble, while in the Peristyle even the wall surfaces are of antique cipoline, and here it is that we have an example of the coloured treatment of an ancient architectural creation such as surpasses in its completeness anything yet seen. Compared with the effect here achieved by Hansen, all earlier attempts of the same kind such as those in the Propylæa at Munich, the

restoration of the Tuscan temple by Semper, the polychrome decorations of the Eginetan pelmet in the new museum at Berlin, all fall very far behind; and, indeed, we may make bold to assert that it is only now that we have practically recovered the lost art of the ancient polychrome paintings and decorations.

But this is not the only service Herr Hansen has rendered by the execution of these paintings. He has likewise discovered anew, it is asserted, the hitherto lost process of the ancient art employed in the production of wall-paintings, the process, namely, which imparted to them their extraordinary durability. Thus in the Festival Saloon of the Parliament House a series of panels are at present being filled with decorative work, which, when finished, will, it is hoped, be perfectly secure against external influences, and which may hereafter be washed without any fear of their suffering injury. The process followed in producing these decorations is extremely simple, and it was discovered by Herr Hansen chiefly by studying the wall-paintings of Pompeii. The surface of the wall is first covered with ordinary stucco, and then a thin layer of marbled dust of the colours required for the background is laid on like ordinary *stucco lustro*, and is rubbed smooth. Upon this the ornaments and figures are then drawn in the usual fresco colours, rubbed in with a little soap. Finally the whole is rubbed over with a smooth piece of hot iron, and the work is complete. By this process the paintings become intimately united with, and are, in fact, all of a piece with the substratum, forming an integral part of the plastic mass.

In his efforts to introduce the ancient polychrome painting into practice on this new basis Herr Hansen has met and is meeting with much opposition, but there appears no reason to doubt that he will triumphantly maintain his ground.

Whoever on principle rejects the painting of plastic works, or parts of them, has just now a favourable opportunity of observing the difference between the effect of architecture with and without polychrome decorations. It may be seen in the Festival Saloon of the Parliament House, where the door-cases and jambs of the two side doors still remain unpainted, while the main entrance-door of the hall is already finished in polychrome. In the latter how delicate and beautiful appear the different portions of the marble!—while in the former cases the effect is quite coarse, in spite of their noble plastic proportions. That the gilding of the acroteria and upper parts of the mantel-pieces at present has a somewhat glaring appearance need not trouble us; for, as other portions of the work clearly show, this effect will be toned down of itself in the course of a short time.

The present advanced state of the various portions of Hansen's work in the Austrian Parliament House enables the observer to form a definite opinion as to the value of his process, and the result of the examination is pronounced by Herr Turner to be, beyond question, most favourable to the system of polychrome decoration as revived by the artist in question.

#### NEW SYSTEM OF MURAL PAINTING.

The Royal Bavarian Academy of Arts at Munich appointed a Commission in March last for the purpose of investigating the merits of the system of mural-painting which has been perfected by Herr Keim, of that city. The report of this Commission has recently been issued, and it records the fact that the problem of rendering wall-paintings indestructible by climatic action has been solved by the new method. It is also stated, without hesitation, that when the merits of the system are fully known, an important change is likely to take place in mural-painting, both of a monumental and of a decorative character.

The system is, to a certain extent, founded upon the stereo-chromatic method of Schlottbauer and his fellow-workers, but professes to remedy the defect of insufficient durability which was complained of with respect to that process. The improvements made are in the fundamental ground and the painting ground, as well as in the preparation of the colours and the concluding fixing of the picture in its completed form.

The fundamental ground is, in some respects, the same as that employed in the stereo-chromatic process, being a mortar composed of slaked lime, sand, and water, which, after drying, is flattened with rough sandstone, and

is afterwards impregnated with soluble silicate of potash. Before applying this mortar it is necessary, in new buildings, that the walling should be perfectly dried; while, in older buildings, the part of the wall intended to be treated should be laid bare to the stone, and the commissures scraped out. The painting ground consists, in the new process, of a mixture of 4 parts (by measure) of quartz sand, 3 parts of marble sand,  $\frac{1}{2}$  part of fossil meal, and 1 part of quick-lime, which is stirred up with distilled water. A mass is thus produced, which is considerably strengthened by the admixture of carbonate of lime in the crystalline form of marble sand, and which, from its rough and porous nature, readily absorbs the colours which are subsequently applied. The addition of silicic acid, finely decomposed in the form of fossil meal, promotes the formation of silicate of lime, and thereby increases the hardness of the material and its capacity to resist chemical and mechanical influences of a trying character.

After being thoroughly dried, this painting ground is saturated with silicic fluoric acid, which destroys any crystalline particles of carbonate of lime which may be on the surface, and opens the pores of the material for the absorption of the colours to be laid on. According to the stereo-chromatic process the colours are only laid on with water; but by Herr Keim's system (as described in the *Deutsche Bauzeitung*) each colour receives in its preparation a certain admixture of a nature suited to its special properties, which is intended to promote the solidity and durability of the work.

In order to prevent the darkening or lightening in the shade of certain tones of colour, which is sometimes produced by the final application of the soluble glass used for the purpose of fixing, the colours receive before use an admixture of potash or ammonia. By this means they do not alter in shade, and the painter is saved the trouble of calculating what shade the colour he is applying will be after it is subjected to the process of fixing. The colours are delivered by the factory almost ready for use; only requiring to be rendered thinner according to circumstances by the addition of water. The fixing of the completed picture is finally effected by a wash of soluble glass containing an admixture of caustic potash and caustic ammonia. This is not applied cold, but warm, to the wall surface, which has previously been dried to the stone. When the weather is cold or damp, this drying is promoted by a specially constructed iron stove. To complete the process and to prevent the subsequent appearance of the alkali, which becomes free in the form of a white dusky coating, the fixed picture is again treated with carbonate of ammonia. For subsequent cleanings, washing with water is sufficient.

As a proof of the weather-resisting properties of wall-paintings executed according to this system, it is stated that Professor Lindenschmit buried such a picture during the whole winter of 1880 in the snow under a gutter, without the slightest injury resulting. The Commission to which allusion has been made has further established the fact that the placing in cold or hot water, and the application with brushes of water, alkalis, diluted and even concentrated acids produced no injurious effects worth naming, and that the pictures thus experimented upon continued after these tests to display hardness and imperviousness to mechanical influences.

Apart from these properties of resistance to the effects of climate, the clear white painting ground shows up the colours, particularly ultramarine shades, in a bright and effective manner. The paints are easily applied and blend well together; the production of a pleasing and harmonious effect being facilitated in many ways by the process in question.

#### Poor-Law Buildings in the Metropolis.

The Wandsworth and Clapham Board of Guardians have unanimously resolved that ten acres of land, situated between Allfarthing-lane and Garrett-lane, Wandsworth, be purchased of Mr. R. Davis, for 10,000*l.*, for the purpose of erecting a new workhouse, or for such other purposes as the guardians, with the consent of the Local Government Board, might determine.—The Lambeth Board of Guardians have agreed to purchase of Mr. Woolley 2 acres, 3 roods, 98 perches of land, copyhold, at 1,250*l.* per acre, for the enlargement of the Norwood Schools.

#### A NEW ELECTRIC RAILWAY.

The Austrian Ministry of Communications has granted to the Südbahn or Southern Railway Company the concession for the construction of an electric railway to run from Mödling to Brühl in the suburbs of Vienna. This will be the first electric line in the Austrian capital. It will be about three kilometres, or two miles, in length, and will run from the Mödling railway-station on the southern line, through the village of Mödling, and thence through Klausen to Vorderbrühl. It will be a single line. The gauge is one metre, and the gradients are not to exceed fifteen in the hundred, while the minimum radius must not be smaller than thirty metres. The maximum speed allowed by the terms of the concession is twenty kilometres, or about twelve miles and a half an hour. There are to be halting and signal stations at the most frequented crossings, and they are to be connected together by telegraph or telephone apparatus. The carriages of the new line are to contain eighteen seats, besides standing-room for a few more passengers. Each carriage will be fitted with its own electrical conducting apparatus, and the traffic will be worked by a stationary steam motor of at least forty horsepower, and two machines for the production of the electric current. The new line is to be finished and opened for traffic by the 15th of July, 1883.

#### INFERIOR PORTLAND CEMENT.

The adulteration of Portland cement continues to attract considerable attention among Continental builders, and the subject is under constant discussion in the clubs and periodicals of the profession across the North Sea. One of the most interesting of the recent contributions to this question is a pamphlet by a German mining engineer, Herr Roth, who deals especially with the adulteration of the cement by means of blast-furnace slag or cinder. Herr Roth entirely agrees with the Society of German Cement Manufacturers in rejecting the mere addition or mechanical admixture of this material in the production of Portland cement. He inquires into the essential ingredients of which the cinder is composed, and shows that it always contains, amongst other constituents, one compound which is highly injurious,—that is to say, sulphuret of calcium. In order, therefore, to obtain a useful cement from blast-cinder, it is necessary in some way to remove or neutralise this substance, and, by adding certain other materials, to obtain an article which corresponds in composition with real Portland cement. The practical point of Herr Roth's researches is, that he recommends the employment of Bauxite along with lime. The former material, owing to its containing free argillaceous clay-hydrate, suffices, with the addition of a certain proportion of lime, not only to convert the injurious sulphuret of calcium into a harmless compound, but produces, with the furnace-slag, a resulting mixture agreeing in all essential respects with real Portland cement. The inventor of this system states that, while the quality of the new article is equal to that of the best Portland cement, it can be produced at considerably smaller cost.

#### STRAW AS A SUBSTITUTE FOR WOOD.

The invention by which straw is used as a substitute for timber is an American one, and if the material fulfils all that is prophesied of it, it will probably interfere considerably with the timber trade. The following account has been published in America of this new substitute for wood, and re-issued by the Society of Arts.—The straw timber is said to be counter to many kinds of finishing work, panels, and table tops, fine doors, and ornamental work, and it is said that it can be produced and sold in competition with the finer grades of pine or wide walnut, at about one-half the price of the latter. The standard measurement is in width of 32 in., a length of 12 ft., and a thickness corresponding to surfaced boards. These dimensions may be varied to suit such orders as may be given, and embrace any width, length, or thickness. Unlike lumber, however, narrower widths are the most costly. The straw lumber may be ripped with the hand saw, or upon the buzz saw; may be run through the sticker for the manufacture of mouldings, and takes a nail or screw as well as oak. It is, practically, water- and fire proof, being manufactured under 500

degrees of heat, and it is stated to have stood boiling some hours without any apparent change of structure. Its tensile strength is greater than that of walnut or oak, and its weight about one-fifth greater than the former, when dry. It is made from any kind of straw, including hemp and flax fibre; in fact, from any material that will make pulp, and a ton of straw will produce 1,000 ft. of boards. The pulp is rolled into thin sheets, a number of which, corresponding with the thickness of the lumber desired, are placed together with a peculiar cement, which is claimed to be waterproof, and are then rolled under a pressure sufficient to amalgamate them into a solid mass, which may be worked with a plane, if desired.

When it is remembered that it takes 100 years to grow a tree to maturity, suiting it for commercial purposes, and a tree producing 32-in. lumber will require fully twice that time; while 20,000 ft. per acre is a large yield under the most favourable circumstances, it will at once be realised that where 2,000 ft. can be taken from an acre of ground for an indefinite number of years, the process which enables such a result to be accomplished, and which will yield a really valuable lumber, should be one of great importance.

#### GLAZED BRICKS.

THE Union of German Architects and Engineers has been endeavouring to collect information on this subject, and a contribution of interest has been afforded by the statement of the Hanover Architects' Society which recently organised a commission respecting the matter. From the numerous examples of Medieval ecclesiastical architecture in Hanover, it would seem that the use of glazed facing bricks did not become usual until the earlier part of the fourteenth century. The market church in the City of Hanover is considered the oldest important specimen extant of building with glazed facing bricks, which are used in the windows and doorways, on the slopes of the windowsills, &c.

From the middle of the fourteenth century, the use of glazed wall bricks continued in favour not only for ecclesiastical purposes but, also in ordinary house-building. On the other hand, it is stated that glazed roofing-tiles were only used on a limited scale during the Middle Ages. It would seem that the substances used in the process of glazing did not in those times materially differ from those in use at the present day. It is supposed that the oxide of lead employed was prepared at the brick factories, and that that name. It is not certain that the glazing was applied to the bricks in their unburnt state, but such is conjectured to have been the case. It is remarked that in those ages wood fires were alone used, and thus it was possible at one operation to burn the brick and fix the glaze upon it. At the present day, the burning is usually done by coal fires from motives of economy, and wood fires are used for the separate operation of glazing, for which purpose they are specially effective. The glaze on Medieval bricks was thinner than is the case with modern productions of this class.

In recent times glazed wall-bricks have been used in an increasing proportion. Since 1862 glazed bricks have been used in Hanover in building spires. The brickworks in the vicinity of the city of Hanover now make them in various tones of colour, and they have been as a rule found to be weather-proof. Absolute freedom from crazing has not been as yet arrived at, yet in from 50 to 70 per cent. of the bricks made this defect has been avoided; at least, to such an extent as to be visible to the naked eye.

The durability of glazed bricks does not directly depend upon their colour, but varies according to the composition of the glazing substance. Yet, as the composition of the glaze reacts upon the colour, it has been noticed that the darker kinds are, as a rule, better preserved. In the composition of the glazing substance each producer varies the proportion of the component parts according to the quality of brick to which it is to be applied, and according to the method of burning which he employs. As a rule, the proportion varies between one part of protoxide of lead with one part of sand; two parts of protoxide of lead with one part of sand.

For greenish-coloured glaze there is a less proportion of protoxide of lead used than is the

case with any other colour. For colourless glaze, three parts of sand and four parts of protoxide of lead form a usual mixture. The sand used must be colourless and pure. Some makers add baryta in order to prevent the glaze from melting except at a high temperature.

The quality of the body of the brick is capable of exercising an important influence upon the durability of the glaze. The harder it is burnt the more complete will be the cohesion between it and the glaze, and the less fissures will there be in the latter. The danger of injury to the body of the brick from the penetration of frost is therefore reduced to a minimum. Small particles of lime in an undivided state are capable of cracking the glaze.

From these facts the following rules are deduced by the Hanover Architects' Society:—1. The brick which is to be glazed must be absolutely weatherproof and free from undivided particles of lime. 2. The mixture of glaze must be laid on very thin, and must be free from crazing, as far as can be seen by the naked eye. Absolute freedom from crazing is, of course, recommended if it can be attained. 3. Any considerations as to the colour of the glaze are of less importance than the good quality of the body of the brick and of the glazing substance.

A practical illustration of the necessity of using the greatest care in the manufacture of glazed facing bricks is afforded by the fact that at Altona the examination of the steeple of St. John's Church, for the purpose of repairing the cross, has disclosed the fact that the glazed bricks used in some portions of the steeple (and which have been in position about twelve years), have become so weather-beaten that they require to be removed. It is proposed to replace them by another make of glazed bricks, produced in Silesia, which has been employed in other portions of the church (more recently erected), and has been found to resist the influence of the weather in a satisfactory manner.

#### THE LADY CHAPEL REREDOS, CHICHESTER CATHEDRAL.

OUR readers may be glad to have a fuller account of the reredos in the Lady Chapel of Chichester Cathedral, a view of which appeared in our number of Sept. 16, p. 372.

The altar and the reredos were given by Mr. J. F. France, in memory of his wife and family. She lies buried in the "Paradise" of the cathedral adjoining the Lady Chapel. The material used is polished alabaster, executed by Messrs. Farmer & Brindley. The subject is executed in Salvati's mosaic by the Murano Glass Company, of St. James's-street, from a cartoon by Mr. J. R. Clayton. There does not seem to have been an ancient reredos, for the original ashlar of conured stone existed, and, curiously enough, it was proved by the discovery of a small portion of tiling *in situ* that there had been no difference of level between the west and east ends; the ancient altar, however, must have had a separate step, so it was determined to retain the ancient level, and give the altar a foot pace. Portions of the ancient detail of the piscina existed, and this gave the type of mouldings for the reredos, the curious cusp terminations being copies of these of the piscina. The detail of the rich tombs in Westminster Abbey of the same date were carefully studied, and that of Gervase Alard, in Winchelsea Church, built at the same period as the eastern part of the Lady Chapel, and of very similar detail to the piscina. The altar is of solid oak framing, bolted together by iron bolts passing through the columns. The marble "mensa" is an ancient one, which was discovered built up in the walls. The inscription does not show fully in a front view, as it returns on each side. The whole runs thus:—"In Deo spei nostræ—in dilectum memoriam Elizæ France famule Domini plenæ fide ac beneficæ—conjugis charissimæ meæ."

Many of the large windows of the chapel have been filled with stained glass by Clayton & Bell at Mr. France's cost. The general restoration of the chapel was carried out some years ago by the Dean and Chapter, under the late Sir Gilbert Scott and the late Mr. W. Slater; it was formerly a library, and the floor was lifted up to form a vault for the Dukes of Richmond, the floor was lowered, and the whole of the masonry and marble work, externally and internally, was restered. There, however, yet

remains to be done the restoration of the roof and the cast gable to the original higher pitch, still to be traced on the cast wall of the choir. The original Lady Chapel was Norman and Early English, with a high-pitched roof, but when extended in the fourteenth century the western end was raised and the roof lowered in pitch so as still to keep its apex under the sills of the east window of the choir. It would be a most desirable work to complete, as the exterior much suffers by reason of the modern flat pitch and low gable.

#### THE PRESIDENT OF THE ROYAL SCOTTISH ACADEMY ON ART.

THE annual Dundee Fine Art Exhibition was opened the other day by Sir William Pettes Douglas, P.R.S.A., who in the course of an address delivered on the occasion, said,—The attention now given to art in this country is one of the most curious of the innumerable, reasonable, unreasonable, and fantastic fashions of the day. Even fifty years ago art was recognised only by the few, and they recognised it as a very trifling, although sometimes pleasant, accomplishment, and never dreamed it could become as it is daily becoming, a great power in the world; indeed, it seems not unlikely to usurp a larger share of the world's attention than it can or ought legitimately to claim. Books of today very often consist of pictures, with a word or two of letterpress,—not, as in a proper division of labour, of letterpress, with accompanying pictorial illustrations. And we seem fast returning,—though under very different influences to the style of the earliest printed books,—viz., "The Bibles for the poor," which consisted of pictures only, or pictures with a word or two incorporated in the woodcuts. Indeed, unless it be in the gloomy regions of abstract science, every department of human activity calls in the assistance of art. Natural philosophy claims its help, history claims its illustration, romance seeks to add art's pignancy to its own; and I need not speak of its activity as an advertising medium. The word of the physicist is explained by it, and the mind of the child is ripened by it. Much of all this, as I said before, is the result of fashion; and it is to be hoped that before the fashion can change art will have become incorporated, so to speak, in the very nature of the next and succeeding generations, and will then hold its position permanently as a necessity of life. Nowhere has this change in art's position shown itself more remarkably than in the picture-books of the nursery. They represent a real advance; a generation ago they were worse than weak and uglier than bad,—now they are prodigies of luxuriant ability; and in this matter we must recognise a vital factor in the progress of art generally, because the unconscious education children receive from these silent companions,—their picture-books,—must have a permanent effect upon their future tastes and habits; and the improved and really high quality of many of the children's books of today will render even the most obtuse among them impatient of the presence of all that is rude and unrefined. As in morals, constant contact with pure and upright conduct is the best, indeed the only true, education, so in art familiarity with beautiful,—not necessarily expensive,—objects will inform better than a thousand schools. They speak a language which does not need to be learned, and is more eloquent than the thousand conventions and rules of a thousand teachers. Next to the influence of children's picture-books in the formation of art feeling,—but, as I sincerely believe, only next to, and not before them,—is the influence of art exhibitions. They appeal, no doubt, to the riper and more cultivated mind, and ought to carry on and further the education earlier begun; but though theoretically true, this is not always practically possible. We have the best art-power of the whole world producing children's books and illustrations to popular literature; while all local exhibitions must depend more or less on local ability. Keeping this in view, the Committee of the Dundee Fine Art Association deserve no ordinary praise for the collection they have this year gathered together in these rooms. It is probably the finest exhibition hitherto seen north of the Forth, and it is to a great extent free from any local or provincial character. Some of the most eminent of our English contemporaries are well represented upon the walls, and a large proportion of the members of

our Scotch school seem to have put their best foot foremost, and show themselves literally in their best colours. The public and artists themselves are quite unable to appreciate the labour and the various annoyances and difficulties,—I have even heard of dangers,—encountered in getting together such an exhibition as this, and no one who has not served on a Committee of Arrangement, or, as it is termed professionally, a Hanging Committee, can understand the embarrassment, and not seldom the pain, experienced in making final decisions. A member of the Hanging Committee ought to begin his labours with the principle that he must have no friends, and when he has finished he will probably find himself blessed with many enemies. It is almost impossible to do justly and love mercy in exhibition arrangements; these two qualities are generally found to be absolutely incompatible with each other; moral reasons, conventional reasons, and mechanical reasons, all make a tangled skein of his best intentions, and he who went in as a man of principle and benevolence comes out of the ordeal a demoralised cynic. I see it stated in your leading journal that your last exhibition was relatively in one respect more successful than any other in the country, or indeed in the empire. And the Exhibition Committee of a smaller and more local exhibition in a town not a thousand miles from this place, makes a somewhat similar assertion. The statement is founded simply and solely upon the large amount of sales effected during the season; and there is a congratulatory chuckle accompanying this very satisfactory statement which would be allowable enough did it not stand alone in an apparently all-sufficient isolation. I sincerely hope, and do not doubt, the present exhibition will afford its promoters an equal amount of satisfaction from the same point of view, and there is no doubt men must live before they enjoy life; but committees and councils may not forget that such gatherings of works of refinement and beauty are not mere bazaars, and are, or ought to be, primarily for the advantage of the public, and the advancement of local and ultimately of national taste. In this country, and in the vast majority of the very best of us, a love of art is an artificial accomplishment, and not a spontaneous feeling. Probably the spontaneity will supervene after ages of culture, for habits of mind are as certainly transmissible as habits of body, aptitude for culture not less so than tendency to crime; and with our mind's eye we may look forward to our successors possessing intuitively that sense of the beautiful and the true which may make life in itself and its surroundings one long enjoyment.

#### THE ROUND ARCH IN THE "POINTED STYLE."

How difficult it seems to be at the present day to give anything an appropriate name. New towns, new streets, and new houses all have to be named, and some one has to invent or discover appellations for them, but whether the godfathers and godmothers are at fault or whether the infants are themselves to blame, there often seems to be little connexion between what the thing really is and what it is called; thus we find a street of closely-built houses will be called "Dash Park" or "Something Grove," and some specially dismal alley or court will be called "Pleasant-place" or "Paradise-row." This difficulty of naming anything seems so great that in a new district of London called Queen's Park, the avenues are called after the letters of the alphabet and the streets after the numerals. The invention is an American one. Now, when so much difficulty is experienced in naming a street, that we are obliged to have recourse to the first letters of the alphabet or to the numerals, it is not to be wondered at that we are quite incapable of giving a name to a style of architecture, and this must, we suppose, account for the introduction of such an unsatisfactory name as the "Pointed Style" applied to the Mediæval architecture of Europe. We cannot, for several reasons, regard the name as a good one.

When we speak of the "Pointed Style," it must refer and can refer only to buildings erected with arches which come to a point, and therefore, for the name to be worth anything, it must exclude all buildings in which this feature is wanting. But if it can be proved that there are a very great number of buildings and other

works in what is called the "Pointed Style," which do not possess this feature, then it is manifest that the name is inappropriate. Then, again, the word "Pointed" is a mistake in the way it is applied, because it is only used to signify the style in which European buildings are erected, and is not extended to works in Asia and Africa which possess the peculiarity of the pointed arch in as marked a degree as do European buildings. Some writers are even of opinion that the pointed arch came originally from Asia, and others claim Africa as the place of its origin. If, however, the pointed arch originated in Asia, it is a very remarkable fact that the eastern parts of Europe were the last to adopt it, and that we find the old Romanesque or other purely round-arched styles existing in Poland, Hungary, Servia, &c., long after they had been given up in the West of Europe. Russia may be said never to have adopted the pointed arch at all. Africa seems to be able to lay a better claim to the introduction of the pointed arch, and if the date of the Mosque of Touloun, at Cairo, is as early as that ascribed to it, it is probably the oldest existing building with pointed arches extensively used. The form of the pointed arch was, of course, quite well known to the ancients, as is to be seen in the "Treasure House" at Mycenæ, &c. Hoskins, in his journey to Meroë, in Upper Nubia, mentions chambers and cisterns there with roofs formed by pointed arches, which he regards as the earliest example of that form of arch in existence; but as these buildings have no dates inscribed upon them, and as the history of all the buildings in Upper Nubia is more or less obscure, this statement of Hoskins is a mere conjecture. Wherever the pointed arch did originally come from, there can be no doubt that it was known many centuries before it became a feature in buildings. The ancients do not appear to have appreciated its merits, or we over-value them; and it is a great question whether it has exercised anything like the influence upon architecture which is usually attributed to it; it is also a question whether its influence was altogether for good! Do not let any Gothic man suppose that we are "abusing Gothic architecture" or the pointed arch: we are simply stating a view which has occurred to us, and one which we shall not in the least object to find refuted.

Now, we have three questions under consideration.

1. Is the term, the "Pointed Style," an appropriate expression when used to signify the Mediæval architecture of Europe?

2. What influence did the "pointed arch" exercise upon art, especially architecture?

3. Was that influence advantageous or the reverse?

With regard to the first question. We have already stated two reasons why we consider the expressions, "Pointed Architecture" and the "Pointed Style" inapplicable. The first is that it cannot include works erected in Europe, which, though thoroughly in the spirit of the style, exhibit no indications of the pointed arch; and the second is, that it does not include works in Asia and Africa which do possess pointed arches; and we will suggest a third reason against the use of the term, and that is the fact that the pointed arch was never at any time used all over Europe to the exclusion of the semicircular and other forms of arch, and, in fact, that all through the Middle Ages the round arch was extensively used, much more so than is commonly supposed. We will almost go the length of saying that in some parts of Europe Gothic was almost as much a round-arched style as a pointed-arched style! Also that it gains few of its peculiarities by the introduction of the pointed arch, and that it would have developed itself much in the way that it has done if the pointed arch had never been introduced. To take our own country first: we believe that the earliest examples of the pointed arch to be met with are in the nave of Buildwas Abbey, which was commenced in 1138 or 1139; the pointed arches are only to be seen in the lower portions of the building, whereas the clearstory has round-headed windows. We should have expected to find Buildwas Abbey possessing more Gothic development than works of the same period which do not possess pointed arches, yet quite the reverse is the fact. Malmesbury and Kirkstall Abbeys and Chiffen-Hampden Church, Oxfordshire, present also the earliest examples of the use of the pointed arch, and yet in none of these churches do we find any of the marked and distinctive

features of what is called the Pointed style. We have the heavy cylindrical columns, the absence of mouldings, the old cushion cap, and the general heaviness which distinguishes the Norman from the Early English style.

None of these buildings have so much the effect of Gothic architecture as the naves of Norwich Cathedral, commenced in 1036; or Peterborough, erected in 1117; or Ely, Henry I.'s time. In these three naves we find strongly accentuated vertical lines, produced by the subdivision of the piers, mouldings, and an effect of aspiring loftiness, with the absence of strongly-marked horizontal lines, which was evidently a preparation for the piers of the great Gothic interiors of the thirteenth and fourteenth centuries; but all these peculiarities and characteristics are wanting in the naves of Buildwas, Fountains, and Kirkstall, which seems to point out that the use of the pointed arch in these latter buildings does not show any advance in the road towards Gothic development in those early churches where it is found.

The struggle for mastery between the pointed and the semicircular arch which was going on all over Europe at the close of the twelfth and the commencement of the thirteenth century, and the way in which the architects of that period seem to have vacillated between the two is most instructive, and there is no doubt that in their minds the question must often have presented itself that whether the style then in formation would eventually adopt the new pointed form of arch or the ancient round form. During this period of doubt and indecision some of the most magnificent churches in Europe were erected; it is to it that we owe the glories of Chartres, Sens, Canterbury (the choir), the nave of Ronen, Glastonbury Abbey, the presbytery, Chichester, the west transept of Ely, Vezelay, in France, and other exquisite churches too numerous to mention. In Germany, Italy, Spain, and the Low Countries, the struggle did not take place until half a century later, and the round arch had as yet undisputed possession of the field. To show how undecided the question was at the end of the twelfth century, we over and over again find churches commenced with Gothic arches, and the round arch used in their later portions. As an example, the crypt of St. Joseph's Chapel, Glastonbury, has pointed arches curiously enough (four-centred pointed arches), whereas the chapel above has semicircular arches throughout; and the same is the case in France, at Chartres, Vezelay, Puy-en-Velay, Neoyon, &c.

Although by the year 1200 the matter was settled in favour of the pointed arch as the rule, yet it has too often been supposed that the semicircular arch was entirely given up, although it was certainly less used in this country after the year 1200 than in France, yet examples of it are far more common than is generally imagined, and the examples are nearly always singularly pleasing, and serve to show that it was quite as capable of combination with all the distinctive features of Gothic architecture as the pointed arch, for instance, in the beautiful double doorway of the north transept of Boverley Minster; we find it in combination with richly undercut mouldings, clustered columns, and tracery. The entrance to the Chapter-house at Furness Abbey consists of three semicircular arches, adorned with the richest mouldings and dog-tooth ornament, and springing from jambs composed of a profusion of shafts. In the Retro Choir, or presbytery, at Chichester (commenced in 1230), the main pier arches are round, and adorned with rich Early English mouldings. They rest upon piers composed of a slender centre column with four detached shafts. The capitals are remarkably elegant examples of stiff-leaved foliage, and the bases well moulded. The effect of these semicircular arches is singularly beautiful. The western doorway at Llandaff Cathedral, the connecting arch over the lancet windows at Great Yarmouth Church, some of the windows of the cloisters at Fountains Abbey, are round-headed, although the work is quite developed Early English; and the same thing is to be seen at Byland. The doorway of the refectory at Rievaulx has a trefoil arch below the round one, and is purely of Early English character. At Chadlington Church, Oxfordshire, the south doorway is round-headed, with very beautiful Early English detail and rich undercut mouldings. At Broadwell Church, Oxfordshire, the

north doorway is also round-headed, with Early English mouldings.

The western doorway of Lambeth Palace Chapel is another fine example of a doorway with a semicircular arch; it is very richly moulded, and is sub-divided into two divisions by a quatrefoil shaft, with moulded caps and round abaci, supporting trefoil-headed arches: the space between these and the enclosing arch is filled in by a quatrefoil, all well moulded.

At Llanthony Priory the windows of the central tower are round-headed. At Sherbourn Hospital, Durham, the windows are round and the principal doorway, although all the details are purely Early English. At Hartlepool Church, the arches which cross the aisles are round, resting upon fine clustered columns. In the choir of Boxgrove Priory Church, Sussex, and St. Giles, Oxford, we find richly-moulded round arches. In the transepts at York Cathedral, —1230-1260,— we find the semicircular arch used in a very beautiful manner in the triforium. The main arch to the triforium is richly moulded, and adorned with a double row of dogtooth; it incloses a four-light composition with three circles filled with plate tracery. This triforium is the most developed piece of Gothic architecture in the whole transept, and shows at once that the round arch was found to combine with tracery and rich mouldings quite as readily as the "pointed." In certain cases it lends itself better to the forms of tracery than does the other: this is especially the case when large circles are introduced into the head of the window. It must be acknowledged that the triangular space left above any large circle enclosed by a Gothic arch is a singularly ugly feature, which is avoided when the enclosing arch is round. This was evidently strongly felt by the French, who generally made use of the round arch over the great rose-windows of their west fronts. It may, in fact, be questioned whether the difficulty of filling up the space between the circle and the point of the pointed enclosing arch did not eventually lead to the abandonment of geometrical tracery and the introduction into tracery of the "vesica" which exactly meets the difficulty; this will be seen by comparing the eastern windows of Lincoln and Carlisle cathedrals. Beautiful as the east window at Lincoln Cathedral undoubtedly is, it has this one defect, that the circle does not seem to fit the space between the enclosing arch and the subsidiary arches. At Westminster Abbey, and above all at Rheims, this defect is very apparent. At Exeter, in the west window this space is filled by a small circle, and in other instances by an inverted trefoil, none of the make-shifts really get over the difficulty, and in fact, it was not till the curvilinear style of tracery was introduced that a satisfactory solution was arrived at. The great south window at Chichester and the east windows of Selby and Carlisle are most triumphant examples of the way in which a Gothic arch can be filled with tracery. It must be acknowledged that when curvilinear tracery succeeded to geometrical, we find few examples of the use of the semicircular arch in English buildings; in fact, in this country its use during that period may be said to have been almost confined to decorative work such as wall-painting, stained glass, metal-work, &c.; here and there, however, examples are to be met with, such as the arches above the windows at Penshurst, the east window of the south aisle, Ely Cathedral, the chief entrance to Yarnworth Hall, Westmorland, the archway to Fisher-gate Bar, York, the cusped arch supporting the parapet, Lumley Castle, Durham (this is late in the style); a small window at Broadwell Church with round head, looks like Decorated work. The Bishop's bridge at Norwich and some other bridges erected during this period have semicircular and segmental, or sometimes even elliptic arches. Those of Elvet Bridge, Durham, are probably of this date. Round, segmental-headed windows are also to be found; examples are to be seen at Carsington and Baldwin, Brightwell Churches, Oxfordshire, the Abbey gateway at Worksop, and Byfield Church, Northamptonshire. Semicircular roofs of the Decorated period are to be occasionally met with. That over the nave of Romsey Abbey appears to be of this date.

With the Perpendicular style the use of the round arch was, to a great extent, revived, and examples of its use are very numerous; the outer gateway at New College, Oxford, has semicircular arches and a barrel-vault built askew. The Dean's chapel

at Canterbury Cathedral has semicircular vaulting and large east window of the most elaborate design. The wooden vaulting under the lantern at Merton College is composed of round-headed arches. The doorway to St. Paul's Chapel, and in the old altar-screen at Westminster Abbey, have also round arches. The practice during this period of filling in Norman windows and arches with tracery formed of itself a sort of round-arched Gothic. The effect is sometimes exceedingly pleasing. The Lady Chapel in the crypt at Canterbury Cathedral, and the eastern arches of the transepts at Norwich, are very fine examples. The monument of Cardinal Morton has its canopy composed of a very finely-treated semicircular arch, fitting in to the old Norman vaulting. Segmental and three-centred arches are very common in their style; Cathedral affords a magnificent example of the latter, and the window of the porch at Peterborough is a very good one of the former.

The lights of Perpendicular windows are frequently round-headed, while the arch of the window itself is pointed. A good example of this will be found in the screen of Abbot Islip's Chapel at Westminster Abbey. This is still more frequently the case when the window is square-headed. At Yarnworth and several of the Oxford colleges examples are to be seen. In very late Perpendicular buildings, the Pointed arch is the exception, not the rule.

During the fourteenth and fifteenth centuries the round arch was very sparingly used in France, though more frequently than in England. The arch of the great north window at Rouen Cathedral is semicircular, and very richly adorned with canopied niches running the whole way round it. Connecting the pinnacles which support the flying buttresses at Narbonne Cathedral, are a grand series of semicircular arches, finely moulded and of rather large span. At the cathedral at Troyes the parapet of the choir is formed by a series of round arches.

The round arch seems to have continued in use in Brittany throughout the whole of the Middle Ages. Examples of the fourteenth and fifteenth centuries exist at Folgoat, Guingamp, St. Jean du Doigt, Morlaix, &c.

The same remark may be made with respect to Scotland. Round-headed fourteenth-century doorways or windows are to be found at St. Giles's, Edinburgh, Aberdeen Cathedral, Roslyn Chapel, Linlithgow, Kirkwall, &c. Germany also retained the semicircular arch throughout the whole of the Middle Ages, and the examples of it are numerous and very interesting. One of our illustrations (Fig. 1) represents a most delicate and beautiful thirteenth-century doorway at Treves. This doorway is at the east end of the Lieftrauenkirch, and is one of the most perfect and beautiful examples of Gothic architecture in Germany. Its mouldings are richer than one is accustomed to find in Germany, and the carving is singularly graceful. This doorway leads from a cloister, which is a most interesting example of round-arched fourteenth-century Gothic. The windows have thoroughly developed "bar" tracery, but all the lights have round heads, and the enclosing arch is also round. The mouldings are all very rich, and the work excellent (Fig. 11.). At Eternach there is a small pilgrimage church of late fourteenth or early fifteenth century work which not only has all its arches semicircular, but the lights of the windows are also round-headed. The interesting gateway or gallery at the east end of Ratisbon Cathedral is composed entirely of round-headed arches, and dates from the fifteenth century (Fig. 14.). The Rathaus at Freiburg, in Breisgau, has entirely round arches, or those composed of a series of inverted segments of circles; it is a singularly pleasing and picturesque building erected of red stone. The arches which support the upper story have hollow mouldings, which die down upon round columns without capitals (Fig. 13.). The round arch is also frequently used in Germany to support organ-galleries; a very fine example is to be seen at Vienn (called the Giant's Gate), St. Mary's, Wurzburg, Ochsenfrith, and the gallery above the shrine of St. Cyriac, at Augsburg. Brandenburg offers some very interesting examples of round-arched Gothic. The front of St. Catherine's Church is a very rich example; it will be seen from our illustration that this is ornamented with the richest tracery, without the use of the pointed arch (Fig. 5.). Work of a somewhat similar character is to be seen at Luheck. The fine rood-screen at Munster Cathedral, recently pulled down, afforded a charming illustration of the

round arch used for ornamental purposes, and very profusely adorned with tracery and cusping, dating from the fifteenth century (Fig. 111.). The Church of Iphoven, near Wurzburg, has a very interesting staircase of stone, ornamented with round-headed arches. The Thein Church at Prague has a very rich doorway, enclosed by a round arch. The Chapel of Castle Trausnitz, at Landsht, which is partly thirteenth and fourteenth century work, and partly late fifteenth century, has round arches throughout (see Fig. 16.), and the network vaulting is semicircular in section. St. Wolfgang's, Rothenburg, on the Tauber, has semicircular vaulting to the apse and side recesses of the nave. The chapel of the "Braucherhof" Nuremberg, has also round vaulting. The portal of the singular church at Chemnitz is round-headed.

Later in date, after the year 1500, the round arch becomes still more common, and we find it frequently used in windows. Examples are to be seen in the cloisters at Ratisbon, &c.

In civil and domestic buildings round arches are of very frequent use. Examples are too frequent to quote at Nuremberg, Prague, Landslut, Munster, &c. At the last-named place it is profusely used in the tracery decorations of gables. For bridges, gates, &c., its use is quite as common as that of the pointed arch during the thirteenth, fourteenth, fifteenth, and sixteenth centuries.

Throughout the whole of the Middle Ages the round arch was used in Italy; more frequently, in fact, than the pointed in some works which are quite of Gothic character, not a single pointed arch is to be found. The upper portion of the baptistery at Pisa is a case in point (Fig. 111.). The magnificent fronts of the cathedrals of Siena and Orvieto have few pointed arches about them, although they are among the finest works of Italian Gothic. In the beautiful Cathedral of Cremona the round arch is far more used than the pointed.

It must not be forgotten that, in addition to constructive architectural works, the use of the round arch in purely decorative work must be studied in order to arrive at a just appreciation of its influence during the Middle Ages. In this branch of the subject a great deal of new and most interesting information has been collected together by Mr. Westlake, in his excellent papers upon glass painting. Mr. Westlake's remarks and illustrations show distinctly that the Mediæval glass-painters certainly favoured the round arch, and its use may be found in their works through the whole of the Middle Ages. In wall-painting, also, we find a decided inclination towards the round arch, and that even in the middle of the fourteenth century. Amongst the paintings which adorned the wall of St. Stephen's chapel, Westminster, are some remarkable examples. One of these, the subject of which, unfortunately, it is not easy to decipher, as the figures are so mutilated, shows a very remarkable background, which appears to represent a vast hall or temple of very singular architecture, every arch of which is round. The well-known manuscript drawing of the imprisonment of the Duke of Orleans at the Tower, now amongst the Royal manuscripts in the British Museum, represents all the buildings as having round arches, although we know as a fact that London Bridge had acutely-pointed arches. This manuscript dates from the fifteenth century. Amongst early printed books we rarely find pointed arches represented. The *Nuremberg Chronicle*, 1493, though profusely illustrated with views of towns and buildings, does not show a single pointed arch, and the *Schatz-behalter*, 1491, only represents that form twice, whereas in the representation of the large Gothic church, called "Sibundsbentzigst Figur" (seventy-seventh figure), every arch is shown round.

Our space will not allow our carrying out this inquiry to a greater length by entering upon the subject of cabinet pictures, &c., but we think that we have already shown that the round arch maintained an existence through the whole of the Middle Ages. In fact, there seems to have been a struggle going on between the two forms of arch not only during the twelfth century, but also during the thirteenth, fourteenth, and fifteenth centuries. During the three latter centuries, architects in England and France certainly favoured the pointed arch, but in Germany and Italy it never gained so complete a mastery over its rival as in England and France. The

paintors seem always to have favoured the round arch through the whole of the Middle Ages.

In Germany during the thirteenth and commencement of the succeeding century, a regular round-arched Gothic style was formed. It, however, does not seem to have stood against the "Cologne School,"—a matter, to our minds, greatly to be regretted, because, however grand Cologne Cathedral may be, it is simply a copy of French Gothic with all the French peculiarities exaggerated until they become faults. The great height of the French churches, the long windows, and slender columns are so exaggerated in the German imitations at Cologne and elsewhere as to give a wiry and metallic character to the buildings, and, for our part, we are bound to acknowledge that we consider the German churches which are not influenced by Cologne far truer examples of German art than those which have borrowed their inspiration from that vast cathedral. It is greatly to be regretted that this German round-arched Gothic style did not prevail, as, from the examples which are to be found of it here and there, it might have developed into a very pure and noble style of architecture. In Italy, it is true, we have a round-arched Gothic, but it is so influenced by Classical recollections and inspirations that it is never quite free from their influence; but in Germany the case was different, and the Germans might, but for Cologne, have established a style which would have possessed all the distinctive features of Gothic architecture combined with the round arch. In England and France the pointed arch was used in such a magnificent manner, and the style produced at the commencement of the thirteenth century was so remarkably magnificent that one almost ceases to regret the loss of the round arch; but in Germany the case is different, for there the buildings which are the most thoroughly removed from the influence of the round arch, and the most thoroughly developed into the Pointed style, are precisely those which are the least admirable. In England the severe discipline of the Cistercian order, and their almost puritanical objection to sculpture, painting, stained-glass, carving, and ornamentation in general, was of considerable advantage to a style just coming into existence because it forced architects to attend exclusively to the purely architectural development of the style, and probably produced that rich system of moulding which is so distinguishing a feature of English Gothic. Rosengarten's theory that the monks were attached to the old Romanesque style, and that the Gothic was favoured by secular architects may have been true of Germany, but we doubt it; it is not certainly true of England, as may at once be proved by comparing the Abbeys of Rievaulx, Byland, the choir of Fontaines, with contemporary secular works, or works executed by secular architects. Nor do we quite agree with Rosengarten as to the advantages gained in German architecture by the Freemasons. The fact is, there was too much mere Masonic skill about German Gothic work, and however wonderful such works as Strasburg spire may be, yet there is too great a sacrifice of architectural propriety and simplicity to mere skill in workmanship, and it is a question whether the retention of the round arch would not have restrained the aspiring ambition of German architects and workmen within due limits, and have given a sobriety and solidity to its later development which it certainly needed, were we led to this idea because wherever we have seen the round arch used in German Gothic, it always seems to have a beneficial effect.

As we have, we trust, shown that the round arch was never banished from Gothic architecture, and that it was alone during the fourteenth and fifteenth centuries that the pointed arch was in the ascendant, it must be evident to all that the influence of the latter upon European architecture cannot have been very deeply rooted or very lasting. It has been usually supposed that the round arch came into general use again through the revival of the Classical style or the Renaissance, but it is evident that other influences were also at work to bring it back again, and that the very transitory rule of the pointed arch would have come to an end, even if the Classical style had not been introduced in the sixteenth century. The fact is, that Gothic architecture was never in a thoroughly settled condition after the banishment of the round arch at the middle of the

thirteenth century. From this time we find the arch getting more and more depressed until the appearance of the four-centred arch in England, and the three-centred arch on the Continent. There seemed to be a want of something equivalent to the semicircular or round arch, and nothing could be found quite to fill its place. The semicircular arch is so thoroughly commonplace, so simple in its construction, so convenient as to its form, and so structurally sound, that no architecture can afford long to ignore its existence. The inconvenience of the pointed form of arch was from the first felt in domestic work, and we find through the whole of the Middle Ages the domestic windows square in form; the point never came well under a flat ceiling.

In doorways, also, the point was felt to be inconvenient, and this accounts for the fact that we so frequently find the inner arches of doorways round or segmental in English buildings, and that the French used the lintel under their Gothic doorways, so that the arch, magnificently as they adorned it with niches, statues, &c., was really only a piece of ornament, the actual doorway being square-headed. As we have before pointed out, in purely constructive works the round arch was the rule, and the pointed arch the exception. A singular example of this occurs at Beverley Minster, where the arches of the triforium which are visible from below are pointed, but the purely constructive arches at the back of the triforium are semicircular. In bridges and engineering works the round arch is the rule, even in the fourteenth century. As the round arch was so eminently valuable on account of its constructive qualities, it becomes a question whether we have hitherto been right in considering the highest and most perfected style of Gothic to be that in which it is almost entirely thrust out of sight, and whether the fact of this concealment of the round arch does not show a certain decline and falling away from "the true principles of Gothic architecture." If this be so, those who strictly insist upon "true principles" ought to hold what we are in the habit of calling the "Transitional style" as the most perfect development of Gothic architecture, because in that style both forms of arch are used openly. We should not be surprised if a careful study of the influence of the round arch in Gothic were to lead to a renauncing and redistribution of the different styles. In this case Norman work of the eleventh and early part of the twelfth century would be looked upon as early Gothic; the Transitional style of the latter half of the twelfth and the first twenty years of the thirteenth century as perfected Gothic; and the subsequent styles simply as different phases of its decline. To exclude the Norman of France and England from the list of Gothic styles, as must be done if the name Pointed style is ever universally adopted, must be a mistake, as so many purely Gothic features were developed in the Norman.

That the pointed arch alone and without mouldings or other features peculiar to Gothic architecture has little or no real Gothic effect, is proved by some of the arches at the Town-hall at Cologne, which, though pointed, have no effect of Gothic architecture whatever, owing to their being unaccompanied by other Gothic features, whereas the round arch from the screen at Munster which we have placed by its side our illustration, does not in the least mar in the general Gothic effect of the composition to which it belongs. What is still more singular is the fact that the Church of St. Enstache, Paris, has a wonderful Gothic look about it, though it possesses not a single Gothic arch or moulding. With regard to the later Norman or Transitional style, it certainly seems to deserve more attention and study than it has received, but one thing was wanted to make it the most perfect of all styles, and that was some kind of principle which might determine where the round arch was to be used and where the pointed. There was a little too much mere fancy in the matter, but if the style had only lasted a few years longer it would in all probability have developed some system which would have set this right; unfortunately (from the point of view which we are now taking) it only lasted some sixty years, and the attempt to unite the two forms of arch was abandoned, at least in France and England. Now comes a question, and one worthy of our attention. Would it be possible to take up this Transitional style and attempt to develop it, either as a round-arched style or as a style using both forms of

arch consistently? The great difficulty at the present day in doing anything original in architecture is that all styles have been so fully developed that there is nothing further to be got out of them. They are like Australian tinners' reefs, which are already so much cooked that any attempt to warm them up again only ends in making them tasteless and insipid. But with regard to the Transitional style, it never became thoroughly developed, and if it were revived there is a possibility that it might lead to something. One thing seems to us to be certain, and that is, that any style of architecture which is to become largely in use must include so valuable a form of arch as the semicircular, as it is the most useful and most convenient of all arches. It is by no means improbable that the exclusion of this form of arch from Gothic architecture was the weak point in that style, and may have been the reason that it lasted for such a short period.

It would be well if our architectural students would make careful sketches of every example of the use of the round arch in Gothic buildings. There can be no doubt that numerous examples are to be found, which are at present little known. They would be then able to judge whether the examples are sufficient to warrant the experiment of trying to work out a style from them. There is a good deal of round-arched Gothic work in Spain and Portugal, but it seems mostly of a very late character. Earlier examples might, however, be found in parts of those countries which are less known. We do not, of course, mean to be understood that these examples would of themselves constitute a new style, but they might help to develop one. It is, of course, possible that we are incapable at the present day of forming a new style of architecture, or that the unfortunate rage for cheap work may be destructive of all true art in building. Let us, however, hope that this may not be the case, and that architecture, which has produced such glorious works in the past, may be destined to an equally glorious future.

## THE BREWERY, ALDERSHOTT.

THESE premises have been recently completed at Aldershot, now the largest and most important military station in the United Kingdom, the War Department having decided to replace the present wooden huts with substantial brick buildings in the North and South Camps.

The tower contains the various working floors where the operation of brewing is carried on on the gravitation system, by which method a maximum result is obtained with a minimum of labour, both mechanical and manual.

In one wing are the offices, boiler and engine rooms, with malt-store, &c., above, cask-cleaning shed and cooperage. In the other wing are the racking-rooms, hop-store, cellarage, cart-sheds and stables, &c. The fermenting-squares and coolers are built in glazed white brick externally, and lined with Portland cement internally, rubbed to a highly-polished surface. The present plant is a ten-quarter set, with ample space for extension. The floors of the racking-rooms, stores, &c., are laid with Staffordshire paving bricks. The external walls are faced with red bricks; the piers between the panels having bold moulded angles; the heads and sills of windows and doors being of fine Portland cement.

The machinery is all furnished with the latest improvements, and is by Messrs. Coney-beare, of Greenwich, and Messrs. Morton, of Burton-on-Trent. The whole of the works were carried out by the well-known firm of Government contractors, Messrs. Martin, Wells, & Co., Aldershot, for Mr. Thos. Sheldrake, Ipswich. Mr. J. St. C. Milley, of Aldershot, was the architect.

**Architectural Association.**—The President and Committee of the Architectural Association have issued cards for the opening *sessione* of Session 1882-83, which is to be held on the evening of Friday next, the 27th inst.

THE  
LIFE OF  
SAMUEL JOHNSON  
BY  
JAMES BOSWELL  
ESQ.

**PRINCESS ALICE MEMORIAL HOSPITAL.**

On the death of H.R.H. the late Princess Alice, it was decided by the inhabitants of Eastbourne to erect an hospital as a memorial of her, her Royal Highness during her lengthened visit to Eastbourne in 1878 having made herself much beloved by her kindly acts and gracious manners.

The hospital is being built on a site close to the railway station, which was given by Mr. C. D. Gilbert. The subsoil is chalk; and the main building is faced with red bricks. The roofs are covered with brown Broseley tiles. The upper floor of administrative block will be half-timbered. The walls are built hollow, and lined inside water-closets, bath-rooms, lavatories, &c., with glazed bricks. The floors of the wards are to be laid with oak in narrow widths, and wax-polished.

No skirtings or mouldings will be set up to collect dust or dirt. All internal woodwork is to be varnished. All baths, sinks, lavatory basins, and so on, are to be of white glazed pottery in one piece. All sinks, lavatories, &c., are to be free from inclosed framing, to insure cleanliness.

The grates in the wards are to be Galton's ventilating grates for the supply of warmed fresh air. The ward flues are to be swept from the outside of the building.

Natural ventilation is to be effected by window-sashes, glazed with plate glass, divided into three compartments, the bottom and middle sashes to be hung so as to be raised or lowered any height as required, the top sash hinged to fall inwards, with glass hopper sides to admit fresh air without draught. Fresh-air inlets will be carried under every bed in the wards, to be opened or shut as required. The gas lights are to be enclosed in locked globes, so that all fumes may be carried direct into the ventilating-flue. Ventilating-flues (for exit of vitiated air), heated by gas, and smoke flues, are provided to all rooms. Fresh air will be admitted to the wards, fire-grates, warmed, and supplied to the wards, surgery, and matron's room. Slop-sinks, lavatories, baths, and water-closets are disconnected

from the wards by cross-ventilated lobbies. The wards are detached from the administrative department by cross-ventilated corridors. All the drains are carried direct to the outside of the building, and flushed at the two highest points by Field's flushing-tanks, and ventilated by fresh-air shafts near the entrance to the sewer, and ventilating pipes on the highest points.

The foundation-stone was laid by H.R.H. Princess Christian of Schleswig-Holstein, Princess Helena of Great Britain and Ireland, on the 5th of July last.

The hospital, without detached mortuary, will cost about 5,000*l.*, and is being built with funds raised by voluntary contributions. The success of the movement is greatly indebted to the personal exertions of the Rev. Canon Whelpton, chairman; Mr. G. Gurney hon. treasurer; and Mr. J. H. Campion Coles, hon. secretary of the committee.

The building is being erected by Mr. Gregar, Victoria Wharf, Stratford; Mr. W. Slack is clerk of works, and the architect is Mr. Thos. W. Cutler.

**Liverpool Engineering Society.**—At the meeting of this Society, at the Royal Institution, Colquitt-street, on Wednesday evening, the 11th inst., Mr. F. B. Salmon, president, in the chair, a paper on "Some recent Progress in Electrical Engineering" was read by Mr. J. S. Brodie, M. Inst. M.E., of the City Engineers' Department. The paper described leading types of dynamo-electric generators, including those of Siemens, Gramme, Brush, and Lactraussée, discussing the merits and comparative efficiency of each for the production of electric currents. The secondary batteries of Plauté, Faure, and De Meritens were next illustrated and described. Passing to the subject of the electrical transmission of power, the electrical railways of Siemens, at the Paris Exhibition, was explained and illustrated by diagrams. An interesting discussion followed. We understand that a supplement to the paper, on "Electric Lighting," will be read at the next meeting of the Society, on the 25th inst., by Mr. Brodie.

**HASTINGS CASTLE.**

THE Rape of Hastings is the most eastern of the six divisions of the county of Sussex, which are supposed to derive their somewhat peculiar name from the early occupation of the district by emigrants from Jutland. The Rape of Hastings probably is so called from its principal town, which was also the seat of its lords, both before and after the Norman conquest. Like the other Rapes, it had its river and its forest, its castle and its castelry, often designated as an Honour. The river, the Rother, is the common boundary of Kent and Sussex, and joins the sea at Rye. The forest, long since disafforested and enclosed, is represented by frequent patches of woodland, scattered over the least fertile parts of the district, and by the numerous and well-timbered parks by which it is characterised. The town once possessed a small port, now silted up. It was situate at the mouth of a stream, which still brings down its inconsiderable tribute, flowing at the foot and to the west of the castle hill.

The origin and etymology of the name of Hastings are lost in obscurity. It is so uncommon that it has been supposed to come from Haesten, the celebrated pirate and Danish Viking, who infested the southern coasts of England and the valley of the Seine in the ninth century,—a period when warriors of Northern descent gave their names to their possessions, instead of, like their descendants of two centuries later, reversing the practice. Mr. Lower, familiar with Sussex topography, has suggested that the small stream of the Aston, a few miles west of Hastings, may play some part in its etymology, and that Hasting, or the Haesten-Ceaster of the English, may have stood upon its margin. It has also been regarded as the seat of the Hastings, a tribe said to have been warred upon by Offa of Mercia in 792. Another not less interesting point connected with the place is the fact that it gave name to the ancient family who so long ago bore the title of Pembroke, and still bear that of Huntingdon.

The castle occupies the narrow, acute, and

very steep extremity of a ridge of chalk, which here terminates abruptly to the seaward at a height of about 180 ft. above the seashore, and seems intended by Nature for a defensive position. The ridge is a spur from a range of larger and more elevated character, which extends from the high ground of Battle, by Ore, south-eastwards to the sea, and has to its west and south a large tract of broken and highly fertile picturesque land known as the hop garden of Sussex, and within which are the well-known seats of Hurstmonceux, Ashburnham, Battle, and Crowhurst,—a tract which presents to the sea an open frontier of about twenty-two miles from Hastings to the Marsh of Pevensey, defended anciently by the two castles of those names, and more recently by twenty or thirty martello towers, in which our fathers, three-quarters of a century ago, placed an expensive confidence.

The ridge and promontory of Hastings remain unnumbered by modern buildings, and are occupied only by the castle and its outworks. The older part of the town, with its two parish churches of St. Clement and All Saints, occupies a deep valley to the east of the castle, while round the nose of the rock, and to its west, the remains of the old port have been superseded by the new town, a fashionable watering-place. Much of this town stands within the parish of St. Mary de Castro, the parish church having been the chapel of the castle, and collegiate. The town seems to have been partially walled, and certainly had four gates. Hastings, though now affording no accommodation for shipping, is still a cinque port, and its ancient consideration is attested by the fact that in 1229, Scaford, Pevensey, Bulverhythe, Ilidney, Iham, Beaksbourne, Greenhythe, Northwey, were its subordinate members, and *tanquam membra*, were Ryo and Winchelsea.

The castle is composed of two wards, separated by a formidable ditch cut through the sandstone rock, about 400 ft., across the ridge, with a breadth of 60 ft., and to a depth of 30 ft. to 40 ft. The inner ward lies to the west of this ditch, between it and the point of the promontory. The outer ward lies to its east, and is again protected by an outer and considerable, though less clearly-defined, ditch, of greater length than the former, and also crossing the ridge. There was also another ditch cut as a sort of step in the steep northern slope, and covering that side of the place, and chiefly intended for the defences of the inner ward. Between the east end of this ditch and the north end of the great cross ditch was the original entrance to the inner ward, the approach to which wound up the steep north-western slope of the rock.

The inner ward is in figure nearly a right-angled triangle, containing about  $1\frac{1}{2}$  acre, the north side 154 yards and the east side 87 yards in length, while the hypotenuse is concave, reducing the breadth of the ward at one point to 16 yards. The cliff which forms the boundary has been either scarped or has fallen away, so that it is at present precipitous, and its face has been patched with modern masonry and brick-work. It is said that this side was once straight, and has been cut away to make room for the gasworks and a crescent of houses below, so as to diminish the castle area. This may be so, but the encroachment cannot have been considerable. A wall for defence on this front could never have been needed: probably there was only a low parapet.

Along the north from the ground, though very steep, is not absolutely precipitous, and along the crest of the slope are the remains of the curtain wall, about 6 ft. to 9 ft. thick, and in parts 20 ft. to 30 ft. high. Upon this wall is a rectangular tower, about 12 ft. by 20 ft., having a ground and upper floors in which are parts of three windows of Norman date. Connected with this tower are said to be traces of a small postern, and there is certainly a mural passage, 18 ft. long, ending in a garderobe. East of this tower is a turret, square at the base, but which above seems to have been cylindrical. It contains a well-stair connected with the chapel. The wall is continued round the east front, across to the cliff. At the angle it is still 20 ft. to 25 ft. high, but further on it has been reduced to 10 ft. In this front, overlooking the ditch, are the bases of three half-round buttress towers, 20 ft. diameter. Their ground-floors have been vaulted in; all above is removed. Between the two most northern of these are still to be

seen the jambs of an Edwardian gateway, of 9 ft. opening, with a square portcullis groove, and rebates for a door immediately behind it. In this part of the curtain are the remains of some mural cells. The gateway must have communicated with the outer ward by a bridge across the ditch, probably of timber, since there is no trace of masonry in the rock. This entrance is now disused, and the entrance in use is in the north side between the chapel tower and the north-east angle, protected by a late tower, about 20 ft. square, with very slight walls and a flanking wall, also slight, and projecting about 20 ft. This is thought to have been the original gateway of the ward, and may have been so, though the other entrance between the two flanking half-round towers has at present more the aspect of a main entrance.

The eastern, naturally the weakest side of the inner ward, is further defended by a broad artificial bank or ramp of earth from 20 ft. to 30 ft. broad and 8 ft. to 10 ft. high, piled up against the back of the wall, which, in fact, is a revetment. At the north-east angle of the ward this bank is expanded into a mound about 20 ft. high above the inner area. The curtain traverses this mound, of which about two-thirds is within its circuit.

No doubt this mound was the keep of the English fortress, and the bank and ditch its main landward defences, but, save the curtain, there is no trace of any masonry upon it, nor does the Norman castle appear to have been provided with any regular keep, either shell or rectangular. Probably, as at Exeter, the whole inner ward was the keep.

There are at present no traces of a hall, kitchen, or regular lodgings, within the castle, but placed against the north wall are the remains of the chapel, or rather of the free collegiate church, composed of a nave and chancel. The nave was 30 ft. by 64 ft., the curtain forming the north wall. There seem to have been a west door, and one or perhaps two south doors. At its east end a handsome highly-pointed arch opened into the chancel, and still remains very perfect. The jambs are square, the angles replaced by delicate shafts, a quarter engaged, with caps and bases of Norman type. The abacus is part of a moulded string, and the arch, though the section is square, as in the Norman style, is richly moulded. The central member of the arch is a bold rib, springing from two brackets or corbels carved in foliage. The general character of the whole is very late Norman, passing into Early English. In the north wall, at its east end, are the remains of the arches of three sedilia, and near the middle of the wall, in a sort of buttress, is a piscina, probably a Perpendicular insertion. Near the north-west angle is the cylindrical base of the font. In the east wall, on each side of the chancel arch, is a flat-topped doorway of rude workmanship, as though intended to be concealed by hangings. The northern door opens into the well-stair of the turret, the southern into a vestry.

The chancel was about 18 ft. broad by 28 ft. long. Of its walls only a few traces remain. It communicated on the north side with a small chamber, perhaps a garderobe, and on the south side with the vestry. The vestry, called also the chapter-house, is a small, nearly square chamber, 12 ft. by 15 ft., with a plain Norman recess in its east wall, and the jambs of a door, evidently Norman, opening into what seems to have been a sort of lean-to cloister resting on the south wall of the nave. The cloister itself is gone, but in the nave wall are traces of an arcade. Here are three graves inclosed in pieces of stone placed edgewise, and a much-worn *dos-d'âne* coffin-lid. The breadth of the nave is wide for a single span, but if there were aisles, there must have been two, the arches being central, and in that case very narrow ones, even for a Norman church. The floor of the chancel is three steps above that of the nave.

The curtain wall along the north front and over the mound is apparently of Norman date, as is most of the east wall; but its buttress-towers and the gateway are probably insertions of the reign of Henry III. or Edward. The chapel may be later than the north wall, probably of the reign of Henry II. or John.

The old part of the masonry is coursed rubble, with occasional pebble-stones, faced with bold open-jointed ashlar, the blocks being rudely dressed. In one part, near the church, is a little herring-bone work, though probably

not older than, if so old as, the rest. The quoins and window-dressings, where preserved, are good ashlar. Various fragments of cut stone are collected and heaped up; of these a few are late Norman, some good Early English, some Perpendicular. A late Norman crypt has been discovered in the town.

It may be doubted whether William or his feudatories, the Earl of Eu or de Tilhoil, added defences in masonry to the works already existing. At least there is no evidence that they did so, and the oldest masonry now seen is certainly not very early Norman, though too early to have allowed time for the decay of any previous masonry of the same architectural period.

The chapel was probably founded in the reign of Henry I., and though the castle was erected by, and for some time held, under the Crown, by the powerful Earls of Eu, it was never a great baronial residence, being in that respect far inferior to Arundel or Lewes, but was probably maintained only as a strong, though small post, to cover embankments for, or disembarkation from, Normandy.

The outer ward is contained between the inner and outer lines of ditch; within the latter is a considerable bank of earth, which rises at the north-east angle, and is continued across the northern end, that being naturally the weakest part of the inclosure. It does not appear where was the entrance of this ward, but possibly near the south-east angle. There are no traces of masonry here, so that the defences of the outer ward may have been a stockade only.

From the position of this fortress it is most probable that, like Dover, it may originally have been a British work, the entrenchments including the promontory, and the south ditches being the defences landward. The mound, however, placed at an angle of the inner ward, upon the bank, and covering the approach, is almost certainly a later, and, no doubt, an English work.

Whatever may be the origin of Hastings as a defensive work, its known history commences towards the end of the sixth and the beginning of the eighth centuries in the times of Offa and Athelstane, when it was a place of some consequence, and contained a mint. Coins, indeed, were minted here as late as the reign of Henry I.

The termination, "ceaster," which it then bore, shows it to have been fortified. Towards the middle of the eleventh century it was plundered by the Danes, and towards the middle of that century it was the men of Hastings who, after the murder of Beorn by Swegen, captured his ships, and slew his accomplices in the murder, though Swegen himself escaped. Hastings also played a part in the Norman Conquest, though not that popularly assigned to it as the scene of the battle. William landed at Pevensey, and thence moved rapidly to Hastings in search of food. There Odo of Bayeux, as one of his lieutenants, ordered a fortress to be thrown up "at *folestrat* castellum," and thence, according to the same authority, the Bayeux tapestry, William marched against Harold. William, we are told, on reaching the port, selected a proper site, and fortified it rapidly with a castle in timber, "*lignum castellum*." This, we must suppose to be a replacing or restoration of whatever there was standing on the old site. It can scarcely have been a palisade on the low ground below the castle rock. He then placed Humphrey de Tilhoil, brother-in-law of Hugh de Granmainsin, to discharge his orders, "*qui Hastings a prima die constructionis ad custodiam suscepit*." Wace's description applies more to Hastings than to Pevensey, which was already walled in:—

"Un chasteil i ont fermé  
De breteschies è de fossé."

De Tilhoil's occupation was confined to the construction or restoration of the defences: the castle and castle, manor, and superiority of the whole Rape were granted by William to Robert Earl of Eu, one of the most powerful of his Norman adherents. This grant of the castle is recorded in Domesday, and a castle involves the existence of a castle. The Earls of Eu held possession for five generations in the male line. No doubt, either Earl William, who succeeded in 1090, or Earl Henry, who died 1139, executed some works in masonry at the castle,—probably the wall of the *enceinte*, much of which still remains. Either the first or second earls founded within the castle a free chapel.

and college, with a dean and secular canons, and to this Henry, the third earl, added a considerable endowment by charter in the reign of Henry I. The college survived the castle, and flourished when the latter was a ruin. Thomas à Becket held the deanery, and William of Wykeham one of the prebends. The college endured to the 38 Henry VIII., when it was dissolved, and the property alienated to Sir Anthony Brown. After the extinction of the Eu barony the patronage vested in the Crown. The charter of Earl Henry is recited in a confirmation, 22 Edward I.

In 1088 the castle probably had been made strong, for it was the boast of William of St. Calais, Bishop of Durham, that he secured Hastings for the powerful military force with which that king proposed to invade Normandy. At that time Anselm and many bishops and barons were present in and about the castle, and were detained there from Candelmas in 1094 for six weeks by contrary winds, during which time the king was present at the completion and consecration of his father's Abbey of Battle. Immediately afterwards Robert Bloet was consecrated bishop of Lincoln within the chapel of the castle, and here also Bishop Herbert of Thetford was deprived of his see. It was in the castle of Hastings also, on this occasion, that Rufus once more refused attention to the reasonable remonstrances of Anselm, who left him unblinded to depart on his Norman expedition. The Earls of Eu, by no means always faithful vassals of the Crown of England, seem lately to have neglected the castle, which was inferior to Pevensey as a muster-place for troops, and had become of but moderate value. Henry, the fifth earl, who died in the reign of Richard I., left an only daughter, Alice, who married Ralph de Essoudun, who in her right became Earl of Eu, and so died in 1211. Their son, William, elected to become a subject of France, and, 29 Hen. III., his possessions in England escheated to the Crown, and were granted to Prince Edward. As early as 1227 King Henry allowed to Robert de Auberville 10 marks, half his salary, as keeper of the castle. The college was retained by Henry in his own hands. In 5 Edward III. the dean and canons petitioned to have the castle wall restored, it having been injured by the sea. In 1372 the castle was granted to John of Gaunt, and in the reign of Richard II., it was a ruin, and probably so remained. The Early English work, especially connected with the chapel, was probably executed by Henry III. on his acquisition of the barony.

By Henry IV. the castle was granted to Rauf Neville, Earl of Westmoreland, with reversion to Sir John Pelham, who again transferred it, in 1412, to Sir Thomas Ho, created Baron Ho and Hastings in 1447. He died without issue male about 1453. The fees of Sir Thomas sold the castle and other property, in 1461, to Sir William Hastings, who in that year was summoned to Parliament as Lord Hastings of Hastings. By his descendant, Henry, Earl of Huntingdon, the castle and its appendages were sold, in 1591, to Sir Thomas Pelham, in whose descendant, now Earl of Chichester, they remain vested. Those who wish to understand thoroughly the position of Hastings as regards the landing, first movements, and subsequent advance of Duke William upon English soil, will do well to consult the very lucid and quite original account of the battle of Senlac, given in Mr. Freeman's "History of the Conquest." G. T. C.

#### SYNAGOGUES.

A CORRESPONDENT inquired in our columns a few weeks ago (*ante*, p. 416) whether there is any synagogue in Europe with a spire to it. The *Jewish Chronicle*, quoting the inquiry, adds, "We believe there is not any." We hope this inquiry will be carried further.

**British Archaeological Association.**—We understand the London excursion of the local members of the British Archaeological Association has been definitely fixed for October 27th, 28th, 29th, 30th, and 31st,—Friday to Tuesday inclusive. Arrangements are in progress for visiting Herolds' College, Eton College, Windsor Castle, new discoveries at the Tower, Waltham Abbey, Greenwich and Eltham Palaces, &c.

#### A YEAR'S BUILDING OPERATIONS IN OXFORD.

IN accordance with its custom at the commencement of the Michaelmas term, the *Oxford Journal* gives a description of the new collegiate and other buildings which have been in course of erection or alteration during the past twelve months. From this account we extract and condense the following details:—

**The Divinity Schools.**—This fine pile of buildings, including Bodley's Library, has been undergoing thorough restoration during the last five or six years, at a cost defrayed by the curators of the University chest, under the direction of M. T. G. Jackson, architect, Devexen-court, Temple, London. The library, round which the schools are grouped, was finished by the donor in 1538, and formally opened in 1602. Bodley himself died ten years afterwards, and was buried in Merton Chapel. About this time the schools were begun, Thomas Holt, a native of York, being the architect, and he was at his death interred in Holywell Cemetery, where so many notable men connected with the University have been buried. To Holt belongs the honour, if honour it may be called, of having introduced the Classical orders of architecture in a series over each other in the same building. The central tower of the schools is the most famous, if not a unique, specimen of this kind of work in England, and this prominent object has just been restored in a very complete and careful manner. The stone with which it was originally built was from the Headington Quarries. Some sixty or seventy years ago a partial patching up was necessary, owing to the decay of the stone. Roman cement was then used, in the hope that the decaying finger of time might be arrested; but cement and stone have continued to crumble and fall together, especially in wet and frosty weather, in such a manner as to render the structure highly unsafe. The tower, from the pavement to the top of the angle pinnacles, is 110 ft. high, or to the top of the octagon turret, 117 ft. Its width, from east to west, is 31 ft., and from north to south, 6 in. less; so that it is nearly square. The west front is the most important, composed as it is of the five orders of architecture, with Elizabethan ornamentation, the columns rising above each other in pairs on either side. This has now been completely repaired, and as Cliphurst stone has been used for the purpose, it is hoped that the weather will have little effect upon the new work. Every detail of the old structure has been minutely copied, stone for stone, and wherever it was possible the work of the former restorer has been retained. This has been rendered still the more easy from the fact that Bath stone was used in those portions of the work which have been allowed to stand. The parts untouched consist of six columns on the south side of the west front, a portion of the cornice of the upper order, the parapet and pinnacles. The masonry is solidly laid in Portland cement. The old stained glass and the oriel windows on the east front have been restored and re-leaded by Messrs. Powell & Sons, Whitefriars, London, the subjects being chiefly Scriptural. A curious discovery was made near the canopy over the statue of James I. in the course of the demolition. A window, similar to those above and below, evidently occupied the site of the existing group of figures previously to their being placed *in situ*. Part of the inside arch and jambs were left undisturbed. Lightning-conductors have been fixed to all prominent points, as well as over the rest of the building, by Messrs. Newall & Co., of London. The east front of the tower has also been carefully restored. The splendid oriel window lighting two floors, and which is 39 ft. high and over 10 ft. wide, is divided by mullions and transoms, and, besides the tracery panelling, there is much carved work in the several stages. In the upper part of the window the old stained glass has been restored, as have the two transom windows above. In the parapet between the angle pinnacles are built intermediate pinnacles, according to the original design, and half pinnacles answering to those on the west front form buttresses at the north-east and south-west corners. The arches over the upper windows are strengthened by wrought-iron rods; ornamental fleurs-de-lis are placed in the parapet coping; and the remainder of the tower is strengthened with iron tie-rods passing through both walls, and secured with nuts and plates. The windows on either side of the tower have been replaced according to the

original design. The restoration of this chief feature has occupied just over a year, and has cost over 6,000*l.* Mr. Burgess has been clerk of the works. The carving was done by Mr. McCulloch, Kennington-road, London; and the general contractors were Messrs. Symm & Co., of Oxford.

**The New University Schools.**—We some time ago published a description of these schools, of which also Mr. Jackson is the architect. The principal features which remain to be noticed are the lighting arrangements, and the carving work which is now being executed in the front. The former have been carried out by Messrs. Hart, Son, Peard, & Co., of Wych-street, London. The gaseliers which light the great hall and the west ante-room have been reproduced from Flemish examples. In the writing-schools and north-west and south-west halls there are simpler pendants, designed in the feeling of the Flemish chandeliers. The panels on each side of the principal entrance are now being carved, and represent a *viva voce* examination for a degree on the one side, and the conferment of a degree on the other.

**Brasenose College.**—The buildings in course of erection at this college will take the place of two slightly-built and not-well-planned constructions, now standing in the kitchen or cloister quadrangle. By their removal, and that of some cottages and outbuildings, a spacious quadrangle, bounded on the east by the ante-chapel and cloisters, and on the west by the new wing, which is set a good way back, will be formed in the place of the present confined and irregular space. To the south, the new quadrangle is only separated from High-street by the houses and shops facing that street, and the buildings now being erected form part of a scheme for a quadrangle which will extend the whole distance from the old Brasenose buildings to High-street, and add one more to the series of collegiate and academical buildings with which that street is lined. The building will contain twenty-two sets of rooms for undergraduates, two large lecture-rooms, and a spacious set of rooms for a Fellow. The old collegiate plan of disposing the rooms on separate staircases had been followed, but various conveniences in the way of sculleries and servants' offices are provided, which were unknown or disregarded when the older college buildings were designed. The foundations are laid at a depth varying from 14 ft. to 20 ft., that being the depth of the "made" or artificial earth for the most part within the ancient limits of the city. In the soil that has been removed at Brasenose, a great variety of relics of the past were found, consisting chiefly of pottery, coins of no great value, old knives, wig-curlers, and tobacco-pipes, some of which date from the introduction of tobacco. In order to gain space enough for the new building it was necessary to demolish the greater part of Amsterdam Court, which occupied the site, and preserved the name of Amsterdam or Broad-gates Hall, one of the numerous academical halls with which Oxford abounded during the Middle Ages, and especially before the existence of colleges. The walling of the new building is of Headington rubble, faced with Gibraltar rag-stone, with dressings of Cliphurst stone for strings, cills, weatherings, and mullions, and hard Doulton for the rest. Flagstone from Castlehill, near Thurso, will be used for the landings, and the stairs will be of hard Portland. The foundations and the walls, to the height of about 3 ft. above ground, were put in by workmen under Mr. Mockford, the clerk of works. The contract for the building above this level has been let to Messrs. Symm & Co., of Oxford, who have carried the buildings almost to the roof.

**Lincoln College.**—The new buildings here form the north side of the space of ground known as The Grove, at Lincoln College, bounded on the west by the older quadrangle of that college, and on the east by the back of Brasenose College. They replace the old "Grove buildings," which contained eleven sets of small and inconvenient rooms, and which, although only built in 1759, had suffered so much from the action of the weather on the perishable local stone of which they were constructed as to have become dilapidated. The new building, now approaching completion, is designed by Mr. T. G. Jackson, and contains fifteen sets of rooms for undergraduates, and one set for a Fellow, besides making provision for some of the servants' offices. The depth to which it was necessary to go in order to secure

a sound foundation has given opportunity for an extensive basement, which serves partly for cellage and partly for sculleries and servants' offices, a convenience unknown to the economy of older collegiate buildings. The basement contains also a new larder, reached by a subway from the college kitchen. The south front is faced with Handborough stone, and the north is of red brick, coursed with ashlar, the dressings throughout being of Clipsban stone. The stairs are of Portland, with landings of the extremely hard Castlehill flags from Caithness. In forming the subway from the kitchen, which is part of the original college buildings of about 1436, it was found that the foundations were about 17 ft. deep, although the ground had apparently been very little, if at all, raised since the building was erected, the floor being still at the ground-level. In joining the new building to the college hall, it was necessary to open one of the hall windows which had been locked on the outside with masonry, and concealed on the inside by the panelling erected by Lord Crews in 1701, at which time, probably, the other hall windows were converted into the present plain square sashed openings. On opening this locked window the original tracery was found behind it so complete that the whole of the design could be accurately recovered. The foundations and basement up to the ground-level were put in by workmen under Mr. Mockett, the clerk of the works. The contractor for the superstructure is Mr. Estcourt, of Gloucester.

**New College.**—Extensive alterations have been in progress at this college in re-modelling and re-organising the kitchen wing and its various offices. The original kitchen of William of Wykeham's foundation must have been a lofty and spacious apartment, but subsequent alterations and clumsy fittings, which may, perhaps, have been convenient in their day, sadly marred its proportions. The kitchen has now been restored to its probable former size. An entirely new system of cooking apparatus, with steam and hot-water services, has been fitted up by Messrs. Jenkes & Co. The old larders and other offices have been replaced by substantial new buildings. The builder's work is being executed by Mr. Holland, Hurst-street, under the superintendence of Messrs. Wilkinson & Moore, architects.

**Magdalen College.**—Great progress has been made with the new buildings for this college, the roof rafters having been fixed. The work consists of thirty sets of rooms, with lecture-room, and Fellows' chambers, and the style, to be in keeping with the remainder of the college buildings, is Late Perpendicular. The front stands about 200 ft. in length in the High-street, and the west wing goes to a length of 114 ft. northwards. The oriel windows in the east and west ends of the High-street front constitute prominent architectural features in the building, and in the spacious lecture-room the panels are richly carved with representations of lilies and Tudor roses. The stone which has been used is Headington and Taynton, and the gurgoyles are of Ancaster stone. The tower, which will harmonise with that of the founder, will rise to a height of 80 ft., beside the pinnacles. The architects are Messrs. Bodley & Garner, of London. Messrs. Franklin & Son, of Deddington, are the builders; and the carving has been executed by Mr. McCulloch, of London. Mr. Fitzwilliam is the clerk of works. Sundry improvements and restorative works have been carried out at this college by Mr. George Castle and Messrs. Knowles & Son, and where any architectural features were interfered with the designs were furnished by Messrs. Wilkinson & Moore.

**Keble College.**—Further works of extension have been carried out at this college, and they are in a style corresponding with that of the rest of the buildings, namely red brick with Bath stone dressings. The additions comprise a bursary, steward's office, over both of which is a lecture-room, 39 ft. in length by 26 ft. in width, and twenty sets of rooms for undergraduates, together with the necessary offices. The new buildings extend 131 ft. in length by 30 ft. in depth, and the lecture-room is approached by a flight of Derbyshire marble steps. Messrs. Parnell & Son, of Rugby, who have been entrusted with the construction of the rest of the college, are the builders, Mr. Butterfield being the architect. The work has been superintended by Mr. A. G. Cook as clerk of the works.

**University College.**—At this college, Messrs. Symm & Co. have restored several of the stone

gables in the Radcliffe Quadrangle, which were found to be in a very dilapidated state. Taynton stone has been used. The same builders have also carried out extensive improvements in the drainage at Balliol, Merton, and Corpus colleges, and the Radcliffe Observatory, from the plans of Mr. Griffith, C.E.

**The Indian Institute.**—The work of pulling down the six old houses, excavating the ground, and laying the foundations of the building for the Indian Institute, the site of which is at the east end of Broad-street, has been accomplished by Messrs. G. Wyatt & Son, and the contract for the erection of the building has been undertaken by Messrs. J. R. Symm & Co., who have already commenced operations. The architect is Mr. Basil Champneys, and the style of the building will be that commonly known as Jacobean. The angle formed by the junction of Holywell-street with Broad-street will be occupied by a turret surmounted by a lantern, which will contain the staircase, leading to the basement below and to the library and museum above. On one side of this turret, facing Broad-street, will be the main entrance. The whole of the first and second floors towards Broad-street will be occupied by the library, which will, when completed, have a series of five oriel windows, while the upper floor will have the same number of smaller windows lighting the galleries. The front towards Holywell-street will be necessarily of irregular shape, and will be broken up into parts by two projecting features, which are intended to obviate the awkwardness of the site. The material throughout will be of Mitton stone.

**Radcliffe Infirmary.**—A new entrance-ledge for this institution has been erected by Mr. Thomas Selby, builder, from the designs of Messrs. Wilkinson & Moore, architects.

**Church of St. Peter-in-the-East.**—An improvement has been effected in this church by the removal of the old pulpit, and the substitution for it of one of Caen stone, in the Byzantine style. The front is supported by four columns, and it is very richly moulded. The carving has been executed in a very excellent manner by Mr. McCulloch, of London, who also has had the charge of the stone screen under the chancel arch. New oak choir seats and desks have been placed in the chancel. An old piscina has been discovered in the south wall of the chancel, and is now exposed to view. Mr. Jackson has been the architect of the work, and Messrs. Symm & Co. the builders.

**Wesleyan Mission Room, St. Clement's.**—A large mission-room for the Wesleyans is now in course of erection at the end of William-street, Cowley-road, to seat 300 persons. The walls are being constructed with red bricks, the south and east fronts being faced with Garsington white bricks, relieved with Headington red bands and pilasters. A row of semicircular-headed windows, in pairs, with headed brick arches (with keys and chamfered jambs), will be in elevation next William-street, with bold doorway in harmony with the windows. The whole is being carried out in separate contracts for each trade from the plans and under the superintendence of Mr. J. C. Gray, architect.

**Magdalen Bridge.**—The work of widening this bridge was commenced in April, notwithstanding protests, since which time the abutments and piers in the north-western branch of the Cherwell have been built, the centres fixed, and the arches partly turned, and similar progress has been made with the small land arches adjoining. A large portion of the retaining-wall of the bridge has been erected in the meadow between the two branches of the river, and the space between it and the old work partially filled up. A dam has lately been placed across the south-eastern arm of the river and the water pumped out, and the piling and concreting for the foundations of the abutment-piers are now going on. To enable these works to be pushed forward with the greatest possible expedition a gas-lamp of 100-candle power has been suspended from each arch, so as to thoroughly light the works at night. The foundation of the curved wing walls, at either end, is also partly done. The main-surface water-drain from the High-street has been diverted, so as to discharge below the new part of the bridge, and the river-wall to the Botanical Gardens has been set back and rebuilt. In order to facilitate the passage of the river water through the bridge a temporary channel has been cut across the meadow, on the upper side of the bridge, so as to connect the

two branches of the river. By an arrangement between the Local Board and the Thames Valley Drainage Commissioners, and in view of the river improvement works contemplated by the latter body, certain works,—agreed upon between Sir John Hawkshaw and the engineer to the Board,—have been carried out in the north-western branch, and will be likewise executed in the south-eastern branch of the river, so as to enable the river to be deepened to the extent recommended by Sir John Hawkshaw without endangering the foundations of the old part of the bridge, which have been discovered to be shallower and more unsatisfactory than was at first supposed.

**New Hincsey.**—A new street has been opened in this locality, leading out of Lake-street, by Mr. James Boffin, who has erected a row of nine houses, with bay windows to each, on one side, and he is at present erecting six on the other side, of a class suited to the requirements of the neighbourhood. The architect is Mr. J. C. Gray, 82, Cowley-road, Oxford, who also superintended the erection. In Cross-street, New Hincsey, the Wesleyans have erected a mission-room suited to this growing suburb of Oxford. The walls are constructed of red and white bricks, relieved with bands, and the roof is covered with blue slates. The seats and rostrum are of pitch-pine, stained and varnished. Mr. Gray was the architect.

**New District Church for Cowley St. John.**—Rapid progress is being made with the new district church for Cowley St. John. It is situated in the Cowley-road, in close proximity to the University Cricket-ground and National Hospital for Incurables. The style is Early Decorated, the walls of Charlbury stone, with Box ground weather stone external dressings, and Corsham Down stone internally. The chancel was built seven years ago, and the remainder of the church will be in accordance with that. The church will accommodate 730, and consists of nave, 69 ft. by 25 ft.; north and south aisles, 54 ft. by 12 ft.; north and south transepts, 14 ft. by 15 ft.; tower, 16 ft. square; vestry, 17 ft. by 17 ft.; organ-chamber, 17 ft. by 8 ft. The tower is at the west end, and when completed, its total height, with spire, will be 183 ft. It will have a wooden polygonal panelled roof inside; its height in nave from floor level to ceiling will be 43 ft. There will be five bays in good proportion on each side of nave, with an arched clearstory above. The nave is to be commenced at once, and the cost of the present work will be 7,000l., and it is estimated that the carrying out of the whole undertaking will involve an expenditure of 13,000l. Mr. Mardon Mowbray is the architect, and Messrs. Symm & Co., of Oxford, are the builders.

**The Hospital for Incurables.**—Sixteen more rooms and offices are being added to the Hospital for Incurables. Bath stone is being used for the dressings, and Charlbury for the face work. Mr. Pearson, of 13, Mansfield-street, London, is the architect, and the builders are Messrs. Symm & Co.

**St. Edward's School.**—Further additions are in progress at this school. A large new house is now nearing completion, intended as the residence of the Head Master, with accommodation for thirty boarders. The building is carried out with red brick and stone dressings, in a style to match the other buildings. The work is being executed by Mr. Franklin, of Deddington. Messrs. Wilkinson & Moore are the architects.

**The "Queen's Restaurant."**—This new restaurant, situate in Queen-street, midway between New Inn Hall-street and Corn Market-street, has been opened. The architectural designs were supplied by Mr. H. J. Tollit, of St. Aldato's-chambers, who superintended the carrying out of the details. The work has been done by Mr. Bridgford, of Birmingham.

**New Schools, Headington Quarry.**—At the new Schools, Headington Quarry, an additional schoolroom, 40 ft. by 17 ft., with passage for hats and coats, has been built of local stone, with Bath stone dressings, to match the old work. The cost of the work is about 3000l., the builder being Mr. J. Horn. The architect is Mr. Codd.

**Residential and Business Premises.**—Several residences have been built on the Woodstock road, by Mr. Brucker, for Mr. Walter Gray, during the past year. Each house is varied in its accommodation and design to meet, as far as possible, the requirements of different house-holders. The designs were furnished by Messrs

Wilkinson & Moore, architects. The houses are built of red brick, with stone dressings and tile roofs. A new residence has been built by Messrs. Wilkins, of Eynsham, on the Summertown-road, for Mr. George Fisher, which is the first house to break ground on this freehold building estate. The building is of red brick, with stone dressings, worked out on designs by Messrs. Wilkinson & Moore, architects. On the new building estate recently laid out by St. John's College, adjoining the Canal, Walton Manor, a small colony of cottage residences is springing up. The roofs and drainage works are complete, and have already been taken to by the Local Board. In nearly all cases the houses are being worked out from some architectural designs. Those that are at the present time well forward are a pair of houses built by Mr. Arnatt, a pair by Mr. Lucas, and a pair by Mr. Lambourne; also a block of six by Mr. Bedding, and another block of four by Mr. John Money, all of which we believe are from designs by Messrs. Wilkinson & Moore; also a pair of houses for Mr. Bond, from designs by Mr. Gray. Mr. W. Boucher, of Observatory-street, is erecting a detached house on the Ilfley-road, from plans and under the direction of Mr. J. C. Gray, for Mr. T. Archer, of the firm of T. & C. Archer, coal merchants. Mr. Matthew Gray, of Cowley-road, is erecting a pair of semi-detached houses in Southmoor-road, for Mr. E. Bond. They are being carried out from the plans and under the superintendence of Mr. J. C. Gray, architect. In Frewin-court, Corn Market-street, the premises of Messrs. Gammon, Wicks, & Co., wine-merchants, are being rebuilt. The elevation is similar in character to that of the offices recently erected in Frewin-court for Messrs. Gammon & Wicks. The work is being executed by Mr. Thomas Selby from plans prepared by Mr. Frederick Codd, architect, Oxford. Alteration has been made to No. 9, King Edward-street, consisting of new front, strong room, fittings, &c., for occupation by the Oxford and Berks Bank, for Mr. St. Swithin Williams. Messrs. Symm & Co. are the builders, and Mr. Codd is the architect. Alterations and repairs have been carried out to the old North Star public-house for Messrs. Baker & Prior, of Broad-street. The new front was manufactured by Messrs. Baker & Prior from drawings by Mr. Rogers, designer to the firm. The general alterations were carried out by Mr. J. Horn, from plans prepared by Mr. Codd. Extensive alterations and repairs have been made to the old Ship Hotel for Messrs. Baker & Prior, of Broad-street, with new furniture warehouse in rear. The building will be fitted up as a University lodging-house. The warehouse consists of four floors, each about 110 ft. by 22 ft., and includes the Martyrs' Tower, one of the bastions of the old city wall, which formerly ran through the site of these premises. With the exception of the foundations and the bastion no part of the old work remained, the wall having been destroyed many years since, but the bastion has been carefully preserved. Messrs. Symm & Co. were the builders, and Mr. Codd is the architect.

**Local Board Improvements.**— Besides the routine work of the Local Board, a great deal of work in the shape of minor street improvements, paving, draining, &c., has been carried out under the superintendence of Mr. W. H. White, C.E., Engineer to the Board. At Walton Well the retaining-walls and embankment of the approaches to the new bridge over the canal have been completed, and the roadways formed by the Board.

**BOLAM CHURCH, NORTHUMBERLAND.**

BOLAM CHURCH was re-opened for divine service on Saturday last, after having been closed for some months during the progress of necessary restorations. It is an interesting fabric from the fact of its retaining the original Saxon tower raised by the first builder, subsequent Norman work, a Transitional south aisle and south doorway, an Early English elongation of the chancel and a chantry chapel, and two windows formed by the interlacement of lancets. Before the present repairs were undertaken, the roofs admitted rain in many parts; the outside soil had risen higher than the floor, causing walls, piers, and arches to be saturated with an unwholesome moisture. The thick coating of whitewash, which had been put on in former efforts to mend matters, has been now removed, new roofs have been placed over the structure,

a new cement floor has been spread over the whole; new sittings have been substituted for the decayed pews; and a new reading-desk and pulpit have been placed in the nave. The Right Hon. Lord Decies and Sir Arthur Middleton have been at the cost of restoring the chancel, and the parishioners have borne the remainder of the cost, aided by the exertions of an appreciating committee and church-wardens. Mr. F. R. Wilson, Alnwick Diocesan Surveyor, has been the architect. The contract for the restoration was taken by Mr. James Gibson, Newcastle, with the exception of the painting and staining, which were executed by Mr. Garvie, Morpeth. The cost of the preservation of this beautiful work of former ages has not exceeded 700*l.*, exclusive of the chance.

**PROPOSED METROPOLITAN STREET IMPROVEMENTS.**

At the meeting of the Metropolitan Board of Works on the 13th inst., a long report was presented by the Works and General Purposes Committee in regard to several extensive metropolitan improvements, in respect of which it is proposed to seek powers from Parliament during next session. The first recommendation contained in the report was as follows,—“That application be made to Parliament, in the Session of 1883, for power to form a new street 60 ft. wide, from the Holborn Town Hall to the ‘Angel’ at Islington, at an estimated net cost of 324,100*l.*

Mr. Dalton, in bringing up the report, said the various suggested improvements had been before the Board and the public over and over again, and they had all been thoroughly investigated and considered by the Works and General Purposes Committee. In respect of the proposed improvement from the Holborn Town Hall to the Angel, the committee had, by a very large majority, adopted the recommendation on the paper. It would be remembered that, in the Street Improvements Bill which the Board introduced in the session of 1877, a portion of the proposed scheme was included, viz. the making of a new street in the form of a viaduct from the intersection of Gray's-inn-road and Ligonier-street to Montpelier. This proposal, although passed by the House of Commons, was rejected by the Select Committee of the House of Lords, mainly upon the ground that the improvement did not extend sufficiently northwards. Since that period the local bodies had from time to time memorialised the Board on the question, urging the great necessity for the improvement, and suggesting that the original scheme should be extended by carrying the new street to a point near the Angel at Islington. The committee, having fully considered the subject, concurred in the view that it was desirable that this improvement should be carried out in its entirety. He concluded by formally moving the adoption of the committee's recommendation.

After some discussion, the motion was agreed to.

The next recommendation of the Committee was, that application be made to Parliament in the session of 1883 for power to widen to a width of 60 ft. the portion of Walworth-road between Hampton-street and Thomas-place, at an estimated cost of 66,900*l.* On the motion of Mr. Dalton, this recommendation of the committee was approved without discussion.

The Committee further reported that they also considered the memorials from the Vestry of Islington, referred by the Board at various times, praying them to carry out as a metropolitan improvement the widening of a portion of the Upper-street, Islington. This was an improvement for which, judging from the particulars and statistics placed before the Board, great necessity existed, it being stated that, in consequence of the narrowness of the portion of this road between Islington-green and Barnsbury-street, accidents were of frequent occurrence, and the public traffic was greatly impeded. The committee, having carefully considered the application, and viewed the portion of the road which the Board was asked to widen, had now to report the conclusion at which they had arrived, and submitted the following recommendation,—“That application be made to Parliament in the session of 1883 for power to widen to a width of 60 ft. the portion of the Upper-street, Islington, between Islington-green and Barnsbury-street, at an estimated net cost of 148,000*l.*” Mr. Dalton moved the

adoption of the report, which, after a long discussion, was agreed to.

The Committee also recommended that application be made to Parliament in the session of 1883 for power to widen, to a width of 60 ft., the portion of King-street East, Hammersmith, between the Broadway and a point opposite the Roman Catholic Convent, at an estimated net cost of 40,900*l.* Against this recommendation it was argued that this was a local, and not a metropolitan, improvement, and an amendment was moved that the proposition be referred back to the committee for reconsideration. Further discussion ensued, in the course of which it was urged that the street in question was a part of the Great Western-road, that it was one of the most important thoroughfares in the West of London; that a very large and increasing traffic passed through it; and that the road at present between Rowan-road and the Broadway was narrow and inconvenient, and quite inadequate for the traffic.

Mr. Richardson said this was a proposition to go to Parliament for an improvement which consisted of taking the forecourts of the houses to widen the road.

On a division, the amendment was negatived, the numbers being nine for and twenty-eight against. The recommendation of the committee was then adopted.

The Works Committee further recommended (and their recommendation was approved without discussion):—“That application be made to Parliament in the session of 1883 for power to widen, to a width of 53 ft., the portion of Green-street, Bethnal-green, between Cambridge-road and Globe-street, at an estimated net cost of 58,300*l.*” In the course of their report the committee said,—“The grounds upon which this application is made are that there is a constant block of the traffic arising from the extreme narrowness of the greater part of this street, occasioning much inconvenience and sometimes serious accidents; that there has been a large increase in the number of houses and factories east of the thoroughfare; and that the street in question is really the continuation eastward of Bethnal-green-road, from the western end of which road the Board have provided direct access to the West of London.”

The Board next resolved, on the recommendation of the Works Committee, that application be made to Parliament, in the session of 1883, for power to straighten the South Lambeth-road, and make it of a width of 60 ft. from Walton-terrace to Wilcox-road, at an estimated net cost of 18,500*l.*

The Works Committee further recommended as follows:—“That application be made to Parliament, in the session of 1883, for power to widen Postern-row, Tower-hill, to a width of 65 ft., from the Nag's Head public-house to Trinity-square, at an estimated net cost of 78,000*l.*

This was agreed to.

**THE PROPOSED WIDENING OF PARLIAMENT-STREET.**

In the “Additional Chapter to the Story of the Government Offices” which we published on the 8th of July last, we criticised the proposal of the Office of Works to build the new Admiralty and War Office on what is known as the Spring-gardens site, especially as the Government had already, by the advice of former First Commissioners, spent a quarter of a million of money in acquiring property in the neighbourhood of Parliament-street and Great George-street. Going on to discuss the eventualities and possibilities of the property so acquired, we said:—

“This land, we are credibly informed, is to be offered to the Metropolitan Board of Works. It is actually proposed, if it has not already been publicly announced, to throw upon the Metropolitan Board the duty of widening Parliament-street by the obvious absorption of King-street, and to hand over, for a substantial pecuniary equivalent, Government property recently purchased at a heavy, even an exorbitant, cost, in order to obtain, at a vast extra outlay, the very improvement in the approaches to the Houses of Parliament which the scheme of building Public Offices in Great George-street would have of necessity accomplished. It is actually proposed thus to misuse money raised by the Metropolitan rates . . . to continue an enlargement, which, if needed at all, is of imperial, not metropolitan, character.”

As a sequel to the above, we have now to note that at the meeting of the Metropolitan Board of Works on the 13th inst., the following

was one of the items on the *Agenda*, under the head of "Applications and Communications" received, viz.:

"Letter from Her Majesty's Office of Works, &c., stating that, the Government having decided on erecting the new Public Offices on the site between Parliament-street [sic] and Spring-gardens, it becomes the duty of the First Commissioner to dispose of certain properties in Parliament-street, Great George-street, King-street, and Charles-street, which were acquired in the expectation that the site might be required for Public Offices, but before doing so he thinks it right to give this Board the opportunity of purchasing the property in question, with a view to completing the approaches to Westminster Bridge and the Houses of Parliament by widening Parliament-street to the same extent as Whitehall."

The letter was referred to the Works and General Purposes Committee for consideration and report. We have already expressed our disbelief that the shrewd majority of the Board will be led into the purchase of the property by any anticipation that the value of the new frontages created by the widening of Parliament-street will more than compensate for the entire expenditure involved.

#### THE WEST HAM LOCAL BOARD AND THE INSPECTION OF NEW BUILDINGS.

UNDER an Improvement Act which the West Ham Local Board obtained in the late session of Parliament, the Board, amongst other extensions of their powers, were authorised to appoint five building inspectors in addition to those already in their employ. The duties of these new officers will be to inspect all new buildings which may in future be erected in the parish. The determination of the Local Board to appoint these officers has been brought about by the existence of builders of the "Jerry" class, who, it is stated, abound in Stratford and West Ham. The five appointments were made at the meeting of the Board last week. The Building Act Committee submitted the names and qualifications of eleven selected candidates out of the large number of applicants from different parts of the country. The following five gentlemen were appointed by the Board:—Mr. John Adams, Devon; Mr. John A. Angel, London; Mr. Lockyer Sandilands, Greenwich; Mr. David A. World, London; and Mr. John George Morley, Stratford; all of them undertaking to devote the whole of their time to the service of the Board, and to act under the direction of the Board's surveyor.

#### THE WORK OF THE SCHOOL BOARD FOR LONDON.

##### SITES AND BUILDINGS.

Mr. E. NORTH BUXTON, Chairman of the School Board for London, made an interesting statement of the work that has been accomplished by the four successive Boards which have been elected to administer the Elementary Education Act in London since that measure was passed twelve years ago. We reproduce a few passages from the address:

The Act of 1870 (said Mr. Buxton) requires that "schools should be provided for all the children for whose elementary education efficient and suitable provision is not otherwise made." We cannot be said to have yet reached this state of things. While the number of schools that have been built, together with those we found in existence, would more than suffice for the children of London as it was in 1870, London in 1882 has increased to such an extent that we still find ourselves in arrear. But though the stern chase which is imposed upon us is proverbially a long one, we have distinctly diminished the distance between the schools that exist and those that are needed. Thus, while the school population has increased since 1871 from 574,693 to 733,000, the accommodation in efficient schools has grown from 262,259, or 45·6 per cent. of the children of school age at that time, to 531,427, or 72·4 per cent. of the children now in existence. During the past three years the school population has increased by 34,720, and we have provided during that period new schools for 70,589. During the twelve years we have provided in 260 schools accommodation for 256,360 children, while the accommodation in voluntary schools, which in 1871 was for 262,259, is now for 261,868. If we now strike a balance of the net results, we find that the number of school places required, after

making all necessary deductions for the reasonable causes of absence, amounts to 641,428; while the total number of school places in efficient elementary schools will amount at the end of our term of office to 539,044 only. One practical proof of this deficiency is found in the number of children who are still refused admission in the growing districts. While some improvements in detail have been introduced into the construction of our schools, there has not been much departure from the general design which was determined upon some years ago; but in a few cases a large central hall has been introduced, or, where space was a secondary object, schools have been built entirely on the ground-floor. The cost of our permanent Architect's Department, which has been sometimes criticised, is really far less than if we adopted an open system of competition. It amounts to less than 3·5 per cent. on the cost of the schools, and has the further advantage that experience of all suggestions of proved value is accumulated and applied in future designs.

#### OPENING OF THE GREAT EASTERN RAILWAY COMPANY'S FISH MARKET.

THE new wholesale fish-market which the Great Eastern Railway Company has for some months been preparing on the ground level of their spacious new goods station at Shoreditch, has this week been opened for business, and the thousands of residents in and around the extensive districts embraced in the east and north of London have now the advantage of a large fish-market in addition to that at Billingsgate. The new market, which, it may be incidentally stated, the railway company have designated a "depot," in order, it is understood, to prevent any interference by the Corporation, is situated on the north side of the station, the principal approach being from Bethnal-green-road, which leads to a carriage-way 30 ft. in width, running alongside the several arches under the station, which form the market. Ten of these arches, which are about 40 ft. in width each, and 100 ft. in depth, have been specially fitted by the company for fish and poultry market purposes. The floors have been flagged and channelled, and a comprehensive system of drainage and sewerage is carried out which admits of the entire floor area of the market, as well as the marble and stone slabs on which the fish are placed, being daily washed and cleansed. These slabs and the whole of the fittings and offices have been put up by the company. Of the means for successful ventilation employed we have less satisfactory knowledge. In the basement under the market floor there is a spacious storage space, which will be occupied by the several tenants of the market. At the rear of the several arches there is a raised platform, a line of rails running parallel with it the entire length of the market. The fish-laden trucks, on arriving at the railway station level above, will be lowered to the level of the market platforms, on to which the fish will be discharged for immediate transmission into the market. There has already been a large demand by dealers for the market space provided, all the arches which have been prepared by the company denoting the names of different fish-salesmen who have become the tenants. The present floor area of the fish-market portion of the depot, which is capable of extension if necessary, is upwards of an acre in extent. It may be added that the company's vegetable and fruit market, which is formed of the arches on the south side of the station, and which was opened a few months ago, has been so successful that other arches are now in course of preparation for its extension.

**Watt and Stephenson.**—Among the exterior decorations of the great Polytechnic High School of Charlottenburg, Berlin, are the statues of James Watt and George Stephenson. The latter is represented as the "Father of the Locomotive Steam Engine," having the model of one under his arm. Watt is represented as absorbed in thought; he has a roll of manuscript in his left hand, while his right is raised with a gesture as though he were speaking. Stephenson has his right hand on his breast. Both inventors are represented as bareheaded, and in long coats. Stephenson has his top boots, while Watt is in low huckled shoes, knee breeches, and long stockings. Both the statues are the work of the sculptor, Professor Keil, of Berlin.

#### "PROPORTION IN PRACTICE."

SIR,—All controversialists on the subject of proportion in architecture will, I believe, concur in the profound conclusion arrived at by the writer of the article with the above heading, in last week's *Builder*, viz., that the parties to the controversy "are likely to confront each other as advocates of these incompatible theses. On one part it will be maintained that the employment of a precise and systematic scheme of proportion would in no way assist,—in fact, would hamper,—the designer and so far be detrimental to beauty of design, and therefore could not have been an instrument of such masters of design as the great Greek architects. On the other part we should hear,—As it can be positively made out that the Greeks of the best time did employ a scheme of proportion in the final adjustment and scrupulously exact execution of their designs, the presumption from their success is decidedly in favour of the importance of such an instrument, if we moderns can only recover and master it."

Now, although all controversialists concur in the foregoing conclusions, they have long since expressed them with far less circumbulation, and simply thus,—"either there is a science of architectural proportion, or there is not." Just so; the writer referred to, therefore, only leads us at the old starting-point, whereas if he really meant to lend a helping hand in the discussion, he should have pointed out to what absurd admissions the hypothesis that there is no science of proportion commits those who may support it. The general conclusion of the scientists of this scientific age is that law reigns throughout the empire of Nature, but on the opposite hypothesis, architecture claims exemption from law. Now, if architects were not bound by law in their work they might do just what they please, as Sir Edmund Beckett affirms they do. No law, no responsibility, there would be neither right nor wrong. Who, then, but atheists with respect to aesthetics, nay, with respect to all law and order, could hold with such an hypothesis? "Order," it has been said, "is Heaven's first law,"—proportion to purpose is the characteristic of the divine handiwork of the Great Architect. Shall, then, mundane architects declare themselves independent of all rule and governance but their own whims? Sir Joshua Reynolds, some century since, had the acumen to perceive that "everything which is wrought with certainty is wrought upon some principle," and, again, "every object which pleases must give pleasure upon some certain principles." Colour is a far more subtle consideration than that of architectural proportion, for colour can only be measured by sense, whereas architectural proportion can be measured to a title by mechanical means. But if the possibility of a science of proportion be admitted, I cannot agree with the writer of the article aforesaid, that no theorist who is sufficiently sober-minded to be worth attention "would insist on science doing more than to help the architect to the leading dimensions of a composition, and that to imagine it would do more than this would be preposterous." Why preposterous? Is there the slightest evidence that law does not reign in the minutest, as well as in the most colossal aspects of nature, with respect to microscopic existence infinitesimal as compared with the least of architectural features? The minutest atom of matter is as amenable to the law of greatest universality, the law of gravitation, as the great globe itself. This attempt to claim exemption from law is but a symptom of the writing of human pride, which would take all merit to itself; which would fain deny that excellence is but a symbol of faithful stewardship, of a right utilisation of means; and which would declare the dictum of the great poet, that Nature lends no scruple of her excellence, but that, at the same time, she claims both thanks and use, to be false sentiment, mere affectation. It is repugnant to the human microcosm to be compelled to admit that art when at its best is most completely in conformity with law; nevertheless, this is both the humiliating and the exalting truth. The whole weight of evidence, as well as the leaning of science, is in favour of there being a science of proportion in architecture. Every opportunity, therefore, should be taken to discountenance that false and vulgar opinion, the rules are the fetters of genius; they are fetters only to men of no genius.

To assume that "the proportions which are

established between the notes of the accepted musical scale are not in the main arbitrary, and might not have been very different indeed," is but to assume that music is not yet established on its true basis. But supposing that the present musical scale has been arbitrarily adopted, we see that law reigns even in the second nature of use, that there is a science even in custom, a method even in musical madness, which can be taught and can be acted on.

It may be shown, too, that the writer referred to is not at all justified in asserting that, "it seems premature to expect that we are very close to the end of our journey" as regards the science of proportion, for he could not conscientiously say this if he himself knew the science; for he would know that it had been attained; if, however, he does not know the science himself, and although he may be far off from it, he is clearly not in a position to affirm that we are not close to the end of our journey, not knowing himself the whereabouts of what is sought.

W. CAVE THOMAS.

#### EMPLOYERS AND EMPLOYED.

SIR,—As the relations of masters and men have been much discussed lately in the press, and as your readers are naturally anxious to have facts rather than opinions laid before them, and as many of the assertions I have seen made are not in accordance with my own experience, will you allow me to give them the results of twenty-three years' trading, for nearly the whole time the sole member of a well-known joinery and (latterly) building firm, from which I am now partially retiring?

First as to trade-unions. I have never found any inconvenience from them, and the workmen would be very foolish to give them up. They have a perfect right to combine for their own advancement; it is simply the old motto, "Unity is strength," put into practice.

Then as to strikes. I have never had one. I read about them in the papers, and that is all I know about them. With the public clamouring for cheap work, and the workmen struggling for an improved position, strikes would seem the natural result; but when the matter can be discussed early it is compromise *versus* war, and strikes can generally be avoided.

Then, as to the honesty, intelligence, sobriety, and industry of the British workman as compared to past times and to Continental and other foreign workmen, my experience is at variance with the statements and assertions I see in the press from time to time.

I have never discharged a man for dishonesty; and I have no occasion, and never had, to doubt the perfect honesty of every man in my employ.

Then as to intelligence, the state of ignorance in which the present generation of workmen were brought up was enough to damp the ardour of the brightest men. This was not the fault of the workmen; the wonder is they have succeeded so well as they have.

Sobriety and industry I bracket together. I have never seen a man on my works the worse for liquor, and I have never discharged a man for drunkenness; and as for industry, I do not suppose any body of men ever worked harder or did a fairer day's work than the British workman does at the present time.

Masters have said to me, "Why, when I was a workman I did twice as much work as any of my men do now." Well, it might be so, and the result was the workman became a master; but we cannot all be masters, and a man must have strength, skill, and intelligence far beyond the common to attain such results. Then as to British *versus* foreign skill. In the Paris Exhibition of 1878 there was, your readers will remember, an avenue called "The Street of Nations." This was a rare opportunity for comparing workmen of all nations,—all picked men working under similar conditions,—Italians, Swiss, Belgians, Frenchmen, Spaniards, Japanese, Chinese, and Norwegians, all working orderly side by side; and, as I had business in the building, I watched them daily with great interest. Every nation worked in its peculiar way. The Belgians handled their heavy marble-like stone as only Belgians can; the Italians discussed the details of their decoration, and often came in a body down from the scaffold and, at a little distance, discussed, in a most excited manner, the respective merits of their different embellishments as only a nation of born artists can. The Japanese, merry little

fellows, if you stopped to look at them they would nod, and laugh, and chatter to each other most amusingly. As for our friends the Heathen Chinese, they were fine athletic fellows, with pig-tails down to their heels, and their faces beaming with intelligence; they seemed to despise scaffolding and ladders, and clombered about with the skill of practised acrobats, and, with the funniest little tools slung over their shoulders,—more like children's toys than anything else,—they patiently chipped, chipped, chipped away by the hour.

Bring those men to London, and what would they be? The Belgian would make nothing of our softer stone,—even an English Portland-stone mason is of no use as a Bath-stone mason, and neither is of use as a Kentish rag or granite mason. If a master builder saw a dozen of his Italians standing on the other side of the street smoking cigarettes, and coolly discussing the merits of the work they had in hand, it would drive him crazy; and the Japanese or the Chinaman could no more wield the heavy tools with which the British workman earns his daily bread than he could fly in the air.

Those men, therefore, who talk about foreign labour driving British labour out of the market are at sea on the subject, and those masters who have tried the experiment are not likely to repeat it.

Then, as to capital, we are constantly told that capital will be drawn from the trade, and what will the masters do then? The fact is, the only capital worth a hutton is knowledge. If a master builder knows his business, and is energetic, he may succeed; if he does not, and his only recommendation is cash, he will most assuredly fail.

I have now said my say. I do not mean to state there are no workmen who are had in every sense of the term,—the same might be said of all ranks of society; but that those men form the rule and not the exception, I deny. I have told you my experience, extending, as master and man, over thirty-seven years, and I do not believe it is exceptional, but that the experience of the bulk of the masters is the same as mine, and that the calumnious statements one reads from time to time in the press have only to be inquired into to be refuted.

W. H. LASCELLES.

#### THE PERILS OF PLEASURE.

SIR,—Pleasure's gentle laxation of over-strung nerves is naturally courted by most brain-workers in this age of speed. If it can be safely procured, and rationally enjoyed, Pleasure is pleasure indeed, not only yielding the desired relaxation at the time, but also imparting pleasure in the day of its review. But if in the search for pleasure perils are encountered, it were better not sought; for of it then, however pure or laudable in itself, may be justly said, as of the pleasure on folly based,—

"Pleasure known but by its wings,  
And remember'd by its stings."

Confined workers in towns long for a week of sand or beach, and sea; and, when occasion permits, they lie to a watering-place of more or less note, in the hope of health and pleasure. They get accommodated with apartments, with or without a scramble, and, tired with their day's outing, they go to bed. As soon as they have retired, their sitting-rooms are converted into bedrooms, sofas and chairs being populated with great dexterity. Often two or three groups of lodgers are stowed away in a house that usually sleeps the original family but comfortably or healthily. It is well that sea air conduces to sleep. A wakeful, wandering lodger might possibly be surprised to find his day apartment made a bedchamber for a pair or so, the said pair or so not proving the cleanest or the healthiest of the human race. Many persons quit their scenes of pleasure with the seeds of disease sown in their systems by the abuse of the lodging-house trade.

I thus prefer a trip across the water. Workmen wishing to see the wondrous art-metal work of generations past often visit the shrines of art to cultivate whilst they refresh their minds. If there be nobility in pleasure, surely this is it. Pleasure, to be worthy of the name, needs to be instructive. While it relaxes, it must also edify. They draw upon their savings and go; but to go, they must board a steamer. Steamers, however, are not always admirable for their sanitary provisions. A friend of the

writer went with his wife, a few weeks back, to revel in a cathedral of the hoary past and a noble city's mine of wealth. Their compartment was near a closet, and so strong was the smell that the lady passenger was made thoroughly ill. Better amid the city's sights and wonders, she became worse when shipboard was reached and the stench again encountered; and, on reaching home, she was struck down with a bad attack of typhoid fever. Fortunately life has been spared, but at a great cost of anxiety and weary watching, to say of nothing else, for one who sought to lissac mind and body in the contemplation of things exalting. Pleasure can hardly be said to have resulted in refreshing in this case.

The doctor in attendance said he had recently met a friend who had taken a holiday trip to the same place and in the same steamer, and, noticing a difference in appearance, he inquired the reason. It was the same story. Typhoid fever arising from the closet's stench. Sanitary science should surely be able to check a stench in a floating closet, and so lessen the perils of the pleasure of art.

T. B.

#### BUILDING PATENT RECORD.\*

##### APPLICATIONS FOR LETTERS PATENT.

- 4,873. G. Hurdle, Southampton. Opening and closing window sashes, &c. Oct. 7, 1882.  
4,811. A. J. Boulton, London. Door stops or checks. (Com. by G. R. Elliott, Boston, and J. M. Winslow and T. E. Clary, Norwood, U.S.A.) Oct. 10, 1882.  
4,831. A. J. Boulton, London. Sash balances. (Com. by C. E. Bogle, Milton, U.S.A.) Oct. 11, 1882.  
4,842. F. Garon, Southend. Locks or door-fastenings. Oct. 11, 1882.  
4,850. W. Teague, Illogan. Apparatus for ventilating purposes. Oct. 12, 1882.

##### NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

October 10, 1882.

- 2,656. J. Harris, London. Means for holding up windows. June 6, 1882.  
2,831. A. M. Clark, London. Water-closets, &c. (Com. by J. J. B. Frey, New York, U.S.A.) June 15, 1882.  
3,688. W. Thompson, Shaw. Door knobs. Aug. 2, 1882.  
3,969. J. Chaffin, Bath. Means of glazing greenhouses, conservatories, &c. Aug. 13, 1882.

##### ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending October 14, 1882.

- 1,019. C. J. Mountford, Birmingham. Fire-resisting bricks and blocks. March 3, 1882. Price 2d.  
The bricks are made of asbestos and silicate of soda or potash with fire-clay. These materials are ground and mixed, then moulded and burned in a kiln. (*Pro. Pro.*)

- 1,021. L. Lenzberg, London. Door rods and springs. March 3, 1882. Price 2d.

The rod has a spring joint on that side which is connected to the bracket on the hinge side of the door, so adapted that it tends to close the door when it is opened. A spring bolt operates in slots or holes in the joint to fix it and allow the door to stay open. (*Pro. Pro.*)

- 1,039. G. Gore, Balsall Heath, and W. Morris, Blackheath. Stoves and grates. March 3, 1882. Price 2d.

The coal is supplied to the bottom of the grate from a hopper. (*Pro. Pro.*)

- 1,047. S. A. Clark, Croydon. Fastenings for window-sashes. March 4, 1882. Price 2d.

On the stiles of the lower sash are two vertical axes, the upper ends of which force bolts above the meeting-panels which shoot into holes on the upper sash and secure the window. (*Pro. Pro.*)

- 1,065. J. Wetherill, London. Blinds or screens for windows. March 6, 1882. Price 6d.

These are enclosed in frames which are hinged at their lower parts so that the blind can be inclined. They are secured in this position by rods with hooked ends taking over studs on the sides of the frame.

- 1,620. P. M. Justice, London. Improved plaster for casts, mouldings, &c. (Com. by M. B. Church, Grand Rapids, Canada.) April 4, 1882. Price 4d.

This is composed of pulverised calcined gypsum, glue, and sulphate of zinc, and is very suitable for walls, &c.

#### WOOD AND IRON.

SIR,—Can any of your readers inform me of a method for working out the breaking strains of wood and ironwork without the use of algebra, and the best book (if any) on the subject?  
R. H. X.

\* Compiled by Hart & Co., Patent Agents, 25, New Bridge-street.

## GLASGOW INSTITUTE OF ARCHITECTS.

The annual meeting of this Institute was held on Tuesday last, the President, Mr. John Honeyman, in the chair.

The Secretary (Mr. Wm. MacLean) read the annual report. The total number of members now upon the roll is forty-nine; and, while some further accession is desirable, the council consider it to be a fair subject for congratulation that, considering the necessary qualifications, so large a proportion of the profession in this part of the country has joined the Institute. The attention of the council had been given to the revision of the regulations for the measurement of mason work. They think it desirable that, before any decision is come to, the matter should be brought under the notice of the Edinburgh Architectural Association and the Edinburgh Measurers, with the view of introducing one uniform system of measuring mason work in all parts of Scotland. The New Municipal Buildings competition also occupied the attention of the council. The letter of the conditions was barely fulfilled by the exhibition of the ten designs submitted in the final stage for six days only in most unsuitable rooms, and the representations of the council as to the general desire of competitors and others that as many of the designs as could be obtained should be publicly exhibited were entirely unavailing. The Town Council unanimously refused to have anything to do with such an exhibition. In these circumstances, and being ascertained that it was generally desired by the competitors and by many members of the profession, the Institute decided to undertake the management and pecuniary responsibilities of the exhibition. The exhibition was accordingly held in the upper rooms of the Corporation Galleries (the use of which was kindly granted by the Town Council for the occasion), and was open to the public free of charge from September 2nd to September 14th. It proved both interesting and instructive, and was visited by over 4,000 persons. Fifty-six designs were exhibited, and these were illustrated by about 400 drawings.

The President, in moving the adoption of the report, referred to the proposal of the Gas Committee to debar all and sundry from supplying electricity, in order that they might secure a monopoly of that production themselves. Many of them must know that they were already reaping the fruits of this short-sighted reactionary policy, and that there was more difficulty in getting work of the kind done there than in any large city in the kingdom; but then, while five firms wish to commence work there, the Town Clerk has been instructed to inform them that the committee "cannot consent to any licences or provisional orders being granted to any parties empowering them to provide or supply electric light within the city." He could not say more on the subject then, but he would express his own personal conviction that, if the citizens allowed the Corporation to act on the recommendation of the Gas Committee, they would, ere long, heartily repent of it.

A meeting of the newly-elected council took place immediately after the general meeting of the Institute. Mr. James Thomson was elected president; Mr. David Thomson, vice-president; Mr. John Barnet, auditor; Mr. William Landless, treasurer; Mr. William MacLean, secretary.

## STEAM HEATING OF TOWNS IN AMERICA.

AMONGST the places in the United States where the system of supplying heat to houses through tubes from a common centre has been introduced, is the little town of Lynn, in Massachusetts. The project has been for a short time in actual operation, but through a series of explosions it seems that in the place in question, at least, the system is likely to be abandoned. On the 14th of August one of the larger steam-pipes, laid down under the street, exploded, causing a considerable amount of damage to the buildings in the immediate vicinity. This is the third explosion of the kind since the Lynn Steam Heating Company started operations. Owing to the fact that the cause of these alarming occurrences is unknown and no explanation could be afforded on the subject by those immediately concerned, the authorities of the township of Lynn have given notice to the company to remove their pipes and tubes from the streets without delay. This, however, they have not yet done, but, on the

other hand, a reward of 1,000 dollars has been offered in the name of the company for the discovery of the person or persons who caused the last explosion. Notwithstanding this handsome offer, it is not expected that it will lead to any result, for it is said that the company themselves do not really believe that the explosions were caused by foul play. The real cause is believed to be attributable to the thinness and weakness of the pipes and tubes employed in the entire installation of the heating system, and this unwisdom economy in the original outlay appears likely to put a complete stop to an interesting, but as yet very imperfectly-tested experiment.

## SEWER VENTILATION.

SIR.—Equally with your unfortunate correspondent, I am at a loss to understand in what lies the science of an ordinary sewerage system. My house drains into an earthenware pipe-sewer, in which, at intervals, there are fixed ventilating shafts; but every time there is a heavy rainfall the sewer-gas is driven into my house through the scientific (f) traps, which are often rather otherwise dry. I suspect there is a stoppage in the main sewer, but, of course, one cannot be sure as to the exact position, as we cannot examine these scientific sewers, and, for aught I know, the private connexion to my house may be gradually choking up. I should be glad if some of your enlightened readers would explain wherein lies the scientific principle of the system of sewerage, which appears to my unscientific mind to be opposed to the dictates of good sense.

ANOTHER POOR BUFFER.

## NECESSITY OF GIVING NOTICE TO DISTRICT SURVEYORS.

MR. W. BALCOCK, of 119, Well-street, Camberwell, builder, was summoned before Mr. Ellison at the Lambeth Police Court, by Mr. Benister Fletcher, District Surveyor, for neglect in giving notice for work which had been executed at 182, Hill-street, Walworth. The work done consisted of a joist being inserted in a 9-in. party-wall for the purpose of supporting joists which had become decayed at the ends. The defence set up was that the work done was only repairing, and being so small it did not come within the meaning of the Act. The district surveyor referred the magistrate to sec. 15, sub-sec. 2, of the Building Act, which says that the ends of any beam or joist shall be at the least  $\frac{1}{4}$  in. distant from the centre line of the party-wall.

The magistrate said the work done, although perhaps small, was a repair which came under the supervision of the District Surveyor, and therefore required the defendant to give the proper notice, and to pay costs.

The notice was then given and the money paid.

## PROVINCIAL NEWS.

Newcastle-on-Tyne.—The new free library erected in Bridge-street, Newcastle, partly on the site of the Carlil Tower, at a cost of about 20,000*l.*, has been opened. The new building has been erected from plans by Mr. A. M. Fowler, until lately borough engineer of Newcastle. The design of the first story of the front elevation is of the Doric, and that of the remaining two stories of the Corinthian order of architecture. The centre portion of the building is 107 ft. 6 in. in length, and as there is at each end of this bold projecting wings 30 ft. wide, the total length of the exterior is 167 ft. 6 in. The principal entrance, with seven steps, is placed in the centre, through a portico 30 ft. long by 8 ft. wide. This is ornamented with massive stone columns supporting an entablature from which springs a continuous row of balustrades running the entire length of the front. The spandrel panels of the door at the principal entrance bear groups of carved figures representative respectively of literature and engineering; while on the keystone between, a bust of George Stephenson is brought out in bold relief. Niches, which will no doubt be filled at some future time, are provided at each side of the spandrels, and in close proximity to these are busts of Lord Collingwood and John Bewick. The whole of the front is surmounted by a massive pediment, supported by six caryatides, in the centre of which a carved date-stone is placed. Mr. Brno, of Newcastle, is the sculptor of the busts and carved work on the first and second stories of the building, and Mr. Pringle, sculptor, has executed the figures at the top. The bays at each end of the building are furnished with a medallion cornice, surrounded by a balustrade, and the roof is semicircular in form. Set back a little from the main thoroughfare, the public library is protected by a dwarf wall, surmounted by ornamental railings, with lamps placed at intervals. As to the interior, the basement is provided with a workroom, in which hooks are received, checked off with the

invoices, collected, stamped, and labelled, after which they are sent to their respective departments in the library. Throughout the entire building open fireplaces have been dispensed with, and hot-water pipes employed for heating purposes. Passing through the portico from the street into the main building, the visitor finds himself in a spacious and lofty vestibule, 43 ft. long by 20 ft. wide, at the end of which is a beautiful marble group, by Lough, of the Archangel Michael subduing Satan. For this and other pieces of statuary by the same eminent sculptor the city is indebted to the generosity of the donor, Sir Matthew White Ridley, bart., M.P. The vestibule is supported by pillars of elegant design, and is divided from the main doors by a handsome plate-glass screen, with floriated ornaments and the city arms in bold relief, the entrance-doors bearing designs of the old castle, that at the left of the entrance being a representation of the Carlil Tower. To the left of the vestibule is a new lending library, 61 ft. long by 22 ft. broad, and it is connected with the Mechanics' Institute portion, which has been used as a lending library for the last two years. It was originally intended that the Mechanics' Institute portion should be the reference library, but so successful has been the lending library during the two years that it has been opened, and the demands made upon it have been so enormous, that the committee felt themselves obliged to abandon their original design, and to throw that room as well as the new lending library into one. The new portion of the lending library is so arranged as to store 25,000 volumes. This is accomplished by carrying the wall-cases on two sides of the room to a height of 13 ft., and by arranging separate double cases to form alcoves, projecting from the north and south walls. These are enclosed within a counter, which supports the library indicator. Five separate portions of the stock are placed within 3 ft. of the right or left of the issue desks. The connexion with the old lending library is effected by an elliptical arch cut through the main wall. The two rooms combined provide accommodation for at least 60,000 volumes. In the old room, to which there is a special entrance, the juvenile library is stored. In addition to the juvenile department, between 4,000 and 5,000 volumes of the publications of the Commissioners of Patents and Inventions will also be placed there. The committee have also temporarily stored in this room about 5,000 volumes acquired towards the reference library. A wide staircase leads to the reference library, which was at first intended as an art-gallery. A large coloured-glass window, of geometrical design, lights the staircase, in addition to a light from the roof. A statue of Edgar, by Lough, is placed on the landing, which is to serve for conversational purposes, so as not to disturb the comfort of the readers in the reference library. The reference library, which is 132 ft. by 41 ft., is divided by an entablature supported on Corinthian columns, and is lighted on the south side. Four life-size figures, in marble, by Lough, have been placed here, the gift of Sir Matthew White Ridley, bart., M.P. An American revolving book-case is to be provided, upon which, when ordered, all the works in the reference library upon any special subject may be placed, to be within reach of the reader at will. The book-case will hold about 200 volumes of various sizes, and when wheeled to the side of the reader, he has the advantage of a library specially devoted to the subject he may be investigating within his reach. This book-case does away with the necessity of littering the table with books, as each volume can be easily replaced until it is further wanted. The cost of the building and site has been about 20,000*l.*

Workington.—An energetic start has been made in the construction of the new works at Workington for Messrs. Cammell & Co., of Driffield. When amalgamated with the existing works, the whole will cover eighty-three acres of land. The Derwent Works, which were purchased by Messrs. Cammell & Co. for 105,000*l.*, consist of three large blast furnaces, with all the necessary adjuncts. According to the plans agreed upon, a new chimney and a large shed for the purpose of placing therein six Bessemer converters in three pits, are to be built, while large boilers and engines will be laid down capable of turning out an average of 3,000 tons of steel rails per week. Several new furnaces will be erected, and all the improvements that modern science has invented will be adopted in the construction

of the works. Ample engine-power will also be provided. It is the intention of the company to make the new mills of larger capacity than the present Dronfield works, so as to meet the contemplated extensive weekly out-put of steel rails. The cost of the additions are variously estimated at from 40,000, to 60,000, and the contractor (Mr. R. H. Hodgson, Workington) has undertaken to have the whole work completed by March next. While those additions are being made, the plant at Dronfield will be removed to Workington. The cost of removal is estimated at 34,000. Workington is already feeling the effects of the new outcrop in the extensive building operations prosecuted on all sides. "Dronfield" streets and "Dronfield" terraces are springing up all round, and even steps with all manner of designations to include the word "Dronfield" or "Sheffield" are being opened.

It is expected that a population of between 2,000 and 3,000 will come to Camberland with the new works, and it is estimated that at least 500 more houses will be required at Workington to provide accommodation for the great influx of workpeople.

**Crewkerne.**—Advantage has been taken of the holidays by the Governors of the Crewkerne Grammar School to complete the main entrance, which, when the new building was opened recently, was left in block for future attention. The whole of the facade of the building is now finished. The re-building of the school was talked of for years, and ultimately the designs of Messrs. Giles & Gough, architects, of Craven-street, London, were accepted. The structure is built of local stone, with Ham-hill stone dressings, and the style of architecture is of the Domesticated fifteenth-century type. The carved work about and pertaining to the entrance is now completed. It has been carried out by Mr. Harry Hems, of Exeter, from the architect's designs, and from ancient shields and crests provided him. We gave a view and plans of the new building in our thirty-ninth volume (July to December, 1880), pp. 264, 265.

**HAMMERSMITH BRIDGE.**

The Metropolitan Board of Works has recognised the hardships that would be inflicted by the closing of this bridge for two years without erecting a temporary bridge, for at the last meeting of the Board the Works Committee presented a report, in which they said:—

"The course which suggests itself to your committee as the one most likely to meet all the requirements is the construction of a temporary bridge to meet for the accommodation of the traffic during such time as it may be necessary to close the existing bridge. As regards the legal questions to be involved in the reference, your committee have to state that your solicitor has, by their direction, obtained the opinion of counsel as to the power of the Board to incur expenditure in making temporary provision for the traffic, which opinion is to the effect, although some doubt is expressed upon the point, that the Board could, assuming the contract were limited to the discharge of the obligation to maintain and repair the bridge, include therein a provision to work a ferry or erect a temporary bridge. A further question is, however, here involved, and that is whether the alterations proposed by the Board can be held to be within the powers conferred upon the Board by the Toll Bridges Act of 1877 with regard to the maintenance and repair of the bridge. Upon this point the Board are advised, in order that the whole matter may be freed from doubt and uncertainty, that it is desirable, before proceeding with the works included in the plans as now proposed, that they should obtain further Parliamentary powers, not only for constructing a temporary bridge as advised by your committee, but also to execute the desired works of alteration to the existing structure."

The Committee recommended action in accordance with their report, which was adopted.

**COMPENSATION CASE.**

**FORD. THE METROPOLITAN BOARD OF WORKS.**

THIS was a compensation claim by Mrs. Ford, as widow and executrix of Henry Russell Ford, of the Ship public-house, 63, Gray's-inn-lane, opposite the side entrance of Gray's-inn, required for the Metropolitan street improvements. The claim was for between 2,000, and 3,000, and on the other side it was alleged that the temperance movement had depreciated public-house property.

The premises belonged to the Cannon Brewery, and when leased to the late occupier, Ford, in 1879, the Board of Works had power to make the improve-

ments in the neighbourhood, but made no claim when applied to, and notice to treat was given last December. The lease was at 180*l.* a year, with an agreement that if Ford dealt with the Cannon Brewery, the rent was to be only 65*l.* He let off the back premises for 30*l.*, and furnished apartments to about 60*l.* The profits were alleged to be net nearly 200*l.* a year, and twenty-seven years of the lease were unexpired. The premium was put at 1,500*l.*, which had not been paid, nor the interest. The claim by the evidences was 2,322*l.* On the part of Mrs. Ford, a claim was made for six years' profits as goodwill. On the part of the Board, the profits were said to be about 110*l.* a year, and the lease of no value without the licence, which, of the house in question, was worth about 500*l.*, and the fixtures and furniture was agreed upon at 127*l.*, and that was affirmed to be the full value. Mr. Ford had paid 250*l.* when he took the house.

Mr. Under-Sheriff Barchell put before the jury the several items of the claim and the evidence on both sides. The jury would consider the net profits, and fix what they thought proper. One side said six years was the usual, and the other side three or four years, for a goodwill.

The jury were in consultation three-quarters of an hour. They assessed the leasehold, interest, and goodwill at 700*l.*, and the fixtures and furniture at 127*l.*, making a total of 827*l.*

**CHURCH-BUILDING NEWS.**

**Haggeston (London).**—The spire of the Church of St. Paul, Haggeston, having been completed, the vicar, the Rev. S. J. Stone, on the 6th inst. mounted the scaffolding to a height of 103 ft., and, attired in his clerical and academic garb, placed in position the final cross, after which some brief prayers appropriate to the occasion were said by the vicar. The congregation in the streets below, including 700 school-children, then sang "The Church's one Foundation," and the vicar from his exalted position pronounced the benediction.

**Hoggeston.**—The Bishop of Oxford has reopened the Church of SS. Peter and Paul, Hoggeston (which name is said to be a contraction for Holy Cross Town, indicating the supposed original dedication). The building is one of considerable interest; and, after repeated attempts, since the preparation of the first plans eight years ago, and various proposals for reducing the width of the aisles, or for removing one or both of them altogether, or for an entire rebuilding on a smaller scale, on the score of cost and of the church being unnecessarily large for the wants of the parish, the original plans for reinstatement have been carried out in their entirety. The chancel has been restored at the cost of the rector, the Rev. C. H. Hole, and the remainder almost wholly through the exertions of two of the principal farmers, Mr. Baylis and Mr. Morris. The building has become latterly too insecure for use, and had been closed. The chancel, which had been rebuilt and shortened nearly to half its length, has been restored to its original length, and fitted with stalls in carved oak. The rest of the church has had new roofs, a very few of the old timbers being capable of re-use. Great effect has been obtained by the use of Northamptonshire orange-brown sandstone instead of the customary Bath. The work has been carried out by Mr. Green, of Wellington, under the direction of the architect, Mr. William White, F.S.A.

**Whitstone.**—The parish church of Whitstone, North Cornwall, has been re-opened after restoration. A roof-screen once stretched across the nave and aisles, but of this there are no remains, though certain projections on the walls show its position. Dividing the aisles from the nave are granite arcades, while light is given by arch-headed windows. In 1796 high straight-backed deal pews were placed in the body of the church and a singing-gallery erected at the western end of the nave. The foundation-stone of the south-east corner of the tower is an irregular block of white spar, and a tradition arose that the pixies played it there, and that this stone was the origin of the name "Whitstone," which the first holder of the manor assumed, and afterwards gave to his parish. The church has for a great many years been in a most dilapidated state, and after the snow-storms of recent winters, its defects became so disagreeably apparent that any further delay of restoration could not be entertained. The churchwardens commissioned Mr. Hooper, of Hatherleigh, to prepare plans, and subsequently entered into a contract for the necessary work with Mr. Wiffen, of Holsworthy. The aim has been to retain the characteristics of the old

church, and, where possible, the old material has been used. The old Cornish harrel-roof has been rebuilt, the carved bosses of the old roof being still retained. All the new wood-work is carved after patterns that remained in the old edifice, the work being performed by Mr. Northcott. The chancel has been extended, and a new porch added, and the church has been reset and floored.

**Chiswick.**—Chiswick Church has been closed for restoration at the cost of Mr. Henry Smith, churchwarden. This restoration, we are told, does not mean the complete removal of old parts. Those marks of antiquity which are worthy of preservation will remain intact, such as the tower, which, in 1425, was erected by the Rev. William Bredale. The chancel will be widened 10 ft. and lengthened 10 ft. The north and south aisles will be re-erected in a later style of architecture to show that they are additions to the original structure. The whole of the new part of the church will be of Kentish rag, so as to harmonise with the old tower. On the old wall of Chiswick Churchyard there is a curious-voiced tablet, which records that Lord Russel in 1632 built the wall to preserve God's acre from "violating of swine and other profanations." The antiquity of Chiswick Church is evident from the fact that in a grant of land by Edward the Confessor, mention is made of a previous charter of A.D. 866, which included the church and churchyard of the parish of Chiswick. So many additions have been made to the church in later years that the trained eye only can distinguish between the very ancient and the more modern parts. Mr. H. Smith, who provided the church with an organ-chamber, new pulpit, and a lectern some time ago, will spend 10,000*l.* on the building. The work of restoration is being carried out from designs by Mr. J. L. Pearson, R.A.

**Clerkenwell.**—On the 13th inst. Clerkenwell parish church, which has been in course of restoration internally, and of repair externally, was reopened with ceremonies in which the Lord Mayor and other civic dignitaries participated. The alterations in the interior of the church, which abuts on Clerkenwell-green, are so radical as to amount to a transformation. All the old-fashioned high pews have been cleared out and modern sittings in oak substituted. The upper galleries have been shortened, and in place of the old staircases leading to them, which used to block the windows, new staircases have been erected on the west side of the building. The side windows, of tinted cathedral glass, are all new; while the two windows at the east end of the church, and on which are portrayed the beginning and completion of Solomon's Temple, are the gift of the Crusaders' Lodge of Freemasons. The brass lectern was given by the Clerkenwell Lodge of the same craft. New heating-apparatus has been fitted up in the vaults, and the floor of the church is paved with wooden blocks. The exterior of the edifice has also undergone very substantial repairs. The cost of the restoration has been about 3,300*l.* The work was carried out by Messrs. Dove Brothers, under Mr. Blomfield and Mr. Paull as architects.

**ROMAN CATHOLIC CHURCH-BUILDING NEWS.**

**Springburn (Glasgow).**—The new Roman Catholic Church of St. Aloysius at Springburn has been opened for worship. Designed by Messrs. Bruce & Sturrock, architects, Glasgow, the edifice occupies the site of the old chapel. It is divided, internally, into three roomy aisles separated by arcades consisting of richly-moulded arches supported on clustered columns with moulded caps. On the street front the aisles are masked by short transepts, and one of these contains the organ-chamber and choir, while the other holds the stair to the choir gallery. Piercing the street gable of the centre aisle is a large three-light lancet window, flanked by recessed niches, and over it a stone cross rises to the height of 60 ft. above the road. The intersection of the transepts and main roof is emphasised by a pinnacled flèche terminated by a cross, the whole reaching to a height of 100 ft. At the end of the central aisle is the sanctuary with its high altar, while the sacristy is on the west, and the Lady Chapel and the altar on the east. The building, which provides accommodation for about 1,000 persons, has cost some 3,000*l.*

**Loftus-in-Cleveland.**—A new Roman Catholic Church is being erected here. The building, which is to cost about 600*l.*, will be dedicated to St. Joseph, and will, when completed, accommodate 300 worshippers. The style of architecture is Tudor, the materials being brick, with stone facings. The roof, of open timber, will be stained and varnished. The building will consist of nave, sanctuary, and sacristy. Mr. Martin Carr, of Queen's-terrace, Middlesbrough, is the architect; and Mr. Dickenson, of Saltburn, is the contractor.

**Shefford.**—On the 4th inst. (the seventh century of the birth of St. Francis of Assisi), the foundation-stone of the new church to be dedicated in honour of that saint at Shefford, Beds., was laid by the Rev. Dr. Riddle, R.C. Bishop of Northampton. The church is to serve for the ordinary parochial services as well as the Church of the Seminary of the diocese for ecclesiastical students and of St. Francis's Home for Boys. The architect is Mr. S. J. Nicholl, of 1, Caversham-road.

#### STAINED GLASS.

**London.**—The west window of St. Paul's Church, Camden-square, has been filled in with stained glass by Mr. James Barton, of Camden-road, in memory of his sisters, Mary and Louisa Barton. The style of the glass is similar to that which prevailed in the fourteenth century, and is in accordance with old examples which are still to be found in Wells Cathedral. The subjects illustrated are selected from the life of St. Paul. The chief figure is that of St. Paul himself, and on either side of him and in the three panels below are the following incidents:—Saul witnessing the Stoning of St. Stephen; the Conversion of Saul; St. Paul preaching at Athens; St. Paul before the Council; and St. Paul's Martyrdom. In the upper part of the window is (in the apex) a cross borne by two angels; in other openings are angels bearing scrolls inscribed with texts. The window has been designed and executed by Messrs. Lavers, Westlake, & Co., of Endell-street, Bloomsbury. In addition, the new approach and west door entrance has been made, the organ removed and restored, and six windows filled in with stained glass of mosaic design (by Messrs. Bell & Co., Kentish-town-road), at the entire cost of Mr. James Barton.

**Winchester.**—A window in the south aisle of the choir of Winchester Cathedral has been filled with stained glass, in memory of Lieut.-Col. Collins, of the 60th Rifles, who died in India, after going through the Afghan campaign. The window is the work of Messrs. Powell, of Whitefriars, London. The window is a four-light transom window, with cinquefoil-headed lights, and the arch of the window is made up with fifteen tracery lights of varied size and form. These are filled with figures of angels, double-winged, and resting on wheels, like St. Catherine's, an ornament taken from some old glass here, and also with cherubim. The upper lights have the four archangels, Michael, Gabriel, Uriel, and Raphael, and the lower openings have SS. Peter, James, John, and Paul, and these are represented with their proper traditional emblems.

#### SCHOOL BOARD SCHOOLS.

**Felling.**—Three groups of schools are in course of erection to meet the deficiency of school accommodation in the Heworth School Board District. Two have been completed, whilst the third, which is being erected at Windy Nook, will be completed in the course of a few months. The Felling Schools are arranged to accommodate 725 children. The building is in two stories, and the characteristic features of the interior are the large number of class-rooms provided, with the facilities that exist for easy and direct supervision by the heads of departments, and the means that are provided to enable all the children to approach and leave their several class-rooms without noise or disturbance to the rest of the scholars. Mr. G. Waddell, of Edinburgh, was the contractor for these schools, and the cost of their erection has been 3,461*l.* or 5*l.* per scholar. The schools at the Felling Shore are for infants only, and the work has been well carried out by Mr. Alexander Thompson, contractor, of Gateshead. Messrs. Oliver & Leeson, of Newcastle-on-Tyne, are the architects for the three groups of schools.

**London.**—On the 6th inst. a new school, erected by the School Board for London, in Mina-road, Old Kent-road, was opened. This is the 260th new school erected by the Board, and its site occupies half an acre. The building has accommodation for 1,398 children, namely,—420 boys, 420 girls, and 558 infants. The ground cost 6,565*l.*, and the local expenses necessary in obtaining it, 431*l.* 18*s.* 11*d.*; its total cost being therefore 7,007*l.* 18*s.* 11*d.* This gives a total cost per head on the site of 4*l.* 10*s.* The building of the school cost 13,130*l.*, which, with the architect's commission of 333*l.* 18*s.*, makes a total of 13,523*l.* 18*s.*, thus bringing up the cost per head to 9*l.* 18*s.* 5*d.* This makes the gross total expenditure 20,230*l.* 16*s.* 11*d.*, and the total cost per head 14*l.* 9*s.* 5*d.*

#### Miscellaneous.

**Metropolitan Drawing Classes.**—On the 12th inst. the Queen's prizes and honour certificates gained during the past year by the students of the various metropolitan drawing classes in connexion with the Science and Art Department at South Kensington were presented to the winners, in the Cullhall, by the Baroness Burdett-Coutts, in the presence of a large gathering of spectators. The chair was taken by the Lord Mayor. Mr. W. Bushbridge, the conductor of the classes, read the annual report, which stated that during the past year classes had been conducted in twenty metropolitan centres, consisting in the aggregate of 960 students. In the Government examination of May last twelve passed in honours, two obtained Whitworth scholarships of 150*l.* each, 203 first class Queen's Prizes were gained, and 459 obtained certificates. The Baroness Burdett-Coutts having presented the prizes, gave an address of some length, in which she dealt with the interest taken by the City Guilds in the efforts made by those outside the walls in the promotion of the trade and commerce with which the City was so closely allied. They had a forcible reminder of the immense benefit the country derived through such an association as theirs in the technical night. It was not merely the technical advantage to be derived from the course of instruction, nor the material advantages accruing, that they had to consider, but rather the indirect results of the industry, perseverance, and self-restraint that must have been exercised by all attending the classes, all of which tended to the formation of habits equally beneficial in private as in public life. There seemed to her no method of fostering among the teeming population of the metropolis those habits of mind leading to the promotion of industry and reflection so likely to be attended with success as the agency of these classes.

**Furniture.**—Under the management of the City and Guilds of London Institute, at the Technical College, Finsbury, a course of about forty lectures by Mr. A. F. Brophy, will be given, commencing Wednesday, October 18th, at eight o'clock p.m. precisely, and to be continued every Wednesday throughout the Session, on "Furniture, from the earliest times to the English Renaissance." The lectures will be illustrated by sketches of furniture, showing construction and details of moldings in the different styles, so as to enable a cabinet-maker to design and execute work in any of these styles with correct feeling. They will treat of ancient furniture, furniture of the Middle Ages, and modern furniture.

**Nottingham Government School of Art, 1882-1883.**—A Travelling Studentship, value 25*l.*, is offered by a member of the committee of this school, Mr. S. Dutton Walker, F.S.A., for the encouragement of the study of architecture. The object of the scholarship is to assist the successful competitor to visit the Continent for the purposes of study. To insure this, the amount will be paid to him upon signing an undertaking to carry out the intention of the donor, and to submit the works executed during the tour to the committee upon his return.

**Female School of Art.**—The annual exhibition of students' drawings which received the Queen's Gold Medal and Scholarship, Baroness Burdett-Coutts's scholarship, and other scholarships and medals, takes place this Friday, the 20th, from 9.30 a.m. to 4 p.m., and from 7 p.m. to 9 p.m., and on Saturday, the 21st, from 9.30 a.m. to 4 p.m.

**The Streets of Paris.**—The estimate for street repairs in Paris next year has just been submitted to the Municipal Council by the Prefect of the Seine, who asks for a sum of 407,000*l.* The total area of the streets and roadways paved with stone is given in the estimate as being 6,800,000 square yards. The expenditure upon this head is nearly half of the whole amount, each yard of paving costing nearly sixpence. The area of macadamised streets has been much reduced of late years, and is now not more than 2,000,000 square yards. The cost of repairing this for next year is estimated at 184,000*l.*, or 2*s.* per square yard, the materials employed being ordinary flints, and porphyry stone from the department of Mayenne, this latter being only used in a few exceptional cases, as it costs a guinea per square yard. The area of streets paved with asphalt is 345,000 square yards, and the cost of repairs for next year is estimated at rather more than a shilling a yard, the work being executed by contract.

**Loss of Life by Fire in European Cities.** A committee appointed by the Brussels municipality to consider what means should be taken to diminish the risk from fires, has drawn up a table showing the proportionate number of victims to fire in fourteen great cities of Europe during the ten years from the 1st of January, 1869, to the 1st of January, 1879. From this it appears that by far the largest number of victims were in London, where the proportion was 8.3 per 100,000 inhabitants. Next comes Cologne, with 7.1 per 100,000; then Hanover, with 5.7. The greatest immunity was enjoyed by the people of Munich, where the proportion per 100,000 inhabitants only reached 0.4.

**Exhibition of Works in Horn.**—The exhibition opened at the Mansion House on Wednesday, under the auspices of the Worshipful Company of Turners, was a most interesting one, containing as it did numerous ancient specimens of work in horn, besides exemplifying the various uses to which that material is applied at the present time. The exhibition was avowedly promoted by the Company with the view of furthering the technical education of workmen engaged in the trade, and it is to be regretted that, as it closes this Friday (the 20th), any recommendation which we might give our readers to visit it would not come before them in time to be acted upon.

**A Monument to Fielding.**—Some time before his death Thackeray expressed the hope that a memorial of Fielding would be erected in Somerset, his native county. But though many years have passed since this wish was expressed, no effort has been made to carry it out. We learn, however, that Mr. Arthur Kinglake, a well-known west-country magistrate, and brother of "Ethan" has been so far encouraged by promises of support as to commission Miss Margaret Thomas, of High-street, Eccleston-square, who executed the marble bust of Charles Somerville, the sculptor, lately placed in the Taunton Shire-hall, to execute a memorial of the great novelist.

**The Transmission of Electrical Force.**—At the Electrical Exhibition which is being held at Munich some interesting experiments have been made by M. Marcel Desprez for transmitting electrical force. With two Gramme machines modified to the system of M. Desprez a half-horse motive power was carried a distance of about thirty-five miles, from Meisbach to the hall in which the exhibition is held in Munich. The communication was effected by means of a single telegraphic wire of the ordinary kind, supported upon wooden posts placed from point to point along the distance traversed.

**Mahogany.**—Some correspondents desire to know if mahogany is timber. Our reply is, "Yes." Gwilt defines timber as being all such wood as is suited for the purposes of building. In Jamaica and some other places mahogany is used for joists; it is also largely used in ship-building.

**The Court Theatre.**—Considerable structural alterations are being made, and a new porch erected, to this theatre, under the supervision of Mr. Alexander Peebles, architect, in order to satisfy the requirements of the Metropolitan Board of Works. The theatre will be re-opened during the current month.

**Conuaught Theatre.**—This theatre has been sold, subject to the approval of the Court of Chancery, by Messrs. Thurgood & Martin, of Chancery-lane. The premises after decoration will be opened under the management of Mr. John Bann.

**Destruction of Ingestre Hall by Fire.**—Ingestre Hall, one of the seats of the Earl of Shrewsbury and Talbot, was burned to the ground on the morning of the 12th inst. It is situated about four miles from Stafford, in the midst of an extensive park. Since their marriage a few months ago the Earl and Countess of Shrewsbury have resided at Alton Towers, about twenty miles from Ingestre Hall, which was left in charge of servants. In anticipation of the return of the Earl and Countess to Ingestre, large fires were kept burning daily in most of the rooms to air them. On the night preceding the fire, one of the servants went through the house about ten o'clock and found everything safe. The first alarm was raised at a quarter-past five on the morning of the 12th, and by the time the engines arrived the hall was a mass of flames. Willing helpers rescued what they could in the shape of furniture, paintings, and other valuables. The whole of the stave-room floor, which was of imposing proportions, fell through into the grand hall below, and the flames shot through the main entrance to the other side of the building. The historical paintings on the staircase were all destroyed. The total loss is estimated at 100,000. It is believed that the fire originated from the ignition of a beam beneath one of the hearths,—a common occurrence.

**Sad Fatality to a Builder.**—A very distressing accident occurred at the new Naval Barracks, Keyham, Devonport, on the 12th inst. Whilst Mr. Matcham, the contractor for the works, was standing upon a scaffold superintending the operations, a labourer came up with a hod, when Mr. Matcham moved aside to let him pass, and in doing so slipped from the scaffold, and fell a height of about 25 ft., in his descent striking a girder, and thence being precipitated to the ground. He fell on his face, which was terribly disfigured. He was immediately removed to his office in an insensible condition, and subsequently muttered a few words, but never perfectly regained consciousness, and died about an hour and a half after the mishap. The deceased was a native of Dorchester, but settled in Plymouth thirty years ago. In the course of his career Mr. Matcham has carried out several important works, amongst them being the new Public Hall, Devonport; Col. Peard's mansion, in Cornwall; the Rougemont Hotel, at Exeter; Mr. Singer's mansion at Paignton; the Imperial Hotel, at Torquay; St. John's Church, Torquay; and the large goods station of the Great Western Railway, at Millbay. His personal qualities were such as to cause him to be widely esteemed. The coroner's jury returned a verdict of "Accidental death."

**Sale of Land.**—A freehold estate was offered by auction at the Mart last week by Messrs. Protheroe & Morris. The estate comprised four acres of freehold land, and was distinguished as Osborn's Nursery, Fulham. It was offered with a detached residence, seed-shop, and conservatory recently erected. The auctioneer opened the sale by remarking that the land was immediately ripe for building, and was specially the class of land that was going off well at the present time, and in dealing with the same there was no loss of interest on capital to be considered, there being no danger of the land hanging fire, as plenty of substantial builders would be ready to go on the land, which in the course of twelve months would probably be covered with shops and houses. The property was put in at 6,000, and after twenty-two subsequent biddings had been made, the hammer fell at 10,000, at which sum it was sold to the well-known firm of Messrs. Veitch & Son, of King's-road, Chelsea.

**Christmas and New Year's Cards.**—We have received from Messrs. Hildesheimer & Faulkner a selection from the large series of prize designs which they have now reproduced, and are offering to the trade, and very beautiful of their kind they are. The firm spent, it will be remembered, the sum of 5,000*l.* in prizes and purchases, and the complete collection now produced will, it is stated, consist of more than 250 series, and fifty series on satin. We should have been glad to see more figure subjects: the large proportion of those which have reached us are flowers and landscapes. Doubtless, however, Messrs. Hildesheimer & Faulkner know the taste of the public. Without attempting to make selections, we may fairly mention a number of flower designs by Mr. W. J. Muckley as being equal to anything of their kind that we have seen.

**The Worcestershire Exhibition.**—On Wednesday last the Worcestershire Exhibition of Arts and Industry was closed, with some ceremony, by Earl Beauchamp, Lord-Lieutenant of the county. The Mayor of Worcester (Mr. W. Stallard), as chairman of the General Committee, read a report, which stated that upwards of 20,000 visitors had inspected the various exhibits of Worcestershire manufactures; and with the view of securing an interesting permanent record of the exhibition, and of supplementing its educational influences, the sub-committee had arranged for the early publication of reports on their various sections. The actual receipts of the exhibition had been 9,794*l.* 16*s.* up to the previous night, besides 290*l.* for items not yet quite ascertained. The actual and estimated expenditure was 8,500*l.*, so that a balance of over 1,500*l.* was at the disposal of the committee. Earl Beauchamp then addressed the meeting, after which Sir Canliffe Owen said the exhibition had been distinguished in one respect from all similar exhibitions, in that there had been shown in it processes of manufacture which had not been divulged to the public before. In his twenty-five years' experience he had never known an exhibition of this kind brought to so successful an issue as this had been, and he congratulated all concerned on the result.

**Present Condition of Ephesus.**—In reply to expressions of disappointment as to the appearance of the remains, Mr. J. T. Wood writes,—"Of great interest are the several courses of beautiful marble masonry of the south and west walls of the cella of an earlier temple, which were made to serve for the foundations of the last temple; also the foundation-piers of the great columns, and the whole of the marble pavement of an earlier temple, which was probably built in the time of Cressus, who contributed largely to its cost. A portion of this pavement on the south side has been uplifted by an earthquake with a large mass of the mortar, which was in use at the time for building a church or some other large building within the cella of the temple. There is also to be seen on the north side of the site, and at the east end, 100 ft. of the lowest step of the platform upon which the temple was raised. Then there are countless drums of fluted columns, altogether making a most interesting though not an imposing ruin. A good idea of the appearance of the ruins may be obtained by a glance at the lithographs in my book, which were carefully drawn on stone from large photographs."

**Announcements.**—A new edition, enlarged, of Mr. Lewis D'A. Jackson's "Hydraulic Manual," consisting of working tables and explanatory text, is announced for early publication by Messrs. Crosby Lockwood & Co., London. The same publishers also promise immediately a new and enlarged edition of Mr. Michael Reynolds's "Stationary Engine Driving," a practical manual for engineers in charge of stationary engines; and the following scientific and technical works in their popular "Weald's Rudimentary Series":—"Land Drainage, its Theory and Practice," by Professor Scott; "The Smithy and Forge," including coach-smithing, farriers' work, &c., by W. J. E. Crane; "Details of Machinery," comprising instructions for the execution of various works in iron, in the fitting-shop, foundry, and boiler-yard, by Francis Campin, C.E.; "Plumbing," a text-book to the practice of the art or craft of the plumber, with chapters on house drainage, embodying the latest improvements, by W. P. Bechler, fourth edition, enlarged; "Quantities and Measurements," with rules for abstracting, hints for preparing a bill of quantities, and prices for all work in the building trade, by Alfred Charles Benton, sixth edition, with prices revised to the present date.

**Competitions: Matlock.**—Fourteen designs were submitted in open competition for laying out the grounds of the Matlock Bath Pavilion and Gardens Company (Limited), several of them of considerable merit. The first premium of 25*l.* was awarded to Messrs. Barron & Son, Borrowash, Derby; the second premium of 15*l.* to Messrs. Brockbank, Wilson, & Malliner, Albert-square, Manchester; and a supplementary premium of 5*l.* to Mr. F. S. Smith, 14, St. Anne's-square, Manchester.

**Surveyorship.**—Mr. Alfred B. Brady, C.E., has been elected surveyor to the Sanitary Authority of the Maldon Union, Essex, at a salary of 200*l.* per annum. There were sixty candidates for the appointment.

**The Nurses' Home at the Manchester Infirmary.**—The Nurses' Home which has been erected in the grounds of the Royal Infirmary is rapidly hastening to completion, and will be ready for occupation probably in four or five weeks. It stands at the south-east corner of the Infirmary, and in its style of architecture harmonises with the main block of buildings. It is three stories in height, and there are about twenty-eight bed-rooms on each floor, special sitting-rooms for superintendents being provided in addition. Each bed-room is fitted with wardrobe, dressing-table, wash-stand, and fixed mirror. Gas and water-pipes are attached to each room also, and the whole building, with the exception of the sitting-rooms, which have fireplaces of their own, is heated with steam. Each room has its window; but, besides this, there is a swing-glass panel over the entrance-door, and a ventilating grating in the wall. By means of the glass over the doors light is admitted to, or received from, the corridors, as the case may be. Each set of rooms is provided with baths and other conveniences. The architects are Messrs. Pennington & Bridgen, and Messrs. W. Southern & Sons are the contractors.

**Association of Municipal and Sanitary Engineers and Surveyors.**—The Midland District Meeting is to be held at the Vyrnwy Waterworks (for the supply of Liverpool), near Llanwddyn, Montgomeryshire, on Saturday, the 28th day of October. The members will assemble at the Works, about two miles south-east of Llanwddyn, at ten o'clock on the morning of Saturday, and will have an opportunity of inspecting in progress of construction one of the most important works of water supply that has ever been attempted. The exceptional interest attaching to these works will be understood when it is stated that the Valley of the Vyrnwy, when closed by the masonry dam about to be constructed across it, will form a lake nearly five miles in length, with an area of 1,100 or 1,200 acres, and between 800 ft. and 900 ft. above the mean sea level. In many respects the magnitude of this work exceeds anything hitherto undertaken. The distance of Llanwddyn from any railway station renders it absolutely necessary that those members who intend to visit the Vyrnwy Valley should arrive on the previous evening, Friday, the 27th.

**Canterbury Cathedral.**—An addition has been made to the altar of Canterbury Cathedral by the filling in of four open spaces facing the choir with enamel mosaic designs. The subjects are four angels taken from the paintings of Fra Angelico, the originals of which are now treasured at Venice. The background of each is of gold, on which the delicately traced figures present a striking picture when seen in a favourable light. The work has been carried out by the Venice and Murano Glass and Mosaic Company.

**Municipal Buildings for Leamington.**—Alderman Bright, mayor of Leamington, laid the foundation-stone, on the 17th inst., of the new municipal buildings which are to be erected on a site near the parade, at a cost of 20,000*l.* The architect is Mr. C. Candell, and the contractor is Mr. John Fell, both local men.

**TENDERS**

For the erection and completion of a new Wesleyan chapel at Sutton-in-Ashfield, Notts, Mr. Arthur Marshall, architect, Nottingham. Quantities supplied:—

H. Vickers .....	£1,325 0 0
W. Bailey .....	1,298 10 0
W. Holson .....	1,249 0 0
Bell & Son .....	1,394 0 0
Dudson & Parish .....	1,176 0 0
G. Hewitt .....	1,134 0 0
S. & G. Frisby .....	1,075 5 0
Goodall & Dousis .....	1,073 11 6
Boot & Redwood .....	1,035 15 0
Stainforth Bros. ....	960 10 0
S. G. Hibbert .....	528 3 6
Foster & Parkinson ..	619 0 0
Fisher Bros. ....	900 0 0
A. Eastwood (accepted)	839 9 0

For new roads at Carlton, near Nottingham, Mr. Frederick Jackson, engineer, Nottingham. Quantities by the engineer:—

George Morris, Carlton ..	£807 2 6
Thos. Smart, Nottingham ..	796 10 0
Jas. Knight, Loughborough ..	714 13 7
Wm. Gordon, Nottingham (accepted)	701 7 0

For alteration to South Horsey Schools:—

Goodall .....	£149 0 0
Southcott .....	127 10 0
Deveraux .....	117 0 0
Matlock Bros. ....	113 0 0
Kerry & Son .....	110 0 0
Altworth .....	106 0 0
J. S. King .....	103 0 0
Twitchin .....	102 10 0

For alterations at 59, Bishopsgate-street. Mr. W. Smith, architect, 1, Gresham-buildings:—

Portland.	
Stevenson Bros.	£852 0 0
J. Anley	1,016 0 0
Mattock Bros.	977 0 0
Johnson	874 0 0
Woodward	835 0 0
Thomson	850 0 0
Darnford & Langham	815 0 0

Lark & Son	760 0 0

For alterations and repairs to the Old Chesterfield Arms public-house, May Fair, for the City of London Brewery. Mr. J. Jewhurst, architect:—

Hawlett	£376 0 0
Bastley	861 0 0
Taylor	846 0 0
Longmire & Burge	797 0 0
Jackson & Todd	769 0 0
W. Shurmur	745 0 0
Spencer Bros.	725 0 0
Cubitt	725 0 0
Moore	624 0 0

For two houses at Wood Green. Mr. John Hamilton, architect:—

Larter & Son	£1,330 0 0
W. Shurmur	1,182 0 0
J. Harper	1,175 0 0
J. Roome	970 0 0

For alterations at 11, Dowgate-hill, for the Worshipful Company of Dyers. Mr. W. Waymouth, architect:—  
W. Shurmur (accepted).

