

AN

✦ ILLUSTRATED ✦ WEEKLY ✦ MAGAZINE ✦

FOR THE

ARCHITECT, ENGINEER, ARCHÆOLOGIST, CONSTRUCTOR,  
SANITARY REFORMER, AND ART-LOVER.

CONDUCTED BY

GEORGE GODWIN, F.R.S., F.S.A.

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedom, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"Our English word TO BUILD is the Anglo-Saxon Byldan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"Art shows us man as he can by no other means be made known. Art gives us 'nobler loves and nobler cares,'—furnishing objects by the contemplation of which we are taught and exalted,—and so are ultimately led to seek beauty in its highest form, which is GOODNESS."

VOLUME XLIII.—JULY TO DECEMBER, 1882.

OFFICE: No. 46, CATHERINE STREET, COVENT GARDEN, LONDON, W.C.

# INDEX TO VOLUME XLIII.

JULY TO DECEMBER, 1882.

ABATTOIRS, mod-d, 797  
 Abbey, Melrose, 235  
 Abordon improvements, 236  
 Academy, Royal: architecture at, 75; prize distribution, 791

Our Waterside Towns, and the Present Gravitation of the Building Trade towards them.

WE remark that all great cities are situated on the banks of great rivers is one that must be accepted with some reserve. London, no doubt, is the child and the nursling of the Thames. But Rome is not the child of the Tiber, nor is Paris

that of the Seine. The existence of a copious and perennial supply of water is, indeed, a necessary condition of the growth of a great town. But it is not always by a river that the requisite supply is best afforded. And in early times, at least in many parts of the world, the spots selected, first for the cryeries of the little robber chieftains, and then for the sites of the towns that grew up under the shadow and protection of these strongholds, were rather mountain tops than river estuaries. Throughout Italy, and in many parts of France and Germany, this is notably the case. And in Palestine, where history goes as far back towards the past as in almost any part of the world, the struggle for the capital rank was long kept up between the arid but highly defensible rock of Jerusalem, and the naturally commanding and equally riverless elevation of Samaria or Shechem. The maritime importance of Tyre and of Sidon, like that, in later times, of Venice and Amalfi, was by no means connected with a local supremacy over the interior of the country.

Our present object in referring to this matter is to call attention to the change in the gravitation of population towards urban centres, of which certain indications are now visible. To the architect, the builder, the owner of, or speculator in, house property of any kind,—the moment he looks beyond the prices or the

wants of the hour,—the subject is one of primary importance. Great fortunes are most readily won or lost, in any matters connected with building, by the exercise of the faculty of prevision, or at least of that sound induction from known facts which tends to show in what direction the movement of the future may be anticipated. As to this, a cause of change which came into operation some half a century ago, although still powerful, is no longer alone in its efficiency. Other causes are beginning to act as factors,—some naturally, some disastrously. It is for the statesman, or the public counsellor, to look these elements of change in the face.

In the first place, the observer has to inquire into the change which is taking place, not in England alone, or in Europe alone, but pretty well all over the world, in the distribution of urban and rural population. We took occasion the other day (vol. xliii., p. 727) to point out that the increase in the building going on in the metropolis, and in towns of more than 3,000 inhabitants, was exactly double that going on at the same time over all the rest of the country. In France the disturbing element is far more active than in England; but this is, unfortunately, only matter of degree. The first Juno number of the *Revue des Deux Mondes* contains a very significant and sombre article on the decrease of the population in France. It is in certain provinces, specified by the writer, that the most alarming and rapid decrease takes place. But, on the whole, the population of France is on the ebb, amid the full tide of surrounding Europe. And if the evils pointed out by the writer cited spread in their contagion, the national decline of that country is a certain feature of the not remote future.

The special cause active in France,—the positive refusal of a considerable portion of the population to rear families,—is not, as yet, thought to be prevalent among ourselves. Yet it is impossible to avoid hinting that the main though unspoken cause of certain personal or party squabbles that have of late disgraced our civilisation has been the strong repulsion felt by Englishmen of nearly all shades of opinion to

the attempt to found in this country a sort of propaganda of national decay. Even as it is, while our rate of interest during the last decade was higher than it has been in any decade since 1831—41, there was actual decline of the population in no fewer than fourteen counties. While the balance of increase was 14.34 per cent. on the number of 1871, there was a decrease of from 0.05 to 9.1 per cent. in the counties in question, the most considerable decline occurring in Cornwall. But we should not confine our purview to England alone, in face of the fact that, since 1846, the population of Ireland has decreased by no less than 40 per cent.

What is common to England and France, and no doubt exists elsewhere, is this. The rural population are attracted towards the towns, and the proper balance between births and deaths is thus altered, partly by the less viable conditions of town life for infants, and partly by other assignable causes. This movement we can do little more than mark. But the change to which we refer is this. The town agglomeration of the last three or four decades has been chiefly aided and stimulated by the facilities of railway communication. We have some very remarkable figures before us which show that this element of change, which is still powerful in agglomerating buildings around stations, instead of spreading them along inland highways, is in some marked cases far less efficient than are the increased facilities for maritime communication which have been won by the enterprise of such towns as Newcastle, Stockton, and Glasgow.

In the middle of the last century the Clyde was fordable on foot at Dumhriek Ford, twelve miles seaward of Glasgow. In the year 1778, the improvement of the river was commenced by Mr. Golborne, and within eight or ten years, partly by dredging, and partly in consequence of the improved scour of the river, the channel was lowered 14 ft. at this spot. In the beginning of the present century the work of improvement was carried on by Mr. Rennie; and in 1810, a digested scheme of improvement laid down by Mr. James Walker, was taken in hand. Between 1844 and 1871, about 14,000,000

cubic yards were dredged from the river. Thus, while in 1755 the depth of the Clyde at Glasgow was only 1 ft. 6 in. at low water, in 1830, vessels drawing 15 ft. of water, and in 1870 vessels drawing 22 ft., were able to use the harbour. And now the available channel is 24 ft. deep at high water, from Glasgow to Port Glasgow, and vessels drawing 22 ft. of water can reach the sea from the former city in a single tide.

Directly connected with this opening of the maritime channel has been the increase of Glasgow. In 1801, the population was 77,385. In 1841, when Mr. Walker was attacking the question of water access, it had risen to 255,650, or rather more than trebled. In 1881, including the population of the suburban burghs, it was 603,850, or between ninefold and tenfold of its size in 1801. In the last twenty years the ship-building on the Clyde has increased from 66,801 tons to 341,022 tons, or more than fivefold.

Similar effects have been produced, by like means, on the Tyne. The improvement of this river was commenced in 1843, but by 1860 the depth over the bar was only 6 ft. at low-water spring tides, and the depth of water at flood tide at the Redheugh Bridge was only 12 ft. below the high-water level of 1875. It is now 34 ft. at that spot below that level. During the same period the tonnage clearing from the Tyne ports has grown from 3,196,781 tons in 1861 to 5,908,886 tons in 1881; and the population of the Tyne ports from 227,926 in the former year to 500,000 in the latter.

The significance of these figures is enhanced by comparing them, not only with the decrease of the population in Cornwall, or with the mean increase of 14.54 per cent. in ten years in England and Wales, but with the steady normal increase of London and Liverpool. The latter port has now very close upon one-third of the entire sea-horne commerce of the kingdom. From 1861 to 1881 its shipping has increased 59 per cent. During the same period that of the Tyne has increased 85 per cent., and that of the Clyde 103 per cent. Thus, when the engineer has waited upon nature, and has, with her powerful aid, opened a channel for sea-horne traffic to inland towns, the builder has followed in his wake; and while London has demanded housing for double her population in forty years, Glasgow has made a like demand in thirty, and the Tyne ports have done the same in less than twenty years. So important a change in the distribution of our internal growth is a fact of extraordinary significance.

It will be understood by our readers that we are approaching this many-sided question from the point of view of its architectural significance. Not, that is to say, of pictorial or structural architecture, although that is a matter on which there is perhaps much to be said,—but with regard to the prospects and the activity of the builder. Not is it house-building alone that is in question. Churches, markets, town-halls, and other important buildings are demanded by the increase, and grow with the growth of population, and that with greater rapidity, as well as in more stately proportions, than at any previous time in our own national history.

While, then, the contrast between inland and seaboard or riverain building may be considered as originally a question of race, it is certain that since races have become blended, as they now are in this country, there has been a sort of oscillation between the two tendencies. In those remote times, as to which we have not a single word of written history, although we have monuments in great numbers, it is pretty clear that the capital of great part, and probably of the whole, of the island was in the elevated site of Avebury. The numbers of harrows that surround a spot of such extraordinary former grandeur testifies to this, no less than do the actual relics. It might, perhaps, be urged that this concourse of the departed only indicated a religious, and not a political centre. But the reply to this is, that the distinction is a mark of comparatively recent times. When we obtain the first written account of our country, from the pen of Julius Cæsar, it is tolerably certain that no inland mountain capital existed. Neither the Roman nor the Norman conquest would have been possible if Avebury had been at the date of either of those invasions a strongly-fortified capital. On the contrary, it was, as late as the time of Alfred, to the swamps and to the marshes that our ancestors betook themselves for shelter from the

foe; and the Swiss lake dwellings may probably give us an idea of the architecture of Britain in the first century. We are not unaware of the claim put forward for Verulam as the capital in the time of Cæsar, but we incline to the view which points even then to the primacy of London.

We need not trace the alternate importance of seaport and of inland towns during the changes of our early history, or recall the past importance of the Cinque ports, afterwards improved to eight. Generally speaking, as maritime adventure and prowess predominated, the ports rose in comparative importance; as travelling was made more easy and roads improved, the inland towns increased. London shared in the advance of each. But it was the opening of the cheap and easy route of the canals that opened our collieries, and enabled the steam engine to create those hives of internal industry which abound in the Black Country and other mining and manufacturing districts.

The reduction of the cost of land carriage to one-fifth of the former cost by road, which we owe to George Stephenson and his school, gave again an impulse to the growth of our inland centres. But as this mode of conveyance spread over Europe, and as foreign manufactures, produced by English machinery,—more and more competed with English manufactures in the markets of the world,—the fact that every form of land carriage must of necessity be more costly than water carriage has become more and more apparent. And at the moment at which we write it is this force which is causing such a movement as we have before mentioned to the free water sides of the Clyde, the Tyne, the Tees, and other rivers and estuaries. It is not the sea-port, alone, or the neighbourhood of mines or collieries, alone, that now determines the site selected for a great and lucrative industry. What manufacturers are now observing is this. They must have at the same time water access to the sea, and water access to mines and to collieries. The more near the centre of a great consuming district these two conditions can be secured, the more certain is the future growth of the population. But the feature which, so far as we can foresee, will distinguish the building energy of the next twenty or forty years from that of the past half century is the fact that water access to the sea is likely to prove more attractive than proximity to mines. An instance of what we mean is found in the fact that the directors of the great limited Company of Charles Cammel & Co. have reported that the rail-mills must be alongside the blast furnaces, and that these must be close to the place where the ore is found, and must also be accessible by sea. They are for this reason removing their works from Sheffield, the cradle of the steel manufacture, to Cumberland. It is hardly to be doubted that this great blow to the prosperity of Sheffield is not unconnected with the purchase of the Dove river navigation, of the Sheffield Canal, of the Dearne and Dove Canal, and of the Stainforth and Keadley Canal, by the Manchester, Sheffield, and Lincolnshire Railway Company. The direct waterway from Sheffield to Goolse is only thirty-five miles. The cost of carriage, if unimpeded, would be not more than a shilling a ton for the entire distance. Wherever the new works are situated, there must be some cost incurred,—and it is hardly to be thought credible that a great manufacture would leave its cradle if all that it could expect to gain by so doing would be the fraction of a shilling per ton on its transports. At all events, it is extraordinary that, at a time when steel is becoming more and more exclusively a building material, not only for naval architecture, but for military defence, Sheffield should lose its ancient predominance in the manufacture.

It may be said that the activity of the builder will be as lucrative on the new site of every such displaced industry as in the old. Nay, even more so; for the workmen, who are already housed in Sheffield, will require new dwellings on the new site. But a brief stimulus of this nature given to the activity of the builder is not without its counterpoise. How about the empty houses at Sheffield? How about the increased incidence of the local rates on those left behind? What is of even more importance than foresight, as to the movement of the centres of industry, is the need that such movements should not be produced by artificial causes. We fear that it is so in this case; and, if so, whatever be the gain to individuals, the balance is loss to the country.

#### SEPULCHRAL AND MEMORIAL ARCHITECTURE.\*

THE transition from the Pagan to the Christian tomb seems to be as gradual, as deficient in marked character or decisive alteration of type, as the transition from Pagan to Christian style in architecture considered at large. In a certain sense, the passage from the one to the other might be said to be found in the Catacombs, but, in fact, these rather serve to show how impossible it is to draw the line, save in one point only; the Christians did not burn their dead, and did not, therefore, make use of cinerary urns. The urn is a purely Pagan attribute, so distinctly so as to render almost absurd the prominence given to it as a feature in Christian monuments during a great portion of the period since the Renaissance. But the Roman arrangement of cinerary urns in columbaria, or ranges of niches, seems to have given the hint for an arrangement which was destined to be continued in a modified form up to the end of the Medieval period. The placing of the coffin or sarcophagus in a niche in the wall, there can be little doubt, was derived from the columbarium; the sarcophagi of Roman families had been, in fact, so placed before the Christian era, but often with the ends turned towards the opening, of course a manner of arranging them which was much more economical of space than the longitudinal position. For whatever reason, however, the longitudinal adoption of the sarcophagus was definitely accepted by Christians at an early period; and it is in this form that Christian tombs and monuments appear in the Early Medieval period, after an interval during which Pagan architecture had gradually decayed and Christian architecture not yet fairly entered on its course of new development. Of course, as far as architecture at large was concerned, there never was any real gap in the series of buildings from Roman to Medieval; but in regard to tombs there seems to have been a positive hiatus, for some time previously to the twelfth century, during which the treatment of tombs as opportunities for expressive and decorative architectural design was almost entirely in abeyance.

There is, however, another development of tumular architecture on a larger scale, from Roman into Christian, of which there are but few though important examples, and which could not possibly be omitted in our glance at the subject. The examples of this are in the circular or octagonal tomb-churches, as they may be called, which formed the repetition of the idea set forth in such an erection as the mole of Hadrian. In these, again, we have the repetition of the Roman form of building merging, by gradual and almost imperceptible stages, into a form essentially Christian, but which was practically abandoned at an early stage of Medieval history. The earliest link in the series was the tomb of St. Helena, almost entirely Roman in style, a circular building in two stages; another form is the tomb of Theodoric at Ravenna, octagonal instead of circular, but in other respects preserving the Roman two-story form even more completely than the tomb of St. Helena, inasmuch as the upper story is of smaller dimensions than the lower, appearing to grow out of it, as must unquestionably have been the case also with the mole of Hadrian before the colonnade was removed from the exterior of the lower stage of the building. The church at Aix-la-Chapelle, first built as a circular church with no choir, by Charlemagne, and probably intended to serve the purpose of a grand tomb on somewhat the same model as that of Hadrian, is the last of this class of building in the progress of European architecture, unless we were to include the circular churches of the Templars, which are so far connected with the subject that they are copied from a tomb-building, though not built with any idea of their fulfilling the same function, save in the same degree in which nearly all Medieval churches may be said to do so, as being the receptacles of monuments of the dead. The octagon or dome form of tomb, however, received even higher development than it had ever received from the Roman or Romanesque builders, at the hands of the Saracenic architects in India, whose peculiar form of tomb design, the octagon dome rising from an arcade on the ground-story, is probably to be traced to Rome also, though through what intermediate

\* See vol. xlii., p. 750.

stages it is not easy now to say, when so much of the probable connecting chapters of the history have been expunged. The comparison of the Taj Mahal with the mole of Hadrian is, however, very significant and striking, not only architecturally, but in regard to the sentiment expressed in each of these great and world-famous monuments. The Hadrian building was the expression of no tender memory of the dead; it was the expression of mere personal pride and ambition, the resolve of an irresponsible ruler to provide a great monument to testify to his own wealth and power. The Taj expressed a far higher feeling; it was the consecration of the memory of one who was beloved, the desire to do honour to her memory, not to that of the builder of the monument himself. And though in any case the one would have been in Roman, the other in Saracenic style, there does seem to be about the Indian monument a poetry and tenderness of feeling, an endeavour to convey the idea of hallowed and beautiful repose, which is certainly widely different from the cold pomp of the structure reared by the Roman Emperor, if we can imagine it as it was in its entirety without its Mediaeval additions. In one respect there is, however, something in common between the circumstances of these two erections; both were the work of despots, done for their own pleasure only, though in a somewhat different sense; both represented a magnitude and costliness of structure which can only be applied to tomb-building when economical considerations can be set aside, at the will of a despotic power. In this respect the Mole and Taj represent the same thing socially as the pyramids represented,—the domination of a favoured caste. The only other condition under which such expenditure can be gone to in the building of tombs or monuments is when the popular will combines in favour of a sumptuous monument to one who has deserved well of his country; otherwise, immense and costly tombs and monuments are generally symbols of despotism.

The earliest form of Mediaeval monument on a smaller scale is one which presents a very interesting union of Roman and Gothic feeling. It is shown in the form of a sarcophagus placed in a niche,—a sarcophagus manifestly derived from Classic forms, but partly fenced in and defended by a light Gothic arcade. Instances of this stamp of Gothic monument occur in France in the twelfth century, at which period it seems probable that the sarcophagus was, in fact, the coffin, and contained the body, though it was not long after this that the actual practical use of the sarcophagus was abandoned, and the form alone for a time retained, the actual receptacle of the remains being beneath it, as is generally the case where the sarcophagus form is used in modern cemeteries. The arcade in some cases did not form an actual screen in front of the sarcophagus, but was based upon it, a shaft, or more than one, springing from the apparent lid of the sarcophagus. Nothing could well be more pleasing and picturesque in effect than the niche tomb with the arcade in front of it, and it seems surprising that this feature of the arcade was abandoned at so early a period as it was, while the niche or arched opening in the wall for the reception of the sarcophagus was retained up to a late date of Gothic architecture. In England this picturesque idea of the niche or wall arch, with the arcade in front of it, did not come into use at all, as far as we remember. The earliest form of monument or tomb known in English Gothic architecture, was the simple sarcophagus with the top falling either way like the section of a roof, and with a cross worked on it. There are occasional instances of more elaborate work, as in a well-known instance at Lewes; but they are exceptional in work of early date. Afterwards this sarcophagus was placed in a wall arch, though without the arcade in front, but in both English and French tombs it was not long after the middle of the twelfth century that the practice was adopted generally of placing on the sarcophagus the image of the deceased. The practice of doing this was by no means unknown in Roman, and even in Etruscan tombs; but in these the figure was always represented in a sitting posture (see the well-known and remarkable Etruscan monument in the British Museum); while in the Mediaeval period, the tomb-figures are always represented recumbent and generally as if to convey the idea of sleep. If the intention really was to convey this latter idea, it must, of course, have

bad reference to the Christian idea of death as merely a sleep, awaiting resurrection. It does not seem, however, by any means, certain that this was the intention, or that more was intended in many cases than to give the likeness of the deceased, in such a guise as would shadow forth, however, his Christian faith, representing him as trampling on the lion, as protected by and trusting to the emblem of the cross, &c. The way Viollet-le-Duc puts it is that after the period when the introduction of such recumbent figures became common, the tomb was in reality a permanent representation of the lying-in-state of the body, and there is a good deal in the design and appearance of many Mediaeval tombs, which tends to bear out this idea, whether intentionally or not, from the period when this prominence was given to the recumbent effigy, the old Roman form of sarcophagus, with sides sloping inwards towards the base, nearly disappears for a considerable period, and is replaced by a straight-sided block or table, on the top of which is laid out the effigy, while the sides are occupied generally with ornamental architectural work, in the shape of arcades, panelling, or niches sometimes filled by miniature figures of saints or angels, or (but this is mostly in the late Gothic and Renaissance periods) by bas-reliefs representing other members of the family in prayer for the deceased. In the fourteenth-century period, and thence to the close of the Gothic period, it was common, especially in the richer and more costly tombs, for the recumbent figures to have canopies carved above their heads; an application in horizontal position of a feature in decorative architecture which properly belongs to the vertical position, and when thus employed horizontally on the top of the tomb looks rather like a misapplication of the feature in a position in which its original meaning, as a protection for the figure, is somewhat lost. The idea of the tomb thus formed, as a kind of lying-in-state of the body, is further supported by the practice in England of placing wooden canopies over the tomb and the figures, which give very much the idea of the figures reposing in a bed of state. These wooden canopies were, as we all know, subsequently imitated with far greater elaboration in stone, and carried out in such a manner as by a *tour de force* of masonic construction to appear almost as if self-supported, over a considerable space, from pier to pier; for it is always between the piers of a church that erections of this description are found, partly because this was the most convenient site for a large tomb without too much cumbering the floor of the church, partly because the piers thus afforded a good and substantial *appui* to this somewhat venturesome piece of ornamental construction. Concurrently, however, with this class of tomb standing free between the piers, we have those which are placed in wall arches, generally also exhibiting a recumbent figure on the top of the sarcophagus or dais; but in the place of the plain arch of early Gothic we have, in complete and late Gothic, niches richly decorated with traceried canopies, often of great beauty and elaboration. In the fourteenth century it became not unusual to make the figures of brass or "latten," which appears to have been an alloy somewhat softer than brass, and more analogous in substance to pewter, though of yellow or brazen colour; and the addition of other metal ornaments to the stone tombs was not uncommon. Over the Beauchamp tomb at Warwick is an open cover somewhat in the outline of a roof, formed of brass railing; and such a finish or covering probably existed in many cases in which it has now disappeared. Commenting upon this feature in Mediaeval tombs, Viollet-le-Duc, in one of his brilliant if not always quite probable suggestions, connects this fact with a possible very ancient custom of placing a cover of some other material over a stone tomb or sarcophagus, and points out that in the well-known Lycian tomb in the British Museum, the upper portion only imitates pointedly wooden construction, the lower being masonic in form and treatment, as if a wooden cover or but with pyramidal roof were set upon the stone sarcophagus; and he suggests that the Mediaeval metal canopy, taking the roof outline, is a survival of the same idea. His connecting link is in some tombs which form a group apart in the Vosges district, each of which consists of a square-sided sarcophagus with a curved conical top in a separate stone, exceedingly resembling the outline of the top of the Lycian tomb; and these Vosges tombs he sets

down as "Gallo-Roman." His theory, stated under the heading "Tombeau" in his "Dictionnaire," is worth referring to, though we confess to a feeling that the great French architect and critic was sometimes rather too ready to accept a theory because it was interesting and brilliant rather than because there was definite proof of its truth.

The most elaborate development of the later Gothic tomb was that in which the sarcophagus and figure and all, instead of being merely placed under a canopy, were enclosed in a chapel, making a small building or complete architectural design in itself, within the cathedral or church. More important in structural design than these, and quite exceptional in their treatment, were the Scaliger tombs at Verona (to go back for a moment to an earlier period), in which the sarcophagus is displayed aloft on a platform raised on columns, and in its turn carrying columns which bear a vaulted canopy from which, again, there rises a truncated cone, differently treated in the two principal examples, though the main idea in each is the same. This conical finish is the fault of the designs, inasmuch as it is, in appearance at least, the heaviest part of the structure, and seems the more so in consideration of the very light and elegant character of the rest; and if the objection is valid against the Albert Memorial that its superstructure is too heavy to be balanced on arches and columns with no angle counter-fores, it is certainly as much or more valid against the much-admired tomb of Can Grande, which is nevertheless one of the most brilliant and original of sepulchral monuments.