For the erection of new schools, Harrow-road, N.W., for the London School Board. Quantities supplied. Mr. E. R. Robson, architect:—

W. Brass	£12,548 0 0
W. Scrivener	12,340 0 0
Higgs & Hill	12,234 0 0
W. G. Larkle	12,233 0 0
E. Lawrence	12,233 0 0
Perry & Co.	12,078 0 0
W. Oldrey	11,783 0 0
G. Wall	11,787 0 0
Stimpson & Co.	11,066 0 0

For proposed new roads and sewers at Harrow, for Mr. D. R. Soames. E. E. Croucher & Co., 76, Chancery-lane, surveyors:—

T. G. Dunmore	£1,193 0 0
G. Rayner	1,190 0 0
McKenzie, Williams, & Co.	1,074 0 0
J. Bell	991 0 0
T. Adams (accepted)	749 0 0

For building boundary-wall and fence at the cemetery, Shooter's Hill, for the Greenwich Burial Board. Mr. T. Dinwiddie, architect:—

E. Pitt	£1,112 11 0 1
Holloway	973 0 0
M. Redman	887 0 0
Martin & Goddard	699 0 0
Bridg	613 0 0
G. W. Sly	600 0 0
F. C. Smith	535 0 0
Wood	577 0 0
Holding & Son (accepted)	548 0 0
Lonerga	510 0 0 1

For repairs at Old Park Farm, Enfield, for Mr. S. Sugden. Mr. Walter Graves, architect:—

Ward & Lambie	£507 0 0
Coopet	480 0 0
Harris (accepted)	358 0 0
Spencer & Co.	315 0 0
G. Thomas	297 0 0
J. Richardson	235 0 0

For sundry alterations, &c., at 52, Highgate New Park, for Mr. Moss Benjamin. Mr. Thomas Millbourn, architect:—

Warren	£241 0 0
Roberts	143 0 0
Ferley	130 0 0
R. Conder	126 0 0

For addition to house at Theydon Bois, for Mr. W. H. Nicholls. Mr. Thomas Millbourn, architect:—

Palmer	£609 18 0
R. Conder	800 0 0
Pamphilon	988 13 10
Salmon	690 0 0

For sundry repairs, &c., at malting premises, &c., Crib-street, W. Mr. Herbert Blair, for Messrs. B. Young & Co., Brewery, Hertford. Mr. C. A. Legg, architect, Mile End, London:—

F. Hitch, Ware	£298 0 0
T. Hunt, Ware	257 10 0
H. Euggins, Ware (accepted)	247 0 0

For fifty rate fermenting-squares, upon the Yorkshire system, for Mr. John Smith, the Brewery, Tadcaster. Messrs. Scamell & Colyer, engineers, 18, Great George-street, Westminster:—

Contract No. 10.—State Mason.  
1st Section.  
Ashton & Green, London (accepted) £2,750 0 0

For new front, &c., 23, Marine-square, Brighton. Mr. Arthur Loader, architect, Brighton:—

J. M. Newnham	£753 0 0
H. & F. Parsons	750 0 0
J. Barnes	728 0 0
W. Hackman	720 0 0
G. R. Lockyer	689 0 0
J. Bruton, Brighton (accepted)	630 0 0

For decoration, repairs, &c., 3, St. Peter's-place, Brighton. Mr. Arthur Loader, surveyor, and  
Cheeseman & Co., Brighton (accepted).

For the enlargement of the National Schools, Ashford, Middlesex, by the addition of a new schoolroom, &c. Mr. W. Evernden, Howard-street, Strand, architect:—

New Room.		Boys' V.C.	New R.W.
Lodge	£327 0 0	293 0 0	216 0 0
Reavell	475 0 0	68 0 0	15 0 0
Richardson	460 0 0	65 0 0	15 0 0

TO CORRESPONDENTS.

### Locks, Inclined Planes, and Lifts on Canals. COMPARATIVE SPEED, WATER DEMAND, AND COST OF EACH METHOD.

UNDER the influence of the excitement which is now awakening in so many parts of the world as to transport by canal, great interest attaches to the account of the inclined planes on the Morris Canal (which extends from the Hudson to the Delaware River) which has been abstracted from the "School of Mines Quarterly" of New York, in the recently published quarterly volume of the Minutes of Proceedings of the Institution of Civil Engineers. The canal in question is 102 miles long. In a distance of 60 miles it rises 914 ft., or more than 15 ft. per mile, from the mean tide level on the Hudson to the summit at Port Morris. Thence it falls 780 ft. to the Delaware River. On the Hudson side are sixteen locks, giving a total rise of 157 ft. But the serious further height of 757 ft. is surmounted by twelve inclined planes; and on the Delaware side eleven inclined planes give a descent of 691 ft., besides a fall of 69 ft. through seven locks. The canal is 4 ft. deep, 25 ft. bottom width, and 40 ft. top width.

The boats are of an average capacity of 65 tons, and are constructed in two sections, abutting together, and secured by pins and latches. This arrangement, which originated independently of the introduction of the inclined plane, is remarkably well adapted to that method of transport.

The inclined planes in question are laid with a pair of steel rails, the gango being 12 ft. 4 in. from centre to centre. The weight of the rails is 76 lb. per yard. They are spiked to longitudinal sleepers, which rest on stone slabs bedded in the ground, and are laid for a short distance along the bottom of the canal in both the upper and the lower pond. The boat is carried in a cradle, which is supported by four pairs of double-flanged wheels, provided with brakes, and is worked by two wire ropes. The water of the canal is used as a propelling power; a four-armed wheel, 12 ft. in diameter, giving movement to the winding-drum, also of 12 ft. diameter. The wire rope passes round a submerged sheave. The discharge is 1,000 cubic feet per minute, under a head of 45 ft., which is said to be equal to 235 horse-power. The gradient is usually one in eleven; and a laden boat, weighing 70 tons, is carried up the rise of 51 ft. in about three minutes and a half.

The object of introducing an inclined plane on a canal is twofold,—to save time, and to save water. On some of our English canals the rise of 10 ft. is accomplished in a single lock in about the time here allowed for five times that rise. As to water, it is estimated that

the quantity that would be expended in a lock, or series of locks, giving a 51 ft. rise, would be twenty-three times that used for a laden boat in the case described, and 830 times that needed in the case of an empty boat. We may add that three minutes and a half is the time allowed for the filling of the large lock, 525 ft. long and 52 ft. 6 in. wide, at the Malatière weir across the Saône at Lyons, with a head of 5 ft.

Both lifts and inclined planes are used on our English canals, although the neglect into which this important mode of transport fell on the introduction of the railway system has been such that it requires some research to ascertain what has been, or at the present time is, in actual operation in remote districts of England. On the Grand Western Canal, which was authorised by Parliament in 1796 for the purpose of opening a waterway between the Severn and the Bristol Channel, a lift was erected by Mr. Green in 1835. This lift was 46 ft. in height, consisting of two chambers, similar to those of a common lock, with a pier of masonry between them; each chamber being of sufficient dimensions to admit of a wooden cradle, on which the boat to ascend or descend floats. The cradle being on a level with the pond of the canal, watertight gates, at the end of the cradle and of the pond of the canal, are raised up, and leave the communication betwixt the water in the canal and the cradle free, and the boat swims into or out of the cradle. The cradles were balanced over three cast-iron wheels of 16 ft. diameter, to the centre of one of which spur and bevil gear was attached, so as to allow of operation by manual power if scarcity of water made it necessary. To compensate the variation in the length and weight of chain over the ascending and descending cradle, a length of the same chain is attached to the under side of each cradle, that obviates any disparity in weight. A slight excess of water is admitted into the cradle that is about to descend, which can be regulated at pleasure, so that, in fact, the expenditure of this ton or two of water is the motive power by which one barge is raised and another lowered at the same operation. This essential feature in the economy of the scheme has thus been known and utilised for at least forty-seven years.

The boats in this case were of small dimensions; and Mr. Green, in 1838, said that he should not recommend the use of a lift for boats of more than 30 tons, but that on narrow canals, for boats of that burden, and of from 50 ft. to 60 ft. in length, lifts were extremely advantageous. The time occupied in passing one boat down and another up this lift of 46 ft. was three minutes, whereas it was considered that thirty minutes would be required to attain the rise of 45 ft. by a series of locks, making the saving in time amount to nine-tenths, for boats of 8 tons. The quantity of water consumed is about two tons for eight tons of cargo, while in ordinary locks it is rated at about three tons of

water per ton of cargo, showing a saving of more than 90 per cent.

It is a curious feature of this arrangement that in cases when the bulk of the traffic descends (as in a coal country on a high level), a weight of water equal to the weight of the loads sent down is actually raised from the lower to the upper level. Thus, in a coal country where water is scarce, the transport of the traffic by lift acts in the same way as pumping water to the higher levels.

On the 24th of June, 1854, the subject of inclined planes, lifts, and locks on canals was fully discussed at the Institution of Civil Engineers; the president, Mr. James Simpson, being in the chair. A paper by Mr. James Leslie was then read, descriptive of an inclined plane on the Monkland Canal at Blackhill, near Glasgow, and the opinions then expressed by Mr. Vignolles, Mr. Hawkshaw, Mr. Rendel, Mr. Bidder, and others, are of great interest as showing how, at that time, the competition between canals and railways was regarded by the engineers of the day. Mr. Vignolles observed that the smallness of canals was their great merit, and that it was especially owing to this feature of their construction that they had proved so much more successful in England than in France or in Ireland. At the present moment, it will be noted, not only is the reverse of that opinion held, but while the English canals are reduced to one fourth of their former tonnage, the French canals are daily assuming more and more importance, and their dimensions are 30 per cent. or more in excess of what were regarded, thirty years ago, as large canals in England. At the same time there is this much truth in Mr. Vignolles's remark, that very great economy of transport is attainable on a small canal.

The inclined planes on the Morris Canal in the United States were referred to in this discussion, and it is very interesting to observe that the principle of the "bogy," which has been so much relied on on American railways, and in some cases used by some engineers on those of the United Kingdom, was in use more than forty years ago on the Morris Canal. The principle of the incline is the use of a watertight caisson, set level on a carriage, and fitted with rising or portoullis gates that shut watertight at each end. The caisson, being hauled up to the top of the incline, and pressed hard against the gates of the upper reach of the canal, so as to form a water-tight joint, acts as a portable lock, out of which the boat is floated into the upper reach, and vice versa in the case of vessels descending. There are two lines of rails, so that the ascending and descending cradles balance one another. The great difficulty is as to the introduction of a sufficient number of wheels to support the weight. On the Morris Canal two four-wheeled trucks bore the frame of the cradle, which rested on four pivots, two of them being placed halfway be-

tween the wheels on each truck. The experience gained on the Blackhill incline, where the weight of carriage, boat, and water, was about eighty tons, borne on twenty wheels, showed that it is not advisable, with such a load, to diminish the number of wheels. For further details we refer to the debate.

So far back as 1780 inclined planes were applied to the purpose of conveying vessels from one reach of a canal to another at a different level, by Mr. William Reynolds, on the Ketley Canal, in Shropshire. They were afterwards adopted, but subsequently discontinued, on the Duke of Bridgewater's Canal, from which the hint was probably taken for the Morris Canal. An account of the latter is to be found in the "Sketch of the Civil Engineering of North America," which was published by Mr. David Stevenson in 1838.

On the Blackhill incline, in 1851, as many as fifty boats have been passed up and down in a day of ten hours. The time taken for a passage was ten minutes, against forty minutes by locks. The Governor and Council of the Company of Proprietors of the Forth and Clyde Navigation reported, in 1851, that in the working of the incline during the season in which it was used for the purpose of economising water 5,452 boats had passed by it, saving 60,000,000 cubic feet of water, or a two-months' supply for the trade done. The height to be overcome at Blackhill was 96 ft. and the incline was 1,040 ft. long. There were two tracks of rails, with a 7-ft. gauge, and two 25-horse-power high-pressure engines were employed to impart motion to the caissons. The work cost £13,000; while the two double locks, constructed in 1839, cost 16,000.

A great stride in the construction of works of this nature was made by the construction of the hydraulic lift graving-dock, in the Victoria Docks, by Mr. Edwin Clark. A description of this important work, illustrated by a plate, compiled from Mr. Clark's drawings, is to be found in vol. xv. of the Minutes of Proceedings of the Institution of Civil Engineers. This lift was the child, so to speak, of the study and experience acquired in making the arrangements necessary for lifting the tubular bridge over the Menai Straits, where no less a weight than 1,800 tons had to be raised. The great originality of the Victoria Dock arrangement lay in the associating the thirty-two hydraulic presses used in three groups, so arranged that their centres of action form a tripod support, upon which the pontoon is seated. Any catastrophe from such a cause as the bursting of one of the presses is thus guarded against. The sectional area of each ram being 100 circular inches, a pressure of 2 tons per circular inch gives 200 tons as the lifting power of each press, or 6,400 tons for the whole lift. From this must be deducted 620 tons, as the weight of the rams, cross-heads, chains, and girders, leaving 5,780 tons for the pontoon and vessel. The presses were tested to 2½ tons per circular inch. The force-pumps are twelve in number, and 1½ in. in diameter. They are worked by a 50-horse-power engine, six pumps to the larger group of sixteen presses, and three to each of the smaller groups of eight presses. The extension of the system so as to provide for any probable weight is contemplated and discussed by Mr. Clark.

On the principle thus successfully brought into practice, Mr. E. L. Williams, engineer to the River Weaver Trustees, with the counsel and aid of Mr. E. Clark, designed the hydraulic canal lift at Anderton, which raises barges up to the capacity of 100 tons burden from the river Weaver to the Trent and Mersey Canal. We have not room at present to describe the ingenious mechanism by which this is effected. An account, illustrated by a drawing, will be found in vol. xiv. of the Minutes of Proceedings of the Institution of Civil Engineers. The length of the iron caisson containing the boat to be raised or lowered is 75 ft., and the work, for each caisson, is accomplished by a single ram, of 3 ft. diameter. The boat floats during the whole time; and Mr. Williams stated that, to his own surprise, "the canal boatmen, with their wives and donkeys, took to it most comfortably; and although stairs had been provided, they were not used." The improvement of the river Weaver has been carried on by a series of eminent engineers, from the time of Telford. Twenty years ago vessels of 100 tons only could use the navigation, but now 200-ton steamers work from Winsford to Liverpool.

In the flight of locks at Runcorn, where the

difference of level is the same as at Anderton, it takes, according to Mr. Dner (the author of the paper describing this lift), from an hour and a quarter to an hour and a half for a barge to pass through. By the Anderton lift, eight minutes are sufficient for that purpose. In a chain of six locks, with a total fall of 51 ft., that depth of water, for the area of the lock, must be expended for each passage. Although, if the traffic demands it, this will be expended per barge, yet, in the event of six boats being ready to ascend the chain of locks in close succession, at a time when all the locks were empty, ten lockfuls would be required to make them to ascend. For six boats to ascend, and then to descend,  $\frac{21 \text{ locks} \times 50 \text{ ft.}}{6}$

= 175 ft. depth of water for the area of the lock would be expended. With the elevator the waste of water is only 6 in. for each pair of boats, if one rises and another descends at the same time; or 3 ft. of water for the six pairs, being 17 per cent. of the water required for locking, besides the gain on time.

The cost of masonry of basins, approaches, &c., for the Anderton lift was 18,9657. That of the ironwork and machinery, including patent right, was 20,4631, making altogether a total of 48,4288, for the lift. But the contract was taken at the time when the price of iron was the highest ever known in England.

An allowance of 5 per cent. for interest, and of a second 5 per cent. for depreciation on the capital cost, comes to 931 per week; working expenses, when the lift is in full operation, amount to about 157, making a total of 1088 per week. The Parliamentary tolls are,—

	s.	d.
Per ton for all goods .....	0	1
For each laden barge .....	1	0
For each empty barge .....	2	6

The capacity of the lift is given as sixteen barges per hour,—eight up and eight down,—giving 480 of each per week. The load averages 25 tons, making 12,000 tons per week, so that for one week's traffic the possible income would be,—

12,000 tons at 1d. ....	£50
480 laden barges at 1s. ....	24
480 light barges at 2s. 6d. ....	60

£134

Making a profit on the working of the lift of 26l. per week. This gives the annual traffic of 624,000 tons, which, though high, is far from being the maximum attained on more than one important English canal. The charge amounts to nearly 27d. per ton of goods passed up. It would be very desirable to have the means of comparing this cost, from the freighter's point of view, with that of passing a chain of locks.

#### THE PRECURSORS OF THE ASSYRIANS.

Few more interesting acquisitions to our daily-increasing knowledge of the artistic history of the past have been made of late than those afforded by the series of Chaldean antiquities which, after having been unearthed almost in secret by the French Government, are now at length placed on public view in the new Assyrian galleries of the Museum of the Louvre. With the art of Assyria the labours of Layard and of Botta have made the artistic world familiar; the recent discoveries made by M. de Sarzec, the French consul at Bassorah, if they do not yet place the Louvre on the level with our British Museum in the possession of specimens of Assyrian art, may be looked upon as supplying a fund of information on a perhaps even more interesting and certainly earlier civilisation.

Relics of the art of the Chaldeans,—the forerunners and teachers of the Assyrians,—have till now been of the extremest rarity; the British Museum and the Louvre have both possessed fragments of bricks, statues, and statuette known to belong to the archaic stages of Assyrian civilisation, but further research in this direction has been singularly thwarted by circumstances. Chaldea, which lies to the south of the district so successfully explored by Layard and Botta, is situated in a strip of land formed by the embouchment of the Tigris and the Euphrates; each year the district, during certain seasons, is entirely under water, leaving a series of unhealthy marshes scattered over a country once fertile and thickly populated,—the seat, more than

twenty centuries before the Christian era, of a brilliant civilisation, of which, though mention is made both in Biblical and classical history, we have so far possessed no exact knowledge. In this deserted district have reposed undisturbed till now the relics of the Chaldean people.

It has been the good fortune of archaeological research that M. de Sarzec, the French consul at Bassorah, should have possessed the zeal to undertake a series of excavations on the site once occupied by the Chaldean cities. When, some five or so years since, the success of the consul's explorations was proved to the home authorities, the utmost secrecy was enjoined so as in no way to excite the emulating zeal of any foreign nations. Hence it is only within the last few months, when the result of several years' successful excavations have been at length sent home, that any public attention has been brought to bear on what will prove, we suspect, to be among the most curious archaeological discoveries that have been made since the day when Layard's explorations aroused such widespread interest. Layard's discoveries, however, only opened new horizons of conjecture, and it is not until now that these conjectures can be said to be explained by the results of M. de Sarzec's recent explorations in Chaldea.

Consul at Bassorah, M. de Sarzec visited the whole of Mesopotamia as far as Bagdad, then descending southwards on his journey back to Bassorah, he traversed the plain which stretches between the Tigris and Euphrates. Here, in a district unvisited by any previous explorer, he determined, entirely on his own responsibility, to commence the series of excavations the results of which are now submitted to the attention of the archaeological world. M. Georges Perrot, himself a distinguished Orientalist, has graphically described, in a recent issue of the *Revue des Deux Mondes*, the adventures of M. de Sarzec in the pursuit of his task, and it is not unlike a chapter of Captain Marryat or Mayne Reid, the story told of the worthy French consul's encampment in the midst of the once thickly-peopled but now almost inaccessible district, visited not alone by all the horrors of marsh-fever and intolerable heat, but by hordes of nomadic and reckless Arab marauders, who more than once attacked the party; for Chaldea proper,—that is, the plain stretching between the Tigris and Euphrates, from the site of Babylon to the confluence of the two rivers,—is one of the most remote and rarely visited districts of the whole Turkish empire. Provided with the necessary powers, and accompanied by a gang of trustworthy native workmen, it was here that M. de Sarzec, in the winter of 1876, commenced operations.

The spot known to the Arabs as Tello, from the *tells* or artificial hillocks which mark its position, lies in the desert on the left bank of the Chatel-Hai Canal,—a still existing relic of the ancient Chaldean system of irrigation,—an hour and a quarter's march to the East above Chatra and below Said-Hassan, both on the other side of the canal. Tello, it may be remarked, will be found on no existing map of the district; but Said-Hassan and Chatra, which may serve to determine its position, will be found on the map which accompanies Loftus's "Travels and Researches in Chaldea" (London, 1857). Such, however, was the impossibility of settling down at Tello, where, in the dry season, not a drop of water was to be had, that the camp had to be pitched at an hour's walk from the scene of the daily excavations.

Under these conditions the difficulties met with by M. de Sarzec can be understood. In 1881 he suspended his researches, after four separate campaigns, during the last two of which upwards of 200 men were employed. There alone remained the transport of the unearthed antiquities from Tello to Bassorah, and thence to France. The chief difficulty lay in the three miles or so which separate Tello from the canal, for many of the statues were of considerable weight, the lower part of the principal figure exceeding three tons and a half. By the use of a number of teak planks the work was finally completed, although five weeks were occupied in the transport of the largest statue alone. Once afloat, an English vessel bore the precious relics to Marseilles, whence they reached, some months since, the museum of the Louvre, where they have been subjected to the most minute study on the part of the archaeologists and Orientalists. The French Government have liberally recouped M. de Sarzec for his outlay; and though we may express some regret that

the English agents who tempted the worthy consul at Bassorah were unable to induce him to part with his treasures, they are now placed in Paris as entirely at the disposition of students as if they had come to enrich our collections in Great Russell-street.

What, now, is this art which these recent discoveries in Chaldaea have brought to light? During the whole course of antiquity (of Biblical antiquity, we may call it) there existed between the western border of the high plateau of Iran and the desert of Syria, two distinct yet strikingly similar nations, who occupied the double basin of the Tigris and the Euphrates. Both possessed the same type,—the Jewish type,—the same language, the same art, the same writing, the same tastes, similar manners, costume, and religion. Where, however, the difference is observable, is in the fact that Assyria became entirely a warlike nation, and was, ten centuries before our era, one of the most powerful military monarchies of the world; whilst, on the other hand, Chaldaea was more exclusively devoted to industrial and scientific pursuits. It was essentially to the superiority of its intellectual culture that Babylon owed its influence and fame. The highest social position would seem invariably to have been reserved to the sacerdotal caste,—to those whom the classic writers call markedly the Chaldeans, the scientific students, the *savants* of those distant days, and to whom the system of Greek philosophy may in no small measure be said to be greatly indebted.

Here, on this once fertile strip of land, in the centuries almost as remote as those in which the oldest Egyptian monarchs reigned, the Chaldeans created a great civilisation, a complicated religion, a language, possessed technical and industrial processes, a profound knowledge of scientific agriculture, a literature, and a brilliant art developed under many forms. This civilisation preceded that of Assyria; the relative positions of the two being not unlike those of Greece and Rome, or, in our own time, of China and Japan. Like the Assyrians, the Romans were better fitted for conquest than their masters in refinement, the Greeks; and, as we see in the case of the Japanese, many of the art-traditions of their teachers, the Chinese, have been developed in their more modern hands with singular brilliancy. The Chaldeans never appear to have sculptured on their walls such spirited pages of their history as adorned the palaces of Nineveh. None the less, the Assyrians must be looked upon as only the pupils, intelligent and gifted as they were, of the Chaldeans. The reputation of the Chaldeans is Biblical, but their art remained till now practically unknown to us; we possessed a few cylinders, a few bronzes, a few bas-reliefs and terra-cottas, but their meaning was largely conjectural. As long ago as 1817, John Landseer (the father of Sir Edwin) communicated to the Society of Antiquaries some "Observations on the engraved gems brought from Babylon by A. Lockell, esq.," and a few years later, he also delivered a series of lectures (eventually published in 1823) on the engraved hieroglyphics of Chaldaea. The better-founded conjectures which were suggested by the Assyrian discoveries of later years were, however, none the less problematical, though everything pointed to Assyrian art as a derivative of that of Chaldaea.

With the relics from Tello we can at length form an opinion respecting the art of Chaldaea, and not merely from a number of small and unimportant objects, but from remains of considerable size, by means of which the religious, civil, and funereal architecture of the people can be judged; as also their art as represented in numerous statues, bas-reliefs, and statuettes in bronze and terra-cotta. These remains belong to what is called "the first Chaldaean empire," and are of a much greater antiquity than any Assyrian monuments we possess. This assertion is corroborated not alone by the archaic character of the art,—always a deceptive criterion in the past, when refinement was so irregularly distributed over a country,—but by the nature of the signs which compose the inscriptions found on each monument. These belong to the oldest form of Chaldaean writing; like that of Egypt, it was at its outset essentially hieroglyphic, and composed of a series of pictured words. It was only later that, with the desire to obtain greater rapidity, the scribes reduced their signs to the character known as cuneiform or wedge-shaped. But between these two periods many centuries must have elapsed.

A comparison of the artistic differences of the two arts leads to a similar conclusion, and this suggestive means of study has been favoured by the excellent arrangement in the same room at the Louvre of the early Assyrian monuments and those of Chaldaea, both clearly the creations of one school. General treatment of drapery, of costume, of attitude, all afford ample matter for the attention of the student and the expert, and show how direct and uninterrupted were the traditions by which the Assyrian art of the seventh century (B.C.) is connected with that of the Chaldeans as represented in these newly-discovered monuments, the oldest of which carry us back probably twenty centuries prior to the Christian era.

When the plans of the Tello ruins are made known, similar conclusions will doubtless be arrived at respecting the architecture of the two nations. The principal edifice of Tello or Sirtella strikingly recalls the great Assyrian palaces, but on a smaller scale, as can be understood when the relative importance of the Nineveh is taken into account. To erect such large edifices as the palace of Sargon, with its superficies of twenty-five acres, the Chaldeans did not employ flocks of whip-driven captives, but the principles of construction employed are the same as at Khorsabad. At Tello, as in Assyria, the edifice is built on a basis of unbaked bricks, rising about 50 ft. above the level of the desert; the walls of the rooms are all of baked brick, while in Assyria they are generally of unbaked bricks, but none the less the constant and alternate use of baked and unbaked bricks is one of the chief characteristics of all the architecture of Mesopotamia.

The monuments of very different epochs have been discovered at Tello, the oldest being unquestionably the most interesting, carrying us back as they do to centuries, the work of which we could scarcely expect to find in existence. A *stèle* of white stone, covered on both its faces with inscriptions and bas-reliefs representing strange scenes of war and burial, appears to offer by its character the proof of being the oldest specimen. The art is essentially tentative, possessing not a trace of style,—the work, in fact, of mere beginners, but interesting as representative of the primitive art of Chaldaea. The advance made is shown by a numerous group of statues and fragments, all indicative of a noticeable progress made by the artist in his realisation of nature, in face of the difficulties of the material he employed. The nude, where represented as in uncovered shoulders or arms, is firm and robustly treated, the hands and feet are well drawn, the details fully marked. The representation of the human face, as presented in two heads, shows no less breadth of treatment. The long hair and curled hair, it may be remarked, are not yet introduced. An interesting effort,—not noticeable in Egyptian art or in the subsequent Assyrian art,—can be traced to give some idea of the relief and direction of the folds of drapery. As representative of the Archaic Chaldaean art, these figures are of the utmost interest; but the conventional treatment,—the figures in general being seated and very squat,—is marked.

Once arrived at this degree of merit, Chaldaean art progressed with rapidity; but of its ultimate development we possess alone a few small fragments, which, while ample in themselves to show the skill attained by the Chaldaean sculptors, are singularly calculated to excite our curiosity as to what must have been their more important creations in a period when we may say their art had arrived at its classic development,—when its artists, free and learned in their execution, are complete masters of the power they possess to render what they desire to imitate in the life about them.

What influence this art exercised on that of Assyria we now know, but till recently many points in connexion with the sculptures and bas-reliefs of Nimroud, of Khorsabad, and Kouyoundjik, were surrounded with puzzling doubts,—doubts at present solved by the relics brought from Chaldaea by M. de Sarzeec. The curiously contradictory character of much of the Assyrian art, conventional and yet full of life, stiff and yet natural, is now explained by its evident dependence on the earlier traditions of Chaldaea; the Assyrian art of even a thousand years before the Christian era is not, as has long been believed, a primitive or even archaic art; it is not what is understood as a classic art,—the art of a school striving to interpret nature by a close study of its beauties. It is

not, perhaps, an art in decline, but it may be said to be stationary, and which, with a view to the production of a large quantity of work, freely uses the conventional formulas created and taught by its masters and teachers. The position of Assyrian art in its relations to the earlier art of Chaldaea may be in a measure compared with that of the Greek traditions of Phidias, of Praxiteles, and of Lysippos, in the hands of the later artists of Pergamos, of Rhodes, of Antioch, and of Rome, where all the skill and learning of the original school may be found united to a novel expression of enhanced grace of life, of vigour, and of even theatrical energy, such as exactly marks the art of Assyria, when compared with that of Chaldaea; but neither the Greek sculptor of the declining centuries of antiquity, nor the Assyrian sculptor, can be said to invent or create in the true sense of the word. Diligently as the Greek still studied nature, it is less with his own eyes than with those of his predecessors; it was they who taught him to render his model according to those canons which constitute Greek "style." Such also was the position of the Assyrian sculptor, even more urged into the routine of conventionality by his constant representation of draped figures. It is only when he represents animals that he appears to have referred to nature, and there his skill is masterly. In the treatment of the human figure he follows only the traditions of his Chaldaean predecessors, whose power of interpreting nature was the result of a close observation and study, the rendering of which it is curious to trace,—when the art of Chaldaea and Assyria are compared,—the latter artists exaggerating in the same manner as the successors of Phidias exaggerated his treatment of the nude.

It will be seen that the interest of the discoveries made by M. de Sarzeec is great. A light has been thrown on the origins of a powerful civilisation which, till now, possessed in the eyes of the archaeologists many conjectural points. With the existence of these recently-discovered relics of Chaldaean art, the art of Assyria ceases to be an incomprehensible problem. Like the Egyptian art of the Theban dynasties, which it in some points resembles, it was, we see, preceded by a naturalistic or realistic period, which, by its close and simple study of the living form, created one of the essentially original styles of antique art from the influence of which Greece at the outset unquestionably acquired no small share of profit.

One more step has, in fact, been made towards our knowledge of that mysterious westward movement of civilisation from Central Asia,—which history will some day, we believe, explain,—and which, with the discoveries first of the Egyptologists in the land of the Pharaohs, then of the Assyriologists in the mounds of Nineveh, and now in the desert of Mesopotamia, has, within this century, shown us the true origin of Greek art and dispelled the fallacies of the old school of antiquaries, who claimed that the art of Phidias was the Heaven-born creation of Greece, that land of legend and romance, of learning and of refinement, of wisdom and of wit.

#### SALISBURY CATHEDRAL.

We hear with great satisfaction that the Dean and Chapter of Salisbury, at their meeting on the 19th inst., appointed Mr. Arthur W. Blomfield, M.A., architect to the cathedral, in the place of the late Mr. Street.

**The Painter-Stainers' Company.**—On St. Luke's Day, October 18, the master, wardens, and livery of this company, in accordance with custom, met together to celebrate the feast of the patron saint in their hall, Little Trinity-lane, Queen Victoria-street, afterwards attending divine service at the Church of St. James, Garlickhithe. The old hall was destroyed in the Great Fire of 1666, and about the end of 1669 the present structure was erected. The building is now threatened with destruction, in order to facilitate the carrying out of the "Inner Circle" railway completion scheme. In the afternoon, a common hall was held, when Mr. W. F. London was elected master for the year ensuing; Mr. J. D. Craco, upper warden; and Mr. S. S. Phillips, rector warden. A banquet was held in the evening.

MATTERS AFFECTING ARCHITECTURE  
AND THE PROFESSION.

At the opening meeting of the Liverpool Architectural Society, at the Royal Institution, Colquitt-street, the President, Mr. Parslow, F.R.I.B.A., delivered an address containing much suggestive matter. After a few introductory sentences the President said,—There is a tendency among some of us to keep to engineering and such solid business, and a disposition to disparage the artistic, while there is also, we are conscious, a tendency, among others, to overrate the artistic; but this is the exception. There is a wide field for the artist and his pursuits, and there is also a wide field for the engineer. The architect, whatever may be his preference, has to combine both. Slaves to the useful are apt to neglect the beautiful. The necessities of everyday life press upon us the observance of the one; but the other, the cultivation of the beautiful, is apt to be pushed out, and it is for those of us whose vocations call specially in this direction to see that it is not. The Grecian Emperor when asked to play the lute replied contemptuously he could not fiddle, but he could turn a small city into a large one; and this emperor has many who echo his sentiments, and apply the word "fiddlesticks" to attainments which they do not appreciate.

"What is the use," contemptuously said a poor woman to a lady candidate of an important School Board, "of teaching our girls drawing when they are only going to be servant-maids?" "Well," replied the lady candidate, "the great objection to servant-maids of the present day is, that through rough handling they break valuable glass and china put into their hands. They lack the delicate touch necessary for the right handling of them, and there is nothing so calculated to cultivate this delicate handling as the art of drawing, and hence it qualifies them for whatever may be their position in life."

Even the audience this lady had was able to appreciate the force of such reasoning, and the value of refining our rougher tendencies will by the force of circumstances become known in due time to the public, and those whose education teaches them this must not be unfaithful in times when the necessity is not generally admitted.

If a character like Ralph Nickleby has the command of money, and has nothing about him of a refining tendency, rubbish and dirt, where there might be ornament and comfort, gloom and overcrowding where there might be sunshine, the demoralising habits will show themselves in the outward life.

While it is possible, and undoubtedly is the case, that candidates for School Boards have sometimes carried their crochets to extremes, and have overdone teaching, so the artistic may be overdone, and the extreme must be avoided; but as doctors watch the tone of health does not diminish without their raising a cry, and as our literary guides do not permit declension in literature without an effort to keep up the standard, so the architect should see that the tone of public taste in building does not decline without a vigilant effort to raise it. Goldsmith, in his poem on "The Deserted Village," raises a cry on behalf of Poetry in which we may hear a faint echo on behalf of her sister art.

It is pleasing to observe the number of buildings going up around us, all giving evidence of skill and development in artistic power among the architects of our city.

We remember the time when a distinguished town councillor said, "Architects in Liverpool! Why there are no architects in Liverpool." There was sufficient in those days (twenty-five years ago) to rebut such an assertion, but now there is a great deal more. The citizens have reason to be proud of their buildings, rising up on every hand under the superintendence of Liverpool architects.

We are highly pleased to have in our midst buildings by the privileged architects of London and elsewhere; but we note that the buildings of our fellow townsmen show that the necessity does not exist to go out of Liverpool for architects in every way qualified for such work.

When an architect from outside Liverpool obtains by competition the commission to erect public buildings in our city, we congratulate and welcome him; but where buildings are erected for public purposes, the business of which will be supplied by Liverpool enterprise and Liverpool money, and an outside architect without competition is appointed to the work, we feel

the mistaken notion of the town councillor still exists.

We have observed some disparaging reference to the decision of Government not to remove our present post-offices, their decision being to re-arrange by extensive alterations the present buildings. Whatever may be said as to the convenience of the principal business bodies among us, and of the disappointment at not having another handsome building in our city, such as would be an ornament and a credit, as we may be sure would be the case, yet there is a view of the question that those of us who are architects cannot fail to notice. The position for a half-century of an important centre like a post-office gives value to the property around, and many properties are acquired with the knowledge of the advantages consequent upon the position of such a building, the removal of which would be an injury to them, and, therefore, while some regret the decision of the Government, many will have cause for congratulation.

We have known a divergence like this diminish the value of property 75 per cent., while sites, as in Victoria-street, have gone up 75 per cent. owing to improvements. Recently, a property which a gentleman refused to take for 4000, five years ago has sold for over 30,000. This is owing to improvements in the vicinity.

When owners suffer through a divergence in their vicinity there is no compensation for them, and when owners gain advantage in a contrary direction there is no tax upon them to make a *quid pro quo*.

To come down from the consideration of the larger creations, we see a curious prospect for the building community.

"Nobody of any means will build now for investment, it is not likely," said a wealthy contractor to us recently. This contractor's conclusion was, that it had long become a by-word among us that to get reasonable interest on building is now out of the question, and certainly we see farms with hundreds of acres offered to any one who will occupy them and pay the rates, or to any who will keep them in order.

Others are offered without any restrictions, free for a certain term. Houses in our suburbs are offered free for so many months, and then for occupation at quite a nominal rent. What is the cause? Who are to blame? And what are the lessons? We have seen the same thing in commercial matters. Ships taking freights that will not pay expenses, let alone bring a return to the owners, imported goods selling at so much less than it cost to bring them to England, and the commercial men engaged in the transactions tell us that it is impossible for them to do otherwise. To do no business they say would mean greater loss. Yet these commercial matters have been quickly righted.

A few years ago the proprietor of a manufacturing mill where we were doing some work said it cost him 10,000, a year to let his mill lie idle, but he preferred to let it lie idle than work it at what was the state of trade then. But ultimately those manufacturing difficulties became settled; and the present state of the building trade, though some blame the public, others the builders, and others again building societies, may be explained in the fact that a wave of adverse circumstances has passed over the land impossible to restrain, like a wave of the ocean, and this has culminated in the present state of the building trade, and as the ebb tide follows the flood in the ocean, and has been repeated in the commercial world, we may look for a receding tide bringing things to their normal condition in the building world likewise. Meanwhile, there are some admonitions to building societies and those who pull the strings in like organisations. Building societies have lent money to speculating builders, we are afraid, too indiscriminately. These in numberless instances have been unable to meet their obligations, and the mortgagees have seized the properties and let them for any nominal sum, so as to bring a return; and so general in all parts of the country has this experience become that all good property duly paid for in suburban districts has had to come down in rental value to compete with this class.

Building societies have missed their purpose, and in the future their projects will require restraint. The object of their promoters was to enable prudent people to acquire their own houses in due time and at moderate cost. But their aims seem to have become misdirected. Their advantages have been sought after in

ways never contemplated, and for the present the societies have defeated their own object, and have built up a state of things that is like the monster in the fable with which the celebrated authoress has favoured us. The hero is said to have created a hideous monster, and by some marvellous means put life into it. This monster followed its own creator with a dagger all round the world, until at last the man was slain by the object of his own creation. So, building societies are at present succumbing to the state of things they have themselves created. We have known one building society recently write off 8,000, at a sweep to get rid of responsibilities arising from circumstances as explained. Others besides building societies, including ourselves, may find lessons from the like experience of the past, but we cannot dwell upon them now. Every branch of the building trade suggests topics for useful reflection, and which we hope may be matured in papers and discussions during this session.

We must all be pleased by seeing the action of our Government relative to the manufacture of white lead. This very useful article,—one which we have considered so essential in the work of an architect,—on account of evils in its manufacture is calculated to afford us pain in its use. To obtain the oxide from the pure lead, and which constitutes the white-lead, it is necessary, as most of us have witnessed, to store the pure material soaking in the acid in partitioned apartments for months, and the effects on the atmosphere, as well as doubtless a want of perfect attention to cleanliness in the habits of those in its proximity that are engaged in the works, cause these workpeople in the course of a few years to become physically disabled. How to reduce the evils has now the attention of Parliament, and with all its advantages, if the evils cannot be materially reduced, its manufacture should be curtailed or abolished. The oxide of zinc, the manufacture of which produces no such ill effects, might be a substitute. The trouble that exists in grinding zinc when oxidised might by due attention be diminished. At present we keep to the old practice of using white-lead. People are obstinately conservative in this particular who would abjure the name in politics. If we turn to the zinc in preference to lead, this article would doubtless soon compete favourably in price. Certainly it retains its whiteness purer than lead, and much may yet be learned by experience in its favour as regards the chemical action set up by the effects of the weather. At present we find oxide of zinc is used more in marine and naval architecture, and it is said to prove much more enduring when used for the painting of bulwarks, exposed as they are to alternating wet and dry, than does painting with oxide of lead.

To turn from the painter's line to the brick department, no article has made so much progress in development during the present quarter-century as terra-cotta or ornamental brickwork, and undoubtedly this forms a prominent feature in the architectural work of this generation which may yet develop a new style. At the Building Exhibition in London, a great variety of specimens from different makers and manufactories was exhibited, all showing the wonderful progress towards perfection that is being achieved in this art. And during the recess the Fellows of this Society paid a very entertaining and instructive visit to the well-known works in Ruabon, where, through the obliging courtesy of Mr. Edwards and his son, the successful manufacturers, we were astonished and gratified both by the character of their work and the development of the appliances and machinery for its execution. We have an admirable specimen of this material in the Eye and Ear Infirmary buildings of this city, the architectural work of our excellent friend Mr. Ellison.

We may appropriately turn from the subject of brickwork to that which so seriously disfigures its brightness in all our cities, viz., smoke,—although, by the way, the chemical action deteriorating the surface of terra-cotta is as nothing in comparison with its effect on the generality of stone, and this must ever be a high testimony in favour of terra-cotta. How to lessen the amount of smoke hanging over our cities is one of the important questions of our day; and really one is disposed to say it need be, when we find that the weight of carbon hanging over the City of London is estimated by an eminent professor at 60 tons.

A very important exhibition of contrivances to diminish the evil has been held in South Kensington, and another in Manchester. Wose no reason why there should not be one in Liverpool before long. In some large residences, as, for instance, Biddulph Grange, near Congleton, the flues of the whole of the establishment pass underground, across the estate, to one immense and ornamental tall chimney. This system, however, while it concentrates carbon, cannot materially diminish it. What might be done by collecting it as we do drainage, and consuming it at different stations, may yet be proved. But who is to have the honour of inventing the only successful open or closed grate that will consume its own smoke and do its work of heating in the most economical and convenient method? It may prove that some patent fuel or gas may accomplish what is required. The many who have been giving this subject attention, and the numerous representatives of public bodies that have visited the exhibitions, show how widely interest in this subject is spreading.

The vexed question of light and air is now likewise one of the subjects of the day. We have reason to believe that our worthy ex-president may be relied upon to bring this before us during this session in the way its importance deserves. It is too soon to give an opinion upon the labours of the committee of the Royal Institute of British Architects, so generously undertaken, but there cannot fail to be much good come out of them, and all right-minded members of the legal profession, as well as of our own, will be glad to lend a hand in assisting, as far as possible, to put aside the dog-in-the-manger policy of the past, as well as to secure, with reasonable expense and trouble, the protection of undoubted rights. We frequently hear surprise expressed at the variations to be met with in the testimonies given by professional witnesses. We meet with people who wonder why there should be professional men found to witness on both sides of a question. They forget that the occasion of a dispute is in the fact that there are two sides to every question. To witness against conviction of the truth admits of no excuse; but that two professional men should be found to witness in opposite directions is not at all to be wondered at. The cause of antagonism is often misunderstanding, and the object of law, then, is to get at a settlement of where the misunderstanding exists. That which is subject to variable conditions occasions difference of opinion. In a recent assize, a case was heard relative to the former seaworthiness of a vessel now lying at the bottom of the ocean. There was a wide difference in the testimony of the experts, some engaged on the one side to prove one thing, and some on the other to prove the reverse. But it transpired subsequently that the witnesses on the winning side had access to far superior sources of information than had the witnesses on the other, and herein was the occasion of the difference in their statements, and doubtless the witnesses on the losing side, on calm consideration, would be convinced on which side was the right, but it required the conflicting testimonies notwithstanding to get at where the truth lay. If the matter in question is simply what is strong enough for certain purposes, that may be settled by reference to rules and fixed data, the result of experience, and if in witnessing in such a matter there is conflicting testimony, the truth may be got at, and should be got at, by cross-questioning. The same as to the obscurities of light. If the question be on the subject of expediency, here conflicting testimony will arise.

We have known one of the first architects of our generation to attest strongly in favour of Roman cement for outside work, and would have Portland cement that had been used knocked off in order that Roman might be substituted. This shows how wide a difference as to expediency will exist in the minds of experts. The professional witnesses, if of snail-sho calibre, can, if cross-questioned, give good reasons for what they affirm in matters of strength and expediency; but if the question is a matter of value, this depends upon such varying circumstances that, like the facts relative to the ship at the bottom of the sea, the truth can only be got at after weighing the conflicting testimony. The light appears after striking the flint. We have already referred to a property which, though offered five years ago for 4000, was recently sold for over 30,000. The professional witness who might have said five

years ago that that was its prospective value would have created a sensation.

If the question is a matter of sanitation,—what is good for health and what is not,—then a subject is started on which there are as many opinions as witnesses. And that there should be architects found to witness strongly on both sides of such a question is no disparagement to their veracity, but merely a reflection of the now well-received axiom that doctors differ. Those who conduct inquiries should get at what is available evidence to prove a conclusion. The mere statement of a professional witness that his opinion is so-and-so should not be accepted without his giving his reasons why, and the truth could soon be got at. Who is there among us that has not had his opinion changed, as careful barristers have brought forward appropriate facts, opinions that when formed were perfectly conscientious?

Much has been done in our day to provide open areas as lungs or breathing-places to assist the vitality of residents in our large towns, and a considerable amount of property, unfit for human habitations because of its condition excluding the light and air of heaven, has been removed. Our City Corporation has striven with almost insurmountable difficulties, most commendably, in this direction, and yet our lamentation is that, so where we may, we find that while our authorities are doing away with the evils of the past generation, we are rapidly multiplying the same evils to be dealt with at the same enormous expense by the next generation. Echoing the sentiment, posterity has done nothing for us, so we will do nothing for them. Small houses are being erected, not, we should judge, as a barrister said, at so much a dozen, but so much the hundred gross. These small dwellings are accumulating as thick as mushrooms, and no open spaces are being provided to aid health or cut off the spread of pestilence. Such open spaces might be provided at infinitely less cost now than hereafter. Additional legislation is certainly needed in this direction, and the strenuous efforts of individuals who come in contact with this state of things should on no account be withheld to secure some improvement before it is too late. The condition near our own city of Marsh Lane and Seaford at this time reminds us of a plague of locusts just alighted upon a verdant spot, and determined not to leave it until every mark of verdure has been eaten up. Cannot something be done before it is too late to provide a room to our city as constituting dwellings for the labouring classes, and for the want of which London and Paris are now crying out, may prove a chain of woe, promoting death instead of nourishing life, through shutting out the essentials to life.

To turn more particularly to local subjects. It is a matter of satisfaction that our enterprising Corporation has resolved to add to the appearance of St. George's Hall by completing the outside sculpture. All will be pleased to know that the gentleman whose models were chosen from the number contributed in competition has been appointed to execute the work, and, though a comparative stranger to most of us, there seems every reason to believe the work entrusted to him will be carried out creditably to himself and to the noble building with which it will be associated, as also to the city of which this is essentially a municipal transaction. We must congratulate Mr. Stirling Lee upon his success. We understand he has been pursuing the studies of his art recently in Paris. The evident enthusiasm with which he has approached the task assigned to him, and the skill he has already shown, afford bright prospects for the future.

The Mersey Tunnel is another undertaking, though of private enterprise, naturally attracting considerable notice. Our townsman, Mr. William Williams, in the memory of some of us, approached the late Emperor of the French on the subject of a tunnel under the English Channel, and produced his models for a tubular structure of clover design with hall and socket-joints of an exceedingly interesting scientific and creditable character, and had the Emperor remained in power the matter would doubtless have received more of his attention. Subsequently there seemed great probability that the same system would be applied for carrying a tunnel under the Mersey, and the preliminary Parliamentary notices appeared in the papers. But since then, instead of laying a tunnel, the project of boring

a tunnel under the Mersey has been undertaken with a spirit and enterprise worthy of the importance of the object, and the work is now satisfactorily progressing. The question of such a prodigious undertaking as forming a tunnel under the Mersey could only commend itself to us when the exigencies of the community necessitated the step. Many have said,—Why was not the railway communication that occasioned the tunnel from Edge Hill to Liverpool obtained by purchasing the land years ago and opening up the whole to the heavens then, instead of waiting and opening it up now when the cost is so much greater? The answer that suggests itself is, that there was not enough business then to justify it, and not the same culmination of identical interests at both ends of the tunnel years ago that there is now. And what leads to the necessity of the Mersey Tunnel now is the culminating of identical interests at both ends calling for such a means of joining them. No such tunnel would have been dreamed of for passing under water were there no such important identical interests. And though the subject of the English Channel tunnel is beyond the limits of this address, we may state our opinion that the necessity for such an undertaking to commend itself to wise men must show culminating identical interests on both shores. The interests must not merely be culminating, but must be identical, and to commend itself to the national mind there must be some guarantee that the interests will remain identical.

We have had progress reported in the scheme for supplying this city with water from Wryny, and in which our esteemed member, Mr. Deacon, has so important a part to perform. The seven miles of piping laid offers some little indication of when we may expect the works to be complete. The engineering difficulties already got over are gratifying, but to form a reservoir with nearly two square miles of area is still a formidable matter. We hear very little of this, and it is well it is so. There are few who understand as do architects the need of silence, while work is in progress, from outsiders and lookers on. Usually they are jubilant at the commencement, perplexed and often indignant at what they see in progress, then jubilant at the completion. An unplastered apartment is always less than they expected, and not half so high or light as useful. We are jubilant at seeing an army start for Egypt, impatient with the delay of preliminaries, then again jubilant on seeing the result, and many a small battle is fought in building operations, and every such operation is like a life: the infancy, the patient growth, the ornamental finish, all comprising the maturity. We trust Mr. Deacon may find circumstances favourable, and that no insurmountable obstacle may overtake him and those associated with him. While this great undertaking is being pushed forward by our city to supply the wants of more than half a million people in the city of London already there is agitation for increasing the water supply for that immense population by an entirely different means,—to catch the rain-water and adapt this to household purposes; and the best means of doing it is now a prevailing question, and with all the great water schemes afloat in our country the immense boon we possess in a copious rainfall should not be overlooked as a supply for drinking purposes. Among the subjects of local interest an important one is the suggestion of providing in our city waiting-rooms for ladies: if not dealt with by our authorities this will be a matter for private enterprise. The vast increase in the city of female occupation, shop assistants and lady-clerks, all very proper, to say nothing of the continually increasing number of visitors, travellers, and ordinary emigrants passing of necessity to their destination through our port, and yet nothing in the form of waiting-rooms for ladies, is a state of things admitting of no excuse. Waiting-rooms, with a small charge, would pay considerably towards the expense of those that are free. But pay or not pay, the rate-paying community has at least as much claim to such institutions as have the equestrians to our local Rotten Row.

We are glad to notice the names of those who have formerly been connected with this society as they come before us in their new spheres. Mr. Shoolbred, who has been lecturing during the recess, and Mr. Laidla, who figures in the architectural world, were both formerly members with us. We have observed likewise with pleasure our much-respected

member, Sir James Picton, as president of the British Archaeological Association, and in that capacity lecturing in the south of England. In honouring Sir James by this appointment to fill the place of an eminent nobleman, the society has honoured itself. The late Lord Brougham was on one occasion advised to content himself with doing the work of four ordinary men, and we have at times thought similar advice might be given to Sir James; his gifts and tremendous application make us justly proud of him as a fellow-citizen and a member of this society.

Let us, then, conclude these somewhat discouraging observations by a few words of encouragement. A worthy literary friend, having a taste in early life for the violin, was told by his master that to succeed he must serve an apprenticeship of seven years, practising ten hours a day, and then he might expect to know a little. Let young architects likewise realise what is before them, and cultivate the power of executing artistic sketching and design in all their multifarious branches, Gothic and Classic, Mediæval and Ancient, and practise the modes of executing such work in pencil and pen, colour and crayon, and likewise seek acquaintance with the most natural as well as approved methods of construction; and acquire a facility to calculate the various strains, breaking, crushing, and safe weights of all the known materials under their varying circumstances; understand the many kinds of timber and stone, metals, and materials of all descriptions; acquire familiarity with all the various artificers' work, bricklayer and mason, carpenter and ironfounder, slater and plasterer, plumber and painter, glazier and decorator, efficiency in any one of which it takes the artificer himself a lifetime to acquire; and learn the technicalities of the measuring and pricing in these various trades, of which the artificer himself is in many cases uninformed; study sanitation, ventilation, and the jurisprudence of building, Building Acts, Fire Prevention Acts, Sanitary Acts, and all the Local Government Board requirements, the light and air, the party-wall and compensation cases; start with the level and theodolite, and study the technicalities of land surveying; and by the time they have further learned what are the requisites for good planning, in all the known requirements of modern dwellings, ecclesiastical, manufacturing, and public buildings, they will, at any rate, be ready for starting business on their own account.

Knowledge is power, and the duly-qualified architect should not be among the least powerful in the community.

#### ARTISTS.

In our "Post-office Directory" and "Court Guide" the mysterious italics affixed to a householder's name stating him to be an "artist" are amply sufficient to designate to the public at large the profession of an individual who paints pictures, and, in the height of his glory, is a member of the Royal Academy. This very vague term of "artist," in fact, is fully accepted in our country as being applicable, almost exclusively, to a painter. We well remember a lady of some social importance once declaring that she would not allow her daughter to marry an artist, but she would be very willing that she should marry an architect. Fortunately, however, there are many of us who are better acquainted not merely with the correct acceptance of the term, but who are perfectly well aware of the absolute importance of the aid to our happiness and prosperity that is secured by the work of the artist, as architect, painter, sculptor, engraver, and musician. It is not, however, every follower of these universally-admitted branches of the fine arts who is entitled to the dignity of being regarded as an artist, and here it is that the true acceptance of the word makes itself felt. Every painter is not necessarily an artist, while the humblest artisan, by some creation of his brain and fingers, may show himself worthy of the highest praise as an artist. Readers of that ever-delightful classic, Walton's "Angler," may, perhaps, remember how on one occasion Venator apostrophises the talk of Piscator as that of an artist. Here, of course, we meet with the term used in one of its original meanings.

In the past, the term "artist" was applied, we know, to any one who had studied the liberal arts at the University, a relic of which we still see in the familiar degrees of B.A. and

M.A., retained in our educational system. The meaning of the term is, of course, traceable to the original Latin *ars* from which our word is derived (whence the Italian *arte* and the French *art*), and which scholars have regarded as only a contraction of the Greek *aretê*, virtue, merit. Following up, however, this derivation, it may be observed that modern philological research has rather attached the word to an origin more indicative of the classic acceptance of the term as signifying industry, manual skill, the Sanskrit *kri* and *kar*, to make,—whence the Latin *er-are* can distinctly be traced.

All this, however, is entirely beside the question, though it may tend in some measure to explain the somewhat confused meaning generally attached to the word "artist"; and yet the confusion exists alone in our country. In Italy, the word "artist," in our sense of the word, is unknown, the architect, the painter, and the sculptor, being respectively and invariably known by no other terms than *pittore*, *scultore*, and *architetto*; in Germany, the distinction is equally marked, the generic term of artist (*Künstler*) being applied when used alone to the actor. With our French neighbours, again, where the distinctions of painter, sculptor, and architect are equally well marked, the terms will be occasionally found united, as *artiste-peintre*, *artiste-sculpteur*; the word *artiste* used as with us, alone being accepted as applicable to the actor and actress,—as a contraction of the expression *artiste dramatique*. Our French friends are, however, fond of uniting the fascinating word with many of their neater branches of industry.

In all four languages, French, German, Italian, and English, the term "artist" in its general acceptance is the same. We, like our Continental neighbours, understand thoroughly the meaning of the praise that a *prima donna* sings like a true artist, or that a book is the work of a thorough artist.

Art has, of course, over and over again, been very pithily defined; it is skill reduced to theory, says one; it is nature interpreted by one soul for other souls, says another; it is man added to nature, says a third; and so on, while the artist has also been epitomised in a no less numerous series of questionable definitions. It will, however, we think, be universally admitted that the title is merited by any one who manifests in his work a marked individuality, and succeeds in impressing his creation with anything of his own character; and here it is that the architect,—whom some consider as not deserving the title of artist,—may essentially be said to be an artist, because the materials at his disposal afford him those means of displaying that subtle individuality which, when successful, ranks highest among the qualities of art, and this though he may never have put band to brick or mortar, more than the sculptor has touched the marble for which he has modelled the clay, reproduced by his Italian *abbozzatore* paid at so much a week,—anent which point, by the way, we are likely, before many days are out, to hear a great deal.

The question is, indeed, a most subtle one. If we are to accept the dictionary definition of an artist as distinguishing the architect, the sculptor, the painter, and the engraver, professors of the liberal arts, from those employed in the mechanical arts,—carpenters, jewellers, &c.,—the veriest daub on canvas, the most ghastly attempt of the modeller in clay, is more the work of an artist than the door-knocker wrought by a Sansovino, or the cup chiselled by Benvenuto Cellini. In those happy times of the Renaissance and the earlier Mediæval and Classic days, distinctions between the artist and the artisan were unknown. The great artists felt none of our modern touchiness as to their position. Great painters kept in Italy their *bottega*, or shop, and executed any commands their customers might require. This now so apparently incongruous union of art and trade which marked the past was the very cause of the beauty which distinguishes everything produced in those distant days. The beautiful and the useful were then inseparable, and decoration, that bigbear of the present day, sprang from absolutely rational necessities. To the union of art and industry in the past we owe the marvels which fill our museums and overcrowd some of our houses. The proper understanding of the respective relations of art and industry lasted till the seventeenth century, when the painters in France separated from their Mediæval corporation, and founded the Royal Academy of Painting. From that

day, as has been truly said, dates the rise of the separate aristocracy of architects, painters, and sculptors, the divorce of art and industry, since Classic days known but by one name, while a strong undercurrent set in of disunion between the great artistic professions, and to which, in no small measure, may be said to be due the existence of any doubt ever being expressed as to whether the architect be an artist.

If, however, such a doubt should be expressed, unless it be dictated by those personal feelings which, it is to be regretted, are known to exist, there is no small degree of thoughtless irreverence in such a doubt being sent forth to the world from an authoritative source; for, if we do not all understand exactly what constitutes an artist, no shadow of a doubt can exist on the point that some of the greatest artists that have ever breathed have belonged to the architectural profession.

#### THE MANCHESTER SHIP CANAL.

MANCHESTER has not confined herself to talking about the ship canal; she has hestired herself in earnest. The country between Manchester and the Mersey has been independently surveyed by two professional men. The plans have been laid before the provisional committee, accompanied by a report from Mr. James Abernethy; and the principle which we pointed out (on June 24th and July 8th) as the only available one, that of a high-water basin at Manchester, communicating with the Mersey by a canal furnished with locks, has been unanimously adopted. At a large meeting of the promoters and guarantors held in Manchester on the 26th ult., the recommendations of the provisional committee were adopted without a dissentient; and it was decided to take the requisite steps for raising the funds, and applying to Parliament for power to carry out the project.

We cannot recall an instance of any projected work in which the prospect of economical return has been so large and so distinct. The imports and exports of Liverpool now form very nearly one-third of those of the United Kingdom. From an analysis of the exports from Liverpool in 1880, "it is clear," says the author of the pamphlet on the proposed ship canal, "that by far the greater proportion of Liverpool exports must proceed from Manchester either directly or in course of transit." The import trade must follow pretty closely the same lines. That some 100,000,000 tons of merchandise pass in the year to or from between Manchester and Liverpool, then, there is little room to doubt. But take it at fifty millions. On every ton of this enormous quantity, according to the uncontradicted evidence before the Select Committee on Railways (Rates and Fares), at least 5s. is paid for transport more than need be paid if the inland water-communication were open. But this comes to the prodigious tax of 12½ millions sterling on Manchester. Looking at the price alone, with our estimate of quantity, we can put it in another way. We suppose that would be accounted a very small trade which exported only twenty tons of produce per annum. But take a business of that magnitude. Now, in a joint-stock undertaking of any kind, the condition of success is, that every member should so act as if the whole prosperity of the undertaking depended on him, as far as his powers and engagements went. Thus each shareholder should look on his subscription as essential to success. Hence it follows, that for every twenty tons of produce that he exported or imported, it would pay a Manchester man five per cent. on a 100l. share, if the canal were made, even if he never received a penny by way of dividend. This consideration we beg leave to commend to all those interested in this great work, and we venture to think that alone, and unsupported by any other argument, it is enough to cause the eager covering of the subscription.

**The Proposed United Drainage Scheme for the Black Country.**—At a meeting of the Wednesbury Local Board on the 23rd inst. a resolution was passed approving of a united drainage scheme for the parishes of Wednesbury, Darlaston, and Tipton, and a small portion of Sedgley. Mr. Pritchard, C.E., estimates the carrying out of the scheme to cost 78,500l.

## THE PROGRESS OF THE DECORATIVE AND INDUSTRIAL ARTS.

MR. WILLIAM MORRIS, speaking at the opening of the Fine Art and Industrial Exhibition in St. James's Hall, Manchester, on the 21st inst., in response to the toast of "English Decorative Art," said,—"Some twenty-five years ago these arts of mere decoration were in such a state that one is bound to say that they looked as if they were coming to an end; of the traditional part of them there was, in England at least, scarce any more left than there is now, i.e., nothing. On the more obvious and self-conscious side there was nothing stirring. What individual talent was left could only show itself in eccentricities that most often deserved to be called by any other name rather than decoration. The public was as blankly ignorant of the history of the art as the designers were of its first principles. The contempt with which the whole subject was treated in those days is shown pretty clearly by the law which relates to the copyright in industrial designs, which, strange to say, is to this day all the protection accorded them. The framers of that law doubtless wished to secure to manufacturers all reasonable advantages for those designs which they had paid for or invented; yet to this day it is only possible to protect such design for three years; three years seemed at the time when that law was made ample time for a manufacturer to reap all reasonable advantages from any design he might produce. Certainly an advance has been made, a reaction from neglect to heauty has touched at least some part of the people who live among civilisation; and in what we technically call the decorative arts, this new Renaissance has been helped in this country by many agencies, not least among which has been the steady endeavour on the part of the Department of Science and Art to spread artistic education among the public in general. Some of the results of this new Renaissance are now before the people of this great city: any one who chooses can make the interior of his house comely and pleasant without an unreasonable expenditure of time and trouble. I am always asking myself,—Is this apparent success real? Is this seeming advance of a quarter of a century going somewhere or nowhere? That is a serious question, to which it is impossible to answer, ay or no. But, after all, to us as practical people, it does not matter much whether it can be answered directly so long as we see clearly what are the conditions of the health or disease, the life or death of our art,—in short, so long as we can see what work is immediately ahead of us to maintain our art in a hopeful state. Now, to my mind, it is not so very difficult to see this. Firstly, we have, to put the matter in its simplest form, to interest the whole public in the work. That once done, the whole public will see to this matter. Well, that is easy to say and very hard to do. These decorative arts, when they are genuine, real from the root up, have one claim to be considered serious matters which even the greater arts do in a way back, and this claim is that they are the direct expression of the thoughts and aspirations of the mass of the people; and I assert that the higher class of artist, the individual artist, he whose work is, as it were, a world in itself, cannot live healthily and happily without the lower kind of art,—if we must call it lower,—the kind which we may think of as co-operative art, and which, when it is genuine, gives your great man, be he never so great, the peaceful and beautiful surroundings, and the sympathetic audience, which he justly thinks he has a right to. If you compel a Michelangelo to live in a world of dullards and blunders, what can happen to him but to waste his life in ceaseless indignant protest, till his art fades out in sour despondency and his whole career has turned out a useless martyrdom? Great minds need no slaves to rule over, but rather fellow-workmen whom they can help and be helped by. So I say that the decorative arts are as necessary to our life as civilised men,—nay as men,—as the more strictly intellectual arts are, and that which has become our end and aim, to wit, the new birth of popular art, as, on the one hand, it is a most arduous, so, on the other, it is a most worthy undertaking. Such great works both make the utmost courage necessary and inspire us with the necessary courage for carrying them out. I am afraid I must admit that the public in general are not touched at all by any interest for decorative

art; a few of the upper and middle classes only have as much as heard that there is such a thing as decorative, which should be popular, art. Time was when all manufactured wares had some claim to beauty, and, other things being equal, the most beautiful thing was the most marketable. I fear we cannot say that this is the case now. Pray excuse me for drawing an illustration from a very interesting and useful class of goods to which we are none of us strangers,—printed cottons. If you turn over the pattern-books of this or that cotton-printer in this city, you will find many patterns which are exceedingly pretty, while some of them are exceedingly—well, ugly, as I am sure, the gentleman who prints them will admit. Now, having the honour of the acquaintance of a cotton-printer in this city, I am able to say that, so far as I could understand, the ugly patterns sell quite as well as the pretty ones. Now, you know, if the decorative arts were in a healthy condition, instinctive good taste would refuse the ugly patterns and demand the pretty ones, and so prevent what I must consider a degrading waste of money, time, and intelligence; for what in its way can be more wasteful than using all the accumulated knowledge and skill of centuries in spoiling the fair white surface of a piece of cloth by putting a pattern on it which you know to be ugly? And in like manner it fares with all the other industrial arts. If a manufacturer determines to be also somewhat an artist,—as he most certainly should be,—and to turn out nothing but what may do credit to his own reason and intellect, he must also make up his mind to give up a great part,—probably the greatest part, of his business; and I will say at once that if a good few of our makers of common wares were so much touched by the importance of the decorative arts of England as to do this, it would mark a new era in that advance of the art which I have been speaking of; and if we could add to such a sacrifice of apparent wealth an obvious and lively interest on the part of the public in the processes and methods of the art, I do think we should be nearing our goal. For at present the divorce of commercial manufacture from art has made the public had marketers; too often they do not know what they are buying, and it seems to be generally believed by a people to my mind somewhat overdone by machinery, that works of minor art can be and are turned out like the sausages in the mythical Yankee machine,—live pig at one end, sausages at the other. The divorce of commerce from art has been wasteful of more than the works of man's industry, and in many places,—and I must say nowhere more than in South Lancashire,—has made the advice which we must always give to all students of art, to go to nature, somewhat of a mockery. Believe me, I do not speak of this or any other evil wantonly, but with the hope of, in my small way, encouraging those who are fighting against it; and, indeed, fight against this evil we must, if we are to have decorative or any other art for long. The choice lies before us: Which will you have, art or dirt? In the long run, I believe you will find art the cheaper of the two commodities; for if we choose dirt we shall make England, all of it, sooner or later, what it was not meant to be, an uncomfortable country, and discomfort breeds discontent, and discontent,—what will that bring forth in this land of stout-hearted men? This is far from being beside the question; it is English decorative art I am speaking of, and can we forget what the country is like which bred that art as it once was, which has made an ancient English house, for all its simplicity and rudeness, the loveliest of the habitations of man? Surely my voice is speaking the thoughts of many people when I plead with the mighty and overwhelming commerce of England to spare the source from which all English art has sprung, that is left us of the land of England, with all its growth of familiar beauty, sweetened every acre of it with the memories of the men that made us. When that plea is listened to, and we make up our minds, first, to keep all we have left us of fair and unspoiled country and dwellings, and second, to replace what we have lost by a reasonable and living art which shall really express our lives and their aspirations,—I say when we have made up our minds to do this, then is all gained. Nature, which has covered with her kind hand the battlefields of the Edwards and Henries and Charleses, will, in one way or another, when we call upon her, do no

less for the battlefields of commerce. Our scientific men, who, to me, an outsider, seem able to do anything they care to do, will have shown us the right use of carbon and sulphuric acid, and the sun will shine as brightly through the boughs outside the factory windows in Lancashire as it does through the Kentish hedges. I think those days will come, wild as the prophecy seems. We shall not see them. Who cares, since we amongst others shall have worked to bring them about? Nor will anybody in those days need to talk about English decorative art, for every one will have it ready to his hand; like the company of a friend with whom one can talk if one wills, or be silent with if one pleases, so restful, so familiar, shall it be.

## SUSSEX ARCHAEOLOGICAL SOCIETY.

LEWES CASTLE AND PRIORY.

THE Sussex Archaeological Society on the 19th inst. held a meeting at Lewes, where the members were hospitably entertained by the Mayor (Mr. Alderman Wynne E. Baxter). Afterwards assembling in the Keep of the Castle, they listened to a paper by Mr. G. T. Clark (read for him in his absence by Mr. Somers Clarke, jun., F.S.A.), who has recently investigated the castle. The paper was stated to be a rough draft only of a more exhaustive paper which he has in preparation for the Sussex Archaeological Society's next volume. The paper read contained a description of the topography of Lewes, and hazarded the conjecture that the name Lewes was of Celtic origin. It pointed out that no settlers could long remain blind to its strategical advantages, and described the natural features of the ground occupied by the castle, Mr. Somers Clarke illustrating the same by exhibiting an Ordnance map, showing that the castle and precincts covered two mounds and the connecting space. It appears uncertain whether the Britons took advantage of the facilities offered, and fortified the spot, or whether it was some Saxon hero who first did so. After pointing out the details of the Norman work, the paper proceeded to explain the obvious necessity that existed, from a military point of view, to fortify the mound on which the company were assembled, and the other mound, known as Brack Mount, although it is believed by Mr. Clark that no similar example exists of a castle with two mounds, each surrounded by a keep, as was formerly the case at Lewes. The written history of Lewes from the time of Ceadwalla, who founded a college there, was briefly touched upon, and the remark made that no notice of the castle appears in the Domesday Book. Mr. Clark is of opinion, however, that William, son of William de Warrenne, found a castle fortified upon the spot, and that the existing masonry was the work of the Earl Warrenne, or at latest of his son and successor, and that it has been but little altered. The Earl Warrenne had little to do with the building of the towers. The keep is formed of a shell of masonry some 10 ft. or 12 ft. thick, placed upon the ground without any other foundation, a form of construction which, it was pointed out, was very faulty when mining was the usual mode of attacking such fortresses. The keeps were connected, it was explained, by two curtain walls, deepest at the most vulnerable points. The shell of masonry surrounding the Brack Mount, Mr. Clark was of opinion, was less important. The moat, part of which is now filled up and cultivated as a garden, the site of a supposed postern, and the entrance from the town (thought to be but little altered), were all also noticed. The charlarian was minutely described, and the peculiarity of the cruciform loops with short cross-bars pointed out. It was suggested that a passage, supposed to lead from the postern, should be cleared out. It was also remarked that a staircase to a Norman shell keep was unusual. Attention was called to the remains of a vast fire-place facing towards the interior of the keep, with corbels indicating that the erections within the keep had lean-to roofs. Mention was made of the hall, the chapel, the garrison great kitchen, of which no remains have been found; nor are there the remains of any known well. The next point touched upon was the very perfect Norman vault, 12 ft. square, beneath Mr. Lucas's house, and which is supposed to have been used as a cellar or store for the dwelling of some dignitary of importance, probably of the Lords' hall. The Earl de Warrenne, it was remarked, possessed

two other castles besides that of Lewes, and to each was appended a religious house. The characteristic feature of Norman masonry,—the material used being rubble faced with flint,—were dealt with, the fortunes of the De Warenne family detailed, and some remarks made upon the fortifications of the town of Lewes, which it appears was formerly defended by three walls.

The excursionists having proceeded to the Priory, where excavations are in progress, Mr. Somers Clarke observed that there were several points connected with the plan which could not be accurately set down, as the work had not yet extended to those parts of the site. The history of the foundation was set forth in the Sussex Archaeological "Transactions," more particularly in vol. ii., in a paper by Mr. W. N. Blaauw. There was also in vol. iii. a very valuable small plan by Mr. J. L. Parsons, who measured the remains which were discovered in 1847, when the railway was made. The railway entirely destroyed the greater part of the foundations of the church. Mr. Somers Clarke proceeded:—"As there is a pressure upon my time, and as the rain is falling, I will assume that those present are acquainted with the general history of the original founding of the Priory of St. Pancras, and only remark that we all know that the reception accorded to William de Warenne and his wife Gundrada, at the great monastery of Cluny, decided them to place the religious house they were proposing to found at Lewes under the care of the Cluniac order. They arranged with Hugh, abbot of Cluny, to send over three or four monks, and Lanzo, with three others, came over to England in 1077. We may presume that before the arrival of the four monks the plan of the monastery had been laid out and the works commenced. It does not appear that William de Warenne intended to found a house of great size. The somewhat modest dimensions of the church, as well as the small number of monks asked for, would both lead to this conclusion. I may here remark that, so far as can be gathered from the measurements of the original church built by William de Warenne, it was smaller than Chichester Cathedral, which, you will remember, is the smallest of our English cathedrals. The first consecration of the church took place between 1091 and 1097. Probably we shall be able to get at the date a little more accurately." Mr. Somers Clarke here proceeded to explain the plan of the building as he believed it had existed up to the time of the first dedication, pointing out that the church was only 54 ft. in extreme width, internal measure, and remarked that for this fact, together with all other information concerning the church, we were indebted to Mr. Parsons's plan. Allowing for the substantial piers always used by the Norman architects, the speaker said he was inclined to think the building may have been a small one. He had no doubt the remains of the infirmary would be found, and that was a very important part of a monastic establishment, as it was the part of the building to which the aged monks retired when they were permitted to relax somewhat from the severity of the rules of their order. In the time of the third Earl Warenne a second dedication took place, probably between 1136 and 1147. Mr. Somers Clarke proceeded to give details of the alterations made in the building, giving his reasons for supposing that the new church had double transepts, as is the case with the mother church at Cluny, and observing that although there was very early documentary evidence relating to the Priory, the number of monks in residence was, so far as he was aware, nowhere stated. Various additions to the Priory made from 1218 to 1312 were then described, and certain events affecting the Priory as given in a MS. in the British Museum, dated 1312, in which mention is made of the building of the great infirmary in 1218, the erection of two houses of the infirmary on the north in 1219, the celebration of the first mass in the Lady Chapel in 1229, and a bequest of 200 marks towards completing the two towers of the front of the church in 1268. From another authority it was also shown that in 1375 there was a bequest for masses to be said in the chapel of Our Lady on the north side of the great church. Mr. Somers Clarke then remarked:—"We have no further information as to the church or monastic building till the time of the suppression under Henry VIII., Feb. 16, 1538, when 'the church, the bell tower,' and

'the cemetery,' are specifically mentioned in the grant to Lord Cromwell, and in the letter dated March 24, 1537, from Johan Portinari to Lord Cromwell. My plan of the church," said the speaker, "is based upon the details given in those letters and on the plan already mentioned, made when the foundations of the east end of the church were revealed in 1847." The details given by Portinari were here quoted, and the different points upon the plan believed to harmonise with these were pointed out. Mr. Somers Clarke then said:—"My plan is based on a contemporary work in our own county, the nave and crossings at Chichester: and it works out very satisfactorily on this basis, but upon the whole on a smaller scale." After giving the supposed measurements of the different portions of the church, and a number of interesting details, Mr. Somers Clarke briefly sketched the history of some of the illustrious personages buried in the church and in the chapter-house of the Priory, and then passed on to speak of the recent excavations. He said the work now done has been to clear the place, and to take much of the earth away from the whole site of the dormitory, and to reveal the great enlargement that was made after the first foundation. A circular staircase was also found in the north-east angle of the refectory similar to the one before known to exist. The London and Brighton Railway Company had courteously sent a representative to inform him of their willingness to place a fence round a portion of the ruins abutting upon the line, and to remove certain obstructions, so that visitors to the grounds might have free access to every part of the existing remains of the Priory. The speaker further said he had to thank the members of the Sussex Archaeological Society for the help some of them had given him, but, in reply to some 600 notices sent out, he had only received seventeen contributions. He wished especially to thank Mr. Evelyn Blaker, who had not only given a handsome subscription, but had announced that he would pay any balance there might be on the wrong side, and be (Mr. Somers Clarke) must express his indebtedness to Mr. St. John Hoppe for having so opportunely come to his assistance and superintended the excavations.

#### DURATION OF CONTRACTORS' OR ARCHITECTS' LIABILITY.

The French *Cour de Cassation* recently devoted two days to the examination of the above question, which was stated in the following terms:—

"In law, is the action of the proprietor against the architect limited by the expiration of the ten years immediately following the taking over of the work? Or can this action be exercised during thirty years, provided the defect upon which it is founded has revealed itself during the first ten years?"

It was laid down that, according to French law, architects and contractors are exempted from liability as to the past and the future, if the owner of a building has not instituted any suit within ten years from the taking over of the work.

#### MORTAR FOR MASONRY.

The *Central Blatt der Bauverwaltung* calls attention to a patent composition manufactured at Meissner's factory at Stargard (Pomerania), which has for some years past been successfully employed on the Berlin-Stettin Railway in the coping of counter walls and bridges, the base of water-courses, &c. The substance is composed of coal-tar, clay, asphalt, resin, litharge, and sand.

Amongst other works executed, special reference is made to the coping of a counter-wall which is exposed to the injurious effects of the water running down from a slope 33 ft. in height. Although built four years ago it has not as yet needed any repairs. Other works executed with this mortar have proved equally satisfactory.

In applying this mortar, the masonry for the coping of which it is to be employed is allowed to dry thoroughly, and after being well cleaned is painted over with hot roofing varnish. The mortar is then laid on cold, to the thickness of about three-eighths of an inch, with wooden or steel trowels, and is properly flattened and made smooth. If the surface is an extensive one another coating of roofing varnish is applied, and finally rough sand is strewn over it.

The cost of the materials and labour is estimated at about 5d. per square foot, and it is said that as low a cost as about 4d. per square foot can be arrived at when the workmen have become experienced in the operation of applying the mortar.

#### THE THREATENED STRIKE OF MINERS.

THE resolution that again emanates from Manchester in favour of the strike of a very large body of coal-miners seems likely to lead to more results than did the last, because of the fact that there is not now the element that made the last decision almost impossible to execute. This decision overlooked the fact that a large number of the miners in the kingdom were bound in honour to work during the continuance of sliding-scale arrangements, and it was this fact that gave the chief opposition in Manchester to the passing of the first resolution. That agreed to last week is for districts where the sliding-scale arrangements are not general, and thus it becomes of importance to learn the relative proportions of the workmen and the relative production of coal in the two classes of districts; for it is largely upon this that the probabilities of success in a strike depend. From official statements we are able to give these facts, and to append to them figures that show the strength or weakness of some of the trade unions of the miners, all of which have their bearing on the probabilities of a strike.

The following figures from the returns of the Inspectors of Mines will show the number of miners and the yearly production of coal in the districts where sliding-scales rule,—Durham, Northumberland, and South Wales,—to which is added Cumberland, where an agreement to adopt a sliding-scale is settled on.

Miners.	Coal Production.
	Tons.
Durham .....	73,291 .....
Northumberland ..	22,740 .....
South Wales .....	53,452 .....
Cumberland .....	6,175 .....
	156,658 .....
	53,269,000

There are several other districts where the sliding-scale principle is at work at single or associated collieries, or in localities, especially in Staffordshire and Yorkshire, so that the quantity of coal produced and that must be expected to be continued in production under all circumstances, is much above that stated above; but in these four districts more than a third of the whole of the miners in the kingdom are located, and more than a third of the whole of the coal produced in the kingdom is raised. But in addition, it must be remembered that only some of the remainder were represented at the second of the conferences at Manchester. None of the four districts above-named were represented. The official statement gives the number of men represented by the twenty-four delegates as 113,674, or about a third of the miners in the kingdom after those under sliding-scales are taken from the total. In other words, if the whole of the 113,674 represented were to strike,—and this is not the ultimate decision,—more than three-fourths of the miners in the kingdom would still remain at work. The four leading districts in which the strike is threatened are Yorkshire, Lancashire, Derbyshire, and North Wales; and it is added that so far as Yorkshire is concerned, only one-half of the miners are ready to strike. Taking a similar proportion of the coal out of the county, and giving the whole of the other districts, the possible strikers are as under, with the coal yielded by their districts:—

Miners.	Coal-Tons.
Yorkshire .....	39,000 .....
Lancashire .....	61,127 .....
Derbyshire .....	27,422 .....
North Wales .....	10,100 .....
	128,649 .....
	38,700,000

If, then, the whole of these miners in the districts struck; if none of them worked under sliding-scales; and if none of them made arrangements with their employers, a strike would mean, if it were continued for a month, little more than three million tons of coal less produced.

But there is one other consideration,—the number of those in the unions of the miners; for this has its bearing on the probability of the men following out the "notices," and on the financial ability of the miners to endure a strike. Mr. Crawford, the secretary to the Durham

Miners' Association, states, in his official circular this month, that in Lancashire 9,000 miners out of 61,000 were in the union; that Derbyshire and several other adjacent counties have 300 in the union out of over 49,000; it is stated from a similar source that Yorkshire has only 7,000 out of 60,000 in its unions. Hence, it is clear that not one miner in twelve in the districts where a strike is threatened is a member of the union, and with 128,000 men out of employ,—if it were possible,—the union funds could not endure a week. The districts where the strike is threatened are the worst organised in the kingdom, the hours of work are longer, the wages less, and thus the possibility of the success of a strike that is only probable can be readily gauged and estimated.

#### AN OLD PARIS HOTEL.

The old hotel in the Rue du Temple, where there had previously been a sum of 300,000 francs in old coins found, continues, as the demolition proceeds, to yield other treasures in somewhat remarkable abundance. Thus, behind the wooden panels of one of the *salons*, some fine frescoes were discovered, which are valued at 25,000 francs. They are in excellent preservation, and admit of being removed without difficulty. Another case is that of a room on the first floor, behind the panelling of which some very richly-carved panels have been found in the finest Louis XIV. style. For these, 75,000 francs were at once offered and accepted. The lead from the roof of the hotel has been sold for 10,000 francs. The plates were so thick that they had to be cut up with special tools on the roof itself before they could be readily removed. The timber of the roofing is all of the finest and soundest oak, which has been bought by *créveres*, &c., at a much higher price than they would give for new oak timber. The masonry of the hotel consists of fine large cubes of stone; the stairs are of marble, and so are the tasteful chimney-pieces, which have all been sold at a high price. The same solidity and excellence are found in the doors, and all the other parts of the building, and everything has been sold at very high figures on account generally of the additional artistic value of the materials. The contractor who bought the building for the purpose of demolition will, in fact, have made the handsome sum of 1,100,000 francs, or about 44,000*l.*, out of the mere *débris* of the old hotel, notwithstanding the fact that the solidity with which it was built has necessitated a greater expenditure on the work of pulling down than had been originally calculated upon.

#### TENDERS IN GERMANY.

At the recent meeting of the Union of German Master Builders, resolutions were adopted approving the proposals which have of late been made relating to the institution of test examinations for those who desire to enter the building industry. The importance of the joint action of the various local guilds, and the necessity of uniformity in such tests as might be adopted, were fully brought forward in the course of the discussion which took place. A good deal of attention was given to a proposal, which was finally adopted by the assembly, to the effect that in all tenders for public works the lowest tender should always be rejected, and the next higher be accepted, provided all special conditions were fulfilled. From the explanatory remarks quoted in the German press on the matter, it would seem that the uncertainty as to the result of tenders is found to be a considerable disadvantage to the German building industry, and that estimates sent in on the new system would not be of the speculative character which is encouraged by the principle of the acceptance of the lowest offer. The various tenders are, it is remarked, likely to come much nearer to each other. It is added that when the greater part of the contract is the execution of labour (apart from the furnishing of materials) it is by no means uncommon to find some estimates exceed others in the proportion of 3 to 1, in which case a certain amount of discredit attaches to the person whose tender is of an extreme character. It is, of course, not urged that the choice should fall in all cases on the second lowest estimate, as there would be in some instances reasons of distance or unreliability to be urged against such a selection; but the absolute re-

jection of the lowest tender is insisted upon in the scheme thus propounded. The terms of the contract for which tenders are asked would in all cases state this point in an unmistakable manner.

It does not seem very clear in what way the master builders could settle this question, which would rather rest with their employers.

#### CENTRAL EUROPEAN CANALS.

A GRAND system of canals connecting all the great rivers of Central Europe has been projected by a number of Austrian engineers and others connected with the Donau-Verein or Danube Society. The various projects contained in this scheme have already been brought before the Austrian Parliament. One of these canals is to connect the rivers Danube and Oder, another the Danube and Rhine, and a third the Danube and Elbe. By means of this great project not only would the largest rivers of Austria and Germany be brought into connexion, but there would ultimately be uninterrupted water communication, available for the traffic in the heaviest classes of goods, between all the countries of Europe from the Black Sea to the German Ocean, and from the Adriatic to the Baltic. The engineering difficulties to be overcome are, however, very considerable. A *brochure*, just published by the Donau-Verein, which contemplates first the execution of the Danube and Elbe Canal, contains certain details of interest in reference to this project. In the rise from the Danube to the Moldau there will be required 130 locks, and in the descent down the Moldau fifty-five locks. The highest ground along which the canal would pass is 550 mètres, or about 1,700 ft. above the sea-level, at which the canal would run for about forty-eight miles. The depth of the canal is to be 6 ft., and the width at the bottom about 50 ft. The cost of the entire Danube and Elbe Canal, with locks, is estimated at 6,000,000*l.* sterling. The cost of cutting the canal is computed at 412,000 marks, or rather over 20,000*l.* per kilometre, being equal to nearly 33,000*l.* per mile (English). Compared with the existing railways, the distance by the proposed canal from Vienna to Melnik (470 kilometres) is certainly not calculated to recommend it.

#### TYPHOID AND DRAINAGE AT NANCY.

THOUGH it is satisfactory to note that the unsanitary condition of Paris is at last awakening the attention of both the public and the authorities, there remains as much to be said with regard to the large provincial towns of France. For instance, the present typhoid epidemic in Paris is, after all, but a recent disaster as compared with the prevalence at Nancy of the same preventable disease. From 1870, typhoid fever has assumed an endemic character in that town, and this case offers special interest from the fact that the outbreak of the fever corresponds with the abolition of cesspools and the introduction of direct drainage from the houses into the sewers. Strange as this fact may seem, it will not surprise those who have some acquaintance with the ignorance prevailing in France on such matters. The town was allowed to drain into the sewers; but no measures were taken for emptying the sewers. At last, after three or four years' delay, and when many useful lives had been sacrificed and the inhabitants of Nancy had endured much illness and misery, the necessity of increasing the water-supply dawned upon the authorities. Now there is plenty of water, at least, in the streets, the supply amounting to 71 gallons per day per head of the population. Yet, in spite of this, the fever continued its ravages year after year, attacking sometimes the inhabitants of the old town, sometimes those of the new town, and showing, on the whole, considerable impartiality in its selections. Nor is there anything very exceptional in this fact, for, though water has been abundantly poured out into the streets, it has only been supplied to 750 houses out of about 8,000. Dr. Lallement, Professor of the Faculty of Medicine, in a protest recently issued, says:—

"We must have the courage to realise the truth. In each house, a horrible hole surrounded by dejectious of all sorts allows the ascension of the most injurious gases, which, after sojourning some time in the disgusting and damp closet,

generally reach a narrow back-yard with a humid permeable soil, and ventilation is rendered almost impossible by surrounding balconies and a canvas or tent-made roof."

The house drains are not, as a rule, protected by syphons, and where a syphon does exist, it is generally blocked up through the want of proper flushing. In some instances the house drains empty themselves in old and abandoned sewers, which receive no rain-water, and are never cleaned. Some houses still drain into permeable cesspools, which allow sewage matter to filter into neighbouring wells: in fact, the town is in as barbaric a condition as it is possible to imagine, and yet there are, comparatively speaking, good sewers in the streets and a fair water supply. It is, therefore, to ignorance and indifference that we are to attribute an epidemic which has lasted for more than ten years. We have already remarked on the fact that sewers are being introduced on an extensive scale among the winter resorts of the Riviera, frequented by so large a number of English visitors. We trust that the experience acquired at Nancy will serve as a warning to the authorities of these health stations, and that before building sewers they will first ascertain what are the means by which they can be successfully managed.

#### THE NEW RATHHAUS OF VIENNA.

THE completion of the above splendid edifice was celebrated last week by a grand banquet in the great hall of the building itself. The new Rathaus is situated in the Ring Strasse, opposite to the new Burg Theatre, and near the new Parliament Houses of Austria, forming with them one of the most remarkable groups of modern structures to be found in Europe. The Rathhaus was commenced just ten years ago, in 1872. It is certainly one of the most magnificent Gothic edifices on the Continent. It has one lofty principal tower, and four subordinate ones. There is one large square court surrounded by a colonnade, and eight other subordinate courts. The edifice contains no fewer than 500 rooms, including two large festival halls. The principal façade, in solid masonry, has a fine terrace with outlook on the Park and Ring Strasse. The cost of the entire building has been 12,000,000 florins. The great tower was at the end of last week finished by fixing on its summit a figure, 9 ft. high, holding a flagstaff of 16 ft., and a sword 6 ft. 6 in. in length. This figure of the standard-bearer, which has already been nicknamed the Guardian of the Capital, will, like the spire of the Cathedral of St. Stephen, be a prominent object in all views of Vienna in future, being visible at very great distances. The architect of the Rathaus is the Chevalier von Schmidt, one of the most distinguished of Austrian architects, who is at the present time engaged on the work of restoring and repairing the Cathedral of St. Stephen. The architect was entertained by the Vienna Municipality at the inaugural banquet in the Rathaus, on Saturday, being his fifty-seventh birthday.

We gave a view of the building in vol. xxxv. (1877), p. 980; and a larger view (with two interior views), a year ago (vol. xlii, p. 516).

#### RIDLEY HALL, CAMBRIDGE.

FOLLOWING closely upon the opening of Selwyn College, Ridley Hall, near Cambridge, was opened on the 18th inst. The new Hall, which has been erected by the munificence of Mr. Henry Gamble, is built in the Tudor style from the designs of Mr. Charles Luck, architect, of Carlton-chambers, Regent-street, on a freehold site, consisting of two acres, at Newnham. It contains principal's lodge, library, dining-hall, vice-principal's room, and accommodation for twenty students. It, as well as Wycliffe Hall, Oxford, is intended to assist in the preparation of resident members of the University, who are candidates for holy orders, in the principles of the Reformed Protestant Church. The building has cost 21,000*l.*

A New Sunday School and Lecture Hall, connected with the Baptist Chapel at Leytonstone, was opened on Thursday, the 19th inst. The cost was about 2,000*l.*, and the works have been carried out by Mr. J. Marsland, builder, under the direction of Mr. John E. Sears, architect.

### THE POLLUTION OF RIVERS, THE SOIL, AND THE AIR.

THE society recently formed on the Continent under the title of "The International Association for the Prevention of the Pollution of Rivers, the Soil, and the Air," is announced to hold a congress this week at Brunswick. Amongst the papers to be read at the sittings are the following:—(1) Modern Hygienic Legislation, by Professor Reclam, of Leipsic; (2) The Most Recent Experiences with the Flushing System of Sewerage, by Professor Müller, of Berlin; (3) On the Supply of Water to Towns by the Filtration System, by Dr. Gerson, of Hamburg; (4) The Use of Peat Dust in Privies, by Professor Schulze, of Brunswick; (5) The Manufacture of Potrettes, Manures, and Ammoniacal Salts according to the Freiburg Process, by Professor Engel, of Carlsruhe; (6) The Chemical and Mechanical Purification of Sewage Water, by Dr. Petri, of Berlin; (7) A New Process for the Cheapest Purification of Foul Waters, by Dr. Gerson, of Hamburg; and (8) On Moisture in the Atmosphere and its Measurement, by Professor Reclam, of Leipsic. In addition to holding sittings on two consecutive days for the reading and discussion of the papers, the members of the Congress will visit the Brunswick Ahatours, Technical High School, and other institutions.

### ST. SAVIOUR'S CHURCH, STRIESEN, DRESDEN.

THIS little church, recently erected in Striesen, a suburb of Dresden, has a history of its own which appeals to our sympathies. It is, at the same time, a memento of the tolerance and hospitality of the rulers of Saxony, who gave a welcome, more than 200 years ago, to the Protestants driven from Bohemia. The emigrations of the Evangelical Bohemians began at the commencement of the Thirty Years' War, after the unfortunate battle of the White Mountain, near Prague (November 8th, 1620). In 1622, four German Lutheran pastors from Bohemia found an asylum in Dresden. During the next year, the flower of the Bohemian nobility came to Pirna, where several thousand refugees had found a temporary home. Most of them, who had been induced to return to their native country in 1639 with the Swedes, under General Stollhans, but who were shamefully plundered and maltreated by their protectors on the road, now turned to fortified Dresden, where they were received by the then elector, Johann Georg I., with great kindness. They settled to the north of Dresden, and laid the foundation of the present Antonstadt, where the "Böhmische Gasse" still reminds us of their early struggles. Those men and women were the ancestors of the present community of "Exulants," as they are called, to whom Dresden is indebted for the flourishing state of its flower and vegetable culture. At the present day many of their descendants are well-known and much-sought-after florists. The Exulants worshipped at first in their native tongue in a private house. In 1650, however, St. John's Church, at the Pirna Gate, was given them. Their religious services were conducted in this building for 210 years, at first in the Bohemian, later in the German, tongue. That church being taken down in 1860, the church attached to the Dresden Orphan Asylum was handed over to them for use. Still, their desire was to have a "God's house" of their own, and this wish has now been fulfilled, the present Erlöserkirche reminding them of the St. Salvatorkirche which they once possessed at Prague.

The church, which we illustrate in this week's *Builder*, was built from designs by the architect, G. L. Moeckel, of Dresden. It is in the Early Gothic style, and very solidly constructed.

**International Electrical Exhibition at Vienna.**—An International Exhibition of Electrical Apparatus will be held in Vienna in the months of August, September, and October next year. The building in which the exhibition is to take place is the Retirada, which has been left standing from the Universal Exhibition of 1873. Announcements from intending exhibitors must be sent to the General Committee at Vienna not later than January 1, 1883. It has been resolved that no rent or fees of any kind shall be imposed on exhibitors.

### CHAPEL ROYAL, BRIGHTON.

THIS building, which is, or rather was, a perfect square on plan, with deep galleries on three sides and a square lantern in the centre, was altered as to its internal arrangements and decoration some few years ago by Mr. Blomfield. At that time the south side of the chapel was hidden by certain houses in High-street, parts of which were actually built up against it. When, in widening and improving the street, the town authorities removed these houses, the side of the chapel, which was never built to be seen, was revealed in all its ragged deformity. Mr. Blomfield was then called upon to design a mask, or casing, of effective, but not too elaborate character, one of the conditions being that the form of the windows should be preserved, a condition which made the task more difficult than it otherwise would have been. The town, at the same time, gave up a piece of ground sufficient for the erection of a small belfry and clock-tower.

The work has been carried out in red brick and terra-cotta by Messrs. Geo. Lynn & Sons, of Brighton, and an effort is now being made to complete it by casing in a similar manner the old entrance-front, which is at present much out of harmony with the side.

We may add that this building was erected in 1793, to serve partly as a Royal Chapel and partly as a Chapel of Ease to the parish church of Brighton. The foundation-stone was laid by his Majesty King George IV., who himself attended Divine service in the church when it was completed, until a private chapel was built within the grounds of the royal residence. The church has no endowment, and is, moreover, encumbered with a debt. It has attached to it a large poor district of 4,000 souls, and the congregation attending it is wholly unequal to the financial strain involved in the work of restoration. A bazaar is accordingly being held during the present week in the Dome, Royal Pavilion, and it is hoped that by this means the funds required may be secured.

### HARVEY GRAMMAR SCHOOL, FOLKESTONE.

THIS school was founded in 1674 by Sir Eliab Harvey, brother of the famous Dr. William Harvey, the discoverer of the circulation of the blood. Though the great Harvey spent the chief part of his life away from his native town, he did not altogether forget it, as at his death he left the sum of one hundred pounds towards the endowment of his brother's school. The founder himself, Sir Eliab Harvey, left to the school certain lands at Lympne, in the county of Kent, besides the school premises in the town of Folkestone.

Originally it was intended that the charity should provide (1) a free school; (2) a new boat periodically for the poor fishermen of the town; (3) a van-lade or copper for the use of the Folkestone fishing trade; (4) apprenticeship fees for deserving boys. Eventually the income of the charity was found to be insufficient to meet all the charges upon it, and the school having fallen into decay, or nearly so, an Act was passed in 1858 for "confirming a scheme of the Charity Commissioners for Sir Eliab Harvey's Charity in the town of Folkestone." This Act provided that the apprenticeship of boys and the purchase of fishing-boats out of the funds of the charity should cease; but the trustees were empowered to continue the van-lade at an expenditure not exceeding 5*l.* a year. As for the school itself, twenty boys were to be educated free, the course of instruction including English subjects, French and Latin, mathematics, drawing, science, &c., the master being at liberty to take private pupils to the number of thirty.

For nearly half a century the school has been carried on in small premises situate in the centre of the town. The old buildings included, besides the schoolroom, a small cottage for the master and two other cottages, one of which was used at one time as the Folkestone Dispensary, the other being let off to a private tenant. Later on, the dispensary was removed to other quarters, and two of the cottages were thrown into one for the use of the master.

As the population of Folkestone increased, the old premises became altogether inadequate to meet the wants of the town, and accordingly, in 1880, the trustees having obtained the con-

sent of the Charity Commissioners, sold the old site. Being in the best business-quarter of the town, they realised sufficient to build new and larger schools. A site, about 150 yards distant, was purchased from the Earl of Radnor, and the trustees commissioned their architect, Mr. Robert Wheeler, of Tunbridge Wells, to prepare plans for a new building. These were subsequently approved by the Charity Commissioners, and a contract was entered into with Mr. H. Clemmans, contractor, Folkestone, for erecting the building. In consequence of the great fall in the site the plan required special treatment to suit the inequalities of the ground; as will be seen by the plan, the level of the school-floor ranges with the line of the chamber-floor of the house. The buildings are designed to accommodate 130 scholars, including about twenty boarders, and are faced with red and stock bricks. The external walls are built hollow. Corsham Down stone is used for all dressings. The roofs are covered with Broseley tiles, the dormitory story being hung with red weather tiling, relieved by white bands. Nearly all the joiner's work is executed in pitch-pine. Care has been taken with regard to ventilation and drainage. The cost of the whole of the works, including boundary fences and fittings, has been about 3,000*l.*

### AN OLD KNOCKER.

RUINS OF THE PALACE OF MOSSEN SORELL, VALENCIA.

NOT long ago, the Spanish press lamented the loss, by fire, of the above ancient building,—the property of the family of the Sorells,—an edifice reported to have been of exceptional architectural beauty, which adorned Valencia, and of which the city was deprived in the space of a few hours. The loss of the remarkable building having been very sensibly felt, in order to preserve the recollection of its beauties to the Spanish nation, the Spanish Academy of Arts has had a series of sketches, drawn by the director of the School of Fine Arts, executed, in which the several artistic features of the edifice have been carefully incorporated. Very few historical data are obtainable respecting the Sorell Palace; but the Marquis de Cruilles, in his "Gnia Urtana de Valencia," mentions that Arnaldo Sorrell, whose coat-of-arms contained two fishes, called, in the language of the troubadours, *Sorell* (tunny-fish), was knighted by Don Jaime I., in Mallorca, on account of his having hoisted the pendant on the walls of Palma during the conquest of the Balearic Islands, in 1290. During the combat at Puzol, Valencia, however, he was wounded, and died at Puig; but his son was very liberally rewarded for the bravery of the father by gifts of valuable land in Algemesi. Mossen Luis Sorell built, in the fifteenth century, the palace which engages our attention. It appears, however, the direct line of successors of the original possessors of this edifice having become extinct, the property descended to a collateral branch of the family, who did not place much value upon it, and permitted the building to go to ruin. The Spanish writer whom we have already quoted says:—"This edifice, being used for various other purposes than those of habitation by its owners, combined with the want of means to keep it in repair, soon fell into ruin. From the two points of view, its antiquity and architectural style, it is a painful picture to contemplate in its present deplorable condition, and it is still more pitiful to witness its roofs demolished, walls calcined, its rich ceilings reduced to ashes, and its doors carbonised." Out of these ruins, the knocker which we illustrate was saved, as a specimen of artistic work of the fifteenth century. Although every effort is said to have been made to save the principal portions of the building from the flames, it was only possible to preserve the rear part, which possesses little of architectural interest. The principal hall has disappeared, with the famous ceiling, for which 14,000 dollars were offered in 1852, and the frieze of which contained the following inscription:—"What edifice should I raise which could not pass away with Time?" The above sentiment harmonises with that expressed in Gothic characters on the stones of the portal of the edifice, and which runs thus:—"Our possessions vanish, but our good works do not perish."

**West St. Giles's Church, Edinburgh.**—The architects of this new church, recently mentioned by us, are Messrs. Hardy & Wight.

AN OLD KNOCKER: FROM THE RUINS OF THE PALACE OF MOSSEN SORELL, VALENCIA.

of a style very popular at present, and certainly very piquant. But if we consider what is the meaning of this piquant quality which many people admire in work of this kind, we shall find that it really means that it is in opposition to what may almost be called natural canons of artistic design, and that probably the admiration for it arises merely from the fact that it is in opposition to the classic habitudes of design, and is therefore interesting as a change. People get tired of a correct art like the Greek, as people get tired of hearing Aristides called "the just," and they take to something that is all wrong for a change. It is a natural vagary of taste; but while admitting that it is pardonable to like ugly things for a change, do not let us try to make out that they are beautiful. As a matter of design, fig. 10 is really quite stupid in shape. The handles have no connexion with the rim, they are again merely stuck on; and the feet stick out from the spherical under-side of the bowl, as if they were wooden pegs put in as an afterthought; and the want of all spread at the base gives a bad support, and conveys the idea that the proper termination of the feet has been sawn off. In the actual example the feet appear to close in towards the base (though probably they are really straight), owing to the spread of the body of the vase above them; a disagreeable illusion which a Greek artist would have guarded against. A better design would be made by spreading the connexion of the feet over part of the under-surface of the vase, as in fig. 11, so as to take away that peg-like appearance we have complained of, and then by turning the extremities of the feet outwards, so as to give a more secure base. The handles also should be, as it were, tied into the rim moulding, so as to have a hold upon the body, instead of being merely stuck on the top of the rim. All these points are illustrative of the want of perception of the relation between design and construction which characterises so much Japanese work, in spite of its beauties of colour and sometimes agreeable piquancy of form.

A very simple example of an object which is thoroughly well-shaped is the fork shown in fig. 12. This is satisfactory simply because every part is shaped in accordance with its purpose and meaning. The handle is the right shape for the hand, the shank of the fork is designed so as to be strongest where strength is most required; the metal rim, which seems to hind the fork to the handle, gives emphatic lines just where they are required to suggest strength. This is an example of success arising from the entire absence of any self-conscious attempt to be ornamental. The reverse is shown in the spoon, fig. 13. Here the end of the handle has been cut up into a series of points with the idea of making it "ornamental," with no consideration of the practical use of the article; the result is only an absurdity, as every one feels at once that the handle must be uncomfortable for use. Fig. 14 is an extreme example of absurdity; the adoption of a coral branch for the handle of a spoon. Coral is a very pretty thing in its right place, but it is ridiculous as thus used, and makes the spoon a mere eccentric curiosity instead of an article for use. Fig. 15, the outline of a Persian brass kettle, affords a curious instance of a mistake arising from what leads to so many mistakes in design, the wish to be "original," in the sense of doing something that no one has done before. This has led the maker to turn up the rim which forms the base of his kettle, on each side, like a looped-up straw hat. He fancied he had done something pretty and piquant when he had done this. He has merely succeeded in making the kettle look absurdly insecure, and as if it must roll over with the least touch.

Figs. 16 and 17 present an instructive contrast. The first may be considered to be in the main a very well designed object, chiefly because of the harmonious progression of all the lines, the handle, it will be observed, growing tangentially from the curve of the bowl, instead of merely butting against it as in so many of the Japanese examples; and the base is sufficiently broad and heavy to look secure without interfering with the general character of lightness and elegance in the whole design. In fig. 17 the base is far too light for the scale and spread of the upper portion, which at once gives an unsatisfactory effect, and the upper and lower portion of the bowl are most inharmonious in line, and seem to have no relation to one

another; the upper part looking almost as if it were a separate straight-sided cup fitted into the lower one. Another kind of discrepancy is shown in figs. 20 and 21. The first is the actual form of the object; and it will be seen that while it has a strong projecting moulding in the centre of its height, dividing the upper from the lower part of the cup, the base mould is only a simple flat rim ornamented with a leaf pattern. This is disproportionate. The conditions should have been reversed, as in fig. 21; a strong and plain moulding at the base, and the thinner and ornamented moulding as the subsidiary one, the "string-course," we may call it, above.

Fig. 19 is an instructive example of the manner in which an object, admirably designed and very picturesque in the main, may be to some extent spoiled by want of attention to constructive expression. The main outline of this, which is a tea-urn, is most elegant, and a form specially suitable for metal. But in joining the handle, feet, and spout into it, the artist has shown a want of perception of the proper way to do this, and has weakened the whole appearance of the thing in consequence. The handle has been merely jammed into one of the angles on the surface of the urn. It ought to have been connected with and tied into the mouldings on the rim and the body, as shown in fig. 18. The spout is merely stuck into the middle of the ornamental chasing on the lower part of the urn, as if by accident, instead of having a proper insertion designed for it. The foot in the original design is the worst of all. It is a weak piece of curly-whirly work, with no proper foot, no connexion with the body of the urn, and no look of strength in itself. It should have been connected with the constructive lines of the base, as, for instance, in fig. 18, and it should have had the appearance of a foot or support,—a shank with an extended surface to form a base or foot, instead of looking like a mere ornamental curl that might occur anywhere in a design, and has no constructive expression at all.

We have purposely selected a good many of these examples from works of a class and date much thought of at present. We hope we have at least succeeded in indicating how poor a guide to taste is the mere assumption that this or that school of work is good and is to be accepted as artistic work, and in showing that the decision as to good or bad, "well-shaped" or "ill-shaped," in the design even of the commonest articles of use, is to be made on grounds of abstract criticism, and in reference to the manner in which the use and the construction of the object are expressed in its design, and not in reference to a mere aimless preference, "I like this," or "I don't like that"; still less in obedience to any dictates of a purveyor of "artistic" objects.

#### THE FEMALE SCHOOL OF ART.

The prize drawings by the students of the Female School of Art, which were on exhibition in Queen-square, Bloomsbury, last week, were in many cases distinguished for grace of design and delicacy of execution, and showed distinct signs of that careful and systematic training by which alone serious results can be attained. In the Female School of Art, drawing in outline and from the round, with a proper study of light and shade, is insisted upon before the students are entrusted with colours. Miss Gann, the Lady Superintendent, and her staff may be congratulated, as well as Miss Ethel Chapman Nisbet, on winning the national gold medal, for a group of chrysanthemums, in water-colours. Miss Nisbet also takes the Princess of Wales's scholarship. Miss Lydia Bacon King is successful in carrying off the Clothworkers' Company's scholarship of 20l. and the Queen's gold medal, for a chalk head of a *contadina*, drawn from the life. The Queen's Scholar (for the second year) is Miss Constance Wood, and the Gilchrist Scholars (first and

second years respectively) are Miss Lilian Abraham and Miss Otilie A. R. Bodé. The Baroness Burdett-Coutts's scholarship of 40l. has been won by Miss D. Crittenden (second year); a second scholarship of 20l. was granted to Miss Lilian Young; and her ladyship's prizes for designs for cameo locket are taken by Misses Edith Ellison, Emmeline Deane, and Mand Earl. Several scholarships have been presented to the school. Mrs. William Atkinson has presented 25s. a year, for ten years, in memory of her late husband; and a member of the committee, Mr. George Brightwen, of Stanmore, has also presented a scholarship of 10l. per annum, for ten years. It is satisfactory to note that Miss Florence Renson and Miss Mary Harding have been admitted from the Female School of Art in Queen-square as students of the Royal Academy schools. The Baroness Burdett-Coutts has offered the following prizes to the students for the coming year:—Prize of 5l. for the best design for a cameo for a bracelet; prize of 5l., for the best design for a painted fan; prize of 3l., for the best design for Buckinghamshire lace.

#### THE TEACHING OF DRAWING.

PROFESSOR ROSCOE, speaking at Stoke-on-Trent, on the 20th inst., on the subject of technical education, made the following observations:—

It is often said that the French have a natural taste for art, and that it is hopeless for England to compete with her in this department of industry. This I do not believe. England has produced artists of every grade and kind equal to any which France can boast, and therefore the capability of the Englishman to receive and to excel in art-work is, I believe, certain. But he needs training, and that he has not yet had, either in pure or applied art, to anything approaching the extent to which it is supplied to the French student. Our system, or want of system, of teaching drawing in primary schools is exceedingly bad; the French system is excellently good. In the one case the boys learn nothing except to detest the whole business; in the other, the children soon find that they benefit from the teaching. They then take an intelligent interest in the subject, and this expands into a decided taste, which grows with their growth and strengthens with their strength. In my opinion no subject whatever can be taught to young children which can exceed, if even it can compare, in importance with drawing. But then, of course, it must be properly taught. If properly taught, it not only trains the hand and eye, but may be made the most excellent means of exercising the child's observing faculties, of teaching it accuracy and patience, and of rewarding it when the difficulties are successfully surmounted in a tangible definite form by the drawing which it takes home. Moreover, this teaching of drawing is the proper commencement of technical instruction for every trade and for every class of industry, and for every position in those trades and industries. From highest to lowest the power of representing correctly on paper what has to be worked out in reality is a power which cannot be too highly prized, and yet it is one which, even amongst what is termed our educated classes, is rare enough. Now I maintain that our old-fashioned system of drawing from the flat leads to none of the above advantages; on the other hand, the time of the children is wasted, and not only so, but either their interest is never awakened or, what is worse, they are disgusted with the subject. The working of the Continental system has exactly the opposite effect. In place of drawing pictures of old tubs and beams, broken-down cottages, or equally valueless objects, the French boy begins almost at once to draw from the round,—a simple cast of a leaf, for example. He then has some tool or simple piece of machinery placed on his desk. This he has first to sketch, then he accurately measures all the parts, and, noting these, he afterwards has to construct a sectional drawing to scale of the object. Problems of constantly increasing complexity are thus placed before him, and the objects which he has to draw are such as are of everyday use and of practical value, and the result is that the little French or German boy out of the street is able to draw, and draw accurately, in a way which is absolutely astounding to an Englishman conversant only with the work of the ordinary primary English school. I am perfectly well aware that we

\* No. 22 was inserted as an afterthought, and represents the outline of a perfectly plain glass tumbler in which, since these remarks were written, a mixture of water with another liquid was presented to us at a club of somewhat æsthetic tendencies. Now, here is an article which, without the slightest pretence of being "ornamental," is really well shaped, because its shape is exactly suited to its purpose. The lip is spread to be convenient for drinking from; the base is spread, not so much, but sufficiently to give stability, while the narrower proportion of the middle part admits of being easily grasped, and prevents any chance of the glass slipping through the fingers, as a straight-sided tumbler may do. Such an object is shaped in an artistic spirit,—a spirit which may be shown in the plainest as well as in the most elaborate design.

have in England schools where drawing is well taught, as well, perhaps, as anywhere else. But the exception only proves the rule.

#### SCOTLAND IN PAGAN TIMES: THE BRONZE AND STONE AGES.

THE BRIND LECTURES IN ARCHEOLOGY.

Dr. JOSEPH ANDERSON commenced, on the 16th inst., in Edinburgh, his third course of Brind Lectures, in connexion with the Society of Antiquaries of Scotland. In his first lecture he dealt with the sepulchral remains of the Bronze Age as found in cists and cemeteries.

The second lecture of the course was delivered on the 18th inst. The lecturer said that having obtained from the description in the previous lecture a general knowledge of the characteristics of the burials of the Bronze Age, as they were manifested in Scotland, they had now to proceed to the examination of a series of burials distinguished from those previously described by their association with those peculiar erections known in this country by the designation of stone circles, or circles of standing stones. He gave a detailed account of the group of burials discovered in 1860 by the late Dr. Bryce at Mauchrie Moor, Arran, and which were found to contain urns and implements or ornaments of bronze and flint among the fragments of human bones. In these burials the phenomena were of the same special character as those described in the previous lecture. They were associated with implements of bronze or urns decorated with that ornamentation of straight zig-zag lines which was characteristic of the age of bronze; but they differed from those already described, in respect that they were marked by the presence of a ring of standing stones encompassing the area in which the interments had been made. He went on to describe a series of interments in which this peculiar characteristic was especially conspicuous,—the group of burials found at Tuack, near Kintore, with its area enclosed by a circle of upright pillar-stones; the grave-ground at Crichie, where the circular space was cut off from the surrounding area by a trench passing round it, but leaving accesses on the north and south sides, and in which, among the other relics, was found a finely-made head of a stone hammer or battle-axe; the circular cemetery, surrounded by standing stones, at Rayne, Aberdeenshire; and those at Sunhoney, Ardoyne, Ardair, Castle Fraser, and other similar groups. These were all burials chiefly after cremation, but occasionally of unburnt bodies, and the burnt and unburnt burials occurred in the same group, and with similar associations. The objects associated with the burials in the character of grave goods were small pins of bronze, portions of thin bronze blades, chips of flint, bracers of polished stone, and the head of a perforated stone hammer or battle-axe. From the frequency with which these burial circles were found to contain a plurality of interments, it was obvious that they were not the monuments of single individuals, but family or tribal burying-grounds. From the fact that they contained interments burnt and unburnt, it was obvious that they were in use when both these customs were practised, while the occurrence of bronze in association with the burnt interments assigned them to the age of bronze. In all these instances the circular stone-setting, whatever might be the precise form which it assumed, had been found to be the external sign by which the burial-ground was distinguished from the surrounding area. Like the cairn, it was the visible mark of the spot of earth to which the remains of the dead had been consigned, though of course it was impossible to say, and it was not necessary that it should be affirmed, that in every stone circle the evidences of interment would be found. The colossal size of their pillar stones, the magnitude of the area enclosed, the care and labour expended in trenching and fencing it, were features which gave to these singular constructions a peculiarly impressive character. This impressiveness was especially characteristic of such a circle as that of Stennis, in Orkney, which encloses an area of two and a half acres, and the chief features of which he described. He also noticed the standing stones of Callernish, in Lewis, a type of structure which was associated with a chambered cairn. He called attention to the occurrence of this small chambered cairn in association with a great stone circle, because the cairn appeared in a subordi-

nate character,—because it was plainly the great stone-setting and not the small cairn which was the principal object. The cairn had given way to the circle, and the circle had risen to the dignity of the principal member of the composite structure. It thus became clear that the circular stone-setting, which first appeared as an adjunct to the stone-age cairns, acquired its dignity and importance through the degradation of the cairn structure which it encircled, and came at last to stand alone as the characteristic mark of bronze age burial.

Dr. Anderson's third lecture was given on the 20th inst., its subject being "The Culture and Civilisation of the Bronze Age in Scotland." As there was no example of a dwelling or a stronghold which could certainly be assigned to the bronze age in Scotland, the remaining materials from which conclusions might be drawn with regard to its culture and civilisation consisted chiefly of the arms, implements, and ornaments of the people which had been preserved in the soil, though not associated with burials. The circumstances in which they occurred were (1) in hoards or deposits of greater or less numbers of articles, often of different varieties of form and character; and (2) in single examples found casually in the soil. He described the principal deposits which had been found in Scotland, and, noticing the typical forms of each of the several varieties of objects which he had described in detail, he observed that the weapons differed widely in their form from those with which they were familiar as products of the iron age. They were, however, of the same class, though differing in form and material. With these groups of weapons and implements there were associated certain peculiar forms of personal ornaments, chiefly in bronze and gold. The lecturer gave examples to show the prevalence of the use of gold in Scotland, at a period when iron and silver did not appear among the industrial products of the people, and bronze was the only metal employed in the fabrication of their cutting tools and weapons. Summing up, in conclusion, the characteristics of this peculiar phase of culture and civilisation, as they found it manifesting itself in Scotland, the lecturer said its essential characteristic was that bronze was the only metal employed in the useful arts. Whether they were weapons or tools they had this characteristic in common, that they were always well made, substantial, and purpose-like. In addition to these serviceable qualities, they possessed the high merit of being well designed, graceful in outline, and finely proportioned, exhibiting even in the commonest articles a play of fancy in the subtle variations of their distinctive forms that was specially remarkable. As the metal of which they were composed was an alloy,—a compound of copper and tin in certain proportions, variable according to the purpose of the instrument,—it was evident that knowledge and skill were requisite for the successful working of the material. As the forms of the manufactured articles were given to them in the moulds in which they were cast, it was evident that the brain which designed, and the hand which modelled, these forms must have been specially conversant with the technicalities of delicate processes, and with the experience of dexterous and skilful workmanship implied in such manufactures. Although we knew nothing whatever of their household arrangements, or the manners and customs of their domestic life, seeing that not a trace of a dwelling or site of a settlement of the bronze age had yet been discovered in Scotland, yet we were not without evidence of an indirect nature to indicate that they could not have been wholly destitute of the comforts and conveniences of life.

The fourth lecture of the series was delivered on Monday last, Dr. Anderson taking for his subject "Stone Age Burials—The Horned Cairns." In the outset, the lecturer said that in 1865 and 1866 he excavated a series of sepulchral cairns in Caithness of singular interest and importance in a scientific point of view, inasmuch as they disclosed features in connexion with the construction of cairns that were previously unknown. On the crest of a considerable eminence overlooking the south end of the Loch of Yarhouse, on the estate of Thrumster, in Caithness, are two cairns of great magnitude within a short distance of each other. They are not circular, but elongated in form; they lie across the crest of the hill from east to west; they diminish in breadth and height from

east to west, and they have at both ends curved, horn-like projections of their structure, falling gradually to the level of the ground, and quite grown over with turf and heather, although the body of the cairn is bare. The larger of those cairns, after it was excavated, was 240 ft. in length. The breadth of the base of the cairn at the spring of the horns at the eastern end was 66 ft., and at the western end 36 ft. The horns expanded in their curvature so as to make the line across their tips at the eastern end 92 ft., and at the western end 53 ft. The extreme height of the cairn at the east end did not exceed 12 ft., sloping gradually to less than 5 ft. at the west end. The removal of the loose stones from the upper part of the east or higher end of the cairn discloses the existence of a chamber, with a passage leading into it, the nature of which Dr. Anderson described in some detail, adding that the chamber to which the passage gave access was excessively small as compared with the gigantic size of the body of the cairn. It was evident from the examination which he had made of it that this great cairn was a cairn only in external appearance, and for the same reason that a broch was a cairn,—that was, because it was a ruin. Originally this great cairn, which, by the dilapidation of ages, had assumed the appearance of an oblong mass of loose stones, had been built upon a definite ground plan, with a double wall defining its external outlines. It was a construction with an external elevation in the architectural sense, of which they had portions remaining of the height of 4 ft. It was also a structure in the architectural sense of having an internal elevation,—an interior chamber covered by a roof partitioned into compartments, and provided with access by a lintelled passage and an external doorway. It was not built with mortar or cement of any kind; its stones were unsquared, and bore no mark of any tool; its roof was partly flat and partly arched by the overlapping of the stones, but in all these respects its constructional features were not different from those of the dry-built structures of the early Christian period or of the Iron Age of the Pagan time; but its singularity of form, and the absolute individuality of its architectural conception, precluded the possibility of assigning to it any relationship with them. In point of fact, they had hitherto met with no form of structure to which it was comparable.

#### THE ALTERATIONS AT HYDE PARK CORNER.

THE tender of Messrs. Mowlem & Burt for carrying out the Hyde Park Corner scheme has been accepted, and the work of removing the Wellington Arch, preparatory to its re-erection lower down Constitution Hill, is, we regret to hear, to be commenced at once. There were three tenders sent in for the execution of the work, which includes widening the thoroughfares, namely,—Messrs. Mowlem & Burt, 31,000l.; Messrs. Hill & Higgs, 39,000l.; and Mr. Webster, 39,727l.

The only monumental entrance to London is thus to be destroyed, without, as we fully believe, any necessity. Is it even now too late to prevent this damaging act?

#### THE ST. LAWRENCE TUNNEL.

THE contract for the projected tunnel under the St. Lawrence has been given to the engineer, Mr. Rouillard, of Montreal, who has undertaken to do the work for 3,905,000 dollars. The length of the tunnel is to be 16,000 ft., with a breadth of 20 ft., and a height of 23 ft. The time within which the work is to be completed is three years. The gradients will be so steep that the line in the middle of the tunnel will be 176 ft. below the level of the entrances. Great attention is being attracted to this three-mile-long tunnel, which, of course, is to be illuminated by electricity.

#### Proposed New Bridge at Teddington.—

It is proposed to erect an iron bridge over the Thames at Teddington, subject to the approval of the authorities. The members of the Teddington Local Board, together with the great majority of the ratepayers, are said to be in favour of the project, and a special meeting of the Board is about to be held to consider the matter.

## OBITUARY.

Mr. Lewis Pocock, F.S.A.—With great personal regret we have to record the death of this estimable gentleman, which took place at his residence, 70, Gower-street, on the 17th inst. The date of his birth was January 17th, 1808, so that he had nearly reached his 75th year. For many years he was one of the directors of the Argus Life Office, and in 1842 published a book on Life Assurance. He brought out some other works, notably "The Lord's Prayer," a poem by the late Dean Alford, and an edition of "The Pilgrim's Progress," published by Holloway, in which the Bibliographical chapter bears his own name. Mr. Pocock was treasurer of the Graphic Society, and worked very ardently in the cause of the Society for the Prevention of Cruelty to Animals. During many years of his life he was occupied with making a collection of Johnsoniana. This collection was begun when he was quite a young man, and grew to be of great interest and importance. It may be worth note that as long as thirty years ago he devoted much time and attention to the bringing out of a patent for electric lighting. He was before his time.

It will be inferred that Mr. Pocock was always a zealous worker in the cause of art. He will be chiefly remembered, however, in this respect from his long connexion with the Art-Union of London, of which he was one of the founders. He became one of the honorary secretaries soon after its foundation, and laboured assiduously and continuously in that capacity down to the day of his death, often working all night with his colleague in the earlier years of the Association, when the paid staff was small and the difficulties which beset the establishment of the Corporation were greater than would be supposed by those only now connected with it. Mr. Pocock leaves a considerable family, more than one of whom have already made their mark as artists. At a meeting of the Council of the Art-Union of London, held on Tuesday last, the following resolution was passed unanimously:—

"The Council of the Art-Union beg to express to Mrs. Lewis Pocock and the family their sincere sympathy under the heavy affliction which has overtaken them; as well as their sense of the great loss which the Society has experienced by the removal of one who, for forty-five years, devoted the most assiduous and uninterrupted attention, as one of the Honorary Secretaries, to the direction of its affairs, for which his refined taste and matured judgment eminently qualified him."

## AMBIGUOUS SPECIFICATIONS.

SIR,—Some unknown friend having kindly sent me a Kentish paper, I scanned its columns in search of news, when my eye lighted on the report of the meeting of the Walmer Local Board, and I saw there had been a row over "the strict intent and meaning of a specification." Some knowing persons (they are to be found in most public bodies) complained of the way in which a well-known contractor had executed his contract for road-making, and stated, with more or less point and fervour, their ideas of road construction. One of these gentlemen, it is reported, argued "that the contractor ought to have put gratings down which he had not done," and added, "no other practical man would have undertaken that job without putting down a grating on each side of the road," in confirmation of which latter remark, he appealed to builders on the Board for their views of the proper performance of the work. And, as a clinching argument, he said the contractor "brought the new gratings there to lay down, and now they are back again in his yard."

The Clerk to the Board defended the contractor from the charge of responsibility, saying "that, having read the specification, he was of opinion that the contractor's responsibility was confined to the footpaths and channelling, and that, though there was much ambiguity in the wording of the specification, he thought there was nothing which required the contractor to raise the crossing right across the road." And, as regarded the "gratings" contention, "the specification simply required the contractor to take up gully-gratings, and build a new pit, but there was nothing said about what was then to be done."

There could hardly be a better description of an ambiguous specification, hardly a better illustration of its results. The Board thought the contractor wrong; their Clerk pronounced

him right; and the contractor himself had evidently been at one time in doubt. His name is, however, too well known, and his respectability is too well assured, for any to question his disposition to perform his work aright. Had he been wrong, the blamo would fairly have rested with the specification which few read alike; but, having been right, blame as fairly rested with the specification, since it laid him under the suspicion of having been wrong. Ambiguity gives rise to obscurity, obscurity to uncertainty, uncertainty to different interpretations, and different interpretations give rise to possible errors and imputed breaches.

A clearly worded specification would have prevented the hubbub. It would have set forth unmistakably what had to be done; and the contractor, actuated by his usual desire to work creditably, would have complied therewith. No specification is clear which does not thoroughly explain the nature of work, and contain full particulars of the mode of execution. Gratings were on the job, but their use was not specified, consequently they were removed. They might or might not have been necessary. If necessary, they should have been specified. Not being specified, their use would have seemed a work of supererogation, and that is just the kind of work for which Local Boards and Corporations never think of paying.

A specification cannot possibly be too clear or too simple. Speaking generally, clearness is almost unattainable without simplicity; and too many specifications are devoid of both. Often, when taking off quantities, the greatest annoyance has been caused by wholesale omissions and sweeping generalisations. Insufficient information, and a jumble of works, are enough to try the patience of a saint. Looking now on one page, then at another, now backward and now forward, for descriptions, undiscoverable perhaps, or contained only in vague and scattered allusions, and then conflictingly, a correct inference must be the result of chance.

Ambiguous specifications are due either to carelessness or want of practical knowledge. In either case they are to be condemned. In the former case, they are especially to be condemned. There may be an excuse for a want of practical knowledge; there is none for carelessness. Orderly arrangement and adequate description are naturally to be expected. The specification is as needful as the drawings, and if it be incomplete the architect's work is imperfect, and so, in all probability, will be the work of the builder. The incompleteness of a specification is a sure sign of an unstudied building. A well-prepared specification proves thought, and makes the architect master of his design. But if he do not himself understand it, he cannot expect others to understand it. They may guess at its meaning; but guesses, when money, appearance, and durability, are at stake, are not advisable. Obscure intentions cannot be embodied in lucid instructions. Nor can obscure thoughts. Want of knowledge may sometimes be concealed in generalities; but in specifications, when concealed, it is often revealed. The studious avoidance of practical details tells its tale; and when generalities soar, the result is not invariably happy.

Stereotyped specifications are likewise the cause of confusion. Stereotyped specifications are mostly ambiguous specifications. Specifications to be serviceable should be adapted to requirements; and, as the requirements of no two jobs are alike in every respect, the stereotyped specification will only apply in part. Cutting out and inserting in no way improve them. Every job requires its separate specification. The outline, or general arrangement, of specifications may be, in fact, should be,—similar, so far as the test of practice stamps it with approval. But all the nice explanations of details required for each job should be strictly original, and introduced at the right places, that the estimator and the foreman may readily comprehend the architect's wish or intention.

The idea that an imperfect specification tends to the closer study of the drawings, and, consequently, to the better execution of the work, may or may not be correct. If correct, the architect should divide the commission with the builder, since the expense of the time spent in puzzling out the specification and the design has to be borne by the latter. It would seem much more reasonable to suppose that, as time is money, and economy a prominent feature in builders' business, when drawings conflict with the specification, and practical requirements conflict with either or both, the puzzle is solved

by these practical requirements being settled off-hand by the practical judgment of the practical man. The solution might be anything but what the architect might desire, but, not having taken the trouble to specify his wish, he has to abide by the consequence. Hidden work is dumb.

With regard to ambiguous specifications arising from unpracticalness, some suggest,—to the architect the design, to the builder the construction. But while the union of art and practicalness is desirable, this particular union is not to be commended. Rival interests clash. To be of advantage, art and construction must be united in one,—the designer of the work. The sounder his knowledge of construction, the clearer will his specification be. Less time would be wasted, fewer disputes would arise, fewer mistakes would occur. If architects could but hear the sneers of foremen and workmen at some of their specifications, they would not feel particularly flattered, but might be led to think a specification deserving of more attention than it generally receives.

Ambiguous specifications are downright evils. They offer loopholes for evasions and furnish grounds for exactions. To them is doubtless attributable the great difference frequently seen in tendering. As read by some, certain works are suggested; as read by others, these works are overlooked. The shrewd, careful reader notes that certain works are necessary, but he does not provide for them, knowing to a certainty that others will not. Were he to provide for them the job would be lost, and if he lost the job he would for certain nothing gain; whereas, by taking it in its incompleteness he has at least the possibility of gain. The bareness of the possibility is a strong temptation to wrong. Thus it is that swindling occasionally begins with putting in the foundations and ends with scrubbing the floors. Where lies the fault? In the architect's office or the builder's? The truthful answer is,—in both.

Keeness of competition means lowness of price; lowness of price entails cutting of work; cutting of work is another name for theft, and theft by rights should send men to prison. When a builder takes work in the full consciousness of the specification's incompleteness, he burdens himself with the responsibility of the due performance of all things needful. However loose or vague a specification may be, it is pretty well sure to contain some such stipulations as these:—"The contractor shall provide for all works, and do all the several matters and things required for the thorough performance of the contract"; and "The contractor shall hand over the building clean and perfect throughout on completion." In submitting his tender, he announces his determination to execute the work in accordance with the specification, and since the specification requires thoroughness, honour asserts that thoroughness should be had. This, however, is no excuse for the architect. The work should be clearly specified in his office, then all would tender alike, fair prices should be obtained, and the evils of sharp practice should be banished. There will be a certain amount of sharp practice under any circumstances so long as men are in haste to get rich, but the fault and the blame would then rest with the evil-doer. If, when a specification is clear, or tolerably clear, the shifty contrive to disregard its plainness and wrest its obvious meaning, much worse must the case be with a specification that even the honest can barely understand. This proves the need of clearness. If the work of the ambiguous specification is honourably performed, the builder has to pay the penalty of the architect's negligence.

It is, of course, open to the builder to prefer a claim for extra work. Then come other evils. The claim is, perhaps, compromised. Omissions are made to set against extras; this may be just as between the architect and the builder; but is it just as between the architect and the proprietor? If the "extras" were necessary, and the "omissions" were likewise necessary, the house must originally and eventually have been a long way removed from the requisite completeness. If the claim is allowed, the builder receives justice. But how stands the case with the architect and the proprietor? It is then the latter who pays the penalty of his adviser's negligence. If, as sometimes happens, the claim is disputed, an angry controversy ensues; and, the architect being his own arbitrator, the builder goes to the wall. What, then, becomes of justice between

the architect and the builder? If, as sometimes happens, the claim is wholly ignored, the architect carries the point, the proprietor has his house,—but what becomes of justice between the three? Whatever works are necessary in the opinion of the architect, but not shown on his drawings, or set forth or implied in his specification, are justly deemed extras, justly claimed as extras, and should be justly paid as extras. It is withhold payment for work executed in theft, as much as the wilful omission of contract work is theft. It is all very well to point to the clauses of an ambiguous specification, clausewise enough to embrace everything under the sun, and show that the building is to be given up perfect. Ideas differ widely as to perfection. The man who has tendered from an ambiguous specification thinks his work perfect when he has executed soundly all necessary works. The author of the ambiguous specification may include in his idea of perfection many other works not actually necessary. This, therefore, should be an axiom in the composition of a specification:—Every essential work, and every work of opinion and taste, and all nice points of construction, should be clearly specified and explained; while all minor works, if not described at length, should be explicitly mentioned, or, at least, clearly implied.

Ambiguity, the bane of ancient oracles, ought not to be the bane of modern specifications. Intended for practical use, they should be practical and to the point. Clearness and connexion, to be regularly maintained, call for a deal of attention, since each trade has to be described separately. The difficulty appears to be in describing fully those works connected with or dependent upon other work of the same trade or of other trades. To overcome the difficulty, greater length would appear necessary; but lengthy clearness is infinitely preferable to condensed uncertainty. Specifications, however, are not always read with care by masters in tendering for work, or studied by foremen in executing work, so that it is probable that greater length, although desirable for the sake of clearness, would not altogether be appreciated. While some complain of the vagueness of specifications, and others of their lack of particulars, not a few complain of their fulness, meagre though it be. The last are they who either dislike the trouble of wading for information, or have not the time to waste in such a task. Still it is possible to combine full directions and descriptions with clearness of language, connexion of works, and system of arrangement. A specification having this union must commend itself to all.

The specification in the Book of the House, a book of constant reference, and should, therefore, like most other books of reference, have a complete index. This index would not only make reference easy, but also secure connexion otherwise unattainable. The several points of allusion being readily found, a perfect description of every item of work would be obtained, and its connexion with the work of every other trade would be clearly presented. The specification requires little if any less study than the drawings. Rightly viewed, it is an integral part of the design. Till the specification has been written the design is imperfect. A specification's searching criticism will always bring defects to light. It is better for the architect to detect and remedy them than for the builder to do so when expense has been entailed.

In design of the first importance, in practice drawings are of secondary importance. In the workshop and on the job they become merely the pictorial illustrations of the specification. How necessary, then, that the specification should be thoroughly well considered and clearly expressed. OBSERVER.

**Substitute for Gypsum.**—A prize of 500*l.* was some years ago offered by the German Government for the invention of a composition for taking casts of works of art and other kindred purposes. This composition was to possess the advantages of gypsum, but was also to have sufficient power of resistance to bear periodical cleaning, or other treatment of an analogous character. No less than forty-one competitors entered the lists, but none of the proposals submitted were of a nature to satisfy the official and artistic commission charged with the examination of the various suggestions. The prize has, therefore, not been awarded.

**BIRMINGHAM ARCHITECTURAL ASSOCIATION.**

SOME of the members of this Association made an excursion, on the 14th inst., to Hales-owen and the neighbourhood, adopting a programme arranged by the honorary secretary (Mr. F. W. Franklin Cross). The Royal Manor of Hales was granted by King John, in the sixteenth year of his reign, to Peter, Bishop of Winchester, for the purpose of founding an abbey, which was first inhabited by monks of the order of White Canons, and which shared the fate of so many other monastic buildings at the dissolution, in the reign of Henry VIII. An idea of the importance of this religious establishment may be imagined from the fact that the site of the abbey church and other appendages within its boundary walls occupied eleven acres of land. The ruins are extremely meagre; the stone of the columns, pillars, and arches was used for many centuries to repair the roads in the neighbourhood. What remain, however, form a picturesque group, worthy alike of the attention of the artist and the antiquary, but consist of only a few examples of fine lancet-windows, with fragments of groining and moulded work. The Church of St. Mary and St. John the Evangelist is an ancient structure, it being claimed for it that portions of it were built prior to the Norman Conquest. In the town was born the poet Shesstone, and in this church reposes his dust. During the time of the Heptarchy, when the kingdom of Mercia comprised the Midland Counties, Kenelm, king of Mercia, died, leaving his son Kenelm heir to the kingdom. He was very young at his father's death, and, through the artifice of his sister Querande, who entertained the ambitious views of assuming the government of this the largest kingdom of the Heptarchy, he was deprived both of his crown and his life. At the eastern side of Cleit Hills stands in all its solitude a monument of this dark and cruel deed, the Chapel of St. Kenelm, whither the members journeyed after leaving the church and abbey. The situation of the chapel is remarkably picturesque. It is built over a ravine, on the declivity of a hill. St. Kenelm's Well under the chancel marks the spot where the young prince was buried after being murdered. The greater part of the fabric is not older than Henry III's time; the tower is of about the time of Henry VIII.

**THE MANCHESTER FINE ART AND INDUSTRIAL EXHIBITION.**

THIS Exhibition, which is being held in St. James's Hall, Oxford-street, Manchester, was opened on the 20th inst. by the Earl of Wilton. It is spoken of as the best exhibition which has been held in Manchester since the well-remembered "Art Treasures" Exhibition of 1857.

Among the exhibitors is the well-known firm of Gillow & Co., who have erected and furnished four rooms,—a dining-room in the Italian style, a drawing-room in the Adams style, a morning-room in the Flemish style, and a bedroom in the Queen Anne style,—the drawing-room containing all the furniture used for the boudoir of the Princess of Wales when she visited the Paris Exhibition in 1878. In the Italian dining-room one of the features is a reproduction in tapestry of Mr. J. O'Connor's cartoon of "Windsor Castle." One of the most important displays is that made by William Morris & Co., of Oxford-street, London. Here will be seen not so much in the way of furniture as of tapestries, silks, velvets, and other stuffs, figured from Mr. Morris's own designs, and a number of hand-woven carpets, also made from his designs. Mr. G. F. Armitage, of Altrincham, has furnished a room with the idea of showing at what a moderate cost a sitting-room can be tastefully fitted up, and the whole of the articles have been manufactured from his own designs. Messrs. Kendal, Milne, & Co., of Deansgate, Manchester, have erected a drawing-room of octagon shape, furnished in the style of the Renaissance, the chairs, tables, settees, &c., being of black wood with ebony carvings, and handsomely decorated. The speciality of their show is the Tynecliffe tapestry for walls, which is made of flax and shows the grain. Over this hang some drawings which have been executed by Mr. Lockhart, R.S.A. Messrs. Doveston, Davey, Hull, & Co., of Manchester, have fitted up a reception-room and bedroom on the plat-

form. The furniture in the bedroom is described as being in the Early English style, whilst that in the reception-room is of the fashion of the seventeenth and eighteenth centuries. Messrs. Procter & Co., of London, show a collection of objects of Indian art, including carved furniture, decorative pottery, enamelled and metal work, Indian fabrics, gold, silver, and enamelled jewelry, and Indian bangles, arms, and shields; they have enclosed their display by an architectural front designed in the Oriental style. Sir Humphrey de Trafford has loaned an Italian cabinet and a number of Florentine bronzes, which are exceedingly interesting. In the pottery department, Mr. E. H. Downs, of Manchester, has a good display of porcelain, Dresden china, and Hungarian work. Messrs. Doulton & Co., of Lambeth, have on view some excellent specimens of their now well-known and esteemed Doulton ware, Lambeth faience, impasto, *pâte sur pâte*, and silicon ware, their latest development being the modelled silicon, which has the effect of bringing out the different clays made use of in producing the article. The whole of this work is done by hand. The Gateshead Glass Company have a good show of domestic glassware, and Messrs. Minton, of Stoke-upon-Trent, contribute a fine collection of majolica, pottery, porcelain, and ordinary artistic faience. The Venice and Murano Glass Company make a contribution to the exhibition in the shape of Venetian glassware, mosaics, &c. Messrs. Wm. Cook & Co., of St. Ann's-street, Manchester, show at their stall the operation of engraving on glass. Messrs. Jones & Willis, of London and Birmingham, have a show of ecclesiastical brass and other work, including a reredos in carved oak and a variety of other woods, an eagle lectern, and a large embroïdered altar-frontal. Messrs. Hart, Son, & Peard, of London, Messrs. Dutton & Powers, of Manchester, Messrs. Thomason & Co., of Manchester and Birmingham, and Messrs. Thos. Brown & Sons, of Manchester, display ecclesiastical brass and embroïdered work of a very rich character, and Messrs. Elliott, Alston, & Olney, of Manchester, contribute *repoussé* brass work, a number of inlaid fire-places, and a Sienna marble chimney-piece. Messrs. Leech Brothers and Hoyle, of Manchester, also make a display of chimney-pieces, fire-grates, &c. The exhibition contains some good wall-papers, sent by Messrs. Jeffrey, of London. Messrs. Heighway & Sons, of Manchester, are also contributors in this department. Some decorative wall-painting on tiles is exhibited by Messrs. W. B. Simpson & Co., of London. Messrs. Farrer & Brindley, of London, have sent specimens of marbles and other minerals suitable for architectural work. In the front hall, apart from the spacious room in which the exhibits we have already referred to are placed, will be found a collection of tapestry from the Royal Windsor Tapestry Works. They are sent as examples of the revived art of tapestry weaving which has been inaugurated at Windsor by the Duke of Albany. They are all hand-woven, and those which hang on the end wall have been made for Mr. Vanderbilt, the American millionaire. In the same room is some old embroïdered which belonged to Dante Gabriel Rossetti, and which has been lent by Mrs. W. A. Turner, of Manchester. Messrs. Tassinari & Chattel, of Lyons, exhibit a rich collection of satins, silks, brocades, and velvets; and Messrs. William Woolllams & Co., of London, take up one whole side of the room with a display of excellent wall papers. The suite of ant-rooms in front of the building is devoted to an exhibition of stained glass. Mr. William Morris, of London, shows a window, designed by E. Burne Jones, and the subject of which is Solomon giving instructions for the building of the Temple. In this department the other exhibitors are Mr. W. F. Dixon, of London, Messrs. Cox, Sons, Buckley, & Co., of London, and Mr. J. G. Sowerby, of Gateshead. In the three galleries upstairs there are a large number of oil paintings, water-colour drawings, engravings, etchings, autotypes, hand-painted plaques, embroïdered, silks, brocades, &c., which are well worthy of inspection, and which will doubtless add much to the attractiveness of the exhibition.

**Ayr.**—At a special meeting of the Ayr Town Council, held on the 23rd inst., it was stated that the total cost of the new town-hall and municipal buildings amounted to 38,917*l.*, being 5,704*l.* more than the original estimates.

## THE LIME PROCESS OF COAL-GETTING.

The opening lecture in the Coal Mining Department of the Yorkshire College was delivered in the Philosophical Hall, Leeds, by Mr. A. Lupton, the subject of the discourse being "Coal-getting by the Lime Process, and other Flameless Substitutes for Gunpowder." Mr. Lupton having dealt with the processes for getting coal without the aid of explosives, said that the last method introduced was the lime process. It had been known for ages that quicklime had the potentiality of heat and power. When mixed with water, it developed considerable heat, and expanded in volume. It was not until recently that a practical method of using quicklime for coal-getting was discovered. In this process lime was applied in exactly the same way as gunpowder, only in a much larger quantity, 10 lb. of lime being used in a charge when one-third of a pound of gunpowder would suffice. After the holes were drilled, they were charged with the purest kind of lime, in the form of a cartridge,  $4\frac{1}{2}$  in. long by 2½ in. in diameter. The pressure was 1½ tons to the square inch, and the cartridges, as soon as made, were packed in an air-tight box. Seven cartridges were rammed into each hole, which was then stemmed with clay. When the holes were charged, a hand force-pump was connected by a flexible tube, with small tubes projecting from each hole, and fitting into grooves moulded on the sides of the cartridges. By this means a given quantity of water was pumped into each hole, equal in bulk to the lime. A tap at the end of each tube was closed, and in one or two minutes the chemical action of the lime and steam caused great heat, which converted the remaining water into steam. The pressure of this steam caused the coal to crack. In a short time the steam either escaped or condensed; still the lime continued to work and expand, and on examining the cartridges after they had broken down the coal, it was seen that they had enlarged the bore-holes. About half an hour after the charge had been watered, the sprags might be withdrawn, and the coal would come down. This process had been successfully tested in hundreds or thousands of cases in South Wales, Lancashire, Durham, Derbyshire, Yorkshire, Belgium, and elsewhere, and had been approved by many competent mining engineers. Compared with Grafton Jones's hydraulic wedge, the lime process had the advantage of cheapness, safety, and economy of labour. Calculating the cost compared with gunpowder, the balance of profit might be found on the side of the lime process.

## RECLAMATION OF IRISH BOG.

In former volumes of the *Builder* we have shown how idle lands might be employed, and starving mouths filled, by the reclamation of waste lands. If ever there was a country affording scope for such enterprise, it is surely Ireland. Little has been done there in this direction, although Mr. Mitchell Henry, in a letter to the *Times*, shows that such work of reclamation can be profitably undertaken. The piece of land to which his figures relate consists of thirteen acres of deep bog, for the drainage of which the medal of the Royal Agricultural Society of Ireland was awarded. It forms part of a tract of several hundred acres, more or less reclaimed, of which the judges report that the bog was from 5 ft. to 10 ft. deep, and it is the worst piece of land that it has been attempted to improve. Except in the driest weather, cattle could not cross it, and it contained swallow holes or soft underminings of slush, which continued to discharge mud and water for many weeks. For shooting purposes it may be taken as worth annually 1s. an acre, and that was its only value, but now converted into cultivated land it is worth, after six years' cropping, 1l. an acre, and, with a trifling exception, it has repaid all the capital expended on it. These are striking results, especially as in the balance-sheet nothing has been estimated for the buildings or for superintendence, or for the proportion due by this bit of land to the cost of a large arterial drain, serving both as a canal to convey produce, and to cut off the mountain torrents. The margin of profit, however (Mr. Mitchell Henry goes on to say), is so large that a great reduction may be made, and yet establish the proposition that if capital and superintendence are forthcoming, land apparently most unfavourably situated can be reclaimed

and made the homes of peasant proprietors, each with thirty or forty acres, at a profit to the State both pecuniarily and morally.

Mr. Mitchell Henry concludes his letter by dwelling on the disastrous results likely to accrue to Ireland from neglecting to carry out systematically, and on a national scale, a well-ordered scheme of land reclamation.

## SURVEYORSHIP ITEMS.

*Croydon*.—The Croydon School Board have elected Mr. Robert Ridge, of 7, Katharine-street, Croydon, to be Surveyor to the Board in the place of Mr. Howard Martin, resigned.

*Melksham*.—Mr. David Mackenzie, of Glasgow, has been appointed land surveyor and inspector of nuisances and local surveyor to the Melksham Highway Board, the aggregate salaries amounting to 130l. per annum. There were eighteen candidates.

*Mile-End*.—Mr. J. Knight, formerly Surveyor to the Vestry of Mile-end Old town, and lately a member of that body, died on the 18th inst.

*Poole*.—After a residence in Poole of some four years, Mr. H. Miller, formerly of Bristol, has resigned his office of Borough Surveyor, being about to join a large firm of engineers in the North. At a meeting of the council on the 13th inst., the resignation of Mr. Miller was read and accepted, a unanimous expression of good wishes being given effect to. Then arose the question as to how the vacancy was to be filled. Mr. Conway proposed and it was seconded that the appointment be advertised. Mr. Curtis, proposed, and Mr. Hudson seconded, as an amendment, the appointment of Mr. John Elford, a former candidate, at a salary of 150l. a year. This was carried.

## PUBLIC-HOUSE PROPERTY IN THE METROPOLIS.

## EVIDENCES OF DECREASED VALUE.

WHATEVER may be the rate at which property generally in London is increasing in value, it does not appear just now to apply to public-house investments. Last week, at a sale of several properties of this description, which was held at the Masons' Hall Tavern, Basinghall-street, the prices realised fell far short of what was expected. In one instance, the offer of a well-situated City tavern was withdrawn, as the highest bid was some 30 per cent. less than the sum paid by the vendors. The Exeter Arms, Burleigh-street, Strand, described as commanding a trade of a most profitable character, derived from theatres, halls, markets, and other places of amusement and resort in the neighbourhood, with a long lease, was sold for 4,100l., the auctioneer stating that the same property realised 6,000l. only a very short time since. Another instance was that of the City Wellington in Fleet-street, an old-established house. Though the value of the house, as situated in one of the busiest thoroughfares in London, was enlarged upon, the highest offer made was 1,820l., and the auctioneer stated that only very recently the sum of 5,000l. was given for the property. As the price offered did not amount to half the reserve, the property was withdrawn. Possibly the spread of the Temperance movement, of which the "Blue Ribbon Army" is the latest phase, may have something to do with this falling-off in value.

## ANCIENT LIGHTS.

## LONDON TAVERNS CO. V. DONNINGTON.

This was a motion which came before Mr. Justice North (sitting as vacation judge) last week. It sought to restrain the defendant from erecting some buildings opposite the Albion Tavern, Aldersgate-street, so as to obstruct the windows of that tavern.

Hitherto, until recently, there had been some not very lofty buildings (including Shaftesbury House) on the opposite side of Aldersgate-street to the Albion, but these had now been pulled down, and in their place and on the site of them very extensive new buildings were being built by the defendant. There being some apprehension that these buildings might affect the plaintiff's rights, Mr. Chatfield Clarke, of Bishopsgate-street, wrote to the defendants, who then gave this undertaking:—"We are of opinion that the buildings can be erected in conformity with the drawings submitted to you, without injury to your clients; but in order that we may have the opportunity of discussing the matter fully, we undertake that no part of the proposed buildings

shall be carried up beyond a height of an angle of 45° from the sill of the ground-floor windows of the Albion Tavern until we have an interview with you; we think it will take two months to erect the buildings to the height we have mentioned." That was on August 6th, and the next letter was written by Messrs. Taylor & Looke, the defendant's architects, on October 10th. In that letter they said:—"We feel satisfied that after the interview you will be of opinion that the Albion Tavern Company have no grounds for asking that the building should not be carried out on the plans submitted with our undertaking." Later on Mr. Chatfield Clarke reported that the works were being rapidly pushed on, and the plaintiffs gave notice that in the event of the building being raised up beyond an angle of 45° from the sill of the ground-floor windows of the Albion Tavern, a mandatory injunction would be applied for. Notwithstanding this, the building had been proceeded with, and the buildings were now 8 ft. above the angle of 45°, and were 79 ft. high, the former buildings being only half the height.

His lordship granted an injunction over the first motion day in next sittings restraining the defendants from putting up the building any higher than it is at present.

## CASES UNDER BUILDING BY-LAWS.

## PARTY-WALLS: LAPSE OF TIME.

THOMAS CASEY, a builder, living at 83, Boleyn-road, Kingsland, was summoned by the Clerk to the Leyton Local Board of Health, Mr. Ralph Vincent, for contravening the 26th By-law of the said Board by neglecting to put up party-walls to the houses he erected on the Ley Spring Estate, Leytonstone.

William Dawson, the surveyor, deposed that the defendant simply erected a sort of party-wall in the front part of the house, so that any one on the road would imagine there was a party-wall right through, but, in point of fact, there was none at the back. He had given the defendant several notices to erect the wall in accordance with the By-laws, but that had not been done. At length the defendant positively refused to do the work; hence the proceedings.

The defendant said he received no notice whatever until after the roofs were covered, and it would be very hard to cause him to erect one now, as there were hundreds of houses built in the same way as his in Leyton and Leytonstone.

The Clerk said the latter statement of the defendant was not correct.

The Magistrate said the defendant must comply with the By-laws, and to enable him to do so the case was adjourned for a week.

CHARLES SUTTON, a builder, of Bethnal-green, was summoned by Mr. Houghton, Clerk to the Walthamstow Local Board of Health, for erecting a wooden building on the Haile Park Estate, Walthamstow, without having given notice of the same, and deposited plans.

It could not be proved that the building had been erected within the past six months, and

The Magistrate accordingly dismissed the summons.

## THE POMPEII FRESCO OF

## THE "JUDGMENT OF SOLOMON."

The recent discovery of a wall-painting at Pompeii (now placed in the Naples Museum), representing the "Judgment of Solomon,"—an episode generally considered to have been unknown beyond the circle of Jewish tradition,—has been the cause of some controversy, owing to the apparent difficulty of accounting for such a scene being portrayed in a pagan city at so early a period. It seems, however, to have escaped notice that this is not the first occasion in which a Gentile artist appears to have selected this subject; for in 1880 the late M. de Longperrier, at a meeting of the French Academy, described an engraved gem also presenting a picture of the scene. The small intaglio to which he referred forms part of the collection at Bucharest, to which city it was presented, with other antiquities, by M. C. Cohen, and M. de Longperrier's remarks were illustrated by a cast.

The engraving contains six figures, one of which, of preponderating stature, is seated upon an *okladias*. He is robed in a long tunic, and holds in his hand a naked child, suspended head downward. Behind the seat a person of smaller proportions stands dressed in a short tunic. Facing the seated man are two females, one kneeling, the other with outstretched arms, as if in supplication, and close to them stands a helmeted soldier, with a buckler, and brandishing his sword. That the person of proportionately larger size is a king is evidenced, because his head is encircled by a diadem. The value of this relic depends necessarily almost entirely upon whether it was produced before the spread of Christianity had disseminated

the story of Solomon's wisdom all over the East, or is merely the handiwork of some Christian or Gnostic artist. Upon this question no one could be more confidently relied upon to arrive at a correct conclusion than M. de Longperier; and he, after a most careful consideration, was of opinion that it was pre-Christian. For a complete appreciation of his reasons for this decision the reader must refer to the report of his paper; but a few of the principal ones may be mentioned. For instance, the workmanship is very Oriental in style, and in this respect the figure of Solomon bears a distinct resemblance to those figures familiar to us on Assyrian and Babylonian cylinders, and there is every reason to believe that the intaglio comes from some place adjacent to those countries, for the donor, M. Cohen, resided for a long time at Bagdad. However, the drawing of the woman, especially the one in an attitude of supplication, is more like the style exhibited in Greek bas-reliefs or vase-painting. For this and various reasons, M. de Longperier assigns the stone to a somewhat late epoch, but still previous to any possibility of a Gnostic or Christian influence. It is needless to point out that the Pompeian painting is confirmatory of M. de Longperier's opinions, whilst the Eueharest gem tends to show that it is quite probable that the history of "Solomon's Judgment" had, although doubtless with much-verified details, spread as far as Italy before A.D. 79.

JOSEPH OFFORD, M.S.B.A.

THE BOMBAY MARKETS.

Sir,—I shall be exceedingly obliged if you will insert the following explanation with reference to Mr. Russell-Aitken's letter in the *Times* of October 18th, in which he says I only designed the architectural details of the Bombay Markets, which statement gives rather a false impression.

The markets at Bombay cover some acres in extent, and were arranged, planned, and carried out,—as to the iron sheds,—by Mr. Aitken, the ornamental portions of the iron-work being from my designs.

But the whole of the stone entrance buildings, with the clock-tower and the façades facing the esplanade, were wholly designed and carried out by me under instructions received from Mr. Arthur Crawford, the Municipal Commissioner, originator of the markets, and after whom they were called, Mr. Aitken having nothing to do with them beyond a general supervision as Municipal Engineer.

WM. EMERSON.

SEWER VENTILATION.

Sir,—In your issue of last week [p. 540] "Another Poor Buffer," in referring to the sewer into which his house drains debouch, says:—"Every time there is a heavy rainfall the sewer-gas is driven into my house through the scientific (?) traps, which are oftener than otherwise dry."

As his correspondent would wish us to believe that his drains are all right, and the sewer alone is at fault. Now, if what he says is true about bad smells being "driven" into his house every time there is a heavy rainfall, it strikes me he had better get his own drains, &c., examined by a competent party before he again rushes into print exposing their bad condition. It will be some time enough for him to blame the sewers after he has taken the beam out of the eye of his own drains and pipes.

It is quite customary for me to find that the real cause of bad smells often complained of is not gas from the common sewer, but foul odours from the complainor's own drains and pipes.

W. P. BUCHAN.

BIRMINGHAM.

*Exhibition of China Paintings.*—An interesting exhibition of paintings on china, which has been annually promoted by Mr. R. W. Thrupp, of New-street, has reached its fourth year in the display now open to the public at Mr. Thrupp's gallery. This year prizes for the encouragement of the art have been given by several ladies. Nearly 450 exhibitors, some of them ladies and some of them gentlemen, have sent in works from all parts of the country.

*St. Mary's Garden.*—On the 16th inst. a welcome addition to places of public recreation in Birmingham was made by the opening of St. Mary's Garden, which is situated in a densely-populated neighbourhood. The disused churchyard of St. Mary's has been transformed into

a pleasant playground for the young of the neighbourhood, and makes an agreeable resort for older inhabitants. The garden covers two acres and a half of land, and the cost of laying it out has been about 1,500*l.* The principal entrance to the garden is from Whitbail-street; there is another in Loveday-street, and two others in Weaman-row and St. Mary's-row. The work of planting the shrubs and flowers, and generally converting the ground into its present aspect, has been carried out by Mr. Alfred Rodway, curator of public parks, from the plans and designs prepared by the Borough Surveyor. The ground and the walks are paved with the Val de Travers Paving Company's limestone paving; and this part of the work has been carried out under the superintendence of Mr. J. Gadsby, the local manager of the company. In the centre of the garden, which is provided with several sheltering-sheds, there is a drinking-fountain, which is also close to the children's playground.

SEWAGE TREATMENT.

*Aylesbury.*—Representatives of the Corporation of London, the City Commissioners of Sewers, the Metropolitan Board of Works, and of many other bodies interested in the solution of the sewage problem, together with several engineers, chemists, and other men of science, visited Aylesbury on the 19th inst. to inspect the Native Guano Company's works, and the show of farm and garden produce grown with the "native guano" at Aylesbury. The "A. B. C." process (alum, blood, charcoal, and clay) has been now some years before the public, although its operations up to the present time have been confined to Aylesbury. The sewage of the town flows to the works through the ordinary pipes by means of gravitation. First of all a grating is fixed to prevent anything in the shape of rags passing through. Immediately beyond the grating the sewage is met by a side current of the "A. B. C. mixture." After flowing a few feet a precipitating agent is added in the form of alum, which completes the materials necessary for purification. It next flows along a channel to a large tank at the end, and after passing round, it returns to another channel, having meantime deposited most of the impurities. After passing through two more tanks, the process of treatment is complete, and the effluent water, perfectly clear, flows through a channel into a tributary of the river. At certain intervals the sediment or residuum left at the bottom of the tanks is removed by means of a pumping-machine, and converted into powder or cakes, and sold for manurial purposes at the rate of 3*l.* 10*s.* a ton. Its fertilising effect was shown at the exhibition of farm and garden produce in a tent close by. Altogether there were 441 entries, the principal ones being made by farmers, cottagers, amateurs, and gentlemen's gardeners, and the exhibits included potatoes, mangels and swedes, cabbages, carrots, turnips, barley, oats, wheat, flowers, &c. The produce came from different parts of the country, but was all the result of the application of the sewage manure. The specimens were, we are told, almost without exception, of very fine quality and appearance. The Right Hon. the Lord Mayor, who was among the visitors, in the course of a speech after the luncheon which followed the inspection, referred to the pestilential consequences of the manner in which the sewage was now dealt with in the metropolis and around our coasts. He believed that in the end we should be compelled to adopt some system of precipitation of the solid matter, clearing the water which had been originally contaminated, and letting it again flow into our rivers pure and free.

*Brentwood.*—The Brentwood Parochial Sanitary Committee, having visited the sewage works at Ealing, Middlesex, have determined to adopt the lime process as there carried out, and have asked Mr. Jones, the Engineer to the Ealing Local Board, to advise them as to plans, &c.

*Forfar.*—Sewage farms so seldom show a balance on the right side that when it is reported it is worth recording. The financial statement of the Forfar Sewage Farm for the twelve months ending the 15th inst. shows an income of 42*l.* 19*s.* 7*d.*, and an expenditure of 255*l.* 2*s.* 4*d.*, leaving a balance of 169*l.* 17*s.* 3*d.*, for the 27 acres to which the town's sewage is applied, and the 13 acres which are not irrigated. It is stated that the crop

from the sewage land realised 13*l.* 8*s.* 5*d.* per acre, while that from the other portion only fetched 3*l.* 17*s.* 3*d.* per acre.

*Stoke-upon-Trent.*—At a meeting of the Stoke Town Council on the 19th inst., the Sanitary Committee recommended that the farm be let to Mr. T. Wiberley, of Stone, for three years, at 120*l.* a year. Mr. Bilton pointed out that after receiving this rent the net loss of the Corporation with respect to their sewage farm was 386*l.* The recommendation was agreed to.

CHURCH-BUILDING NEWS.

*Bidston.*—A new chancel has been added to the parish church of Bidston, having been erected by subscription as a memorial of the Rev. C. A. Graham (who was the incumbent and afterwards the rector of the parish for upwards of thirty years) and of Mrs. Graham, his wife, both of whom died last year. The cost of the chancel has been about 400*l.* Mr. Grayson, of Liverpool, was the architect, and the contractors were Messrs. Morbury & Upton, of Liverpool, for the pulpit, chancel, seats, and reredos; and Mr. Isaac Griffiths, of Cloughington Village, for the masonry work. The style of the work is in harmony with that of the rest of the building, the new chancel projecting about 10 ft. into the churchyard. The consecration took place on the 17th inst.

*Brighton.*—The re-opening services of Holy Trinity Church, Ship-street, Brighton (well remembered as the church where the Rev. F. W. Robertson once ministered), were held on the 19th inst., after alterations. A change for the better has been made in the gallery and its supports, which seemed to be so heavily constructed. A higher elevation by 5 ft. has been made to the centre ceiling, which now exhibits the open wood-work construction in place of the former plastering. Gas pendants, so arranged as to light the whole building, hang from the ceiling. Tobin's system of ventilation is introduced. The work of restoration has been in the hands of Mr. Somers Clarke, junior, and the expenditure will be something over 800*l.*

*Birmingham.*—St. Mark's Church, Birmingham, was re-opened on Sunday, the 22nd inst., after having been cleaned and enlarged. This is one of the early elurehes built by Sir Gilbert Scott, in the year 1841. A chancel, organ-chamber, and vestry have been added, and the church has been thoroughly cleaned and painted, the work having been superintended by Mr. Miggott, and carried out by Mr. Wilson, of Soho.

*Soho.*—The chancel and nave of St. Nicolas's Church, Lower Tower-street, have been enriched by the insertion of two additional lights in the east window, and the erection of a stone pulpit. The pulpit, which is entirely of selected Bath stone, has been executed by Messrs. Jones & Willis, from the designs of Mr. John Cotton, architect, 15, Temple-row, Birmingham. The two lights inserted in the east window complete the subject of the Crucifixion commenced a year ago. The work has been executed by Messrs. R. W. Winfield & Co., successors to Camm Bros., of Smeethwick, and under the personal direction of Mr. T. W. Camm, at a cost of 120*l.*

DISSIDENT CHURCH-BUILDING NEWS.

*Clevedon (Somerset).*—The erection of a new Wesleyan chapel and manse has been commenced at this growing watering-place. The memorial stones were laid on the 28th ult. The buildings are Early English in design, and comprise a chapel to seat 500 persons, a school-room to accommodate 200 children, in addition to which all necessary and suitable class-rooms and vestries are provided. The main walls and buttresses are to be of Pennant stone, with Bath stone dressings, sills, plinths, and courses. The architect for the works, which are being executed by Mr. W. A. Green, of Clevedon, is Mr. Herbert J. Jones, of Bristol. The total cost, inclusive of lighting, heating, and erection of boundary-walls, will be about 4,000*l.*

*London.*—On the 19th inst. the foundation-stone of a new Welsh Wesleyan chapel, in City-road, was laid by Mr. David Jones. The chapel will probably be completed by May. It will cost about 9,000*l.* The architects are Messrs. Wilson, Son, & Aldwinckle, 7, East India-avenue.

*Carnarvon.*—On the 16th inst. the ceremony of placing two foundation-stones of an English Presbyterian chapel at Carnarvon was per-

formed by Mr. Richard Davies, M.P., and Mrs. Hugh Pugh (Ilymeicron). The site is in Castle-square, at the corner of Chapel-street, and has cost 1,500*l.*, and the estimated cost of the building is 2,349*l.*, making a total of 3,849*l.* The style adopted is a thirteenth-century Gothic. The whole contract has been let to Mr. R. R. Williams, of Carnarvon, who has already made good progress with the work. Mr. Richard Owen, Beck-road, Liverpool, is the architect under whose superintendence the work will be carried out.

**Seaforth.**—On the 17th inst. the opening services of a new Congregational church, which has been erected on a piece of ground at the corner of Elm-road and Gladstone-road, were commenced. The new building is of grey brick, with Stourton stone dressings, and will seat about 490 persons. It is so arranged that it can be used as a Sunday-school, with seven separate class-rooms downstairs, an infants' class-room, small lecture-hall, &c. The architect is Mr. Thomas Cook, of St. George's-crescent, Liverpool, and the contractor is Mr. James Holmes, builder, of Seaforth.

#### VARIORUM.

The eighth volume of "Proceedings of the Association of Municipal and Sanitary Engineers and Surveyors" (E. & F. N. Spon) is edited by Mr. Thos. Cole, the secretary of the association, and contains reports of the proceedings at meetings at Eastbourne, Stockton-on-Tees, York, Sunderland, Goole, and London. The number of *L'Art* (134, New Bond-street) for October 22 (No. 408), includes several illustrations of the Chaldean antiquities, concerning which we have given our readers some particulars on another page of our present issue. The same number of *L'Art* contains an illustration of a very delightful drawing by Mr. Burno Jones, the "Chant d'Amour." In the current *Quarterly* will be found a perspicuous and interesting paper on "Greek Sculpture," and which we recommend for reading. It is noticeable that in tracing the probable origin of Greek sculpture no reference is made by the writer to the Chaldean relics now lodged in the Louvre as already pointed out. Another set of readers will find interest in a paper, also in the *Quarterly*, on "The Fish Supply of London."

#### Miscellaneous.

**A Mortuary for Fulham.**—At the meeting of the Fulham Committee Board of Works on the 18th inst., the committee appointed to consider the question of erecting a public mortuary for the parish reported that they had made inquiries as to a site suitable for the erection of a public mortuary, and had been in negotiation with the Hammersmith Burial Board for the purchase of a piece of land on the south side of the superintendent's lodge, Margrave-road, Fulham, and that they had instructed the surveyor to prepare a plan of a proposed mortuary, which they submitted and recommended to the Board for adoption. Mr. Muscard moved the adoption of the report, and it was carried. Mr. Jones (the clerk) read a letter from the Hammersmith Burial Board offering to sell the said land for 873*l.* The land offered is nearly half an acre in extent. After some discussion the offer was accepted. It is proposed that a coroner's court and *post-mortem* room shall adjoin the mortuary.

**Fire at a Builder's.**—The extensive building works at Southampton of Messrs. Bull & Sons, the builders of the new Law Courts, were totally destroyed by fire last week. The fire is supposed to have broken out in a blacksmith's shop at the rear of the premises, which are situated on the banks of the river Itchen, at Northam. The offices containing the books, papers, &c., being detached from the main body of the works, were not injured. Messrs. Bull are insured. In addition to Messrs. Bull & Sons' valuable plant, machinery, stock of seasoned wood, &c., a large quantity of prepared carving and other work for the completion of the Law Courts and for the new Houses of Parliament which the firm are now erecting at Cape Town was destroyed. A heavy loss also falls on the workmen by the sacrifice of their tools, and many of them will, it is feared, be thrown out of employment for some time.

**Ephesus.**—We referred last week (p. 543, ante) to the proposed further excavations at Ephesus, and some three months ago (p. 138) we reported pretty fully what was said at the Mansion House meeting in aid of funds for defraying the cost of continued explorations. Mr. J. Russell Endeau protests against further excavations, and gives the following reasons:—

"1. The manner in which the excavations have been made is more destructive of the ruins than the effect of time could possibly be, for, instead of unearthing the buried records and glories of the past and presenting them to the eye-witness as found, the debris of one part so removed seems heaped up upon another, or has been returned to the pits whence removed, or has been scattered and levelled over a wide area, thus removing or obliterating such landmarks as might otherwise have been still standing; or, again, tomb after tomb has been entered and rifled, only to be left with utter disregard of the object for which they were made, and so the relics and resting-places of the illustrious dead have been desecrated.

"2. Because whatever has been found, instead of being preserved on the spot, has been removed many hundreds of miles away from the scenes where discovered; and it is intended by the society above named so to remove whatever may yet be found of any value."

He goes on to ask, "Is it not possible to excavate this city as Pompeii has been excavated, to insure that whatever comes to light worthy of preservation shall be preserved on the spot, and that a museum of Ephesian antiquities shall be erected in Ephesus, or in its immediate neighbourhood, so that when the visitor from any part of the world looks upon the scene he shall no longer be told, 'You will find all the beauties of Ephesus in the British Museum, London,' but rather he should be shown where he stands all that can be found of this once-glorious city?" He is sanguine enough to believe that diplomatic representations as to the exceeding value and interest of the remains discovered and to be discovered would suffice to secure adequate protection for them.

**Sir John Soane's Museum.**—The London correspondent of a Birmingham paper, writing of Lincoln's Inn-fields, speaks of Sir John Soane's Museum as being located on the north side of the square "for no other apparent reason than that the College of Surgeons has taken possession of the other side." We are aware that Sir John Soane's interesting and unique library and collection of antiquities and works of art are not visited by the public to the extent which they deserve, but we thought everybody knew that they are located where they are because they remain in what was Sir John Soane's residence. In the year 1833, Sir John Soane obtained an Act of Parliament (3 Will. IV., chap. 4), entitled "An Act for Settling and Preserving Sir John Soane's Museum, Library, and Works of Art, in Lincoln's Inn-fields, in the county of Middlesex, for the benefit of the public, and for establishing a sufficient endowment for the due maintenance of the same."

**Monumental.**—Mr. Frank Priestman, sculptor, Darlington, has been for some time occupied on a bust of the late Rev. Dr. Chadwick, R.C. bishop of Hexham and Newcastle, and has brought his work to a successful termination. Some of the admirers and friends of the late bishop suggested the work, and placed the commission in the hands of Mr. Priestman. Numerous photographs were supplied, and these, with occasional hints from clergymen intimate with the late bishop, were the only data supplied for the construction of the model. It is difficult with such materials to revive well-known features, but on the present occasion it seems that an excellent likeness has been produced.

**Personal.**—We are requested to state that Mr. W. R. Glasier and Mr. W. R. M. Glasier have retired from the firm of Messrs. Glasier & Sons, surveyors and land agents, of Charing-cross, and that Mr. G. H. Brougham Glasier has taken into partnership Mr. Henry J. Dowden, who for many years past has been with Messrs. Driver & Co., of Whitehall. The style of the firm will still be Glasier & Sons.

**The Builders' Benevolent Institution.**—We may remind our readers that the thirty-fifth anniversary dinner of this Institution will take place on Thursday next, November 2nd, at the Freemasons' Tavern,—the president, Mr. J. T. Chappell, in the chair. Efforts are being made to mark the occasion by a substantial addition of subscriptions and donations to the funds of the Institution.

**The Midland, Western, and Metropolitan Canal Carrying Company.**—We are glad to see that the attention which has lately been given to the subject of facilities for canal transport of merchandise (primarily in our own columns) appears to be bearing fruit. In support of our position that commerce, especially in heavy goods, is largely dependent for prosperity upon facilities of cheap transport, and that water-carriage is cheaper than railway carriage, we have adduced ample evidence. We have therefore, earnestly advocated the development of our canal and river traffic, both by the utilisation of existing waterways and by the formation of connecting-links between them, so as to provide means of water-carriage to and from all parts of the kingdom. The Midland, Western, and Metropolitan Carrying Company (Limited), whose prospectus appears in our advertising columns this week, covers a large part of this programme, and should, if judiciously managed, prove to be a remunerative undertaking. The company has been formed for the purpose of providing increased facilities for the carriage and distribution of merchandise between the ports of Bristol and London and the Western and Midland Counties, and generally for carrying on the business of carriers by river, canal, railway, and otherwise, and for the warehousing of goods. With this view it is proposed to utilise the facilities already afforded by the existing canals and waterways, and to provide warehouse accommodation in the centre of the city of Bristol and at other points convenient for collection and distribution. The company has acquired a lease, with the option of purchase, of the Wilts and Berks Canal of about 69 miles, from a junction with the Kennet and Avon Canal at Semington, near Bath, to the river Thames at Abingdon, near Oxford, with all the land, buildings, reservoirs, wharves, and works in connexion therewith. The company has also arranged for the purchase of a large block of buildings containing ample warehouse accommodation, occupying a most central position in the city of Bristol, with a frontage of 393 ft. to the floating harbour, in close proximity to the establishments of the principal merchants and importers, and to the railway-stations. The matter of comparative cost of transit by railway and canal has been very fully reported upon to the Wolverhampton Chamber of Commerce by Mr. Francis R. Conder, C.E. (who is the consulting engineer to the company). The following figures derived from his report show a saving of 64.7 per cent. in favour of canals, viz.:

	Railway.	Canal.
Maintenance of Way.....	6.5	0
Do "Works.....	3.5	1.15
Repairs of Rolling Stock.....	9.5	3
Traction.....	8	4
Traffic Expenses.....	15	3
General Charges.....	7.5	7.5
Interest on Capital.....	50	16.65
	100	35.3

Mr. Conder has also reported upon the properties to be acquired by the company.

**"Art in Costume."**—In the Brighton County Court, on the 20th inst., a claim was made in the case of Coffin v. Taylor, for making a dress. The defendant pleaded that the plaintiff spoiled the dress. The plaintiff (indignantly), "I did make the dress properly, but the lady has no natural figure whatever. She said she was suffering from liver complaint, and could not be squeezed, and how could I make her look like Venus when it was all wadding?" At the request of the Judge the defendant retired and put on the dress, and his Honour then gave a verdict for the defendant.

**A Lecture on Egypt.**—We give last week by Mr. H. H. Bridgman, architect, to the members of the Hawley-road Young Men's Society, Kensington. Interesting descriptions were given of Alexandria and Cairo, of the Pyramids of Ghizeh and Memphis, the tombs of the sacred bulls and tomb sculptures, the Sphinx, and other Cairo, Heliopolis, the museum at Boulak, and other places of interest visited by the lecturer in Lower Egypt.

**New Law Courts.**—We are asked to mention that Messrs. W. M. Pepper & Co. were selected by the late Mr. Street to do the ornamental lead-glazing for the refreshment-rooms, and that they have supplied the glazing for the whole of the courts and many of the corridors.

**The Princess Alice Memorial Hospital, Eastbourne.**—The name of the clerk of works at this building (illustrated in our last) should have been given as Mr. W. Geach.

**Putney New Bridge.**—The contract for the construction of the new bridge and the extensive approach and improvement works connected therewith has been placed in the hands of Mr. John Waddell, of 4, Victoria-street. The Engineer of the 21st inst. gives some of the detail drawings. We extract a few lines from the specification accompanying them:—

**Spans, &c.**—The granite bridge shall consist of five arches, each with level springings 9 in. above Trinity datum. The five arches shall be proportioned thus:—Central arch: span, 144 ft.; versine, 19 ft. 3 in.; central roadway, 20 ft. above Trinity datum; radius of voussoir intrados, 144 ft. The two arches adjoining the central arch: spans, 129 ft.; versines, 16 ft. 3 in.; central roadways above Trinity datum, 17 ft.; intrados radii, 136 ft. 6 in. The abutment arches: spans, 112 ft.; versines, 13 ft.; central roadways above Trinity datum, 13 ft. 9 in.; intrados radii, 127 ft. The whole of these arches throughout the length of the bridge shall measure between their exterior faces, in the width of the bridge, a uniform width of 47 ft.

**Piers.**—At their springings the thickness of the two central piers shall be 19 ft., and of the two outer piers, 15 ft. The upper surface of the bridge shall be divided into a carriageway 25 ft. wide, and footways each 9 ft. wide. The summit level of the bridge roadway midway over the central arch shall, when completed, be 38 ft. 6 in. above Ordnance datum, from whence uniform gradients of 1 in 45 shall incline north and south to points upon the bridge, midway in the 112 ft. spans.

**High-street, Putney, and Windsor-street Approaches; Gradients.**—The main Putney approach to the bridge shall have a uniform gradient of 1 in 35 from the point midway in the Surrey arch aforesaid, terminating at a point in High-street, Putney, about 204 ft. distant from the river face of the Surrey abutment.

**Mantegna's Altar-piece of St. Zeno at Verona.**—In an article headed "Mantegna at the Museum of Tours," the *Times* of October 21st, says the Museum of Tours, saying that it possesses one treasure of the first order, would, perhaps, be most serviceable as suggesting what is to be avoided in forming an artistic collection. No more than one swallow makes summer does one masterpiece in the midst of a mass of hopeless mediocrity constitute a museum. The one attraction of the museum, and which draws so many lovers of art to make a pilgrimage to the fine old capital of Touraine, is the portion of the predella of Mantegna's altar-piece of St. Zeno at Verona, one panel,—the Crucifixion,—being in the Louvre, the remaining two,—the Agony in the Garden and the Resurrection,—unfortunately separated from their companion picture, being at Tours. How they came there was this: when the altar-piece was sent to Paris by Buonaparte, the smaller panels of the predella were removed,—one was retained at the Louvre, and two were sent to Tours, in 1806. The formation of provincial museums had then been recently undertaken in France, and distributions of pictures, of what was considered of inferior interest, were made in 1803 and 1806. At the overthrow of the Imperial power the three larger panels were restored to the Church of St. Zeno, but, through the ignorance or neglect of the Italian Commissioners, the predella was left behind.

**The Earnings of Building Trade Operatives.**—Mr. George Potter contributes another letter to controversy, already noticed by us (p. 517, etc.), as to the poverty of the working classes. In the course of it he says,—“The London working men are divided into many trades, and they vary greatly both in regard to wages, condition, and habits. The building trade is one of the largest and most important. It comprises masons, bricklayers, carpenters, joiners, plasterers, painters, slaters, and plumbers. These men are not employed regularly. Frosty and wet weather stops the masons, the bricklayers, the carpenters, and the slaters, while the painters' work is mostly confined to the summer and autumn months. Considerable loss of time is therefore experienced by many of these workmen during the year. At the present time the wage of the operatives in the building trades is 9d. per hour, their working fifty-one hours a week, which amounts to *l.* 18s. 3d. It must, however, be remembered that the men are not paid for loss of time in bad weather or when out of work owing to slackness of trade. I should say from experience and careful observation that a very large number of workmen employed in the building trades are out of work ten or twelve weeks in the year. This will reduce their average wages to about 30s. per week.”

**The Prevention of Waste.**—This was the subject of an interesting lecture given by Dr. Siemens, president of the British Association, to the students of the Coventry Science Classes on the 20th. Speaking of the waste of mechanical energy, he said that twenty years ago 10 lb. of coal was consumed for every horsepower of effect yielded, which had been by scientific method and mechanical skill reduced to 2 lb. In like manner, in smelting works the amount of coal required to produce a ton of iron had been reduced from seven or eight tons to a fifth of the quantity, whilst a ton of steel was produced with three tons instead of fourteen. Those were instances showing how much waste could be prevented by the proper direction of working machinery, and the development of processes. At the bottom of it there must always be science. No improvement that was not the outcome of first scientific principles could be trusted. If an improvement was merely the result of rule of thumb or rough observation of the working of machines and their effects, it generally led to very partial and doubtful results, applicable only to one particular instance, whereas it was always by the application and thorough comprehension of those first principles in science that the revolutionary inventions of modern times had been brought about. The point to which science and the arts should be directed chiefly, was the prevention of waste, and in doing so they would vastly increase not only the national resources, but individual well-being. An old proverb, “Waste not, want not,” had been in our mouths for hundreds of years, but only now were we beginning to realise it scientifically.

**Bakehouses in Bethnal-Green.**—Dr. Batc, Medical Officer of Health for Bethnal-green, has issued a report giving the result of a thorough inspection of the whole of the bakehouses in that parish, 112 in number. There are 41 bakers who carry on their business in underground cellars. The walls and roofs required lime-washing in 58, and the troughs and utensils were unclean in 22. In 37 instances he found refuse flour swept under the troughs, the refuse being, he says, usually sold for feeding pigs. There were 35 bakehouses badly ventilated and 41 badly lighted. In 14 cases the sink-traps in the bakehouses were defective and the bell-traps were little better than none at all. The traps in the yards next the bakehouses were also defective in 32 instances; in 12 the water-closets were badly placed, but in only one was the closet actually within the bakehouse, though in another case it was in the four-loft; and the closets were either foul, dilapidated, or ill-ventilated in 61 cases. Dr. Batc is decidedly of opinion that the condition of the bakehouses in Bethnal-green is worse than when he last visited them in 1878. The Bakehouse Regulation Act of 1863 ought never to have been repealed. It should have been amended, and the registration of all bakehouses made compulsory, power being given to the vestries to refuse to register unfit premises.

**Completion of the South Shields Corporation Tramways.**—Mr. James Cowans, contractor, of Edinburgh, commenced the work of laying down the above tramway at the Pier Promenade, on Monday, July 24th, and finished it at Tyne Docks on Saturday, October 21st, this being the exact time allowed for in his contract, viz., twelve weeks. The length of the tramways laid down, taken as a single line, is three miles and a half. The gauge is 3 ft. 6 in., and the system is that known as “Gowans's.” The works have been carried out under the direction of Mr. Matthew Hall, borough engineer.

**Vienna.**—According to the *Neue Freie Presse* the magistracy of Vienna have, after an exhaustive discussion during three meetings, at which the project of Ob. Ing. Berger, chief of the Stadthauptamt, found general approbation, unanimously decided for the arcing in of the Wienflöss in connexion with a Stadtbahn, and for the execution of the project within three years, and recommends the Gemeinderath also to accept the scheme. Berger calculates to obtain from the sale of the ground reclaimed by the execution of the project a surplus of three million florins, after defraying all expenses.

**The Boulak Museum.**—M. Maspero, the well-known Egyptologist and Curator of the Boulak Museum, returned to Cairo on the 6th of October. He has made an examination of the contents of the museum, and it is satisfactory to learn from the *Times* that he finds everything absolutely as it was left by him.

TENDERS

For the completion of “Homeward,” Ancland-road, Upper Norwood, for Mrs. Forbes Watson. Mr. C. J. C. Pwley, architect, 26, Moorate-street. Quantities by Mr. C. L. Cadney, York Buildings, Adelphi:—  
W. Henley ..... £2,862 0 0  
J. & C. Bowyer ..... 2,542 0 0  
J. Stuart Hollidge (too late) ..... 2,297 0 0  
J. Holloway ..... 2,270 0 0  
B. E. Nightingale ..... 2,253 0 0  
Turtle & Appleton ..... 2,250 0 0  
T. Smith & Sons ..... 2,197 0 0  
J. O. Richardson (accepted) ..... 2,141 0 0

For the Marlboro-drainage:—  
W. Crockett, St. Pancras ..... £908 10 0  
A. Storr, South Norwood ..... 689 2 6

# CHAPPUIS' PATENTS FOR REFLECTING LIGHT.

## DAYLIGHT REFLECTORS OF EVERY DESCRIPTION, ARTIFICIAL LIGHT REFLECTORS.

WHY BURN GAS?—CHAPPUIS' REFLECTORS DIFFUSE DAYLIGHT.—They are exclusively adopted by and fitted at Buckingham Palace, all H.M. Government Offices, Houses of Parliament, H.M. First Commissioner of Works, the Metropolitan Board of Works, British Museum, South Kensington Museum, Royal Institution, Guildhall Museum, on board H.M. Ships, also Railway Companies' Offices, Hospitals, Institutions, Banks, Insurance Offices, Manufactories, Private Houses and generally from Noblemen's Mansions to Artisans' Workshops. 30,000 in use in London alone. Patronised by leading Architects, Engineers, Contractors, &c., &c.

N.B.—For Prospectuses and Diagrams, address Stamped Envelope to  
**P. E. CHAPPUIS, Patentee and Manufacturer, 69, FLEET-STREET, LONDON.**

NOTICE.—The POLYGONAL REFLECTOR (Latest Patent) FOR ARTISTIC and PICTURE GALLERIES.  
Its construction allows of the angle of light being readily altered so as to reflect in any desirable direction.

### Ionian Antiquities.\*

THE publication by the Society of Dilettanti of the Fourth Part of the Antiquities of Ionia is not likely to be the conclusion of the distinguished services which this private association of amateurs has rendered to the arts since its institution in 1743; but it may be regarded as the completion of one section of the work which it set itself by a standing expression of regard for antique ideals,—for "Grecian taste and Roman spirit." Certainly there has been something of Roman pertinacity in the steadiness with which, through all the variations of national fashion and taste, the principle which the Society originated has been kept in view and acted on, that opportunities were to be made the most of, while it was yet time, to seek out and rescue illustrations of the arts of Greece from the very soil of Greece itself. The results are seen in the publications which they assisted and promoted, from those of Stuart & Revett to Mr. Cockerell's splendid work on the "Architecture of Ægina and Bassæ," as well as those which were more exclusively their own; Mr. Penrose's palmary work on the Parthenon, "an acquisition for all time," and the successive volumes of the "Unedited Antiquities of Attica" and the several parts of the "Antiquities of Ionia," which in the part now before us in some degree by corrections of what went before, and no less importantly by additions of the highest interest, combines at last into a completed work,—a thesaurus of all the aids and materials for the study of Ionic architecture, especially throughout the period of its greatest perfection. It may, indeed, be said that this last part is by far the most valuable of the four, but it will be well that either in the architect's office or his library the series should range together.

The monuments illustrated in thirty elaborate and beautiful engravings and eighteen woodcuts are three Ionic temples of Asia Minor,—that of Athene Polias, at Priene; of Dionysus, at Teos; and of Apollo Smintheus, in the Troad. The authentic materials for these representations of works of ancient architectural genius were obtained by excavations conducted through a course of several years by Mr. Poppelwell

Pullan, at the expense of the Society. The temple of Apollo Smintheus had never been examined before; the other two had been explored, so far as was possible without the means of moving the vast masses of the confused ruins, and only with the effect of suggesting the more thorough examination which has been so fully justified. It is not too much to say that by the certified restoration of the temple of Priene, as exhibited in the admirably engraved perspective view which is the frontispiece of the work, there is recovered for the world the design of a building which is entitled to range with the limited series that are in the very first line for elevation, dignity, and grace.

Besides Mr. Pullan's reports on the circumstances of the excavations, the letter-press by members of the society comprises an introduction by Mr. Fergusson, on the origin of the Grecian orders of architecture, and notes on the architectural fragments and sculptures which were presented by the society to the British Museum. Interesting notes on the sculptures recovered, which have found the same appropriate home, are by Mr. C. T. Newton, who also summarises what is known of the history of the various sites, and interprets the significance of coins and inscriptions. The contribution of Mr. Watkiss Lloyd is a memoir "on the proportions of the Ionic temples of Priene, Teos and the Smintheum," which we apprehend may best be studied in combination with his appendix to the Bassæ and Ægina of Mr. Cockerell. Mr. Penrose brings to bear on the problem of the exact height of the Priene column, the power of analysis which stood him in good stead in his study of the work of Ictinus on the Athenian acropolis. Uncertainty as to this dimension,—so important an element in the expressive proportions of the order,—seems to have been a main and not insufficient motive for the renewed and complete examination of the ruin. It will be seen that in the engraving of a former volume no dimension is inserted, and a height was assigned by conjecture, and that to all appearance not a happy one. Yet the views of the ruins appeared to indicate that they lay much as they had been cast, at some unknown date by one of those earthquakes which we know to have occasionally brought ruin upon entire cities in Asia Minor. More difficulty, however, was encountered than had been expected. The ruins were found to be jumbled in an extraordinary manner, and not to have remained through the ages by any means unmeddled with. It thus appeared that all the slabs of the frieze which there can be no doubt were sculptured, were missing, and the drums of the columns, numerous as they were, lay out of all order amidst and about the mould, and in no case could be taken up with any confidence that juxtaposition on the ground agreed with original sequence as erected. In such case there was nothing for it but to secure accurate measurements of all the

frusta remaining,—their heights and upper and lower diameters,—in the hope, which was justified by result, that they would give up to study at home what it was hopeless to attempt to recover from them as it proffered to measurement spontaneously on the ground. To those who appreciate as a treat and a luxury what so many approach only with self-distrust and under compulsion, the elucidation of a problem by the resources of mathematical ingenuity, we commend Mr. Penrose's appendix. It will be obvious how the interference of the element of entasis frustrated any deduction from the comparison of upper and lower diameters of the column and a uniform intermediate rate of diminution as discoverable from the better preserved frustra. The key of the question was, in fact, the independent determination of the special entasis. A beight for the shaft was in this manner ultimately obtained and was further certified by coincidence with a proportion of diameters to height which is favoured by authorities, and still more importantly by beauty of effect. A restoration of the temple was attempted by Messrs. Olivier Rayet and Albert Thomas, in their learned work, "Milet et le Golfe Latmique," of which the second *livraison* appeared in 1880. They had the advantage of working upon the ruins as uncovered by the Dilettanti Society, but were content to adhere to the stunted height of the column, which has already been found unsatisfactory as adopted in an earlier part of the "Antiquities of Ionia." The comparison of the elevation as they give it with that which is presented on the authority of Mr. Penrose's conclusions will probably leave doubt with few as to which we may adopt with full confidence of having the Greek architect on our side.

The temples of Priene and Teos are both hexastyle, and differ very little in dimensions, their breadths approaching as nearly as 69.60 and 72.33. Again, the free intercolumn at Priene is given as 5.810, and the corresponding interval at Teos is 5.950, but the greater diameter of the Priene column gives a relatively closer spacing, and with the superiority given by its majestic beight it realises a dignity of effect which distances all comparison. The uniformity which is sometimes imputed to Greek temples is due, in fact, to the defective sensibility of the same nature as that which Dr. Johnson exemplified when he said, "He who has seen one green field has seen all green fields." Agreement in broad distinctions obscures, to a novice, those all important differences which render it incomprehensible to others how one racehorse can be mistaken for another, one musical air for another, or how a new acquaintance blunders between different members of a family; nay, how a traveller can be so unobservant as to think all Chinamen alike. Temple resembles temple as the physiognomy of one brother corresponds with that of another,—resembles it so, and not otherwise, that is, reserve being

\* Part IV., published by the Society of Dilettanti.

made of very sufficient indications to the eyes of familiar of most contrasted temper and disposition.

The free intercolumn of the *Smithium* is again as near to the average of the others as 5:805, but differed in this case by less opening than at Teos, the lower diameter of the column being 3:870 to compare with 3:380, and less close than at Priene. This temple is octastyle, and might be called pseudo-dipteral, but that it does not seek an advantage by putting forward a false pretence. The ambulatory is spaced of width sufficient to admit of a double row of columns all round, but no such row was introduced, as usually in the pseudo-dipteral arrangement, even on the fronts. In this temple, therefore, we have a unique example of an ambulatory that was too broad to be spanned by marble beams, and must have been roofed throughout by aid of timber.

The Priene temple was raised on only two steps below the proper stylobate,—that at Teos had five, while the *Smithium* was raised 10 ft. all round above the general platform by ranges of ten steps. The capitals of the columns of all three have differences of refinement of the same dependent on delicate modifications of the same elementary members, and all are destitute of the enriched necking of the Erechtheum columns; but the bases have remarkable differences. The Teos column has a proper Attic base only set on a plinth, which the Athenian architects disallowed. The bases of the *Smithium* are without a plinth, but vary from the Attic by the interpolation of a second scotia between the upper and lower torus. In general structure the base of Priene may be said to agree with this, except for the omission of the lower torus. It is probable, however, that Priene presents us with the more original type of base of the Ionic of Asia Minor, and that the addition of a lower torus was a later innovation. This later type assuredly commends itself preferably to our sympathies, though there can be no question that the Priene temple is, on the whole, and in general study and execution of details, the far superior work. The value or the objectionableness of this form of base may be studied by observation of Mr. Cockerell's reproduction of it in the portico of the church in Regent-street. We trace in it an endeavour to endow with gracefulness an original type, of which a cruder form has been preserved in the archaic base of the Samian temple. The date of the design of the temple at Priene, which may have preceded by some decades the completion, may probably fall within the half-century following 360 B.C., as the dedication of it by Alexander the Great is recorded in a beautifully-executed inscription, which may be seen on the original marble in the British Museum. The dates of the other temples are uncertain, but quite as likely to be earlier than later. Any attempt, therefore, would be frustrated to link them in a sequence of regular evolution of style. The Priene base may be as easily a survival as an intentional revival of an archaic type which had been variously modified, and taken different directions of development in various sites and among the numberless monuments of importance that have perished. From this point of view we may, perhaps, fairly speculate as to the course of the development, without attempting to localise the introduction of each successive change, or to make any inference beyond general order of succession. Tentatively, then, we may assume two primary centres of development, a Western and an Eastern, for the composition of the mouldings which are in question. For the West we claim the primary type of a scotia interposed between an upper and lower torus of varied proportion, as already adapted for the capital of the pillar of the Lion Gate of Mycenæ long before some man of genius discerned that the combination was more fitted for a base. In the East we may start from the base of the Samian column, a torus grooved with horizontal channels, and superposed upon what may be called a very high but very shallow scotia, which likewise receives horizontal channels in its hollow, as the torus on its swelling profile. To this the Priene base, late as it is historically, comes next in order. The channelled torus, here as at Samos, is united to the apophyse of the shaft by an annulet, but the sub-base is now made available for more decided contrast; the numerous channels are superseded by a pair of bolder scotias, divided and bounded by double annulets, and resting on a plain square plinth. The refinement of the profile of this base may

be appreciated in the enlarged outline given at plate xi. of the work before us. And yet it may be doubted whether it is truly an artistic improvement upon even the Samian type. Enriched hollows separated by slender projections introduce a weakening and frittered effect precisely where there is demanded an expression of adequately responsible solidity. The Athenian architect knew how to avail himself of all the suggestions of enrichment and embellishment which such designs afforded, and yet to preserve unimpaired all the suggestions of structural propriety. In all the bases of the Ionic columns of the Erechtheum, the annulet below the apophyse is suppressed,—it is admitted in the little temple of Nike Apteros,—and in all we have the true Attic type of the paired torus with a bold intermediate scotia. On the eastern and western fronts the upper torus is grooved with horizontal channels divided by narrow fillets; on the eastern base by a further variation it is embraced by a plated guilloche. The lower torus is in every case left plain. This, however, is not the case with the bases of the antæ, and its extension along the wall of the so-called caryatid portico,—the "Stoa of the Maidens" of the inscription. The lower torus in these cases contrasts with the upper by convex instead of concave treatment, by exhibiting place of concave treatment, by exhibiting place of convex treatment, by exhibiting place of concave treatment, by exhibiting place of convex treatment. In the annulets in section instead of channels. In the less ornate order of the beautiful little Ionic temple on the Ilyssus, we have the plain Attic base which is adopted at Teos, where, however, it is set upon the square plinth. At the *Smithium* the architect approached so far to Attic practice as to substitute a torus for the omitted plinth, while he favoured that of his own side in the *Ægean*, so far as to adopt, though in a simplified form, the double scotia, and, it must be said, almost forfeits, in consequence, all the advantage of his judicious innovations.

This temple, there can be no doubt, was the successor, and probably occupied the site of that which was served by Chryses,—that is, by the priests he poetically represented,—who, in the first book of the "Iliad," calls down the vengeance of his god,—whom he appeals to as *Smithium*—upon the sacrilegious Greeks who have robbed him of his daughter. It is quite true that Homer settles Chryses and his temple much nearer to the seashore; it served his manifest convenience to do so, and students of Homer did not need even the excavations of Dr. Schliemann, or the geognostical survey of the Troad by Professor Virschow, to be aware how elastic was the poet's conscientiousness with respect to space or to time either when a poetic purpose was to be attended to at any sacrifice. We ourselves seem to have wandered away in a digression from a general consideration of the book which supplies our theme. Let us, to find our way back, take ship with Ulysses and his chorus of young men on their return to the camp after appeasing the angry divinity by reparation at the *Smithium*—

"So soon as the daughter of dawn appear'd rose-finger'd  
Eyes,  
Immediately launching were they to return to the camp  
of Achæians;  
And the Far-darter Apollo sent forward a gale in their  
favour,  
And they stepp'd the mast and the white sails above  
expanded,  
And full fairly blew the wind in the sail; and the wave  
on both sides,  
Purple about the gunnel, made loud sound, the vessel  
going;  
And she ran to meet the waves, so speeding on her  
passage;  
And when they had reach'd the spacious camp of the  
Achæians,  
On to the mainland did they haul the safe vessel,  
Up on the sands very high, and extended the long props  
beneath her,  
And went themselves dispersing about the tents and the  
navy."

(A literal and lineal translation.)

The introduction, by Mr. Fergusson, treats in detail of the origin of the Doric and Ionian orders, and with his well-known perspicacity and vigour he traces the obligations of each, to Egypt on the one hand, and to Assyria on the other, the fine skill with which the Greek developed from foreign materials and concurrently two styles of distinctly-marked characteristics which yet were participant in certain leading principles that stamped them as equally available for sacred national architecture. It was from the dignified architecture of Egypt that the Greek learned the value of extended colonnades and a rectangular plan, of the enhanced verticality of the fluted column. It was even from Egypt that the Greek ultimately took the hint for the relief of the

hard outlines of Ionic construction by embellishments founded upon floral forms and luxuriant vegetation. But whatever the Greek borrowed he thoroughly assimilated; he made it thereafter far more Greek than barbarian, and this he did partly by direct transformation, and partly by subtle elaboration. So it was that he superinduced upon his Egyptian borrowings the refinements of entasis of the shaft and geometrical development of the flutings, and in appropriating the Oriental entablature of which Mr. Fergusson engraves an example, while he retained for his Ionic order the triple fascia of the architrave, he either suppressed the expression of rafter ends above it entirely, as in the Attic examples, or moved them up a stage, reduced to an ornamental modillion course above the sculptured frieze. In the representations of archaic Doric architecture on the vase, we see that it retains the erect cornice of the Egyptian pylons, but in the very earliest monumental remains this position and profile, appropriate for a rainless climate, is corrected, and the cornice, turned forward to a right-angle, becomes a proper drip-moulding and protection for the face of the wall. In one particular, and for once, we hesitate to follow our so learned and so experienced guide; Mr. Fergusson, after pointing out the taste and skill with which the Ionic Greeks adopted the general proportions and modified the voluted capitals of such columns as those of Persepolis, has the further remark,—“The Greeks never, unfortunately, adopted the Persepolitan bell-shaped base, which is one of the most pleasing features of the style; perhaps they thought it too lofty, being about one diameter in height.” Such a motive would in itself assuredly be sound as affecting an architectural member of which recumbency and not creteness is the appropriate expression, but we believe there was a sounder motive still. If we follow the practice of the Greek architects of the best ages, we shall find that in their base mouldings they uniformly avoided a profile which conveys the impression of the pressure of shaft or pedestal, being carried down to rest upon an edge at its last attenuation. If the Greek had made use of the Persepolitan base at all, it would have been to turn it upside down and employ it as a capital, in which position the taper leaflets which clothe it would, moreover, be reminiscent of the natural direction of growth. Indeed, the capital of the Tower of the Winds at Athens exhibits the precise equivalent of such a transposition. The Roman architects, or it may be the Greek architects, in degraded Roman times, changed all this. When their more noble predecessors made a change from an established precedent, it went often to the extent of an entire reversal, but ever with the direct motive and result of superseding an incongruity and substituting an expression of consistency and truth. Less gifted practitioners in those days, as it has happened not infrequently later, resorted to random reversal of traditional models as the method of compassing stimulant novelty, as a modern critic in desperation of an original idea betakes himself to paradox, denounces the drawing of Raffaele or the dramatic instinct of Shakspeare, as the barren of conversational power can always find something to say by a flat contradiction of any one who unguardedly ministers an occasion to them. There is no more certain conviction of an architectural profile as of the lowered style—or, let us say, practice,—of the Roman as contrasted with the pure Greek period, than the termination of a base moulding by a concave instead of a convex profile; the final curvature of the Greek is either that of the independent torus or of a similar profile blending continuously with a scotia more or less pronounced above it, or the somewhat less decided *eyne reversa*.

It is in the greater variety, more complex combination of mouldings and the liberal admission of profiles of double curvature, that the Ionic style contrasts with the austere Doric rather than in an advance in refinement upon those which the Doric employed. The editor of this volume merit gratitude for the number of plates that they have devoted to large-size profiles of mouldings which were accurately taken by the assistance of the cyanograph. They are all of great delicacy and elegance and not least those which belonged to base and cornices of merely secondary pedestal within and about the temple. The importance of reproducing these graceful details upon a sufficient scale may be appreciated by com-

paring the plates before us with the small representations of the same mouldings,—that is, of a few of them, which appear in the reductions of Messrs. Rayet & Thomas. A note of Mr. Fergusson reflects on these gentlemen, not perhaps, uncharitably, as having "shown haste to anticipate the publication by the Dilettanti Society of the results of the excavations made at their expense at Priene"; they may plead on their part that allowance must be made for zeal, even though it be zeal which outruns discretion. But the truth is that when elegance, accuracy, completeness, and finish are in question there has been no anticipation whatever of what constitute the distinctions of the beautiful work which it is our pleasure to commend to an appreciative reception by the profession. There is yet one more service which the profession may not uncharitably look for at the hands of a society to which it already owes so much; but the suggestion of this will be most appropriately conveyed in the first instance direct to the Society of Dilettanti itself.

#### THE ART OF THE ARABS.\*

WE may continue our glance at the art of the Arabs, with a notice of their domestic architecture and the industrial arts of the people who have occupied the land of the Pharaohs for the last 1,200 years, and who have left so deep a mark on the Egypt of to-day.

The history of Egypt is a long series of constant invasions, conquest, and revolutions. Cairo, as the capital, has naturally suffered severely in these changes; the city, however, still retains, in addition to many of its ancient mosques, some few admirable specimens of the domestic architecture of its past and brilliant days. Ravaged as Cairo has so often been, no unimpaired relic of the former homes of the caliphs and sultans has been handed down to our time, except the gate of the palace of Sultan Beybar and a few interesting remains of private dwellings, amply sufficient, however, to show that the splendour displayed by the Arabs was not confined to the decoration of their mosques. The endeavour at improvement, and the scarcely less destructive influence of fashion, have in many cases aided the work of war, and swept away many of the relics of the past, substituting for them the incongruities of European taste and Turkish vulgarity, but there fortunately exist in Cairo some few houses which retain the character, now as lamentably deficient in the modern buildings of the East as in those of the West.

The old houses of Cairo are invariably solidly built, the ground-floor of stone, the upper stories of brick. In plan, every means were adopted to ensure that entire secrecy of private life which constitutes so essentially the character of the Egyptian Mahometan; and exteriorly, as we have previously remarked, the utmost simplicity was aimed at, with a view to discouraging possible attack from marauders, or from exciting in any way the enmity of a too exacting royalty. The entrance to the house is in many cases a marvel of military architecture, with massive doors and intricate vestibule. Above the gate of the house of the Sultan Beybar, one of the few remaining relics of the past domestic architecture, can still be seen a frowning machicolated *moucharabiyeh*. Once, however, the interior is reached, the scene changes. The *salamluk*, or *mandarah*, the reception-rooms, are as lavishly decorated as the exterior is grim. Tiles, fountains, divans, rich hangings, and gildings meet the eye in every direction; the walls opposite the door agreeably covered with a series of architecturally-treated shelves, on which are arranged various vases and utensils, rare china, and other *bric-à-brac*. From top to bottom the other walls are covered with tiles, usually Persian; the windows filled with delicate grating of bronze work, the woodwork intricately carved and inlaid, the ceilings abuzz with arabesques and gold, contrasting delightfully with the rich blue of the tiles. Of furniture little or none, the divan supplying all needs. Not the least important feature, as taking a conspicuous part in the decorations of the room, deserves mention the *moucharabiyeh*, or projecting covered balcony, a sort of oriel window (suggested, perhaps, by its Egyptian counterpart) completely caged in by delicate latticework.

A further element of the interior decoration deserves mention, the windows,—usually about 2ft. broad and 3ft. high,—filled with stained glass of conventional design. The large rooms are generally very high, in order to ensure coolness, and ventilation is obtained by large open garret windows, constructed so as to catch the breezes, and send a draught through the house. The ceilings of the room are in every case of richly-decorated woodwork, the rafters painted; below the ceiling stretches a long frieze, generally containing a verse from the Koran.

Decorated in this manner, the walls of a Mussulman's house are very different to those of our West. Amply supplied with quaintly-conceived, yet handy, cupboards and shelves, the wall-spaces richly covered with tiles or carving, and divans stretching along one whole side of the room, to serve in day-time as a sofa, at night as a bed, the only furniture necessary to move into such a place is a few carpets, a few cushions, a table, an inlaid piece of work suggesting more a stool than that sturdy article of furniture, a few odds and ends, and simple cooking-tensils. The bath, in the present day as in the past, takes a great place in the best houses, often supplied with two or three bath-rooms, each with a stove and retiring-room. As for the portion of the house reserved to the females, the strict privacy in this respect which the Mahometan religion enjoins, has from all time led to a very distinct separation of the women's quarters from those visited by the stranger.

As builders, the Arabs have never greatly excelled, they at all times have relied, as we have more than once repeated, on Christian assistance, which, originally afforded by the Byzantine workmen, is continued to this day by the Christian Copts. In our time Mehemet Ali employed Greek workmen as the most capable. Plans, such as we understand them, we have ample evidence, were unknown to the Arab architects of the past.\* A general idea of the plan is given by tracing it on the ground with some dry plaster, but beyond this the whole scheme is carried out by the architect as the work progresses and in accordance with the requirements of his client.

The masonry is usually that known to the Greeks as *opisthokoma*, a facing of regular stone-work, with a centre of rubble. The courses proceed alternately a square stone and a parallelogram. From a very early period the joggle-joint, so peculiar to Arab architecture, appears to have been used, apparently with a view to obtaining greater strength. In spite of the weakness of this mode of construction being soon recognised, and discharging arches having therefore to be used, the decorative character of the joggle over-ruled all other considerations. It will be sometimes found even imitated by incised lines on the marble lintel of a doorway, apparently out of that sheer fancy which seems so largely to have directed the Arab artists in their creations.

Some interest attaches to these experiments of the Arab architects from the fact that this may perhaps have led in a measure to the introduction of the ogive or pointed arch, first met with as an acknowledged architectural feature in the mosque of Touloun (ninth century). It is not our intention to enter here into the vexed question of the pointed arch. But in the above-named mosque the pointed arch will be found used as a leading motive. One interesting feature *Prisse d'Avennes* has drawn attention to. The Oriental pointed arch key-stone is this rarely the case in the Gothic pointed arch, the vertex of which is formed by two voussoirs meeting directly in the centre. As tending to show that the Europeans may not perhaps have borrowed from the East the pointed arch, this detail is worthy of note.

As we have so far allowed ourselves to digress with the pointed arch, the dome forms a scarcely

less characteristic feature of Arab architecture, and the peculiarities of the construction of which, in the hands of the Mussulman, have not ungenerously been explained by the suggestions of the observation of the vegetable forms of nature on which the Arabs were thrown from the restrictions of their religion. The German authority, *Salzmann*, has suggested the common water-melon as affording, in its horizontal section, the exact hemisphere of the Arab dome; the vertical section of the same fruit giving other forms to be met with in Arab art. The honeycomb pattern (further asserts *Salzmann*) was perhaps suggested by the interior of the melon cleared of its seeds.

As wood-workers, the Arabs have at all times excelled. Egypt, rich in rare marbles, has from antiquity been deficient in forests. This want of wood has, however, in no way hampered the inventive skill of the Arab wood-workers. Their intricate, incised, and inlaid patterns of ivory and mother-o'-pearl, their complicated joinery, necessitated by a dry climate, are only the more wonderful when it is seen how primitive are the tools and methods in use. In the mosques, the pulpits, and doors are invariably most complicated works, while in the interiors of the older houses no small portion of the lavish decoration are the creations of the carver and carver. In the *moucharabiyehs*, so conspicuous a feature of the Arab house, all the skill of the wood-workers' art was displayed. A perfect cage of lattice-work, there will sometimes be as many as 1,200 separate pieces of delicately-turned woodwork in one square yard. This characteristic art is, however, now dead in Egypt. It still flourishes on the coast of the Red Sea, so *Prisse d'Avennes* tells us, but European influences are driving out the picturesque *moucharabiyeh*. Fortunately, in the native quarter and older parts of Cairo, they will still remain for many a generation to come, to give their peculiarity to the City of the Caliphs.

As stucco-workers the Arabs have intrinsically excelled; wonderful, indeed, are their intricate arabesques, which we see carried to the wildest extreme in the Alhambra; there, however, let it not be forgotten the ornaments are almost in every case pressed out repetitions, while in the earlier and purer art such decorations are each the work of hand. The traditions of their art the Arab plaster-workers have retained almost to this day; the plasterers most in esteem in France coming from the southern provinces, where the Saracenic traditions have left deeply their trace. Intricate as may appear the arabesques used by the Mussulman artists, their composition is, as has been shown by more than one authority, purely geometrical, and when analysed will be found most simple. This simplicity especially marks the work of the earlier days; in the ornamentation of the purest period, the ground is usually coloured red, blue, or green, the projections remaining white, or when decorated, a line of yellow on a red, blue, or green ground. As to white and gold, they will chiefly be found in ceiling decoration. Analysis proves these colours to be, the blue, ultramarine; the green sometimes verdigris, but most often nitramarine and yellow, of vegetable origin; the red, vermilion, or sulphuret of mercury. What skillful use the Arab artists made of these simple yet effective colours, all in any way familiar with Eastern art know well, but the most successful triumphs of their decorative talent are, it cannot too often be repeated, not to be found in the Alhambra, but scattered over Cairo and Bagdad in the few remaining early mosques of the purer period, in which will be seen in all its power the marked simplicity and breadth of decoration which forms one of the characteristic features of the best Arab art.

As an important element of effective decoration the Arabs have at all times largely employed mosaic,—an art, it can be understood, they acquired from the Byzantines; but here again their own peculiar originality soon marked out characteristic differences. The work known as *opus Alexandrinum*, such as still is to be found in the Mediaeval churches of Italy and in our own Westminster Abbey, has at all times been largely used until very recent days in the mosques; and the South Kensington Museum possessing a series of curious specimens of the work taken from a seventeenth-century Cairene mosque. In addition to the *opus Alexandrinum* used for floor work, the walls were decorated, as in Byzantine art, with mosaics of vitrified paste or *smalto*, less costly and more effective than

\* Sir Geo. Birdwood, in a recent letter to the *Athenaeum* (Sept. 23), has drawn attention to the fact that in India the native architects to this day use no plans, the mason's work being usually discussed with the builder and the workmen at the close of each day's work. Certainly the evidence of an Arab writer of the twelfth century, *Abdel Latif*, may be brought forward to show the antiquity of this custom. "When a palace or other edifice has to be built," he writes, "the architect to whom the execution of it will be the different portions, and terminates them one after another, so that each may be used and occupied as it is completed."

\* See ante, pp. 292, 231, 297, 320, 359, 452, and 486.  
\* The word *moucharabiyeh* is derived from *charab*, to drink, being the custom to place vases containing water to cool the draught of the latticed window.

the mosaic of coloured marbles, a matter of no small consideration with the Arabs. As for tiles used for decorative purposes, they may be said to constitute one of the most important features of Arab architecture. Early found to possess, at a far less outlay of time and expense, all the effective qualities of mosaic work, tile work developed exceptional beauty in the hands of the Arabs and Persians. The oldest tiles, those of pure Arab style, decorated with Koulic characters,—for later on the Persians monopolised this branch of art,—are small (about 4 in square), the ornaments in slight relief. They are of excessive rarity, their manufacture having ceased at an early period. Andalusia, in Spain, at one time, it would seem, produced large quantities of tiles. In the best period the decorations will be found to be large and grouped on a number of tiles; the designs, it will be noticed, are only continual modifications of a general motive, and this may be observed through centuries. Our decorators, ever painfully in search of so-called original, and too often only eccentric, designs, would do well to learn from their Eastern brethren something of this admirable method of producing their artistic results.

In the extraordinary splendour of the sumptuary arts of the East, no small influence may be traced to the lavish magnificence of the Caliphs and Sultan. To the treasures of the palace of the Caliph Mostanser and of Saladin we have previously referred, and the traditions of this splendour have to this day been retained by successive Eastern rulers. The East, indeed, is the land of the sumptuary arts. The rich woven fabrics, the gorgeous embroideries in which the wealthy revelled in the East, composed alike the costume and surroundings of the church and court of the West. To this day in the sacristies of more than one Northern cathedral the vestments will be found to consist of rare specimens of the skill of the Eastern looms in the Dark Ages, when for such luxuries we were dependent on the East. Egypt during centuries was the Flanders of the Middle Ages, and the looms of Damietta were busy in the production of rich fabrics, the smallest fragments of which we now treasure at their weight in gold. In later centuries the Italians were to imitate the Eastern patterns; not a little of the splendour of the Renaissance and even earlier Italian stuffs being largely imitated from Eastern examples. It is, however, worthy of note that the workmen who produced in the now almost dead cities of the Delta the rare and costly fabrics which clothed the Caliphs of Egypt and Persia, the emperors at Byzantium and the popes and princes and high Church dignitaries of the West were Christian Copts who have at all times exercised a powerful influence on Arab art. Little is known of these busy Egyptian looms but that they were active as early as the eighth century, and generation after generation continued to produce their delicate fabrics, which the merchants of Venice, of Pisa, and of Genoa scattered over Europe.

A branch of the same industry, that of carpet-weaving, is also one in which the Arabs have long excelled, but no single specimen of the art in the Middle Ages has been spared. From the Arab writers we learn of the splendour of the carpets used by the Sultans of the tenth and eleventh centuries, while the rare specimens we possess of the fifteenth, sixteenth, and seventeenth centuries, often woven with gold and of the most delicate colours, only serve to show how degenerate has become the modern art of the Arab carpet-weaver.

How profusely and lavishly the Mussulmans used draperies for all purposes is shown by the luxury of their tents, described by the old writers. The description of Arah Pasha's tent, captured in our recent victory at Tel-el-Kebir, still fresh in our minds, singularly proves how abiding are the traditions of Eastern military splendour.

Hangings of the most costly nature, we have the evidence of the Arab writers, were largely used in the past to cover the room during winter-time, while their divans to this day afford the Oriental the excuse for the utmost expenditure of luxurious beauty.

As glass-workers, the Easterns have peculiarly excelled, and the rare Medieval lamps,—one of which, purporting to have belonged to Saladin, is justly considered one of the treasures of the South Kensington Museum,—hanging to this day in some of the older mosques in Cairo show how delicate was the art of the glass-worker

and enameller in the Middle Ages.\* With the fourteenth and fifteenth centuries, when the art had arrived at its highest perfection, Venice succeeded, through a study of Eastern examples, in establishing her fame for glass, and now in Cairo, a once famous and prosperous branch of industry has completely died out.

Among the other sumptuary arts of the Arabs stands conspicuous their skill as damascene-workers. From an early period they appear to have possessed vases of latten covered with finely-engraved patterns and suggestive inscriptions. The oldest specimens of damascene work,—originally work from Damascus, "*Lavoro alla Damascina*," the Italians term it,—do not appear to carry us further back than the commencement of the eleventh century, to which belongs the quaint griffin carried by the Crusaders to Pisa, where it now forms one of the treasures of the interesting museum established in the Campo Santo of the famous cathedral. With the twelfth and thirteenth centuries the art would seem to have reached its fullest development, the name of the artist being often found engraved in connexion with the invariable inscription glorifying the possessor. Here, again, Italy was indebted to the East for its skill in damascene work, an art which still feebly exists in Spain and in Cairo; but the days when the Arab warriors lavished on their arms the utmost resources of the damascener's skill are gone, and only in museums can we study the brilliant past of a once prosperous branch of the industrial arts.

Before leaving the subject of the sumptuary arts, a word is due to the skill and beauty displayed by the Arabs in the art of calligraphy. Their Koráns,—not alone to know which by heart, but to have copied every word, is a duty enjoined on every good Mussulman,—are among the choicest creations of the art of the past. The exquisite delicacy of the missals produced contemporaneously in the quiet of our Northern cloisters, is scarcely surpassed by the beauty of some of the old Persian and Arabic manuscripts still in existence. The art is one which, though its past is its most glorious period, has been allowed to decline but slowly, and the delicate manuscripts of Persia, of even the seventeenth century,—such as, if we mistake not, that which forms one of the treasures of the Sonne Museum,—are scarcely less beautiful works than the earlier productions of the Arab scribes, in the practice of whose art Saltans themselves have been proud to indulge and excel.

Refined, in fact, in all their existence in the past, the Orientals of to-day are but the creatures of a long train of traditions. Their respect for their past is almost dead, modern influences they worship, and the civilisation of our West, so largely built up on original Eastern foundations, is slowly working its destructive influences on the creations of the past. The East, once the home of the arts, is now indifferent to their existence, and it is now practically left to us Europeans to rescue from neglect and from ruin what still remains in the East of a once brilliant and gorgeous civilisation to which we owe so many elements of our own refinement and culture.

#### THE ANTIQUITY OF THE EGYPTIAN VAULT.

It must be admitted, we think, that until very recently, in all perhaps but speculative or political quarters, any mention of Egypt has been usually connected in the public mind with inevitable vistas of museum-guarded mummies, mysterious hieroglyphics, vague Biblical memories, and even vaguer notions of the period when all these age-dried antiquities formed the active factors of a living civilisation. Of late, however, we have all found ourselves taking a very different interest in the land of the Nile, and while, but a very short time since, the news that reached us from Egypt announced from time to time the wonderful discoveries of fortunate antiquaries, little heed has of late been paid, notwithstanding articles in our own pages and elsewhere, to the distant generations of Pharaohs so long dead and buried. But now that the clang of war, with its thrilling incidents of the moment, has ceased to resound

\* The Museum of Chartres possesses a glass cup sent by Haroun al Raschid to Charlemaigne (eighth century), a delicate work of art, decorated with an inscription wishing its owner "Glory eternal, long and healthy life, and perfect happiness."

in Egypt, once more the conquests of the antiquary will be resumed, and, let us hope, under conditions even more favourable to their prosecution.

Egypt and the civilisation of its distant past will always command with the cultivated world a special share of interest from the peculiar position it holds as the precursor of that Classic civilisation on which we have so largely built up our modern complicated existence. There is, indeed, much of our wisdom, our life, and our art that through Rome and Greece can be traced back to the banks of the Nile. We are all aware how largely our architecture is derived from that of our Classic forefathers, who themselves, again, acquired so much of their learning from the Egyptians.

From the stores of his wide professional erudition M. César Daly has recently endeavoured, in the pages of his *Revue Générale de l'Architecture*, to prove an interesting theory of his concerning the great antiquity of the Egyptian vault, the origin and history of which, as the eminent writer truly observes, are singularly involved in obscurity. To the proof of his statement that the vault will be found not alone in the architecture of the Egyptians of the historic days, but in that of pre-historic ages, M. César Daly, with his usual familiar facility of expression and agreeably displayed learning, brings the result of an extensive professional observation. Coming from such an authority, M. Daly's views respecting the antiquity of the vault may be regarded as a distinct acquisition to the literature of architecture.

Research into the origin of a great people is so constantly, as the writer remarks, met by the evidences of exterior influences, that the difficulty is considerable in tracing any single point to its apparent origin. If, however, a continuous and uninterrupted evolution,—one social, political, religious, æsthetic, and technical,—ever did exist, we shall find it in Egypt. Isolated as the country was, eminent authorities have none the less urged on philological grounds that Egypt was originally occupied by a band of Asiatic emigrants; but, should this view be correct, the civilisation they introduced must have been singularly imperfect, for not a trace of its existence is to be found in the arts of Egypt.

The geographical character of Egypt, a narrow valley of verdure, stretching between two vast deserts and watered by the Nile, has of late been made too familiar to render necessary any lengthy details. The Mediterranean, we have evidence, formerly reached as far south as Cairo, the vast tract of the Delta having been formed by the alluvial deposits of centuries; the deposit in the present day being as active as ever. The excavation of many Egyptian edifices has shown that the soil has risen round their base since their construction,—at Thebes, M. Daly says, as much as 16 ft. The Nile, in addition to thus having created the very soil of the country ("Egypt," said Herodotus, "is a gift of the Nile"), has served from all time as the great highway; the rafts of branches and reeds still used on the river resembling unquestionably those used in the most distant days. Along this silent highway has passed all the traffic of Egypt during thousands of years.

Wood, suitable for building purposes, is, and always has been, rare in Egypt, while the quarries have at all times been numerous. As the inhabitants acquired the knowledge of the use of tools, they commenced to utilise the stone, while at the same time they used bricks. The existence, however, of this comparatively advanced state of civilisation pre-supposes a much earlier stage, prior to this period, before the invention of the tools requisite to work the palm, the sycamore, and the acacia,—the chief wood of the country,—or the limestone, the granite, and still harder porphyry.

How, asks M. Daly, were the Egyptians lodged, say 10,000 years ago? A period at distant as this is positively needful, he urges, the oldest specimens of Egyptian architecture and sculpture showing clearly the evidences of a long previous technical and æsthetic experience, so slow, too, when unaided, is the early progress of a nation. It is outside the question to speak of the caves that formed man's first shelter; on the same ground, the tent, that early formed the home of the wandering Egyptian, is too foreign to the development of architecture,—and especially of the vault,—to require attention.

What was the first form of fixed habitation that the prehistoric Egyptian built for himself? The materials at his disposal were not many; scattered about he found stones; in the river, reeds; on the banks, mud. With these simple materials the primitive Egyptian built a hut just as does to this very day his scarcely less fortunate descendant the *fellah*. A square hole dug in the ground surrounded by four walls of mud and reeds, a roof of cane covered again with branches and grass, amply sufficient in a climate where it never rains, but where the dews are abundant,—such is the hut of the modern *fellah*. Though it might be imagined that it would have been preferable to build the walls of stones, yet such a system has never prevailed, even to this day, the mud walls being probably found to resist better the night dews and the heat. At the present moment unbaked bricks are preferred by the *fellahs* to stone, except where mud is not to be obtained.

Primitive as is this system of building,—requiring no other tools but, perhaps, a piece of stone or the horn of some animal,—it is M. Daly's opinion that the prehistoric Egyptian must have adopted an even more simple method of making for himself a shelter. "He formed a heap of sand of about the desired size of his hut, he then threw over this a layer of Nile mud; the mud, once dry, he simply dug out by an aperture,—eventually the door,—the sand which had served as a mould, and his house was made, without stone, without scaffold, or without reeds." With a circular base the form of this shell would necessarily be that of a blunted cone, which, affording but very small interior space, experience would soon dictate an ovoid or beehive shape. When, however, such a habitation had to be enlarged, from the inability of the constructor to cover anything but very narrow space, the plan would have to be lengthened and the hut given something of the form of an up-turned drain-tile. This view of the progressive advance in the form of the vault, M. Daly urges is supported by the ovoid curve found in the old brick vaults still existing at Thebes and elsewhere. Such a hut,—to be found to this day in Egypt,—is essentially one of the primitive forms of the human habitation.

"The oldest house in Egypt offers, therefore," says M. Daly, "the rough appearance, in the first place, of a dome, and, later on, of a vault. This conclusion will surprise some architects accustomed to consider these forms as the work of the maturity of architectural skill, and not as being the first-born productions of its genius. Here the dome precedes the vault as it does the isolated arch; absolutely the inverse of the generally accepted idea, that the arch preceded the vault, and the vault the dome, a view the result rather of abstract and scientific than historic research.\* The vaulted arch is, in fact, simpler in conception and execution than the architecturally-constructed vault, and this, again, than the dome. The error, it is M. Daly's opinion, arises from the theoreticians having somewhat topologically argued from the idea to the fact, instead of from the fact to the idea, as also from an imperfect distinction having been drawn between the *form* and its *execution*. Hence the moulded forms of the dome, the vault, and the arch have been entirely lost sight of. A study of facts would, he argues, have certainly avoided such confusion. A knowledge, even superficial, of the savage hut in the different parts of the world would have sufficed to show that we find, in a rough state, it is true, in the rudimentary efforts of primitive peoples,—anterior to the creation among them of a style of architecture proper,—almost all the regular forms which have served successively as the basis on which the *styles* have been constituted."

While mud is still largely used in Egypt as a building material, M. Daly states that it has long since ceased to be employed to form such moulded vaults as he describes being made in the past. Mud is still used for many purposes,

\* The form of the arch, M. Daly urges, may have originated with that of the dome, for the door of the beehive hut may have been arched; the isolated arch, on the contrary,—as we see it in the Roman triumphal arch,—must have appeared only late in the architectural evolution, being probably posterior to the invention of the brick. M. Daly states from his experience in Egypt that he has never met with the isolated arch, except, perhaps, at Assiut. As to modern Egypt, arches will be found in the *harems* of those *fellahs*' houses which are covered with the isolated vault; a vault which, however, is closed at each extremity by a straight wall, in one of which will be found the entrance to the house. Historically, remarks M. Daly, it seems to me that the form of the arch is as old as that of the dome and the vault, but that its isolated construction by voussoirs is later than theirs.

to form, for instance (modelled into various rude architectural shapes), the tomb of the *fellah*; but, excellent reasons explain the discontinuance of its use for the moulded vault. In the first place, such a form of roof could alone be used to cover a very narrow space, for it easily cracks; while a vault of unbaked bricks possesses an elasticity permitting of its use over large spaces. With the invention of the unbaked brick,—easier to transport than wet mud,—the principle of rude architectural construction must have soon replaced the primitive method of the sand mould. To this day the house of the *fellah*, with its vaulted roof of unbaked bricks, will be seen in every village side by side with the primitive hut simply covered with branches, reeds, and grass. "The two systems of houses," writes M. Daly, "the flat roof and the vaulted, are at this very moment still to be found existing together, as they did doubtless thousands of years ago, with the sole difference that the invention of bricks has introduced into the execution of the vault a greater correctness of form and a science of construction unknown to the first inhabitants of Egypt. The form of the vault is more often in the present day semicircular, and the processes of execution have ceased to be as rude as in the past."

It would not appear, however, according to M. Daly, that even after the invention of the more scientific mode of constructing the vault, the Egyptians ceased to employ the older method; it would seem, indeed, that they regarded the architectural vault with "a pronounced æsthetic aversion." They used it, it is true, but the priests avoided its introduction into the temple, the rich employed it only rarely in their dwellings. It was abandoned to the hut, the storehouse, and the tomb. The use of the vault, in fact, after the discovery of the process of its architectural construction appears by no means to have received the welcome with which one would suppose such a progress would be hailed. This curious feature of the objection of the Egyptians to the use of the vault, and yet their introduction of it into their architecture, is to be alone explained, it is M. Daly's opinion, by a proper understanding of the influences under which the æsthetic genius of Egypt was formed. This, of course, is a subtle question, which M. Cesar Daly reserves to a future occasion to fully discuss.

We take a translation of a portion of the article touching "The Invention of Bricks":—"The invention of bricks may have had various origins,—that is to say, it may have been occasioned by different causes, in different places, or even in the same country. It is incontestably due to a want, and any want for which it provides may have given rise to the invention, or may have contributed to it. I may cite one of these possible origins,—that is, the greater facility of transport of brick as compared with soft and heavy clay. Another origin may, perhaps, be discerned in the necessity under which the early inexperienced builders laboured of rapidly repairing vaulting which was cracked or threatened to fall. A small crack could be filled up with a handful of mud, but the wider this crack became the greater the importance to remedying it promptly, and the soft mud would be ill adapted to repair it. Not being supported from below as it was during the construction of the dome, the mud of which it was composed tended to fall into the interior of the hut by its own weight, and softness combined; while, on the other hand, dry tompons, cemented together only by mud, did not present the same disadvantages. Thence, perhaps, arose the custom of keeping tompons of dry clay, as is done upon our vessels of war, where tompons are prepared beforehand to fill up the shot-holes made in the hull."

There can be no doubt that forethought

\* M. Daly has a theory,—which, it is true, he puts forward only as an hypothesis,—that the brick originated in the plug of dried mud prepared to fill up any cracks that might present themselves in the mud roof or walls of the primitive hut, and this view the writer supports by the evidence of the very small size of the bricks found at Sakkarah. The use of stone for building purposes is only mentioned in the time of the second Pharaoh of the third dynasty (in a passage from Eusebius quoted by Drusch); and yet the first Pharaoh of the first dynasty, we have evidence, founded great cities (Memphis, for instance), which could scarcely have been erected simply with mud, small stones, mud, and reeds.

† The sketch given by M. Daly of a view of a group of houses at Edfoin, some covered with vaulted roofs, others covered with branches, is very interesting, as showing the extraordinary tendency of antique traditions among a community still unaffected by modern influences.

is a quality which appertains more especially to civilised peoples than to those bordering upon barbarism; but the frequent accidents occasioned by the inaptitude of the early Egyptian builders, and their entire ignorance of the forces set in motion by the construction of vaulting which led to repeated failures in construction, must in the long run have awakened in them the sentiment of precaution. In any case, it is possible, and even probable, that the Egyptians, who were good observers, and not stupid, as historical records show us, if, as I say, the Egyptians took the precaution of preparing beforehand tompons of clay: these could not fail to take the form of bricks by reason of their being more readily handled, moved, and stored. If this suggestion be true, the most ancient bricks would be of small dimensions. Cracks, for instance, from 6 in. to 8 in. wide, would be too large for mud without any support upon the inside of the dome, but if the mud were strengthened by dry bricks the whole became sufficiently strong. In the case of a settlement, or the fall of a portion of a vault from 6 in. to 8 in. wide, it would be necessary to employ two of these bricks; three or four for a larger opening: experience of the juxta-position of bricks with plastic joints would lead naturally to the idea of a vault of brickwork. The oldest bricks measured by me (at Sakkarah) confirm this impression of the antiquity of small bricks. Those belonging to the second or third dynasty, of which I have a specimen, are 0.135m. x 0.07m. x 0.10m., or 5 $\frac{1}{16}$  in. x 2 $\frac{7}{16}$  in. x 3 $\frac{3}{16}$  in., or very nearly 4 in.

#### THE FLOODS AT BATH AND BRISTOL.

EVEN a hasty journey through the district between Bath and Bristol last week would have been sufficient to prove that the accounts which the daily papers gave us, from local sources, of the devastation caused in this district by the extraordinary rainfall of the early part of the week were in no respect exaggerated. Indeed the published accounts fell short of conveying any adequate idea of the reality. Those whose chance it was to pass along the Great Western Railway through Bath on Wednesday, the 25th, will not readily forget the scene that presented itself in bird's-eye view from the railway embankment and viaducts. In crossing the outskirts of the town from the London side, before reaching the station, we seemed to be passing over a colony of "lake dwellings." Squares and streets of houses rose from the midst of an expanse of water, amid which was seen, here and there, a boat going from house to house, or, in the shallower portions, a tradesman's horse and cart slowly feeling the way for fordable points. Melancholy as the scene appeared from here, it was nothing to the state of things as seen from the viaduct on the Bristol side of the station. Here the Avon takes a sweep round, running under a viaduct from the south to the north side of the railway line, this being at about the lowest ground of the town. The river is lined with houses, between which and the water runs a small paved quay, about 10 ft. or 12 ft. wide; and the surface of the river is ordinarily 4 ft. or 5 ft. below the level of this quay. On the 25th, it was 10 ft. or 12 ft. above the quay, and from the railway viaduct the extraordinary sight was presented of a swelling torrent of water pouring along at the height of the first floor of the houses, the walls of which formed the visible margin of the stream, which must have been running with a velocity of seven or eight miles an hour. This was towards the close of the afternoon; in the morning of the same day it had, we believe, been higher. The Great Western Station at Bath was high enough to be out of reach of the flood; but there was no exit from the station except by the high-level bridge crossing to the hotel at the other side of the road; and during the day there was considerable apprehension of this being carried away by the timber and other *débris* brought down by the current. How the houses could stand for an hour against such a rush and weight of water it is difficult to understand; a visit to the spot two days after, however, showed that little damage had been done to the walls. Along the before-mentioned quay, railings, and the kerb-stones in which they were set, had been twisted out of place, but the solid walls of the houses showed little result from the action of the water, and their comparatively uninjured appearance certainly speaks well for stone as a building material, at all events for resisting forces of this kind, as compared with

brick. One reason, no doubt, is that stone walls, to be impervious to damp, and to make at all deceivably habitable dwellings, must be of a certain thickness much beyond that which is supposed to be necessary for brick walls in the same class of houses. The houses which were thus obliged to measure their strength against the rush of water were among the poorer habitations of the city, and Bath stone is not among the strongest of building stones, yet their shells had stood nearly unharmed. What would have been the fate of a set of ordinary speculating builders' brick houses under similar circumstances? They would have been bodily swept away.

The scene from the railway after leaving Bath was not less extraordinary to those who knew the usual aspect of the landscape. The swollen river, relieved from its partial confinement amid the houses, spread out over the country far beyond the usual line of its banks, which was completely obliterated; the whole of the land between the railway and the low hills opposite being occupied, for part of the route, by a waste of moving water. On arrival at Bristol, we were told that the same state of things we had witnessed at Bath might have been seen in the low-lying portions of Bristol at the same time. As far as one could judge from an after-inspection, after the water had partially abated, it does not appear that the flood had prevailed here in quite such extraordinary proportions as in Bath. The Avon where it passes Bristol is a tidal river, and has superfluous space in its channel, except at a very high tide, for taking away a good deal of water; and there is not so large a proportion of low-lying ground covered with houses. The major part of the damage in Bristol was in the region known as Baptist Mills, in the neighbourhood of the lower end of Stapleton-road, and the overflow was chiefly from the Froome, a tributary of the Avon, which runs through this portion of the town. A good deal of the low land here is open ground, building land, and rope-walks, &c.; and over this the water was lying in lakes the next day, while the Froome was running "fall bore" between its banks, and evidently much above its usual height; but the damage that had been done did not present very marked external evidence to the eye of a visitor. The difference between the power of brick and stone walls to resist the force of water, to which we have already alluded, was however, illustrated in this part of Bristol, where in one or two places brick parapet walls of considerable thickness (much thicker than the ordinary speculating builder's house wall) had given way and fallen flat at once on the waters rising above the ground-level on the other side of them. This point has its practical significance at present in reference to the possibility of barring out the high tide-waters of the Thames from the streets and houses of the Lambeth district and elsewhere. The experience at Bath and Bristol seems to show that a good stone wall of coursed masonry will resist a considerable water pressure for some hours at least, where a brick one will not.

Although the visible damage to buildings was not so great either in Bath or Bristol as might have been expected, the amount of loss to the inhabitants of the districts inundated has unquestionably been immense, and it is to be feared that many of the dwellings inundated cannot for a long time be inhabited without serious risk to health. The wealthier population in both towns are bestirring themselves to give relief to the sufferers, and considerable sums had already, when these remarks were written, been collected for this purpose. The point which ought to be considered, however, is whether any preventive measures can be taken to lessen the danger and loss in the case of future floods. This is rather a difficult question. It is about forty-five years since a flood of the same magnitude swept down the valley of the Avon, as we learned from a dweller on the bank of the river at Bath, who had been there since the last flood, and was able to fix the date approximately, and remembered it as having risen, if anything, rather higher than the recent one. If there is no reason to expect that there will be another such visitation for half a century, it must be admitted that it is hardly in accordance with true economy to go to any great expense in changing the sites of dwellings, and providing extra outlet for the river channel, to meet an event of which we can only say that it may possibly happen again at some distant period. The reasoning is the same as that which we go upon in calculating the

required dimensions of sewers, in regard to which it has long been pretty well agreed among engineers that it is not worth while to construct sewers on the scale necessary to ensure the rapid removal of the rainfall from an exceptionally violent thunder-storm. And in regard to the upper part of the Avon, nothing could be done except what would involve engineering operations on a very large scale, and the complete transformation of the river channel. It may, however, be advisable that the local authorities at Bath and Bristol should direct some municipal legislation against the erection of houses in places which are known to be liable to floods in bad seasons; and while allowing the present dwellings to run out their life, to prevent speculators from rebuilding in the same dangerous locality. This is hardly a case of  *caveat emptor*, or not simply that; the owners of the property will, no doubt, suffer loss, but they have carelessly and thoughtlessly led to almost the entire ruin of the unfortunate tenants, mostly of the poor and uneducated class, who have entrusted their all to houses which those who built them knew to be in a hazardous and unhealthy situation. And if it is rational to legislate against the building of houses for human habitation on unhealthy or insecure foundations of rubbish, or with inadequate materials, it should seem equally rational to place some legislative restriction on the building of houses where they are liable to be flooded. This seems to apply, as far as we can see, more especially to the Bristol case, where the houses which have been drowned out were mostly of a very jerry description, and palpably built as cheaply as possible, and without regard to possibilities of effective drainage even under ordinary circumstances, and leaving the ravages of floods out of the question. And in the case of the Bristol flood, the difficulty appears also to be more within management, for it would be possible for the Corporation to embank the Froome so as to enlarge its capacity of channel considerably, and also to provide an extra outlet for storm waters without any ruinous expenditure. The scale is smaller than in dealing with the Avon itself, and the mischief and its remedy more within compass. Another thing which might very well be done would be to raise some of the lowest-lying portions or hollows of Stapleton-road, the principal road leading down to the district inundated, which was flooded deeply in one place, and in which, the shops and dwellings being of a better class, the pecuniary loss of individual owners or tenants was much more serious than in the case probably of any individual instances in the poorer portion. The raising of the roadway would be followed by the raising of the shops and houses as soon as their rebuilding became necessary; and though it calls for no more sympathy than their poorer neighbours, the loss of property is a much more serious thing to make up to them in their case. There was one additional danger and inconvenience to which the inhabitants of Bath were subjected, and which brought even those who were out of the reach of the water within the unpleasant consequences of the flood; this was, that the city was suddenly deprived of gas by the drowning of the works at the gas-works. This is an evil against the recurrence of which the local gas company ought to be able to provide, and we hope, will provide.

It would be, of course, possible to embank the Avon artificially so as to allow for a great rush of water from the higher lands without the present disastrous overflow and devastation; providing, of course, extra artificial drainage for the low lying ground; and perhaps it is a subject which ought to be taken into consideration by Government, under proper professional advice. We surmise, however, that it would be an open question whether the expense of making and keeping up such an artificial embankment would not be a heavier drain on the public purse, or on the resources of the Avon watershed district (in whichever way the expenditure were met) than the loss caused by a flood such as the present, which might not happen for an even longer period than has elapsed since the last one. A satisfactory answer to the question, however, could only be given on the basis of statistics as to the more frequent damage arising from the flooding of the district from insufficient surface drainage in years of no more than ordinary winter rainfall; which may be considerable, and such as, in conjunction with such extra-

ordinary floods as the recent one, to justify a large expenditure on economic grounds. The subject should be looked into.

#### THE FRENCH GALLERY.

It cannot be said that the present Winter Exhibition at Mr. Wallis's gallery contains any very remarkable paintings, though there are some interesting specimens of the work of artists whose names are known there, and one or two by unfamiliar names which are of interest. Madame Henriette Brown's "Alsace, 1870" (153), is the largest and one of the best works there. This is a half-length, the size of life, of the figure of a lady of the red-cross sisterhood, apparently soliciting contributions for the wounded, as she has before her on a table a bowl full of miscellaneous coins, to which the action of her hands appears to draw attention. If the title is intended to indicate any special illustration of the case of the annexed province named, we fail to see where the meaning comes in. The picture is, in fact, a life-size study of a figure, of which the face is remarkably well painted, but the work as a whole has not the power of effect nor the interest and character which mark this artist's finest work. Professor Müller's "Guardian of the Sacred Well" (60), on the opposite wall, is a capital painted picture, rather deficient in subject, two figures relieved against a piece of wall with crumbling details of architectural ornament, which wall, with the hot sunlight upon it, forms perhaps the best part of the painting. "In the Fields, Brittany" (15), by M. Julien Dupré, is a work of more character and originality; it represents a couple of rustics, a young woman and young man, carrying between them a load of hay, the youth in the rear stretching up his head to get a look at his companion over the intervening pile of hay; the artist has attempted to convey strongly the idea of the effort of weight-carrying, in the manner of the girl's walk, which is unceasing, but characteristic. The faces are expressive and powerfully painted, but the picture has the special interest that it shows some variation from the usual type of "field labour" pictures, in which many French painters have followed the lead of Jules Breton. Mr. W. H. Bartlett's "Muss Gatherers, Venice" (22), has the same kind of interest; it is individual and distinctive, though the subject is slight enough, being merely one or two lads, naked except for bathing-drawers wading about in the water for the shell-fish. The figure of the nearest boy is excellent, drawn and painted, in a style at once broad and realistic. The water and the low background are very slightly treated. There is no sort of "composition" in the picture, which is ugly but clever. Mr. Dicksee's "Hermione" (146), expressionless enough for a statue, but, if as we are presumed, the work is intended as an illustration of Shakespeare's heroine personating the statue, the artist has forgotten that she especially described in the play as showing in her countenance the effects of the ravages of time during the many years in which she had been supposed to be dead.

Among the small genre pictures which often form the most interesting items of this collection are two very pretty specimens by J. Duverger, "Dolly's Dressmaker" (11) and still better one of the same size, in which the same little girl is shown as "A Partial Critic" (18) of her own portrait. Herr Seiler's two works, "A Freischütz Bargain" (36) and "Arguing out the Point" (42), form a very effective contrast, and exhibit the same delicacy and power of depicting character in life and in high life respectively; the figure of the gentleman listening to the argument in the latter painting is very good. "Rent Day in Germany" (42), by Herr Oelmüller, displays some humour and good execution. Two of the best-painted things in the room are the two heads by Herr de Blaas, "Ripe for Mischiefs" (47) and "From the Sunny South" (72); the first the head of a dirty and mischievous boy, the latter that of a girl whose full colour a plump rounded features agree well with the title of the painting. Mr. Webb's "A Gentle Aldine" is a very agreeable scene in a modest script bibliophile's shop, where a cloaked figure is bargaining for a rare book; it has the particular merit of being arranged with a view to that effectiveness of grouping and lighting which is notably wanting in some of the best pictures of the more realistic school; and the

ame may be said of Mr. Mowbray's "The Aquafortists" (56), though there seems no reason for the exceedingly melancholy expressions of the man who is applying the acid to the plate. A "Flemish Bird-stuffer" (76) by M. Zagre, is a clever and careful study of Medieval costume and of the effect of light through semi-transparent glass.

The landscapes by Herr Heffner do not keep up to the remarkable excellence of some specimens of his art which have been exhibited here of late, though it is only in comparison with some of his own previous efforts that they could be regarded with any disappointment. "Smiling Spring" (7) is, however, a very admirable landscape, in which the artist has realised the peculiar character of spring landscapes with great success. Herr Windmaier, whose small and delicately-painted scenes, in which he re-creates himself a good deal, have always been among the pleasures of this exhibition, is represented this year by a work on a larger scale than is usual with him, "The Rising Moon, Lake Starnberg" (104)—a very highly-finished attempt to realise moonlight effect. The artist has avoided the mistake so commonly made in moonlight scenes, of putting too much detail to his landscape, and thus destroying the mystery of moonlight; and the sky is fine, though perhaps a little artificial in effect. It is, however, seldom indeed that one sees a moonlight painting which really gives the actual effect of moonlight; the effect here is just a fine "stage," but it comes nearer than the average of moonlights even by able artists. Nothing in landscape-painting seems easier than to convey the general effect of moonlight,—up to a certain point; nothing more difficult than to pass that point, and achieve reality of effect. Munthe, the unequalled painter of snow scenes, is not represented; here is a snow scene by Herr Cegerfelt, in which the snow seems to be scattered not only over the ground, but over the sky as well, which is as solid as the rest of the scene, suggesting the idea that the painting might be in another way up with nearly similar results. R. F. W. Halm's scene at "Bettws-y-Coed" (4) is a good-sized picture, reminding one of a masterpiece in the art, a solidly-painted landscape in Academic style, very satisfactory in its way, but deficient in variety of local colour. Among the best landscapes are three very small but well and powerfully-painted studies by Herr Henk, "An Autumn Evening," "Noonday Rest," and "Study from Nature" (106, 115, and 162); these are admirable little works, painted in a truly artistic spirit.

#### THE WINTER EXHIBITION OF CABINET PICTURES IN OIL. DUDLEY GALLERY.

As in the French exhibition, so in this, the most noticeable work is a life-size study of a woman, in this case "A Peasant Girl" (166), by Mr. G. Clausen, and certainly one of the best works by this artist that we have seen. The scene is a very interesting one, the general figure that of a robust young woman in perfect health, the flesh finely painted, the hands well drawn, the figure, rather more than half-length, faces the spectator, leaning on a long staff. This is a piece of thoroughly sound and unpretentious painting. Among other paintings of the *genre* class, on a smaller scale, "A Cornish Lad" (79), by Mr. Janson, is a powerful little work, in which the figure, not without character, passes, however, as part of a study of what used to be called "chiaroscuro," from which the figure emerges as the salient point. Contrast in artistic method is represented in its greatest sense in comparing this with Mr. Val. Prinsep's "Wood Gatherer" (254), in which the face of a peasant girl (one presumes) gathering wood is painted in the nearest and most precise and finished manner. After looking at some others of the "rough" school, this strikes one as hard and prosaic,—it is not poetic, at all events; but there is no doubt that the "rough" element too prominent in some of the painting here is in Mr. Hugh Carter's "Net-mending" (96), where the modelling of the features is altogether omitted. Mr. Howard Hebbick's study, "The Contented Mind" (239), which is sketched throughout and therefore in keeping, is one of the best pieces of humour in the gallery, and very effectively treated altogether; it represents the contentment of a man in a scantily-furnished room cooking a herring before the

fire on the end of a fork; though not highly finished, the whole is handled in a truly artistic spirit. Mr. Watson Nicol's "finished sketch" of an Irish lout in bishcain is very clever, but somewhat vulgar. Among things which are clever, and quite the reverse of vulgar, are two small works by Mr. David Bates, on the screen, "Returning from the Moor" and "Heather Gatherers" (403, 420), slight combinations of figures and landscape showing real poetic feeling. Mr. Hamilton Macallum, in "A Summer Half-Holiday" (80), shows a slightly painted, but fresh and breezy, sea-shore scene, with a number of boys bathing and splashing in and out of the water; more might have been made of the figures, but the whole is a large sketch rather than a finished picture. Mr. James Hayllar's two heads, "A Connoisseur" and "Patchwork" (197, 213), are clever, and Miss Maria Brooks's "La Tricouze" (87), and Miss Bertha Newcombe has realised a pretty effect in her little painting called "The White Calves" (321), in which the animals and their girl-keeper are ranged in a kind of frieze fashion, with a stone wall for a background. Mr. Mullins's terra-cotta head, "A Simple Child," and Miss Barlow's small studies of animals in the same material, on the centre table, should be looked at.

Among landscapes there are two by Mr. Joseph Knight, 74 and 85, which are very good, the latter, "With Verdure clad," the best. Studies of foreground, or in which foreground predominates, are rather numerous, such as Mr. F. Walton's "Ankle-deep in English Grass" (49); Mr. Parsons's "A Thames Garden" (66), a study of water-plants and rushes; Mr. H. E. Bowman's "A Deserted Garden" (93), a small work highly finished in detail; Mr. Walter Wallis's "Cutting Old Friends" (219), the old friends being a bed of cabbages. On a larger scale are Mr. Hemy's two sea-pieces, "Rowing for the Port" and "The Morning Catch" (161, 176), and a fine little landscape by Mr. de Brenscki, "Marsh to Walgrave" (337), a rainy river landscape overhanging by sweeping clouds, which might have had a better place in the hanging. Mr. F. Dillon's "Festival of the Cherry Blossoms, Osaka, Japan" (122), is a brightly-painted and rather highly-elaborated open-air scene, of considerable interest in more than one respect. There are some clever little bits of still-life painting, such as that by Mr. Handel Lucas (48), and "Memories of Schooldays" by Mr. E. Holliday (57); and M. Fantin shows his splendid gift as a painter of flowers to perfection in such works as "Autumn Flowers" (181) and "Fleurs de Poirier et Cerise" (415).

#### GOUNOD'S "REDEMPTION" AT THE ALBERT HALL.

The first performance in London of Gounod's oratorio attracted to the Albert Hall on Wednesday evening one of the largest audiences that has ever been assembled there; and whatever opinion may ultimately be formed of the position of the composition in modern music, it was certainly a very impressive spectacle to see such an immense concourse of people listening with rapt attention to a work of such serious intent, in which there is not from beginning to end a bar written for mere display or effect. The "Redemption," indeed, must be judged of from a standpoint of its own; it is not so much an oratorio as a religious service, in which a great musician and a devout Catholic has brought all the resources of his musical genius to the expression of his religious creed. It is this strong prevalence of devotional feeling in the work which leads to it assuming the character which some listeners have found rather monotonous and musically deficient in effect,—not altogether without reason. The religious feeling of the composer has apparently led him to reject in great measure the ordinary resources of melodic expression in the solo voice parts, as if he thought the mere enunciation of the sentences in musical tones sufficient to impress the hearer; so far, that is to say, as the voice parts are concerned. The musical expression and colouring in these portions are supplied by the orchestral accompaniments, which are throughout of the fullest, richest, and most finished description. Those who are acquainted with the modern theory of oratorio music as developed by Wagner will recognise that in such a treatment there is somewhat of the application of the same theory

to oratorio music, though without the noisy and tumultuous effects into which Wagner is too often betrayed. Everything is well balanced and in due proportion to the expression of the whole.

The oratorio is divided into three main sections:—"Calvary," "From the Resurrection to the Ascension," and "The Pentecost"; and these again are subdivided into what may be termed short-scenes, such as "Mary at the Foot of the Cross," "The Two Thieves," "The Holy Women at the Sepulchre," &c. There is nothing like what is usually called an "air" for any of the solo voices, and only one instance of extended choral writing, in the concluding chorus. One of the most prominent and beautiful features of the composition is the melody for the orchestra (it is never heard in the voice parts) which, in the language of modern musical criticism, would be called "the Redemption theme," and which springs up continually whenever the mission of the Saviour is referred to, always with fresh beauty and reaches its climax at the close of the second part, where, after the short and striking choruses, "Unfold, ye Portals everlasting," this theme is given out in jubilant strains by the whole orchestra, with an effect which is quite ethereal, and must be heard to be realised. The thoughtful spirit in which the composer has viewed his subject is shown, among other things, by the passage entitled the "March to Calvary," which sounds startling until we perceive that the object here is to indicate the temporary triumph of the Pagan spirit. Among other salient points in the work may be mentioned the pathetic chorus, "O my Vineyard," the chorale, "For us the Christ," with the beautiful change of feeling at the words, "Faith unswerving, holy Hope," the chorus, "Lovely appear over the mountains," and the final chorus, which commences with a melody sung by the male voices of the chorus (somewhat resembling in character the composer's well-known song, "Nazareth"), and afterwards repeated in baronised form by the whole chorus.

The work was very ably performed by the Albert Hall Choral Society, conducted by Mr. Barnby; the chorus parts present little difficulty, it is true, the intricate work being all for the band, which was quite equal to its task. The solo singers, Madame Albani, Madame Bassett, Miss Edith Santley, Mr. Pratt, Mr. Lloyd, and Mr. Santley, sang the music with the feeling of true artists, making no attempt at display where none was called for. We go a little out of our way to devote a few words to it, believing that a good many of our readers who were unable to be present would be interested in hearing something about a production which, though it has its limitations from a musical point of view, we are inclined to think will lay hold of the public mind in this country, and prove an important contribution to our list of sacred music on a great scale.

#### AN ELECTRIC TRICYCLE.

RECENTLY inquiries appeared in our correspondence columns as to whether a tricycle could be lighted by electricity. We now learn that the improvements in the storage of electric energy and in electro-motors have so far advanced that tricycles can not only be lighted, but also propelled solely by electricity, as was seen from the tricycle ridden last week by Professor Ayrton in the City. The Faure accumulators, in which the energy was stored for the lighting and driving, were placed on the footboard of the tricycle, and the motion was produced by one of Professor Ayrton and Perry's newly-patented electro-motors placed under the seat of the rider. Using one of these specially-made tricycle electro-motors, and the newest type of the Faure accumulators, the total dead weight to be added to a tricycle to light and propel it electrically is only 1½ cwt., or little more than that of one additional person. In the tricycle ridden by Professor Ayrton the ordinary foot-treadles were entirely absent, so that there could be no question as to electricity being the sole propelling agency; but with ordinary electric tricycles it may be desirable to leave the treadles, so that while electric propulsion alone is used on the level, the rider can, on going up a steep hill, supplement it by using the treadles, instead of, as at present with the ordinary non-electric tricycle, having to get out and ignominiously push his tricycle up the hill before him.

### THE INFERIOR OR ADULTERATED CEMENT QUESTION IN GERMANY.

THE latest phase of the discussion which has for some time been going on in Germany with respect to the question of inferior or adulterated cement is represented by a statement published and circulated in the name of a committee representing the Association of German Cement Manufacturers. This publication is in the nature of a reply to the opinions put forward by Dr. Michaelis, of Berlin, in reference to the alleged improvement of Portland cement, by the addition of a certain quantity of blast furnace slag or cinder. This gentleman, in an article he wrote in one of the technical periodicals, had contended that "an addition of suitable pozzolana to cement increases the cementing power or quality of the latter," but he admitted that a favourable result was dependent on such delicate conditions as to the particular nature of the cement employed, and as to the character and quantity of the material to be mixed with it, that in practice any such addition could hardly fail to be highly dangerous unless the admixture were made under the eye of the purchaser and user of the article. Dr. Michaelis, who criticises the remark, in testing whether a cement is adulterated, would be willing to allow the question to be asked whether the material mixed with it has been added for the sake of making a profit. The writers proceed to say,— "Of course he knows as well as any cement manufacturers that a wagon-load of pulverised furnace slag, weighing five tons, can be obtained at the works, in Rhineland, for 16s., and this quantity of material when mixed with cement represents, at the cement works, a price of 300s. and further, that furnace slag in other districts, or the various other materials which may be employed in its place, could be bought and sold at similar prices. And yet, as a matter of fact, in no such mixtures can Dr. Michaelis discover any evidence of an attempt at making improper profit. In fact, he can find no adulteration. He does not regard as adulterations any admixtures that do not degrade the quality of the article, but which leave it, in this respect, either unaffected or perhaps improved." The Association of German Cement Manufacturers have, on their part, passed a resolution against additions of every kind. Dr. Michaelis, on the other hand, claims an exceptional position for his pozzolanas, and especially for furnace slag; but, without any explanation, he has abandoned chalk and limestone. His critics proceed to say that "if we examine his theoretical observations respecting the effects of pozzolana additions, all we can find under the numerous reservations with which he puts forward his statements is the well-known fact that certain cements which are not entirely free from defects may, to a certain extent, be corrected by the addition of certain finely-ground materials in limited quantities. Such an expedient, however, no one has ever regarded as anything but a makeshift, applicable in cases where we have to deal with the peculiarities inherent in certain kinds of raw materials employed in the manufacture of cement. In such circumstances the Association of German Cement Manufacturers permits the addition of suitable correctives to the extent of two per cent., because with such a small percentage, the charge of making fraudulent additions purely for the sake of profit cannot possibly be maintained. It is a fact that blast-furnace refuse is, by many German firms, now habitually added to their cement in enormous quantities, amounting often to as much as 40 or 50 per cent., and each of these firms uses several wagon-loads of such refuse every day in the manufacture. When, therefore, Herr Michaelis proposes to establish a wholesale business based on the addition of pozzolana, he ought, at least, to furnish evidence showing that the article he produces is an improvement upon, or, at any rate, not a debasement of, the quality of the genuine material; but this proof he has failed to give. So far, in fact, is he from doing so that the numerous restrictions he imposes on the use of the foreign materials show clearly enough that he is himself conscious how extremely dangerous is the employment of such additions, and that, therefore, under the temptation of large profits, these additions are likely to be made on so large and constantly increasing a scale, that the result in the end cannot fail to be most pernicious. Dr. Michaelis has published some tables showing the results of his systematic experiments in testing the tensile strength of

his mixed cement; but they teach us nothing to the purpose, for he does not, in these experiments, deal with samples of the mixed cements manufactured by help of furnace-slag, and now brought in enormous quantities into the market. Instead of this, we are furnished with figures representing the strength only of small samples, prepared with scientific accuracy by Dr. Michaelis himself in his own laboratory for the purpose of being experimented upon; Dr. Michaelis, moreover, fails to state the degree of fineness of the cements and of the materials he added to form the compounds tested in his experiments,—data which are very necessary for forming a judgment on the value of his tests. However, his numbers as they stand simply go to show that really good Portland cement is only deteriorated by the addition of furnace-slag; and it is further clear from Dr. Michaelis's own tables that this deterioration makes itself felt in the long run. Let us now ask in what the alleged improvement of these cements consists so far as cement-users are concerned. It is, in the first place, admitted that such cements are inferior as regards the initial strengths. Are consumers to wait one or two years before they can ascertain whether the materials added were the right ones, or whether they were employed in the right proportions? As regards the twenty-five per cent. superiority which Dr. Michaelis claims for them in practical use, he overlooks the fact that, so far as the purchaser is concerned, this advantage has no existence at all, because he pays for the mixed cement the full price of the genuine and pure cement. In addition to the above objections to the figures in Herr Michaelis's experimental tables, we must add that his tests were made in the shelter of rooms, and therefore prove nothing as to how the mixed cements would withstand the influence of changes of temperature; and, moreover, that the tensile strengths alone do not settle the question how a mixed cement will turn out when used for ornamental work, for *béton*, artificial stone-work, and so on."

The motives which have guided the Association in its resolution against the addition of foreign materials to cements do not touch the question how far such additions change the quality of cements. "Our motives are based on the principle that it is contrary to justice, that it is dishonourable to abuse the name 'Portland cement' by applying it to every arbitrary compound. We have in view the consequences which must arise in practice from a system of manufacture which opens wide the doors to fraud. The Association, of course, has neither the right nor the power to prevent the practice of mixing up other materials with cement. The Association is well aware that such admixtures can be made without needing any special cement manufactories for this purpose; but the Association is also of opinion that the mechanical addition of foreign ingredients should be left to the purchasers and users of cement themselves. Further, the Association holds that purchasers will, in most cases, do well if, instead of adding slag, chalk, or limestone, they would employ pure Portland cement, and, when they do make any additions to it, should confine themselves to sand. By its resolution the Association only wishes to urge on those firms who persist in making additions to their cement, the duty of avoiding the use of the term "Portland cement," as it can only serve the purpose of deception when they sell their mixtures of slag, chalk, limestone, tarrace, or what not, as genuine Portland cement."

### A LUXEMBURG STATUE.

THE authorities of the city of Luxembourg, the capital of the Grand Duchy of Luxembourg, decided some time back to erect an equestrian statue in honour of William II., the Dutch King and Grand Duke of Luxembourg, who in 1841 voluntarily granted the population of the little State the blessings of Constitutional Government. Up to a comparatively recent period the city was enclosed in strong fortifications, but these have now been done away with, since it was determined that the Duchy should be made neutral territory. Side by side with the removal of the ramparts and forts of the old fortress, the city has been undergoing great architectural improvement and embellishment, the adornment of the numerous open squares or places with artistic monuments being part of the scheme. For the statue of William II., who may be remembered by readers of English

history as having served under Wellington in the Peninsula, the Luxembourg authorities did not open a general competition, but decided to invite the following five sculptors to send in designs:—M. Ch. van der Stappen, of Brussels; M. A. Mercié and M. A. Cain, of Paris; Herr Hundrieser, of Berlin; and M. Ch. Pétre, of Nancy, the last of whom is the sculptor of the fine bronze statue of the Princess Amalie of Saxe-Weimar, wife of Prince Henry, the deposed Stadtholder of Luxembourg, which is already erected in the city. The five models of these artists have been for some time on exhibition in the Town-hall of Luxembourg, and, according to the unanimous verdict of the critics, are all remarkably fine works of art. The jury to whom was entrusted the task of selecting one of these designs for execution consisted of the following gentlemen:—M. Eyschen, of Luxembourg, Minister of Justice, as representative of the Grand Ducal Government, chairman; M. Tony Duteux, Deputy, vice-chairman; M. Canelier, and M. L. Gérôme, both sculptors, and members of the Institute, Paris; M. Auguste Marc, editor of *L'Illustration*, Paris; M. E. Portals, director of the Academy of Fine Arts, Brussels; and Professor Schaper, sculptor, Berlin. On the 25th ult. this jury met to adjudge on the designs, and by a unanimous vote selected the model of M. A. Mercié, of Paris, for the first prize, and recommended that with certain changes they indicated this design should be carried out.

### THE TELEPHONE AND UNDERGROUND CABLES.

AN interesting series of experiments has recently been carried out with the telephone through the subterranean telegraph cable between the two cities of Cologne and Elberfeld in Germany. The experiments were conducted at the instance and by the employees of the well-known firm of Messrs. Felten & Guillaume. For a long time it was found impossible to use underground lines for telephonic purposes owing to the disturbances occasioned by the phenomena of induction. Many attempts had been made to overcome this difficulty, but in no case had the success been complete. By theoretical considerations the firm above mentioned had arrived at a contrivance by which they believed all the obstacles hitherto experienced from the induction currents would be overcome, and they obtained permission from the German Imperial Post-office to put their ideas to the test upon the Cologne and Elberfeld cable, which is 52 kilometres, or about 32 English miles in length. The result has been completely to prove the correctness of the theory upon which Messrs. Felten & Guillaume proceeded. Hitherto, owing to the sensitiveness of the telephone, it had been found difficult to speak on one wire when another wire was at the same time being used. Moreover, the sound conveyed by a given wire could also be heard through others. By help of a new contrivance invented by the firm above mentioned it was found, throughout the experiments between Cologne and Elberfeld, that the obstacles arising from induction entirely disappeared. A conversation could be carried on upon one wire while other wires in the same cable were being used for telephonic or telegraphic purposes. The experiments have conclusively proved that, by help of the new system, a subterranean cable may be employed at the same time both for telegraphing and speaking, and thus it has been shown that towns at great distances from each other may be brought into telephonic communication.

### OBITUARY.

*Mr. Sibley.*—The death of Mr. R. L. Sibley, of Great Ormond-street, is announced. Mr. Sibley was District Surveyor of Clerkenwell, to which district he was appointed by the Justices in 1849, and to this district the Metropolitan Board recently added a portion of Islington parish. The gross value of the district was returned last year at 460l. Mr. Sibley was a Fellow of the Royal Institute of British Architects, and sixty-three years of age.

*Mr. J. W. Holland.*—The death is announced of Mr. James William Holland, architect, Newmarket. He was employed in conjunction with Mr. Clark in designing race-stands at Newmarket, Alexandra Park, and elsewhere, and also designed and completed Falmouth Houses for Mr. Fred. Archer.

## THE GENIUS OF SIR CHRISTOPHER WREN.

HAVING expressed an opinion of Wren's steeples that some may not be inclined to agree with, I beg to add a few remarks in further illustration and support of it.

These structures are beautiful as elements wrought, along with others of their kind and the grand unifying form of St. Paul's, into the texture of the general aspect of the City; and valuable for their picturesque and elevating effect upon it; and, with the enchantments of distance and association, must be touching objects to the citizens, more especially those who have gazed upon them from infancy. Such objects breaking the skyline of a city are to it what lofty trees, rising above the underwood, are to the country; and are felt by all to be equally life-giving. The spirit of poetry dwells among them no less than in the woods, and its voice in some degree

"Re-measures  
Whatever tones and melancholy pleasures  
The things of nature utter."

Wren's steeples, though comparatively juvenile, being some of them scarcely two centuries old, are not without historic interest; having looked out upon the human tide that owned the sway of the "Good Queen Anne," and overshadowed the homes and haunts of the Addison and Steeles, and the scenes of our old acquaintances, Sir Roger de Coverley and Will Honeycomb, cannot be uninteresting to any who think or feel.

But this is by no means a proof of their being of a very high and unapproachable order of merit. Only one of them, that of St. Mary-le-Bow, can be considered a successful example of the application of the Italo-Classic elements to that species of structure. This is graceful in outline, and a truly charming and artistic composition. But the remarkable falling off of the rest in point of merit, which none will deny, and for which falling-off of funds will not account,—a fact, to which I called attention in the *Builder* just thirty years ago,—justifies the suspicion that Bow's steeple was more the outcome of geometry than of artistic genius; for had it been the fruit of inventive power in himself, that power would certainly have shown itself again in the others, which, judged by his own standard in St. Mary-le-Bow's, are found wanting. By this standard chiefly I would now test them, on something like the principle of trial by jury.

The great diversity of Wren's steeples is often the subject of praise. But it arises in some measure, I fancy, from their great inequality in point of merit; and, in that well-known published family group of them, in which Bow's steeple always strikes by its graceful proportions and poetic air, though there is a strong family likeness running through them, some are very poor relations indeed.

Perhaps the best, after Bow's steeple, is St. Bride's, which, though graceful in outline, is certainly a monotonous and puerile composition, too much reminiscent of certain corresponding creations of the Chinese. The most admired after St. Bride's, I believe, are those of St. James's, Garlick-hill, St. Vedast's, Christ Church, and St. Botolph's.

The proportion which exists between the lantern and tower of St. James's, Garlick-hill, is condemned by the example of St. Mary-le-Bow, and that of nearly all the others, and, I believe, justly; and while one of the other towers would be complete in itself if stripped of its surmounting features, this tower of St. James's would be perfectly so without its lantern, for which it was not prepared, and would gain in dignity by throwing it off. The lantern is merely an ornamental capping to the tower, and not an essential feature.

St. Vedast's steeple, though in its design unusual means were resorted to to make it graceful, the adoption of a four concave-sided plan is by no means graceful. Each separate stage of its lantern is ingeniously composed, but it has no harmony of form: the convex dwarf order between the concave order below it and the concave spire above it, which is surely a mistake, could only produce discordancy. Moreover, the four-sided spire is one of the clumsiest of spires.

Christ Church steeple is satisfactory up to the segmental pediment which crowns the first columnar story; but, above that, the law which requires in a work of art the utmost variety consistent with unity, and which is fully obeyed in Bow's steeple, demanded a change to an

octangular or circular plan, instead of the monotonous repetition of the lower square order. St. Botolph's, Bishopsgate, is less faulty than many others, but a very homely uninspiring pile,—of the earth, earthily.

St. Dunstan's-in-the-East, which demands a passing notice, is not beautiful artistically, but, like the toad, ugly and venomous, it wears yet the precious jewel in its bead of scientific beauty; which may be said also of its prototype at Newcastle-upon-Tyne.

Compare these for beauty and merit of design with some of the corresponding features of the Gothic churches at home and abroad, premising that the columns and other cylindrical forms of the Classic style give a greater brilliancy than square or octagonal buttresses, since there must always be a line of high light on them, and they more naturally assume the open, bower-like disposition and character befitting their aerial position.

It is but just to Wren to say that his pupils and successors have done but little to throw them into the shade, either in London, Edinburgh, or elsewhere, and this is one cause of Hawkesmoor's works, St. Mary Woolnoth and St. George's, Bloomsbury, merely show that their author had, like Vanbrugh, the courage to go alone; while the steeples of Gibbs, though he had opportunities second only to Wren's, show not even that, let alone invention or strong feeling. His steeple of St. Martin's-in-the-Fields is stately and harmonious in form, but lacking relief; it is inferior in merit to St. Bride's, and seems little more than a prose translation, if I may so figure it, of St. Mary-le-Bow. St. Mary's-in-the-Strand is equally lifeless.

Steeple followed these before and during the Greek mania both in the metropolis and the provinces, which, if not more inanimate and prosaic, may be characterised as, to make a metaphorical application of Pope's lines,—

"So sublimely bad,  
They were not poetry, but prose ran mad."

The great desideratum in most of these structures is mysterious nooks and deep-shadowed recesses that the eye cannot penetrate, and which are therefore so exciting to the imagination. Nothing will so well secure these as the porticos and peristyles and chambers which, though to some people meaningless up in the air, are to the susceptible invaluable as fields in which the imagination, seeing there more than meets the eye, delights to wander.

The fact is, this class of structures is in its infancy, and presents scope for all but infinite variety and beauty of design. It opens a field in which art may become an enchantress,—a creator of romance in stone, wherein architecture's highest elements,—domes, arches, columns,—may be carried to the utmost perfection, and reach their most beautiful combinations, involving both subtlety of thought and delicacy of feeling.

It is evident that the aerial and prominent position and object of a structure, rising above the general skyline of a city, to be the observed of all observers for ever, and the cynosure of neighbouring eyes; whether to bear aloft the metal tongue of time, and—

"Give it this a voice  
As if an angel spoke;"

or to be the finger of Religion pointing to its hope and home on high, demand for it a high degree of beauty,—that in it should be found, if anywhere, the poetry of architecture, its highest visions, its ideal of grace and beauty. There is nothing in the nature of Protestantism, no lack of inspiration or opportunity, to militate against this. The doctrines of the Protestant churches have not, it is true, enriched painting and sculpture with the graceful and majestic forms bestowed on them by Catholicism, and this renders them less able to adorn her sanctuaries generally. But in the feature in question architecture is sufficiently independent of sculpture and painting, and, with only carving or the lower forms of sculpture, has opportunity of embodying visions of architecture as bright as ever dawned on Mediaevalist's mind.

Wren, no doubt, felt all this, and if he did not succeed in all his examples, still, to him is due the merit of having opened this rich field of design in Anglo-Classic architecture.

I should not have gone into the subject of design of a class of structures now, through the disuse of the style in ecclesiastical edifices, seldom or never called for, but for a cherished belief that the style will one day be reinstated

in its ecclesiastical office, not to the exclusion of its rival, but jointly with it; which it might claim as being the elder servant of Christianity. Its effect on the general character of our towns could only be a favourable one, as the Classic churches being more in harmony with the dwellings than the Gothic ones, would serve as links between them.

But whatever its style, the steeple may be made beautiful; and there are considerations which would induce me to advocate its universal employment.

Every Mahomedan mosque has, I believe, its accompanying minarette, generally a most solemn and graceful object; and it would be well if every place of Christian worship whether Gothic or Classic, down to the smallest Dissenters' chapel, had a steeple, which, being of no use, in the vulgar acceptation of the term, as to exhale smoke or foul air, would be an acknowledgment of something above the present life, and of that instinctive yearning for a better, of which no human creature, perhaps, is wholly unconscious, and a standing protest against the materialism of the age which calls for the efforts of art and poetry as auxiliaries of religion, to preserve men from sinking under its sensualising influence. A numerous army of these structures in one of our great commercial or manufacturing towns would be like a show of hands as votes in favour of the immortality of man. They would tend to mitigate its hard, harsh, utilitarian aspect and character; put the spiritual stamp on it; and make the whole, in some sort, to sympathise with the devout and grateful heart. Viewed in this light, steeples can never grow obsolete.

If beautiful architecture has an educational function in the exertion of a refining and elevating influence on the mind and heart, its lofty position in these structures would obviously give it immense advantage, a greater leverage, if I may so speak, in performing that function, which is needful, I believe, to indemnify the dweller in towns, who sees nothing of nature but the sky, for the absence of the beautiful scenery of the country.

One more use of steeples I would mention. So susceptible of interest are they from their aerial position and possible beauty, and their high and holy uses, that if full advantage were taken of it they would go far to render architecture as popular as any other of the fine arts; and not only vindicate the right and title of its professors to the name of artist against the cavilling of envy or ignorance, but cause them to be looked upon by the public with reverence. Architecture, like Wisdom, is justified by her children.

But, to return to Wren: I should be sorry to hear of the disappearance of his steeples through the demolition or removal of the churches they adorn, thus which nothing would disfigure or disenchant the City more. But the sooner they cease to be pointed to as standards of perfection and models for all future structures of their kind, the better for the study and progress of architecture. But this fact, if it be one, does not dim the glory of Sir Christopher Wren, but only shows that he was not, like Leonardo da Vinci, a universal genius. He was as great an architect as any man of the highest scientific endowments, without the highest development of the art-faculties also, could be; and only failed where Newton himself, for aught that appears to the contrary, would have failed likewise. Men of universal genius, like the wonderful man just named, or like Goethe, who was scarcely less distinguished for his discoveries in science than for his creations in art and literature, are exceedingly rare.

The fact that Wren's art-genius did not manifest itself when it was most likely to do so, in youth, but, on the contrary, a precociousness of intellect in the direction of exact science which made him a prodigy of philosophy and mathematics at the age of sixteen, shows that the bent of his genius was decidedly mathematical and philosophical. Scarcely less, it seems to me, was the determination towards science in his case than in the celebrated one of Pascal. As in the case of that "Sublime Spirit," science seems to have smiled upon his birth and marked him for her own. Astronomy, mechanics, pneumatics, gnomics, even anatomy, visited him before architecture, and this came not by invitation; and his ability in architecture was not developed till a tremendous calamity (the Great Fire) gave him opportunities for its display that do not occur twice in a thousand years.

But everything proves that his scientific faculties were of the very highest order; and though his celebrity as an architect has thrown into the shade his scientific distinction, it appears to me more than probable that had he devoted his life exclusively to science his fame would at this hour be greater than his combined scientific and architectural achievements have made it; that he would have been even a brighter and more peculiar star in the galaxy of scientific men of his time than he was; and, perchance, have anticipated Newton and Leibnitz in some of their greatest discoveries.

He had, however, on the other hand, the satisfaction of having cultivated the whole of his nature, and so brought himself into contact with the universe at all points, a course which must be favourable to mental sanity; and was, perhaps, a better and happier man for having strayed into the fold of art. This will appear the more probable if we consider that in the pursuit of science the emotional part of our nature is far less cultivated than in that of art, which must be prejudicial to the mind of the exclusively scientific, since from the emotional region spring the great moral virtues, as gentleness, temperance, fortitude, justice. This is one of the advantages of art over science. SAMUEL HUGGINS.

#### THE OPENING CONVERSAZIONE OF THE ARCHITECTURAL ASSOCIATION.

SESSION 1882-83 of the Architectural Association was commenced on Friday evening, the 27th ult., when the usual *conversazione* was held, the visitors being received by the President, Mr. Edward G. Hayes, who subsequently distributed the prizes to the successful students of last session.

*The Association Travelling Studentship.*—Awarded in May last to Mr. W. A. Pite, whose excellent drawings made in the course of his tour were exhibited on the walls of the Institute meeting-room. A second prize of the value of 5*l.* was now presented to Mr. F. H. Tullock, and honourable mention was made of the work submitted in the same competition by Mr. A. S. Haynes.

*The Association Medal* was presented to Mr. George W. Ward for the best design for a building to be let out as offices.

*The Architectural Union Company's Prize* (value 5*l.*) was awarded to Mr. John E. Newberry, for measured drawings of portions of Wells Cathedral.

*Class of Design Prizes*, for the best series of sketches submitted in the class during the past session, awarded to Messrs. G. W. Miller and J. G. Sankey, bracketed as equal. Honourable mention made of the sketches submitted by Messrs. T. E. Pryce and C. Wilson.

*Elementary Class of Design.*—First prize awarded to Mr. G. G. Woodward; second prize, to Mr. A. C. Houston. Honourable mention made of Messrs. W. A. Webb and G. H. Oakley.

*Colour Decoration Class.*—Prize, value three guineas, awarded to Mr. S. R. J. Smith. Honourable mention made of Mr. C. T. Coggin.

*Class of Construction Prizes*, for the best series of papers submitted at the meetings of the class:—First, Mr. A. H. Gausden; second, Mr. A. C. Houston; honourable mention of Mr. L. Hunt.

*Class for the Study of Planning and Specification Writing.*—First prize to Mr. A. S. Gover; second prize divided between Messrs. C. G. Killmister and W. J. Lander.

The President then delivered a brief address. He observed that the Association had now reached the fortieth year of its existence. For the first few years it had a somewhat different title,\* but its present name was adopted in 1847. Since that time the history of the Association, judging by the work it had done and the number of members upon the list, had been one of continued and increasing prosperity. During the past ten years the number of members had nearly doubled itself, as in 1872 there were about 600, and now there were almost 1,000. The Association had always been less exclusive in admitting members than the Institute, and rightly so, being a society the members of which were associated together for purposes of study and mutual improvement. The Association admitted to membership not only those who were engaged professionally in

the study and practice of architecture, but gentlemen interested in the arts or sciences associated therewith. The reason for such latitude was obvious. The knowledge required in an architect's practice is varied in its character and very extensive in its range, and it is, of course, desirable for the architectural student to acquire all the information he possibly can in the various branches of his profession. The Association endeavoured, as far as possible, to give students an opportunity of studying in common any such subjects as their inclination or previous training might have rendered it desirable for them to pursue. With this end in view, the Association had now in full working order classes for the study of construction, design, planning and specification writing, surveying and levelling, decoration, and various other subjects. In addition to papers read at the fortnightly general meetings, the Association had also established courses of lectures in connexion with some of the classes, one of the primary objects of these lectures being to put students in the right course to be pursued by all who intended to enter the Royal Institute of British Architects. The Association also possesses an excellent lending library, containing some 1,200 volumes,—largely used and greatly appreciated by its members. It should be recollected that the work of the Association was all voluntary. All its officers were honorary, and the classes were carried on upon principles of mutual help, with the assistance and guidance of some of the older and more experienced members of the profession, which was always freely given, regularly and systematically, when required. There could be no doubt that the Association supplied a very great want in the profession, and afforded to many men opportunities of study which they would not otherwise have. What, it might be asked, was the necessity for so much voluntary effort to assist the architectural student in his training? That necessity existed in the fact that it was found practically impossible for a pupil to acquire as much information as he might, and should, desire during the short term he spends in an architect's office; and although he could supplement his office training by becoming a student in the School of Architecture at the Royal Academy, or by going through a diligent course of study in connexion with the lectures at the London University or King's College, but there was a very large number of architectural students who, from different causes, were unable to avail themselves of either of these means, and it was for them that the Association specially catered. We were rather in the habit in this country of drawing comparisons with our neighbours over the water, and of saying "They do these things better in France." The School of Fine Arts in Paris was a national institution, consisting of about 270 painters, 140 sculptors, and 570 architects, and it now had an annual subsidy from the Government of about 12,000*l.* A course of study in this school was the recognised mode of training adopted by French architects. The students passed through an elaborate and systematic course of study under duly appointed professors. In Paris, the paternal Government not only brought up the young architect in the way it thought he ought to go, but when he was let out into the world it looked after him, and by means of very stringent rules and regulations, carefully and systematically enforced, it ensured that he should not go very far astray from the appointed paths. Hence all that uniformity in height and general effect which produced in the minds of some persons, especially when seen for the first time, a feeling of admiration, and a tendency to draw comparisons with our own streets by no means flattering to the latter. Such first impressions, however, were not very lasting, for the mind became wearied with the monotony of the long façades and the almost unbroken skylines. Here in England, on the other hand, the young architect had no such systematic training, nor when he commenced to practise was he confined by any such stringent regulations as to height or uniformity in general effect. The result of this freedom was seen in the variety of design and colour in the buildings which were being put up in our leading thoroughfares, and which, in spite of occasional eccentricity, imparted to our streets an interest which was entirely wanting under the French system. Several events of importance had taken place in the architectural world during the past year. It was his sad duty to add his small tribute to

praise to the memory of George Edmund Street, who died in December of last year. Mr. Street's talents were so universally admired that it was unnecessary to dilate upon them. Any one who examined carefully his last and greatest work,—the Royal Courts of Justice,—which he was not permitted to see completed, could but be struck with the infinite variety in design and beauty in detail which met the eye in every part of the vast building. It was evidently the work of a master mind and hand, and one upon which that mind and hand had lavished a wealth of thought and care. Another event of considerable importance to the profession was the institution of an Examination for all those who might now be desirous of entering the ranks of the Royal Institute of British Architects. It was to be hoped that in course of time that examination would be firmly established, and that it would be considered a necessary qualification for all who might be desirous of practising in this country as architects. Hitherto, unfortunately, nothing of the kind had been necessary, and the result had been that the profession had frequently suffered severely in being misrepresented by untrained and unsuitable practitioners. Considering the importance of the interests frequently involved in an architect's practice, and the extent of the knowledge required to produce at all satisfactory results, it could not be doubted that the step which the Institute had taken was a most important one, and one in the right direction. The subject of architectural competitions had received a very large amount of consideration during the past session, but no very satisfactory conclusions had been arrived at. The objects to be attained were to frame such rules and regulations for the conduct of competitions as would obtain the approval and adherence of the profession generally, and to persuade the public in all cases to adopt such rules. Architects did not want to discourage competitions, but what they did want was to have the instructions clearly framed by an expert; to be satisfied that the requirements laid down would be strictly adhered to in every respect; and that the final selection if possible (or, if not, the selection of some small number) shall be made by a professional assessor whose position and qualification shall be such as to command respect. Another great object that architects had in view in discussing the question was to reduce, as far as possible, the amount of work to be done. In these days, when the promoters of nearly every building enterprise, small or large, must have a competition, and when so many architects were found to send in designs for anything upon almost any terms,\* it behoved those who had the interests of the profession at heart to make a decided stand. The matter was really in their own hands. If architects could only be got to agree as to the terms and conditions upon which competitions should be conducted, and to agree, further, not to compete unless upon such conditions, the committees and boards (who desired, in most cases, to act fairly and honourably) would no doubt be generally ready to adopt such leading principles as might be laid down. Passing on to glance at the present state of the art of architecture, the President observed that the Association might justly claim to have exercised considerable influence in guiding the tastes and supplying the wants of the public. Architects were often told by their critics that they had no style of their own in this nineteenth century, and that they were mere copyists. The first part of the statement was, no doubt, true, but he was rather disposed to adopt the opinion of those who thought that a new and distinct style of architecture was an impossibility. For what was called style was a combination in the masses and voids, and in the details and ornament, of certain well-known and distinctive forms; and if it was a fact,—as most of them believed,—that those forms had in past ages been well-nigh exhausted, the best thing they could do was what they were doing now, viz., to adopt such a period of work as they or their clients might consider best suited for the purpose, and to design their buildings in accordance therewith. The present century had witnessed the revival of Gothic architecture, and the old work had been studied and measured and sketched until its spirit had been thoroughly acquired, and buildings of all kinds had been

\* The history of the Association was very fully treated in a series of letters which appeared in the *Builder* two or three years ago.

\* An apt illustration of Mr. Hayes's remarks reaches us in the shape of the following advertisement, clipped from a recent number of the *Manchester Guardian*:—"Architectural Plans, Detailed Drawings, Gratis. Address."

erected, carrying on the tradition and feeling of the style in a most perfect way, and in a manner which could no more be said to be a copying of the old work than one building of the twelfth century could be said to be copied from another of the same date. The Gothic work of different periods thus revived still continued, and probably would continue, to be used for all ecclesiastical work, and it would almost seem to have been developed in new ways in consequence of the introduction of new materials. But it was questionable whether this century would see many more secular buildings of importance erected in the Gothic style. The kind of work which was now commonly known as "Queen Anne," but which included a great variety of features both English and foreign which were in use before and after that sovereign's reign, had given scope to great originality of idea. It had been found very suitable for all kinds of secular building, and seemed likely to hold its own for some time to come. We had also seen erected recently some few buildings in which Late Gothic features with Classic details were used, and it was still open to architects to adopt more largely than hitherto mixtures in the art of architecture. The current of thought in the architectural world had been at times somewhat slow and sluggish, but now it appeared to be full of life and energy. They, the younger members of the profession, were doing their best to maintain that life,—to breathe into their designs that nameless spirit of beauty which should pervade every architectural work, and which was necessary to raise it above the sphere of mere building. They were stimulated in their exertions by the consciousness that they were devoting their energies to a noble study,—that they were following one of the few callings in life which were worth doing for their own sake alone, and by the recollection of the enduring character of their work.

Mr. Rickman said it was now some twenty-eight years ago since he had the honour of filling the chair of the Association, and he was very pleased to hear the present President uttering very much the same sentiments, in very much the same words, as were uttered by him (the speaker) and by others, a long time ago. He felt at that time, and he was glad to perceive that the Association still felt, that its business was that of a younger society,—of a society of students of architecture,—just as the business of the older society was that of a society of practitioners of architecture. He was exceedingly pleased to find that the class of young men who were now coming forward as students had such excellent opportunities of which to avail themselves, and he felt assured that the Association would continue to do its work in a satisfactory manner during the coming year.

Mr. J. B. Fraser, president of the Leeds Architectural Society, said it gave him great pleasure to be present, and to be informed of the valuable work which was being done by the Association. Architectural societies in the provinces looked upon the Association as taking the lead in all matters connected with the educational work of the profession, and as being entitled to a very large share of the credit of what had been done of late years for the advancement of the *status* of the profession.

Mr. William White, F.S.A., proposed a vote of thanks to the President for his address. Among the several points which it had touched upon was a reference to the lamented death of Mr. Street,—one of his (the speaker's) oldest and dearest friends. It was some thirty years ago since he was associated with Mr. Street in offering some suggestions for the formation of an Architectural College,—suggestions which would be most properly carried out now if they could be, although the Association had to a very great extent covered the ground which the college, as at first proposed, was designed to cover. They wrote to three men very highly distinguished in the profession at the time, and received most kind and cordial replies from them, but the time had not arrived for carrying the proposal into execution, and it fell through. Another point of interest to which the President had alluded was the possibility of the development of a new style. He (the speaker) did not think it impossible that a new style should be developed, but he was quite positive that a new style could never be developed without the very scrupulous adhesion of some definite lines or principles of design. But the Architectural Association was animated

by the same conviction, and the greatest benefits would accrue both to the profession and the public from the systematic teaching of the Association's classes for design. He had always strongly deprecated eclecticism, which was too generally interpreted to mean that the architect, having the whole world of architectural art to choose from, should be at liberty to pick out the bit-bits of each style and to put them together,—of course, in an orderly and systematic manner.

Mr. John Norton briefly seconded the motion for a vote of thanks, which was carried, and thus terminated the formal part of the evening's proceedings.

#### Syllabus of Papers, &c., Session 1882-1883.

Nov. 10, 1882.—Address from the President. Mr. E. G. Hayes.

Nov. 21.—"Sundry Working Drawings." Mr. J. P. Seddon.

Dec. 8.—"Horticultural Buildings." Mr. F. A. Parkes.

Jan. 5, 1883.—"Vaulting." Mr. W. H. Wood.

Jan. 19.—"The Ornament of the Period." Mr. Lewis F. Day.

Feb. 2.—"The Position of Choirs and Organs in Churches." Mr. H. W. Brewer.

Feb. 16.—"Secondary Schools." Mr. J. Sulman.

March 2.—"About Modern Design." Mr. J. D. Sedding.

March 16.—"Theatres." Mr. Walter Emden.

April 6.—"Italy." Mr. F. T. Baggs.

April 20.—"Members' Society."

May 4.—"Museums." Mr. J. Osborne Smith.

May 18.—"Some Notes on Professional Practice." Mr. A. J. Gale.

June 1.—"Rural Sanitary Authorities and their By-laws." Mr. H. D. Appleton.

#### THE TULERIES.

In the approaching demolition of the Tulleries it has been decided to preserve and employ again certain portions of the materials as nearly as possible in the relative positions in which they have hitherto lain. The architect, M. Garnier, has been instructed to see that the blocks of masonry, the parts of the cornices, stone lintels, and heavy stones should be numbered and kept in order. After the demolition is completed it will be decided whether these materials shall be employed to erect a pavilion or some other small edifice in imitation of the architecture of the old Tulleries in memory of that ancient residence of the old kings of France. For ten years past there has been a great difference of opinion as to what should be done in this matter. The deceased M. Viollet-le-Duc thought that the large space between the Champs Élysées and the Garden of the Tulleries ought not to be left without some building upon it. Amongst the artists and architects of the French capital there is a strong desire to see a museum of the Nineteenth Century erected in that locality, and thus to substitute a temple of art for a monumental edifice, with which the names of Philibert de l'Orme, Jean Bullant, Jacques Androuet, Levan, and others are associated.

#### EXCAVATIONS IN THE FORUM AT ROME.

The excavations in the Forum and on the side of the Palatine Hill nearest to the Forum, have of late been carried on with unusual energy. The modern wall which cut off the Palatine on the north-eastern side has been pulled down, and the soil beneath and about it has been carried away down to the level of classical times. By this means extensive sub-structures have been laid bare that belonged to the Palace of Caligula, and a row of small private houses has been discovered which formed the boundary of the Forum on this side. The Italian Government is in negotiation with the Cardinal Vicar, with a view to the purchase of the adjacent Church of Sta. Maria Liberatrice, and there is good reason to believe that it will be successful. The church in question stands on the site of the buildings once belonging to the shrine of Vesta. The ground there has never yet been disturbed, and accordingly the excavations that are intended to be carried out there can hardly fail to lead to discoveries of interest, and bring to light important relics connected with the worship of Vesta.

The project of connecting the Forum and Palatine in their entire extent by systematic

excavations is the grandest scheme of the kind ever attempted in Rome, and the present Minister of Education, Signor Bacelli, merits the applause of all civilised peoples for the resolution he has displayed in persisting, in spite of much violent and often very personal opposition, in carrying out the idea in its entirety. The proposals, on the other hand, which have been made by the municipal authorities, with a view to provide the means of communication across the site are almost enough to take an archaeologist's breath away. The suggestion is to throw an iron bridge over the Forum from the Piazzetta di S. Teodoro in the direction of the Faustina Temple. One can hardly imagine anything more incongruous than a modern structure of that sort among the classic relics of the Forum. It is to be hoped that the Italian Government will feel how monstrous an absurdity it would be to carry out such a scheme, and that Signor Bacelli's energy will succeed in preventing the Municipality from proceeding to its realisation.

An interesting discovery has already been made in the course of the excavations. In removing the causeway passing across the area in front of the Arch of Septimius Severus the remains of an ancient and forgotten church, now recognised as that of Santa Maria in Foro, have been found beneath the road. The church, which is of small size, was constructed within the western porticos of the Basilica Julia, and on the ancient level.

#### THE ASPHALEIA THEATRE IN VIENNA.

SPEAKING of the Asphaleia, or "safety," theatre in Vienna, Herr F. Brandt, who is manager of the stage-machinery at the Wagner Theatre at Bayreuth, delivers his opinion as follows:—The so-called Asphaleia Theatre at Vienna, the often-described model of fire-proof theatrical buildings, appears to be the work of an engineer devoted to hydraulic machinery,—of a man, in fact, who knows very little about theatres, and who understands nothing of the technical department of the stage. The application of hydraulics to theatrical machinery is a very unhappy thought. The most excellent water-pressure machines are not to be provided except at an immense cost, as they must be of the best materials; they also require to be moved and loaded in a uniform manner, but what is worst, they constantly stand in need of repair. How can we act with machines of this sort in the theatre where, during a single performance,—often, indeed, during a single act,—the same machine has to be employed three or four times with burdens and movements that are never uniform? Hydraulic machines are by far the least trustworthy we have. But on the stage, where everything depends on punctually doing what is wanted at the exact moment, and where there are a thousand accidents unknown to the non-professional man and invisible to the spectator, the only machines that are of any use are the simplest, the most trustworthy, and the least complicated. Let us only remember how soon the notion of employing steam for moving stage-machinery was abandoned, and how often, in the few attempts that were actually made with it, human life was endangered! Precisely similar is the case with hydraulics. It is one thing to construct a model of one-tenth the natural size, and on which three or four pieces of decoration have to be moved, and quite another thing to build and fit up a stage which will satisfy, not only the requirements of the current *repertoire*, but also be equal to any new scenic-technical tasks as they arise. All the pompous phrases that are employed,—such as "the immediate and unprepared opening and lowering of the entire podium or large parts of it at any moment, or setting the entire podium or certain sections in wave-like motion; raising and lowering of entire rooms by trap-doors or flaps running parallel to the side walls of the stage; the wonderful horizon which, in connexion with the often very difficult task of limiting the extent of the scene in an upward direction, is to render us entirely independent of soffits and arches,"—all such phrases can only raise a smile on the face of every really experienced stage painter or machinist. In models, such things are very easy to execute, but when carried out on a large scale they leave their inventor completely in the lurch. In certain special and exceptional cases such things may be and have been successfully applied. But to attempt to

bring them into operation together as a complete system, is absurd and impossible, whether the motive power be hydraulics or steam or anything else.

In a theatre so fitted, one would never be able to find at the right moment the proper piece of theatrical machinery through being overdone with machines. It is quite possible to erect fire-proof theatres without resorting to all these so-called practical, but really most unpractical, expedients.

#### THE CORINTH CANAL.

WHILE war has been raging on the banks of the canal that joins the Mediterranean and Red Seas, the spade has been busy on the Isthmus of Corinth, where the Greeks are engaged on a new and bold undertaking, which is destined one day to be the highway of commerce between the ports of the Aegean, Constantinople, and the Black Sea on the one hand, and all the States of the western half of the Mediterranean as well as of Western Europe generally, on the other. The work of excavating the new Corinth Canal, of which King George turned the first sod in the spring of the present year, is, according to the latest accounts, rapidly progressing. Within the past month additional hands have been taken on, and at present the number of navvies employed on the excavation is about 800. The work commenced on the 10th of April last, and up to the 15th of August the quantity of earth removed was a quarter of a million cubic metres. New dredging-machines have been ordered, and are expected to arrive at Corinth in November, by the help of which the progress of the work will be vastly accelerated. At the two ends of the new Corinth Canal the first steps have already been taken in laying the foundations of the two new ports which the Greek Government has decided to establish there.

#### EDINBURGH.

A CONGREGATION in connexion with the Established Church, which at present occupies an iron church at Lorn-street, has succeeded in raising a building fund to enable them to erect a suitable permanent church. Plans, it appears, have been obtained from Messrs. Sloan & Balderston, the celebrated American church architects, and the carrying out of these is to be supervised by Mr. Thomson, architect, Leith. The architecture of the church, it is said, will embrace the principal features of the Gothic style. The frontage towards Lorn-street is to be octagonal, with three entrance-doorways, one in a tower at one side, one in a porch at the other side, and one in the centre. Besides these three entrances, there will be two in the rear. A circular arrangement has been adopted in the interior which will have a gallery of horse-shoe form. The area of the building will be 76 ft. square, and an open span-roof, without intersecting beams, will give an appearance of airy spaciousness. A commodious platform is provided for the preacher, and the vestry is placed behind it on the same level, the session-rooms, &c., being placed underneath. Above the centre vestibule space will be left for an organ-loft. The spire is intended to rise to a height of 200 ft., but it is not proposed to complete it at once. The estimated cost of the building is about 6,000*l.*, and accommodation will be provided for 1,200 sitters. It may be mentioned that Messrs. Sloan & Balderston lately obtained the contract for the building of a palace for the Emperor of Mexico.

The foundations are in process of excavation for an addition to the Advocate's Library. The addition will consist of three stories, and be fitted up to contain about 100,000 volumes.

An influential committee has been formed for the purpose of erecting a monument to John Knox. A list of subscriptions to the amount of upwards of 1,200*l.* has been published, and should a sufficient amount be obtained it is intended to place accessories, statues of Patrick Hamilton, George Wishart, George Buchanan, and Andrew Melville, one at each corner of the pedestal. The committee have secured as sculptor, Mr. D. W. Stevenson, A.R.S.A., whose embodiment of the Reformer, as represented in the published engraving, "has received a warm and universal approval." The monument is intended to be placed in the small square to the west of St. Giles's Cathedral. None of the designs submitted for the Wallace and Bruce Memorial

have been deemed worthy of acceptance, and it is not yet decided what steps will be adopted to carry out the scheme.

After paying all expenses connected with the care of the public monuments in the city there remains a profit of 28*l.* 2*s.* 3*d.* for the year. From the accumulation of balances the Town Council have been able to expend 1,418*l.* 4*s.* 10*d.* on statues and statuettes, which have been placed in the niches of the Scott monument, while there still remains in hand a balance of 1,442*l.* 17*s.* 6*d.*

#### THE EVANS MEMORIAL CHAPEL.

ROME AND COLONIAL TRAINING COLLEGE, GRAY'S INN-ROAD.

A CHAPEL has been recently erected from the designs and under the superintendence of Messrs. Charles J. & C. Herbert Shoppee, architects, of 61, Doughty-street and 22, John-street, Bedford-row, London, W.C., on a site forming part of the exercising-grounds of the College. It is approached from an arched covered way serving as a cloister, and is intended as a memorial to the late Rev. J. J. Evans, M.A., for many years principal of the College. The foundation-stone was laid about five months since by the Right Hon. the Earl of Chichester, and the chapel was opened for divine service on Thursday, the 12th of October. Its architectural treatment is Romanesque, and its dimensions are 53 ft. in length by 29 ft. in width, with an aisle on the north side, 27 ft. by 9 ft.

Externally the chapel is partly faced with glazed white bricks and Box stone dressings relieved with blue bricks in courses, and covered with green slates and red ridge tiles.

On the stone tympanum over the entrance-doors the words "Holiness unto the Lord" are incised and the letters gilt.

The interior of the chapel is faced with white Suffolk bricks and string-courses and cornice of dark purple Luton bricks with Box stone quoins, jambs, and arches to the windows. The windows are glazed with tinted glass in geometrical patterns, in lead lights, by Messrs. Odell, of Bath-street, City-road. The arcade separating the aisle from the chapel is semicircular, and has moulded stone voussours and labels. The shafts are of polished red Aberdeen granite, with moulded stone bases and stone capitals, carved by Mr. Bradford, of Albert-street, Kennington-road. The roofs are of pitch pine, with moulded principals resting on Box stone corbels, and with moulded ribs and cornices. A pitch-pine dado, 5 ft. high, is fixed to the walls.

At the west end is a gallery with ornamental pitch pine front, and with separate access by stone staircase from the cloister. The reading-desk, entrance-doors, lobby, and seats are of pitch pine. The chapel is paved with Craven, Dunnill, & Co.'s geometrical tiles, with encaustic tiles at intervals. The gasfittings are of wrought-iron of Messrs. Gardner's manufacture. The chapel will be heated by hot water.

A brass memorial plate engraved by Gawthrop is fixed against the south wall.

Ample provision has been made for ventilation and the admission of fresh air.

The works have been well carried out by the builder, Mr. Henry Burman, of 37, De Laune-street, Kennington-road.

#### THE COURT-YARD "DE LAS DON-CELLAS," SEVILLE PALACE.

"THE Alcázar of Seville," says Señor Don Pedro de Madrazo, in the eleventh volume of his *Recuerdos y Bellezas de España*, "is in great part a reproduction of the charms of the Alhambra, due to the same architects, who constructed the magnificent palace of Granada. There are to be seen the precise copies of those beautiful traceries which adorn its doors and ceilings; those staccato vaults which dazzle the eye and puzzle the mind; those mural decorations of elegant Byzantine twigs and geometrical twists which, even to this day, puzzle drawing-masters; those charming saloons where the genius of harmony appears to predominate; those luxuriant gardens, which invite to rest, meditation, and solitude."

One of the marvels which captivate the attention of the visitor and the artist in the beautiful Alcázar of Seville is the principal inner courtyard, called "de las Doncellas" and also "del Trono del Tributo"; names derived

from an unfounded tradition, according to which the Moorish Kings received in this court the fabled tribute of the time due to the caliphs of Cordova, and consisting of a hundred maidens. This legend is contradicted, on the ground that Seville never was the capital of the Andalusian caliphate, and that there are no data justifying the conclusion that any Saracenic palace existed until the eleventh century.

The illustration which we give in this week's *Builder* represents one of the corners of this yard. It is a rectangle containing galleries supported on marble columns, arranged to match with each other, and embellished with arches in the pointed style. On the frieze are shown trophies and shields with the arms of Don Pedro I. and of other kings, as well as the pillars of Hercules, with the motto, "Plus ultra," the design of which is attributed to Luis Marliano, physician to Charles V.

#### DESIGN FOR BIRKENHEAD TOWN-HALL.

THE design we illustrate, marked "Fide," and which was the third in order of merit, is by Mr. G. B. Rawcliffe, architect, Burnley, and Mr. E. P. Wright, surveyor, Plymouth. This design, although considerably richer in detail, is intended to harmonise with the surrounding building in Hamilton-square. The borough surveyor, borough treasurer, and town clerk occupy the principal floor, which is 8 ft. 6 in. above the street; the other officials, medical officer, school attendance officer, nuisance inspector, gas and water, &c., being located in the basement and top story.

The first floor is the municipal floor, with council-chamber in front centre; town council and mayoral apartments down each side, and a large public assembly-room in the rear. The four elevations were intended to be faced with Hollington stone, and the principal entrance, staircases, passages, &c., with Ancaster or Combe Down stone. The cost is estimated at 42,000*l.*

#### EAST SUSSEX, HASTINGS, AND ST. LEONARD'S INFIRMARY COMPETITION.

THE design submitted by Messrs. Higgs & Rankin, of 68, Lincoln's-inn-fields, now illustrated, consists of a block of buildings covering nearly the whole site. It is only four stories in height. The basement is 4 ft. below the level of the Parade, and contains the kitchens, dispensary, waiting-room, heating-chamber, and mortuary, which is completely cut off from the main building. The central portion of the ground-floor is occupied by the administrative department; the right wing by the accident-ward for women; and the left by that for the men. This arrangement is followed on the upper floors. The wards contain an average of 1,200 cubic feet of air per bed, and are each overlooked by a nurses' room. The ventilation is effected by means of Tobin's ventilating tubes and extracting-flues. The entrance-hall is situated in the centre of the building, and provided with double sets of swing-doors, protecting the main building from draught, the principal staircase being immediately opposite. There are also two secondary staircases for nurses and servants in direct communication with the wards, and four lifts (two in connexion with the kitchen, one with the dispensary and medical department, and the fourth for ambulance). The elevation, though inexpensive, is effective, being of red brick and terra-cotta; it is well broken up by the two end wings and a fine central tower.

The building will accommodate 100 patients, at an estimated cost of 20,000*l.*

**Vandalism.** The village of Sawston, Cambridgeshire, is noted for a fine stem of an ancient cross of Barnack stone. Of late years the base has been damaged by children playing upon it. Last week the parish authorities, who ought to be proud of this interesting relic, decided to utilise it by converting it into a lamp-post and fixing street-lamps thereon. It is to be hoped some public-spirited persons will invoke the aid of the Society for the Preservation of Ancient Monuments, or otherwise effectually prevent this gratuitous piece of ignorant vandalism.

SARACENIC GEOMETRICAL TRACERY.

### PROPOSED DESIGN FOR BRIGHTON, HOVE, AND SUSSEX THROAT AND EAR DISPENSARY, BRIGHTON.

This valuable institution has been but a few years in existence, yet its rapid development required suitable architectural extension. With this purpose in view the design we have illustrated was furnished.

It was proposed to be built of red brick and Corshill stone, with green slates for the roof, the principal feature of the facade being the carving. The arrangement comprises, on ground-floor, waiting-room for out-patients, with separate entrance, consulting-room, &c., with kitchen and out-offices at back; on the first floor the board-room, running the whole width of the frontage, and comprising the three large bays, lavatories, &c., a large women's ward in the rear, with bay-window looking on the back, &c. On the second floor men's ward over the other, and similar to it, and on the attic floor caretaker's rooms. Necessary lifts, nurses' rooms, &c., are provided on each floor.

The floors are of fire-proof construction, with 1 in. of asphalt between two thicknesses of outer walls for the prevention of wet. The whole of the interior fittings are of pitch-pine, varnished. The architect is Mr. Jerome F. D. Goodrich, Union Chambers, North-street, Brighton.

Since this design was prepared a suitable plot of ground has been purchased by the committee for the dispensary in the Queen's-road, Brighton, a commanding position in the town, which has, however, necessitated a revised design, which is now under consideration, and although the facade will lose frontage, the great depth of plot will give a separate entrance for out-patients at the rear.

### SARACENIC GEOMETRICAL TRACERY.

The great beauty and wonderful variety in the ornamentation of Mahometan buildings are very striking when we consider that the artists were prohibited by the Koran against idols, and that this has been construed by their fanatical commentators into an edict against any imitation whatever of the human form or of natural objects, except in scarcely recognisable conventional forms. This compelled the Arab artists to take up a new line, and to depend upon themselves for their inspirations; and so it was, that science allied itself to imagination, and conceptions were evolved of decidedly original character from an infinite combination of geometrical lines. They delighted in intricacy, and prided themselves on perpetual novelty; but however elaborate their designs may be, they are always based on some simple form,—either the square, the triangle, the pentagon, or the hexagon; and though, to many persons, it would seem almost impossible to copy some of the more elaborate designs which decorate the mosques of Ispahan, Cairo, Damascus, Bagdad, and other Mahometan cities, a little geometrical knowledge immediately gives the clue to the principle, and at once facilitates the task. Splendour of colour is also a characteristic of Arab art, all the positives and secondaries being sometimes used in one design, but separated from one another by tracery lines of black or white or gold singly, and sometimes black and white or gold and white combined. Their harmony and repose were secured by arranging the colours on some geometrical plan. Those, in the circular design we give of the centre compartment were red; the next ten triangular spaces might be blue, the next ten pentagons red, the next triangles green, and so on. The tracery (of which we only give the centre-line) would be formed of a black centre-line and a white line on either hand, and would interlace or pass under and over at the intersections.

The Persian Mahometans, being of a different religious sect to the Arabs, were able to imitate nature, and consequently their art, in some of its examples, closely resembles that of Europe in the Middle Ages.

As in the West, in Mediaeval times, Saracenic art was universally applied. Copies of the Koran were elaborately illuminated in gold and colours. Doors, lecterns, and tables were inlaid with ebony, tortoise-shell, ivory, and mother-of-pearl. Windows of cupolas and interior courts were filled with jewel-like stained glass. Walls were lined 8 ft. to 12 ft. high, with impressed faience tiles glowing with

lustre and harmonious tints, surmounted by arabesque tracery work in stucco, 4 ft. or 5 ft. deep, of designs similar to those we print. Pavements were of different marbles. Carpets were woven with wools of richest dyes; palls and sacred hammers in mosques were embroidered in gold and silver and richest silks. Externally the details of doors, panels, and friezes were of rich marbles, porphyries, breccias, and serpentine.\*

We have, here, then an architectural and decorative mine which has not, in this country, been very diligently explored, and as the style which has lately been in vogue appears to be going out of favour, it may, perhaps, prove a successor, and not inconsistently, inasmuch as our Queen rules over a greater number of Mahometan subjects than Kaliph, Sultan, or Shah.

### THE RHIND LECTURES IN ARCHAEOLOGY.

Dr. JOSEPH ANDERSON delivered the fifth lecture of this course† (in connexion with the Society of Antiquaries of Scotland), on the 25th ult., taking for his subject "Chambered Cairns in Argyle, Orkney, Inverness-shire, &c." Dr. Anderson said that in 1871 Dr. Angus Smith, Manchester, explored the large chambered cairn at Achnacree, near Loch Etive, in Argyleshire. In form the cairn was approximately circular, 75 ft. in diameter, and rising to a height of 15 ft. in the centre. There were traces of an outward ring formed by a trench, and an embankment round it 135 ft. in diameter. The entrance passage was about 28 ft. in length, 3 ft. 6 in. high, and 2 ft. wide. It was lined with slabs set on end and covered with lintels. The chamber interior to which this passage gave entrance resembled that of the Caithness cairns in being triply divided, but differing in the manner of division. Each of the three parts of the triply-divided space formed a separately-roofed and walled chamber, the second entering by a doorway with a raised sill in the back of the first, and the third entering similarly from the back of the second. The passage decreased slightly in height from the exterior entrance inwards, so that the entrance in the first division of the chamber's interior was only 2 ft. 2 in. square. The first chamber measured on the ground 6 ft. by 4 ft. The walls were formed by flat slabs, set on edge in the lower part, over which they were built in the ordinary manner of dry walling, the upper stones lapping so as to bring the space to be covered into an area of 5 ft. 4 in. by 1 ft. 10 in. Its rudely vaulted roof was covered at a height of 7 ft. by a single stone. The two other chambers were smaller, and had no overlapping of the side and end walls, but were spanned at a lower elevation by large flat slabs. The floors of the chamber were covered with stones, strowed loosely about, and in the loose soil of the floor were found fragments of several urns of peat-furn. No indications of cremation were observed, and though no remains of unburned bodies were discovered, the presumption was that the interments were unburned, both on account of the form of the urns and the absence of burned bones, which are almost indestructible. Having described the cairn at Lurgie, Kilmartin, together with the urns found there, and also the cairn at Kilehoun, Dr. Anderson said that in this group of Argyleshire cairns he recognised the same features that gave character to the Caithness group, but with certain differences. They were chambered cairns; the chamber was subdivided into compartments, the roof was partly rounded by vaulting and partly by flat slabs, and in one case it was wholly flat. The contents were burials after cremation. No trace of bronze was present in any of them; and when implements were found with the interments, they were merely of chipped flint. Passing to speak of the group of cairns of a similarly interesting character to the north of Caithness, the lecturer described the Maeshow cairns, in which there were indications which led to the conclusion that the chambers were broken, probably in the hope of finding treasure, in the twelfth century. The names carved in Rumes on its walls were, mostly names of persons living there in the time of Earl Rognvald, the Jorsala-farer. He

\* With all this, breadth and simplicity were quite consistent with this style, as may be seen by examining the Photographs at the India Museum.

† For some notice of the previous lectures of the course see *Builder*, p. 669, ante.

described the crosses carved in the chamber, and the carving of the "Dragon of Maeshow," and remarked that the art characteristics of these carvings were those of the twelfth century and of the colonial Scandinavian style; and, he held, these accidental carvings did not elucidate the story of the structure. The essential features linked it with the chambered cairns of the Scottish mainland, while its special features were those of a local variety of the general type.

Having described the structural peculiarities of the chambered cairn on the Holm of Papa Westray, Dr. Anderson said that in this Orkney group of chambered cairns we had the same essential characteristics as were exhibited by the groups which had been described on the mainland of Scotland. There was a typical relationship with strong local differentiation in each of the groups, so that while the essential characteristics remained the same, the Orkney group, the Caithness group, and the Argyleshire group had each a special character of its own. Another group of cairn structures, of a very remarkable character, was situated in the little plain of Clova, on the edge of Culloden Moor, within a few miles of Inverness. Like all the others, they possess a definite internal outline and a regularly-constructed interior chamber and passage; but, unlike any of the others, there was no sub-division of the internal chamber, and they presented an external feature which was not present among the groups of similar structures peculiar to Orkney, Caithness, and Argyle,—namely, the addition of a ring of standing stones erected outside the periphery of the cairn. It was clear that all these cairns, however much they might differ from each other in their structural details, belonged to one type of sepulchral structure, differing from all other types that were present in the same area,—(1) in the possession of an interior chamber accessible by a passage; and (2) in the possession of a definite external form, which was structurally defined. In speaking of them he had called them cairns, with respect to their present appearance, but with respect to their essential characteristics it had been demonstrated that they were in reality the ruins of buildings that were distinctly structural in architectural character and conception. The system of their structure and design was a system that produced a building with outside and inside, with roofs and floors, external and internal doorways, partitions, and passages. A just conception of these features of their character and of their significance was only attained with difficulty, and after investigation, comparison, and reflection. But their enormous magnitude was a feature of their character which gave an instantaneous impression of energy and power, and the obvious fact that they were houses of the dead instinctively challenged our respect for their builders. They were men who were in their stone age, but it was plain that they were not on that account inferior in capacity and culture to the men of the bronze or iron ages, in so far as capacity might be indicated by the construction of cairns, or culture signified by an attitude of mind which regarded the perpetuation of the memory and honour of their ancestral dead.

The sixth and concluding lecture of the present course was delivered on the 27th ult., the subject being "The Culture and Civilisation of the Stone Age in Scotland." Dr. Anderson said that, as he had before had occasion to remark of the Bronze Age, there was no vestige of a dwelling or of a defensive structure known in Scotland which could be proved by evidence to have been the work of the men of the Stone Age. It was to their burial-places that we must, therefore, look as the chief sources of the materials which might disclose the quality of the culture and the pattern of the civilisation existing among them. These materials were not abundant, but there were others which were more abundant, and whose testimony, though less direct and circumstantial, was not the less relevant to the purpose of their investigation. They were rarely found in hoards or groups. By far the larger number had been found casually in ploughing, in draining, or in excavations in peat-mosses, in the beds of rivers, and in the margins of lochs, or in sandy wastes by the sea-shore. He pointed out that stone axes and moulds for casting spear-heads of bronze had been found together at Campbeltown, Argyleshire; and that instances of stone implements occurring in groups had been found in Aberdeenshire; at Dmmore, Gleshee; at Daviot, Inverness-shire; at Ting-

wall, in Shetland; and at Fochabers. These implements served the double purpose of tools and weapons. Speaking of the method of hafting and the form of the typical stone axe, the lecturer said that its speciality of form and fineness of finish were indications of culture, while the perforated battle-axes of stone were characterised by a fineness of finish and decoration which exhibited special skill and taste in their manufacture, and afforded evidence of the capacity and culture of their makers. In the finer forms of these chipped implements, it was manifest that their rudeness was the result of processes carefully adapted to the properties of the material, and performed with a dexterity and a precision only to be acquired by practice and experience. That their surfaces were always unsmoothed, while other implements in the same material were finely polished, was evidence that the absence of polish in them was the result of intention and not the result of incapacity. And that this abstention from all effort to produce a finer finish of surface and outline than that which resulted from the merely constructional process ought rather to be recommended as a merit than censured as a defect in the workman's culture seemed plain from the fact that, whether practically or aesthetically considered, the form thus finished possessed a character of fitness and beauty which was universally acknowledged as most admirable. This character was the result of a single process perfected to a pitch of delicacy and refinement which is now unattainable. The process which they thus invented and perfected was the very process which scientific investigation had found to be the most suitable to the qualities of the material which they employed. In all these manifestations of special knowledge and skill it was impossible to hold that there was not evidence of culture. The man of the Stone Age, whose culture and civilisation were thus made dimly visible to us by the relics of his life and the memorials of his dead, was the typical representative of primeval man in Scotland. There was no evidence of the existence in the Scottish area of any representative type of man of higher antiquity or of lower culture than this.

#### AN OFFICIAL VIEW OF LONDON.

To the new number of the *Nineteenth Century* Mr. G. Shaw Lefevre, her Majesty's Chief Commissioner of Works, contributes an article (with plans) entitled "Public Works in London," in which the intentions of his department in respect of Grosvenor-place and Hyde Park Corner, the site of the proposed new Public Offices, Charing-cross, and the Tower of London, are set forth and defended. Without at the present moment entering on the disputed points involved, we quote Mr. Lefevre's introductory sketch of London as it remains to us. We must, however, mention one agreeable announcement, which is to the effect that endeavours will be made to find a better position for the statue of the Duke of Wellington which now surmounts the Arch:—

In some of its many aspects London is one of the most beautiful and interesting cities in Europe. There are, indeed, vast districts in it of unredeemed ugliness, lowness, and poverty, where there is no single feature of beauty or grandeur, where the population passes through its daily toil, from the beginning to the end of life, unillumined by a ray of interest from surrounding influences, and where society seems intent on reducing life to the most monotonous and dreary existence that could be devised. Nor are dulness and monotony confined to the districts inhabited by the labouring people only; the more fashionable quarters which have grown up during the last two centuries in the west of London have been constructed on a system, and under a tenure, which was best calculated to prevent any individualism from manifesting itself; and contractors, bent only on making the utmost profit out of hundreds of houses built, for the sake of cheapness, on the same model, have impressed and stereotyped whole districts with the most uniform, dreary, and commonplace domestic architecture.

Probably also no city in the world has ever owed so little to the munificence or taste of its principal owners and wealthiest citizens. The great owners of the freehold of London, with rare exceptions, have been content to lease their land for long terms to contractors, who have built without regard to external appearance. If open spaces have been left uncovered with

buildings, it has been through no consideration to the public, but in order to attract a wealthier class of tenants by the exclusive use of the gardens thus formed, and which, screened from the public by iron railings, give a sense of dreariness and seclusion which would not be tolerated by public opinion in any other capital of Europe. Of the untold wealth which has accrued, or is accumulating against the time when the leases fall in, to these London freeholders, from no efforts of their own, but from the growth of the population and the consequent continual increase in the value of land, nothing has been devoted to public improvements. They have not even contributed to their share of the great public works of utility carried out by the Metropolitan Board, as by the terms of their leases the whole of the rates, however unexpected they may be, must fall upon the leaseholders, and Parliament has not seen fit to compel these owners to contribute their share. They have also been content for the most part to live in houses of no greater external merit than those which their contractors have built for others; and of the great houses of London with character, dignity, and beauty, scarcely one belongs to those who owe the greater portion of their wealth to the metropolis. The absence of public spirit in the owners of the freehold of London is scarcely less conspicuous among its wealthiest merchants, and few indeed are the benefactions to the metropolis on their part for the purpose of adding to its permanent beauty or attractions. The improvements in Leicester-square, and the bringing to England of the Obelisk and its erection on the Thames Embankment at the cost of Sir Erasmus Wilson, are among the rare cases of the kind that have occurred.

London, however, owes much to its connexion with royalty, in respect of that which above all things is its chief boast,—its parks. What other great cities in this country have of late years owed to the munificence of wealthy citizens, or to the self-imposed taxation of their people, London has owed chiefly to the wise liberality of its sovereigns, whose ancestors, fortunately, through love of sport, had provided themselves with ample parks for this purpose, in close contiguity to the palaces in or near London. Regent's Park, formerly called Marylebone Park, came into possession of the Crown in Queen Elizabeth's time. Hyde Park was taken by Henry VIII. from the Abbey of Westminster in exchange for the lands of a dissolved priory in Berkshire; and St. James's Park by the same monarch from Eton College in exchange for other lands. The three together formed a hunting-ground for Henry VIII. of considerable extent and wildness. Hyde Park was opened to the public for the first time of his own free will by Charles I., and though it was closed again during the Commonwealth, and indeed sold in three lots, yet on the restoration the sale was annulled, and the park was again made public. The Green Park was purchased by Charles II., and the same monarch opened both St. James's and the Green Park to the public in the autumn of 1660; and the Regent's Park, as its name indicates, was opened to the public by the Prince Regent in the early part of the present century. The splendid application of New Gardens to scientific purposes was due to the wise generosity of our present Queen. Battersea and Victoria Parks were bought out of moneys voted by Parliament, a part of which it was intended to recony by the sale of frontages, before the existence of the Metropolitan Board, and before the time when it was considered that the supplying such breathing-places was a function of municipal government. The wide domains of Richmond, Hampton Court, Greenwich, and Bushey have also long been enjoyed by the public, owing to the fortunate propinquity of these royal possessions to the metropolis. These are all now separated from the management of the Crown property, and under the Act of 1851 maintained at the cost of the country, under the control of the Office of Works; and it is matter of common acknowledgment that the management of these parks, and especially the gardening of the more central of them, have of late years marvellously improved, and leave nothing to be desired in comparison with those of any other capital in Europe.

Looking broadly at the results of these operations, it may safely be said that no other city or number of cities have in their neighbourhood so many and so beautiful or so varied places of public resort open to all the world.

The views from Hampstead Heath, from Plumstead Common, near Woolwich, and from the higher parts of Epping Forest, are unequalled in their various aspects, while on Wimbledon Common, on Blackheath, or Barnes Common, and many others that could be named, the public have opportunities of breathing fresh air and of enjoying nature in its primitive state to a degree which is wholly unappreciated in the neighbourhood of such a population. It would require many years thoroughly to explore all that the neighbourhood of London has to offer in this direction, and, as all these places are within an easy walk, they may be enjoyed by people of all classes.

Turning from our parks and commons to the buildings of London, it is necessary to speak with less of praise. Considering its vast size, and its enormous population, the number of buildings of architectural importance is not large; but what we have of them are perhaps not to be easily matched in other cities. What is beautiful and interesting in London is for the most part concentrated on the banks of the river from Lambeth Palace and Westminster to the Tower of London, and the streets north of the river which are parallel to its course. It is singular, indeed, that in a city of the antiquity and size of London the buildings which have been preserved to us from ancient times should be so few in number. Of buildings erected before the year 1100 we have only now survived the keep of the Tower and its chapel of St. John, built by Bishop Gundolph, one of the most perfect specimens of Norman architecture in England, the chapel of the Pyx in Westminster Abbey, and the old tower in the precincts of the Abbey known as the Jewel House. Of the twelfth-century work we have remaining only St. Bartholomew the Greater, in Smithfield, and the round church of the Temple (much modernised, however), and three or four ancient crypts in the City. To the thirteenth century we owe Westminster Hall, the choir, transepts, and nave of Westminster Abbey, the inner church of the Temple, the chapel of Lambeth Palace (much altered), and the outer walls, water-gate, and the church of St. Peter ad Vincula in the Tower of London. Of fourteenth-century work we have but little; it consists of the College Hall and the Abbot's House of Westminster, the Jerusalem Chamber, and part of the cloisters of the Abbey, built by Abbot Liddington, the cloisters of the Houses of Parliament, the Church of St. Helen, Bishopsgate-street, and St. Saviour's, Southwark. Between 1490 and 1500 were built the Guildhall, Crosby Hall, the gateway and the Lollards' Tower of Lambeth.

The next century, from 1500 to 1600, gave us Henry VII.'s Chapel at Westminster Abbey; the three gateways of St. John's Priory, Clerkenwell, of Lincoln's Inn, and of St. James's Palace; the churches of St. Andrew Undershaft and St. Giles's, Cripplegate; Gray's Inn Hall, Middle Temple Hall; the Chapel Royal, St. James's, the Savoy Chapel; the older parts of Hampton Court, and part of Fulham Palace.

Coming to more recent times, it may be said that London owes what it has of interesting and important buildings to the genius mainly of three architects,—to Inigo Jones, to Sir Christopher Wren, and to Sir Charles Barry. Other architects are represented by one or at most two works, many of them of great merit, but these three alone can be said to have set their mark upon the general tone of London architecture.

Of Inigo Jones's work we have the Banqueting House, Whitehall, the Rolls Chapel, the Gateway of Westminster School, the Water Gate of York House, St. Paul's, Covent Garden, the chapel of Lincoln's Inn, Shaftesbury House, Bishopsgate-street, and the interior of St. Catherine Cree; and we have a reminiscence of his work in the Strand frontage of Somerset House, which was adapted by Sir W. Chambers from the original building erected by Inigo Jones.

Sir Christopher Wren had the splendid opportunity offered by the clean sweep made of the City churches and buildings in the Great Fire of 1666. To the variety and vigour of his genius we owe a great part of what the City of London still has of architectural interest. Besides St. Paul's, the noblest fan of modern times, of Italian Classic style, with the exception of St. Peter's at Rome, and exceeding that in the grace and beauty of its exterior, he rebuilt fifty-three churches, many of which, such

as St. Michael's, Cornhill; St. Stephen's, Walbrook; St. Mary-le-Bow, and St. Bride's, are most beautiful specimens of their style. We owe also to Wren the more modern parts of Hampton Court, the two rare blocks of Greenwich Hospital, with their splendid colonnades; Chelsea Hospital, Marlborough House, Kensington Palace, the Halls of the Paper Stainers' and the Skinners' Companies, the College of Physicians, and the western towers of Westminster Abbey. Of his many churches, two only,—St. Mary Aldermany, and St. Alban, Wood-street,—are in the Gothic style.

To no architect since the time of Wren does London owe so much as to Sir Charles Barry. Of his work we have the Reform Club and the Travellers' Club, the reconstructed Treasury buildings fronting Whitehall, the College of Surgeons in Lincoln's Inn-fields, and Bridgewater House, all buildings of high merit; and, lastly, we owe to him the Houses of Parliament, a building which, whatever criticism in detail it may call forth, is, undoubtedly, when looked at as a whole, a most beautiful conception, and worthy alike of its site and its purpose. After this, the only public buildings which need be noticed are the Public Offices, by Sir G. Scott; the Natural History Museum, recently completed by Mr. Waterhouse; and the New Law Courts, the architect of which (the late Mr. Street) died but a few months ago, not before he had completed every design for the marvellous variety of detail of this building, but before he could realise in its entirety the result of this his greatest and most beautiful work.

Of private mansions there are but very few in London and its neighbourhood worthy of notice. Among the few exceptions are Holland House, one of the most beautiful specimens of Tudor Domestic architecture; Charlton House, near Woolwich; Ham House, the unaltered and most interesting family residence of the Dysart family; Sion House, the seat of the Duke of Northumberland, on the top of which is to be seen the lion formerly so familiar to London on the house improved away to make place for Northumberland-avenue. In the more populous parts of London, the list of really fine houses is very small. It comprises Spencer House, Bridgewater and Stafford Houses, and Dorchester House,—a remarkably beautiful specimen of pure Italian style, and a great ornament to Hyde Park. Of other great public works of modern times, it is almost superfluous to mention the magnificent embankment of the Thames; and the three beautiful arches, with connecting pillars, at the entrance of Hyde Park, by the late Mr. Decimus Burton.

It will be obvious from this slight survey how few are the relics which have come down to us intact from olden times. It may warn us how secretly we should preserve them, and how important it is that they should be opened out to the fullest view on every side. It also shows that, while much has been done in the past few years, a wide field remains, in which all the agencies for the improvement of the metropolis may find work for a long time to come. The means at the disposal of the Government for this purpose are necessarily limited, as the general taxpayers are rightly jealous of the expenditure of public money for any purely metropolitan work; and in the future there is more to be hoped for from the Metropolitan Board, or whatever may hereafter be the municipal government of a united London, than from any Government agency.