Towards the late Gothic period the unpleasant custom became common of carving on or beneath the tomb, not the peaceful sleeping figure of the deceased person, but the representation of his decaying body, emaciated by disease or corruption. There is a remarkable instance of this in Tewkesbury Abbey. This ghastly taste for the painful aspect of death, in the close of the Mediaeval period, was the forerunner of the more confirmed Pagan view of death which was taken in so many of the Renaissance tombs, where the object seemed to be divided between glorification of the character and personality of the deceased and of his deeds when living, and the emphasising of the melancholy fact that he was no longer living,—a fact symbolised in an uncouth and what may be called a hutchery manner by the frequent introduction of the skull and cross bones, which blend in the strangest manner with the gay and florid ornaments characteristic of the Renaissance period, with which they are intermixed. Sometimes emblems of a less ghastly character are introduced, the inverted torch or broken column; but the whole idea of the Renaissance monuments is essentially Pagan, so far as symbolic ornament is concerned. Like everything else in the art of the Renaissance, however, the monuments displayed the determination to give the most prominent place to the figure, and they have afforded opportunity, as it is needless to observe, for some of the greatest work of the greatest sculptors. Without the figure, the monuments of the Renaissance are, for the most part, exceedingly elegant and finished in detail, but also weak and unmeaning. They lose for the most part the dignified architectural forms in which the Gothic monuments were cast, and assume forms of far less architectural beauty and meaning; they become a kind of elegantly ornamented picture-frame for a bust or a panel. There are fine exceptions to this, no doubt; and there is one form of monument which became common in England in the Renaissance period, and which in a peculiar degree combines dignity and elegance; that in which a recumbent effigy reposes under an arch, or more often under a couple of arches, carried at right angles to the length of the sarcophagus, and springing from light Classic columns, which seem like a Classic revival of the early Gothic screen or arcade before the sarcophagus. Monuments of this type are not infrequent in English churches, and are nearly always elegant in general effect, even when their details are not good. A curious example of a monument entirely retaining a Mediaeval form, while every detail is Renaissance, is to be seen in the Browne monument in Battle Church, which is one of those representing the effigies of two people recumbent on a large square sarcophagus or altar panelled at the sides, with shafts at the angles, and with canopies rising behind the heads of the recumbent figures; everything just as we find it arranged in an orthodox Mediaeval tomb of this class, but

and sentimentality that are "the cant terms of Richardson and his admirers;" and on "that cant phrase [Fielding] goodness of heart, which is used every day as a substitute for probity, and means little more than the virtue of a horse or a dog."

But, in truth, Hawkins, who doubts whether authorship is a creditable profession, and calls Goldsmith an idiot for preferring it to soliciting the grant for favours, was not a man to appreciate what there was of true nobleness and sound principle in Henry Fielding, whose life comprises a contradiction as emblematic as that of the relation of dissoluteness and political profligacy in the early life of Charles James Fox to the virtues of later days, that make him still an object of personal and political reverence. The chairman of the Middlesex Quarter Sessions sneers at "the disreputable station" of Fielding as a "trading justice;" but Fielding did his best to make the station reputable while he held it, at the cost, as he says, "of reducing an income of 500*l.* of the dirtiest money upon earth to little more than three hundred," and his report on crime in the metropolis is worth gold as compared with Hawkins's optimistic enumeration of the beauties of the criminal law and its administration. Fielding, shocked at the scenes which took place at public executions, recommended the change which has been but so recently introduced. He used a remarkable argument. He said that when he had seen Mr. Garrick in the character of *Macbeth*, and the murder of *Duncan* was understood to be proceeding behind the scenes, it was not too much to say that he had seen the hair of the audience stand on end.

It is curious to find the leverage which is now relied on for assistance in weaning the intemperate from the Circean cup of the demon alcohol denounced as its ally. Johnson is commiserated if not contemned for his "unmanly love of tea." The epithet is an odd one, and odd is the qualification as "signs of effeminacy," of demeanour such as could be thus described:—"Whenever tea appeared he was almost raving, and by his impatience to be served, his incessant calls for those ingredients which make that liquor palatable [why not say cream and sugar?], and the haste with which he swallowed it down, he seldom failed to make that a fatigue to every one else which was intended as a general refreshment." Such a devotee might well be expected to come down heavily on Jonas Hanway and his "Essay on tea as pernicious to health, obstructing industry and impoverishing the nation, &c.," and which coupled tea,—harmless necessary tea,—with demoralising and degrading gin. But Hawkins himself commends, without hesitation, that Mr. Hanway was right in asserting "that the practice of drinking tea is productive of harm among the lower classes of people as certainly to be admitted," and seems to sympathise with serious grudgingness in what Swift only vented as a witty sarcasm,—that the world must be encompassed, that is to say, by a voyage to the East Indies for tea, and another to the West Indies for sugar, before a washerwoman can sit down to breakfast.

Johnson evidently was not a man to reform manners, but Hawkins believes that he had entered Parliament, of which there was once a dream, he might have checked the introduction there of such unauthorised words and phrases (they have all made good their ground) as the following:—"a truisim,—reciprocity,—living in habits of friendship,—a shade of difference,—that line of conduct,—sentiments in unison,—blinking the question,—I am bold to say,—I should then commit myself,—and others equally affected and singular."

Hawkins, as infirmities grew upon him, made vain trial of the efficacy of the waters of Islington Spa; a notice which misleads the writer in the "Biographie Universelle" into supposing a conflict of authorities as to whether he died at Spa in Belgium or in London.

Sundry criticisms of contemporary architecture, which can be gleaned from the pages of the pupil of Mr. Hoppins, are not without interest. "Vanbrugh and Hawksmoor, he says, had such ideas of beauty and harmony as have no archetypes in the material world." He would have been quite in accord with Mr. Ferguson's appreciation of Blenheim. "Altogether the palace looks as if it had been designed by some Brodingtonian architect for the lodging of their little Gulliver." Hawkins continues, as to Hawksmoor, "in an evil hour he

was employed by the Commissioners for building fifty new churches, as also by a parish in the city, St. Mary Woolnoth, in the re-edification of an old one, and has left his mark behind him in several parts of the kingdom."

James and Kent are not more mercifully dealt with. Kent we have still with us, conspicuously in the Horse Guards and north front of the Treasury Buildings. "They were micro decorators, and could do little more than design a saloon, a gallery, or a screen."

But Campbell and Gibbs he appreciates as men of genius.—"The former designed the best house in the Kingdom,—that at Wanstead, in Essex, built by the Earl of Castlemao (see Ferguson, 'Modern Architecture,' p. 237); the latter St. Martin's Church, and other edifices (among them the Radcliffe Library) that are an honour to his memory." The Wanstead House seems to have been exactly reproduced,—see the illustrated papers,—in that palace of the Dukes of Hamilton which even now is giving up its contents to follow in the fatal train to the auction-room.

But Ripley comes in for a contemptuous notice, and somewhat unfairly, not exclusively on account of his art or want of art. "Columns thus disproportionately,"—the reference is to those of Mylar,—"but in a less degree, are also to be seen in the portico of the Admiralty Office, designed by Ripley, who, from a carpenter that kept a shop, and also a coffee-house, in Wood-street, Cheapside, by marrying a servant of a minister, obtained a seat at the Board of Works." The true introduction to the minister seems to have been conducting alterations in his residence, to which the marriage with the servant,—not necessarily an under housemaid,—was incidental. He succeeded Vanbrugh in the post over the head of Kent in 1726. Horace Walpole held Ripley to be deficient in taste, but speaks in his favour as excelling "in the mechanic part and in the disposition of apartments and conveniences,"—how justly those must decide who are familiar with the interior of the building which was called in Nelson's days by the aspirants for promotion and its insignia, the "Lace Manufactory."

Pope finds a niche for Ripley in the "Dunciad," and satirises him twice elsewhere with a pertinacity that reminds us that the supplanted Kent was patronised by Pope's friend, the Earl of Burlington:—

"See under Ripley rise a new Whitehall,  
While Jones and Boyle's united labours fall."  
*Dunciad*, III., 323.

In the "Imitations of Horace," II., i., 186:—

"Who builds a bridge that never deers a pile?  
Should Ripley venture all the world would smile;  
But those who cannot write and those who can  
All rhyme and scrawl and scribble to a man."

Lastly, in the fourth Moral Essay, the satirist in guise of moralist, contrives to spit upon the same envenomed rapier the architect and his patron, Bubb Dodington (Lord Melcombe):—

"Heaven visits with a taste the wealthy fool,  
And needs no rod but Ripley with a rule;  
See sportive fate, to punch awkward pride,  
Bids Bubb build, and sends him such a guide!  
A standing sermon at each year's expense,  
That never excomb reach'd magnificence."

Pope finds room in a note for a sneering reference to the carpenter's shop, which Hawkins might have consistently respected, considering the original trade of his own father; and, on the whole, the tendency of these attacks is to dispose one at the present day to listen favourably to any evidence in favour of Ripley. As to Bubb,—"*Syllabus*," as a contemporary nicknamed him,—his own memoirs justify satire of any severity.

**Haggerston Churchyard.**—Through the kindness of Lord and Lady Brabazon, the churchyard of St. Mary's, the parish church of the most densely populated district in Haggerston, has been transformed from a neglected and unsightly wilderness of dilapidated graves, broken gravestones, and straggling tufts of coarse grass, into a fresh and pretty garden to be open for the recreation and enjoyment of the public. The formal inauguration of what is a small oasis in a dreary surrounding of crowded dwellings of poor people was made on Saturday afternoon last, when a special service was conducted by the Rev. George Wingate, M.A., the vicar, who, with Messrs. F. E. Brown and Liquorish, churchwardens, has helped forward the work.

HINTS FOR THE MANAGEMENT OF COMPETITIONS.

BEING one of those who signed the memorial to the Royal Institute of Architects relative to the regulation of competitions, I have been looking for the improvement that was reasonably to be expected from the adoption of small-scale sketches along with the appointment of a professional referee or adjudicator; but in vain.

I have been observant of competitions since the important one for the design of St. George's Hall, and the following one for the Queen's College, Liverpool, more than forty years ago, in both of which (the late Mr. H. L. Eines was victor, and have seen the "Conditions and Instructions to Architects" of not a few. But I remember nothing worse than some of the most important of the late ones since the action of the Royal Institute, whose object and that of the Conference was evidently to mitigate and put them on a just basis. When, on a Saturday morning, I open the *Builder*, and look out through its pages from a somewhat lonely rural retreat into the busy world of architecture which it discloses, with glimpses of the adjacent worlds of art and literature beyond, the most disagreeable scenes that meet my mental eye are still those connected with competitions. The very word, indeed, at the head of the paragraph or article promises the exposure of some act or scene insulting or dishonouring to the profession.

But lately a copy of one of those tightly-binding schemes of "Conditions and Instructions to Architects" for an important building fell into my hands, and with this I was perfectly disgusted. First, with the utter forgetfulness of what was due to the professors of an art which is generally supposed to clothe its followers with gentility; and, secondly, with the immense and needless amount of work entailed upon those simple enough to engage in it, with no very satisfactory guarantee for justice in the decision. It appeared to me entirely out of harmony with the age. While all other professions are going in the direction of short hours and long holidays, competitions are taking architects back to serfdom. As I read this scheme of a competition in which successful drudgery in the first round earned for the victor a title to the quadrupled drudgery of the second, the whip of the slave-driver which it called up grew less painful to my imagination than before, and hewing of wood and drawing of water in the open air to which the Israelites condemned the inhabitants of Gibeon for deceiving them, seemed pleasant employments. The author of the "Song of the Shirt," in bewailing the case of certain poor needlewomen, complains that bread should be so dear and flesh and blood so cheap; but it is the brain,—the organ of the mind with all its Godlike powers, including the "vision and the faculty divine,"—that is held cheap by the patrons of architecture. When councils and boards, in their irreverent manner, call upon the architects of the world to furnish them with a design for a town-hall, art-gallery, or museum, to cost 100,000*l.*, or more, with the understanding that only one of them is to be paid for it, they should be told what the art is which gives to the great cities of the world their chief interest, and is capable of increasing the attractions of their city, and what the productions of that art are worth. A good plan and exterior design of a building, to cost the sum just mentioned, though only in sketches, should be worth 1,000*l.*; and were the competitors paid for their time at the rate at which I have known some surveyors to be paid for infinitely lower work, such as valuing land and houses, the whole 100,000*l.* would be insufficient for the purpose. High art purifies the minds of its true votaries from worldliness, but it does not so etherealise their bodies as to enable them to live without dining.

Then the manner of their announcements there is perhaps nothing more ridiculous to be found in any newspaper or journal that appears, which is saying a good deal; and these announcements will surely some day be looked back upon as curiosities of advertising or of literature. What can be more ridiculous than promoters of a competition asking an unjustifiable favour from a liberal profession, with the air of men conferring an obligation? And when it is their interest to attract the highest members of that profession to the competition, inviting to it in terms calculated to repel, and which ought to repel, the very lowest?

The matter is made worse by the inadequate means of adjudicating. The employment of a professional man for this purpose is, perhaps, an improvement on the practice of miscellaneous committees selecting by the highest number of votes; or, as in the Raikes Memorial Church competition, by the advice of "persons well versed in architecture," who would most likely advise them to take the worst piece of architecture in the lot. But there should be more than one adjudicator. No one man, however eminent, is sufficient. If it is in the multitude of councillors there is wisdom and safety, there cannot be much of either in one. Two would be not merely twice, but four times as safe as one, and the advantage of multiplying them would, I fancy, increase in something like the ratio of the squares of the numbers. I think it utterly absurd to let the object of a competition,—the securing of the best possible design,—with the interest of the profession and progress of art involved in it, depend on the sense of justice, taste, and critical acumen of any one man. It limits the reach or final results of the competition to his mental stature, for what is above him he will reject. There may be designs submitted whose beauties are of too subtle and refined an order for his powers of appreciation. Or he may have a leaning towards one style, or sub-style, unfavourable to some of the very best designs submitted. He may have achieved his eminent position by intellect only, while very deficient in art-feeling. But the work of an art whose breath is poetry and capable of clothing the idea of religion and God, cannot be judged of by intellect alone. It is more by sympathy, by depth and delicacy of feeling, along with purity of taste, than by critical judgment that we can understand or appreciate the merits of works of art. But supposing his mental powers equal to his task, his moral may not be; in saying which I am influenced solely by my knowledge of human nature, which would forbid me to trust in such a matter Aristides the Just, were he to live again, and to his moral sense added the art-genius of Phidias. He should not be a man of like passions with ourselves to whom such a task was committed.

Viewed in another light, it is out of unison with English institutions and in harmony only with despotism and trial without jury.

With these sentiments and the belief that example is better than precept, even when only imaginary, I cannot resist the impulse to offer, in all diffidence, the following model for a competition, trusting it will be regarded in no other light than as suggestions to all whom they may concern, and not as a rival system to any put forth or to be put forth by the Royal Institute of Architects—

NEW MUNICIPAL HALL.  
Conditions, &c.

The Mayor and Council of Wisely being about to erect a new municipal hall, and being anxious to secure to the city the prestige of a first-rate structure, have determined to make the design of it the subject of a public competition, as the surest way of obtaining their desire.

They hereby respectfully invite architects to furnish designs, assuring them that, mindful of what mental faculties must be exerted in their production, they have, in drawing up the following conditions, had an eye to sparing them all needless labour and waste of their invaluable time; asking only, indeed, as will hereafter appear, for what is essential to the general expression of the design.

The competition will be a single one, the council being advised that the scale of the drawings hereafter mentioned, though small, is quite sufficient to allow every feature and distribution of features on which the merits of the designs depends to be fully rendered therein.

Touching the matter of adjudicating on the relative merit of the designs which may be sent in, and selecting the most meritorious one, being advised that artist-painters and sculptors, accustomed to draw the subtle lines of the human body and to make the tenderest strokes of art are, after architects, most sensitive to the harmonies and graces of architecture; and believing that in the multitude of counsellors there is wisdom and safety, have engaged one artist-painter and one sculptor along with two architects, practitioners of different styles, to be the judges.

These gentlemen pledge themselves to see nothing in the drawings which may be submitted to them but designs, and to judge them by their

intrinsic merits only, uninfluenced by delicate finish on the one hand, or sketchiness on the other, if they clearly exhibit the design; or by love, or hatred, or envy of their authors, or supposed authors. Conceiving the proper object of competition to be imperfectly attained if the finest exterior were selected along with inferior plans, excellence of plan being so important in a practical point of view to the public, the adjudicators are resolved to give at least as much heed to merit and fitness of plan as to beauty of exterior.

The council pledge themselves to abstain from any interference with the adjudicators. They also pledge themselves that no member of their body or of the bench of adjudicators will take part in the competition.

Each design to be represented by the following Indian-ink drawings to a scale of 16 ft. to an inch.

- Plan of the principal floor.
- Plans of first and second floors.
- One transverso section.
- Front elevation.
- One side elevation.
- One small perspective view.

The elevations and perspective view to be simply shaded in Indian ink. The latter to be correctly drawn from the plans and elevations of the same scale, without ornamental details (unless the competitor prefer to give them) merely to display the outline of the composition and the main masses of shadow.

For the better comparing of the views with each other, the competitors will please place the plans of the picture at the north-east angle, and to make an angle of about 30 degrees with the front.

The harsment plan being almost entirely governed by the principal plan, and having no influence on the artistic scheme, is here omitted. The successful architect will supply it along with all other working drawings to the usual larger scale.

No less a number of drawings than those stated can be deemed sufficient.

The Council wish to have, in addition to the apartments named in the schedule, a central hall, of dimensions proportioned to the building; a grand staircase, and not less than two inferior staircases; and some crowning detached feature above the roof of tower or pavilion to give prominence to the building viewed from a distance, and assist in elevating its character. These particulars are named merely to give the competitors some idea of the scale of magnificence desired, and to prevent any wide difference between their designs in respect of cost.

The warming and ventilating, except so far as their consideration may affect the form and general distribution of the apartments, need not have attention. Nor need the drainage beyond getting water-closets, urinals, &c., contiguous to outer walls, so that no drains need pass under the building. The successful architect will attend to these.

The style of the building to be in harmony with its surroundings, of which a photographic view will be furnished to each competitor along with the plan of the site, &c.

Any competitor may submit two designs for the exterior, or two plans, provided that in each case either may be adopted or will fit the rest.

With regard to what is above stated, the number and size of the apartments and width of essential passages, with the height of each story, are all given in the schedule, and as walls must be of a certain thickness, the council presume there cannot be much difference of cost among the designs which may be sent in, provided each competitor simply aims at making the building in architectural character worthy of the city.

The Council have been advised that the building will cost from 80,000, to 90,000. Any design exceeding the latter sum, unless it can be so denuded of sculpture as to bring it within that sum without prejudice to its architectural merits, must be excluded. No estimate, therefore, need be sent in.

The drawings to be singly mounted, so that the corresponding parts of different designs may be compared with each other, as plans with plans, &c.

The designs to be sent in within three months from the above date, each either signed by its author or with a motto, repeated in a sealed letter containing the name and address of the competitor, which letter will be returned along

with his drawings with the seal unbroken at the conclusion of the competition.

The Council pledge themselves that no delay which they can prevent shall occur in bringing the competition to a conclusion; when 2½ per cent. on the proposed cost will be divided among the competitors, including the successful one, in sums varying according to the order of merit of their designs. The author of the highest in merit will be employed to execute his design, and allowed clerk of works, travelling expenses, &c., as usual.

All the designs whose authors are willing shall be publicly exhibited after the awards have been made.

Should any accident occur to any of the drawings during their lodgment with the Council, the Council will, of course, make just compensation to the owners.

Designs of unsuccessful candidates shall be returned free of expense.

Whatever may be thought of the above, it gives competitors, in suitably expressing their designs, but one-fifth of the usual labour (the perspective view would be produced in a few hours) with ten times the chance of justice, which renders the remuneration named almost sufficient.

For such an advantage as a public competition, rightly conducted, holds out to its promoters the increased chance of obtaining a first-rate design, 2½ per cent. beyond the 3 per cent. which they would in any case have to give, would be a very reasonable outlay, while the competitors would be not very ill paid in proportion to the merit of their designs. I agree it will be seen, with Professor Kerr, that all the competitors should be paid.

I should have added a non-professional man or two to the bench of adjudicators if qualified men in the present state of education were not so rare a phenomenon. Poets should be able to judge of architectural merit, but literary men generally are feelingless on the subject, and till English education grows to something like that of ancient Greece we must be content with architects and artists alone for the purpose in question.

Objectors to the smallness of the scale adopted for a final competition I would ask, do we not judge of the comparative merits of two or more existing buildings by their engraved illustrations, often to a scale of 50 ft. to 100 ft. to an inch? All the details cannot be given, but I believe sufficient can be given to show, along with the composition and chiaroscuro, which can fully display themselves, the merit and beauty of the whole.

I do not see any difficulty in discerning degrees of merit of design through any amount of high finish, or the want of it, in the sketches. There is not as much difference between sketches and full drawings in architecture as there is in painting. More masses of colour or of light and shade, with little or no drawing, constitute a sketch in landscape. But architects cannot design in light and shade, though they may think in light and shade. All the lines must be put in, however faintly, that the scale admits.

It is not the adoption of sketches instead of full drawings, that causes the reduction of labour. It is the reduction of scale almost alone.

To conclude. Competitions wisely and justly conducted must become a useful engine for putting men into their right places, and raising indigent merit. Young ambition could not have a surer ladder by which to climb, nor sharper "spur to prick the sides of his intent." But, conducted as they generally have been, they become a species of gambling at the lower end of the profession, useful only in bringing down its moral tone and dignity, and cumbering the earth with commonplace erections.

SAMUEL HUGGINS.

**St. Pancras Workhouse Competition.**—Mr. Arthur Cates, Crown surveyor, to whom the competition designs by the five selected architects were submitted for his professional opinion thereon, has presented his report to the guardians, which has been published. Mr. Cates limits the contest to two of the competitors, one of whom is Mr. H. H. Bridgman, architect, of the Poultry. The contemplated expenditure, we understand, approaches 60,000. Our readers have been informed of the earlier stages in this matter.

## THE HAMILTON PALACE COLLECTION.

The interest excited by the promise of the second portion of the Hamilton Palace Collection, composed of some of the Italian pictures and a further instalment of rare furniture and decorative objects, crowded, it can be imagined, all through the middle of last week the rooms in King-street. Among the pictures, several bore a reputation, though the generality may be said to belong rather to a style and period of art which within the last few years we have come to look upon with an indifference that would, we suspect, sadly shock the original owners who gathered the collection.

The large Botticelli, "The Assumption of the Virgin," was made familiar to the artistic world at the Burlington House Exhibition of 1873, and stands, if not among the most beautiful of the early Florentine master's works, certainly among his most interesting. Vasari has spoken at some length of the picture, and has told one of his familiar stories respecting the envy of the artist's detractors succeeding in having the picture covered from view on the accusation of heresy against the painter and the patron who employed Botticelli to paint the picture for the Church of San Pietro Maggiore. Perhaps what is unsatisfactory in the work, with its very large number of figures, may be accounted for by the tradition that the design was dictated to the painter, and was not one of those simple earnest works of love for which he obtained the reputation he has borne at all times in Italy, but only more recently tardily awarded him in England, France, and Germany. To those familiar with Florence, the view of the Tuscan capital, Pistoja in the distance and the de' Medici villa Careggi, will curiously remind them of the beautiful valley of the Arno and the hills round Florence. As regards the picture itself, though it has undergone repair, it cannot be said to have been really seriously injured. By its side two small Fra Angelicos, though not by any means highly representative of the master, deservedly attracted the attention of the public. Hanging on the same wall in Messrs. Christie's large room, the interesting Bronzino portrait of Leonora di Toledo may be regarded as thoroughly characteristic of the painter, who is so well represented in the National Gallery by a picture of exactly the same period, and, curious to say, of the lady's husband, Cosmo Duke of Tuscany. The Titoret portrait of an "Admiral in Armour" fully realised the expectations of the promise which the catalogue held out to those unfamiliar with the collection. The same may be said of the two or three other Titorets, notably the "Descent from the Cross," in the harder style of the master, and most interesting, alike from its exquisite colouring,—much resembling Paul Veronese,—and the life-like portraits of the donors, equally fascinating in colour was the "Presentation." Concerning the so-called Titian, representing the painter's daughter, in spite of the very handsomely-carved Italian frame which surrounds the picture, there cannot fail to continue to be expressed much doubt, while the brilliant so-called Giorgione, which so conspicuously occupied the centre of Messrs. Christie's second room, will, we suspect, to all familiar with the famous "Fête Champêtre" of the *Salon carré*, at the Louvre, and the story attached to it, that it is by Titian, only serve to confirm that belief. For brilliancy and glow of Venetian colouring it is long since the world has had brought before it so characteristic a specimen of Italian art and the traditions of the founders of the modern school of painting. The possession of this treasure alone entitled the Hamilton collection to the fame it has long borne. Fortunately, indeed, is the National Gallery to have obtained this extraordinary specimen, which, to the student, will be found to afford every necessary element of instruction in the technical management of transparent colouring and "ground," which constitutes so curious a charm in the works of the Venetian masters. Attributed to that school, the landscape thus vaguely named we should be inclined to assign to Domenico Campagnola, the friend of Titian, from the resemblance of the treatment of the background to that to be seen in his numerous engravings. A so-called Leonardo da Vinci small portrait, belonging, perhaps, rather to the Venetian school, and a Madonna by Francia, attracted during the view not a small degree of attention from those unfamiliar with the collection, as also the so-called Mantegna portraits of Luigi

Gonzaga, Duke of Mantua, and his wife, but concerning which it would be interesting, with the information now possessed respecting the early Italian masters, to hear well discussed, in spite of the authority of Vasari and that most doubtful and untrustworthy, though respected of all authorities, Dr. Waagen, whose name is constantly quoted by the catalogue compilers. Another picture of Mantegna, a monochrome, is by the master, though beyond this fact it is of no great interest.