**Richard Trevithick.**—The Cornwall correspondent of the *Mining Journal* says,—There is no unmemorialised man in England to whom the county lies under a deeper debt than it does to Richard Trevithick,—one of the group of Cornish worthies on whom Mr. Worth lectured at the recent Polytechnic Exhibition, and of whom he spoke as probably the greatest all-round inventor the world had ever seen. It is no credit to popular writers upon engineering matters that Trevithick should have been cold-shouldered into oblivion while Watt and the Stephensons were written into far more than their due meed of fame, great as that meed undoubtedly was. This injury to his memory can never be recovered, but something might surely be done in the county of his birth, as proposed, to associate his name with a work of popular utility. Need his grave at Dartford lie any longer unmarked by monument or record of the great man whose bones lie beneath its sod?

#### THE ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD.

The eleventh annual report of the Local Government Board, as now constituted, lately issued, is a voluminous record of a year's work, in connexion with poor-law administration, local government and taxation, and the public health. The report is for the year between March 25th, 1881, and March 25th, 1882, and contains a mass of information and statistics.

Among the encouraging items in the report, we find testimony borne to the effect of sanitary improvements in diminishing the death-rate. The report adds to the remarks made in last year's report upon the steady improvement of the public health, as indicated by the progressive reduction in the death-rate, that the death-rate of 1881 was lower than that of any other year since the establishment of civil registration in 1837. The rate of mortality from all causes in 1881 was only 18.9 per thousand of population, while in the two decades,—1861-70 and 1871-80,—it averaged 22.5 and 21.5 respectively. The rate from the seven principal zymotic diseases was 2.24 per thousand in 1881, whilst in those decades it was 4.11 and 3.36 respectively. The rate from fever was 0.27, whilst in 1861-70 it was 0.88, and in 1871-80 it was 0.41. "We cannot," says the report, "but regard this progressive diminution in the mortality from zymotic diseases, and especially from fever,—which is probably the most amenable of all to sanitary control, as a special matter for congratulation."

As a large number of plans for hospitals are from time to time submitted by Boards of Guardians for approval by the Local Government Board, it seemed desirable to the Board that in this matter we in England should avail ourselves of anything which can be taught us by the experience of foreign countries regards the arrangement and construction of such buildings. With that object the Board instructed their architect, Mr. P. Gordon Smith, to visit certain hospitals at Heidelberg, Strasburg, Paris, and St. Denis, which were stated to present good examples of various types of improved hospital construction. Mr. Smith's report of the short inquiry which he was able to make on the subject, together with some notes by Dr. Mouat, who accompanied him, is printed in the Appendix to the Board's report. The hospitals reported upon are the Académische Krankenhaus at Heidelberg, the Chirurgio Klinik at Strasburg, the Hospital Diebât at Paris, the Municipal Hospital at St. Denis, and the isolation-wards for puerperal fever at the Lariboisière Hospital, Paris. Mr. Smith gives a great many interesting details as to cost and arrangement of these buildings, and says that the general result of his observations at the several institutions leads him to believe that much advantage is to be gained from an insight into the most recent hospital arrangements adopted in other countries. One of the most important points that struck him was the large extent of site compared with the number of patients occupying the buildings erected thereon. The tendency in the modern hospitals described in the report is to subdivide each institution itself into a number of detached ward-blocks containing comparatively a small number of patients in each. This is especially noticeable at Heidelberg and St. Denis.

Dr. Mouat, in his notes appended to Mr. Gordon Smith's report, says that the chief feature of excellence, in a medical sense, of the hospitals mentioned consists in the perfect separation of wards devoted to different purposes, and the consequent complete classification of cases which this separation renders possible. The rough arrangement, adopted in most of the older hospitals at home and abroad, into medical and surgical wards, with a separation of the sexes, is now known (says Dr. Mouat) to be quite inadequate to secure the highest standard of healthy conditions in the treatment of disease. Each pavilion or block being self-contained, with all the needful means and appliances, as well as the staff required, is also a first-class feature in obtaining the same end. A general feature of undeniable advantage in all the Continental hospitals now in course of construction is the extended area in which the best of them stand; the utilisation of the interspaces as gardens; and the arrangements made by verandahs and otherwise of getting the sick into the open air the moment they are able to leave their beds,—and

even before, in surgical cases, when the weather permits. Dr. Mouat regrets that the time at Mr. Smith's disposal did not permit of his seeing the Friedrichshain Hospital in Berlin, which has been some years in occupation; the Moabitte Hospital for the treatment of infectious diseases, in the same city; and the Maternity Clinique recently built and occupied in connexion with the École de Médecine, in Paris. The latter, however, in Dr. Mouat's opinion, possesses some serious defects, which would, he feared, take no long time to reveal. The building had not been occupied at the time of his visit.

Under the Artisans and Labourers' Dwellings Improvement Act the Board have authorised the borrowing of 1,878,374*l.*, and have recommended the advance of all except 57,374*l.* by the Commissioners at a low rate of interest. The borrowers were—Birmingham, 1,500,000*l.*; Liverpool, 50,000*l.*; Norwich, 10,000*l.*; Swansea, 121,000*l.*; Walsall, 15,000*l.*; and Wolverhampton, 182,374*l.*

The Alkali Act of 1881 did not take effect till this year. Dr. Angus Smith, in his seventeenth annual report, appears to indicate that sulphuretted hydrogen, the most offensive gas escaping from chemical works, escapes less from the works than from alkali waste heaps and the drainage therefrom, with which there is power to deal; and as regards the acid gases, excess of escape has been generally conquered, and the chief difficulty remaining is in condensation, as to which he offers some suggestions.

As to the metropolitan water-supply, the report cites the report of Lieutenant-Colonel Bolton as to the floods making the water of the Thames and Lea polluted and difficult to filter,—a difficulty which was successfully contended with except by the Southwark and Vauxhall Company, who were unprovided with sufficient storage reservoirs, and who were compelled to take in dirty and muddy water. Reference is also made to the report of Professor Frankland, which states that little more than one-twentieth of the whole supply can be described as of uniformly good quality for drinking, and to the voluntary report of Messrs. Wanklyn & Cooper that London water compares advantageously with that of other large towns. Constant supply was extended to 20,377 houses in 1881, but had still to reach three-fourths of the houses in London. Fire hydrants are increased, but still fires occur frequently, the reports of which describe the water arrangements as unsatisfactory.

#### WHITE'S CLUB, ST. JAMES'S-STREET, PICCADILLY.

WHITE'S CLUB has recently undergone extensive alterations. In consequence of the back portion of the premises adjoining Jermyn-street (consisting of the Strangers' Dining-room, Kitchen, and other offices) having been erected on Crown land, the lease of which expires early in 1883, it was determined to re-arrange the front and principal portion of the premises so as to obtain all requisite club accommodation; this has been done by the construction of a lofty and commodious kitchen on the second floor of the back portion of the front premises, with a pantry, scullery, and a powerful lift to the same from the basement level.

The old floor was not removed, but a second and fireroof floor has been constructed with rolled-iron joists filled in with galvanised corrugated iron centring, and the whole covered with concrete, composed of Portland cement and coke breeze.

The large and handsomely-decorated room which extends the whole frontage of the premises on the first floor (formerly used as a card-room) will now be used as a members' and strangers' dining-room, and will form one of the most spacious club dining-rooms in London. It is supplied from a composite service-lift from the kitchen, which will also supply the private dining-room in the rear.

The left-hand wing of the back portion of the premises has been extended in width on the ground-floor to make it wide enough for a billiard-room, and the room in the basement under the new billiard-room will now be used as the servants' hall.

The old billiard-room is now converted into and appropriately furnished for the strangers' smoking-room. These works, with numerous alterations in the front basement of the premises, have been executed in six weeks by

Messrs. W. & E. Curtis, of Cannon-street. The kitchen has been fitted up with every modern convenience suitable for an establishment of this magnitude by Messrs. Jones, Dray, & Co., of Castle-street, Leicester-square; and the whole of the works have been executed from the plans prepared by and under the superintendence of Mr. Thomas Milbourn, architect.

#### THE PARKES MUSEUM.

The first general meeting of the members of the Parkes Museum, since the incorporation of the Museum, was held on Saturday last (October 25th, 1882), at the new premises lately acquired by the Council in Margaret-street, Regent-street. Captain Douglas Galton, C.B., was voted to the chair, and amongst those present were Mr. Thos. Twining, of Twickenham; Mr. George Godwin, Professor de Clamout, Professor John Marshall, and numerous other gentlemen interested in the success of the Museum. The secretary, Mr. Mark H. Judge, having read the notice convening the meeting, it was unanimously resolved that H. R. H. Prince Leopold Duke of Albany, who had graciously consented to accept the presidency, be formally elected to that office. The following noblemen, ladies, and gentlemen, all of whom had signified their consent, were then elected vice-presidents:—The Duke of Northumberland, the Duke of Westminster, the Earl of Derby, Earl Fortescue, the Baroness Burdett-Coutts, Sir Richard A. Cross, M.P., Sir Joseph Fayrer, K.C.S.I., Miss Florence Nightingale, Mr. Edwin Chadwick, C.B., Professor Huxley, Mr. Robert Rawlinson, C.B., and Professor Tyndall. The following gentlemen were then elected as the Council of the Museum, in whose hands its administration is vested:—

Captain Douglas Galton, C.B., F.R.S., chairman; Dr. George Vivian Poore, vice chairman; Berkeley Hill, esq., M.B., 55, Wimpole-street, W., treasurer; Professor W. H. Corfield, M.A., M.D.; Rogers Field, esq., B.A., M.Inst.C.E.; George Godwin, esq., F.R.S., F.R.I.B.A.; Dr. William B. Gowers; Professor T. Hayer Lewis, F.S.A.; Professor John Marshall, F.R.S.; Charles Henry Parkes, esq.; Dr. J. Russell Reynolds, F.R.S.; Edward C. Robins, esq., F.R.I.B.A.; Dr. Edward H. Sieveking; Professor T. Roger Smith, F.R.I.B.A.; Dr. J. Charles Steele; Thomas Twining, esq.; Alfred Waterhouse, esq., A.R.A.; Dr. Dawson Williams, hon. secretary.

Capt. Douglas Galton, in replying to a vote of thanks for presiding, said that the Museum had now entered on a fresh phase of existence, and had established itself as an independent institution, in premises which, after the necessary alterations had been completed, bid fair to serve its purpose, for the present at least, admirably. The Council contemplated making the sanitary arrangements necessary for the museum itself as perfect as possible, and it was intended that all such arrangements should be useful for teaching purposes; the drainage, for instance, had been carefully considered by Professor Corfield and Mr. Rogers Field, M.Inst.C.E., and the latter gentleman had generously undertaken to bear the whole expense of carrying it out. Mr. Twining had undertaken the whole trouble and cost of arranging, and for the most part of providing, the Food Collection; the Warming, Lighting, and Ventilating have been referred to a special committee, whose endeavour it would be to ensure that every appliance was the best of its kind. The general collection was to be carefully weeded and rearranged, and it was hoped that the Museum would be opened to the public soon after Christmas.

#### THE LANCASHIRE "PLATEWAY."

STUR is the name of a new engineering project which is likely to make its appearance in Parliament next session in the hope of obtaining Legislative sanction. It aims at effecting a very great change of method in the inland transit of merchandise, but in the first instance its sphere is restricted to the manufacturing districts of Lancashire. If practicable in Lancashire, it will be practicable elsewhere, and the scheme, therefore, involves vital issues for the railway companies,—at least, so far as goods traffic is concerned. Broadly, the proposal is to lay out a series of roadways radiating from Liverpool to the centres of manufacturing industry in South Lancashire, to carry along these roadways a double set of iron plates corresponding in breadth with the wheels of ordinary lorries or wagons (and having raised

flanges on their outer edges to keep the wagons on the track), to set the loaded wagons on this smooth plateway, and draw them by steam traction engines to their appointed destination. Passenger traffic is excluded from the scope of the scheme; it is confined entirely to goods, and the anticipation is that it will be possible to carry these at a much lower rate than is now charged by the railway companies. The movement has its origin and motive in the burdensome charges now levied by the companies.

The "plateway" is not, we are assured, put forward as a rival or counterblast to the contemplated Manchester ship-canal. It aims at facilitating the transport of cotton and other commodities to and from Liverpool and Manchester. To take the case of a bale of cotton which has to be conveyed from a ship at Liverpool to the mill at Manchester or elsewhere. Under existing usage it undergoes frequent transference from carts or vans to railway trucks, and vice versa, and, of course, all these transfers augment the cost of transport while at the same time delaying it. The process of the "plateway" will be infinitely simpler, and, therefore, proportionately cheaper. The bale will be loaded on to the appointed wagon at the ship's side or at the warehouse door, the wagon will be drawn by horses to the nearest station of the Plateway Company, it will be linked on to a long train of other similar wagons, a steam traction-engine will be placed at the head of the train, and it will haul the whole train of vehicles along the smooth plateway to the appointed destination. At the further end of the plateway the traction-engine will be disconnected, horses will be yoked to the wagons, and they will at once be drawn to the mill-yard. By this treatment all the labour and expense of repeated transhipments will be obviated. The same vehicle that receives the cotton at the Liverpool dock or warehouse will deliver it into the mill without any intermediate handling. According to the Liverpool correspondent of the *Times*, the scheme, as mapped out by the projectors, covers a large portion of the manufacturing districts of Lancashire. The present proposal is to lay down 133½ miles of plateway, at a rough estimate, costing about four and a half millions of money. There are two main routes, one starting from the south end of Liverpool and running to Oldham, via Warrington, touching the south side of Manchester, and taking in Ashton and Staleybridge. The other route starts from the north end of Liverpool, touching St. Helen's, Ashton-in-Makerfield, Bolton, Bury, Heywood, and Rochdale, and, like the other line, terminating in Oldham. There will also be subsidiary lines leaving the main road at convenient points, and branching off to Burnley in one direction and Preston in another. The originator of the project is Mr. Alfred Holt, of Liverpool.

#### DEATH OF A WELL-KNOWN BUILDER AT FLEETWOOD.

THE death has just been announced, at the age of seventy-four, of Mr. Thomas Atkinson Drummond, a builder and contractor at Fleetwood, who for more than a quarter of a century past has been well known as the builder of almost every house in Fleetwood from the time of its foundation in the year 1836 to a period of something like three decades later. The deceased, who was greatly attached to Fleetwood, was a native of Newcastle, where he served an apprenticeship to a bricklayer, and subsequently, having been a journeyman in London and Dublin, he repaired to Manchester, where he became a sub-contractor in brickwork for several new bridges. In 1837, the year after the foundation of Fleetwood, having heard glowing accounts of what was then designated "New Liverpool," he was induced to take up his residence there, and he soon became a contractor for the brickwork of the greater portion of the houses and other buildings which quickly rose up in succession in the newly-founded town. He erected most of the public buildings which rose up within thirty years after the first formation of the town. Of churches and public institutions he was contractor for the large Roman Catholic church, the Independent chapel, the Wesleyan Methodist chapel, the Primitive Methodist chapel, and the Whitworth Institute. The deceased had been one of the Town Improvement Commissioners from the passing of the Improvement Act in 1841 to the

time of his death. He was the largest owner of house and warehouse property in Fleetwood. His funeral last week was attended by the Improvement Commissioners and members of other public bodies, and a numerous gathering of the residents.

#### RESTORATIONS AT THE TOWER.

SOME fresh buildings are about to be erected at the Tower of London by the Commissioners of her Majesty's Public Works and Buildings, and in order to clear the site for the intended structures, the materials of the large block which has for many years been used as the Ordnance office and stores were sold by Messrs. Hoare, Eversfield, & Co., on Monday. This building, which is towards the east end of the Tower overlooking the Thames, and situated between the Wakefield and the Salt Towers, contains a spacious ground area, being upwards of 160 ft. in length and 90 ft. in depth, and contains four lofty floors. It was erected at different periods. The basement is said to have been built some 200 years ago, in the latter portion of the seventeenth century; whilst the first and second floors were erected about a century since, during the reign of George III. The third or top floor is of comparatively recent erection, having been built in 1854, during the period when the Crimean War was raging, and here the Guards were entertained at a public dinner on their return from the Crimea in 1856. The side of the materials on Monday was held in this apartment, where there was a numerous attendance of builders and dealers in this class of property. The catalogue contained 129 lots, and stated that the building comprised upwards of a million bricks, in addition to the stonework, and a large and valuable quantity of ironwork (including 100 iron columns), and lead. The timber, stone, and ironwork connected with the different floors, comprising 120 out of the entire number of 129 lots having been disposed of; the lead on the building was offered in two lots, and realised 269*l.* The brickwork forming the main walls and carcass of the building, sold in four lots, concluded the sale, realising only the moderate sum of 216*l.* The total proceeds of the sale amounted to 1,320*l.* It was stated that the estimated original cost of the building was between 30,000*l.* and 40,000*l.* The purchasers of the materials are under engagements to have the whole of them removed in six weeks, when the buildings intended to be erected on the site will be at once commenced by the Office of Works.

They will extend eastward from the Wakefield Tower to the Salt Tower, the main feature being the restoration of the old Lantern Tower, which is to be erected about midway between the above-named two towers, and exactly on the site which it formerly occupied, many centuries ago, before the building now about to be taken down was erected. The original foundations of the old Lantern Tower have recently been discovered, and upon them the restored historical structure will be erected. The drawings for its erection have been made from old sketches, and in the rebuilding of it all the original features will be preserved, the materials, as far as possible, consisting of the old stones forming the building annexed to the White Tower, which was some time ago taken down. Between the three towers a stone wall, in continuation of that on the west side of the Wakefield Tower, and in every respect uniform with it, will be carried along eastward in front of what was formerly the palace, to the boundary of the Salt Tower. The removal of the Ordnance Offices, which are upwards of 70 ft. in height, will open out a commanding view of the White Tower from the river. When this particular portion of the work has been completed, the old and now disused horse-annex, which was built in 1826, on the south side of the White Tower, will be taken down when the original plinth of the White Tower will be exposed to view.

Within the last few weeks the horse-annex has been removed from the last-named building into the upper floor or council-chamber of the White Tower, and is now being arranged there, an oaken handrail being carried round the apartment alongside the different specimens of armour. The smaller chamber, on the east side of that in which the horse-annex is arranged, is now fitted as a museum for the display of Indian armour. The specimens will be enclosed

in lofty and spacious chry glass cases, erected on two sides of the chamber. The whole of the new horse-armoury arrangements and the Indian museum are being carried out by the Royal Engineering Department of the Tower, Sergeant-Major Andrews, R.E., being foreman of the works. It is to be hoped he is competent.

## BUILDING PATENT RECORD.\*

## APPLICATIONS FOR LETTERS PATENT.

- 4,875. E. Guattari, London. Device for preventing the surreptitious opening of doors and windows. Oct. 13, 1882.  
4,894. J. Wadsworth, Manchester. Apparatus for heating, cooking, and ventilating, &c. Oct. 14, 1882.  
4,936. P. M. Justice, London. Water or steam-trap connexions. (Com. by C. Lightbody, Brooklyn, U.S.A.) Oct. 17, 1882.  
4,951. J. M. Hart, London. Automatic registering apparatus for closet doors, &c. Oct. 18, 1882.  
4,980. H. McRuer, Glasgow. Cooking-ranges. Oct. 19, 1882.  
4,995. T. Kay, Stockport. Apparatus for warming and heating rooms and places, &c. Oct. 20, 1882.  
5,027. G. A. Biddis, Newbury. Apparatus for regulating the supply of water to water-closets, &c. Oct. 21, 1882.  
5,041. E. Green, Halifax. Sewage-traps. Oct. 23, 1882.  
5,100. H. M. Tarratt, London. Appliances for securing window-curtains, &c. Oct. 26, 1882.  
5,106. W. H. Lindsay, London. Construction of window-sashes. Oct. 26, 1882.

## NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

Oct. 17, 1882.

- 2,839. H. C. Tucker, Peterborough. Sash-weight attachments for sash windows. June 17, 1882.  
3,145. C. Priestland, Birmingham. Rack pulleys for blind-cords. July 4, 1882.  
3,702. L. Roth, Wetzlar, Germany. Manufacture of cement. Aug. 3, 1882.  
3,956. J. H. Johnson, London. Production of artificial stone, &c. (Com. by the Certaldo Marble Company, Paris.) Aug. 18, 1882.  
4,090. W. Thornburn, Berongbridge. Appliances for heating and warming. Aug. 26, 1882.

Oct. 20, 1882.

- 2,828. E. H. Baxter, Birmingham. Attaching door-knobs to their spindles, &c. June 15, 1882.  
2,868. J. Thomas, Bangor. Apparatus for cutting or shaping stone. June 17, 1882.  
3,103. W. A. M. Valon, Ramsgate. Bricks and tiles. July 1, 1882.

October 24, 1882.

- 2,926. A. K. Robinson, Leeds. Cooking ranges and stoves. June 20, 1882.  
3,223. J. H. Topham, Manchester. Filtration of water for domestic and other supply. July 7, 1882.  
3,229. U. Bromley, G. Crowe, and W. James, Chester. Flushing apparatus for water-closets, urinals, &c. July 7, 1882.  
3,324. C. Portway, Halstead. Gas stoves. July 13, 1882.  
4,112. W. M. Brown, London. Baths. (Com. by W. W. Rosenfield, New York, U.S.A.) Aug. 20, 1882.

October 27, 1882.

- 2,961. J. Harsant, London. Finishing water-closets, traps, and urinals, &c. June 22, 1882.  
3,000. G. Dawson and C. Batchelor, Thorncliffe. Kitchen ranges. June 24, 1882.  
4,281. S. Heimann, London. Treatment of peat for paving purposes, &c. Sept. 8, 1882.  
4,438. J. W. Andrews, Whittlesea. Blind roller furniture, &c. Sept. 8, 1882.  
4,655. R. Hudson, Gildersome. Construction of metallic staircases. Sept. 30, 1882.

## ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending October 21, 1882.

- 1,077. J. J. Lish, London. Fire-blowers for hastening combustion and abating smoke in fire-grates, &c. March 6, 1882. Price 6d.

A soft sheet of iron is fitted to the grate, which is sufficiently flexible for the force of the draught to make it fit tight to the front of the fire-place.

\* Compiled by Hart & Co., Patent Agents, 28, New Bridge-street.

- 1,113. R. Pearson, Kingston-upon-Hull. Combination stench-traps. March 8, 1882. Price 6d.

This is a double trap, the first being of a smaller capacity and leading into the second larger one.

- 1,143. E. P. Phillips, London. Spring hinges. March 9, 1882. Price 6d.

The pin of the hinge is formed by two divided parts, a projection on the end of one fitting into a hole in the end of the other. A helical spring is wound round this divided pin, with each end secured in one of the parts. Each part is secured to opposite flaps of the hinge. Thus whichever way the door opens the spring is brought into play.

- 1,213. R. Wright, Richmond. Fire-grates. March 13, 1882. Price 4d.

After the fire is lighted, a small quantity of lime is sprinkled on the top of the coals to consume the smoke.

- 1,228. J. Chaffin, Bath. Glazing green-houses, skylights, &c. March 14, 1882. Price 2d.

To dispense with the use of putty, felt, indiarubber, or other soft waterproof material is used, which is placed round the edges of the glass and secured to the frames. (Pro. Pro.)

- 1,236. W. R. Lake, London. Venetian blinds. (Com. by A. H. Lindefeldt, Gothenburg.) March 14, 1882. Price 2d.

These are rolled round rollers instead of being drawn up in the usual way. (Pro. Pro.)

- 1,251. J. T. Todd, Edinburgh. Roadways, tramways, and railway platforms, &c. March 15, 1882. Price 2d.

The wooden blocks are set in a metallic framing in which there is a separate socket for each block. (Pro. Pro.)

Published during the week ending October 28, 1882.

370. A. Cordingley, Bradford. Finishing the surface of concrete floors. Jan. 25, 1882. Price 2d.

The surface is rolled by a roller with grooves, thereby raising slight projections thereon. (Protection not allowed.)

394. H. M. Bennett, Liverpool. Isolating fire and smoke from the auditorium in theatres, &c. Jan. 26, 1882. Price 2d.

A perforated water-pipe is run along the top of the curtain, so that when this is lowered a sheet of water can play down it. (Protection not allowed.)

- 1,128. J. Ra von, Balsall Heath. Apparatus for controlling the flow of water from cisterns. March 8, 1882. Price 2d.

A stand-pipe is fitted to the long leg of the syphon in the cistern, on the end of which is a valve. When this is opened, the flow of water exhausts the air out of the syphon, and sets up the action. (Pro. Pro.)

- 1,175. E. B. Edwards, Liverpool. Roofing materials. March 10, 1882. Price 2d.

These slates are formed of well vitrified silicate of alumina and silica. They are baked at a high heat, and a glaze is formed on them with salt oxide of lead. (Pro. Pro.)

- 1,232. J. H. Johnson, London. Bricks or blocks for building walls, &c. (Com. by F. Bander, Paris.) March 14, 1882. Price 2d.

The bricks have ribs or projections on them which fit into corresponding recesses in the next adjacent bricks, by which they are locked together. (Pro. Pro.)

- 1,306. W. Simmons, Maidstone. Ingredients for the manufacture of heartstone. March 17, 1882. Price 2d.

These are Hasseack stone, chalk, and Portland cement, which are ground and mixed with water. The blocks are then moulded therefrom.

- 1,325. C. Slagg, Leeds. Drain and sewer pipes. March 18, 1882. Price 4d.

A rest is formed on the outer edge of the socket which supports the spigot end of the next pipe while the joint is being made tight.

- 1,326. C. Slagg, Leeds. Traps for drains. March 18, 1882. Price 2d.

To create a sufficient velocity through the trap with the ordinary run of sewage the sectional area of the throat is reduced. (Pro. Pro.)

- 1,388. G. Keut, Portsea. Chimney-tops or ventilators. March 22, 1882. Price 6d.

A tapered perforated tube is placed on the top of the chimney, on which is the inverted frustum of a cone, above which are a series of conical frustra, the whole being surmounted by a cap. These are all surrounded by a cylindrical casing, somewhat larger than the outer circumferences of the frustra.

**The Fall of a Railway Bridge.**—The late accident on the Great Western Railway (Weymouth branch), when a bridge fell, through the floods, and caused the death of a stoker, formed the subject of inquiry at an inquest held on the 27th ult., at Cattistock. According to the evidence, the foundations of the bridge had been undermined, the structure, which was of wood, easily giving way, as it was only supported by brick abutments. Only a few days before the bridge had been inspected and found safe. "Accidental death" was the finding of the jury.

## WATER SUPPLY.

**St. Helen's.**—The ceremony of turning the first sod for two wells which the Corporation of St. Helen's have commenced sinking on Lord Derby's Knowsley estate was performed on the 28th ult., by the Mayor of St. Helen's, Mr. Richard Pilkington. Alderman M'Bryde (chairman of the Water Committee), before calling upon the Mayor to cut the first sod of the new works, gave a brief history of the St. Helen's Waterworks, and the reasons which had compelled the Council to seek an additional water-supply from that district. He then expressed the belief that they had every reason to expect that from those proposed works an abundant supply of water would be obtained, which, with the water obtained from existing sources, and the supply they were entitled to demand from the Liverpool Corporation upon the water from Wyrwag being delivered to that city, would, he hoped, be sufficient to meet the requirements of the town for many years to come. Mr. Gaskin is the engineer. It is intended to first sink two wells at Knowsley, each to be about 150 ft. deep, with an additional bore-hole of between 800 ft. and 400 ft. deep, the two wells being connected with a drift-way, after which a well will be sunk at Kirkby, three miles north-west of the Knowsley station. The water will be conveyed in 15-in. pipes from Kirkby to Knowsley, where it will join the Knowsley water, the whole to be carried in 21-in. pipes to Portico, where a junction will be effected with the existing mains, which at present supply the Brownedge and Ecclestone mill-surface reservoirs, whence it will be distributed to the town.

**Stafford.**—The Stafford Town Council on the 17th ult. held a special meeting to take into consideration the advisability of applying for an Act of Parliament to obtain a water-supply from Cannock Chase. A desultory discussion took place in committee, the general feeling of the Council being apparently against going to the expense of a fresh Act. A resolution was ultimately carried, that samples of the pump-water of the town should be analysed, in order to see what improvement had taken place since the adoption of the tub system, and that the meeting should be adjourned for a month. A pretty general feeling seemed to exist in favour of making further attempts at the bore-hole on the common, by employing a first-class practical firm to sink a shaft down past the difficult salt deposits, to tap the latter out, and then make a heading over the 750 ft. of bore-hole relinquished by the first contractor.

## HARBOUR WORKS.

**Berwick.**—The report on the scheme for the proposed fishery harbour at Green Haven, prepared by Mr. J. Watt Sandeman, C.E., Newcastle-upon-Tyne, shows that he proposes to construct the harbour in three sections, the first, or northernmost, being two acres in area, and the second and third each three acres, making a total of eight acres. The depth of the entrances, which are to be protected by outer and inner piers, would be 7 ft. below low water, or 22 ft. below high-water level of spring tides,—a depth which exceeds that of any harbour between the Tyne and the Forth. The area of the quays around the harbour would be about 8½ acres. The levels of the ground adjacent are such that a branch railway could be made without difficulty. The North British Railway Company have been applied to, and it is expected they would construct the branch railway, which would be only 900 yards in extent. The Duke of Northumberland assents to the project, and has agreed to grant, at a rent of 12l. a year, 4½ acres of land adjoining the proposed harbour, including his interest in the harbour as lord of the manor. Mr. Sandeman estimates the cost of making No. 1 harbour and the piers between Nos. 2 and 3 harbours at 24,743l., and the cost of No. 2 harbour and the pier between it and the first at 23,891l., and the cost of No. 3 harbour at 15,317l., or a total of 63,951l. Mr. Sandeman points out the great railway facilities Berwick enjoys, and which are essential for the development of a first-class fishing port. There are in all thirty-four opportunities of despatching fish from Berwick in the twenty-four hours, twelve of which are by fast trains.

**Burntisland.**—The sea-wall on the foreshore

west of Burntisland Harbour, which has been erected by the Harbour Commissioners for the purpose of enclosing ballast, and reclaiming ground thereby, has just been completed, after a twelvemonth's labour, at an expense of about 3,000l. The contract for reconstructing the point of the breakwater, and widening the harbour entrance is proceeding satisfactorily. Other works in progress are: extension of quay wall at dock-head; dry stone rubble embankment at head of tidal basin; and repairs to roundhead at dock entrance, all of which are being carried out by Mr. Chalmers.

**Montrose.**—On the 16th ult. a special meeting of the Montrose Harbour Trustees was held to receive the report of the committee appointed to consider as to the construction of a new pier from the corner of the east quay to the outer corner of the wet dock protection wall. The committee, after discussion, resolved to approve of the large plan reported on by Mr. Cunningham, the engineer, the probable cost of which he at first estimated at 6,100l., and now at 5,750l., with a new pier about 550 ft. in length, extending from the outer corner of the east quay to the outer corner of the dock protection wall. The report was unanimously adopted.

**St. Ives.**—A meeting of fishermen and others interested was held in the Town-hall, St. Ives, Cornwall, on the 13th ult., to consider a scheme for the improvement of the harbour. Captain Jacob Care, who presided, said,—"A scheme has been discussed here at various times for the improvement of our harbour. It consisted in the addition of 250 ft. to the present quay, pointing in the direction of Hayle Bar. There have been some amongst us who did not altogether agree with that scheme, and after a great deal of deliberation on the matter another has been prepared. It is that a pier of 900 ft. in length be extended from Pedolvet in the direction of Smeaton's pier. This would leave an opening of 220 ft. for the mouth of the harbour. In addition to this it will be necessary to strengthen the present wooden pier that it may act as a breakwater, and the effect of this will be to throw the sea, which would otherwise come into the harbour, on to the back of the proposed southern pier. After discussion, it was resolved to approve of the new scheme as being the best, but that the opening be reduced from 220 ft. to 180 ft.

#### SCOTCH NEWS.

**Falkirk.**—The work in connexion with the erection of the new Post-office is going on quickly, and it is expected that the building will be ready for occupation by the Post-office authorities some time in the month of April. The building will have a frontage to Market-street of 47 ft., and will be (says the *Falkirk Herald*) "of a plain style of architecture." The depth will measure 39 ft., while the height above the footpath will be 40 ft. The ground-flat will be exclusively devoted to the requirements of the Post-office, while the upper flat will consist of two dwelling-houses approached by a front entrance in Market-street. The following are the names of the successful contractors:—Mason, Mr. J. Gardner, Falkirk; joiners, Messrs. J. & A. Main, Falkirk; slater, Mr. James Walker, Falkirk; plasterer, Mr. D. McNair, Falkirk; plumbers, Messrs. Philips & Bruce, Glasgow; ironfounders, Messrs. Christie & Smith, Glasgow.

**Galashiels.**—A contract has been signed between the proprietors of Buckholmside Skin-works and Messrs. R. Hall & Co., for the reconstruction of that portion of the works which was destroyed by fire in May last. Messrs. Aimers, engineers, have been successful in securing a contract for a large share of the iron work. The erection of a wool store for Buckholm Mill has also been commenced. The building will be 144 ft. long, 24 ft. wide, and two stories in height. The contractors are Messrs. J. & J. Hall.

**Montrose.**—The new Freemasons' Hall, at Montrose, was opened on the 14th ult. The plans were prepared by Mr. John Sim. The hall, which is situated about the middle of the New Wynd, on the south side, is capable of holding comfortably about sixty persons. The building is a two-story one, the ground flat being divided into two shops. The following were the contractors:—Mason, Mr. John Valentine; joiners, Messrs. Milne Brothers; plumbers, Messrs. Colla Wood & Co.; plasterer, Mr. William Grant; slater, Mr. Robert Keillor.

**Paisley.**—On the 18th ult. Mr. Thomas Coats, of Ferguslie, handed over to the keeping of the Paisley Philosophical Institute, for behoof of the community, a new observatory, erected by him on Oakshaw-hill, and fitted up with a complete set of instruments. He has besides given an endowment of 2,000l. for its upkeep. The full value of this gift is stated to amount to over 10,000l., and it may be added that during the present year the community of Paisley have been presented by townsmen with property to the value of not much short of 150,000l.

**Haddington.**—In the Haddington Sheriff Court, Mr. Whitelaw, architect and surveyor, Edinburgh, sued the Ormiston Local Authority for 59l. 16s. 1½d. as remuneration for his services in connexion with the drainage of the village of Ormiston. The Local Authority resisted the demand, and tendered first 20l., and thereafter 25l., as in full. Parties agreed to refer the matter to Mr. Black, architect, Haddington, who reported that, in his opinion, 30l. was a fair and even liberal allowance. The Sheriff-Substitute has therefore decreed for that sum, and, under the circumstances, found neither party entitled to expenses.

#### GLASGOW.

**The Work of the Improvement Trust.**—At the meeting of the Glasgow Town Council, on the 19th ult., on the minutes of the Improvement Trust coming up for consideration, Councillor Smith expressed his regret that back-to-back dwelling-houses were to be erected in Claythorn-street, on Trust ground. Sir W. Collins submitted a statement on the position and prospects of the Trust. The surplus of assets over liabilities was 1,260l. 9s. 7d. on the whole affairs of the Trust. The cost to the ratepayers up to May last had been 403,000l. On hand they had property to the value of 700,000l. During the past three years they had only succeeded in realising a portion of it, worth 4,549l. The process of reduction had been a very gradual one indeed, and the time had now come when they might make a step forward. It was to be feared that their property would be subject to a depreciation of no less than 100,000l. During the time taken in its disposal there was an enormous amount of interest to be paid on unoccupied spaces. In fact, the greater part of the assessment had been swamped in payment on unproductive ground. The loss in the course of the next fifteen years, and affairs could not be closed earlier, would make the total cost to the ratepayers 600,000l. It had been urged that the Trust should have provided dwelling-houses for the working-classes. The hope that was held out that cheaper houses would thus have been provided was a delusive one raised for special purposes. Perhaps the greatest blunders made in the history of the Trust was the depopulation of too many districts at once, and the imposition of the entire expense of the operations upon the occupiers of houses. In conclusion, he urged that they should change their policy to the extent of accepting the market value for their ground when they were offered it. No action was taken in the matter.

**The Population of the City.**—At a meeting of the Town Council, held on the 23rd ult., for the transaction of police business, Dr. Russell, the medical officer, in his fortnightly report, stated that while in ten years the population of Glasgow had only increased 4 per cent., there had been 355 per cent. added last year. He also pointed out that, by the present mode of calculation, the Registrar-General would, in 1890, estimate the population at 330,451; while there was the best reason for believing it was already 531,200.

#### PROVINCIAL NEWS.

**Darlington.**—Oakwood Croft, near Darlington, the residence of Mr. C. G. Johnson, J.P., has just been rebuilt, under the direction of Mr. G. G. Hoskins, architect, Darlington.

**Derby.**—The new Art Gallery here will be formally opened this Saturday, November 4th, but will not actually be available for the permanent exhibition of works of art until early in 1883. The committee desire that a special feature of the first exhibition next year shall be a large collection of the works of Wright, of Derby. The great ability of this artist, and the number of his works locally owned, should ensure this being a most attractive exhibition, whilst it will have the stamp of local speciality.

**Weston-super-Mare.**—The Weston-super-Mare Town Council have accepted the offer of Mrs. Henry Davies to give land valued at 7,000l. as a people's park.

**Preston.**—Last week, at the annual meeting of the Preston Industrial and Orphan Home Society, the committee reported that the Harris Trustees had agreed to erect and endow an orphanage which should be an ornament to the town, and worthily perpetuate the name of the late Mr. Harris. They had, therefore, decided to devote the magnificent sum of 100,000l. to that purpose, of which they proposed to utilise 25,000l. in the erection and furnishing of the orphanage, and 72,000l. for endowment purposes. The site chosen is 28 acres of land in Garstang-road, of which 12½ acres have been offered to and accepted by the Harris Trustees, and the remaining 15½ acres have been re-sold. The total cost of the site is 2,600l. On the 26th ult., at the meeting of the Preston Town Council, Alderman Gilbertson moved "That the entire undertaking of the Ribble Navigation Company be purchased for the sum of 72,500l., free from all incumbrances, and that application be made to Parliament in the next session for an Act to authorise the purchase and transfer, the undertaking to be taken over and the purchase-money paid within three months from the passing of the Act, the company undertaking to maintain the river walls, embankments, and property in a proper state of repair, and to hand them over in as good repair, order, and condition as they are in at present, and the council to undertake to pay the company's costs of and incident to the application to Parliament, a provisional contract to be entered into within six weeks from this date"; and also, "that the Ribble Committee be requested to report to the Council as early as possible the improvements in the river Ribble and the quays and walls thereof, for which they deem it advisable that the sanction of Parliament should be obtained in the next session." This was agreed to by 29 to 10.

**Hyde (Lancashire).**—On Saturday last the foundation-stone of the new Reform Club, which is about to be erected for the accommodation of the liberals of Hyde, was laid by Mr. Thomas Ashton, mayor of the borough. The site of the new building is at the corner of Market-street and Foundry-street, the main frontage being to the former street, and the style in which it is to be erected is that known as "Queen Anne." The materials to be used in the construction of the external fabric are red terra cotta bricks, with Yorkshire stone dressings, and over the principal entrance, in Market-street, there will be a tower containing a clock with transparent dials for night illumination. This tower will be 63 ft. in height from the basement. At the corner of the building, abutting on Market and Foundry streets, a balcony will be placed for the convenience of those desiring to address crowds outside the club. The architect is Mr. W. Telford Gunson, of Manchester, and the work has been entrusted to Mr. Peter Green, of Hyde. The cost is estimated at about 3,000l.

#### SEWER PIPES.

AN improvement in the jointing of sewer-pipes has been made, and patented, by forming a "rest" on the outer edge of the inside of the socket, for about 6 in. in width at the bottom, upon which the spigot ends of the pipes lie, and which is formed in one with the pipe. Upon this projection, or "rest," the end of the pipe lies at its proper level, but in the common sockets it drops down below the level of the adjoining pipe, and in the case of heavy pipes, in making the joint, the spigot end is not held up to its proper level while the joint is made under it. The rest being formed on the outer edge of the inside of the bottom of the socket, the jointing material is placed behind it, and when the spigot end of the pipe has been laid in upon the rest, the joint is made continuous in the usual way. It is a great safeguard against bad workmanship in that part of the joint where it ought to be most perfect.

**The Builders' Benevolent Institution Dinner** took place at the Freemasons' Tavern on Thursday last, the 2nd inst., Mr. J. T. Chappell, president, in the chair. The total amount of the subscriptions and donations announced during the evening was 1,630l. 8s. We defer our report until next week.

CASES UNDER THE EMPLOYERS' LIABILITY ACT.

SCOTT V. BRASS.

At the Clerkenwell County Court, on the 26th ult., before Mr. Gordon Whitbread, judge, a scaffolding named William Henry Scott, of Berkeley-street, Clerkenwell, sought to recover from Mr. Deputy Brass, builder, of 47, Old-street, 50*l.* compensation for injuries received whilst in the employ of the defendant, and in consequence of the alleged negligence of a foreman in defendant's employ.

The case for the plaintiff was that he was injured and incapacitated from following his employment for six weeks in consequence of a portion of defendant's scaffolding at Monument-yard not having been properly secured.

This was positively denied by the defendant's witnesses, they stating that the men were ordered to secure the poles rather than otherwise as stated by plaintiff and his witnesses.

The Judge said, although the evidence was most conflicting, he was inclined to give credence to the defendant's case, and found in favour of the defendant, with costs, to be taxed and paid within fourteen days.

O'GRADY V. PERRY AND CO.

This case was heard before his Honour, Judge Dasent, at the Bow County-court, on Monday, October 23rd.

The plaintiff sued Messrs. Perry & Co., contractors, Irredegar Works, Bow, under the Employers' Liability Act, for the recovery of 150*l.* for personal injury, arising at times sustained by plaintiff, in consequence of an accident in the erection of "Queen's Mansions," Victoria-street, in March last. The plaintiff was a scaffolder, and alleged that he was at work under the orders of one Cashman, his foreman; that by his instructions he was placed in a certain position where scaffolding work was being done, to work people from passing under it; to do this, he had to stand near a stage which was being used for a barrow-hoist for hoisting concrete for fire-proof floors, &c., and one of the barrows, in ascending, struck against one side of the horse-run, which caused it to rebound, and so it went swinging a little to the top, and there caught the end of one of the planks on the top of the stage, which loosened another plank at the back of it, the latter falling end-on on to the plaintiff's toes, and so damaged them. The plaintiff was sent at once by the defendants into the hospital, and they paid him some sums of money, although they considered they were not at all liable for the accident, and also offered to let him come to work again at full wages. The plaintiff, however, had been advised by his relations that he had a claim under the Employers' Liability Act, and that, if he went to work again till the action was brought and settled, it would be at his peril, whereupon he brought the action.

The plaintiff was himself engaged in making the stage, which, he alleged, was left all right by him, but that some carpenters' labourers had moved some of the planks after he had left it. It turned out that Cashman was only a working-man, and was not defendant's foreman, he being simply a leading scaffolder. The plaintiff's counsel contended that Cashman had no right to tell the plaintiff to stand in a dangerous place such as that near a barrow-hoist.

The Judge held that the defendants had taken proper precautions in placing a man in the position the plaintiff was in to avoid an accident to other persons, and that it was absurd to hold the defendants responsible for an act which the plaintiff himself stated had been committed by some other labourers on the building not acting at all under the orders of Cashman, and who were, in fact, a separate gang of men altogether. His Honour, therefore, nonsuited the plaintiff.

USE OF BAD MORTAR.

FREDERICK THAMES, builder, of Buxton House, Lower Sydenham, was summoned at the instance of the Metropolitan Board of Works for using in his building-work at Bell-green mortars not composed of "fresh-burnt lime and sand or grit without earthy matter in the proportion of one of lime to three of sand or grit."

Mr. John Hebb, Assistant Architect to the Board, said he took samples of the mortar used by the defendant, and found it crumbled readily in the hand. On testing it with acid, he found it contained small proportions of lime and burnt ballast, and some bits of coal and very fine sand. It was almost in the condition of mud, and ought never to be used. One of the chimneys was out of the perpendicular.

The defendant called two witnesses, one of whom said the mortar used was of the best, but was as good as that used in "speculative building."

Mr. Balguy fined the defendant 3*l.* and 12*s.* costs.

**The Surveyors' Institution**—The first ordinary general meeting of the Session will be held on Monday, November 13th, when the president, Mr. Edward Ryde, will open the Session with an address.

CONDITIONS OF CONTRACT.

SIR,—Some few years back the Royal Institute of Architects and the London Builders' Society, after several meetings and much discussion, arrived at an agreement as to what should in future be fair conditions of contract as between employers and building contractors. I am very sorry to say that some architects are now altogether breaking from this agreement, and seeking again to enforce such conditions as I think no builder should succumb to. I send below some conditions put forward by a leading member of the Institute of Architects, on which, it seems to me, comment is needless. Some builders refused to subscribe to these conditions, and their tenders were rejected.

A LONDON BUILDER.

Conditions in proposed Contract for new Council Chamber for the Corporation of London:—

"Should the architect at any time require the execution of the works to be suspended, either wholly or in part, the contractor is at once to comply with such request and will not be allowed any remuneration for loss or damage that may be sustained by him in consequence of such suspension.

No extension of time will be allowed in respect of a strike by workmen against the contractor, such strike not being general in the trade or trades.—Mem. The penalty for non-completion is 25*l.* a day.

Power to the architect to withhold all certificates until the completion of the contract.

On all points connected with the performance of the contract, the decision of the architect to be final and conclusive."

SEWER VENTILATION.

SIR,—In reply to Mr. W. P. Duchan, "An Old Buffer" wishes to say that he was not aware that drains and pipes were gitted with visual organs. If Mr. Duchan will only point out the exact position where the organ of sight can be found in his drains, "Old Buffer" will find out whether it contains a beam or not; as it happens, however, the private drains have only been relaid (within a short period), formed with good, socketed, earthenware pipes bedded on concrete, with a direct fall towards the sewer. If the private drains were stopped up, this fact would be discovered in a day, as by careful calculation "Old Buffer" finds that as much water is passed down the private drains as would entirely fill them in ten hours. A more effectual proof of the freedom of the drains from stoppage could hardly be found; and if Mr. W. P. Duchan can refer to a more reliable test let him do so. The fact still remains, however, that every time there is a heavy downfall of rain poor "Old Buffer's" house is almost rendered insufferable by odours of unquestionable sewage origin. As to the remarkable "rushing into print," "Old Buffer" wishes to remind Mr. W. P. Duchan of another proverb; *ergo*, "Those living in glass houses should never throw stones." ANOTHER OLD BUFFER.

LAND STORM INSURANCE.

SIR,—Long before the recent gales, the owners of house property have felt the want of means to insure buildings against damage by tempest, and although the subject has been brought to the notice of the principal fire offices, suggesting the addition of such a branch of business, they have declined to adopt it; therefore, a company, if established by men of high reputation, would, in all probability, prove advantageous to the proprietors and the public. As such visitations are, fortunately, not of frequent occurrence, the rates of premium would be so low that landlords would readily avail themselves of the security, while the insurance company would have a profitable business, in which fraud would be impossible, as crime cannot create a storm, as it can make a fire. GEORGE ELLIS.

CHURCH-BUILDING NEWS.

**Reddish Green.**—The new Church of St. Elizabeth, Reddish Green, near Stockport, which is being built by Mr. W. H. Houldsworth, at a cost of upwards of 20,000*l.*, will be ready for consecration early in the ensuing year. Mr. Alfred Waterhouse, A.R.A., is the architect.

**Tidcombe.**—The parish church of Tidcombe, Wilts, was re-opened on the 17th ult., after restoration. The church is of early foundation, but has at various times been much altered, having been in great part rebuilt at the beginning of the fourteenth century, and had the present roof of the nave and north aisle put on and the clerestory and upper tower altered late in the following century. More recently the brick porch and buttresses have been added, so that the only distinct feature of the original church now remaining is the Norman font. The Norman church at Tidcombe is supposed to have been built by the monks at Mottisfont, near

Romsey, a monastery which was endowed shortly after the Conquest. Among the special features of the edifice is an arched recess in the north aisle, which in pre-Reformation times was known as the Easter sepulchre. At the east end of the same aisle a piscina has been disclosed, and also an ambry, both of which have been carefully preserved. In the chancel, the whole of the stonework has been renewed, redressed, and pointed, and the floor laid with encaustic tiles. The chancel has been restored by the Ecclesiastical Commissioners, under the direction of Mr. Purley, from Mr. Christian's office. The contractor was Mr. Woodbridge, of Hungerford. In the course of the proceedings connected with the re-opening of the church, Mr. Walter Money said that when he first came to Tidcombe with his friend, Mr. Hawkins, he was struck with the interesting character of the church, and the distinctive features it possessed, and he felt exceedingly anxious that its restoration should be placed in careful and conservative hands; he therefore recommended that application should be made to the Society for the Preservation of Ancient Buildings, who reported upon the church, and he felt very glad to say Mr. Christian had carried out the alterations almost exactly on the lines recommended by the society. [We do not know whether Mr. Christian will regard this as a compliment.]

**Stonchouse.**—St. George's Church, Stonchouse (erected about a hundred years ago), was re-opened by the Bishop of Exeter on the 11th ult., after alterations. The work has been carried out from plans prepared by Mr. H. J. Snell, architect, Courtney-street, Plymouth, and has included the erection of a chancel, organ-chamber, and vestry, and the re-seating of the ground-floor of the church. The pulpit, which stands just outside the chancel steps, and on the north side, is of somewhat large proportions, and on plan is hexagon, its supports being detached columns of polished Ippelen marble. These columns, in their turn, rest upon richly-moulded bases of polished Devonshire black marble. The capitals surmounting the columns are of delicately-tinted grey polished marble, and upon these rests the soffit of the pulpit, which is a monolith, and richly panelled; around the soffit is a frieze of red polished marble, with bosses of polished green marble from the quarries at Yealton at every angle. Around the base of the body of the pulpit itself is a frieze of polished grey marble, and at each angle are pilasters of Ippelen marble. The five main canots are enriched by sculptured representations of the four Evangelical emblems, and of the Holy Spirit, symbolised by the descending dove. These panels are further encircled by rounded inlays of alabaster. The interior of the pulpit is lined with teak, and the approach to it is by a flight of stone steps curved on plan. The new font has a bowl of octagonal shape resting upon a circular shaft. The various panels are deeply moulded: it is composed wholly of Beer stone from the well-known quarries near Scaton. Both pulpit and font are the handiwork of Mr. Harry Hems. The work has cost about 2,000*l.*

**Edinburgh.**—St. John's Episcopal Church, Edinburgh, was re-opened on Sunday last, after enlargement. Consisting of a chancel, clergy and choir vestries, and a porch, the additions have been carried out in keeping with the Perpendicular style of the edifice. Originally it was intended that the chancel should have a square end, but circumstances arose which rendered that impossible, and it has, therefore, been made five-sided. The steps of the chancel, which are of marble, have been placed in lieu with the pillars that divided the old chancel from the nave, and in this way the interior of it extends to about 30 ft. A notable feature of the design is the arch erected over the site of the old east wall. It is about 50 ft. high. The roof is vaulted, with wooden ribs, the intervening spaces being painted in harmony with the old work. Of the five windows in the chancel, the east one has alone been permanently filled with stained glass. The central figure represents "Our Lord in Majesty," flanked on either side by the Virgin and St. John. Underneath these are representations of "The Ascension," "The visit of Mary to Elizabeth," and "The visit of the Angels to St. John at Patmos." This window was the gift of the widow and daughter of the late Mr. John Blackwood, in whose memory it has been erected. It was executed by Messrs. Clayton & Bell, London. The memorial of Dean Ramsay, which formerly stood in the east end of the south aisle, has

now been placed on the south wall of the chancel. The east of the works, which were designed by Messrs. Kinnear & Peddie, architects, has been about 3,500.

**Llanwnda (Fishguard).**—The ancient church of this parish, the one in which the French landed at the end of the last century, has just been re-opened by the Bishop of St. David's, after a very complete restoration. A roof-loft staircase, extending the whole length of the western wall of the north aisle, has been discovered and opened out, as well as a squint in the eastern wall of the south porch. The interesting double bell-turret at the west end has been straightened by mechanical means, under the guidance and instructions of Mr. Lingen Barker, the architect. The works have been performed by Messrs. Balcombe & Price, of Pembroke Dock. The chancel was rebuilt by the Ecclesiastical Commissioners.

**Walsall.**—The capitals of the nave arcading of the church of St. Michael and All Angels, Caldmore, have been carved in a handsome manner by Mr. Thos. Earp, of Lambeth; and a new stone pulpit of Early English design has been erected by Messrs. Jones & Willis, of Birmingham, under the superintendence of Mr. J. R. Veall, of Wolverhampton, the architect of the church.

**Bickleigh.**—The parish church of Bickleigh was re-opened on the 22nd inst., after extensive alterations. The church was rebuilt in 1838 by Sir Ralph Lopes, and the cost of the present works has been wholly defrayed by his son, Sir Massey Lopes, on whose estate the church lies. The intention of the recent works has been to supplement what was lacking, and to make it more suitable to the requirements and taste of the present day. The recent works consist of the re-arrangement of the chancel, with the addition of a marble pavement and of handsome oak stalls; new oak seats in the nave, the ends of which are panelled and carved; a new vestry and tower screen, and new glazing and plastering and general repairs have been done. The works have been carried out from the designs of Mr. Sedding. The builder was Mr. Cowling, of Bickleigh. The carving was done by Mr. Trevenen, of Buckingham-place, Plymouth.

#### DISSENTING CHURCH-BUILDING NEWS.

**Woodberry Down.**—The memorial-stone of a new chapel for the Baptist community has been laid in Woodberry Down, between Stamford Hill and the Seven Sisters-road, by the Rev. T. Vincent Tymms, President of the London Baptist Association. The east of the new edifice, Early English Gothic in style, from the designs of Messrs. Paull & Bonella, architects, of Chancery-lane, is estimated at 6,500l.; the purchase-money for land, site, &c., 2,500l.; and when completed by the builders, Messrs. Allen & Sons, of Kilburn, accommodation will be provided for about 900 worshippers.

**Edinburgh.**—The new church erected by the Colston-street United Presbyterian congregation has been opened. The church has been built in thirteenth-century French Gothic style, and occupies an obtuse angle at the corner of Colston-street and Buchanan-street. The plan of the interior of the church is in the shape of a horseshoe, the auditorium being constructed not unlike that of a theatre. The ground-floor, which accommodates 500, excluding elders' seats, has a fall of 2 ft. from front to rear, and all the seats radiate so as to face the pulpit. The gallery is arranged to seat upwards of 300 persons, without overhanging more than one chord of the ground-floor sittings. The entrance doorway faces the angle of the street, and above it there is a large circular window, 12 ft. in diameter, filled with stained glass, the gift of Mr. Small, Miramio-place. The window is surmounted by a lofty gable, 60 ft. from the pavement, and a slate spire with ornamental louvre ventilator rises to a height of 90 ft. The total cost of the erection will not exceed 3,500l. The church has been built from plans prepared by Mr. Andrew Dewar, architect, Edinburgh.

**Perth.**—The plan for a new church for the congregation of Free St. Leonard's have been prepared by Mr. J. J. Stevenson, London. The church will be situated in Marshall-place, between James-street and Scott-street, and erected in the later Scotch Gothic style of architecture, founded on old examples, such as St. Giles's, Edinburgh, Stirling, Linlithgow, and St. Monaca, in Fife. In the area of the church

there will be 545 sittings in pews, 53 in open seats, and 58 seats for the choir and elders, and in the gallery accommodation will be provided for 329 persons, making a total of 985 sittings. In connexion with the church there will be a hall seated for 309 persons. It is estimated that the buildings will cost between 7,000l. and 8,000l.

#### STAINED GLASS.

**Jedburgh.**—A stained-glass window, the workmanship of Messrs. James Ballantine & Son, Edinburgh, has just been put into Edgerston Parish Church, in memory of the late Mr. William Oliver Rutherford, of Edgerston, who, for the long period of sixty-one years, was Sheriff of Roxburghshire. The subject is that of the Good Samaritan.

**Lerwick.**—Sheriff Rampini, chairman of the Decoration Fund Committee of the Lerwick Town-hall, has received intimation from Mr. C. H. B. Hayfield of his desire to present a stained-glass window to the Lerwick Town-hall, now in course of erection. The subject will be James III. of Scotland, and the window will be executed, along with the remainder of the historical series, by Messrs. Cox, Sons, Buckley, & Co., of London.

**Lower Norwood.**—Messrs. W. M. Pepper & Co. have just placed in St. Luke's Church, Lower Norwood, a five-light chancel window, depicting our Saviour in the act of blessing, and the four Evangelists (two on each side). The window was presented by Mrs. Fredwell, a member of the congregation, in memory of her late husband.

**Birmingham.**—A window to the memory of the late Mrs. Julia Baker has been placed in the east end of St. Philip's Church. The subject depicted is the Crucifixion, treated in the Renaissance manner. An imposing canopy is formed, harmonising with the architecture of the church. The window is the work of Mr. Swaine Bourne.

**Nottingham.**—The large and lofty south transept window of St. Matthew's Church has just been filled with stained glass as a memorial of the late Mr. Wm. Moody. The window, of three openings, is of Early English architecture, and by means of bordures has been adapted by the artists to the illustration of four subjects. The lower three are, centrally, "The Last Supper," flanked on one side by "The Agony in the Garden," and on the other by "The Appearance of Christ to Mary after the Resurrection." Above these the whole upper portions of the window are devoted to "Our Lord's Ascension." The various subjects, with their accessory groups, selected in accordance with the Scriptural record, are vigorously delineated; and as the southern aspect permits and justifies, the colouring is more than usually rich. The window is by the firm of Powell Brothers, Leeds; Messrs. Walker & Howitt, of Nottingham, being the supervising architects.

**Southport.**—The Mayoress (Mrs. W. Sutton) has presented to Mornington-road Chapel a stained-glass window, the work of Messrs. Ballantine & Son, of Edinburgh. The principal subject is "The Lord's Supper," taken in the main from Leonardo da Vinci's well-known picture. As the height of the window afforded a favourable opportunity for a lower tier of figures, the subject of Gethsemane has been chosen for five smaller panels underneath. In the tracery are the Christian symbols of the Hand, the Lamb, the Dove, the Trinity, the Alpha and Omega, and in the cinquefoils immediately over the principal subject are the Sacramental elements symbolised by the Wheat and the Vine. The window cost 500l.

**Hambleton.**—The east window of the parish church of Hambleton, Hants, has lately been filled with stained glass in memory of the late Mr. Forrester Wilson, of Whiteale. It is the work of Messrs. Lavers, Barrand, & Westlake, of Endell-street, London. The subject is the Crucifixion, with the usual attendant groups, in the centre; the upper part, Christ in His Majesty, adored by angels; and beneath, the Last Supper, with groups representing two Old Testament Types of the Eucharist, the Manna on one side and the Grapes of Eschol on the other.

**Aston-green.**—The three-light east window of Aston-green Mission Church has been filled with stained glass. The subject (the Crucifixion) occupies all the lights. In the centre is our Lord on the cross, the Magdalen weeping at His feet. On the one side the prominent figures are those of St. John and the Centurion; on the other, those of the Virgin Mother and the other

Mary. The window is by Messrs. Powell Bros., Leeds.

**South Acton.**—The last of the plain windows of All Saints' Church has just been filled with stained glass, "erected by the Clergy and Congregation in acknowledgment of great progress and many blessings" to commemorate the tenth anniversary of the church opening. This (aisle) window is of three lights, of which the subjects are—1. Noah's Sacrifice after the Flood; 2. The Confusion of Tongues at Babel; 3. Job in his Affliction. The window is by Messrs. Powell Bros., Leeds, by whom also is all the other stained glass in this church.

#### Miscellaneous.

**Proposed Additional Workhouse Buildings at Newington.**—At the meeting of the Guardians of the St. Saviour's Union on the 26th ult., the report was brought up of the special committee appointed to consider the most economical means of providing for the indoor poor of the Union. The committee, after a lengthened inquiry, and going through the statistics of the pauperism of the Union for past years, have arrived at the conclusion that it is necessary to provide indoor accommodation for 500 over the number for which the establishments at the disposal of the Guardians are at present certified for, and with the view of ascertaining the best means of giving effect thereto, your committee sought the assistance of Mr. Jarvis, architect, who on many previous occasions has been referred to by the Board in similar matters. The interviews the committee have had with that gentleman have enabled them to prepare two alternative plans, both of which show that it is practicable to provide the required accommodation upon a portion of the land already in the occupation of the Guardians at Newington, coupled with the acquisition of the five houses lying between the boundaries of the infirmary and the Westmoreland and Boyson roads, which, if necessary, could be obtained under compulsory powers. From inquiries which the committee have made, they believe that the adoption of either of these plans would not entail an expenditure exceeding 25,000l. to 28,000l. The chairman moved that the report be adopted, and the plans sent to the Local Government Board. This was unanimously agreed to.

**Tate's Electric Engine Stopper.**—Among the numerous applications of electricity in connexion with machinery is one which has been applied by Mr. Tate, the manager of some large woollen mills in Bradford, to the purpose of stopping steam-engines in case of a breakdown of machinery or other accident in factories, or in the event of an impending collision on board steamship. The apparatus consists mainly of a weighted suspension-rod, an ordinary Leclanché battery, an electro-magnet, and conducting wires leading to any number of points from which it is desired the engine shall be controlled. The electro-magnet is placed in a small box at the top of the stopping apparatus, which is connected with the stop-valve of the engine. Should an accident occur to the machinery in any part of the factory where the electric push is fixed, upon the button being pressed and contact made the electro-magnet acts upon a lever, which releases the weighted suspension rod. This rod instantly descends by gravity, and in its descent it opens a three-way cock, by which means steam is admitted from the boiler to a cylinder containing a piston, which latter is raised, and, in rising, closes the stop-valve and shuts off the steam.

**Guildhall.**—The Council-chamber here has been ventilated by Boyle's system, and a few days ago a number of gentlemen interested in such matters attended by invitation to inspect the arrangements. The invitation sent to us reached us too late to enable us to avail ourselves of it. We may, however, take an early opportunity of noticing the matter. In the meantime, we may say that very favourable accounts have been given by some of the gentlemen who have seen the arrangements. Sir J. B. Monckton, for example, the Town Clerk, has given a strong testimonial as to their success.

**Loosening Screws.**—A Continental mechanical journal states that for loosening rusted screws and other connexions, kerosene oil or naphtha, or even turpentine, will penetrate into the smallest fissures between connexions which have been for a long time in contact with each other. By exposure to the fire the parts then soon become disunited.

**A New Idea for London Gardens.**—Ivy lawns are known to but few amongst the many who are interested in garden economy. They consist, as the name implies, of ivy only, and they offer some peculiar advantages in cases where grass lawns are apt to occasion more trouble than they are worth. An ivy lawn may be well made in one season, and if the primary operation of planting be properly performed the lawn will make itself; it will want no cutting, no sweeping, no watering, no protection, from the birds that eat the grass seeds to-day and to-morrow scratch up the tender plants, as though it was their mission to make grass lawns impossible. And when made, being, as it were self-made, an ivy lawn will take care of itself for any number of years; but if in need of repair or trimming, the knife, the shears, or the spade may be used with good effect by unskilful hands, and with the least imaginable cost of time, for it is not an easy thing to kill, or even to seriously injure, a lawn consisting of ivies solely. Such lawns are unfit for games, and, indeed, should not be trodden on. They will not, therefore, supersede grass in a country garden, which perhaps is a matter for gratulation; but they will give us the most delightful breadths of verdure in thousands of places where grass is more plague than profit, and, at the very best, tends rather to disgrace than adorn the position. In town gardens generally, where small patches of ill-kept grass tell us but too plainly that a garden is not necessarily an advantage, the ivy lawn would make all the difference between a too evident failure and a complete success. So again in spots shaded by trees, where usually we see bare earth, and it is confidently said that nothing will grow, a surfacing of ivy may be as surely secured as the shade that renders grass impossible. And while with grass for a lawn we have but little choice as to colour, for the good lawn grasses are all green, with ivy we may have a great variety of colours, for there are ivies with creamy-tinted leaves and leaves splashed with gold-yellow, as well as dark-green leaves and light-green leaves. After observations and experiments extending over many years, however, we have concluded that the very best of all known ivies for the purpose is the one known as "Hibberd's Emerald," for it is literally always growing, and travels fast and far, and the colour of its fresh growth is a rich blue-tinted green, suggestive of the gem from which it takes its second name. It is, in truth, a delicious ivy at all seasons; it is the first to begin growing in spring and the last to cease growing in autumn, and, while it spreads freely and forms a close felt of rich herbage on the ground, it will climb and cling wherever it touches a perpendicular surface, and thus, without being directed, it will quickly clothe walls and pillars and trees with its ever-fresh and lovely foliage. But the well-known Irish ivy is a valuable carpeting-plant, and is at command everywhere for the purpose.—*Gardener's Magazine.*

**Drainage at Portsmouth.**—At the meeting of the Portsmouth Town Council on the 27th ult., a letter was read from Mr. G. C. Adams, Borough Engineer, resigning his position, assigning ill-health as the cause of his taking that step. The resignation was not accepted, but Mr. Beaumont was appointed to undertake the duties of the office *pro tem*. Grave complaints are made as to the condition of the drainage of the town, it being alleged that the drains have become choked through the negligence of the Borough Engineer and those under him. On the other hand, it is hinted that the Borough Engineer has had pressure brought to bear upon him to send in his resignation, and so become a scapegoat for the rebusiveness of the Sanitary Committee. A special committee of inquiry has been appointed. The calm consideration of the question seems to have been somewhat interfered with by the proximity of the municipal elections. The *Hampshire Telegraph*, commenting on the matter, says that the defective condition of the drainage is universally admitted, and although conflicting opinions are entertained as to the best means of remedying the evil, it is only too certain that any plan whatever will involve a very large outlay.

**Peterborough.**—Mr. W. Matthews, Assoc. M. Inst. C. E., who has for some time been connected with the Peterborough Corporation, has been appointed Borough Engineer. The Water and Sewage Works recently constructed have cost 200,000l.

**American Patents.**—The report of the Commissioner of Patents at Washington for the fiscal year ending June 30th of this year shows that the number of applications for patents during that period was 28,853. Patent rights in the United States, however, not being granted in the same indiscriminate manner as in England, a large number of the applications were refused on the ground of the alleged inventions having been anticipated or for other stated reasons. The number of patents granted as a matter of fact was 17,713. The receipts of the office for fees, &c., were \$390,864, and the expenditure (not including printing), \$651,719. The commissioner recommends that an Act of Congress should be passed to determine the length of time for which a patent may be issued for an invention already patented in a foreign country.

**Drawings by John Leech.**—At a recent *séance* of the Manchester Literary Club a suggestion was made as to the desirability of obtaining, by public subscription, a selection of drawings by John Leech, similar in character to the series now in the South Kensington Museum, to be offered in the first instance to the Manchester Corporation for the permanent art gallery of the city. This suggestion was warmly approved, and a subscription-list was opened in the room, to which about fifty of the gentlemen present at once contributed. It is hoped that the public response to this effort may result in the purchase of the whole of the remaining works, in which case selections could be made and placed not only in Manchester, but in Liverpool, Leeds, Sheffield, Nottingham, and other large towns.

**A Great Strike of Cabinet-makers in Paris is imminent.** A few evenings ago 482 masters met to deliberate on the measures to be taken in regard to the threatened strike. The main point on which the masters and men are at issue is the system of placing masters on the "index," and of settling disputes with a general executive committee of the workmen. At the meeting were described the terrors of the "index." M. Allard, one of the leading cabinet-makers, summed it up as amounting to the bankruptcy of the employer. The lock-out, in case of a suitable arrangement not being effected, was adopted by 212. Sixty-two voted against it, and 208 abstained from voting. The workmen on their side held a meeting to take counter-measures. A conference between deputations of both sides has been held.

**The Carlyle Statue.**—On the 26th ult. the statue by Mr. Boehm, which has been erected on the Chelsea Embankment, as a memorial to Thomas Carlyle, was unveiled by Professor Tyndall. Shortly after the death of Carlyle, some of his friends commissioned Mr. Boehm to execute in bronze a replica of the statue he had modelled from the life some six years before. The statue had passed Carlyle at the time. It represents Carlyle wrapped in a loose dressing-gown, seated in his arm-chair, his legs crossed, and his long characteristic hands folded on his lap. It is erected in the little public garden on the Chelsea Embankment, at the end of Great Cheyne-row, where Carlyle had spent the last forty years of his life.

**Competition. Hall.**—A new Savings Bank is to be built here, and the directors, at their meeting on the 25th inst., awarded the premium of twenty guineas to the design bearing the motto "Frugality," submitted in public competition. Thirty-two designs were received, and Mr. Robt. Clapp, A.R.I.B.A., of Hall, is the author of the selected design. The estimated cost of the building is 4,000l.

**International Exhibition of Fine Arts, Rome.**—The General Commission for the International Exhibition of Fine Arts have approved the proposal of the Executive Committee to postpone the opening of the Exhibition to the 14th of January, 1883, and to prolong the period for the delivery of works until the 1st of December next.

**Cranford.**—The corner-stone of new buildings to be used as a church school-room, &c., with mistress's residence, was laid on last Friday week by Mr. O. E. Coope, M.P. The building is Gothic in style, but freely treated, and is being erected from the designs of Mr. Robert Willey, F.R.I.B.A., of 66, Ludgate-hill.

**Japanese Art** was treated by Mr. Pfounder in two lectures at the Royal Institution, Manchester, on Monday and Wednesday last. The errors of the passing fashion and the blunders of imitators were somewhat strongly criticised in unmistakable language by the lecturer.

TENDERS

For erecting a new hall, to be called the Albany Hall, in Fife-road, Kingston-on-Thames, Messrs. Robins & De Boinville Brothers, architects, 2, Victoria Mansions. Quantities supplied:—

J. Higgs	25,741 0 0
Martin, Wells, & Co.	4,670 0 0
M. Manley	4,667 0 0
W. Lamb	4,535 0 0
Hughes & Co.	4,530 0 0
J. Macerostie	4,490 0 0
J. Collings	4,455 0 0
J. Jarvis	4,275 0 0
Allen & Sims	4,225 0 0
G. Morredew	4,200 0 0
J. Piller	4,147 0 0
E. Wells	3,815 0 0
C. Oldridge (accepted)	3,872 0 0

For the erection of Nos. 18 and 10, Recent-street, Swindon, for the Iron, and Right Rev. Dr. Clifford. Mr. W. H. Read, architect, Corn Exchange, Swindon:—

Jackson	2,915 0 0
Henley	885 6 8
Barrett	885 16 0
Wiltshire, Swindon (accepted)	832 10 0

For building new stables at Newmarket for Mr. Saich. Mr. J. Falman, architect, Newmarket:—

Kerridge & Shaw	21,305 0 0
Kent	1,170 0 0
Hook & Telford	1,117 0 0
Simpson	1,085 0 0
Cowell	998 0 0
Denson (accepted)	907 0 0

For alterations to wharf in East Ferry-road, Millwall, for the London Guelph Patent Cask Company. Mr. E. C. Allan, architect, Romford:—

Abel Hillyer	513 0 0
George Gibbs (accepted)	90 0 0

For the erection of a factory for the London Guelph Patent Cask Company, Millwall. Mr. E. C. Allan, architect:—

G. H. West (accepted)

For the erection of a baker's oven at No. 11, Sunford-lane, for the Incorporated Society of Licensed Victuallers. Mr. H. L. Newton, architect, 27, Great George-street:—

Cook	519 0 0
Pickersgill Brothers (accepted)	95 0 0

For a central lighting station at Pimlico for the Swan United Electric Light Company, Limited. Mr. John Slater, B.A., architect, R. E. Crompton & Co., engineers:—

E. S. S. Williams & Son	24,100 0 0
Peto Bros.	4,024 0 0

For new Council-chamber, Guildhall. Mr. Herace Jones, architect. Quantities by Messrs. Reddall & Son and Messrs. Williams & Gritten:—

Ashby Brothers	438,560 0 0
Thompson, Peterborough	37,850 0 0
Chappell	37,850 0 0
Webster	35,500 0 0
Cander	35,570 0 0
Ashby & Horner	35,343 0 0
Mowlem & Co.	34,928 0 0
Holland & Hannen	34,566 0 0
Lucas Brothers	33,985 0 0
Colls	32,888 0 0
G. Trollope & Sons	32,286 0 0
Nightingale (accepted)	32,249 0 0

\* These four tenders were rejected in consequence of alterations in the wording of the lithographed conditions made by the contractors.

For new model dairy farm buildings, with manager's residence, &c., for the Express Dairy Company, Limited, at College Farm, Finchley, chief offices, Bloomsbury Mansions. Mr. Fred. Chancellor, 8, Finsbury-circus, architect. Quantities supplied by Messrs. Franklin & Andrews:—

Brass	68,245 0 0
Gascock	61,398 0 0
Morter	6,171 0 0
King & Son	6,105 0 0
Manley	6,097 0 0
Adamson	5,671 0 0
Brown	5,393 0 0
Steed Bros.	4,912 0 0

For the erection of a new schoolroom for seventy-two infants at Codsall, Staffordshire. Mr. J. R. Veal, architect, Wolverhampton:—

Barrett, Tettenhall	2,246 0 0
Morris, Penn Fields	210 7 9
Stretton, Codsall	210 0 0
Collins, Tettenhall	206 8 8
Moreton, Codsall (accepted)	204 10 0

For the erection of an infants' school, Chadwell Heath, for the Dagenham School Board. Mr. John Hudson, architect, 80, Leaman-street:—

A. Davey, Romford	21,471 0 0
J. Abraham, Romford	1,410 0 0
G. W. C. Death, Chadwell Heath	1,212 10 0

\* Accepted.

For factory and offices at Eagle Wharf-road, Hoxton, for Mr. F. Foster. Mr. Spencer W. Grant, architect, 63, Finsbury-pavement. Quantities by Mr. C. W. Brooks:—

Colls & Son	23,335 0 0
Oxford	2,395 0 0
Nightingale	2,249 0 0
Dovus	2,137 0 0
Jerrard	2,149 0 0
Lawrence	2,052 0 0
Groves	2,048 0 0
Atherton & Latta (accepted)	2,025 0 0

For alterations and fittings at 12, Great Russell-street Bedford-square, for Mr. C. J. Cardwell. Mr. H. E. Pollard, architect:—

Sage	2,440 0 0
Howard & Davrel	339 0 0
Hodgkin	335 0 0
Ward & Lambie	286 0 0
Evans	283 0 0

### The Value of the Services of the Architect as Regards the Food Supply of Great Cities.

AMONG the various services rendered to the commonwealth by the architect and the surveyor, few persons will be inclined to rank the cheapening of food. We have, however, in the current number of the *Quarterly Review*, so signal an instance of the opposite state of things,—that is to say, of the enormous increase in cost, and waste in bulk, of nutritious human food, arising directly from the want of those facilities for sale and distribution which it is the function of the architect and of the surveyor to provide,—that the value of the services actually rendered in this respect by the profession assumes incontestable importance.

A perusal of our article of the 14th ult., on "Food for the Million" (which, of course, was not published in time for such consultation), would have enabled the author of this sprightly and instructive article,—it is headed "The Fish Supply of London,"—to avoid the only serious error that we detect on perusal, viz., his view of the costly character of the long railway carriage. It is Mr. Spencer Walpole, not the writer of the article, who tells the extraordinary story, to which most readers will be apt to apply the term "Cock and Bull," of a van loaded with fish being driven round and round Billingsgate for eleven days, still with the same load of fish, with the result,—"The fish which it contained was, of course, ultimately condemned." We should think so. By what extraordinary hoax the Inspector of Fisheries to the Home Office could have been induced to insert in his report a tale of this kind,—calculated, as it is, to throw doubt on the accuracy or judgment of the whole report,—or how the *Quarterly Reviewer* can have cited it without comment, we cannot attempt to guess. But the staple of the paper is of a far different order.

Billingsgate Market, we are told by the Reviewer, has a frontage to the river of 200 ft. and a superficial area of 40,000 square ft. (or '918 acres'). But as this site contains seventeen shops, and, till very lately, two public-houses, it is obvious that the space left for market proper is miserably small. It is a pity that its area is not given by the Reviewer. Not only is the market itself so disproportioned to the wants of the trade, and of the metropolis, but the approaches are of the most stunted and barbarous description, allowing only two vans to pass abreast, so that "if a van is being unpacked at the market, one of the two streams of traffic is temporarily blocked."

The regulations of the market, it must be freely allowed, are as thoroughly calculated to make the worst of inefficient space, and intermittent approach, as the wit or folly of man could well devise; not that we take it that either wit or folly were the arbitrators in the matter. That function was fulfilled by another abstract personification, by blind and greedy "Vested Interest," our old enemy. And to effect this, first, no fish is allowed to be sold before the hour of five a.m.; and secondly, "when the clock strikes nine, the police interfere, and clear all the closely-packed vehicles, sometimes amounting to nearly 4,000 in number, out of the City, in order to make way for the ordinary day traffic of the streets." If the salesmen and frequenters of the market were undisturbed, we suppose that something would be going on within it from two to three a.m. to ten or eleven p.m., that is to say, for twenty hours out of the twenty-four. To reduce the possibility of doing business at one stroke in the ratio of from 20 to 4 is a sample of that blind abuse of corporate power which has raised up such fierce opposition to what in their origin were very noble institutions.

Nor is "Vested Interest" content with inadequate space, inconvenient approach, and capriciously shortened time. As with the brick-makers, as with the cutlery-grinders, as with the divers,—at least not so very long ago,—the greatest possible amount of inconvenience, with no little risk to human life, is thrown in the way of landing the fish. If there be one object which it is, more than another, important to move in the most rapid mode, and without touch of human hands, from the hold or deck of a ship to the stall of the market, it is a box of fish. If there be any article of trade which it is more thoroughly easy to move in this way, by cranes and trucks, than any other, it is this same box of fish. How is it actually done?

"In front of the market, on the water side, there is a large floating pontoon, but the steamers are not allowed to come alongside it in order to unload, being compelled to lie off at a distance of nearly 100 ft. from the market quay, and to land the fish along planks thrown out from the steamer to a barge, and from this barge to the floating pontoon. Every pound of fish brought by steamer and landed from the river at Billingsgate is carried along these planks upon men's heads. Only two roads,—one from and one to the steamers,—are permitted to exist, and as the men have no choice but to follow each other, it is obviously impossible to land a large quantity of fish before the market closes at nine in the morning. The result is, that fresh fish are often thrown away, because it will not keep until four o'clock the following morning."

Is it possible to describe a state of things,—we can find no other word for it,—more thoroughly infamous, more disgraceful to the corporate authorities and to all those holding rule

over the market? Four hundred tons of fish for every working day in the year are sent to Billingsgate Market. This is calculated by Mr. Birkbeck, M.P., to be equivalent to a drove of 1,000 fat oxen entering London every day. How much of the 400 tons actually makes its way on the heads of the water-side porters into the market we are not told. The quantity is limited to that which a file of men can carry along a rough plank between the hours of five and nine. During half the year, too, this barbarous system of portage, which only needs to be conducted by women instead of men to be the very worst that could be adopted by any savage tribe, is carried on in the dark. "Accidents happen frequently, and occasionally there is loss of life." It would have been well if the reviewer had ascertained the number of men thus employed. We fully anticipate, from the experience attained in those cases of the most debasing, the most deadly, and the most dangerous work of which we have any previous cognisance, that it is these half-clad, hard-worked porters, who, in the dark winter mornings, at the risk of their lives, do the work of a quarter of a donkey a piece, that will be found the most strenuous supporters of so frightful a state of things. They probably are, comparatively speaking, well paid; as a single firm, the largest in the trade, has paid from 4,300l. to 4,500l. a year for this wretched colportage of their cargoes. So, to keep up, or rather to keep down, in a few hands, the remuneration for a wholly unnecessary portage, life is risked on the one hand, and East London is starved on the other.

For East London is fond of fish. The "wet trawl fish" that is thus brought to Billingsgate is divided into two classes,—prime and offal. Prime consists of turbot, brill, soles, John Dory, and red mullet. Offal includes plaice, haddock, cod, skate, roker, whiting, sturgeon, hake dabs, thornback, and gurnard. "Roker," a term unknown to the naturalist, includes all fish of the ray family, except skate. It "is a favourite food of the working classes, to whom it could be supplied at 3d., or less, per pound." Is it not incredible that the vast population of East London so tamely submits to the daily "condemnation" and destruction, by tens if not by hundreds of tons, of a large portion of the fish that is actually brought to the verge of the market,—there to be destroyed—rather than put down a second plank for the London lazzaroni, or allow the natural business of the fisherman to be carried on, in the way of removing his cargo, during the proper and natural hours of labour?

All this wrong, waste, oppressive cruelty, and national loss would be impossible but for the small area of the market, and the utterly inadequate approaches. It appears to be a wanton, as it is a wicked, waste on the part of the City authorities. "In 1863, Mr. Horace Jones, the City Architect, suggested the only practicable scheme for making Billingsgate more

accessible by land that has yet come before the Common Council. At an estimated cost of 88,000*l.*, he proposed to construct a new street, from the corner of Eastcheap and Fish-street-hill to Thames-street. The Common Council approved, and allowed the proposal to lie on the table, and when, twelve years later, the Improvement Committee of the City of London sought to give effect to the plan, the estimated cost had risen from 88,000*l.* to 525,000*l.* *£* 0 0 0 for the economy of procrastination!

Of the plan now in progress for establishing a new riverside fish-market of at least 4 acres in extent in the parish of St. Paul, Shadwell, and of the persistent, though, happily, unsuccessful, opposition raised to the Bill authorising it in both Houses of Parliament, we are not now about to speak. One thing, however, does tell with force from the perusal of our article, which we recommend our readers to study,—it is, that there seem to be reasons, both many and good, for establishing a market for railway-fish, *not* on the river-side, but at some central position for other parts of the metropolis. At Billingsgate, if we may rely upon our authority, the supply of fish by railway does not seem to have increased the total supply of London; for the railway-borne fish had to struggle for admittance to the wretched marketplace with the river-borne fish during the four hours to which supply was restricted. Therefore, the more fish brought by railway got in, the less time was there left for the admission of the water-borne fish! The subject is one on which it is a hard test of temper and of self-command to write. Of all the wicked and wanton oppressions from which the serfs in feudal times had to suffer, was there one at once so persistent, so wanton, and so wicked as the regulation of the fish-market at Billingsgate by the City of London?

#### OPENING MEETING, ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The opening meeting of Session 1882-83 of the Royal Institute of British Architects was held on Monday evening last in Conduit-street, Mr. Horace Jones, President, in the chair.

The decease was announced of the following members, viz., R. Lacon Sibley, Fellow, and T. E. C. Streetfield, Associate.

The following gentlemen were balloted for and declared to be duly elected, viz.:

*As Fellows.*—Mr. Charles Trubshaw (Associate), Architect, Northern Division of the Midland Railway, Derby; and Mr. William Henry Pictou, of Liverpool.

*As Associates.*—Mr. Frederick de Jersey Clere, of Feilding, New Zealand; Mr. John William Simpson,\* Mitre-court Chambers, Temple, E.C.; Mr. Arthur Sutton Cooper,\* Queen-street, Cheap-side; Mr. Francis Hooper,\* Beckenham; Mr. Nathaniel James Stanger,\* of Tresillian-crescent, St. John's, New Cross; Mr. Charles James Tait,\* of Highbury Park; Mr. Charles Stewart Smith,\* of Friar-street, Reading; Mr. George Alexander Thomas Middleton,\* of Ryde Vale-road, Balham; Mr. Samuel Cuthbert Rogers,\* of Bedford-row; Mr. P. Cowpor,\* of Frederick-street, Gray's Inn-road; Mr. E. W. Foley,\* of Lady Somerset-road, Highgate; and Mr. R. W. Bousfield,\* of Clifton-gardens, Maada Vale.

#### The President's Address.

The President then proceeded to deliver his opening address. After a few preliminary observations, he entered upon a review of the events of the past session, and went on to speak of the hopes and expectations of the present one, and generally of matters now interesting the world of architecture and its sister arts. The Institute's losses by death had been more than ordinarily serious, first and foremost being a national rather than a merely professional bereavement in the vacating of the Presidential Chair by the death of Mr. Street. They were the more forcibly reminded of the sad event by the circumstance that at this very time arrangements were being made for the State opening of his greatest work, the most important national building completed since the Houses of Parliament. Had he lived to see the inauguration of the New Law Courts it might have been hoped that some special decoration in public recognition of his toil, skill, and

\* Passed candidates in the Obligatory Examination, March, 1882.

genius might have been granted him. The audience was reminded of Mr. Street's earnest advocacy of the preservation of the City churches, and of his brilliant and exhaustive Opening Address last year. One further act remained for the Institute,—the placing of his memorial portrait on its walls. For though it had been often mooted that the custom of thus honouring their past presidents should not be allowed to harden into an inflexible rule, he felt sure none would be for making the break upon this occasion. In the New Palace of Justice its architect would have a monument in his honour, but that was no reason why the Institute should forego its right to a canvas memento of its illustrious president. Brief obituary notices were next given of two past vice-presidents, Mr. Decimus Burton and Mr. Mocatta, neither of them of late much spoken of in the profession, but both noted more or less in former times, Burton especially having been a ruling light and power in architecture half a century ago. Mr. Mocatta, although not so well known in the profession as Mr. Decimus Burton, always evinced a great love for his art, and took a very great interest in the well-being of the profession. In Mr. Anthony Salvin the profession had lost a member whose works of restoration at the Tower of London, at Cambridge, and elsewhere, were well known. The death of Mr. George Somers Clarke was too recent an event to allow of his being as yet adequately commemorated. The President had lost in him a special friend. He was a pupil of the late Sir Charles Barry, travelled through Italy, France, and Germany about thirty-six years ago, and wrote for the Architectural Publication Society. Tallis's Printing-house and other large mercantile buildings in the City were designed by him, and, together with some of his country-houses, especially one for the late Mr. Hermon, marked well his talent and originality. The accessions to the ranks of the Institute during the past year had been 42 Fellows and 223 Associates. Some of the papers read at their meetings had been more than usually interesting. The President instanced Mr. Hugh Stannus's on "The Artistic Treatment of Constructional Iron-work" as a most acceptable essay. Indeed, it might have been wished that the author could have had more time allotted to him; but they were willing to accept it as a prelude to a future paper on the same subject, which might be further developed to the great advantage of them all. Mr. John Slater's paper "On Recent Progress in the Electric Lighting of Buildings" was, perhaps, even a more popular production of the session. The practical utility of the subject, the interest felt and shown by all in the wonderful adaptation of science to the wants of the whole world, an interest resulting in so many National and International Electric Exhibitions; and the pleasant way in which the whole was popularised, could not fail to charm and instruct the audience. The President did not wish his special allusion to these two papers to be understood as a depreciation of other communications. Reference was next made to the Institute's important labours for adjustment of the vexed question of light and air. The report was not yet ready for presentation to the members, but when produced it would be found, the President believed, useful, valuable, and exhaustive. Many minds had been brought to bear upon the problem, and to harmonise the various views they had taken of it, so as to reduce them into an orderly and useful digest, required time, care, and discretion. Two or three other questions before the Council had in like manner long waited to be reported on, not from any supineness on its part, but with a view to make the reports as perfect as possible.

The session of 1881-2 would long be memorable for the inauguration by the Institute of its system of compulsory Examination. The Council, having seriously weighed the question, had come to the determination that they would begin with an examination neither too strict nor too exhaustive. After complimenting the examiners, with special mention of Messrs. Grüning, Mathews, Robson, Watson, and others, the President remarked that at present their *curriculum* might be truly described as a preliminary one, not insisting on more knowledge than was absolutely indispensable to any aspirant to employment as an architect. He was firmly convinced, however, that whilst it would be both practicable and wise to extend the range and to increase the stringency of the examina-

tion, it would have been impolitic and injudicious to make a fresh start from such a high level as to necessitate the lowering of their standard. Very much remained to be done in future years, not only by the Board of Examiners, but also by the candidates themselves. Every candidate should be encouraged to pass as an Associate before aspiring to be a Fellow. The examination must be scientific and practical rather than æsthetic. Art could not be tested in the same way as arithmetic, and what Cowper said of a poet was no less true of an architect,—

"A poet does not work by square or line,  
As smiths and joiners perfect a design."

Perhaps there was no better test of art knowledge than the numerous and valuable prizes offered for competition by the Institute. The President spoke highly of the good work done by the Architectural Association in preparing for the examination many of the best candidates. The Royal Academy was able to award even more valuable awards and honours than the Institute, and he believed they were always given with great care and appreciation. The *curriculum* of the Academy's Architectural School, under Mr. R. P. Spiers, a friend and Fellow of the Institute, showed that in many branches of art no student lacked opportunity to perfect himself, any more than in the scientific branches of the profession. Careful drawing and modelling were insisted on, as well as attendance upon lectures on perspective, and there were liberal rewards inducing to earnest study. Like aids in mastering the theory and practice of their art were to be found in the architectural classes at University and King's Colleges. No doubt museums of models and casts, for which there was still much onerous, would prove a great boon to many, but casts were no proper substitutes for originals where these themselves could be studied. But after all that schools could do to fit a man for the present examination, or for some higher one, there was still to be acquired the practical education best learned in an architect's office, whether large or small,—for each had much to be said for it,—and in everyday business red-tape was, perhaps, a bad master, but it might often be found a good servant. In every calling there was much detail work which was best learned when very young, and familiarity with which saved much time in after-life, often enabling men to form quick decisions, seemingly prompted by instinct or intuition. The President illustrated the importance of the practical side in an architect's education by pointing out the prominence of the element in the examination for the military profession. He referred also to actual or possible relations of the Institute with schools of practical engineering and with the City and Guilds of London Institute, whose Technical College would doubtless welcome such an alliance. That College would afford young architects insight into artificers' work, whilst its students might be aided by the body to which his audience belonged in the study of the more scientific and æsthetic branches.

It was one of the duties of the Institute to guard against infringements of the code of honour which governed the relations between architects and their employers. Architects could not be too careful with regard to the pecuniary affairs of themselves and of those whom they employed on behalf of their clients. It was a tradition which had been handed down to them, and should continue to be handed down from generation to generation, that the architect should think of his duty to his client before contending for his own remuneration, and no illiberal gains, however small or however large, should for a moment enter into his imagination, still less into his pockets.

National and international exhibitions were the next topic touched upon, *à propos* of those forthcoming at Amsterdam and Berlin, both of which, it was understood, would devote much of their space and efforts to Art. At the outset, the President threw out a suggestion by the way, that the Sanitary Institute of Great Britain might well make itself the Sanitary Institute of Europe, and hold forthwith, as such, an International Congress of its own. There were many sanitary matters of cosmopolitan interest, and especially applicable to all large European towns. The safeguarding of public buildings, especially theatres, against fire was another question of common interest to all the great capitalists, and the panic caused by the terrible catastrophe at Vienna drew attention to the want of interna-

tional conferences on such problems. Friendly converse between experts from the different countries might lead to the general adoption of all really necessary precautions, and at the same time tend to moderate the excesses of Government interference, such as those into which the Austrian authorities had been frightened in this melancholy instance. The President here glanced at Mr. Aitchison's advocacy, at a provincial congress, of the artistic employment of colour in the interiors of houses, and took occasion to notice the sudden turn taken by the public taste in favour of polychromy.

The year had not been rich in architectural and æsthetic literature. Such productions as the Edmund Sharpe Memorial were not common, and its usefulness to the architect, as well as to the general art student, would make this unique work highly prized. It was a work highly honourable to those who produced it as well as to him to whose memory it was dedicated. The "Lectures" of a former vice-president of the Institute, the late E. Middleton Barry, R.A., edited by his brother, Canon Barry, came next, and a projected reproduction of Art Costumes. The completion of a translation of Viollet-le-Duc's "Lectures on Architecture" had appeared, and there had been published several treatises on warming, ventilation, plumbing, sanitation, practical geometry, and iron construction as applied to roofs. The Americans had sent us their views on cottage, farm, and villa architecture, as well as on the interiors of dwellings. From France had been received the concluding *livraison* of "The Vatican," a work on the construction of the "Hôtel de Ville, another on the Château de Versailles, several on the Renaissance, and another part or two of the works of Viollet-le-Duc. Germany had sent photographic views of executed buildings in her chief cities, and works on the various architectural styles and their history.

Passing to the subject of restorations, the President said those at Bristol, under their friend and fellow, Mr. J. L. Pearson, R.A., would, doubtless, add to his laurels, but some regret had been expressed that his plans involved the destruction of the abbot's lodgings. St. Alban's was still a focus of discussion and criticism, and was likely to be so for some time to come. The Tower of London was now, he believed, about to receive the attention of the restorer.

In the archaeological investigations of Classical architecture, what now mainly interested men of culture was the contemplated resumption of Mr. J. T. Wood's excavations at Ephesus. They could only hope that an undertaking on which that gentleman had lavished so many years of patient and thoughtful toil, and from which nothing but the exhaustion of his resources could have induced him to desist, might be started afresh, and brought to a successful issue. The Temple of Diana at Ephesus was unique among Greek fæces. It was not a copy of the Parthenon at Athens, but had an individuality of its own, making a type by itself. As to the importance of its rescue from the dust of ages, Professor Newton's words were quoted—"The complete excavation of the Temple of Diana at Ephesus is an object well worthy of support from the nation, only now possesses in the British Museum the only portions of the beautiful sculptures as yet discovered of the Temple." The President earnestly appealed to those present to do their best in enlisting the sympathies of all able to help forward a renewal of the enterprise. The cessation of his labours just at the time when he was expecting to find the most important remains of the Temple, including the sculptured frieze and cornice, was a bitter disappointment to the man who had made for a noble end so many personal sacrifices, amongst them being his professional prospects as an architect. Roman remains of some interest to architects seemed to have been recently found at Bath, and the more important discovery of a Gallo-Roman city near Poitiers was reported from France.

Metropolitan improvements, decided on or proposed, were next passed in review. With regard to the necessity of improved approaches to the new Royal Courts of Justice, reference was made to a plan suggested by Mr. C. F. Hayward, F.S.A., for a new thoroughfare proposed to be driven northwards from the Strand through the slums of Clare-market to Holborn. With reference to the proposed new Govern-

ment Offices, the President expressed the hope that no morbid desire for economy would be allowed to prevail, to the detriment not only of architectural effect, but of public utility. He strongly deprecated the construction of other bridges below London Bridge, as tending to shift the world's commerce,—which had made London what it is,—to Blackwall, Gravesend, possibly to Southampton.

The new system of graded architectural competitions had been tried at Glasgow and Birkenhead, so far with success. At Glasgow there were some 140 primary candidates, from whom ten were selected for the final struggle. At Birkenhead 130 set for in preliminary sketches, of whom five were selected for the final competition. In both cases the commission had been confided to the winner in the last trial of strength. Perhaps the most important competition abroad in the course of last year was that for the Berlin Senato House. The Institute should endeavour this session to bring to a practical conclusion its discussion on this head. From a list of British Architects who had achieved successes during the past year were named Brock, Brandon, Blomfield, T. C. Clarke, Ferrey, Lanson, Low, Peebles, Phipps, Plunbe, Robins, Robson, Shaw, Verity, and Yulliamy.

Turning to the prospects of the opening session, reference was made to some of the papers which it was expected would be read at the general meetings. These would include one on Cyprus by one of the Vice-Presidents; one on the decoration of St. Paul's; one by the holder of the Godwin Bursary, who would describe some of the things being done in American building and sanitary work; and one by Mr. William Simpson, on architecture among the Himalaya Mountains. The newly-instituted Examination might be trusted for the recruiting of their ranks, which would also continue to be swollen by ever fresh accessions of painters, sculptors, and other fellow-artists, through the Honorary Association, dating from 1877. And whilst knitting their bonds of amity with votaries of other arts, there was room, the President thought, for improvement in their relations with the Royal Academy, so far as concerned the Institute's friendly rivalry with the architectural section of that body. Did he trespass unfairly on dangerous ground by hinting that were that section placed under a more catholic régime the Academy would be more popular with architects, without any loss to the public? One other all but vitally important matter that would have to be dealt with was the relative position of the metropolitan and provincial members of the Institute. Some of the latter complained that, whilst the burden of support fell on all alike, the benefits were not so equally shared, and accordingly demanded a conference. The President felt sure the Council would heartily welcome their country brethren to such a meeting, hear them with attention, and redress any proved grievances.

Mr. Charles Hutton Gregory, Vice-President of the Institution of Civil Engineers, said it afforded him very great pleasure to move a vote of thanks to Mr. Horace Jones for his very interesting, instructive, and genial address. The singular honour having been done him (the speaker) of asking him to move the vote of thanks, he could not help looking back to the time, now nearly fifty years ago, when, by the kindness of his dear old friend, Professor Donaldson, he was allowed, as a young engineering student, to attend the meetings of the Institute of Architects, to those in which he now found it. It was then, although warmly supported by many good men, a struggling body, and had not attained to that high position as the representative body of the profession which it now occupied. The address which they had just listened to was characterised by that practical good sense, generosity, sincerity, and geniality so typical of the distinguished architect whose production it was. Referring to the great municipal works erected in the City of London by the President, the speaker said that the great markets built from his designs and under his supervision were laid out with great skill both above and below ground. Among the President's other works were the restoration of the Guildhall, the erection of the new Library and Reading-room, and the new Council Chamber, now in progress. There was one work by the President which he could have

wished had been perpetuated in stone in some appropriate position, viz., the beautiful temporary archway erected at the foot of Ludgate-hill (screening the railway bridge) on the occasion of Her Majesty's visit to St. Paul's to return thanks for the restoration to health of H.R.H. the Prince of Wales. He was pleased to know, however, that although the erection did not live in stone in the City of London, a drawing of it occupied a prominent position on the walls of the Queen's private apartments at Windsor.

Professor T. Roger Smith said he felt it to be a great privilege to be allowed to second a vote of thanks so ably proposed by a distinguished member of the sister profession of engineering. He was quite sure that the members could not have listened to the way in which the President had reviewed the work of the past year, and sketched out the programme for the future, without feeling that they had in him an excellent example of the value of a professional president. The address to which they had had the pleasure of listening was eminently professional, and also eminently presidential. Besides noticing the larger matters appertaining to the work and education of the architect, allusion was also made to many smaller matters, all interesting and important, and deserving of recognition. The touching references made in it to those who were dead, and the kindly allusions to those who were living, had been very appropriate. It was a matter on which the President might fittingly be congratulated that he was called upon to preside over the Institute at the time when the compulsory Examination which he had laboured hard for many years to bring about, was duly established. The institution of the Obligatory Examination was the most important step, having regard to the future of the profession, that the Institute had taken for many years, but he thought that it was unquestionable that the establishment of a compulsory examination would not have been possible at this time but for the fact that the way had been prepared for it by the Voluntary Examinations established some twenty years ago. He hoped to see the time when they should feel justified in setting up a higher standard by making the Examination more stringent and wider in range than it was at present. In conclusion, Professor Roger Smith offered his personal congratulations to his old friend Mr. Horace Jones on having attained to a position to which the excellence of his personal merits, and the excellence of his works as an architect, so fully entitled him.

The motion was carried by acclamation, and the President having said a few words in acknowledgment, the meeting terminated.

#### THE INSTITUTE VOLUME OF TRANSACTIONS.

THE volume of the Transactions of the Institute of Architects for the session 1881-2 is a remarkably practical one; perhaps we may say that it is rather too much taken up with practical matters to the exclusion of the artistic side of architecture. The next year's subjects may, however, be arranged so as to balance this tendency. There were special reasons at the present time for some part of the practicality of the Proceedings. The coming use of the electric light is so important a subject in connexion with the arrangements for lighting dwelling-houses, that it would have been a decided omission if it had not received special attention. The biographical element also occupies a considerable space, and two long memorial notices of one architect, however eminent, in the same volume, seem a little disproportionate.

The only purely artistic paper in the volume is that by Mr. Hugh Stannus, "On the Artistic Treatment of Constructional Ironwork," a subject of equal interest and difficulty. Mr. Stannus's paper is a very thoughtful one, and includes a good many good suggestions; not all new, certainly, but which may just as well be repeated until more attention is paid to them. It may be questioned whether the author or the Institute were well advised in publishing some of the illustrations which accompany the paper. It is one thing to lay down the principles on which a material should be treated, another thing to give illustrations showing what is good and what is bad; he who succeeds in the one may not succeed in the other. We certainly could not accept fig. 3 in No. 8 of the illustration pages as an example of good treatment of a

small cast-iron girder; on the contrary, we should feel compelled to repudiate it as entirely bad and mistaken both in regard to the purpose and material. The wrought-iron girder above it is much better. The fact is that if we must use cast-iron and strive to use it ornamentally, the simpler the ornament the better, and certainly it should never attempt to imitate surface modelling such as might be carved. If we understand Mr. Stannus a right, he implies as much in his paper, but his illustrations do not in all cases carry it out. The two contrasted examples of brackets for roof springers (fig. 1, sheet 9) illustrate well the principle on which an iron bracket should be treated in the case supposed. The page of iron cantilevers (No. 10), again, is very much open to criticism, simply as design, independently of the material. The most agreeable of all the iron cantilevers is the perfectly plain one (fig. 1), introduced merely to show how the material is best applied, so that it shall be all doing its work, and not wasted; and this illustrates, in fact, what we believe will be found to be the best rule in treating the design of constructional ironwork,—to be content with making it express its constructive function as clearly and simply as possible. Most of what is added beyond this is in danger of weakening the constructive expression, and of appearing uncalled for, and introducing an effect at variance with the real character of iron. Indeed, we are inclined to suggest that the best way of treating constructional ironwork is to make it to trust to colour for relieving it (colour of some kind being a necessity, at any rate), or colour combined with perforation of the parts on which the stress does not fall. Iron cannot well be surface-modelled, in the forms in which it is used in construction, and it must be painted, for practical reasons: let the colouring provide the ornament, or the principal part of it, only giving a little characteristic shaping, where possible, to the leading lines or prominent points of the ironwork.

The long paper by Mr. Boulton, on "Uniformity in Building and Sanitary Regulations," and the elaborate discussion thereupon which followed, embody together a good deal of suggestion as to what is required in building and sanitary legislation, though the conclusions to be derived from the paper and discussion combined might certainly have been led up to with a much smaller expenditure of space and type; and a résumé of the discussion, merely showing the views which each speaker held, would have been sufficient for the purpose of reference. The reporting of the discussions appears to us in this and other cases to be carried to far too great length and to be a very questionable expenditure of money on printing. Some of the discussions read like newspaper reports republished in a permanent form. It is certainly very superfluous to stereotype in this way all the complimentary sentences with which speakers constantly commence their remarks, of which complimentary element there is, in fact, a good deal too much in the Institute discussions. If the council authorised a sub-committee to read the notes of the speeches and condense them into a brief expression of the kernel of their meaning, a good deal of unnecessary type and paper would be saved. It would be an invidious duty to impose on the secretary as a single individual, but a small editing sub-committee in conjunction with the secretary could do the work of condensation, and save money which might be spent more usefully in procuring some out of the long list of books which it is stated are wanted for the library, or in furnishing a greater number of illustrations to the Transactions, which would be likely to give to the volumes much more value, both to members and to outsiders, than they could derive from the detailed records of speeches not always concentrated or to the point. In other respects the editing of the volume, and the character of type and paper, are all that could be wished.

#### THE PALACE OF THE TUILERIES.

ACCORDING to the Paris correspondent of the *Toussische Zeitung*, the commission respecting historical monuments lately decided upon selling the ruins of the Tuileries as they now stand. Thus, after three centuries, it will be the ultimate fate of the palatial structure of Philibert Delorme (the celebrated architect of Catherine de Medici's period) to come under the auctioneer's hammer.

#### REMARKS ON THE SETTLED LAND ACT.

THE passing of the Settled Land Act is matter for congratulation, for it is the most considerable step towards what has been termed "freedom of land," that the Legislature has yet taken. Primarily it may be said to interest large proprietors of land in agricultural districts; but, on the other hand, it is impossible to suppose that its effect will not be largely felt in towns. It is not improbable that it may diminish to a considerable extent the present custom of granting long leases, for though these are authorised by the Act, it is highly probable that the power of sale which is given by it will take their place. When we are upon this point of the fact that it was only allowable for trustees of settled estates to grant building leases for long terms under the provisions of the Settled Estates Act, 1877, by permission of the Court of Chancery. Now, however, by the Act which comes into operation on the 1st of January, the tenant for life may, without consulting either the Court or the trustees of the settlement, "lease the settled land, or any part thereof, or any easement, right, or privilege of any kind, or over or in relation to the same, for any purpose whatever, whether involving waste or not, for any term not exceeding (1) in case of a building lease ninety-nine years." Practically, therefore, the tenant for life has as much power over the land as if he were an owner in fee, and there can be no question that many owners of land will exercise their new rights. In many cases, too, even where building leases of land were before attainable, much trouble had often to be undergone before a lease could be obtained when trustees and courts of law had to be moved in the matter; though this will now be ended, yet, as we have said, we think that sales, rather than long leases, will become more common. By the third section of the Act, "a tenant for life may sell the settled land, or any part thereof, or any easement, right, or privilege of any kind over or in relation to the same," that is to say, the tenant for life has all the powers of an owner in fee, though when he has obtained the money it can only be expended in certain specified ways, such as buying fresh land, improving that which remains, and investing it in a few high-class and low-interest-bearing stocks. But we are not now concerned so much with this point of the application of the money as with the fact that land can now be sold whether it is, as the phrase goes, "tied up," or whether it is wholly in the power of its owner. We can hardly doubt that the effect of the statute will be to put into circulation, not only properties in agricultural, but also in urban districts. This should give an impetus to building enterprise, ever give an impetus to the present system there is a good deal of commercial energy expended in this manner. But as soon as land circulates in urban districts and can be bought and sold with greater ease, we should have lively hopes that more substantial and lasting houses will be erected. The system of leasing land for building purposes practically sets a premium upon houses of a comparatively unsubstantial character, and therefore anything which tends to subdivide land (we are now speaking of towns) tends also, in our opinion, to the erection of substantial and well-built houses. For it is almost certain that more land will come into circulation. There are undoubtedly many tenants for life who, from various reasons, would be glad to sell their property, but cannot as yet do so. Under the provisions of the new Act they will no longer be so hampered, and that, too, whether the settlement be drawn before or after the date at which this statute comes into operation; for it applies to settlements made both before and after the passing of the Act, and not only to settlements entered into after the end of this year. Nothing will be more interesting than to watch the working, not only practical but social, of the Act, and, from our point of view, its effect especially upon buildings and building operations.

There is also another point in this Act which cannot very well be passed over in commenting on its provisions. That is, that the mansion-house of an estate cannot be sold or leased without the concurrence of the trustees. It seems to us that once give the tenant for life absolute power over the estate, it is absurd to put a limitation on his power over the mansion-house.

For example, the mansion-house might be in a bad situation, either from a sanitary or from an artistic point of view. Its construction might be old-fashioned, its drainage bad, its rooms and passages inconvenient, and the cost of altering it might be out of all proportion to its value. What would be more reasonable than to sell it and a few acres of surrounding land and build a more convenient residence in some better situation? But in order to do this, the tenant for life must get the permission of the trustees, and if they refuse, then he must take his case before the Chancery Division of the High Court of Justice; whereas, if he wishes to sell all the rest of the estate he can do so at his own will and pleasure, with or without a valid reason. It appears, therefore, to be highly desirable that an alteration in the provisions of the Act in this respect should take place at an early period of next session. We feel convinced that the retention of this limitation will only harass owners and prevent the erection of new and better houses. We should be the last to desire to see old houses, if worthy of preservation on account of their beauty or historical associations, pulled down; but we do not fear that absolute power over property would produce this result, and we see many ways in which it would be beneficial.

Again, it is worthy of notice that among the ways in which purchase-money may be spent are, section 25, the erection of (10) "cottages for labourers, farm servants, and artisans, employed on the settled land or not; (11) farm-houses, offices and out-buildings, and other buildings for farm purposes; (12) saw-mills, scutch-mills, and other mills, water-wheels, engine-houses, and kilns; (13) reservoirs, tanks, conduits, water-courses, pipes, wells, ponds, shafts, dams, weirs, sluices, and other works and machinery for supply and distribution of water, for agricultural, manufacturing, or other purposes, or for domestic or other consumption; (14) tramways, railways, canals, docks; (15) markets and market-places; (16) streets, roads, paths, squares, gardens, or other open spaces for the use, gratuitously or on payment, of the public or of individuals, or for dedication to the public, the same being necessary or proper in connexion with the conversion of land into building land; (17) sewers, drains, &c." All these passages, however, must, we conceive, be read in connexion with the first part of the section, which states that the works are to be "for the benefit of settled land." Now, as this money must be laid out by the trustees, or else by the court, we fear the Act will not have so wide or so beneficial an effect as if the tenant for life himself had the power to dispose of the money raised by the sale of property, which sale, be it observed, he, and he alone, is the sole person to effect. Surely if the Legislature gives a man power to sell the property, it should allow him to deal with its proceeds, especially as the way in which they are to be disposed of is so carefully specified. But even as it is, we look forward to this Act giving rise to considerable structural activity on many properties which, but for its passing, would not have seen such operations. The Act, therefore, may, from various points of view, be considered as one of great importance, and should its operation be as beneficial, as we may reasonably hope it will, the present Parliament will have passed at least one statute of practical and lasting utility.

#### VERONA.

THE Municipal Council of Verona, a city which has suffered most terribly from the inundations of the present autumn, has offered three prizes, one of 6,000 lire and two of 3,000 lire, for the best project for protecting the city against floods in future. Intending competitors are invited to apply to the Municipality of Verona for further particulars.

**The Exchange at Berlin.**—The enlargement of the old Exchange, according to the plans of the late architect, Herr Hitzig, has given the city of Berlin an exchange-room, which (according to the *Cologne Gazette*) is more than twice the size of any hall in other cities devoted to similar purposes, the superficial area being upwards of 28,000 square feet. It is intended to accommodate 3,000 persons, and will be lighted by 6,000 gas jets.

## APHRODITE.

Now that the globe is so frequently circumnavigated, and no seas are unknown except those where first hinds the waves, and forbids the mariner to pass, the Mediterranean appears but as one of its smaller water expanses; but time was when in ancient story the sovereignty of Neptune was bounded by the Pillars of Hercules.

In early classic fable this blue salt lake was the sole ocean of the Greek. Others were presented to him only through dim report, and even the Euxine was shrouded in mystery. The Mediterranean, the mid-earth sea, was the only recognised kingdom of his god Poseidon, and it was in its azure waves that the nymphs, sirens, and tritons of the Greek were born to his teeming imagination, and sported and sang and blew their shells. This was the sea of Hesiod and of Homer, and it was from its waves that Aphrodite rose.

In Italy she was afterwards entitled Venus, may be from the universal adoration paid her; but in Greece her chief name was Aphrodite, from Aphros, the sea foam from which she arose. She was thus pictured by Apelles, emerging from the ocean and wringing her tresses in the sunshine on her ivory shoulder. Several parts of the Mediterranean disputed the honour of her birth, but mostly the poets concur in fixing it near the new British acquisition, the island of Cyprus. It was thither, they narrate, that she was borne by her attendant Tritons, and on its shores that she first lauded, whence her title of Cyprian. It was also near the town of Paphos in that island where the admiring inhabitants first welcomed her with divine honours, and erected a temple to her as a divinity, whence her epithet of Paphian; and, in return, it is said that she bestowed on the women of that lovely island, which was her first home, especial gifts of beauty and fascination.

This classic legend, full as it is of poetry and grace, may be acknowledged to be equalled in charm by its Eastern version, as set forth in the Oriental mythology, according to which the Hindoo Venus rose from the profoundest depths of the Indian Ocean, enclosed in the bud of a sacred lotus, which, expanding when it reached the surface of the sea, set free its lovely burden to bowtow the world. Afterwards she became the consort of Vishnu, and is entitled Lakshmi, the universal mother. It is, however, round the shores of the Mediterranean that our most cherished ancient legends will ever linger, and among them those which tell us of the birth of the Goddess of Beauty.

Our classical dictionaries record a good many Aphrodites. Plato mentions two; Cicero speaks of four; and, even when she is described as one, a number of names are assigned to her. Of these she received a great variety in sound and signification, as Cytherea, Dione, Libertina, Apturea, Telessigama, Myrtea (because the myrtle was dedicated to her), Phloemeis (as the Goddess of Mirth), Basilea (as the Queen of Love), Thalassia (as born of the sea), and Analyomene (as in the act of rising from it, as portrayed by Apelles in his celebrated picture). Many other titles also did this most worshipped of all the female classic divinities receive, not unfrequently from the names of the localities where she was especially adored, and these were very many. Thus scarcely was there an island in the waters of the Ægean, or a city on its shores, but possessed temples erected to her honour, and cherished pictures and statues portraying her imagined graces. The genius of Zeuxis, Apelles, and the pictorial talent generally of the time and Greek race were enlisted in her service, and thus she came to be presented to an admiring world in a great variety of actions and characters. Alas! that all these marvels of the painter's art have perished, and that they should live but in the records of the past, which bear, however, full testimony to their surpassing excellence, and the admiration with which they were regarded in their day.

It is not quite so sad a story in respect to her representations in the sister art, but yet one sufficiently grievous, inasmuch as those statues of her which appear to have been most celebrated seem to have met a similar fate; and, notably, the most celebrated of them all, namely, the Venus of Cnidus, by Praxiteles, for the sole purpose of beholding which, ancient authors inform us that many a voyage was made to that city, up to the time when the statue was

removed by the Romans, who were such wholesale despoilers of other cities, of works of art wherewith to enrich their own capital. In the course of time she was again removed to Constantinople, where she eventually perished in the conflagration of the Lausan Palace.

Several statues are extant for which it has been claimed that they more or less resemble her, but none of these can be faithful, as none are ended with the style of form and pose peculiar to Praxiteles, nor with the attractive graces attributed by Lucian, Pliny, and other ancient writers to the Aphrodite of Cnidus, which is asserted to have been not only the most beautiful figure by that sculptor, but also the most beautiful statue in the world.

So far as this, however, we may gather from what is extant on record, that the attitude adopted for her by the sculptor was as standing before the shepherd Paris, on Mount Ida, on the occasion of his celebrated judgment when she bore away from the other goddesses the prize for beauty. Also that she had appropriately such a winning expression that Lucian says that every beholder flattered himself that she smiled upon himself. She was so placed in the small temple in which she stood that she could be seen all round, and every view appears to have been beautiful. The marble in which she was wrought was Parian, of peculiar brilliancy, which may be inferred by the term Lucian applies to it of *Lampyrotos*. She rested chiefly on the left foot, the right leg being slightly bent, and her head inclined to look over her right shoulder. In her right hand she held a pendent drapery, which fell in folds over a vase at her feet, and her left hand was in the position of that of the Medicæan Venus at Florence. There has been some uncertainty as to which hand held the drapery, and which was before the figure, from the circumstance that, in an ancient coin of Cnidus, of which there is an example in the British Museum, occurs a representation of this Venus, in which its position is reversed. This was a variation, however, not uncommon in olden times, arising from the working of the die out of which the coin was struck, the same way as the object copied, which, of course, was reversed in the impression.

Art may well lament a loss such as this, of the most admired by the ancient world of all the statues of the Celestial Queen of Beauty which the Greek chisel produced. As regret, however, will not recombine her ashes, we must find relief in trying to imagine her charms superior to those of all other versions, and thus reconstruct her ideal by referring on the beauties of those which remain to us.

It is not, however, always easy to distinguish the true representations of Venus from those which were only modified portraits, or which represent other divinities of the heathen mythology. A statue of any beautiful woman is very apt to receive the name of a Venus, although such may not have been the intention of the artist; and as an example of the uncertainty of subject which attaches to some ancient works of this class may be cited the grand statue in the Louvre which goes by the name of the Venus of Melos. Noble and excellent as she is, there is nothing special in her attitude or character to assure us that she represents an Aphrodite, or that she may not rather embody the Genius of Victory or the Nereid of the island where she was found. Truth to say, the features of the face, when they are examined critically, are not very elevated in character, and are much surpassed in refinement and beauty by those of some other ancient female statues and busts. The arms of this magnificent figure, which bears much resemblance in style to the Phidian type, are lost, and authorities are undecided as to what they were occupied with; but we are unwilling to suppose, as has been suggested, that they originally held a mirror in which she was regarding herself. A worthier sentiment would be more welcome, as more in accordance with her noble form, which is that of a heroine rather than of a coquette.

The Venus of Naples, entitled *Callipygos*, discovered in the ruins of the golden house of Nero, is an instance of uncertainty in another direction. She possesses none of the poetic air of the Goddess of the Sea, but rather has the semblance of the full-length portrait of a pretty model, and the story associated with her favours this idea. It thus runs: a model visiting a sculptor's studio to exhibit herself for employment in her vocation, and the artist not appearing to appreciate her beauties to her

satisfaction, she prepares to depart in some indignation. Her dress, however, in this action not being fully arranged, she turns round hastily to complete its disposition, looking over her shoulder, which she does with such grace that the sculptor eagerly exclaimed, "Stay, I beseech you, I must sculpture you as you are!" And the marble statue was the result. This incident, with the scene of the classic sculptor's studio, might afford a good subject for a picture.

In the Museo Nazionale at Naples, which contains the above statue, is also the beautiful torso and head of another Venus which possesses far more the aspect of a goddess. It is usually called Psyche, from the fragment at the back, of what has been suggested to have been a wing, but which is probably drapery. The scale and style of this work are too large for it to be a Psyche, who is usually represented as somewhat *petite* in both respects. It is more probably a Venus, and is of a very grand type; also instead of its having been upright in position, as the torso is usually posed, the statue of which it was a part was more probably in degree recumbent and supine, as in part indicated by the forms of the bosom, which are somewhat spread out and flattened, as is the effect of this position in Nature. It is one of the noblest and most "blue blood" examples of the Classic Aphrodite which exist.

The gem of Florence, the Venus de Medicis, always demands attention. Assuredly she has the air of being fully conscious of her claim to admiration, and appears to have posed herself for the purpose; every limb is adjusted so as to be graceful. She affects to be desirous to hide her charms, at the same time she solicits not to conceal them too much. The marked expression of this beautiful figure is the invitation to admire; and for some centuries the world has responded to her summons. Indeed, no tour of Italy could be complete without a visit to her shrine.

On the practice of the art of female sculpture in modern times she has had great influence. Partly because her composition is so decorative and her play of line so agreeable, she has had perhaps, almost too much sway in the dictation of female statueque form; especially in regard to the hands and arms, which are not the originals, but derive their authority from having been adopted as restorations. Her head is not too small, although this is a frequent remark, as that is simply the result of the whole figure being on a somewhat reduced scale so as to enhance delicacy, but, on the other hand, the feet are really larger than is requisite for strength, as they are actually of greater substance than those of some living women of greater stature and perfect activity. The record on her plinth that she was the work of Cleomenes, has been the subject of doubtful comment, for which there appears little reason. But it does not follow that she was made by the Cleomenes who was the sculptor of the Muses. On the contrary, she was probably an Athenian who dwelt in Rome. Her face is rather Roman than Greek, and she does not possess the simplicity of the Greek art of the shores of the Ægean, while yet she has the beauty of execution which belongs to its craft and hand.

Among the well-known antique statues of this class are two familiar and very pleasing ones in crouching attitudes, entitled *Venusnes*, but which might be more appropriately called *Nymphs*, as the nature of their actions, although graceful, deprives them of dignity.

There are so many statues which have received the title of Venus that anything approaching to a complete list might be tedious to any one but a devout statistician, and allusion will only be made to a few more. Of the alternative draped statue of Venus, which was presented to the people of Cos to choose from at the same time with the nude one of Cnidus, there are several aspirants to the honour of being copies, but none of them, unfortunately for their pretensions, bear the stamp of Praxiteles, either in style of form or free arrangement of draperies, and the reverse of a coin of Faustina which has been regarded as representing its attitude possesses but little authority in this respect. In fact, we know even less about her than of her rival sister. Both appeared enveloped in a cloud of mystery, and the only fact which seems distinct is that the committee of art at Cos made a wrong choice, an error not without parallel in our days.

Among the Venuses of note are to be reckoned

the Venus of Capua, the Venus of Arles, and the Venus Genetrix, and several marine Venuses, so-called from the objects associated with them; also several with Cupids, and others with vases and draperies. Most of these are called Greek, and probably were produced by Greek hands in Italy. The ancient Roman despised the chisel and the brush, and thought only the sword and lance worthy of his warlike hands. The metal style even, with which he wrote on his waxen tablets, may perhaps have found the more favour with him, as he could, on occasion, use it as a weapon, the stiletto of modern Italy.

Our own British Museum possesses several Venuses, among which two are especially charming. One of these is much less than life-size; the other considerably exceeds it. The smaller Venus is in an upright position, and is so extremely simple and innocent in its expression that it might personify an Eve but for the adjunct of a little drapery at the lower part of the figure, which helps to support it. The larger figure is the Dione, or the Townley Venus, which was found at Ostia, and, of all the statues of Venus which are now extant, none may be said to have greater claims on us for admiration. While different in style, she fully equals the Venus of Melos of the Louvre, and her face is of a much more elevated character. In some respects the two statues coincide, namely, in being somewhat larger than life-size, and having the lower half of the figure draped, which also is in a separate block of marble. In other respects their character is widely different, the Venus of our Museum possessing more intellectual and refined character, and she of the Louvre more of the development of physical contour. They are, however, a worthy pair, and the two nations to whom they now respectively belong may well prize and cherish them. The bust of the Townley Venus is deficient in one point of detail in a somewhat peculiar manner, which, however, is not perceptible when she rests on an elevated pedestal, which, no doubt, she was originally intended to occupy, as she does in the Museum, as the divinity of a shrine. It may be remarked of her that, of all the antique statues of Venus extant, there is no one that is more perfectly a lady in expression, dignity, and grace.

With all her great wealth, and profusion in dispensing it in magnificent luxury, the period of Imperial Rome did not equal the three most energetic and prolific centuries of Greek art in the production of noble statues and groups. In addition, however, to those which she took from Greece and her isles and the shores of the Egean Sea, she added many by the hands of Greeks transported to Italy for the purpose. The time was to come, however, when she, in her turn, had to feel the dismay of defeat; when, eventually, wave after wave of revolution and ruin destroyed or concealed, among other riches, the larger portion of her sculptural treasures.

After the lapse, however, of some centuries another era dawned over Italy, and the seeds of beauty which had been originally derived from another land having been scattered so lavishly in her soil, Fine Art again arose from it as if it had been its native home. At the period of the Renaissance she took up her thread anew, and began afresh to weave her magic web. Fostered by the occasional discovery of some of the finest works of ancient time among the ruins of palaces and temples, and even from beneath the soil of the chief Italian cities and their neighbourhoods, Sculpture arose again, took up her chisel, and, favoured by her anciently-worked and ready quarries of beautiful marble, began again enthusiastically to fashion the human form, and seek to rival the grace, dignity, and beauty of the examples of the ancient statues which were being discovered around day by day in excavations prosecuted by newly-aroused enthusiasm.

True sculpture, which was born in Greece, after her sleep of ages, awoke to find a fresh and modern home in Italy, especially in Rome, which she has of late centuries made especially her residence, and where accordingly by far the larger portion of really worthy poetic modern sculpture has been born and bred, and the production of Aphrodites has not been neglected. With but few exceptions each modern sculptor of note who has made Rome his residence, has considered his career incomplete without stamping in marble his own idea of the Goddess of Beauty. And but that these remarks are restricted to the Aphrodites of ancient time, it

would be a pleasing task to add a view of those which have been produced in modern days.

No one of these sculptors, however, seems to have applied his talents to reconstruct, from such data as we possess, the acknowledged most beautiful Aphrodite of ancient time, of which we have spoken, the marble statue of the Venus of Cnidos. It appears, nevertheless, to be a most attractive subject, on which a sculptor might lavish all the resources of his experience, research, invention, and taste, and that it would be also infinitely interesting archeologically. We, therefore, venture to suggest the idea as one worthy to be entertained by the greatest masters of the art; at the same time adding that it might not be an unfit subject for a prize to excite the ambition of students. In the case of the former they probably would not be content without their work being of full size; while in that of students, the scale might be judiciously restricted to half-life size, or even less.

What we know of the style and flowing contours of human form adopted by Praxiteles has received a most valuable accession in the statue of Hermes, lately discovered at Olympia, which, although not female, is, at any rate, divine and youthful. In the lovely and startlingly fresh arrangement of drapery also which is pendent by its side, admirable hints might be gathered for the folds of that drapery which we know hung from the right hand of the Venus of Cnidos over the vase at her feet. That the subject of the restoration of this gem of ancient sculpture seems not hitherto to have been attempted in modern days appears to afford no valid reason why it should not be so; but rather, on the other hand, offers the advantage of a fresh and untrodden field for the enthusiasm, ardour, study, and ability of our modern sculptors.

#### THE PROPOSED LONGFELLOW MEMORIAL.

The first meeting of the Longfellow Memorial Committee was held last week at the Marlborough Rooms, Regent-street, under the presidency of Lord Bray. The Chairman stated that it had been proposed that the memorial should consist of a bust to be placed in Westminster Abbey, and that the object of the meeting was to select a special committee to whom the carrying out of the project should be entrusted. Canon Rowsell moved the appointment of such a committee, "for securing the presentation of a bust of the late Henry Wadsworth Longfellow, to be placed in Poets' Corner, Westminster Abbey," on the ground that the whole English-speaking race owed a deep debt of gratitude to Longfellow, and that the good feeling between England and America would be deepened by the proposed memorial. He observed that there would probably be a larger fund raised than would be required for the bust, and that it was proposed with the balance to found scholarships. Earl Granville, in seconding the resolution, spoke eloquently, though with a little pardonable exaggeration, of the importance of the contributions of the departed poet to the poetical literature of the English language. Sir J. Arlathnot supported the resolution, and it was agreed to. Mr. Borsani, M.P., moved the appointment of an executive committee, for which he submitted a list of seventy-five names (far too large a number, we may observe, for practical working, if any large proportion of them were to take active part in the business); which resolution, with the support of the Rev. Paxton Hood and Mr. Rossetti, was also carried. Mr. G. Godwin moved, and Sir J. Bennett seconded, a resolution (also carried), that as soon as possible a public meeting should be held at the Lyceum Theatre, which Mr. Irving would lend for the purpose, in support of the object. It was stated that 5000 had already been subscribed by about one-third of the members of the committee.

We must protest against the very mistaken course which, as it appears to us, the committee are pursuing in regard to this matter. In the first place, Westminster Abbey is the mausoleum of distinguished Englishmen, not of distinguished Americans, however endeared to us. In the second place, the diversion of part (perhaps it will turn out to be a large part) of the subscribed funds towards founding scholarships is a most unsatisfactory way of founding a memorial to a poet whose chief place and popularity in this country is owing to the fact, not that he was as great a poet as some others

of our time, nor that he was a learned student of modern literature, but that he wrote what came home in a remarkable degree to the hearts and sympathies of the people at large; and his monument should be a memorial placed in a public situation, and of such a nature as to give opportunity for the production of a work of art on a large scale, such as would appeal, as long as it endured, to the observation of every one, and be a worthy reminder of the man whose thoughts and expressive have passed into household words in so many thousands of English families, and will become to a certain extent proverbial among us. Now, a scholarship is no memorial at all in a public sense. It might be a fitting kind of memorial if we regarded Longfellow mainly as a student of literature; but it is not in that capacity that we honour him; it is as a poet. When a committee met at Oxford the other day to propose a memorial to the late Professor Balfour, it was fittingly urged by Professor Huxley that the endowment of students in the same field of research would be the best memorial to his name; because his was essentially a University and student's reputation. But Longfellow's was not a student's reputation, but the reputation of a popular poet (using the term in no disparaging sense), and his monument should be before the eyes of the people. A scholarship is no monument at all in a popular sense. Most persons forget all about it, and of those who may read an occasional announcement that some one has gained the "Longfellow Scholarship," probably nine out of ten will be under the impression that it was a scholarship founded by Longfellow himself. Moreover, the memorial to a poet who has created beautiful ideas and embodied them in beautiful form should be such as will afford the opportunity for a beautiful creation in art of another class; not a mere portrait bust, even if Westminster Abbey were the right place for that, which, as we have said, it is not.

This opinion cannot be new to those members of the general committee who were present at the meeting referred to, inasmuch as they were strongly urged by one member of the committee who spoke on the occasion, and appeared to have the approval of a considerable number of those present. It is, however, one of the peculiarities of the manner in which these kind of discussions get represented in the daily press, that the young men who are entrusted with the duty of reporting the proceedings can form no judgment as to the point or importance of any suggestion which goes out of the beaten track, or which is not included in the remarks of the one or two titled speakers upon whom they generally bestow all their attention. It would be impossible for any one to conclude from the reports in the daily papers that there was any dissentient opinion expressed at the meeting, or that everybody was not entirely unanimous in adherence to the very questionable proposal on which we have commented. It seems hardly reasonable, however, to expect accuracy in reporting a discussion from newspapers which cannot even give correctly the well-known name of the poet in whose honour the meeting was convened, and describe him as "Henry Wordsworth Longfellow"!

**The Growth of American Trees.**—Some notes have been published on the native trees of the lower Wabash and White River Valleys, the result of long and careful observations, made by Mr. Robert Ridgway and other naturalists, upon the forest growth of Southern Indiana and Illinois. The region described is of special interest. Nearly all the largest and most valuable broad-leaved trees are there found associated together, and in a single square mile of woods seventy-five species of trees, nearly all of the first class, were tabulated, being nearly as many as grow on the whole European continent. By actual measurement thirty-four species were found to occasionally exceed 100 ft. in height, while seventeen others, although not measured, were apparently at least 100 ft. high. The tallest specimen measured a tulip-tree, was 190 ft. in height, and individuals of ten other species exceeded 150 ft. Mr. Ridgway states that the numerous small prairies, which were common in the Wabash basin at the time of its first settlement, have been transformed into woodland, and the area of the forest has greatly increased of late years.

A VISIT TO THE BRIGHTON RAILWAY WORKS.

CAN you imagine London without cabs, policemen, or railways, and that travellers about sixty years ago are said to have made their wills before starting on a journey? The most imaginative of the rising generation can scarcely picture such a state of London life, and yet there are men and women living who can remember it.

In 1819, when Thomas Gray, the first promoter of railways, published a work on this subject, he was considered little better than a madman, but his name, associated with those of Joseph Sanders and William Edward Pease, should always be respected; for these were the men who first promulgated and brought the subject commercially home to the people of their time.

Mail-coaches sixty years back took seventeen hours, and forty-six years ago fourteen hours, to run from Derby to London, the distance being about 130 miles. The *outside* fare was 30s., and the *inside* fare, 52s. The charge for sending letters at that time was 10l. each, that for forwarding silk goods by boat on the canal was 5s. per cwt.; other goods from 3s. 6d. to 5s., according to their value. To send goods of all sorts by Pickford's vans, or by coach, the charge was 14s. per cwt.

I have been favoured with the following copy of fare-bill published then, as follows:—

Name of Coach.	Time taken in running to London.	Outside fare.		Inside fare.			
		Hours.	£. s. d.	£. s. d.	£. s. d.		
Mail Coach ...	14	1	10	0	2	12	0
Defiance .....	16	1	6	0	2	10	0
Telegraph .....							
Times .....							

In addition to these charges, passengers had to stop for refreshments three times, and on each occasion there was a change of coachmen and guards, who had all to be fed. The distance may now be travelled by railway in three hours, the fares being—for third-class, about 10s. 7d., and for first-class, 17s.

When railways were first opened, the passengers were so few that the booking-clerk used to enter their names down and the stations to which they were going, and very often delayed a train several minutes to see if any more customers showed up. They very often had to travel in open trucks like a lot of cattle stowed together, and third-class passengers were looked on more as a nuisance than as a source of profit; travellers were carefully locked in the carriages, and a second latch near the bottom of the door was placed so that they could not reach it, except by hooking it up with a walking-stick or umbrella-handle. It seemed to be generally understood at that time that none but railway men dare to open any carriage-door.

Having often heard these seemingly strange things related, we thought a visit to a modern railway works would, by way of contrast, be both amusing and instructive, and through the kindness of Mr. W. Stroudley, Locomotive Engineer of the Brighton Railway Works, we lately had permission to inspect the various workshops under his charge, which are situated on the eastern side of the railway, and adjoining the Brighton terminus.

At the present time there are 1,400 men and boys employed in the various departments, which consist of carriage and wagon shops, saw-mill, wheel turnery, smithy, general turnery, erecting-shop, boiler-shop, brass foundry, copper-smiths' and timmen's shops, ironfoundry, painters' and trimmers' shops, &c. We may say, generally, that throughout the whole of the works care has been taken that the employees engaged in the company's service shall have plenty of light, air-space, and lime-whitened walls, the shops being both spacious and lofty, and a cheerfulness seems to pervade the workshops throughout, as the visitor passes from one department to another. On inquiring from Mr. Traugmar, who acted as our guide, we learned that the company have in use 2,880 carriages for passenger traffic, 7,237 wagons, &c., for goods

traffic, and 401 locomotives. The miles run by passenger trains the last half-year were upwards of 3,000,000, and by passenger and goods train combined 3,814,882, the number of miles now open for traffic being 413.

The advantage of inspecting a large railway works, like the London, Brighton, and South Coast, is that one can see every part of an engine or carriage in detail, and afterwards put together in complete form. Take a railway coach, for instance: a scantling list is first made out from the general drawing of that particular vehicle, and the various timbers are cut in the saw-mill to the sizes given. The pieces are then taken into the machine-shop and planed, tenoned, mortised, and drilled, and then conveyed to the underframe-shop, or the body-shop, as the case may be, for the workmen to fit together, the ironwork being supplied from the smithy,—bolts and coach-screws from the stores,—which has been made up from a working list supplied from the drawing-office, as described in the case of timber scantlings.

All headstocks and cross-bars in a carriage under-frame are of oak wood. Diagonals and sole or side bars are of pitch pine, the sole bars having a quarter-inch wrought-iron fitch-plate on their outer surface, firmly bolted at intervals throughout its length.

The buffer-rods, side-chains, and corner-knees are of wrought iron, buffing and bearing springs of steel, the former consisting of twenty plates 3 in. wide and 5-16ths in. thick, with exception of back-plate, which is 3-8ths in. thick, and supported in their working position by cradle-timbers, framed into cross-bearers, so that the ends of the springs come into contact with shoes at the ends of the buffer-rods, to take the thrust of the latter when brought into play.

The outside panels, door-stiles, &c., of carriage bodies are of mahogany, the flooring, seat-frames, &c., are of pitch pine, and in all first-class compartments the divisional partitions are veneered over with a layer of very clear and white sycamore wood, which has the effect of lightening the interiors of compartments, thereby giving them a cheerful appearance to the traveller. To assist the springs, and give elasticity to the carriage when running, the ends and sides are bedded on Attock & Spencer's patent recessed india-rubber blocks, fitted between the top of sole bars and bottom of carriage bodies.

Brake blocks are mostly made of black poplar, imported from France; other soft stringy wood is also used, such as willow, &c. The continuous brakes used on this line are all Westinghouse's patent. Carriage-axes are made of double-flanged iron, supplied by the Monkbridge Ironworks.

The carriage-wheels are made with tyres of Cammell's crackle steel, with treads 2 in. thick, and 3 ft. 6 in. diameter over the treads or the surface running on the rails of the permanent way.

The bodies of most passenger-stock wheels are filled in with teak wood blocks, secured to tyres by a method known as "Stroudley's patent." Each pair of carriage-wheels of this make, after being fixed on their axles, are balanced by being placed between two steel bars, perfectly horizontal; the wheels, having their axle for a centre, are turned round, and if one part of such wheels is heavier than the corresponding part on the opposite side of the wheel, the heavier part naturally falls lower, and the defect is thus detected and balanced. Very few of the travelling public are aware that railway wheels are balanced to such a nicety; this is done to secure uniformity in running.

In the wagon-building shop are made wagons for carrying loads of six, eight, or ten tons, as may be required, high and low sided, and also covered goods-wagons. All under-frames are built up of American oak, and the bodies are of pitch pine, all cut out of logs and trees on the premises.

The saw-mill presents a scene of great activity to the visitor; here we viewed frame saws, circular saws, and hand saws, all fully occupied in cutting up the various scantlings for the carriage and wagon builders. An oval spoke-turning lathe, made by Robinson & Co., of Rochdale, is a great labour-saving machine compared with the old method of hand-working.

In the smithy all fires used are made with small coke, no coal being used in this department. All heavy forgings are wrought by steam hammers, the largest of which strikes a

blow up to twenty tons, or as low as a few pounds, at the will of the hammer-man, who regulates it by a handle worked with one hand.

The weight of a passenger locomotive engine without tank varies from 34 tons to 38 tons, and a goods tank-engine in working order about 40 tons. The cost of locomotive-engines may be roughly taken at 2,200l. each. The pistons are of solid brass, with two cast-iron split rings to make them steam-tight when working inside cylinders. All crank-axles are of cast steel, other axles wrought-iron. The nave, spokes, and rim of an engine-wheel form one piece when welded together, and have a steel tyre forced on by hydraulic pressure equal to 60 tons, after the body of the wheel has been completed. The ordinary diameter of a driving-wheel on this railway is 6 ft. 6 in., but the company have one engine with 6 ft. 9 in., and two others with 7-ft. driving-wheels. Most of the engine axle-boxes are made of Vickers's cast steel.

At the time of our visit some 1-in. steel-plate tank-engine frames were being cut from the solid plates. Six plates were firmly bolted to the table of a planing-machine, the tool cutting the metal in a straight or curved line as required, so that these plates being cut at one time would be exact duplicates of each other.

To explain how true, and to what exactitude, the various parts of engine works are fitted, we were shown steam-chests, cylinder-covers, &c., faced so perfectly that by simply putting a little boiled oil over their surfaces, and bolting the two faced parts together they make a steam-tight joint.

Boiler shells are made of ½-in. Lowmoor iron plates, and all engine-holders are "lagged" or covered with 1-in. deal boarding; this serves to keep the heat in, and is again covered with ½-in. wrought-iron lagging-plates, which are painted over on completion of the engine; if it were not for the 1-in. lagging-boards the paint on the outside of the engine-holder would be burned off the first run the locomotive made. All engines and tenders are cleaned every night, before they are sent out to work again.

The company run specially-constructed Pullman limited express trains, lighted by electricity, twice daily each way, performing the journey in one hour and fifteen minutes; but this time is to be shortened by an engine now being built of their D 3 class express type, which has 6-ft. 6-in. driving and leading wheels, 20-in. cylinders, and is calculated to take twenty coaches from Brighton to London Bridge (52½ miles) in one hour.

The company do not make all their own engines and carriages. Messrs. Neilson & Co., of Glasgow, lately completed an order for thirty-four locomotives for this railway. All engines have painted on their weather-boards the name of driver and distance run since first built, thus giving a record of the mileage made by each locomotive, and this is added to each time the engine enters the shops for repair. An engine and tank in the painters' shop, just finished, looked quite in holiday costume, Scotch green being the predominant colour, panelled with black and scarlet lines.

In the copper and tin smiths' shop are made the sheet-iron lamp protectors, for fixing outside the roofs of carriages, tin paint-pots, and cans. Here is beaten out of sheet charcoal iron, steam domes for boilers, and in this shop is executed the tinning over, by dipping in molten tin, of wheels, &c., for Stroudley & Rusbridge's patent electric communication between passenger and driver.

In the foundry, which is both large and lofty, they can cast up to 10 tons weight. Some of the works we saw, such as a double-cylinder casting, were as perfect works as anything of the kind could be, and moulders and pattern-makers evidently do not get as much credit for their skilled labour as they deserve. In order to turn out the castings with as smooth a face as possible, the moulds are coated over with a mixture of ground charcoal and water, which enables the patterns to leave the sand freely. A powerful hand-crane is fixed there, for lifting the heavy ladles with their contents over the various moulds. As much as 10 tons of molten iron is frequently lifted in this manner, and swung about with the greatest ease. The sand of the neighbourhood not being fit for foundry purposes, they have to obtain it from Charlton.

In the brass-foundry is seen the process of mixing and melting the metal for axle-bearings, &c. The different quantities are all weighed before being put into the crucibles: by this

means a uniformity for various castings can always be kept.

The brass-turnery is kept distinct from the other shops, and all borings, turnings, or drillings are collected, and after cleansing from all extraneous matter, are melted over again for further use. The magnet is especially used for removing any iron filings, &c., as, on being forced into the brass and moved about, all refuse iron adheres to the magnet, and so can easily be separated.

In this shop is shown a model of Stronley's Patent Speed Indicator, which enables the driver to see the speed in miles at which his engine is travelling.

The paint shop, situated on the western side of the line, clear away from the dust and dirt of the other workshops, is a new building about one-eighth of a mile long, with a light iron-trussed roof, and has lines of rails laid down to accommodate upwards of 370 railway coaches, besides space for repairing and painting light parcels-carts. At the end of this shop is the trimming department, where the process of picking horse-hair is soon. The n-twisting of the ropes or plaits as delivered by the merchants is done by a machine. In this place all the damask blinds are made, and fitted at bottom with Peters & Co.'s patent leather fringes for windows and doors of carriages, which blinds are mounted on coiled spring-rollers, and are self-acting.

To keep in thorough working order a line of railway as large as the Brighton and South Coast, a good supply of materials must necessarily be kept in stock; and in the yards adjoining the workshops are large numbers of new tires as delivered by the makers, and Vickers's steel cranks, iron-plates, timbers, &c., the value of which is determined at every stock-taking.

Perhaps one of the most pleasant features in the whole work is the reading-room and library attached, for the workmen employed; it is capable of holding between four and five hundred persons. Most of the technical papers, all the London daily newspapers, besides weekly periodicals, are taken in. At one end of the reading-room is a stage which enables the members to get up theatrical and other entertainments, and here performances are often given to raise a small fund for widows or orphans of deceased workmen.

The inspection of the works occupied us upwards of four hours, and at the close we were introduced to Mr. Jeffries, who kindly, on behalf of Mr. Stronley, furnished us with much statistical information. On leaving the locomotive shops we looked over the extensions now in progress, including the new station roof, &c.

The contractors for this work are Messrs. Kirk & Randall, who have lately completed the erection of the Avenue Theatre, and will be remembered as the firm that carried out the extension to Margate pier. The iron-work being used is from the Patent Shaft and Axletree Company, of Wednesbury. The improvements consist in building a roof over the whole of the station, formed by two large spans of 112 ft. each, and a small one on the eastern side of about 46 ft. span. The two large spans will be erected for a distance of about 600 ft. in length, while the eastern and smaller span will only extend 420 ft.; of this, 334 ft. from the entrance and southern end of the station will be covered by a 46 ft. span, and the remaining 86 ft. by a roof 35 ft. wide. There are four rows of columns, two running the entire length of 600 ft., each row numbering twenty-four columns, in most cases being from 27 ft. to 30 ft. apart. The large spans are formed of four channel irons, the two lower ones forming a curve, and the upper two meeting at an obtuse angle of 240 degrees, the whole being strengthened and connected by diagonal struts. The height from the platform level to the apex of the roof is 58 ft. The columns are 26 ft. high. A louvre will be provided at the top of the roof for ventilation, of a span of 20 ft.; the height from the platform level to the top of this louvre is 62 ft. For 32 ft. from the louvre down towards the gutter the roof will be glazed, the remaining portion being covered with board and zinc. The roof on the western side is supported for about half the distance down on columns, the other portion being carried by a wall. The smaller span (46 ft.) is in proportion similarly constructed.

On the eastern side of the station new refreshment-rooms, cloak-room, parcels office, station-master's office, lavatories, &c., are to be built, the whole covering an area of 120 ft. by 40 ft., the old offices and premises being con-

verted into waiting-rooms, &c. A wooden ornamental screen, glazed at the top, is to be placed on the eastern side between the columns, to shield the building from the weather. This will effectually hide a dull and monotonous wall on this side, the view of which has hitherto formed rather an eyesore. At the northern end of the 46 ft. span,—on the eastern side, by the side of the 35 ft. wide roof,—there will be a line of rails, the platform to which will be covered by a verandah.

In addition to these extensive improvements in the interior of the station, the entrance in front is to be entirely covered, this being a space of 246 ft. by about 70 ft. This covering is formed by six bays, the principals of which are constructed with T-irons, and are provided with louvres and glazing at the top. Also a lean-to roof, of 17 ft. span, is to be built on the eastern side, and at the front a glazed lean-to will be formed from the building to the centre of the columns, a distance of 8 ft.

F. J. BANCROFT.

#### STRAIGHTENING A CHIMNEY.

We find an interesting account of straightening a chimney, 330 ft. high, in the *Wochenschrift* of the Society of German Engineers, from which we take the following particulars. The chimney in question, erected in 1880-81 for the blending-roasting furnace of the Liebohoffnung zinc-works at Antonienhütte, Silesia, for carrying off sulphurous gases, soon after its completion began to curve in consequence of strong and continuous gales from the south-east. The work of straightening it was at once confided to two experienced chimney builders, Herron H. Hohmann and F. Ebeling, of Bernburg. It should be premised that the chimney was begun in July, 1880, the base, 53 ft. high and 24 ft. square, being finished before the setting-in of winter, when operations had to be suspended. The work was resumed in the following spring, and actively pushed forward, so that by the end of September, 1881, the chimney was completed. Its principal dimensions are:—

Base, 24 ft. square	...	...	...	ft. 53			
Octagonal portion	...	...	...	19			
Round shaft	Diameter at base {	Exterior, 19 ft.	Interior, 5 ft. 6 in.	267			
					Diameter at top {	Exterior, 9 ft.	Interior, 6 ft. 6 in.

Total height above ground ..... ft. 339

The base is of ordinary Dutch brick laid in lime mortar; the round shaft, 267 ft. high, of stone and lime-mortar, to which was added cement in the upper portion of the chimney, from 40 ft. below the summit. The thickness of the walls of the round shaft, constructed in thirteen steps each about 20 ft. high, is at the lower portion 6 ft. 6 in., at the top 1 ft. 3 in.

The completed chimney was first used in October, 1881. Soon after it began to show a strong curvature towards the north-west, beginning at the foot of the round shaft and running up towards the top in the form approaching a parabola. The curvature was ascribed, as stated, to the continuous south-east gales prevailing at the time, to which the brickwork, which was not yet sufficiently set, had to give. As the foundation of the chimney went down to the solid rock, its curvature could not be attributed to the giving way of the foundation. Subsequent measurements proved, moreover, that the square base had not moved out of the perpendicular, but had remained undisturbed. It was determined by measurements that the summit of the chimney had gradually bent over nearly 10 ft. towards the north-west, so that a plumb-line suspended from the centre of the periphery of the inclined chimney-top was hanging outside the base of the chimney. The two builders named above undertook to remedy this dangerous state of matters, and began work on July 1 of this year. The chimney was first mounted by means of their special scaffolding to a height of 130 ft., where the first cutting was to be made. At this portion, the outer diameter of the chimney is 16 ft., the inner 6 ft. 6 in.; the thickness of the wall was consequently 4 ft. 9 in. The weight of the portion of the chimney-shaft above this first cutting, of a height of 191 ft., is about 670 tons. Calculations and measurements with zinc-gauges had shown that a perpendicular from the calculated centre of gravity of the portion of the chimney above the cutting to a height of 191 ft. upon the section plane inter-

sected the latter about 3.29 in. inside the periphery of the width in the clear of 6 ft. 6 in. diameter, at a distance of about 5 ft. from the outer edge of the brickwork.

For safety's sake, and because the mortar had not sufficiently set, owing to the chimney being taken in use directly after completion, six strong wrought-iron rings, with spring locks, were placed round the chimney above and below the cutting. The latter was begun while the roasting furnace was continued at full work, and had proceeded so far by July 21st that the projection of the centre of gravity upon the section had been undercut to the extent of 34 in. On one side, however, a piece of the brickwork had remained, and could not be cut away by the saw, because the latter began already to get too much jammed in the cutting. This piece of brickwork prevented the upper part of the chimney going back, as it hindered the intended turning at the end of the cutting. The consequence was that, the other side of the chimney being undercut, the upper part turned back in a slanting direction towards the south-east by only about 6½ in., and a crack running perpendicularly upwards began to show itself in the brickwork at the height of the centre of gravity. In this little satisfactory state the chimney was on July 21st; decisive action became necessary, and it was resolved to at once blow out the furnace. The next day the chimney was mounted from the inside as far as the cutting, and the piece of brickwork left as above mentioned so successfully removed that on the same day, in the evening, the undercut part of the chimney turned back the thickness of the cutting. But as this was not sufficient, a second cutting was made at a height of 184 ft., and a third at a height of 223 ft., the whole work of straightening the chimney being completed by August 1st. Although it was found impossible to make the chimney perfectly perpendicular, because the bend began lower than it was possible, with due regard to safety, to make the first cutting, the result of the operations was considered satisfactory. The stability of the chimney had been ensured, and its outward appearance almost restored to the normal.

#### SCHOOL CONSTRUCTION IN GERMANY.

A MEDICAL commission has lately been engaged in framing a series of regulations for the higher schools in Alsace. It is remarked in the report which has just been issued, that if the air in schoolrooms is not to contain more than the proportion of carbonic acid usually allowed (one-tenth per cent.); there must be arrangements made for the conveyance of 2,120 cubic feet of air per hour for each scholar. This can only be done by thorough ventilation, and by the rooms being made as spacious as circumstances will permit.

It is stated that the theory is erroneous which sometimes prevails, that the windows of a schoolroom should only be on one side, and so arranged that the light falls upon the left of the pupils when they are at work. It is remarked that although applicable to the case of high and relatively narrow rooms, it is not usually possible by this method to obtain sufficient light. When, however, this arrangement is employed, the intermediate portions of the wall between the windows should not be more than three-quarters the width of the windows. The bays should be sloped, and the distance from the wall with windows to the opposite wall should not exceed the height of the windows by more than 3 ft., or at most, 5 ft. Thus, according to this principle, it is only relatively small class-rooms which will admit of this system of arranging the windows.

For most school-rooms the admission of light from two opposite sides is, therefore, a matter of necessity. In order to exclude the less useful and monotonous light from below, it is suggested that the windows should not come to a less distance than about 3 ft. from the floor. The window-frame, or any portion of the work which throws a shadow, must take up as little room as possible. With a view of utilising the light reflected from the walls and ceiling, a light-blue paint for the walls, and white-washed ceilings, are recommended. Windows at the end of the room where the master's desk is, are condemned, as in that case the pupils have the light facing them. Light from behind can sometimes be judiciously employed, though its use is not recommended. Suitable arrangements require to be made for regulating by

blinds the admission of light, and it is recommended that care should be taken to have any walls in the immediate proximity of the windows painted a dark colour, as white walls in such a position are very trying to the sight of the pupils.

Artificial light, it is suggested, should be employed without hesitation when the day becomes dark from fog, &c., as working with an insufficient supply of daylight is far more trying to the sight than the use of gas. A sufficient number of gas-jets should be provided, according to the size of the school-room, and preference is given to cylindrical burners as producing a more steady light than is obtainable by means of slit burners. Metal reflectors, lacquered above in a dark colour, and white beneath, are recommended. Globes of ground glass absorb too much light, and do not sufficiently illuminate the desks, although the room as a whole is better lighted by them. There should be gas-lights above and in front of the master's desk, and the other lights should, it is said, be in two rows over the seats of the scholars at a height of at least 3 feet.

#### THE ROYAL PALACE AT DRESDEN.

The rebuilding of the magnificent hall-room in this palace is nearly terminated, and it is rumoured that the Emperor of Germany will be present at the inaugural festivities. In the restoration of the hall-room the frescoes by Professor Bendemann are preserved, and the improved arrangement of the windows allows of the beauties of this pictorial decoration being more easily appreciated. Some of the mural ornamentation has been restored by Herr Diethe. The late Herr Krüger solved in an efficient manner the difficulty which attended the heightening of the room, by the removal of the servants' apartments which formerly were over it, and in its new form it extends through no less than three stories of the palace; the ventilation of the room gaining materially by this change.

A gallery for the accommodation of an orchestra has been erected; but the local press comments upon the fact that the want of a gallery for spectators is still unprovided for, although such a feature could easily have been comprised in the plans for the restoration. The fundamental colours in the decoration are cream and gold; this delicate combination allowing the magnificent architecture of the room to be displayed with full effect.

#### THE BRUNSWICK HYGIENIC CONGRESS.

This assembly, which met on the 20th ult., under the presidency of Professor Reklam, of Leipzig, had for its object the prevention of atmospheric impurities, as well as the remedying of such evils as arise from the pollution of rivers and of the ground by sewage and other matter of a noxious character. The opening paper, read by the president, dealt with the general question of sanitary legislation. After reviewing the manner in which the subject is practically treated in various European countries, he gave some valuable and interesting details of the system now in force in Servia, which country he considers a model in this respect. A funded capital of 250,000*l.* exists, the interest of which is devoted to the advancement of sanitary reform. This income, together with the tax especially levied for sanitary purposes, forms a total annual sum of 46,000*l.* available for the purposes contemplated by sanitary legislation.

The discussion on the practical value of the various systems of disposing of sewage matter was remarkable for the objections urged against the water-drainage system, the application of which to the city of Berlin will have cost, when the works in progress are completed, no less a sum than 4,340,000*l.* After making allowance for interest, sinking fund, cost of maintenance, &c., the Berlin drainage costs about 6*s.* 10*d.* per annum per head of the population. Professor Müller's paper was not unanimously approved, as far as his attack on the Berlin drainage system was concerned. Herr Claus argued that the sanitary condition of Berlin had not deteriorated of late years, but had, if anything, improved.

Dr. Gerson, of Hamburg, reported that the adoption of the same system of drainage as that of Berlin, had in his own city been pro-

ductive of no had results. He agreed, however, with the opinion expressed at an earlier stage of the discussion by Dr. Blasius, of Brunswick, that local circumstances were in most cases of a nature to regulate the plan of disposal of sewage to be adopted, and considered that the question was hardly as yet ripe for definite treatment. Captain Liernur, of Amsterdam, reported that the municipal authorities of his city had officially expressed their approval of his system, which entails a cost of only 7*d.* per annum per head of population.

Importance was given to the subject of turf, as a deodorising agent, and as producing, after being used for this purpose, an efficient fertiliser. Herr Knauff, of Berlin, reported the details of a process invented by Dr. Petri for the chemical and mechanical purification of sewage by the agency of turf straw.

Dr. Gerson afterwards called attention to his system of filtration, which he stated costs only one-fifth of the expense of ordinary sand-filtration.

The question of the pollution of rivers by factories was treated with special reference to the local industries of Brunswick.

Before the assemblage finally broke up, a joint inspection was made of the Polytechnic and other public buildings of the city.

#### IN THE CITY BY THE SEA.

THROUGH all contending "fors and againsts," Brighton, backed by Dr. Richardson's reports, continues victoriously to hold her own as the brightest, gayest, as well as one of the healthiest resorts during the too often gruesome months of October and November. The winds that rage and storm and sweep with violence over moor and mountain,—that strew our streets with the debris of insecure houses,—that toss at their pleasure the stately ships onward bound,—here but drive the clouds away, leaving the heavens an "unclouded blue," and sending the waves, a mass of foam, dashing and leaping to the shore; while a battle even with an east wind, rich with iodine, stirs our blood like it did the Vikings of old. The rain has been trying lately. Yet once over, the streets dry so rapidly that a rush out is again made by the health-seeking crowd. The two months of October and November are essentially idle months here. People who have drifted apart for months have a friendly chat once more,—so near to London, and yet so far from its turmoil and unrest; and a slight resemblance to Nico gives a *quasi* air of Constantinianism to this bright little city by the sea. Theatres, concerts, bazars, all invite, and all amuse. But the feature of the season has naturally been the welcome given to the 4th Dragons (Royal Irish) by the town and visitors on Friday in last week, and which many of us remained to see. The day before wind and rain had it all their own way, so that when the morning dawned bright, clear, and sunny,—a day to dream of,—great was the exultation. The town was gay with Venetian masts, banners, floral decorations, and devices. The regiment paraded on horseback through the town in the morning, and marched on foot in their Egyptian costumes to the banquet given at the Dome in the afternoon. The regiment, now under the command of Lieut. Colonel Shaw Bellier, dates from the reign of James II., by whom it was raised to aid in suppressing the Duke of Monmouth's rebellion, and for nearly two hundred years it has done good service to the State at home and abroad: in France, in Flanders, at the storming of Badajoz, and in the Crimea. Balaclava and Sevastopol are inscribed on its colours, and Cairo and Tel-el-Kebir are now added to its roll of fame. The welcome may have been less noisy than it would have been amongst a rougher set, but it was none the less heartfelt and touching, and we cannot but think, however divergent the opinions as to the war, or the policy of the war, may have been or may be, one glance at the worn and pallid faces of some of the men made one forget for the moment the thought of the rush and the roar of the battle,—colours flying, victory in view,—and think only of the hardships our men have gone through on the sandy wastes of the desert, under the scorching noonday sun,—under the misty starlit heaven, weary often with hunger,—parched with thirst, or, barded still, chained with wounds and racked with pain, to the dull monotony of a hospital bed, where the heroism to "suffer and be strong" becomes more heroic still. The

thought that they have borne all this must make for the nonce Conservative and Liberal lay party spirit aside, and join as one in the welcome we give all who have helped to make, we trust, peace more lasting, and who are popular, not from the love of bloodshed and warfare, but because we feel when our Empire is in question the soldier knows but three things,—England, Honour, and Duty. CARLEON.

#### ANCIENT GREEK PAINTING.

PROFESSOR C. T. NEWTON, C.B., on the 3rd inst. delivered at University College the first of a course of lectures on ancient Greek painting. The lecturer observed that the main epochs in the history of ancient sculpture had an intimate connexion with the general history of the Greeks, but we could not get a clear idea of the history of ancient sculpture without tracing out, so far as our imperfect knowledge permits, the characteristics and successive stages of ancient painting. Between these twin sister arts there had been in all times, and especially in Greek antiquity, a close sympathy and a reciprocal influence. In the case of painting the extant monuments were few and far between, but we might learn much by the careful study of the mural paintings from the buried Campanian cities, Pompeii, Herculaneum, and those found in the tombs near Rome and Etruria. The paintings on Greek vases would enable us to trace the history of what is called ceramic art from B.C. 600 for nearly five centuries onwards. After noticing the traditions preserved by Pliny and others as to the earliest painters, the lecturer passed on to the period after the Persian war. Polygnotos of Thasos was the earliest Greek painter of celebrity. He flourished B.C. 480-400. At Athens he decorated with paintings the portico called the Stoa Poikile, the Temple of the Dioscuri, the Temple of Theseus, and the Pinakothek on the Akropolis. At Delphi he painted on the walls of the building called Lesche two celebrated pictures, the "Taking of Troy" and the "Descent of Ulysses into Hades." All these were mural paintings; the subjects were partly mythical, partly historical. Thus in the Stoa Poikile were represented the taking of Troy, the battle of Theseus with the Amazons, the battle of Marathon. In the Temple of Theseus came the battle of the Lapiths and Centaurs, and the battle of the Amazons again. In the other two Athenian temples he treated mythological subjects. These great public works were executed during the administration of Kimon, to whom Polygnotos stood in the same relation as Phidias did to Perikles, the successor of Kimon. The paintings in the Stoa Poikile were executed by Polygnotos gratuitously, for which service the Athenians rewarded him with the freedom of their city. His greatest and probably his earliest works were the two pictures in the Lesche at Delphi. Of these there was a very full description in Pausanias. The building called Lesche was thought to have been of elliptical form, with a colonnade on either side, separated by a wall in the middle, and to have been about 90 ft. in length. The figures were probably life-size. According to the list given by Pausanias, there were upwards of seventy in each of the two pictures. In that representing the taking of Troy, Polygnotos had brought together many incidents described in the Cyclic epics. Menelaos, Agamemnon, Ulysses, Nestor, Neoptolemos, Antenor, Helen, Andromache, Cassandra, and many other figures, with which the Homeric poems have made us familiar, all appeared united in one skillful composition, arranged in groups. The other picture, the descent of Ulysses into Hades to interrogate Teiresias, might be called a pictorial epic of Hades. On one side was the entrance, indicated by Chiron's boat crossing the Acheron, and the evocation of Teiresias by Ulysses, besides the punishment of Tityos and other wicked men. On the other side were Tantalos and Sisyphos. Between these scenes on the flanks were various groups of heroes and heroines from the Trojan and other legends. From the remarks of ancient critics it might be inferred that the genius of Polygnotos, like that of Giotto, was far in advance of his technical skill. Aristotle called him the most ethical of painters, and recommended the young artist to study his works in preference to those of his contemporary Pauson, who was ignobly realistic, or those of Zenxis, who had great technical merit, but was deficient in spiritual conception.

The course will comprise four more lectures, as follows:—November 17, "Greek Painters from B.C. 460 to accession of Alexander the Great, B.C. 336,—Apollodoros, Zeuxis, Parrhasios, Pamphilos, Aristides"; November 24, "Greek Painters from Age of Alexander to Augustan Age,—Apelles, Protogenes, Theon"; December 1, "Pictures on Greek Fictive Vases"; December 15, "Mural Paintings from Pompeii, Herculaneum, and other ancient Sites."

#### ST. PANCRAS WORKHOUSE.

For several years past the question of additional accommodation at the St. Pancras Workhouse, which had been asked for by the Local Government Board, has received the attention of the successive Boards of Guardians of that parish, but as the views of the two authorities differed as to how this should be accomplished, the matter has drifted on without any decision being arrived at, the Local Government Board urging that additional buildings on a new site were necessary, whilst the Guardians, on the other hand, contended that the buildings on the present open site, some five acres in extent, could be remodelled to meet the requirements of the parish for many years to come.

In April of last year a new Board of Guardians was elected, with Mr. Commissioner Kerr as chairman, when it was determined to have the question settled, as a large sum was being lost annually to the parish from the Common Poor Fund, inasmuch as a far greater number of inmates were in the house than had been certified for by the Local Government Board.

The Guardians, anxious to meet the difficulty, though not desirous of incurring the expense of a second workhouse away from the parish, after much consideration of the question, proposed a compromise to the Local Government Board, viz., to add to the area of the present site by purchasing the adjoining properties, comprising Cook's-terrace, &c., thus adding materially to the area of the site, and having the effect of almost entirely surrounding the present site by open space.

The Local Government Board perceiving the great advantages of the additional area, and being also desirous of reciprocating the concession made by the Guardians, consented, under certain conditions, to the proposal which had been made to them. Consequently, in March last the Guardians selected five architects to compete for the appointment of architect, the conditions of the competition providing that each competitor should send in two schemes, one to show the whole number,—about 2,000,—on the existing site, and the other to include the area of Cook's-terrace, which would necessitate the demolition of less of the old buildings, six weeks being allowed for preparing the plans. The several designs and reports were referred to Mr. Arthur Cates to report upon, the result being that the Guardians selected the drawings of Scheme B, sent in by Mr. H. J. Bridgman, A.R.I.B.A., estimated to cost 57,475*l.*, Scheme A being estimated at 72,262*l.*, including the entire reconstruction of the drainage. We illustrate this week the ground-plan and view of Scheme B. The arrangement adopted preserves intact all the modern buildings on the site, also the original workhouse block in front erected in 1809, since which time additions have from time to time been made without due regard to the ultimate requirements of the parish or fully utilising the great advantages of the site, which is bounded on the east and south by the St. Pancras Gardens and the railways, and by wide roads on the other sides. The existing buildings on the south side, which are to be removed, stretch in parallel lines along the frontages, whilst the new blocks will be placed at right angles to the boundary to permit the sun and air to have free access to the interior of the site, the number provided for being 2,000, classified in the various blocks, men on one side and women on the other.

The probationary wards are placed at the entrance to the workhouse, and provide for 40 of each sex, with complete day and dormitory accommodation; of these, isolated wards are provided for each sex. The main block will be altered and slightly added to for baths, lavatories, water-closets, &c., whilst one wing will be removed. The chief offices will be located here,—the master, assistant master, matron, chaplain, &c. 225 able-bodied men and women are provided for, 20 married couples, and a part of the aged and infirm, who can during the day get about and go to the general dining-rooms.

Various improvements have been made to this block, which stretches across the front of the site, but with due regard to the fact that it is an old two-storied, though fairly substantial, building, erected in 1809,—in fact, the original workhouse,—and it is quite probable not many years hence it may have to give place to other buildings, in order that the site may be used to greater advantage.

The remainder of the aged and infirm, making a total of 615, are placed in blocks 33 and 41, which include all the necessary day and night accommodation.

The list of references will show the appropriation of the various parts of the building.

The Cook's-terrace block, which does not appear on the plan, but is shown on the left-hand side of the view, forms an important part of this scheme. The instructions stated that this area should be utilised for the chronic, infirm, or bedridden inmates of the workhouse, and that the medical officer and the head nurse should be accommodated there. The competition plans provided for 384 of each sex on five floors, with ambulance lifts in the staircases, the wards being 100 ft. long by 40 ft. wide, on either side of two central staircases, back to back, for men and women respectively, with bay windows overlooking the St. Pancras Gardens. This arrangement, however, is to be altered,—as will probably be some other parts of the general scheme,—and all of one class are to be placed there, with only one staircase, separate kitchen accommodation being provided for them.

We shall probably give further illustrations of this block as it is intended to be erected, and which we understand is the first portion of the work that will be proceeded with.

The thermodynamic stoves and hot water will be adopted for heating the large wards. The ventilating throughout has been carefully studied, provision being made for the admission of warm fresh air, and for carrying off the products of combustion. The drainage of the entire workhouse will be reconstructed in an efficient manner.

All the various baths, lavatories, and water-closets are provided, the latter in all cases built out with intervening lobbies.

Safety from fire will be sought for as far as possible, both by rendering the various blocks practically fireproof inexpensively, and by providing the necessary fire apparatus throughout.

Airing spaces divided off with covered sheds and seats are provided for the different sections, and every requisite provided to make it a completely classified and efficient workhouse.

#### PROPOSED MUNICIPAL BUILDINGS, GLASGOW.

We have before now described briefly the design, by Mr. W. Young, for the Glasgow Municipal Buildings, selected for execution as the result of the competition. We now give the principal elevation, which is before George-square, and add some additional particulars. The central part forms the approach to the quadrangle, over which is the Council-chamber, expressed by coupled Corinthian columns, backed by pilasters, and surmounted by an upper story, also formed of Corinthian columns, crowned by a pediment. This pediment has 60 ft. of frontage, and the apex is 96 ft. above the level of George-square, while on either side of the pediment rise two belfry towers, 18 ft. or 20 ft. in height. Immediately below the Council-chamber is the entrance to the quadrangle and the main staircases leading to the floors above. The quadrangle is approached by a spacious loggia, having three wide archways, and forming a striking feature in the interior of the structure. The central archway, being intended for carriages, rises to a height of 25 ft., and it is 12 ft. in width. Two side doorways, 17 ft. high, and similar in style, form accesses to the main staircases. Above the central floor, occupied by the Council-chamber, are the upper and saloon stories, lighted from the roof. The two under stories of this, as well as the other fronts, are treated as a basement, with rustic stonework, relieved with coupled Ionic columns and pilasters, between which the windows are placed. Behind the central pediment rises the grand tower to a height of 190 ft., and surmounting the apex of the pediment to a height of 96 ft. At its base, which is about 35 ft. square, and for about 20 ft. above the apex, the treatment is plain rustic masonry, without

openings. Overhead are other two stages formed of Ionic pillars, above which rises a circular colonnade of Ionic pillars. The colonnade is about 14 ft. in diameter, and is surmounted by an elongated stone dome. At the base of the dome the effect is enriched, and the tower is made to graduate into the colonnade and dome by the introduction of statuary. The central front projects some 7 ft. or 8 ft. beyond the line of the building, and between it and the wings on either side is a recess forming a screen. The wings, which, like the central front, also project beyond the screen, terminate with towers rising some 48 ft. above the front balustrade.

It may be stated that all round the block of buildings the third floor is architecturally emphasised. In the George-street front the council-chamber is thus specialised, and in George-street the banqueting-hall is placed on the third floor, with double rows of massive, Corinthian pillars supporting an entablature surmounted by a balustrade. Here, as in the other fronts, the wings are formed by a repetition of the tower front in George-square, and are in every way similarly treated as to projection and detail. In the John-street elevation the Dean of Guild Court forms the leading feature, placed as it is on the third floor. Architecturally it corresponds with George-square, although the details are of a simpler character. The Cochrane-street front has a doorway or carriage entrance, 22 ft. high and 10 ft. wide.

The leading features of the whole design may be said to consist in the handsome treatment of the third floor all round, and in the two under stories forming a massive basement, broken by Ionic pillars and surmounted by a bold continuous line of cornice, a similar line of unbroken cornice being carried over the windows of the third or principal floor. The appearance of the building is relieved from all sense of flatness by the treatment of the centre and wings in the several fronts, and this feeling is further conveyed by the author having caused the upper floor all round to recede some 7 ft. or 8 ft. from the line of the lower stories. This effect is obtained by the columnar formation of the principal floor. Considerable care has been taken with the quadrangle fronts, which form a most interesting architectural feature of the building. The general treatment is in strict harmony with that of the street elevations, the base being Ionic surmounted by Corinthian pillars. As to the internal arrangements, two spacious staircases lead to the Council-chamber and the banqueting-hall. The latter is a noble apartment, 103 ft. by 54 ft., having a circular ceiling 50 ft. high. In connexion with it there are three elegant reception saloons, which, with four saloons of a similar class on the fourth floor, will afford ample accommodation for social gatherings of the citizens, &c. The general decorative treatment of the banqueting-hall and staircase is in harmony with the leading design, the Corinthian details being repeated.

#### Nos. 88 & 89, PICCADILLY.

These buildings have been erected on the site of Nos. 88 & 89, Piccadilly, and Nos. 1 & 2, Half Moon-street. The ground-floor is arranged for shops (with store-rooms under) next Piccadilly, with private entrance and one set of residential chambers next Half Moon-street. The first, second, and third floors are arranged as residential chambers; each set containing three rooms with water-closet and lavatory. The basement and fourth floor provide accommodation for housekeeper and staff of servants. The fronts are faced with red bricks, with Doulton's stone dressings.

The work has been executed by Messrs. Langmead & Way, builders, of Gray's-inn-road, under the superintendence of Mr. D. Cubitt Nichols, of 3, Howard-street, Strand.

**Llandudno.**—A set of oak choir-stalls have just been placed in Holy Trinity Church, by subscription. The front desks are carried out with richly-cut mouldings and carved striae, with an arrangement of sunk quatrefoils separated by hutsresses dividing the desks into panels. The work has been carried out by Messrs. Jones & Willis, of Birmingham and London.

BUILDERS' BENEVOLENT INSTITUTION.  
ANNUAL DINNER.

THE thirty-fifth anniversary festival of the Builders' Benevolent Institution was held at the Freemasons' Tavern on the 2nd inst., the president, Mr. J. T. Chappell, in the chair. There was a large attendance of the friends of the Institution, and financially the anniversary is the most successful which the Institution has yet seen.

The usual loyal and patriotic toasts were duly proposed and honoured, Major Brutton, formerly of the Royal Marines, replying on behalf of the "Army and Navy," and referring with gratification to the distinguished part which his old corps, in common with other regiments, had taken in the recent Egyptian campaign. Captain Bird responded for the "Reserve Forces" in appropriate terms.

The Chairman, in proposing the toast of the evening, "The Builders' Benevolent Institution," observed that such an institution was eminently necessary in the building trade, for there were few trades in which so many difficulties had to be encountered, and so many risks incurred, as in the conduct of a builder's or contractor's business. The Institution, founded in 1847 by the late Mr. Coxens, had been the means of alleviating the wants of a great many deserving though unfortunate members of the building trade. He had had the pleasure of receiving a very pleasing letter from Mr. Yeo, one of the founders of the Institution, probably now the only survivor of those who met, in 1847, at the King Alfred Tavern, Lisson-grove, to discuss the best means of setting on foot such a charity. Mr. Yeo, he was happy to state, was still an annual subscriber to the funds of the Institution. The Institution dispensed its aid in what was perhaps the best and most acceptable way to the recipients, viz., in granting annuities to old and decayed members of the trade and their widows. While these annuities were not large, they were yet sufficient to enable the recipients to live with their friends and relatives without being burdens to them. At the same time, the receipt of pensions or annuities apart from residence in an almshouse did not proclaim to all the world that the recipients (many of whom once occupied good positions in life) were objects of charity. The pensions were formerly 25*l.* for men and 20*l.* for women, but of late years they had been considerably augmented, and now stood at 30*l.* for men and 27*l.* for women. Of deceased pensioners, there were 134, and there were now 26 male and 29 female pensioners on the funds of the Institution. The aggregate sum paid in pensions last year was 1,797*l.*, and when he mentioned that the funded capital of the Institution only brought an income of 643*l.* per annum, it would be seen how largely dependent the Institution was upon subscriptions and donations. The ages of the pensioners averaged about 70 years, and it was worthy of mention that on the death of a male pensioner, his widow, provided she was not less than 60 years old, continued to receive the pension given to her husband. At the present time, there were three vacancies on the list of pensioners, and for these three vacancies there were six candidates,—five men and one woman. With regard to the necessity of increasing the donations and annual subscriptions, he could not help referring,—indeed, he did so with great satisfaction,—to the great amount of good which resulted from the aid last year rendered by Mr. George Godwin,—the acceptance of whose offer and compliance with the conditions on which it was made resulting in the fact that last year the income of the Institution was greater than it had ever been. On the occasion of the last anniversary dinner, the then President, Mr. George Burt, offered, on behalf of his firm, to give a donation of 100 guineas to the funds of the charity this year if his successor could prevail upon nine other firms to contribute a like amount each. Now, he (the Chairman) on becoming President, felt that acceptance of Mr. Burt's offer was a very large undertaking, but he determined to do all he could to claim the fulfilment of Mr. Burt's promise, especially as that gentleman was kind enough to modify the condition of his gift so that it might be claimed if he (the Chairman) succeeded in obtaining 900 guineas for the funds of the Institution in a larger number of smaller donations instead of nine of 100 guineas each. He was glad to say that he had succeeded fairly well

in his object, but, however large might be the aggregate of the donations obtained on this and on similar occasions, he hoped that the annual subscriptions would be increased in number. The Institution was one which was eminently worthy of the liberal and systematic support of the members of the building trade, for many of those who were now prosperous did not know how soon the day of adversity might dawn upon them. While fervently hoping that no one present on that occasion would ever be compelled to claim the aid of the Institution, he earnestly called upon them, each and all, to help the charity to the utmost of their ability.

The toast was enthusiastically received, and the secretary, Major Brutton, proceeded to read the subscription-lists. The Chairman's list presented the handsome total of 1,246*l.* 3*s.*, and other donations received by him subsequently to the dinner make the total of his list 1,277*l.* 18*s.* The Chairman's list included a donation by himself of 105*l.*, a donation of 105*l.* by Mr. (Ex-Shoriff) George Burt, and a donation of 105*l.* by Messrs. Lucas Brothers. Other subscription-lists brought up the grand total to 1,071*l.* 3*s.*, an amount unprecedentedly large.

Mr. George Burt, in proposing the health of "The Chairman," said that for nearly twenty years he had known Mr. Chappell, of whose ability and judgment he entertained the highest opinion. Mr. Chappell's energy and perseverance were sufficiently testified to by the result which had been announced of his labours on behalf of the Institution. To these qualities he owed the eminent position to which he had attained and the esteem in which he was held by all who knew him.

Mr. Chappell, in replying, said that, like Mr. Burt, he claimed to be a practical man, and, like him, had worked his way up from the lowest round of the ladder. His experience told him that unless a man had a thoroughly practical knowledge of the business he could not succeed as a builder in these days of keen competition. He was very strongly disposed to think that builders' tenders at the present time were too often sent in with little regard for what were only fair prices for the work which they represented. Instead of tenders being what, he ventured to think, they ought to be, viz., estimates for work at a fair value, they seemed to be based upon conditions more suggestive of those of horse-racing than of anything else. Having due regard for the facilities that some men might have over others for the execution of a particular work, both in stock and in the personnel of their staff, he was bound to say that he could come to no other conclusion than that which he had stated. He had no doubt that this condition of things was largely due to the badness of trade which had been experienced of late years, and from the laudable desire of those who had a large number of deserving men on their permanent staff to find employment for them rather than dismiss them. While it was only right that they should show such consideration for their *employés*, it was obvious that if carried too far it would be ruinous.

Mr. Blyth, in proposing "The Vice-Presidents and Trustees," coupled with the name of Mr. Thomas Stirling, referred to the great services done to the Institution by a recent President, Mr. Thomas F. Rider.

Mr. Stirling briefly replied. Mr. Colls proposed the health of the Treasurer, Mr. George Plucknett, J.P., and spoke of the valuable services rendered by that gentleman to the Institution during the thirty years since he had held the position of treasurer.

Mr. Plucknett, in replying, dwelt upon the necessity of obtaining a larger number of annual subscribers to the funds of the Institution, so as to render the prosperity of the Institution less dependent upon donations, which fluctuated in amount. He did not think that the number of subscribers to the Institution was at all commensurate to the number of builders in the metropolis. There were in London upwards of 2,000 master builders or builders' merchants, and within a circle of ten miles round London there were probably double that number. But the Institution only had about 700 subscribers. He trusted to see this number largely augmented, for in all such institutions the annual subscriptions should be the mainstay.

Mr. Stephen Phillips proposed "The Architects and Surveyors," coupled with the names of Mr. Harrison and Mr. W. B. Brown, who briefly acknowledged the compliment.

The concluding toast was "The Committee and Stewards," proposed by Mr. Dove, and responded to by Mr. T. G. Smith.

## THE DERBY ART GALLERY.

ON Saturday last there were great rejoicings in Derby, the occasion being the formal opening of a new Art Gallery (the gift of Mr. M. T. Bass, M.P., and erected at a cost of 3,000*l.*), the opening of the Arboretum to the public free for ever, and the turning of the first sod of the little Chester recreation-grounds.

The new Art Gallery is described in the *Derbyshire Advertiser* as being in a mixed style of architecture, partaking somewhat of the Tudor and Gothic styles, with, perhaps, a dash of the Caroline Classic, such as may be seen in the window-heads of the County Hall. The two main rooms, 60 ft. by 24 ft., are of fair height and proportion. The lower apartment is lighted mainly by side windows in the Strand, and, in part, by a fanlight in the adjoining annexe. The upper room is lighted entirely from the ceiling, and is therefore admirably adapted for showing pictures and sculpture. Considering the nature of the site, the utmost advantage has been taken of the floor space. The structure has been well and substantially built, and is admirably fitted for the purposes to which it will be devoted. The entrance-hall and lobby, necessarily confined, lead to a light and easy staircase of Hopton stone, which affords ample facilities for approaching the upper story, where a connexion has also been made with the Bass Free Library and Museum. The heating and arrangement of gas are well spoken of. An even temperature is preserved throughout the building, and the gas jets are so placed that every case can be accurately inspected by night as well as by day. The ventilation, perhaps, is not quite so perfect, but the experience of crowded occasions will best prove if the ingress of fresh air is adequate for the purpose. The elevation of the building has been so designed as to render possible the continuation, at some future period, of a similar frontage to the Free Library premises, which would then form one of the most striking features in the Strand, and he a decided ornament to this part of the town. The architect of the new building is Mr. J. Somes Story, who has carried the work out under the superintendence of Sir Philip Canliffe Owen, K.C.B.

The Gallery is now occupied by pictures and specimens of industrial art, mostly contributed from South Kensington Museum.

THE NORFOLK AND NORWICH  
ARCHÆOLOGICAL SOCIETY.

THE members of this society recently visited several buildings and places of interest in the City of Norwich and its neighbourhood. Among the places visited was Magdalen Chapel Hospital and Fair, where Mr. T. G. Bayfield read some notes and made some interesting observations. St. Augustine's Church was next visited. Mr. Phipson read notes upon it; the Rev. C. R. Manning undertaking a similar duty with respect to St. Mary's Coslany Church, and also as to St. Michael Coslany, on the brasses in which church the Rev. W. F. Creeny contributed a paper. Mr. E. Boardman read a paper on St. George's Colegate Church, and the Rev. C. R. Manning was again the *cicerone* at St. Clement's; while Dr. Bensly read a paper on "The Old Meeting House." Opposite St. Mary's Church is a general shop and beer-house, known as the Rosemary Tavern, the interior of which the company inspected. Ascending to the upper floor, the antiquaries found themselves in a subdivided apartment, retaining characteristic work in arches and woodwork of the fourteenth or fifteenth century. Little or nothing is known of these portions of an old building so curiously preserved amid much that is modern, save that it is called "Pilgrims' Hall." It may have been a sort of hospice for the accommodation of some of the many pilgrims who, in the Middle Ages, visited Norwich or passed through it to offer their devotions at the famous Norfolk shrines. Down Dial-yard, opposite the Church of St. Michael at Coslany, are relics of another grand mansion, whose building and grounds extending to the river may be traced, and the ruins of a demolished rookery swept down to make way for an extension of Messrs. Inghard's premises. Some of the fine carvings and panellings from this old mansion were a few

years ago purchased by Lord Stafford. Here lived one of the merchant princes of Norwich in the sixteenth century, William Coo, mercer. William Ramsay, mayor, conveyed this property to William Coo, in 1508, together with other edifices, appurtenances, and a garden described as a "bitmay" from being surrounded with ditches of a "bitmay" from the heaps of rubbish which Messrs. Bullard have not yet cleared away stand a few fragments of the mansion and edifices. A large handsome mullioned window, set in thick walls, lights what is now a workshop, but which, two or three centuries ago, was no doubt a fine hall, and out of it the inmates looked upon the "bitmay" stretching down to the river side. Mr. Fitch pointed out amid the rubbish the sites of the old ditches, now vaulted over. When Sir Francis Gawdy, Chief Justice of the Common Pleas, possessed it in Queen Elizabeth's days, the garden had ceased to be a "bitmay," and had water only on three sides. In 1640 the widow Herring owned the mansion and grounds. These facts concerning the mansion were contributed by Dr. Bensly and Mr. Fitch upon the authority of the late Mr. Harrod. Subsequently another fine old mansion was noticed, that of Henry Bacon, merchant, in Cologate-street, opposite Bridge-street. Bacon's initials, merchant's mark, and the date 1566 are carved on the spandrel of the doorway of the substantial flint-built mansion.

#### RAFFAELLE'S STATUE.

On the 25th of March, 1883, Italy will celebrate the four-hundredth anniversary of the birthday of Raffaello Sanzio di Urbino. The citizens of Urbino have decided to honour their immortal fellow-townsmen by the erection of a statue, for which the committee have recently invited competitive designs. The prizes are to be three of the respective values of 1,500, 1,000, and 500 lire. It is intended that the statue shall be in white Carrara marble, with reliefs in bronze. The total cost is estimated at 8,000 lire. The competitors are to send in their drawings by the 25th of February, 1883, to the Raffaello Academy of Urbino. A month afterwards the designs will be exhibited to the public at large, and the decision of the jury announced.

The monument is to be erected on the great square in front of the Palazzo Ducale of Urbino.

#### PHOTOGRAPHIC STUDIO IN OXFORD STREET.

The name of Barraud has long been associated with photography (his famous picture of the Royal Society will be remembered by many of our readers), and now being about to make a departure from 293, Oxford-street, Mr. Barraud has provided himself with premises which will move the envy of his confrères. Externally, the upper portion of the building is carried on polished red granite piers, having foliated bronze caps supporting black marble fascias. The superstructure is composed of red Farnham brickwork, with Mansfield stone dressings, interspersed with terra-cotta and Donlon work decorations, the whole forming a pleasing facade.

The visitor enters, through a vestibule of carved oak panelling filled in with stained glass, a gallery, harmoniously enriched with a carved ceiling, charming oak mantelpiece, and screens, the most noticeable feature, however, being the staircase of various inlaid woods, embellished with carvings; this leads to the reception gallery, similar in arrangements and ornamentation to the ground floor. Here Mr. Barraud has, amongst the other conveniences which he has afforded, constructed a lift, the case of which is handsomely designed. This lift glides up and down between the first-floor to the studio (situated on the roof of the premises) with the greatest ease and smoothness, stopping itself automatically at the top and bottom of its destination, an ingenious brake apparatus having been especially devised for it. The well-known firm of Messrs. Wraygood & Co., Falmouth-road, Great Dover-street, has executed and fixed it with their usual care. Its motive power is supplied by one of the "Otto" silent gas-engines.

The studio is very convenient; it is entirely constructed of polished pitch pine and plate glass, designed in similar style to the rest of the building, and supplied with every modern convenience.

The various floors between the reception gallery and studio are used as dressing-rooms, and other apartments necessary for the efficient working of the establishment.

In all respects the arrangements appear to reflect credit on the architect, Mr. H. H. Collins, of 61, Old Broad-street, whose design has been ably carried out by the builder, Mr. Downs, of Hampton-street, Walworth-road, and by the carver, Mr. Sansom, of Kennington-road. The stained glass has been executed by Mr. Gibbs, of 397, Kingsland-road.

#### HASTINGS CASTLE.

A VERY friendly local critic writes, with reference to a late article upon Hastings Castle, that the castle does not stand upon chalk. No doubt the chalk ceases at Beachy Head, and the castle stands actually upon the Wealden formation, the middle division of which is known as "Hastings sand."

The old port, he observes, lies east, not west of the castle. The fact is that the small stream that made the port runs down west of the castle, but turns eastward before reaching the sea; at least, this seems to have been the case.

It appears also that the writer mistook the roof of St. Mary's Chapel for a gas-holder, which it is admitted to resemble. No doubt an apology is due to the chapel authorities, and it is to be hoped that the resemblance is confined to the exterior.

#### WHERE WAS THE "JOYOUS GARD" ?

In the "Morte d'Arthur" (the original edition of Caxton) frequent allusion is made to a particular stronghold, or castle, called the Joyous Gard. It is mentioned as the castle of Sir Lancelot du Lake that he had won with his own hands, and described as garished and furnished fit for a king and queen to have sojourned in it. When Sir Tristram brought La Beale Isoud from her home, Sir Lancelot placed it at their disposal, and this noble knight and "gay-be-seen" lady occupied it for some time. King Arthur visited it on more than one occasion, and it was to Joyous Gard that Sir Lancelot carried Queen Guinevere when he rescued her from death at Carlisle. When Sir Thomas Malory describes the death of Sir Lancelot (in the same original edition printed by Caxton) he mentions that he desired the Bishop of Canterbury to see that his body should be taken to Joyous Gard; and states precisely "some men say it was Anwick, and some men say it was Bamborough."

It may be impossible to determine whether it was Anwick Castle or Bamborough Castle that once bore the designation of Joyous Gard; but it cannot be otherwise than interesting to inquire which of the two is the more likely to have been the distinguished edifice in question, especially at the present day, when there is a proposal on foot to establish a hospital within the precincts of the latter. Curiously, antiquaries of a former time, from Kingston to Sir Henry Ellis, repeated from one another that Berwick Castle was the *château de la joyeuse garde*, and Bamborough was the *chastel orgueilleux* (see Ellis's "Metrical Romances"). But there appears to be no reason why we may not return to the opinion popularly entertained in Sir Thomas Malory's time, that it was either Anwick or Bamborough.

Long before the poet-laureate revived an especial interest in the proceedings of the Knights of the Round Table, there lay in the church of St. Aidan, Bamborough, a carved stone figure, always spoken of as the effigy of Sir Lancelot. It appeared to be an ordinary representation of a knight, such as was usually placed upon tombs in the days of the Plantagenets. But the associations of the place had so encrusted it as to cause it to be identified as a representation of King Arthur's most famous knight. This traditional acceptance of the association of the site may count for one piece of evidence in favour of Bamborough Castle being the Joyous Gard.

Another fact corroborative of this view is the circumstance that there is no allusion whatever in Sir Thomas Malory's version to the river that flows before the northern walls of Anwick Castle. King Arthur besieged the Joyous Gard whilst Queen Guinevere was in it, and came close below its walls; which he could not have done if there had been a river surrounding them.

Bamborough Castle is built on the top of a rock that rises so abruptly from the sea-shore as to be quite inaccessible except from the land side of it, where there is a plain such as the king is described as occupying with his forces. Thus there are two points in favour of Bamborough.

#### THE SAFETY OF LONDON THEATRES.

The Criterion.—At the meeting of the Metropolitan Board of Works on the 3rd inst., the Building Act Committee presented a report recommending that the Lord Chamberlain be informed that the Board, having regard to the peculiar circumstances surrounding the case of the Criterion Theatre, in Piccadilly, are of opinion that the theatre is entirely unfit for a place of public entertainment, and that Mr. R. Vigers, in reply to his letter, asking that the owners of the Criterion Theatre might have an opportunity of conferring with the Board as to the structural defects of the building, he informed of the decision of the Board upon the foregoing recommendation. The report went on to describe the position of the theatre, that it was not originally intended as such, and that no structural alteration that could be made would afford a sufficient means of egress in the event of a panic or alarm of fire. The report was unanimously adopted. With reference to this, Mr. Thomas Verity, the architect of the theatre, writes:—

"This theatre was opened in 1874, and at the time of its completion the Board of Works certified that it had been constructed in accordance with the provisions of the Building Act, and to the satisfaction of their district surveyor; indeed, the building could not otherwise have been opened. No alterations in its arrangements have been made since that time.

All the staircases and corridors are of fireproof construction, and no question has ever arisen as to the sufficiency of its approaches or exits. So far as I am aware, the only objection ever raised was its position, which necessitated artificial ventilation. This has been so successfully accomplished that a comparison with other theatres shows that even in this respect it is better than the majority of other houses. As to the usual risks, this theatre is entirely free from them. There are no carpenters or scoundrel painters' workshops, all doors open outwards, and every precaution is taken to insure the safety of the public. The fireproof corridors are alone sufficient to contain the whole audience.

Up to the present time the proprietors have not had the opportunity of conferring with the Board as to the possibility or desirability of making any alterations. When the matter comes before the arbitrator, I have no doubt, I shall be able to show that the Board has arrived at a judgment which will not be sustained."

Covent Garden.—The Building Act Committee further reported that they had carefully considered the question of the present arrangements for the egress of the public from, and the prevention of fire in, the Royal Italian Opera-house, Covent Garden, and the improvements which it was desirable to effect in the same under the provisions of the Act of 1878, and that they were of opinion that the following alterations of a structural character should be made by the owner, in order to remedy existing defects in the building:—That a proper proscenium-wall be built, to divide the stage from the auditorium; that such wall be carried down to the level of the foundations, and carried up to the height of 3 ft. above the highest part of the roof to which it adjoins; that a wall be built in continuation of the proscenium-wall, under the proscenium opening, such wall being carried up to the under side of the stage, and carried down to the level of the foundations, and that all openings in this wall, and in the walls dividing the dressing and other rooms, at the side of the stage, from the staircases adjoining, be closed by wrought-iron doors in wrought-iron frames, fitted without woodwork, and hung so as to shut automatically. That the floors of so much of the workshop and store-rooms in the roof of the theatre as extends over the auditorium be formed of fire-resisting materials, or covered with Drako's concrete slabs; that an additional staircase, with the necessary exits, leading directly into the street, be provided from the gallery and the amphitheatre on the south side of the house; that strong handrails be fixed on both sides of all staircases, where not already provided, and that a central double handrail be fixed to the grand staircase; that the doorways between the theatre and the Floral Hall be closed with wrought-iron doors in wrought-iron frames, fitted without woodwork, and hung so as to shut

automatically; that the doors throughout the building be made to open outwards. These and other recommendations were unanimously agreed to.

#### THE LATE MR. SIBLEY.

We mentioned last week the death of Mr. Robert Lacon Sibley, District Surveyor of Clerkenwell, and now add a few words to the short notice then given. The deceased gentleman was the oldest son of Mr. Robert Sibley, who died in 1849, having been County Surveyor of Middlesex, District Surveyor of Clerkenwell, and Surveyor to the Ironmongers' Company. Mr. Robert Sibley carried out Hanwell Asylum and numerous bridges for the county, and had an extensive practice in arbitrations, valuations, rating, and similar business. Mr. Robert Lacon Sibley entered his father's office in 1833, after studies at University College; was a good draughtsman; was admitted to the School of the Royal Academy in 1836; and showed considerable talent in architectural design.

On the death of his father, he was appointed by the magistrates of Middlesex to the District Surveyorship of Clerkenwell, under the Metropolitan Building Act. He was also elected an Associate of the Royal Institute of British Architects in 1849, and a Fellow in 1861. In his later years, however, he seldom went beyond the regular work of his appointment. About two years ago, in the course of official duty, he visited a cellar and inhaled poisoned air, which affected the blood; and though generally in sound health up to that time, tumours developed themselves, one of which broke into the wind-pipe and caused his death. The warmth and strength of his private friendships are spoken of by those who knew him long and well.

#### THE NEW BRIDGE OVER THE LEA, AND THE HACKNEY MARSHES.

THE long-aggitated bridge over the Lea in the Hackney Marshes, the necessity for which we pointed out in these pages upwards of a dozen years since, is now being proceeded with by the Hackney Board of Works. The operations, however, partake of a tentative character, as conflicting interests obtain on the common known as the Marshes. There are manor-lord claims and copyholders' rights on these common lands, and conditions are endeavoured to be exacted which the local authorities do not think they have a right to comply with in the public interest. As the Lea divides Middlesex from Essex, one pier of the bridge might be supposed to be in the latter county and the other in the former, but a portion also of the Hackney Marshes, so called, occupies the Essex bank of the Lea. At Temple Mills, near the site of the new bridge, there is an ancient mill-race, which diverges from the old course of the Lea further up the stream, and reunites with the old river again in the immediate vicinity of the new bridge. This mill-stream by many is looked upon as constituting the real border-line, and not that where the new bridge is being erected. Be the facts what they may, the Hackney authorities are building a pier on the Middlesex side of the Lea, the progress of which has been delayed by recent floods, and when this pier is finished they will proceed with the erection of the opposite pier, although some opposition is anticipated. There can be no doubt that there is a great need for the bridge, as, for long years there has been only an old and shabby timber-foot-bridge. Notwithstanding, numerous vehicles are driven this way, and men prefer fording the river, and often swimming their horses through the water, sooner than taking the long journey round by Bow to Stratford, or the equally long journey round by Clapton and Lea Bridge-road to Low Leyton. On several occasions lives have been lost in fording the river at Temple Mills. Apart from the piers, the new bridge will be an iron structure, and its completion is likely to give a fresh impetus to speculative building on either side of the Lea. The open spaces of several acres in extent which existed less than ten years ago are now covered with buildings, now known as Clapton Park. Both at Clapton and Hackney Wick nearly all the available land has been covered to the very border of the marshes, and even these hundreds of acres of commons, free to the people for recreation, and often flooded in the winter, are threatened by building speculators, who are look-

ing with wistful eyes, and are ready to commence operations if manor lords could give the word. It behoves the people to keep their eyes open in this direction, or a march will be stolen upon them under one pretence or another, and a portion of the Hackney Marshes appropriated for building land for the erection of speculative dwellings of the worst description. The character of the houses erected on the monster rubbish-shoots of Hackney Wick was described in our articles in 1873 on "Homes in Homerton and Hackney Wick," and future dwellings, if erected, would be likely to be of the same kind.

Since the above was written, a decision has been given by Mr. Commissioner Kerr in the City of London Court, having an important bearing on the question of public rights on the Hackney Marshes. The East London Waterworks Company prosecuted Mr. Jacob Base, a well-known parish contractor, the plaintiff's company seeking to recover 10*l.* damages against the defendant for the illegal deposit of rubbish on the Marshes, and also damage to a portion of the wall of the River Lea. The defendant, though first inclined to resist the company, subsequently, but not until the action was commenced, removed the rubbish, and repaired the wall to the satisfaction of the company. As it might be inferred from the case that the private rights asserted by the company and other private rights claimed from time to time by other claimants of parcels of marsh land, override the public rights, a few words of explanation are necessary. The East London Waterworks Company, through their Acts some years ago, acquired certain parcels of land along the Lea River in connexion with their service, and certain works were carried out, and, of course, their absolute property needs protection from injury. Apart from this, however, the immemorial pasturage and commonage rights remain intact, and custom and ancient usage on the part of the people constitute their rights in the marshes as a free common and recreation ground, only subject to certain restrictions at stated times of the year. It is at the same time only proper that nuisance should be put down, and in this respect both private and public claimants to rights should join issue. The local sanitary authorities have been too long negligent of their duty, and thus the fine expanse of open lands, comprising some hundreds of acres, and acting as a healthy lung to East London, was fast becoming injured by the operations of parish dustmen, brickmakers, and a low class of speculative builders. As we have said already, we will repeat again, the public will have every need to be on their guard against encroachments and the extinguishment of their public rights.

#### COMPETITIONS.

Leith.—Six architects, who were invited to send in plans for a Sailors' Home, to be erected in Leith, have accepted the invitation, and a committee has been appointed to examine and report upon the plans. Messrs. Anderson & Brown, of Edinburgh, have furnished a design in the French style, of the period of Francis I.; Mr. Hyppolyte J. Blane, Edinburgh, has adopted the Scottish Baronial style, as has also Mr. Charles S. Johnston, Edinburgh. The design of Messrs. Ireland & McLaren, of Dundee (architects of the Dundee Sailors' Home), is in the Elizabethan style; that of Mr. R. Wilson, of Edinburgh, is of French Renaissance character; and Mr. George Craig, of Leith, sends two sets of designs, Gothic in style. The estimates range from 7,000*l.* to 7,700*l.* The committee appointed to examine the plans have, after visiting similar institutions, and careful consideration, selected the plans submitted by Mr. C. S. Johnston, architect, Edinburgh, subject to certain conditions to be arranged hereafter. Mr. Johnston's design is in the Scottish Baronial style of the seventeenth century, with an elevation of four stories, having in the centre a tower with flat roof for distant outlook. The estimated cost of the building is about 7,000*l.*

Railway Bridge across the Indus at Attock.—It has been announced that the bridge across the Indus at Attock is all but completed, and that Lord Ripon, the Viceroy of India, will pay a visit to the spot when the opening ceremony is to be gone through.

#### SYDNEY, NEW SOUTH WALES.

SIR.—It is now three years since I wrote to you as an architectural emigrant concerning the shipment of emigrants from London. I have now to speak of New South Wales, Australia. It is of vast extent, and in many parts has a beautiful soil, but for the most of its area is very deficient in water supply, there being subterranean water-courses, which make the country appear uninhabitable, and have been the chief drawback to *bona fide* settlers. The Government have now seen the necessity of employing diamond-drills to make practicable travelling for steamers to convey provisions and merchandise into the interior; for with last year's drought no water was to be had on the roads for hundreds of miles, nor pasture for the cattle; and the Government, seeing that the want of water would ruin certain districts, tardily consented last month to the employment of diamond-drills. During last winter, in some districts chaff was 50*l.* per ton, and food at famine prices, owing to steamers not being able to get their teams from place to place. It has been reserved for Messrs. Amos, the railway contractors, to prove the practicability of obtaining water in the bush. Where a railway is to be constructed, at equal distances of ten miles they sank for water to supply their men and cattle; by using the diamond-drill they came upon an unlimited supply, which will go far to induce men with small means to take up lands for cultivation.

The Government have been very slow in promoting railways, compared with those of other colonies, until the last few years, and now every district is agitating for its line: they consist of a single line of rails, and the influx of trade to and from Sydney is becoming greater and greater every year, as the lines increase. It is sought to connect the capitals, Adelaide, Melbourne, Sydney, and Brisbane, by a continuous line, and it is completed nearly to the Queensland frontier at Uralla, which was opened last month. In some districts there are engineering difficulties of gradients up steep hills,—zig-zags being the remedy,—nor can I see the reason why tunnels are not used, as elsewhere. The hills are not composed of harder stone than in other countries. It is peculiar that the capital of the colony should have no railways from it to the northern districts, which are as important as the southern ones. Travellers have to take the steamer to Newcastle, a distance of seventy-five miles, and at holiday times the boats are utterly inadequate to convey the number of travellers, and when there are gales at sea, they are delayed; at one time last winter, for three days no mails could be delivered. The Government is now waking up to the importance of connecting the northern district with its capital, but it has been delayed by the squabbles respecting the route to be taken; the chief difficulty being to cross the Hawkesbury river, it has been decided to take the line to Waratal, a suburb of Newcastle, instead of Maitland or Singleton, which would have shortened the journey from the north considerably. Only first and second class fares are allowed. At holiday times, agricultural shows, and race meetings, excursions are allowed at a single fare; and at Christmas time, owing to this, Sydney is full of visitors who can stay two or three weeks.

Owing to the want of roads and water, the natural resources of the colony have not had the chance of being fairly opened up. Within the last two years great gold-fields have been opened up at Tomara, Wilcamina, and Mount Brown. The two latter are at the extreme north-west end of the colony, and without any adequate road, so that many adventurers lost their lives for want of water.

The last season to the cattle-breeders was one of the worst ever known, through the small rainfall, and it is not until they have mustered their flocks for shearing that the losses can be ascertained. In the Dubbo district this month one run that last year mustered 30,000 sheep, this season mustered only 5,000, and the same is experienced on other runs in the neighbourhood. In consequence, the prices of meat have advanced from 2*d.* to 6*d.* per lb. for good meat. The exportation of meat to England by the freezing process has been begun in earnest, but is only partially successful. Owing to the tropical nature of the country, cattle-breeders will never be able to compete with the Americans or with New Zealand.

The laud question has for many years been a

vered one. Large areas of land have been granted as runs, the lessees of which have had to admit selectors who were willing to settle upon and cultivate the land. The latter would naturally look out for the best plots with water facilities. In time the squatters resorted to dummyism by getting elderly men brought to the district and introduced as selectors, who, for a small consideration, would give up their rights, and so shut out bona-fide settlers. Out Duhbo way this has reached to a notorious pitch, and it has come to a kind of hattle in Parliament, the majority of the members of which may be termed as being in the squinting interest, and many have been the dodges of squatters and selectors.

The harbour of Sydney may be said to be one of the finest in the world; it may be termed an inland sea, deep enough for vessels of any burden; the outlet is two miles wide, and inside it consists of a vast number of bays. The direct distance from the Heads to Parramatta is 15 miles; but to travel along by the water's edge from the Heads and back on the other side is a distance of 1,500 miles. Owing to its having been selected as the convict station of Britain in the beginning of this century, persons who emigrated as traders did not feel much love for its traditions. There was then no idea of its importance in the future. Lands were granted to persons on condition of their maintaining a certain number of servants or convicts, who frequently were allotted a plot of land to settle on; but in many cases they, when their time was up, preferred being out of the neighbourhood where they were known as "lags;" and twenty-eight years ago it was a common practice for these men to sell their plots for a bottle of rum. Many of the plots now under cultivation would realise 1,000l. The old parts of the town were never properly set out for the convenience of traffic; the water frontages were allowed to be enclosed by private traders, and in some cases access to a wharf was closed up so that people had to ascend a steep hill and down again to get to the next wharf, separated by a simple partition. This is the case at Miller's Point and Darling Harbour, which is a great shipping centre. Had the Government years ago have insisted on a road being carried round by the shores, or parallel with the wharfs, much fatigue would have been saved pedestrians and horses. Much has been done to deepen and improve the harbour to admit large steamers to its quays; but a great drawback is in the amount of sewage that is allowed to be poured into it, poisoning the air in warm weather, instead of erecting engine shafts to throw the sewage into main sewers at various heights, and thence far into the country, where it could be utilised for the earth. The authorities prefer the costly system of dredging it up into punts, which are taken out to sea and the contents discharged into it. Many schemes have been devised for the interception of the sewage, and getting it conveyed to the sea, but none have yet come to maturity; whilst fresh sewers are being made to discharge into the numerous bays. During the spring and summer an immense number of excursions take place.

Owing to the suburbs having extended very much, the authorities had to allow the inhabitants to obtain their water from the reservoirs at Botany: these were thought sufficient for any number of people, but owing to the droughts the supply became so low that, during the last two seasons, the authorities have had to issue orders for the factories and bath-rooms to discontinue having any. The streets are now watered with salt water, which is found to be better, as it keeps damper much longer than the fresh water. While the rest of the world has been in a depressed state, New South Wales has been prospering to an unprecedented extent, and Sydney has increased its population rapidly; in consequence, the building trades have been very active; materials and labour increased in price, so that it is difficult sometimes for an architect to obtain a tender for work. Last month muddling carpenters easily obtained an advance from 10s. to 11s. for eight hours per day; while you will be able to surmise the state of the building and other trades by a perusal of the *Sydney Morning Herald* to this date, which will rather underestimate than otherwise the rates of wages paid. Draughtsmen obtain about double the pay they do in England, and work but thirty-nine hours a week. Strikes are now taking place, but, as a rule, may be said to be soon over, the masters giving in and obtaining higher

prices for their work. One of these is worth mentioning. Messrs. Hudson Brothers, who are large railway-carriage makers, not being able to obtain sufficient men, brought from England a number of blacksmiths and strikers with their families, at an expense of 800l. They guaranteed them 3l. per week for two years, which is about double the amount they would earn in England. After working a few weeks they struck, alleging that by the piecework they could not earn 3l. a week. They were summoned at Parramatta and told they were liable to imprisonment if they neglected their contract, and very unwillingly they returned. It was stated that local workmen had induced them to strike. These are the class that should be made an example of. A painters' strike is on the tapis.

In consequence of building being costly, rents are very high, 18s. a week being paid for a labourer's cottage of three small rooms, and 25s. for a six-roomed house, including attic and kitchen. The consequence is, in spite of high wages, the majority of these tenements have lodgers. The taxes are heavy, while out in the country there are none, except upon dogs, and, considering these animals are most useful to settlers, it might well be done away with.

The Town-hall scandal has had its side for the last two years. A brief account of it is this. A banqueting-hall was some time previously begun to be built in the rear of the town-hall. When the walls were up a few feet above the ground, the works were stopped. A drain was subsequently made from the town-hall alongside part of the new work, and it was then discovered that the foundations had been built anyhow. This led to a search of the rest of the foundations, which were found of the same character. The city architect, Mr. Beath, had never appointed any clerk of works, and ultimately resigned his appointment, returning a sum of 1,500l. as the consequence of the oversight; and there is reason to believe a similar defect exists in the plaster-work, which was so scamped that some of the ceilings partly dropped, and an examination of the rest proved it to be so bad that those using the rooms are in fear of a like visitation.

At the end of last session a new Licensing Act was hounded through Parliament, much in the same style that the Epping Forest Preservation Act was passed in London, when members at the end of a session were anxious to get away. Up crops an important measure, requiring a deal of debate, which is allowed to be forced through without discussion, and afterwards the Corporation of London, by means of an arbitrator, obtain ground-rents at a fictitious price, under pretence of its being for the purpose of paying the costs and preserving the forest, and at the same time levying a duty upon corn brought into London. The new Licensing Bill out here proposed to make publicans pay a licence of 70l. a year for first-class hotels, 50l. for second-class, and 30l. for third-class, the latter having been the old amount. This was rejected, and an Act closing them on Sundays, and those that had less than eleven rooms of 1,200 cubic feet each, were to be at once enlarged, or the licence forfeited. The Act came into force on the 1st of January, and the police were very active in hunting up people who sold drink on Sundays. Owing to the state of the building trade, it was found impossible to obtain sufficient men all at once, and to hear the magistrates cautioning publicans who were summoned for not having their houses completed in time, one would have thought that some disaster was going to overtake the colony. By the Act, a publican who was fined less than 5l. could not appeal to a higher court. The magistrates said that it rested with the publicans to prove that people were travellers, and not the police. The former is commonly indoors, while the latter in course of time know most persons residing on his beat. Three weeks ago seven publicans appealed against the decisions of the magistrates: they produced witnesses to prove that the men served were bona-fide travellers, and Judge Forbes reversed six out of the seven decisions; yet do the magistrates still keep on their vicious system of fining publicans on the testimony of the police. During the last week an inspector's zeal led him to make application to the magistrate to cause the licence of an hotel to be forfeited, because the licensee was not living on the place, through its having been pulled down as a dilapidated building, and set back on a line with other houses. The Corporation had ordered it

to be rebuilt, yet the inspector, although asked by the magistrates to withdraw the case, refused to do so, and then the magistrates rejected the application. The result of this severe dealing will cause a reaction, and many of the members of the Legislature will lose their seats at the next triennial election; for many publicans are afraid to admit travellers, and say they will sooner take the chance of being summoned for not doing so. This is a curious state of things. The Act has done good in Sydney in stopping habitual drunkards.

But it is in the country districts that the Act has proved a curse. In many thinly-populated localities there have been log houses built for public-houses when the districts were being opened up. The rooms were low, and the bedrooms small, to accommodate one traveller each. Owing to the introduction of railways, the road traffic has diminished, so that with the imposition of a 30l. licence a great many public-houses have been shut up, and travelling prohibited, so far as obtaining food for man and beast. To my own knowledge, the route from Bendemeer to Burrigong, a distance of sixty-two miles, has not now a public-house along it, where previously travellers could use the route. A well-advised Premier would have insisted on the houses being enlarged at the expense of the Government, if the owners were too poor to give the legislative accommodation, which was never required in the country, through the small amount of business done.

The Botanic Gardens are the most beautiful in the colonies; they skirt that portion of the harbour which the shipping passes as it goes to the quays; but a needless act of officialism is practised. The great majority of visitors use the path skirting the water, leading to the Macquarie Chair in the domain. A fence divides the two, and there is a gate at the end of the gardens, yet, strange to say, it is not allowed to be commonly passed through by the public, who have to turn up steep rising ground to a lodge for 100 yards; it is rarely that the gate is opened. The native flowers are abundant and luxuriant.

The connexion of the footpaths with the streets in the city is of a very defective character; there are iron plates about a third of the width of the pavement; while in the suburbs, where it is not so much required, the remedy has been adopted.

Some of the local beers are of an inferior manufacture, very little malt or hops being used. It is proposed for the good of the colonists to introduce a measure that will quickly rid the colonials of drinking bad beer, by causing each member of the Legislature when elected to undertake to drink half a pint of beer at each sitting, under a fine of 10s. per day to be paid to an official; each brewer in the town and colony to have a week's testing of their beers. When this is done a wholesome reaction is anticipated, as members will become so frightened at the idea of drinking adulterated liquors that, for their physical and pockets' sakes, they will soon set about this reform without any debates.

A feature of the neighbourhood round about Sydney is the land sales, which take place daily, and which are somewhat expensively got up by the auctioneers. Where townships are formed the neighbourhood is hought by speculators, who employ auctioneers to sell the land. These, in their turn, go to surveyors to make plans of the land on large sheets, with embellished borders and gorgeous colours to the plots of land, on sheets up to 12 ft. long. The auctioneers advertise the charming qualities of the district, with the certainty of its fetching double the price in a few years, and giving free passes by rail, tram, or road to those attending the sales; and, if the distance is great, a free lunch is provided; and many are the excursions indulged in by non-intending purchasers. In the surveyors' offices the spare time of the clerks is employed in getting up borders for auctioneers' plans.

Emigrants arrive here from England every month. Upon landing they are mostly met at the hiring-room, but few present themselves there. Two months ago, out of a shipment of 400 emigrants, only three young women presented themselves as household servants, for whom no fewer than 100 Indies applied. When the emigrants are landed with their luggage, they are met by draymen, who charge high prices,—which ought to be stopped by printed notices at the landing-places giving the legal charges per cwt. for conveyance of

their luggage,—at a time when every shilling is of consequence.

Taxation in the towns is heavy, but in the country no taxes are levied, with the exception of a dog-tax, which, to me, is strange, as in pastoral districts they are more useful than men.

I trust this lengthened communication may not prove unwelcome to your readers.

Sept., 1882. J. B. WATTS.

**BUILDING PATENT RECORD.\***

**APPLICATIONS FOR LETTERS PATENT.**

- 5,107. W. T. Gooden & C. F. Casella, London. Apparatus for indicating excessive variations of temperature in buildings, &c. Oct. 27, 1882.
- 5,115. T. H. Collins, Winchester. Manhole doors for passages leading to sewers, &c. Oct. 27, 1882.
- 5,116. J. Wetter, London. Fire-escapes. (Com. by C. H. Höbmann, Cassel, Germany.) Oct. 27, 1882.
- 5,124. A. W. L. Reddio, London. Alarm-bells for doors, &c. (Com. by F. J. Masseron, Paris.) Oct. 27, 1882.
- 5,125. A. J. Boulé, London. Door-checks. (Com. by the Elliott Pneumatic Door Check Co., Boston, U.S.A.) Oct. 27, 1882.
- 5,132. S. Williams, Birmingham. Kilns for burning lime and bricks, &c. Oct. 27, 1882.
- 5,165. A. M. Clark, London. Gas cooking-stoves. (Com. by W. W. Goodwin, Philadelphia, U.S.A.) (Com. Spec.) Oct. 30, 1882.
- 5,197. W. R. Lake, London. Apparatus for flushing water-closets. (Com. by J. Cooper, Boston, U.S.A.) (Com. Spec.) Oct. 31, 1882.

**NOTICES TO PROCEED**

have been given by the following applicants on the dates named—

Oct. 31, 1882.

- 3,009. W. S. Morton, Edinburgh. Domestic fireplaces, &c. June 26, 1882.
- 3,251. A. M. Clark, London. Ovens. (Com. by J. E. J. L. Monnié, Paris.) July 8, 1882.

Nov. 3, 1882.

- 3,095. H. Conolly and A. E. Hubert, London. Overflows of valve closets. June 30, 1882.
- 3,096. H. Conolly, London. Water waste preventers. June 30, 1882.
- 3,110. J. Brownrigg, Windermere. Door furniture, &c. July 1, 1882.
- 3,459. A. Dix and J. H. Dix, Rock Ferry. Apparatus for checking the cords of blinds, &c. July 30, 1882.
- 4,789. G. Hurdle, Southampton. Opening and closing of window-sashes, &c. Oct. 7, 1882.

**ABRIDGMENTS OF SPECIFICATIONS**

Published during the week ending November 1, 1882.

- 1,109. T. W. Helliwell, Brighouse. Securing on to buildings sheets of zinc, metal, &c. March 7, 1882. Price 4d.

The edge of each sheet is turned up at right angles, and when placed in position there is a small space between two of these adjacent flanges, over which is placed a cap or bulby bar, which is secured to the framing by screws passing between the two flanges.

- 1,351. J. Rettle, London. Binding for scaffolding. March 20, 1882. Price 4d.

China is used instead of rope, and on one end is a hook which engages in one of the links. Part of the chain is enclosed in a small length of tubing, and the wedge is driven in between this tubing and the poles to tighten the chain.

- 1,357. J. Thom, Wolverhampton. Seaming door-knobs to spindles. March 21, 1882. Price 2d.

The collar has a conic plug projecting outwards, on which is cut a thread in the opposite direction to that inside the collar; this plug enters a hole in the knob. The collar is screwed on the spindle and the knob passed over. The collar is then screwed home, when the plug screws into the knob and secures it.

- 1,375. J. H. Black, London. Locks. March 21, 1882. Price 2d.

The locking mechanism is contained in the knob and consists of levers which fall into slots in the rose, and prevent the knob from turning. (Pro. Pro.)

- 1,382. C. Fisher, Loughborough. Apparatus for drawing off water, &c. March 22, 1882. Price 2d.

The two legs of the syphon are connected by a flexible tube. The short leg is suspended from a lever, and when it is dropped into the water so as to place the flexible bend below the level of the same, the syphonic action is established. This is especially applicable to water-closet cisterns. (Pro. Pro.)

- 1,397. J. F. Grimmo, Leyton. Flower-pot stands for windows, &c. March 22, 1882. Price 4d.

\* Compiled by Hart & Co., Patent Agents, 186, Fleet-street.

Beneath the grating on which the flower-pots stand is a sheet metal tray depressed in the centre, which catches the water and passes it into a vessel placed beneath a hole in the centre.

- 1,410. U. Scott, London. Means of ingress and egress to theatres, &c., in case of fire. March 23, 1882. Price 4d.

Balconies are made to each floor, connected together by staircases outside. The canopies over the entrances to the theatre are hinged to the lower balcony, and formed with steps on their upper surfaces, and are capable of being lowered down until their outer edges rest on the ground. A fire-proof shaft is made to each house, &c., with a metal ladder inside. Doors made of non-inflammable material communicate from each floor with the shaft.

- 1,434. E. G. Banner, London. Sewers. March 24, 1882. Price 6d.

The sewers are divided into sections by traps, and to ventilate each section air is admitted at one end through lamp-posts or other shafts with the foul air and gases are drawn out at the other end through shafts fitted with exhausting bowls. These latter shafts are made of a height above that of the surrounding buildings.

- 1,435. B. Finch, London. Chimney-flues. March 25, 1882. Price 2d.

To prevent the accumulation of soot the flues are built of pottery—were glazed inside. (Pro. Pro.)

- 1,498. W. R. Lake, London. Metallic shingles for roofing purposes. (Com. by C. Comstock, New Canaan, U.S.A.) March 28, 1882. Price 4d.

This is an improvement on Patent No. 3,494 of 1878 in making a projection or hook on each side of the point of the shingle, and in springing up the metal at the obtuse corners of the same so that the hooks of the overlapping shingle will pass under the adjacent edges of the two underlying shingles and hold the point in place.

- 1,512. T. Jones, Scigley. Ladders. March 29, 1882. Price 2d.

These have tubular metal rungs, the ends of which are opened out when they have been placed in these bars and plugs of wood are driven in from the outside. (Pro. Pro.)

**ALLEGED LIBEL ON A BUILDER.**

At the Westminster Police Court, on Monday, Henry Ashford, builder's clerk, was charged on a warrant before Mr. D'Eyncourt with unlawfully and maliciously publishing a certain defamatory libel of and concerning Mr. Edmund W. Bradwell, builder and decorator, of 112, Great Portland-street, knowing the same to be false. Mr. J. E. Grain appeared for the prosecution; the defendant was not represented.

Mr. Grain said the prosecutor obtained the contract to rebuild the new St. James's Theatre. Lord Kilmorey, who had employed him, afterwards disputed a portion of his bill, and pleaded a counter-claim of 2,000*l.*, alleging that the work was not performed within the specified time. The matter was referred by Lord Coleridge to Mr. E. M. Dowdeswell, Q.C., one of the official referees of the High Court of Justice, and he gave his award in February last in favour of Mr. Bradwell. The defendant was, up till September last, in the employment of Mr. Bradwell, and, on being discharged, he wrote a letter, the alleged libel, to the official referee, making very grave charges of fraud and falsification of books against his late employer. At the trial the books were examined by both sides.

In the letter to Mr. Dowdeswell the defendant alleged that upon Mr. Verity (Lord Kilmorey's surveyor) insisting on seeing Mr. Bradwell's books for the purpose of arriving at the prime cost of the work done at the theatre, the prosecutor, with the defendant's assistance, altered them on the evenings between August 6th and 30th, 1880, ten months after they had been properly made up, Mr. Bradwell's idea being to obtain a further 12 to 15 per cent. profit from Lord Kilmorey.

Mr. D'Eyncourt remarked that the defendant made himself out to be a party to the roguery.

Mr. Grain said that was so. The defendant also stated that the prosecutor asked him, if called as a witness at the trial, to swear that his pencil entries in the books had been carefully inked in by another clerk. The defendant further alleged that Mr. Bradwell had wilfully countenanced a mistake of 50*l.* in his own favour; that various credits were not given; and that, in fact, a fictitious statement of accounts had been concocted. The defendant also averred that he absented himself from the trial to avoid committing perjury.

The defendant said the charges he had made were true in every respect; his defence would be a plea of justification.

After some discussion the case was adjourned, Mr. D'Eyncourt agreeing to accept bail for the defendant, two sureties in 40*l.* each, in addition to his personal security.

**A Primitive Methodist Chapel and School** are about to be built in Queen's-road, Bootle, Liverpool. The plans have been prepared by Mr. S. Hurst, of the firm of Maxwell, Tuke, & Hurst, architects, Southport, and were selected by the committee from amongst several designs submitted in a limited competition.

**LETTING A HOUSE WITHOUT GIVING NOTICE.**

JOSEPH ELLIS, of Mitcham, was summoned before the Croydon bench, on October 28th, by R. M. Chart, Surveyor to the Croydon Rural Sanitary Authority, for letting a house, No. 6, Tramway-terrace, Mitcham, without having given fourteen days' previous notice to the authority. After hearing the evidence, the magistrates convicted the defendant, who was fined 40*s.* and the costs.

Frederick Titeomb, of Merton, was summoned before Mr. Paget, at Wandsworth, on November 1st, by Mr. R. M. Chart, Surveyor to the Croydon Rural Sanitary Authority, for neglecting to give notice specifying the date of commencing houses on the Merton Abbey Estate. The defendant relied on a letter written by the architect to the surveyor, informing him, in general terms, that the houses would shortly be commenced. This, however, was held not to be sufficient, and the defendant was fined 10*s.* and the costs.

These are the first convictions under the by-laws recently obtained by this Authority.

**METROPOLITAN IMPROVEMENTS AND ARTISANS' DWELLINGS.**

**SPENCER V. METROPOLITAN BOARD OF WORKS.**

In this case (which came before Mr. Justice Chitty on Monday last) the plaintiff moved for an injunction to restrain the Metropolitan Board of Works from proceeding to take down sixty-three houses in the district of St. Giles-in-the-Fields, and which were owned by the plaintiff, who was also the freeholder.

It appeared that the Metropolitan Board of Works, under their powers given in the Metropolitan Streets Improvement Act of 1877, proposed to take the houses in question for the purposes of the improvement known as the Piccadilly to New Oxford street Improvement Scheme. At the date of the Act in question almost the whole of the houses were occupied by the labouring classes as tenants or lodgers. The Metropolitan Board served the usual notice to treat on the plaintiff about March 12, and the plaintiff's solicitor then sent in a claim for compensation to the Board, accompanied by a notice that the claim was delivered without prejudice to all questions in regard to the right of the Board to exercise their compulsory powers without having complied with the 33rd section of the Act referred to. This section provided, amongst other things, that the Board shall not, without the consent of one of her Majesty's principal Secretaries of State, take for the purposes of the Act fifteen houses or more occupied at the time of the passing of the Act, either wholly or partially, by persons belonging to the labouring classes as tenants or lodgers; the Board shall prove to the satisfaction of such Secretary of State that sufficient accommodation in suitable dwellings has been provided elsewhere upon certain lands specified in the Act or other lands approved by the Secretary of State. The contention of the plaintiff was that as the Board had neither the consent of the Secretary of State, nor having otherwise complied with the requirements of the section, was not in a position to take any valid steps towards obtaining the houses; and that the words "take for the purposes of the Act" must bear the ordinary meaning.

The defendants, on the other hand, read the words of the section as "taking possession of." The object of the Board was in this instance to destroy property, while the Act of Parliament was distinct on the question that they were also to construct houses for the poor whom they turned out of their homes. It was expected that in time the labouring classes turned out of their homes would be provided with suitable dwellings, but if the Board were called upon to erect these, a great deal of delay would take place, and as the Board had only a limited time to construct the new street, their powers would be exhausted, and the works would not go on. The street about to be formed would begin at St. Martin's place, and end at Oxford-street, so that there would be a direct line of communication to Hampstead.

His Lordship said that this was a question of considerable importance to the Board and the owner of the houses, as also the labouring classes, for whose protection certain clauses were introduced into the Metropolitan Streets Improvement Act of 1877. It was stated that in this particular district there were over 10,000 of the labouring classes dwelling within the area. He considered this question of much importance, as the particular statutory period was running out, and he thought it would be much better that he should at once express his opinion rather than order the motion to stand over till the trial of the action, when it would be more fully discussed. There were certain questions not in dispute between the parties, and amongst these it was admitted that the plaintiff was served with a notice to treat, and that the Board was about to summon a jury to fix the amount of compensation. It was not denied that the Board proposed to take down more than fifteen houses at one time, and that the consent of the Secretary of State had not been obtained by the Board to justify them in the course

they proposed to adopt. It had been urged that the defendants could not take the property or lands when they had not complied with the clauses of the statute and obtained the consent of the Secretary of State, and he had come to the conclusion that the construction put upon the 33rd clause of the Act by the plaintiff was the correct one. The plaintiff was, therefore, entitled to the injunction asked.

#### STAFFORD WATER SUPPLY.

SIR,—In the *Builder* of the 4th inst. I observe a statement on this subject, which, I think, deserves to be noted. It appears that a proposal has been entertained to apply for an Act of Parliament to enable the Corporation to obtain a new supply from Cannock Chase, but that this project is deferred for further consideration, and meanwhile the present supply is to be analysed, "in order to see what improvement had taken place since the adoption of the tub system," and the meeting was adjourned for a month.

If I read the report correctly, it appears that the Town Council are looking for or hoping for an improvement in the quality of the drinking-water supplied to the town by the adoption of the excreta tub system! Is it possible that a corporation can be found to make an admission that they hope the new system of collecting excreta will show an improvement in their water-supply? If so, inferentially, the inhabitants of the county town are not to be congratulated either as to the quality of their water, or as to the public spirit of their Corporation, who must know that, if the suggested analysis shows no improvement arising from the tub system, the people must go on for at least another three years as they are, as the adjourned consideration of the all-important question of water-supply puts it out of the power of the Corporation to apply for powers during the coming session.

I have not the slightest personal interest in this question only as a constant reader of yours and as a

SANITARY ENGINEER, M. Inst. C. E.

#### SEWER VENTILATION.

SIR,—In your issue of October 14, p. 507, a "Poor Buffer" complains that at Littlehampton the manholes have been stopped up, and asks where the sewer vapours and gases go now? In the issue of Oct. 21, p. 540, "Another Poor Buffer" laments, and states that he is at a loss to understand (and well he might) in what lies the science of an ordinary sewerage system. In the issue of October 28, W. P. Buchan enters the list, and advises one of the complainants to take the beam out of the eye of his own drains before he complains. In the issue of November 4th, complainant replies to W. P. Buchan that he was not aware that drains and pipes were gifted with visual organs (perhaps the discovery that they have is a part of the hidden science). May I, sir, be permitted to offer, briefly, a few remarks on the foregoing letters. As regards the first "Poor Buffer's" complaint, it is manifest the sewer emanations will find their way out at the ventilating-pipes, and, as a consequence, more or less, according to the favourable or otherwise condition of the atmosphere, poison the air contiguous to these openings, and probably endanger the health of those who have to breathe it.

As regards the complaints of "Another Poor Buffer," I am bound to confess I am equally puzzled as himself to know where lies the science of constructing an ordinary sewerage system. The great evil is, according to my thinking, that the sanitary authorities should have dealt with the conducting away of sewage, after the manner of our professional architects and civil engineers in their designs for supplying a town with water and gas to certain fixed spots, to be turned off and on by taps. In such cases the fluid and gas are under pressure, and render entire pipes and sealed joints absolutely necessary.

Now, the removal of sewage seems to me to require quite the opposite consideration. In this case, the pipes are never full, and never under pressure (ordinarily). Special cases may require special provision, and the greater the provision for admitting air to them, the more salutary will be the system, and the easier the flow.

It is just as reasonable to expect thunder without clouds as it is to expect to be free from

the danger of the deadly sewer gases while we persist in having bottled-up pipes and sealed joints.

Wherever circumstances would allow it, I would recommend that all house-drains should be pierced all along the tops, so that they might be supplied with air and rain-water through the "filling" as a medium, a layer of single being placed immediately over the pipe.

REFORMER.

#### CHURCH AND RAILWAY ROAD.

SIR,—It is wished to build a church in a poor neighbourhood by the side of an approach-road to a bridge over a railway, and to enter the church at the biggest point of the road, so as to give a space underneath the floor of the church for a large hall and rooms for mission work and parish purposes, without which it is believed the church would have but comparatively few worshippers.

Can any of your readers tell me of such a church having been built in the metropolis, and if so, where? It is wished that the church should be of the most durable character in every respect, so as to minimise as much as possible the yearly cost of maintenance. Perhaps, also, some of your readers would give me the benefit of their experience as to the materials to be used, especially for the roof.

C. C.

#### SALE OF A BUILDING ESTATE AT WIMBLEDON.

A FEW days ago Messrs. Baker & Sons offered for sale, at the Auction Mart, an extensive freehold building estate at Wimbledon, containing altogether an area of thirty-seven acres. The estate was described as being within three minutes' walk of the Wimbledon Railway-station, and no portion of it more than ten minutes from any station. It was stated that the surrounding roads were all sewered, and water-mains run through the whole of the property. There was a very numerous attendance of capitalists and builders present, the sale-room being much crowded. The property was submitted in four lots, the first lot offered being a block of building land, containing 6½ acres, having a frontage of 500 ft. to the Dundonald-road, and 594 ft. to a proposed new road from the Dundonald-road to the Kingston-road. The biddings commenced at 2,000l., and the property was sold for 3,800l. The next lot contained 2 acres, possessing frontages of 1,052 ft. in length. The particulars stated that it included a detached residence, known as Henfield Villa, with stabling, garden, and a paddock of 2 acres in extent, which was let for an unexpired term of three years, at a rental of 63l. per annum. It was sold for 4,500l. Two adjoining lots, one containing 1½ acres, and the other 1½ acres, were sold at the rate of 500l. per acre. The total amount realised by the sale was 21,000l., representing an average of about 570l. per acre.

#### NEW RAILWAYS.

*Denton and Dukinfield.*—Major Marindin, one of the inspectors of the Railway Department of the Board of Trade, has inspected the new Denton and Dukinfield Railway, and certified that it has been completed to his satisfaction. It is a double line of railway between Denton and Dukinfield, in length about 1 mile 37 chains. For its length the works have been exceptionally heavy, and comprise a covered way under Guide-lane, in length about 170 yards, and another under the Manchester, Sheffield, and Lincolnshire Railway, about 140 yards in length, this work having been carried out without any disturbance of the large daily traffic of that company. From this covered way the line is continued upon an embankment between the river Tame and the Manchester, Sheffield, and Lincolnshire Railway, until it joins the line near Dukinfield Station. The object of the London and North-Western Railway Company in constructing the line is to avoid running through Guide Bridge Station. The works were commenced about April last year, and have been carried out from the plans of Mr. Francis Stevenson, engineer in chief to the company. Mr. Walter Scott, of Newcastle, has been the contractor.

*Newbury and Lambourne.*—The project for the construction of a railway between Newbury and Lambourne, to meet the requirements of the important agricultural district lying along the Lambourne Valley, has been revived. The present scheme has been worked out on an

amended plan, avoiding some of the defects which appeared in the Bill lately rejected by the House of Lords Committee.

#### PROVINCIAL NEWS.

*Manchester.*—The Mayor of Manchester has formally opened Upper Campfield Market, Deansgate, for the sale of miscellaneous goods. The stalls for this class of goods which for a number of years have been located at Shudu-hill have been abolished, and new stalls have been erected in the market by the corporation. The building was erected from designs by Messrs. Mangnall & Littlewoods, architects, Manchester, its total length being 187 ft. and 130 ft. wide, covering an area of 2,700 square yards. There are arcades in Liverpool-road, Tomnan-street, and Deansgate, the latter being through the centre of the new block of buildings erected by the Manchester Corporation for a free library. The market is principally of iron construction, the sides being enclosed with wood framing, glazed with rough plate-glass. Internally the building is divided into three bays, the centre one or main avenue being 50 ft. in width between the columns which support wrought-iron elliptical lattice principals and iron purlins.

*North Shields.*—A new banking establishment is being erected here for Messrs. Hodgkin, Barnett, Pease, Spence, & Co. It is being reared on the site of the old "Commercial Hotel," and from the designs of Mr. F. R. N. Haswell, architect. The design is Classic in style, and the façade will be entirely of polished and moulded stone. The front consists of a slightly-recessed central part with two wings, divided into five bays, each separated by pilasters with bases and carved Corinthian capitals, the lower or ground floor stage being built in rusticated ashlar, the whole being surmounted by an elaborate cornice with carved consoles. The plinth is of grey Dalbeattie granite, and the entrance-door to the banking-room has deeply-recessed and moulded jambs with segmental arched head, the inner moulding being of polished red granite. The private door to the residence is at the opposite end of the building to the public entrance. Three large windows occupy the space between the doors, and give light to banking-rooms. On the first floor are five windows with moulded architraves and pediments over them, with carved ornaments in the tympana, and over these five smaller windows for the second-floor rooms. The banking-room will be a fine apartment, 36 ft. by 26 ft. 6 in., extending from front to back, and lighted from front and back. The walls are to be panelled with mahogany. The height of this room is 16 ft. The manager's residence consists, on the first floor, of drawing, dining, and breakfast rooms, kitchen, scullery, and several pantries and store-rooms; on the second floor, of five bed-rooms, bath-room, and other conveniences; and on the third or attic-floor, two sleeping attics, a large attic with space enough for a gymnasium, and a cistern-room. The contract for the building has been entrusted to Mr. George F. Shotton, of North Shields.

*North Ormsby.*—The Roman Catholic Bishop of Middlesbrough has formally approved the plans of the new Roman Catholic Cemetery and Chapel at North Ormsby, which have been prepared by Mr. McCarr, architect, Queen's square. The site consists of two acres of ground adjoining the present cemetery on Ormsby-road. The gate-house will occupy a central position in the site, and will consist of sexton's house and offices, with connecting central gateway. The chapel will be in the middle of the ground, and will be in the Early Decorated Gothic style freely treated. It will comprise entrance-porch, and main building consisting of nave and sanctuary. The buildings will be of brick with stone dressings.

*Stormy Weather* in several districts is again reported. In parts of Yorkshire there was a heavy gale, and one of the pinnacles of the spire of Goole Church was blown down, and fell through the roof into the chancel, doing considerable damage. A violent thunderstorm passed over Kendal and the Lake district, accompanied by showers of hail. The lightning wrecked a cottage at Longpool, destroyed some telegraphic wires, struck the gable end of one house, and did rather serious damage in another.

## CHURCH-BUILDING NEWS.

**Pelynt.**—Pelynt Church, Cornwall, has been re-opened, after restoration. Some three years since it was found that the north aisle and roof were in a most dilapidated condition,—in fact, almost falling in,—and steps were taken by the then vicar, the Rev. W. Martin, to procure means sufficient to enable him to renovate the sacred edifice. This resulted in the renovation of this part of the building and the tower. This completed the work of restoration for a time, but subscriptions continued to come in, and it was resolved to go still further with the work. Efforts were at once made by the present vicar, the Rev. John B. Kitson. Mr. J. Piers St. Aubyn's services as architect were called into requisition, and the result of the action of the committee is that the whole of the south wall, together with the Trelawny aisle, porch, and vestry, have been entirely rebuilt. Messrs. Slate, Sons, & Lean were the builders, and the cost up to the present has been about 1,350l.

**Ashill.**—The parish Church of St. Mary Ashill, near Ilminster, Somerset, has been re-opened, after restoration at a cost of 700l. The church is an ancient building, exhibiting Norman, Decorated, Perpendicular, and Early English styles of architecture. It had fallen into decay, and its restoration became imperative. The beautiful Norman arch in the chancel has been preserved; the roof has been restored, and the woodwork is now open to view; the walls have been re-plastered, a new moulded arch of Ham Hill stone has been built in the western nave, and a new window has been placed in the north wall. The work has been carried out by Mr. H. J. Spiller, of Taunton, under the direction of Mr. J. D. Sedding, architect, London. The building contains several monuments of the Speke family, and two monumental effigies, the history of which is unknown; but concerning one of them, tradition preserves a curious legend. The wife of a yeoman residing in the parish, and in close proximity to the church, some time during the Middle Ages (parochial record does not state the year) was delirious at seven at a birth. The progeny being too numerous for the husband to maintain until they reached years of maturity, he carried the whole of them away from his home in an apron, with the intention of drowning them in a stream which ran close by. While he was passing the church on his way to carry out his unchristian intention, he was met by the lady to whom the manor belonged, who at once questioned him as to the contents of his bundle. He replied, "Only a few puppies, which I am about to drown." Not satisfied with the man's statement, and his strange and excited demeanour arousing her suspicions that something was wrong, she examined the contents of the apron, and found that there were seven children. She rebuked him for his diabolical design, and at once relieved him of his charge. Taking the children under her own care, she brought them up to manhood's estate, and made one of them a prebendary of the Church, and in honour of him, it is said, one of the effigies has been raised. As giving some slight corroboration of the truth of the legend, it may be mentioned that at the present time Ashill parish is a prebend of Wells. The manor-house is still in existence where the children are stated to have been reared.

**Canwick (Staffordshire).**—The parish church was re-opened by the Bishop of Lichfield on the 18th ult., after enlargement under the direction of Mr. Nicholas Joyce, architect, Stafford. The church, which is old, has a nave, north and south aisles, a chancel, and a western tower. The nave underwent considerable alteration at the time when the south aisle was rebuilt, in 1753. Until recently the walls of the chancel, erected about the year 1300, remained nearly in their original condition, but a low-pitched hipped roof had taken the place of the old gabled roof. In order to effect the enlargement, the removal of the old chancel was unfortunately inevitable. The style of architecture of this part of the church has suggested the character of the whole of the new work, which includes the extension of the nave and aisles two bays in an easterly direction, and the building of a new chancel with a north aisle for organ-chamber and vestry. About 250 additional sittings have been obtained. All the new woodwork is of pitch-pine, oil-stained. The floor of the chancel is laid with tiles, from the Campbell Tile Company's Works at Stoke-upon-Trent. The glazing, in imitation of some old quarry glazing preserved in an old

fourteenth-century window that had been blocked up, has been well executed by Mr. Evans, of Smethwick, who has also put in a stained-glass memorial window at the cost of Mr. Ewan Christian. The ironwork is made by Messrs. Brawn & Sons, of Birmingham, and the general contractor was Mr. Thos. Williams, of London. The cost has been about 2,700l.

**Plymouth.**—The work of embellishing the Church of St. Peter, Plymouth, recently erected from the designs of Mr. G. R. Fellowes Prynne, is being proceeded with. Massive double stalls in oak are now in course of construction, and are nearly complete. The new chancel-screen will be a very notable feature. It will stretch right across the wide expanse of nave from arcade to arcade. The whole of the upper part is of elaborate iron grill-work, by Messrs. Ellis & Rice, of Gray's-inn-road, London. The lower parts are of polished alabaster, richly moulded and carved with Early English foliage. This alabaster work is being executed by Mr. Harry Homs, of Exeter, who has also a parcel of screen for the south side in hand. This is in Bath stone, with millions of red Corschill. All the work is being executed from the designs and full-sized details of Mr. Fellowes Prynne, the architect. Unfortunately, differences have arisen as to the settlement of accounts for the erection of the church. It seems that a builder of the name of Finch commenced the work, his tender having been accepted and a contract entered into; but circumstances early arose resulting in Mr. Finch being paid a certain sum, and in the work being placed in the hands of Mr. Alfred Gay, the clerk of works, to build. In the settlement, Mr. Gay and the architect failed to agree, and the matter got into the Court of Queen's Bench, and it was referred to arbitration. Mr. J. Edmonston, F.R.I.B.A., the arbitrator, held his first sitting in the case on the 17th ult., at the rooms of the Royal Institute of British Architects.

**Birkenhead.**—The parish church of St. Mary, Birkenhead, was reopened on Sunday last after alteration and renovation, the intention having been to restore the church as far as possible to the form originally intended by the architect, the late Mr. Rickman; and at the same time to increase the comfort of the congregation. Before those works were undertaken, there were three large galleries occupying the whole of the north and south transepts and the west end of the church. There was no centre aisle, and all view of the communion-table was blocked up by the lofty old-fashioned "three-decker" arrangement in the centre of the church. The church, as originally designed by the architect, had no galleries in the transepts, and these were subsequently added in consequence of the rapid increase of the parish. The following is a brief description of the most important alterations that have been made:—The height of the church has been increased by lowering the floor 15 in., it being found impracticable to alter the height of the ceiling; the whole of the galleries in the north and south transepts have been removed, the space occupied by the staircases and vestibules being added to the area of the chancel. The front of the western gallery has been set back 2 ft. The organ has been removed to a new organ-chamber built on the north side of the chancel, and the seats entirely re-arranged. All the pews have been reconstructed. A centre aisle has been formed, and the pulpit re-erected at the north-east corner of the chancel. The chancel has been raised 18 in. above the floor of the church, with stalls for the clergy and choir. Vestries for clergy and choir have been built on the south side of the chancel, and on the north side an organ-chamber, with heating-vault underneath. The lighting is done partly by four of Siemens's regenerative gas-burners. The passages and aisles are laid with wood blocks, the chancel and baptistery (late vestry) being laid with encaustic tiles, and the apse with mosaic pavement. The windows in the apse and the baptistery are filled with stained glass of an ornamental character. The main contract for the alterations has been carried out by Messrs. E. Legge, Son, & Co., of Birkenhead; the tiling and mosaic work by Mr. Leadley Brown, of Liverpool; the stained glass by Messrs. Campbell, Smith, & Campbell, of London; the ornamental glass by Messrs. Forrest & Son, of Liverpool; the whole of the works having been carried out under the superintendence of Messrs. Aldridge & Deacon, architects, Liverpool.

## DISSENTING CHURCH-BUILDING NEWS.

**Felling.**—The Wesleyan chapel at Felling, after having been closed for a considerable period, was opened for service on the 1st inst. The chapel and schools may practically be said to have been reconstructed, rendering them more adapted to present requirements. The works have been carried out from the designs and under the superintendence of Mr. J. J. Lish, architect, Newcastle-on-Tyne, Mr. Brown, of Felling, being the general contractor, and Mr. Atkinson, Newcastle, contractor for the stained-glass work.

**Runcorn.**—St. John's Presbyterian Chapel, Runcorn, was reopened on the 1st inst., after internal decoration by Mr. Greyson, of High-street. A heating apparatus has recently superseded the stove system of warming. The apparatus is Mr. W. E. Lea's patent.

## SCHOOL BOARD SCHOOLS.

**Upton Noble.**—A new Board School has been erected at Upton Noble, Somerset, from the designs of Mr. R. J. Withers, architect, London. It has been erected by Mr. J. Vallis, of Frome. It is built of native stone, with Douling stone dressings. The roof is open timbered, covered with Broseley tiles of a special make. The woodwork of the roof and of the interior fittings is of pitch-pine, varnished.

**Peckham.**—On the 20th ult., a public meeting was held in connexion with the opening of a new Board school in the Crendon-road, Peckham. The chair was taken by Mr. R. Freeman, the vice-chairman of the School Board. The school contains accommodation for 480 boys, 480 girls, and 650 infants, and has been erected from the designs of Mr. E. R. Robson, architect to the Board.

## STAINED GLASS.

**Ringwood.**—An addition has just been made to the adornments of the chancel of St. Peter's and St. Paul's Church, Ringwood. It consists of a stained window, by Messrs. Ward & Hughes, of London, erected to the memory of the late voluntary organist of the church, Elizabeth, wife of Mr. J. Holliday, formerly of Ringwood. The subject of the window is St. John, "the beloved disciple." The Apostle is represented, in full-size figure, as standing in an attitude of adoration, with his eyes fixed on the wonderful scenes he witnessed in the Isle of Patmos. Over his head is a richly-executed canopy, above which an angel is represented as holding his crown of life. The lower panel of the window contains a representation of a choir of angels with musical instruments.

**Horton.**—A new stained glass window by Kempe has been erected in Horton Church, near Slough, by Mr. Tyrrell, in honour of the holy Nativity, and in memory of his late wife.

**Carlisle.**—Mr. Charles Evans, of Warwick-street, London, has lately erected a painted window in Irthington Parish Church. The subject is "The Ascension." The window is very elaborate in detail, numerous cherubim being introduced in close proximity to the central figure of our Lord, and the window has been designed strictly in accordance with the architecture of the church. It is the gift of the Rev. Thos. Hodgson, in memory of his brother.

## Books.

*Lectures on Art: delivered in Support of the Society for the Protection of Ancient Buildings.*  
London: Macmillan & Co.

The lectures included in this volume were delivered partly, it appears, as a means of replenishing the funds of the Society under whose auspices they were given, which therefore would not seem to have recommended itself to public support to any great extent, if its conductors have been obliged to resort to this method of producing the sinews of war. The lectures are six in number. Mr. R. Stuart Poole, the Keeper of Coins and Medals at the British Museum, contributes one on "The Egyptian Tomb and the Future State"; Professor Richmond one on "Monumental Painting"; Mr. Poynter, "Some Remarks on Decorative Art"; Mr. Micklethwaite, one on

'English Parish Churches'; and Mr. W. Morris, two on "The History of Pattern Designing," and on "The Lesser Arts of Life." The last-named lecture embodies a good many of the opinions expressed in a recent volume of lectures, published by its author, and which were noticed in our columns at the time of their appearance. In most of the sentiments of this last lecture we agree, only objecting to the author's over-acted solemnity about rather small things, and his too-sweeping denunciations. In speaking of glass, for instance, he says:—"It is matter of course that I am only thinking of that which is blown and worked by the hand; moulded and cut glass may have commercial, but cannot have artistic value." It is quite true that the method recommended here is the most rational, and the one which brings out best the most characteristic qualities of the material, but it is absurd to say that artistic feeling and artistic effect cannot be realised in cut glass at all. Mr. Morris is continually weakening his own arguments by these sweeping and inaccurate statements. He says truly, in regard to painting on pottery, "Don't paint anything on pottery save what can be painted only on pottery; if you do, it is clear that, however good a draughtsman you may be, you do not care about that special art. You can't suppose that the Greek wall-painting was anything like their painting on pottery." That is exactly, however, what a great deal of it probably was very like, as Mr. Poynter observes in another lecture in this very volume. We are glad, however, to see for once an admission from a preacher on decoration that there are limits in the excellence of Chinese and Japanese art. Mr. Morris observes that "these non-architectural races (let the Chinese stand as a type of them) have no general mastery over the arts, and seem to play with them rather than try to put their souls into them. Chamsy-handed as the European and Aryan workman is (of a good period, I mean), as compared with his Toranian fellow, there is a seriousness and meaning about his work that raises it as a piece of art far above the deftness of China and Japan; and it is this very seriousness and depth of feeling which, when brought to bear upon the matter of our daily life, is, in fact, the soul of architecture, whatever the body may be; so that I shall still say that among ourselves,—the men of modern Europe,—the existence of the other arts is bound up with that of architecture." We are grateful for a remark so true and so well put, and which is in opposition to some of the exaggerated worship paid at present to Chinese and Japanese art. The constant colloquialisms of Mr. Morris's style, his perpetual use of "don't" and "can't," and such inelegant abbreviations, form a great drawback to his writing, even when we agree with the opinions expressed in this jaunty fashion. The lecture on "Pattern Designing" contains much that is interesting, and is the best and most practical in the book. There is definite information conveyed in the lecture by Mr. Poole, who is learned in Egyptian archæology. The other lectures are suggestive in places, but somewhat desultory, nor can we perceive that anything very much is to be learned from them. Mr. Poynter, we observe, also enters his protest against the exaggerated love of mere *objets de luxe*. He speaks of the hundreds of exquisite little terra-cotta figures from Tanagra, which have been discovered within the last ten or twelve years, but of which he says:—"Not a dozen, I believe, have found their way into this country; there are a few in the British Museum. The French have the good taste to buy them all. I do not imagine that the best of these exquisite works, the purest expression of the Greek artistic instinct, ever rose in price to that of a Hawthorne jar at Christie's, and yet there is more art in the little finger of the man who made one of those figures than in the whole Chinese nation." Professor Richmond's lecture is a recommendation of the idea of the mutual advantage of the union of painting and sculpture with architecture,—true on the side on which he looks at it; but he fails, like so many other advocates of monumental art, to see the other side. "Architecture calls, being conscious of her own limits, for the fanciful and sensitive blow of the chisel to enrich and moderate her severity; Sculpture, while she adorns, is awe'd and constrained by the naked beauty of architecture; Painting, when in contact with both sculptor and architecture, catches their elasticity of form, their reserve,

their regulated quantities, while the full tones of colour give life to the bare surfaces that are permitted to her." True enough, and well expressed as far as it goes; but painting has a life of her own apart, as well as this, and in some senses a higher life. Titian and Turner were not monumental painters.

It is curious to observe the different methods in which the lecturers turn the close of their discourses to what preachers would call the "application," the reference to the Society for whose aid they were given. Mr. Poole gives what is, from his point of view, a practical illustration; he says that his feeling, as Keeper of Coins in the National Museum, is very strong against restoration, "because I have suffered long and tedious labour, and have had to draw upon the national purse for thousands of pounds to replace the Roman coins which had been touched up and restored, and consequently had lost all their historical value." It does not seem to occur to Mr. Poole that a building has some practical uses which an old coin has not, and that the cases are not quite parallel. Professor Richmond and Mr. Poynter pass over the matter. Mr. Micklethwaite, who we suspect is not quite a "sound" believer in the creed of the Society, and has not entirely parted with common sense in the cause, forgets himself so far as to say that churches have a life in the present; that the present generation has as much share in them as any of the past, and the same right to alter them according to its wants; and he is profane enough to suggest that there is much in some churches which may with advantage be removed. But Mr. Morris comes to the rescue. According to him, Oxford exists not for the pursuit of literature and science, but for the sake of the contemplation of the old buildings. "The poor remains of our old buildings in themselves, as memorials of history and works of art, are worth more than any temporary use they can be put to. Yes, apply it to Oxford if you please. There are many places in England where a young man may get as good book-learning as in Oxford; not one where he can receive the education which the loveliness of the gray city used to give us. Call this sentiment if you please, but you know that it is true." Mr. Morris's audience may have known no better certainly. But it would be a pity to spoil that by any further comment.

### Miscellanea.

**Condemned Houses at Bristol.**—In the House of Commons on Monday, Mr. S. Macdver asked the President of the Local Government Board if his attention had been called to the action of the Sanitary Authority at Bristol in summoning the owners, chiefly working men, of seventy-four houses condemned by the Medical Officer of Health, those houses having been erected on the strength of the official sanction to the plans; and whether such proceedings, without compensation to the owners of the property, were approved by the Board. Mr. Dodson, in reply, said:—I have communicated with the Sanitary Authority on the subject. I find that the Medical Officer of Health has reported a number of houses as being unfit for human habitation, because they are built on low lands, which are liable to be flooded whenever there is an excess of rain. It is true that the houses have been built in accordance with plans submitted to the Sanitary Authority in pursuance of their by-laws; but when the plans were before the Sanitary Authority they had only to consider whether the requirements of the by-laws were satisfied; and the by-laws referred to the structure of the buildings and not to the fitness of the site. The Sanitary Authority, therefore, gave no approval to the site. The Local Government Board have no control over the Sanitary Authority in this matter, but the case will be brought before the Justices before the houses are closed, and it will, of course, be necessary to satisfy them that the houses are, in fact, unfit for habitation.

**A Piece of Mosaic Work,** representing St. John the Divine, executed for St. John's Church, Fauresmith, Orange Free State, is on view for a few days at Messrs. Thomas Pratt & Sons, 24, Tavistock-street, Covent-garden.

**Lord Mayor's Day.**—Messrs. Piggott Bros., of Bishopsgate-street, erected the arch and decorated the ward of Cripplegate for the Lord Mayor's Show.

**Hittite and Babylonian Antiquities at the British Museum.**—Within the last few weeks the authorities of the British Museum have received a considerable addition to the monuments previously obtained from the excavations which have been carried on under the superintendence of Consul Henderson, at Jerablus, on the Euphrates, the reputed site of the renowned city of Carchemish. The national collection has thus been enriched by more than thirty fragments of various sizes. There are on some of them parts of inscriptions; but unfortunately, these are very far less considerable than those on the three principal monuments previously acquired. Besides the portions of inscriptions, there are fragments bearing ornamental devices, and others which may possibly have represented on a large scale parts of a lion or some other animal. There are also large portions of two human figures, one much defaced, but apparently not differing very greatly in type from examples with which we were previously acquainted. Of the large consignment of Babylonian inscriptions received from the excavations conducted by Mr. Rassam, only a part has yet been examined, consisting in by far the larger proportion of contract-tablets.

**St. Bartholomew's, Smithfield.**—At a meeting of the Vestry of the parish of St. Bartholomew-the-Great on the 3rd inst., the Clerk brought up a report of the Works Sub-committee, which stated that there was much that required immediate attention. The roof was in a sad condition. The tower required repairing and pointing. The sub-committee had themselves seen to some of the most urgent repairs; 300*l.* was wanted at once to put the church in a condition fit for worship. The Vestry Clerk suggested that it would be a good thing if the vestry were to make an appeal to all the City companies and the archaeological societies to help them to put this unique and venerable edifice in thorough repair. The Vestry Clerk then moved that the Works Committee, with the sub-committee, continue their services. The motion was seconded by Mr. Wildash, and carried. From recent visits we can bear testimony to the need of something being done for the preservation of this church. The works carried out some years since were mainly limited to the prevention of the threatened collapse of the building, and to the partial opening out of the Norman apsidal arcade. Funds for further works of reparation were not then forthcoming.

**Proposed Removal of City Churches in Manchester.**—Manchester, like London, has its city churches question. Some time since a scheme was suggested for the closing of some of the churches in the city on the ground of the sparse attendance, caused by the constant demolition of the neighbouring dwelling-houses, and the consequent removal of the population to the outskirts of the city. Since then no action has been taken in the matter, which practically fell into abeyance; but the *Manchester Courier* states that measures will shortly be taken for the closing of one or two "deserted" churches in the centre of the city, the proceeds of the sale of the sites to be devoted to the erection of new churches in the suburbs. Some years since St. Clement's Church, Lever street (which was not a consecrated church) was sold, and is now occupied as an iron ware house. The proceeds of the sale formed the nucleus of a fund out of which the three churches of St. Clement at Lower Broughton, Higher Openshaw, and Greenheys were largely built, the grants from the fund being supplemented by subscriptions.

**Electric Lighting and its Dangers.**—To be struck dead by lightning is a possibility hanging over the head of every inhabitant of this part of the world. A new peril is added of being killed by contact with an electric light wire. A few weeks ago in a street in the lower part of this city many horses were shocked by currents escaping from the side-walk. On Saturday last the Central Methodist Church sent out shocks from its iron fence more powerful even than those which emanate from a pulpit. Passers-by were stunned by contact with the fence in which electricity escaping from a wire which fed a light next door to the church had grounded. To "lightning and tempest" as calamities to be prayed against must be added the electric light. Meanwhile protective legislation is called for.—*New York Christian Advocate.*

**The Sanitary Condition of Brighton.**

Dr. R. W. Richardson, F.R.S., has reported to the Mayor and Corporation of Brighton the results of a complete and independent sanitary inspection he recently made of that town. He finds that there is no specially prevailing epidemic or contagious disease in the town or district; that there is nothing whatever to point to any extant local cause as producing such diseases; that the health of the town is unusually good; that from the nature of the supply it is only from the most culpable negligence that the water can be made a medium for the conveyance of disease; that he found nothing whatever that could lead him to believe in the occurrence of any special disease or mortality from bad drainage; that the roadways and side-pavings are, on the whole, exceedingly good; that the slaughter-houses and cowsheds are, as a whole, no better and no worse than in other large towns; and, lastly, that the death-rate of Brighton was below that of the country in general. Dr. Richardson concludes by suggesting a few improvements in regard to mortuaries, public baths, washhouses, laundries, lavatories, slaughter-houses, new model lodging-houses, the removal of dust and rubbish from the town, the reception of sick from Brighton schools and other places, public markets, and the drainage and removal of sewage. The *Lancet* has published Dr. Richardson's report, together with a conciliatory article, which the *Brighton Herald* understands, has been deemed so satisfactory that the Town Clerk, by direction of the Local Sanitary Committee (consisting of the Mayor, the ex-Mayor, the Town Clerk, and the Corporation Solicitor), has given instructions for all further proceedings against the *Lancet* to be abandoned. This decision is a wise one. We said some time ago that the Brighton authorities would do well to abandon the proceedings.

**The Changes at Hyde Park Corner.**—In the House of Commons, on the 3rd inst., Mr. Warton asked the First Commissioner of Works whether any contract had been entered into in respect of the contemplated alterations near Hyde Park Corner; and, if so, whether the contractor had undertaken to remove the arch near Hyde Park Corner bodily to its new position; and, if not, whether he could state why. Mr. Shaw-Lefevre, in reply, said,—"I have entered into a contract for the execution of the works at Hyde Park Corner, and they are now in course of progress. With respect to the Wellington Arch, I told the House in July last that I expected it would be moved bodily. I had been advised by more than one authority that this could be done at a considerably less cost than that of pulling it down and rebuilding it. When, however, the plans for removing it were submitted to a contractor, it was found that, owing partly to the flimsy construction of the arch, and partly to the slippery nature of the soil on which it would have to be moved, the cost of the removal was about the same as the cost of pulling it down and rebuilding; and consequently, by the advice of Mr. Fowler, the eminent engineer, I abandoned the project of moving it in a more adventurous manner. The statue will come down in consequence of the arch being pulled down. When the arch is rebuilt, the statue will not be reinstated without some previous experiments to find some better and more dignified place for it."

**New Shops, Birmingham.**—Mr. C. Ede, milliner, of Birmingham, has been erecting a number of shops, situated in Constitution-hill, one of the leading thoroughfares of the town. They are in the Early Gothic style, freely rendered, and the elevation includes a series of bay windows, two stories in height, and diminishing in width, terminating with pinnacled and enriched pinnacles. The front of the building is relieved by bands of moulded stone and brick, terra-cotta panels, and stone diapers. The work has been performed by Mr. Evans, builder, from designs prepared by Mr. J. Statham Davis, architect, both of Birmingham. The cost will be about 5,000l.

**Fine Art Exhibition at Swaffham.**—A fine art exhibition has been opened at Swaffham, in aid of the funds for the establishment of an art class in the town. The authorities of the South Kensington Museum lent some valuable *objets d'art*. The loan collection of pictures from Norfolk Hall and elsewhere included works by Crome, Cotman, Eddy, R.A., Francesco Guardi, Watteau, Jacob Ruyssdael, Sir Godfrey Kneller, Hogarth, Zoffany, Nicholas Maas, Gaspar Poussin, and other well-known painters.

**Prehistoric Remains in Cornwall.**

During a recent outing of the Penzance Natural History and Antiquarian Society, the party, after visiting Halcetown, proceeded to the Stonnack, where Mr. Borlase, M.P., described some prehistoric remains, generally known as a "Piet's House." The building they were looking at, he said, if it was anything at all, was a very great curiosity indeed, because it was the only specimen that they had in Cornwall of that class of antiquity which was common in Scotland, where they were known as "Piet's houses," in the Western Islands and Orkney and Shetland, and also on the west coast of Ireland. It was first brought to the notice of antiquaries in this country by the Rev. William Bazeley, who sent an account of it to Mr. G. B. Millett, the secretary of their society, who visited the place and made a plan of it. The building differed entirely from the ordinary bee-hive house. If it was what he thought it was, it was the remains of what was known in the northern counties as a "burgh." If it were not one of those buildings he could not think what it was, for it was not at all like the bee-hive structures, several of which he had himself excavated. Canon Venables had called the attention of antiquaries of the West Country to the fact that the Cornish prehistoric monuments were not inserted in Sir John Lubbock's Bill, the reason assigned being that they were in Duchy property. He (Mr. Borlase) did not for one moment believe that if a proper application were made to the Duchy to have those monuments which might be upon its ground included in the Bill, there would be the least difficulty about the matter. Mr. Borlase added that plans of the rude stone monuments of Cornwall, most carefully prepared by Mr. Luens, were at present in the hands of the Society of Antiquaries, who were about to print them at their own expense.

**Damage to Roads by Traction Engines.**—On the 3rd inst. a deputation waited upon Mr. Dodson, at the offices of the Local Government Board, to urge upon him the necessity of restricting the use of traction engines on highways. The deputation, which was a numerous one, was introduced by the Duke of Buckingham. Mr. Stuart Wortley, M.P., said that the question resolved itself into two main heads,—the damage done by traction engines to the roads, and the danger caused by them to the other traffic on those roads. One point to be considered with regard to the damage was the increase in the maximum weight allowed for these engines, which had risen from 10 tons to 14 tons, while the width was also increased from 7 ft. to 9 ft. The damage to the road was also increased by the use of diagonal cross-bars on the wheels. The Duke of Buckingham endorsed what the last speaker had said, and stated that while they had no wish to see steam traffic abolished, they wished to see the drivers of the engines licensed as competent persons. Mr. Dodson promised that the memorial should, when the time for considering the question arrived, have the most careful consideration of the Board.

**Bequest to the Yorkshire Fine Art Institution.**—The *York Herald* announces that by the will of the late Mr. John Burton, of Poppleton Villa, York, the whole of his gallery of pictures by modern artists passes into the hands of the Council of the Yorkshire Fine Art and Industrial Institution, of that city. There are, however, certain conditions attached to the bequest, such as that they shall be placed in one of the galleries of the institution together, and shall be called the Burton Collection, and that a proportion of the proceeds arising from their exhibition shall be annually handed over to the Lord Mayor and the Sheriff of York for the time being, to be by them distributed amongst the poor of the city of York and of Upper and Nether Poppleton.

**New Public Hall at Kingston-on-Thames.**—Kingston has, for some time past, felt the want of a good hall, available for assemblies, concerts, &c., and Mr. George Bristow, a resident, has just accepted a tender for the erection of a building, to be called the "Albany Hall," on a site in the Fife-road, close to Kingston Station. The architects are Messrs. Robbins & De Bohville Bros., of 2, Victoria Mansions, S.W., and the building, which is in the Classic style, is to be of red brick relieved with stone dressings. The contractors are Messrs. Oldridge & Sons, of London-road, Kingston, and the amount of their contract is 3,872l.

**TENDERS**

For the erection of schools for 250 boys, 250 girls, and 250 infants, in Crowle-street, Holm-road, Hull, for the Kingston-upon-Hull School Board. Mr. W. Botterill (Botterill, Son, & Bilson), architect to the Board. Quantities by the architect:—  
 J. P. Skinner ..... £6,290 0 0  
 Henry Grassby ..... 6,290 0 0  
 Wilson Bros. .... 6,290 0 0  
 H. Sergeant ..... 6,170 0 0  
 B. Masgrave junr. .... 6,290 0 0  
 Executors of T. Southern ..... 5,772 6 4  
 John Drury ..... 5,768 0 0  
 Huddershaw & Son ..... 5,644 17 8  
 Jackson & Son ..... 5,623 0 0  
 J. Stamp & Son ..... 5,568 17 6  
 Hockney & Liggin (accepted) ..... 5,560 0 0

For alterations and repairs at No. 24, Paradise-street, Marylebone, for Viscountess Osington. Mr. Charles Fowler, architect:—  
 Staines & Son (accepted) ..... £920 0 0

For taking down and rebuilding walls of the Corner Pia tavern, Stibbington-street, Somers-town, for Messrs. Podnus & Palmer. Mr. W. F. Potter, architect:—  
 Richard Soeven (accepted).

For proposed new offices, Whittington-avenue, Leadenhall-street, E.C., for Messrs. M. & N. Salaman. Messrs. Edward Ellis & Son, architects. Quantities by Mr. W. B. Brown:—

	Less if Bath Stone.
Tungate .....	27,000 0 0
Goodman .....	25,799 0 0
Croker .....	25,217 0 0
Downs .....	24,964 0 0
McLachlan .....	24,919 0 0

### Some Publications on Decorative Design.

SMALL hook on decoration is a kind of book that ought to be very good, and this can hardly be said of the new addition to "Wenle's Rudimentary Series" on this subject,\* which is not by any means equal in merit to some of the monographs of special subjects in

connexion with art which have appeared among the earlier numbers of this generally excellent series. The object of such a publication should be to go to the root of the matter, and give the standing-ground from which to go farther and farther. Mr. Facey's book seems rather a collection of hints with pen and pencil; some of them good, some not very good, and not bound together by any very prominent or recognisable general principles. The aim of the writer, he would perhaps reply, is not to suggest such principles, but to give practical hints, "a course of suggestions applicable to those experiences ordinarily met with by the house-painter, who too frequently knows little or nothing of the most elementary rudiment of his business in its higher form as a decorative art." This is rather a contradictory sentence. The "higher form" of the painter's business, as "a decorative art" certainly needs something more, to furnish any useful guide, than some suggestions; and, on the other hand, it may be doubted whether such suggestions are of any real value to a less ambitious painter who wants to produce something "tasteful" without knowing exactly how to do it. Such a man is not likely to get further than copying and reproducing the suggestions given him, wherever they seem to fit in. He might do something worse if he trusted to his own taste and invention, no doubt; but the adoption of a few diagrams of ornamental design, however good in themselves (those given here are not all good), will really not bring him a whit nearer understanding what he is about, or make a decorator of him. The most practical and purpose-like remark in the book, looking at the matter in this light, is the

recommendation in regard to the art of stencilling, "First learn to draw." And the man who has learned that would not be very much in want of the rest of the book, except where it deals with practical difficulties in regard to the preparing of surfaces and colours for decoration.

A good deal of the small treatise is devoted to the consideration of stencilling, which may be called the workman's branch of decorating, and many of the hints given in regard to the use of this method of covering a space inexpensively with more or less decorative detail are useful. We differ from the author, however, in the idea that "taking out the ties,"—i.e., painting over the gaps in a stencilled design by hand,—is by any means a necessary or even desirable sequel to the process. A stencilled pattern had better appear as such, and not try to look as if drawn by hand; and part of the art of stencilling consists in so arranging the design that the necessary gaps left for the ties should not appear to injure or break up the design. The character of a stencil pattern should be peculiar to that process,—should arise out of the process,—and should show its origin and manner of working frankly.

It would be perhaps unfair to criticise from an artistic point of view the original sketches of detail given; a good many of them are fairly applicable to their supposed position, and well drawn in regard to balance and delineation of curves, but none of them can be said to belong to other than a very ordinary standard of decorative art. In some instances there are heinous mistakes made which should be pointed out, as in the suggested external stencil adornments for a cemented house-front, fig. 57. This shows for its principal feature the surrounding of the windows with sprigs of foliage running up vertically from the extremities of the window-sills and turning to meet over the top. The planting of such ornaments on the face of the wall outside of the architrave lines, with no bounding line to give it weight or architectural form or feeling, would merely result in giving a ragged and tawdry effect to the whole. The writer can have no perception of the proper relation of ornament to architectural detail and architectural character, or he would never have put on record such an unhappy suggestion as this. We should regard it also as a great error in judgment to place conventional representations of flowers in the windows of a conservatory, where the real flowers are present in their natural form. Nor is it the right way of regarding decorative design to say that the dictum that all floral forms are to be conventionalised in ornament, is chilling to the student of nature, as presenting him with nothing but "cold conventionality." If the student of nature wishes to draw or paint flowers, that is one thing; if he wishes to invent ornament, that is another thing. In the

latter case the floral forms are merely suggestions on which to build a creation of his own, having more direct relation to the architectural forms in connexion with which the ornament has to be used. That is, in fact, the real interest of decorative design; it is not copying, but creation or adaptation, calling out a different kind of intellectual effort from painting in its usual sense. The book is meant well, but we cannot regard it as at all up to what the subject demands, even in a "rudimentary" treatise.

The relation of American architecture and decorative design to European is an interesting and at the same time rather perplexing subject. For a long time it has appeared to amount in the main to following each phase of fashion in English work at a little distance behind, the various tastes for Gothic and Queen Anne, &c., appearing to reproduce themselves with little difference on the other side of the Atlantic. The author of "Democracy" has shown us the picture of an American lady of æsthetic tastes arranging her new room according to her liking, and we seem to be reading a description of the furnishing of a "flat" in some æsthetic quarter of London. America has developed individuality of late in certain branches of art, as wood engraving and decorative tiles; but not much, as far as we have evidence, in architecture and decorative detail generally. There is a certain satisfaction to be derived from the fact that the States chiefly copy English work rather than that of other European nations, and thus pay us the compliment of remembering our close relationship and following our tastes. We, on our part, somewhat tired of our own fashions, would be glad to get the benefit of some new idea from across the water. In regard to practical matters of comfort and convenient arrangement of buildings, our cousins could probably give us a good many suggestions; in regard to art, they seem at present to have little to offer that is new. We make these reflections *à propos* of the first number of a new art-magazine published in New York, "The Decorator and Furnisher," which has been forwarded to us, and which in some respects, we confess, puzzles us a good deal. The illustrations, with the exception of a certain chromo-lithograph, are mostly very good, and the artistic views expressed in the text in many respects sound and sometimes original. With these qualities is combined a style in some of the letterpress which in this country would be supposed at once to stamp a paper as third-rate. Among the editorial reflections on the first page, for instance, occurs a paragraph, to the effect that, "Speaking of good times reminds us that we want some first-class canvassers,—some of the kind that can capture a subscription at sight. This seems to be a good opening for some regular lightning-rod purveyors." Imagine an English paper professing to aim at a high position among its class, delivering itself in this fashion. In some other respects the paper is

\* Elementary Decoration: a Guide to the Simpler Forms of Everyday Art as applied to the Exterior and Interior of Houses. By James Williams Fyfe, Jun. Illustrated with sixty explanatory engravings, chiefly from designs by the author. London: Crosby Lockwood & Co. 1882.

English enough. Two of the articles are by an English architect and an English decorator, Mr. Edis and Mr. Day. The first two illustrations, representing what a carpet design should not be, and what it should be, respectively, show that the standpoint is still in the rear of English taste, for the bad form of carpet, which is very pronounced, is certainly not a kind of article that would now be found "in every average sale-room" in this country, though it would have been not so very long ago. The carpet intended to show what carpets should be is a very pleasing and very suitable design. Mr. Edis commences a series of articles on "Art applied to Decoration and Furniture of Modern Houses," in which we have no doubt that there will be a good deal that is suggestive; but it is a pity Mr. Edis commences by repeating the common fallacy of the moment about all art being decorative, and to give such misleading examples of this: stating that Titian "put his noblest thoughts on the common lath-and-plaster walls of Venice," as if every one did not know that Titian's greatest works were easel pictures; and that Michelangelo's greatest work was the decoration of a chapel ceiling, as if Michelangelo or any one else looked on the Sistine paintings as decorative, in the modern æsthetic use of the term. We hope the readers of the American journal will not accept such statements without a good many grains of salt. Mr. Day delivers a criticism of Owen Jones and his dicta on decorative art, in which he makes some points. But some of Owen Jones's mistakes merely amount to having asserted rather too dogmatically what is nevertheless usually right. It is quite true, as Mr. Day points out, that the tangential junction of curves is not a law or universal habit of nature, as Owen Jones very unaccountably asserted it to be; but it is nevertheless the fact that very little good ornament has been found or can be made in which the springing of the curves from one another is not tangential. So also it is undoubtedly true that all ornament need not necessarily, as Owen Jones asserted, be based on geometrical form and spacing (it must be remembered that Japanese ornament was not discovered when he wrote his "Grammar"), but it is certain that all the highest class of ornament that we have yet seen is geometrical in its basis. On the whole, there are not quite so many blemishes in the "Grammar of Ornament" as Mr. Day perceives; but nevertheless we may concur in his final summing up, which he adds as a thirty-eighth commandment to the thirty-seven of the Grammar: "Be grateful for your Owen Jones, but do not swallow his principles whole." Some designs for furniture that are given are good, and have some little novelty of style in the rich decoration of the surfaces by (apparently) inlay. Of the chrono-lithograph which professes to give some hints, in the shape of portions of ceilings, for design in colour, the less said the better; it is common-place in design, and poor in colour. As the proprietors are invoking the aid of English writers, they might be wise to get some English colour designs; they would probably be better than this, at all events. But in the main the "Decorator and Furnisher" seems to promise to be of some interest and value for American readers, at any rate; and we hope that it will obtain the desired pliancy of canvassers equal to "capturing a subscription at sight."

A publication of much the same type comes to us from Berlin, in the shape of the first number of the "Illustrirte Schreiner-Zeitung" (Illustrated Joiner's Journal; or "Cabinet-maker's" world, perhaps, represent it more correctly). This deals with a narrower section, of course, of decorative design, and the value as well as the bulk of the periodical, judging from the first number, lie chiefly in the illustrations. They are very neatly drawn and got up, as German illustrations usually are, but there seems to be no life or originality, and certainly little enough of beauty or refinement, in German work of this class. Whatever the Germans may be doing in other branches of art, in this of decorative furniture they are certainly very backward. They seem content always with the same rather heavy and clumsily-assorted architectural forms, and the same uninteresting and inelegant ornamental detail; and among the furniture drawn in these plates there is really nothing we can call good or in pure taste except the doors in the second plate, which are perfectly simple six-pannelled doors made of various woods, and the panels inlaid with a rather pretty conventional foliage pattern. In some

stools and a table in the fourth plate the vulgarities of Louis Quatorze detail are reproduced in wood, without even the kind of refinement which the style in its original form might claim, owing to the fine execution of a panel in it. There is a coloured lithograph of a panel of inlay for a door, in what material is not stated, probably various coloured marbles; it is one of those inlaid imitations of natural flowers in which some artists both in Germany and Italy excel; but the flowers are intertwined around a framework of very poor and tasteless design. Altogether we cannot say much for Berlin taste and achievement in these matters, if this new journal is to be taken as any indication.

#### ERRORS OF ARBITRATORS.

ANY ONE who knows anything at all of building contracts and building disputes is well aware that, when litigation arises out of them, in by far the larger number of instances the differences are settled by an arbitrator. That this is a much cheaper way of settling disputes than by the decision of a judge is more than doubtful, for it must not be forgotten that a competent arbitrator must be properly paid, and that the room in which the arbitration is held cannot be had for nothing. Therefore, in the result arbitration may be considered just as expensive a luxury as an ordinary lawsuit,—that is, one which does not involve any extra expense, such as the costs for commissions abroad. It is, therefore, of the greatest importance that arbitrators should act with the strictest regularity, and thus not put the parties either to the great expense of a new arbitration or to the lesser loss incurred by an attempt to set aside the award. For it is marvellous how eager suitors who have once entered into legal battles are to fight them out to the bitter end, and how they clutch at the smallest shred of a possibility of upsetting an adverse award. Again, the most upright arbitrator may, in a moment of forgetfulness commit an act of indiscretion which may afford just the barest bit of ground upon which a dissatisfied litigant may hope to find room to upset the award, for "there may be ample misconduct in a legal sense to make the court set aside an award, even where there is no ground for imputing the slightest improper motive to the arbitrator." It is difficult, indeed, to find any strict definition of misconduct such as will induce a court of law to upset an award. Perhaps it may be roughly stated to be conduct which may tend to make the award an unjust one. Not an action which actually did make an award unfair, because about that there can be little question, but which might reasonably influence the arbitrator one way or another. A very recent case has been before the Court of Appeal, and was decided so lately as November the 8th, which will serve as an example of what has just been stated. The arbitration was in regard to certain land which had been taken by the Hull and Barnsley Railway. The arbitration in connexion with it had ended on the 13th of March, and on the 25th of that month the arbitrator, before making his award, had gone down and viewed the land. When on this spot he met the company's engineer, and had a casual conversation with him, which in no way related to the land except that, as a matter of curiosity, he asked him where the old river wall was, and then the engineer also pointed out the jetty said to have been silted up. Neither of these questions had any relation to the matter in controversy. Under these circumstances, the Court of Appeal did not consider that there was anything done by the arbitrator which could have influenced his decision, although the Court below had thought otherwise. But in delivering judgment, Lord Justice Baggallay made the important remark that, had there been a conversation between the arbitrator and the engineer as to the value of adjacent land, then this might have influenced the arbitrator's mind, and so have caused the Court to have set aside the award. But this remark and the judgment show very well how extremely careful arbitrators must be. A conversation of a few minutes about some points in adjacent land was very nearly upsetting a careful and lengthy arbitration which had run over fifteen days, and had the conversation been a little more connected with the land in dispute, there can be no doubt that the money spent over the arbitration would have been wasted. In an earlier case a very strenuous effort was made to

upset an award, because the umpire and the arbitrator, together with a solicitor and shorthand writer, lunched together with and at the expense of one of the litigants. It was positively affirmed that the subject of the arbitration was never mentioned at the luncheon. "I have had," said the judge, "a great deal of difficulty on the subject, and I must confess that my first impression was that it would be better, on general principles, considering that what passed at the luncheon-table might, by possibility, have influenced the mind of the arbitrators, to set aside the award as a lesson to all parties in future not to adopt that line of conduct. But upon carefully considering the authorities, and upon looking at all the surrounding circumstances of the case, I come to the conclusion that I should not be justified upon setting aside the award on that ground." The judge then went over the evidence to show that nothing occurred which could, in the slightest degree, influence the umpire's judgment. But just as the Hull and Barnsley Railway case seems to contain a distinct warning to arbitrators not to go and visit a building or land the subject of dispute without a representative of each of the parties being present, so as to prevent any possibility of a suspicion of misconduct, so this earlier case is a warning against lurching either with or at the expense of one of the parties. In a still earlier case it appeared that the arbitrator, in the absence of one party to the reference, and without his consent, questioned a witness some days after the hearing. The arbitrator declared that the interview did not influence his judgment, and the apparent object of the questions was to help to form his opinion as to the way in which certain things in the nature of work to be executed on a particular spot which had to be done for the effectual carrying out of the award could be effected. But the Court held that they could not take into consideration the nature of the statements because there was a probability that the conversation in question might have influenced the arbitrator's mind. To consult a professional witness was very different from asking the opinion of a legal friend as to the best way to draw up the award. It was, in fact, what may be termed legal misconduct, although done without the slightest intention of unfairness on the part of the arbitrator. There are, of course, more flagrant acts of misconduct which too may be done without any corrupt motives, which clearly are of a nature to cause an award to be set aside. Some of these have been summarised in a well-known work,—Russell on "The Power and Duty of an Arbitrator,"—in these words:—"Thus the award will be set aside if the arbitrator refuses to postpone a meeting for the purpose of allowing a party time to get counsel on his part, where the other side unexpectedly appears by counsel; so if he receives affidavits instead of *in vivo* evidence, when he is directed to examine the witnesses on oath," and "if the arbitrator make his award without having heard all the evidence, or having allowed the party reasonable opportunity of proving his whole case." It is very clear, therefore, how very careful an arbitrator must be not to do any act which can, in the slightest degree, be likely to influence his opinion in an irregular manner. If he does do some such act, and becomes aware of it, he should at once give the parties full information of the particular step, and if the parties either expressly or impliedly waive an objection which would otherwise be valid, then the irregularity is purged and the award will stand good. What, however, we have here more particularly desired to point out is not how irregularities may be waived, but the necessity of guarding against their occurrence at all. The instances which have been given above, and the very recent case of the Hull and Barnsley arbitration, show conclusively that the most apparently innocent acts may almost suffice to upset an award.

**Dumbarton: the Deepening of the River Leven.**—At the last meeting of the Dumbarton Harbour Board, it was agreed to accept the offer of 100l. forwarded by Mr. J. Watt Sandeman, C.E., Newcastle-upon-Tyne, to report as to the effect of deepening the river Leven 3 ft. deeper than that of the Clyde between Glasgow and Greenock, the effect it would have on its banks and the bridge across the river, as also the plant necessary for so doing.

## RICHMOND CASTLE.

THE Swale, one of the principal tributaries to the Yorkshire Ouse, and the stream in whose waters Paulinus of York is said to have baptised 10,000 Pagan Saxons, rises in the north-western quarter of the county, in a wild and spacious tract of moor and moss, studded over with heights ranging from 500 ft. to 1,500 ft., and even reaching 2,000 ft., from all parts of which a number of becks and gills converge upon the old town of Muker, to form there a considerable volume of water in its brightest, purest, and most attractive form. From Muker the Swale takes, with many windings, an eastern course, down a dale, wild and lovely even among Yorkshire dales, past the town of Reath, beneath many a scar and across many a bolin, past places whose names fall strange upon the Southern ear, by many a camp of unknown antiquity, and by abbeys now venerable in ruin, until, about eighteen miles below Muker, it emerges in ample volume from one of the most charming of its gorges, and in one of a succession of bold and graceful curves, sweeps round a tall and precipitous headland of rock which, rising on the left or northern bank, projects about 130 ft. above the stream, and seems fitted by nature for the site of a mediæval fortress. Such at least was the opinion of Earl Alan, when, five years only after the coming in of the Normans, in the centre of a bravo and insubordinate population, here, upon the tabular summit of the rock, he founded the celebrated Castle of Richmond, the seat of a great Northern earldom, and the capital of a Shire of five wapentakes, and of an Honour, to both of which it gave its name.

While the castle occupied the broad summit of the promontory, and was protected naturally on the west, south, and eastern faces by a cliff, the river, and a steep slope, the neck of the peninsula to the north, not above 20 yards in breadth, connected the castle with the town which speedily rose up under its protection. Besides works in masonry, there seems originally to have been a ditch across the neck, including a narrow esplanade in front of the fortress. This is now, in great measure, filled up and built over, though the line of the depression may still be traced. Around the castle, but beyond the slope, and occupied by the old town, and beyond the river, the ground rises considerably and steeply, so that the castle stands in the centre of an amphitheatre of higher ground, though at distances far beyond the reach of the artillery of the eleventh or twelfth, or even of the fifteenth or sixteenth centuries. A short but charming summary of the position and features of Richmond Castle will be found in Freeman's "Norman Conquest" (vol. iv, p. 296).

Before the Conquest this territory, under some unnumbered name, was the inheritance of the English Earl Edwin, whose "aula" or hall was at Gilling, about one mile and a half east-north-east of the village of that name, and about the same distance from the castle. Here the earthworks that usually marked the great English residences long remained, though now they have disappeared under the plough and spade. Gilling, by Bede called "Ingeldingum," being the "ing" or meadow of Guille, is a place remembered for the slaughter there of Oswi, King of Northumberland, in A.D. 651. He also tells that an expiatory monastery was built, where prayers were offered up for both murderer and murdered. Of all this nothing is locally remembered, but the actual site of Earl Edwin's residence is still called Gilling Castle, and is in a field attached to Scales Farm, near a way known as Gilling-lane. Earl Edwin's "aula," though commanding a noble view, had no natural advantages for defence, and, therefore, Earl Alan, on obtaining the soken of Gilling, moved the chief seat from hence to the place which was named, not inappropriately, Richmond.

It is not probable that a position so marked out by nature as a rock of defence was neglected by the early inhabitants of the district. A formidable entrenchment, known as the Scot's Dyke, is still traceable from Gilling village southwards to the Swale, south of which it sweeps round to the west so as to protect the castle rock. At a distance of half a mile, Roman remains, coins, and pottery have been found between the rock and the river. There is, however, no actual evidence that the site of the castle was ever actually occupied by either Briton or Roman.

Alan, surnamed Fergant, was the second

son of Eudo, and, in succession to his father, Earl of Bretagne. He was present at Hastings, and, by a charter preserved by Camden, granted by William while besieging York, and therefore at Christmas 1069-70,—received the land of Earl Edwin in Yorkshire. The grant is specified in Domesday as the "Terra Comitum Alan," containing 199 manors, of which 108 were waste. The roll begins with "Ghellinges habuit Edwinus Comes." Domesday also mentions the castle. The "Registrum Honoris de Richmond" informs us that Earl Alan founded the castle there, which, no doubt, he did after his return from the harrying of Northumberland in 1070, and built the encircling wall as quickly as possible,—it is said in 1071, as without it he could not long hold the place. He also attached the chapel of his castle, and with it the parish church, to the house of St. Mary at York. Alan married the Conqueror's daughter Constance, but died 1089, childless. Dugdale says he held, in divers counties, 452 lordships. The soken of Gilling was under Earl Edwin geldable, but it was afterwards enfranchised in favour of the Norman lords. Alan was succeeded by his brother Alanus Niger, Alan the Black, Earl of Bretagne and Lord of Richmond, which had become an Honour. He died, in 1093, leaving a son or a brother,—

Stephen, Earl of Bretagne,—who died there, 1137. He is said to have been succeeded by his second son,—

Alan, who is styled "Comes Britannie et Anglie." He also held the Earldom of Cornwall. He died, probably 1145-6, leaving a son,—

Conan le Petit, Duke of Bretagne and Earl of Richmond, the first so called. He died 1171, and is generally regarded as the builder of the keep in 1146. He gave to St. Mary's the tythe of the castle mills. He married Margaret, sister to William, king of Scotland, and he left by her a daughter, his heiress. At his death the Honour fell into the hands of Henry I. 18 Hen. II., 1171-2, the Honour of Earl Conan was let in farm by the king, and the farmer had to account for the manors, the service of the Dregages, and the third part of Gipswic, besides the seutages of the knights. The number of the latter had, however, not been correctly ascertained. The fees were scattered widely through many counties.

Constance, Duchess of Bretagne, married twice,—first, in 1106, Geoffrey, fourth son of Henry II., by whom she had Arthur, whose death in 1203 has been dramatised by Shakespeare. Geoffrey was killed at a tournament at Paris in 1186-7. Her second husband was Ranulph Blundeville, Earl of Chester, from whom she was divorced. Her third was Gury, Vicomte de Thouars, who became tenant by the courtesy, and who died in 1213. By the last she had two daughters, of whom the eldest, Alice, was the final heiress.

Alice was in ward to King John, who was in no hurry to give up her possessions. 1st John the earldom contained 140 fecs, on which the Countess of Bretagne paid 250 mares for the first scutage in the new reign. This may, however, have been Constance, the time of whose death is uncertain. 2nd John, the honour was in the king's hands. 4th John, 1203, Guido de Toure [Thouars] was "quondam comes Britannie," so that Constance must then have been dead. His acts in the earldom regarding certain fines are confirmed by the king. In 1204 John appointed bailiffs for the Honour. 1205 he informs the tenants that he has granted the Honour, late that of "G. Comes Britannie," to R., Earl of Chester, the earl from whom Constance was divorced. John was at Richmond on the 14th and 15th of February, 1206.

8th John, 1207, Hugh de Nevill held the castle as constable during pleasure. He superseded Roald Fitz-Alan, who was constable in 1205, and had a considerable grant of lands. Roald had been diseased for refusing to swear touching the thirteenth, and gave 200 marks and four halfpence to be quit of his fine and to have his office restored, and besides to have letters patent enabling him to distrain upon the knights of the Honour for their castle-guard.

1209, 10th John, Alice, Duchess of Bretagne and Countess of Richmond, invited her Breton vassals to support King John. She was probably still a minor. April 29th in this year, John was again at Richmond, and again, 15th June, 1212, in which year, and 1213, he still held the Honour, and in 1215, Roald was con-

stable. Soon after, 17th John, 1216, the constable of Richmond Castle was directed to obey the orders of Ranulph, Earl of Chester, and to discharge from prison the knights and men belonging to Roald Fitz-Alan, who, therefore, in the short intervening time seems to have fallen under suspicion and then to have cleared himself. The Earl of Chester probably succeeded him, for in 18th John, 1216, he is ordered, if he cannot hold the castle, to destroy it utterly. Countess Alice married Peter le Droux, of the blood royal of France, who in 1219 had livery of the Honour. 14 Hen. III, he is styled Duke of Bretagne and Earl of Richmond. By his adhesion to French interests in 1235-G he forfeited his English honours. He died childless in 1250.

In 1241, Henry granted the Honour to Peter of Savoy, uncle to Queen Eleanor; he held the Honour and Shire of Richmond till his death in 1268, when, under a power granted him by the king in 1262, he bequeathed them to the queen, who compounded for an annuity of 2,000 marks. Henry then, in July, 1268, granted the Honour to John le Droux, son and heir of the preceding Peter.

John le Droux, Duke of Bretagne, succeeded to the earldom in 1268, but passed it to his son. He died 1286.

John le Droux had the earldom from his father in 1268, and by licence from Henry III., his father-in-law, in 1269. He also became Duke of Bretagne. He married Beatrix, daughter of Henry III., and was killed at Lyons, 1305. This earl, on his departure for Palestine in 53 Henry III., founded a chantry for six priests in his chapel of Richmond, which could scarcely have been the Norman oratory in which six priests could barely find room. They were to be lodged near the great chapel, but to leave the castle during war. Duke John left Arthur and John.

John, the second son, succeeded by grant from Edward I., 1306. He was summoned as "John de Britannia, comes Richmond." He was taken prisoner while in the king's service in Scotland (17 Ed. II.), and the king, failing to obtain money for his ransom from Parliament, addressed a letter to the tenants of the Honour, adjuring them, for the sake of natural justice and by their duty and fealty, to contribute according to their holdings. The appeal seems to have been successful, for next year the earl was free. He died unmarried, 1334, and was succeeded by the son of his elder brother,—

John le Droux, Duke of Bretagne, and Earl of Richmond from 1335 to his death, childless, in 1351, when the earldom escheated to the crown. Upon his inquest it is stated, "Et est apud Richmond quoddam castrum quod nihil valet per annum infra muros, nec in fossa ejusdem castris, sed munitur iudicet in reparatione domorum et mitorum dicti castris." He had licence to wall the town, and houses were cleared away for it; but it is doubtful whether anything more was then done. The gateway between the castle and the river bridge seems of about this date, and may very probably have been part of an intended wall.

John le Droux, half brother to the last earl, and Comte de Montfort, became Duke of Bretagne, and had a grant of the earldom of Richmond in 1341. He died 1345, leaving a son; but, probably by some arrangement with the king, the earldom was granted to John of Gaunt, who was created earl, but resigned the whole into his father's hand in 1372.

John le Droux, the "Valiant," Duke of Bretagne, Comte de Montfort, son of the last Earl John, received the earldom from Edward III. in 1372, and is styled Earl of Richmond. His French interests were very great, and (7 Ed. II.) he forfeited those held in England. His sister Joan, widow of Ralph Basset, had a grant of the Honour, as afterwards had Ralph Neville, first Earl of Westmoreland. It was then held successively by John, Duke of Bedford, Edward of Haddam, and Henry VII., with whom ceases any remarkable interest in the owners. The title, an evident but scarcely creditable proof of the estimation in which it was held, was conferred by Henry VIII. and Charles II. upon their illegitimate children.

## DESCRIPTION.

Though not precisely of one date, the remains of the castle are mainly of the Norman period. The keep has of late been occupied as a militia store, and is so employed to the strict exclusion of visitors, notwithstanding that spacious barracks have been built not far off. The

remainder is in ruins, but the prohibition covers the whole area, and the keep is not allowed to be sketched even from the exterior. There is no trace of any fortification preceding the present, nor of any of those massive earthworks which usually accompany Norman castles, when placed on English sites. These, whatever they were, were at Gilling; all here is Norman, and the chief works therefore are in masonry. Those in earth are but moderate.

The castle seems to have been composed of a main, east, and north ward or barbican. The main ward is roughly triangular, the outline being governed by the ground. The base or southern face is about 186 yards long, and crowns the edge of a cliff of about 30 ft. high, at the foot of which a very steep slope of 100 ft. more descends to the river. A shelf has been judiciously cut at the base of the cliff for a modern footpath, whence is a charming prospect of the river and the castle mills, as well as a close view of the exterior of the wall. The west side,—about 130 yards,—crowns a depression very steep but not precipitous, and now more or less covered with cottages. Here, just below the castle wall, is a water-gate, having a highly-pointed arch placed in a segmental recess. This gateway stands in a fragment of wall, probably part of the defence of the town, and about 5 ft. thick. The east front, also 130 yards, is less strong by nature. There, from the base of the wall, which is of great thickness, a gentle slope descends towards the river, from 50 to 100 yards distant. A part of this slope is occupied by the east ward. The northern part, or apex of the triangle, is rounded, and upon it are placed the main entrance and the keep.

The north ward is very small, about 40 yards by 30 yards, and was, in fact, a sort of triangular barbican or outwork, covering the keep and gateway, and occupying the neck of the peninsula between the castle and the town. Of this ward there remain only traces of the *cœneste* wall, and a fragment, probably of the outer entrance, between the keep and the town.

The east ward may be a little larger than the rest. It is in plan a sort of half oval, the chord of 55 yards being applied to the curtain of the main ward, and the long semi-diameter of 80 yards descending the slope. The object of this enclosure, at present called the cockpit, was to occupy what would otherwise have been a convenient post for an assault, and to cover the postern which opened in the main curtain near the south-east angle, and whence a path led down to another gate in the east ward wall into a ditch which served as a covered way to the river. The wall of this ward is less solid than that of the main ward, and may have been an addition, though probably an early one. It not only covered the postern, but afforded a safe access to the castle mill, and stood to the south-east between the castle and the river, at a point where the river makes a sharp turn, and where a reef of rock supplied an effectual and inexpensive weir. The church mill has a weir of its own, and is about 200 yards lower down the stream.

Although the keep is placed at the northern point of the main ward and upon the *cœneste*, it stands mainly on the north ward, and is placed where it could most effectually oppose any attack on the town side. It is in plan rectangular, 56 ft. east and west, by 48 ft. north and south, and about 100 ft. high. The walls at the base are about 11 ft. thick, and are reduced by two sets-off at the level of the upper floors. It has the usual characteristics of a Norman keep, though with certain peculiarities. At the base are the usual footings suited to the irregular levels of the ground, but from these the wall rises quite plain about 10 ft., nearly to the level of the first floor. Here, from this stage as a plinth, rise the usual broad flat pilasters, one at each end covering the angle, which is solid, and supporting the usual four rectangular turrets above. These, however, are peculiar, in that the pilasters cease at a string which marks the base of the parapet of the curtain. Above this the outer half of the pilaster is continued as a narrow strip, which dies into the wall of the turret at the base of its special parapet.

On the north and south, or wider fronts, two pilasters, somewhat narrower than the flankers, intervene. On the east and west faces there is but one, and that a much narrower one, in the centre. These are all stopped by the string at the base of the parapet. Besides this string,

the tower has exterior indications of its several stages. The first floor is indicated by a bold half-head carried round the three outer faces of the keep. At the level of the second floor is a set-off of about 6 in., and a similar one marks the level of the third. These are continued round both walls and pilasters, reducing the wall by about 1 ft. in thickness, and probably the modern floors conceal similar sets-off within. There is one other peculiarity. The south or inner front is not so wide by about 6 ft. as the north, and the east front is 4 ft. less than the west. This is caused by a recess, or rather a nook or hollow angle, occupying the south-east angle, and measuring 6 ft. by 4 ft., in which, at the first-floor level, where the recess begins, is the entrance-door. The base of the parapet and lower part of the turrets seem original and of Norman date; the embassures both of turrets and curtain are probably modern. One turret, at least, has the original Norman doorway opening on the rampart. These turrets had a first-floor, as was usual, the holes for the beams of which remain. The basement and the two lower floors are of excellent ashlar work. The upper floor is inferior, though sound work. It is of different date.

The inner or southern face differs considerably in its basement from the rest. Here is a large, lofty, round-headed archway, of 11 ft. opening, plain, but with recesses for two flanking columns, nook-shafts, on each side, inside and out, with ornate capitals, eight in all, and a very bold rebate, showing that the doors opened outwards, a fact corroborated by the position of the bolt-holes. Moreover, the whole of this basement face is of very rough rubble. It is clear that here was a low building against the keep, part of its original design, and that this archway opened from the basement of the keep into an exterior chamber, now removed, probably with a small exterior doorway.

Originally the floors were all of timber, and no stair in masonry connected the basement with the floor above. The well, of the date of the Keep, was central, as at Conyngsborough. In the Decorated period, a large, strong, eight-sided pier, upon a square base, was built over the well, which is reached by means of a lateral arched recess in the east face of the pier. From the four main faces of the pier spring four ribs dividing the chamber into four bays, each of which is also ribbed diagonally with cross springers, plain, but producing an excellent effect. The wall shafts are half octagons with square bases. This chamber is 35 ft. by 19 ft. It has no lights, vents, or recesses. In its south-west corner, barely touching the wall, is built a thin cylindrical shell of masonry, containing a spiral stair, which ascends to the first floor. The door of this is to the north-west, and it is lighted by a loop to the east, both opening from the chamber in which it stands. This staircase is an addition, probably of the date of the vault. It is now disused and closed at its upper end. Probably it always stopped at the level of the first floor. This is a curious example of the conversion of the basement of a Norman keep into a late Decorated chamber. The first-floor of the keep of Brougham has undergone a similar change.

The regular and original entrance to the first floor of the keep is by a square-headed door of moderate size, flanked by worked columns, now gone, which supported a round-headed recessed arch. This door is in the south face, close to the east end, in the hollow angle before described, and it is entered from the ramparts of the *cœneste* wall. It opens into a lobby in the wall, 9 ft. wide, and on the left a small door opens upon an ascending flight of stairs, and a second, about 4 ft. 6 in. wide, opens direct into the first floor. This floor is of the same dimensions with that below. It was the state-room. It has three windows in the north wall, of about 1 ft. opening, round-headed. The recess in which each is placed has but a slight splay, from 3 ft. at the window to 4 ft. 6 in. in the chamber. These are flanked with detached columns, and above is a plain slender dripstone. The recesses rest upon a string-course, embattled or billeted along its under side. These windows, on the outside, are also flanked by columns and furnished with dripstones. There is also a door in the south-west corner of the room, which leads by an oblique passage into a small mural chamber, which opens by a large round-headed door, or window, of 7 ft., opening on the west face of the keep, at the level of the contiguous curtain. The present opening has been restored, but, no doubt, represents an old

one, though for what purpose intended is difficult to say. A loop here would have raked the curtain in safety, where this opening, quite within reach of a short ladder, would be very dangerous. It is, indeed, possible that the original opening was a loop, lighting a small garderobe. The spiral stair, now closed, must have opened just in front of this door. There is no visible fireplace. In the centre of the room, over the lower pier, is a cylindrical pier of rather smaller dimensions, about 3 ft. diameter, and broken off. This may have been intended to support a vault, of which, however, there are no traces on the walls. This floor is or was filled with the trowers of her Majesty's militia, and therefore is only allowed to be inspected through a grated door, even by those who are fortunate enough to be allowed to see the keep.\*

G. T. C.

#### RECENT ALTERATIONS AT THE TOWER.

"I pray you let us satisfy our eyes  
With the memorials and the things of fame  
That do remon this city."

Those who have allowed some mouths to elapse since their last visit will find important alterations in several portions of the Tower of London. With one or two exceptions the changes made tend to remind us that the Tower once possessed the three-fold character of fortress, palace, and prison. There is, then, the greater pleasure in recording them at a time when, as now, the historical features of our city are rapidly disappearing before the pickaxes of Utility and Improvement. Taking first in our survey the parts which are commonly shown to the public, there will be missed the popular long line of armed figures which formed so remarkable and beautiful a display in the Horse Armoury, and the Queen Elizabeth's Armoury in the White Tower, with its popular attractions of the beheading-block and thumb-screw, the Skevington's gyves (scavenger's daughter), and the axe which forcibly appealed to even the most illiterate. From the earliest ages the Tower has formed the principal place of deposit for the national accoutrements and arms. In the year 1213 Geoffrey de Mandeville was commanded to surrender the Tower to the royal authority, "the arms and other stores being therein." King Henry III. issued a mandate to the Archdeacon of Durham to transmit thither "twenty-six suits of armour five iron cuirasses one iron collar three pairs of iron fetters and nine iron helmets," which the preceding monarch had left in his charge. During this and the two following reigns similar writs occur. In the year 1339 John de Flete, Keeper of the Arms in the Tower, was ordered to buy and provide as many "espringalls quarrells hauberks necessary for the defence of Southampton Castle. Two years later the Sheriff of Gloucester was called upon to purchase and send to the Tower 1,000 bows and 300 sheaves of arrows. Of the reigns of King Richard II. and his successors up to King Henry VIII. many interesting documents exist relating to the warlike stores contained in and issued from the Tower. More notable, however, is the inventory taken in the first year of King Edward VI. Here † we find described several of the articles comprised in the present collection; as, for instance, the brigandines with coloured silk and satin sleeves, ‡ the "Targetts steilde with gomes" (being round shields with pistols in their centres), the "Holly water sprincke, with three rones in the topp,"—since labelled as "King Henry VIII.'s walking-staff," and the like. Paul Hentzner the German traveller who gives us so vivid a picture of London in Queen Elizabeth's time, describes his inspection of the Armoury, mentioning several of the still most popular exhibits,—such as "spears out of which you may shoot, shields that will give fire four times, a great many rich halberds, commonly called partisans, with which the guard defend the royal person in battle, the suits of armour of Henry VIII., many and very beautiful armours as well for men as for horses, the lance of Charles Brandon, Duke of Suffolk, three spans thick; two pieces of cannon,—the one fires three, the other seven, balls at a time [these are the guns cast by

\* To be continued.

† The inventory is in the possession of the Society of Antiquaries.

‡ The brigandine jacket, made by enclosing small squares of steel between two layers of canvas. This, with the morion, formed the body and head armour of the foot-soldier temp. Henry VIII.

Peter Baude, who succeeded the three brothers Owens in the royal foundry at Homdsditch; the former gun bears "Petrus Baude" near the breech), "to bring down maces of ships," &c. It is to be carefully observed that Bentzen, writing ten years after the defeat of the Armada, makes no reference to a "Spanish Armoury" or to any arms taken from that fleet. Had a collection of this kind been made (and it is noteworthy that already the Tower Armouries formed one of the "sights" of London), it would certainly have been brought to the notice of one who would carry abroad the fame of such trophies. In a survey of 1608 made by William Legg upon his re-establishment in office as Master of the Armouries is scheduled a "Spanish collar for torture, taken in 1588," though this, the first mention of a Spanish trophy, is perhaps no less fanciful than the assignment in a preceding item of the complete suit of plate armour to John of Gaunt. Yet Legg's inventory is highly curious as containing the earliest account of the mounted figures,—then ten in number,—described as "sundry compleat armours and others whereof some of them [sic] were standing formerly at Greenwich [the royal palace of Placentia], in the greene Gallery there." They were all mounted on "horse statues of wood," and ascribed to various sovereigns, the Earl of Leicester and Charles Brandon, Duke of Suffolk, though our faith is somewhat shaken when we read of a suit of white, i.e., plate armour, for William the Conqueror.\* In this document the so-called "Spanish Armoury" has no place; though in an inventory of date 1675 we read for the first time of a "Spanish Weapon-house." The name is manifestly derived from the detailed contents of the building where whilst we have Danish clubs, Venice targets, English javelins, Dutch half-pikes, &c., the weapons distinguished as Spanish largely predominate in number. Nothing is said of the latter being *spolia opima*, and the term Spanish clearly applies to their fashion or manufacture. In the Weapon-house, which stood to the east of the now Guard-room by the Wakefield, or Record, Tower, we first discover "King Henry ye 8th walking-staff," and among the items the armour attributed to De Courcy,—

"Armour espasse of ye Lord Corsys white and parcell gilt."

Also, the "Champion targett and lance of King Charles II.," and "Old wooden shields, whereof two said to be King Henry the 7th, and one for other Charles Brandon, Duke of Suffolke."

About this time armour falling into disuse the stores were returned into the Tower by the different corps of the army and have never since been called for. Particulars of the stores are set forth in the rough draft of a survey made in 1697. It opens with an imposing list of "Harquebus Armor Ordnaary," followed by others of "Harquebus Strong," "Carnaset Armor," "Footman's" and "Toiras Armor"; these include "Backes, Brests, Head Pieces, Dutch Potts and Potts made in England."† It would seem that the equestrian figures remained as before, though this cannot be exactly ascertained, a portion of the paper being torn away. There are specified, however:—

"Statues of wood whereof a[re] faces ij carved 2.  
Horse statues of wood ..... 2"

These are the work of Grilling Gibbons, the "faces" being those of Kings Charles I. and Charles II.; both are in the Tower, but the head of the latter is transferred to King James II., on the equestrian figure which represents him in the chair and the casque, with aorelletes, which he wore at the battle of the Boyne. Augmented, probably, by a few others subsequently sent in from out-stations, the stores enumerated in the two inventories of 1675 and 1697 furnished the additional embellishments to the existing Armouries. The mounted figures were increased from ten to twenty-seven in number. The "line of kings," as it was termed, began with our old friend William the Conqueror in his impossible suit of plate armour, and finished with the Kings George I. and II.; George I. appearing in the suit of Sir Henry Lee, the veteran champion of Queen Elizabeth; and George II. in that of Edward Clinton, Earl of Lincoln, A.D. 1535. King Edward I. masquerades in gilt armour,

\* Plate armour was not worn before the end of the fourteenth century.  
† The harquebus (*hakenbüchse*) survives in the modern cavalry carbine, worn, until the new drill, slung from the shoulder-belt. The pot was the helmet of the pikeman.

and James I. in a tilting suit that indubitably belonged to Robert Dudley Earl of Leicester; whilst King Henry VIII. was encased in John of Gaunt's. A figure clad in a beautifully unshagreened English suit of russet armour of King Edward VI.'s time, beset with a horse encased in a suit, embossed with the striking iron and pomegranate,—the badges of Burgundy and Granada,—which was presented by the Archduke Philip of Flanders to King Henry VII. The group was shown as Edward the Black Prince. Moreover, by way of anti-climax, King Henry V. had exchanged to William III. the suit he wore at Crecy for one made up of those belonging to Kings Charles I. and Henry VII. Absurdities of this kind leading the less well-informed to picture to themselves the heroes of Senlac as men-at-arms of the Tudors, cavaliers as equipped for the Wars of the Roses, were rendered more obvious upon the appearance of Sir Samuel Meyrick's "Critical Inquiry into Ancient Armour." His advice and co-operation were secured; in 1826 the ancient Cold Harbour Gate was removed, and a Horse Armoury built against the southern wall of the White Tower. At the same time the misnomer of Spanish Armoury yielded to the title of Queen Elizabeth's Armoury, since most of the latter collection was made during the sixteenth century. John of Gaunt, De Courcy and others were taken down from their wooden pedestals, Sir Samuel Meyrick reclassified the various exhibits, and in the year 1869 at the hands of the late Mr. Planche the whole collection assumed the shape which is familiar to most of our readers. It will be remembered as conspicuous for the picturesque line of horsemen ranged beneath the house colours of the several dynasties, the two coloured wood-carvings, known as "Gin" and "Beer," on the staircase,—relies from the Greenwich Palace buttery,—and for the tawdry, Tussaud-like group of Queen Elizabeth and a page, which stood in the Queen's Armoury facing the stairs made through the eastern wall of the White Tower. She is represented as riding to St. Paul's to offer thanks for the defeat of the Armada, though she was carried thither in a coach,—one of the first seen in England.

The two armouries are now being regrouped in the Council Chamber and room forming the top floor of the White Tower; but the old order is destroyed owing to the shape of the two new show-rooms. The vestibule communicating with the Horse and Queen's Armouries, which was built in 1851 after the plans of W. Stacey, Ordnance Store-keeper, is happily demolished. By the removal of the panelling, with other changes, its original condition is restored to the upper crypt of St. John's Chapel (Queen Elizabeth's Armoury). It is in the north party-wall of this apartment that the dark chamber is built known as the "Little Ease," and shown as the bed-chamber of Sir Walter Raleigh. Made a captive on three several occasions, his second and longest imprisonment extended over sixteen years. During this period the highest level of his sovereign's crown was confined in the Bloody Tower,\* and here his son Carew was born. Here, too, whilst engaged upon chemical experiments and his "History of the World," he received the visits of his friends including Ben Jonson, and the Prince Henry who avowed that no man but his father would keep such a bird caged in such a cage. He would work and cultivate rare plants in the adjoining Constable's garden; the narrow walk upon the wall connected with this tower, by which the murderers Miles Forest and John Dighton approached the princes, is yet styled Raleigh's Walk. The second crypt of the chapel is also cleaned and opened to inspection. Below the ground level, it is entered through the dungeons into which More and Fisher,—shortly to be canonised by the Roman Church,—were thrown, and where remain traces of the rack that tortured Anne Askew, Guy Faux, and the coin-adulterating Jews.

Visitors now enter the chapel by the flight of steps made in the southern wall of the White Tower, at the foot of which the remains of the murdered princes were found. A well, in good preservation, has just been discovered within the keep, by the south-western turret.

Along the eastern side of the White Tower, adjoining the circular turret, once occupied by Flamstead, there formerly stood a large

storehouse, flanked with two castellated buildings of Edward III.'s time. The area between the White Tower, the Wakefield, Salt (Assault) and Broad Arrow Towers was occupied by the palace, its gardens and offices. The Queen's private lodging and garden adjoined the Salt Tower at the south-eastern angle of the Inner Ward; the Queen's Apartments and Gallery lay to the west, their site now occupied by the doomed Ordnance Buildings. In the middle space near the Wardrobe Tower, King Henry III. erected his banquetting-hall; another large hall abutted on the Wakefield, for some time termed the Hall, Tower.\* In this, the favourite palace of the Plantagenets and Tudors, John, King of France and his son Philip, entertained their conqueror. Another royal captive, Charles Duke of Orleans, father by his third wife of Louis XII, wore here the English poem which, preserved in the British Museum, contains the earliest known view of the Tower. Hither Bruce, King of Scotland, was led prisoner by Edward's heroic queen; and here according to Froissart, Richard II. resigned his crown to Bolingbroke: though this episode is by some laid in the Council Chamber of the White Tower; by others, in the West-rectory, now the scholars' dining-room, at Westminster. From the scene of the magnificent wedding festivities of Eleanor of Provence and Henry III., the daughter of Edward IV. and queen of Henry VII. started to be crowned in the Western Minster; and here the brides of King Henry VIII. were royally received. In the Great Hall was arraigned his second victim, who but three years before had landed from Greenwich at the Water Gate, "amidst the great melody of trumpets and divers instruments, and a mighty peal of guns." In the palace she, whose name is carved in the prison-logging of the Beauchamp Tower, lived a nine days' Queen, and her successor kept court. Well might Elizabeth, passing the Bell Tower on her entry as queen, alight from her horse and reverently thank God for her past deliverance from its cell, and refuse to make that a palace which had been her prison. At the coronation of King Charles II. was observed for the last time the ancient custom, established by Henry IV., of proceeding in state from the Queen's Stairs to Westminster. For this occasion they made the St. Edward's crown to replace that of the Confessor broken up by the Commonwealth men. This is the crown which Blood nearly succeeded in carrying away, and was used at each subsequent coronation except that of her Majesty. The Regalia is now deposited in the Wakefield Tower, where a case containing the insignia of the Thistle fills the recess in which King Henry VII.'s body was found. After Charles II.'s time the palace fell into disuse as a royal abode; the southern precincts were occupied by a large storehouse which, burnt in 1789, made way for the huge and unsightly structure now being demolished. So desirable a measure accords with a scheme of the late Prince Consort for restoring to the Tower and its precincts somewhat of their ancient character. In a few weeks the remains of the Lantern Tower and Inner rampart beneath the Ordnance-house will be brought to view. The central keep should stand forth in solitary grandeur no longer for the awe but for the admiration of citizens. It is to be hoped that the guard-house with the mighty Horse Armoury will not be spared, and that we may thus regain the former prospect from the river that White Tower where Gundulph laid in tears the foundation of a fortress which was to be the scene of so much suffering.

Other modifications harmonise but ill with the time-honoured associations of the Tower. The warders (officially styled yeomen gaulers and porters) no longer wear the picturesque costume of the Yeomen of the Guard to King Henry VIII. That dress was secured for them by the Duke of Somerset on his release in the reign of King Edward VI. in recognition of their "dayly and diligent attendance." The garrison chapel, dedicated appositely enough to St. Peter in bonds, is denuded of its galleries and high-backed pews; two old entrances are filled in, plaster and stucco are laid about with no liberal hand. In the course of excavations four or five years ago some deal boxes were discovered, containing remains of state victims. Across the nave floor lay a body pronounced by competent judges to be that of a woman advanced

\* In the room, now subdivided, on the second floor being that in which the two sons of King Edward IV. were murdered. This was known as the Garden Tower until the middle of the sixteenth century.

\* The lower portions of the Wakefield, St. Thomas's (Traitor's Gate), and Salt Towers are of William Rufus's time, and are splendid examples of early masonry.

in years, being, in fact, the venerable Countess of Salisbury, last in whole blood of the Plantagenets. Close by they discovered the bones of a man of great size and stature, answering to the description of John Dudley, Duke of Northumberland, father-in-law to Lady Jane Grey. It was at first doubted whether this was really he, since the head was found as well, but a search in the Tower records showed that in his case the usual exhibition of the head at London Bridge had been dispensed with. Next to Dudley, and near the altar beneath which the Duke of Monmouth is buried, lay the relics of an arrow-chest containing the mouldering skeleton of a young and delicately-fashioned woman. Careful scrutiny demonstrated that here was the "lacy neck" which Anne Boleyn told the headsman would give him small trouble. The remains were placed in leaden caskets labelled with the names of their respective owners. But the chapel as now restored and refitted has a cold and untoward aspect opposed to the emotions which its history justly inspires. Something more becoming than an ugly heraldic pavement emblazoned in black and white marble could assuredly have been devised to indicate their last resting-places whose diverse lives and common fate illustrate the oft-pointed moral of fallen greatness and lighted fame.

W. E. MILLIKEN.

#### BELOW BRIDGE BRIDGES.

THE reports of the City Architect, and of the City Engineer, on the question of the below-bridge passage of the Thames, have been issued, we learn. In one point these gentlemen agree with the Engineer of the Metropolitan Board of Works,—but in one point only,—they think a crossing is desirable. As to that, in the abstract, perhaps, few persons will differ. The difficulty arises when we come to discuss the method, and to count the cost. As to this, the ratepayers may certainly be advised to insist on an accord being arrived at among the engineers before they are pledged to pay a single penny.

The City advisers hold with ourselves that the difficulty of the approaches to either a high-level bridge or a tunnel are so great that it is not to be expected that any traffic, in any way proportionate to the cost of the new viaduct, would cross it. Each gentleman advises a bridge on the ordinary level,—one thinking that it should be a swing-bridge, another that it should be a bridge pure and simple,—wharf-owners being compensated for the keeping masted vessels below it. On this we have not the data at the moment for forming any opinion. We have no doubt that much more traffic would cross a swing bridge than a high-level bridge, and that, again, much more would use a permanent bridge than a swing bridge. But before saddling the ratepayers with millions of money, these points ought to be taken out of the province of opinion into that of statistical fact. We recently showed the results of one mode of arithmetical calculation applied to the subject. Why not carry the same investigation a little further? Above all, why not tell us what use was made of the steam-ferry, and what is the number of passengers now using the two existing tunnels? It is a significant fact that no notice is taken of these points by the Metropolitan Board of Works. The confidence which those authorities entertain that the ratepayers must find, without demur, such sum as they may demand, for such crossing as they may prefer, is strikingly shown by the use made (as we before mentioned) of the returns actually made. The case put forward by the Metropolitan Board of Works for a new bridge is based on the erroneous assumption that out of 384,000 pedestrians who cross fourteen metropolitan bridges in a day, 332,000 go over Hammersmith, Battersea, and the intervening bridges. A slip of the pen, no doubt, only it is on this very slip that the argument in favour of a vast outlay is based. Sir Joseph Bazalgette has not availed himself of the opportunity afforded him by our former remarks to give any explanation of his figures. We take it for certain that Mr. Jones and Mr. Haywood have something definite to show in the way of figures; but we are anxious to have the real and full statistics of all the attempted eastward portions of the Thames brought before the world.

And here we must say that we think the public are entitled to demand an accord among experts before they part with a penny. Three advisers counsel three different modes. If a

fourth were called in he would probably be strong for a tunnel. Much as we admire the independence of the engineers of this country, we cannot but think that it would be better in such a case to adopt the Italian method, and to decide by a council of experts on the main features of a new engineering project, than to let every man fight for his own hand, so that, out of three professional men, no two agree on any point, except that the proposals of the third are totally inadmissible. As to this, every pair agree as against every third.

If it be not thought worth while to do the best that can be done with a steam ferry, while the engineers are making up their minds as to the best mode of crossing, it can only be because there is a shrewd guess that the small use that would be made of the ferry would be conclusive as to the small use that would be made of the bridge.

#### A HISTORY OF WALL PAPER.

THE seventh exhibition of the Central Union of Arts applied to Industry has conveyed some useful facts to the minds of the public with respect to the trade and manufacture of wall-papers. The Central Union is making every effort to do for French industry what South Kensington has achieved in England. Its organ, the *Revue des Arts Décoratifs*, having its observations on this year's exhibition, held at the Palais des Industries, gives us a good insight into the development of this trade throughout France. Without, however, going into all the elaborate details spread before us in the course of this lengthy and technical history, there are a few facts that may be of interest to English readers. First, we could not but note that the foundations of this industry were laid by Englishmen. Great and just as is the praise which has always been accorded to France for her skill in applying the arts to industry, we must in our own honour recall the French proverb, *Ce n'est que le premier pas qui coûte*. This "first step," though the most difficult of all, was taken by an Englishman, at least, so far as Paris is concerned. The manufacture of wall-papers was commenced at a comparatively recent date in France. The first record is that of a factory established at Rouen, in 1610, by Le François; but this was combined with the printing of pictures and the illumination of vellum, parchment, &c. Traces of wall-papers are to be found at Lyons, Orleans, Macon, and other towns, but these are not typical of a *bona fide* industry. They are isolated cases, where certain persons unable to imitate the Paris fashion of painting the walls of their houses, pasted paper of a more or less decorative character over them. The people who supplied such paper did not make a regular trade of the article. It was looked upon as an exceptional contrivance, adopted by a few persons whose means did not allow them to use paint, according to the fashion. But in the *Géographie Parisienne* of 1769 an announcement will be found, to the following effect:—"An Englishman, Mr. Lanck, has obtained from the king the permission to establish at Carrière, near Paris, a manufactory of wall painted paper, of painted prints for furniture, and all sorts of tissues. The general warehouse is in the Rue Saint Antoine, opposite the stores of Geoffroi-Lanier, and the public will find the wherewithal to satisfy its taste."

Some years later another similar advertisement will be found in the *Annuaire des Voyageurs à Paris*. This time it is the firm of Windor, Father, Son, & Co., who announce that they have undertaken to manufacture papers for covering walls, reproducing some of the finest arabesques of Italy, and others, we are told, are elaborately gilt, and all very handsome. The initiative thus taken, French manufacturers were not slow to follow the example; and, by applying their knowledge of art and their innate good taste to this new product soon won a high reputation. Political events also contributed to give publicity to the new trade. M. Réveillon, a manufacturer of wall-paper, who is described by M. Thiers, in his history of the French revolution, as having created, by dint of his industry and ability, "vast workshops where he was perfecting the national manufactures and gave employment to 300 workmen, was accused of seeking to reduce by half the salaries he was in the habit of paying." The rest of the story is familiar to readers of history, who know that the murder

of M. Réveillon, the sacking and burning of his house on April 27th, 1789, was one of the first acts of violence on the part of the mob which heralded the coming revolution.

Réveillon was certainly one of the first, and evidently at that time the most successful, of paper-painters; but his name and the nature of his trade will ever be associated with the record of the first outbreak of revolutionary violence. Many specimens, fortunately, still remain of his work. They are distinguished by their life, gaiety, elegance, recalling at times the Pompadour stuffs. By his papers he replaced the panelling, frieze, and other decorations, and secured, for this purpose, the services of the most talented designers of the day, such as Desrais, Prieur, Jean Baptiste, Fay, Huet, &c. By obtaining the collaboration of these artists, he disarmed opposition; no one could say that his papers were not most artistic. One of Réveillon's papers, printed in 1788, and designed by Prieur, is especially graceful, and all students of this subject will be particularly gratified to find that such precious relics have been preserved by *L'Union Central*. Réveillon was succeeded immediately by Jacquemart, who at first imitated his predecessor; but he had soon to yield to the influence which the painter David exercised over art. Like all the other sections of society, he had to sacrifice to the Greeks and the Romans.

Dufour, from Macon, who had followed the traditions left by Réveillon, came to Paris in 1807, but he was overcome by the bad taste that prevailed during the Imperial régime, and his productions were cold and pretentious,—more heavy than imposing. Some curious specimens of this artistic decadence are exhibited. The bad taste, after all, was but in harmony with all the surrounding circumstances; the firm was capable of some good work, as illustrated by a design dated 1814, drawn by Lafitte, painted by Madère, representing Psyche sacrificing to Venus. There are also some good specimens of the work of the firm of Cartulat-Simon, that existed from 1809 to 1835.

In 1830 a revolution was at last accomplished in this trade. Dauphin junior, whose father had founded an important firm in 1811, had the courage to abandon the stiff and unpleasant styles of the Empire and Restoration. In their stead he introduced a great variety of styles. The artist Martin supplied him with Arab and Moorish designs; then Aimé Genavard gave him a number of comic sketches; while Poterlet brought his brilliant and quick imagination to the service of the firm. Stuff, documents, illuminations of the Middle Ages, the Renaissance, the seventeenth and eighteenth centuries were eagerly disinterred, and even Pompeian art was freely copied. As, at the same time, the means of manufacture, the mechanical appliances, the size of the workshops, had all been greatly improved, the firm was fully able to suddenly carry out these great changes. M. Dauphin had also carefully studied chemistry, and hence science, industry, and art all combined to rid France of the incubus that had weighed on it so long. This proved a death-blow to the Imperial style. The wall-papers of Dauphin soon acquired the highest reputation, and every firm sought to imitate his bold initiative. He had succeeded in creating a new school. After Dauphin came the artistic struggles between the rival firms of Dalcourt and Défosse, to which the enormous progress achieved by this industry from 1850 to 1860 may be in the main attributed. In the wake of these valiant champions followed Genoux, Bezanit, Riollot, and many others.

From a technical point of view, there are two dates which are landmarks in the history of this trade. In 1835 the continuous or endless sheet of paper was invented, and in 1852 the machine was introduced. By these two inventions the cost of production was reduced to an unhopful for extent. In a country such as France, where wealth is more evenly diffused and large fortunes are comparatively rare, cheapness is especially essential. At the same time, art is not improved by the cramping influence of machinery. Great, therefore, have been the disputes that have arisen as to the evil influences resulting from the use of machinery. It is urged that art is murdered by the bad taste introduced by mechanical processes. On the other hand, the manufacturers argue that purchasers would be repelled if the trade did not avail itself to the full

of all the advantages derived from modern appliances. Unfortunately, both these arguments are true, and unless the manufacturers display great public spirit, and some disinterestedness, the trade is likely to degenerate. True artists must be employed in the work, and they must seek by ingenious contrivances to impart to mechanical production an artistic stamp. Art for art's sake is but a hollow cry when applied to the decorative arts; for art is of little practical value unless it can be made to apply to the things of everyday life.

By the aid of such exhibitions as those which have just been held, this end will be more readily attained; and the display of specimens of the best work, from the earliest record of the trade down to the present day, must be of great and suggestive value to designers, artists, and manufacturers.