In works of the period and by the masters which the great galleries now desire to possess, though the Hamilton collection is not, as will be seen, wanting, the generality of the gathering is, so far as we see by this instalment, not very strong. Times have seriously changed since the days when the Hamilton Gallery was formed, and Guercino, Domenichino, Sassoferrato, Parmegiano, Guido, Salvator Rosa, and the Caracci were in vogue. To those brought up under the new influences it is not a little calculated to inspire a spirit of irreverence to find a number of works of the very smallest merit not only composing a great and famous gallery, but bearing names which the slightest acquaintance with the works of the past shows to be ridiculously false. It is to be hoped that one of the results of the efforts of our modern art directors has been to spread among those who are interested in art, a power of selection which it would appear was not exactly possessed by our ancestors. We live in an age of fierce criticism, which has opened our eyes, or afforded us at least the means of opening our eyes. The result of the sale of the Hamilton Gallery will curiously come to show how by the light of modern criticism the art and taste of the past are now appreciated.

Were every one to be guided in his choice by the standards which of late have been set up by those whose opinions we must respect, it would, we are afraid, go hard with much that composes the Hamilton Palace collection. It is to be regretted indeed as the sale creeps on, that as yet, nothing has been shown (among the furniture) belonging to the periods which the taste of the most instructed has agreed in declaring to be the best. From an historical point of view it is impossible to award the utmost interest to the wonderful pieces of "Buhl" work which the collection contains, and the exquisitely-delicate marquetry creations of the cabinet-makers of the court of Louis Seize and Marie Antoinette. It is difficult, however, to have to continue to admire an uninterrupted series of Rococo creations unbroken by the presence of a single specimen of work belonging to earlier and none the less decorative periods of art. It is sad to see so evidently displayed the mere desire of the creators of these costly pieces of work, to produce a "show," which it is true, was the sole condition required from them. When Louis XIV. built Versailles with its myriad distracting mirrors, crystal chandeliers, and pompous gilt carvings, the homely decoration of the previous periods was out of place, and only the creations of a Lebrun or a Boulle could harmonise with a degree of ill-placed splendour that, to the grief of all true lovers of art, has only too deeply left its mark in the history of decoration. Where are the more refined but none the less palatial and grandiose creations that adorned the Venetian and Italian palaces? It is to be regretted that in addition to the French Revolution to which we owe the presence in England of these magnificent pieces of Louis XIV., Louis XV., and Louis XVI. furniture, the sales that of all time have taken place of the contents of the great palazzi, in the original home of all the splendours of Versailles, have not enriched the Hamilton collection with some specimens to break what promises to become somewhat monotonous.

Public interest, however, was none the less excited during the show last week, by the two magnificent "Buhl" *armoires* designed by Lebrun, and formerly in the Louvre; the several "Buhl" clocks, with their characteristic decorations; the Louis Seize upright secrétaire, with its pretty inlaid festoon figure of Silence in the central panel; the palatial Florentine *pietra dura* cabinet; and the various ormolu chandeliers and other grandiose creations of the seventeenth and eighteenth centuries. Among the what are understood as precious objects which composed this second portion of the sale there were some most valuable specimens of gold and silversmiths' work; two German sixteenth-century cups of the type that

has long been rendered familiar by the so erroneously termed "Cellini vase" in the British Museum, one the design of George Roemer, who has inscribed his name on his work, with the date 1590. Among the richly-chased, embossed, and showy plate, presentoirs, ewers, and dishes, it was curious to note the sobriety and good taste of a Gothic silver-gilt cup, as if to recall the attention, in the midst of so much unnecessary ornament, to the true canons of decorative art. The more costly objects in jade, agate, and crystal, among them a delicate Italian pax,—not like Francia's famous work at Bologna, or Mass Finiguerra's still more interesting "Amurcication" in the Bargello at Florence, in *niello*, but in relief,—and smaller pieces of plate, attracted, as can be understood, all through the week a great share of the attention of the visitors. It is to be regretted that there should still be evidence of some remains of the old spirit in which the catalogue of the Strawberry Hill sale was compiled, when a statuette of the famous figure of the sturdy Nuremberg artist, Peter Vischer,—an artist who was not ashamed to wear his leathern apron, and thus proudly portray himself to posterity,—should be designated as "a silver figure of a Russian smith" (No. 627).

Before concluding, let us not neglect to mention the interesting if somewhat pretentious bust by Thorwaldsen of the first Napoleon, and the architectural drawing (in *bière*) by Sansovino, of the decoration of Sta. Maria del Fiore, designed by him for the visit of the Pope Leo X. to Florence; though we can ill conceive why the beautiful cathedral was thought to need any such adornment, even at the hands of so refined an artist as the architect of the Libreria or the Zecca at Venice.\*

## APOLLO AND DIANA.

So great a charm has the memory of our early Classic studies in after-life that they are constantly referred to with unabated pleasure, and in example of this, in more than one modern instance, have British statesmen turned, as to a recreation in the intervals of their political labours, to the adding to the many existing translations of the Greek poets. The love of the dead languages as treasure-houses of noble thoughts and poetic imagery, is still full of life, and scarcely a public debate takes place without recourse to them for illustration; and, wider than this, the evergreen character of the old Greek genius and Roman force and *grace* is evidenced by our frequent reference to them in literature, conversation, and art.

As a part of this permanent love for the old Classic sphere of thought and work exists the regard in which we hold those of the antique statues which have come down to us through so many perils and adventures. And although we no longer look on them as representations of real divinities, the interest in them seems to be almost as great as when they received the homage of actual religious worship. The art now, rather than the gods it personifies, is respected, but the amount of admiration is as intense perhaps in the art archaeologist as formerly in the Greek devotee.

The Apollo of the Vatican and the Venus of the Uffizi Palace have received maybe as much adoration in modern times as they attracted of old; and the group of the Laocoon, although he was not a god, but only the priest of one, has been made the subject of a whole book by Winckelman, while Pliny only gave it a phrase, although this may be acknowledged as one of the highest admiration, as he speaks of it as "the most excellent work of fine art which had ever been executed."

These, and a few other ancient statues, ap-

\* At Saturday's sale, the National Gallery acquired no fewer than six of the Italian pictures. The Botticelli "Assumption," for 4,774. 10s.; by the same master, "Adoration of the Magi," 1,627.; the so-called Leonardo da Vinci, for 525.; by Titoret, "Christ Washing the Disciples' Feet," 1,577.; the Giorgione, for 1,474.; the Mantegna monochrome panels, for 1,753. The Fra Angelico fetched 1,312.; the Bronzino portrait, 1,877.; the Titoret portrait, 1,155.; by Titian, "The Artist's Daughter," fetched 735.; by Marcello Venusti, "The Money Changers in the Temple," 1,827.; and by the same painter, the "Adoration of the Magi," 1,210.; the Sansovino drawing, from the collection of Sir Thomas Lawrence, was purchased for 315. The two Buhl *armoires* fetched the enormous sum of 11,600.; the Gothic silver-gilt cup, 405.; the Baron Carl Meyer de Rothschild, of Frankfurt, purchasing the "Roemer" cup for the sum of 3,090 guineas, the second cup for 735 guineas. One of the pair of Louis XVI. ormolu chandeliers fetched 2,220 guineas; the companion pair, 2,650 guineas.

pear, indeed, never to wane in interest with the educated public, and any fresh theory with respect to them, instead of being slighted as treating a threadbare subject, on the contrary, readily attracts attention, and a recent speculation of this nature will be noted and examined in the course of the following remarks on the statues of the Apollo of the Belvedere and the Diana of Versailles. The speculation above mentioned is, however, confined to that statue of Apollo, and what he may be supposed to be doing; but a few words may not be out of place in respect to both statues contemplated as a pair, which appears to be an idea with a good foundation.

The birth and parentage of the deities they represent is familiar to every schoolboy who reads his Lempricci. Apollo and Artemis, answering to the Latin names of Apollo and Diana, are spoken of in Greek mythology as having been twins to the supreme Zeus, by Latona, a nymph of primeval mystery. Born at one birth, their advent to life thus points to the belief in the Classic mind that the sun and moon they represent were created at the same time, in accordance with the Mosaic record, the one to rule the day, the other the night. Hebrew thought, however, did not picture them as gods, which it was the character of the Greeks to do, and to personify them, like all the other powers and elements of Nature, under human forms. As the great luminaries of the earth, they entitled them, from their shining qualities, the brother, Phoebos, and the sister, Phoebe.

This "giving light upon the earth" appears to have been, even in the Greek view, the principal mission of the divine pair; and, although Apollo was devoted to music and poetry and the fine arts, and his sister to the chase, and they had also other occupations and diversions, yet, in their most glorious phase, never lost sight of by their true devotees, they were permanently worshipped as the light-giving benefactors of the world, directing their beams to the uttermost parts of the earth, and thus portrayed as divine archers with shafts of radiance.

An article, however, which appeared in the *New Quarterly Review* of April, 1878, denies this sentiment and action to the renowned statue of the Apollo Belvedere. It opposes the usually accepted idea that he was originally represented as he stands now in the Vatican, holding a bow in his left hand, and suggests instead that he held an *agis* with a Medusa's head embossed on it. And, to a limited extent, some facts afford an opening for this view. When the discovery of the Apollo took place, in the fifteenth century, it had suffered several mutilations, and among these that of the left hand, which was wanting. This was never found, and the present one, which grasps the centre of a bow as it now appears, was a restoration. The question raised is whether it was a just one. The author of the article in the *New Quarterly* suggests that it was an error.

In preface to his theory he quotes from the fifteenth book of the "Iliad" the charge by Zeus to his son Apollo to give aid to the Trojans in driving back the Greeks to their ships. "Take thou in thy hand the fringed *agis*, and shake it mightily, and strike terror among the heroes of the Achæans." This passage is the sole classic authority advanced by the author for Apollo being represented as a bearer of the *agis*. The more direct and substantial illustration, however, of this speculation which appears in the article in question, is that in 1860 Dr. Stephens, of St. Petersburg, published an account, with figures, of a bronze statuette he had discovered in the possession of Count Strokanoff, of that city, the ownership of which he had traced back to Dr. Frank, who was physician to Yeli Pacha; and also had ascertained that it was one of eighteen bronzes which had been found in company together, in the neighbourhood of Zanina in Epirus. This statuette is 18 in. in height, not very highly finished, and the *clavus*, instead of hanging over the left arm, as in the Belvedere Apollo, falls straight down behind the shoulder. It is also stated that it is somewhat more robust in its proportions than that statue, and that the left arm is held somewhat lower, so that in these latter respects, at any rate, there does not appear to be any identity between the two works. Nevertheless, with this preamble the essayist proceeds to introduce his speculation by drawing attention to the fact that in the left hand, which is perfect, is held something

which is incomplete, but which, although it could not, he says, have been part of a bow, yet might, he states, have formed portion of an *agis*, as it appears to be a fragment of something crumpled like a piece of leather; the classic *agis* having been originally a goat's skin, on which was displayed eventually the Gorgon's head.

The above statements are the grounds on which the author submits that we should discard from the hand of the Apollo Belvedere the hitherto accepted bow, which is typical, and substitute for it the *agis* with the Gorgon's head, which has no such claims for its adoption in the passage in Homer is at least exceptional.

Were it not apparent that this theory candidly derives its chief authority from the above-mentioned 18-in. bronze statuette from Epirus, which, however, does not now possess the *agis* in its hand, but only a fragment of something which might have been one, it might be imagined that the idea of the *agis* in the place of the bow had originated from contemplating the fine statue of Perseus, by Canova, which does appropriately hold the head of Medusa in its left hand. This graceful figure resembles the Apollo in its general character and in the position of its outstretched left arm; and that it is especially proper to the hero it represents that he should display the Gorgon's head, is evident from the well-known story of Perseus and Andromeda, so forcibly narrated in the fourth book of Ovid's "Metamorphoses." It is worthy of note, also, that under the first Napoleon, and during the time that the Apollo was, by his order, removed to Paris, this statue of Perseus by Canova, which approaches the Apollo in scale and height, was selected to occupy his vacant niche in the Belvedere Court of the Vatican, from which circumstance, during that time, it bore the name of "*Il Consolatore*."

Notwithstanding this event, which was calculated to have drawn Canova's attention very near to the speculation in question, we do not hear that that great sculptor, who was a devout worshipper of the antique, said anything in that direction. The left hand now on the Apollo was a restoration by a pupil of Michelangelo, who, as is well known, was also an enthusiastic admirer of ancient art. In more modern days the classic and erudite Flaxman thus speaks of the statue.—"The energetic Apollo Alexicacos, or the driver away of evil, is severe in youthful beauty, his golden locks are agitated, the quiver is hanging on his shoulder, and he stops forward in discharge of his arrow."

Great as are these authorities, there can be no desire to oppress with their weight the author of the article in question, for the outcome of such suggestions as his is advantageous, inasmuch as they promote discussion on interesting points of art, and thus are welcome as useful to its cause. Nevertheless it may be submitted that it does not appear likely that the bow in the Apollo's hand will have to give way to the Gorgon's head. What was suited as a glory and as *spolia opima* to Perseus and as an appropriate instrument of vengeance in his hands, to turn his adversaries to stone, might seem indeed almost to entail a loss of dignity to one of the superior gods, who, so much more appropriately, might exert his own especial power, and slay by sunstroke and by his fierce rays, as typified by his fatal arrows. But the question may well be asked,—Why should it be necessary to consider the Apollo, in his noblest state, as representing in any respect a destroyer?—and why not, on the other hand, a benefactor? Flaxman, by preference entitles him "Alexicacos, a driver away of evil," the god of sunshine, the harbinger of health; and in his youthful and godlike vigour he looks like it! In "Childo Harold," Byron speaks of him as "the lord of the unerring bow," "the god of life and poetry and light," "the sun in human limbs arrayed." This is how this noble work impressed our noble poet, and why should not these eloquent epithets be correct? It seems, indeed, to be a subject for regret on this occasion of the poet's contemplation of the Belvedere Apollo that the Diana of Versailles did not stand beside her brother in the gaze of the bard, as in that case she might have inspired another description equally happy, poetic, and noble.

In both sentiment and execution these two statues have much in common. They are extremely and equally beautiful, and there is nothing savage or malignant or dismal or vengeful in their expression, so that it seems to be beside the mark to entertain for a moment

the suggestion that they are represented as in the act of destroying the children of Niobe. That is a cruel classic episode, quite removed from the character in which the divine brother and sister were best worshipped as deities of light and life and beneficence; and not to be accepted in these statues of serene beauty.

In taking leave of the above speculation of substituting the *agis* for the bow in the hand of the Apollo, it may be well acknowledged that, after all that may be said in the way of discussion, words are but an inadequate test in such cases, and that it might be submitted to its author that the most practical and efficient way of placing the change he proposes before the artistic world would be for him to procure a cast of the Apollo Belvedere, and afford his guidance to some young sculptor in substituting in the left hand an *agis* for the bow. This is not a costly experiment, as even a reduced plaster-cast would illustrate the variation, and the trial might probably be convincing.

As has been already intimated, there is no novelty in the theory that the Apollo of the Belvedere and the Diana of Versailles, which is now in the Louvre, might have been companion figures; for copies of them have been so arranged on several occasions. Various hypotheses have also been set forth—as to the modes in which they may have been originally associated as a pair, and of other figures which might have been introduced in their company, but there does not appear to be any ancient authority extant on the subject.

Their resemblance of type and similarity of art-treatment are, however, intrinsic qualities which may be judged of as well now as ever, and in this respect it may be interesting to note in juxtaposition some of the details of this parity as companion figures, for in the action and arrangement of their limbs a correspondence and yet a variety may be readily recognised which renders them perfect as a pair and complete by themselves as a composition. Apollo has just released a shaft from his bow, and Diana is preparing to shoot, and is drawing an arrow from her quiver, which, like her brother, she bears on her back. In the Apollo the right leg is foremost, in the Diana the left. In the Apollo the right arm and hand are the lowest, in the Diana the left. In the Apollo the head is turned towards the left shoulder, in the Diana to the right. They are also, allowing for sex, of corresponding stature, namely, that which is called heroic, Apollo being a little over, and the Diana a little under, 7 ft. Their features possess a strong family likeness, appropriate to their divine consanguinity. And it may be noticed of the Apollo's head at Basle, which is evidently a somewhat free replica of his of the Vatican, that the features bear a still greater semblance to those of the Diana of Versailles; also that the treatment of the hair has in that version still more similarity to that of the goddess.

It appears highly probable also, even if not the actual originals from the same hand, that these statues are at least direct copies from such originals. And this is not only evinced by the general coincidence of their characteristics of youthful beauty, in which the form and limbs are compact, long, and slender, exhibiting powers of fleetness and activity, not by any strong markings but by trained and perfect beauty of contour; but that also this similarity of style, allowing for difference of sex, may be followed in a likeness of details which could scarcely come but from one and the same inspiration and hand. In one respect this may be peculiarly evident even to the general observer, namely, in the treatment of the shin-bone, or edge of the tibia in the legs. This, although in each case delicately rounded, is made very apparent and distinct, and is a more generic form in these two statues than in most others, with which, however, it may be requisite that they should be compared in this particular to fully appreciate the difference.

The same limbs also offer another remarkable coincidence, namely, a similar departure from exact equality of measurement between the right and left leg: the one thrown back, in either case, being, by measurement, distinctly longer than the forward one, which difference was made doubtless for the purpose of giving greater movement stride and advance to the action of both statues. This, however, is done to a greater degree in the Apollo than in the Diana. It is agreeable to the support of the above idea of these two statues having been designed as a pair that the corresponding such details as

these, which are far, however, from being the only ones, should bear out the theory that, as the deities they represent were of one parentage, likewise the statues themselves should have possessed close kindred of birth. It is also satisfactory that this argument does not rest upon hearsay, but that their intrinsic qualities and similarity of treatment are extant in their forms to bear witness. It is on these foundations, open to all to judge of for themselves and to discuss, that the conception of the closest relationship of these two statues as works of art rests; for this is in no degree assisted by their modern history, which is scanty and in a small compass.

The discovery of the Apollo took place towards the end of the fifteenth century among the ruins of Nero's great villa at Antium, now Anzio, on the coast of the Mediterranean, about thirty-five miles from Rome. It was purchased by Julius II. while Cardinal, and when he became pontiff he had it placed in the Belvedere court of the Vatican, where it now stands. Of the discovery of the Diana there is no certain record, but it is supposed to have been brought from Italy to France by Primaticcio, in the reign of Francis I., and placed at Versailles, whence its title, and after a prolonged sojourn there was removed to the Louvre, where it still remains. The present shrines, therefore, of the twin divinities are situated far apart, and they can be brought together as companions solely by means of copies.

It is thus only, however, that they can be contemplated in perfection as associated works which have no superior, and which may well have peculiar interest with us as personifying, in such beautiful human forms, the two great luminaries of the day and night which the Greeks worshipped as gods.

#### THE STATE OF THE RIVIERA HEALTH RESORTS.

THE outbreak of a typhoid epidemic at Cannes, the presence of scarlet fever at a high-class hotel at Nice, some cases of small-pox among the natives at Hyères, the prevalence of zymotic disease during the summer months among children in the Principality of Monaco, and, above all, the hope that the Queen may again visit the Riviera during the forthcoming winter, have occasioned a decided movement in favour of sanitary reform among the Mediterranean health-resorts. The foreigners have now all left the coast, and this is the moment when public works may be carried forward without interfering with the enjoyment of the visitors, on whose presence the greater part of the inhabitants depend for their livelihood. After the severe warning of the last season, we have the right to expect the realisation of important reforms before the commencement of next autumn. The town of Cannes received a double blow. Not only did it lose an enormous number of its customary visitors, but the Queen would undoubtedly have selected Cannes in preference to Montone had she not been warned of the danger of typhoid fever. Yet, of all towns on the Riviera, Cannes the least deserved this severe lesson. We gave the details last year of the loss of 120,000*l.* which this town has raised, and how it was to be expended for the most parts on works calculated to improve the health of the inhabitants.\* This loan has now been realised, and the cash is lying in the coffers of the Municipality; but, to execute a grand scheme of drainage on which the health of the town in part depends, signatures are required from both the Minister of Public Works and of Marine, and the red-tapism for which France is notorious has occasioned months of delay. Altogether these incidents are most discouraging. The one town which, of all others, has made the greatest sacrifices in the cause of sanitary reform has been the most severely punished. It is true that Cannes is not so well situated as most of its rivals, for the central district is built almost on a level with the sea, and it is only the outlying villas that enjoy positions on elevated ground. So great, however, is the demand for land in the suburbs that the entire neighbourhood is studded with villas, so that now it is almost impossible to manure a field without causing a nuisance to the wealthy visitors who have built their elegant homes amid the olive and orange groves of the coast. Orders were consequently

given by the Municipality to cease manuring fields in the Commune of Cannes during the winter season. A tank barge is placed at the head of the pier to receive the contents of cess-pools and soil-tubs, which periodically sails out beyond the island of St. Marguerite and empties its contents into the deep sea. Thus the olive trees lose their former supply of manure; but a nuisance is avoided.

Even in this detail, however, Cannes was not exempt from the ill-luck that has pursued the town of late. During the height of the season, the solitary guardian who, in the evening, watches over this tank barge, was taken ill and went home. Thereupon some boys, lounging idly on the pier, were tempted by the sight of the unprotected boat, and, ignoring its true character, clambered on board. Their attention was then attracted by an unfamiliar mechanism, which they soon contrived to set in motion; and this, without knowing what they were about, opened the valve, and let out into the harbour all the sewage which had been stored in the barge. The results are better imagined than described. Several yachts in the harbour at once weighed anchor and took flight in terror. Angry letters were written to the English papers, and yachting clubs were advised to give Cannes a wide berth, as the harbour was poisoned by sewage. The accident of the one night was taken to represent the chronic condition of the port; the existence of the sewage barge was not suspected, and the nuisance attributed to sewers opening into the harbour. Thus the bad reputation acquired by the town of Cannes was accentuated.

The question of the disposal of sewage, becoming every year more urgent as the population increases on the Riviera, is a matter of exceptional difficulty. The native system of drainage is of the simplest. It consists of small wooden tubs, which, when filled with soil, are poised on the back of a mule, one on each side, and carried out to the fields and emptied, probably under an olive-tree. In the better-class houses a cesspool is substituted for the tubs, and, when emptied, the contents could generally be sold for 4 francs the cubic metre, including carriage to the field or farm. A pipe coming through the wall conveyed into the street or gutter vegetable, kitchen, and all other household water and refuse. The contents, therefore, of the cesspools and tubs were of a valuable and concentrated character. As the number of visitors and winter residents increased, the number of cesspools increased and that of tubs diminished; while, for the open gutter or street drainage, closed sewers were substituted. It is to be doubted whether this change and so-called improvement has always proved to be a real benefit. Most of the Riviera towns now suffer from the disadvantages of both the sewer and cesspool systems. The sewers are generally much too large for the work they have to perform, are rarely flushed, and never ventilated; the deposits are therefore very considerable and very foul. They would be had enough if, according to the French rule, nothing worse than vegetable water was allowed to enter; but as a matter of fact, there are a number of cesspools which have overflows into the sewers, and this has become all the more necessary where the English visitors, contrary to all French habits, insist on pouring large quantities of water down the closets. While the increased quantity of water in the cesspools has reduced the value of the manure they contain, the thousands of villas yearly built in districts formerly given up solely to agriculture has lessened the demand for manure. The poorer inhabitants, therefore, cannot so readily dispose of a mule to convey them a long way into the country, they often prefer stealing out in the silent hours of the night, and emptying the entire contents of their tubs into the mouth of the sewer. Where some poorer streets join the main street at Cannes, it has been necessary this winter to keep the police specially posted by the openings contrived to enable the gutter-water to run down in the sewer; but the number of police were insufficient, and, in spite of their watchfulness, the sewers were frequently fouled by the emptying of soil tubs and vases.