#### ICONOCLASTIC VANDALISM IN FRANCE.

WHENEVER there has been a change of dynasty or alteration of the form of government in France, one of the first "reforms" to be carried out has ever been the changing of the names of a considerable number of streets in the principal cities of the country. Any *rue, avenue, or place*, bearing a name derived from the leading personages or events connected with the *régime* last abolished is re-christened with a title agreeable to the form of Government which has displaced it. Proceedings of this sort are childish enough, but they do little or no harm. They are calculated to raise a smile of contemptuous pity on the countenance of an impartial observer; but except as being comical manifestations of a kind of feminine spite and undignified bitterness unworthy of a great nation, such incidents do no permanent injury. But the deeds of the Commune, the throwing down of the Vendôme Column, and the application of petroleum to the destruction of some of the finest buildings in Paris, are only the outcome of a more virulent form of the same spirit of barbarous ignorance and malice. Against any repetition of these acts of violence it is but natural that every lover of art and architecture throughout the world should raise his voice in indignant condemnation. The events which have been taking place recently in connexion with the agitation among the mining population of Montceau-les-Mines and the anarchists of Lyons, unfortunately show that a certain political party in France is still capable of the most atrocious and savage acts of Vandalism. The anarchists with their dynamite have proved themselves not only enemies of architecture and art, but of human society itself. This latter part of the subject we leave for others to deal with. In these columns we must be content to record some of the facts which have come to light in proof of the iconoclastic mania of the newest school of French anarchists. At Montceau-les-Mines, the Vandalism of the agitators was directed against such images of the Virgin and such representations of the Crucifixion as they could lay hands on. These objects, it turns out, were first holed with regular blasting instruments and then shattered to pieces with charges of dynamite. With respect to the outrage in Lyons, where the anarchists employed dynamite to blow up a *café* resorted to by persons whom they disliked, it has been shown that the act had been contemplated for some time, and was in fact, foretold in one of the revolutionary organs more than six months ago.

That such deeds of barbarism can be perpetrated even by the very lowest class in France is a fact of the greatest gravity. But there are those belonging to higher classes who are hardly less guilty than the most violent of the extreme revolutionaries. It is a fact that for some time past many men among the more respectable sections of the Republicans have been urging the Government to undertake what has been called a "purification" of the public statues throughout France. These more moderate Republicans desire to have their own heroes honoured in this form, but not content with obtaining permission to erect statues to those whom they admire, they demand that the authorities shall remove or destroy all the monuments erected to the heroes of the Royalists, Legitimists, Orleansists, and Bonapartists. The Republicans, as we have above hinted, have already substituted Republican for Royalist and Imperialist names of streets,

roads, and places. Now they go further, and for a couple of years past they have been importuning the Minister of Education to do away with any statues except those whose originals the parties at present in the ascendant recognise as having been patriots.

Hitherto the Government has not given way. But the question is, will it be able, in the long run, effectually to resist the importunities of its supporters? There are about three thousand public statues in France, and three-fourths of these even respectable Republicans wish to have thrown down and destroyed. As the Ministry has not yet made up its mind to yield to the iconoclasts, the mob is beginning to take the work into its own hands. Some time ago an attempt was made to blow up the statue to Thiers at St. Germain. Soon after, the fountain of St. Sulpice, which is adorned with figures in stone of France's greatest pulp-orators,—Fénélon, Bossuet, Fléchier, and Massillon,—was threatened with destruction. Upon the fountain the agent of a secret committee had written the sentence passed by that occult organisation condemning all these figures to destruction by dynamite, and the fact that this has not yet been carried out is solely attributable to the unceasing vigilance of the police. On the other hand, in some quarters the authorities have been, to a certain extent, yielding to the narrow prejudices of the iconoclasts. Thus the *Maire* of Caen caused the statue of Louis XIV., which stood on the Place Royal, to be removed. Fortunately, in this instance, the outcry of the local opponents of the act was powerful enough to induce the *Maire* to refrain from destroying the statue, and in ultimately compelling him to set the statue up again in a less prominent spot. Again, the Town Council of Marseilles has passed a resolution requiring the removal of the statue of Bishop Belzunce. The decision has met with no opposition. It is attributable purely to a blind hatred of everything connected with the Church and priesthood. The fact that Bishop Belzunce has had a statue erected to his memory, chiefly in consequence of his heroic self-devotion to the wants of the Marseillais victims of the terrible plague of 1720, has had no weight with the fanatic anti-religious and iconoclastic politicians of the present day.

When such is the conduct of official personages and corporations, the Vandalism of the ignorant and fanatical anarchists of Montceau-les-Mines is hardly to be wondered at. Altogether, for the lover of art, the present state of feeling amongst large classes of Frenchmen with regard to their national monuments is one of the most depressing facts of contemporary history.

#### THE USE AND ABUSE OF SCREWS IN WOOD WORK.

ARCHIMEDES is credited with the invention of the screw, but whether the famous geometer's labours extended much further than the enunciation of the scientific principles and the mechanical power of the screw, it is difficult to say. If he made a screw, he certainly must have tried its effect, and was probably well satisfied with its performance, for in the whole range of mechanical appliances in the constructive arts there is not a more useful article than the screw. Archimedes is further reported to have said, "Give me a prop, a position, and a lever strong enough, and I will move the world," and, no doubt, if these conditions could be granted to him, he, as well as others after him, could lift the earth, or ought upon the earth, by a combination of the tremendous lifting and driving powers exercised by a series of screws, apart from the lever. Screws are various, and of various sizes, forms, and materials, but the same principle runs through them all, whether they be manufactured for use in metal or woodwork, or for exerting a lifting, driving, or pressing power separately. Our object here is not to treat of screw-cutting, but rather screw-driving in woodwork, and to throw out some useful hints to the building constituency, and particularly workmen. The use and abuse of screws is a matter of importance to architects, builders, and their clients, for it is according to the way screws may be applied in several building and kindred operations that good or bad workmanship will be evidenced.

Screws are more extensively used than formerly in putting together various kinds of wood

framing, and even in cabinet and chair work screws are pressed into service in places where their use would not have been tolerated by manufacturers in the earlier portion of the present century.

Although their existence is generally concealed in furniture and fancy work, they are often present, nevertheless, and too often they are used as a substitute for dowels, dovetails, and tenons, in the manufacture of cheap work. It is an instructive and remarkable fact that our building workmen of a century or two back, in many operations in carpentry and joinery, discarded, as far as was possible, the use of nails or screws, depending more on carefully-jointed work, put together by means of mortise, tenon, dovetail, hard-wood dowel, or oaken pin. Their work might have taken a longer time to execute than that done by our present race of joiners and woodworkers, but it was infinitely more lasting, and kept together so long as the timber or wood continued sound. The nearly universal remedy now for every broken article on the part of the jobbing joiner and cabinet-maker is to repair it with the aid of a nail or a screw. Glue is even often dispensed with, or used where it will exercise little sustaining power, and coloured putty is not only made to cover the heads of sunken nails and screws on the face of a piece of work, but used also to hide bad joints and workmanship. Some years ago the writer examined an old oaken staircase and hand-rail in a college, which work was executed more than two centuries since, and in the construction of which not a nail or a screw was used. From time to time, over long years, some slight repairs were made, but the workmen during their operations were never able to discover that a nail had been used in the original construction. There were mortises and tenons, grooves and tonguing, wooden pins or dowel work, but no iron fastening of any kind. The writer also examined more than one old roof in which the use of iron spikes, nails, and other iron fastenings was dispensed with, and the joining of the timber was effected without their aid. In the hinging of doors and other framework it is necessary to use screws, but, unfortunately, many workmen, if not watched or cautioned, will not do the screwing properly or in a workmanlike manner. In deal, pine, and other soft woods a Bradawl is sufficient to make an opening for the screw, which opening, of course, should be less than the thickness of the body, and short of the length of the screws used. It will be found, however, that most workmen, not content with tapping the screw a fourth of an inch or so to give it a hold before applying the screw-driver, will actually drive the screw into the wood two-thirds of its length with the hammer. This the workmen will do to save themselves trouble. If there be two hinges upon a door, and if each hinge has eight screw-holes,—four in each plate,—the chances are that the workmen will drive half of the screws nearly home in the door-stile and frame with his hammer rather than take the trouble of driving them gradually home with the screw-driver. Hence, if the door be a massive or heavy one, the weight of it will tend to the hinges loosening, and after a time will follow a train of other ills,—the "dragging" and "rubbing" of doors, and their makeshift cure in what is known as "easing" them. If remonstrated with for driving a screw nearly home with the hammer, the workman may probably say (as some workmen certainly think) that a few turns of the screw in the wood are sufficient. This is an erroneous and mischievous idea. A screw that is nearly driven its whole length with a hammer cannot make a regular and corresponding thread or spiral in the wood, and therefore its binding and maintaining power in keeping the hinge in its place is all but gone. Workmen should be made to drive every screw home gradually with the screw-driver, and not only an odd one. In hard-wood operations as well as in soft woods, particularly in hinge work, screws should be properly driven, and the aperture or opening made for the passage of the screw should be much less than the thickness of the screw to be driven. The screw will bite a sufficient passage for itself. In hard wood, however, it is necessary to give a little more freedom of entry to the screw than in soft wood, and a gimlet is needed for making the suitable opening instead of the Bradawl.

A difficulty is often experienced by persons who wish to withdraw a screw, by finding that though it will turn round under the application of the screw-driver, yet it will not unscrew

out. In this case a well-grounded suspicion may be entertained that the screw in question was driven, or nearly driven, home originally by the hammer, instead of gradually by the screw-driver, and that no regular thread corresponding with the screw exists in the wood. Under such circumstances it becomes necessary often to wrench off the hinges or hinges by force, at the risk of their breaking, and this often happens. When hinges have lain undisturbed for long years on old doors or other framings, perhaps for a quarter of a century or double that time, it becomes difficult to extract the screws, although they may have been originally properly driven. This arises from the screws rusting in the wood and sometimes from other causes. Workmen themselves often fail to withdraw a screw, and are forced to break the hinge to enable them to get under the head of the screw, and wrench it out. They often split, and break too, fancy and delicate wood-work articles in their efforts to take off hinges, locks, mountings, and other finishings, despite that simple methods exist for extracting screws that have rusted in the wood. One of the most simple and readiest methods for loosening a rusted screw is to apply heat to the head of the screw. A small bar or rod of iron, flat at the end, if reddened in the fire and applied for a couple or three minutes to the head of the rusted screw will, as soon as it heats the screw, render its withdrawal as easy by the screw-driver as if it was only a recently-inserted screw. As there is a kitchen poker in every house, that instrument, if heated at its extremity, and applied for a few minutes to the head of the screw or screws, will do the required work of loosening, and an ordinary screw-driver will do the rest without causing the least damage, trouble, or vexation of spirit. In all work above the common kind, where it is necessary to use screws, and particularly in hinge-work and mountings, fancy fastenings and appliances affixed to joinery or furniture work, we would advise the oiling of screws or the dipping their points in grease before driving them. This will render them more easy to drive and also to withdraw, and it will undoubtedly retard for a longer time the action of rusting.

As matters obtain now in carpentry, joinery, furniture, and other wood workmanship, with regard to screws, although they cannot be dispensed with, yet it would be advisable in sundry classes of woodwork to minimise their use, and in other cases to do without them altogether. They can seldom be used with advantage to the displacement of mortise and tenon or good dovetail or dowel work. The growing practice of putting together woodwork with screws bespeaks a decadence of skilled labour, and of nails and screws there are far too many pressed into service in our workshops and dwellings. While admitting the usefulness of the screw in various ways, we have here endeavoured briefly to show its abuse in woodwork, and at the same time to afford some hints for better methods of procedure in building and kindred workmanship.

#### THE BRAZILIAN EXHIBITION AT BERLIN.

In the extensive apartments belonging to the Club House of the Berlin Architects an interesting exhibition of Brazilian products has recently been opened. The various collections present a vivid picture of the vegetable, animal, and mineral wealth of tropical South America. The walls are covered with the skins of panthers, pumas, jaguars, coats, opossums, and ant bears, grotesquely or artistically grouped together, or combined with richly-carved Indian weapons, bows, arrows, and quivers, and various ornaments, such as necklaces of teeth, wooden combs, &c. There are also fine examples of Brazilian vegetation, including palm trees, giant grasses, mosses, and the great creeping plants of the primeval forest. In the more strictly commercial department of the Exhibition the special section devoted to coffee is beyond question the most striking and important. Here we find a great pyramid, which illustrates in the clearest manner the total annual coffee production of all the tropical countries and the relative share of each. The base of the pyramid is a cube representing the grand yearly total, amounting to 615,711,200 kilograms. Immediately above this comes the block representing the proportion of the whole produced by Brazil, and amounting to 300,000,000 kilograms.

Next come the Dutch colonies in the East Indies, and then Venezuela, Ceylon, Haiti, &c., each being represented by a proportional block rising one above another in diminishing scale. Another portion of the Coffee Exhibition presents us with the actual article itself, of which we find here no fewer than 200 varieties. Another section of the Exhibition is devoted to sugar, with specimens of the Brazilian sugarcane and cane sugar. Close to these are samples of sugar, brandy, and rum, and further on the Paraguayan tea called *Cha do mate*. The exhibition of Brazilian timber and dye-woods is also very complete and interesting. Especially notable are the Ipé wood from Pernambuco and the cedars from Sao Bento. Other sections are devoted to different sorts of cotton, wines from Campo Bom, orange wine, malt, cocoons and silkworms, with some very beautiful raw silk, white and yellow, and a great variety of fruits and seeds. The department of preserved fruits is very extensive, and includes many varieties almost unknown in Europe. The section devoted to fibres adapted for spinning cord or ropemaking is also very important. There is, in addition, an immense variety of miscellaneous articles which we have no space to mention, and among which we can only note the bricks and tiles of Pernambuco, and a complete earthenware stove from the latter place. An interesting collection of articles had been sent for the ethnological section, but many of them were lost through shipwreck on the way to Europe, especially a collection of primeval earthenware vessels. However, the Exhibition still shows a curious collection of objects of the Stone Age of the Brazils, including stone weapons, arrow and axe heads, as well as some stone plates. Altogether, the Exhibition is one of singular interest, and is well adapted to forward the object of the Berlin Society for the Study of Commercial Geography and of the Berlin Architects, who have brought it together, viz., to promote the extension of trade between Brazil and Europe.

#### THE EXAMINATION OF PORTLAND CEMENT.

CONSIDERING the interest which the question of the adulteration of Portland cement has lately aroused, it will be useful to briefly quote a valuable article on the subject which appears in a recent issue of the *Annales des Ponts et Chaussées*. After an introduction in which reference is made to the importance of examining every description of cement before it is used, numerous analyses are cited, showing the composition and the causes of the hardening of cement, of which the following are the most noteworthy, as supplying a comparison between French, English, and German cements, viz.:—

##### a. French Cements.

	Lime.	Silica.	Alumina.	Oxide of Iron.	Sulphuric Acid.	Magnesia.	Water, &c.
First sample	61.29	23.82	8.09	3.24	1.17	Trace	2.44
Second sample	60.85	23.70	9.83	2.75	1.00	Trace	1.87
Third sample	59.40	24.19	7.20	3.35	0.55	0.95	4.45

##### b. English Cements.

First sample	61.72	23.07	8.55	3.25	1.45	Trace	1.96
Second sample	63.00	21.35	8.53	2.70	0.68	0.43	3.79
Third sample	58.29	23.50	6.20	6.76	1.62	0.82	3.79

##### c. German Cements.

First sample	62.68	23.29	5.43	2.47	1.03	1.10	3.44
Second sample	63.21	22.81	2.69	3.52	1.12	3.00	3.95
Third sample	63.27	19.80	6.73	3.22	1.08	2.02	3.84

With the increase of lime up to a certain degree, the liability of the mixture to sinter declines, the hardening requires a higher temperature, the product gets harder, and furnishes a cement of greater resistance. A great value is to be placed upon the presence of magnesia, and the excellence of German cement is partly due to the higher percentage of magnesia, as seen from the above table. One of the most essential conditions of the successful production of cement is a careful composition of the parts. In this respect the German mode of manufacture is favourably referred to, and manufacturers are cautioned against leaving the composition to the practice and experience of the workmen. Wherever large quantities of cement are to be used, it is essential to inquire into the care exercised in the manufactories in the composition.

As regards the removal of the cement from the kiln, it is pointed out how necessary it is to

keep the hard and badly-burned stones carefully separate; cement turning into a fine powder in cooling is totally unfit for use, and must be rejected. The cause of this disintegration is a superabundance of alumina. In order to save the mills, manufacturers employ a coarse grain for hard-burned cement; but a fine grain should be insisted on, because coarse pieces of hard cement act in the mixture like sand. In receiving and using cement, care must be taken that it is not too fresh. It is a mistake on the part of manufacturers to pack fresh cement at once in barrels or sacks. Cement, when finished, must be left exposed to the air for some time, in order to allow of the excess of quicklime to slake itself. English cement manufacturers pay great attention to this point, and leave the fresh cement spread in thin layers for some time.

The microscopical examination of cement with regard to its quality is highly recommended, because it enables us to discover foreign ingredients, especially the presence of blast-furnace cinder. But it is difficult to carry on microscopical as well as chemical examinations on building sites, independent of the consideration that it is impossible to recommend a certain composition as the best. It is to be recommended to examine cement for its weight and its density, for cements are proved to be better the denser they are. The difficulty of the examination consists in determining the comparative density of various descriptions of cement. In supplying the large quantities for the harbour works at Boulogne, the rule was laid down that the cement must contain no more than one per cent. of sulphate of lime. Further numerous data on the effect of the fineness of cement, practical experiments, determination of time required for setting, production of test pieces, experiments as to strength, and the effect of age on the resistance of cement, make the paper to which we have referred one of the most complete on the subject. The writer is M. Barreau, Ingénieur des Ponts et Chaussées.

#### THE ADULTERATION OF PORTLAND CEMENT.

In order to discover whether cement has been adulterated with blast-furnace cinder, 5 grammes of cement are put in a glass containing 50 grammes of diluted muriatic acid (one part of pure acid and four parts of water). To prevent parts of cement settling at the bottom, the mixture must be stirred with a glass or wooden crusher. Pure cement imparts a yellowish colour to the solution, without rendering it turbid. If, on the contrary, the liquid turns turbid (milky), from the presence of suspended sulphur, while, at the same time, the yellowish tinge disappears, and a strong smell of sulphuretted hydrogen (like rotten eggs) becomes perceptible, this is an indication that blast-furnace cinder has been added. Presence of ground limestone or chalk may be detected in a similar manner. If, on pouring the diluted muriatic acid on the cement, an ebullition takes place, it is a proof of the adulteration with those substances. The greater the ebullition, the larger the addition. Pure cement does not effervesce, because no carbonate of lime is contained in it.

#### THE EMPLOYMENT OF TERRA COTTA IN GRECIAN ARCHITECTURE.\*

THE remarkable advantages which antiquarian knowledge has derived from the explorations at Olympia have become more appreciable, since the termination of the work has permitted a systematic arrangement of the objects found and the institution of a comparison between them and similar discoveries made elsewhere. Thus fragments at first sight of no apparent value often acquire an unlooked-for significance, from the fact of their throwing light upon the extent of the employment of various objects which have been from time to time found in places distant from each other.

The foregoing remarks are specially applicable to the terra cotta which was formerly used for constructive purposes. Specimens of this material have been found in more or less considerable numbers since the commencement of the explorations, the importance of which, from an architectural point of view, has only been recognised at a comparatively recent date.

\* *Tausische Zeitung* (Berlin).

Although the questions involved had not been finally settled, a reference to them is appropriate in connexion with Winkelmann's treatise on the use of terra-cotta in the *geison* and roof of Greek buildings.\*

At one time it was an accepted principle that in both sculpture and architecture the Greeks rejected special colouring substances, and in all cases preserved the natural colour of the material.

As to both subjects, modern research has proved the unsoundness of this theory. In consequence of more careful observation during the course of explorations, traces of colouring have been noticed with certainty. Thus the conviction gains ground that the buildings themselves, as well as the reliefs and rows of statues, were coloured for ornamental purposes; and what is true of statues when used in architecture must also be considered as holding good with respect to them when they are independent works of art.

The extended acceptance which the theory hitherto current met with is ascribed to the fact that observations as to the presence or absence of colouring were made more or less accidentally by travellers, whose negative expressions were considered (though opposed to positive assertions) sufficiently capable of proof to controvert any ideas as to the original use of colouring. Besides, although traces of former colouring may have been noticeable when discoveries were made, it would, of course, be difficult to find them after some time had elapsed, particularly in the case of marble, which would in the sun rapidly lose any remains of colour in consequence of the drying which would thus be caused to take place.

It is particularly by means of the discoveries made of terra cotta that light has been thrown upon the polychromatic treatment of architectural works in ancient times. In cases where the burning in of the colours imparted considerable durability to them, observations have not been made in merely a cursory manner, but numerous specimens have been preserved, and an augmentation of the present number of them in Germany is looked for in accordance with arrangements which have been made.

The discovery of the treasure-house of Gela has had much to do with settling the various questions at issue as to the employment of terra-cotta in Olympian architecture. Most of the Grecian states and colonies are supposed to have had special edifices or treasuries at Olympia, in which the sacrificial gifts brought by the inhabitants of the different states were safely kept. They were situated close to each other on the terrace on the southern declivity of the Kronion Hill, and their sites can still be traced by the foundations, though the structures themselves have long since disappeared. Yet sufficient evidence exists as to the materials of which the Gela treasure-house was composed to show that the *geison* and *sima* were not prepared in the same manner as the other stones in the building. Traces of bronze nails having been discovered in these stones at regular intervals, and specimens of painted terra-cotta work found in the immediate vicinity presenting corresponding appearances, the conclusion has been arrived at that the latter were at one time fastened to the former.

The architects who had so far elucidated the question at issue did not, however, content themselves with the progress thus achieved, but pursued their researches in other places, more particularly in Sicily. From their investigations it was satisfactorily proved that the style of architecture of the aforesaid treasure-house was similar to that usual in the district of Gela, in Sicily. It has therefore been presumed with more or less reason that the portions of the building which still exist were exported at Gela and transported to Olympia.

It was also found that other Sicilian cities contained examples of a similar kind of incrustated terra-cotta to that found at Olympia. In particular, the temples at Selinus (from which several sculptures and architectural objects are to be found in the museum of Palermo) are noteworthy for the arrangement of the numerous terra-cotta slabs, the importance of which to architectural research had not previously been fully recognised. The colours of the various slabs are not uniform, but black, red, and yellow

\* It is remarked that on the pillars which support the structure, rests the architrave, and then follows the frieze. Above the frieze comes the *geison* made of intersected projecting stones, which may be considered as supports of the roof; then the *sima* with a gutter, as finishing off the lower part of the roof.

predominate. It is conjectured that the slabs must have been re-baked after being coloured, and to this operation is ascribed the durability of the colouring substances employed. The principal ornamentation consists of a Vitruvian scroll, and an entwined ribbon pattern. Palm-leaves also occur frequently, but other designs are also met with.

#### INTERNATIONAL EXHIBITION OF FINE ARTS AT MUNICH, 1883.

THE Artists' Society of Munich have issued an address to all artists connected with the plastic arts, inviting them to participate in the next International Exhibition of the Fine Arts, which will take place in Munich next year, 1883. The address runs as follows:—

"To Artists! Comrades!—In the years 1869 and 1879, Munich, the capital of the art-loving princes of Bavaria, gave a cordial reception to its guests at the great International Exhibitions of Art in those years. Artists and laymen alike received valuable impressions from those displays, which contributed materially to foster and promote the noblest efforts. What was then so well begun, the artists of Munich are resolved to continue, and they make it a point of honour to perform this duty. Once more, therefore, we invite all our comrades in art to a peaceful contest, and to assist in bringing together a rich display of contemporary artistic talent and creative energy. The third International Exhibition of Art in Munich, in 1883, will, it is hoped, present fresh evidence that in their efforts to attain the highest aims of art all nations are united. In the course of a few days, the detailed programme drawn up by the Central Committee of the Exhibition will be issued. At the present moment we wish in particular to make known that his Majesty King Louis II. has been pleased again to accept the office of Protector or Chief Patron of the Exposition. The Bavarian Government has also promised its active sympathy and support, and to grant gold medals for the reward of the most distinguished contributors. A large number of the works exhibited will be bought by help of a lottery, while the success of the late Munich exhibitions affords sufficient guarantee for further excellent opportunities of disposing of works that are for sale. The plan we purpose following on the approaching occasion is that each country should have a separate collective exhibition, with a jury of its own countrymen; while the committees entrusted with various departments will invite the co-operation of foreign artists to assist them in the performance of their tasks. It is intended that the Exhibition shall last from the beginning of July till the end of October. These few remarks will be sufficient to give a preliminary idea of what we purpose. We shall use our utmost endeavour to give you a worthy reception. Accept, therefore, our friendly invitation."

#### THE OLD MANOR HOUSE ESTATE AT DULWICH.

WHAT is historically known as the Old Manor House Estate, at Dulwich, which was Edward Alleyn's first seat at Dulwich, about the period which he was founding his college, will very shortly be covered with modern buildings. The whole of the estate, about 15 acres in extent, has been let on lease for building upon, and is now being laid out for that purpose. The ancient mansion, in which Alleyn resided, has just been taken down; but the timber on the estate, which includes several fine old trees, yet remains, and in laying out the estate it is intended to preserve as much of it as is possible. An old pollard elm, standing in the grounds, close to the site of the mansion, and which is of great age, is of unusually large dimensions, being between 8 ft. and 9 ft. in diameter, and about 26 ft. girth. This tree is believed on many occasions to have formed a pleasant shelter for Alleyn and his dramatic and other friends. The estate now about to be utilised for the erection of suburban villas extends from the old high-road leading from Norwood to Dulwich, to the foot of Gipsy Hill in a south direction, and westward it stretches almost to the boundary of the cemetery. On the east side it extends to the grounds of the new college. The roads are now being laid out, and building has already commenced. The residences to be erected on the estate are about

180 in number, of rentals ranging from 60l. to 120l. per annum. The houses are all to be built under the immediate superintendence of Mr. Charles Barry, architect to the Dulwich Estate.

#### THE LONDON AND PROVINCIAL FIRE ASSURANCE COMPANY'S NEW BUILDINGS.

At the corner of Abchurch-lane, King William-street, the London and Provincial Fire Insurance Company are erecting an extensive block of new buildings, a portion of which is intended to be occupied by the company, whilst the upper floors will be let as offices. The buildings will have a handsome and commanding elevation in Portland stone, in which a profusion of elaborate and ornamental carving will be introduced. The frontage is 36 ft. in length, and extends to a depth of 80 ft., the height of the building, which contains five floors besides a deep basement, being 58 ft. The elevation at each angle is surmounted by two towers, rising to a height of nearly 70 ft., and above the main cornice in the central portion of the frontage there are ornamental gables. The ground and the first, second, and third floors have bold mullion windows. Immediately above the ground-floor windows is a deep projecting cornice, surmounted by a balcony. There are richly-carved panels carried across the frontage between the windows of each floor, and similarly carved panels and pilasters at each angle of the elevation. The second-floor windows are surmounted by arches, within which there is some very elaborate carving, including the arms of the company. The top floor of the building is in a high-pitched roof, covered in with sea-green slates, the towers being covered with the same material.

The main entrance to the building is in the centre of the ground-floor, the whole of which is intended to be occupied as one large apartment for the transaction of the business; and containing an area of about 2,400 ft. It will be very artistically decorated and fitted, and will be lighted by an ornamental lantern in the centre covered in from an open well, faced with white enamelled brick, from which several of the offices in the upper floors of the building will also be lighted. A considerable portion of the basement, which will also be occupied by the company, will be fitted up as a strong room. The ground-floor portion of the building will be entirely fire-proof. There will be a separate entrance at the corner of King William-street, leading, by a stone staircase, to the upper floors containing the general offices.

Messrs. Davis & Emmanuel are the architects, and Messrs. Trolope & Sons the contractors. Mr. Richards is foreman of the works. The cost of the building will be about 10,000l.

#### STAIRCASE OF THE "PUERTA ALTA," OR "CORONERIA," BURGOS CATHEDRAL.

We learn from Spanish historians that Don Juan Rodriguez de Fonseca, an eminent prelate, who resided at Burgos from 1513 to 1524, impelled by veneration for the basilica of the city, the work of Francisco de Colonia, conceived, in 1516, the idea of dismantling the staircase of the upper door, and of replacing it by a more ambitious piece of architecture. Accordingly, he had the old staircase removed, and submitted to the cathedral chapter a sketch for a new erection, drawn by a certain Diego Sylve, an artist of the time well known for his works. The project was sanctioned, as we learn from an entry made in the minutes of the chapter meeting on November 4th, 1519, and begun and completed under the prelate's supervision. As late as 1866 it was not known who was the originator of the design; and it was only then discovered by the learned author of the "Historia del Templo Catedral de Burgos," Señor Don Manuel Martinez y Sauz, canon of the cathedral.

The staircase, of which we give an illustration in this week's *Builder*, is placed on the north side of the transept, between the chapels of San Nicolas y del Nacimiento and of the Concepcion de Nuestra Señora, and served formerly for the upper door or *coronaria*, which was closed in 1786, by order of the chapter, on account of the draught which it caused in the church. The staircase was called in the sixteenth century, and even later, *escalera de rada*

(gilded staircase), on account of the ironwork being gilt. The latter is stated to be the work of a Frenchman, Hilarie, and not (as is erroneously asserted by Señor Madzo, in his "Diccionario Geográfico") of Cristóbal de Andino, architect and sculptor, who, however, made the valuable ironwork which adorns the chapels of the Condestable and of the Consolación y Presentación de Nuestra Señora. On the staircase, which was erected and completed in 1522, is placed an altar for the Maundy Thursday celebrations.

#### WAREHOUSE, HARROW-ROAD.

THESE premises are amongst the largest which have been erected in London in connexion with the leather trade. They have been built by Messrs. Lilley & Skinner. A spacious and very light basement, nearly 14 ft. high, gives accommodation for about 130 persons engaged in the manufacturing department. On the ground-floor are the private and clerks' offices and waiting-rooms, a large leather show-room, goods entrance, and lift. The three upper floors consist of warehouses and show-rooms. The frontage is about 110 ft., and the site, which occupies a conspicuous corner against Paddington-green, forms a part of Harrow-road as widened and improved by the Metropolitan Board of Works.

The building was erected from the designs of Mr. J. Wallis Chapman, of 11, Sutherland-gardens, Harrow-road, by Mr. J. Woodward, of Wilson-street, Finsbury, in fourteen weeks.

#### NEW STREETS AND COMMUNICATION BETWEEN HOLBORN, THE LAW COURTS, AND THE STRAND.

THE completion of the new Palace of Justice, and the certainty that very shortly this important work of Mr. Street's will be opened by royalty, —either the Queen in person or the Prince of Wales,—brings to the subject of the approaches to the building prominently before us.

One of the longest-felt wants in our street communications, and one of the most obvious in that business part of London, not being actually in the City nor the West End, long, indeed, before the Post Office had formed its districts, and called this one "West Central," —has been the want of direct connexion north and south between the line of the "New-road," as it used to be called, which receives all the streams of traffic from the high ground of Hampstead and Highgate, and the slopes of the same, as Haverstock-hill, &c., and the line of the Strand,—from which steep streets run down to the Thames Embankment.

The Holborn line runs about midway and parallel to these two main lines, receiving on the north and giving out on the south, as it were, in some few irregular little streams, the traffic which ought to flow on in continuous courses. None of these pass onward in anything like a direct line. Some come altogether to an abrupt ending in Holborn, and a passage can only be continued southwards through small and distant openings, almost lost amidst a locality filled with poor and narrow lanes, which should have been marked "no thoroughfare" long ago, as they lead nowhere, and end only in confusion and dirt. Only the London cabman can be trusted to find an exit through the tortuous and narrow ways from Bloomsbury or the neighbourhood of Lincoln's Inn Fields to Somerset House, or that part of the Strand between St. Mary's Church and St. Clement Danes. If a stranger try it, he is as likely as not to get into a very dirty and once really dangerous *cul de sac*, and he set upon by little ragged urchins offering to show him the way out, hoping for some trifle for so doing. To find one's self caught in the neighbourhood of Clare Market without plenty of time to seek one's way out is really not a pleasant matter, as many of our readers may well know.

From time to time remedies for this state of things have been suggested, but when the great discussion as to the site of the new Law Courts was going on, some special plans were produced differing according to the position in which it was suggested the Palace of Justice should be built. One notably,—proposed as the site the centre of Lincoln's Inn Fields, giving additional access thereto by openings north and south of that locality. In that case of course the objections of the occupiers of the houses

adjoining, to the great traffic brought to and through the Fields, would have had to be overcome.

But the erection of the Law Courts on the Carey-street site, as it is called, and the completion of them for the present, have both set aside all these premature schemes, and afforded an opportunity for bringing forward one which is eminently practicable,—designed by Mr. C. Forster Hayward, F.S.A., architect,—which we reproduce in our present issue. Though long contemplated by the author, it is new in the sense of being just adapted to the circumstances of the present time and the exigencies of the case.

It is evident to any one who either knows or studies the locality that, owing to the laying out of the streets and squares in the Bloomsbury district so as to give no through line anywhere,—an arrangement more like the setting out of a maze than of the streets of an inhabited town,—there is but one long direct line from the north by Euston to Holborn, past St. Pancras Church, through Russell-square and Southampton-row. This is continued in a direct line across Holborn as far as Great Queen-street, through Little Queen-street (which it was proposed to widen only a year or two ago, and to which improvement the Metropolitan Board of Works were willing to contribute a large sum), and there stops abruptly, the traffic being diverted at right angles,—eastward into Lincoln's Inn Fields, and westward along Great Queen-street, taking its onward course by Drury-lane or Long-acre. The fine old houses on the west side of Lincoln's Inn Fields have all large gardens at the back, on part of which exist some old sheds and one-story buildings, not only of little value, but some of a highly objectionable nature, so that there is no formidable range of buildings to take down nor valuable businesses to require compensation.

Mr. C. F. Hayward, besides being an architect of many years' standing, is the District Surveyor for the St. Giles's district, and being, as may be supposed, well acquainted with the locality, has planned to continue this line southwards by a new street cut through the gardens, sheds, and similar unimportant property existing at the back of Lincoln's Inn Fields, passing through Chapel-mews and Bear-yard with a slight curve, and so avoiding the Roman Catholic chapel in Sardinia-street and the School Board schools in Vere-street. At this point the new street would open into a wide "Place" or "Circus," the centre of which would be in the exact line of the west side of Lincoln's Inn Fields, to which it would be opened by removing some old projecting buildings in Portsmouth-street. Some new frontages already built would form part of this new Circus. It would then pass on to the Carey-street front and west side of the new Law Courts, and so on to the Strand, near St. Clement's Danes, leaving King's College Hospital on the east and Clement's Inn on the west intact.

By a continuation of Newcastle-street, Strand, in a direct line to the Circus (with very little demolition of property, as it would cross two streets in that small distance), the traffic for the west would be diverted from the line of the Law Courts and pass out through Newcastle-street, close to the Church of St. Mary-le-Strand. This special facilities would be separately afforded for both the south-eastern and south-western traffic to and from the north without entering Lincoln's Inn Fields at all.

It is supposed, however, that suggestions from another quarter for opening up the north-western end of Lincoln's Inn Fields, through Little Turnstile from Gate-street, are under consideration, and if so, the traffic requiring to go in that direction will also be facilitated; but this opening alone would not permit of direct northern traffic, and, although in itself desirable, would still leave the difficulty of direct communication in that direction just where it is. At the same time this opening into Holborn would form an admirable supplement to the plan herein proposed, and the objections which the inhabitants would surely raise if the whole of the traffic northwards were carried through the western side of Lincoln's Inn Fields, would be less if the main traffic northwards were diverted to a more direct line behind, and only such portion as required to go towards the City passed through the fields.

The importance of the subject to this locality of the metropolis is considerable; for the utilising of vacant ground, the improving the rating value of the district, at the same

time that the thoroughfares are increased in number and some widened and improved, cannot but be matters of special interest to the inhabitants of the locality. It is seldom that so large and so long-acknowledged an improvement can be so easily and so cheaply accomplished, there being hardly any other neighbourhood wanting communications where there is at the same time so little in the way of them; for where the ground is not actually vacant, the property is generally so wretched and bad in a sanitary as well as a constructive point of view, that it has long been understood to require renovation the first opportunity.

The opening of the new Law Courts will show the necessity for some plan for access on the north-western and south-western sides, and it is submitted that the plan proposed herein is the most desirable to adopt in the interests of the public generally as well as of the inhabitants of the locality in particular.

Many additional communications suggest themselves, and some are shown upon the plan, such as the connexion which might be opened with Covent-garden, now that the street,—late Princes, now Kemble street,—is widened, and bounded by Peabody Buildings, and with Long Acre through the head of Great Wild-street. Again, the widening of the Strand and Wych-street, continuing Drury-lane, and so forth. But one of the most valuable would be the removal of the block of buildings in Carey-street, next King's College Hospital, and so adjusting the entry into the new street that a further space could be given to the site for the new Law Courts, which indeed may soon be greatly needed.

Mr. Hayward's plan was referred to in the address of the President of the Institute as reported in our last week's issue, p. 613, and many others professionally well acquainted with, as well as inhabitants of, the locality,—notably, the venerable Professor Donaldson, than whom none perhaps can be a better judge,—have expressed themselves highly favourable to the proposal. We can only express a hope that the matter may receive the fullest consideration of the authorities.

#### HOUSES AT BROMLEY.

THESE houses have a good frontage to the Windmill-road of about 45 ft. each, and are separated by a 10 ft. passage. Each contains on the ground-floor a drawing-room, 18 ft. by 17 ft.; dining-room, 24 ft. by 17 ft., and library, 16 ft. by 14 ft., with good kitchen, scullery, &c. On the bedroom floors there are ten good rooms, bath, w.c., &c., and every domestic convenience.

The corner house has a return frontage to a new road, in which is placed the main entrance. The chimney-pieces to the reception-rooms are of carved walnut and oak, and the corbels of the fittings throughout are of a superior kind. The materials are red bricks with tile roofs and covering to the upper stories. The cost was the very moderate one of 3,550l. the two.

The architect is Mr. Charles Bell, F.R.I.B.A., of Dashwood House, 9, New Broad-street, City.

**Sanitary Association for Rathmines and Rathgar, Dublin.**—A meeting has been held in Rathmines Town-hall for the purpose of forming a sanitary association for the township of Rathmines and Rathgar. Dr. Montgomery Ward, one of the speakers at the meeting, stated that the authorities of the township hoped in a short time to have an ample supply of pure water for it. The works for that purpose were progressing under the supervision of Mr. Hassard, C.E. The township commissioners, in conjunction with those of Pembroke township, had already completed a perfect system of main drainage for the two townships, by which the sewage of those townships was conveyed into the sea, half-way between the Pigeon House and Poolbeg lighthouse. It was resolved to establish the association, and on the motion of Dr. Cameron it was agreed,—

That the objects of the association be,—(1) To instruct all classes of the public in practical sanitary knowledge; (2) To co-operate with the sanitary officers in carrying on their work of inspection; (3) To use all legitimate means to check the spread of infectious diseases; and (4) To provide suitable visitors to go amongst the working-classes, lend sanitary pamphlets, and give them hints on the simple laws of health.

PROFESSIONAL TOPICS AT  
THE ARCHITECTURAL ASSOCIATION.

THE Architectural Association held its first ordinary meeting for the Session 1882-83, on Friday, the 10th inst. After the despatch of other business (which included the nomination of no fewer than fifty-nine new members),

The President (Mr. E. G. Hayes) delivered his inaugural address, in the first portion of which he reviewed the educational work of the Association as carried on during the past session by the various classes, courses of lectures, and other means. Although a very great deal of useful work was done in the classes, its amount might be greatly increased if a larger number of members joined the classes and attended regularly. Reference was made to the value of the courses of lectures now in progress of delivery to members of the Association by Messrs. Tarver and Blashill, in connexion with the Classes of Design and Construction. The library of the Association now contained about 1,200 volumes, and was much used and highly appreciated by the members. The excursion to Northamptonshire was largely attended. The work seen was for the most part domestic, and of that peculiar character which was familiarly described as "lato and flat." Nothing earlier than the thirteenth century was worth looking at, and nothing (as it appeared to some of the party) was too lato or too utterly dreadful to be sketched, measured, and adored. Even the cherubs' heads and the palm-branches on the tombstones in the churchyards did not escape attention. However, the annual excursion afforded an agreeable opportunity for studying in common such specimens of work as the taste of the day or the inclination of the members might lead them to select. Looking at the general position of the Association, the President observed that if the accession of new members was to be taken as a sign of increasing prosperity, the Association might certainly congratulate itself. Passing on to topics of general professional interest, he said:—

I must not neglect to say a few words upon the subject of the Institute Examination. We shall, no doubt, all be ready to admit the desirability, if not the absolute necessity, of taking some steps to insure a fit and proper training for all those who may wish to practise as architects. It is desirable first, upon professional grounds, that by guaranteeing a certain known and recognised standard of proficiency in all those who may hereafter become Associates of the Institute, the professional status of the whole body may be raised, so that in course of time the mystic letters signifying membership will have a real value, and no architect will be recognised unless he has them, and thereby unqualified practitioners will be excluded. It is desirable, upon public grounds, that in employing the services of an architect, the public may be assured that they are placing their interests in the hands of a man who has received special training for the work he undertakes to do, and does not simply rely upon his own very common sense for the general idea, and upon other persons' brains and knowledge for the practical working out of the scheme. And last, but not least, it is desirable, for the sake of architecture, that our art, which is so long-lived, may, so far as lies in our power, be improved, or, at all events, may run less risk of being vulgarised and brought into disrepute, as it too often is now by the performances of amateurs and others whose only qualification would appear to be a knowledge of "how not to do it." With these ends in view, it behoves us all to do what we can to insure the success of the scheme. Every student should be encouraged to look upon it as a necessary part of his career, and must no more dream of trying to practise without it, than a doctor or a lawyer does, each in his respective calling. It will, no doubt, involve a certain amount of hard work and self-sacrifice; but the end to be achieved is well worth this, and it is not so great but that two sessions of diligent work in our classes will go a long way to prepare a student for it.

There is no doubt that the position of architects, as a body, will be greatly improved in time by this Examination. There is great room for improvement in this respect; at the present time there are so many hangers-on of all kinds,—men who have possibly been in some branch

of the building trade dub themselves architects; others there are who consider it a nice easy sort of occupation to combine with sundry other vocations which they already carry on, such as agencies, and the like. These are the things which have brought the profession into disrepute, so that the ordinary public scarcely know what an architect is, or ought to be. He is often looked upon, by people who ought to know better, as a sort of builder, a useless kind of being upon the whole, and one of whose duties and responsibilities very little is known. Persons of this class would rather place their interests and requirements in a builder's hands, with vague uncertainties as to price, and what they are to get for their money, than incur the cost, but to them the doubtful advantage, of employing an architect. Then there is another class of persons who think because now any one can call himself an architect, so any one can do an architect's work. Such a man is frequently met with; he has great confidence in his own capabilities, and is sure he could design a house as well as any architect. He knows exactly the sort of plan he requires, which is probably that of some house he recollects; he is discreetly silent as to the elevations, but assures you confidently he is sure he could carry it all out, and that all it wants is a little common-sense. If he tries, he probably finds that this was precisely what he did want.

Much of the ignorance as to the duties and responsibilities of architects, and the tendency to amateur performances referred to, will doubtless disappear before an assured status, such as will be obtained for the profession when the Examination becomes a fully-recognised qualification.

It will, I fear, be a long time before the public will be brought fully to recognise the fact that architects are men whose profession, upon the artistic side, consists in showing upon paper plans and designs for buildings, and other schemes, which ideas are afterwards carried out by them, and consequently that they are better able to judge of the effect of designs when upon paper than those who do not devote themselves to such matters, and often scarcely understand what a plan is. We have seen recently some cases in which architects have ventured to express their opinion upon some proposed public improvements, and in both cases, I believe, the suggestions have been politely declined by the unprofessional judgment of those in authority. It is a great pity that such should be the case, but so it is. This great city of ours might be a very different kind of place if in all those questions artistic effect received its proper share of consideration, instead of being, as it generally is, thrust aside, and the utilitarian aspect alone considered.

There is another matter which I think has an important bearing upon the status of our profession generally, and that is the habit which architects have of criticising in rather too unmeasured language the works of their brethren. Now, it always seems to me that we get quite enough criticism of this kind from an unthinking and unappreciative public. In most things it is considered desirable that a person who takes upon himself to criticise any particular work should know something of the matter upon which he wishes to speak. This fact does not seem to be at all recognised as regards architectural criticism; in this subject any one who has eyes to see does not hesitate to form his judgment and to condemn or praise as the spirit moves him, but generally the former. Now, I think it is a pity for us to lend ourselves in any way to this sort of thing. We should endeavour to be temperate in our remarks, not finding fault, as would almost seem to be the case sometimes, to show forth our own fancied superior knowledge,—to appear wise in our own conceit. If we undervalue and condemn each other too largely, we do but encourage the wholesale system of criticism and condemnation to which we are all more or less subject.

It is a useful thing for us to stop, as it were, for a few minutes, as we are doing to-night, to review generally the work of the past session, and our plans for the future; to consider whether we are taking that position as a student society which we ought to take.

If we look around we see on every side great activity in the architectural world. There is no doubt that our art has been making great progress in late years. Very many large and important buildings have been put up in different parts of the country in almost every known style of architecture. These buildings show in

most cases a variety in design and fertility of imagination which are very creditable to the profession at large. All this variety of design and the information essential to meet the numerous and varied uses of our modern buildings necessarily entail an increased range of study upon the part of the architectural student, and I think that any one who looks at the history of the Association will see how it has endeavoured to keep abreast of the demands of the age, and to satisfy the probable wants of its members upon all artistic and practical subjects.

The so-called Queen Anne revival still continues to be very fashionable, and appears likely to hold its own for some time to come. It includes in its modern treatment a wide range of design, which makes it equally suitable for a cottage or a mansion, or for public buildings of almost any kind, and whatever may be the objections to it, we cannot say so much of many other kinds of work. It is adapted to modern requirements in various ways; first, because it allows of large windows and plenty of light, and does not altogether ignore the good qualities of plate-glass, for which so many of our clients entertain such an unbounded admiration, while, at the same time, the artistic eye can be partially satisfied by stout sash-horns and small squares introduced into other portions of the design. Then it does not altogether object to lifting sashes, and it admits of the more artistic treatment of this deservedly popular form of window. Also, on account of its entire freedom from rule or order, it lends itself to all our modern requirements in planning, and at the same time allows of the introduction, even in buildings of the simplest kind, of internal features which give character to the work throughout. Another important consideration which has made this kind of work so very suitable is that it is essentially a hick style of architecture; and although in its more elaborate developments of carved brickwork it is almost as costly as stone, yet these elaborations are luxuries which need not be introduced. These are some of the chief reasons for the rapid rise and extensive use of this fashion of buildings, and which will in all probability serve to keep it in fashion for some time to come. We know that it is looked down upon and ridiculed by many, and that the detail has been stigmatised by a great poet as "jolly rubbish, which can be rattled off by the mill." This, however, is not an essential quality in the work, although, no doubt, it is a distinguishing mark of much that is done. Many modern buildings might be mentioned in which great refinement is shown in the details and mouldings. I think the charge of want of refinement is with more reason to be brought against the work in its main features and general outlines, in which quaintness of form is frequently carried to a point verging upon extreme ugliness. I leave for the present the question how far these ugly, hump-backed, one-eyed effects are useful in architecture in enabling us to appreciate the more beauty of form and purity in outline when we see them.

We have lately seen some revivals of a slightly earlier type of work, when the mouldings and ornaments of the Renaissance were being engrafed on to the dying-out forms of Tudor work which had preceded. This was, to a great extent, the type of work visited in the recent excursion,—generally picturesque and interesting, often good in form and sometimes in detail, but very often coarse both in the one and the other; in any case, an undesirable training for a student, who ought certainly to be encouraged to gather his inspiration from purer sources. It would seem that in designing work of this description more than the usual amount of care and taste is necessary to prevent the introduction of features which, however picturesque they may be in themselves, tend to vulgarise the design. These mixtures require to be compounded with very great skill and judgment, or they had better be left alone.

We seem to be unable at present to pin our faith to any particular style of work for special purposes: there seems to be such a ceaseless craving for novelty and variety. This is no doubt due to a large extent to the prevalence of the competition system, the desire or the necessity to produce some startling novelty, some sensational effect, which shall attract attention and perchance obtain the work. Were it not for this, architects would, I doubt not, ho willing enough to be "sober in their designs," and to cease striving after eccentricities which tend so much to vulgarise our art, and there would be

\* The "Brown Book" of the Association states the total number of members to be 851 (of whom 725 are resident in London), as against a total number of 863 in Session 1881-82.

a better chance of carrying on more generally some kind of work, and possibly developing it in a way that should make it distinctive of the latter part of the nineteenth century.

I ventured the other evening to make a few remarks upon the prospect of a new style in architecture, and to express my opinion as to the possibility, or, rather, the impossibility, of such a thing.\* This opinion was based upon the assumption that the various combinations of forms which, in past ages, have been adopted, and which constitute the different styles, are, in reality, well nigh worked out and exhausted, and that it is hardly possible to devise any sufficiently new combinations to produce a really new and distinct style. I will not take up your time by attempting to follow out this reasoning, because it can have no practical result, although the subject is one of much interest as a mere speculation. However, I may say this much, that if we are to have anything approaching a new style in architecture, which I am not at all sure is wanted, it will be produced only by combined effort and by steady systematic work in one direction, starting with some particular style as a basis, and training students to work in it alone. Then in time the requirements of the day, being expressed by many minds, may possibly develop into a really modern style. This is, however, but a mere dream. At the present time we are further from it than ever; all the change and variety in which we are now indulging will certainly not conduce to anything of the kind.

And now let us consider, for a few moments, what is the chief end and object of all our work here. It is in order that we may endeavour, as far as possible, to follow out the advice given in our motto,—“To Design with Beauty and to Build in Truth.” How difficult it is to arrive at any proper appreciation of what is really required by the first part of this instruction, and how much more difficult it is to explain! We can, no doubt, all talk glibly enough about beauty in architecture, and each one of us probably thinks he knows what he means, but it is not easy, if not impossible, to define it closely. Mr. Fergusson, in his work upon the subject, says:—

“One of the most prevalent sources of error is the assumption that beauty is one single and well-defined emotion, and capable of being reasoned on as such, whereas, in truth, nothing can be more various and, at the same time, more universally prevalent; and so variously are we formed, that no two men is it the same thing, though all can perceive it, and most men fancy they see it as others do; so each man assumes the beauty he sees or can appreciate to be the only true one, and excludes all others from the category.”

This is very true, because, in considering the question in regard to architectural design, we are confronted at the outset by the fact that, unfortunately, architects who make these questions the study of their lives are so seldom able to agree as to the merits of any particular work. There are, of course, the differences of opinion caused by a partiality to some particular style or period of work. A Gothic man cannot see any beauty in a Classic design, and *vice versa*. However, differences of opinion arising from any of these causes must be disregarded as not worth a moment's consideration, being prompted by individual taste or by fashion, both of which now-a-days change very rapidly. There is no doubt that each style may lay claim to some particular merits,—that all have some qualifications which may entitle some buildings erected in them to rank as works of art and beauty. Those qualifications may be defined somewhat as follows:—A perfect sense of repose, of constructive fitness and suitability, a feeling that everything is in its place exactly where it is required, and a sufficiency of ornamentation to impart proper richness of effect, but no excess; in one word, the work must be well proportioned. The word for this purpose must be taken in its widest sense, and must regulate, not only the quantitative relation of the various masses and voids, but the size, position, and amount of all the accessories, such as mouldings, carving, and other ornament. In a perfectly well-proportioned building it will be found either that the bare forms of solids and voids are such as to satisfy the eye by their proportions, and that the arrangement is such as not to be materially affected by the addition of the mouldings and ornament, or it may be that the building requires

the addition of its mouldings, strings, or dressings to complete the forms intended and to make them satisfactory in their individual proportions or relatively to each other.

A very great deal has been written and said at different times upon the subject of proportion in buildings, and many attempts have been made to show that beauty in proportion, that is to say, satisfactory relative dimensions of the various parts, is founded upon regular geometrical forms, and that without such geometrical basis such proportions can hardly be satisfactory or beautiful. It is not possible for me now to attempt to discuss this question; it is one of very great interest, and well worthy of close attention. However, I must say this, that although I believe there is a great deal of truth in the system proposed, I do not think it is possible, or hardly even desirable, to reduce the process of architectural design to any such almost mechanical method. The variety of form is so great, and the requirements of our art are so various, as to baffle any attempts to systematise them on a geometrical basis. Ruskin, in his “Lamp of Beauty,” says:—

“Proportions are as infinite as possible airs in music, and it is just as rational to attempt to teach a young architect how to proportion truly and well by calculating for him the proportions of fine works, as it would be to teach him to compose melodies by calculating the mathematical relations of the notes in Beethoven's ‘Aldelaide’ or Mozart's ‘Requiem.’ The man who has eye and intellect will invent beautiful proportion, and cannot help it.”

I will quote here also a few words from an article in a recent number of the *Builder*,\* which have an indirect bearing upon the subject under consideration. The writer says:—

“All buildings are erected by human hands for human use in one way or another, and hence the scale of the human figure becomes, in regard to architectural proportion, a kind of constant, the effect of which must always be taken into account.”

Now it seems to me that the idea suggested by this quotation is the true one, and I do not suppose any one will disagree with the proposition. I wish particularly to commend it to your consideration with this addition,—that the question of fitness and suitability in architectural proportion is to be judged readily and satisfactorily by the eye alone, but that in order to do this the eye must have been trained by a course of study which shall enable it to appreciate the true and the beautiful.

There are and must necessarily be many different degrees of beauty in architecture, as there are in nature, and the differences are caused by the predominance given to one or more of the various qualities of which it is constituted. It is not possible, perhaps not even desirable, for many buildings to possess the highest form of ideal beauty which I have been endeavouring to describe. In buildings of the very highest type the world has ever seen, such as a Greek temple or a Gothic cathedral, the effect is produced by the careful blending in the composition of all these qualities, and the result is the production of works of sublimity and grandeur which have never been equalled. These results of sublimity and grandeur can only be obtained in buildings of considerable importance or monumental character; in most cases we can only attain a much lower standard, until at the lowest end of the scale we must be content with an honest expression of the minor requirements, with such forms and proportions as good taste may suggest, only taking care to prevent the introduction of meaningless and vulgar ornament, which one so frequently sees, and which spoils what might otherwise be a satisfactory design.

Buildings of this kind may be exceedingly plain in outline, entirely devoid of ornament, of quaint, squat, or ugly proportions, but may yet bear upon their face clear evidence of the designer's thought and care. Such buildings, I say, are, of great value in the architectural world. There is a beauty in their simple form, in their plainness, in their quaint proportions,—in short, in their extreme ugliness, which is of the same use in architecture as the ungainly form of a hippopotamus is in the animal world,—that is to say, to set off by contrast other forms and other proportions which are better, and in which more excellencies are combined. At the same time it must not be forgotten that even this perfection in ugliness is not achieved without much care and study.

The sense of a keen appreciation of beauty of

form and proportion is one which every student should endeavour to acquire. This sense is, I believe, to be most readily obtained by a diligent course of study from the human figure, and such a course is most desirable for an architectural student. By carefully drawing the figure in outline, or with some rapid kind of shading, not attempting any of that delicate but rather mechanical stippling that we are accustomed to see practised in our art schools, the student learns in time to appreciate delicacy and refinement in form, and the subtleties of perfection in proportion, in a manner and with a rapidity which is, I believe, attainable by no other means. I am told Mr. Burgess always attached very great value to this kind of study, and said that he regarded it as a most essential element in the education of an architect. The facilities offered for work of this description in the various schools of art in London are available to all students. I may also draw your attention to the Langham Club, of which particulars are given in our Brown Book. In addition to this drawing from the life, the architectural student must neglect no opportunity of drawing and measuring such executed works as may commend themselves for the purpose.

The objects to be attained by architectural sketching, I take it, are threefold:—

1. To obtain a practical familiarity with the forms and details which were in use, and which constitute the distinctive features of a style, and which cannot be learned from books alone, and to study their proportions.

2. By studying features which are admirable when executed, and transferring all particulars carefully to paper to acquire a knowledge of the reverse process.

3. To lay up in the mind stores of forms and ideas which can be and are unconsciously drawn upon in designing, and which materially assist in combination of new forms.

Under the first heading would be classed all the carefully-drawn outline sketches which are or should be made by a student, and in making them the objects to be gained should not be forgotten; these are to learn the character of the work and to study the proportions,—which, of course, by the selection, we assume to be good,—but certainly not to make pretty pictures. It is important to pay attention to these points. One frequently sees brilliant, showy sketches rapidly done, which are far from being true representations of the portion of the building sketched. It is hard to see how work of this kind can be of much value. With the second object in view, namely, to learn the relative effect of features upon paper and in stone, the best plan undoubtedly is to draw and measure the work, and to plot it to scale upon the spot. It is much better to do so than to leave it to plot afterwards, because it can be done with greater accuracy. And it is as important, if not more so, to measure and draw out the mouldings as the complete feature, in order to learn the effect that the different sections have when executed in the round. The third object is, of course, attained by drawings of both the kinds we have been considering; but the various notes and little bits which one does from time to time are done solely with this object. These little sketches are not to be allowed to take the place of the other two kinds referred to, but only to supplement and follow them. These small sketches are often necessarily roughly done, and an architect looks upon them simply as memoranda to give him hints for new combinations, and trusts to his own power to adapt, modify, and shape them as occasion may require. In these days of changing fashion and requirements, and of the frequent necessity there is to make a design rapidly, it is of importance to every architect to have a store of such material laid up in the recesses of his mind, and he is likely to succeed best who has the largest store to draw upon.

One word as to the manner of sketching, before leaving the subject. Ruskin says, “All merely outlined drawings are bad, for the simple reason that an artist of any power can always do more, and tell more, by quitting his outline occasionally, and scratching in a few lines for shade, than he can by restricting himself to outline only.” And again, in another place, “A good artist habitually sees masses, not edges, and can in every case make his drawing more expressive with any given quantity of work by rapid shade than by contour.” Now how far are we, as architectural students, to consider it desirable to follow this advice? The answer seems to be, that so far as we are

\* See *Builder*, p. 556, ante.

\* See p. 234, ante.

simply studying effects which we see executed in order to be able to produce similar effects from geometrical drawings, outlines are the best. But if we are wishing to carry away memoranda of massing and general effect, or of details, this is more effectually and rapidly done by means of shaded sketches.

The necessity of following out, as far as possible, the advice contained in the second part of our motto, is one which we shall, no doubt, all be ready to admit. It is desirable, apart from any question of truth or honesty, in the interests of art, for nothing can be really beautiful unless it is true. The beauty that is attained in a building by honestly expressing the arrangements and requirements of the interior ought to be of more value than that which is obtained when the necessities of the interior have been sacrificed to produce it. And this honesty of expression as regards the elevation of a building is the chief thing to be considered, because there is, I think, no more necessity, as a matter of principle, to insist upon the details of construction in architecture being shown for the sake of truth and honesty, than there would be for insisting upon our seeing the framework or skeleton of every leaf and flower that grows, and of every being upon the face of the earth. There can be no objection, but rather the reverse, to cover up, clothe, and decorate the rough unsightly forms which compose the framework of a building, whenever desirable, and it only becomes wrong to do this when the covering is used to disguise and apparently alter the forms, and not merely to cover them, or when it is done with any intent to deceive.

The requirements of modern building unfortunately often compel us to do things which are and cannot be the most unsatisfactory, artistically speaking, such, for instance, as the small supports and wide openings filled with plate glass, which are required in shop-fronts. It is impossible to make anything decent of this sort of thing, either by showing the supports and girders, or by casing them; the latter plan, I think, generally preferable, for several reasons.

But there really are very few cases in which an architect is tempted to disguise his construction in any way, and it is always made more satisfactory to ourselves so to proportion our work as to satisfy the eye and mind of the observer. Then, with regard to truth in finishing and decoration, for similar reasons it is quite permissible to clothe and cover up any common material for the purpose of adding a better surface. Why should it have been thought almost wicked to plaster the walls of churches, as it was some time since? If one cannot afford to build the walls with a material which has a sufficient finish for an inside lining, it is much better to plaster them. There is no deception done, or intended to be done. The question of painting in flat colours, graining has been often considered, and the flat colouring is generally voted the more artistic treatment. There are many advantages in the other method, but although it rarely does deceive, whatever may be the intention, we must not hesitate to condemn it on principle; and, as a general rule, the treatment of one material in more or less direct imitation of any other is to be deprecated.

I think it was Professor Roger Smith who has paraphrased the language of Demosthenes in saying that the three chief qualifications in an architect are, "1st, Drawing; 2nd, Drawing; and 3rd, Drawing." This, no doubt, is very good advice, but I think it requires a certain amount of modification. There is a great danger, nowadays, of falling into the opposite error of forgetting that our drawings, after all, are but a means to an end, of making them as if they were merely intended for pretty pictures, and not as an honest attempt to show a building as it would appear. This is what another learned professor said upon the subject:—

"Let architects be sober in their designs, let their drawings be made so as to represent the building as the building would be when it was built, eschewing all those tricks and peculiarities of draughtsmanship which were so charming in a picture or an etching. Then if the building were bad in design it would appear bad in the drawing. A great deal of bad architectural work at the present time was to be attributed to nothing more than the self-deception of the designer by his draughtsmanship."

Now we have in these two opinions some apparently opposite views upon the subject. The one seems to magnify unduly the necessity

of drawing, and the other implies from the cautions conveyed that the drawing of the present day is frequently made too much of; that the draughtsman, in his desire to make a pretty and attractive drawing, entirely overshoots the mark and deceives himself as to the effect that will be obtained when what he is supposed to be representing is carried out in brick and stone. This over-elaboration in drawing,—this, so to speak, wilful perversion of the truth,—is no doubt to a great extent the outcome of the system of perpetual competition under which architects now suffer, and in these cases we can only look to the forthcoming rules and regulations for the remedy. We must, I think, all admit the necessity for caution in this respect, and bear in mind, as architects, that as a good design may undoubtedly be marred and spoiled by bad drawing, we must be able to express our ideas upon paper so as to convey a correct impression of our building; but we must never allow ourselves to be carried away by the desire to make a pretty picture only, and deceive ourselves as well as our clients. Manual dexterity is, no doubt, a very good thing, but it may be made too much of, and mislead woefully, and in any case it plays a secondary part to that more important qualification, a correct and well-trained eye.

It should be the aim and object of all architects so to refine and elevate their work that it may show to an educated observer unmistakable evidence of the thought bestowed upon it. In proportion as this is the case does the building rank as a work of art, and in that degree may its designer lay claim to the title of artist.

The world has lately been informed by a great legal authority that architects can have no claim to that title, not so much even as a hairdresser; and why? Because they do not work with their fingers. It is hardly worth one's while to take any notice of such a statement. We all know that real architects do occasionally have to use their fingers. I only refer to the subject because I have been at some pains this evening to impress upon you that it is the spirit of our work that is of the greatest value, and that the fingers are but agents,—most necessary ones certainly,—to convey it from the mind and eye on to the paper. It must also be observed that the power of fully appreciating, as of producing, beautiful works is not acquired by study of the law, or of mathematics, or even of campanology, but by careful and loving study of the beautiful in nature and art, and an earnest desire to apply the principles learned to our own work.

I have endeavoured, in putting down these few thoughts for your consideration this evening, to touch upon some of those matters which, whether as architects or students, should ever be uppermost in our thoughts. It is both pleasant and profitable for each one of us, amid the hard matter-of-fact details of everyday life, to study and think them out for himself.

The message of art always remains the same; there is nothing new in what I have said,—scarcely, I fear, in the manner of telling it,—but it is, I may hope, not without some use to have again reminded you of these things. I cannot do better than conclude with the words of a great artist:—

"Excellence is never granted to man but as the reward of labour. If you have great talents, industry will improve them; if you have but moderate abilities, industry will supply their deficiency. Nothing is denied to well-directed labour: nothing is to be obtained without it."

Mr. Stannus, in moving a vote of thanks to Mr. Hayes for his address, referring to the so-called "Queen Anne" style, said it was quite true that, as the President had stated, it had a wide range of design,—far too wide a range, indeed,—and one which, it was to be hoped, would be considerably narrowed before long. He thought there were already signs of a movement in the direction of limitation, some of the men who had set the fashion going being probably alarmed at the terrible Frankenstein which they had caused to arise. Having passed through the dregs of corruption and dirt, it was to be hoped that it would gradually be purified and led into that style of pure Classic to which they were all tending, and to which they, with some exceptions, looked forward with a very great deal of pleasure. ("No, no.")

Mr. S. Flint Clarkson seconded the motion, which was supported by Messrs. J. Osborne

Smith, Aston Webb, and Cole A. Adams, and carried by acclamation, Mr. Hayes making a few observations in reply.

#### A NOTABLE REREDOS.

We have had an opportunity of seeing, at the studio of its sculptor, Mr. G. W. Seal, Coldharbour-lane, Brixton, a reredos which is noteworthy not only on account of the elaborateness of its design and the excellence of its workmanship, but from the probability that it is the largest work of the kind executed in this country since the Reformation. It has been modelled and executed by Mr. Seal from drawings made by Mr. J. D. Sedding, architect, of Charlotte-street, Bedford-square, and its total cost will be about 2,000*l.* It is about to be erected in the Church of St. Clement, Bournemouth, at the cost of Mr. J. F. Christy, in memory of his son, Lieut. Edwin Christy, of the 8th Hussars, who, after passing scatheless through the recent Afghan war, had the misfortune to meet with a fatal accident while playing a polo match in India about two years ago. The reredos consists of a central portion, which will be erected beneath the east window, flanked on either side by a structure of panelling and canopy-work rising to the springing-line of the arch of the window.

The central portion,—the reredos proper,—is about 15 ft. high from the level of the footpace, and 13 ft. in width. Above the restable there is a long panel of sculpture in alto-relievo, representing the Adoration of the Shepherds, and the Adoration of the Magi, combined in one subject. This panel is 11 ft. 4 in. long and 4 ft. 6 in. high, the figures contained in it being about two-thirds full-size. Above the framework enclosing the panel is a row of niches, containing the twelve apostles,—these figures being on a much smaller scale than those in the panels. Above this row of niches there is a boldly-coved cornice, vaulted on its under-side, and surmounted by open brattising. It has been sought to treat the subject of the large panel in a natural though with a devotional manner, and the same sort of pictorial effect as is seen in Adam Krafft's sculpture at Nuremberg has been aimed at, with no small degree of success. This panel is in Caen stone, but the remainder of the central part of the reredos is in alabaster. At each end of the panel is a triple shaft; one of these shafts is surmounted by a figure of the Blessed Virgin, and the other one by the angel Gabriel announcing the Incarnation. In the centre of the upper frieze is a boldly-projecting canopy, which will come over the altar-cross, after the manner of the one at Winchester Cathedral.

The flanking portions of the reredos will rise, as we have said, to the level of the springing of the east window,—i.e., to the height of 26 ft. 8 in., the aim of the architect having been to attain somewhat of the effect of the fine examples at Winchester, St. Mary Overy, St. Alban's Abbey, and Christ Church, Oxford, where, as in the work now under notice, the reredos extends across the whole width of the church. Each of the flanking portions is composed of panelling, divided into three vertical spaces in each stage by moulded shafts, the central compartments being larger than the outer ones. These central spaces contain, one above the other, two large and prominent figures on each side of the chancel, standing in canopied niches. The smaller spaces on either side of the large spaces contain a number of smaller niches filled with figures of saints,—all characteristically treated and with their several emblems. The dado next the ground is of the same height as the altar, and is divided into compartments corresponding with those in the upper part. Under the cresting of the dado is the inscription describing the purpose of the memorial, and on the right-hand side is a square panel containing a figure of the deceased on horseback in his regimental dress. The four large figures we have mentioned are those of St. Edwin, St. George, St. Edmund, and St. Alban. There are in all twenty smaller figures. We may add that the whole of the work was modelled by Mr. Seal. Mr. Philip Westlake supplied the cartoons for the large figure subjects, so that they might correspond in scale with the figures in the stained-glass window which is also being given to the church by Mr. Christy in memory of his son. The style is Early Perpendicular, corresponding with that of the church, of which Mr. Sedding was the architect.

ARCHITECTS AND SURVEYORS.  
BIRMINGHAM ARCHITECTURAL ASSOCIATION.

At the annual meeting and *conversazione* of this Association, held on the 7th inst., the President, Mr. J. J. Bateman, delivered an address, in which he particularly considered "that portion of our professional practice connected with the duties of a surveyor," and he divided the subject into,—first, those surveyors' duties immediately connected with the practice of an architect; second, those connected with the practice of a surveyor. Connected with the practice of an architect were land surveying and levelling, landscape gardening, development of building estates, and legal knowledge respecting easements, Acts of Parliament affecting building, law of contracts, dilapidations and fixtures. Connected with the practice of a surveyor were valuations of property, parochial assessment and compensations. The more important of these points he discussed in detail. Respecting landscape gardening, which was, he said, a study essential to the architect, he addressed to the students a few hints upon suburban gardening. The house was to be placed upon a well-developed terrace. They were not to be too ambitious in the style of the garden; the simpler the plan, the greater its effectiveness. Unnecessary divisions, multiplicity of flower beds, numerous walks, and vases and pedestals (except in special situations) were to be avoided. The surface of the ground would determine the character of the plan, whether "rectangular" or "curvilinear." Without special observance of aspect, no garden arrangements would be successful. Lastly, the main approach or carriage-drive should be planned so as to give the greatest amount of privacy. Greater scope for design would be afforded by country houses, where the distant view, the introduction of water, the terrace flower-garden, the grouping of timber, garden architecture, in fountains, picturesque bridges, arbours, and other ornamental buildings, balustrades, and numerous other embellishments, might tend to the one object of heightening the architectural effect of the mansion. To the branch of his subject classed as "Legal Knowledge," Mr. Bateman devoted a large part of his paper. In "easements" which were prescriptive rights acquired by time and use, the most important was that of light. No subject connected with the architect's profession was more fruitful of vexatious litigation than rights of window-lights, as few buildings of importance could be erected in the centre of a closely-built town without their architects being embarrassed by the obstructive interference of adjoining owners. The strict right of property entitled the owner to so much light and air only as fell perpendicularly on the land. Happily for Scotch architects the law of Scotland was so limited; but in England the right of light in a lateral direction was protected and called an easement if it had existed for twenty years, when it became an "ancient" light. It was, however, a moot point if railway companies could prevent adjoining owners from the enjoyment of light over a railway. The law permitted the opening of windows over adjoining land, but the adjoining owner could obstruct such windows within twenty years by an erection on his own land. He was of opinion that the repeal of the law permitting windows to open over adjoining land might very profitably be considered. At present the law admitted of an encroachment on the rights of adjoining owners, which by lapse of time became an easement or legal right. It certainly appeared to be a legal anomaly to admit a right to one party which might be cancelled by another, although the cancelling might necessitate great inconvenience, expense, and loss. It was true easements of light might be obtained by building within the boundary of the property, and this would be to exercise a just and equitable right of property. An ancient light could not be prejudicially affected, and the Courts had frequently ruled that no obstruction should exceed an angle of 45 degrees; but scarcely any two cases of damage to light were alike. It was a wise precaution to erect a temporary obstruction before proceeding with the permanent work, as a test of what, if any, damage would be caused. Another easement to which Mr. Bateman referred was that of "support," which entitled an owner to the lateral support of adjoining land; whilst for the support of buildings a twenty years' user must have been acquired. Referring to Acts affecting building, the President said it was much to be regretted

that there was not in Birmingham a comprehensive Building Act, which would relieve architects of considerable difficulty in dealing with party-walls and other vexatious questions, and at the same time ensure the erection of more uniformly substantial property. He recommended the study of the Metropolitan Buildings Act, which regulated all building operations in the metropolis to secure sound construction and protection from the spread of fire. Town Improvement Acts, where they existed, were also necessary to be studied. As to the Artisans' Dwellings Act, he remarked that it might fairly be questioned whether the Corporation had legitimately used this Act in forming Corporation-street. He referred to this to correct any erroneous impression that this Act was intended to be used for the purposes of street improvement instead of the improvement of artisans' dwellings.

THE TRANSIT OF LANCASHIRE  
COTTON GOODS.

Sir,—It is satisfactory to know that the great importance of the question of reducing by some means the cost of inland conveyance of Lancashire cotton manufactures is at last receiving the recognition it deserves. To fully understand this importance it is only necessary to examine the statistics relating to the increase of production of the cotton manufactures of our foreign, and especially American, competitors. The inland position of the cotton industry of Lancashire owes its origin to its peculiar introduction and development. The exiled Flemish weavers, driven from their homes by the revocation of the edict of Nantes, were welcomed by the fustian-weavers of Lancashire. Years after, thanks to the genius of a galaxy of inventive weavers, Lancashire could supply not only home consumers, but a greater part of those abroad, with calico, and the Lancashire manufacturers had, up to the time of the great Exhibition of '51, very few, if any, foreign competitors, and at that time it was immaterial whether their mills were inland or on the seaboard. But now all this is changed, and the change may be partly attributed to our too great readiness to exhibit the products of British ingenuity before the imitative eyes of foreigners, and now Lancashire manufacturers will have to face ever-increasing foreign competition. Compared with the Americans, it will be readily conceded that the Lancashire manufacturers are at a great disadvantage. The former are now commencing to erect their mills actually in the cotton fields, so that the raw material can be cultivated and manufactured *in situ*. The cotton is then, at little expense, transmitted by rail or river steamer to the ocean liner, to be carried direct to all parts of the world, and no doubt the enterprising Americans will eventually utilise, by electrical transmission, the great natural sources of power so common in their land. And then the fertile and luxuriant character of the American soil allows them to obtain comparatively cheap labour. The Yankee knows his natural advantages over his Lancashire competitor, and by the increased production of American cotton goods he is proving that he intends to utilise them, and it must be confessed that, naturally selected, the Southern States of America are pre-eminently adapted for both the cultivation and the manufacture of cotton. The Lancashire cotton manufacturer has all the expenses of river and ocean shipments, transit by road and rail, loading and unloading various times, before he can even touch the raw material. And then there are the brokers' charges. These latter, however, the Lancashire manufacturers appear determined to remove, and some of the cotton-spinners of Oldham have already banded themselves together in order to buy cotton direct without the intervention of the middlemen or cotton brokers. Several important schemes have lately been announced, having the aim of reducing the cost of inland transit of the Lancashire manufacturers. Certainly the most important of these schemes is the suggested ship-canal, which, if carried out with vigour to a successful issue, would ensure at least a moderate degree of prosperity for the cotton trade of Lancashire for many years to come. But this is not all. Its effect upon other Lancashire industries,—especially the chemical and iron,—would be equally as beneficial, and in time its banks might become studded, like those of the Clyde,

with works of the textile, iron, and ship-building industries.

The importance of a seaboard position for other industries than that of cotton is, in the face of foreign competition, beginning to show itself, and Messrs. Cammel are, with commendable enterprise, removing their ironworks from Sheffield to a seaboard position in Cumberland.

Another scheme for improving the means of conveying Lancashire manufactures is that described as the Lancashire plateway. This scheme appears, however, to be too crudely developed to deserve any attention. Would it not be possible and better to connect the tramways existing in nearly all the Lancashire townships with the railways, so that the trucks of a light and special character could be drawn, as one, from the railway to the mill or the ship? If the railway companies could only see that, by high and excessive tariffs, they were driving the staple trades out of the country, they might make some endeavour to reduce their tariffs to something like a reasonable proportion, otherwise they will discover when only too late that they have been perpetuating the folly of killing the hen that laid the golden egg. The future of Lancashire will be seriously influenced for good or evil by the degree of energy devoted to the work of improving at once the means of inland conveyance of her manufactured goods, and it behoves all Englishmen to wish success to any scheme that will ensure this desideratum.

B. H. THWAITE, F.C.S.

LEEDS ARCHITECTURAL SOCIETY.

THE following syllabus of papers is issued for session 1882-83:—

1882.

Nov. 6th.—Opening Address by the President, Mr. F. B. Fraser, F.R.I.B.A., and Annual Report.

Nov. 26th.—"Constructional Ironwork, as applied to Architecture," by Mr. F. Campin, C.E.

Dec. 4th.—"The Foundation of Art in Architecture," by Mr. E. R. Robson, F.S.A., F.R.I.B.A., Architect to the London School Board.

Dec. 15th.—*The Conversazione*.

1883.

Jan. 8th.—"The Place of Tradition in Modern Design," by Mr. J. D. Sedding, F.R.I.B.A.

Jan. 22nd.—"Kirkstall Abbey," by Mr. J. Wright Common, F.R.I.B.A.

Feb. 5th.—"Art Foliage," by Mr. J. K. Colling, F.R.I.B.A.

Feb. 19th.—"Wakefield Town-hall," by Mr. G. B. Bulmer.

March 5th.—"Hindrances," by Mr. J. Honeyman, F.R.I.B.A., President of the Glasgow Society of Architects.

March 19th.—"Recollections of Flemish Architecture," by Mr. William H. Thorp, A.R.I.B.A.

April 2nd.—*Members' Soirée*.

GLASGOW INSTITUTE OF ARCHITECTS.  
PROPOSED BUILDING ACT.

At an extraordinary general meeting of the Glasgow Institute of Architects, held to consider the new Police Bill,

Mr. Wm. Maclean, writer, the secretary, read the report of the Council of the Institute on the Police Bill. The report contained the following passages:—

The Council of the Glasgow Institute of Architects having considered the sections of the new Police Bill from 307 to 392 inclusive, relating to the jurisdiction and procedure before the Dean of Guild Court, Master of Works, his powers and duties; streets and courts, sewers and buildings, their erection, alteration, and use, are unanimously of opinion that these sections should be omitted from the Police Bill, and that all necessary building regulations should be embodied in a Building Act applicable not merely to the city, but also to the suburbs. The growing need for such an Act to regulate building operations in this large city has been apparent to the architects of Glasgow for many years. In 1875 and 1879, in particular, the subject was discussed at numerous meetings, and a deputation from the Institute had several opportunities of conferring with a committee of the Town Council which had this matter under consideration. At that time it seemed probable that the different municipalities would co-operate with the view of promoting a general Building Bill applicable to the whole of Scotland,—a course which the Institute warmly approved and recommended, but the scope of the measure now under consideration proves that the Town Council has entirely abandoned all idea of proceeding with a Building Bill either in conjunction with other corporations or separately. Instead of that they propose to mix up building laws with the miscellaneous provisions of a Police Bill, in such a way that the original mistake of so doing

shall be perpetrated and aggravated. . . . With the view of bringing the opinion of the Institute before the Town Council in a formal manner, your Council submit for the approval of the general body, the following resolutions:—1st. That it is expedient that the claims relating to buildings and the jurisdiction of the Dean of Guild be omitted from the Police Bill. 2nd. That the laws relating to buildings should be consolidated and amended by a new Act dealing with that special subject, similar generally to the Metropolitan Buildings Act, and applicable to the suburbs as well as to the city of Glasgow. 3rd. That inasmuch as it is impossible for the Town Council or the ratepayers either to consider the advantages of the course now proposed by the Institute, or the merits of the draft Bill now published, before the day on which Bills for next session must be lodged, therefore the Institute protests against the Town Council giving notice of their intention to proceed with the Bill at this time. 4th. That a copy of the foregoing resolutions be forwarded to the Town Council.

The report and resolutions, on the motion of the President, Mr. James Thomson, seconded by Mr. James Salmon, and supported by Messrs. James Sellers, Jno. Hamilton, and Campbell Douglass, were unanimously adopted.

LIVERPOOL ENGINEERING SOCIETY.

At a meeting of the above Society, held at the Royal Institution, Colquhoun-street, on Wednesday evening, the 8th inst., Mr. F. B. Salmon, president, in the chair, a paper, by Mr. C. E. Hamanford Stiel, M. Inst. C.E., on "The Testing of Materials for Use in Engineering Structures," was read. In the paper the author, for want of space, dealt with only two classes of materials, viz., limes and cements, and metals. He selected these on account of there being many differences of opinion with respect to some of the methods of testing, and therefore will, he hopes, leave more matter for a discussion thereon. After relating briefly the usual tests applied to hydraulic limes, with a view of ascertaining their quality, he passed on to Portland cement. In dealing with this material, reference was first made to the different methods of manufacture, after which he described at some length the various tests to which it should be subjected, including comprehensive and tensile strength, fineness of grit, weight, colour, &c., and then pointed out that by actually breaking a sample by other tension or compression is given the most reliable information of its quality. He then described, and showed by the aid of diagrams, the various forms of briquette which have been used at different times, giving the preference to the last form introduced by the Metropolitan Board of Works as being the one he believed calculated to give the most accurate results. He then entered at some length into the various methods of making the briquette, the amount and nature of the water found most beneficial under different conditions, and other details, and concluded this section with some remarks on the utmost necessity in comparing the relative strengths and other properties of two or more samples, that all the details of gauging and manufacture should be as nearly as possible identical. In dealing with the section on metals, the author described the various but usually applied tests to cast and wrought iron and steel, pointing out several tests which, although occasionally resorted to, are, in his opinion, to be condemned. In referring to the forge test of the last two metals, he quoted the latest tests required by the Admiralty for these metals, and concluded this section with a review of the connexion which exists between the chemical and mechanical qualities of iron and steel.

The Society of Arts' House, Adelphi.—

During the recess the Society of Arts' House has been renovated under the superintendence of Mr. E. C. Robins. The great hall has been redecorated in the style of the work of the Brothers Adam, raised mouldings being added to the cove, well accentuated in gold and colour, with the effect of increased height. The hall has also been ventilated by the introduction of fresh air over warm-water pipes, and the extraction of expired air by a shaft 3 ft. square, heated above the level of the meeting-room with hot-water pipes. The result is expected to be the change of air in the meeting-room three times in the hour, with the maintenance of 60° of temperature, Fahr. The lower hall has also been decorated and ventilated in a similar manner. The electric light has been introduced, and is in course of regulation.

COMPENSATION CASE.

CHAMBERS v. METROPOLITAN AND DISTRICT RAILWAY COMPANIES.

The claimant in this case (tried in the Lord Mayor's Court before the Recorder and a special jury) sued for compensation in respect of his interest in premises held by him on lease, situated in Black Raven-court, Seething-lane, and which were required by the railway companies in consequence of the extensions now being carried on.

The claimant is a wine-merchant. He took the lease in March, 1880, for twenty-one years at a rental of 70*l.* per annum. He had expended 300*l.* in repairing the premises. They were now in good repair, and in consequence of their proximity to the markets, of considerable value. He had let off the house at a yearly rental of 130*l.* He now claimed 700*l.* as compensation.

Mr. S. Chambers, the claimant, stated that he obtained the lease of the house in question on March 25th, 1880. He had expended 300*l.* in repairs. He had let the house under an agreement at a rental of 130*l.*, the lessor paying taxes. Cross-examined: He took the house for a speculative purpose. When he took the lease he did not know the railway companies were coming.

Mr. R. G. Bishop (of the firm of Messrs. Smallpeice & Bishop), surveyor, Godliman-street, said he had a large estate in the district in which the house in question was situated. He superintended the final repairs which had been done, and gave the final certificate. His valuation amounted to 676*l.* 10*s.*

Mr. J. F. Field, surveyor, Broad-street, valued the premises as worth, on compulsory sale, 712*l.*

Mr. E. Mason (of the firm of Messrs. Reynolds & Mason), surveyor and auctioneer, Bishopscote-street, said that in his opinion 794*l.* was the fair value of the property.

Mr. Pollock, on behalf of the companies, called Mr. Lang (of the firm of Messrs. Jones, Lang, & Co.), auctioneer, King-street, Cheapside, who valued the property at 302*l.* 10*s.*

Mr. George Low, architect and surveyor, Basinghall-street, gave as his valuation 302*l.* 10*s.*

Mr. R. Ritchie, architect and surveyor, Parliament-street, said he acted for the railway companies in the acquisition of the property. He considered the value of the property to be 300*l.*

The Recorder having summed up, the jury were of opinion that the plaintiff was entitled to 454*l.* as compensation.

BUILDING PATENT RECORD.\*

APPLICATIONS FOR LETTERS PATENT.

5,250. W. D. Scott, Moncrieff, and W. Dodds, London. Valve apparatus for supplying baths. &c. Nov. 3, 1882.

5,259. A. E. Crisp, London. Window-fasteners. Nov. 4, 1882.

5,266. R. Chapman, Patricroft, and J. Hibbert, Manchester. Apparatus for closing doors and windows. Nov. 4, 1882.

5,274. A. M. Clark, London. Means for attaching hat-pegs, curtain-holders, brackets, &c., to walls and ceilings. (Com. by MM. Gollot Frères, Paris.) Nov. 4, 1882.

5,283. W. Kennedy, Glasgow. Translucent plates as substitutes for glass in roof-lights, &c. Nov. 6, 1882.

5,310. J. G. Whyte, Bo'ness. Construction of cooking-ranges, &c. Nov. 7, 1882.

5,347. R. Crane, London. Smokeless stoves and grates. Nov. 9, 1882.

NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

Nov. 7, 1882.

3,170. T. G. Webb, Manchester. Pavement lights, &c. July 5, 1882.

4,495. W. R. Lake, London. Manufacture of bricks. (Com. by H. R. Dickinson, Hamilton, U.S.A.) Sept. 20, 1882.

5,165. A. M. Clark, London. Gas cooking stoves or ranges. (Com. by W. W. Coodwin, Philadelphia, U.S.A.) Oct. 30, 1882.

Nov. 10, 1882.

3,140. T. French and J. Monks, Manchester. Ladder tapes for Venetian blinds. July 4, 1882.

3,242. J. Carr, Hulme. Tapeladders. July 8, 1882.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending November 11, 1882.

1,466. W. L. Fison, Stowmarket. Perforated tiles. March 27, 1882. Price 2*d.*

The undersides of these tiles are strengthened by parallel ribs. (Pro. Pro.)

\* Compiled by Hart & Co., Patent Agents, 186, Fleet-street.

1,522. J. B. Denton, London, and G. Butler, Turnham-green. Apparatus for flushing sewers, &c. March 29, 1882. Price 6*d.*

A syphon is fitted in a tank, to the long leg of which is connected a valve governed by a tipping-box or bucket in a smaller chamber contained in the tank. As the tank overflows it fills this chamber, and this in turn fills the tipping-box. This then raises the valve and water flows into the long leg of the syphon, setting up the action, which empties the tank into the sewer.

1,544. C. F. Grimmer and J. Cook, Birmingham. Curtain suspenders. March 30, 1882. Price 2*d.*

The rings have a clip, between the jaws of which the curtain is suspended. (Pro. Pro.)

1,568. F. Render, Manchester. Manufacture of bricks, tiles, &c. March 31, 1882. Price 2*d.*

To make firebricks, &c., silica brought to a gelatinous state is added to the ground clay. (Pro. Pro.)

1,575. W. R. Lake, London. Metallic roofing shingles. (Com. by R. Seaman, New York, U.S.A.) March 31, 1882. Price 6*d.*

These are diamond-pointed shingles, which have a central longitudinal rib formed in them, which creates a groove on their undersides. These grooves are widest at the points of each shingle, and therefore the ribs of one shingle will enter the rib of the next shingle above it. The parallel edges of each shingle are also turned up to dovetail in the groove of the central rib.

1,584. G. L. Shorland, Manchester. Fire-places or grates and stoves. April 1, 1882. Price 6*d.*

A box is fixed behind the front bars of the grate for warming air. The inlet pipe of this box conveys air from outside the building, and delivery pipes from the upper part of the box deliver the warm air into the room, &c. The gases of combustion are made to pass again through the fire to two flues, which are filled with dampers.

1,589. M. Menge and H. Krause, Berlin. Apparatus for painting the interior of houses, &c. April 1, 1882. Price 2*d.*

For painting floors a colour receptacle is attached to the lower end of a handle carrying a brush through openings in which the colour falls on the floor, and is distributed by the brush. (Pro. Pro.)

1,596. W. Johnson, Liverpool. Latches or locks. April 1, 1882. Price 2*d.*

The handle is fastened by a slotted washer catching in a groove in the spindle. A cam is placed on the spindle so that the bolt can be drawn by pressing or pulling the handle instead of turning it round. (Pro. Pro.)

1,609. F. H. F. Engel, Hamburg. Parquet flooring. (Com. by F. H. Schmidt, Altona, Prussia.) April 3, 1882. Price 2*d.*

The veneers are cut to shape by a circular cutter, the supporting frame of which is provided with a table on which is a sliding table. This table is moved so that the saw will cut the veneer exactly. The portions of veneer are then arranged and glued on the ground-board and a press with two jaws fastens them to the board. (Pro. Pro.)

1,652. J. J. Wheeler, London. Curbs of roads and footpaths. April 5, 1882. Price 4*d.*

These are made of artificial stone, granite, or iron, and an internal way or channel is formed in them for conducting wires for electrical purposes.

1,655. H. Conolly, London. Water-closets. April 5, 1882. Price 4*d.*

The overflow arm communicates with the flushing rim in such a manner that every time the closet is flushed part of the water will pass through the overflow arm and seal the trap.

1,694. C. F. Grimmer and J. Cook, Birmingham. Coric-poles, curtain-suspenders, &c. April 8, 1882. Price 6*d.*

A wire is coiled round the coric-pole, half of the coil being right-handed and half left-handed. From this the curtain is suspended. When the pole carrying the wire is revolved the curtain is carried backwards or forwards. Several modifications are shown.

NEW BOARD SCHOOLS IN LONDON.

THE London School Board have given notice of their intention to procure sites for the erection of forty-four new school buildings, in addition to 311 schools which they have already erected in different parishes within the Metropolitan area. The building of these proposed new schools will involve the removal of a considerable number of houses, and the consequent displacement of a numerous population. In the Middlesex portion of the Board's area, twenty-eight new schools are proposed to be erected. Of this number, eight are in the Chelsea division, five of which are in the parish of Fulham, two in the parish of Hammersmith, and one in the parish of Chelsea. The sites to be purchased for these proposed schools cover a total area of eight acres, and involve the demolition of thirty houses. Without continuing further the detail, the aggregate area covered by the sites of the several proposed schools is upwards of forty acres, and the number of houses required to be taken down 310, involving the displacement of a population estimated at about 2,000 persons.

### THE SERIOUS LANDSLIP AT THE DENMARK HILL RAILWAY STATION.

The great landslip at Champioui-place, on the south side of the Denmark-hill station of the South London Railway, the property of the London and Brighton Company, now threatens to be more serious than it has been within the last few months, during which a large number of men have been at work repairing the damage done to that part of the cutting on the south-east side of the station.

The railway retaining-wall is immediately to be taken down, as it is at present in a highly dangerous condition, whilst it will also be necessary to take up the roadway in Champioui-place for the purpose of re-constructing the sewer, and also in order to restore the road to its former level.

Works already done have been executed by the London and Brighton Company, under the immediate superintendence of Mr. Banister, their engineer, at a cost of between 7,000*l.* and 8,000*l.*; and it is expected that a further large outlay will have to be incurred in the necessary works on the south-west side of the station.

It is not improbable that the matter may lead to some litigation between the railway company and the Camberwell Vestry, the railway company apparently being of opinion that the slips have been caused by the imperfect drainage of the roadway above, under the control of the Camberwell authorities.

### NEW WATERING AND SANDING MACHINES IN LONDON.

SOME of the metropolitan vestries have just introduced what appears to be an improved and more expeditious system of watering and sanding the public thoroughfares. Last week the Works Committee of the Westminster Vestry met for the purpose of witnessing the trial of two new watering and sanding machines, which have recently been invented and patented by Mr. Robert Willacy, of Preston. The trial took place in the neighbourhood of the Abbey, between three and four o'clock in the afternoon of Wednesday, and was witnessed by a large body of spectators, in addition to the committee of the vestry. The sanding-machine was first tried, the trial commencing at the door of the Vestry Offices in Great Smith-street, and thence coming round in front of the Albee along Parliament-street, and into Bridge-street. One of the advantages of the invention appeared to be the great width of roadway sanded, 30 ft. in width being covered at one journey, and Bridge-street, which is about 60 ft. in width, being covered during the first and return journeys in a few minutes. The watering-machine was next tried, and distributed the water at one movement to the extent of 32 ft. in width. The trials showed that streets of ordinary width can be entirely covered by water or sand without doubling, thus saving much time and expense. The trials were so satisfactory to the Westminster authorities that they decided upon adopting the sanding-machine, which the inventor has been instructed to supply. The committee expressed themselves equally satisfied with the watering-machine, but have not yet adopted it, as they are at present under a three years' contract for the machines at present in use.

### LIABILITY OF ARCHITECTS GIVING ORDERS FOR GOODS.

METCALF V. MYRES.

In this case (heard in the Preston County Court on the 25th ult., before Mr. W. A. Hulston, judge), Messrs. Metcalf & Dilworth, hot-water engineers, Preston, sued Messrs. Myres, Vevers, & Myres, architects, Preston, for 32*l.* 10*s.*, the value of a hot-water heating apparatus.

The defendants were a firm of architects in Preston. They had to do with the erection of some Local Board offices at Walton-le-Dale, and in October, 1880, one of the defendant firm, Mr. T. H. Myres, waited upon one of the plaintiffs, Mr. Dilworth or Mr. Metcalf, and requested to be shown some heating apparatus for the offices. The result of this request was that a tender was sent in to Messrs. Myres, Vevers, & Myres. At that time the plaintiffs were not informed who was the contractor for the erection of the offices. The whole of the correspondence on the subject, the interviews and arrangements which took place, had been made with Mr. T. H. Myres and the firm. The work was

completed, and then application was made for payment to Mr. Myres, and he believed that at Mr. Myres's request Mr. Metcalf saw Mr. Ward, the builder, and asked him for payment. This was done expressly at the request of Mr. Myres, and he told Mr. Ward that he should be glad if he could see his way to pay him, but if not, he should look to Mr. Myres for payment of the amount. The question was whether or not they could recover the amount from the architect.

On the 7th inst. his Honour delivered the following written judgment:—

This action has been brought to recover 32*l.* 10*s.*, the price of a heating-apparatus and other goods, furnished by the plaintiffs to and on account of the Local Board at Bamber Bridge, under the following circumstances:—In the year 1880 the Local Board of Walton-le-Dale were erecting new offices at Bamber Bridge, and they entered into contracts with various persons with relation to the building of such offices. The defendants in the present action acted in the erection of the offices as architects for and on account of the Local Board. It was found necessary that a heating-apparatus should be set up in the offices, and the plaintiffs tendered for it, and, after a reduction in the price, the tender was accepted by the defendants, and the work was proceeded with. During the progress of the work, the boiler to the apparatus was changed, and a more expensive boiler was supplied by the plaintiffs at the order of the defendants. In the same manner an ornamental cover to a coil in one of the rooms in the offices was ordered by the defendants, and supplied by the plaintiffs. It appears that a contract for the supply of a heating apparatus to the offices had been entered into by one Mr. Ward with the Local Board. It further appeared that the contract price of the apparatus had been paid to Mr. Ward, and the question now is,—for Mr. Ward is unable to pay,—whether the defendants are liable. I think they are. It was the duty of the defendants, under the circumstances, to be very careful to leave no doubt on the minds of the plaintiffs as to the parties with whom they were dealing; and if any other persons than the defendants were concerned in the contract, notice of that fact ought to have been expressly given, and in the fullest terms, to the plaintiffs. In this case, both the plaintiffs positively asserted that they did not know of Ward's contract till long after the apparatus was finished. And though Mr. Myres stated that he had informed the plaintiffs of the contract, yet the communication was evidently not sufficient to give the plaintiffs the notice required. There was no question at the hearing as to the liability of any other party. I do not consider that the plaintiffs can be held to have elected to have taken Ward as their debtor. And as there is no doubt that the contract was made and the orders for the goods given by the defendants, and no authority from any other party to do so was shown to exist in the defendants, I must hold that they are liable to the plaintiffs, and that this action is maintainable. A question arose at the hearing whether the tender made by Ryley had the effect of altering the position of the parties. I think it had not. The whole sum tendered was offered to be taken on account, and the offer was refused. The effect of the tender, if any, was thereby put an end to. I direct the verdict to be entered for the sum of 32*l.* 10*s.*, the amount of the sum due for the heating apparatus being reduced, according to the contract agreed upon.

### PROVINCIAL NEWS.

**Gorton, Manchester.**—A large block of general offices is now being erected for Messrs. Beyer, Peacock, & Co., engineers, at Gorton Foundry, opposite the Manchester, Sheffield, and Lincolnshire Railway works. The building occupies an area of 224 ft. by 44 ft., by about 42 ft. in height, and will be faced with red pressed bricks, having moulded arches and cornices; stone string-courses, cappings, &c.; and all the internal woodwork will be of pitch pine, varnished. It comprises a very complete range of private offices, a large office for clerks on ground-floor, 70 ft. by 40 ft., by 16 ft. high, with separate room for cashier and fireproof safe; and on the first floor a general drawing-office, 90 ft. by 40 ft., by 24 ft. high, with open roof and glazed central double light in addition to the side windows; also a separate tracing-office, photographing-room, model-room, &c. Arrangements have been made for warming and ventilation, on Messrs. Haden's system, for which a special smoke and ventilating shaft is provided at one end, rising to a height of 80 ft.; and at the other end of the buildings will be a clock-tower, 90 ft. high. Messrs. T. Bates & Co., of Droylsden, are the general contractors for the work, which is being carried out according to plans and directions of Messrs. Worthington & Elgood, architects, 110, King-street, Manchester.

**Ancoats, Manchester.**—An important improvement is being carried out by the Manchester Cor-

poration in connexion with the bridge crossing the canal in Ancoats. The bridge has been entirely reconstructed from the designs of Mr. Allison, the city surveyor, so as to give a roadway 60 ft. wide and to cut off an awkward bend. Some difficulty has been experienced in carrying out the work in order to avoid encroaching upon the towing-path beneath or an interference with the canal locks adjoining, but this has been successfully overcome. A rearrangement of the water-main, which was previously carried on the parapet outside the bridge, has also been necessary, but by providing a special casting for the main, of an oblong section, it is now supported underneath the bridge between the two main girders.

**Salford.**—The Salford Union Infirmary at Hop, near Eccles, has been opened for use. The buildings have been erected on the pavilion principle, and a continuous corridor, 850 ft. long and 10 ft. wide, connects the several pavilion blocks with each other and with the administrative block which stands in the centre, so as to be easy of access from the several departments. There are two double-pavilion blocks, which, together, will contain 400 patients, and four single blocks, each designed to accommodate 100 patients. Capacious day-rooms and other apartments have been provided. The total cost has amounted to 60,000*l.* The architect is Mr. Lawrence Booth, of King-street, Manchester, and the contractor, Mr. W. Southern, of Salford.

**Bradford.**—Deputations have waited upon the First Commissioner of Works, Mr. G. Shaw-Lefevre, and the Postmaster-General, Mr. Fawcett, on the subject of a site for a proposed extensive new post-office for the town of Bradford in Yorkshire. The deputation profess themselves encouraged and satisfied with the reception given by both Ministers to their representations.

**Hartlepool.**—Last week witnessed not only the completion of the quay-wall here, 800 ft. in length, on the west side of the new dock, but also the completion of the extensive new fish-curing houses at the north-east corner of the Slake. There are two large smoke-houses, cleaning, and salting-sheds, and every appliance for the carrying on of a business next season, which will employ about sixty men, as well as a number of females. The ice-houses are also complete and ready for use next season. Good progress is also being made with the new graving dock.

**Stockport.**—An exhibition of gas appliances for cooking, lighting, heating, and other purposes has been opened here, in the large weaving-shed of Spring Bank Mill, Wellington-road South, Stockport. With the view of stimulating and encouraging exhibitors and inventors the promoters offered gold and silver medals for the best and most economical cooker for working men's homes; for the best and most economical gas cooking-stove adapted for family use; for the best and simplest apparatus for preparing flour to make bread, and for the baking of it by gas; for the best application of gas for warming and ventilating purposes; for the best regulator or governor to economise the consumption of gas; for the best possible tube for the transmission of gas which will not foul; and for the best and most economical lighting of public lamps with single flame, and also with combination of flames.

**To Preserve Old Country Mansions from Fire.**—In *Baily's Magazine* for this month, Mr. John Birch, architect, who is restoring Everleigh House, in Wiltshire, for Sir John Astley, bart., destroyed by fire at Christmas last, makes the following suggestions for the prevention of such calamities, and for bringing the risk of fire within reasonable limits:—

“Have all flues, fireplaces, and hearths carefully examined, and all chimneys too near the fire removed. Carry up the solid internal walls through the roof to a sufficient height to divide the building into sections, and so prevent an extension of the conflagration, and if possible to shut off each by sheet-iron doors, so much the better; a water-tank over each portion is indispensable, and ought to be fed from an elevated water-tower, worked by steam power. This arrangement would ensure a constant, and unfauling supply to the several tanks, and the contents of the whole might be brought to bear on any one portion of the mansion. These tanks must be connected with hydrants and fire-hose on each floor, placed, if possible, in lobbies near the sheet-iron doors, and contiguous to the various stair-cases.”

## OBITUARY.

Mr. E. B. Stephens, A.R.A., the sculptor, died on the 10th inst. The deceased, Edward Bowring Stephens, was a native of Exeter, and son of the late James Stephens, a statesman. He was in his seventy-sixth year. Spouting at the banquet given in Exeter in his honour, on the occasion of the presentation of "The Deerstalker," the deceased sculptor said that "the Earl of Devon's father and Sir Thomas Acland's father, above all others, were the founders of his professional career, and his first friends, who helped him on cheerfully and hopefully to try and do big things, to represent that which was true, and to do that which was right." In the same speech he stated that his artistic life was begun under the guidance of the late John Gendall. He afterwards studied under the sculptor Bailey, and in 1843 gained the Gold Medal of the Royal Academy for an alto-relievo of "The Battle of the Centaurs and Lapithæ." He spent three years at Rome, and produced in succession, among other works, two groups,— "Satan Tempting Eve," and "Satan Vanquished," both of which were on view at the great Exhibition of 1851; "Eve contemplating Death," in 1853; "Group of Euphrosyne and Cupid," in 1856; and the "Angel of the Resurrection," in 1861. His grand portrait statue of Sir Thomas Dyke Acland, placed on Northembay, was completed in 1862. He also executed for his native city the statues of Earl Fortescue, in the Castle-yard; John Dinning, on Northembay; of Prince Albert, in the Memorial Museum; and of the Earl of Devon, in Bolford-circus. "The Deerstalker," which now stands at the entrance to Northembay, was exhibited at the Royal Academy in 1876. This group in bronze is generally regarded as his *chef d'œuvre*, and the manner in which Exeter became possessed of it afforded to Mr. Stephens one of the happiest incidents in his life. The work was so greatly admired by a number of Devonians that they determined to secure possession of it for the sculptor's native city. A committee was formed for the purpose of obtaining subscriptions, and though the price put upon the masterpiece was not realised, Mr. Stephens's generosity did not allow a consideration of that kind to stand in the way.

## PEVENSEY CASTLE.

Sir,—In an article on Pevensey Castle, in a recent number of the *Builder*, there appear to me to be two or three mistakes committed by "G. T. C." As I have not seen any comment upon them, allow me to draw your attention to them.

The plan, which appears to have been taken from the Ordnance Survey, is scarcely correct in some parts. The middle buttress on the west side is evidently a mistake of the engraver: it is probably a shed. The plan made by Mr. Figg, and published in the "Sussex Archaeological Collections," shows all the discoveries more clearly. On it are shown the wall between the buttresses of the Decman entrance, the postern on the north side, the remains of a Roman tower and parts of the wall on the south side, where there were discovered the remains of a narrow postern. The oblique postern on the south side of the Medieval castle, with the sunken Roman tower in front of it, are also shown. In 1783 this Roman tower had a parapet remaining round the top of it, and on the courtyard side of the postern there existed a wall on each side of the passage to it (see Grinnin's drawings in the Burrell MSS., Add. MSS. 5671).

It scarcely conveys a correct idea of the postern gateway in the Roman wall on the north side, to say it passes "obliquely through the wall." Instead of its being straight, the plan of it is curved, which is much more ingenious, and renders it more difficult to force an entrance.

I think there is a slight mistake in saying that the mouth of a sewer has been discovered in the south wall. There was a tradition that connected Pevensey Castle with the ancient house at Westham called Priesthaves by a subterranean passage. Mr. Lower, to prove the fallacy of it, made some excavations, and found this supposed underground passage to be a drain constructed of large stones. It was 2 ft. 6 in. below the surface, 1 ft. 6 in. high, and runs about north-west and south-east. It is shown on Mr. Figg's plan. It could not have passed

through the south wall without a considerable twist.

Instead of the facing of the north wall having been destroyed by the Northmen, it is more likely that it suffered most of its destruction when Pevensey Castle was used as a quarry, which was from about the end of the sixteenth century to about fifty years ago. In 1650 the materials of the castle were sold to John Warr, of Westminster, for 40*l.*, who did not avail himself of his power of destruction. The external facing stones at the bottom of the walls have been removed for building purposes; the difficulty of raising stones compared with merely knocking them down saved the foundation from destruction. Mr. Hartsburne, in his description of Porchester Castle, in the Proceedings of the Archaeological Institute at Winchester, 1845, gives a description of the Roman method of forming foundations when the ground was unsuitable for building purposes, and which explains why some of the wall has fallen.

I do not know what authority there is for extending an arm of the moat northwards towards the Roman tower; it is true there is a hollow in the ground, but a moat in this direction would have offered facilities for draining it if the attacking party obtained possession of the outer ward. The moat round the Medieval castle could scarcely be supplied with water from the sea, as it is so much above the sea level. If the moat had been supplied from the sea instead of from a spring it would not be fit for drinking purposes, to which use it was applied, for in the Burrell MSS. in the British Museum (Add. MSS. 5,682) is the following:—

"In 1710 Rev. Jn. Wright, vicar of Pevensey, Chancellor, Res. of Chichester, for benefit of his parish, who laboured under the inconvenience of bad water, employed Jn. Pursglove, of Hurstmonceux, for his workman to convey water from the castle moat to the town, in order thereto he found it necessary to his way under the castle wall, which is very high, and the thickness he computed to be ten feet. The foundation upon which the superstructure is erected consists of plies planked over with slabs of extraordinary substance; but, notwithstanding the long Tract of Time since the Building this weighty fabric, there appeared no decay in the slabs, only the colour changed from what we may suppose it when they were first laid down; the leaves of faggots found there were sound. Transcribed 1782 (from a paper in the possession of Mr. Lambert, of Lewes) by W. B."

Mr. Lower and others have been of the opinion that the walls of the inner castle were built in the twelfth century, the towers added at the end of the thirteenth century. From what I could see of the building during the short time I was there, I could not discover any difference in the character of the work in the walls and towers, and any one examining the plan would, I think, say without doubt that they were built at the same time. The following extracts from Rolls will show that the towers existed previously to 1301, or they would not have required repairing:—

"The king intending to fortify it in 1250, commanded the sheriff to compel all persons who owed service to the castle to perform the same" (Pat. 34, H. III.).

"In 1264 Simon de Montfort was to have 700 marks towards his expenses in besieging the castle. In the same year the Barons of Hastings, Winchelsea, and Rye were to try diligently to capture those enemies of the king, who endeavoured to fortify this castle with men and victuals."

"The sum of 12*l.* 11*s.* 3*d.* was allotted in 1304 for payment of the repairs of the hall and chambers of the castle done in 1301; 3*l.* 12*s.* 6*d.* for the repairs of the chapel in 1302; and 7*l.* 13*s.* 7*d.* for those of the great tower and granary tower. The sum of 2*l.* 2*s.* 10*d.* was allowed for the repairs of the wall of the inner ward in 1303; 2*l.* 12*s.* 11*d.* for the repairs of the stable; 18*s.* 0*d.* for those of the great tower; 1*l.* 6*s.* 5*d.* for those of the gate of the outer ward."

"In 1394, also, the sum of 12*s.* was allowed for the carriage of 200 round stones, fit for engines; from the store at this castle to Winchelsea."

Several large green sandstone catapult balls, 9 in. to 15 in. diameter, were found at the bottom of the wall; some are in the garden of the cottage on the east side.

The chapel foundations, which were uncovered in 1852, were covered in again; it would have been much better had they been covered with slabs of stone, and been left exposed; there would not then have been such a discrepancy between the position of them as shown by the Ordnance plan and Mr. Figg's plan, which shows the chancel facing the east, and is more likely to be correct. Neither would any one have fallen into the error of

making the nave 8 ft. or 9 ft. broad by 40 ft. long,—rather a queer proportion. The dimensions, as given by Mr. Lower, are,—nave 40 ft. by 16 ft. 8 in. wide; chancel, 12 ft. 8 in. by 11 ft. 6 in. wide; the general thickness of the foundations of the walls, 2 ft. 5 in. There were indications of an aisle having existed on the north side. The flooring, which had been removed, appears to have been laid upon a bed of shingle; a stone step to the chancel remained. The chancel was divided longitudinally into three, and below the floor were discovered several skeletons. Right and left of the chancel step stone enclosures existed, perhaps for the pulpit and desk.

The piscina, which is about the only thing to guide one as to the date of the chapel, is in the form of a capital; from the carving it may be very late Transitional or Early English, and of nearly the same date as the castle. It could scarcely have been a holy-water stoup, as it has a hole through it, and it was found at the east end of the nave, probably near its original position. When the chapel was burned, the slates of the roof falling on the font and piscina probably prevented their entire destruction.

In a small sketch-plan that I made of the north-west tower, there are shown seven bays round the lowest story, and seven vaulting ribs; I fail to see how there can be eight vaulting-ribs, unless two spring from one of the angles. The oblong round chambers, east of north-west tower and west of north tower, appear to have been for hours to protect the base of the wall.

It is a pity that, when the excavations were carried out, there was not an effort made to discover the foundations of buildings in the inner ward, as we should then have known the correct position and size of the hall, &c. It appears that the only thing that led to the discovery of the chapel was the dried appearance of the grass. WILLIAM G. B. LEWIS.

## VENTILATION OF THE COUNCIL-CHAMBER, GUILDHALL.

THE present Council Chamber at Guildhall wall, in all probability, in a few years hence be superseded by a more commodious and architecturally-effective chamber than that in which the Common Councilmen of the City of London now hold their courts. Plans for a new chamber have already been prepared by the City Architect, Mr. Horace Jones, and the works connected with the substructure are in hand. Pending the erection of the new chamber, however, the City authorities have wisely sought to properly ventilate the old chamber, but, it would appear, they have sought in vain until recently, when they requested Messrs. Robert Boyle & Son, ventilating engineers, of London and Glasgow, to submit a scheme for the efficient ventilation of the chamber, which was accepted only on condition, as we understand, that unless the work when completed was approved of,—that is, unless it was completely successful,—it would not be paid for. Messrs. Boyle, confident in their power to succeed, set to work, with the result, as it would seem, of fully justifying their anticipations, and, what is more, of so fully satisfying the Corporation authorities that, after experiments and observations made since the completion of the work in January last, Messrs. Boyle have, on the certificate of the City Architect, been paid for their work.

We have had an opportunity of being present in the chamber during a meeting of the Common Council, and being aware, from personal experience, of the bad state of the atmosphere which used to prevail on court days, we are in a position to say that a marked improvement has been effected,—so decided a change for the better, in fact, that we can quite endorse the favourable opinion of it which has been given by Sir John Monckton, the town clerk, in a letter to Mr. Whitehead.

The application of the system may be briefly described as follows:—For the extraction of the vitiated air nine of Messrs. Boyle's patent self-acting air-pump ventilators are fixed on the top of iron shafts standing at various heights above the roof to clear the ventilators of obstructions. Four of these shafts, two at each end of the chamber, are 13 in. in diameter, branching off a little above the ceiling into two 10-in. pipes communicating with openings in the ceilings 2 ft. in diameter, connected by means of ornamental centre flowers. On the top of each of

these shafts is fixed a 2-ft. air-pump ventilator. At the east end of the chamber a shaft, 18 in. in diameter, penetrates through the roof, having a 30-in. ventilator on the top, and expanding at the bottom to 2 ft. 6 in. by 2 ft. 3 in., covering an opening of the same dimensions in the centre of the ceiling. At the west end of the chamber a large shaft, 2 ft. 6½ in. by 1 ft. 8½ in., is carried a considerable height to the top of an adjoining building, surmounted by a 3-ft. ventilator, and terminating over an opening in the ceiling. A shaft, 16 in. in diameter, connected with the large chandelier suspended from the lantern over the central dome of the chamber, is also run into this shaft, the ventilation of the body of the chamber being partially effected by this means. On the top of the outer casing of the lantern three 13-in. shafts are fixed at equal distances from each other, capped with 29-in. ventilators; these shafts communicate with openings in the under portions of the lantern by means of expanded iron hoppers, and complete the arrangements for the extraction of the vitiated air from the centre of the chamber. A portion of these shafts formed part of the old system of ventilation, and were previously ornamented with revolving cowls. For the supply of fresh air Messrs. Boyle, with certain alterations, have utilised the arrangements which existed, making them thoroughly efficient. On the south side of the chamber four vertical air-tubes or brackets are fixed against the wall, two 2 ft. by 2½ in. by 3 ft., the other two placed a little higher up in the wall, being 1 ft. 6 in. by 4 in. by 2 ft. These tubes communicate with holes cut through the walls, 2 ft. by 8 in., finished with cast-iron gratings. These air inlets are all fitted with Messrs. Boyle's patent heaters, which are now so well known as to need no further description here,—for warming the supply of air to any temperature required as it passes into the building; the north wall is similarly treated to the south, with the exception of having an extra tube at the end where the Lord Mayor sits. At the public end of the chamber three inlet-tubes are fixed, one at each side and one in the centre, also fitted with the air-warming arrangement. An abundant supply of air is admitted through these tubes, and tests have shown that the air can be warmed in cold weather to a temperature of from 60 degrees to 120 degrees, thus preventing cold draughts. With respect to the extraction of the vitiated air, experiments have shown that the average extraction of air from the chamber was 500,000 cubic feet per hour, and that during the whole of the experiments no down-draughts were experienced.

#### STAFFORD WATER SUPPLY.

Sta.—Having been responsible for the report on the proposed water-supply from Cannock Chase, which has recently been under the consideration of the Stafford Town Council, I venture to offer a few remarks suggested by the letter of "Sanitary Engineer" (*Builder*, November 11th).

I think the fact of obtaining fresh analyses of the shallow well water, with which the town is now supplied, must be only regarded as an expedient deemed necessary by some to again show unbelievers the urgent necessity of a pure town's supply. Though the Cannock Chase scheme has again been shelved, I do not think the public spirit of the Corporation can yet be fairly impugned when I enumerate the following facts:—

1. All the water-mains have been purchased and a great many laid.
2. Three borings in the New Red Sandstone have been executed under the supervision of a London engineer, but without success.
3. A fourth boring has been executed on a site suggested by an eminent local engineer, but without success.

It may seem like "putting the cart before the horse" to lay mains before the water-supply is obtained, but at the time they were purchased the price of iron was extremely low, and the first bore-hole was progressing so favourably that geologists and others declared the water-bearing stratum was about to be tapped.

I may add, with regard to the Cannock Chase scheme, that seldom has a corporation in late years been placed in the favourable position of Stafford in obtaining a water-supply with the payment of so little for compensations. The water has been pronounced by the county analyst as "simply splendid," and like "a very good and soft spring water or a perfectly filtered

brook water." It would flow into the town by gravitation, and no expensive engineering works would be necessary in collecting.

Sir F. Bramwell, Professor Green, and Mr. W. Dennis, M. Inst. C.E., who have been consulted by the Corporation, have strongly favoured this scheme, and it is to be regretted that in a district where suitable collecting-areas are being rapidly snatched up by the larger towns and water companies, the county town of Stafford should have again let an opportunity slip of providing a pure water-supply from so economical a source.

J. BRADDOCK McCALLUM.

#### THE GREAT FIRE IN SYDNEY, AND THE COLONIAL COLLECTION OF PICTURES.

Sir, There has been considerable anxiety about the Colonial Collection of Pictures, for which the New South Wales Government have at various times liberally voted moneys. I must confess that, at first, I shared in this anxiety, and more especially with respect to Mallox Brown's great picture of Chancer. I have since, however, been inclined to think that it was a collection of some 350 pictures got together for a temporary exhibition, that was consumed in the burning of the Garden Palace, and not the Colonial Collection. In this supposition I am supported by a letter just received from the office of the Agent-General for New South Wales by desire of Sir Saul Samuel, K.C.M.G.

W. CAVE THOMAS.

#### NEW RAILWAYS.

*Bala and Festiniog.*—The new line of railway constructed by the Great Western Company, from Bala to Festiniog, was opened for passenger traffic on the 1st inst. Leaving Bala, for the first twelve miles the railway follows the river Trywern, the scenery along the whole distance being wild and romantic. The first station is near Frongoch Farm, and will be called Frongoch, about three miles and a half from Bala; the next is Rhydyfen, eight miles and a half, near the half-way inn of that name between Bala and Festiniog. At the foot of the Arenig mountain, within a mile of Llyn Arenig, the lake whence Bala derives its water supply, and Llyn Trywern or Migneint mountain, the line skirts the latter, and, being the highest point of the railway, there is here a relief siding for the traffic. Soon after leaving Llyn Trywern, twelve miles from Bala, the viaduct over the the Lladron Brook is reached. This is a notable piece of engineering work, having nine arches of 36 ft. span and 104 ft. in height, and is the introduction along a high and steep elevation to the beautiful Vale of Cwm Prysor, passing Castell Prysor, the remains of a Roman fort, and approaching within three quarters of a mile to Trawsfynydd village, seventeen miles, where it makes a detour to the right. It passes the junction of the Festiniog and Meantwrog roads, where Meantwrog-road Station (twenty miles) is situated, with charming views of the surrounding hills over the Cymael, not far from Hugh Llwyd's Pulpit and to the terminus of the Blaenau and Festiniog line, which has been purchased by the Great Western Company, and widened to the ordinary gauge. Rhydyfen station is at the foot of the Arenig, within a mile of Llyn Arenig. Mr. Dean was the contractor for the new line, which, in addition to opening up an attractive and hitherto little frequented route for tourists and visitors to this part of the Principality, will, it is expected, prove an important factor in the extension of the slate trade of the Festiniog district.

*Sheffield to Southend.*—The proposed route of the projected railway from Arnold's Wood, Sheffield, on the Great Eastern line of railway, via Billerica, Wickford, Rayleigh, and Rochford, to Southend-on-Sea, has been surveyed by Mr. Vincent Yardley and Mr. Chas. S. Morgan, from the office of Messrs. E. Wilson & Co., of Dean's-yard, Westminster, engineers to the Great Eastern Railway Company.

*St. John's, Kosselydown.* the interior of which has been restored by Mr. Thomas Gregory, Station Works, Clapham Junction, under the direction of Mr. Blomfield, was opened on Friday, the 9th inst. New seats and stalls have been provided, the windows have been glazed with cathedral glass, and the floors relaid with pitch-pine wood blocks.

#### CHURCH-BUILDING NEWS.

*Somerset.*—The Church of St. Mary, Somerset, near Ipswich, has just been restored. The church was probably built about 1350, in the reign of Edward III., but some of the existing windows, doorways, &c., are later. The building consists of a nave and chancel, with arch into the tower at the west end. The old gallery, which extended across this simply moulded but well-proportioned archway, completely spoiling its proportion and greatly marring its effect, has been removed. A few of the large roof-timbers are still to be seen, and are of solid oak, some being moulded,—viz., the tie-beams and cornices, and these are probably of the date of about 1500 or 1600. These timbers had been coloured, but the colour has been carefully cleaned off and the wood oiled. The old square high pews in the nave have been entirely cleared away and replaced by open pitch-pine benches of Early English detail. There is no chancel arch, but the floor of the chancel has been raised 4 in above that of the centre aisle of the nave, with a wide Portland stone step extending across the church. The old choir steps were of oak, but of poor and unworthy design, and these have been replaced by oak stalls of Early English character. The whole of the carving of the choir-stalls has been carried out from full-sized drawings supplied by the architect. The old flooring in the chancel was of pavement. This has been replaced by Minton's tiles of black and red, with border, and some oncaustic tiling has been placed inside the communion-rails. Extensive repairs have been executed to the exterior. The whole of the nave roof has been stripped and re-tiled, and the water-pipes and guttering re-adjusted, with proper drains from the pipes. The whole of the work has been carried out from the designs of Mr. E. F. Bishopp, architect, Ipswich, and under his superintendence. The contractors are Messrs. J. B. & F. Bennett, of Ipswich. Messrs. Crisp & Smith did the painting and stencilling work, and Messrs. Groom & Son, of Ipswich, have executed the carving.

*Oxford.*—The parish church of St. Peter, at Oxford, Devon, has been re-opened, after being closed for some three months for the purpose of internal renovation. The building was all, except the tower, re-built so recently as 1838. In the ancient tower there are eight bells, and the church registers date from 1568. For some time it has been felt that the pews and other internal arrangements were hardly adapted for modern requirements, and so a clean sweep has been made of them, and Mr. Edward Ashworth, architect, Exeter, was commissioned to prepare the necessary plans and superintend the renovation. The general contractor for the work was Mr. James Wood, of Lutley, near Thverton, who has resented the entire church with open benches of pitch-pine. The pulpit, prayer-desk, credence, &c., are of waistcut oak, and the work of Mr. Harry Hems. The pulpit, which is a memorial one, bears upon one of its panels, in unobtrusive characters, the following legend:—"This pulpit was given in memory of Frederick Temple and Walter Hilliard, by their brothers, George Anson, Arthur, and Henry, 1832."

*Barnstaple.*—The work of restoration at the parish church of St. Peter's, Barnstaple, is proceeding. The new records is to be of Beer stone. Mr. John Oldred Scott, M.A., the architect for the restoration, has produced a particularly ornate design for this record, and the work has been entrusted to Mr. Harry Hems, of Exeter. Mr. Hems has also been commissioned by Mr. Scott to prepare from his designs some altar-rails and a sedilia for the sanctuary. They will be of English oak, and are to be profusely carved.

*Swansea Baths and Laundry.*—In this competition (advertised in the *Builder*), the directors of the Swansea Baths and Laundry Company have received fourteen sets of designs for the erection of Turkish and swimming-baths and steam laundry. The directors met on Thursday to inspect the plans, but we are not aware whether they have yet come to any decision. A premium of 25l. was offered for the design which should be chosen, and the design so honoured was to "thenceforth become the absolute property of the company," who were to be "at liberty to deal with it in any way they might think proper." No other premiums were offered.

STAINED GLASS.

**Bicester.**—A three-light window has just been erected in Bicester Parish Church to the memory of the late Rev. G. Baydon Rogerson, M.A., formerly Tyrwhitt Hebrew Scholar and Seventeenth Wrangler, St. John's College, Cambridge. The artists are Messrs. Mayer & Co., who have already executed three other windows for the same church.

**Islington.**—The large west window of St. James's Church, Prebend-square, has recently been filled with painted glass, at the cost of Mr. T. W. Wing, a member of the court of assistants of the Clothworkers' Company, the trustees and patrons of the church, which is the foundation of William Laub, citizen and cloth-worker. The upper part of it, which is a wheel window, in eight compartments, represents the six days' work of creation; in the five lower compartments are the figures of the following prophets, viz., Noah, Moses, Daniel, David, and Abraham, and under each figure is the illustration of an incident connected with his life. The accessory surroundings consist of canopy work, with angels bearing musical instruments, &c., in the shaftings. The whole is Venetian in tone of colour. The arms of the founder of the church and of the Clothworkers' Company are introduced, as are also, on a brass plate, those of the donor, with a suitable record of the gift. The work was designed and executed by Messrs. Lavers, Westlake, & Co., of Endell-street.

SCHOOL-BUILDING NEWS.

**Ripon.**—New Wesleyan schools here have been opened. The total cost of the new buildings has been about 1,000*l.* The contractors for the carrying out of the work were Messrs. Mitchell & Webster, builders, Ripon; Mr. Simpson, joiners' work; Mr. Baynes, slaters' work; Mr. Dalton, plumbers' work; and Messrs. Appleton & Son, stonework.

**Dalston.**—On the 14th ult. the late Lord Mayo (Sir J. Whittaker Ellis) laid the foundation-stone of new school and mission buildings for the parish of Holy Trinity, Dalston. The building, which, inclusive of fittings, will cost about 2,500*l.*, and will afford accommodation for 150 girls and 160 infants, has been designed by Mr. G. H. Jones, the builders being Messrs. J. Jarvis & Sons, Hackney-road. It will be in the Gothic style, brick-built, with stone dressings.

Miscellaneous.

**Convict Labour and Harbours of Refuge.**—The committee appointed by the Home Secretary on the employment of convict labour, which was presided over by Sir Edmund D'Aene, has concluded its report, which states that there are in Great Britain about 10,000 able-bodied convicts, of whom only about 1,000 are available for public works, but a largely increased number will shortly become available. The committee enter at some length into the question of harbours of refuge, and suggest that convict labour might be utilised in the construction of such harbours at Dover, Fife, and Peterhead. The commission of 1859, over which Sir James Hope presided, recommended Peterhead Bay as a suitable place for a harbour of refuge, further suggesting that 300,000*l.* should be spent upon the work, 100,000*l.* of that amount to be subscribed in the locality; but this latter condition was at that time found to be impracticable, unless a second harbour should be provided on the east coast of Scotland. The proposal to select Peterhead will be met by representations of the claims of Stonehaven Bay, in favour of which Robert Stephenson, the eminent engineer, and an official committee, reported in 1812, and again in 1830, as a suitable mooring-ground for the North Sea fleet. The present convict committee, who have been conducting their investigations for several months, state that the labour of nearly 700 convicts would be at once available for the construction of a harbour of refuge on the Scotch coast.

**Carlisle.**—A new mission-hall, erected in connexion with the parish of St. Paul, on a site generously given by the Duke of Devonshire, was opened on Sunday evening by the Lord Bishop of the Diocese. Mr. George D. Oliver was the architect of the building.

**Liverpool Science and Art Classes.**—The prizes and certificates gained by the students of the Liverpool Science and Art Classes were tributed by Professor Abel, F.R.S., on the 20th ult. The chairman (Mr. James Samuelson), in introducing the Professor, said that in the technological examination of May last, which, if not the first, was one of the earliest examinations in connexion with the trades' guilds, he found that the total number of passes in the United Kingdom was 1,162. In this list he was sorry to say Liverpool cut a very poor figure; Bolton obtained the largest number of passes, 124, against 112 secured by London, 109 by Glasgow, 71 by Manchester, 65 by Bradford, 35 by Huddersfield, 20 by Liverpool, 11 by Birmingham, 9 by Hull, 1 by Bristol, and 15 by Ireland. Of the twenty Liverpool students who passed the examinations nine were connected with the Science and Art classes. What he desired to draw attention to was the fact that this system of tuition gave a remarkable impetus to the industries of the United Kingdom. In Bolton, for example, nearly all the students had passed in cotton manufactures; in Glasgow, chiefly in pattern designing and mechanical engineering; in Bradford, in weaving and pattern designing; in Huddersfield, nearly all in cloth; and in Ireland, in linen. Professor Abel said the system of instruction, of special inspection and testing, and acknowledgment and reward of success, which had been pursued throughout the country under the direction of the Government Department of Education, was certainly one of the greatest among the many benefits which they owed to the successful realisation of that grand conception of the wise and far-seeing Prince whose memory was so deservedly revered,—the conception of gathering together all nations under one roof, as represented by their several achievements in arts, manufactures, domestic economy, and applied science in its many ramifications.

**Lerwick Town-hall.**—The new town-hall at Lerwick, in Shetland, exhibits much gorgeousness in its enrichments. The building is rapidly approaching completion. It will be peculiarly rich in painted glass and stone carving. The cities of Hamburg and Amsterdam, mindful of their long commercial association with Shetland, have each given a painted window, adorned with their arms and bearing appropriate inscriptions. The heraldic lions of Norway,—it will be remembered that Shetland was an ancient Norse possession,—and of Scotland are plentifully distributed; while in the great hall there will be a series of four windows of two lights each, constituting a complete historical sequence of the various princes, earls, and other noble personages formerly connected with the island.

**South Stockton.**—At a meeting of the South Stockton Local Board, on the 7th inst., it appeared from the minutes of the Finance Committee that the District Surveyor (Mr. S. E. Thorold) had applied for an increase of salary in consideration of the important work of paving and sewerage which he is about to carry out under the instructions of the Board. Having fully discussed the question, the committee recommended the Board to increase Mr. Thorold's salary from 200*l.* to 300*l.* per annum from the 1st of January next, the Surveyor undertaking to continue in the employ of the Board for at least four years. The Board adopted the recommendation of the committee.

**The Discoveries at Pottiers.**—Further particulars have been received regarding the important archaeological discoveries at Pottiers. They consist of a temple, 114 metres long, and whose facade measures 70 metres; a thermal establishment covering two hectares, with the piscina, canals, paving, &c.; a theatre, with a stage of the depth of 90 metres; and, finally, several entire streets of houses. The whole occupies an area of about seven hectares,—about seventeen acres. Some of the buildings contain beautiful sculptures, attributed to the second century, and numerous objects of iron, bronze, and earth.

TENDERS

For new building for the Bury and West Suffolk Club, Bury St. Edmunds	£2,880 0 0
Robinson, Bury	2,880 0 0
Grimwood & Sons, Sudbury	2,695 0 0
Saunders, Maldon	2,640 0 0

The work was offered to Messrs. Grimwood & Sons, but refused by them, the form of contract and conditions not being in accordance with those agreed upon by the Royal Institute of British Architects and the Central Association of Master Builders.

For Chatham-place Schools, Hackney, for the School Board for London. Mr. E. R. Robson, architect:—

Wood	216,840 0 0
Higgs & Hill	15,890 0 0
Perry & Co.	14,773 0 0
Atherton & Latta	14,709 0 0
Sargeant	14,634 0 0
J. Grover	14,466 0 0

### Dr. Dresser's "Japan."

THE author of this interesting and instructive book\* apologises for having added another to the considerable list of books about Japan, on the ground that he is a "specialist," and being an ornamentist by profession, went to Japan to observe what an ordinary visitor would pass un-noticed. His book needed no apology, and though he is not the only specialist who has produced a book on Japanese ornament, he takes a wider and more critical view of the subject than any other such book we have seen gives us; he took special means to procure a number of reliable illustrations, engaging the best native photographer he could find to take views and architectural details of buildings, and the best ornamentist in Kyoto to make coloured drawings of temple decorations; and, which gives the particular value to his book, he has bestowed a degree of attention to Japanese architecture which we have not met with in the works of previous writers, who have usually been entirely taken up with the ornamental details and animal paintings of Japanese art.

Like other visitors to Japan, Dr. Dresser appears to have been a little carried away by the novelty and ingenuity of the art among which he found himself, and to have attributed under this influence a rather greater degree of importance and interest to Japanese architecture than the illustrations he gives would bear out, or than we should be at all disposed to accept as probable. Dr. Dresser tells us that in reality the public here at present know nothing, and even architects very little, of Japanese architecture; and that coloured illustrations, which he was unable to furnish, would have been necessary to enable his readers to realise at all the beauty of detail which fascinated him so much. Both these statements we can readily accept, but we must take with reserve the statement that Japan "has had a great architectural history." We can hardly see how such an expression can be used in regard to a people whose architecture is almost entirely a wooden one, of a charmingly piquant, ingenious, and picturesque, but also a very

flimsy and perishable type. That the history of many of the leading forms used in Japanese architecture must go a long way back is true enough, but if the country had ever had anything that could be called a great architecture there would be the remains of it. There is this peculiar kind of historic interest about it, however, which we do not see that our author quite appreciates, namely, that it seems almost like the traditional preservation in their original wooden form of many of the characteristic details of the stone architecture of India, which were obviously imitations of wooden forms in stone. The Japanese would seem to have had in their architecture the same kind of perpetual conservatism which has characterised China in almost everything; so that we have now before us, in these elaborate wooden bracketed buildings, of which Dr. Dresser has procured some good illustrations, the type of wooden building from which the Indian stone buildings originally were derived, still preserved by Japanese tradition. Either this is the case, or, on the other hand, it may be that the Japanese re-translated into wood the Indian stone architecture; in which case Japanese architecture must be regarded as a kind of painted flyleaf blown from the vast volume of Indian architecture. That the two are closely connected no one can doubt, as far at least as regards many of their details.

As to the general character of Japanese structures, dwellings especially, which is really rather that of roofs supported on props than of "buildings" in the true meaning of the word, Dr. Dresser finds the origin of this in the style of erection still represented in the temple erected by the people called Ainos in the northern island, Yesso. This very rude form of temple, of which he gives a sketch, consists of a heavy and clumsy-looking thatched roof supported on three rows of poles, at the two ends and across the middle, representing, in fact, the very rudest idea of columnar architecture. If the same general design were decorated with the rich details usually found on Japanese temples, and the spaces between the columns filled in with wooden panels, the general idea of a Japanese temple would be realised. The explanation is a not improbable one, and is only a repetition of the process seen in other styles, of the growth of an elaborate architecture from a primitive simple structure, the main forms and arrangement of which are retained. In his expressions in regard to the architectural merit of even the finest of these buildings as they stand, our author is, we think, somewhat carried away by the influence of Japanese air and Japanese surroundings. It may be possible that the same effect would be produced on others, and that an architect who went out to Japan in the spirit of Balaam, to curse the architecture of the people, would bless it altogether. To speak seriously, we quite understand the fact on which Dr. Dresser so

much insists, that the brilliant and effective colouring is a great part of the value of Japanese temple architecture, and that this cannot be well realised to the mind's eye by any verbal description. But no colouring can alter the fact that the Japanese architecture, the very examples which are shown in Dr. Dresser's illustrations as the finest specimens, partake largely of what is an essentially barbaric element, viz., the attempt to produce effect by profusion of detail rather than by thoughtful design directed to the true expression of the construction. In one or two more considerate moments the author himself admits this, and observes, for instance, that in some cases the system of bracketing "is carried to an extent which seems altogether extravagant." It certainly is; and this is not a characteristic of really intellectual or well-considered architecture; and when the author gets into his enthusiastic mood again, and says that "no one can look upon either the temples of Shika or of Nikkô without feeling that the architect of these glorious buildings understood perfectly the principles both of construction and of beauty"; when he elsewhere comments upon the admirable sense of "proportion" in Japanese architecture; and when we compare these laudations with the view of one of the principal gateways of the temple enclosure at Nikkô, we feel that the author's enthusiastic spirit has entirely run away with his critical spirit. The elaboration of the thing is astonishing, and may well look much more so when covered with colour; but, to talk of "proportion" or of "principle" in reference to such a design as this, a mass of ponderous and unnecessary roofing and bracketing all huddled together in a heap on the top of a substructure which it seems entirely to crush, is really a misuse of words. The very quality which, more than any other, distinguished civilised from uncivilised architecture is the power of choice, of selection, of what we may call reticence, which is exemplified in such architecture as that of the Greeks and the earlier Medieval builders. To give the same praise to design such as that from Nikkô, to which we have referred, is really to forget, in admiration at the barbaric profusion of the detail, the qualities which are needed to raise architecture to the rank of an intellectual art. The manner of using and applying ornament in Japanese architecture is as much at variance with the conditions of intellectually true architectural expression as is the thoughtless profusion of its application. What could be more absurd, more contrary to the whole meaning of ornament as applied to architecture, than to sculpture conventional water all over a wooden column? The author seems himself to have some difficulty in swallowing this water, and makes an attempt to defend it by observing that the Greeks used the wave-scroll "on various parts of their buildings."

\* Japan: its Architecture, Art, and Art Manufactures. By Christopher Dresser, Ph.D., F.L.S., &c. London: Longmans, Green, & Co.

Yes; but not on columns and architraves. A remark which is made about the use of diapers on beams and other horizontal members of architecture is so extraordinary as to lead us to doubt whether Dr. Dresser is not too much prejudiced (temporarily only, perhaps) in favour of Japanese art for us to accept his evidence as to facts without making considerable allowance for an apparently very strong bias. He says "we never enrich beams and joists by small, repeating, geometrical patterns, but the Japanese do." In this respect they are wrong, and European artists are right. That is not the proper way to give expression to constructional lines or features. But Dr. Dresser adds, "in no case have I seen a diaper pattern so placed on a beam that it was broken by the angle, or so that one, two, or more repeats of the pattern did not exactly fit on each side of the timber figured." If we are to accept this as a statement of the characteristics of the Japanese method of applying ornament in such cases, all that can be said is that almost the whole of the Japanese work sent to England, including most of the specimens in the South Kensington Museum, must have been deliberately selected so as to take us all in, and convey to our minds a notion entirely at variance with the truth. One of the most marked characteristics of Japanese ornament as represented there and in other collections is the habit of applying ornament to objects without the slightest reference to their shape or bounding lines, inasmuch that it is as common a thing as possible to find one half of a leaf on one face of a rail or a box, and the other half doubled over on to the other face: it is done, in fact, so constantly as to lead to the idea that the Japanese have a perverse wish to throw ornament on to an object as if it had only got there by accident, and had never been intended for its position.

There are some special points mentioned in regard to Japanese construction which are worth attention. One is, in reference to the means taken to secure pagodas against being overthrown by earthquake, which have not been described before, and which is very interesting, whether it be the regular way of constructing them or whether it is only a special case. We will quote the author's words:—

"When I first ascended a pagoda I was struck with the amount of timber employed in its construction; and I could not help feeling that the material here wasted was even absurdly excessive. But what offended my feelings was the presence of an enormous log of wood, in the centre of the structure, which ascended from its base to its apex. At the top this mass of timber was nearly 2 ft. in diameter, and lower down a log equally large was bolted to each side of the central mass. I was so surprised with this waste of timber that I called the attention of my good friend Sakata to the matter, and especially denounced the use of the centre block. To my astonishment, he told me that the structure must be strong to support the vast central mass. In my ignorance I replied that the centre part was not supported by the sides, but on reaching the top I found this monstrous central mass suspended, like a clapper of a bell; and when I had descended I could, by lying on the ground, see that there was an inch of space intervening between it and the earth which formed the floor of the pagoda."

The pagodas thus formed, with a hanging weight inside to keep their balance, have in some cases withstood the earthquakes of 700 years. The method is certainly very characteristic of that peculiar cleverness, rather than genius, which is the distinguishing quality of the Japanese.

The treatment of walls by the Japanese, in the comparatively rare instances in which these are built of stone, is characteristic. They are always built with a batter, as the only means of giving them anything like tolerable security against the effects of earthquakes; and in the case of a water-tank at Shiba, of which Dr. Dresser gives an illustration, the monolith granite columns which support the tank and its roof or shelter all lean inwards to a considerable extent. Certain walls have a character and meaning of their own; walls which surround land which is in the occupation of any one of royal blood are yellow in tone, with five horizontal white lines dividing them into bands, looking like the joints of a system of horizontal rustication. It is common to cover walls along their whole length with a roof to keep off wet and sun; and in a like careful practical spirit the ends

of all timbers used in building construction are cased with metal. But in the ordinary dwelling there is hardly anything usually like what we call a wall. Rooms are divided from each other by a series of light, carefully-made panels, most of which can be slid backwards and forwards over each other at pleasure. (One of the author's first experiences was that just after he and his party were in bed (which appears to have meant an endeavour to arrange themselves under, upon, or between a series of little mattresses) a young woman entered through a corner panel to get something from a cupboard in the room: you can never tell, he observes, when or where any one may enter a room in a Japanese house, the wall is all a series of doors and a person coming in enters at the most convenient point. This is quite in keeping with various other habits of a country where everything seems to be done in the contrary way from that practised by the rest of the world, where carpenters plane wood by drawing the plane towards them instead of pushing it from them; and similar eccentricities appear to meet the visitor at every turn.

Concerning the general excellence of workmanship which characterises Japanese production, and also the habit of elaborately decorating portions of objects which are not seen unless specially looked for, Dr. Dresser has one or two interesting suggestions to make. One cause of the ambition after perfect execution he thinks is to be found in the constant presence among the people of a being who is still, except to very advanced and rationalistic Japanese, almost in the place of a god; namely, the Mikado. Part of the mystery hanging over this hereditary deity, as he may be called, is now being dissipated, and Dr. Dresser was even admitted to an interview for the purpose of exchanging addresses with him. But the Mikado has long been regarded as the god incarnate of the Shinto Church, and a being too sacred for human eyes to rest upon; and in every house is a little raised dais cut off from the rest of the room, on which the Mikado, if ever he came to the house, would sit. This is, in fact, an altar to a god who may visit the place in person at any time, and becomes a little centre for offerings of beautiful things, and for the exercise of art in decorating it; and the existence of such a centre in every house probably would not be without its effect on the artistic culture of the people. The liking for ornament in odd places, as on the bottom of a teapot or tray, Dr. Dresser ascribes to that pleasure in ingenious surprises which is a common quality in mankind, but which seems peculiarly developed in Japan. They seem to have a feeling that whatever is worn or used should, even though appearing simple and unpretending, be worthy of most minute examination. Thus, says the author "a walking-stick which Mr. Yeno, the late Japanese minister to England, kindly gave me, appears at first sight to be a mere rude beech-stick; but upon close examination it is seen to have most existentially-cut metal insects creeping over it,—some being half buried in the bark, some crawling out of the little holes, and some running along the surface." This is very pretty and piquant, and no doubt this feeling of making everything worth minute examination is one of the most fertile inducements to the production of highly artistic work.

There is one feeling which the Japanese seem to have highly developed, and which we, in our popular taste, seem to be peculiarly and deplorably destitute of,—the importance attached to the work, the design rather than the material. In metal work, as our author observes, iron, zinc, bismuth, gold, silver, and copper, are all of indifferent value to them, being only so many different substances capable of being artistically treated each in its proper manner. We know how it is with us. Some interesting illustrations are given of the large ornamental nail-heads, some of them of beautiful design, which are inserted, it appears, solely as ornament, for the sake of the heads. Some of them might furnish suggestions (greatly needed) for the artistic treatment of rivets and bolts in engineering work.

One of the most interesting bits in Dr. Dresser's book is his account of an evening when he was asked to meet some of the leading artists of Japan, and see them execute sketches, which several of them did in succession in the presence of the visitors. We may quote the description of one of the sketches, and its

method of execution. The subject was a flying duck:—

"A brush of considerable breadth was dipped in water and drawn between the fingers of the artist till nearly dry. It was then dipped in a thin wash of Indian ink, the central portion of the brush being bent outwards, so that the hairs of the brush assumed a crescent form. The convex or centre portion was now hastily dipped into dark Indian ink, and the brush was allowed to straighten itself. Two or three hairs were now separated from one side and dipped into dark ink, but these remained detached from the other part of the brush. By a dexterous movement the artist produced with one stroke the shaded body of the duck and an outline, the few separate hairs making the latter, while the shading resulted from the darker ink of the centre not having fully spread to the sides of the brush. A bill is now drawn, then feet, then tail feathers. An eye is added, then follows a neck, legs, and a few finishing touches, when an admirable sketch of a flying duck is before us."

After this another gentleman proceeded to draw what was supposed to be a sea-piece, but just as they were expecting him to add the fish in the waves, he finished with a few dots and dashes, and the drawing became a procession of white rats, the lines of whose heads and backs were formed by the limit where the wave-like shading stopped. This is another characteristic example of that curious inversion of the usual habits of mankind which seems to pervade Japanese life: artists of other nations draw an object and then add a background; the Japanese draw the background first and leave the outline. Remarkable as is the skill of manipulation described above, it is possible to make too much of this sort of work. It is a kind of art in which long practice may produce a dexterity which seems extraordinary, but which, after all, is rather a matter of a quick eye and sleight of hand than of artistic production in the intellectual sense; and the frequent repetition of the same animals in nearly the same attitudes in Japanese paintings tends to support this view. It is a curious example of the partial drawing powers of the Japanese, highly practised in one direction, limited in another, that Dr. Dresser mentions that, having engaged one of the best decorative artists of Japan to make drawings of the decorative details of the temples for him, a particular rather complicated bracket was sent to him in the form of a model instead of a sketch, the explanation being that the artist had not sufficient knowledge of perspective to make a sketch of it, so he made a model instead; so that a draughtsman who could probably have drawn a foreshortened figure of a crane or a duck readily enough, was "floored" by a complication of artificial lines and surfaces at right angles to each other. Dr. Dresser's remarks on the universal use of the brush, and not the pencil, for drawing in Japan, and the freedom of style resulting therefrom, are worth attention; but he must not undervalue the training in form which the use of the hard precise lines of pen or pencil is calculated to give.

Some of the lights thrown on the character and social feelings of the Japanese are interesting, and also throw out strange contrasts. Their kindness to animals, especially of the smaller and feebler sort, is a very pleasant trait. A Japanese child, we are assured, will play with a butterfly, but will not harm it, and the birds show no fear of a people who never hurt them. On the other hand, a Japanese dinner-party will cut slices from a living fish which looks at them from its dish as they eat it. The curious indifference of both sexes in Japan about bathing or going to the bath without any clothing, in the presence of any number of spectators, is alluded to by the author, as it is by most visitors; curious on the part of a people who are habitually very fully clothed, and who do not appear to strip themselves publicly on any other occasions. But we doubt the deduction the author draws as to the simple morals of the people. An English lady, who wrote a clever hook on Japan a little while ago, with special reference to the social rather than the artistic side of the subject, recorded the opinion, if we recollect rightly, that the idea of morality, as we understand the word, had no existence in Japan. We take it, the habit is only one of the eccentricities and contradictions of Japanese life, and that no particular deduction can be drawn from it. Another and a very agreeable trait of Japanese society which the author mentions, and which is connected with the appreciation of art, is the respect in which, according to his observation, the genuine artist is held in Japan. Money alone, Dr. Dresser

believes, brings a man no position in Japan. A prince will spend hours in conversation with a skilled workman, and will receive him respectfully at his residence, but the richest merchant will be beneath his notice. If this be true, Japan certainly, in one sense, is a very advanced country.

The author mentions that his book has had to be brought out during a serious illness and chiefly by the assistance of his family. This may account for one or two oversights; the letter from the late Mr. Okubo, the Minister of the Interior in Japan, in regard to contributions representing English industries that were sent over through Dr. Dresser, is printed twice over in two different portions of the book. But the volume is full of interesting information, and the copious and excellent illustrations render it in another sense a very useful and ornamental addition to an artistic library.

#### SHAFTESBURY'S "CHARACTERISTICS" OF EPHEBUS AND ARCHITECTURE.

In our recent observations on the late publication of "Ionian Antiquities" by the Society of Dilettanti, we purposely reserved any notice of one marked peculiarity of the templar architecture on the eastern coast of the *Egean*; this is the affection, among the Ionian Greeks, for the elevation of the walls or cells and its peristyle upon a platform of numerous steps. The temple at Priene, it is true, conforms very strictly to the western usage; like the Parthenon and like the Erechtheum at Athens, it has only two steps below the proper stylobate. In this respect it departs from that agreement with the great Ephesian temple, which is so marked in the design of the bases and sub-bases. The general platform of the temple at Teos was ascended by five steps, and additional dignity was sought to be given to the eastern and principal front by ascent from a lower level by seven more. The peristyle of the Smintheum surmounts a uniform system of ten steps on all sides,—a solid basement which was maintained by a peculiarly firm foundation of clamped masonry. In both these cases the bases of the columns were set so far back as to allow the stylobate to tell with the effect of an additional step, and the spreading basement harmonised at Teos with the open spacing of the columns, and at the Smintheum still more expressively with the unusual breadth conceded to the ambulatory. The plinths of the Priene columns are set all but flush with the edge of the steps.

The feature of a broad and spreading basement, then, is as decided in these two temples of Ionia as in the temple of the great goddess Artemis at Ephesus, though there it appears on a vaster scale and more magnificently designed. Callimachus, in his Hymn to the Ephesian goddess, refers especially to a broad basement (*themelion*), that was built around the statue, of which the original dedication was ascribed to the Amazons. It was by the suggestion of this passage, combined with the observation that the large all-round dimensions given by Pliny were inconsistent with a commensurate octastyle front, as avouched by Vitruvius, and with an interval for the columns which were among the first discoveries reported by Mr. Wood, that the conclusion was anticipated which the progress of excavation was destined to confirm, that the temple proper, with its immediate steps, was elevated upon a broad platform, giving a wide margin all round, and ascended by its own system of steps. The argument will be found at length in the *Builder* for February 10th and 17th, 1872, with the conjectural plan, which may be compared with that of Mr. Wood in the number for July 25th, 1874. These dates, we cannot but interpose, remind of the rapid flight of time; they remind,—they warn us also,—that the excavation is still incomplete, and that though the funds which are required for its effective prosecution are as likely to be obtained hereafter as at present, the main conditions for such prosecution, apart from which any affluence of funds will be nugatory, are the zeal and energy and knowledge of an individual,—of the discoverer himself,—who happily is still in full force, but who can no more than the rest of us last for ever.

The recurrence of this topic of the "broad basement" of the Ephesian temple is an invitation to supplement some remarks on architectural metaphors of the Epistle to the Ephesians,

which will be found in the article, "Revision (architecturally) Revised," in the *Builder* of 11th June, 1881. We were there only concerned with giving an accurate interpretation of "the chief corner stone" as a normal foundation stone, and to be distinguished from the "head stone of the angle,"—the acroterion of Matthew xxi. 42.

But the passage has a further interest from the point of view of architectural history. The observation of this is due to Anthony, Earl of Shaftesbury. The third Earl of Shaftesbury was one of those writers whose influence upon the world is astonishingly wide and deep, whether we consider how little they wrote, how absolutely what can be called the popularity of their writings, if ever popular they can be said to have been, has gone by; these are frequently writers, and Shaftesbury is no exception, whose style is occasionally careless, and, though seldom obscure, at times somewhat perplexingly desultory and disconnected; but there is ever originality at the basis, and this secures for them not only their primary influence but continued vitality and important reaction on the minds of important students. No slight matter this, though any such continued interest is missed too often by the historians of mind and morals, who, after bestowing upon them a chapter, a page, or a paragraph, think they have done enough, and unceremoniously write them off as exhausted and superseded once for all. The grandson of the first earl, who was at once the Archdiocesan of Dryden and the friend of a high-minded and consistent patriot like John Locke,—the great-grandfather of the present earl, who is the object of such well-deserved and uniform regard and respect; Anthony, the third Earl of Shaftesbury, stands in scarcely less contrast to one than the other. The side of his character which interests us here,—it is not that which has had least justice done to it by biographers and historians,—is his interest in the fine arts and in the theory of beauty especially as allied to the faculty of appreciating moral character and ethical distinctions. It was in his pursuit of this theme that he originated the phrase of the Moral Sense, which Adam Smith only used cautiously as a neologism, but which now seems to be absolutely indispensable for the conduct of any discussion as to the expression of sentiment by any art whatever that pretends to go beyond the commonplace and the superficial.

We seem to be wandering somewhat wide of Ephesus, but divergence from the high road may easily become habitual with those who take the hand of Shaftesbury; the very passage which we are interested in is introduced by a repudiation of "ordinary exactness and regularity,"—by an assertion of "the greater privileges by way of variation, interruption and digression allowed to us writers of miscellany, and especially to such as are commentators upon other authors." But, not to ramble further, the immediate point in question is this:—Shaftesbury, in one of the interesting notes to his "Miscellaneous Recollections," in the small volume of "Characteristics," which let us casually into the secret of the wide range of his learning and depth of study, adverts to the architectural images and metaphors in the Epistle to the Ephesians, as manifestly suggested by the familiarity of his correspondents with the great temple. "The magnificence and beauty of that temple," he says, "is well known to all who have formed any idea of the ancient Grecian arts and workmanship. It seems to me to be remarkable in our learned and elegant Apostle that though an enemy to this mechanical spirit of religion in the Ephesians, yet, according to his known character, he accommodates himself to their humour and the natural turn of their enthusiasm by writing to his converts in a kind of architect style, and almost with a perpetual allusion to building and to that majesty, order, and beauty of which their temple was a masterpiece."

The title of the Epistle to the Ephesians is, it may be said, universally assumed to be erroneous, as it purports to be addressed by Paul during his captivity to a congregation of exclusively Gentile converts, to whom he was unknown (i. 15 and iii. 2), a very unlikely case in a city where his activity had been prolonged and successful. At the same time there is strong presumption that it was addressed to converts in the Asian neighbourhood of Ephesus. This is a natural inference from the correspondence of its topics and phraseology, as pointed out in detail by Paley, with the Epistle

to Colosse, a town on an affluent of the adjacent river of Meander. This epistle refers to one which had been despatched to another neighbouring city, Laodicea, to converts who were equally unacquainted with him personally, and the possibility has always been entertained that it is this which we possess under the Ephesian title.

But there is, at the same time, at least a possibility that there were more than one congregation of Christians at Ephesus; not only that which Paul had commenced and extended so far as to alarm the devotees of the great goddess, which included disciples whom he had separated from the synagogue and taught in the school of Tyrannus, but a distinct congregation of later origin. In the speech to the elders of Ephesus at Miletus he expresses an anticipation which we may safely take to represent the event, that "among themselves men would arise speaking perversely and drawing away the disciples after them." He says that "he had not shrunk from declaring to them the whole counsel of God," a phrase which always imports, as he employs it, an allusion to the broad principle of the entire supersession of the Jewish law both for Jew and Gentile equally. If this were so we need not wonder,—in fact, we must inevitably conclude,—that as the Christian movement went on at Ephesus the Judaisers became more and more exclusive, and the more liberal party more and more decided and explicit. We are in no way justified in supposing that in so large a city as Ephesus all the congregations, differing as,—we have St. Paul's word,—so many did among themselves, were already a uniformly organised church, with a single set of officers. Now this view of the true Ephesian reference of the epistle is strongly confirmed when we look closely to the terms of the passages which struck Lord Shaftesbury so forcibly. It is true that architectural metaphors occur in the other epistles, and particularly in the First to the Corinthians; but the fact that this was written from Ephesus is in itself confirmation of the source of the suggestion. The Ephesians are thus addressed in the passage which the note quotes in the Greek,— "So then ye are no longer foreigners and aliens, but fellow-citizens of the saints and of the household of God, being built up on the foundation [*themelion*=basement] of the apostles and prophets, Jesus Christ himself being the normal angle stone," &c. At chap. iii. 17, the value of the allusion is lost in the Revised Version, which gives or leaves, "To the end that ye, being rooted and grounded in love, may be strong to apprehend what is the breadth, and length, and height, and depth," &c. The word translated *grounded*, and thus inevitably conveying an impression of allusion to the same image as *rooted* that precedes it, is a derivative of *themelion*,—basement,—and might more properly be translated "founded."

This temple was the centre of multitudinous gatherings and religious celebrations for all the adjacent districts and provinces of Asia ever since, as far long before the time, when even the Persian satrap Tissaphernes, according to the last sentence that Theophrastus penned, resorted thither to pay service to the great goddess; it is, therefore, not extraordinary if in the parallel epistle to the neighbouring Colosse we meet with parallel metaphorical phrases allusive to the grand *themelion* (i. 23; ii. 7). Shaftesbury is earnest and enthusiastic, if we may not say precisely eloquent, in claiming for the arts the same sympathetic harmony with nature which he asserts for morals against those who would represent "that all actions are naturally indifferent; that they have no note or character of good or ill in themselves, but are distinguished by mere law, fashion, or arbitrary decree." "Harmony," he says, "is harmony by nature; let men judge ever so ridiculously of music. So is symmetry and proportion founded still in nature, let men's fancy prove ever so harsh or their fashions ever so Gothic, in their architecture, sculpture, or whatever other designing art [as we should now say, art of design]. 'Tis the same case where life and manners are concerned. Virtue has the same fixed standard. The same numbers, harmony, and proportion will have place in morals, and are discoverable in the characters and affections of mankind, in which are laid the just foundations of an art or science superior to every other of human practice and comprehension."

It is not easy to decide what exact sense the author attaches to *Gothic* in this passage; doubtless his general sense is *barbarous*, but his use

of the word elsewhere seems to require a more special application. It occurs in a passage which evinces a certain almost spiteful feeling against Sir Christopher Wren. It is conceivable enough that even a moral philosopher should take pleasure in raking up satire from the "Rehearsal" to vex Dryden as *Mr. Bays*; for had not the poet unmercifully satirised the philosopher's grandfather and best friend. But what was the offence of the dignified architect? When these cavils were set down the noble structure of St. Paul's had just reached completion, and most of the churches of London had risen from their ruins. Shaftesbury had never seen the Gothic structures which they replaced, though he may have seen some in their ruins; everything points to his preferences tending towards the style of the Renaissance, which would explain regret for the loss of Inigo Jones's Corinthian portico to old St. Paul's, but this passage might have emanated from a modern anti-restoration committee concerned for Early English or Late Decorated.

"As for architecture, 'tis no wonder if so many noble designs of this kind have miscarried amongst us; since the genius of our nation has hitherto been so little turned this way, that through several reigns we have patiently seen the noblest public buildings perish (if I may say so) under the hand of one single court architect; who, if he had been able to profit by experience, would long since, at our expense, have proved the greatest master in the world. But I question whether our patience is like to hold much longer. Hardly, indeed, as the public now stands should we bear to see a Whitehall treated like a Hampton Court, or even a new cathedral like St. Paul's. Almost every one now becomes concerned, and interests himself in such public structures." In the meantime, he notices that the reparation of the metropolitan churches was hastened; "and since a zeal of this kind has been newly kindled amongst us, 'tis like we shall see from afar the many spires arising in our great city with such hasty and sudden growth as may be the cause, perhaps, that our immediate relish,—[his odd word for taste],—shall be hereafter censured as retaining much of what artists call the Gothic kind." Shaftesbury died before Wren was superseded in his surveyorship, but it may be doubted whether, had he survived to a good old age, he would have had reason to hail the advent of a superior architectural genius. Many a generation passed before "two of the noblest subjects for architecture,"—which he noted as still left open "by the good fate of the nation,"—were undertaken, "our Prince's Palace and our House of Parliament."

Let us conclude with an extract from following pages which are nearer to our sympathies, pages worthy of the pupil and friend of Locke and Somers, who had recently co-operated in the happy establishment of constitutional Government and national self-respect.

"In reality the people are no small parties in this cause. Nothing moves successfully without them. There can be no public but where they are included. And without a public voice knowingly guided and directed, there is nothing which can raise a true ambition in the artist; nothing which can exalt the genius of the workman or make him emulous of after-fame, and of the approbation of his country and of posterity. For with these he naturally, as a free man, must take part; in these he has a passionate concern and interest raised in him by the same genius of liberty, the same laws and government by which his property and the rewards of his pains and industry are secured to him and to his generation after him."

It will be observed that public opinion when unadvised is by no means assumed to be infallible, and so the influence of a court is not to be despised, under conditions. "What encouragement our higher powers may think fit to give to these growing arts I will not pretend to guess. This I know, that 'tis so much for their advantage and interest to make themselves the chief parties in the cause that I wish no Court or Ministry, besides a truly virtuous and wise one, may ever concern themselves in the affair. For should they do so they would in reality do more harm than good; since 'tis not the nature of a Court (such as Courts generally are) to improve, but rather corrupt, a taste. And what is in the beginning set wrong by their example, is hardly ever afterwards recoverable in the genius of a nation."

One more architectural allusion may be gleaned from the Book of Revelations. In the

missive to the angel in Pergamum, in the second chapter, we read:—"I know thy doings and where thou dwellest, even where is the throne of Satan." We can scarcely be wrong in recognising an allusion here to the vast sub-harment ascended by many steps, adorned with the sculptured wars of the gods and giants, of which such remarkable remains have recently been discovered, and surmounted by an altar certainly, and probably with a statue of Zeus (Jupiter), to whom it was dedicated. The remains attest an ascent of 24 ft., and go far to justify the full height of 40 ft., which the notice of Ampelius ascribes to the complete structure.

#### RICHMOND CASTLE.\*

RETURNING to the entrance-lobby, the staircase to the upper floors is seen to be straight, and carried up by a vaulted passage in the thickness of the south wall, where it is lighted by two loops. At the head and end of the staircase, also in the south wall, has been a door, now converted into a loop, a Perpendicular alteration. The loop is splayed hour-glass fashion, inside and out. It is difficult to understand for what purpose this opening was intended. It seems original. At Scarborough a somewhat similar door opened on the roof of the tower covering the entrance; but, to judge from the surface of the exterior wall the tower did not rise to this height. Opposite to this opening a door opens into the second floor.

This floor is about the same size with those below. It is lighted very sparingly, by two splayed loops in the east wall and one in the west, all high up. Under one of these loops at the north end of the east wall a door leads to a mural chamber, now fastened up, but which seems to be lighted by a loop in the east wall. In the west wall, near the south end, and close to the door entering from below, a small door opens into a narrow mural passage, which runs, like a triforium, the whole length of the north wall. This gallery is widened at its south end into a chamber 7 ft. 6 in. long, lighted by two loops, to the south and west. The north end forms another chamber, much longer, lighted by one loop, to the west. These may have been garderobes, though no shafts are now seen. They are too narrow for bedrooms.

Besides the three doors mentioned is a fourth in the south and of the east wall, which opens into a mural lobby, whence a stair, similar to that below, ascends to the south wall. The lobby has a loop in its east wall, opposite the stair-foot, and the stair has itself four loops in the west wall. This staircase does not, like the lower one, stop at the west wall, but it has a door on the right which opens into the third floor, in its west wall, and beyond this it ascends in that wall to the battlements. It is said that the north-east angle of this floor also contains a mural chamber, but if so, it has no exterior loop.

The present and recent roof of the building is laid at the floor-level of the third floor, which is therefore at present open above. Here the evidence of the exterior masonry is confirmed, for two water-tables remain along the base of the north and south wall, showing, as at Porchester, that the second floor was originally the upper one, and that the keep has been raised one story. Like Porchester, also, it is evident that the addition was made in the Norman period, and, therefore, probably not above fifty years later than the original work. The wall is as thick as that on which it rests, or about 10 ft. How the added story was lighted, or whether it has any mural chamber is not apparent, as an examination is not permitted. One only opening, a loop, is seen in the east wall, near its north end, and the stair in the west wall has two loops looking into the chamber, but there are no traces of regular windows, though there is a curious hagiocope sort of opening in the staircase, near its summit.

The turret at the stairhead, that to the north-west, has a flat-headed door beneath a round-headed relieving arch. These turrets are open below, and the rampart wall passes through them. Their upper floors were probably reached by ladders.

Such is Richmond keep, resembling other Norman keeps in its rectangular plan, its pilaster buttresses, its angle turrets, and its entrance on the first floor. Peculiar in its enormous array in the basement, in the absence of any

original spiral stair, fireplace, or visible garderobe, in the position of its door in a hollow angle, its approach from the rampart, and the absence of any regular fore-building or barbican tower attached to the entrance side. Probably, indeed, the large arch opened, as a small one in the basement does at Porchester, into an attached chamber, of no great height, and carrying a platform at the level of the adjacent ramparts, and having its own door into the inner ward.

The main ward of the castle seems always to have been clear in the centre. The buildings were placed against its curtain, probably along all three fronts, and certainly along those to the east and south-east. The curtain abuts upon the keep, and its ramparts are on the level of the first floor. Proceeding westward from the keep, the curtain, though mutilated, is tolerably perfect for about twenty-five yards. Then, along the west front follows a breach of forty yards, and thence the wall is tolerably perfect to the south-west angle.

Though much altered and repaired, there are traces of flat pilasters outside, and inside are two rather peculiar features, one a large opening the arch of which is nearly a half-circle, and which may possibly have been connected with the principal or garrison chapel of the castle, which there is reason to believe stood near this point. It was founded in 1278 by Earl John, and services was performed there by six chaplains supplied from Eglinton. Below this, at the ground level, is a flatter segmental arch, now walled up. These may have been fire-places, but they do not look like it. The lower certainly had nothing to do with a postern. They appear original.

The south-west angle is capped by a rectangular turret of moderate size, and of Norman origin. It stands upon the cliff, which here commences. From hence, along about three-quarters of the south front, the curtain appears to have rested upon a revetment wall, filling up the natural irregularities of the rock, and crowned probably by a low parapet, a high wall inside being scarcely necessary. Part of this wall has fallen down at an early period, for there have been approached at an early period, to other parts of the wall have buttresses which savour of the Decorated period.

The principal domestic buildings, hall, kitchen, and chapel, stood near the south-east corner of the ward, and were built against either wall. They extended about forty-five yards along this southern front, the curtain being raised to support them. Of these buildings the most perfect is the great hall, "Scollands Hall." This is an oblong of about two squares, the curtain forming its south side. The basement, probably a store, has a door near the middle of the north side, and each side is furnished with loops. At the floor level, but high up on the outer side of the curtain, about 30 ft. above the present walk, is a range of square holes, probably for the support of a timber balcony or *irretasche* for the defence of this important quarter. The upper floor or hall was entered by an exterior stair on its north side, near the west end. It had a wooden floor and roof, the latter probably flat, the rather elaborate Norman corbel table remaining, and there being no trace of grooves or lower corbels for the principals of a high roof. There is a high narrow window, possibly one of a triplet, at the west end, and at the east end were probably the gallery and kitchen. The north and south walls were pierced by a range of coupled round-headed windows, five on the south, and four, leaving space for the door, on the north. The most eastern in each wall has been unspersed; the one by a large Decorated window, the other, in the north wall, by a door, also in the Decorated style, connected with some exterior additions, also Decorated. There is no fireplace. A circular staircase in the north-west angle leads to the roof.

The south-east angle of the ward is capped by a similar turret to that at the south-west angle. The space that intervenes between this angle and the east end of the hall is divided into two floors. The upper, probably a withdrawing-room from the hall, seems to have undergone some alterations in the Early English style. The basement leads to a postern in the base of the turret, opening to the east ward. This postern is a rather large Norman doorway, evidently of the age of the curtain. The kitchen seems to have been placed against the curtain, north-east of the hall, and beyond it is the Norman shell of a chapel. The east wall of this being the curtain, there is no east win-

\* See p. 613, ante.

dow; but on the south side is a trefol-headed Decorated piscina, and the western window seems to have been in the same style. The chapel is on the first floor; floor and roof being of timber. This, and the adjacent fragments of buildings, seem to have been much altered in the Decorated period.

Following this very remarkable specimen of an early Norman curtain from the posteriors northwards, there are seen a number of curious square-headed doorways, under rounded relieving arches, in the base of the wall, leading into mural cavities, now mostly choked up with rubbish. Some are probably garderobes; one seems to contain a stair leading up to the ramparts, such as may be seen in the keep at Tamworth. Near the middle of this front is a rectangular tower, of no interior projection; and north of this a small original doorway, now rather below the ground level, opens direct into the west end of a very remarkable mural oratory, of Early Norman character,—a very curious chamber indeed. This is 13 ft. long by 10 ft. wide, and 12 ft. high, and therefore very small, rectangular in plan, and roughly barrel-vaulted. A very heavy rude round-headed arcade occupies the north, and is continued along the west wall, interrupted by the doorway, and then along the south side. The east window is a splayed loop in the curtain, below the eill of which was the altar, and on either side of it a small circular window, much concealed by rubbish. On each side of the loop, in the spay, is a rude square hole,—no doubt for a beam to support a rood. This oratory is the Chapel of St. Nicholas, and is entirely contained within the curtain, here of very great thickness, and supporting what remains of a quadrangular mural tower. Of the same thickness the curtain was continued to the keep, and it contains several cells similar to the oratory, but which have been converted into prisons for the militia, and are inaccessible. Through this curtain, close east of the keep, is the main entrance to the castle. This was a large Norman archway in the curtain, without gatehouse or flanking tower other than the keep, which, indeed, completely protected one side of the approach. Recently this gateway has been modernised, and its details removed, but the opening itself, and the curtain through which it passes, are original.

It is said that some excavations made half a century ago outside this gate, showed the ditch, and the piers of a drawbridge, which is likely enough.

Outside and abutting upon, but not bonded into, the west wall of the keep the main curtain is seen. It is of rude masonry with some courses of stone laid obliquely on edge, a sort of half-herring-bone work, and probably of the date of the founder of the castle, and certainly older than the keep. A rough place on this wall shows whence sprang the wall of the barbican. The area of this barbican is now open towards the town, and any one may enter it, but if he produce pencil and paper, and proceed to take notes of what he sees, a sergeant from the inner gateway will be upon him, and will inform him, with great politeness, that notes are forbidden, and all access to the interior absolutely out of the question. As the keep has been photographed all round, and impressions may be purchased in the town, this interference seems only intended to annoy visitors. The order is of recent date, but for many years entrance to the keep has been forbidden. Similar orders as to notes are in force with regard to Dover and Scarborough.

It seems perfectly clear from the internal evidence afforded by the remains of the curtain that Alan Fergant on receiving the lordship lost no time in selecting this new site, and in walling in the area very substantially. Most of the existing wall, the three mural turrets, the postern, the hall, the oratory, and what remains of the barbican, seem to be his work, and the original chapel near the hall.

Whether Earl Alan began the keep is uncertain. Mr. Milward, in an excellent account of it in the *Arch. Journal*, v. 52, supposes its date to be about 1170, and it is usually attributed to Earl Conan, who died in that year. This may very possibly be the correct view, but the lower part of the keep appears earlier, possibly the work of Earl Alan Fergant. The keep is small, compared with the importance of the Honour and fortress, the walls are very thick, the ornaments few and simple, and so far as can be seen, there is no trace of fireplace, sewer vent, or portcullis. The straight staircases are

somewhat similar to those seen at Chepstow, Ludlow, Carlisle, and Prudhoe, keeps of various dates, though all Norman. By whom the keep was raised a story is also unknown. The work is of the Norman period, but scarcely by the original builder of the keep, being of inferior quality. If Earl Alan built the keep, Earl Conan probably raised it, but if Conan was the builder, the addition must be due to Geoffrey, or the Earl of Chester, his next successors.

The trifling Early English additions seen about the south-east angle of the main ward, may be due to any of the lords who held the place during the close of the reign of John or that of Henry III. The Decorated additions are far more important, and being late in the style, may be the work of John of Ganut before 1372. They include the greater chapel with adjacent buildings, and the vault of the basement of the keep. The princes of the House of Lancaster were great builders, and have usually left their marks in the castles which came into their possession.

In the "Registrum Honoris de Richmond" is a birdseye view of the castle, of uncertain date, showing groups of buildings, and upon each building a banner of the arms of the knight whose duty it was to defend it. On the keep, Barry of ten, or gulcs; FitzAlan of Beilak; and sable, a saltire or. Over the mural oratory, or, a chief indented, azure, FitzRandolph. Over the postern, argent, a cross engrailed sable; this may be Conan, FitzHenry, or Mansfeld. On the hall, harry of six, or and gules. On the kitchen, west of the hall, azure, three chevrons argent, and a chief, or; FitzHugh. Over the south curtain, vair, a fess, gulcs; Marmion or FitzCernegan. The tower at the south-west angle carries nothing. Over the west curtain is argent, on a fess three bezants. The feudatories said to be represented by these arms, but whose names do not tally with them, are thus placed:—Ranulph FitzRobert, "Placea in Castro Richmond ad Capellam St. Nicholai"; the Constable, "In claustris tarris"; Brian FitzAlan, "In aula de Scolland"; Torphin, filius Robt. de Mansfeld, "Inter coquinae et bracinam"; Ranulph FitzHenry, "In parte occidentali aula"; Conan, filius Helias, "Juxta claustrum tarris ex parte orientali extra muram. Placea Camerarii ex parte orientali de Scolland Hall juxta furnam." Thom. de Burgo, "Ex parte occidentali majoris capelle ad canonicos in maris." Each tenant in *capite* had a quarter appointed, and further, each had two specified months during which he was to serve.

It seems singular that a family so powerful as that of the old Earls of Bretagne should allow a town founded by them, and under their protection, to remain exposed to the dangers of fire and sword in a district in which the old English feeling was strong. Possibly the town did not immediately follow upon the building of the castle, but so it was that it was not till the time of John le Drex, who was earl from 1335 to 1341, that we read of town walls. This duke had licence to wall the town, and he cleared away the houses that stood in the way, but the actual walling was a later work. That it was done appears from Leland. The town was small, for the area enclosed did not much exceed that of the castle, which formed a part of the general *enceinte*. There were three gates, of which Leland saw the remains French Gate on the north, Finkel-street Gate on the west, and Bar Gate towards the south, and by the Swale Bridge, at one time crossed by a chain. In the town, or its immediate suburbs, were the parish church and chapels of St. James, Trinity, St. Anthony, and of a female anchorite, besides the chapel in the castle, "with strange figures on the walls of it." There was also the Grey Friars. Grose gives a moderate account of the castle, with a plan and two views, in 1786. He shows some buildings close west of the hall, of Norman aspect, and others north of the chapel, all now gone. Whitaker, in his valuable history of the Shire, gives a view of the keep and a history of its descent.

A few years ago the castle was a ruin, but one open to every visitor, and so strongly built that the hand of Time lay upon it but lightly. A few years ago some unfortunate economist persuaded the authorities to build barracks within the enclosure, and to fit up the keep as a militia store, and the ante-chamber to the hall as a powder-magazine. Of course, with the natural instincts of authority, those who desire to explore the details of these parts

are excluded. This is bad enough, but there is now, or was a short time ago, a project for further utilising the area, pulling down the eastern ward wall for new school buildings, and making other alterations and destructions, the effect of which would be to destroy the peculiar value, in an historic point of view, of one of the most remarkable of the purely Norman fortresses in England. These words, and the substance of the preceding account, were written some years ago, when access to the castle court was allowed, but that to the keep only to be obtained, and that partially, with difficulty; but now, since the building of the new and large barracks outside the town, all entrance to any part of the castle is forbidden.

Why cannot the burghers of Richmond, those educated in its famous school, and the broad-acre gentry and nobles who regard the town as their provincial capital, resist these absurd restrictions, convert the keep into a local museum, and lay out the area and slopes in public walks and gardens? The walk already laid out above the river is a specimen of what might be done, and the happy thought that formerly converted the base of the keep into a reading-room, and saved it from the militia tailors, points in the right direction.

G. T. C.

#### THE PROPOSED NEW APPROACHES TO THE STRAND.

A SEQUEL.

In the *Builder* of last week appeared an article on some proposed "New Streets and Communications between Holborn, the Law Courts, and the Strand"; the following paper is intended as a sequel to that article by briefly recording some of the more notable places and buildings that will be trampled out of existence by the march of these improvements.

Passing from the Strand between the Palace of Justice and Clement's Inn we enter the southern end of the line of one of the new streets, Traversing Clement's-lane and Gilbert-street,\* we have Portsmouth and Portugal streets on our right, and Clare Market and Vere-street on our left. Of Portsmouth-street there is little to tell beyond that, at the Black Jack public-house,—still to the fore,—Joe Miller cracked his jests probably in the hearing of two notorious rascals, Jack Sheppard and Jonathan Wild, who frequented the house. In Portugal-street (Roque's plan) was the play-house. Sir William Davenant, in his epilogue to "The Play-house to Let," tells us that his theatre was

"Behind the Row which men call Portugal,"

Portugal-row being the old name for the southern side of Lincoln's Inn-fields. William, Earl of Rochester, who died in 1680, in writing to a friend, says,— "If you write to me you must direct to Lincoln's Inn-fields, the house next to the Duke's Play-house in Portugal-row; there lives your humble servant, Rochester." Howell, the compiler of "Londinopolis," tells us that there "is towards Drury-lane a new market, called Clare Market; there is there a street and palace of the same names, built by the Earl of Clare, who lives there in a princely manner, having a house, a street, and a market, both for flesh and fish, all hearing his name." It is recorded by Aston that Anne Bracegirdle, the famous actress of two centuries ago, who resided in Howard-street, Strand, was in the habit of going often into Clare Market and giving money to the poor unemployed basket-weavers, inasmuch that she could not pass that neighbourhood without the thankful acclamations of people of all degrees. Clare Market one hundred and sixty years ago could hold up its head against any market in London: it "was very considerable and well served with provisions; for besides the butchers in the shambles it is much resorted to by the country butchers and higglers. The toll belongs to the Duke of Newcastle." At the spot where all the above streets diverge, a circus is laid down in Mr. Hayward's plan.

Leaving the circus and turning to the west we enter Vere-street, a large portion of which was built on lands called St. Clement's Fields, and one of the earliest erections was a bowling-alley and tennis-court in Bear-yard, named so, doubtless, in consequence of the premises being

\* See *Builder*, June 10, 1882.

occasionally used for hear-haiting. The tennis-court, built by Charles Gibbons, communicated with Vere-street by the passage which still exists at the north end of the School Board schools. In Shadwell's play of "A True Widow," 1673, occurs a reference to it: "Engaged! No; faith let us make a match at tennis to-day. I was invited to dine by two or three lords, but if you will let me have pen, ink, and paper I'll send my despatches and disengage myself. How will that gentleman and you play with Gibbons's?" In 1660, on the site of the tennis-court, was erected a small theatre, the first built after the Restoration, and on Thursday, November 8, of that year it was opened with the play of "Henry IV.," by the company from the Red Bull, John-street, Clerkenwell, under the direction of Killigrew. Reed tells us more than one special event in the history of the drama has given some importance to this theatre. On Saturday, December 6, 1660, at the performance of "Othello," the first time that season, "it is probable an actress first appeared on the English stage." The prologue spoken on the occasion is still extant. It is entitled, "A Prologue to introduce the first Woman that came to act on the Stage in the Tragedy called 'The Moor of Venice.'" The part undertaken by the adventurous lady was *Desdemona*. In this theatre Killigrew's company remained till the opening of the "New Theatre in Drury-lane," by Killigrew in the second week of April, 1663. While at the theatre in Vere-street his company obtained the title of "The King and Queene's Company of Players." After the removal it does not appear that the house was again used for dramatic representations. Davenant, who shortly afterwards produced his "Playhouse to Lett," alludes to it by making a musician say,—

"Rest you merry,

There is another playhouse to lett in Vere-street."

Probably it remained unoccupied till John Ogilby took advantage of it, as standing in a popular and fashionable neighbourhood. In the *Gazette* of May 18, 1668, "Mr. Ogilby's Lottery of Books" opens on Monday, the 25th inst. at the Old Theatre between Lincoln's Inn Fields and Vere-street, where all persons may repair on Monday, May 18, and see the volumes and put in their money." On May 25th, there appears in the *Gazette*, "Mr. Ogilby's Lottery of Books (adventurers coming in so fast that they cannot in so short time be methodically registered) opens not till Tuesday, the 2nd of June." Ogilby styles it the "Old" theatre to distinguish it from the two neighbouring edifices in Portugal-street, the "Duke's Playhouse," on whose site stands the College of Surgeons, and "Drury Lane." A word about John Ogilby, who, among his many works, has left us many Surveys of England, and notably a plan of London. He was born at Edinburgh in 1600, and while yet a youth removed with his parents to London. His unthrifty father was thrown into the King's Bench Prison for debt, and John became apprentice to a dancing master. In 1633, when Earl Strafford went to Ireland as Lord Deputy, Ogilby accompanied him as dancing-master to his children. He danced himself into high favour until the rebellion of 1641, when ruin fell upon him and he returned to London destitute. He wrote many poems, but none of a high class. At the age of fifty-four he learned Greek, and in 1660 he published a magnificent version of Homer's "Iliad," dedicated to Charles II., with engravings by Hollar and other artists. By his interest at court he was appointed Cosmographic and Geographic Printer to the King. He erected a printing-office out of the proceeds of his lottery, 4,210l. He died in 1676.

Another change passes over the Vere-street Theatre. The players are succeeded by the Paritans. In 1675 the parish rates paid by the widow of "Charles Gibbons, esq.," hostess of the Bull's Head in Vere-street,—the site now covered by a portion of the School Board school,—and proprietress of the Bear-yard, are entered for the Tennis Court, which might be an error of the collector, who could not remember "such things were," as in the following year it is fitly described as "The Meeting-house." The same title occurs in 1682, when, in consequence of an Order in Council for the suppression of conventicles, several attempts were made by the constables to take into custody the preachers who held forth at the "Old Play-house in Vere-street." The building must have been very substantial, as it remained till

1809, when it was destroyed by fire. The new street will sweep away Bear-yard, and passing onwards, enter Duke-street at the side of the Roman Catholic Chapel, on the site of a former chapel, demolished by the "Gordon rioters" in 1750. Opposite this chapel lived Benjamin Franklin when employed as a journeyman printer at Watt's office, some say in Lincoln's Inn-fields, and others at the corner of Wild-court,\* Wild-street. Crossing Duke-street, the new road will take away a portion of the gardens pertaining to the houses on the west side of the fields, and among them those of Lindsey House, built by Inigo Jones for Robert Bertie, Earl of Lindsey, General of the King's forces during the Civil War. The fourth earl was created Duke of Ancaster, and the house took that name for awhile. The duke sold it to the Duke of Somerset. "Old Somerset is at last dead," writes Horace Walpole in 1748; "to Lady Frances, his eldest daughter, he has given the fine house built by Inigo Jones," &c. Away, too, will go a portion of the grounds of Powis House, in the north-west angle of the Fields. It was built in 1686 by William Herbert, Viscount Montgomery and Marquis of Powis, and forfeited by him to the Crown for his steady adherence to the ill-fated James II. For a short time it was in the possession of the great Lord Somers. It was subsequently sold to the Duke of Newcastle and took his name. Walpole informs us that the architect was Captain William Winde, a scholar of Webb, the pupil and executor of Inigo Jones. At one time the Government had an intention of purchasing it for the official residence of the Great Seal. Having thus curtailed the gardens, the road emerges in Great Queen-street, and is continued along Little Queen-street into Holborn. It was along Little Queen-street that Wilham, Lord Russell, passed to the scaffold in Lincoln's Inn-fields. Bishop Burnet, in his journal, writes,— "As we came to turn into Little Queen-street, he (the king) said, 'I have often turned to the other hand with great comfort, but I now turn to this with greater, and looked towards his own house; and then, as the Dean of Canterbury, who sat over against him, told me, 'He saw a tear or two fall from him.'" The image of his wife, the pure and loving Rachel Russell, the grand-daughter of Shakspeare's Earl of Southampton, rose before him. It was through her he inherited Southampton, afterwards known as Bedford House, which occupied the whole of the north side of Bloomsbury-square. It was sold by auction on May 7, 1800, and immediately afterwards pulled down.

Another proposed route from the Strand commences between the Church of St. Mary-le-Strand and the western end of the block of buildings lying between the Strand and Holywell-street, passes through Newcastle-street, so named after John Holles, Duke of Newcastle; cuts through Houghton-street, where formerly stood the residence of William Holles, created Baron Houghton in 1616; then onwards, right through the centre of Holles-street, so named after the above-mentioned William Holles; thence through the eastern portion of Clare Market, reaching the circus at the foot of Vere-street.

The Vere-street line, which leads to Long Acre, is continued through Great Wild-street, formerly Weld-street, in which was the family mansion of the Welds of Lutworth Castle. It stood partly in Wild-court and Little Wild-street. The following is an extract from the inscription engraved on the plate affixed to the printing-press at which Benjamin Franklin worked during his first residence in London:—"Dr. Franklin's remarks relative to this press, made when he came to England as agent of the Massachusetts, in the year 1768. The Doctor at this time visited the printing-office of Mr. Watts, of Wild-street, Lincoln's Inn-fields, and going up to this particular press . . . thus addressed the men who were working at it,— 'Come, my friends, we will drink together. It is now forty years since I worked like you at this press as a journeyman printer.'"

Another line leads from the Circus, cuts off a large portion of Portsmouth-street, passes through the forecourts of the houses on the west side of Lincoln's Inn-fields, and thence along Gate-street, through the block of buildings on the west side of Little Tarnstie, into Holborn. Gate-street in Roque's plan (1730) is called Yate-street, and the site occupied by the

\* Both may be right, "Lincoln's Inn-fields" being often used in a very comprehensive sense.

music-hall in Holborn, on the east of Little Tarnstie, is marked "A Tennis Court."

Samuel Pepys was quite familiar with all the localities we have mentioned, being on terms of friendship or acquaintanceship with most of the noblemen and gentlemen we have referred to. In his diary, "November 20th, 1660. To the new play-house near Lincoln's Inn-fields (which was formerly Gibbons's tennis-court), where the play of 'Beggars' Bush' was newly begun, and so we went in and saw it well acted; and here I saw the first time one Moone [Mohun], who is said to be the best actor in the world, lately come over with the king, and, indeed, it is the finest play-house, I believe, that ever was in England." Another entry,— "To the theatre [in Gibbons's tennis-court], where was acted 'Beggars' Bush,' it being very well done, and here the first time that I ever saw women come upon the stage."

The district to be traversed by these proposed streets illustrates more vividly than other portions of the metropolis the changes and vicissitudes in the lives of houses and their inhabitants. From Clement's-lane, the "Bond-street" of the west, the lounge and promenade of the courtiers, cavaliers, and high-born dames in the days of the Charleses, right on through Clare Market, Vere-street, and Wild-street, the glory has departed, and poverty and squalor have taken its place. The mansions in Lincoln's Inn-fields echo no more the revelries of titled birth and wealth: the walls, once hung with tapestry and ancestral portraits, are now hidden by piles of deed-boxes, and it may be that the lawyer pens his brief in the very room where the Duchess of Newcastle wrote,—in the judgment of Pepys,— "the silliest play that ever was writ."

#### FROM PARIS.

THERE is much that is suggestive in the recent Paris upholsterers' strike, which, after assuming a very threatening aspect, has now, for a time at least, been amicably arranged. In a measure the men may be said to have gained the day, but only through the disunion of the masters, who, after much altercation, having formed themselves into a general assembly, do not appear to have found their respective views universally acceptable. The masters, therefore, having once again acquired their liberty of action, have opened their shops, and business has been resumed. Such, after a great deal of bad feeling and misunderstanding on both sides, is the upshot of an affair which has, in no small measure, been exaggerated in certain quarters, but the real bearings of which have, we suspect, been to a great extent overlooked. The men have unquestionably cause for complaint. The rise in house-rent, in common with the other requirements of existence, which has accompanied the improvements of late years in the French capital, has afforded particularly a not unjust ground for a demand in the increase of wages; while, on the other hand, the masters urge, with no less justice, that the competition of foreign rivals daily reduces their profits and compels them to the most continuous and watchful attention. The Faubourg St. Antoine does not, as in the past, enjoy the largest share of the furniture trade; England, Belgium, Germany, and Italy, have, of late been most successfully rivalling France. The daily talk of art, and the constant discussion of the question in its commercial bearings, have produced at length their results, and while the rest of the world has been advancing, France has relied too confidently on the reputation she gained in the past, when there existed little or no rivalry. The French, as we have more than once pointed out, are commencing to wake to this fact, and such a strike as that which has lately disturbed the busy Faubourg St. Antoine has served, let us hope, not a little to open the eyes of those who gain experience by such events. It is certainly significant that during the recent strike the report was circulated that orders of considerable importance had been given to foreign firms, among them some English houses, to supply the French market with work which Frenchmen have, for a very long time, considered it necessary to receive alone from the Faubourg St. Antoine.

Such unseemly disputes as these are unlucky for France, which of late years has been run hard in the competitive race. The complaint is now constantly being expressed in France of the alarming progress of foreign nations in the

production of those very objects of which up to this time France has considered herself to enjoy a monopoly. The last form which this alarm has assumed is the determination, recently arrived at by a meeting of the various trade-committees, of the necessity for the formation of some association which shall gather abroad all information interesting to the French manufacturers at home. The foundation of a special trade museum, such as exists already in Belgium and in Italy, has been further urged. The preparation of such required reports is, it is true, essentially a large share of the work which consuls are required by their respective Governments to send home, and which not long since the United States, it may be remembered enjoined as a necessity on all its consular agents. But useful and instructive in many ways as are the consuls' reports, they are certainly not sufficiently made known to the public; the very irregularity of their publication, the nature of their contents is far from satisfactory and is eminently unpractical. Our French neighbours complain of their consuls' reports, as doubtless do our manufacturers. As a further aid to the more constant and regular returns which would be made by the proposed appointed body of foreign agents, it is suggested that a commercial museum should be immediately commenced, on the plan of that which has been in existence in Brussels for two years past, and has met with admitted success. Italy, it would appear, followed the example of Belgium,—the feature of the commercial museum formed one of the attractions of the recent Milan exhibition,—and in Holland at this moment the formation of a similar museum is under discussion. The formation of an association of Chambers of Commerce with agents in every country, and the foundation of a commercial museum in Paris and in each of the principal centres, such is the suggestion put forward. In the present day of active competition the information thus gathered by the associations who have been (with the public indirectly) perhaps the chief gainers by the series of recent international exhibitions. England may find in the suggestion some points worthy of notice; for our future prosperity largely depends on the continuance of our power to compete with the rest of the world.

The interesting discovery made some time since in Poitou of a large Roman "spa,"—a discovery reported at the time in these columns,—has now found its counterpart in an even more interesting discovery of a Roman city at Eining in Bavaria, and of which the supplement of the *Allgemeine Zeitung* of the 16th inst., contains a lengthy account. While from the last report of the progress of the Poitou excavations,—as made at a recent meeting of the French Academy of Inscriptions,—it would appear that little of fresh interest has been unearthed, and scarcely any antiquities or objects of art, in the Bavarian find, the yield of these is beyond anything that has yet been discovered in Germany. The existence of Roman remains in the neighbourhood of the spot, not far from Landshut, has long been known to the inhabitants and the archaeologists,—the great wall which the Romans built to keep out the German tribes having passed through the district,—but it is only within two or three years that any serious search has been made. Brilliant success has come to crown the efforts of the exploring party. Some idea of the importance of the recent discoveries may be judged by the statement that the remains of a building some 60 yards long by 30 yards broad have been brought to light. Such a discovery has never before been made in Germany. The bricks bear each, in accordance with the Roman custom, a stamp which determines their date, these bricks bearing the mark of the "Cohors prima Flavia Conanthenorum" and the "Tertia Italica legio." This would settle the date of the building as about the time of the Emperor Marcus Aurelius,—161-182 A.D. The walls of the building (so our informant states) are painted red, brown, yellow, and green; the pavement and the heating apparatus are in excellent condition, as indeed is all that has been discovered, and not least interesting a large quantity of thick window-glass has been found; such a mass of flue-tiles have, it is stated, never before been discovered. It is suggested, pending further research, that the building served as a Casino or sort of club for the military station, which was posted here on the frontiers of the Roman empire. It may be men-

tioned, by the way, as specially interesting to English readers, that among the bricks found were some bearing the stamp of the third British cohort. The yield of small objects is reported as most rich, vases, drinking-vessels and cooking-utensils, cups, glasses, hair-pins of bone, *fibule*, bracelets, knives, scissors, rings, keys, bells, tools, &c., and a most important find of arms. But to continue the excavations, as at our recently-discovered Roman villa at Brading, money is required. Our German relations are more universally interested in a case of such importance there will not be wanting ample funds to prosecute the inquiry now that an appeal has been made to the public.

Though the recent stormy debates which have been taking place in the French Chamber respecting the State remuneration of the clergy, are eminently outside the interests of art and archaeology, one feature in the discussion is worthy of attention. An amendment was urged by a deputy,—so we learn from the *Journal des Débats* Parliamentary report of the 18th inst.,—to reduce by half the sum of two millions of francs (80,000*l.*) set down in the proposed budget, "for the purchase of buildings, repairs to religious edifices, &c." Every one will be pleased to hear that the very proper indignation of the French Minister of the Interior at this attempt to reduce the sum devoted to such a purpose as the repair of "monuments, which are the artistic honour of the country," was warmly responded to, and the amendment rejected by an overwhelming majority.

We are glad to hear the announcement in connexion with the Louvre of a series of Sunday lectures to be delivered at the museum, in the course of the next few months. On the committee formed to further this object we meet with the names of several distinguished painters and a number of most eminent men of letters. The first lecture, it is stated, will be delivered on the first Sunday in December. Our neighbours, it will be seen, not content with throwing open their museums on Sunday, are anxious to turn their stores of information to even greater account by the intelligent explanation to the public of the real value of the national gatherings, not alone as objects of curiosity, but as objects of study. We have not yet got further than the stage of violent opposition to the proposal even of having our museums open on the only day when many thousands are alone able to profit by the collections which are amassed with the funds of the public.

The latest news from Assos announces,—we have the authority of a recent issue of the *New York Critic*,—the satisfactory progress of the American expedition. Extensive and interesting remains of ancient baths have been laid bare, the description of which will form one of the features of the next report of the Archaeological Institute of America. August and September last were occupied by Mr. Hughes in obtaining a series of photographic views for the expedition, and it is expected that all the necessary work of exploration will be finished by the end of the present season. The Institute intend to publish a bulletin which, in addition to other matter, will contain a full account of the last summer's work in Asia Minor.

In a more recent issue of the same admirable publication the *Critic*, will be found some very suggestive remarks on the question of modern architecture, in connexion with the typical architecture of the French Renaissance and its effective character. "We will have to get our large architectural effects by happy chances, and the coming together of different buildings. Perhaps the time will come when builders and architects will consult adjacent edifices before settling the design of a building, and use great care that not its forms only, not only its masses and outlines shall fall agreeably with the broader effects of streets and squares, but that its colour shall be such as in a general view to delight the eye, not jar upon it." Our cousins are earnestly considering these questions, and not without reason, when one hears of the rapidity with which houses are being built in the Empire City; how comes it, however, that with this announcement, reaches us from another source the sad wall that what are most wanted in Manhattan are not merely houses, but homes?

**Stained Glass.**—Two Munich windows by Messrs. Mayer & Co. have just been erected in the parish church of Downham, Norfolk, representing the Agony in the Garden and Christ's appearance to Mary Magdalen.

## ARCHITECTURAL REMAINS IN CYPRUS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary general meeting of this Institute, held on Monday evening last, Mr. Horace Jones, President, in the chair,

Mr. E. Panson, Vice-president, read a paper on "The Mediæval Buildings of Cyprus." He observed that having read a recent work by the Chevalier Cesnola on the antiquities of Cyprus, he determined to visit the island to see some of the architectural remains which were referred to by that writer, in the hope of discovering some fragments of Greek architecture. In this, however, he had been disappointed. Having described the geographical position of the island, and shown that it was located in the midst of the great nations of antiquity, he remarked upon its successive occupation by the Phœnicians, Greeks, Romans, and Crusaders, who had all left behind them traces of their occupancy. The history of the many changes which took place in the occupation and government of the island had been recorded by competent writers, extending as far back as Herodotus and Aristotle. Richard Cœur de Lion took the island in 1191, and sold it to Guy de Lusignan, a French Crusader. Subsequently it passed successively into the hands of the Genoese, the Venetians, and the Turks, who conquered it in 1571, and to whom it still belonged, though it had been during the last few years under British administration. The few remains which existed of a prior date to those of the Romans were probably Pelægic. Of Arabian remains the lecturer had been unable to trace anything like the works of which the Arabs had left such fine examples in Cairo. The Turks appropriated to their own uses the buildings which had been erected during the time of the Lusignan kings, but removed all the stained glass from the windows, replacing it with thin perforated slabs of stone or plaster of Paris. Among the earliest remains in the island were the tombs, some of which were partly hewn out of the rock, and partly formed of gilt masonry. One large tomb near Larnaca measured 33 ft. long by 23 ft. wide, and was arched over with stonework of the rudest construction, somewhat resembling that of the Treasury of Atreus at Mycenæ. This tomb had an inner chamber which was entered through an archway, the soffit of the arch being hollowed or carved out upon the under side of a huge lintel. Running round the interior of the larger chamber was a cavetto moulding very similar to those seen in the interiors of Egyptian temples. Numerous other tombs existed near Salamis, at Citium, at Paphos, and in the immediate vicinity of Nicosia. The roof of one which Mr. Panson saw opened was formed either of sloping stones or was carved out of the solid rock. Nothing was found in the tomb, as it had apparently, like others which had been explored, been diligently ransacked. Nevertheless, there were probably to be found some tombs which had escaped spoliation. The lecturer found near Larnaca an Ionic column, and at Paphos a number of Roman columns, apparently part of the portico of a temple. These columns, which were about 2 ft. 6 in. in diameter at the base, and about 20 ft. high, were of a dark-coloured granite. They presented indications of being late Roman work. The lecturer saw a Corinthian capital sufficiently preserved to enable it to be identified as Roman Corinthian. Some columns were standing at Nicosia carrying Doric capitals of Renaissance character. At Famagusta were some remains in the Italian Renaissance style. At Salamis there were remains of a large building, 60 ft. by 180 ft., which seemed to have had a lower vaulted story. Near Nicosia the lecturer saw some remains which he attributed to the Roman period. These comprised walls, 16 ft. or 17 ft. thick, composed of huge stones. There were also to be seen the remains of very large tanks formed in the rock, the stucco with which they were lined being even now quite perfect. These tanks reminded him very much of the tanks at Pozzouli, near Naples. Cesnola recorded that at Kuchlia he had found the site of a temple of Venus, 167 ft. long, but he (the lecturer) had visited the site without being able to trace the temple. The temple was probably anterior to the Roman Emperor Vespasian. There were considerable remains of the outer walls which formed the boundary of the precincts of the temple. Here, as at Salamis, the ground was thickly strewn with stone which exhibited no sign of having

been used in building. There exist the remains of a very fine group of churches, which must have belonged to the time of the Lusignan kings. The climax of their prosperity seemed to have been reached about the middle of the fourteenth century. A German pilgrim who visited Constantinople about the time had left it upon record that he was more struck by the wealth and activity which he beheld in Famagusta than he was by what he saw at Constantinople. This, then, must have been the period when the numerous churches were built, the ruins of which were so frequent in the now almost deserted town of Famagusta. In Nicosia the Turks had used some of the churches as mosques and some as storehouses. Nicosia contained the cathedral Church of St. Sophia, the Church of St. Catherine, and the Church of St. Nicholas. Both of the first-named were used as mosques, and the third as a storehouse for grain. The cathedral at Famagusta had been illustrated recently in the Architectural Association Sketch-book, from measured drawings made by Mr. Sydney Vacher. Neither of these churches had any transepts, neither was there any triforium. A peculiarity of their construction was that they never had any other covering external to the stone vaults,—no roofs of carpentry-work. The French architects by whom these churches were designed and built no doubt found all the buildings of the country covered with flat roofs, and, while following the style of their own country, they adopted the flat roofs which prevailed in Cyprus. The Cathedral or Mosque of St. Sophia at Nicosia measures internally from east to west 232 ft., its total width being 87 ft. The east end was semicircular inside, semi-octagonal outside. The height of the nave Mr. P'Anson calculated at 67 ft., and that of the aisles at 35 ft. The style of the building throughout was Decorated. This church had the peculiarity of a door formed at the east end, and one also on the north side. The masonry of these doorways was of marble, but the architectural details corresponded very closely with those of the other parts of the church, which were of a very fine hard limestone. M. de la Mas Latrée, Director of the École Nationale des Arts du Paris, had published a list of more than one hundred gravestones or slabs in the churches, containing inscriptions and coats of arms, and bearing dates ranging from 1255 to 1533. These stones were, in the churches now used as mosques, covered by carpets. Many of the persons commemorated by them fell in the great plague which afflicted Europe in 1348. The church of St. Catherine, not far north of the mosque of St. Sophia, measured 57 ft. in length by 28 ft. wide. The height was calculated at 52 ft. The nave had vaulted compartments. The east end was semi-octagonal. The side and west windows were in the best style of the Decorated period. The buttresses were masked by converting them into semi-octagonal projections. On one side of the church are indications of a cloister and other buildings, probably conventual. Of the church of St. Nicholas the author was unable to give any detailed account. It extends about 130 ft. in length. It had three eastern apses, and an octagonal domed tower in the middle of the building. Its plan was probably that of a Greek cross. At Famagusta the remains of churches were numerous. The mosque, originally the cathedral, dedicated to St. Sophia, was well preserved, although considerably injured by the Venetian bombardment. Its length is 170 ft., and the total width 75 ft. The height of the nave was about 75 ft., and of the aisles about 40 ft. There were many remains of other fine churches in Famagusta, but this was the best preserved. There were said to be twenty churches of which remains existed, and in some of them remains of frescoes were to be seen. The Abbey of Bella Pais stands upon the side of a mountain in a most beautiful situation. The church has the plan of a Greek cross. Mr. P'Anson considered it to be pre-Medieval in date. Three sides of the cloister still remain, although a good deal injured. On the north of the church is a noble hall, 100 ft. long, 32 ft. wide, and 40 ft. high, with a large rose-window at the west end. This was assumed to be the refectory. On the north wall is a pulpit reached by steps in the thickness of the wall. In conclusion, Mr. P'Anson briefly referred to the domestic architecture of Cyprus.\*

\* For details of this part of his subject, see Mr. P'Anson's letter, accompanied by illustrations, in the last volume of the *Builder*,—xiii., pp. 413, 454.

In the discussion which followed,

Mr. J. T. Wood said he was in Cyprus in 1878, when he visited the island for the purpose of reporting to the trustees of the British Museum whether it would be desirable to continue the excavations commenced by Cesnola. Unfortunately, he had seen very little of the architecture of the island, for he was only there a month, and was ill half the time. With regard to the number of ruined churches in Famagusta, he had not been able to count so many as twenty; he only saw twelve, including the cathedral. Four of them had perfect stone roofs. The cathedral at Famagusta was full of grace and beauty, with regard both to proportion and detail. While there he found on the side of the cathedral an inscription which showed the date of the building; he thought it was 1320. Gothic architecture, as it was practised in Cyprus, was full of peculiar beauties, and it was well worthy of further study. In one church he saw a painting containing at least twenty figures which had escaped obliteration by the Turks. The rock-cut tombs at Paphos were very interesting.

Mr. William White, in proposing a vote of thanks to Mr. P'Anson for his paper, said it did not appear that Cyprus possessed any indigenous architecture. Mr. P'Anson had spoken of the cathedral at Nicosia having an eastern door, which was a remarkable thing, and quite unknown, as far as he (the speaker) was aware, in Medieval architecture. Mr. P'Anson had said that this eastern doorway was subsequent to the building itself; but could he say how long subsequent, and whether its insertion had led to any modifications of the arrangements of the choir or sanctuary?

Sir Ralph Thompson, K.C.B., said he had travelled all over the island of Cyprus, and was familiar with the buildings described by Mr. P'Anson. He was not an architect, and did not pretend to much knowledge of architecture, but what struck him as being particularly interesting was the feudal or military architecture of the island. There was a very fine castle remaining near the Abbey of Bella Pais. Cyprus being, indeed, a home of the feudal system, it was probable that further investigations into the architectural remains of the island would reveal interesting particulars as to castles and buildings of that class.

Mr. John Hehl observed that shortly after the island of Cyprus passed under the administration of the English, it was proposed to restore the church of St. Nicholas at Nicosia and to convert it into a church for the English residents. He should like to know whether that proposal was likely to be acted upon, because if the churches of Nicosia and Famagusta were to be restored, there would soon be an end of all that was interesting in them. They would suffer more at the hands of the restorer than at the hands of the Turks.

Mr. R. Phend Spiers regretted that Mr. Vacher was not present, and suggested that as that gentleman was very familiar with the cathedral at Famagusta, having studied, measured, and drawn it on the spot, he should be asked to do good enough to furnish some particulars of it as an *addendum* to Mr. P'Anson's paper.

Professor T. Roger Smith, in seconding the vote of thanks, asked whether Mr. P'Anson could give some further particulars of the covering-in of the churches which he had described as vaulted, although without any additional external roof. How were the upper surfaces of the vaulting made to serve as a roof? Were the haunches filled in?

Mr. Ewan Christian, in supporting the motion, referred to Mr. P'Anson's paper and the interesting sketches by which it was illustrated as constituting a most remarkable specimen of good holiday work.

The Chairman, in putting the motion, said there was another island, somewhat similarly placed to Cyprus,—i. e. contiguous to a mainland of historic fame, and which had been occupied by the Greeks and Romans, by the Venetians, and by Templars. He alluded to Sicily, which in three or four circumstances was analogous to Cyprus. Sicily was, of course, very much richer in Grecian remains, while of specimens of Medieval architecture there was a remarkable number of very fine buildings, no doubt the works of the Templars and Crusaders, with probably some works of the earlier Normans.

The vote of thanks having been carried, Mr. P'Anson acknowledged the compliment, and in reply to the questions raised said he did not know how the haunches of the vaulted roofs

of the churches were filled in. Probably the upper surfaces of the vaulting were covered with mud and chopped straw, beaten carefully down, in the same way as the roofs of the houses were covered, with some slight arrangement of ridges and furrows to readily carry off the rain, of which there was not much in the island. With regard to Mr. White's question, the interior arrangements of the church had been very little altered at all, although used by the Turks as a mosque. The eastern door which had been mentioned was more modern than the building itself, although the details were just as good and characteristic as those of the other parts of the building. Whether, however, the door had been inserted in French times or subsequently thereto he could not tell. With regard to Mr. Hebb's question, he had been informed by Mr. Charles Barry that a former pupil of his had been commissioned to restore the church in question. Although the church was a good deal shattered in many parts, he (Mr. P'Anson) thought that any careful man could satisfactorily restore it, for there was so much old work left by way of precedent. The meeting then terminated.

#### THE COLOSSAL STATUE OF GERMANIA.

The great national statue of Germania, which is to be erected at Niederwold, near the Rhine, to commemorate the victory of Germany in the last Franco-German war, is now in process of being cast in separate pieces at Munich. The head and several other parts have already been completed. Some idea of the magnitude of this work may be gathered from the fact that the total weight of metal in it will amount to not less than forty-five tons. In the work of casting and finishing as many as fifty men are often being employed at one time. The gigantic head of the statue is already finished, and so is the powerful left arm with hand, on the tip of one of the fingers of which rests the Imperial crown of Germany. Last week the workmen were engaged on finishing the right arm and hand grasping the handle of the sword. Other men were at work on the huge shoulder and breastplate, on which is the Imperial eagle. The largest single portion of the statue,—the throne with cloak lying on it, the whole weighing fifteen tons,—has just been cast. The blade of the sword, which alone weighs a ton, and which, enveloped in an oak garland, has been cast separate, is also finished. Part of the chain armour, with its froe-lying texture of rings, is likewise ready, and is a beautiful piece of workmanship. The other parts of the monument are being cast at different establishments in other cities. Thus, the figures of the Rhine and the Moselle, to be placed at the foot of the pedestal,—the latter is itself 80 ft. in height,—are being executed at Dresden; the reliefs are being prepared in Berlin, the great Imperial eagle at Laushammer, and the allegorical figures of War and Peace at Nuremberg.

#### RECENT PERGAMIC DISCOVERIES.

The *National Zeitung* of Berlin records the addition to the existing Pergamic relics of various objects of interest, amongst them a figure of Athene, of which unfortunately the head, neck, and arms are wanting. The drapery of the remaining portion of the figure, and the scaled armour on the breast with the Gorgon mask, are said, however, to produce an imposing effect. At the base of the statue are distinct traces of a frieze in relief work.

A second figure, on a diminished scale, is also intended to represent Athene, and is in such a good state of preservation, that the artistic perfection of the work can be easily recognised. The countenance of the goddess wears an expression of severity, though the general character of the impersonation is youthful. With the exception of the right arm and the fingers of the left hand, the work is untouched by the ravages of time. The arrangement of the drapery is free and unconstrained. The figure has been chiselled out of a fine-grained, delicate yellow-toned marble, described as resembling the Pantelion description.

The third draped statue is deficient as to the head and arms, but it is supposed to be a figure of Ceres. All the three statues referred to were discovered in the Sanctuary of Athene. A pillar in a good state of preservation, with a capital which bears in its style some resemblance to Indian ornamentation, is amongst the other objects recently discovered.

## THE HERMES OF PRAXITELES.

HERE FRITZ SCHAPER, the German sculptor and member of the Berlin Academy of Arts, who is best known for his statues of Prince Bismarck in Cologne, of Göthe in Berlin, and of Gauss in Brunswick, has just completed his ideal restoration of the Hermes of Praxiteles. The manner in which he has acquitted himself of this delicate task is spoken of by Berlin critics in the highest terms. Those parts of the ancient statue, the hands, lower portions of legs and feet, and parts of the infant Dionysus, which were not found when the statue was discovered at Olympia, have been supplied by Herr Schaper in masterly style. The work of Praxiteles, as now restored, is at present on view in a room at the Berlin Academy.

## THE DURABILITY OF BRICKS.

A REPORT on the general question of the properties which glazed bricks should possess was lately issued by the Hanover Architects' Society,\* and touching as it does upon many points more distinctly affecting the manufacture of such bricks than their use in building, it is not surprising that the subject has been taken up in a practical manner by a leading organ of the German plastic industry.

In a somewhat elaborate treatise on the question in the *Thonindustrie Zeitung*, Herr Rühne disputes the assumption that no progress had been made in this class of work until the fourteenth century, and brings forward many interesting facts to prove the diversity of the processes now in use in the manufacture of glazed bricks, also elucidating from the point of view of the brick manufacturer some of the questions raised as to the most suitable and economical method of applying the glaze.

He brings forward some arguments of weight in order to disprove the theory that the work of the Middle Ages in this particular branch was more free from crazing, and consequently more durable, than the productions of our own times. He is quite ready to admit that such specimens have been preserved as models of careful workmanship, but asks whether any positive proof exists that all the work contemporaneous with that which has come down to our day, was equally perfect.

In his remarks on the subject, Herr Rühne goes further than the Hanover architects' Society, and discusses at some length the question as to what are the influences which a brick is expected to withstand during a long series of years, or even during the lapse of centuries. He records the fact that weather usually affects bricks in consequence of the changes of temperature which occur, and the formation of ice which is thus induced; as also the influences of rain-water and of gases which may habitually or accidentally be found in the atmosphere. These attacks are thus of a chemical as well as of a physical nature. The chemical influences are such as are connected with decomposition through the action of carbonic acid and other gases in the atmosphere, and by the dissolving or removal of particles of stone by rain-water. The crystalline salts which sometimes appear upon the surface are, it is remarked, mostly produced under circumstances which are injurious to the durability of the material on account of the increase of volume which takes place. The danger is all the more real because, at the next fall of rain, these crystals return into the material in a state of solution, and when dry again become crystallised, thereby producing a splintering effect. Although scarcely noticeable in the first instance, yet the continued repetition of the process which is induced by every shower of rain constitutes a destructive agency which, according to Herr Rühne's theory, is capable of causing the decomposition of a brick when a sufficient quantity of these salts are present in it.

The effects of frost, though of a similar tendency, are, he remarks, more of a mechanical character, as the extension of the volume of water through freezing operates towards the destruction of the brick. In spring and autumn the extension and contraction of bulk, caused by the wide range of temperature comprised in the daily thermometric variations, are specially calculated to affect the portion of the brick nearest the surface. These various influences of a more

or less destructive character are rendered specially effective by any irregularity in the resisting properties of the substance of the brick, which should be homogeneous and free from stones, lime, or similar foreign substances. Homogeneity further implies an equal tension throughout the brick. In machine-made bricks it is remarked that it is by no means unusual to find on the outer surface a layer of finer grained material than in the other portions. In fact, it is urged that for purposes of a monumental character machine-made bricks should not be used, more particularly as glazed bricks. Hand-made bricks, it is considered, should be moulded and heated in general with due observance of special measures of precaution when durability for a period of several centuries is expected from them.

When frost sets in, such congelation as may exist within a brick that is glazed, is by that fact prevented from following out its natural course of extension in the only direction in which it is not closed in. Thus, it is argued that a glazed brick is exposed to a more severe test than an unglazed one, with the result of the forcible destruction of the glaze in some instances. The inference is drawn from this fact that the position of glazed bricks in a building has a certain influence upon their durability, and various facts are quoted with a view of proving that too much must not be expected from them.

In conclusion, Herr Rühne draws from the foregoing explanations the following theoretical and practical inferences:—

1. Weatherproof bricks must not contain any soluble salts; and their formation, as well as their haking, must be carried out so as to ensure this result.

2. They must resist the attacks of carbonic acid in a fluid state. Their porosity must not be too great, and the disposition of the pores must be uniform, the brick being thus rendered homogeneous. The porosity of glazed bricks must in particular be as small as practicable.

3. The haking must be of such a thorough nature as to resist the extension which may result from congelation. The substance of the brick must be as tough as possible, and not brittle or glassy in its character.

4. The coefficient of extension must be low, in order that a change of temperature may have as little influence as possible on the interior of the brick.

## NEW AGRICULTURAL HALL AT NORWICH.

This building was opened by H.R.H. the Prince of Wales on the 16th inst. The building has its principal façade fronting Bank-plain. It is described as being in the pure Italian style, carried out in red moulded Cossey bricks, and red sandstone from St. Bees, Cumberland, with a richly-sculptured pediment, surmounted with a vase for statuary, and the keystones of the ground-floor windows carved,—the first specimen of Italian architecture in red stone in this part of the kingdom; as although the same description of stone was introduced by the architect (Mr. J. B. Pearce, of Norwich) in the new Town-hall at Yarmouth, that building is of "Queen Anne" character. The space covered by the building is 175 ft. by 103 ft. Besides the great central hall, there are spacious galleries, a theatre and concert-room capable of seating 900 people, a board-room and offices, dining and market rooms, kitchen, lavatories, &c.; these latter being obtained by utilising the difference between the ground-level at the two sides. The main entrance is in the centre of the front, beneath a portico of wrought-iron and glass, carried on iron girders springing from the wall. Beyond the turnstiles fixed in the vestibule, there are large upper doors leading into the main building. On the left is a wide passage with a staircase to the concert-room, the ladies' cloak-room, and a buffet with lift from the kitchen; on the right, a secretary's office and a board-room. The galleries are on both sides and at the end of the hall, the former 18 ft. and the latter 24 ft. in width. They are approached from the ground-floor by three staircases, and are well adapted for displaying agricultural produce and machinery. All the central portion of the building, which is primarily intended for cattle-stallage, is paved with wood blocks, and the sides with Staffordshire bricks, so that these are easily convertible into temporary stables, or may be used for any purpose

in which efficient draining is an element of some importance. Indeed, the internal arrangements are so designed that the hall will be available for such entertainments as circuses, horse shows, horticultural exhibitions, bicycle and pedestrian races, &c. The interior walls are of buff brick, with red and black coloured bands. Springing from the gallery level and supporting the roof are some handsome circular girders, the span of the centre girder being 61 ft. The roof has a lantern top with skylights, and its supports are ornamented with some fine scroll-work. Over the galleries, which are supported on lofty, foliated columns, there are also skylights. The concert-room occupies the whole front of the first-floor, and is 100 ft. in length by 48 ft. in width; it is fitted with a stage at one end, and is well lighted by windows and lunettes.

The architect, as already mentioned, was Mr. J. B. Pearce, of Surrey-street, Norwich, and the contractors were Messrs. J. W. Lacey & Co. About a million and a quarter of bricks have been used in the building, and these have all been supplied by Mr. Charles Cunneil, from his works at Catton. The contractors for the iron roof were Messrs. Butler, of Leeds, and for the ornamental ironwork required in the building, Messrs. Barnards, Bishop, & Barnards, who sub-contracted with Messrs. Lacey. The slates were supplied by Messrs. Ashton & Green, of London; and the stone-carving has been executed by Mr. Allan, of St. Giles's-road. The hall is heated with hot-water apparatus supplied by Messrs. Barnards & Bishop, and is lighted both with gas and electricity.

## THE EXCAVATIONS AT THE FORUM.

THE excavations at and near the site of the Forum in Rome are now being energetically carried on. In the course of the works foundations of a massive character have been discovered, which belonged, it is supposed, to the Palace of Caligula, and a number of private houses have also been traced, which bounded one side of the Forum. Negotiations are now in progress for excavations in the vicinity of the church of Santa Maria Liberatrice, which covers the site of the ancient temple of Vesta.

The project for the systematic carrying out of excavations at the site of the Forum is receiving the earnest attention of the Italian Government. The municipality has suggested the throwing of an iron bridge over the site of the Forum when its entire excavation has been accomplished. This proposal will, doubtless, meet with energetic opposition from lovers of the relics of antiquity.

**Proposed New Street to the Angel.**—At the last meeting of the Clerkenwell Vestry, Mr. Churchwarden Goode in the chair, Mr. Abrahams moved:—

"That the Metropolitan Board of Works having decided to seek Parliamentary powers to form a new road, from near the Holborn Town-hall to the Angel, this Vestry would respectfully submit that of the three ways thereto indicated by their recent surveys in this parish, it is most advisable to take the short, direct, and nearly level route, viz., behind Baynes-row to the Fire-engine Station, thence across the north-west corner of Exmouth-street, through John-street, across Tysoe-street and Rosoman-street, past the Catholic Chapel, towards the drinking-fountain in the New River wall, thus, at no increased cost, avoiding all the unequal and sharp gradients by way of Exmouth-street and Gurnault-place, and above all relieving instead of increasing the constant danger that is incurred by the meeting of the large and increasing traffic from the nine or ten thoroughfares that are concentrated at the junction near the Vestry Hall; that the matter be referred to the Works Committee; and that a copy of the resolution be forwarded to the Metropolitan Board of Works."

He said that the route he proposed for the new street would not cost more than taking down one side of Exmouth-street so as to widen that thoroughfare; that the line would be somewhat shorter to the top of Gurnault-place, and more direct; that, while better property could not be erected, if one side of Exmouth-street was pulled down, the property along the line now proposed would be enhanced in value, while the business in Exmouth-street would be improved by the removal of some of the heavy traffic from it, and the gradients of the new street would be much better than those of Exmouth-street. The motion was carried unanimously.

\* See *Builder*, p. 519, ante.

## BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE first meeting of the Session 1882-1883 was held on the 15th inst., Mr. Thos. Morgan, F.S.A., in the chair. It was announced that the autumn congress would be held at Dover. The memorial in favour of the preservation of the ancient Tol-house at Great Yarmouth has been presented, and the Town Council have resolved to preserve the building. It is about to pass into the hands of trustees, and to be devoted to some local use. The quaint Rectory-house of St. Paul's, Deptford, a building of triangular plan, the work of Sir John Vanbrugh, is about to be demolished, the site having been sold for building purposes. Mr. Loftus Brock, F.S.A., described a portion of the Roman wall of London, now being removed, at Finsbury-place. It is 9 ft. 2 in. thick, of similar construction to what has been already noticed of the wall elsewhere. Mr. W. G. Smith exhibited several pre-historic stone implements, including a celt of dolerite found at Bedford. Mr. Walter Myers, F.S.A., produced a fine collection of Egyptian antiquities of very early date, and a series of flint arrow-heads from Chisnal and Paralyia. Several fragments of brittle vessels, of Egyptian manufacture, were inscribed with receipts for the delivery of wine to the garrison of Thebes. Mr. Flinders Petrie referred to the frequency of similar inscriptions on ancient Egyptian sites, although but little attention has hitherto been bestowed upon them.

The first paper was by Mr. C. H. Compton, on the archaeological features of the recent Exhibition of the Horners' Company, an exhibition which was visited by 7,000 persons during the four days that it was open. There were a large number of pre-historic objects mainly recovered from London, exhibited by Mr. H. Syer Cuming, F.S.A., Scot., and others. Among the objects placed upon the table were two or three examples of the Jewish Shofar, or horn, used in synagogues on the day of the New Year, including that from the synagogue in Bevis Marks. These were so similar in form to the horn found in the Tbamess, now in Mr. Cuming's collection, as to render it all but certain that the latter is a relic of the presence of the Jews in England in Medieval times, prior to their expulsion. It was recognised as a Shofar both by Mr. Alf. A. Newman and by Mr. Adler, who described its use. Its form has not been changed since the destruction of the Temple of Jerusalem.

The second paper was by Mr. Roach Smith, F.S.A., on the discovery of a hoard of bronze armlets grouped around a single lance-head, in what was, probably, an ancient cemetery at Brading, I.W.

## THE PROPOSED MUSEUM IN OLYMPIA.

DURING six years the German Government, as our readers know, have devoted much money for excavations in Olympia (between Patras and Pyrgos). Professor Curtius and the Architect Adler, in Berlin, had the direction of the works, and published the antiquities found. During some years the question was ventilated whether the antiquities unearthed should be transported to Athens, or if it would be better to build a museum in Olympia. A rich Greek, named Synros, has given 200,000 francs for the erection of this building, and the Ministry of Cultus is charged with the execution of the project. Architect Adler prepared a plan for the museum, but it did not agree in style with the antiquities found, and would cost from 2,000,000 to 3,000,000 francs. For these and other reasons it was not found desirable to carry out his design. In May last Professor Ziller was charged by the Minister of Cultus to go to Olympia, to see the collection of antiquities, to select a convenient site, and to prepare a design for the museum. This he did, the ground selected being opposite the excavations from the street from Pyrgos. The plan has been approved by the Committee for the Conservation of Antiquities, and it is hoped that in a short time the Museum of Olympia will be built.

We give a sketch and plan of the proposed design.

Professor Ziller is already known to our readers, in connexion with Dr. Schliemann's palatial residence in Athens and the Academy of science in the same historic city.\*

\* We are indebted to Professor Ziller for the materials of our illustrations, forwarded through Mr. James Hill, of Upper Thames-street.

## SKETCH IN ROUEN: CHURCH OF ST. LAURENT.

THE Cathedral, St. Ouen, and St. Maclou, Rouen, are pretty well known to all travellers, but the church, with its interesting tower of St. Laurent, most of which dates from the fifteenth century, standing in the Rue de l'Hôtel de Ville, is not so well known, and is often overlooked by the hurried visitor; but it will well repay a visit. The church is desecrated and abandoned to ignominious uses, and is but the wreck of its former self, but the tower still rears its head, shorn, indeed, of its tiara crown, but beautiful still in its bold open tracery and pinnacle work; airy, yet strong in its construction, and full of a subtle play of light and shade.

ANDREW T. TAYLOR.

## CHURCH OF THE HOLY TRINITY, PRIVETT, HANTS.

THIS church, entirely built by the munificence of Mr. William Nicholson, of Basing Park, M.P. for Petersfield, stands prettily in the rural parish of Privett, and close to Basing Park. The church, which, as the view shows, is Early English in style, is built of flint with dressings of Douling stone.

Intervally, it is faced with asilar of Ham Hill stone, and has a dado of Corsehill stone running round the church. The rest of the internal stonework is Corsham Down Bath stone. All the polished columns are of Purbeck marble. The roofs are of pitch pine, and covered externally with Broseley tiles. The floor is laid throughout with marble mosaic by Barke & Co., except that under the seats, which is of pitch pine block paving. The chancel seats and other fittings are of oak, the nave seats of pitch pine.

There is a fine organ by Lewis, and a peal of eight bells by Messrs. Mears & Stainbank.

In plan the church consists of nave, aisles, and chancel, with north and south transeptal chapels, in the north of which are placed the organ and vestry.

A tower with a lofty spire stands centrally at the west end.

The east window and some of the other windows in the church are filled with stained glass by Messrs. Heaton, Butler, & Bayne.

The lectern, which is of wrought iron, and the rest of the metal work in the church, was executed by Messrs. Hart, Son, & Peard. A view of the lectern we give separately.

The contractors were Messrs. Dove Bros., and the architect was Mr. Blomfield.

## LECTERN: HOLY TRINITY, PRIVETT.

THIS lectern, of which we publish an illustration, is (with the exception of the base and hook-rest) entirely of forged charcoal iron, the foliated ends of scroll, leaves, &c., being beaten into their various forms after being forged, and when cold. The circular parts of the shafts are turned in the lathe, and the crocketed terminations of the hutteress-stay are slightly trimmed up, but nearly all the other parts are used as they came from the anvil. The moulded base is of cast iron, and the book-rest of brass, in two plates, with a moulded edging between them, to avoid the unsatisfactory appearance of a single thickness plate. The work is painted a greyish-black, and relieved by the careful etching of some of the parts and the entire gilding of others, and is a very creditable specimen of modern art workmanship.

The design was prepared by the architect of the church, Mr. A. W. Blomfield, M.A., and carried out by Messrs. Hart, Son, Peard, & Co.

## The Standard Theatre offered for Sale.

—At the Mart, Tokenhouse-yard, on the 16th inst., Messrs. Farebrother & Co. offered for sale by public auction, by order of the Court of Chancery, the National Standard Theatre, Shoreditch, together with the Bishopsgate Hall adjoining, described as being licensed for music. Six houses in High-street and Holywell-lane, adjoining, were also included, the whole property covering an area of 17,000 superficial feet. The bidings commenced at 10,000l., and advanced by 1,000l. at a time to 10,000l., at which sum the property was withdrawn, the auctioneer stating that it was less than the value of the land alone.

## THE PARIS SCHOOL OF PHARMACY.

WHEN, two years since, the Architectural Congress which met in Paris visited, as we reported in these pages, the new buildings of the Ecole Supérieure de Pharmacie, the works, though well advanced, were still far from completion. Rapid progress has, however, of late been made, and we are now able to present a view of the new institution. For a long time past the old Ecole de Pharmacie, situated in the Rue de l'Arbalète, the creation only of the last century, has been unable to accommodate the increasing number of pupils who avail themselves of the gratuitous courses of lectures afforded by the school. The Ecole de Pharmacie is one of the many admirable educational establishments of Paris which have long helped to give its character to the Quartier Latin,—the students' quarter, *par excellence*, in the city of pleasure by the banks of the Seine.

Built on a plot of ground cut off some years since from the Luxembourg Gardens, what English reader who has not even seen Paris does not recall Thackeray's delightful picture of the spot? The new school will provide ample accommodation for many a generation to come of rising chemists, for the preparation of whom the Ecole is specially endowed by the Government. Commenced in 1877, the new buildings lie between the Rue l'Abbé de l'Épée on the north, the Rue Michelet on the south, on the west the Rue d'Assas, and on the east the superb Avenue de l'Observatoire, towards which are turned the principal façade and the entrance courtyard. The buildings consist of three blocks, parallel with the avenue, together with two wings. Two large amphitheatres, each able to contain 600 pupils, are connected with the main building by vestibules and galleries. On the north lie a series of laboratories intended for chemical and micrographic research.

The principal buildings comprise, on the ground-floor, the *salle des actes*, or examination-hall; the secretary's offices, and the laboratories of the professors of botany, cryptogamy, mineralogy, toxicology, chemical and galenic pharmacy, &c. On the first floor lie the collections of zoology, physics, botany, mineralogy, the library, and reading-rooms. In the annexes contiguous to the northern wing reside the principal officials; while there is also a further series of laboratories.

A large botanical garden, occupying the remainder of the ground, stretches behind the buildings between the Rues Michelet and d'Assas, at the corner of which lies the gardener's lodge. The garden is supplied, it may be stated, with ample hot-house accommodation.

The building rests on a foundation formed of 700 walls filled with concrete, the greater part reposing on pillars of rubblework reaching 20 yards down to the level of the so-called "caucombs," or worked-out quarries, which undermine almost the whole southern portion of the French metropolis.

On the side turned towards the Avenue de l'Observatoire, in the principal court-yard,—which is decorated with a series of well laid-out beds, and surrounded on three of its sides by a graceful portico,—are placed the statues of Vanquelin, the great chemist, and Parmentier, the introducer of the potato into France.

Above the portico, under the large windows of the first floor, are let into the walls a line of medallions (in white marble) of the *savants* who by their research have extended the domain of pharmacy and chemistry. These medallions, executed under the direction of the Minister of the Fine Arts, are the work of various artists. Among the portraits may be mentioned those of Pérouze, Balard, Caventon, Pelletier, Davy, Dumenil, Jussieu, Seba, Schelle, Bayen, Rouelle, Geoffroy, Charras, Lemery, Bouillic, Macquer, Bauné, Lavoisier, Berthollet, Schammerdan, Chaptal, Thenard, Serullas, Valenciennes, Gibourt, Langier, Gerardt, Houël (the founder of the Ecole), and Fourcroy, one of its first directors.

As our readers can judge from the view we present, the building is in the simplest style, and essentially of a utilitarian character, a feature we remember the architect, M. Charles Laisné,—one of the Government architects,—impressing on the members of the Congress who, as we have stated, visited the buildings two years since, as the result of the small sum placed at his disposal to carry out his plans.

ADDRESS TO THE  
LEEDS ARCHITECTURAL SOCIETY.

An address was delivered by the President, Mr. J. B. Fraser, F.R.I.B.A., at the opening meeting of the session.

At the commencement the President expressed regret that he could not refer in more cheerful and hopeful terms to the commercial outlook of the profession. He said,—Notwithstanding the enormous energy developed in the production of merchant shipping, which would appear to point to the increased circulation of wealth in the country, the more than fairly average harvest, and the briskness of many of our staple manufactures, there seems still to be a lack of money for permanent investment and want of buoyancy in the building trades, and as a consequence we find ourselves for the most part by no means so actively engaged as we should like to be. The returns of the Inspector for Buildings in our own town, and of the Building Committee of Bradford, show very plainly and somewhat painfully that although our population is increasing, the demand for house property is, instead of being on the increase, actually declining. In Leeds, during 1879, 1,721 houses were completed and certified for occupation; in 1880, 1,313; and in 1881, 1,012; for the present year, the returns are 1,044.

In Bradford a still more extraordinary diminution is shown, for whereas in 1877 the number of new dwelling-houses certified for occupation was 1,213, whilst for this year we find only 313, or little more than one-fourth. In Leeds, under the heading of miscellaneous buildings, we have not such a discrepancy, as the figures run for the three years,—886, 847, 905, and for the present year 852; at Bradford, curiously enough, under the same heading, we find a considerable increase, which we will try and regard as a hopeful sign for the future, and particularly if we bear in mind the fact that a few years ago, when at the height of the great revival of trade in both districts, the building of houses was considerably overdone, and a number of those built in the Bradford district have never yet been occupied, though I am happy to find, owing to the increase in trade, a decided improvement is apparent.

We give some further passages from the address:—Whilst referring to the work of the younger members, I must take the opportunity to say a few words on a far from pleasant topic, but which must not for that reason be shirked: I mean the undertaking of work by architects' assistants without the consent of their employers. This is a great and, I am afraid, a growing evil; at any rate, during my term of office as your president, I have had several complaints about the practice.

It may seem hard and arbitrary, perhaps, at first sight to endeavour to prevent a young man with possibly a limited salary and many claims on his slender purse, to take advantage of an occasional windfall in the shape of work coming into his way, especially when the work is introduced to him by reason of personal friendship. Where the system pinches most is in the employment of very young and inexperienced men by unscrupulous speculative builders and others, to prepare drawings in such a way as to enable the builder to represent that the design is his own, and to persuade his unfortunate victim that an architect is a useless and costly luxury, and that his services can be dispensed with. I think all must see the great discredit done to our profession by this illicit practising (I know no better term for it); much of the work so carried out is very crude and slipshod, and being hurriedly prepared at night after office hours (a time which ought to be devoted to study), must necessarily be ill considered and imperfect, and even if a show of superintendence is made it is often of the most useless description; and besides, the charges are so ridiculously low as in themselves almost proclaim the work dear at any price. If a young man has a good connexion and is confident of his own powers, by all means let him commence business for himself, and not play a double part. I trust the members of this association will set their faces very strenuously against a continuance of this pernicious practice; to the older members it is a question of the honour and well-being of their profession, and to the younger members especially it is important to put a stop, if possible, to it, as their only chance of success in life is to prepare themselves thoroughly by training for the

production of first-class work, and to charge for that work upon the usual scale. In speaking of the late Mr. Burgess, Mr. Ewan Christian coupled him with Lord Beaconsfield as having, like that illustrious statesman, learned the lesson of "how to wait," and, hard as the lesson may be in some cases, it is essential to our mutual well-being that all young architects should learn how to wait until they are justified by their knowledge and experience in undertaking work of a responsible nature, and can command a fair recompense. I think it is a question worthy of consideration whether a written agreement should be made by assistants, on entering into an engagement, that they will not undertake work without first obtaining the consent of their employer; and I have no hesitation in saying positively that such an arrangement should be imperative in the case of assistants in public offices. It will be in your recollection that we addressed a protest to the Institute of British Architects against the official consent of that body being given to the system of double competitions which has recently sprung up. The members of that Institute seem, however, to think that the scheme is of benefit to the profession in certain cases, and have virtually determined to abide by their regulation or suggestion relating to it. I regret that this is so for I cannot see that it will lead to anything except extended labour in the production of two sets of drawings instead of one; and as there may in future almost always be a professional assessor or referee, I think it lays such assessor open to temptation in preferring the particular style of architecture that he affects, as it will be impossible in his first report to prevent his conveying some idea of which of the selected sketches he prefers. Besides, the system seems to give more scope for the unscrupulous to canvas the members of the corporate or other body for whom they are working, and thus bring personal influence to bear. The sketch system alone is quite sufficient, without any second competition, and would, indeed, be a great boon; for if competent referees were consulted, their professional knowledge ought to be sufficient to enable them from plans, one or two sections, and one perspective sketch, all to a fixed scale, to judge of the relative merits of the designs, especially if two or three sheets of working detail in pencil, showing the proposed method of treatment intended, were added to the list above, so as to enable the assessors to guard against the misleading effects of meretricious work in the general drawings. The advocates of the double scheme insist on its advantages to the young and clever members of the profession, as giving them a chance to come to the front; but it appears to me that a young man, unless he had a good capital, would, if he were selected once or twice for the final competition, and then proved unsuccessful, run a risk of bankruptcy on the threshold of his career, as the fees allowed for the final stage would by no means cover the cost of the elaborate finished design.

Another important public question is the housing of the very poorest of our working population. It is high time that legal powers should be granted to enable corporate bodies, or even private companies, to obtain dilapidated untenanted property, not at the ridiculous prices awarded by arbitrators, but at so low a price as to make the erection of new and improved dwellings on the sites thus obtained a remunerative speculation; the great drawback to private enterprise, at any rate, is the excessive cost of the land, and the fact that there is so large a demand for central sites in our business towns for manufacturing purposes. In Leeds the mechanic class is not badly off for suitable dwellings, and at moderate rents. The class of people for whom industrial dwellings, so called, are really wanted, are the poorest of the poor,—those, in fact, who can barely afford a single room, and who at present herd together in a way shocking to contemplate. Of course, in these buildings there is always the difficulty of great height and many steps to contend against, but perhaps the upper stories might be adapted for common lodging-houses, for young and vigorous tramps and navies, and the lower stories devoted to those whose limbs are not so pliant. Then, again, some of these model dwellings, as they are called, have unnecessarily lofty stories. I think if a room has ample window-space and means of thorough ventilation, a height of 9 ft. would be sufficient, especially when we consider

that one of the greatest difficulties of the very poor is procuring sufficient bodily heat, either by food or fuel, and a too lofty room must necessarily be cold. What is required, it appears to me, are rooms about 16 ft. by 14 ft., with recess and screen for parents' bed, a sink-closet shut off from the living-room, and, of course, with the best known appliances for cutting off the waste-pipes from direct communication with the drains, and, in addition, if possible, a small pantry, projected from the face of the outer walls, to secure a through current of air. All should be under constant supervision so as to ensure cleanliness in all the sanitary arrangements. It may be objected that no family should be allowed to live in one room only, and, theoretically, that is all very well; but the fact is,—and we cannot alter it,—that many thousands of our fellow-creatures are so extremely poor, that it is a question with them between one room and the workhouse; and this is the class whose needs ought to be considered.

That large blocks of industrial dwellings are healthy as compared with ordinary low-class houses, is evident from the returns of several of the most important properties of that description; thus the death-rate of the London Improved Industrial Dwellings Company, of which Sir Sidney Waterlow is chairman, only averaged 16·4 per 1,000 during the year 1881, as against 21·2 in London generally. The Peabody "Trust" Buildings, with accommodation for 12,000 persons, show a death-rate of 17·22, and the Metropolitan Association show a death-rate as low as 14·3 only for last year. More striking, however, than either of the three instances just quoted is the case of Newcastle-on-Tyne, where (as we are told by the able manager, Mr. Price), during the past twelve months, the block of buildings belonging to the Newcastle Improved Industrial Dwellings Company, which accommodates an average of 500 persons, only had a death-rate of 12 per 1,000 per annum; the rate for the parish in which the block is situated being for the same period 22·2 per 1,000 per annum.

The blocks of buildings referred to above, however satisfactory in themselves, have not solved the great problem of how to provide healthy dwellings for the poorest class at rents within their means, and therefore if we are to have such comfortable, though humble homes, I fancy that philanthropic aid will have to be called in to a certain extent. Whenever a corporate body finds it necessary to pull down the houses of the very poor, the erection of suitable dwellings, under careful superintendence, should be immediately undertaken, having at least as many rooms or tenements as are removed; and I would further suggest that the corporation, backed by the Poor Law authorities, should build, at any rate, one block as an experiment, as they have almost unlimited borrowing powers, and the absence of any interest above what would be necessary to pay the Loan Commissioners would not be of consequence. There is also a field for very practical and useful benevolence on a large scale for some of our wealthy merchants and manufacturers; if they will find the money, I think there would be no difficulty in getting excellent designs in competition.

THE COST AND CONDUCT OF THE  
ELECTRIC LIGHT.

DR. SIEMENS, in his opening address as Chairman of the Council at the Society of Arts on the 15th, devoted the greater part of it to a consideration of the electric light from an economic point of view. His statements dispelled some popular errors on the subject, and it will be useful to give them increased circulation. The Chairman said,—Complaints appear almost daily in the public papers, to the effect that townships refuse their assent to applications by electric light companies for provisional orders; but it may be surmised that many of these applications are of a more or less speculative character, the object being to secure monopolies for eventual use or sale, under which circumstances the authorities are clearly justified in withholding their assent; and no licences or provisional orders should indeed be granted, I consider, unless the applicants can give assurance of being able and willing to carry out the work within a reasonable time. But there are technical questions involved which are not yet sufficiently well understood to admit of imme-

diatc operations upon a large scale. Attention has been very properly called to the great divergence in the opinions expressed by scientific men regarding the area that each lighting district should comprise, the capital required to light such an area, and the amount of electric tension that should be allowed in the conductors. In the case of gas supply, the works are necessarily situated in the outskirts of the town, on account of the nuisance this manufacture occasions to the immediate neighbourhood; and, therefore, gas supply must range over a large area. It would be possible, no doubt, to deal with electricity on a similar basis, to establish electrical mains in the shape of copper rods of great thickness, with branches diverging from them in all directions; but the question to be considered is, whether such an initiative course is desirable on account either of relative expense or of facility of working. My own opinion, based upon considerable practical experience and thought devoted to the subject, is decidedly adverse to such a plan. In my evidence before the Parliamentary Committee, I limited the desirable area of an electric district in densely-populated towns to a quarter of a square mile, and estimated the cost of the necessary establishment of engines, dynamo-machines, and conductors, at 100,000*l.*, while other witnesses held that areas from one to four square miles could be worked advantageously from one centre, and at a cost not exceeding materially the figure I had given. These discrepancies do not necessarily imply wide differences in the estimated cost of each machine or electric light, inasmuch as such estimates are necessarily based upon various assumptions regarding the number of houses and of public buildings comprised in such a district, and the amount of light to be apportioned to each, but I still maintain my preference for small districts.

By way of illustration, let us take the parish of St. James, near at hand, a district not more densely populated than other equal areas within the metropolis, although comprising, perhaps, a greater number of public buildings. Its population, according to the preliminary report of the census taken on the 4th April, 1881, was 29,865, it contains 3,018 inhabited houses, and its area is 784,000 square yards, or slightly above a quarter of a square mile. To light a comfortable house of moderate dimensions in all its parts, to the exclusion of gas, oil, or candles, would require about 100 incandescence lights (or, if I may suggest a more euphonious expression, glow-lights) of from 15 to 18-candle power each, that being, for instance, the number of Swan lights employed by Sir William Thomson in lighting his house at Glasgow University. Eleven-horse power would be required to excite this number of incandescence lights, and at this rate the parish of St. James's would require  $3,018 \times 11 = 33,200$ -horse power to work it. It may be fairly objected, however, that there are many houses in the parish much below the standard here referred to, but, on the other hand, there are 600 of them with shops on the ground-floor, involving larger requirements. Nor does this estimate provide for the large consumption of electric energy that would take place in lighting the eleven churches, eighteen club-houses, nine concert-halls, three theatres, besides numerous hotels, restaurants, and lecture-halls. A theatre of moderate dimensions, such as the Savoy Theatre, has been proved by experience to require 1,200 incandescence lights, representing an expenditure of 133-horse power; and about one-half that power would have to be set aside for each of the other public buildings here mentioned, constituting an aggregate of 2,926-horse power; nor does this general estimate comprise street lighting, and to light the six miles and a half of principal streets of the parish with electric light, would require, per mile, thirty-five arc lights of 350-candle power, each, or a total of 227 lights. This taken at the rate of 0.8-horse power per light, represents a further requirement of 182-horse power, making a total of 3,108-horse power, for purposes independent of house-lighting, being equivalent to 1-horse power per inhabited house, and bringing the total requirements up to 109 lights = 12-horse power per house. I do not, however, agree with those who expect that gas lighting will be entirely superseded, but have, on the contrary, always maintained that the electric light, while possessing great and peculiar advantages for lighting our principal rooms, halls, warehouses, &c., owing to its brilliancy

and more particularly to its non-interference with the healthful condition of the atmosphere, will leave ample room for the development of the former, which is susceptible of great improvement, and is likely to hold its own for the ordinary lighting up of our streets and dwellings. Assuming, therefore, that the bulk of domestic lighting remains to the gas companies, and that the electric light is introduced into private houses only, at the rate of, say twelve incandescence lights per house, the parish of St. James's would have to be provided with electric energy sufficient to work  $(9 + 12) \times 3,018 = 63,378$  lights = 7,042-horse power effective; this is equal to about one-fourth the total lighting power required, taking into account that the total number of lights that have to be provided for a house are not all used at one and the same time. No allowance is made in this estimate for the transmission of power, which, in course of time, will form a very large application of electric energy; but considering that power will be required mostly in the day-time, when light is not needed, a material increase in plant will not be necessary for that purpose. In order to minimise the length and thickness of the electric conductor, it would be important to establish the source of power, as nearly as may be, in the centre of the parish, and the position that suggests itself to my mind is that of Golden-square. If the unoccupied area of this square, representing 2,500 square yards, was excavated to a depth of 25 ft., and then arched over so as to re-establish the present ground level, a suitable covered space would be provided for the boilers, engines, and dynamo-machines, without causing obstruction or public annoyance; the only erection above the surface would be the chimney, which, if made monumental in form, might be placed in the centre of the square, and be combined with shafts for ventilating the subterranean chamber, care being taken, of course, to avoid smoke by insuring perfect combustion of the fuel used. The cost of such a chamber, of engine-power, and of dynamo-machines, capable of converting that power into electric energy, I estimate at 140,000*l.* To this expense would have to be added that of providing and laying the conductors, together with the switches, current regulators, and arrangements for testing the insulation of the wire. The cost and dimensions of the conductors would depend upon their length, and the electro-motive force to be allowed. The latter would, no doubt, be limited by the authorities to the point at which contact of the two conductors with the human frame would not produce injurious effects, or say to 200 volts, except for street lighting, for which purpose a higher tension is admissible. In considering the proper size of conductor to be used in any given installation, two principal factors have to be taken into account; first, the charge for interest and depreciation on the original cost of a unit length of the conductor; and, secondly, the resistance of a unit length. The sum of these two, which may be regarded as the cost of conveyance of electricity is clearly least, as Sir William Thomson pointed out some time ago, when the two components are equal. This, then, is the principle on which the size of a conductor should be determined.

From the experience of large installations, I consider that electricity can, roughly speaking, be produced in London at the cost of about 1*s.* per 10,000 Ampère-Volts or Watts (746 Watts being equal to one horse-power) for an hour. Hence, assuming that each set of four incandescence lamps in series (such as Swan's, but for which may be substituted a smaller number of higher resistance and higher luminosity) requires 200 volts electro-motive force, and 60 Watts for their efficient working, the total current required for 64,000 such lights is 19,200 Amperes, and the cost of the electric energy lost by this current in passing through  $\frac{1}{100}$  of an ohm resistance, is 16*l.* per hour. The resistance of a copper bar one quarter of a mile in length, and one square inch in section, is very nearly  $\frac{1}{100}$  of an ohm, and the weight is about 2½ tons. Assuming, then, the price of an insulated copper conductor at 90*l.* per ton, and the rate of interest and depreciation at 7½ per cent., the charge per hour of the above conductor, when used eight hours per day, is 1½*d.* Hence, following the principle I have stated above, the proper size of conductor to use for an installation of the magnitude I have supposed, would be one of 48.29 inches section, or a round rod 8 in. diameter. If the mean

distance of the lamps from the station be assumed as 350 yards, the weight of copper used in the complete system of conductors would be nearly 168 tons, and its cost 15,120*l.* To this must be added the cost of iron pipes, for carrying the conductors underground, and of testing-hoses, and labour in placing them. Four pipes, of 10 in. diameter each, would have to proceed in different directions from the central station, each containing sixteen separate conductors of 1 in. diameter, and separately insulated, each of them supplying a sub-district of 1,000 lights. The total cost of establishing these conductors may be taken at 37,000*l.*, which brings up the total expenditure for central station and leads to 177,000*l.* I assume the conductors to be placed underground, as I consider it quite inadmissible, both as regards permanency and public safety and convenience to place them above ground, within the precincts of towns. With this expenditure, the parish of St. James's could be supplied with the electric light to the extent of about 25 per cent. of the total illuminating power required. To provide a larger percentage of electric energy would increase the cost of establishment proportionately; and that of conductors, nearly in the square ratio of the increase of the district, unless the loss of energy by resistance is allowed to augment instead.

It may surprise uninitiated persons to be told that to supply a single parish with electric energy necessitates copper conductors of a collective area equal to a rod of 8 in. in diameter; and how, it may be asked, will it be possible under such conditions to transmit the energy of waterfalls to distances of twenty or thirty miles, as has been suggested. It must indeed be admitted that the transmission of electric energy of such potential (200 volts) as is admissible in private dwellings would involve conductors of impracticable dimensions, and in order to transmit electrical energy to such distances, it is necessary to resort, in the first place, to an electric current of high tension. By increasing the tension from 200 to 1,200 volts, the conductors may be reduced to one-sixth their area; and if we are content to lose a large proportion of the energy obtained cheaply from a waterfall, we may affect a still greater reduction. A current of such high potential could not be introduced into houses for lighting purposes, but it could be passed through the coils of a secondary dynamo-machine, to give motion to another primary machine, producing currents of low potential to be distributed for general consumption. Or secondary batteries may be used to effect the conversion of currents of high into those of low potential, whichever means may be found the cheaper in first cost, in maintenance, and most economical of energy. It may be advisable to have several such relays of energy for great distances, the result of which would be a reduction of the size and cost of conductor at the expense of final effect, and the policy of the electrical engineer will, in such cases, have to be governed by the relative cost of the conductor, and of the power at its original source. If secondary batteries should become more permanent in their action than they are at the present time, they may be largely resorted to by consumers, to receive a charge of electrical energy during the daytime, or the small hours of the night, when the central engine would otherwise be unemployed, and the advantage of resorting to these means will depend upon the relative first cost, and cost of working the secondary battery and the engine respectively. These questions are, however, outside the range of our present consideration. The large aggregate of dwellings comprising the metropolis of London covers about seventy square miles, thirty of which may be taken to consist of parks, squares, and sparsely-inhabited areas, which are not to be considered for our present purpose. The remaining forty square miles could be divided into, say, 140 districts, slightly exceeding a quarter of a square mile on the average, but containing each fully 3,000 houses, and a population similar to that of St. James's. Assuming twenty of these districts to rank with the parish of St. James (after deducting the 600 shops which I did not include in my estimate) as central districts, sixty to be residential districts, and sixty to be comparatively poor neighbourhoods, and estimating the illuminating power required for these three classes in the proportion of 1 to 2 to 3, we should find that the total capital expenditure for supplying the metropolis with electric energy to the

extent of 25 per cent. of the total lighting requirements would be—

20 ×	177,000 =	3,540,000
60 × $\frac{2}{3}$ ×	177,000 =	7,080,000
60 × $\frac{1}{3}$ ×	177,000 =	3,540,000

£14,160,000

or say 14,000,000., without including lamps and internal fittings, and making an average capital expenditure of 100,000. per district. To extend the same system over the towns of Great Britain and Ireland would absorb a capital exceeding certainly 64,000,000., to which must be added 16,000,000. for lamps and internal fittings, making a total capital expenditure of 80,000,000. Some of us may live to see this realised, but to find such an amount of capital, and, what is more important, to find the manufacturing appliances to produce work representing this value of machinery and wire, must necessarily be the result of many years of technical development. . . .

The amount of the working charges of an establishment comprising the parish of St. James would depend on the number of working hours in the day, and on the price of fuel per ton. Assuming the 64,000 lights to incandescence for six hours a day, the price of coal to be 20s. a ton, and the consumption 2 lb. per effective horse-power per hour, the annual charge under this head, taking eight hours' firing, would amount to about 18,300., to which would have to be added for wages, repairs, and sundries, about 6,000.; for interest, with depreciation at  $\frac{7}{4}$  per cent., 13,300.; and for general management, say, 3,400.; making a total annual charge of 41,000., or at the rate of 12s. 9d. per incandescence lamp per annum. To this has to be added the cost of renewal of lamps, which may be taken at 5s. per lamp of sixteen candles, lasting 1,200 hours, or to 9s. per annum, making a total of 21s. 9d. per lamp for a year. In comparing these results with the cost of gas lighting, we shall find that it takes 5 cubic feet of gas, in a good argand burner, to produce the same luminous effect, as one incandescent light of sixteen-candle power. In lighting such a burner every day, for six hours on the average, we obtain an annual gas consumption of 10,950 cubic feet, the value of which, taken at the rate of 2s. 8d. per thousand, represents an annual charge of 29s., showing that electric light by incandescence, when carried out on a large scale, is decidedly cheaper than gas lighting at present prices, and with the ordinary gas-burners. On the other hand, the cost of establishing gas-works and mains of a capacity equal to 64,000 argand burners, would involve an expenditure not exceeding 80,000., as compared with 177,000. in the case of electricity; and it is thus shown that, although it is more costly to establish a given supply of illuminating power by electricity than gas, the former has the advantage as regards current cost of production. It would not be safe, however, for the advocates of electric lighting to rely upon these figures as representing a permanent state of things.

#### ARCHITECTURAL STYLE.

SIR,—In his address at the opening *conversations* of the Architectural Association, the President expressed his opinion that a new and distinct style of architecture "is an impossibility," and although another speaker was quite positive that a new style might be developed "if the very scrupulous adhesion of the very large body of educated architects to some definite lines or principles of design" could be secured, I am very certain that those who have thought about the subject at all will agree with Mr. Hayes, that during past ages all the principles applicable to the practice of architecture have been exhausted. Modern science may do much, but the discovery of a new principle in construction (upon which alone a distinct style can be developed) is, I venture to think, beyond its power. And the speaker I have quoted appears to think that, given the little "if," a style could be evolved in a lifetime or a generation. But I apprehend that a style to deserve the name must be complete and perfect, must have arrived at maturity; and, if so, history proves that every style took a few hundred years in development before it arrived at the inevitable period of decline.

If, however, all this be true, it is no reason for not doing the best we can with the styles

we are acquainted with, and I am certain that a great deal remains to be done,—sufficient, indeed, to satisfy all our art cravings. With the principles, the art, the materials, and the wealth at our command in this wonderful nineteenth century, an edifice could be erected which might be quite unique in beauty, splendour, and magnificence, and probably without extra cost upon works in actual existence. And this brings me to the more particular object of this letter.

Of late our attention has been much directed to the East, and I should, therefore, be glad to be allowed to urge the advantages that might accrue if the architects of the West would turn their attention to Oriental details as a means of improving future English buildings, and adding to the resources of Western Pointed architecture. Harmony must, almost of necessity, result, because it would be the revival of a process adopted in the early centuries of Western art, when our Norman ancestors were building churches and palaces on the eastern shores of the Mediterranean with pointed arches, chevron mouldings, domical roofs, and other details, most of which afterwards appeared on our national architecture. Surely these buildings, if studied, would yield further riches. Though the Eastern Pointed style has no elaborate riches, buttresses, or pinnacles, it is distinguished by a breadth and boldness of general treatment, an exquisite refinement of details, and a charming application of coloured materials. The Western artists, however, who brought Eastern ideas to our side of the Alps, neglected the scale and proportions of the originals. Nook-shafts of beautiful materials and 12 in. in diameter, were reduced to insignificant 3-in. colonettes of limestone. They failed to introduce those noble portals, wide and deep, and reaching to the very summits of Eastern edifices, and which were enriched with inlay of porphyry and serpentine, panels of arabesque mosaic in breccia, and shafts of syenite; and which rivalled in architectural effect the most magnificent portico of Greek or Roman temple.

And it is difficult to understand why those beautiful features of Eastern cities,—the cupola and minaret,—should not appear in our future designs.

Perhaps, then, our Northern Pointed might be refreshed and invigorated by a new infusion from the parent stock in the East. Urban architecture would profit in a specially appropriate manner, inasmuch as the above smooth and superficial details would enable the architect to dispense almost entirely with complicated mouldings and rich carvings in soft perishable freestone, which are too soon clogged with the soot and *debris* of the London atmosphere, and become eyesores rather than ornaments.

It may be thought that only in Eastern lands are the requisite materials to be found for this phase of Pointed architecture, but the fact is that no soil yields richer treasures for the highest class of buildings than that of the United Kingdom. From Ockhampton and the banks of the Tamar, in Cornwall, a white granite; Mount Sorrel, Leicester, a red syenite; Shap, Cumberland, a flesh-coloured porphyry; the Lizard, a green serpentine; Clew Hill, Salop, a black basalt; Scotland, gray and rose-coloured granites; and these quarries are all in connexion with rail or sea, and some with both, and are a few only of those which exist. The requisite machinery, moreover, has been invented for surfacing and polishing, at a minimum of cost, and increased demand and competition would still further reduce expense. As between such carved and moulded stonework as that of the Houses of Parliament, and a building entirely faced with the above polished materials, with splay only and no mouldings, the difference, as shown by a careful comparative estimate, is only 3 per cent., after allowing 15 per cent. profit. The granite workers, however, demand 100 per cent. profit at present.

II. T.

**Mrs. E. M. Ward's Pupils.**—News of the good progress made at the studio in William-street, Lowndes-square, bravely established by Mrs. E. M. Ward on the death of her late husband, always gives us pleasure. It is agreeable, therefore, to hear that Mr. J. E. Mills, R.A., on visiting the studio on Monday, the 20th, by arrangement, expressed his great satisfaction in respect of the drawing done there.

#### PROPOSED ARCHITECTURAL EXHIBITION FOR EDINBURGH.

At the meeting of the Royal Institute of British Architects, on Monday evening last, the secretary read a letter from the Edinburgh Architectural Association, stating that it had been resolved to hold an Architectural Exhibition in the rooms of the National Gallery, Edinburgh (subject to the confirmation by her Majesty's Treasury, of the permission already granted by the Board of Manufacturers). The exhibits will comprise framed and unframed paintings, sketches, drawings, photographs, models, and sculpture illustrative of architecture. These will be received at the Association's Rooms, 20, George-street, on the 13th and 14th of December. It is proposed to open the Exhibition on the 22nd of December by a *conversazione*. The public will be admitted during the following ten days, at a moderate charge. The proposal has met with hearty approval in Edinburgh, and the Council of the Edinburgh Architectural Association hope to have the sympathy and support of the members of the Institute.

We trust that the efforts of the Association in this matter will be successful, as they well deserve to be.

While speaking of the Association, we may add that it has presented a very good syllabus of papers to be read and discussed, and buildings to be visited, during the session 1882-83 just entered upon.

#### NEW STANDING ORDER OF PARLIAMENT FOR THE DEPOSIT OF PLANS.

At the end of the last session, Mr. Lewis Angell, C.E., engineer and surveyor to the West Ham Local Board, represented to Colonel Makins, M.P. for South Essex, the inconvenience caused to the officials of urban sanitary authorities by reason of the non-deposit of Parliamentary plans affecting such authorities, Standing Orders only requiring plans to be deposited with the practically obsolete "Parish Clerk." In consequence of the action of Colonel Makins, the following new Standing Order has been made, and comes into operation for deposits on the 30th of this month:—

*Extract from Standing Orders, Session 1883.*

ORDER 29.—On or before the 30th day of November, a copy of so much of the said plans and sections as relates to the district of any Urban Sanitary Authority in England or Ireland, in or through which the work is intended to be made, maintained, varied, extended, or enlarged, or in which any lands or houses intended to be taken are situate, together with a copy of so much of the book of reference as relates to that district, shall be deposited with the clerk of that Sanitary Authority.

#### AN ELECTRIC LIGHT ENGINE-HOUSE ON THE EMBANKMENT.

The Jabbohoff Electric Light Company, which has for some time past supplied the electric light to the Victoria Embankment, are erecting a new engine-house in place of the temporary premises which they at present occupy under the Charing-cross Railway Bridge. The site on which the building is being erected is at the south-east corner of the Embankment gardens, immediately adjoining the Charing-cross Station of the Metropolitan Railway Company. The structure, which is being erected in red brick, will have an elevation to the Embankment, 85 ft. in length, and will be 32ft. in depth. It will consist of one story, and will be about 25 ft. in height, surmounted in the centre by an ornamental turret, and a chimney-shaft at the rear. The engine and machinery in connexion will rest on a concrete bed, excavated to a depth of 6 ft. below the Embankment level. The building has been designed by the company's architect, and Mr. Hook, of Westbourne-park, is the contractor.

#### A NEW FORM OF INSURANCE.

ACCORDING to a Continental journal, an insurance company has been established in Paris under the title of "Le Bâtiment." This body undertakes in consideration of annual premiums the maintenance in good constructive and decorative condition of all kinds of buildings. It is stated that the principle of the association is to assure to householders a provision against being prevented by temporary want of funds from having to exercise economy which may afterwards lead to increased expense. The project is not very clear.

Williams, however, argued to the effect that no fee could be claimed, unless there was a permanent building built in conformity with the Act, and that if the building were taken down, or so altered as to become in its altered state exempt, the district surveyor had no claim.

Mr. Price pointed out that under clauses 49 and 51, taken with schedule 2, a fee is assigned for every new building surveyed by the district surveyor, and that such fee accrues immediately on the covering-in of the roof, and is payable one month thereafter, and argued that the ultimate alteration or removal of such building could not affect the question; and

The Magistrate, remarking that if Mr. Williams's argument could be maintained, the district surveyor might be deprived altogether of the fee to which he was entitled for discharging his duty,—made an order for the payment of the fee of 2*l.*, with 23*s.* costs.

#### BUILDING PATENT RECORD.\*

##### APPLICATIONS FOR LETTERS PATENT.

- 5,378. R. Plush, London. Fastening the sliding sashes of windows. Nov. 11, 1882.  
 5,383. J. J. Tylor, London. Apparatus for the water supply of water-closets, baths, and urinals, &c. Nov. 11, 1882.  
 5,435. C. R. Stevens, Lewisham. Apparatus for heating and ventilating. Nov. 14, 1882.

##### NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

Nov. 14, 1882.

- 3,444. E. L. Ransome, San Francisco, U.S.A. Artificial stone or concrete pavement. July 20, 1882.  
 3,741. A. Bouquet, Paris. Manufacturer of bricks, tiles, paving, &c. Aug. 5, 1882.  
 4,402. S. H. Hyllyer, London. Supply and waste-valves for baths, lavatories, &c. Sept. 15, 1882.  
 4,509. F. H. Nooit, London. Drain-pipes. Sept. 21, 1882.  
 5,179. W. E. Lake, London. Apparatus for flushing water-closets, &c. (Com. by J. Cooper, Boston, U.S.A.) Oct. 31, 1882.  
 Nov. 17, 1882.  
 3,361. T. Hughes, Market Drayton. Metallic glazing bars for glazing without use of putty, &c. July 15, 1882.  
 3,993. J. Hopewell, Salford. Door-mat, boot and shoe cleaner combined. Aug. 19, 1882.  
 4,679. J. D. Lampard and F. Coppen, London. Cover for protection of bricks from rain. Oct. 2, 1882.

##### ABRIDGMENTS OF SPECIFICATIONS

- Published during the Week ending November 18, 1882.  
 1,695. G. H. T. Beamish, Queenstown Breakwaters, retaining walls, &c. April 8, 1882. Price 6*d.*  
 The bricks or blocks of concrete, or other suitable material, are tenoned into one another to bind the whole wall together.  
 1,751. W. P. Thompson, London. Window-cleaning chairs or fire-escapes. (Com. by A. Dornitzer, New York, U.S.A.) April 13, 1882. Price 6*d.*  
 This improves these chairs by simplifying the clamping arrangement, which consists of a clamping-bar actuated and held by racks.

##### PROVINCIAL NEWS.

**Maldstone.**—The new Church Institute in Union-street has been opened by the Venerable Archdeacon Harrison. The building is in close proximity to Week-street, and has a frontage of 32 ft. to Union-street. It is in the fourteenth-century Domestic Gothic style, and is constructed of red brick with Bath stone dressings. It is of three stories, the height to the parapet opening being 48 ft., while above the main entrance is a tower rising to an altitude of 13 ft. This tower and the fenestrals in front make the façade a striking one. There is on the library floor a fine oriel window, supported by boldly-treated corbels with neat mouldings and conventional foliage, while the main doorways and windows are enriched by tracery, and are polished granite shafts with carved caps. Over the doorway is a facial likeness of his grace the Archbishop of Canterbury, with in vitro, very faithfully carved in bas-relief. In the windows and panelling of the doors stained glass has been inserted with good effect, and in the three reading-room windows are represented

the heads of Shakspeare, Milton, and Dickens. This room is 30 ft. by 20 ft., and immediately above it are a large class-room and the library, while on the second-floor are situated smoking, dressing, and attendants' room. The main room is the Hollingworth Hall, which, thanks mainly to the liberality of the two gentlemen bearing that name, has been erected for use until such time as the whole plans can be carried out. It is constructed of match-boarding, and its dimensions are 50 ft. by 30 ft. It will seat 300 persons, and is intended to be used for public meetings and entertainments, while it will also be utilised as a gymnasium. The building has been erected from the design and under the superintendence of Mr. E. W. Stephens, architect, Week-street, Maidstone, the contractors being Messrs. Wallis & Clements, of Maidstone. The total cost has reached nearly 4,000*l.*

**Banbury.**—The foundation-stone of the new Masonic Hall, in the Marlborough-road, was laid on the 17th inst. by H.R.H. the Duke of Albany. Mr. W. E. Mills is the architect of the building. Mr. A. Kimberley, of Banbury, is the contractor.

**Lowestoft.**—On the 9th inst. the new hospital at Lowestoft was formally opened. The building has been erected at a cost of upwards of 6,300*l.* by Mr. Arthur Bedwell, builder, the architect being Mr. J. L. Clemeuce. Messrs. C. & T. Lucas, with characteristic liberality, marked the occasion by a donation of 500*l.* to the funds of the hospital.

**Norwich.**—Extensive new premises for Messrs. H. P. Colman & Co. have been erected in Rampant Horse-street, from the designs and under the superintendence of Mr. Boardman, architect, Norwich. The building is Gothic in feeling. Air-light cases, by Mr. Sage, of Hatton-garden, are inserted in the series of plate-glass windows that face Rampant Horse-street. One thing that calls for notice is a new lift running throughout the building. This is by Messrs. Thomas & Sons, of Cardiff, who claim to have obviated the risks of accident common to these most useful and indispensable machines, by a mechanical contrivance simple in its character, but very effectual in its operation. No matter what the weight be upon the lift, immediately the hand is removed from the pulley it comes to a standstill, and in the event of the main rope breaking from any cause the descent of the lift is arrested by a spring at once releasing a series of dog-hooks, which take a powerful grip of the surrounding framework. The whole of the basement is effectively lighted, principally by means of Hayward's prismatic lights. The builders were Messrs. Wilkin & Wilkins.

##### CHURCH-BUILDING NEWS.

**Darlington.**—The new chancel of St. James's Church, Darlington, was opened on the 7th inst. by the Bishop of Durham. The old portion of the church was completed in 1876. The additions now made comprise new chancel, organ-chamber, and choir-vestry, with heating-chamber under. The chancel is apsidal-ended, and lighted by three geometrical traceried windows. It is raised three steps above the nave, while the Communion-table is raised three steps above the chancel-floor. The division of the sanctuary from the chancel is marked at the walls by light detached stone shafts carrying the roof principals. The roof is an open timber one, with boarded ceiling divided into panels by moulded ribs. The floor is paved with Minton's encaustic tiles. The works have been carried out from designs by Messrs. Clark & Moscrop, architects, Darlington, and under their superintendence.

**Preston.**—All Saints' Church, Preston, was re-opened on the 12th inst. by the Archbishop of York. The original church was erected in the thirteenth century, and is thought to have been a one-aisled edifice, the only portions remaining being the chancel arch and the arcades on the north side. Late in the fifteenth century the church was extended by throwing out an aisle on the south side, and at the same time the existing eleventh and tower were added. The present rector found the church, with the exception of the chancel, in an almost ruinous condition, especially the north aisle and vestries, and at once set to work to raise funds for the restoration. The north aisle has been rebuilt stone by stone, and fortunately, in pulling down the old walls, the traceried heads of the windows were discovered and have been replaced in their old positions. An open-timbered roof, with

carved ribs to the principals, has taken the place of the rough decayed roof which formerly disfigured the church. The stonework throughout the interior has been cleaned and repaired, and the unsightly pews have been removed, open seats being substituted. The restoration up to the present time, including certain works of repair to the exterior, has cost 1,500*l.* During the excavation for the pavement an interesting discovery was made of the remains of a carved Easter sepulchre in alabaster. The subjects are:—The Crowning of the Virgin; two sets of the Soldiers watching the Sepulchre; the Sacrament of the Eucharist; the Confessional; the Adoration of the Magi; and the Ascension. These have been carefully preserved, and fixed on a stone slab. The restoration has been carried out under the superintendence of Messrs. Smith & Brodric, of Hull. There were two separate contracts for the work, the first portion being executed by Messrs. Simpson & Malone, of Hull, the latter by Messrs. Wilson Brothers, of the same town. Mr. J. Wilkinson was the contractor for the joiners' work throughout.

**Elsecar (near Barnsley).**—This church was re-opened on All Saints' Day. It had been closed for the purpose of decorating the walls of the chancel and nave, and erecting a new rood of wood, with the "Agnus Dei" in the centre, and angels bearing scrolls on either side, with the word "Alleluia" thereon. The work has been carried out by Messrs. Johnson & Appleyards, of Sheffield, from the designs and under the superintendence of Mr. E. Bailie Smith, their designer.

**Edgefield.**—The parish church at Edgefield, Norfolk, is now in course of being rebuilt. The old fabric has been for a long time disused on account of its dilapidated condition. The whole of the roofs were destroyed about fifty years ago, and the clerestory windows removed, in order to accommodate a roof of one pitch over the nave and aisles, instead of the original arrangement. Such of the old work as still remains will be re-used in the new structure. The church is being rebuilt in a more central position in the parish. The architect for the works is Mr. Sedding. The contractor is Mr. Bartram, of Aylsham.

**Beerhackett.**—The parish church of Beerhackett was re-opened on the 16th inst., after restoration at a cost of about 1,200*l.* According to Hutchins, "The church was a peculiar of the jurisdiction of the Dean of Sarum, and formerly under that of the Abbot of Sherborne. In Dean Chandler's register it is said to be a chapel, dependant on the church of Sherborne, and dedicated to St. Michael. It is a small structure, consisting of nave and chancel, with north porch and low western tower." The chancel and nave have been renovated, and the old pews replaced with open seats of pitch pine (stained). The walls are of Ham-hill and Douling stone, cemented inside. Considerable labour has been expended on the chancel. The east window, which is of stained glass, was presented by Mr. A. F. Newington, in memory of his brother, the late Rev. F. Newington. This window has three lights of perpendicular character, and represents the Crucifixion, treated as a triplet under canopies, while the tracery openings are occupied by angels. The wagon-roof is covered with pitch-pine. The porch has been rebuilt, and new oak doors have been placed at the entrances to the church. The tower is out of the perpendicular, and has been pronounced to be unsafe. Its restoration is, therefore, rendered imperative. Mr. Crickmay, of Weymouth, was the architect, and the contract was taken by Mr. C. Trask, of Norton-sub-Hamdon.

**Cloaceny (Denbighshire).**—The parish church was re-opened by the Bishop of St. Asaph on the 9th inst., after restoration under the direction of Messrs. Perkin & Bulmer, architects, of Leeds. The church was deserted and the roof reslated in the year 1856. The principal works just completed have been the taking down and rebuilding of the south wall, which was from 15 in. to 18 in. out of the perpendicular, caused by the great thrust of the roof principals and the want of a good foundation. The south side of the roof has been stripped of the slating, and was reslated, after the timbers had been foreed, by means of screw-jacks and tie-rods, into their original position. The north-east and south windows and south doorways have been replaced by new work of Ruabon stone. Two additional two-light windows have been inserted in the north wall. The east window, which is a five-light example of the

\* Compiled by Hart & Co., Patent Agents, 195, Fleet-street.

Perpendicular period, has been thoroughly repaired, and the lower compartments have been glazed with leaded lights of cathedral glass. The upper parts are filled with old stained glass. The wooden sacristy floor and step have been replaced by Yorkshire stone steps and tiles. The old oak rood-screen, dated 1675, and the oak pulpit, 1695, and all the seating, roof-timbers, &c., have been thoroughly cleaned from the many coats of paint and varnish which they have received from time to time. The walls have been replastered internally, and pointed on the outside with cement. New oak doors to the north and south entrances have been provided; but the old wrought-iron hinges have been re-used. New priests' desks and stalls have been placed in the choir; and an oak lectern designed to harmonise with the rood-screen has been given by a lady. These and some other works to the church have been carried out by Mr. John Morris, builder, Ruffin. The lectern is the work of Mr. J. W. Appleyard, of Leeds.

### Books.

*Historic Winchester: England's First Capital.*  
By A. R. BRAMSTON and A. C. LEROY.  
London: Longmans, Green, & Co.; 1882.

THOUGH this is one of the dullest books in style, and one of the most confused in its arrangement, that we have ever opened, it appears to be a useful and careful *resumé* of the main facts in the history of Winchester. The writers of the book state, in a preface, that their principal object has been not to give new information, of which there is none except in regard to the publication of two or three MS. letters, and some local details taken from State Papers, but to collect the known facts so as to form a history of Winchester as a whole, not of different parts of it. To do this, however, it is not sufficient to shovel all the facts together into one book; there must be the faculty of putting them together so as to make an interesting and living narrative, and this the authors certainly do not possess. The book is one to keep for reference, but certainly not interesting or picturesque to read.

We turned over the pages with a view of seeing what light is thrown on the architectural history of Winchester in the course of the book. The references to this part of the subject are mostly brief, and not very clear or satisfactory. The first reference to the origin of the Norman cathedral is given thus:—"Bishop Walkelyn must have looked with some contempt on the Saxon cathedral, grand and massive though it was for the times in which it was built, notwithstanding its being small in Norman estimation, and doubtless disfigured by the rough usage of the Danes. He therefore determined to build a new cathedral worthy of the capital of the great Conqueror," &c. It is not very easy to see what the first part of this involved sentence really means; and the matter becomes still more doubtful when we find subsequent reference to the idea that parts of the present building are remnants of the Saxon cathedral, but without the expression of any decided conviction either way. The progress of rationalism in regard to building accidents is amusingly illustrated by the remark quoted from William of Malmesbury, in reference to the fall of the centre tower in 1107, which was supposed to have happened because the wicked King Rufus had been buried under it, a conclusion which the chronicler throws doubt on, "more especially as the building might have fallen from imperfect construction, even though he had never been buried there." The authors touch upon the period of the lengthening of the choir at the end of the thirteenth century, and the substitution of the polygonal for the apsidal termination, and subsequently refer to the alterations of the nave, first suggested by the work of Bishop Edington, the predecessor of Wykeham, concerning which it is observed that "probably there were then, as there have been since, people who regretted the destruction of the massive double arch and simple round-headed windows, and who could see no superior beauty in the Perpendicular style into which their grand Norman nave was gradually to be brought." Probably there were some, as human nature is radically much the same in different periods, and the *laudator temporis acti* is as old as the existence of civilised society; but they would not have been many,

nor have made a fashion of protesting against rebuilding, as people do now. The thing was looked at in a different way then; not as a matter of the past, but of the present.

A good deal of information is given in regard to the great bishop whose name will always be connected with Winchester, and who ought to have been a monarch or a prime minister to have found sufficient scope for his commanding intellect and energetic character. His famous piece of work at the cathedral is dismissed, however, very briefly, with merely the statement that he transformed the whole nave from Norman to Perpendicular style, without giving the unlearned reader the briefest hint as to how this was accomplished.

Among matters of interest in the volume is a long letter from Cromwell's Commissioners in Henry VIII.'s time, in regard to their work of appropriating or "conveying" the treasures and plate of the monastery, about which they seem to have experienced some disappointment, the plate being poor and the precious stones counterfeit in many cases; and "the old prior had made the plate of the house so thin" (reduced it in quantity is what is apparently meant) "that we can diminish none of it and leave the prior anything furnished." This shows a polite consideration for the actual needs of the prior, who on his part is stated to have been, together with all the convent, "very conformable"; so that the pillaging seems to have been carried on in a most gentlemanly spirit on both sides. The spoliation of the treasures of Winchester by one Cromwell was to be followed eventually by the destruction of some of the buildings by order of the other and greater man of the name. In 1649, Parliament ordered the complete demolition of the Castle of Winchester. "This was to be done by the county authorities, and it was thought that they would willingly do it 'to provide for their future quiet,' compensation being given to Sir W. Walker. The county did not apparently take the same view of the matter, and two months later came another letter to the Governor of Southampton about it; not only the castle, but also the wall round it, was to be destroyed, and forty soldiers, 'honest men,' were to be sent 'to keep the peace there while the work is going on.'" Two or three more peremptory orders, however, had to be sent before the work was really done. Following on this notice of the destruction of a great relic of Mediaeval Winchester, we find information as to the awakening of the first hint of the modern spirit in regard to town life, in some wholesome anxiety on the part of the Mayor and Corporation touching the sanitary state of the town. They considered the present state of the streets as "unbecoming a place of eminency or of good government," and urged the inhabitants, some of whom had refused to contribute to the employment of a "skavenger," to clean away all that was objectionable, "whereby the streets have for some time past been and continued very noysome," the officials complaining that the citizens in not doing this prefer "their own private ease more than ye publique good." A few years later there was an enactment that no person or persons should make any mud wall within the city, or make any ledge in the High-street, on pain of a fine of forty shillings for each offence. At the same time, thatched roofs within the city were forbidden, both on account of the danger of fire and of "the unseemliness thereof in soe anciente and famous a city," and all those existing were within a year to be covered with "tyle or slatt." Considering that long previously to this we find (middle of the sixteenth century) that in Winchester no brewer was to be a drunkard, on pain of a fine of six and eight pence for each transgression, and that only twenty-four persons were to sell ale and beer in the city, and they were to be persons "of good behaviour and honest conversation," it was seen that old Winchester was a tolerably advanced town for its period.

A curious instance of the variation of artistic creed in different periods is mentioned in regard to the altar-piece painted by West in 1777. "So precious was the picture considered that a few years later two of the windows in the clerestory of the choir, containing glass of the fifteenth century, were actually whitewashed to prevent any coloured light being thrown upon this work of West's." This fact ought to suggest caution in regard to some of the specimens of art which receive exaggerated worship at the present moment. About the same time

as the painting of this altar-piece, there is chronicled a step in the architectural development of Winchester in the shape of the erection of a number of shops and houses in what a former historian called "the bow-window style." In summing up the building work of recent years, the authors refer to the fact that the Church of St. Cross was restored and "coloured somewhat in the style in which it was supposed to have existed," this work being chiefly suggested by the large donation of an anonymous "O. Z." As far as the painting was concerned "O. Z." had hester he kept his money. There is a good moral, however, drawn in the concluding pages. "A casual observer cannot but be struck with the great importance of even one man's labour, and will notice that it is often the uprightness and energy of a single citizen that leaves a lasting mark by his life's works in the town in which he lived and died. The palaces that kings build for their own glory brought no lasting greatness to Winchester, but the Cathedral of Athelwold and Walkelyn, the College of William of Wykeham, the Hospital of John Devenish and Richard Lamb, the St. Cross of Henry de Blois and Cardinal Beaufort, the Almshouses of Peter Symonds, have not only kept the names of their founders fresh in their memories, but make Winchester famous, even though her trade and her royal favour have forsaken her."

### Miscellanea.

**The Smoke Abatement Institute.**—At a meeting of the Smoke Abatement Committee held on the 18th inst., at the offices, 44, Berners-street, under the presidency of Mr. Ernest Hart, it was announced that the Board of Trade had finally approved of the formation of a Smoke Abatement Institute, and of the articles of association. Communications were read from the Foreign Office enclosing official documents communicated to the Senate of the United States by the President of the United States, containing a detailed report which Dr. Topkinson, F.R.S., had made on the Smoke Abatement Exhibition at South Kensington for the information of the American Government. Official communications were also read from New Zealand, the Dominion of Canada, and Chicago, conveying information as to the steps taken in those countries, on the impulse given to the question by the action of the Smoke Abatement Committee, and requesting information as to appliances and legislative measures, which was ordered to be furnished. It was announced that the volume containing the reports of the jurors, with detailed tabulation of tests, forming a work of important character and permanent value, with a considerable body of illustrations, was now in the press. Mr. T. W. Cutler, F.R.I.B.A., and Mr. J. Lowry Whittle were appointed a sub-committee to report on the question of the formation of a museum and permanent exhibition of smoke-abating kitcheners, grates, and industrial appliances for public use and information.

**Indian Dockyards.**—A powerful steam fire engine, of the Merryweather's London Fire Brigade pattern, has just been supplied to the Indian Government for one of the dockyards. The engine is capable of pumping 350 gallons per minute, and was tested last week in the presence of the officials at the India Stores Department in Belvedere-road. Steam was raised within three minutes to 25 lb. pressure on the square inch, and within ten minutes there were 100 lb. Two 1-in. jets were thrown to a height of 130 ft., and a single jet 14-in. reached 170 ft. The tests were considered highly satisfactory. This engine is specially built for hot climates, and is mounted on wrought-iron wheels of an improved design.

**Excavations at Ephesus.**—A meeting to promote the resumption of excavations at Ephesus, on the site of the Temple of Diana, was summoned for Saturday afternoon last, in the lecture theatre of South Kensington Museum. Mr. J. T. Wood, under whose superintendence the excavations have so far been conducted, was in attendance to explain their object; but owing, presumably, to the fact that the Royal review was in progress, there was so small a gathering that, after a few words from Professor Lewis, Mr. Wood, and Mr. Newton, of the British Museum, the meeting was adjourned *sine die*.

**Art at Godalming.**—On the occasion of the distribution of the prizes gained by the students of the Godalming Science and Art Classes, Mr. Charles Forster Hayward, F.S.A., delivered an address on "Art." In the course of it he observed that the very fact of the existence of the false and absurd aestheticism of the day was a hopeful one, as it was a protest against much that was bad, though itself leading to much the same thing in another direction; but the bend must be the other way to get the thing straight. This false and spurious art, this show of taste in the dress and furniture of the period, however bad, were but the homage paid by the bad to the good, a compliment to the value of something which was not otherwise appreciated. The lecturer drew a favourable comparison between the development of real art in the present day with that existing years ago, and pointed out the facilities, inducements, and encouragements to the cultivation of science and art. He then gave excellent advice to art students, urging them to love their art and enjoy their work, and, above all, to avoid false art, and in connexion with the latter mentioned the "art" shops existing in London, and spoke of artists, Dutchmen and others too, covering their canvases with gold, that is, asking for their pictures as much as would cover them in gold pieces. In conclusion, he asked if it was absurd to hope that they might have in that locality something more than they at present had to help on the cause of art and good taste, science and true progress, such as a public library, a museum, a hall for lectures, and lectures or readings themselves, a small laboratory, and at least class-rooms, where the science and art of Godalming might have local habitation, if it did not eventually gain a name as well.

**The New Natural History Museum.**—(Although this building has been for some time opened to the public, a great deal of space is as yet unoccupied, except by show-cases in various stages of completion; while in the central hall or typical museum, only one of the bays contains any specimens, and these, apparently, are only placed there temporarily. The large detached Spirit Room at the back of the Museum, now approaching completion, has a flat concrete roof, which is being surfaced with Seyssel Asphalt by Claridge's Patent Asphalt Company. This covering is 1 in. thick, and has an area of about 8,000 ft. The parapet walls are being lined with the same excellent material. The workmanship is very good, and altogether he carrying out of the work is likely to fully sustain the reputation of the Company. A useful adaptation of the gurgyle is seen here, as in other buildings designed by Mr. Waterhouse, A.R.A. At or near the point in the gutter at which the down-pipe occurs, the parapet wall is pierced and a gurgyle projected, so as to carry off the water from the gutter in the event of the down-pipe becoming stopped.

**New Town-hall for Battersea.**—The foundation-stone of a new Town-hall for Battersea was laid on the 14th inst. by Mr. Sydney Stern. The site is at the corner of Lavender-hill and St. John's-road, Battersea, close to Clapham Junction Station. The building, which is being erected by the Battersea and New Wandsworth Public Halls Company, has the ground-floor on the two frontages laid out for a suite of rooms intended to accommodate a social club, and including reading, coffee, smoking, and billiard-rooms, club hall and winter garden, and kitchens and servants' offices to the basement beneath. The public-hall, which is 106 ft. long, 40 ft. wide, and 32 ft. high, is in the first-floor, and entirely fireproof, as are also the staircases and approaches. There are various rooms attached, intended for retiring, cloak, and supper-rooms, caretaker's apartments, and secretary's offices. The style adopted is Queen Anne, with steel-coloured bricks for facings, red bricks for dressings and boulded cornices, &c., and ornamentation will be carved in rubbing bricks. The design was selected from six submitted in limited competition, and is the work of Messrs. Morris & Tallwood, architects, Reading, who are superintending the erection of the building.

**Completion of the Ordnance Survey of cotland.**—The Ordnance Survey of Scotland, work which has been going on for thirty-seven years, has been completed, and the surveying staff is being withdrawn from Scotland. During the last few years nearly 100 men have been employed in the work.

**Gas, a Cheap Servant for the Working Man and his Wife.**—In connexion with the Gas Exhibition now open at Stockport (previously mentioned by us) a lecture, bearing the above title, has been given by Mr. Thos. Fletcher, F.C.S., of Warrington. We quote a paragraph from it:—"There is no doubt whatever that gas is a very expensive fuel, and that it is very easily wasted. Its real value for the heat produced, as compared with coal, is not one-tenth its actual cost, provided both can be used with equal economy, as they certainly can on a very large scale for steady work; but you cannot make a coal fire for ten minutes for breakfast and tea, and an hour for dinner. Once a day is quite enough to prepare a fire, and it is kept on throughout the day. You burn as much coal to get an ordinary breakfast ready as would, if the same coal were converted into gas, prepare the same breakfast better and, at least, a hundred days in succession. Here is where the economy shows; in the same way, a workman will buy an extravagantly expensive steel tool to do his work, rather than buy a hundred cast-iron ones. He does better work at a less cost, and saves his time in the bargain."

**Sidcup National Schools.**—These schools, which have just been completed from the designs of Mr. W. Seckham Witherington, architect, 79, Mark-lane and Sidcup, have been opened by the Bishop of Dover. They are erected on a site in the Birkbeck-road, given by the late Miss Berens, and accommodate 160 children. The schoolrooms are divided in the centre by revolving shutters and curtains, so as to separate the boys and girls; and in connexion with each half there is a class-room. The elevation is plainly treated in the "Queen Anne" style. The net cost of the schools, fittings, fencing, and playgrounds was 963*l.*, or 6*l.* per head. The work was carried out by Mr. Gregory, of Clapham Junction.

**The Wellington Arch.**—In the House of Commons on the 16th inst., Mr. Shaw-Lefevre, replying to Mr. Alderman Lawrence, said the contract for pulling down and rebuilding the arch, including the levelling of the ground and making a new road, was somewhat under the estimate he gave last May. The total was 24,000*l.*, of which 10,000*l.* or 12,000*l.* was the cost of pulling down and rebuilding the arch. Mr. Alderman Lawrence asked if the estimate included the cost of a new pedestal for the statue? Mr. Shaw-Lefevre replied that it would not, as it was possible that the old pedestal would do for the statue in its new position.

**Papier Mache Finger-plates.**—The Papier Mache Company, of Wellington-street, Strand, have sent us a few specimens of finger-plates produced in their material. Strange to say, this seems to be the first time this material has been so used, although assuredly adapted for such appliances, at all events of a certain class. They ought to be cheap, and they might be well-looking. The patterns sent are somewhat clumsy, but this altogether depends on the designer. The material would certainly seem to be available.

**The Surveyors' Institution.**—The rules of examination for all classes of members have been published. The examinations under Divisions I. and II. have been in successful operation for the last two years. Examinations under Divisions III., IV., and V. are now instituted for the first time, and will open the Fellowship to any one (whether in practice or not on his own account) who can pass the examinations. The table at the end of the pamphlet gives a general view of the whole scheme.

**Malvern.**—Radnor House, the residence of Mr. C. D. Barker, has been altered and enlarged by the addition of new dining-room and billiard-room, principal and secondary staircases, young ladies' room and bedrooms, servants' offices, &c., at a cost of between 3,000*l.* and 4,000*l.* Mr. E. W. Elmshie is the architect employed, and the work has been carried out by Mr. Everal, builder, of Malvern. Mr. W. H. Sheppard being clerk of works.

**The District Surveyorship of Clerkenwell.**—At the meeting of the Metropolitan Board of Works on the 17th inst., the Building Act Committee recommended that the usual course be taken for filling up the vacancy caused by the death of Mr. Robert Lacon Shibley, late district surveyor of Clerkenwell and part of Islington, and that the Board do proceed to the election on Friday next, the 1st of December.

**Floods in Strood.**—Sir Arthur Otway has again called attention in the House of Commons to the evils arising from the floods in Strood. On the 16th inst. he asked the President of the Local Government Board whether his attention had been called to the petition presented by him from Mr. Roach Smith with reference to the condition of Strood, which was overflowed by the river Medway, not only causing great damage to property, but great sickness in the town. Mr. Dodson replied that his attention had not been called to the petition, but he was aware that there had been floods at Strood. He added that he continued as sensible as ever of the importance of the inhabitants of the country generally being able to take measures to protect themselves, and that powers should be conferred upon them by Parliament to avert the evils of floods, but he was not in a position to give on the part of the Government an assurance as to the course they would take. The people of Strood should endeavour to act for themselves.

**An Arbitration. St. Peter's Church, Plymouth.**—The dispute between the Vicar (the Rev. Geo. R. Prynn) and Churchwardens, on the one side, and Mr. Gray, builder, on the other side, in connexion with the closing of the accounts for the rebuilding of the above-named church, has been brought to a settlement. It may be remembered that the matters in dispute were referred to arbitration, Mr. J. Edmeston, F.R.I.B.A., being chosen as the arbitrator. After the arbitrator had held four or five sittings, the matter was compromised by the plaintiff consenting to accept 1,300*l.* in settlement of his claims, each side paying its own costs. We have received conflicting accounts of the circumstances attending this compromise, but we are not concerned to weigh them.

**The Proposed Paris Metropolitan Railway.**—A report has been published of an interview between the promoters of the proposed Paris Metropolitan Railway and a committee of the municipality. The promoters propose to construct the railway on stone viaducts, except in the centre of the town, where it would be underground. The entire length of the lines would be 28 kilometres, and the outlay 100,000,000 francs. The Government, it is stated, will not assent to the concession until the entire capital has been subscribed.

**Messrs. Croggon & Co.**, the well-known galvanised iron manufacturers, have removed from No. 42 to No. 200, Upper Thames-street, where they will have larger and more commodious premises. The firm is one of long standing.

TENDERS

For the erection of the Albert-road Schools, Romford, Essex, for the Romford School Board. Mr. John Hudson, architect, 80, Leama-street. Quantities by Mr. C. Stanger—

### The Stimulus given by the State to Architectural and Engineering Works.

HERE is no great principle on which we have more felt it to be a duty to insist, when occasion offered, in these columns, than that each art, each science, and each department of business should be dealt with according to its own canons and primary rules. Thus it is for the architect,—and not for the cutting contractor,—to build palaces, no less than churches, mansions, and cottages. It is for the man familiar with the principles of sanitary science,—not for the local representative, whose one object is to keep down the rates, if, indeed, it be not to augment them for some private benefit,—to determine on the sanitary arrangements of urban and rural districts. It is for the educated medical man,—not for the philanthropic amateur,—to tell the world what should be done to give mankind the full benefit of what some hold to be the greatest service ever rendered to the human race,—the great discovery of Jenner. And so it is for the competent statist,—either himself an engineer or guided by the last outcome of the engineer's experience,—to form a judgment as to the advisability, or otherwise, of any great projected public works.

Most of our misfortunes, in the constructive point of view, spring from the neglect of this salutary rule. Do we not see, at this moment, a point of great importance to London,—that of the eastward transit over the Thames,—brought forward on what are called general views; that is to say, in the absence of that definite statistical information which would settle the question, in the judgment of a statesman, but which (for that very reason, may be) each projector scrupulously avoids? Have we not seen how the question of the new public offices, and the utilisation or the spoiling of some of the present sites in London, is made an accident of an accident?

An instructive and, we fear, a very sharp lesson, on this point, is now in course of being taught in France. English people, as a rule, are very little aware of the enormous sums, amounting to from 20 to 22 millions sterling a year, which are now included in the French budget, and borne by the French taxpayers, for the construction of public works in France. Some of these works are not only noble in design, but give full promise of being highly remunerative. Whether the execution by the State of such undertakings be the wisest mode of carrying them out it is not for us to say. It is not, at all events, found suitable in this

York. But at the lack of undertakings of such national interest that there can be no question (except that above hinted) as to the propriety of their being executed at public cost, come a number of others of purely local interest. It is these works,—schools, by-roads, and what are called secondary railways,—of which the origin is not economical, but political, in which we have long since foreshadowed trouble,—a trouble that now seems to be instant. M. Léon Say, who is the last person to be accused of any want of appreciation of the true value of public works, is seriously alarmed at the continued deficit of the French budget. He points out that all over France works are going on which have cost double the sum at which they were estimated, but which are nowhere finished. It is a reproduction of the old system of the *ateliers*, which broke down so disastrously in Paris. We will not say that it is a close neighbour of that system of public works in Ireland, designed in 1848 as a relief from the pressure of famine, and of which the outcome would be so ludicrous, if it were not so sad. But, at all events, it recalls the memory of that deplorable waste of public funds. And M. Say insists that it is the pressure of local and personal interest on the deputies, and thus on the Ministry of the day, which is the mainspring that sets these wheels in motion.

M. Say's recent utterance, which has been published in the *Journal des Economistes*, has an interest to ourselves, over and above the interest that we must take, on the one hand, in the welfare of our great neighbouring nation, and, on the other hand, in the extension of architectural work and the improvement of communications. He speaks in the most unhesitating way as to the State working of railways. Those of our readers who require any impartial testimony in support of the opinions we expressed as to Mr. Watherston's proposal for the State purchase of the English railways, will do well to read what M. Say has to say on the subject. "The failure," he says,—that is, of constructing and working railways directly by the State,—is complete and irreparable. The Budget is overlaid, while the population, whom it is sought to accommodate, are unsatisfied. . . . The blunder is colossal." It takes the form of a national disaster. In four years the net yield of the lines forming what is called the old network of the State has fallen off by more than 20 per cent. The proportion of expenses to receipts is yearly increasing. In 1878 it was 76 per cent.; in 1881 it had risen to 84.63 per cent. In three years the deficit has risen to forty millions of francs!

We shall do well to take note of this outcome of State working in France. It has, indeed, to be borne in mind that when the main trunk routes, with a certain amount of branches, are in the hands of great independent companies, the entrance of the State into the field as the constructor and worker of lines which it is not

worth while for the companies to make and work, looks like a foredoomed failure. Foredoomed or not, of the failure there is no doubt; and we cannot but attribute this fact in great part to what we have long since pointed out as a grave danger, both in France and in England,—that is to say, the obstinate regarding of a very complicated question from one single standpoint.

Let us grant all that can be said as to the primary importance of communicating roads, railways, canals; on the proper organisation of each in its due place the welfare of a people depends, almost as much as on the cultivation of the ground. In fact, in many parts of the country even more so. Let any one travel along such a line as that from Manchester to Leeds, passing as it does within a few minutes' run from a densely-populated town to a barren moor, and he will understand how it came to pass that the importation of food from abroad took such a different aspect in the eyes of the Manchester manufacturer and of the Leicestershire grazier, or the inhabitants of any rich corn-growing district of the country. But he is a short-sighted friend to the builder who urges the erection of street after street, irrespective of the question what rent may be fairly expected to be forthcoming. It is precisely this mistake that is committed when work is forced,—when houses are built, or roads made, or railways constructed,—in advance of the demands of the population. We are not speaking of a population that grows up with the rapidity of the famous bean-stalk of nursery legend, as is the case in some new countries. But in England, and still more in France, the magnitude of the demands of the future may be, at all events, approximately anticipated. We can tell, if we take the trouble, how many persons would use a new bridge if open tomorrow. So the statist ought to be able to tell how long it would take to create a traffic of 5000, per mile over a wild rural district, and he ought to know that until he sees his way to at least such a traffic as that, he will be woefully out of pocket if he constructs a railway even at so low a cost as 5,000*l.* a mile. For all these calculations the data ought to be forthcoming. The mischief is, that those who want works to be done for them, which they are unable or unwilling to do for themselves, are the very last persons to collect and bring forward those data which would show how entirely the required traffic was the creation of imagination, or, to say the least, of a hope that might be long deferred.

As we write come fresh telegrams from Paris, which only intensify the magnitude of the blunders that have been made. M. Herisson, the Minister of Public Works, declares that not only he cannot reduce the sum required for these works in 1883, but that he shall be compelled to spend on the works already commenced the sums voted for the new works. The

new railways which are to be constructed, in order to complete the scheme of M. de Freycinet, represent an aggregate length of 13,700 miles, of which 9,300 miles have been declared of public utility, and 3,470 are in course of construction. But it has been discovered that the original estimate of M. de Freycinet, which was 160,000,000 sterling, is entirely inadequate to the cost of the works in question, which are now estimated at 360,000,000. This is half the sum spent on the entire railway system of this country! However rich, and however powerful, a country may be, it is to court disaster to plunge headlong into such engagements. It is curious to observe that the scheme thus adopted by the French Government assumes almost exactly the proportions attained by the railway mania of 1845 in this country. The 360,000,000, for which the French Government are now to some extent responsible, comprises, indeed, works of all kinds (including school houses) besides the 13,700 miles of railway of a secondary character. The railway projects of 1845 in this country covered 20,687 miles of line, requiring a capital of 350,000,000. Out of this, Bills for 3,733 miles, involving a cost of 130,000,000, received the Royal assent (see *Edinburgh Review* for October last). Thus, if we infer that the weight assumed too hastily for France is three times what the country can bear, we are not without some justification in our own experience.

The railway committee, on November 24, decided unanimously against the State working and administering all the railways of France. It is a matter of deep interest for all concerned in building, or in public works in general, to watch the conduct of our great neighbour under these trying circumstances. But the true value of the experience thus to be attained at the cost of others lies in the light which it throws on the condition of similar projects in England. From all parts of the country, by public and by private announcements, we receive indications of the awakening and direction of public attention to canals. The great Manchester Ship Canal is only one of those schemes which are already in a more or less advanced condition of preparation. For that, the Parliamentary notices will be deposited, we are told, by the time these lines are in the hands of our readers. Then the Corporation of Preston have resolved on improving the navigation of the Ribble, so as to bring sea-going ships up to the wharfs at Preston. The manufacturers of Stoke-upon-Trent are projecting new canal communication, both with the Mersey and the Thames, as well as with the Humber. The purchasers of the Wilts and Berks Canal have obtained from the Board of Trade running powers, at a low maximum rate of charge, over the Kennet and Avon Canal. The Great Western Railway Company are about to have the damages which they have inflicted on the traders of Newport, by the stoppage of the Monmouthshire Canal, assessed by an arbitrator appointed by the Board of Trade. At the present moment every one, — we could cite many instances, — seems to be waiting for a lead, — waiting, probably, to see how the Manchester ship canal comes before Parliament; but, as far as experience is a guide, it only requires one decided step to be taken by one powerful company to awaken a response from end to end of England. At such a moment it is, therefore, very necessary to raise the voice of warning. In 1845 we knew but little either what railways would ultimately cost, or what would be the result of their development. We have now fifty years' experience as to both these conditions. It is time, and we, in common with the railway reporters of the Board of Trade, have often lamented the fact that we are not put by the Parliamentary returns in so favourable a position as are the publicists of almost every other civilised country, for ascertaining with precision the cost of every description of traffic and the value of new schemes. That want stares us in the face, in the anticipation of a renewed activity in the construction of public works. It is a want of which the schemer, the speculator, and the company-monger of the worst sort will not fail to take full advantage; while, on the other hand, it is a want that handicaps the honest and sober advocate of a sound scheme. It is to be hoped that the labours of Mr. Slagg's committee (which has been hitherto obstructed by the proposal to put Mr. Bradlaugh upon it) will throw some light on this subject. The report of the Committee on Railways (rates and fares), or, at all events, the evidence published with that

report, gives much valuable information. What we wish to impress upon our readers is that there are signs of the revival of an interest in certain public works which may be turned either to national welfare or to national disaster. Although all that ought to be known is not known, yet enough is known, — if people look in the right quarter for the knowledge, — to guide the investor in his choice. Let us beware lest we encounter a second 1845; and let us watch with interest the manner in which the French extricate themselves from a liability for 360,000,000, which it will certainly demand time to meet.

#### NEWMARKET PALACE, TEMP. JAMES I. BUILDING CHARGES.

The following extracts from the accounts of the Lord Treasurer's Remembrancer, preserved in the Public Record Office, show the cost of materials used in works and building, with the money disbursed for workmen, at Newmarket Palace, from 1609 to 1625. The first for the year 1609 is as follows:—"Also allowed to the said Account' for money by him yssued paid & defrayed for worke and Emp'cons & Provi'cons within the tyme of the Accompte donne and bestowed in and aboute his Ma<sup>ty</sup> house at NEWMARKETT, viz., Masons employed in cutting, fitting, and setting fower Chymney panells in the new pryvy lodgings and laying the Borders of the same: Carpenters employed in fitting and setting up of planks for Dressor boordes in the pryvy kitchen and Larder, Setting up a pit'ron with quarter boordes in the pryvy Chamber at the stayres head by the Chamber of p'sence, taking downe and setting up a paire of stayres in the said room; boording up part of a wall between the Larder and the room where the provi'cons are laid; fastning of quarters to the walls for langings in the new pryvy lodgings; making three new Doores of Oken boordes one between the p'sence Chamber and Princes lodgings, and th' between the Lord Fenton's Chamber and his Dyring-roome, and the third for the Prince's wardrobe; making of tables tressells formes and Cupboordes and doing sondry oth' needefull worke aboute the said house. Bricklayers and Tylers employed in paving w<sup>th</sup> bricks a gutter betweene the King's house and the house next adjoining; making a vanle of bricks from the said gutter through the Bottlehouse and grate entrie to convey the Raine-water into the old vante; paving with paving tyles the floores at the stayres foote going up to the pallett chamber; paving of div'se broken places in the hall; making of Ranges; mending the broken hartles and Furnace; setting the panne in the Scullery; tiling div'se broken places over the Privy lodgings & over the olde lodgings about the house; Plasterers employed in lathing and laying with plaster of paris & lime and baire the outside and inside walles ceilings and p'tions of the new lodgings, the store-house, the pantry, the buttery, the wyne-seller, and the groomes of the pryvy chamber their lodging. Thatchers employed in covering w<sup>th</sup> strawe the Back-side of the olde house over the stayres which were brought up at the ende of the lodgings and over the pryvy kitchen and scullery. Plumbers employed in laying w<sup>th</sup> sheete lead the grate Cornish on the forefront of the new lodgings, playning and fitting of quart' for footeplates there and helping to boorde up the pit'con in the p'sence. Sawyers employed in cutting of timber into div'se and sondry scantlings; and Labourers attending the said workmen & doing sondry other necessary busynesses there; for p'formance of all w<sup>ch</sup> workes diverse quantities of Em'pcons & Provi'cons have been made and bought, the p'ticulars wherof, with their quantities, nombers, and price, as also the charge of carriage, wago of artificers, workemen, labourers, & others employed in these services doe hereafter more p'ticularly ensue, viz."

Then follow the different items, the materials used, with the cost of each, from which it appears that four chimney panels of stone cost 16s. each; 29 ft. 6 in. of border-stone cost 8d. a foot; timber cost 8d. a foot; deals cost 3l. 14s. 4d. the 100; ash poles, 6d. each; lime, 8d. the load; sand and gravel, 6d. ditto; bricks, 13s. 4d. per 1,000; laths, 30s. the load, &c. The workmen's wages per day were as follow: — Masons, 18d.; carpenters from 10d. to 15d.; bricklayers, from 14d. to 17d.; plasterers, from 14d. to 22d.; joiners, 18d.; plumbers, 18d.;

labourers, from 9d. to 12d.; sawyers, 2s. 6d. the couple. Two clerks of works had 1s. a day each. Piece-workers were paid a lump sum for a certain job, — all materials being found by the king, Richard Griffin, for laying 903½ square yards of bulrush mats in the king's new pryvy lodgings and the noblemen's lodgings, finding mat-nails, pack-thread, &c., was paid at the rate of 8d. per yard. The total amount expended on the Royal Palace at Newmarket, in this account, was 457l. 6s. 4½d.

In the following year 50l. 4s. 4d. was expended on the works and buildings at the king's palace at Newmarket. The articles included timber, lime, gravel, sand, hair, solder, hindings-rods, reeds, straw, candles, ropes, nails, iron-work, glass, and glazing, to the value of 27l. 5s. 4d. Among the workmen employed were carpenters, bricklayers, thatchers, plumbers, joiners, sawyers, and labourers. Thomas Poinier, clerk of the works, was employed for forty days at 4s. per day (including horse-hire). John Pigott received 4l. for framing, raising, and boarding a floor in Mr. Bohennon's lodgings in the pryvy buttery, 16 ft. long and 15 ft. wide, with a new pair of stairs leading up the same, taking down the old roof and raising a new one with a "dormer" window; taking down a partition wall between the pryvy buttery and pantry, and laying fittings, "he only finding workmanship." Altering a smoky chimney cost 22s. For laths, lime, and hair used in the walls and ceilings of Mr. Bohennon's lodgings, 39s. 4½d. was charged. John Wyatt, the painter, was paid 27s. 1d. for repairing, stopping, and laying in white-lead, colour in oil, twenty-two lights and double casements, &c., in the presence chamber, where also some new timber cornices cost 9s., while the same apartment was embellished with four score and nine yards of bulrush mats at an expense of 49s. 6d.

In the accounts of money laid out on the Palace at Newmarket for the ensuing year, which amounted to 102l. 2s. 8d., the sum expended on materials came to 70l. 4s. 2d.; land carriage, 9l. 5s. 9½d.; wages, 60l. 1s. 2½d.; riding charges for the clerk of works and surveyor, 10l. 8s.; and 3s. 6d. given in reward to the keeper of the clay-pit for "permitting fetching of xxj lodes at 2d. the lode." These sums were chiefly spent in defraying the cost of taking down two partitions between the prince's bed-chamber and the presence-chamber, "for his highness more easy passage from there into thother," and in mending the ranges in the kitchen, filling over the king's presence-chamber and divers other lodgings about the house, and soldering and mending cracks in divers gutters. The cost of the materials employed, artisans' and labourers' wages are then given in detail, somewhat similar to, and at about the same rates, as in the preceding accounts.

In the financial year of 1612-1613, 85l. 8s. was spent "in and about his Ma<sup>ty</sup> House of Newmarket" in covering vaults, boarding up partitions, setting up shelves, making sliding windows, tables, trestles and forms, screwing and strengthening the floors that were sunk; tiling divers lodgings, setting up pans, and "layeing of Footpaces," and doing many other needful works there with the materials, quantities, prices, carriage, artificers, &c. The items are much the same as before. Lord Montgomery's lodgings were carpeted like the rooms of the king and the prince [? Henry] with bulrush matting.

For the year 1613-1614, 46l. 9s. 11d. was expended upon 10 ft. of oak timber at 8d. the foot; 1,400 of ½ in. boards at 10s. the hundred; and other timber of different thickness; lime, laths, tile-pins, hair, ironwork, nails, glass and glazing were also supplied. A well-rope for the stables cost 2s. 6d., and a bucket for the well 2s. Three loads of gravel and sand were bought at 6d. the load. The carpenters, bricklayers, and tylers were paid at the rate of 1s. 4d. per day, and labourers 1s.

The amount of money expended on the royal palace at Newmarket in the following year was no less than 4,600l. 11s. 9½d. This heavy expenditure was chiefly incurred for building with stone and brick a pile of new lodgings for the king, with a great chamber, presence-chamber, &c., and rooms both under and over the same for noblemen and gentlemen of the bed-chamber, as also for other works done there during seventeen calendar months, commencing May 1st, 1614, and ending September 30th, 1615. This account is very long and interesting, and covers two membranes. The cost of

materials and the workmanship was about equally divided. Building ground in Newmarket was cheap in those days. John Ramsey received 5*l.* 10*s.* "in full payment of the absolute purchase and sale of a parcel of ground containing in length 30 ft., and in breadth 19 ft., wherein part of his majesty's new building is extended, and was taken in to make the said building to range straight." \* The walls of the new buildings were three bricks in thickness from the foundation to the ground-floor, and from that elevation upwards they were two bricks in thickness. The garden was enclosed with a new brick wall, and 750 square yards of new bulrush matting were laid in the king's bed-chamber, the prince's lodging, the privy lodgings, the chambers occupied by the Earl of Montgomery, Lord Haddington, and Lord Hayes, and certain lower rooms of the new buildings, which, at 9*d.* per square yard, cost 39*l.* 17*s.* 6*d.*

The works and buildings at the palace for the ensuing year were also considerable, when the cost came to 2,607*l.* 13*s.* 2*d.* The new premises consisted of a new brew-house, "a kennel for the king's privy hounds, with lodgings over them; besides sundry works and repairs about the house and tennis-court; setting up of diverse postes in the stable close for managing of great horses to runne at the ring," &c. &c.

Workmen's wages had increased. Masons now received 2*s.*, 22*d.*, 20*d.*, and 18*d.* each a day; carpenters 2*s.*, 2*d.*, 2*s.*, 22*d.*, 20*d.*, 18*d.*, and 1*s.*; bricklayers, 2*s.*, 2*d.*, 2*s.*, 22*d.*, 20*d.*, 18*d.*, and 16*d.*; plumbers from 22*d.* to 18*d.*; plasterers, 22*d.* to 7*d.*; mat-layers, 22*d.*; sawyers, 3*s.* 4*d.* the couple; joiners, 18*s.*; lathmakers, 18*s.*; and labourers, from 1*s.* 4*d.* to 10*d.* Most of the stone used was brought from Northampton; 12*l.* 2*s.* 8*d.* was spent on new bulrush mats for the king's gallery, the withdrawing-chamber, the Lord Chamberlain's bed-chamber, and the apartments of the Earl of Pembroke, Sir George Villiers, Lord Hayes, and the Secretary of State in attendance; the king finding in some cases nails and packthread, and in others "nayles onely." Richard Fann, for looking to and setting the clock, received a present of 8*s.*, while he was rewarded with 2*s.* 8*d.* for cleansing the well and digging it deeper. The new stables and the kennel cost 1,704*l.* 19*s.* 5*d.*

In 1616-1617, 2,440*l.* 3*s.* 0*d.* was laid out on the king's establishment at Newmarket in building "a faire largeto newe stable for the great horses, a new doghouse with lodgings over it, a brew-house, riding-house and store-house, alsoe levelling the tennis-court with hicks, and laying the same with paving tiles upon the bryck; hatching the king's hies barns; laying the gutters between the brew-house and store-house; making perit'cons, doores, tressels, and formes; joynting and hoordinge of floores, with doeing sundry other works and repairs about the said house," &c. &c.

During the ensuing year only 467*l.* 15*s.* 4*d.* was spent on this palace chiefly on account of

a stable, with lodgings over it, for Sir Thomas Compton; alterations and extensions to the king's great stable; "making great tables, cupboards, tressels, formes, and screens for feasting the Germany prince and Sweden ambassador"; likewise "for bringing up the fence wall by the tennis-court, and another low fence wall into the churchyard over against the great gates with brick and stone, and in doing sundry other works upon and about the said house," &c.

The accounts for the following year are not extant, but in those for 1619-20, which amount to 2,719*l.* 15*s.* 6*d.*, we learn that some old buildings and sheds towards the street were pulled down and the ground cleared for the erection of additional lodgings of brick and stone, a wooden gallery, and offices for the prince. There were also a farrier's office and coachhouses built. The woodyard was enclosed with stone wall. Lodgings and store-houses were erected for the clerk of works. For framing and raising "a room on the back side of the kinges privy kitchen for the Marquis of Buckingham, with washing, boarding, lathing, and tiling the same, quartering a partition there"; and setting up racks, mangers, and stalls, and other miscellaneous work, including decorations to the ceiling of Buckingham's new lodgings, considerable expenses were incurred. As usual, new mats were provided for the king's chambers, while in other subordinate parts of the palace the old ones were mended and pieced.

In the year 1620-21 the royal works and buildings at Newmarket cost 975*l.* 2*s.* 6*d.* This amount is made up of a variety of miscellaneous items, too numerous and diffuse to mention in detail. A new well was sunk five fathoms deep to serve the king's and prince's kitchen, for which the labourer was paid at the rate of 5*s.* the fathom. New bulrush mats were supplied for all the principal apartments and stairs of the palace.

The accounts for the ensuing year are of a somewhat similar description, when 288*l.* 2*s.* 8*d.* was laid out on works and buildings in and about the palace.

In 1622-1623 the sum of 253*l.* 2*s.* 6*d.* was expended in mending the wainscot, shutting windows and casements in the king and prince's privy lodgings, planking in the prince's great horse-stable, repairing the rack in the king's great horse-stable, a wainscot casement at the end of the tennis-court and the bins in the king's pantry; setting up shelves in the Groom of the Stole's lodging; setting up ledges on the walls of the great horse-stable, with strong pins to hang saddles; setting up a shed to boil fish for the prince, setting up shelves in the lodgings of the prince's secretary, boarding part of a decayed floor in the wardrobe, making a high stool with steps to ascend the top of it for the prince to run at the ring, making a new hearth and range in the king and prince's privy kitchen, mending the beartils and setting the pans in the boiling-house for fish, mending the chimneys in the great and presence-chambers, running up the lower lights in the dog-house, mending the walls in the prince's gallery, new lathing and laying the walls of the stable in the timber-yard with lime and chopped hay, new matting a room for the Marquis of Buckingham and a chamber for the master of the prince's robes, and piecing and mending the broken mats in the king's privy lodgings and the lodgings of the Marquis of Hamilton, the Earl of Montgomery, and the Marquis of Buckingham. Among other expenses, John Straver and Humphrey Warcup received a present of 22*d.* for carrying letters from Newmarket to London, and 6*s.* to a labourer for his attendance during five days at the water-side to see the bricks and tiles safely laid up and loaded at Freckenham.

The works and building at the palace at Newmarket for the following year, only cost 187*l.* 9*s.* 10*d.*, and included boarding and mending the stalls broken in the "hunting horse stable and in the Duke of Buckingham's stable"; shoring up the old house on the west side of the Court "dangerously shaken with wynds," raising the poles in the dog yard on boards "in bredde rounde aboute"; bringing up and finishing the stack of chimneys that served the prince's bed-chamber and other buildings, and mending them "for avoyding the smoake"; taking up the paving-tiles at both ends of the tennis-court and "new pavinge one end agayne." A bucket for the stable well cost 2*s.* 6*d.*, a well-rope, 2*s.* 6*d.*, and a leather for the pump, 1*s.*

The account for the year 1624-5 (which is

the last whole year of James I.'s reign in this series)\* for works and buildings at the Palace of Newmarket represents a disbursement of 148*l.* 5*s.* 6*d.* It thus appears that 20,833*l.* 13*s.* 2*d.* was laid out on this palace during the reign of James I. from the year 1600 to 1625, being an average of about 1,274*l.* per annum.†

J. P. H.

#### DEFECTS IN FURNISHED HOUSES.

A CASE was tried before a judge and jury at Westminster within the last few weeks, in which a landlord sued for rent, and a tenant denied that it was due, as he was obliged to leave the house since it was infested by bugs. The result was a verdict for the landlord, but we gather from the report of the case that the jury did not consider that the house in question was, if we may say so, immoderately infested by bugs. It is well, having regard to this case, that the actual state of the law in regard to defects in furnished houses should be understood. A good many years ago, it was decided that when a house is let furnished, there is an implied condition in the agreement that the house is fit for occupation on the day on which the tenancy begins. That case arose out of a house being infested by bugs, and though it has frequently been discussed in recent years, the main principle as applied to furnished houses and lodgings, as distinguished from unfurnished houses, has never been disputed. But it should be borne in mind that it does not refer to any houses except furnished ones, and therefore a tenant who takes an unfurnished house and finds it unfit for habitation on account of sanitary defects has no remedy against the landlord unless he or his agent has represented that it was in a fit condition for habitation. Whether this state of the law does not conduce to bad drainage and defects, is more than doubtful, but it cannot now be changed except by some legislative enactment. In the year 1576, the "famous bug case," as it is styled, was succeeded by one which may not inappropriately be called the famous drainage case, in which the same principle was still further strengthened, since the judgment of the presiding judge concluded with these words,—"It is an implied condition in all hirings, i.e. of a furnished house, that the house shall be in good and tenantable condition, reasonably fit for human habitation and for comfortable habitation, and from the very day on which the tenant is to enter down to the very day on which the tenancy is to cease, otherwise the tenant has not what he has contracted for." These are words which might well be hung text-like over every house-agent's desk, and it would be well if these persons would always impress them on their clients. The actual case in which this judgment was delivered does not need minute consideration; it is sufficient to state, as exemplifying the reckless way in which persons make assertions, that the agent stated by letter that the owner of the house "believes the drainage to be in perfect order, as she is very particular herself on this point, and there has been no infectious illness of any kind in the house." As soon as the tenant arrived, a disagreeable smell was perceived, and on examination it was found that there was a cesspool full of filth in the butler's pantry within 2 in. of the floor!

It is obvious that a house in such a state was not reasonably fit for human habitation; therefore, that the principle which we have already mentioned applied. Some amusement appears to have been caused in court during the latest case of reference to a single and solitary bug, and though this may seem trifling, it is clear that, in a rather comic form, it exemplifies a principle. To prevent a house being habitable it is not enough that some slight inconvenience should be caused to the tenant; his enjoyment and comfort must be materially interfered with. Some persons may have crochets as to ventilation, but because a house is not supplied with some particular system it does not follow that the house is not, in general opinion, fit for habitation, though in the view of this particular person it may be unfit. It is often said that the word "reasonable" or "reasonably" is too vague, but, in fact, it guards against individual caprice, and it answers to an expression which

\* Compare some fragmentary accounts in the British Museum from 1609 to 1614, sub. tit. Newmarket (MS. Add. 12, 198). Heavy expenses attended the maintenance of the royal stables at Charing-cross, York, St. Alban's, &c. &c. † L. T. R. Works and Buildings, Nos. 46-62. MS. Public Record Office.

\* In 1617 a further purchase of land, consisting of three roods, was made for extensions to the palace, as appears by the following copy of agreement, &c.:-

"Right trustee and right welbelovéd Cousin and Councello, We greet yo<sup>r</sup> well; and will and commaund you that vnder of privy Seale being in yo<sup>r</sup> outside, yo<sup>r</sup> cause of 2*s.* to be made forth in forme following, James, by the grace of God, &c. To the Treas. and Vnder-Treas. of o<sup>r</sup> Exchequer greeting. Whereas Sir John Cotton, Kt. and some of the officers of works, have made compession with Regnold Gawen, of Newmarket, for a small parcel of land, containing three roods or thereabouts, lying on the back-side of a house in Newmarket (commonly knowne by the name of the Star), in o<sup>r</sup> County of Cambridge, on w<sup>ch</sup> peece of ground are lately erected a Brewhouse, and a Storehouse for o<sup>r</sup> use and service. We doe hereby will and commaund yo<sup>r</sup> out of the Treasurie reuolving in the Receipt of o<sup>r</sup> Excheq<sup>r</sup> to cause paym<sup>t</sup> to be made vnto the said Regnold Gawen or his Assignes, of the Some of three score pounds in satisfaction for the said peece of ground, w<sup>ch</sup>out accompt, Imprest or other charge to be sett vpon him or them for the same, or any p<sup>t</sup> thereof. And these, &c. Given, &c. And these o<sup>r</sup> Tres shall yo<sup>r</sup> sufficient warrant in that behalfe. Given vnder of Signett at o<sup>r</sup> pallace of Westm<sup>r</sup>, the six day of January, in the fourteenth yere of o<sup>r</sup> Rainge, France, and Ireland, and of Scotland the fifte.

Entered. To o<sup>r</sup> right trustee, and right welbelovéd Cousin and Councello, Edwarde Barle of Worcester, Keeper of o<sup>r</sup> privy Seale."

† A sum of 8*s.* was charged for extinguishing a fire that broke out in the timber-yard, which at one time threatened to destroy the palace and appurtenances.

‡ Francis Carter, chief clerk of the works, was allowed 400*l.* which he gave to Sir William Conway for changing 400*l.* in silver into gold "for the easier carrying it down, and in consideration it was paid ten days sooner than it was due to the king." He was also allowed 7*s.* 1*d.* for the charges of his officers for a safeguard for the safe-guard of the same filth to Newmarket." (Account No. 55.)

would state, in so many words, that a house or a thing is to be in a certain condition, the test of which is the opinion of a fair number of ordinary persons. "Reasonably fit" means, in fact, that it is fit in the opinion of average persons. When, however, it comes to be considered that sanitary principles are now much more understood, it must be obvious that the average opinion will now expect a furnished house to be in better condition sanitarily than would have been required some years ago. Let any one remember how few houses, not many years ago, had absolutely no system of drainage-ventilation connected with them, and how, in the opinion not only of sanitary reformers, but of most intelligent householders, such a system is now considered essential to a healthy house; and then, if the principle we have mentioned be also borne in mind, it is obvious that its recollection should make all owners of furnished houses most particular as to the sanitary state of their residences. Because no disagreeable smells are at once perceived, it does not follow that a house is in a wholesome state, and we should be much inclined to say that if a tenant took a house which had no drainage-ventilation, a special jury in London would be much inclined to say that it was not reasonably fit for habitation. Therefore, not only for the sake of the general health of the community, but for the sake of their own pockets, every owner of a house, whether in town or country, should see that it is in the best sanitary condition, otherwise when it comes to be let furnished he may find himself tenantless, rentless, and embarked in litigation. We can only regret that the principle we have been touching on in these remarks does not apply to unfurnished houses, and so prevent not a little bad building.

#### "ON SUNDRY WORKING DRAWINGS." \*

WHEN I was asked to read a paper to this Association I did not like to refuse, and yet I felt that I really had but little to say beyond what I have already said at one time or another in these rooms, either with regard to the general principles or the practice of the art of architecture. It is true that a very tempting list of subjects suitable for architectural essays was kindly submitted to me by your officers, from which I might have selected a theme whereon to discourse; but I thought that the task of working up the necessary materials for such a lecture might fairly be left to some of the rising younger men in the profession, who have both more time and ambition for such a purpose than I now have. It struck me, however, that there must be, or at least ought to be, stored in the folios and memory of one who has been so long in architectural practice as I have been, drawings and incidents which, though doomed to ultimate and speedy oblivion, might be temporarily revived for the advantage of his younger brethren upon such an occasion as this. I chose, therefore, the title of "Sundry Working Drawings" simply as a convenient peg whereon to hang, as it were, some gossip which might suffice to occupy one of the evenings of your session. If this should prove, as I cannot but fear it will, to be of questionable taste, as partaking somewhat too much of an egotistical nature, I still venture to hope that, though it may lay me open to censure on that account, it may not be altogether a waste of your time and attention to listen to it. Should I not have been entirely mistaken as to this idea, it is possible that my effort may serve as a hint to other architects, whose stores and reminiscences are of greater value than mine, and lead them to follow my example. Then, if such could be induced to look over the contents of their shelves, and to dip into the pages of their diaries, and extract thence, for the benefit of their juniors, some of the details and particulars of their professional experience of greater value for instruction than mine can pretend to have, I shall feel more than rewarded for the little trouble that the preparation of this paper has cost me.

"Working drawings" being the unornamental subject that I have now to deal with, I shall commence by making some few remarks upon their features and characteristics. Working drawings may be subdivided into what may be termed, for the sake of distinction, general

working drawings and detail working drawings. The former of these are usually drawn to the scale of one-eighth of an inch to a foot, except in cases in which the buildings are very extensive, when the scale of one-sixteenth of an inch to a foot is frequently used. Neither one nor the other of these scales, however, is, in my opinion, the best adapted to set off to advantage a design, the detail of which is of a character at all elaborate. Then the scale of one quarter of an inch to a foot is altogether too large for general working drawings, and it makes the drawings quite too cumbersome in size. In my opinion the scale of three-sixteenths of an inch to a foot is the one which gives the best effect for such general drawings as it may be thought worth while to take some exceptional pains with, although it is true that it is somewhat troublesome, and is objected to by builders on account of its being unusual. For detail working drawings the scale of one-half inch to a foot is the one that is the most suitable for brickwork and stonework, and that of an inch to a foot for woodwork generally; but for roofs, and suchlike designs in wood of large size, the half-inch scale will suffice. Mouldings and the like should, however, be always drawn out full-size; as it is not safe to allow workmen to enlarge them for themselves from drawings to smaller scales, there being considerable risk of the delicacy and essential features becoming more or less spoiled during the process.

The term "working drawings" distinguishes those which are intended to direct the actual execution of the work from either probationary drawings, for which less accuracy and more artistic effect is necessary, or from drawings of executed work, such as may have to be done by students for exercise or in competition for medals and prizes. The minute and painstaking character expected in the latter cannot be maintained in ordinary actual practice. For working drawings, therefore, the primary essential is clearness rather than technical excellence or beauty of draughtsmanship. For this reason the representation of shadows is to be avoided in them, and I need hardly say that hatching, once so fashionable, and which is but an affectation of proper shadowing, is quite inadmissible. Colouring to working drawing should be used simply for the purpose of distinguishing the different materials, and the same colours should always be used for the same materials. The printing and writing should be distinctly legible, though, of course, it is desirable that it should at the same time be somewhat characteristic.

Economy in the preparation of working drawings is a most important point for consideration, both as regards the labour and cost. For though an architect is only supposed, according to the regulations for professional custom of the Institute of Architects, to be obliged to supply one set of drawings and one set of tracings, these fall far short of the usual demands in practice; nor is it often, according to my experience, politic, if possible, to seek or obtain additional remuneration for further copies, although fairly chargeable. My own custom in this respect is to keep my working drawings in pencil, so that I may be able at any time to make any alterations required therein. From these pencil drawings I have tracings made, in strong black ink, upon white tracing-paper, whence other copies may be taken and multiplied by means of photo-lithography. I am thus enabled, at a comparatively small expense, to supply as many sets of the working drawings as may be called for by employers, surveyors, builders, or societies. By the same means also, especially in the case of old buildings destroyed, restored, or altered, the folios of the Institute and this Association may and should be enriched.