These considerations are all of the utmost importance, as no effort is made to sever the connexion between the houses and the sewers. Indeed, the necessity of such precautions is not in the least understood. From the kitchen-sink the lead-pipe goes straight to the sewer;

sometimes there is an inoperative hell-trap contrived with a view of preventing stoppages in the pipes rather than the keeping-out of sewer-gas. Then, as there is no independent ventilation of the sewers, the sewer-air must pass through the houses to reach the external atmosphere. Formerly, when there were no sewers, the streets were dirty, but the insides of the houses were free from sewer-gas. Now the houses are like lungs, each room forming a cell, which by its higher altitude and temperature draws the air up from the sewer and expels it again by the window or chimney. Now are the insides of the houses efficiently protected from the emanations of the cesspools. According to the law, which, it must be acknowledged, is very generally carried out, an open pipe must run direct from the cesspool to the top of the house, and is supposed to allow all the noxious gases to escape. But, on the other hand, there is no disconnection between the closets and the cesspools, no syphon trap under the pan, and the pan rarely contains more than 1 in. deep of water. The pipe is made to descend as straight as possible into the cesspool. It is as wide as possible, to admit the throwing down of brushes, &c., without causing a stoppage, and it is made of porous, thin, ill-conditioned, but very cheap pottery. Under these circumstances, the pipe is always foul, and is in itself a nuisance, independently of the cesspool. Only one thing can be said in its favour, namely, that it is very often conducted outside the walls of the houses. The result is not strictly ornamental, but it is advantageous from a sanitary point of view. The porous nature of the clay used may be judged by the aspect of the chimney-pipes, often made with identically the same pottery, and running up the wall close at hand. These latter are soon coloured through and through by the smoke, like a good meerschaum.

At present the chief concern of the authorities on the Riviera is to prevent the sewer-gas, or rather the bad odours, from ascending into the streets. For this purpose, the openings from the gutter to the sewer are protected by a Barrat valve. This consists of an iron framework, where a gallon or two of water can accumulate, then its weight forces a loose valve back, which closes again when the rush of water is over. As there is no syphon beyond, and as the iron flap valve is very often kept partially open by a piece of orange-peel, or some other substance, the apparatus, most fortunately, does not act. If, on the contrary, allows some sewer gas to escape into the streets, which is preferable to its admission within the houses. Also, as these ineffective traps are much nearer to the sewer, and allow the escape of a larger volume of air at a time than would be the case with the house-drains, the nuisance is more generally noticed, and therefore stimulates the outcry and the complaints raised by the visitors. This ultimately affects the authorities, and stirs them to action; though in reality the nuisance, occurring in the open air, is not so dangerous as the less perceptible escape of sewer-gas within the houses. The bad smells in the streets are a useful warning of the danger around; but, as yet, the French authorities have failed to realise that anything short of a pungent stench can in any way be injurious. Therefore, as these odours are necessary to demonstrate the need of taking action, they had better occur in the open streets than within closed dwelling-houses. The more sewer-gas escapes into the streets, the less will remain to enter into the houses.

The houses being, for the most part, utterly without protection from the entrance of sewer-gas, the first and easiest measure would be to ensure the independent and effective ventilation of the sewers, so as to reduce the pressure upon the house-drains, and improve the nature of the air within the sewers. This could be done promptly and without any serious expense. At the same time, every effort should be made to disconnect each house from the sewers, but, excepting a few among the English owners of villas, there is no one capable of taking such precautions. The newly-appointed sanitary inspector at Cannes, with whom we have had lengthy conversations, knows nothing about this phase of the question; and yet Cannes is in this respect the most advanced of the Riviera towns. It is the only town that has established a Sanitary Bureau, and employs a sanitary inspector. The French doctors, engineers, and architects have no knowledge whatsoever of sanitary science in its relation to the drainage of houses, the trapping, ventilating, and dis-

\* See *Builder*, April 16, 1881, vol. xl., p. 488, "Proposed Improvements at Cannes."

connecting of house-drains. It would be impossible to find a Frenchman capable of constructing a water-closet that would answer to the exigencies of modern sanitary science. The education of the country in this respect is still a thing of the future. We must, therefore, not expect or ask for too much at first.

We can, however, at least, insist on the punctual carrying into effect of those few principles and rules that are recognised on the Continent. Thus, where the pail or cesspool system does exist abroad, we can insist that the sewers shall be effectively protected from cesspool overflows and similar contaminations. It would not be too much to demand and expect that the sewers should at once be ventilated, and the gas carried up to a level above that of the houses. Again, we may legitimately expect that the sewers will in future be better constructed, and placed at a sufficient depth to be sheltered from the effect of heat and cold. At Hyères, in the main street, there is a sewer which is only covered by the large flagstones that form the cutsway. These stones fitting badly, the sewer is ventilated at every step, a fact which is only too perceptible. Of course the heat dries the material within, accelerates the fermentation, and when rain at last comes the foulest of odours rise to poison the neighbourhood. Last year a little child, living on a ground-floor immediately over the worst part of this sewer, died from diphtheria, after an illness of only three hours! There were several other similar but less virulent cases. We could adduce many other cases of fatal results that might have been prevented even if only the French rules of hygiene had been observed. Pending their suppression in favour of a better system, the cesspools should all be visited, to see that they are all watertight, have no overflows, and that the ventilator is really carried up above the roof. This work is being done at Cannes by the new sanitary inspector, and he has found that, in some houses, the ventilator came to an end under a window; in one case it was the ladder-window! Similar inspection should be made in every town in the Riviera. Many startling revelations would ensue. Also, we might suggest that an inlet as well as outlet should be provided for the ventilation of the cesspools. The French rule that every closet should have a window or opening giving on to outer air should also be enforced. We have seen many closets that only ventilate into the staircase of the apartments.

When we consider that English visitors, more than those of any other nationality, have contributed to the success of the Riviera health resorts, we have a distinct right to demand that the local authorities should, at least, do all that the French accepted principles of hygiene proclaim to be necessary. Even thus much has not as yet been done. But we can go further than this. We can urge in the interest of the Riviera towns that nothing would contribute more to their success as health resorts than the adoption of the English ideal, which is fifty or a hundred years ahead of the French conception, and, on the whole, is not more expensive. For this it is indispensable that the municipal councils should despatch delegates to England to study on the spot what is being done. This would be the most conclusive of all demonstrations, and we are surprised that, in defence of their own interests, so easy a measure has not yet been adopted. On our side, while urging forward our English conception with the utmost energy, we must guard ourselves against expecting what is impracticable and altogether beyond the knowledge of the authorities and their recognised advisers, the French doctors, architects, and engineers.

#### BOULLE, THE CABINETMAKER.

THE very large sums that have been recently realised at the sale of the Hamilton Palace Collection by several specimens of the cabinet-maker's art, and among them a number of pieces of the work commonly known as "Duhl," have, as might be expected, aroused interest in the artistic and industrial world. At a time when our most respected authorities have been striving their utmost to call the attention and admiration of the public to the work of artists of earlier days and their purer and more refined creations, such an event as the sale for thousands of pounds of pieces of furniture belonging to the seventeenth and eighteenth centuries is somewhat calculated to disturb the minds of the less thoughtful public. Of the less thought,

ful, we say, because there exist reasons why such sums should be paid for the choice cabinets, the secrétaires, the commodes, and the tables, which have recently realised at the Hamilton sale such incredible prices. Putting aside all rigorous standards,—above all, the artist should, in his admiration, be as eclectic as he is the very opposite in his creations,—putting aside, we repeat, all æsthetic standards, how is it possible to deny that these works were produced in the true spirit, however degraded, as we shall be told, the designs and traditions may have been on which artists such as Boulle and Riesener worked? To what monstrosities of so-called industrial art has not the name of the former of these two artists been given? "Duhl" work, as it is erroneously termed by us, has long since, in England at least, received at the hands of our leaders in taste an amount of quiet abuse which, with all but those who do not merely allow themselves to be led by the opinions of others, has lasted for ever from the homes of those who respect themselves any creations of the reign of the fourteenth Louis. In France, however, such prejudices are not allowed to influence people of taste, and the memory of Boulle as an artist, a good workman, one of the glories of the *grand siècle*, and as a collector of works of art, is not entirely forgotten, though there, almost as much as with ourselves, his memory has been so associated with the work which is known familiarly by his name, that its connexion with his creator has been overlooked, and *meubles de Boulle* are spoken of by our neighbours in much the same manner as we on our side, speak of "Duhl" work.

The sources of information respecting Boulle are few; the lives of the great artisans of the world are scarcely of the eventful nature that fills biographical dictionaries and the pages of history, and where they have not, like Palissy, left behind them their memoirs, or, like our own Chippendale, published elaborate works on their art, or, like Brûquet, the watch-maker, entered the French Academy, we are like to know little of their obscure origin, their early struggles, and their uneventful life-long industry. In the "Biographie Universelle" not a word is to be found concerning the great cabinet-maker of Louis XIV., whose creations crowd the galleries of Versailles. Indeed, were it not for the recent researches of the compilers of the "Archives de l'Art Français," and the by no means common pamphlet by M. Asselineau on Boulle, we should have but few published sources of information on the worthy artist.\*

Boulle, it would appear, was born in Paris in 1642, a Protestant, though we have evidence that he died a Roman Catholic. From the contemporary evidence of the Padre Orlandi,—in his "Abecedario,"—it would seem that young Boulle early showed his artistic tastes, desiring even to become a painter, and only departed from this course at the express wish of his father, who looked to him to continue his profession as cabinet-maker. It is easy to see how greatly this early influence affected the young man's after-life and revealed itself in the less-thought-of productions of his genius. We have probably little cause to regret his forced step. As a painter we know very well what he would have been under the over-towering contemporary influence of Lebrun. Respecting the early years of Boulle's life we know nothing; in all probability they were passed in the long and industrious apprenticeship which was considered necessary in the past to make the good workman. But that the young man must early have shown his power is evident from the fact that at thirty he was already famous. His *brûlé de logement*, which gave him, at the king's hand, a permanent lodging in the royal palace of the Louvre, is dated 1672, and is, we see by the document, accorded him for his "experience" as an *débûteur, faiseur de marqueterie, doreur et ciseleur*.

There is a story, one which would go far to show the instructive value of museums and works of art with the student, that on the Sundays, when the great galleries were open (we recommend this incident to all interested in the views of the Sunday Society) young Boulle used to visit the palaces of the Louvre, Saint Germain and Marly, and return with his mind full of what were termed the wildest fancies. One day, the story goes, his master took him to Versailles to execute repairs, which occupied

some little time; the effect of the visit and the sight of the marvels which "the grand monarch" had called into being on the great sandy plain of Versailles, appears to have operated a positive effect on the impressionable mind of young Boulle, and on his return his imagination was actively employed in the design of pieces of furniture suitable to adorn rooms such as he had seen in the king's palace. A royal competition,—for competitions date from before our time,—gave the young man the opportunity of manifesting his skill, and, through the influence of the king's favourite, Mlle. de Fontanges,—nor does favouritism belong exclusively to our days,—Boulle found his designs accepted; *carte blanche* was given him to carry out his conceptions, and the enchanted monarch who found in the young artisan a worthy decorator of the magnificences which Lebrun and Mansard had created, accorded him for his life-time his protection and patronage. The apprentice had at length realised his dream: he had stepped from the narrow sphere in which he had so long regretfully vegetated, and the glory he had so long sighed for had come.

The numerous commissions which from this time crowded in upon Boulle he appears to have found himself incapable of carrying out. Letters in existence show the sad complaints of the Dauphin,—the son of Louis XIV.,—respecting the delay in sending home a certain cabinet, a marvel of design in mirrors and marquetry; while Crozat, the wealthy banker, we find, even brought an action against the artist for his neglect in complying with his instructions. The liberality of the king was great, and it is at first sight difficult to understand how it was that throughout his life Boulle appears to have been constantly troubled with pecuniary difficulties. The truth is, there still remained in him the soul of the painter he in his youth had aspired to become, and Boulle, we find, was what is understood as a collector, a collector who never missed a single sale of rare prints and drawings; raising money in every direction to satisfy his passion, and finally being almost broken-hearted by the destruction by fire of the greater part of his treasured gatherings, which, from all accounts, would appear to have been one of the most interesting and complete then in existence. His losses, indeed, he estimated at over 15,000*l.*,—a very large sum for two hundred years ago. The sale of the remains of the collection, which took place at his death, occupied many days.

Boulle died at the age of eighty-two (Feb. 29, 1723) at his home in the Louvre, and was buried in the neighbouring church of Saint Germain l'Auxerrois, leaving two sons to continue, only in name it is true, the traditions which he had in a measure positively created. One of the sons, employed at the Sèvres manufactory, was, it would appear, the first to introduce, in the decoration of furniture, the use of porcelain.

The secrets of Boulle's skill may be said to have died with their inventor, for though the traditions were continued, the sobriety and the grandiose style of the master will be found to be sadly wanting in all the work of his imitators. So much was this recognised that, throughout the last century, in all the sale catalogues the works by Boulle himself are conspicuously marked, and more than one collector made it his speciality to gather specimens of the great cabinet-maker's work. The finest of his creations were, of course, made for his royal patrons, and more than one piece in the terrible years of the Revolution was to pass into this country; thus several of the specimens of Boulle work in the Hamilton Palace collection have originally come from the palaces and châteaux of the French kings. That the sums which already several of these pieces have realised are not the result of mere caprice may be judged when it is remembered that in the last century specimens of Boulle work invariably fetched almost equally large sums.\*

It is only when one has had the opportunity of seeing and studying a fine specimen of genuine Boulle work, that the superiority of the original to the imitations which bear his name, can be thoroughly appreciated. There is a sobriety of tone and treatment, of line and proportion, a grandeur of style, a balance of light and shade, of dark and light, of bright and dull, of brass and white-metal (pewter), of

\* "André Boulle, ébéniste de Louis XIV." By C. Asselineau. Paris, 1872; 44 pp. Seventy-six copies only were printed. One will be found in the library of the South Kensington Museum.

\* Boulle is known to have made for the banker Bernard a writing-table at the cost of 50,000 francs (2,000*l.*), but in the Revolution this *chef d'œuvre* is believed to have either been destroyed or gone astray.

“tortoiseshell and lacquer,\* which will be found to be absent from the work of his successors and imitators, and utterly wanting in the coarse crude abortions which have been at all times forced on the public attention under the deceptive title of “Buhl work.” Even in the most conscientious of his successors, such cabinet-makers as Crescent and Cafieri,—who lived in the time of the Regent, contemporary with our Queen Anne,—the prevailing Rococo taste it is easy to see overcoming what little classical severity was left in the seventeenth-century work of Boulle, who largely drew his inspirations from the architectural models that he made his constant study. When we add to his merit as a designer and a delicate appreciator of the work of others, his merit as a good workman whose productions, without need of repair, are as stout in the present day, after two hundred years of use as they were the day they were made, it may be fairly conceded, even by the sternest rigorist, that André Boulle worked in what is understood as the true spirit. Not only in its construction, but in every feature, in the choice of the materials, in the chasing and gilding and the marquetry, his work will be found to be of the honestest, very different to the modern rubbish that passes under his name, where false tortoiseshell, made of horn or gelatine; false mother-of-pearl, box or horn instead of ivory; brass or even zinc lacquered ornament tacked on to ill-made joinery snarp the place of true work, whose only fault was that it was produced in a period when the traditions of art were on the decline. When Boulle used wood it was ebony, which the cabinet-makers, his successors, on the plea of its difficulty in working, in taking the glue or the varnish,—Boulle never used varnish,—and other reasons, replaced with stained pear-wood. In the choice of his woods Boulle showed the extremest care, and one of his severest blows was his loss by the fire that destroyed his collection of prints, of a quantity of rare woods which he had, we learn from the inventory he made at the time, long stored by to season. The bronze he used was honestly chased and chased and gilt, not lacquered, and each ornament was a design not stamped out.

It is somewhat sad, and calculated to rouse reflection, the difference between the spirit in which Boulle produced his work and that in which his successors now produce theirs,—the relative position of the so-called industrial arts in the present day compared with those even of his time 200 years ago. The workman in the past was an artist. Boulle, not to mention many others of an earlier period, was an artist: he conceived his own designs, he drew them out (his patent is given him in his name not only as a cabinet-maker, but as an architect and sculptor), he executed everything with his own hand,—he was a chaser, engraver, and gilder; he was, as we see, a man of cultivated tastes into the bargain.

The division of labour, with its inevitable result of work without intelligence, without good faith, has made the modern workman what he is generally called,—a mere machine; he is in reality only a cog-wheel of a machine. Talent cannot be said to be wanting, nor the inducement which capital and reward are supposed to afford. If Boulle himself were to return, we strongly suspect he would have no opportunity to show his power. In the first place, he would find it impossible to devote the time to his work that he required two centuries ago to elaborate his creations. Hasty production, with a view to the hasty acquiring of fortunes,—to rival, apparently, other competitors who in their branches have acquired equally hastily gotten gains,—would thwart the best endeavours of the artist who would try to work in the traditions which regulated the industrial productions of the past. Are we calmly to state that what may be called the secondary arts are doomed? Let us hope not; but they are in danger.

**Epping Forest.**—The cost of reclaiming Epping Forest, including arbitration, compensation, and other legal expenses incurred by the Corporation, will, we are told by the *City Press*, approach the sum of 270,000.

\* It may be remarked that the presence of lacquer panels in Boulle work must be looked on with some suspicion; it has long been usual to replace by such panels the injured work of an original. When Boulle used Oriental lacquer, which he occasionally did, its quality was invariably of the very finest.

A PROPOSED LABOUR EXCHANGE.

A PROPOSAL has recently been submitted to the French Chamber and the Paris Municipal Council, which, though it is not likely to receive immediate attention, is none the less highly suggestive of matter for consideration, as much here as on the other side of the Channel. The proposal is no other than a suggestion that the Paris Municipal Council should erect and endow a Labour Exchange (*bourse de travail*), which might, to the industrial classes, to employers and employed, afford the same facilities for obtaining professional information and mutual advantage as the Bourse or Stock Exchange affords to the very large section of commercial men who deal or speculate in stocks and shares.

The suggestion, though it cannot exactly be said to be novel, is none the less likely to attract considerable attention among all interested by the proposal. Though there are, it will at once be seen, many objections to the mode in which it is so far proposed that the institution shall be started, the suggestion will probably produce its effect, and private initiative may perhaps do what it is at present proposed should be undertaken by the State.

It is one of the features of modern commercial activity, with its railways, its steamships, its mines, and what not, and the concentration of the considerable amount of capital this activity necessitates, that the market of those two great agents of production, capital and labour, has been singularly enlarged. Where formerly capital was invested in little but local ventures, we now see it spread over the whole world. English, French, Belgian capital is put out, not only in the countries of Europe, but in the United States, in Egypt, India, and Australia. The Suez Canal has now for some years been pierced, and the Panama Canal will soon be opened to the commerce of the world. Ventures of every kind are risked, and it is by millions that the profits on the invested capital can be reckoned. The other factor, labour, is, however, less mobile by nature. It is barely a century since Adam Smith remarked that man, of all commodities, is the most difficult to transport. However, as the means of communication have been facilitated, workmen, like the capitalists, have also set out in search of more advantageous markets. Emigration in its true sense is daily increasing. Last year hard on a million souls poured from Europe into North America, and there is every probability that the number will be increased this year. We have heard of 2,000 emigrants and more arriving in a day at New York. These, let it be noted, are not solely recruited among the agricultural classes, but also largely from among the industrial. The American workmen are, indeed, commencing to be alarmed at the threatened competition, and are asking if, now that they have shut out the Chinese, they shall not adopt the same process with the Europeans. What may be called the labour market is increasing in size every day in spite of the strong ties which attach us all to our native soil; in spite of the difference of climate, habits, and language; in spite, also, of the absence of any gridding trustworthy information. It is in this respect that the artisan may fairly be said to be in an inferior position to the merchant, who, through his exchange, may have at his disposition all that mass of information which the telegraph is able to distribute daily to every portion of the globe, and by means of which the capitalist is enabled to invest his funds wherever he sees the demand is greatest and the probable profit the largest. Unlike the merchant, the workman knows little beyond the price of wages in his own locality; he has no trustworthy means of acquiring any information as to the rate of wages in other places, or if so, his information is nothing more than hearsay, destined, perhaps, by sad experience, to be proved incorrect.

By a recent article on this question of the labour exchange, published by M. Molinari, in the pages of our esteemed contemporary, the *Journal des Débats*, we are reminded that the attempt has before now been tried to institute labour exchanges in the principal centres of industry, and special newspapers have been started, notably in Belgium and Germany, with a view to informing the working classes respecting the state of wages in the different markets of the world; but these attempts have all failed in face of the marked hostility on one side of the employers, on the other through the indifference of the men.

Although the multiplication of cheap and rapid means of communication has largely tended to level the inequalities which formerly existed in the price of wages and the necessities of life, even in places not distantly removed from each other, these inequalities have not entirely disappeared, and employers in localities where wages are low, the workmen in those where they are high, fear equally that any publicity might change so respectively an advantageous state of affairs. Some thirty and more years ago a journal, it would appear, was started in Paris which undertook to make known to its readers the rate of wages in Paris, and which endeavoured to obtain and retail the information gathered from various sources, but the task was one, from the outset, of extreme difficulty. The workmen consulted did not conceal their fear of bringing by this means to the capital a crowd of competitors, while with others imbued with political notions the step was unwelcome.

We only now, remarks our contemporary, one journal,—the *Labour News of London*,—which, as its title indicates, has made a feature of informing its readers of the state of the market, though it may be noticed it is only the market in America, the journal being little but a well-organised advertising medium of the trans-Atlantic emigration agents. The Trade Unions which reckon their members by thousands actively look after their interests. They are, indeed, as is well known, organised almost entirely with this view, keeping themselves well posted up in all matters relating to the demands of labour in different parts of the country. But these great associations are, unfortunately, it must be admitted, strongly imbued with a narrow spirit of monopoly, and they fear above all any immigration of foreign workmen into England, where, whatever the protectionists abroad may say, wages are higher and the day's work shorter than on the Continent. The Trade Unions keep alone for themselves the information they gather, and abstain from making known in any way to the outside public anything that would tend to lower English wages to the level of Continental wages.

In spite of the small degree of welcome with which the proposal has so far been met, the suggestion to free from any monopoly, and lay before those interested all information that can be gathered respecting the state of the labour market in every portion of the world, has not been abandoned. In 1861 it was suggested,—we continue to quote our Parisian contemporary,—by M. Ducaux, the Prefect of Police, to establish under Government direction a Labour Exchange, but the proposal was rejected on the score that the State could not safely interfere with such questions. In 1875 M. Delattre laid before the French Chamber an analogous project, but revised and largely augmented; the proposal was submitted to a commission entrusted with an inquiry into the question of the participation of workmen as investors in contracts for the public works. The Bill now laid before the Paris Municipal Council, suggests the erection in the centre of the city of a large building of iron, brick, and glass, to contain a central hall where the workmen may congregate, five principal committee-rooms for the general meetings of the trades committees, and five large offices for the *employés*. The first and second stories to contain in all some eighty rooms for the offices of the various trades committees. The total expense, including some 300,000*l.* for the expropriation of the land, would come to hard on half a million. The staff of officials would consist of a secretary, five subordinates, and about twenty or more clerks. The duties of this body of officials would be to receive and duly register all demands and offers of employment, to prepare at the end of the week a table of wages in each trade, the table being posted in the general hall. In short, nothing more or less than a species of gigantic registry office.

It does not appear from what has been stated above that the project is to be attempted on a small or economical scale. The report, indeed, remarks that perhaps temporary quarters might at first be found for the meeting of the trades committees, and that certain journals might weekly publish the tariff of wages.

There exist many reasons why this proposal is scarcely likely to receive immediate attention. In the first place, the chief objection, as we have so reported the scheme, lies in the intention of placing it under municipal authority. The Parisian ratepayers would justly have cause to

complain of the large share they would be called upon to pay for the erection and maintenance of so costly an institution. A second objection may be mentioned in the avowed unwillingness that would be sure to be met with on the part of the various trades committees to make known to the world the tariff of their wages. Like so many philanthropic measures, this suggestion of a labour exchange will be found to be beset with obstacles only the more difficult to overcome as they are supported by the most powerful of all motives, those connected with personal and pecuniary interests.

That there should seem to be an opening for such an institution we can well understand, but it will not be till the need is absolutely and widely felt that we may expect to see it satisfied. There is probably no valid reason why such an institution should not be started by private initiative. Indeed, in our country, it is alone private initiative which would attempt such an undertaking; we believe in the possible success that might encourage the promoters of such a scheme.

As bearing on an interesting phase of the labour market we have laid the subject before our readers, concluding as we commenced, by saying that the proposition is suggestive of thought.

#### THE DOGE'S PALACE AND ITS ART WORKMANSHIP.

It is interesting to notice the many evidences we find, in all old countries, of the power and skill both needed, and always found to have been forthcoming, in the planning and erection in detail of buildings destined for monumental or sacred purposes, and which, when completed, call on us to look at them, and, may be, to read on their walls and in their details their special purport. None will dispute this who have for any time looked at and studied the great fanes and monuments of antique art. How much, therefore, must it be deplored when anything occurs to lessen this interest, or even to change in any way the special character of it. A large and impressive building, such as the Palace of the Venetian Doges, belongs to history, and is, indeed, a visible page of it, written on at the time, and by those whose wants and aspirations called it into existence, and the more veritably the impress of the artist and executive power of the hands and minds of those of the past has been made, the more precious and fuller of art value is it, and the more worthy of all due preservation and careful keeping. Looking thus at these evidences of original art-thought and executive skill, as seen in this world-famous palace, the theme of so much song and so many day-dreamings, there may yet be not a few lessons got out of it by those who nowadays do the like work, and in so widely different a way.

We name this Venetian palace not alone from the interest now felt in so famous a building, but from the fact of its displaying so many evidences of the power of hand of the workman, and as evidencing what the artist-workman can do in the building-up and completion of a fine and characteristic structure. He can, as here seen, leave the indelible impress of his hand on it; and it is this which leads us to say a word,—may be, in season,—on the subject of the power of the workman in art, and on what in the past has been done by him all the wide world over, when he,—the actual workman,—has been left to himself, thus to add, as an individual power, to the art-architecture of it. This, indeed, is to be seen everywhere, but nowhere with more convincing effect than in the details of the world-famous building we have cited. It would seem at first glance to be an odd subject to dwell upon, and so it indeed is; but it is ever new nowadays, if we but look at the different ways of work of our present race of workmen,—art-workmen,—and those of the past: of those, for instance, who worked out the details of the Greek Parthenon, or of those who worked out the details of the Romanesque and the Gothic of later days. In no structure that remains to us does this evidence of the "workman's" power more strike us than in and on this very building. We would urge those who are interested to study the evidences of it, in plaster, now at South Kensington and the Architectural Museum, and in Mr. Ruskin's Sheffield Museum.

We thus cite this art, and fine art, of the

Doge's Palace, by way of useful illustration, not because it is the sole one, but from the certainty that none will for a moment dispute its cogency. It was the same with what is termed the Romanesque everywhere, and the early Gothic from its first beginnings to its passing away into another style or phase of Gothic. All goes but to show how entirely different were the ways of work in those distant days to any which nowadays prevail. In them, as in other more remote times before them, the workman was, without doubt, an artist,—a power, however rude and even near-sighted he might have been. He must needs have been an artist, and, so far, a thinker, and one capable of being left to himself, and thus to be guided by his own notions of the fitnesses of things. It is impossible to account else for the fine stoneworking to be found in so many of our cathedrals and churches, and to note in it, in the absence always of reciting and of what is called "restoration," the power and individuality of the handwork, as also the life in the quaint animal forms, and in the leaf and flower cutting, however "conventional" the work may be. It is well to make note of this, and may be to speculate on the difference between this work, and method of work, done in so distant a day, and that of our own to-day. We have before us in our museums fragments of such work from Venice and other cities, and they read, and can read, but one lesson: that the first conception, and drawing and final carving of the animal and the forms imitated or rendered conventionally could not have been from a previous design on paper, and certainly could not have been done from a drawing by another hand. Such work must needs have been the original thought of the art-workman himself, and have been drawn, however roughly, on the stone slab or block; and finally the work itself must have been the intelligent handiwork of the artist workman, without the aid or help of others; indeed, the workman's thought realised by himself. Such a work and so executed is as much a work of art as is the weed drawing in one of Turner's Liber Studiorum etchings the veritable work of the artist's draughtsman. We see, it is true, but very little of this about us, only here and there, by accident. We would point again, for fine and original carving of the "grotesques" at the base of the Monument on Fish-street-hill. These are finely imagined and sculptured, and are worthy of all study. They were the work of one Edward Pierce, and were doubtless suggested by Wren, the architect of the Monument, but designed and worked out entirely by the artist sculptor himself. We would, here, too, point, in passing, to some capital fruit and leaf carving on the panels of a new house in Chancery-lane, as an encouraging sign of better things.

We may thus cite this work of the Doge's Palace as evidence of the power of the art-workman in this leaving his impress of art skill and power of hand on a building. It is a subject that some may think of easy understanding, and all but obvious, but in reality it is not so; for the difference mainly between the past and the present of art, and certainly of architecture, in its details, depends on it. It was common to art and architecture all the wide world over, and the very absence of all machine and mechanical power in fine art then, luckily for us, prevented anything like our present art action from being in any way possible. It was this, indeed,—shortcoming, if you will,—that in reality made the old art what it was, the expression of the individuality, and, as well, of the executive power of the workmen of past days, and which, indeed, makes the work which they have left us so impossible to imitate or reproduce. It may, indeed, be for us, working as we do, and perhaps for the present must needs do, impossible to fully realise this ancient method of working out a design, but that it was so no art-student will for a moment doubt who will be at the pains to study and thoroughly look at, again and again, what has been left to us of the past of art, whether from old Greece of heathen days, or from Venice of more modern and Christian times.

How deplorable this is, no one, we are sure, who at all cares about such matters can be told without a profound feeling of regret. Once gone, the hand impress and the feeling of the artist-workman or workmen who worked out the details of this Venetian palace are beyond recall; there is no possible way of getting them back again, and the building which they illustrate and

beautifully must needs become, by such process, a quite new one, though on the old lines. This work has been, it would seem, but talked over, and we can but hope that it will not be persevered with, when it is considered what must be really the result of it,—the blotting out of the past of art work, so different from the present, and the putting of modern work in the place of it. We may here, perhaps, remind those who feel interested that there are some fine casts in plaster of details from these very doomed capitals in the Architectural Museum, Westminster. They were taken under the thoughtful care and guidance of Mr. Ruskin. With other fragments equally fine they may in the future be all that veritably remains of the old palace of the Venetian Doges, by the side, perhaps, of a faded photograph or a sketch taken by some passing traveller. *Sic transit, we may, indeed, here, if anywhere, say.*

#### STARTING FORCE ON TRAMWAYS.

OUR correspondent, Mr. Lefevre, C.E. (vol. xlii, p. 752), in remarking that it may surprise us to hear of the verification in fact of a suggestion made in our columns, calls forth the remark that, although we were unaware of the existence of the particular accumulator which he describes, the coincidence is by no means unique. To the engineer, as to the architect, the imaginative faculty is essential, if at least he would rise to the higher duties of his profession. But there is this difference between the two orders of workmen, although each is, or ought to be, truly a *poëte*. The demands on the imagination of the latter are ordinarily of a more special character; and in the case of the former, more widespread or universal. Thus, the question of the costliness of starting a tram-car by reason of the injury done to the horse, must have been more or less present to the minds of all mechanical men interested in tramways for some considerable time. This fact must have given rise to a general demand on the inventive faculty which, according to the usual course of invention, is likely to have set several minds independently to work. And, as the problem is the same in each case, it would be by no means surprising if the same solution were independently arrived at by different inventors.

For ourselves, we do not claim to have gone a step beyond the stage of detecting what was most needed, and indicating the need to those whose habits of thought and of occupation rendered them the fittest persons to attack the practical problem. To a certain extent this has been already done by Mr. H. P. Holt, whose tram-car starting-gear was patented on the 13th of May, 1879. The apparatus is figured in the supplementary volume of Mr. D. K. Clark's work on Tramways (p. 177). Mr. Holt claims that by the use of this gear, with its cam quadrant, the force exerted in starting a tram-car of 5 tons is reduced from 470 lb. to 213 lb. on a level, or from 1,400 lb. to 636 lb. on an incline of 1 in 12. This is a material gain, and would bring the strain on the horses on starting down to something like that on an ordinary road. Our own notion, in referring to the probable use of an accumulator, pointed, we may say, to an electric accumulator. But the possibility of a mechanical accumulator, or, in fact, a powerful spring, to act as a brake in stopping, and as a lever for starting, was also before our consideration. Mr. Lefevre suggests an hydraulic accumulator. Of the admirable service which such an application may render there can be little doubt. The main question, perhaps, may be as to the weight of the apparatus. Two hundredweight for a car of five tons is an addition of only two per cent. to the weight of the car; and it is quite possible that this may prove difficult to heat. We call attention to the subject with pleasure, not only in the interest of the inventor and of the shareholders, but even more in behalf of our dumb and deserving clients,—the tramway horses.

**Great Dealings Church, Suffolk.**—A new reredos has recently been put up in this church as a memorial of the late Lord Hatherley. It is of Bath stone, divided into three compartments, with alabaster shafts and carved canopies, from designs prepared by Mr. Wm. Bassett Smith, of 10, John-street, Adolph, and executed by Messrs. Cornish & Gaymer, of North Walsham, Norfolk.

DESIGN FOR THE VICTOR EMMANUEL MONUMENT, ROME: SECOND PREMIUM.—By SIGNORI FERRARI & PIACENTINI.

THE BUILDER, JULY 1, 1882.

PARFETT COTTAGE, EVERSLEY, HANTS.—MR. W. HEWSON LEES, ARCHITECT.  
Wymon & Sons, Printers, Queen St.

DESIGN FOR THE VICTOR EMMANUEL MONUM

ROME: FIRST PREMIUM.—By M. NENOT, ARCHITECT.

DESIGN FOR THE VICTOR EMMANUEL MONUMENT, ROME: THIRD PREMIUM.—By SIGOR STEFANO GALLETTI.

THE INTERNATIONAL COMPETITION FOR THE VICTOR EMMANUEL MONUMENT.

ALTHOUGH, as we stated in our issue of April 8th, 1882, when we reviewed the principal drawings and models submitted, between 200 and 300 were sent in by Italian and foreign architects and sculptors in the international competition for the national monument to be erected in honour of Victor Emmanuel in Rome, not one of them, it seems, has been selected for execution by the commission appointed to decide upon them. A great many of the plans exceeded the estimate fixed by the Italian Parliament (10,000,000 lire = 400,000*l.*), some to a ludicrous extent, one of the designs involving an expenditure of 100,000,000 lire. Others were considered not to meet the requirements of such a monument. But as the programme of the competition prescribed premiums to be given for three of the most meritorious designs, the judges have made three awards.

The first premium has been carried off, as already mentioned, by a young French architect, M. Henri Nenot, who has not yet reached his twenty-ninth year, and who gave early promise of distinction. Having made a journey in 1880 to Delos, Smyrna, Bairout, Baalbeck, Damascus, Jerusalem, and Jaffa, passing thence to Egypt, and ascending the Nile, for the purpose of studying Classic art, he on his return entered the list of competitors for the Victor Emmanuel monument. Full of the impressions gained during his journey, he evolved the design which has been awarded the first prize of 50,000 lire. His work resembles the Piazza del Picciotto of Naples, and would be a second Piazza di San Pietro, but chaster in style, more in accordance with the rules of Classic art, and somewhat smaller. He proposes it to be placed in the Piazza di Termini, Rome. It is of semi-circular form, a triumphal arch occupying the centre, and facing this is placed an obelisk, a modified form of Trajan's Column an important part in M. Nenot's design, fifty-one statues being distributed over the semicircle and the triumphal arch; four triumphal cars, in the form of the bigas of the Roman circus, surmount the arch and the ends of the arcade respectively. The column in the centre bears the figure of Victor Emmanuel in modern dress, its base being surrounded by eight statues. Four fountains complete the decoration of the monument. The column is covered with bas-reliefs, winding spirally round it, and representing scenes from the Italian wars of independence. The design of M. Nenot admits of an alternative: an equestrian statue of Victor Emmanuel may take the place of the triumphal column if the judges should deem fit to substitute it. The wall spaces of the portico of the arcades are to be filled with reliefs.

The second premium of 30,000 lire has been given to Signori Ferrari and Piacentini, two Roman artists. Their united design is not easy of description, but it is a pile of grand proportions, which its authors desired to see placed in the Capitol. It is a mass of staircases, platforms, parapets, the whole surmounted by a triumphal arch, in a niche of which is placed the sitting figure of Victor Emmanuel. At his feet and round him are grouped bas-reliefs, flanked by equestrian groups, that to the left being Garibaldi, that to the right an army general, alluding to the double means by which, under the auspices of her first king, Italy achieved her unity. The base, and indeed all available wall spaces, are filled with reliefs, the whole being adorned by colossal statuesque groups and single figures.

The third premium, of 20,000 lire, has been given to an Italian sculptor, Signor Stefano Gallotti. His design consists of a triumphal column for the Piazza Venezia, and is in keeping with its surroundings, the old palace of the embassy of the Republic of Venice. It is profusely adorned with bas-reliefs, and its base is surrounded by equestrian figures and guarded by lions. The statue of the first king of Italy, on horseback, crowns the summit.

We give engravings of the premiated designs in this week's *Builder*. The decision of the commission has given rise to much hostile comment in Italy.

PARFETT COTTAGE, EVERSLEY, HANTS

The addition to this house consists in a new dining-room, with bed-rooms over, the treatment of which was attended with some difficulty on account of the very dwarfed height and unpretentious appearance of the old building. The new room being 22 ft. by 18 ft., it was desirable to make it fairly lofty, whilst, on the other hand, care had to be taken not to utterly crush the old portions by the height of the addition.

The lower portion of the work is executed in cement concrete, and the upper parts are filled in with tile hanging. The ceiling of the dining-room, to get as much light as possible, is formed as a panelled ceiling.

The works have been executed by Messrs. Harmsworth and Bunch, builders, of Eversley and Yatley, under the superintendence of the architect, Mr. W. Hewson Lees, of Doughty-street, London.

THE VILLIERS BAND STAND: WOLVERHAMPTON PUBLIC PARK.

THE Right Hon. C. P. Villiers has presented to the people of Wolverhampton a handsome band-stand, which is erected in the public park, and was inaugurated with considerable demonstrations on Whit-Monday. We give a view of it. The structure occupies a position on an elevated part of the park, on the western side below the Connaught-road gate, whence are obtainable the best views of the surrounding scenery, embracing Tettenham ridge and the park itself, situated like a verdant amphitheatre within its encircling border of town buildings and suburban residences. Placed on a site formerly covered with grass, a good deal of work has been needed in the immediate locality of the stand to fit it for the promenade of visitors. Round the base of the stand is a grass border some 9 ft. wide, relieved with ornamental heds planted with trees and flowers, and enclosed by a neat ring fence of wire. Outside this is a circular gravelled walk 30 ft. in width, with five other walks, each 20 ft. wide, radiating therefrom to the main roads in the park. The turf has been taken up and relaid upon improved levels to correspond with the walks, and altogether the remodelling of this, the most picturesque part of the whole enclosure, has been well conceived and executed. The band stand has been erected at a cost of 340*l.*, of which sum the ironwork represents 225*l.*, the stonework and flooring 78*l.*, and the painting 37*l.*. The canopy, like the stand, is of cast-iron, and octagonal on plan. It is domed-shaped in elevation, the profile, or outline, being to the curve known as the ogee. The framework on which the covering plates are fixed consists of eight cast-iron ribs, each springing from a column, and joined together at the top to the strong cast-iron base plate of terminal. Between each pair of ribs, and attached thereto by bolts and nuts, are four angle-iron purlins. Each of the cast-iron roof-covering plates is securely fastened to the ribs and purlins, and the roof is surmounted by an ornamental cast-iron weather-vane. The whole rests on eight strong ornamental cast-iron columns 16 ft. high, each column having three ornamental spandrel brackets attached, two of which are set at the angle answering to the shape of the stand, and with the corresponding bracket on the next column, form an arch, enriched and made secure by having an ornamental fret panel of the full length of the bay fixed at the top. The third bracket projects out from the stand in a line with the main rib, and supports the overhanging roof and eaves. A ceiling of varnished pitch-pine is fixed immediately above the line of the top of the columns which acts as a sounding board. An ornamental railing, 3 ft. 0 in. high, fixed to each of the columns, encloses the structure, and on one side a double-leaved gate is hung to plain wrought-iron standards. The total height to the top of the vane is about 35 ft., the diameter over pillars being 20 ft., and over the eaves 28 ft.

The iron stand has been executed by Messrs. Steven, Bros., & Co., of Upper Thames-street, London, and Milton Ironworks, Glasgow, to the satisfaction of those concerned. The decorative painting and gilding have been done by Mr. Harill, of Worcester-street, and Messrs. Bradney & Co., of Wolverhampton, were the contractors for the stone base. The whole has been performed under the personal superintendence of the borough surveyor.

THE COMPETITION FOR DESIGNS FOR THE NEW IMPERIAL PARLIAMENT-HOUSE OF GERMANY.

The jury appointed to adjudge the prizes in the competition for designs for the New Imperial Houses of Parliament of Germany have already published their award:—

I. The two first prizes of 15,000 marks, or 750*l.* each, are awarded to,—

(a.) Herr Paul Wallot, architect, of Frankfurt-on-the-Main, for his design (No. 124); and (b.) Herr Friederich Thiersch, of Munich (No. 83).

II. The three second prizes of 1,000 marks, or 500*l.* each, are adjudged to,—

(a.) Messrs. Kayser & Von Grossheim, of Berlin (No. 131); (b.) Messrs. Cremer & Wolfenstein, of Berlin (No. 93); and

(c.) Herr Heinrich Seeling, of Berlin (No. 147). The five third prizes, each of 3,000 marks, or 150*l.*, are taken by,—

(a.) Messrs. Giese & Weidner, of Dresden (No. 84);

(b.) Herr Hubert Stier, of Hanover (No. 104);

(c.) Herr L. Schupmann, of Berlin (No. 138);

(d.) Messrs. Basse & Schwedten, of Berlin (No. 153); and

(e.) Messrs. Ende & Bückmann, of Berlin (No. 157).

It will be observed that, although they have not taken a first prize, the Berlin architects have been very successful, having carried off six prizes out of the ten. It is stated that out of the 196 competitive designs about eighty came from Berlin alone. The Berlin competitors have won all the three second prizes, and three out of the five prizes class as third. There were 800 programmes given out by the committee, so that, assuming they were applied for by genuine intending competitors, it appears that nearly 25 per cent. of the applicants carried out their intention and became real competitors. So strong or numerous a participation in an open competition has never before been known in Germany. The nearest approach to it was the competition for the Hamburg Town-hall in 1876, where 144 competitors entered the lists. The first competitions for the German Imperial Parliament House in 1872, when the late Sir Gilbert Scott took the second prize, was open to Englishmen and other foreigners, yet only 102 designs were sent in, twenty-three of them being by foreigners. In the present competition, which was limited to Germans and natives of the German-speaking parts of Austria and Switzerland, there were no fewer than 196 competitors. The next most keenly contested cases were the competition for the New Strasburg University (in 1878), where 101 designs were sent in; the Berlin University (in 1868), where fifty-one, and the Vienna Town-hall (in 1869), where sixty-three architects took part in the struggle.

The whole of the 196 designs, embracing, it is said, no fewer than 3,000 separate sheets of drawings, are now hung in the temporary premises of the Museum of Art Industry at Berlin. It is stated that a large number of the competitors fearing, after the warning example of the Hygienic Exhibition, that their drawings might be in danger from fire, had wisely taken the precaution to have each his own drawings insured against loss by fire. This they did in ignorance of the fact that the Government through the Commission had already insured the whole of the drawings.

It will be observed that the two first prizes have been taken by architects of whom hitherto little or nothing has been generally known. The very names of Herr Paul Wallot, of Frankfurt-on-the-Main, and of Herr Thiersch, of Munich, were till now comparatively unknown. On the other hand, the name of Herr Bohnstedt, who took the first prize in the first competition for 1872, is now nowhere; although he is said to have entered again on the second occasion, his name does not appear amongst the list of successful competitors. The question, what architect is to be appointed to see the work carried out, is quite independent of the result of the new competition, and the Commission will, it is understood, announce their selection almost immediately.

With respect to the successful competitors, the German papers state that Herr Paul Wallot, who won a first prize, has for some time been engaged as an architect in Frankfurt. He is a native of Oppenheim, on the Rhine and is under forty years of age. He was edu-

eated at the Berlin Bau-Academie, and travelled for the purpose of studying architecture in England and Italy. Many of the new private houses in the principal thoroughfares of Frankfurt were designed by him, and he has distinguished himself in several public competitions for monumental works in Germany within the past ten years. Professor Thiersch, who takes the other first prize, is only thirty years of age. He studied at the Polytechnicum at Zurich, and was a pupil of the noted architect Gottfried Semper. He assisted in designing the decorative parts of the new Opera House and the new railway-station at Frankfurt, and has for three years been professor of the Munich Academy and School of Art Industry.

The chief feature in the present competition is that most of the prizes have been taken by young and comparatively unknown men. There are many architects of far greater name among the competitors, but they have, with one or two exceptions, been beaten by their pupils. The labours of the committee of judges are not concluded. They have authority to purchase, in addition to the prize designs, any other drawings presenting features which they may desire to have adopted in the new Parliament House. The German Government, in appointing the committee of judges, took care to avail itself of the best architectural talent, not only of Germany, but of the neighbouring States. Thus, besides several members of the Reichstag, the committee numbered the following professional gentlemen among its members—Herr Ferdinand Schmidl, of Vienna, representing the Austrian architects; Herr Vincenz Stalcz, of Cologne, connected with the cathedral there; Herr Siebert, of Munich; Herr Adler and Herr Persius, of Berlin; Professor Egle, of Stuttgart; and Herr Martin Haller, of Hamburg. All the above are architects, and with them on the judging committee there was associated the celebrated painter, Herr Anton von Werner.

#### HOUSES AND HOUSE-BUILDING IN BUENOS AYRES.

Sir,—The following notes regarding the present state and prospects of the building trade of Buenos Ayres, capital of the Argentine Republic, may be of interest to your readers, especially as they show what a great field there is now open for men of enterprise and capital.

This city is the seat of a large and rapidly-increasing trade, and being the principal port and business centre of an immense and wealthy country, it is bound to go ahead.

Two causes have also arisen during the last two years to give an increased impulse to its development, namely, the establishment of a strong national Government, which insures peace and prosperity; and the federalisation of the city,—that is, making it, like Washington, the neutral capital of the thirteen states and other territories which compose the Argentine Republic. As a consequence the population is rapidly increasing, and though the building trade is now very active, and has been so for over two years, the demand for houses, shops, and warehouses still far exceeds the supply. So that whilst rents are continually being raised, people have to submit, knowing that many are putting up with inconvenient premises, and others cannot be accommodated at all.

Before going into details of the business, I will give a brief description of the city.

Buenos Ayres has a population variously estimated between 200,000 and 300,000; but it covers a larger area than a city of this population in Europe would occupy. Roughly speaking, the size of the built-up ground is about five miles by three, but there are roads leading out to neighbouring populous towns which are lined with streets and villas for six or seven miles. The city is regularly laid off in streets which cross each other at right angles. These streets are about 150 yards apart, and for the most part are not above 30 ft. to 35 ft. wide. There are no "mews lanes" between the streets, which causes much loss of ground and inconvenience, as carriages, horses, and all rubbish, have to be taken through the front doors.

The site of the city is nearly flat, and, as a large number of the houses are of one story and of very common style, the appearance of the town is very far from prepossessing. There are, however, some very beautiful, even magnificent, buildings, public and private. But what is notable and singular is, that there

are almost no fashionable or select localities, and we see palaces and bowels, colleges and workshops, first-class shops and market-places, in mingled succession. A change in this state of things must naturally be expected, so that it must be a good speculation to buy up the tumbledown hovels and low-class houses to be found at frequent intervals in the leading thoroughfares.

The usual plan of houses is that which is to be found in Spanish countries, and resembles the Moorish or even the old Pompeian style. The rooms are built round internal open courts, or, as they are styled, "patios," and all open into a piazza or corridor which surrounds the court. The communication is made by doors, glazed in the upper part, which serve thus as windows. Generally there are three of these "patios," separated by cross rooms, but a communication runs through them, which, in large houses, is wide enough for a carriage.

The street elevation of modern houses is generally very tastefully treated, but formerly this was neglected. The windows to the street are still covered with iron gratings, of more or less tasteful design. The roofs are usually flat, styled "azoteas." Much more attention was usually given to the decoration of the principal court-yard than to the front of the house, and these "patios" are in most cases very handsome and pleasant retreats.

This construction is very well suited for the summer, which in this genial climate may be said to extend over three-quarters of the year. But in the winter months the houses are not quite so comfortable, especially as many have no fireplaces.

This plan occupies a good deal of space in comparison to the accommodation afforded, and presents considerable inconvenience when two and three storied buildings are required, as they now are, owing to the value of building sites in the central districts. These houses, too, are usually too large and expensive for families of moderate number and means. There is a great want at present for smaller houses of respectable style. A still more urgent want is for workmen's houses. The working classes, in fact, live most uncomfortably in great yards, which are surrounded by meanly-built rows of single rooms, opening directly into the open air. The centre of these yards is often a mass of corruption.

The drainage and water-works designed and commenced by Mr. now Sir J. F. Bateman, C.E., London, some years ago, have been lying unfinished for four years, but it is most probable that they will now soon be finished.

The common building material is brick, which can be turned out of very good quality near the city. The usual size of brick employed is about 12 in. by 6 in. by 2 in. Lime is burnt in the city. Stone has to be brought from the Banda Oriental. Native marble is found of a good quality, but the greater part of that used comes from Italy. It is most surprising, considering this, to see how marble is lavished on constructions. Some of the fine houses are actually encased in white marble slabs, whilst the most ordinary houses have plinths, window-sills, stairs, and hall pavements of this material.