It is upon the character of his working drawings, rather than upon that of his preliminary sketches, valuable as an able and artistic treatment of those undoubtedly is, that the ultimate reputation of an architect depends. It is those only that actually affect the work itself. Upon the clearness and accuracy of the working drawings alone do the employer's interests and immunity from disputes and extra charges depend, so that they require, and should receive, all the care and attention that can be bestowed upon them. Doubtless, therefore, you have often determined that, come what will, these at least should have your own personal work, and that they should represent you, as it were, and all that is in you, and that their study and completion should precede the execution of the contract. But, alas! man proposes, but fate

and circumstances too often dispose otherwise, and you frequently find to your disappointment and regret that, after complete and elaborate sets of both general and detail working drawings have been prepared, it has proved that it has only been to be set aside in consequence of some change of purpose, with or without reason, on the part of your employers, and then that the whole work has to be done over again. You thus get to learn by experience that circumstances compel some compromise between the perfection of working drawings that you would yourself desire, and such comparative imperfection as may just suffice to secure the work being properly carried out. This, it need hardly be said, will not reach that standard of excellence which is so often attained by the student competitors for the medals and prizes of the Institute and this Association. Sometimes, instead of letting the preparation of the detail working drawings follow that of the general ones, so as to be simply explanatory thereof, I reverse the process, making my designs at once, after mere preliminary sketches, to the scale of  $\frac{1}{2}$  in. to a foot. This plan reduces the working-out of the smaller-scale general drawings completely to a mere mechanical operation, so that it can be done without any personal supervision on my part, and yet with certainty that the character intended for the detail will be preserved throughout. By this means my own time and attention is able to be concentrated upon those parts of the work which alone demand thought and design, the rest being left to be done entirely by others. I was able by this means, in the case of the competition for the Law Courts, to dispense with any increase of my staff, and not to disarrange at all my ordinary practice, whereas I remember to have heard almost all my competitors complain of having suffered severely in both those respects.

It is time now to descend from generalities and to speak of particulars, and I think that the most convenient way of arranging the matters I propose to bring before you will be in what may be termed brief, isolated, autobiographical passages, placed in chronological order, which will admit of occasional divergence as subjects appear to suggest themselves. My excuse for these must be that in reality an architect's life is represented in his works, and his works constitute all that in his life is worth any record at all.

Most of my early professional experience was obtained in the diocese of Llandaff, in connexion with its diocesan work. In the year 1851, the period of my apprenticeship to Professor Donaldson having expired, I spent three months in a rapid sketching tour upon the Continent, in companionship with the late Mr. Thomas Hill. Immediately after my return I was fortunate enough to receive a commission to build an hotel at Southerndow, a small watering-place on the coast of South Wales, near Bridgend, in Glamorganshire. After my first visit to that neighbourhood to inspect the site, I stopped on my way homewards to see the cathedral at Llandaff, which was just then emerging from the condition of ruin and spoliation in which it had lain, in picturesque confusion, ever since Mr. Wood's unfortunate effort to convert it into the semblance of one of his favourite assembly-rooms of his own town of Bath had happily been but partially carried out. I was then courteously shown over the works in progress by Mr. John Pritchard, the diocesan architect, under whose immediate charge they were. Shortly afterwards I received an invitation from that gentleman to join him in partnership, an offer which I accepted, and this led to my going down to reside with him at Llandaff. The cathedral of that little city (which is in fact only a suburban village in the neighbourhood of the town of Cardiff), with its lovely and refined Early English proportions and detail, thus became my constant study and source of inspiration. Its beautiful western front in particular, the exterior and interior of which form two distinct compositions in perfect harmony the one with the other, roofless and fastooned with ivy when I first knew it, seemed, as it still seems, to me to be a model for graceful proportion and refined treatment of mouldings. I quite revelled in its loveliness, thinking it to be one of the choicest examples of that style which England has made specially its own, and of which it may be fairly more proud than of any of the others which it shares in common with other countries of Christendom. The carved foliage of the interior of the cathedral was to me a continual source of delight. It is most

\* From a paper by Mr. J. P. Seddon, read before the Architectural Association on the 24th ult., as elsewhere mentioned.

sparingly used, as if it were jewel-work; and indeed it is as precious as if it were so. It is of the finest type of Early English foliage, the flow of the lines of which have remarkable grace and freedom; the stems are clear and vigorous, and the trefoil-shaped leaves are excellent in outline and surface modelling. I sent up a collection of casts taken from them to the Architectural Museum, and there is nothing to my mind among their treasures to surpass or even to equal them. This carved foliage of Llandaff is, in my opinion, the perfection of that particular class of work which is seen in its very earliest stage, budding out as it were of the simple Norman cushionwork of the capitals of St. David's Cathedral, and which is to be found revelling in its richest and wildest profusion in that of Wells, but nowhere with such developed fulness and power, and yet with refinement and constraint, as at Llandaff. Very noticeable also are the simple but noble piers of the main arches, with their alternately wide chamfers and groups of triple shafts. The effect of these piers is not improved by the access of richness that is seen in those which have been imported into the church of Llanidloes, in Montgomeryshire, which has just been restored by Mr. Street. They were removed from the now destroyed but once marvellous Abbey of Cwm Hir, in the same county, the number of arches in the main arcades of which are said to have reached the unprecedented number of twenty in succession. In these piers the triple group of shafts occur on each face of their octagonal piers, and their capitals are all united in one rich hand of foliage of the character of which we are speaking, but of inferior excellence to that of Llandaff.

The ordinary diocesan work, in which I became at once fully occupied, consisted largely of church restorations, and to my share fell principally those works which were situated in the archdeaconry of Monmouth, under the able and vigorous direction of its energetic archdeacon, whose habit it was to map out his district, and to appoint a visitation to various churches, the dilapidated condition of which required immediate attention, and to take me with him on those occasions. Upon our reaching one of these, possibly some few minutes later than it had been intended, he would first ask me to note its deplorable state, which I could not but admit to be tolerably obvious. He would then inquire of me what could be done with it, promising, however, that there was no money to be found. To this problem I would reply that its solution and the course to be pursued were far less clear. Nothing danted, he would then explain to the assembled ward and churchwardens that he had brought me there simply in my capacity of diocesan architect; which meant that they might set their minds at ease, for the present at any rate, on the subject of fees; but that, as I happened to be there, I might as well take the plans and particulars of the church, so that, in case I should be sent for upon some future occasion, I might be prepared. He would then allot me about half an hour, proffering me his own assistance, when wanted, as a tape-holder. Under such pressure I soon learned to systematise proceedings, first sketching in succession the plans, elevations, sections and details, and then noting down the necessary dimensions; having done this, we proceeded to perform the same task at the next church upon our list. On my return home I plotted out these several sketches, and though, of course, when actual work was contemplated at any of these places, it became necessary, perhaps, to make another and more careful survey, much time had been saved, and the opportunity given for preliminary consultations.

There are now so many different theories on the subject of restoration that I cannot hope to have satisfied all. Mine, then, was to replace matters as nearly as possible as I found them; and I have considered it a compliment when I have been told, as I was by the late Sir John Harding, in connexion with the restoration of Rockfield Church, in Monmouthshire, that he had not been informed he should not have known that anything had been done to it. I was but recently told, however, by a zealous member of the Society for the Protection of Ancient Buildings, that I am only one of the more destructive members of my craft in consequence of the confusion thus wrought for future archaeologists. There are, in truth, so many and grave questions that continually arise in dealing with old buildings, and so many ways in which each

of these may be viewed, that an architect's position in relation to such matters is a difficult one. He has to decide what should be done, and that with the certainty that, whatever his decision may be, it will please few and be disputed by some. His only consolation is, that if his censors be asked how they would have acted under the circumstances, they would either have done nothing, which he was not in a position to do, or that each would have done something different to the rest; so that, therefore, their criticisms neutralise one another. In self-defence I can certainly avow that these village churches then stood, as it were, on their last legs, and that the newly-arisen zeal of the Church would not brook their total loss. After all, an architect is but the servant of the public, and though he may be able to (and, if so, should) influence the opinion of his employers, he is bound to defer to that in the end.\*

#### CORNISH CHURCHES.

ST. PAUL'S ECCLESIOLOGICAL SOCIETY.

At the meeting of St. Paul's Ecclesiological Society, on the 22nd ult., the Rev. H. C. Shuttleworth, M.A., Minor Canon of St. Paul's, read an extremely interesting paper (full of quaint legends and amusing stories), entitled "Stray Notes on some of the Churches of Cornwall." A supplementary paper on the same subject was also read by Mr. J. D. Sedding, architect. We print the substance of both papers.

Canon Shuttleworth observed that generally speaking, the churches of Cornwall were not rich in architectural beauty. The county had always been poor and sparsely populated, and the fierce Atlantic gales, impregnated with salt, swept over the hills and up the narrow valleys with a force which demanded solidity and strength on the part of the buildings, rather than elaborate ornament. The native stone, moreover, was mainly slate and granite, neither of which lent itself very readily to decorative treatment. It was somewhat strange that the beautiful Serpentine stone of the Lizard district had not been more largely used for ornamental work inside the churches of the county. Some kinds of the native granite, also, if sufficient skill and expense were forthcoming, could be worked up into very handsome decoration. The Cornish churches were all of the same character; with few exceptions they were uniformly low, rather flat in the pitch of the roof, and without buttresses, thus giving an effect of long plain lines. Chancel were not the general rule; the larger churches had a nave and one aisle, equal in length, with perhaps a transept, and always a porch on the south side. Almost all of the Cornish churches were rebuilt in the fifteenth century, when a great wave of church building seemed to have passed over the county, and almost all of them, therefore, had the same general features, of which those of the Church of Eglosayle might be taken as examples. The west portion of the nave was evidently the original church, and the north wall contained much of the old work, including two beautiful Early English lancet windows of two lights. The remainder of the nave, the south aisle, with its long array of windows, and the tower, were of the date of the re-building, and were therefore Perpendicular in style. The transept would seem to have been left unfinished, and was probably treated by another and a later hand, for it proclaimed itself debased. Eglosayle Church, the dedication was lost, but the name signified "the church by the river or estuary,"—was remarkable as possessing a very fine old stone pulpit, probably the gift of a certain munificent vicar named Loveybond, who built the noble tower at his own cost, and the bridge from which the neighbouring town had its name. In this it was unlike its neighbours, but like them in the long row of granite pillars and arches between nave and aisle, the granite mullions of the many large windows, and the magnificent tower-arch looking up the long vista of the nave. This was the usual type of Cornish churches of the smaller kind; the larger had two aisles along the whole length of the nave, of which Bodmin and St. Key,—the latter church having a structural chancel,—the latter serve as examples. In common with most others, Eglosayle Church had a wagon or cradle roof to nave and aisle, with bosses

curiously and richly carved. The roof of the nave, however, was found to be so rotten when the church was restored a few years ago, that an open wooden roof was substituted. The old wagon-roof remains, however, in the south aisle. Indeed, the Cornish churches must at one time have possessed rare stores of finely-carved wood-work. The bench-ends of the old seats in this church were covered with singularly-bold carving, in what an experienced London worker in old oak declared were the finest pieces of wood that had passed through his hands. There were also abundant remains of old screen-work, some of it very rich and good. But, alas! much of this kind of work, here and elsewhere in the county, had disappeared under the despoiling hand of the churchwarden of old. It was no uncommon thing to find farm-buildings repaired, and even pigsties fitted, with fragments of old oak carving, upon which, in centuries gone by, some cunning workman had lavished his consecrated skill, for the glory of God. Most Cornish churches possessed towers, of a plain and massive character. The tower of Eglosayle Church was very lofty, from the fact that it stands in a valley, or "bottom," as Cornishmen said. Churches built upon the bleak hills had their towers necessarily low, and of great strength and thickness. On the north coast of the county, upon which the Atlantic gales broke with all their force, a line of church towers, like a row of grey weather-beaten watchtowers, stood along the loftiest and most seaward range of hills, looking over the ocean on one side and the outspread western county on the other. They still served the purpose for which, probably, they were erected there,—that of acting as landmarks and beacons to passing ships. Spires were rare in Cornwall, and when they did occur, it was always near the coast. A few of the churches of the county had no towers of their own, but only a detached bell-tower on the nearest hill. Mylor, a church near Falmouth, was an example in point, and, like every other church which possessed this feature, it stood in the bottom of a valley. A very few of the Cornish towers were rich in design and ornament: that of Truro, for example, and the far-famed tower of Probus, not far off it. This tower was very like that of Magdalen College, Oxford, and of almost equal beauty. Its style was the purest and most perfect Late Perpendicular, though it was built in the reign of Elizabeth. It was 125 ft. high, of granite, carved in every part. Such were some of the most marked general characteristic features of the Cornish churches, most of them resulting from the climate, the position of the county, and the character of the local stone and wood. If, so far, nothing very unusual had been touched upon, it was right to say that Cornwall did possess some few ecclesiastical buildings and remains which were highly unusual, and even unique; for example, only in Cornwall, so far as the lecturer knew, could be found authentic remains of the very earliest period of church architecture in England. The western county was evangelised in the fifth, sixth, and seventh centuries after Christ by Irish missionaries. They landed on the northern coast, chose their vantage-ground, and there built themselves a cell and an oratory hard by. The tiny oratory became a church, in which the remains of the missionary were usually buried. One, at least, of these ancient oratories still existed, though, unhappily, in ruins,—the Church of St. Piran, at Perranzabuloe, about eight miles from Truro. This church was buried for ten centuries under the shifting sand, and had only lately been exposed to view,—and to destruction, for the hand of man had been more unsparring than the sand, and the little building had been despoiled and mutilated, until it became a disappointment and a sorrow to see it. Piran was consecrated by St. Patrick,—so ran the tradition,—at the end of the fourth century, the saint having crossed the Irish Channel on a millstone, and landed near St. Ives. At some unknown date St. Piran's Church was submerged by the shifting sand, and lost to human sight. Another church was built, as near as possible to St. Piran's grave, and care was taken to choose the site upon a spot where a stream of running water formed an insurmountable barrier to the advancing sand. This second church was rebuilt during the great era of church-building in Cornwall (the fifteenth century), and the tradition of the buried sanctuary had never been lost. The guardian stream, however, was diverted by

\* To be continued. See p. 727, &c., present number, for some of the drawings, with particulars, used to illustrate the paper.

some mining works, and Borlase, writing in the last century, said then that the church was in no small danger from the insatiable sand. In 1803 it was dismantled, partly taken down, and a new church built two miles away. Thirty-two years later the sand shifted once again, and the old oratory, buried for 1,000 years, came to light again. It lies due east and west, and is 23 ft. long by 16 ft. 6 in. broad. The entrance was on the south side, through a small arched doorway of the rudest construction, with a curious moulding above, of a character probably older than either Norman or Saxon work. Three bands, roughly carved in stone, formed above the moulding, were now in the Truro Museum, but they were said to be much later in date than the rest of the building. The floor was below the level of the ground outside, and was reached by three steps. A window flanked the south door; over the altar was a rude east window. The stones used in the construction were slate and granite; no lime had been used, but sand and native china clay. The floor was of concrete. The stone altar-slab was still in its place, and beneath it it were found three skeletons. The lecturer said he was ashamed to say that the British Philistine had chipped, hacked, and stolen from this time-honoured relic. The most remarkable of the remains were now in the Truro Museum. With St. Piran's Church might be compared the Chapel of St. Eneodoc, in the parish of St. Minver. "St. Eneodoc" was probably a corruption of St. Guinedoc, and, oddly enough, the popular name of "Sinkinelly" had preserved the true etymology. Like St. Piran's, this little church was built in the sand-hills, about 1430, when it took the place of an ancient oratory, traces of which appeared in 1822 through the shifting of the sands. The lecturer remembered St. Eneodoc in its unrestored condition, when the sand was higher than the roof of the chapel, but now it had been well restored, and the shifting of the sand prevented by the planting of grass and reeds. It had a Norman font, also the base of a fine carved oak screen of Third Pointed work. Besides these ancient oratories, Cornwall possessed unique ecclesiastical remains in the wealth of wayside crosses, which stood in all manner of places,—in churchyards, by the roadside, at the meeting of many ways, on lonely and untrudged moors and hills. Many were doubtless still in their original sites, where they were raised to fix the boundaries of church property, to guide the wayfarer to church or religious house, or to mark the scene of some memorable event, some sanguinary slaughter, or of some missionary's preaching of the gospel of love and peace. They were older, for the most part, than Athelstan's conquest of Cornwall in 936. Almost all were of granite, but they varied *ad infinitum* in size and shape. One type was that of the Greek cross,—four short limbs of equal length, sometimes carved on a circular disc, sometimes with the spaces between the arms pierced with holes. Near the Land's End, the crosses were raised on steps, and often sculptured with a rude figure of the crucified. In the east of Cornwall they were usually very high, enriched with scroll-work and mouldings on the shaft. Resuming his remarks on the churches of the county, the lecturer observed that St. Germans Church was of high interest, as the ancient seat of the Cornish bishopric from the time when it was established under Athelstan. The church is situated in the park of the Earl of St. Germans, Port Eliot, and has the unusual feature of two western towers, overgrown with ivy and fern. There is a nave and a south aisle, and the church had formerly a chancel, which fell, with part of the nave, in 1732, when the north aisle was taken down. Between the towers is a deep central doorway of Late Norman type, richly ornamented. The north tower is Norman in the two lower stages, but the upper stage, which is octagonal, and rather recalls the lantern of Ely, is Early English. The south tower is Norman below and Perpendicular above, and the church has further Norman remains in the font and two piers of the nave. The remainder of the nave is Early Perpendicular, and has a very fine east window of five lights. Between this and the east window of the south aisle is a striking feature which is called the bishop's throne, but which, in all likelihood, was merely a niche for a saint's image. This church has much interesting old carving, in particular, a *miserere* stall representing a man carrying a hare on a stick over his shoulders, with dogs in couples,—said to be oldest piece

of carving in the West. Passing from St. Germans to Bodmin,—from the old cathedral to that which had claimed to be the new one,—the lecturer remarked that Bodmin Church was the largest in Cornwall. Notwithstanding this, and that Bodmin was supposed to be the county town, it was matter of congratulation that Truro had been fixed upon as the seat of the new see, for a more dead-alive place than Bodmin could nowhere be found, as might be inferred from the old Cornish saying,—“Into Bodmin and out of the world.” Bodmin Church, dedicated to St. Petrock, was thought by some to be monastic and parochial, but Sir John Maclean maintained, with good show of reason, that the priory church was distinct. Among other churches referred to by the lecturer were St. Nio's, near Liskeard, with its interesting series of old windows; Temple Church, extra-parochial, formerly a chapel of the Templars, and latterly known as the “Gretna Green of England”; St. Columb, a large and beautiful Early Decorated structure; Mawgan, with its fine Perpendicular tower and early brasses; and Forrabury, with its remains of Saxon work.

Mr. Sedding, in his paper, said,—Cornish churches are what outsiders would call “mean” edifices. They are of small proportions, and low, and very much like one another, and they would be generally considered to be deficient in architectural interest, both on account of similarity of type and detail. There are many points of similarity between the churches of Devon and Cornwall, and as Devonshire churches partake of many of the characteristics of Somersetshire churches we may say that so far as the *genus* is concerned, the work of the three counties is allied. But if they had to be classified in order of architectural merit, they would have to stand thus: Cornwall good, Devon better, Somerset best. Devon echoes Somerset; Cornwall echoes Devon. Cradle-roofs abound in all three counties. In Cornwall there is no other type of roof. In Devonshire there are a great number of that type, but a great variety of other types also. So, there is the same peculiarity of aisles continued to full extent of the chancel, the aisles having pitched roofs of the same description as the nave, but somewhat smaller. This accounts for the absence of clearstory windows: I know of only Callington, Lostwithiel, Fowey, and North Petherwin. Again, in Devon and Cornwall there is an absence of any architectural distinction or break at the chancel. I know of only three cases with chancel arches, at Tavistock, Bodmin, and North-hill (and the latter was removed about fifty years ago for safety's sake, but responds of the corresponding arch in the north arch are still visible). In each case the responds to arches die up near the roof, while the arches themselves are scarcely visible, as they almost merge in the roofs. I have said that the architecture of the three western counties is of the same *genus*, but it would be wrong to suppose that the work of each county had not its own peculiarities and distinctive characteristics. Any one familiar with them soon finds these differences out, and is able to mark how strongly local types and local tricks of method prevail. Cornwall is a remote place, and remoteness in the Middle Ages implied inaccessibility. It was not only remote, but it was little known and visited, for it is strange to note how few large Mediaeval houses of any pretensions exist in the county. This remoteness and isolation were, of course, favourable to the growth of individuality of character. The builders had no one to please but themselves, and as neither the coach nor the railway was running then, there was little chance of their seeing work in other parts of England which would put them out of conceit with their own. The earlier periods of Mediaeval architecture are but sparsely illustrated. The remains of Norman work are not numerous. There are two bays of a Norman arcade at Lelant; there are also portions of Norman arcades at St. Germans, North Petherwin, and St. Brevard; and other Norman remains at Manaccan, St. Cleer, Tintagel, Mylor, and Landweknack. Early English work is rare. St. Anthony's, near Falmouth, is said to be the best example. I have met with several cases, such as St. Levan, Newlyn East, and St. Wendron, where one or more of the transepts of a thirteenth-century church have been left standing, whilst the rest of the structure was destroyed by builders of a later date. The Decorated work which remains

is of a high character, as at South Hill, Shevocke, St. Ives, near Liskeard, North Hill, St. Thomas's Chapel at Bodmin, St. Columb, St. Austell, and Lostwithiel. The stone employed in work of early date is Polyphant or Catacose stone. The prevailing type of the architecture of Cornwall is of various stages of the fifteenth century. One of the most interesting phases of Cornish work is that which was done in the early part of the sixteenth century. This period is represented at the Church of St. Mary Magdalen, Lanneston, and at St. Mary's, Truro, which are remarkable for their elaborate external panelling,—that at the former is done in granite, and that at the latter in Pentuan stone. The tower at Probus, which is, without exception, the finest in Cornwall, is also of this date (1530). Its rival for eminence is Fowey, 100 ft. high. Probus is 125 ft. high, and infinitely more elaborate, and it is interesting to note how closely it resembles a Somersetshire type. In the churches of Perpendicular date granite is, almost without exception, employed for window tracery; and in the later work, where dignity of effect was considered, and funds and stone plentiful, the structures were faced with wrought stone entirely, as at Probus Tower, North Hill (south aisle), and the Lanneston and Truro churches, which are covered over with sculptured devices. To the sixteenth century is also to be ascribed the noble series of stained-glass windows at St. Nio's, which dates from 1528. To the sixteenth century is due also most of the fine woodwork in the county, as the seats at Altarnun, St. Levan, Morwenstow, and in the Buryan, Sancreed, and other screens. The peculiarity of Cornish wood-work is in the profuseness of its surface ornament. There is nothing like it out of the county, anywhere, to my knowledge, except the superb screen at Svanbridge, North Devon. Ordinarily the panels of even the most ornate screens in other counties will have traceried heads, but plain panels. Here the panels are all covered with sculptured devices,—sometimes of foliage alone, of great varieties of type,—growing mostly out of quaint little pots; or foliage mixed with birds or beasts, tortured griffins, and all manner of queer imaginative creatures and religious emblems, and here and there figures of men or angels,—and not only respectable men and men of high degree and the patrons of the church, but in some cases the village clown, the squire's tame bear, and the “passen's” pig. And many is the caricature of Tom, Dick, or Harry, and many the piece of friendly fun or naugby spite that appears in these carvings, which testify to the deft handiwork and keen humour and quaint imaginations of the Cornish craftsmen of by-gone days. The history of the grotesque in Cornish art ought certainly to be written. I have often tried to analyse for myself the sources of the peculiar delight one gets from an old Cornish church, but as often as I have tried I have given it up. One cannot put that sort of thing into words. There is, as I have said, very little to admire in the rough exterior of the churches of the county, or in their unvaried outlines, or their unpretending features, and little variety of plan and type; and the unsympathetic stranger, coming upon them with his mind stored with taller memories, would think them mean and rude and deficient in interest. Yet to me they are always full of a peculiar, inexpressible charm. Somehow they seem more identified with the local surroundings than is the case with the church architecture in other parts of England,—possibly because the surroundings are themselves usually of so striking a character, and because their builders actually, in many cases, merged the churches into the hill sides by building them “into the country,” as the Cornish folk say. But these simple structures seem somehow to be part of the simple Nature of the moor and down which surround them; they have what painters call “quality” or tone in them; they are essentially human, and eloquent of the character of the men who reared them, and they are full of the silent poetry of an art that was religious and human, and that dedicated its best to the service of the great God.

A brief discussion ensued, in which the Chairman (the Rev. Dr. Sparrow Simpson) and Messrs. Somers Clarke, S. W. Kershaw, the Rev. Mr. Acland, and Major Heales took part, the thanks of the meeting being heartily accorded to Canon Shuttleworth and Mr. Sedding for their papers.

## DAMP WALLS.

In a recent issue of the *Badische Gewerbe-Zeitung* appears an article on this subject, the importance of which induces us to reproduce it in our columns, with such additions and remarks as seem to us desirable. The writer, Professor Meidinger, observes that, if in an old house wall-paper turns mouldy and peels off, the cause is dampness in the walls. The walls of an old house may turn damp from various causes:—

1. The rain seeps through a defective roof into the wall, or it penetrates a badly-pointed wall.

2. In the cold season vapour produced from special causes is deposited on cold walls.

3. The wall contains apophronite (nitrate of lime. Chloride of calcium, which occurs less frequently, displays the same behaviour; quarry-stones which remain wet contain probably one of these salts). The wetting of walls in consequence of the presence of hygroscopic salts is caused only rarely by the formation of saltpetre; most frequently sulphates of sodium, and especially of magnesium, show themselves, which are contained either in the mortar or in the bricks. Mortar of dolomitic limestone, which has been burned with fuel containing sulphur, especially has caused very frequently to the formation of wet places. Even the presence of sulphuric acid in a damp atmosphere, in districts where much coal is consumed, has given rise to the formation of sulphate of magnesium in quarry-stones, and consequent damp walls, as was proved some time ago in London on façades of limestone containing magnesium (Portland stone).

4. The underground water reaches so high that it rises in the wall of the basement.

5. The house is built on a slope, so that the rain-water running down enters the wall of the basement.

Firstly. The cause of the dampness named first may be removed by repairing the roof, or by repointing the wall. A coating with oil paint of the outer face of the wall may also be recommended in certain cases. If the outer walls consist of timber and bricks, which cannot be joined closely, the method adopted, especially in mountainous districts, is very serviceable; that is to say, of covering in the walls of the weather-side with boards or shingles, and for greater durability painting the latter in oil. On the Lower Rhine, slate, as used for roofs, is also employed. A cover with metallic slates is likewise to be recommended, and quite recently pressed plates have been used which have the character of shingles. All perfectly water-tight coatings and coverings on vertical surfaces of course keep off driving rains, and prevent the accumulation of dust and the growth of moss and lichen; but they form, at the same time, an impervious layer, arresting ventilation through the walls, on which account they may prove injurious to health, under certain conditions, in overcrowded houses not provided with artificial ventilation. The duration of such coatings and coverings likewise is not very great, for oil varnish becomes gradually humid, liable to form emulsions with water, and, when in that state, persistently retains damp, which penetrates also into the interior of the wall. It is evident that walls already damp cannot be dried by such means; that, on the contrary, their drying is prevented. On the other hand, the shingle walls in use in Switzerland, or the protective walls of Solingen plates employed in the country along the Weser, and the plates used on the Rauho Alb in Württemberg, besides the slate coverings, are quite to the purpose.

Secondly. The precipitation of damp and water on cold walls is observed principally in kitchens and in large rooms filled on occasions by large assemblages. In the former case, the deposition of damp arises from the steam generated in cooking; in the latter, it is caused by the breath of the people collected together. If the walls are painted with oil colour, drops of water are formed which collect on the walls, and in some cases even wet the floor. If the walls are coated with size-calk, the water penetrates and makes them darker, as soon as the generation of steam is arrested for a time, they become perfectly dry again. If the walls are papered, the paper-hangings become wet and dark, to dry, however, again very soon and completely. The paper does not turn mouldy, but the paste will probably be destroyed in course of time, and the paper itself discoloured.

Under such conditions, the outer walls are chiefly exposed to the precipitation of water, especially if they are built of quarry-stones, which are good conductors of heat. Brick walls are less exposed to such a deposition, and walls of tufa and wood not at all. If it is intended to protect an outer wall exposed to such precipitations, the simplest way is to board it. The boards, of a thickness of 0.4 in., are nailed to flat beading  $\frac{3}{4}$  in. to 1.1 in. thick, and secured with holdfasts to the wall, the intervening space being filled with straw. Thus a very bad conductor of heat is placed nearest the wall, upon which water will not be deposited. The warming of the room is also greatly facilitated by this means; for this reason, such a covering may be recommended in many cases, but especially for north or east walls, and more particularly for bedrooms. The boards are either covered with shirting, upon which the paper may be hung, or they are nailed with reeds (much used in place of laths in Germany) and plastered with gypsum, after which the wall may be heated in any manner desired. The cost of such a boarding is in Germany about 1s. per square yard, the shirting 7d., the reed and gypsum coating 1s. 5d.

Thirdly. Apophronite is most frequently the cause of permanently wet walls, or such as become always wet in damp weather. It is observed principally in the lower stories. Its origin is due to organic substances containing nitrogen, especially exhalations of man and animals, which lodge in the walls and form nitric acid during their decomposition; the latter, in combining with lime, forms nitrate of lime. Its appearance is therefore most frequently met with in water-closets, in stables, and in the country very often on walls near accumulations of liquid manure. Nitrate of lime is a soluble salt (it is hygroscopic); that is, it absorbs water from the atmosphere, more or less according to the humidity of the air. In dry weather part of the water absorbed during damp weather passes back into the atmosphere. If a wall contains little saltpetre, it becomes light in colour and dries in dry weather; during damp weather, on the contrary, it turns dark and wet. Should the wall contain much saltpetre, the wall is permanently wet, as in stables. Paperhangings on a wall containing saltpetre appear dark during damp weather, and may easily be pulled off. The paste, kept damp for some time, gradually decomposes, and thus loses its adhesive property, the paper hangs loosely even in dry weather, and is held in its place only at the permanently dry spots. The adhesive ingredients of colours are likewise destroyed, the colours fall off as dust, mould is formed, and the whole appearance is totally deteriorated. The apophronite possesses the property of spreading to a certain distance from the spot where it originates over the porous wall, through stone and mortar. It thus penetrates the whole thickness of the wall, and arrives, although generally found only on one side, at the other surface of the wall. Quite apart from its ugly appearance, a damp wall possesses other disagreeable properties. The adhesive ingredients of paper and colour develop an unpleasant odour during their decomposition; the same is observed in mouldy paperhangings, and in the timber in contact with damp walls. Effects injurious to health have consequently been often attributed to damp walls, although it would be difficult to prove such an assertion. Various means have been proposed for preventing damp in walls from apophronite, or at least obviating the disagreeable consequences attendant upon its formation. We select some of the principal means suggested.

(a.) The evil cannot be remedied by simply removing the mortar coating, as far as it shows damp, even between the stones, and subsequent fresh plastering. After the mortar has become thoroughly hardened and dry, the wet places appear again after a little time during damp weather, although not quite so large as before. The saltpetre still in and between the stones gradually penetrates part of the new plaster, until it shows itself on the outside. There is no doubt that, even after removing this second plastering and putting on a third, the latter would show wet places, although of smaller dimensions. It might be possible to gradually extract the whole saltpetre from the wall, just as it is possible to remove oil spots from wood by repeated applications of wet pipe-clay. This method of drying a damp wall, although it would effect a radical cure, as long as no fresh formation of saltpetre takes place, and although

it would be most advisable from a sanitary point of view,—will not find much favour, on account of its inconvenience, tediousness, and expense. In the rare cases where actual formation of saltpetre is the cause of the dampness in walls, in stables, and closets, a coating of dolomite cement, to which some phosphate of magnesia has been added, has proved a very efficient means for preventing the further formation of saltpetre. As the formation of ammonia always precedes that of nitric acid, the ammonia combines rapidly with the magnesia contained in the mortar to insoluble phosphates of ammonia-magnesia, and the carbonic acid of the decomposing urine contained in the ammonia with the lime to carbonate of lime. As it is, the not inconsiderable quantity of phosphoric acid contained in urine by itself causes the formation of the insoluble magnesia combination.

(b.) It is stated by practical builders that half cement mortar, that is, ordinary lime mortar mixed with the same quantity of Portland cement, is the best means for drying the walls of water-closets; no penetration of damp has been observed several years after the new coating has been applied. In Germany, instead of ordinary Portland cement, Erdmenger's Portland cement of dolomite is considered the most suitable for the purpose.

(c.) For some time past it has been tried to prevent the penetration of the saltpetre still remaining in the stoves into the fresh plaster by coating the stones and the joints between them with an isolating layer impenetrable by water. Asphalt, either by itself or mixed with linseed oil, has been used; pitch, common rosin, and tar have likewise been recommended, the latter, however, less, on account of its liquid state and its powerful smell. The mass must be melted, and applied hot with a brush. It is imperative that the surface of the stones be completely covered, and the joints between them perfectly closed up; the saltpetre will percolate through the smallest crack, and thus produce wet places on the wall. Before applying the isolating layer, the room must be artificially and very highly heated for several days, to make sure that the exposed stones and joints have been perfectly dried. The asphalt or its mixture with linseed oil must penetrate to a certain extent into the stoves to ensure a perfect adhesion; this is not possible if the stones are damp. Small places may also be warmed and dried by holding a charcoal pan close to them. Timber which may be in the damp wall must be treated in the same way; in this case it would be advisable to remove the stonework round the piece of timber as far as it shows damp, to dry the latter well, and then coat it on all sides with asphalt. Upon this isolating layer, which should be from 0.2 in. to 0.4 in. thick without interruption, after hardening, ordinary plaster or gypsum is applied. In carrying out the above, the plaster should be removed, not simply where wet places show themselves, but from 1 ft. to 2 ft. round them, the isolating mass being applied to the same extent, so as to prevent the saltpetre from penetrating sideways and causing damp spots round the edge of the new plaster. It is not to be expected that the latter should combine closely with the isolating mass; it receives its support sideways from the old plaster still sound. This would be no objection where only small patches of plaster had to be renewed; but large wall spaces would sound hollow, and probably might become detached unless a close junction of the plaster with the stones were effected by driving in here and there holdfasts coated with asphalt, before the plaster is put on. A patty of asphalt and mastic, also, was successfully employed at the Allgemeine Hospital of Vienna.

(d.) A few years ago tinfoil was recommended as an isolating material. It was put on the wall with paste, after every vestige of the old paper had been removed, the fresh wall-paper being then put on the tinfoil. Although the latter is very cheap (the cost of pure tinfoil in Germany is only 3s. 7d. per kilogramme, or 1s. 9d. per lb., with which quantity a space of about 12 square yards may be covered), and the process is very simple. It was soon found that it cannot be put on a damp wall, on account of the paste decomposing. It was next tried to secure the tinfoil with tacks, but the latter soon began to rust; tin tacks might perhaps be more suitable. No case has been recorded in which tinfoil has been pasted upon a wall previously well dried either by natural means or artificial heat. If the wet places are not too large, it might be

advisable to paste the tinfoil first on the paper, and, after drying, to put the paper on the wall, care being taken to use paste only for the part of the paper free from tinfoil. The paper would thus lie hollow against the wet place on the wall, where the tinfoil acts as a protector against damp. Lead-foil, in place of tinfoil, is not to be recommended, as lead is attacked by damp saltpetre.

(c.) Asphaltic paper has sometimes been nailed on damp walls, but in such cases a covering of shirting is necessary for receiving the wall-paper. The cost in Germany is about 10d. per square yard. The protection, however, is not permanent, for the asphaltic paper lasts only a few years.

(f.) There is no record as to the effect of painting damp walls, but it is well known that such a coating after some time blisters and finally peels off. It would be worth while to examine more closely into the question whether this always takes place, or only under certain conditions. It is thought that several coatings of paint put on a wall well dried by artificial means would penetrate the same, and mite so closely with the plaster as to prevent a peeling off taking place. Three coats of paint would in this case cost about 9d. per square yard. The paper would have to be put on before the last coat of paint is thoroughly dry, as otherwise the paper would not stick.

(g.) If wet places in walls assume large dimensions, it is recommended to face the wall with a brick (or tufa stone) wall or boards. The first is expensive and takes up room; joints with the old wall must be made with asphalted bricks to prevent a transmission of saltpetre. The second remedy is that to be adopted in most cases. The process is similar to that applied in boarding walls outside; filling in with straw, however, is omitted. For greater protection, the boards, as well as the beading fastened against the wall, are coated with silicate paint. Such a coating on both sides of the boards costs about 2½d. a square yard. The whole expense for fixing such a boarding, including the covering with shirting, but excluding the wall paper, is at most 2s. per square yard. It appears unnecessary to the author to provide for ventilation between the boarding and the wall by leaving openings at top and bottom, as it is not intended to dry the wall. A consequence of induced ventilation would be simply to cause the covered wall to absorb more or less moisture according to the state of the atmosphere, just as if the boarding had not been put, while with sluggish circulation the wall gets damp and dries more slowly, it being impossible to cut off the access of air entirely. By others, the necessity of thorough ventilation between wall and boarding is insisted on, it being pointed out that rapid circulation must tend to decrease dampness and at the same time prevent the otherwise inevitable formation of mould or fungus in the boards.

(h.) Quite recently, wood hangings have been introduced in Germany, serving as isolating layer between ordinary wall-paper and damp walls. These hangings are made in the form of wels or wickerwork of strips of wood or shavings of North Swedish or Finnish pine, 0·04 in. thick, and 1·17 in. to 1·56 in. wide, which are said to resist the effects of damp for a number of years. They are manufactured in lengths of 22 to 33 yards, of a width of 2 ft. 6 in. to 5 ft., and sold at 1s. 4d. per square yard. The wood hangings are fastened to the wall with galvanised nails, the nail-heads being covered with pieces of shavings slipped in, at a cost of about 6d. per square yard. A covering of shirting is also in this case applied before putting on the wall-paper. This wickerwork may be directly used for panelling; the panels are produced by beading, and by leaving the whole in that state, or applying coatings of varnish, or painting the several stripes with various oil colours. Patterns may in this manner be made at a cost of 6d. per square yard; one coating of varnish, at 2½d.; of oil-paint, at 6d. to 1s.

Fourthly. When underground water is the cause of dampness in walls, apbrontite, as a rule, always co-operates. Water alone does not rise so high, as we know from the behaviour of cellars, the sole of which very often is only just above the level of underground water, and the walls of which are nevertheless quite dry. The same means of prevention as above mentioned may be employed; they are, however, only palliatives, which do not dry a damp wall. A radical cure may be effected only either by a

perfect isolation of the wall from the source of damp,—which may be done in existing walls by draining at intervals, and isolating from the ground below by the insertion of sheets of asphaltic felt,—or by completely eradicating the damp from the wall. This may be done by stamping in between the damp wall, which must be previously stripped of its plaster, and a provisional planking, a layer, about 2 in. in thickness, of fresh quicklime powder. For outside walls the planking may be dispensed with; all that need be done is to dig a trench along the foundation, and fill it with lime. The damp may also be got rid of by heating the rooms with coal-haskets, and by drawing the heated air from the interior by means of a suction-pump connected with a box provided with india-rubber packing, which is pressed against the other side of the wall.

Fifthly. When a building is erected on a slope, and the higher wall becomes saturated with percolating rain-water, a cure can only be effected by cutting a deep trench, and thus draining off the water. If substances containing nitrogen and conducing to the formation of saltpetre have been introduced into the wall through rain, the latter will continue to be damp, and the only palliatives against their injurious effects on the inside faces of walls are those already pointed out.

Since the above was written, the *Badische Gewerbe-Zeitung* has published a few additional remarks by Dr. Meidinger. It is stated that in several cases of dampness in walls a coating of oil-paint, upon which subsequently tinfoil has been pasted, has been found efficient. The two substances combine very closely, and permit of the hanging of paper afterwards. The paint must, however, be put on only in dry weather, or after artificial drying of the wall, and the wet places have entirely disappeared. With regard to boarding of damp walls, it is added that it should not be neglected to asphaltic the beading to which the boards are nailed, to protect them against the absorption of water and consequent destruction. Moreover, the boards must not be too far away from the wall, on account of mice. The introduction of air-holes is also to be recommended, experience having shown that in their absence the wood becomes fusty. It has already been pointed out that it is advisable to coat the boards with silicate paint, to prevent rotting. This little extra expense should not be spared, for it is by no means yet proved whether air-holes alone will preserve the boarding; moreover, the introduction of openings for ventilation may be inconvenient. In any case, the naked boards must not touch the wet wall, as otherwise saltpetre would enter them and make them damp also. It would, perhaps, be advisable to remove the plaster wherever damp shows itself, before nailing down the boards. The wall would then absorb less moisture from the air, and would lose it quickly again in dry weather; under these conditions, the space between boards and wall would contain damp air for a shorter time, the presence of which is injurious in any case.

Finally, with respect to the introduction of an isolating layer between stones and mortar, we learn from a prospectus lately issued that a special putty, called Weissang joining putty, has been introduced in Germany which appears to answer the purpose well. The mass, of the nature of asphaltic, but without smell, is boiled with an equal weight of linseed oil, and put on as hot as possible. It is stated that about 2 lb. of the mixture cover 1 square yard of wall space. The mass is sold retail in Germany at 1·80 mark per kilogramme (11d. per lb.). As the price of linseed oil there is about 6d. per lb., to coat 1 square yard would cost 1s. 5d. The mixture is applied in a peculiar manner. The wall is stripped of its plaster, the joints being picked out deeply. The latter are then frostily set with mortar. After drying, the hot mixture is put on, and the wall at once thinly rough-plastered. When the latter has dried, plastering is proceeded with as usual. Under these conditions, a close connexion of the plaster with the isolating mass is effected. The latter is recommended also for the protection of gable-walls on the weather side against the penetration of damp; as a substitute for reeds (laths) in plastering on wood; for painting timbers and ironwork in new buildings; for preventing the growth of fungus on wainscoting and other wooden linings; finally, for coating boardings, garden-rails, barriers, posts, tree and vine stakes.

#### BARNSELEY AND ITS TRADE.

"BLACK BARNSELEY," as it has been often called, has of late years known such improvements that, if the uncomplimentary adjective be allowed, it must be qualified in the quotation, "Black, but comely." It is an ancient town, with fine surroundings, if the dark belt of collieries be pierced through, and its church, modernised and partly rebuilt as it has been, still carries the memory back to the days of the Fourth Henry. It is interesting to compare Barnsley now with what it was forty years ago. Forty years ago it held a court baron; a town-hall was being erected near the earliest church; the principal manufacture was linen, in which thousands of looms in and about the town were employed, whilst steel-wire, steam-engines, and other articles were amongst the productions of the town. In addition to the old church, there were St. George's, built by grants from Parliamentary Commissioners," and six places of worship for various shades of nonconformity. The population at that time was 10,330 in the latest census return,—that of 1831. There was no railway; there were the Royal Mail, the Express, the Courier, the Amity and other coaches; a car to Doncaster; Deacon & Co. were the chief of the carriers; and there was the conveyance by water of the Barnsley Canal Co. Nine bleachers were included in the lists of the trades, thirty-one linen manufacturers, and only five coal-masters and merchants, whilst there were also two iron-masters and merchants.

In the years that have passed there has been a large development of trade, of population, and of signs of progress. The population has been much more than doubled, the coal trade has known an enormous development, the introduction of more than one railway line into the town has given it an impetus, and whilst there have been terrible catastrophes in the district, and whilst some of the trades of the town have not known a corresponding development to that of fuel, there are very many and great signs of the material progress of the district, and at present many also of the material prosperity of the chief town also. A fine park was twenty-one years ago given to "bleak" Barnsley; the places of worship have been increased in number and increased also in attractiveness; the fine hall of the miners is in itself an ornament to the town, and, remembering those who have erected it, and its surroundings, it must be acknowledged to be in every way a mark of the appreciation that the working miners have of art, and an enduring tribute to the memory of some of their early leaders in the trade unions. The old and once narrow streets of the town have not been materially improved, but they have the advantage of having newer and nobler ones appended, whilst there has been a very general improvement of the architecture of many of the places of business in the old streets. And the signs of progress are far from being exhausted, for there are indications that a new era of improvement has begun, and that as the coal trade gives wealth to the town it will be in degree applied to its own betterment. For though some of the older trades remain, and one at least has known some extension in the forty years, it must be acknowledged that coal is king in Barnsley. Instead of three or four collieries there are now fifty-six at work in the Barnsley district, and though in the summer time the want of a demand for household coal makes itself felt from time to time, the wages and the yearly earnings of the miners will bear comparison with those of some districts that are perhaps better known in parts of the country. The visitor to Barnsley by the old route sees from the junction all the indications of a prevalence of the industry of King Coal. There are mines of great extent here and there; there are miners' cottages planted on many a slope; and through the streets and village and town at times the miners troop. Miles of sidings abut on the railways stocked with wagons of coal, and the names of some of the collieries are well known, if not their locality, to the coal-consumers of the metropolis. For a number of years that great industry has been deeply depressed, and that depression was reflected fully on Barnsley. Production of coal in many of the coal-yielding districts had been increased until the demand was more than met, and there was a consequential lying idle of some of the collieries

and a serious reduction from time to time in the wages of the workmen. From this state of affairs the coal trade seems new to be slowly and steadily emerging. Demand is better, wages tend upwards, and the facilities of production are much more fully utilised,—though not perhaps to the entire extent possible. As they are so utilised more, the cost of production is increased because the cheapest-worked collieries are those that are wrought in the days of depression, and every addition to the demand draws in others that are not so cheaply worked. And this process has been going on for some months with the result that the price of coal has tended upwards, and with that price the tendency has been first to the fuller employment of the miner, and then to the increase of his wages. This is the cause of the benefit that Barnsley is receiving now, for higher wages mean to it a large circulation of money, and usually better returns for the tradesmen. We seem to have now entered into an era of better times for the coal trade, and in that era, to adopt the maxim of Scotland's great poet, "Let Barnsley flourish," if in that prosperity it makes itself still more comely and removes some of the eyesores that still linger from the old days.

THE AMERICAN MOUND BUILDERS.

I HAVE, for some months, been making a careful investigation of the works of the American mound-builders along the whole course of their occupation. I was able to trace all those that have been published, notwithstanding that some have been much reduced by the plough. Many, however, and those the most interesting, I found nearly intact, from their being in remote districts and woods where they have never been under culture. Where towns and cities have been built, of course, not a few have been removed, as at St. Louis, Cincinnati, Marietta, &c., but these cities have still extensive works in their vicinities, which act as data to what have been lost. I have found many very curious mounds which are not described in the Smithsonian or other works, and they appear to me of great interest as affording some clue to the intent and objects that the constructors had in view.

From the lowness of the Mississippi and Wisconsin rivers, which have for some years past made the roads communicating with the adjacent localities impassable at this season, I have been able to complete the survey begun several years since by the late Mr. Strong, Civil Engineer to the U.S. Government, who was unfortunately drowned during his survey, which, as I am informed, never being completed, so far as archaeological remains are concerned. From a large number of remarkable forms I have examined, I send you an extract from my note-book, giving, in one case, a well-defined mound of a form unlike any I have met with, published or unpublished; and in another, one of a continuous range of mounds of uniform appearance and clearly-expressed purpose.

A.—The first, which approaches the form of a camel more than of any other animal, though the length of the body is a variation from the perfect proportion otherwise uniformly executed by the constructors, singularly enough lies on the same terrace of the Mississippi levels as the well-known "Elephant Mound," which I also examined. One is to the north, the other to the south, of the Wisconsin river. The heads of both are in the same direction, i.e., with the course of the stream, southwards; and the ravine by which the upper levels of the country are approached from this spot is, and has from the first occupation by Europeans, been called "Camel Cooley," cooley being a local term for a ravine or gorge.

B.—The range of mounds (of one of which I enclose an outline) lies on a but-little-known track of the mound-builders between Lake Superior and the Wisconsin river. It consists of twelve enormous bird mounds, locally called eagles; they have a uniform position and definite purpose, as a dovetail from their course would have involved death in such seasons of floods as have prevailed in the last few years, and which must have been more prevalent in former times. They are well defined even to the birds' beaks, which all lie in the same direction.

At the northern end of this range of mounds there is a remarkable notification of the twelve forms leading thence towards the Wisconsin river, which is unmistakable in meaning, and

which gives a clue to many other forms of mounds, and even to some characters in the Palenquo pictorial alphabet: the details might occupy more space than you could give to this communication.

On the question of the "elephant mound," I may observe, in passing, that elephant figures occur in the Yucatan pictorial writings, and elephant forms, of perfect shape, are found in the museums, carved on the calumets or mound-builders' pipes, which I have seen; while there have been, almost monthly, during my visits to various States, discoveries of elephants' tusks and bones in a high state of preservation, though exposed in swamps to surface water and other destroying effects, tending to show that the elephant existed here during the mound-builders' occupation of this territory. The height of the mounds averages from 2 ft. to 3 ft. at the highest parts, and rises rather abruptly from the surface.

In the Government Geological Surveys of the United States I find the camel and elephant remains are found with the horse, of which I have also found several mounds; and in Bryant & Guy's "History of the United States," these remains, the elephant in particular, are described as found with evidences of human occupation.

This seems to show that though all were extinct on the coming of Europeans, these animals or their descendants might have existed with the mound-builders, as several varieties of each of the animals are described. The llama belonging to the camel species still exists in the South.

J. S. PHENÉ.

Houghton, Michigan, Lake Superior, U.S.A.

NOTES ON THE ISLE OF MAN.

A CONSIDERABLE amount of constructive activity is at present to be seen in the Isle of Man, and large sums of money are being spent upon the erection of additional harbour works, under the general superintendence of Mr. Walker, C.E., the resident engineer to the Harbour Commissioners. Touching, first of all, on this class of work, we find that at Rainsey, the chief town in the north of the island, which has long been in want of better landing accommodation and shelter for shipping, a sum of 31,000*l.* will be spent. At Peel, where the harbour has for some time been inadequate for the wants of the herring fleet when they are fishing from this place, 13,000*l.* is being expended on the inner works and

11,300*l.* on the outer works. At Port St. Mary, which is the chief port of the south part of the island, a breakwater is now being erected, for which 15,000*l.* has been voted by the insular Legislature. Should these works be successfully constructed, they will undoubtedly contribute to the material prosperity of the Isle of Man, as well as give employment during the winter season to many of the fishermen who, owing to the ill-success which attended them during last and the preceding seasons, have somewhat curtailed their fishing ventures. On the other hand, the breakwater which was erected at great pecuniary cost at Port Erin, and to the extreme detriment of the fine coast-scenery, has been a deplorable failure, and upon its repair more money has now to be spent. Nothing, in fact, could show more clearly how impossible it is to produce a frequented port by simply making harbour-works, if there is no natural influx of shipping. Sir John Cooke's work at Port Erin may be said to have caused an absolute loss of 72,000*l.* to the Manx people.

Turning to what may be termed more strictly buildings, we find Peel Church in course of reconstruction and a keen contest being waged as to whether or not it shall be turned into a cathedral for the diocese of Sodor and Man. It is not for us to express opinions upon ecclesiastical questions, but we confess we should much prefer to see the parish churches of the Isle of Man made more architecturally beautiful than money expended on a cathedral establishment. A new church, for example, which was recently erected at Port Erin has neither tower nor spire, and so far from being an addition to the scenery is, if anything, a blot on the landscape. It is to be hoped that the new church at Port St. Mary, of which Messrs. Barry & Sen, of Liverpool, are the architects, will serve as a model for future religious edifices in this island where architecture is at a low ebb. It would be difficult indeed to find anything more hideous than the houses which are erected for the accommodation of visitors; they are in the most debased style of suburban and watering-place architecture without individuality or beauty. At Port Erin, one of the most picturesque spots in the Isle of Man, with one of the most charming bays and views of coast scenery to be found near the coasts of England, lodging-houses are beginning to be erected which are positive eyesores. In the same way at Douglas many of the houses are of the most mottonous and spiritless character, quite unworthy of the really fine promenade which now partially surrounds

the bay. A new infirmary for King William's College should not be passed over without mention; it is being erected some hundreds of yards away from the school buildings, the governing body of which is thus carrying out a principle which should be acted on by the authorities of every large school, namely, to keep the buildings for the sick wholly separate from those for the healthy boys.

It is noticeable further how the small one-storied thatched cottages in this island are giving way to substantial two-storied buildings with good-sized windows. Nothing can be more satisfactory than to see houses of so improved a kind become general among the fishermen and peasants, and nothing can be a surer sign of material prosperity; but if architectural beauty were more sought after and esteemed in connexion with the larger houses in the Isle of Man, its position architecturally considered would be better than it is.

#### THE SOCIETY OF BRITISH ARTISTS.

The present winter exhibition at Suffolk-street is rather a good one. In Mr. Howard Helmick, whom we have before noted as a rising painter of *genre*, the Society has acquired a valuable member, and his talents are well represented in the present exhibition. "The Legal Adviser" (22) is his best specimen in regard to the display of character in the figures, only two in number,—a widow and the lawyer, who is making himself as agreeable as he can to her; the smaller work, "The Poor Scholar" (277), is less interesting as regards the figure, but more complete as a whole, the accessories being numerous and well studied; in the former picture there is an effect of harseness on the canvas which gives the idea of an unfinished work. Mr. J. R. Reid, who seems also to have become a member, sends a large oil-sketch, rather than picture, called "The Plagues of the Village," which will be well worth working out into a picture. Mr. Arthur H. Marsh sends a single figure of a young woman carrying an immense bundle of nets on her back, under the title of "The Lass that Loves a Sailor" (267). Mr. Reid's "Reflections" (482), another broad and free sketch, in this case of a coast scene, should be looked at. Among the landscapes, "A Surrey Lane" (235) by Mr. T. J. Watson, is in a much finer and broader style than the majority of those exhibited. Mr. E. Ellis is very spirited in the movement and swing of his rough seas, of which there are various examples, mostly on a tolerably large scale, but they are mannered in colour, and it is not a very agreeable mannerism. Mr. Denny Sadler, the painter of monks, exhibits a really clever and well-finished picture, "Habet!" (182), representing an interior with two ecclesiastical chess-players at the crisis of the game. Mr. Wyke Bayliss's "At the Cathedral Door" (352) is a nice architectural interior, savouring, however, a little more of the work of the architectural draughtsman or colourist than of the artist in the wider sense. There are various other works in figure-painting and landscape reaching a fair average of merit, and which will interest the "average" visitor; and there are some really pretty terra-cotta models on the centre table, by Mr. W. Merrett, Mr. Raemackers, Miss Barlow, and others. There is, of course, nearly the usual proportion of works which had better not have been painted at all, or, if painted, not exhibited. What can, however, be said is that the best paintings in the collection reach a higher standard than ordinarily.

#### SEWERAGE WORKS.

##### SHIRELY AND FREEMANTLE SEWERAGE.

The Local Board have adopted the recommendation of Mr. J. C. Mellis, C.E., of London, for the disposal of the sewage of their district, and have instructed him and Mr. Pim, C.E., of Southampton, to proceed with the necessary works.

**The Proposed New Line to the City.**—In a Bill to be brought forward next session for extending the powers of the Regent's Canal and City Railway Company, a clause is inserted empowering the Great Northern Railway Company to hold stock in and subscribe towards the undertaking, and to guarantee the payment of dividend or interest upon such capital.—*City Press.*

#### THE MOSQUE OF OMAR.

THE latest contribution to the literature dealing with the enigma of the origin of the celebrated Kubbet es Sachra, or Mosque of Omar, at Jerusalem, has just appeared in Germany, from the pen of Professor J. N. Sepp, who has long been favourably known for his researches among the monumental edifices of Palestine. The title of his new work, "The Rock Cupola, a Church to St. Sophia by Justinian," indicates at once how widely the author, in his views as to the origin of the Mosque of Omar, departs from the prevailing tradition, which ascribes the edifice to the old Arabian or Saracen conquerors of the Holy Land. So confident is Professor Sepp in the correctness of his new theory that on the title-page of his work he even goes so far as to publish a strange challenge to all who do not accept his view, by an "offer of a prize" of 3,000 piastres to any one who will prove the contrary. The arguments he adduces in favour of his theory seem, at any rate, to have practically convinced some of the best architectural critics of Germany, like Herr W. Lübke. The latter writer remarks that the English travellers, Messrs. Catherwood and Arundale, were the first European travellers to enter the celebrated mosque. This they did in 1833, at the imminent risk of their lives. They subsequently published their drawings of the edifice. The next European who entered the building was another English traveller, Mr. Fergusson, who contended that under the cupola of the Sachra Mosque was the real tomb of Christ. A more important contribution, however, to our knowledge of the mosque is thought to have been made by Count Melchior de Vogüé in his splendid work on the Temple of Jerusalem, published in 1864. The most valuable result established by his beautiful drawings was the confirmation of the Byzantine character of all the main architectonic forms in the edifice. Nevertheless, the belief in the Mahometan origin of the mosque continued to hold its ground, and it was supposed either that portions of a Christian church might have been incorporated into the building, or that possibly a Byzantine architect had been employed in carrying out the work. It was not to be denied that the ground-plan and construction of this monument of architecture diverged completely from the usual type of old Arabian mosques; while, on the other hand, there are characteristic analogies to it to be found in the numerous leading Byzantine buildings. Comparatively recently Professor F. Adler had been permitted to examine the cupola, and the result of his investigations was to convince him of its old Arabian origin. It is against this view that the work of Professor Sepp is directed, the latter writer contending that the structure is of Christian origin, and that it was, in fact, founded by the Emperor Justinian, who is chiefly noted for having erected the Cathedral of St. Sophia at Constantinople.

The weight of the arguments Professor Sepp adduces in support of his opinion cannot, in Herr Lübke's opinion, be denied. He points out that we shall search in vain through the whole series of mosques of undisputed Arabian origin for a central cupola like that at Jerusalem. The oldest Mahometan temples all agree in having a central court surrounded by galleries. How little the ground-plan of the rock-dome was adapted for a mosque is shown by the subsequent addition of the Kibla, which, as is well known, shows the direction in which the prayers of worshippers have to be addressed. Professor Sepp, therefore, has very good ground for asserting that the Sachra Mosque appears about as unsuitable as can well be imagined for the worship of Islam. Herr Lübke remarks, however, that, "on the other hand, even for Christian services, the building is very ill suited indeed, because it does not possess the altar apsis, so indispensable for Christian worship. With the exception of the 'Baptisteries,' we cannot point out any Christian temple without that feature." Professor Sepp then traces the origin of the Arabs and the state of civilisation amongst them at the period of their great conquests. He shows how highly improbable it is that such a race of barbarous nomads should be able to create and execute so grand and perfect a work of art as the celebrated mosque at Jerusalem. The weight of these arguments is only increased when we consider that in architecture the Arabs, as a race, were far less distinguished as bold constructors than as splendid decorators. It is

true that there were Turkish architects at a later period who distinguished themselves by the great central cupolas of their works, but it is notorious that it was the model of the St. Sophia Church which inspired them in these unusual achievements. In complete contrast to the Arabs, the Byzantines were celebrated from the first as the great constructors of the Christian world. In a whole series of important domes they had carried out the central idea of a Christian temple. It is known that this tendency prevailed from the time of the Emperor Constantine. Sta. Costanza, near Rome, and still more, the octagonal Antiochia and the Church of the Holy Sepulchre at Jerusalem, are the first important illustrations of this direction of Christian architecture. But it was the Emperor Justinian who, in a series of monumental edifices, brought this style to completion.

It is sufficient to mention as examples, the Church of St. Sergius and Bacchus, St. Vitale at Ravenna, and St. Sophia at Constantinople. That the Omar Mosque may belong to this series, appears in itself quite probable. The probability is strengthened if we consider the character of the architectural forms in the Rock dome, for when we accurately examine the details of De Vogüé's drawings there can remain no doubt that all the fundamental elements of the buildings, except what is immediately recognisable as the later Arab additions and restorations, bear the character of the age of Justinian. Only the twelve slender Corinthian columns of the inner circle may possibly have been borrowed from some other ancient monument. However, we require more accurate and detailed drawings in order to settle this question. On the other hand, the sixteen columns of the octangular gallery, as their capitals with the cross on the abacus, and the Byzantine warrior show, belong to the Justinian epoch. Still more decisive is the observation made by Dr. Bernard Sepp, the author's son, in his examination of the inner arcades. He tells us that the pointed arches prove to be a later Saracen addition, since behind their marble tablets there are still the original Byzantine round arches. If this fact is confirmed there is no longer any reason, so far as the architectural forms are concerned, to doubt the Byzantine and, indeed, Justinian origin of the building. Of course, the entire upper part of the structure the ornamental gallery, and wooden cupola, in the place of which originally there was undoubtedly one of stone, are Mahometan restorations, and date from some time after the great earthquake of the year 1016. The later restorations and additions were carried out under Saladin after the re-conquest of the Holy City in 1187, while the splendid glass paintings with the faience incrustations were executed under Soliman II., in 1528. If, then, with Professor Sepp we ascribe to Justinian the origin of the dome as well as the contemporaneous architecture of the Golden Port, then in place of the incomprehensible anomaly arising when we attribute the work to the Saracens, we have a result harmonising in the best possible way with the other facts of the history of art, as we must place the cupola among the other great central edifices of Byzantine origin. In connexion with this, the Mosque El Aksa, which is generally supposed to be the St. Maria Church of Justinian, must be set down as an originally Arabic mosque, erected by Abdel Melek with Byzantine building materials. It should be remembered that in the foregoing account we are making known only the views of Professor Sepp and his German critic.

#### A SEWAGE FARM IN THE LEA VALLEY.

The following are some particulars of the sewerage works which have recently been carried out in the special drainage district of Much Hadham and Hadham Cross, a town situated on the river Ash, a tributary of the Lea. Previously to the execution of the works, the place was in the usual unsatisfactory condition which obtains where cesspools form the only means of disposing of the sewage. A number of the wells were found upon analysis to be contaminated. The district is of a somewhat rural character, and it was considered one where the surface-water generally was sufficiently pure to flow at once into the natural water-courses. The separate system of sewerage was therefore determined upon. The nature of the place made it somewhat difficult

to gravitate the sewage on to land sufficiently raised above the level of flood-waters, and so avoid the error, only too prevalent in the Leu Valley, of discharging sewage on to land too low to be effectively under-drained; but it was found after careful investigation that a suitable site could be acquired some mile down the line of the Ash. The sewage is taken to this land by a 12-in. outfall-sewer, having a gradient of 1 in 660, which contours the side-long ground to the west of the valley for the purpose of obtaining convenient depths. The manholes on the outfall-sewer are furnished with sluices, so that the flow can be headed-up and a velocity obtained in excess of that due to the gradient. The tributary sewers are 9 in. in diameter, with the exception of a short length having a rapid fall, which is 6 in. The gradients are so arranged as to give the greater falls where they are most required, at the upper ends, and average about 1 in 100, except in the case of the principal town sewer, where there is a considerable flow of sewage, which has a gradient of 1 in 300. These sewers also are provided with sluices in the manholes to aid the flushing arrangements. The total length of the sewers is about two miles and a half, and they are constructed throughout of stoneware pipes, jointed with yarn and Portland cement. Particular care was exercised to secure water-tight sewers, and an idea may be gained of the success of these efforts when it is known that, although at the completion of the works not a drop of water got into them (notwithstanding the fact that a considerable section was laid below the level of the subsoil waters), yet before a dozen house-connections had been made a stream of sewage passed down the whole length of the outfall-main on to the land. Ample ventilation is afforded by manholes and lamp-holes at frequent intervals, which are carried up to the surface and covered with strong iron gratings. These covers are well finished off, having four rings of granite pitching bedded round them, falling slightly away from the centre, so that the danger which so often exists to horses and carriage-springs is entirely obviated. The flushing arrangements are very complete for a district without a water supply. One of the flushing tanks (the largest) is placed at the extreme head of the system, and its contents can be suddenly discharged through a 9-inch outlet pipe. Water is collected chiefly from land drains and the road surfaces, but the large tank already referred to is supplemented with an Alysian well and pump, so that even in the driest seasons water can be obtained at the point where it is most needed; and as the network of sewers is arranged so that nearly the whole can be flushed, if necessary, from this one tank, the system is practically independent of the storage of rainfall for flushing purposes. It has been found by experiments that even without the use of the sluices in the manholes one discharge produces a flow of considerable velocity through the entire length, which is maintained to the extreme point of outfall. No settling-tanks are provided to retain the sewage until putrefaction sets in,—a frequent cause of nuisance,—but a small straining-tank in duplicate receives the flow and intercepts rags, corks, &c. It is needless to say that under the above conditions the sewage reaches the outfall in a fresh state, and becomes assimilated by the soil and vegetation long before decomposition takes place. The sewage farm recently purchased by the Sanitary Authority consists of some four acres of land on the west bank of the Ash. The soil is a light gravel lying above the chalk. Water-tight pipe conduits are constructed along and across the farm, and are furnished with an efficient system of sluice-chambers to enable the sewage to be directed to any required spot. Part of the area has been trenched 2 ft. deep, and the remainder was deeply cross-ploughed. The whole of the sewage is passed over the surface and through the soil. The works have only been completed some six months, and the farm is already in full work. A good roadway has been made along the line of the upper boundary, affording ample facilities for cartage, &c. The system of sewerage is found to work well, and it is to be hoped that as much care has been taken in carrying out the connexions. The total cost of the structural works was under 2,500. Messrs. Smith & Austin were the engineers who designed and carried out the works, and Mr. Bernard Laidley performed the somewhat onerous duties of resident engineer. We hear that at Wormley also, lower

down the valley of the Lea, land has been acquired, and that works of sewerage are about to be carried out by the same engineers.

#### PROPOSED NEW ART GALLERIES, GLASGOW.

A MEETING was held in the Council Chamber, Glasgow, on the 22nd ult., convened by the Lord Provost, with the view of submitting to a number of leading and influential citizens a proposal to provide a suite of buildings to be devoted to the Art Gallery, Industrial Museum, Public Reference Library, and School of Art purposes.

The Lord Provost explained at considerable length the very inadequate provision which at present existed for the purposes mentioned. The Public Library was, he pointed out, accommodated in a portion of a warehouse, temporarily altered to suit library work; while the only museum was the small building in Kelvingrove Park, which, although it might perhaps suit the purpose of a district museum, could never be considered as fitted to meet the requirements of a central and principal industrial museum for a large city like Glasgow. On the other hand, the rooms devoted to art purposes in the Corporation Galleries were totally inadequate as regarded size, and were also very badly suited in construction, and for years the Corporation had been desirous of carrying out some scheme whereby a properly well-lighted building might be secured for art-gallery purposes. At present the school of art was accommodated in the Corporation Galleries, and so unsuitable were the rooms that Glasgow students in national competitions were placed at a most unfair disadvantage when competing with students, even of small provincial towns, where thoroughly equipped schools were provided. The scheme he had to submit proposed to embrace in one block of buildings adequate accommodation for the four purposes he had referred to. If adopted, the scheme involved the purchase of a large square of vacant ground in Sauchiehall-street, immediately to the west of the Corporation Galleries. Were that piece of ground acquired, it was expected there would be ample building accommodation on the south, west, and east sides for a range of art-galleries. On the north side a range of school of art rooms could be placed, and the central part might be filled in with a large industrial museum, having a glass and iron roof. As regarded elevation, it was suggested that the present block of Corporation Art Buildings in Sauchiehall-street be removed, and that the site of Dalnaisie-street, which separated the present buildings from the block proposed, might be utilised to form a good central entrance for both blocks of buildings, thus giving a continuous elevation of 560 ft. in length to Sauchiehall-street. To give effect to this pile of buildings, it was proposed to carry the main line of buildings considerably back from the ordinary building line, thus giving a frontage of free street space of about 90 ft. His purpose in convening the meeting had been to endeavour to obtain the support of those interested to assist him in carrying out such a scheme, as he was desirous that the ground should be purchased by public subscription, and presented as a free site to the Corporation.

Several other gentlemen addressed the meeting, and a general expression of approval was given regarding the scheme. A committee was afterwards appointed to take further steps to carry out the proposal.

Sir Philip Cunliffe Owen, the director of South Kensington Museum, has been consulted as to the advisability of carrying out the proposal, and a letter was read from him at the meeting warmly recommending the scheme for adoption.

**The Shirhind Canal.**—The *Times* Calcutta correspondent telegraphs particulars of the opening, by the Viceroy of India, of the Shirhind Irrigation Canal, one of the greatest works of the kind ever constructed. It will be of immense benefit to the Punjab, as it will irrigate an area of three-quarters of a million acres, or 1,200 square miles. The canal itself is over 500 miles long, and of subsidiary channels there are 2,000 miles more. It has taken forty years to construct and has cost 407 lakhs of rupees.

#### THE EDUCATION OF ENGINEERS.

THE Society of Engineers, desirous of assisting to maintain the *status* of the profession, have taken a practical step of some importance in the direction of affording additional facilities for professional education. We have received a syllabus of the three series of lectures for which the Society has made arrangements, and which are advertised on our front page. Each of the courses deals with an eminently practical and important subject, and each has been entrusted to an able exponent. The fees payable by those who attend the lectures are exceedingly moderate in amount, and we sincerely trust that the Society's efforts will be rewarded by large attendances in each course. The lectures are open to members of the architectural profession, and each of the courses now advertised,—viz., "Strains on Ironwork," by Mr. Henry Adams; "Land Surveying and Levelling," by Mr. A. T. Walmisley; and "Water Supply and Drainage," by Mr. R. W. Pergrino Birch,—deals with a subject with which every architect ought to be more or less acquainted. The Council of the Society feel persuaded that these lectures will greatly add to the usefulness of the Society, especially in educating the young engineer in technical knowledge, and they express a hope that their members of all classes will place before their pupils and assistants the beneficial advantages to be derived therefrom.

The initiation of these courses of lectures is invested with additional significance when taken in conjunction with a movement which has been set on foot with the view of, sooner or later, establishing an examination which would have to be passed by all who are desirous of becoming members of the body. At the present time, any one, however incompetent, may dub himself a "civil engineer" or "mechanical engineer," just as any one may call himself an "architect" or a "surveyor." Of course it is possible, by the exercise of due care, to discriminate between competent practitioners and pretenders in each and all of these professions; but, unfortunately for themselves, a large proportion of the public are unable to exercise this discrimination unassisted by some such criterion of competency as is afforded by ability to pass the examinations recently established by the Royal Institute of British Architects and the Surveyors' Institution, for architects and surveyors respectively. If it be necessary, for the safety of life and limb, to say nothing of property, that the architect should prove himself to possess a sound knowledge of construction before being allowed to practise, and if those who employ him have a right to demand of him some proof of his competency, it is obviously no less essential that the members of the engineering profession,—whose ramifications are so wide, and upon the stability and strength of whose works the lives, health, and means of millions of people are dependent,—should show themselves to be worthy and competent followers of their great calling. It is true that, engineering enterprises being very often on a vast scale, involving the expenditure of millions of money, the promoters may generally be relied upon to confide their interests to men of proved attainments and distinction in the engineering profession; but these great works have to be carried out under the personal supervision of younger men acting as resident engineers, who ought to be (as they mostly are) men of skill and resource in dealing with any emergency that may arise.

Much more might be said in favour of the institution of an examination for civil and mechanical engineers, but before such an examination can be established, there are many points to be considered. Those who are stirring in the present movement point to the Institution of Civil Engineers as the examining body. It has been suggested, however, that as the proposed examination is intended for mechanical as well as civil engineers, better results would follow from the appointment of a board of examiners jointly appointed by the Institution of Civil Engineers and the Institution of Mechanical Engineers,—the senior representative bodies of the two branches of the engineering profession. In the event of an Engineering Examination being established under such auspices, the question would arise,—it has, indeed, been anticipated,—Shall the Institution of Civil Engineers remain an educating body when it becomes an examining body? Those who favour the present movement are disposed to answer this question in the negative, and they

suggest that the large number of students now under by the regis of the Institution should be transferred to one of the junior engineering societies, which should become essentially an educational body, carrying on its work under very much the same method of organisation, as we understand it, as prevails in the Architectural Association. In this way, it is urged, the newly-organised junior society would, in conjunction with existing educational agencies, afford a constant stream of candidates for the proposed examination. The projectors may be over-sanguine, but there is, nevertheless, much in the project that is worthy of consideration.

#### CHANCEL DECORATIONS AT ST. PAUL'S CHURCH, WALWORTH.

The chancel of St. Paul's Church, Lorrimer-square, Walworth, which until recently was well known as one of the most advanced ritualistic churches in the metropolis, has, during the last three months, been undergoing a very elaborate process of re-decoration, notwithstanding that the high ritual for which the church was formerly distinguished has to some extent been abandoned. The decorations having been completed, the chancel was re-opened last week with special services. The east wall of the chancel has been decorated in gold and varied colours, and Scriptural figures introduced. The subjects represented are full-length figures of the four evangelists, with busts of the four great prophets, Isaiah, Jeremiah, Ezekiel, and Daniel; whilst underneath, on either side of the altar table, are emblems of the Passion. The two returning north and south walls have also been decorated and painted, the artistic work consisting of pomegranate foliage. The panels of the chancel ceiling have likewise been included in the decorations. Those portions of the panels immediately over the sacrum have been painted in turquoise blue, with gold stars, and the remaining panels in oak. A massive new reredos has also been placed over the altar. The subject of the reredos is the Adoring Angels, in marble mosaics, enclosed in a framework of alabaster. Carved oak clergy and choir stalls have likewise been introduced, replacing the old painted stalls. The front of the organ has also been re-decorated, and the stained-glass east window has been lengthened.

Messrs. Heaton, Butler, & Bayne, of Garrick-street, Covent-garden, have executed the decorations, and furnished the reredos, the clergy and choir stalls having been furnished by Messrs. Earp, of Kennington-road. The whole of the works have been carried out under the supervision of Mr. Arthur Blomfield, architect, at the cost of the Rev. Erylin Alexander, the vicar.

#### NEW BUILDINGS FOR MESSRS. CROSSE & BLACKWELL.

On the site in Belvedere-road, Lambeth, formerly occupied by the premises of Messrs. Holland & Hanneu, an extensive new block of buildings is now in course of erection for Messrs. Crosse & Blackwell. The buildings will cover a ground area of 25,000 ft., the depth from Belvedere-road to the river being 200 ft. The premises will have a frontage to the Thames, 125 ft. long; the river elevation being 70 ft. in height to the cornice, the roof, which will contain a lantern light, being carried to a further height of 20 ft. The elevation will be in red brick, from the Adderley Park Company's Works, Salfley, near Birmingham, with red terra-cotta strings, window arches, and cornice, furnished by Messrs. Doulton & Sons. The building will contain six lofty floors, and a basement carried to a depth of 10 ft. below the ordinary high-water mark, and having a Wilkinson's concrete floor. The Belvedere-road frontage will also be in red brick and terra-cotta, and will be four stories in height.

The entrance in Belvedere-road, 14 ft. in width, leads into a large open courtyard, 90 ft. in length by 40 ft. in width, around which are the several buildings, divided into six blocks. On the south-east side of the entrance, on the ground floor, is the boiler-house, an apartment 45 ft. square, whilst at the opposite angle are the stables, the remaining portion of the floor consisting of six spacious warehouses. The several upper floors likewise contain large warehouses, besides manufacturing, preparing, and packing premises, together with ranges of offices. The several floors will contain an aggregate

floor space of about 60,000 ft., or nearly an acre and a half in extent, exclusive of the basement, which will contain cellars and storagespace.

Messrs. Roumieu & Aitchison, of Lancaster-place, are the architects, and Mr. F. S. King, of Billiter-avenue, the contractor. Mr. Weston is clerk of the works.

#### THE REGENT'S CANAL AND CITY RAILWAY.

##### PURCHASE OF LAND.

THE Regent's Canal, City, and Docks Railway Company, which obtained an Act of Parliament last session, after a protracted and expensive contest in the Parliamentary committee-rooms, are immediately about to commence the construction of the line, and are making the necessary purchases of land. The project includes the building of a station in the neighbourhood of Aldersgate-street, not far from the station of the Metropolitan Company, and for this station and the general purposes of their undertaking the company have just purchased the large area of land on the south-east boundary of the City in Golden-lane. The land, which has for some time past been vacant, and which contains 45,336 square feet, has been bought from the City authorities for the sum of 80,592l., being at the rate of nearly 2l. per foot. It is stated that the purchase-money is intended to be applied to the erection of artisans' dwellings in Petticoat-square, eastward of Golden-lane.

#### BURGOS CATHEDRAL.

This structure, to which we have recently drawn attention, is one of the finest specimens of ecclesiastical architecture in Spain. It is now being restored, and being provided with stained-glass windows. For the purpose of the latter work, a competition was instituted in which the principal stained-glass works of Europe took part. The commission (which was composed of members of the Madrid Academy) awarded the prize to Zetler, of Munich. The main subject is the Assumption of the Virgin, which will be represented in the principal window.

The early history of this cathedral is involved in much obscurity; but a few trustworthy data are available. It is certain that the foundation-stone of the edifice was laid on July 20, 1221, by King Fernando III., together with his queen, Beatriz, and Bishop Mauricio, as is shown by an entry in an old calendar of the church, where it is stated, "Prinus lapis ponitur in fundamento novi operis ecclesie burgensis xx. di. mensis Julii, era millesima ducentissima quinquagesima noua, die Sancte Margarite." The works were not brought to a final conclusion until the month of December, 1864, when, at the initiative of Archbishop De la Puente, the door known as Archibernal was renewed, and a fresh floor of white and blue Carrara marble laid down. According to a French writer, Paul Alary ("Voyage artistique"), the church "is a legacy four centuries old, to which each generation has added its share of artistic wonders. It is an inland stouework, a kind of gigantic flageework, which inspires the beholder with enthusiasm and a kind of awe at its more than human execution."

The exterior of the cathedral is even more imposing than its interior. The illustration which we give in this week's *Builder* represents a front view, and produces a striking effect. The façade is flanked by two gigantic steeples richly and tastefully adorned, the whole forming a characteristic specimen of the art of the times. According to Dr. Martinez y Sanz, those steeples, at sunset, when the sun's rays strike the metal and wood work below, appear from a distance to be floating in the air. Behind the façade rises from the centre of the transept a powerful lantern, surrounded by a circle of eight turrets of fine workmanship, respecting which the Emperor Charles V. is reported to have said that they ought to be preserved in a case as a precious jewel. The view is closed in by another mass of turrets and finials rising, respectively, over the chapels of the Coronera, Pellejería, and Condestable.

We learn from another entry in the same calendar that it was nine years after the commencement of the works, in 1230,—"era millesima ducentissima sexagesima octava,"—that divine service was held in the cathedral. A hundred years later, on June 4, 1336, royal letters patent, granted by King Alfonso XI.,

witness that the "masters are at work on this church." Another record, in *Libro redondo* (vol. lvii.), points to "Tuesday, September 18, 1442, as the day on which the first stone was laid for the towers which are now being renewed in the Church of Santa Maria de Burgos." Still another entry in the same *Libro redondo* (vol. lxxiii.) states that "the towers which rise over the Puerta Real were finished on September 4 of the year of our Lord 1458." Both are said to have been built on the plans and under the direction of the architect Juan de Colonia, and at the expense of Bishops Alonso de Cartagena and his immediate successor, Luis de Acuña.

The first story of the principal façade is not the original work; of the latter, which was constructed as far back as the thirteenth century, only a faint reminiscence remains, in the shape of a crude engraving in vol. xxvi. of *España Sagrada*, a work by Padre M. Florez. It is reported that, min threatening the façade, it was replaced by another, erected at the instance of Archbishop Rodriguez de Arlellano by the architect Gonzalez de Lara. According to another record, it was discovered in 1749 that the towers showed signs of falling, owing, it is stated to the left tower being built on a slight elevation of the ground, instead of a solid foundation. The damage, however, cannot have been very serious, for it was repaired by two architects, Manuel Cueto and Domingo Oudáteaga, at a total expense of 25,000 reales (about 2500l.).

The transept of the cathedral has also undergone several vicissitudes. It was completed at about the end of the fifteenth century, at the expense of Bishop Acuña, and is described by a contemporary as an "*afabrá constructum*." According to Bishop Apudia, it was "one of the most beautiful works of the universe." The transept was totally destroyed (by fire?) at the dawn of Tuesday, March 4th, 1539, after only fifty years of existence. A few hours after the catastrophe, however, the municipal corporation of Burgos, by a unanimous vote, resolved to rebuild the transept, "confident of the pious generosity of the inhabitants of Burgos." Having, within a few days, collected the sum of 450,000 maravedises (about 1,500l.), the work of rebuilding was proceeded with under the direction of the architects, Francisco de Colonia and his successor, Juan de Vallejo. A beginning was made in October of the same year, and the work was completed in December, 1567, twenty-eight years after its commencement. On August 16th, 1642, we learn further, about 7.30 p.m., a strong hurricane overthrew the turrets of the cupola or lantern. The inhabitants of Burgos again came generously to the rescue, together with the cathedral chapter and the bishop, "moneys being received for this purpose from the Indies from native Burgenses and others." The work of restoration was carried on under the direction of the architect Juan de Rivas, and finished on July 19th, 1644. Strangely enough, in the morning of the very next day, on July 20th, the Burgenses were roused from their slumbers by the pealing of bells, announcing that fire had broken out, and to their horror they found that the transept of their cathedral was in flames, which threatened at one time to envelop the whole building. However, by great exertion the fire was confined to the transept, and was got under without doing great damage.

If it is asked who were the architects of the cathedral, we meet with a long roll of names. The first one mentioned in the records of the municipal archives is Enrique, who also directed the works of Leon Cathedral; he died on July 10th, 1277. The second was Juan Perez, who died in 1296, and was buried in one of the cloisters of the cathedral, and is supposed to have been a brother of Pedro Perez, the painter of Toledo Cathedral, who died six years before, in 1290. The third architect of Burgos Cathedral was Pedro Sanchez, who directed the works in 1384. After that, Juan Sanchez de la Molina, Martin Fernandez, the three Colonias, Juan de Vallejo, Diego de Siloe, Nicolas de Vergara, Matienzo, Pieredonda, Gil, Regines, and others, laboured successively; as well as, during the fourteenth and fifteenth centuries, many Moors, such as Mahonad, Yunce, the "master" Hali, the master Mahomet de Aranda, the master Yunza de Carrion, the master carpenter Brahen, &c. Amongst sculptors may be mentioned Juan Sanchez de Fromesta, the masters Gil y Copin, Felipe de Vigaridi, Juan de Lance, Anton de Soto, Juan de Villareal, Pedro de Colindres, and many others.

ST. PAUL'S CHURCH, HAMMERSMITH.

This church, which forms the subject of our lithographic illustration pages this week, is in course of erection under the direction of Messrs. J. P. Seddon and Hugh Rommie Gough, as joint architects. From the paper read by Mr. Seddon before the Architectural Association on the 24th ult., we take the following descriptive particulars, the drawings being part of his illustrations,—

In order to obtain the lofty proportions particularly desired by my colleague and the committee, it was necessary that the building should be dignified but simple, and devoid of ornate detail, as the funds at our command were strictly limited. Such being the case, we have given great study to the question of the materials, and have reason to think that we have been somewhat exceptionally fortunate in that respect. The stone for the exterior wall masonry is of red Mansfield, laid in horizontal courses, with the facework hammered. This is being supplied from Mr. Robert Lindley's well-known quarries at a price which compares favourably with that of the far colder and less pleasant looking Kentish rag-stone with which Londoners are, in our opinion, unfortunately too familiar. Then the stone for the facing of the walls internally is brown Ancaster, of a rich warm colour, but beautifully varied. This is, we think, the first time that this has been used in the metropolis, although in Medieval times it was extensively used in the churches of Lincolnshire; and indeed the quarries, which also belong to Mr. Lindley, were worked by the Romans. As regards the stonework for the dressings we have been less fortunate; we had hoped to have had all the dressings executed in red Mansfield, but owing to the great cost of working, we have been compelled to content ourselves with Box-ground stone for the exterior and Corsham Down for the interior, the blue bed of which has been selected by us generally for the aisles, in order that they may harmonise with the marble of which I am about to speak. The whole of the columns and responds, with their bases and capitals, are of a Belgian marble, known on the Continent as "Belgian granite," and much used in old Flemish churches, as well as in those of parts of France. The quarries from which we are obtaining this material are situated at Soignies, near Brussels, and are so extensive to be practically inexhaustible. This marble can be obtained in blocks of almost any size, and the isolated columns in this church are of single stones 2 ft. 2 in. in diameter and about 10 ft. long. Its appearance is very similar to our Purbeck marble, though for richness and beauty of colour, in our opinion, this Belgian marble is superior. It has also the advantage of being exceedingly cheap, owing to the comparatively low rate of wages paid in Belgium. This is being used for the first time in England for this work. Mr. Gough, who has visited the quarries, will, I am sure, be happy to give you any information regarding this excellent material, with which, I may add, it is the intention to line the inside walls of the church up to the string-course below the sills of the aisle windows. The whole of this marble that I have mentioned, with the exception of the capitals and bases of the columns, will be polished. I would call attention to the construction of the roof as being novel in ecclesiastical architecture and different from any of those I have previously described. Iron for structural purposes has been hitherto rather the friend of the engineer than of the architect; indeed, to the latter, and I must add to myself, it has been almost held as an enemy. We should not have used it from choice in this instance, but the necessity for economy and the desirability of avoiding all lateral thrust upon the lofty clear-story walls, and any visible ties which would have to cross under the vaulted ceiling, led us to its adoption. Mr. Gough's engineering knowledge, acquired many years ago whilst in the Government service, has, I think, well solved the difficulties of the problem, though in a different manner to that in which I have attempted to do so. Each of the latticed wrought-iron principals is, in fact, a girder, exerting no outward thrust whatever, except, of course, what may be due to wind pressure, which is felt in every roof, no matter what its construction may be. In this respect the report of Mr. Bidder, the engineer, so entirely confirms Mr. Gough's opinion as to disarm further criticism, since æsthetic considerations are, in

this instance, outside the question. No portion of the ironwork of the roof will be left visible, as there will be a ceiling with groining ribs below it, which it is intended to treat with coloured decorations.

ARCHITECTURAL ASSOCIATION.

At the ordinary fortnightly meeting of this Association on the 24th ult., Mr. Edward G. Hayes, President, in the chair, the following gentlemen were duly elected members, viz.—Messrs. A. Kent, G. J. Oakesbott, A. R. Manly, T. B. Rutherford, F. W. Macey, A. B. Johnson, H. H. Hughes, H. W. Collins, T. R. Clemence, A. Gordon, S. Stradwick, A. Roberts, E. T. Boardman, S. H. Seager, J. W. Stenhold, E. E. Brooks, T. E. Watkins, H. H. Satchell, W. F. Cave, A. H. Hart, W. J. W. Ferguson, C. W. Wright, H. S. Perkins, W. W. Short, J. Short, P. Thompson, W. E. Potts, H. H. Mew, A. E. Hanscomb, H. Baker, T. Leadbetter, A. R. Wright, W. G. Nicol, A. H. Freeman, A. W. Bentham, E. W. Knight, C. S. Hornbrook, H. Hutchings, J. A. Whitchord, A. Clark, H. J. Westell, F. Williamson, C. H. Bedells, J. H. Goodman, H. L. Whiteley, F. A. Steer, J. E. Still, W. Sheen, Jun., W. F. Kelsey, M. Fawcett, E. A. Barnard, A. S. Taylor, F. Massie, H. H. Flowers, W. M. Elgood, G. L. Stutfield, W. A. Moul, A. B. Atkinson, A. J. Ward, and W. Leck (sixty in all).

The Chairman then formally moved the adoption of the annual report of the Association, which contains the following passages:—

"The committee, in presenting the report of the past session, was gratified to announce a continuance of the prosperity of the Association, and a rapid increase in the number of its members, felt that the attendance at the various classes during the past session has been scarcely in proportion to that increase; they desire, therefore, to direct the special notice of members to the great advantages to be derived from taking an active part in the working of one or more of the classes; these being, especially to the younger members, among the most useful of the many valuable opportunities and advantages afforded by this Association. The committee trust that during the coming session the classes will be fully appreciated and attended by greatly increased numbers."

Great improvement has, during the past session, been observed in the discussions following the papers read at the general meetings, and the committee hope that this improvement will be fully maintained, and still further developed throughout the coming session.

The library now contains about 1,200 volumes, and continues to be well served. A new and revised catalogue has been prepared.

The courses of lectures in connexion with the Classes of Design and Construction, referred to in the report of last session, have been given by Messrs. Tarver and Blashill, and have been numerously attended. The thanks of the whole body of the Association are due to these gentlemen for their very valuable services. A special grant has been made to the library for the purchase of books for the use of those availing themselves of these lectures. The courses of lectures will be repeated during the coming session.

The new class formed for the study of planning and specification writing has been well attended, and the syllabus for the session energetically carried out.

The Association Travelling Studentship has this year been won by Mr. W. A. Pite; Mr. F. H. Tulloch being awarded the second prize; and Mr. A. S. Hayes receiving Hon. Mention.

The following are amongst the honours taken by members of the Association during the past session:—

Royal Institute of British Architects.

Codwin Bursary .....	A. J. Gale.
Some Medallion .....	A. B. Pite.
Hon. Mention .....	L. Stokes.
Grissel Gold Medal .....	G. Shackle.
	H. P. Drew.

Royal Academy.

Travelling Studentship and Gold Medal .....	J. H. Ince.
Silver Medal for Measured Drawings .....	T. C. Yates.

Contributions to the Prizo Fund have been made by Messrs. Aston Wehh and Ernest C. Leo."

The report was adopted without discussion. Mr. J. Douglass Mathews, treasurer, moved the adoption of the balance-sheet, which showed that the total receipts for the session 1881-82 had been 724l. 6s. 4d. (including 112l. 14s. 4d. balance brought forward from the previous session). The amount received for members' subscriptions was 381l. 19s., while entrance-fees

amounted to 112l. 7s. The total expenditure was 595l. 7s. 6d. (including 155l. for rent), leaving a balance of 128l. 18s. 10d. in the treasurer's hands.

The Chairman called attention to the last-issued number of the "Proceedings" of the Royal Institute of British Architects, which contained a great deal of useful matter for the guidance of all young architects who were preparing for the Architectural Examination. It was gratifying to note that the Institute had fully recognised the work which was being done by the Association, and had largely quoted from the "Brown Book."

Mr. Douglass Mathews said he was glad the President had called attention to the matter. Young architects who were seeking to make themselves proficient in their profession ought to be grateful for the facilities now afforded them, for instead of being left to flounder about in search of knowledge, as they would have had to do a few years ago, they had now a complete course of study laid down for them by those who were fully cognisant of their requirements, and it would be their own fault if they did not avail themselves of the facilities now within their reach.

Mr. A. Beresford Pite said he believed that in the Institute scheme of Examination 175 marks were allotted to Art and 425 marks to Construction. He wished to know whether the Association was to be understood as endorsing such a distribution of marks, and whether the proportion of marks was to be taken as indicative of the Association's view of the relative importance of these two subjects in an architect's education?

The Chairman ruled that the question raised by Mr. Pite could not be discussed on that occasion.

Mr. Stannus having given a kindly lecture to those members of the Association who thoughtlessly or selfishly keep in their possession beyond the specified time the books which they borrow from the library,—to the great detriment and injury of their fellow-members who need the books for purposes of study,—

Mr. John P. Seddon proceeded to read his paper on "Sundry Working Drawings," the first portion of which we print on another page. We also reproduce some of the drawings with which the paper was illustrated.

The Chairman, in opening the discussion, observed that Mr. Seddon had touched upon a great variety of subjects in his very interesting paper. He had expressed a misgiving lest he might be accused of egotism in bringing his works before them, but that was precisely the kind of egotism of which they in that room would be glad to see a little more, for nothing could be more useful to the younger members of the profession than for a gentleman of Mr. Seddon's experience and mastery of his art to take the trouble to show and explain to them so many drawings. He was very glad that Mr. Seddon had so strongly insisted upon the necessity of architects making their working drawings as clear as possible. Such drawings should be without a superfluous line, and free from shading, or some ludicrous results might follow if the drawings were put into the hands of unintelligent workmen. He remembered a case in point, in which a bricklayer was proceeding to execute in black brick some shading which was shown on a drawing.

Mr. R. E. Pownall moved a vote of thanks to Mr. Seddon for his paper, and for the admirable display of drawings by which it was illustrated. As to the question of the scale of working drawings, the one advocated by Mr. Seddon, viz., that of three-sixteenths of an inch to a foot, was, to some extent, a novelty, and although a very desirable scale in some respects, it was open to the great objection that it was not one that could be readily read off, with an ordinary foot-rule, and therefore the adoption of such a scale would add to the difficulties of the workman. With regard to the church at Redruth, he thought that granite hardly accorded well with Bath stone, and it would, in his opinion, have been better to have relied on the local material entirely, even at the sacrifice of some of the detail.

Mr. J. Osborne Smith seconded the motion, and observed that the drawings exhibited both the primary conditions essential in a working drawing, viz., clearness and accuracy. Indeed, these two qualities might be said to be all that was wanted in a working drawing. With regard to the new church at Hammersmith, he could

not help feeling gratified that Mr. Seddon had at last condescended to the use of iron in the construction of the roof of that church. At the same time, he regretted that for a London church Mr. Seddon should have used Bath stone externally while marble was used internally. In his judgment, it would have been better to spend the money expended on marble for the interior in Portland or some other good hard stone for the exterior, using Bath stone internally. In our London atmosphere he thought the exterior of the church would be better preserved a hundred years hence if this course had been followed.

Mr. A. B. Pite, in supporting the motion, said that Mr. Seddon was not the first architect of experience and position who had been kind enough to give the Association the benefit of his knowledge. Two sessions ago Mr. William White read a paper,\* in which he gave some of the experience he had gained in church building, and that paper, like Mr. Seddon's, was ungrudgingly illustrated by the author's drawings. In looking at Mr. Seddon's drawings one saw that their author was an architect who loved his work. Mr. Seddon had constantly and faithfully devoted his energies to working in one style, and the consequence was that, after many years of a somewhat extended practice, he had acquired a facility in that style which very nearly approached perfection. He thought that young architects might draw from Mr. Seddon's career a very valuable lesson, viz., that success would wait upon those who were diligent and constant in their adherence to one grand principle. Other architects might be named who had achieved eminence in the same way. He trusted that the members of the Architectural Association would take the lesson to heart, and if they did so they would be able, when they had reached the acme of their lives, to present to the then Architectural Association, for the edification of their juniors and pupils, such an excellent series of drawings as had been exhibited by Mr. Seddon on the present occasion.

Mr. S. G. Turner, after some remarks with reference to roof construction as illustrated by the drawings, said he had been astonished to hear Mr. Seddon say that he had never used a girder in his life, for it seemed to him (the speaker) that in these days rolled iron girders and joists were necessary, and even indispensable, to the architect. It seemed, however, that Nemesis had overtaken Mr. Seddon by compelling him to use iron for a church roof.

Mr. Hugh Roumie Gough said that, with regard to the materials used in the Hammersmith Church, he might, as joint architect of the building with Mr. Seddon, say that they regretted very much that they were compelled to use Bath stone at all. It was the only church of any importance with which he had had anything to do in which he had allowed Bath stone to be used at all. As to the use of marble internally, he might say that for structural reasons they were compelled to use some hard stone, and this Belgian marble was nearly as cheap as Portland stone, for it only cost, polished, about 8s. 6d. per foot cube, taking it all round. For the clustered columns† carrying the nave arcade, Bath stone would not carry the weight of the superstructure. Externally it was their wish to have used Mansfield, but the difference of cost between that material and Bath stone amounted to between 4,000l. and 5,000l., and the funds available would not allow of the use of the more costly material. The instructions of the committee were to build a church of Kentish rag and Bath stone,—a combination of materials which he abominated. With regard to the use of iron for the roof, it should be observed that all the ironwork of the principals was concealed by the wooden groining. He supposed the time would come when architects would use iron more boldly, and in positions where it could be seen. In the present instance it was fairly and legitimately used, for it was far more economical than wood, while it obviated the necessity of ties, and prevented thrust upon the walls. With regard to the brown Ancaster stone which had been mentioned by Mr. Seddon as being used in the interior of the church, he believed it was the first time that material had been used as a walling stone. This Brown bed lay deep in the quarries, and used to be known as the Corn Grit. It had until lately very little

market in London, and very little even in Lincolnshire. It varied from a rich red to browns and yellows; no two blocks were precisely alike in colour, and its effect in mass was very rich. It was a very cheap walling stone, and he hoped to see it more extensively used.

The Chairman having put the motion, it was carried with much applause.

Mr. Seddon, in acknowledgment, thanked the members for the kindness with which they had received his paper, and entered into a brief explanation of the construction of some of the roofs, as to which questions had been asked. The meeting then terminated.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of this society was held on the 22nd ult., the president, Mr. David MacGibbon, in the chair.

Before proceeding to the business of the evening, the Chairman said the society was called upon to express its deep regret at the death of Mr. James Lorimer, who had been one of its most prominent members, and had aided in all circumstances with his good advice and his best wishes. He proposed that they should minute their sense of the loss the society had sustained. This was agreed to.

From minutes subsequently read, it appeared that arrangements for the proposed exhibition were being pushed forward, the date of opening having been fixed for the 22nd of December, as already stated in the *Builder*. Of the 100l. considered necessary as a guarantee fund, 95l. had been subscribed. The Chairman said everything looked very well indeed for the success of the exhibition.

Professor Baldwin Brown then proceeded to read his paper on the "Mosaics of Ravenna." The Professor, in the outset, pointed out the importance of the mosaics in question as the finest existing examples of the style of art commonly called Byzantine, and went on to describe the special characteristics of this art as compared with that of the periods which preceded and came after it. The art of the Catacombs, he remarked, was of a slight and playful character, making large use of classical forms of decoration, and dealing with specially Christian themes mainly through symbols. The art of the Byzantine period, when the Church became a recognised power in the world, was of a monumental character, presenting to the congregation the impressive forms of Christ and of the saints. The Middle Ages proper introduced more dramatic force and pathos into the representations, and took up subjects like the Crucifixion and the Last Judgment, unknown in the earlier periods. Passing to Ravenna itself, Professor Baldwin Brown sketched briefly the history of the city, and mentioned the three periods to which the best mosaics belonged, answering respectively to the times of Galla Placidia, of Theodoric the Goth, and of Justinian. Some of the principal mosaics were then described in chronological order, stress being laid upon the admirable arrangement shown in the works, and upon their decorative as well as their pictorial excellence. Photographs were exhibited showing the design of some of the more important mosaics, and their relation to their surroundings.

At the close, a cordial vote of thanks was accorded to Professor Baldwin Brown.

#### SOME UNRECOGNISED POINTS IN DRAINAGE.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

At a meeting of this Society, held at No. 1, Adam-street, Adelphi, on November 17th, the President, Dr. J. W. Tripe, in the chair, a paper was read by Mr. Rogers Field, M. Inst. C.E., on "Certain less recognised, but highly important, Points in the Drainage and Ventilation of Houses," of which the following is an abstract.

Three sanitary principles govern house drainage, these are:—

1. All refuse matter must be completely and rapidly removed from the house.

2. There must never be any passage of air from the drains or waste-pipes into the house.

3. There must be no connexion between the drains and the domestic water-supply.

These, although so simple, are very frequently neglected; the first goes absolutely to the root

of sanitation, for were it strictly complied with there would be no leaky drains, no polluted soil, and no production of foul gases in the drains from decomposing organic matter. There cannot be a greater mistake than to assume, as is commonly done in investigating drainage, that if water runs away with freedom, this is all that is required; numerous cases are on record where the sewage from houses has apparently run away freely for years, but where the greater portion of it has really been leaking out of the drain into the ground under or close to the house.

In illustration of this point, the author quoted two cases in his own practice, one in which the connexion with the sewer was actually found to be blocked with shavings, which had been left in when the house was built three years before; the other, that of a school in which the drainage from the lavatories had leaked through disused drains under the floor of a large portion of the building, and where, although there was a mass of filth in some places 7 ft. deep, no leakage had been suspected.

If the drains are exposed and found clean, and jointed with cement, this is not sufficient; the tops of the joints may be good and the bottoms bad. The only safe method is to actually test the drains by plugging them at the lower end and filling them with water; very few house drains, indeed, stand this test.

Even if the drains are outside the house, it is a mistake to assume that it is unimportant whether they are sound, for not only may sewage leak out of faulty joints and percolate under the house, but foul air may be drawn into the house.

It is important to realise how small an amount of deposit will create mischief by decomposing and generating foul gases; a mere irregularity of the joints, even when the drain has a good fall, is sufficient to cause this. There is no better test of the condition of the drains than the amount of small emitted from a ventilating opening, for if the drains be properly laid and in thorough working order, practically no smell should exist.

Faulty forms of traps and water-closet apparatus were strongly condemned by the author, and diagrams descriptive of good and bad closets were exhibited.

The principle that there should never be any passage of air from the drains or waste-pipes into the house was then considered, and the means of isolating the house-drains from the public sewer, the necessity of keeping the drains outside the house, their ventilation as well as that of the soil-pipes, the position of the water-closets, the disconnection of the sanitary fittings inside the house from the drains, were referred to. It was insisted that the danger should be guarded against of trusting too much to those parts of the drainage of a house which are visible as an index of the condition of other and important parts which are concealed, and an instance was mentioned of a house the drainage of which had been recently reconstructed, and where all the sanitary arrangements appeared, at first sight, to be perfect, but where a subsequent examination of the drains which were under the house showed that the joints were, in many places, defective, and at one point the pipes were not jointed at all, but a space left large enough to put a hand in, though it was stated that special care had been taken to make the drains watertight. Old drains, which had no outlet, connected with gullies, were found beneath the passages and rooms; the housemaid nearly died of typhoid fever, and beneath the room she occupied was found an old drain with a large amount of foul deposit. A long list of other defects was described, leading to the conclusion that the drainage, instead of being very good, was really so radically defective throughout that it was necessary to reconstruct the whole of it.

Another instance was given in which a lady and her cook were attacked with erysipelas and blood-poisoning shortly after occupying a house. Various alterations were made in the drainage in the absence of the family, but on their return the lady was again attacked with erysipelas, and shortly after other members of the household. Again alterations were made, and again the lady was attacked with erysipelas, and the housemaid with typhoid fever. An examination of the house by the author showed that an old stoneware drain in the scullery, into which the sink formerly discharged, before it was disconnected, had not been removed, and, though stopped with cement, the stopping was

\* See *Builder*, vol. xl., p. 319.

† Our view shows the cylindrical shafts of stone as originally proposed.

imperfect, thus allowing the air of the drain to enter the house.

The author next considered the various ways in which foul air from faulty drainage inside the house passes to different parts, and pointed out the opportunities which were given for the passage of air from one part of a house to another, depending chiefly upon windows and fires, the latter, of course, mainly acting by drawing air through passages, staircases, and doors. But other channels must also be borne in mind, and an interesting account was given of the passage of foul air along bell-wire tubes, the proximity of the bell-pull to the fireplace giving an increased opportunity for air to be drawn from a distance to this part of a room. Channels for gas-pipes and for hot-water pipes also not uncommonly give facility for the admission of foul air. In connexion with this part of the subject a remarkable instance was given of a particular bed in a school, the occupants of which were constantly the subjects of slight attacks of pneumonia, with tendency to typhoid. In this case the foul air was conducted from a lavatory where there was defective drainage, up a staircase, and impinging on the ceiling of the dormitory, was reflected on to the bed where the sickness occurred.

An interesting account was given of the cause of the Duchess of Connaught's recent illness. Defective drainage was found in the basement of the house, and after numerous experiments, the means by which the foul air entered the Duchess's bedroom were discovered. These showed that it was only when occupying certain positions in the room that she would be exposed to the influence of the foul air, while in bed she would escape. As a matter of fact, in twenty-four hours after sitting on a sofa in one of these exposed positions her Royal Highness's symptoms fully developed themselves.

The necessity of a thorough disconnection between the drains and the domestic water-supply was then dwelt upon, and the mistakes most commonly made in this particular pointed out.

In the discussion which followed, the President, Dr. Buchanan, Dr. de Chaumont, Dr. Corfield, Mr. E. C. Robins, Dr. Bate, Mr. Jacob, Dr. Rogers, Dr. Poore, and Mr. Shirley Murphy took part.

#### THE CONSUMPTION OF SMOKE.

LIVERPOOL ENGINEERING SOCIETY.

At a meeting of the above society, held on the 22nd inst. at the Royal Institution, Colquhoun-street, Mr. H. Bramall, vice-president, in the chair, a paper was read by Mr. W. E. Mills, entitled "Notes on the Mallet System of Controlled Combustion." The author, in introducing his subject, stated that the question of dealing with the cloud of smoke hanging over our large cities, and the immense waste of heat which its presence testified to, had been attempted in many ways from time to time. All engineers were familiar with the different kinds of smoke-consumers and fuel-economisers which were before the public, but none of which altogether achieved the end aimed at, viz., the consumption of the smoke generated by the fuel in the furnace. Mr. Mallet, of Denver Colorado, U.S.A., who had studied the subject, saw that the difficulty with all the smoke-consumers was the impossibility of entirely burning all the atoms of carbon set free in the act of combustion. He conceived the idea that if by any means the fuel could be burned in such a manner as not to produce any smoke at all, and so preserve all the heat which would be otherwise wasted, a great step would be gained. He effected this in the following manner: a combustion-chamber is fitted behind the boiler-furnace, communicating with it by a perforated septum wall. The fire-bars were made hollow, and so arranged that cold air from the exterior could pass through them into the combustion-chamber. The open ends of these fire-bars could be closed by a slide, worked by a lever, which also actuated the apertures in the ash-pit-doors. When coal was first put on the fire, the latter openings were closed. The gases given off from the fuel passed into the combustion-chamber through the apertures in the septum wall, and meeting there with the oxygen conveyed through the fire-bars, were entirely consumed. The inventor claims that by his method, no smoke being produced, all chimneys may be done away with, and a saving of about 45 per cent. in fuel effected. The necessary draught is provided by a fan, which

draws the heated gases, the ultimate products of combustion, through a condenser, in which they are cooled down, and then discharged into the open air. The application of the system to stationary, marine, and locomotive boilers was next described, with the various scientific principles involved.

A discussion followed; and a vote of thanks was accorded to the author.

#### THE SMOKE NUISANCE.

THE question that most directly affects us who are acquainted with a particular grievance is that of the smoke nuisance. Most laudably it has been attempted by a committee of noblemen and gentlemen to devise means to get at the best and most practicable appliances that would be likely to mitigate the evil. The great movement inaugurated by the late Exhibition at South Kensington, and previously that by the Kyrle Society, must not be allowed to collapse. It has been demonstrated that a better state of things is possible, that coal may be burned, even in the open fire-grate, without producing smoke. Although the manner of doing it may not be so simple as to recommend it for general adoption, it has been sufficient to prove the fact. The manufacturers are sure to improve and ultimately perfect any appliance that is in the right direction, if they can rely upon receiving encouragement from the purchasing public, and those whose position in society authorises them to influence the owners of house properties.

Closely allied to the smoke-abatement question is the smoky chimney nuisance. With the former, grates must be used that produce a minimum of smoke; and with the latter the nuisance will partially disappear by using ventilating grates and Tobin's tubes. But my object in writing to you is not to attempt to say anything new to the readers of the *Builder*, for many, if not most, of them know already that chimney-pots and cowls are seldom really necessary. I can mention now, further, that these unsightly additions to the tops of the chimneys, as seen, say, in the neighbourhood of Park-lane, Brook-street, and the Bayswater-road, are not through the architect's recommendations, but through the decorator or jobbing builder, introduced, perhaps, by one of the upper servants or the steward of the mansion. It does seem a pity that these dangerous and hideous appendages should be allowed to exist if they are not necessary. That they are not necessary, I make this bold and sweeping assertion; but, as I said before, the architect cannot help it. They are not consulted. Those only are consulted whose interest it is to get a little job to do, and they no doubt ignorantly introduce one of the many plausible advertisements of patent chimney-pots that will be "sure to be effective" (?). The gentleman having already found him to be a respectable and honest sort of a man as a shaker of his carpets or a cleaner of his windows, thinks he may as well get the pot and put it on as to get a stranger into his house. Hence the chimney-pots multiply.

In getting this evil checked and ultimately entirely put a stop to, it will be necessary to get at the proprietors of these large dwellings, and interest them in the question, and perhaps define a few simple rules by which they will be able to convince themselves whether it is not practicable to do without chimney-pots and cowls; for example, a grate suitable for one room is not necessarily suitable for all the rooms. Ascertain whether there is any tendency for a down-draught without a fire in the room; if so, see, by holding a lighted match to the keyhole or joint of the door or doors, to which direction the draught inclines,—if outward, which is generally the case, the chimney is being used as a descending-flue, to supply air to some adjoining hall or room, consequently a fresh supply of air (warmed preferred) in the hall or room next to the one with a down-draught will immediately change the currents, and cease that which before had been a descending-flue to be a good drawing chimney. Should there be no direct down-draught, and but a very sluggish up-draught, this evil may be got rid of by using a ventilating grate, slow-combustion grate, or "Tobin's tubes." One general remark. It would be a good system if every room of a new building were tested as to the inclination of the flues before a stove or grate were selected. This to be done first without fires, and then with fires on the hearths.

ROBT. CRANE.

#### EMPLOYMENT OF A CRANE IN EARTH CONSTRUCTIONS.

IN the works connected with the raising of the level of the feeding basin of the Rhine, Marne, and Saar Canal at Gondrexange, in Lorraine, the contractors have made what, on the Continent, is spoken of as a novel application of the crane. The embankment surrounding the basin had to be raised by about 4 ft. 6 in. and the idea of availing themselves of machinery in carrying out the work was first suggested to Messrs. Weis & Bernatz, the contractors, by the fact that the wages for hand labour in that part of the country are relatively very high. They found that the quantity of clay which they had to convey from the boats to its place on the embankment would amount to not less than 100,000 cubic metres, in addition to which they had 20,000 cubic metres of stone to unship. They accordingly sought for a suitable crane, and obtained one from the works of Messrs. Booth Bros., of Rodley, near Leeds. They had the crane fixed on a bridge, placed upon two pontoons lying one behind the other, and by its help they were able to lift the clay and stone directly out of the boats and deposit them at once on the spot where they were required. The distance over which it was necessary for the crane to reach in this process of unloading was unusually great. A suitable machine, however, was obtained at a cost of 400*l.* It has an arm with a reach of over 45 ft. The crane is made of American pitch pine, and it is capable of lifting over the maximum radius a weight of fully three tons. The pontoons on which the crane is fixed are able to bear a weight of thirty tons. The hinder pontoon is used as a counterpoise, and is loaded with ballast to such an extent that in the manipulation of the arm of the crane the deviations in depth never exceed 8 in. Another point is that the crane is capable of being turned round so as to reach over three-fourths of a circle, or 270°. The engine employed in driving the crane works with two cylinders, and by means of a break the load can be stopped and held fast at any height. The boiler is certified up to a pressure of six and a half atmospheres. From 3 to 4 atmospheres' pressure suffices for the lifting of three tons. The clay employed on the work is brought by river in barges. These are each divided into four parts, each containing a large chest or box, capable of being lifted out. At the outer extremity of the arm of the crane is a chain, with four end chains terminating in a hook, and each hook fastens in an iron handle or catch in each of the chests. When the chest or box is lifted, the crane begins to revolve, so that the load in passing from the vessel to the shore moves in a spiral line. Some difficulty was met with at first in letting the clay out of the box. It was found impracticable to make the bottom of the box into a drop door, as the recoil in such an arrangement was found to act injuriously on the crane itself, owing to the too sudden difference of weight and pressure. This difficulty was overcome by an arrangement whereby one of the sides was gradually raised while the box was being raised and tipped on one side. The process of lifting out a box, emptying it, and putting it back in its place, does not occupy more than a couple of minutes. By help of the crane it was, therefore, found possible to unload sixty barges, each carrying ten tons of clay, per day. The difference of cost made by the use of the crane was enormous, as it was found that instead of fifty men at 3*s.* 6*d.* to 4*s.* a day, only five altogether, including stoker and engine-man, were required to do the work, the outlay for coal being about 6*s.* a day.

**Surveyors' Institution.**—The next meeting will be held on Monday, December 4th. In view of important changes now in progress in the methods of producing the published maps of the Ordnance Survey, the time is considered opportune for the expression of the opinions of the members with reference to any practical defects or possible improvements in the maps in question. It is believed that any well-considered suggestions will be acceptable to the Director-General of the Survey, and the Council have, therefore, arranged for the reading of an introductory paper (to be followed by a discussion) at the above meeting upon the subject of "The Ordnance Maps, and Suggestions for their Improvement."

### OPENING OF THE NEW TOWN HALL AT LEYTON.

The rapid expansion of Leyton, which is increasing in population at a rate almost unprecedented, has rendered necessary the erection of a new public hall and offices for the transaction of the business of the district, and for some time past a new town-hall has been in course of erection. The building, having been completed, has been opened for business. It has been erected on a site near the railway station, said to be about the centre of the extensive district within the area of the local board. The building is three stories in height, and has two bold and bandsome main frontages, with a tower upwards of 80 ft. in height, at the east angle, under which is the principal entrance into the building. The two principal frontages,—the one to the north-east, facing the Leyton-road, and the other facing the south,—are each about 70 ft. in length, the materials being white Suffolk brick, with a profusion of Portland stone for window dressings and general ornamentation. The entrance at the angular frontage, under the tower, is surmounted by a carved and moulded pediment in Portland stone, supported by piers with richly-carved capitals. The first floor of the south frontage has two lofty and ornamental two-light pediment windows, by which the principal apartment in the building,—the large hall or board-room,—is mainly lighted. A forecourt in front of the two elevations, about 12 ft. in depth, is enclosed by a dwarf wall, surmounted by ornamental railings.

The entrance to the building leads into a spacious hall or vestibule. The ground-floor contains the clerks' office, together with the offices of the assistant clerks; also a spacious committee-room, handsomely fitted and furnished; the surveyor's office, and those of his clerks; and the offices of the inspector of nuisances and the collectors. A wide stone staircase leads to the upper floors. The board-room on the first floor is 50 ft. in length, by 32 ft. in width, and is 25 ft. in height. It has an elegantly-decorated coved ceiling, divided into panels, the coved portion of the ceiling springing from a moulded cornice.

Mr. J. M. Knight, the surveyor for the Mile-end Vestry, is the architect of the building, and Mr. James Road, of Walthamstow, is the contractor. The cost of the building is 6,500l.

### THE MANHOLE SCARE.

The outcry against the system of open ventilation of the public sewers into the centre of the carriage-ways lately raised, has had a powerful effect in alarming the minds of the general public, whose confidence in such matters is based on the opinions of experts. Its example has caused medical officers of health to be so bold in their statements concerning the evils arising from the gases escaping from the manholes, that the average member of the community half believes that the sewerage systems of our best towns, instead of being the means of carrying disease away from our homes, are actually the carriers of it to our very doors.

The Medical Officer of Health for the parish of Chiswick startled his Board a few weeks ago by stating that he knew of no other cause for a case of enteric fever in the parish than the exhalations from the manhole-ventilator in the street where it occurred. The Board promptly ordered an inquiry into the case, with a view to knowing whether their sewerage system, just completed at a cost of nearly 80,000l., was really a means of distributing disease and perhaps death. Dr. Corfield, Professor of Hygiene in University College, was called in, and has presented his report on the case. The manhole-ventilator alleged to be the cause was about 40 ft. from the house in which the case occurred. Inside the house he found that the scullery sink-stone was connected directly to the sewer, and that the only protection from the inrush of gas into the house from it, was a small bell-trap with a water-seal of at most  $\frac{1}{4}$  in. When he removed the top of the trap, and held a lighted wax match over the mouth, the indraght was sufficiently powerful to cause the flame to flicker violently. He further found that the water service was intermittent, and that one cistern alone supplied the water-closet and the taps inside the house. He stated that, in his opinion, the disease was more probably caused by the sanitary defects inside

the house than by the exhalations from the manhole. In this moderate opinion, experts will join. In such a case comment is needless. We will only venture to say that it raises in the mind an uneasy suspicion that medical men look upon the manholes as a cause to which they can refer every case presenting a difficulty of explanation, or in which they are too careless to make diligent search for the real cause.

WATCHFUL.

### FORESTS AND HAILSTORMS.

SIR,—An article under the above heading appeared in the *Globe*, on the 15th inst., in reference to the influence of forests in the prevention of hailstorms, and observations by Herr Riniker, the chief forester of Canton Aargau, Switzerland, are referred to in support of that theory. The subject is interesting, and perhaps the following remarks on the article and the question generally of the formation of hailstones may be acceptable for your columns. That forests induce an increase of rain is certain, and that they tend to the prevention of hailstorms is almost as much so; but on other points the remarks are misleading. He speaks of "hail-charged clouds" as if the hailstones were suspended in the clouds; and also of such clouds being very low. In an article in "Science for All," part 34, "On how Hailstones are forged in the Clouds," in reference to their occasional large size and crystalline form, the author (Dr. Mann) says, p. 296:—"A mass of ice, weighing 3 oz. or 4 oz. cannot be poised in the air like a snow-flake, whilst its prisms and pyramids are being fashioned by the slow and delicate process of molecular attraction and adjustment. The hailstones which are precipitated with the force of a projectile from the air must be the creation of an instant, notwithstanding the cunning regularity and methodical order of the lines." I believe that hailstones never fall from a low cloud, but may fall through one, and that the larger hailstones fall from a great height, being at first very small, but increasing in size as they fall by the accumulation of vapour from the atmosphere, and that they take their crystalline form whilst falling. The larger hailstones of these latitudes, i.e., from 1 in. to 2 in. or 3 in. in diameter, have invariably a nucleus of white, opaque, compressed snow-like agglomeration, incased more or less in transparent ice. They are generally of a somewhat flattened spheroidal form, showing that these stones revolve during their fall; and at times crystals of ice are formed around the edge of their greater diameter. Their formation and fall I would account for as follows:—

As water is more than 800 times heavier than the air at sea level, and 3,000 times heavier than air at heights (five or six miles) at which clouds are known to form, it is obvious that no particles of water (vapour) could rise to such heights, or, in fact, to any height, and remain suspended unless by the aid of some buoyant power. This power I believe to be electricity, and there are good proofs of the connexion of electricity with evaporation. On this theory, in evaporation the minute particles of water rise with a charge of electricity in accordance with their own extent of surface and with the electric condition and temperature of the surface from which they rise, and are buoyed up by it to the level of their buoyancy in the atmosphere, until, from the effects of trees, mountains, or a damp and conducting condition of the atmosphere, the surcharge of electricity escapes, and, the buoyancy and mutual repulsion of the particles being thus reduced, they unite and fall as rain or sink to a lower level.

Clouds may thus form at different elevations, according to their electric condition, up to the greatest height at which vapour could float; the lower portion being liable to dissipation from causes as above named, but the more elevated clouds to which I allude are above reach from such causes, and, if away from mountains, could only be affected by thunderstorms or some such phenomena. Thus, we can readily imagine how, under certain meteorological conditions, and especially under those which present themselves in heavy thunderstorms, clouds might become piled up so as to discharge the electricity, by conduction, from vapour at heights far above that of ordinary rains. Under these circumstances, the precipitation would take place at a very low

temperature, and in the consequent fall particles would attract particles, and this with increasing force as the aggregation goes on. The snow-like nucleus of the hailstones would thus be formed, and the liquid vapour collected in falling through the lower clouds being frozen by the cold of the nucleus descending from such a height would produce the covering of transparent ice in which hailstones are sometimes enclosed. The occasional formation of large crystals of ice on hailstones may perhaps be due to a partial suspension in their fall from whirlings of the wind, giving the crystals time to form from the deposit of liquid vapour under intense electric influence. The connexion of thunderstorms with hail, and the force with which the latter falls, needs no further explanation.

It is seldom that hail falls in Winter, especially in frosty seasons; and destructive storms, with hail of large size, generally occur in hot weather, after a calm, with more or less of drought, conditions under which it seems probable that the upper air, i.e., as high as vapour could be floatable, would become heavily laden, and ready in case of a thunderstorm for the production of hail in the manner I have described. If this explanation be near the truth, it may readily be seen that forests, from their tendency to produce rain, must be preventive of hailstorms by keeping the lower air in a damp and conducting condition, and thus preventing any excessive accumulation of vapour in the atmosphere above them. The effect of forests as preventive of hailstorms, especially of coniferous trees, the pointed leaves of which attract electricity from surrounding vapour and increases the precipitation of moisture, was brought, by the late Dr. Rolleston, under the consideration of the Royal Geographical Society in a lecture at the evening meeting of May 12th, 1879.

Oxford.

G. A. ROWELL.

### THE STONE QUESTION.

SIR,—It is still a marvellous thing that the stone used in London buildings perishes so quickly. I refer more especially to those buildings which have been erected during recent years, many of which I have observed already show serious symptoms of decay. This state of things is no doubt due to the want of care and experience in selection, and I am of opinion that if proper care were taken in selecting the stone our large buildings would be much more durable than they have hitherto been. Unfortunately this is an age of cheapness, and some people will use soft stone; it is a great mistake, however, to use such stone in the erection of London buildings, especially soft Portland stone. Properly selected Portland stone is the best stone that can be used for London work: of that we have proof when we look at some of the old buildings which have been erected of that stone; but its durability here depends on care in selection.

The brown stone, as I said some years ago, is the best stone that can be used; and I hope, for the benefit of the masons' trade of this country, that the stone will be selected with greater care in the future than in the past; if this is done, greater credit will redound to all engaged in masonry, and less disappointment will be experienced by those gentlemen who spend their lifetime in conceiving and carrying out designs for the approval and benefit of the public.

Frequently when I have been in some of the Bath stone quarries selecting some of the hard material, others have selected very soft; and as there is no doubt that the soft and the thin beds of Bath stone perish most quickly, there is every reason to expect that in a few years hence we shall have a great deal more decay than we have had in past years.

Just a word or two with reference to the red grit stone. I have taken great interest in examining this stone in the neighbourhood where it is obtained, viz., Dnmfriesshire and Carlisle, there one can see a great deal of it already perished. I am not in a position to say that this stone is from the same quarries as that which is now sent to London; but I wish to warn stone-buyers against those agents who call upon one with a piece of stone about 1½ in. cube, and represent that this is a sample of the stone they have to dispose of. Very few men are capable of judging from these small pieces whether the stone is good or bad: the proper way is to go to the quarries and examine the strata and the quality of the stone generally;

by so doing one may be able to select stone that will stand the weather.

Corschill stone is a stone which has been used extensively in London, and if carefully selected from the best strata will stand the weather well. There are, however, some inferior stones in this quarry, but generally speaking I may say that it is a durable stone.

Yorkshire stone is frequently described in specifications without any quarry being named, yet the number of quarries in Yorkshire is too numerous to be mentioned here. This is a very important matter, for the difference between the hard and the soft York is just double the cost in working. Soft York, moreover, is of an inferior quality, and perishes with the frost, while the sun will even lift up the small laminated beds.

Caen stone has caused much disappointment to a great number of people. Many buildings erected of this stone are very nearly perished owing to atmospheric influences, the stone crumbling away like so much dry sand, and being blown away by the wind. I have noticed that it is chiefly the yellow and soft stone which decays thus, there being no silica to bind the particles together. One bed of this stone, which is of a grey colour, is as hard as Portland and very close in texture. This bed, I have noticed, stands remarkably well; in fact, equal to any stone we have in London. Where a building is erected entirely out of this, there is no doubt of its standing the weather well.

In conclusion, I may say that I have thrown out these few observations in order that those engaged in the buying and working of stone may take a little more interest in the important matter of selection, so that the masonry of this country may not be disgraced owing to the use of bad material in our buildings.

WILLIAM CROSS.

#### SCULPTURED STONES OF THE SAXON PERIOD.

CAMBRIDGE ANTIQUARIAN SOCIETY.

At a meeting of this society, on the 20th ult., the Rev. R. Burn, M.A., President, in the chair, the secretary exhibited, on the part of the Rev. C. B. Drake, Rector of Teversham, drawings of some trefoil tracery, at the back and sides of the easternmost of the three sedilia in Teversham Church. It appeared to have been covered up in the so-called restoration of the church some twenty years ago; and had been brought to light again a few weeks since. The patterns on the walls were repeated thrice, but were not precisely identical. The work was that of the fifteenth century. Between the sedilia were slender shafts, ending in capitals. On the capitals could be felt mortise-holes, indicating the existence at some time of small statues. The width between the sedilia was not the same throughout, the innermost one being 1 ft. 6 in. in width. The other two were 1 ft. 11 in. wide. The easternmost one appeared to have been surmounted by a lofty finial, of which only a portion of the shaft remained. There were other features of interest in the church besides the sedilia.

The Rev. G. F. Browne then proceeded to give a lecture, illustrated by a number of drawings and tracings,—upon sculptured stones and crosses of the Saxon period in the north of England (Bewcastle, Gosforth, Hexham, Ilkley, Lasingham, Leeds, Rothwell, Whalley, &c.). The lecturer said (we quote from the report in the *Cambridge Chronicle*) he felt some difficulty from the fact that any one of the places named would supply him with sufficient material for one lecture. His object was, however, to bring home to the minds of Cambridge antiquaries, more than had been done hitherto, the considerable number and very great importance of this group of sculptured stones. The great stones of Scotland, those of the Isle of Man, and of Ireland, and those of Wales, had books to themselves recording their description and history. But the ancient stones of England had no book of their own, and yet, as far as he could make out from a comparative study of the subject, there was no group of stones which spoke to them in the way in which they could make these English stones speak. He would first take them to Bewcastle, in the wilds of Cumberland, the place where Dandie Dimont was attacked by the robbers. In ancient times Bewcastle was a very important place, an outpost of the Roman wall, and when the frontier shifted from east and west to north and south, Bewcastle remained on the border-line, being,

as it were, a sort of pivot. It was, no doubt, a very important station in Roman times. Here was a very magnificent column, 14 ft. 6 in. in height. On one side were three panels, with figures, and a fourth panel filled with runes. On the west side there was interlacing work, of which he showed a specimen from the wonderful cross of Myredach, in Ireland. On another side there was, besides these interlacing panels, a very long one of simple chequers, the only instance he knew of a large panel of chequers. Two hundred years ago the Runic inscription on the column was very obscure, but now it was as clear as possible. The inscription stated that the column was put up in the reign of a certain King Egfrith, in memory of a certain King Alchfrith. That represented the patron of Wilfrid, who first established him in ecclesiastical position, by giving him Ripon, and who died in 664. There was inscribed in the very boldest characters the words "Christ Jesus." There were also on the column letters giving the name of Alchfrith's queen, and the queen's sister and brother-in-law. Mr. Browne next noticed a cross, 17 ft. 0 in. high, at Ruthwell, in Dumfriesshire, which was, no doubt, an Anglian cross, put up when Dumfries was in the possession of the Anglians. At the time of the Reformation the General Assembly ordered that it be taken down as being idolatrous. It was knocked down, but, fortunately, preserved in the church. About 100 years ago it was turned out, and it decayed considerably, but was now taken care of, standing in the minister's garden. One figure on it was no doubt St. John with the Lamb. Two other figures could not be made out. Another figure was that of Our Lord in the attitude of blessing. There were several other figures surrounded by inscriptions in Runic characters; one was supposed to refer to a passage in the life of St. Anthony, when he and Paul the Hermit brake bread. On the other side of the cross were similar panels, and then most exquisite scrolls. On this cross there was no interlacing work at all, and that of course made them ask what could have been its origin, for almost all stones in the north had the same sort of interlacing work, which was found also on the Irish crosses. There could be no doubt that this cross represented the Roman view of ornament, and that the interlacing work represented the Celtic view. He had seen it stated that Roman books were sent over to England by Pope Gregory who, having no artists for illuminating, had to employ a Celtic scribe, a book thus illustrated being sent over to Augustine of Canterbury. But this was a great mistake. Of the two MSS. in Corpus Library, that which was no doubt of the Augustinian epoch had no interlacing work, while the one ornamented with interlacing work was of the seventh century. This cross was covered on the alternate sides with runes, which could still be read. It was quite possible for a casual visitor to look at it and not know that he was looking at a large inscription. The history of these runes was the most interesting in literary discovery. Mr. Browne gave the different readings of the Runic characters which had been made out by Kemble and others. Kemble came to the conclusion that there was a very beautiful Anglo-Saxon poem engraved on this cross. About that time an Anglo-Saxon manuscript was discovered at Milan, which the Master of the Rolls had copied and printed. It came into Kemble's hands, and he suddenly found the lines which he had deciphered from the runes on the cross. Then he looked through the poem and saw that in it was every stanza which he had found on the cross. There was another most remarkable cross,—that of Gosforth,—with regard to which it was not too much to say that this year had seen a revelation of the language of these stones which no one had dreamed of before. Gosforth was not far from Wasdale. In the course of this year in examining some of the Scotch stones, he had come to the conclusion that it was quite possible that scenes from the sagas might be represented on some of these stones. Mr. Browne explained how the figures on several of these crosses had been discovered to be illustrative of Scandinavian legends. One figure represented Christ on the cross, and two curved lines from one side represented, one line the water and the other line the blood issuing from his side. Another figure represented Mary Magdalene, and it was very remarkable that the ointment-box she was represented as holding was in the true shape of an *alabastron*, or a cucumber-shaped box, which was snapped across

the middle when it was intended to use the ointment it contained. It was by some accident the Scandinavians had got hold of that detail so correctly. The dreadful serpent-like figure depicted up the middle of the cross was opening its mouth at the Trinity, emblematically represented immediately above. In reference to the Ilkley stones, Mr. Browne said they were of course well known to a great many; but he had never seen a real investigation of them. He did not think they would find anywhere more exquisite scrolls over crosses than were on those. The boldness of design and the symmetry of the scroll were beautiful beyond description. On one cross St. John was represented, with the beak and eyes of an eagle. On some crosses were figures of beasts holding up one paw in an attitude of obedience, the object of the design being to show the power which Christ had over those evil spirits represented in early times by these dragons. He thought these stones would repay more consideration than they had yet received. There were some very remarkable stones at Otley. At Collingham were portions of three beautiful crosses. Mr. Browne pointed out drawings of a Celtic cross, dug up at Tadcaster, on the stem of which were symmetrically inscribed a series of circles,—representing the consecrated wafers, with one larger circle representing the wafer used by the celebrant. Mr. Brown next noticed a Saxon tombstone at Thornhill, near Dewsbury, and a very remarkable cross 14 ft. 6 in. high, now preserved in the chancel of Leeds parish church. Professor Stevens, of Copenhagen, agreed with him in his interpretation of the curious design upon this cross, representing Volund carrying off a "Swan-maiden"; such a panel did not exist elsewhere in the whole world. Another panel from Leeds had interlacing work for its pattern. There were thirly interlacings, supposed to correspond with the days of the month. The four divisions of the pattern were supposed to represent the four seasons, while measurements made showed that a line produced diagonally through one upper corner of the oblong would strike the Pole Star, while one produced through the other upper corner would strike the Sun at Leeds at noon. Mr. Browne also gave interesting details about crosses at Hexham, Lasingham, Simington, and Kirkdale. In conclusion, he urged that something should be done to record the description of these stones in a book. They were being found in considerable numbers, and those at Gosforth furnished nothing less than a revelation. He thought the University might very well undertake such a task. Everything in the way of Greek or Roman art was represented in this University, and they had in this Society a great centre of enthusiasm. These crosses and stones showed them that their Saxon ancestors possessed a skill of execution and fertility of design which might make us very proud to call them our fathers.

In the course of the discussion which followed, the Rev. Dr. Luard said he thought the Society might, among other things, interfere to prevent an act of Vandalism which, according to the newspapers, was threatened at Savston by the utilisation of a cross of Barnack stone standing in the middle of the village for the purposes of a lamp-post.

The Chairman assured Dr. Luard that the Society had already done so, and that the monument had been saved.

A vote of thanks was given to Mr. Browne for his lecture.

#### AN AMERICAN ARTIST'S MANSION BURNED.

AMERICAN papers of the 11th ult. give details of the destruction by fire, on the previous day, of the residence and out-buildings of Mr. Albert Bierstadt, artist, situated at Irvington, on the Hudson. The house was built by Mr. Bierstadt as a summer residence, and is known as "Malkasten," or "Painter's Box." The house was square and built of stone, with four stories and high ceilings. It was erected about seventeen years ago, and its cost and that of the land together was about \$10,000. The loss is estimated at \$80,000, and is pushed up to the figure by the immense number of sketches which Mr. Bierstadt had stored there, in large part, of California scenes. Mr. Bierstadt, it seems, had not lived in the house for the past seven years. The most recent occupant was Mr. Henry T. Chapman, jun.

a broker of New York, residing in Brooklyn. Another account says that the building was erected at a cost of 100,000 dols. A studio, 75 ft. by 50 ft., with a ceiling 35 ft. high, was situated in the rear of the second story. All the rooms were spacious. The interior was finished in hard woods. Large Turkish rugs took the place of carpets. The furniture was costly. Nearly every room contained from three to ten valuable pictures of the famous artist. In the library were two pictures of Yosemite valley, valued at \$10,000 each. The furniture itself was probably worth \$10,000. The pictures and curiosities are estimated to have been worth nearly \$100,000 more. These two accounts appear to show a discrepancy of \$90,000 as to the cost of the building, and one of \$50,000 as to the amount of loss sustained.

#### YORK ARCHITECTURAL ASSOCIATION.

The project of forming an Architectural Association in York has been successfully floated. The first general meeting was held on Thursday evening last week. Mr. Wm. Brown, architect, presided, when the rules were brought forward, and were, with a few slight alterations, finally adopted. The preliminary arrangements have been energetically carried out by Messrs. Braithwaite, Cronnack, Hepper, Smithson, Yeomans, Smith, Burleigh, Benson, and Tate, with Mr. R. P. Shires as hon. sec.

The first meeting will be held on Dec. 21st, in the lecture-room of the Association, Victoria Hall, Goodramgate, York, upon which occasion Mr. J. Perry will read a paper on "The Present Aspect of Architecture in England."

Elementary and advanced classes of design and construction are being formed, and it is to be hoped the committee's efforts will be rewarded with success, as the new association will supply a long-felt want in the district.

#### BUILDERS' BENEVOLENT INSTITUTION.

The fifty-eighth election of pensioners on the funds of this Institution took place on Thursday last at Willis's Rooms, Mr. Jno. T. Chappell, President, in the chair. There were six candidates, — five men and one woman, viz., Charles Wood, aged 60 (second application); Robert John Dutton, aged 72 (second application); Francis Drake, aged 67; William Mansell, aged 64; Edward Bagridge, aged 60; and Martha Attwood (widow of James Samson Attwood), aged 72. When the election was arranged for, there were vacancies for two men and one woman, but in consequence of the great success of the recent anniversary festival, the committee decided to elect an additional candidate. The poll was open from two p.m. to four p.m., and shortly after the latter hour the scrutineers (Messrs. Thomas Stirling and T. F. Rider) announced the results of the voting to be as follows:—Drake, 1,794; Dutton, 1,019; Wood, 504; Bagridge, 170; Mansell, 132; and Mrs. Attwood, 43. The chairman therefore declared the successful candidates to be Francis Drake, Robert John Dutton, Charles Wood, and Martha Attwood.

On the motion of Mr. T. G. Smith, seconded by Mr. Rider, a vote of thanks was given to the chairman, who was congratulated upon the fact that owing to the success of his exertions in connexion with the recent anniversary, the committee were in a position to elect an additional candidate. Votes of thanks were also given to the scrutineers and checkers of votes.

**The Central Hall of the Houses of Parliament.**—Mr. Schreiber, M.P., writes to say that in answer to his question as to what steps the First Commissioner of Works intended to take next session for completing the decoration of the Central Hall, Mr. Shaw-Lefevre was understood to say that he thought it improbable any steps would be taken in that direction. So far as he (Mr. Shaw-Lefevre) could make out, the existing decorations had not given satisfaction, and he did not think the House would wish them to be continued. Upon this Mr. Schreiber gave notice that early next session, unless prevented by the new rules, he should call attention to the continued exclusion of three out of the four national saints,—meaning, of course, St. Patrick, St. Andrew, and St. David,—from their places in the central hall, and move a resolution in favour of their admission.

#### BUILDING PATENT RECORD.\*

##### APPLICATIONS FOR LETTERS PATENT.

- 3,496. S. Slater, Oldham. Stoves. Nov. 18, 1882.  
 3,508. L. A. Groth, London. Producing architectural ornaments, &c. (Com. by C. G. Mineur, Stockholm). Nov. 20, 1882.  
 3,528. E. B. Brooke, Huddersfield. Removing superfluous body and glaze off enamelled bricks and tiles. Nov. 21, 1882.  
 3,581. E. Hughes, Liverpool. Wood block and other pavements. Nov. 23, 1882.

##### NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

- Nov. 21, 1882.  
 4,951. J. M. Hart, London. Automatic registering apparatus for closed doors, &c. Oct. 18, 1882.  
 Nov. 24, 1882.  
 3,511. W. Wright, Plymouth. Flush cisterns. July 24, 1882.  
 3,737. B. J. B. Mills, London. Ceramic composition. (Com. by F. Gillet, Paris.) Aug. 3, 1882.

##### ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending November 25, 1882.

- 1,432. W. Bartholomew, London. Flushing tanks. March 24, 1881. Price 6d.  
 A pipe rises through the bottom of the tank which has a trumpet-mouth. Over this is a bell, which acts as the short leg of the syphon. The pipe terminates in a trumpet-mouth dipping into a box, from which is the outlet to the drain. When the tank is filled a syphonic action is established.  
 1,749. C. Major, Bridgwater. Roofing tiles. April 12, 1882. Price 6d.  
 These tiles are constructed with serrated or step-like bodies.  
 1,785. T. Rowan, London. Ventilating apparatus. April 14, 1882. Price 6d.  
 This is an improvement on Patents Nos. 5,303 of 1859, 162 of 1881, 505 of 1881, and 5,351 of 1881, in dispensing with cowls for producing the current of air, and lifting a store through which passes a series of pipes connected with the sewer or drain, &c., while their other ends open into the up-shaft or chimney. By the heat of this store the current is produced.

- 1,792. A. W. L. Reddie, London. Ventilators. (Com. by A. Huber, Cologne.) April 14, 1882. Price 8d.

A vertical shaft of tapering form is fitted at its upper end with a truncated pyramid, having five sides and independent upright wind-boards.

- 1,828. A. Smith, Huddersfield. Appliance for securing sliding window sashes. April 17, 1882. Price 2d.

A counterbalanced lever is attached to the lower style, the heavy end of which comes in contact with the upper style. (Pro. Pro.)

- 1,836. W. Walker, New York, U.S.A. Manufacture of artificial stone. April 18, 1882. Price 6d.

The stone is made of sand, cement, sulphur, and potash, and the blocks are hardened by being placed in a chamber and subjected to the action of steam which has been passed through a mass of sulphur.

- 1,857. W. Blyth, Barton. Manufacture of bricks and tiles. April 18, 1882. Price 4d.

These are pressed in dies, and finished off by hand.  
 2,047. W. W. Wynne, London. Bridges. May 1, 1882. Price 6d.

To allow the passage of vessels through bridges a portion of the bridge is constructed to be lowered into the water so that the vessel can pass over it.

#### FALL OF TWO RAILWAY BRIDGES.

ON the morning of the 24th ult. seven men lost their lives by the fall of a "cross-over bridge" on the London, Chatham, and Dover Railway, near Bromley, the poor fellows whose lives were thus sacrificed being servants of the company. The bridge which fell was an old brick-built one, about a quarter of a mile beyond Bromley station from London, and is stated to have been erected when the line between Bromley and Bickley was in the hands of the South-Eastern Railway Company. It connected private property on both sides of the line, and was for private use only. The London, Chatham, and Dover Company had been employing men in excavating the sides of the line in preparation for necessary widening, and, in the course of this work, the bridge, which was covered with ivy, was noticed to be in an unsafe condition. On the previous night, soon after the Dover Continental express had passed

the centre of three arches across the line fell. The break-down gang was brought from London to work at clearing the line, and this was done by daylight on the 24th. A telegram was sent from Bromley announcing that the line was clear, and the first London train out passed by the remaining arches of the bridge while the men were under one of them at breakfast. This arch fell and buried eight or nine of the men, gangers and labourers. Seven of them were brought out dead. The inquest was opened on Saturday last, when Edward Pearce, the forman ganger between Bromley and Bickley, was called. He stated that he was present when the accident occurred. On Thursday he noticed that the road on the down-line side was a "little out of the line,"—that it had widened. He examined the bridge, and, seeing that the pier on the down main line had moved, sent at once for Mr. Archer, the superintendent of that part of the road, the witness meanwhile having the bridge watched. The pier appeared to have gone somewhat sideways. Mr. Archer and the witness examined the bridge together, with the result that a telegram was despatched to the engineer's office at Victoria, and Mr. Hewitt, the assistant engineer, came down. He plumbed the bridge, and then gave orders that it should be strictly watched. Between one and four o'clock the brickwork of the bridge opened at the top, just above the pier on the down line, and cracks appeared. Then Mr. Hewitt came again, and gave orders for the bridge to be taken down. The men worked all night; the arch over the main line, and the smaller arch over the siding on the down-line side, fell without any warning. The arch over the hnt on the up side was left standing. The men got the line clear before six o'clock, in time for the 5.55 train to pass. They then went to breakfast, and were warned to be back at 7.30. Some went to Bromley to breakfast, others into the hut. The witness stopped outside to watch the traffic. At 6.52, while he had his back to the bridge, the third arch fell. The pier fell outwards.

The inquiry was then adjourned until this Friday, December 1st.

Colonel Yolland, on Tuesday, opened a Board of Trade inquiry at Bromley in reference to the fall of the bridge. Evidence was taken as to the inspection of the bridge on the day preceding the accident, and the ultimate falling of the structure. The inquiry was adjourned.

A disaster of a somewhat similar character is reported from Scotland. It occurred on the Great North of Scotland Railway, on the Macduff and Turriff branch of that line, and by it five persons have been killed and eleven seriously injured. The accident occurred at a point on the line two miles from Auchterless Station, and about the same distance from Fyvie. The custom of this railway is to run mixed trains of wagons and passengers' vehicles, and the train which left Macduff at 4.20, due in Aberdeen at six o'clock, was of this description, there being three wagons in front of the carriages. After leaving Auchterless the train passes through a level country for about a mile, and at this distance there is a level crossing, called Gatehouse. From this crossing the line rises till it reaches a bridge over the Ythan, a river about 30 ft. wide. A few hundred yards further on there is a bridge across the Turriff turnpike road. It is an old structure, built more than twenty years ago. It is made of iron, with wooden crossbeams, and there is no railing at the edges of it. The height is about 18 ft. from the level of the road, and its length about 40 ft. It was at this point that the accident happened. Telegrams from the spot state that the engine of the train and the guard's van had passed over the bridge in safety, but when the three wagons were crossing the bridge gave way, and the vehicles were precipitated on to the road beneath. The carriages, in which there were a considerable number of passengers, fell into the chasm, and were piled in a heap. The engine remained on the railway about 200 yards forward from the bridge, but the force of the falling wagons had pulled the tender off the line. The line at the point where the accident occurred is carried on the top of a high embankment, and crosses the Forgue turnpike at a height of between 20 ft. and 30 ft. on an iron bridge supported by wooden beams. It is not stated that the bridge had previously shown any signs of weakness, but it is inferred that the long-continued wet weather may have in some degree lessened the solidity of the embankment, and thus, at the same time, have interfered with the stability of the bridge.

\* Compiled by Hart & Co., Patent Agents, 156, Fleet-street.

MID-LONDON MARKET.

NOTICE has been lodged of an application to be made to Parliament next session for powers to form a market on some land at the back of the public gardens on the Thames Embankment, between Waterloo and Charing Cross Bridges.

This project is rather an extensive one, as, besides erecting markets, it provides for the construction of a new street from the Thames Embankment along the northern side of the public gardens to Villiers-street, which it will join nearly opposite the stairs leading to Charing-cross foot-bridge. There will be outlets from the new street to the Strand by way of Buckingham-street and York-buildings, which have been hitherto *culs-de-sac*, but will now be public thoroughfares.

The market buildings will be arranged on the north side of this new street, in four sections, divided by the intervening streets, but they will be connected together by glazed awnings. Each section will have a ground-floor of 30 ft. high at least, and a lofty basement or lower market beneath, on a level with the Underground District Railway. The Metropolitan District Railway will thus be brought actually into the market by means of a loop-line of rails from Charing-cross Station to a junction near Waterloo Bridge, and the markets will be directly connected with the whole railway system of London and the provinces.

Advantage is taken of the difference in level of about 40 ft. between the Thames Embankment and the Strand, and a high-level roadway in line with Adelphi-terrace is projected to be carried above the back part of the markets, on columns, as far as the houses of Lancaster-place, Waterloo-bridge, with light iron bridges spanning the intervening streets. The market buildings proper will not be raised above the level of the roadway of this terrace, but this terrace will have as a background a row of very lofty buildings, consisting of a large hotel and some blocks of offices and chambers overlooking the market roofs, and forming a connecting link in the river facade between Adelphi-terrace and Somerset House.

The architects are Messrs. Benson & Bargman, of Essex-street, Strand, and the Parliamentary engineer is Mr. E. Wilson, C.E.

DOCKS AND HARBOURS.

**Cape Town.**—On the 20th of October, the new graving-dock at Cape Town was formally opened, the Union Steamship Company's steamer, *Athenian*, cutting the ribbon and taking up her position in the basin. The water was pumped out of the basin in five hours, and the *Athenian* now lies there shored up, high and dry. The dimensions of the dock are 539 ft. at coping level, 500 ft. at keel-blocks, 6 ft. wide at coping, and 68 ft. at entrance. The depth of water on sill of entrance at low water is 21 ft. and at high water 26 ft. (ordinary spring tides). The blocks are of Poarl granite.

**Berwick.**—A public meeting of those interested in the proposed fishery harbour at the Green Haven, on the coast about half a mile north of Berwick pier, was held in the Town-hall, Berwick, on the 23rd ult. Mr. W. Henderson read the report of the committee, which stated that they were unanimous in admitting the importance of the proposed harbour to the town and district; that the Duke of Northumberland had agreed to grant the ground at a nominal rent; and the North British Railway Company, the committee believed, would run a branch line to the harbour. It was only proposed to construct section 1 of the harbour, as shown upon the plan, and this could be done at a cost of 24,743l.; and as the power of the Harbour Commissioners extended about two miles along the coast to the north they would have to be consulted. The only plan they could see to float the scheme was to get at least one-half of the amount required, and they thought that if they could raise 15,000l. they might get a loan of the rest. They thought such a scheme might be considered and tried. Alderman A. Darling, as chairman of the committee, said they had been very fortunate in securing the services of Mr. J. Watt Sandeman as their engineer, and he had produced a large and comprehensive plan. He moved the adoption of the report, and that steps should be taken to carry out the scheme. The motion was agreed to, and a committee was appointed to promote the scheme.

**Lerwick.**—At the annual meeting of the Lerwick Harbour Trust, on the 22nd ult., with reference to the opposition of Mr. George Hay to the alterations which have been made in the works, which chiefly consist in carrying the pier out from the shore as a solid work, instead of making a connexion with the shore by means of a bridge, a letter was read from Mr. Hay's agents in Edinburgh (Messrs. Mackenzie & Kermack) intimating that the harbour plans had been examined on behalf of Mr. Hay by a firm of engineers, who stated that in their experience they had never seen such a deviation, as was here proposed, from plans authorised by Parliament, and assuring them that the alteration is not authorised by anything within the limits of deviation described in the deposited plans, being simply a substitution of one kind of work for another. It was decided to intimate to Mr. Hay that the trustees were willing to undertake, but without prejudice as to their claim on the pier, that the depth of water at Hay's pier would be maintained, and that the contract for the erection of the works would be ready for signing at an early date.

COMPETITIONS.

**The Wallace and Bruce Statues, Edinburgh.**—The sub-committee of the Lord Provost's Committee on the Wallace and Bruce Memorial met on Tuesday last, and decided that none of the competitive designs previously noticed were of sufficient merit to justify them in recommending the Town Council to proceed to carry out the bequest of the late Hugh Reid. In acknowledgment of the trouble to which the competitors (eight in number) had been put, they agreed to recommend that each should receive the sum of 10l. They further recommended that, in the meantime, the Reid Bequest money should be allowed to accumulate.

COMPENSATION CASE.

**CLOSE v. METROPOLITAN BOARD OF WORKS.**  
On Wednesday last, at the Sheriff's Court, Westminster, before Mr. Under-Sheriff Farrer and a special jury, the case of *Close v. Metropolitan Board of Works*, was heard.

This was a case in which the question to be determined was the amount to be paid by the Metropolitan Board of Works for the freehold premises of Mrs. Close, No. 3, Moor-street, Soho, taken for the new street from Piccadilly-circus to Oxford-street, and for compensation for disturbance of her business as a baker. The amount claimed was 4,790l., viz., 2,200l. for the freehold property, 2,500l. for damage to business, and 90l. for fixtures.

The evidence for the claimant consisted of that of Mrs. Close and other witnesses who had examined the books, and they calculated the profits of the business at 518l. per annum, on which five years' purchase was claimed.

Various estimates of the value of the freehold were given.

On behalf of the Metropolitan Board of Works, Mr. Dewar, Fetter-lane, made out the profits to be only 320l. a year, and it was maintained that only 1 1/2 year's purchase should be given,—say, 500l.

As to the freehold, the witnesses put the value at 1,640l.—making 2,940l. altogether.

Counsel on each side having addressed the jury, the Under-Sheriff summed up, and the jury found a verdict for 3,375l.

REMOVAL OF STREET SLUSH.

**STR.**—In a recent issue you mention the trial of new watering and sanding machines in London.

Along with these there is much need of a more economical and expedient way of removing slush than that employed at present, viz., shovelling it into open carts in the thoroughfares. Such a method is certainly not in keeping with progress, when other means are at hand.

The vacuum cylinder or drum is not a thing of to-day. It has been used in a Northern city for removal of the contents of urinals, &c. While the machine is being driven along it works an air pump, which forms a vacuum in the cylinder. When a certain vacuum is reached (which is shown by a gauge), an iron pipe, with india-rubber hose connexion, is let into the sunken hogshead or tank; then the tap is opened, and the whole contents rush up into the cylinder without any splashing or inconvenience whatever to the traffic.

If such a machine was thought too complicated, there are plenty of chain or india-rubber valved pumps made to pump slush that could be fixed to the back of water-tight carts, and worked by hand, which could easily remove the contents of any slush-receptacle.

T. T. L.

OLD FORD ROADS.

**STR.**—What is the General Rate? The demand-note says, highways, cleansing, lighting, &c. Surely this is wrong, as a visit to Monier-road, Old Ford, will show.

The road is certainly indifferently lighted, but the cleansing appears on paper only, for both road and pathways are nothing but mud, silt, and slime. The slop lays in the road until it is covered with a green slime.

Is this conducive to the health? I suppose when an epidemic breaks out we shall have inquiries and inquiries. Then things will be altered. Is not prevention better than cure? H. SMITH.

INDEX TO THE BUILDER.

**STR.**—Ten years ago a suggestion was made in the *Builder* that, with thirty years of existence, a complete index for the time being was absolutely necessary to all those who had to search its pages for information they might be in need of.

This necessity is rendered still more pressing now that another ten years of much bulkier matter has been added. Cannot this complete index be compiled by a staff of volunteers? I think they might be found, and that the sale would guarantee the venture. T. P.

CLIFF & SONS v. COTTRELL.

**STR.**—Our attention has been called to the report of the above case in your issue of the 26th ult., and as it is calculated to convey an inaccurate impression of the grounds of the verdict, may we request you to give publicity to the fact that the case was decided on a technical point that the bricks delivered did not correspond with the exact description ordered,—a matter on which there was a quantity of conflicting evidence?

SCATCHERD & HOPKINS,  
Solicitors for the Plaintiffs.

Books.

**Greece, Pictorial, Descriptive, and Historical.**  
By CHRISTOPHER WORDSWORTH, D.D., Lord Bishop of Lincoln. A new edition. London: John Murray.

This is a handsome republication of an old work, the title of which, we may observe, is very absurdly worded, implying that it is Greece which is "Pictorial, Descriptive, and Historical," whereas it is the book which is understood to have those qualities. It is surprising that so good a scholar as the Bishop of Lincoln should originally have permitted such an illogical arrangement of words on his title-page. However, if there is little in a name, there is not, perhaps, much more in a title-page, and the republication of a book containing in one large volume so much in the way of description, comment, and pictorial illustration about Greece will probably be welcome, as the book has become one of that class of which it is said that "no gentleman's library can be considered complete without it," and the new generation may wish to supply this deficiency in their shelves.

It is hardly to be supposed that a book on Greece published a good many years ago will be in its illustrative department equal to what is expected now in a book on such a subject on a large scale; better illustrations are found in many much cheaper books at the present day. But the general view of the history, aspect, and associations of the country, given by a man of extensive learning and refined mind, retains its value, and the rather old-fashioned style of the illustrations is a not unpleasant reminder of earlier days, and an interesting example in regard to the change which has come over book illustration of late years. The book is prefaced by a long introductory chapter, or rather essay, on the characteristics of Greek art, by Mr. Geo. Scharf, which he has revised, and to which, we imagine, some new illustrations have been added; we have not the original edition by us for comparison. We may presume that some care has been expended in the revision of this part of the work, on bringing the information up to the level of the present standard of knowledge, though we do not see any reference to the new theory as to the method of lighting the Parthenon. The present editor, Mr. H. F. Tozer, has added a few paragraphs in their proper places, relative to the recent discoveries at Mycenae, Olympia, and elsewhere; and this he has done with great care and judgment, so that the interpolated passages appear to come in naturally and as if part of the original work, and no "joinings" are perceptible. A view of the street of tombs on the road from Athens to Eleusis is one addition to the illustrations. Binding and paper are all that could be wished,

and the book may be recommended to the notice of the many persons who do not possess a copy of the original edition, as well as to libraries, private or public, in course of formation.

*The Metropolitan Building Acts: a Text-book for Architects, Surveyors, Builders, &c.* By BANISTER FLETCHER, F.R.I.B.A. London: B. T. Batsford, High Holborn. 1882.

THE edition of the Metropolitan Building Act published by Mr. Banister Fletcher some years ago being out of print, he has issued another with the addition of recent additional Acts of Parliament and other necessary matter,—the Amendment Act of 1878, the General Orders published by the Board of Works, and the most recent information as to liability in respect of the paving of new streets and the local management Acts. To save his readers the trouble of referring from page to page and to footnotes to find all the information that relates to the same matter, Mr. Fletcher has sought to bring all the information together, including cases that have been settled, the majority quoted from our own pages. While this has a certain usefulness, the user of the book must be careful to distinguish between what is the actual law and what are merely the opinions of the writer and quotations from newspaper reports, which have no weight in court. They afford, nevertheless, much valuable information.

*The Magazine of Art.* Vol. V. Cassell, Petter, & Galpin, London, Paris, and New York. 1882.

THE volume for 1882 of this art-periodical contains a good many articles of interest, and a large number of mostly good illustrations. Architecture and ornamental art are fairly represented among the papers contributed. In an article on "The Venice of Titian" (a very interesting subject) by Mr. Wyko Bayliss, the point is, however, rather missed by the mistake of drawing the illustrations so as show the buildings looking like old ones, which were comparatively new in Titian's day; a curious mistake, as one would have supposed the very object of such an article should have been to show sketches and suggestions of Venice as the place would have looked at that date. An article on the New Law Courts by Mr. W. Armstrong is noticeable as being one of the few attempts we have seen to form a reasonable critical judgment of the building. Mr. Armstrong, while writing with cordial appreciation of some of the detail of the building, has the independence to speak strongly as to what he calls the "almost malicious disregard of symmetry" in many parts of the building. He goes on to say,— "There are six towers all different, though all of very squat proportions; there are eight façades, counting those in the great or eastern quadrangle, and they are all, with the doubtful exception of that which faces Clement's Inn, broken up into so many parts and into such unsymmetrical masses, that no one of them is much more expressive than if it were made up of half a dozen buildings by as many different architects. Such want of coherence was appropriate enough in the great Mediaeval buildings upon which Mr. Street has modelled his art. They were usually the work of several generations, and as they received successively the impress of many directing minds, their irregularity was a natural growth, and was as true in expression as it was picturesque. In these days of what may be called Romantic architecture, it is too often forgotten that a picturesque ensemble is in its very nature irreconcilable with a great artistic conception. The latter cannot exist without unity, symmetry,—in a word, without individuality; but the qualities which make a building picturesque are identical with those which deprive it of individual expression." We are not sure that Mr. Armstrong has used quite the right word here, unless he means the word "individual" to be taken in its more literal sense, as denoting a building which must be considered as a whole and not in divided portions. It is not impossible for an architect to design a picturesque building which may show his own individuality of taste. It would have been truer to say that a great conception will be homogeneous, and what is usually called a picturesque building is not so. "His meaning is good," however, and we are glad to find a thoughtful artist like Mr. Armstrong concurring in the views about the Law

Courts building which had been already expressed by ourselves.

Mr. Champneys has contributed one or two articles on Wren and his works; there is one on Alwick Castle; and among articles on decorative subjects is one by Mr. G. Wallis on "Decorative Ironwork," with some illustrations of very piquant and charming ancient designs of various types. The affectation at the close of this article and in other places of shading part of the page so as to make it appear as if it were a separate leaf pasted in and curling up from the background, is a piece of foolishness which should be avoided in future. Among miscellaneous contributions is a very well written paper, by Mr. R. L. Stevenson, on Bagster's illustrated edition of the "Pilgrim's Progress," with reproductions of some of its small and quaint anonymous woodcuts. We entirely agree with Mr. Stevenson as to the suggestive interest of many of them; they were quite worth calling attention to; those illustrating "The Chamber called Peace" and "The Enchanted Ground," and one or two others, are almost worthy of Blake.

#### VARIORUM.

*Longman's Magazine*, No. 2, has a considerable instalment of a serial story, by Jas. Payn ("Thicker than Water"), and contributions by Samuel Smiles, R. A. Proctor, J. A. Froude, Mrs. Oliphant, and others. If kept up to this mark it can scarcely fail to succeed.—*The Gentleman's Annual*, Christmas, 1882 (Chatto & Windus), includes four stories, all pleasant reading, the principal one, "Day and Night," being by Mr. Franchell.—*The Belgravia Annual* for Christmas (same publisher), contains matter of the same kind, with the addition of a number of illustrations.—*The Ship Canal Gazette*, just now produced, is devoted to the movement having for its object the constitution of Manchester as a port for ocean-going vessels. This would seem to show that the movement is a wide one.—*Arrowsmith's "Christmas Annual"* for 1882 has the title of "Brown Eyes," by May Crommelin, and is a pleasantly-written and stirring story.—"The Bow of Strength" is the title of the *Quiver Annual* for 1882, and with its coloured cover and many woodcuts certainly a good sixpenny worth.—Then comes "Our Happy Family," the *Little Folks' Annual*, Harrison Weir and Ernest Grist being chief amongst the illustrators.—*Cassell's Illustrated Almanac* for 1883 has a good print on every other page, and sometimes more.

#### CHRISTMAS CARDS.

*Eyre & Spottiswoode* have sent us a long catalogue of the cards published by them for the coming Christmas and New Year, and a specimen packet. Executed under the manager of last year, Mr. W. G. Wallis, and in many cases by the same artists, the results, so far as we see, are entitled to the same praise we gave on that occasion. The sale of such cards appears to be ever augmenting; every shop-window in some parts of town is full of them.

#### Miscellanea.

**The New Scottish Conservative Club-house, Edinburgh.**—was opened by the Marquis of Salisbury on the 23rd ult. The club, which was founded at a meeting held in 1877, originally started with a membership of 1,000. The number has been increased from time to time, and as the limit was exceeded by the applications, recently the club adopted a resolution to increase the membership to 2,000. The constantly-growing membership rendered the temporary premises first occupied inadequate, and the erection of a new club-house was found necessary. In the summer of last year building operations were begun. The site has a prominent frontage in the centre of Princes-street. The design was furnished by Mr. Robert Rowand Anderson, A.R.S.A.

**Didcot, Newbury, and Southampton Railway.**—The directors of the Didcot, Newbury, and Southampton Junction Railway, at a meeting held a few days since, resolved that the works at Southampton should be commenced as soon as the specification and plans (now in active preparation) are completed. For these (with the exception of earthworks) tenders will be invited from local firms, the contract for the general construction of the railway being in the hands of Messrs. Falkiner & Tancred.

**The Health of the Army of Occupation in Egypt.**—We learn that with the view of maintaining the health of the 11,000 or 12,000 troops now in Egypt (of whom about 9,000 are in Cairo and 2,500 at Alexandria), the barracks both at Cairo and Alexandria are undergoing a thorough painting and cleansing. They are mostly lofty buildings, but, as is well known, they were in a condition of horrible filth and dirt when first entered by our men. The sanitary arrangements in these buildings have been improved as much as possible, and the "dry-earth system" has been resorted to and applied in the manner practised in India. The hospital accommodation at Cairo was at first, owing to the condition in which the public buildings were found to be, hardly sufficient, but the cleansing process having been now completed, it is stated to be ample for all probable contingencies. In the citadel there is room for some 280 beds. The situation of this place, which is the highest in Cairo, is well suited for the purpose, and the rooms are lofty and well ventilated. At Abbasieh there is a second hospital of 300 beds, and at Ghezireh there is a third; but this is a tent-hospital, and it is capable of holding a varied number. There is a building near Abbasieh which is being prepared for a hospital; it is an isolated place, and is reported to be suitable for the purpose. At Alexandria the principal hospital is a building, consisting of four large sheds, facing the sea, which will hold 300 beds, and it is contemplated to supplement it by the equipment of a bulk hospital capable of holding 200 patients.