Pine timber has to be imported from North America, but the country has abundance of hard woods and cedar. Cement and flat tiles, as well as all fire-clay goods, are imported from Europe. I shall append to this letter a list of current prices of building materials and labour, and from it I think it will be seen that the expense of building can scarcely be so great as to account for the high rents asked. Taxation is pretty high on house property, but, with all the costs and charges, I am of opinion that the rents are excessive in comparison to the value of property.

That you may form an idea of the present rates of rent, I have made a rough calculation that dwelling-houses of the middle class cost about the rate of 11. 5s. to 11. 15s. per room monthly (calling each apartment a room). Thus a house of four rooms costs 71. 10s. to 81. per month. A twelve-roomed house about 171. per month (rents are all payable monthly). A villa in the outskirts will cost from 2001. to 4001. a year rent. A very ordinary warehouse will cost from 3001. upwards. A fair-sized retail shop in a good street may cost as high as 6001. a year.

It is difficult to learn the average interest which investments in property bear here, but I believe that it cannot be less than 12 per cent. annually. This is corroborated by the fact that money is freely borrowed at the rate of 9 per cent. for

the erection of new buildings. High as this interest may appear to the European investor, it does not, as he might suppose, represent a corresponding risk. For, as I have said, there is no difficulty in letting properties, and the law here makes the landlord a favourite creditor, letting him collect his claim in full from bankrupt tenants, and to execute for rent with facility. Life and property run no more risk in Buenos Ayres than in European capitals. Fires are of very rare occurrence, owing to the absence of hazardous trades and of fire-places in houses.

In spite of the high rate of interest obtained from building property, other industries in this Republic give so much higher returns that building investments are looked on as only fit for ladies and elderly people who wish to live quietly and securely.

The building trade is at present almost entirely in the hands of Italians, who certainly display considerable constructive ability.

There are a few architects of other nationalities who do very well, having generally a good connexion. But in general the same person combines the trade of architect and builder. In many cases these are men risen from the ranks of workmen, and who frequently build without plans.

There are no building societies here yet, and it is a general opinion that such societies would do well, but there are no parties here of sufficient experience or capital to head them. Were such an enterprise properly started its success would be assured, but the genius of the people of this country does not run to the formation and management of joint-stock companies.

Should any of the parties who read this letter be in a position to organise a building society, and to head the subscription for shares, I am of opinion, from inquiries I have made, that I could immediately place a considerable number of shares.

I am also of opinion that competent builders with some knowledge of architecture and a sufficient capital to start with, will find a fine field at present in this Republic. The air is full of projects just now, all indications of future prosperity. Besides the water and drainage works already mentioned, we have the near prospect of vast harbour improvement works, and the new railways to Chili and Bolivia being completed.

The new English banks have lately been started, namely, the English Bank of the River Plate and the Argentine Trust and Loan Company. Money can be readily obtained from the various banks now at work. Two banks are at present erecting splendid edifices, namely, the Italian and Carabassa & Company, and the English Bank is about to build.

Besides, we have the prospect of building an entirely new city; for, as I have stated at the beginning of this letter, the city of Buenos Ayres was, in 1881, converted from being merely the capital of the province of that name to be the capital of the Confederation. The Provincial Legislature have had, therefore, to find a new capital, and after prolonged discussion they have chosen to create a city in the vicinity of the port of Ensenada to be styled "La Plata." The site of this projected town is about thirty miles from Buenos Ayres, and is at present unoccupied. It is a flat land, slightly raised, and sloping gently towards the river.

Here is a fine opportunity for inventors of sanitary improvements to put their theories into practice; a chance to build Dr. Richardson's famous "City of Health" under one of the most genial climates of the world.

The Provincial Government lately advertised for plans for all the principal buildings required in such a city,—Capitol, post-office, cathedral, banks, theatres, official and private residences. This competition has not been sufficiently widely known, nevertheless a goolly number of plans have been sent in which are now on exhibition in a public hall here. Many of these projects have come from Europe, as indicated by the lettering on plans being in different languages, so that some of the competitors may be amongst your readers.

The great bulk of the projects have been rejected, for not complying with the rules of the competition, and one for being an exact reproduction of a building erected in Paris for the Mairie of the Fourth Arrondissement. The pictures of this building in the *Revue Générale de l'Architecture*, edited by M. César Daly, 1872, plates 5, 6, 7, are displayed alongside of the plans of this competitor, to show his flagrant

plagiarisms. One beautiful design for a cathedral, evidently from London, motto, "Fiat Justitia Ruat Cælum," has been disqualified on account of having 1,000 metres square less area than that stipulated.

The following designs have been awarded prizes.—Government House.—First prize, motto, "Hinc Lahor hinc Merces" (French lettering on plan), style Italian Renaissance; second prize, motto, "La Plata," also French. Cathedral.—First prize, "Domus Domini," French; second prize, "Ut Unus," Spanish. As arrangements are very far from being complete there is still abundance of time for English architects to have a chance of obtaining some of these buildings. I may be able later on to send you more information.

I will now give a price current of the principal building materials:—

Bricks, 12 in. by 6 in. by 2 in., per mil, delivered, about 58s.

Lime, 1s. 10d. per bushel.

Flat tiles (French manufacture), 25s. per mil.

Portland cement, 16s. 8d. to 17s. barrel of 300 lb.

Lumber, Canada white pine, 11l. 8s. per mil super.

Spence, 10l. 8s. 4d. per mil super.

Pitch pine, 14l. 11s. 8d.

Iron bars and bundles, 11s. 6d. per cwt.

Castings, 30s. to 40s. per cwt.

Galvanised corrugated iron, 25s.

Paints—white lead, best, 9s. 4d. per keg 25 lb.; green, common, 10s. per keg 25 lb.

Lined oil, 25s. five-gallon drum.

Window glass, 12s. box 100 super. feet.

Tin plates,—charcoal, 24s.; coke, 30s. box.

Steam coal, 66s. per ton.

Nails, Paris points, 18s. cwt.

Wages:—Bricklayer, 8s. 6d. per day; carpenter, 8s. 6d. to 10s.; helpers, 5s.; blacksmiths, 16s. 8d. upwards per day, very scarce.

To any person of the classes I have indicated who think of coming out here or exporting goods to this market I will be glad to give more detailed information; but, as former letters which I have published with regard to the industries of this country have generally brought me many letters from enterprising young men without capital, I may as well anticipate their case by informing them that unless they know the Spanish language their only prospect will be to take to the rough life of the country in agriculture or sheep-farming. So many men have, however, come out here without means, and have made fortunes in these lines, that I do not wish to discourage any hard-working man; but it is well that intending emigrants should know what to expect.

JOHN SAMSON.\*

**THE PUBLIC OFFICES SITE BILL, 1882.**

WE are enabled to state that this Bill, for the acquisition of property and the provision of new buildings for the Admiralty and War Office, has passed through Committee, and has been reprinted for final reading in the House of Commons. The Select Committee which considered the Bill approved the preamble with such rapidity that the protest of the Royal Institute of British Architects against certain defective features of the scheme of the First Commissioner to place the new buildings on what is known as the "Spring Gardens Site" was not read; nor was the request of the Council to be heard granted. The plan of the official scheme, as proposed to be completed by H.M. Office of Works and Public Buildings, has been published in the Institute "Journal of Proceedings," together with the protest addressed to the First Commissioner, as follows:—

15th June, 1882.

Sir,—Having given some consideration to the Public Offices Site Bill, and to the plan which accompanies it, prepared in H.M. Office of Works, the Council of the Royal Institute of British Architects venture to point out what appear to them, judged from a public and architectural point of view, objectionable and defective features in the scheme, viz.:

1. Without more particular information than is possessed, it is impossible to assert that the proposed site is not sufficient for the proper and convenient accommodation of two great Public Departments, but the manner in which the projected buildings are planned in block, with inadequate and cramped quadrangles, conveys the impression that a crucial defect of the scheme is to attempt to crowd too much within the limits of a site inadequate for the purpose.

2. Should it, however, be determined to locate Government Offices on the Spring-gardens site, it

\* We are asked to say that communications for the author of this letter may be addressed to care of Mr. W. M. Adamson, 39, Finsbury-circus, London.

ought to be an indispensable feature of the scheme that the Mall should be continued and opened up to Charing-cross, somewhat after the manner indicated on the accompanying plan.

3. Although the retention of the existing banking premises of Messrs. Drummonds and of Messrs. Coles & Biddulph, is not incompatible with such opening-up of the Mall, yet any comprehensive scheme for the acquisition of the Spring-gardens site, for the purpose of Government Offices, ought unquestionably to embrace these properties as well as the remainder of the property in Spring-gardens having frontages to Trafalgar-square. By avoiding such properties, the scheme proposed in the Public Offices Site Bill may commend itself on the score of economy, but to locate important Public Offices in the background, shut in from one of the principal frontages in London by property of an inferior character, is a scheme, which, from all other points of view, would appear to court condemnation, and which, if carried out, must of necessity entail discredit and failure. On the other hand, by acquiring the whole of the Spring-gardens site, including the frontages to Charing-cross, although the cost would be greater, an opportunity would be afforded for inaugurating a great public improvement, and for erecting public offices on a more liberal and comprehensive scale, such, probably, as might be deemed worthy of its site and of the nation.

We are further instructed to add that, should it be the wish of the Select Committee, the President of this Institute will be happy to attend and give such further explanations as may be desired.

We have the honour to be, Sir, your obedient servants,

(Signed) J. MACVICAR ANDERSON, Hon. Sec.

(Signed) WILLIAM H. WHITE, Secretary.

The Right Hon. G. J. Shaw-Lefevre, M.P.,

First Commissioner of H.M. Works and Public Buildings, Whitehall-place, S.W.

We shall return to the subject next week, when we hope to show that this additional chapter to the ludicrous "Story of the Government Offices," published in the *Builder* (1877, page 852), is similar in character to those other chapters in the history of half a century, which disclose the incompetence of the English system to initiate or even to deal with the artistic improvement of the great highways and public buildings of London.

**THE HYDE PARK IMPROVEMENT SCHEME.**

THE scheme of the First Commissioner of Her Majesty's Works, &c., to ostensibly remedy the block in the traffic at Hyde Park Corner and at Hamilton-place, is, we are informed, to be carried out, in spite of friendly remonstrance, and in opposition to opinion both practical and professional. The objections to the proposed removal of Burton's arch from its present position to a site lower down, where it is to form an entrance to the Green Park of the same character as that of the Marble Arch, are numerous, as we have already pointed out; and the removal is likely, from all appearances, to cost more than was at first supposed—a removal, moreover, which is to be effected principally at the cost of the Metropolitan ratepayers. A notice of motion in the House of Commons was given by Sir Harry Verney as follows:—

"On the Vote of Money for the removal of the Wellington Arch from Hyde Park Corner, to move, That it be referred to a Commission, consisting of members of the Institution of British Architects and of those whose authority in matters of art is recognised, to say whether it is desirable, in an artistic point of view, to move the Wellington Arch from its present position, where it forms part of an architectural group, to a spot on Constitution-hill, lower, and where it would be asked both to the Colonnade at Hyde Park Corner and to Grosvenor-place."

He afterwards put himself into communication with the President of the Royal Institute of British Architects, who brought the matter before the Council. The result has been that a deputation consisting of the President, Past-Presidents, Vice-Presidents, and a few other members waited last Tuesday on the First Commissioner for the purpose of offering some suggestions whereby the Wellington Arch might be retained in its present position, and Piccadilly so widened opposite Hamilton-place as to effectually remedy the present perpetual block of traffic at that spot. The deputation explained their views by means of a plan which had been prepared expressly for the purpose, and submitted the following heads of suggestions, intended as a modification simply of the official scheme, viz.:

1.—That the accompanying plan (whereby the arch is retained in its present position) meets the public requirements of traffic better than any hitherto proposed.

2.—That there is nothing in the said plan to preclude the removal of the Arch to the proposed entrance to Constitution-hill, should it be deemed essential.

3.—That it is undesirable to retain the statue of Wellington on the Arch, whether the latter be moved or not.

4.—That if the Arch be moved to the proposed entrance to Constitution-hill, an appropriate site for the Wellington Statue and pedestal, if suitably treated, would be found where the Arch now stands.

The Metropolitan Board of Works has consented to receive a deputation from the Institute, the object of the latter being to urge the retention of the Wellington Arch in its present position, and the removal only of the incongruous statue to some suitable pedestal. We shall give an account of this next week, and publish the plan suggested by the Council of the Institute.

**ANCIENT MONUMENTS.**

THE Ancient Monuments Bill which has been introduced by the Government selects (says the *Times*) certain ancient remains in the three kingdoms with regard to which it is proposed to empower the owner of any of them to constitute the Commissioners of Works the guardians of it. Thenceforth the Commissioners are to "maintain" it; that is, to fence, repair, cleanse, cover in, and do any other act required for repairing or protecting it from decay or injury. However, the owner is still to have in other respects the same estate in the monument as before. Another power which the Bill proposes to confer is for the Commissioners of Works, with the consent of the Treasury, to be permitted to purchase, out of any moneys which may be provided from time to time by Parliament for that purpose, any ancient monument to which the measure applies. With a view to such purchase, the Lands Clauses Consolidation Act is to be incorporated in the Bill, except those provisions which relate to the taking of land otherwise than by agreement. Power is also given to any one to give or hockneath his interest in any of these ancient monuments to the Commissioners of Works. The Bill further imposes on the Commissioners the duty of appointing an inspector of ancient monuments, to report on their condition, and on the best mode of preserving them. The penalty for injuring any of these ancient monuments is either a fine not exceeding 5l., and also the amount representing the damage, or imprisonment for a term not exceeding a month. But the owner is not to be punishable under this provision, except in cases where the Commissioners have been constituted guardians of the monument. For the purposes of the measure the term "owner" includes not only the owner in fee, but the holder of a long lease or an estate for life.

In the House of Commons, on Monday, Sir J. Lubbock asked the First Commissioner of Works what steps Her Majesty's Government had taken to carry out the unanimous resolution of the House that, pending the passage of a general measure dealing with the ancient monuments of the Kingdom, and in order, as far as possible, to protect them from further injury, it was desirable that her Majesty's Government should appoint one or more inspectors with authority to inspect and report upon such ancient monuments. Mr. Shaw-Lefevre, in reply, said: "I may point out to my hon. friend that I have introduced a measure on the subject of ancient monuments, and that one part of it will authorise the Government to appoint inspectors. As the measure in no way interferes with the rights of owners without their consent, I was in hopes that it would not meet with opposition, but the right hon. member for Whitehaven gave notice of opposition before the Bill was in the hands of members. I am not without hopes that when he has read the Bill he will withdraw his block."

The Sheerness Local Board, acting under the advice of their recently-appointed surveyor, Mr. H. W. Stringfellow, are considering the desirability of introducing Shone's pneumatic ejectors at the sewage outfall at West Minster, in place of the present inadequate pumping machinery. The ejectors would be worked by compressed air from the Board's waterworks, at a distance of one mile and a quarter from the sewage outfall.

## RUSSIAN NEWS.

ARCHITECTURE is duly represented in the Moscow Exhibition. There is a most interesting display of materials for tracing the progress of Russian architecture during the last quarter of a century. The public seems rather shy of the architect's plans, sections, and elevations. There are, however, some fine drawings which should appeal to the untechnical. Several models, too, call for attention, in addition to those we have previously mentioned; that of a tower, by M. Tersky, and that of a village church, by M. Shokhin, may be named. The drawing of the façade of the new historical museum in Moscow is remarkable, presenting, as it does, a somewhat bizarre striving after a national Russian style. It will not, however, strike the visitor from "Europe" as entirely satisfactory, nor impress him with its entire suitability for the purposes of a museum. It is lighter and more fantastic than the façade of the Polytechnic Museum, which, if somewhat heavy, conveys the feeling of worth and solidity. There is, too, a remarkable design for a small church, by the Academician, M. Bogomolof, conceived, as one Russian critic maintains, in pure Slavonic style, with Slavonic ornament, and "not a trace of Byzantinism." There are five designs for the church to be erected over the spot where the late Emperor was assassinated. Of these designs, that of M. Tomishko won the first prize, that of M. Goun and Kitzner the second, that of M. Benoit the third, and that of M. Shreter the fourth. Of the five designs, that of M. Bogomolof is pronounced to be of the most original character, although the author received only honourable mention.

Of the exhibition generally we hope to set before our readers later in the summer an account supplied by a contributor who is about to visit Moscow. Meantime, we may remark that the undertaking seems so far a success, at least as regards the Fine Art and Industrial Art departments. Moscow is at present the scene of far more activity, and the focus of an influx of visitors such as has never before been known at this season, when most people are usually quitting the town for the summer withdrawal to the country—a custom very generally followed in Russia by almost every one but the very poorest classes. The chief object which was the first motive of the present exhibition was to present a complete picture of the present state of Russian manufactures. This it is thought will not be so fully realised as was hoped, as many provincial manufacturers have stood aloof, and it required the utmost efforts of the organisers of the undertaking to get together from 300 to 400 exhibitors of articles of various sorts made at home by the peasantry. It was found necessary to travel about among the villages, to converse and explain to the home-workers that what was being done was to their advantage; that the compulsion of work might, as Archbishop Macarius (recently deceased) remarked in his address at the opening, "conduce to the perfection and development of the capacity of the labourers."

The New York Bell Telephone Company has entered into a contract to establish telephonic communication between 200 subscribers in St. Petersburg. If the contract is not completed by the 1st of July next, the company loses the concession accorded to it.

Emigration to America from Finland has lately been increasing and is awakening some attention. The reasons of this movement scarcely find an explanation in the material conditions of the peasants, which is, generally speaking, good.

The report of the St. Petersburg Association for supplying cheap lodgings to the needy classes is worthy of attention, and will not be without interest to readers of the *Builder*. This association has already been more than twenty years in existence, and during that period has effected a great deal of good. The report just published is that for 1881. It bears witness to the steady perseverance of the association in the object for which it exists, which is chiefly to secure healthy homes for the poor at every period of life from childhood to old age. It owns two blocks, tenements in which are let out at rates varying from 6s. to 24s. a month, heating included. These prices, when the cost of lodging in St. Petersburg is considered, are certainly very moderate, and are such, indeed, as to draw many more applicants than the association can at present provide for. The

sanitary condition of these residences seems very satisfactory, and it must be remembered that St. Petersburg is by no means a healthy city. There were no instances during the past year of epidemic diseases. The association has, moreover, a well-organised sewing establishment, which, during 1881, supplied no fewer than 200,000 uniforms to the military and naval services. Employment in this establishment affords the most indigent of the lodgers the means of living and of paying the low rent. For children there is a school and playground, where they are under surveillance. A certain number of them when old enough are put out to industrial schools at the expense of the society. This year a considerable extension of the good work of the association is contemplated, as its funds have been recently augmented by magnificent gifts from individuals. A new block is to be raised of four stories in which the rooms will be over 11 ft. high, will be well ventilated and heated with steam. The rooms on the ground will be let out for periods not less than one week, the lowest rate being about 2½d. per diem, and there will be a common kitchen for all on the ground-floor. The rents for the upper rooms will vary between 8s. and 10s. a month.

## REPORT OF THE COMMITTEE ON ARTISANS AND LABOURERS' DWELLINGS.

THE question of the housing the industrial classes of London, which has long been pointed out by us as grave, is becoming urgent. It hardly needed the report just issued by the Committee on Artisans' and Labourers' Dwellings to prove this to be the case. Under the Act of 1875, it seems that the Metropolitan Board has, up to this time, dealt with only fourteen areas, formerly inhabited by some 20,000 persons. To obtain the ground has cost 1,500,000*l.*, of which only 24 per cent. has been recouped by rates. Thus we may take it that dis-possession has been effected at a cost of 1,140,000*l.* for that small number of souls, which is at the rate of 57*l.* per head. Assuming this cost to be that of the substituted sites (which is clearly under the mark), we have thus a ground-rent charge of 45s. per head per annum imposed on the new houses. It is evident that this would cause an intolerable pressure on the workpeople. But how the difficulty is to be met is not so sure.

That the danger of falling to the ground between the two stools of the vestries and the Metropolitan Board of Works may be obviated by following the recommendations of the Committee, we will endeavour to hope. But the financial difficulty is more obstinate. And we cannot omit to point out the inadequacy of the proposal to put the burden on third parties,—that is to say, the railway companies. That the urban and suburban lines of railway must play a very important part in the settlement of the artisan's abode question, there can be no doubt. It is one of the most important functions of these lines. And the subject should never be approached without memory of the noble words of Robert Stephenson, "that he hoped to see the day when no poor man could afford to walk."

But the fallacy in all such arguments lies in the avoidance of details. Not only is what the workman can afford an element in the case, but, no less, what the railway companies can afford. The idea is that the latter are to convey the former for a penny a trip, exclusive of distance. Even this moderate fare is an appreciable item as added to rent. It comes to 2*l.* 12s. per annum. Still, as that is for the bread-winner alone, and not (as in the case of the 45s. before mentioned) for every member of his family, we will take it that wages must be so rated as to include the charge. But for what distance can the companies afford to convey passengers for 1d. per head? There is a definite and not very wide limit to the range. People are too apt to draw erroneous conclusions from an arrangement that was possible with the penny post, but which is entirely impracticable when the cost of conveyance is not disproportionately small as compared with that of collection and delivery. Now, in the case of collection and delivery, the cost of third-class traffic is 1*l.* 4s. or at the utmost very small. Almost the whole expense incurred is that of conducting the running traffic, and paying the interest on capital invested in line, stations, and working

stock. The lowest rate at which, as far as experience goes, it has been found practicable to convey passengers, is about one-third of a penny per mile, and that has been on the cheap railways, and with the cheap labour of India. On lines running through London the working costs are two and a half times as much per ton per mile as on the average of the United Kingdom. It is true that the great volume of traffic which fills the vehicles, and thus reduces the tare, is such as to reduce the working expenses to less than 40 per cent. of the total receipts,—but we are speaking not of ratio but of *bona-fide* cost. Then the amount required to pay interest on capital is eight times as much on a metropolitan line as on an average railway. It may be questioned, therefore, whether the companies could afford to run at less than 4d. per mile per passenger with justice to the proprietors and to the general customers. And even if we say 4d. per mile, we get four miles as a limit. It is true that it would cost less to run for, say eight miles without a stop than to run for four, making three or four stoppages. But we must not talk of less or more, but of what can be done mechanically for a fixed sum; and as to this, we say that the limit of cost of a 1d. trip is rigid, and that the distance which it will cover is hardly enough to allow this expedient for increasing the area fitted for the home of the metropolitan working man to be very widely extended. It is important that this should be distinctly understood.

## THE DWELLINGS OF THE INDUSTRIAL CLASSES.

THE thirty-eighth annual general meeting of the shareholders of the Metropolitan Association for Improving the Dwellings of the Industrial Classes took place last week, at the offices in Finsbury-circus. The chair was occupied by the president, Lord Claud Hamilton, M.P., who was supported by the Right Hon. Dudley F. Fortescue (deputy chairman), Mr. G. W. Alexander, Mr. W. Baily, Mr. Julian Hill, Mr. J. H. Janson, and Mr. L. Loyd (director), and Mr. C. Gathiff (secretary).

The report was read by the secretary, who stated that the directors were enabled to report a full year's average occupancy of the dwellings of the association, notwithstanding increased competition not only of the trustees of the Peabody Fund, and kindred associations, but also of the building trade, who, encouraged by their example, had invested very largely in the erection of similar dwelling in flats, and also in building cottages in the suburbs. The state of the dwellings of the working classes, and the operations of the different building societies, had been brought prominently into notice by the appointment of a select committee of the House of Commons on artisans' and labourers' dwellings improvement. Some of the associations called into existence by their example had built dwellings of a superior class, some of them with efficient accommodation to command rents of 70*l.* and 80*l.* a year. These dwellings had undoubtedly conferred great benefits on those who resided in them, but their association had strictly confined itself to provide cheap and healthy homes for the working classes, so as to preserve health and decency of deportment and keep themselves and their children from moral and physical contamination, and afford a fair return for the capital invested, eleemosynary relief being foreign to their views. The directors had not this year taken any additional site. The deaths on the entire property of the association had, during the year 1881, been eighty-seven (fifty-six of which were of children under ten years of age, twenty-eight of the latter being less than twelve months old), out of an average population of 6,684. It appears, therefore, that the average rate of mortality in the dwellings of the association, as verified by the district registrars, had been 14.3 per 1,000, while that of the whole metropolis had been 21.2 per 1,000. The profits for the year amounted to 9,377*l.* 10s. after meeting all the expenses, and after providing for a dividend of 5 per cent. there remained a balance of 907*l.* 11s. 9d., irrespective of 37*l.* 15s. 1d. already added to the guarantee fund, being the year's interest on the same. The sum of 1,366*l.* 6s. 10d. therefore represents the total net profits of the year, of which 991*l.* 11s. 9d. remained, which the directors recommended to be added to the guarantee fund.

The Chairman, in announcing that the Hon. Dudley F. Fortescue and Mr. T. E. Gibson retired by rotation from the Board, said that he much regretted the resignation of the latter, as he felt he could no longer undertake the duties of the post. He (the chairman) was now the only one of the original directors left.

Mr. Loyd moved the re-election of the Hon. Mr. Fortescue, which was carried unanimously, as was also the re-election of Mr. T. Baker (auditor).

In moving the adoption of the report, the Chairman said the object for which their society was started had occupied public attention much more extensively lately than at the former time, and they had had many important rivals, such as speculative builders, the Corporation of London, the Metropolitan Board of Works, and other bodies. When he mentioned that the Metropolitan Board of Works had expended 1,500,000*l.* in such buildings, of which 1,100,000*l.* was a dead loss, the shareholders would see that the association could not think of competing with the bodies which could "put their hands into other peoples' pockets," by means of rates. Only one of their blocks of buildings, however, was not fairly well occupied, and that was owing to the lack of employment in the neighbourhood (Stoke Newington). The report having been adopted, a unanimous vote of thanks to the directors was agreed to.

THE LATE MR. ROBERT PALGRAVE.

The death of this gentleman, which took place at his residence, No. 9, Upper Hamilton-terrace, St. John's Wood, on the 19th ult., will cause much grief among all who knew him. He was the only son of Mr. Robert Palgrave, of London and Bedford, and was born in the year 1831. He was nephew of Mr. C. F. Palgrave, who was Mayor of Bedford in 1851. He was articled to Messrs. Scott & Moffat, architects, and on leaving their office, he became, for a short time, assistant to an architect at Blackburn, in Lancashire. Returning to London in 1852, he became managing assistant to Messrs. Wehnert & Asdown, architects, of Charing-cross, now both deceased. Quitting their office in 1857, he commenced practice as an architect at Pall-mall East. His first work was the Clock and Watchmakers' Asylum, at Colney Hatch, which work he gained in public competition. In 1857 also he was appointed architect to the well-known and extensive Britannia Ironworks, at Bedford. Those works were erected from Mr. Palgrave's designs. Mr. Palgrave also designed some extensive farm buildings at Sidlington, and St. Mary's Wesleyan Chapel, Bedford, and likewise Kempston Chapel, near Bedford, which were erected from his superintendance, as also the Atlas Ironworks, for Messrs. H. Clayton & Co., in the Harrow-road, London, and additions to residence at Bedford for Mr. James Howard, M.P. Indeed, it may almost be said that Mr. Palgrave renovated the town of Bedford, where his principal practice lay, and his works may be seen in all directions. The chief one, however, has yet to be mentioned: this is no other than the rebuilding of the tower and other extensive alterations and additions to the venerable Church of St. Paul, Bedford. It may here be mentioned that great difference of opinion existed at the time for the restoration of this church as to the desirability of entrusting a work of such importance to Mr. Palgrave; and Mr. G. E. Street was called in to make a plan and a report, which he did before he knew Mr. Palgrave had been employed. It will always redound to Mr. Street's honour that, as soon as he was shown Mr. Palgrave's drawings, he at once withdrew and strongly advised the committee to leave the matter unreservedly in Mr. Palgrave's hands. The work, therefore, proceeded, and the result shows its complete success. In 1861 Mr. Palgrave was chosen with a select number of architects to compete for the Agricultural Hall, at Ishington, and much preference was expressed in favour of his design, and, on a division taking place (between the drawings of Mr. Palgrave and those of Mr. Peck), the committee were equally divided; the chairman, however, gave his casting vote in favour of Mr. Peck's design. Mr. Palgrave soon afterwards left Pall-mall East, and took more extensive offices at Westminster Chambers, when he was appointed architect to the Right Hon. Earl Cowper, Lord Lieutenant of Bedfordshire, and for whom he designed and superintended some additions and alterations at Pansbanger, Hertfordshire. This

may be said to have been Mr. Palgrave's closing work, for, losing his uncle, the Mayor, and both his parents, about this period, he inherited ample fortunes, and soon afterwards virtually retired from practice.

The writer of this notice, who was associated with him for nearly twenty years, can testify to his sterling worth and his amiable and fair-dealing disposition. He was never married. W. F. POTTER.

THE SEASON FOR FELLING TIMBER.

THAT there is a right season for felling timber, and that the value of timber for building purposes largely depends on this season being chosen, are generally admitted facts; yet the practice of different peoples and districts is found to vary most essentially. Thus, according to a German writer, while the time for cutting timber for building is legally fixed in Germany in the months of November, December, and January, in the Alpine districts of Switzerland and Austria the best and most durable timber for building is considered to be that which is felled in the summer. The reason of this is that the wood of coniferous trees, fir, pine, &c., contains least moisture in May and June, and as the felled timber is left on the ground till the following winter, it becomes well dried before it is taken away.

However this may be with the coniferous trees of the mountainous districts, it is certain that the trees in the plains require different treatment. The question has been subjected to a series of tests in Germany, and the result is sufficiently conclusive. In one case the experiment was with four beams of equal length, breadth, and thickness, sawn and shaped in the same fashion, cut from trees of the same kind growing close to one another, and kept on the same dry spot, the only difference between them being that they were cut in four different months. The timber felled in December was the strongest of all; that cut in January was 12 per cent. inferior to it in point of strength or power of bearing pressure; that cut in February was 20 per cent.; and that cut in March, 33 per cent. weaker than the December timber. In another experiment, entire pine trees were buried in a moist, damp soil; one sort had been felled in December, the other in February. It was found that the former had turned rotten in eight years, while the latter was sixteen years before it decayed. A similar experiment with deal planks showed that those sawn from trees felled in March decayed in two years, while planks from December timber lasted six years.

THE ROTHERHITHE BATHS AND WASHHOUSES.

THE success which has attended the recently erected baths and washhouses at Rotherhithe is an answer to those who are so often asserting that these establishments are not, as a rule, self-supporting. At last week's meeting of the vestry a statement was read from the commissioners of the baths, from which it appears that the entire expenditure for the year just ended was 1,535*l.*, the items showing that coals had cost 376*l.*; water, 174*l.*; rent, 78*l.*; and soap and soda, 40*l.*; and that 77*l.* had been expended in salaries. It was added that the value of the articles in band was 40*l.* The number of persons who had used the baths during the year was 115,361, of which number 13,804 had used the washhouses. The total receipts amounted to 1,698*l.*, and adding to this sum the value of the articles in hand, there was a balance in hand on the working for the year of 211*l.* The report added that 200 boys had learned to swim during the year, and it also further pointed out that the baths had been largely used by the working classes during the year, 35,421 persons having used the second-class swimming-baths.

DESTRUCTION OF A THEATRE.

AT about half-past eleven o'clock on Monday morning, the 26th inst., fire broke out in the theatre of the Russian Baltic port of Riga. The conflagration lasted until the edifice was completely gutted. There was no loss of life, nor did the fire extend to any building except the theatre. The latter, however, was entirely destroyed, only the four bare walls being left standing.

THE CONDITION OF THE IRON TRADE.

AT the close of the half-year the condition of the iron trade is ascertainable approximately, and its importance, as well as the dependence of other great industries upon it, justify the reference. In the half-year it is clear that there has been some slight reduction in the amount of the crude iron produced; for in the two chief iron-producing districts,—Scotland and Cleveland,—there is a decrease of about 60,000 tons from the quantity made in the corresponding half of last year. In round numbers, Scotland has been making 100,000 tons of pig-iron monthly, and Cleveland about 225,000 tons monthly. The stocks in both districts have been reduced, and that largely in the six months,—possibly by about 150,000 tons, and that it is apparent that not only has the consumption been more than the production, but the consumption has largely exceeded that of the corresponding period of last year. And, with local exceptions, it is probable that the general experience of the whole of the iron-making districts of the country has been in that direction. Hence it is certain that the demand for iron in the past six months has improved, and as prices are above those of a year ago, the volume of demand has been also accompanied with a corresponding increase in the value. These are the chief of the facts in relation to the crude iron trade that are now obtainable, and their testimony is, on the whole, a favourable one for the trade.

In the manufactured iron trade all that can be said is that the great briskness that was known at the beginning of the present half-year has been continued, and that whilst the market prices of iron are not much changed, there has been a steady increase in the realised prices of iron, owing to the running out of contracts at very low prices, and their replacement by those at rates more nearly approximating to the market rates. Practically, the great bulk of the forges and rolling-mills in the kingdom have been employed in the past half-year. A large part of the work is due to the activity in the iron ship-building trade, and though there are not so many new orders being given out as there were a few months ago, there is, it is known, work now contracted for to give a continuance of the activity to the rolling-mills for several months to come. And as the iron rail trade is now almost entirely a thing of the past, this briskness about the rolling-mills is the more notable. It is hoped, too, that the strike in the iron manufacture in the United States will have added to the orders that our ironmasters have received, but there is little really ascertainable as to the extent of the orders that have been received. Its effect, however, has been to lessen very materially the stocks in the hands of the makers abroad, and thus to make more possible larger orders. Altogether, then, the condition of the iron trade has been improved in the last half-year. It has been rendered more lucrative to the makers, and the dead stock in their hands has been much reduced, whilst even the advanced prices that have prevailed cannot have diminished the demand much in the case of the crude iron, though they may have checked the demand for manufactured iron. There are the indications of further reductions in the stocks of pig iron in the hands of the makers, and these should bespeak further improvement in the tone of the trade, and lead to either a fuller production or to higher prices. And as it is generally acknowledged that the present rates are remunerative to those concerned in the production, the former of the two alternatives would seem to be that that would be for the ultimate and more lasting benefit of the trade. One of the remarkable features of the past half-year has been the enormous production of iron in several of the smelting centres from the ores that have been imported,—chiefly from the rich ores of Spain. The weakness in the price of this class of ores would seem to point to the fact that the production has been rather in excess of the demand, and it is probable that in the latter part of the present year the production will be rather diminished than increased.

A Recreation Ground for Walsall.—The Earl of Bradford, as lord of the manor, has presented forty acres of land to the borough of Walsall as a public recreation-ground.

## THE BRADFORD TECHNICAL SCHOOL.

This building was formally opened by H.R.H. the Prince of Wales on the 23rd ult. The building has been erected and furnished at a cost of 13,000. Nearly two years ago we gave a description of it, together with a double-page view and ground plan.\* It may be of interest at the present time, however, to give a few particulars of the building.

The building stands on the north-east side of Great Horton-road, upon a plot of ground formerly called the Tumbling Hill Close. Many years ago this land was quarried, but the supply of stone falling off, it was once more converted into cornfield and meadow until, on September 30th, 1879, it was sold to the council of the school for 3,500. The site itself forms an irregular parallelogram, having a main frontage of about 160 ft. to Horton-road, with a depth of about 240 ft. along Carlton-place. At the rear of the building is a piece of waste ground recently purchased by the School Board, and upon which a large school will soon be erected to meet the requirements of the crowded population in the neighbourhood of Tumbling Hill. Nearly parallel to Carlton-place is a narrow street giving access to the backs of the houses in Lister-terrace, and forming the western boundary.

Within these limits, then, and upon an area of about 4,000 square yards, rise the three sections of the Technical School, two fronting Horton-road and one facing Carlton-place. The school consists of a connected group of buildings to be used for a variety of purposes, bearing directly upon technical education. Therefore, while harmony has been secured in the general design, the elevations have been studied with a view to give greater richness and finish to the more important parts. Thus, the public hall and museum that form the front rectangular block have an individuality easily distinguishable from that of the students' rooms along Carlton-place. The style of architecture is Italian, of the Venetian type. A colonnade of attached columns and pilasters of the composite order, resting on pedestalled dado, and surmounted by a richly-moulded entablature and balustrade, forms the chief feature of the design of the Horton-road frontage as well as the return end of the public hall. The spaces between the columns are occupied by richly-carved, moulded, and mullioned windows, varying in design to suit the rooms and floor levels. The principal entrance is, of course, in Horton-road, dividing the museum and library from the public hall, its two heavy columns, with architrave, frieze, cornice, and moulded arch projecting boldly from the main building line. Rising to a height of 120 ft. immediately over this entrance is a tower, the centre-piece of the facade, and, from its elevated position, a prominent object among the towers and spires of Bradford. The tower has an oblong base with attached columns and embrasures, and suitable corner ornaments. The central or cubical portion is pierced with long narrow windows, flanked with attached composite columns, and is surmounted by a dome and spire with ornamental base. The material employed in the erection of this facade was cleansed ashlar, while cut delf-stone wall-stones with ashlar dressings were used in the other sections. That part of the building which faces Carlton-place is to be devoted more especially to the work of the school, and has a separate entrance for students. Over this entrance are three gabled windows marking the position of the lecture-hall, and, higher still, a dome-shaped tower, 72 ft. high. A double row of large mullioned windows admit a plentiful supply of light from Carlton-place into the class-rooms and laboratories. Viewed from the waste-ground on the north-west, the weaving and spinning sheds, with their northern roof-lights give to the school the appearance of a large well-built mill. The school is surrounded by a palisade of ornamented iron rails.

Want of space precludes us from describing the interior of the building, but we may add that, in point of completeness, the building will compare favourably with any public edifice in the town. Great attention has been paid to the heating and ventilation. The whole of the basement is occupied by an almost interminable maze of brick flues, through which are carried about a mile and a half of hot-water-pipes. At frequent intervals connexion may be opened

between these flues and the outside, and, by means of a system of valves, cold air or hot air, or a mixture of both, can be passed into any or all of the rooms. There is, moreover, a system of exhaust-flues, worked by a small furnace in the basement, which, after the manner of colliery ventilation, insures a perfect and continuous output of foul air from the principal rooms. The hot-water piping has been fixed by Messrs. Taylor & Parsons, and the motive power used for heating purposes is derived from two large "Challenge" boilers, built by Mr. James Keith, of Edinburgh and Arbroath. Special precautions have been taken with the gas-fittings, separate meters having been provided for the public hall, the staircases and corridors, and the students' department. All the pipes are of iron, and are carried along the external surface of the walls, so as to be readily accessible for alteration or repair. It may be added that the Prince of Wales and Mr. Forster spoke in laudatory terms of the new buildings.

Among the contractors are Mr. E. Atkinson, mason, Bradford; Messrs. Dencon & Whitaker, joiners, Shipley; Mr. Samuel Ryder, plumber, Mr. Charles Nelson, gas and laboratory fittings and fittings for new shed; Messrs. Charles Howroyd & Sons, plasterers; Mr. James Smithies, slater; Mr. James Lyran, painter and decorator; Mr. Harry Cliff, castings, Bradford; Mr. John Throp, curving-work, Leeds; and Messrs. E. & W. H. Haley, ironwork for the new shed; Mr. Black, concrete-work, Bradford. Mr. T. C. Hope, Bradford, is the architect, and Mr. Abner Rhodes clerk of the works.

## THE STATIONERS' COMPANY'S NEW BUILDINGS IN THE CITY.

The Stationers' Company have just taken down a number of old buildings in Ave Maria-lane, in front of their hall, and on the site which has been thus cleared an extensive pile of warehouses and offices is now in course of erection. The new buildings will have two commanding frontages, one in Ave Maria-lane, and the other in Amen-corner. The Ave Maria-lane elevation will be 105 ft. in length, and 57 ft. in height to the cornice, the extreme height to the ridge of the roof being 64 ft. There will be three lofty stories above the ground-floor, the last named portion of the frontage, up to the first-floor windows, being in Portland stone, with a range of four richly-carved arched windows in four divisions each, these being surmounted by a bold cornice, also in Portland stone. The principal entrance to the upper floors of the building will be in this frontage, above which is a sculptured representation of the Stationers' arms. The upper floors will be faced with ornamental pilasters and capitals, in Portland stone, surmounted by a second cornice, the remaining portion of the frontage being in Malm brick. Each floor will have a range of thirteen windows, the elevation being finally surmounted by pediment dormers on each side of a central gable, rising several feet above the general elevation. The Amen-corner frontage, uniform with the Ave Maria-lane elevation, will be 72 ft. in length; and at the south-east angle of the two frontages there will be a tower, 80 ft. in height to the apex of the vane.

The architect of the building is Mr. R. W. Mylne, and the contractors are Messrs. Patman & Potheringham. Mr. Thomas Fisk is clerk of the works, and Mr. S. V. Adams the foreman. The cost of the building will be about 30,000.

## THE PROPOSED NEW WORKHOUSE AT CHAMPION HILL.

AFTER expending something like 20,000, in the purchase of a site at Champion-hill, East Dulwich, for the erection of a large new workhouse, the estimated cost of which has been variously stated at 100,000, and even 150,000, the St. Saviour's Board of Guardians have at length come to the determination altogether to abandon the scheme, and to provide the further accommodation required by building an additional wing at the Newington Infirmary, Walworth. For some time past a strong opposition has been manifested to the erection of the proposed workhouse, by the owners and occupiers of houses at Champion-hill, on the ground that it would seriously deteriorate the value of property in the locality; and the project has hitherto

been further opposed in respect of the estimated enormous cost. Mr. Robinson, one of the members of the Board, in moving a resolution for the abandonment of the proposed building, observed that whilst the erection of the additional wing at Newington would only cost 10,000, the carrying-out of the Champion-hill project would involve the Board in an expenditure of 200,000. The chairman observed that a number of houses would have to be purchased before they could build at Newington, and that 10,000 would not by any means cover the cost. The resolution was, however, almost unanimously adopted, and the guardians have now the costly site at Champion-hill thrown on their hands.

## NEW STATIONS ON THE SOUTH-EASTERN RAILWAY, AT DEPTFORD AND LEWISHAM.

The South-Eastern Railway Company are about to erect new and enlarged stations at Deptford and Lewisham. A special interest attaches to the intended new station at Deptford. The existing station there is said to be one of the first railway-stations erected within the metropolitan area, having been opened in the year 1836, in connexion with the London and Greenwich Railway, one of the first lines in England opened for traffic, and it is recorded that its opening was signalled by the performances of a band of music, together with those of a barrel-organ, which are said to have accompanied the passengers to the station. The present station having become altogether unequal to the traffic, the intention is entirely to rebuild it on a much-enlarged scale, not only as a passenger station, but in combination with a goods and coal depot, extensive new warehouses forming a main feature in the intended buildings. The company have had to purchase a considerable quantity of land as a site for the new and enlarged buildings, and the land having been secured the works will shortly be commenced. In addition to the works at Deptford, a new station is to be erected for the Lewisham main and loop lines, whilst the present station at Lewisham is to be materially enlarged.

## ILLICIT COMMISSIONS.

REFERRING to the speech made by Mr. Cossins at the annual dinner of the Birmingham Architectural Association, noticed in our last, "An Ironfounder" writes to the *Birmingham Gazette* to say that he is afraid the "black sheep" are more numerous than the white ones in the profession. He proceeds to say—

"I know that even some who are only at the top of the tree in their profession, and not only scruple to accept bribes in the shape of commissions from tradesmen to specify their goods, but will not allow their clients (if they can help it) to do business with firms who do not play into their (the architect's) hands in this respect. That the system is most dishonourable there cannot be any doubt, as the architect is, or ought to be, the policeman paid to look after the interests of his client instead of assisting others to rob him, for the extra profits put on for the architect come out of his client's pockets. Of course the tradesman who connives at this sort of thing is as bad as the architect, and there are some who will not sacrifice their honour to their pocket, but there are many who will. I quite agree with Mr. Cossins in his remarks, and it certainly behoves the architects of this and other towns to do all they can to purge an otherwise honourable profession from abuses of this kind. The public, too, can protect themselves to a great extent by only employing architects and tradesmen who are above suspicion, and looking more into these matters than they do at present."

The writer, while urging the public to protect themselves by employing architects who are "above suspicion," says that some of those "who are considered at the top of the tree in their profession" do not scruple to accept bribes. How, then, if "An Ironfounder" be right, are the public to protect themselves? The letter is well answered by Messrs. Hassall & Singleton, of the Phenix Foundry, Freeman-street, Birmingham, who write,—

"We read with much surprise the letter signed 'Ironfounder' under the above heading. Such a letter ought to have the writer's name; his signature is unfair to his brother ironfounders, as under it he insults his own trade, as well as a profession that all its members know is one of trust and confidence, and whose social and moral education is such as not to require advice from an ironfounder. We have done business with most, if not all, the architects

\* See vol. xxxix., pp. 504-5, 611 (Oct. 23, 1880).

of the town, and many others elsewhere. Our own experience has been the exact reverse of "iron-founder." The bulk of the work in this district is done under the direction of architects of such standing and position that any proposition as to a commission would be such a direct insult that we should not like to be the ones to make it. On the contrary, if it is any consolation to any one building, we beg to testify that we have invariably found the architect studies his client's interests before his own, the builder's, or ironfounder's, and wisely so, too."

OPENING OF THE NEW MARKET-HOUSE AT DARWEN.

THE new market-house which has been erected by the corporation of Darwon was on the 21st ult. formally opened by Mr. F. W. Grafton, M.P., who, in the course of an address, congratulated the people of Darwon on the possession of so admirable a building. There were, he said, very few market towns in England of the dimensions of that borough that could boast of such a market-hall. He learned that it was originally intended to build a town-hall, but subsequently it was decided, and it seemed to him very judiciously, that they should have what was most essential, namely, a good market-hall. It was afterwards determined to add thereto suitable accommodation for the corporation and their officials, and they had in that building what seemed to him to be rooms admirably adapted for the transaction of the public business of the borough. In consequence of that arrangement a great saving of expense had been effected. That would commend itself to the ratepayers as having been a very wise and judicious step on the part of the corporation, and it indicated the great attention they had paid to the public interest. The accommodation now provided would suffice for many years to come, but it would not prevent the next generation, if they saw fit, carrying out a larger scheme. He noticed in passing through their borough and through other large towns that the buildings which were springing up were larger; that the cottages of olden time were either getting too small or too insignificant for the occupiers, and the probability was that another generation would desire to have a larger market and a larger town hall. He congratulated them upon the admirable way in which the work had been carried out, and he was sure they would join with him in giving a tribute of congratulation to Mr. Charles Bell, the architect, and also to the contractors, who had done their work well. Such buildings as that represented most important considerations with reference to the public welfare. He thought that the physical, material, and perhaps moral aspects of such buildings were worthy of consideration. That building would furnish ample accommodation for the sale of most of the fish, vegetables, fruit, and other things, and it would be for them to show their appreciation of the advantages they possessed by encouraging the traffic which would be carried on there.

The works have been in hand two years, and were the result of a competition (for which Mr. Waterhouse was the assessor) in 1879, when the first premiums for the Town-hall and Market-house were gained by Mr. Bell. The Town-hall is deferred for a time.

The market is spoken of as being excellently adapted to its purpose. It faces north and south, and consists of a central area, 130 x 80 ft., covered with an iron roof with two semi-circular spans, and supported only by three columns. It is glazed on the north side by Ruddle's system, and covered with zinc on the south side. On the north are six butchers' shops opening into the market, lined with glazed bricks, the floors being of wood blocks. There are two main entrances to the market, north and south, enclosed by wrought-iron gates of elaborate design. There are also two other entrances past the fish stalls from the wholesale market. Those, and the shops facing the square, are enclosed by Salmon & Barnes's wood shutters. There is a row of shops facing the market square, having walnut fronts, and each with a cellar below, reached by a circular iron staircase. The whole area of the market is cellared, and some difficulty was met with in the execution of the cellars, owing to the river Darwon passing across the site. It was, however, successfully and temporarily diverted, and solid retaining walls built, between which it now flows, the walls above being carried by iron girders, as is the whole of the market floor, with brick arches, and paved with Lowe's patent concrete. There

are convenient fish and game stalls on the west side, fitted up in a very complete manner, and outside there is a wholesale market, open at each end to the market square and to School-street, and glazed like the general market. Above the south and east fronts are a spacious and well-arranged set of offices, appropriated to the use of the Corporation, comprising Council chamber, 50 ft. by 20 ft., Mayor's parlour, committee-room, and offices for the borough surveyor and gas and water engineer, with lavatories, &c. On an upper floor are a number of spare rooms, part being used by the caretaker. Over the main entrance is a turret of teak and lead for a clock. The offices are reached by a separate entrance and staircase from the square, and those on the south front by a corridor, supported on ornamental iron cantilevers, with handrail and iron panels, from the market wall.

The exterior is of Darwon stone, and is designed in a simple but effective Italian style to suit the material and surroundings. The interior is faced with the Silkestone Brick Company's buff bricks. Carving is introduced in the spandrels of main entrance arch, and in the coupled pilasters supporting main gable, in the tympanum of which are the town arms in bold relief; and in the panels of the centre window, over entrance, are the crests of the mayors in whose term of office the building was begun and completed, viz.: Aldermen Snape, J.P., and Green, J.P., all executed by Messrs. Gregg, of Darwon. The roofs are of green slates with red ridges. The ironwork of the basement was carried out by Messrs. Handyside, of Derby, and the roofs by Messrs. Goddard & Massey, of Nottingham. All the grates in offices are by Shorland, of Manchester. The general contractors were Messrs. Orrell & Son, of Over Darwon. Messrs. Haden & Co. supplied the zinc. Mr. A. D. Dawney, M.I.C.E., acted as consulting engineer. The waterclosets, lavatories, and the whole of the sanitary appliances, were supplied and fixed by Mr. Stidder, of Southwark Bridge-road, London.

The total cost of the building has been 25,000l., including the heavy and expensive foundations not originally contemplated.

Mr. Holson Haigh efficiently acted as clerk of the works.

We published a view and plan of the building in vol. xl., p. 344 (March 19, 1881).

We may add that Messrs. Chubb & Son made the key intended for presentation to the Marquis of Hartington, who was to have opened the building, but was prevented from doing so at the last moment. The key is of solid gold, and the letter H and the figures and coronet are enamelled in different colours, and four turquoises are placed at the four corners. The lock which secured the gates was an ornamental nickel-plated Chubb's patent padlock. The key was made to the order of the architect.

ARCHITECTS' ACTIONS.

STENT V. HARRISON.

THIS was an appeal (heard before the Lord Chief Justice and Lords Justices Lindley and Bowen on the 26th ult.) from the judgment of Mr. Justice Manisty in favour of the plaintiff at a trial which took place before his Lordship without a jury.

The plaintiff, who is an architect at Warminster, sued for commission upon the sale of Stainbridge House, near Malmesbury. He alleged that he had brought the property to the notice of Mr. Edward Miles, who, in consequence, became the purchaser at the price of 6,500l. The claim was for a commission at the rate of 2½ per cent. on the first 5,000l., and 1½ per cent. on the remaining 1,500l. The defendant, who is a member of the firm of Harrison, Beale, & Harrison, the well-known solicitors, was sole executor of the will of Mr. George Cooté, to whom Stainbridge House passed at the death of his brother, Captain Cooté, in 1875. The house being in a good hunting country, and affording a hunting and shooting quarters, Mr. Cooté not being a hunting man himself, instructed Messrs. Harrison & Co. to sell the house. The plaintiff, in August, 1875, received instructions from them to find a purchaser, Mr. Chubb, a solicitor at Malmesbury, having already received similar instructions. The house was advertised in the *Times* and other London papers, and the names of Messrs. Harrison & Co. also appeared at the foot. Advertisements were also inserted in the local papers with the plaintiff's name subscribed. On the 17th day of December, 1875, Colonel Miles went to Chubb's office and made an application on behalf of his brother, Mr. Edward Miles, with reference to a letting of Stainbridge House. Mr. Chubb was

away from his office, and the clerk, not knowing that the particulars with regard to the house were in Mr. Chubb's possession, wrote to tell Mr. Stent that Colonel Miles had called to ask about the house. On the 18th of December, before Stent had received Chubb's letter, Mr. Edward Miles went and looked at the house, and two days afterwards wrote to Stent that, seeing the house still advertised in the local papers, he had gone over it and wished to have particulars. Stent then wrote to Messrs. Harrison asking them to consider about letting the house. Ultimately the house was purchased in 1876. Stent had been paid for the advertisements which he had inserted, and it was contended on behalf of the appellant that no authority was given to Stent to subscribe his name to the advertisements. It was said to be the ordinary practice of house agents to advertise at their own expense, recouping themselves out of their commission.

The Lord Chief Justice said that actions like this must be very carefully watched. No doubt the work done by an agent entitling him to commission was often very slight, but if what he did was the determining point from which the purchase came to be made, that was enough. It might be no more than a wave of the hand effecting an introduction, but if that brought about the purchase, the agent's commission was payable. In the present case certainly very little had been done by the plaintiff. For himself, his Lordship thought he would not have come to the conclusion at which Mr. Justice Manisty arrived, but there was one very material incident which made him think it would be wrong to reverse the judgment. It could not be denied that Mr. Miles was a witness who would naturally have no leaning in favour of either side, and, on the whole, his evidence, though it was not very satisfactory, was distinctly to the effect that Stent had brought about the purchase. If the matter had rested on the advertisements only, his Lordship would have said the defendant was entitled to succeed. Either Stent had no authority to put his name to the advertisements in the local papers, or, if he had, it was not through them that the purchase was brought about. It seemed that the application made to Chubb had wrongly been communicated to Stent by Chubb's clerk, but that was not material. If Stent did the determining act which led to the purchase, his commission was payable. His Lordship could not say that Mr. Justice Manisty was not justified in coming to the conclusion that something had passed between the plaintiff and Mr. Miles which had had the effect of bringing about the relation between Mr. Harrison and Mr. Miles which ultimately led to the purchase. He gave this judgment with reluctance, as he had personally a strong prejudice against these claims, a prejudice which he hoped was not unfounded. He must reluctantly affirm the judgment appealed against.

Lords Justices Lindley and Bowen concurred.

PARR AND ANOTHER V. SMITH.

THIS was an action (tried on Monday last before Mr. Justice Manisty and a special jury) brought to recover a sum of 141l. for work done and services rendered as surveyors by the plaintiffs to the defendant in May, 1881.

This was the second hearing of the case, the first trial, which had resulted in a verdict for the plaintiffs for the full amount, having taken place before Lord Justice Cotton and a special jury, at Maidstone, last December. Subsequently a new trial had been ordered, on the ground that this verdict was against the weight of evidence, and also on the ground of misdirection. The defendant did not deny that he had employed the plaintiffs to prepare sketches for two houses, with stable and coach-house, similar to the house of Mr. Waker, at Gravesend, but his case was that that they had agreed that the cost of the whole of the buildings should not exceed the limit of 1,200l. or thereabouts. The defendant's case was that the plans prepared by the plaintiffs had been useless to him, the lowest tender obtained, when they had been submitted to public tender, having amounted to as much as 2,688l. He paid 100l. into Court in respect of their cause of action, so far as he admitted the same in his statement of defence.

At the conclusion of the case, His Lordship summed up, pointing out the greater probability of the defendant's case as to his having given the limit; and

The jury, without leaving the box, returned a verdict for the defence.

His Lordship thereupon gave judgment accordingly.

KEELING V. BARGEN.

In this case (tried in the City of London Court, before Mr. Gibbons, Deputy Judge) the plaintiff was Mr. Bassett Keeling, architect, King's Arms-yard, who used Mr. G. Barga, restaurateur, Cullinstreet, for 15l. 15s. for work and labour done in making a survey of premises in that street with a view to their being converted into a restaurant.

Mr. B. Cooke, restaurant keeper, deposed that the defendant came to his place early in March, when he stated that he liked it very much, and asked the name of the architect. Witness told him that it was Mr. Keeling, to whom he afterwards

introduced the defendant for the purpose of the work now in dispute being done.

Mr. J. Marston, clerk to the plaintiff, and Mr. Keeling, jun., proved the time occupied in making the survey; and Mr. E. J. Lowther, A.R.L.B.A., said the charge was a very fair and reasonable one.

The defence was that the plaintiff was never employed at all, and that the charge was excessive.

His Honour held that the defendant must have known perfectly well that the plaintiff was doing the work. Besides, when a first-class architect was employed, first-class prices must be paid. He accordingly found for the plaintiff, with costs.

#### BUILDING PATENTS.\*

##### APPLICATIONS FOR LETTERS PATENT.

2,859. H. C. Tucker, Peterborough. Sash-weight attachments for sash-windows. June 17, 1882.

2,868. J. Thomas, Bangor. Apparatus for cutting or shaping stone. June 17, 1882.

2,882. W. S. Laycock, Sheffield. Self-acting window-blind apparatus. June 19, 1882.

2,935. A. Clark, London. Fire-proof screen for separating the stage from the auditorium of theatres, &c. June 20, 1882.

2,940. P. Beddoe, London. Apparatus for supplying disinfectant to water-closets, &c. June 21, 1882.

2,961. J. Harsant, London. Flushing water-closets, &c. June 22, 1882.

2,973. R. Boyle, London. Ventilators for buildings, &c. June 22, 1882.

#### NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

June 20, 1882.

746. F. F. Wintour, London. Ventilating apparatus. Feb. 16, 1882.

1,065. J. Wetherill, London. Blinds or screens for windows. March 6, 1882.

2,420. W. S. Morton, Edinburgh. Materials for covering and decorating wall-surfaces, &c. May 23, 1882.

2,662. J. Davies, Kearsley Moor. Kilns for burning bricks, tiles, &c. June 7, 1882.

June 23, 1882.

850. J. Everard, Birmingham. Raising and lowering Venetian and other blinds. Feb. 21, 1882.

888. H. Sutcliffe, Halifax. Water-closets, &c. Feb. 23, 1882.

889. J. C. Mowburn, London. Water-closets, &c. (com. by J. E. Boyle, Brooklyn, and H. Huber, New York, U.S.A.). Feb. 23, 1882.

914. S. S. Holroyd, London. Water-closets, urinals, &c. Feb. 23, 1882.

956. C. D. Abel, London. Ventilating apparatus (com. by C. Ockmann, Berlin). Feb. 27, 1882.

2,540. G. F. James, London. Furnaces or fire-grates. May 27, 1882.

#### ABRIDGMENTS OF SPECIFICATIONS.

Published during the Week ending June 24, 1882.

4,949. W. F. Padwick, Redhill. Apparatus applicable to water cisterns, &c., for ensuring a supply of water during frost.

This is a conical vessel, with a series of tubes inside, which is attached to the cistern, and to which heat is applied. (*Pro. Pro.*) Nov. 11, 1881. Price 2d.

5,023. P. G. Messenger, Loughborough. Apparatus for charging the syphons of water-closets and urinals, &c.

In connection with the syphon is a vertical pipe of a larger sectional area, which opens at the bottom by a small passage to the water in the cistern, and which has its top above the water level. In this is placed a float, which can be depressed by a lever thereby filling the head of the syphon and setting up the syphonic action. Nov. 18, 1881. Price 6d.

5,033. B. O'Neill, London. Manufacture of artificial marble.

This is made of Portland cement, blue las cement, cinder or coke dust, and marble dust, mixed with water, and a little borax added. This is run into moulds, and allowed to set, then dried and polished. The blocks are then enamelled by successive coats of varnish, after each of which they are baked. Nov. 17, 1881. Price 2d.

5,039. T. Beddoe, London. Apparatus for disinfecting water-closets, &c.

A globe is filled with the disinfecting liquid, whence the mixture passes to the closet. (*Pro. Pro.*) Nov. 17, 1881. Price 2d.

5,040. J. B. Petter, Yeovil. Stoves and fire-places.

These have a shell-shaped hood which contains the fuel,

and the products of combustion pass into the axis of the shell, whence they are carried off by flues to the chimney. Nov. 17, 1881. Price 6d.

5,055. J. A. Davies, Elbow Vale. Manufacture of bricks.

These are made from slag and clay. The slag is subjected to a stream of water before it becomes cold, pulverised, and then mixed with the clay. (*Pro. Pro.*) Nov. 13, 1881. Price 2d.

5,078. G. W. von Nawrocki, Berlin. Apparatus for diffusing liquids in the form of spray for cooling rooms, &c.

The liquid is forced out of a pipe in the form of spray by a small jet of steam. (Com. by P. Lochmann, Schiedditz, Germany.) (*Pro. Pro.*) Nov. 21, 1881. Price 2d.

#### THE METROPOLIS MANAGEMENT AND BUILDING ACTS AMENDMENT ACT.

Str.—This Act confers greater powers on the Metropolitan Board to approve or refuse applications for new streets and buildings.

Is not this to the prejudice of the public? Would it not be more satisfactory for the Building Acts to be framed in definite terms, stating what may, and what may not, be done, without leaving many important points to the discretion of the Board, who may not be competent to judge, or, if they are, the time which would elapse from the application being made until the decision of the Board is quite uncertain, the applicant being entirely at the mercy of the Board, and often suffering loss through unnecessary delay.

GEORGE EDWARDS.

#### TRAMWAYS.

Str.—Tram-car propulsion by steam or electricity is now being discussed, and apparatus for accumulating a starting-force being devised. I would suggest the California endless-cable method of propulsion, which has certain advantages, amongst others, that at certain busy times of the day several passenger-cars can be hooked on to the brake-car, forming a train to accommodate any throng of passengers, instead of keeping them waiting, as under the present system. Of course, it necessitates a double line of rails for efficiency, the endless cable running in one direction in the one line, and in the opposite direction in the other line. The car or train is started by simply clamping on to the cable, which is always in motion at a certain speed, and stopped by unclamping and bringing to a stand-still with ordinary brake-power. The system is also in successful operation in Chicago, U.S.A.

ALEX. BLACK.

#### SPINNING-ROOM VENTILATION.

Str.—In the *Builder* of last week (p. 785), reference is made to Koerting's system of ventilating cotton-spinning establishments. The principle as described is as follows:—"The introduction of air which has passed through a column where a stream of water has been introduced by an appliance similar to a watering-pot." In a work recently published by the writer\* (and which you did him the honour to favourably review), a description is given of a system of ventilation especially adapted for spinning-rooms, invented several years ago by M. Garlandat, of Paris. The principle of this invention, as recently and very successfully applied on the Continent, is similar in part to that described as Koerting's system. The air is drawn by means of a fan from a purpose-made brick well, in which is fixed a perforated grid covered with a layer of coke; and upon this, water of any desired temperature falls in a shower from a pipe having a rose termination. The air is drawn through the shower of water and layer of coke into the fan (which is on Farco's double turbine principle), and then driven into a square box formed of sheet iron, in which is fixed another perforated grid or plate. Upon the surface of the latter is maintained a constant flow of water, the pressure of the air preventing the water from falling through the perforations. The air in its passage through the second flow of water becomes highly charged with aqueous vapour and entirely freed from suspended impurities and deleterious gases, and it is very effectual in preventing the atmosphere of the spinning-rooms from becoming dry and abnormally electrical. Both these latter conditions are fatal to successful spinning operations.

B. H. TERWATTE, C.E., F.C.S.

#### INDUSTRIAL DWELLINGS AND THE HOUSE-TAX.

Str.—We are covering an estate at Sharnwell with industrial dwellings, and have had a demand made on us for the house-tax (we pay all the rates and taxes), although each tenant is rated separately; his name is on the rate-book, and his rent is under 20*l.* per annum. We appealed to the Commissioners of the district, but they were against us.

In 1866 one of the industrial dwellings companies applied to the Treasury on this subject, and an order was made rendering such dwellings free from the tax; but the Commissioners ruled that this exemption does not apply to private individuals who may build these dwellings, but only to associations. As this is very unjust, and will increase the weekly rental of each tenant by about 2*l.* per week, we shall be obliged if you will publish this letter in your columns; and if there are any of your readers who are in the same position we shall be glad if they will communicate with us, so that we may make a joint remonstrance to the Treasury.

*Allegre.*

ASBIE & HORNER.

#### ECCLESIASTICAL HISTORY.

Str.—Amongst the wide circle of your readers there must be many who are learned in early ecclesiastical matters, and could give information which just now would be of much interest to many besides those who, like myself, are interested in the restoration of a small country church in Devonshire, in which some curious discoveries have been made.

Some of the points on which I seek information are:—

1. The relative position in early times of priory to abbey.
2. And of a small church-chapel being a dependency to either.
3. Did the services in abbeys, &c., follow the "use" of the diocese in which they were placed, or had they a peculiar use of their own, and did this also apply to the dependencies?
4. If this should be so, what was the "use" of Sherborne at its founding in 938?
5. Is there any known list of benefactions, or grants of land, &c., received by the bishopric, or subsequent abbey of Sherborne?
6. Was it not usual for small chapels, or shrines by the way side, to have affixed over the entrance the figure of the patron saint, of large size? And is there any special peculiarity about such in contradistinction to ordinary figures?

LESLIE I. MCK.

#### TENDERS FOR BUILDERS.

Str.—Will you, or any of your readers, kindly inform me, through your medium, if I can claim expenses, and to what extent, under the following circumstances?—

I and another builder were asked to tender for additions to a building, and each one to write out his own specifications, the plans being sent me. I sent in my tender, which proved to be the lowest, only allowed for a slab (as directed), the other builder got the roof. Under the circumstances they thought it best to get out their own specifications, and for us tender again, which I did, and was again the lowest, when they gave the job to my opponent, no clause being inserted in the specifications that they did not bind themselves to accept the lowest or any tender.

JUSTICE.

#### DISINFECTANT.

Str.—I should be much obliged if one of your readers could give me any information as to the best and cheapest way of making and employing peroxide of iron for disinfecting and precipitating sewage.

GEORGE ROSELL.

**Middlesbrough Public Buildings.**—At a special meeting of the Middlesbrough Town Council on the 21st ult., a letter was read from the architect of the proposed new public buildings, Mr. Hoskins, of Darlington, respecting the execution of the work. The Mayor (Alderman Archibald) presided. Mr. Hoskins said he would undertake to execute the work for 5 per cent. on his estimate, 68,000*l.*, or upon the ascertained estimate for all portions of the building other than the Town-hall portion. This offer the Sub-Building Committee recommended the Council to accept. Alderman Williams moved that tenders be taken for the public buildings as a whole, and also for the Town-hall separately, and the other portions of the buildings, and that no decision be come to until such tenders shall have been received. Councillor Scrimham seconded, and the motion was carried by 14 votes to 8. At the close of the proceedings a petition signed by five members of the Council was handed to the Mayor requesting him to call another special meeting to rescind the resolution above agreed to.

\* Compiled by Hart & Co., Patent Agents, 28, New Bridge-street, E.C.

PROVINCIAL NEWS.

**Carlisle.**—A number of gentlemen are about to form a company for the purpose of erecting a Corn Exchange in Carlisle, and they have written asking whether the Corporation would, in such event, be willing to transfer the corn-market from the public street to the new Corn-Exchange, and if so upon what terms. Their letter was referred to the Tolls Committee for consideration. The suggested site of the proposed building is upon the Vinuet.

**Silloth.**—Last week Mr. Walker (general manager), Mr. Carswell (chief engineer), Mr. Boyd (resident engineer, Carlisle), Mr. Meik (engineer for the new dock) for the North British Railway Company; and Messrs. Scott and Middleton, contractors, assembled to view the site of the new dock, and to consider the feasibility of altering and increasing its shape and size. They finally agreed to increase its area from five and a quarter to six and a half acres, and to considerably contract the original width and greatly increase the length.

**Tynemouth.**—At a meeting of the Building Committee held on Tuesday, Mr. P. J. Mossent in the chair, it was found that, in consequence of the numerous applications for space, the buildings comprising the winter garden, aquarium, terraces, arcades, skating-rink, &c., were not sufficiently large to meet the requirements of the coming Marine Exhibition. The committee, therefore, instructed the architect, Mr. W. Glover, Market-street, Newcastle, to prepare plans and advertise for tenders for the erection of additional buildings with a floor area of about 20,000 superficial feet, so arranging the new buildings that they could be still further increased should the exigencies of the exhibition require it.

**Workington.**—A new coal-drop has been completed in the Lonsdale Dock. It has the advantage of discharging ten tons each drop instead of three tons, as is the case with the old drops; but it is so constructed that with a simple arrangement of the back weights it can be adjusted to drop three or more tons. This arrangement can be executed in less than a minute. Mr. R. Hodgson, of Workington, and Messrs. Cowan and Sheldon, of Carlisle, had the contract, under the inspection of Mr. J. C. Dees, of Whitbaven. The work cost about 800l.

**Weston-super-Mare.**—Mr. E. T. Dew's new residence, now being erected upon the Esplanade, will be one of the finest buildings of its class in the immediate neighbourhood. The most of the position has been made by Messrs. Hans Price & Wooler, the architects. The type of architecture chosen by them is French Classic. It is built in its three principal façades wholly of Bath stone, the high Mansard roofs being covered with blue Welsh slates. The carving has been entrusted to Mr. Harry Elms, of Exeter, and is now being executed by trained members of that artist's staff, under the immediate direction of his foreman, Mr. James Stools. The general contractor for the work is Mr. S. Vowels, of Swiss-road, Weston-super-Mare.

**Willenhall.**—At a meeting of the Willenball Local Board on the 19th ult., the Sewerage Committee, comprising the whole Board, presented a Report, in which it was stated that it would be absolutely necessary to acquire from the Earl of Lichfield thirty-five acres of land for the purpose of carrying out a system of sewerage for the town. A letter had been received from the London and North-Western Railway Company, complaining that their culverts were polluted by the sewage from Willenball, and a notice had also been received from the Birmingham Town Council to the effect that two months hence a summons would be obtained from the Walsall County Court against the Board for allowing the river Tame to be polluted with sewage matter.—Mr. D. W. Lees, in moving the adoption of the report, referred to the pressure which had been put upon them by the Local Government Board for the last six or seven years to adopt a system of sewerage for the town. In 1877, a Sewerage Committee was formed to consider the sewerage question, and they came to the conclusion that the downward intermittent system would be the best, for land could be procured, and the present committee saw no reason to differ from that opinion. Land belonging to the Earl of Lichfield was inspected at the time, and it was considered as in every way suitable, but the negotiations for the purchase fell through. It was, however, now, in the face of the pressure from Birmingham,

necessary that something should be done to sewer the town.—The Chairman (Mr. J. C. Tildesley) seconded the motion and after some discussion it was agreed to.

CHURCH-BUILDING NEWS.

**Whitbeck.**—The ancient church of Whitbeck, in Cumberland, has just undergone a thorough repair, and been re-opened for worship by the Bishop of Carlisle. The structure has been completely restored. The old roof has been replaced by a new one, the timbers being of pitch-pine stained and varnished, and covered with Buttermere slate. The west wall, bell-gable, and north wall have been taken down and rebuilt, the walling and dressing being of St. Bees stone. All the windows were also taken out and replaced with new glazed lead windows, cathedral glass being used. The high-backed pews and "three-decker" pulpit have given way to open pitch-pine benches and modern oak pulpit and reading-desk. The chancel has been altered, and the floor laid with encaustic tiles in place of the former stone flags, and a new oak altar-rail has been put in with iron standards; while a portion of the west end has been screened off for a vestry.

**Penkridge.**—The parish church of Penkridge, Staffordshire, is now in course of restoration. Since the beginning of May, when the work was commenced, the plaster has been removed from the north wall, the stone underneath being found in fairly good condition, but in places sadly injured by the erection of the galleries. The woodwork of the seats was found in many places to be completely rotten, so that, if not now, it would have been necessary, sooner or later, to repair this portion of the fabric. At the same time the tower arch, which had been bricked up, has been pierced, displaying the west window, one of the beauties of the church. During the clearing out of the church one or two objects of interest have been found; some ancient encaustic tiles here and there, and three slabs marking the resting-places of those whose names are inscribed on them. One of these lies near the centre pillar of the nave on the south side, of which sufficient of the inscription is visible to mark the spot as the vault of the Egginton family of Redbaston, whose mural tablet may be seen over the south porch. Another is near the south-east pillar of the nave, and a third is under the site of the Teddesley pew, and marks the burial-place of Edward Littleton, late of Pileton, and Susanna his wife, who died respectively in 1704 and 1722. These two evidently lie in a vault which extends from under the west window of the south aisle, the entrance to which is distinguishable from the inside of the vault in which lie the bodies of the last Sir E. Littleton and Frances his wife, which was laid bare when the old woodwork was removed.

**Sedgley.**—A Vestry meeting has been held at Sedgley for the purpose of considering the advisability of carrying out a number of alterations and improvements at Sedgley parish church, which have been in contemplation for some time past. The Rev. William Griffiths, vicar, submitted plans showing that it was intended to pull down the side galleries, take down the present pews, and substitute new and more commodious seats; remove the organ from the western gallery, and put it near the choir seats; provide new heating apparatus, after the position of reading-desk and pulpit, besides a number of other improvements. It was resolved to apply for a faculty to carry out the works. It was stated that 600l. would be required.

**Clevedon.**—It has been decided to reseat Christ Church with oak fittings, to introduce several stained-glass windows, and to make other improvements. The outlay will be provided for by subscription, and the whole will form a memorial to a former incumbent, the Rev. G. Wearne Braikenridge. The architect engaged is Mr. E. H. Lingen Barker.

**Brighton.**—The new peal of six bells cast for the parish church of St. Peter's, Brighton, and suspended in the tower of that edifice by Messrs. Warner & Son, were, on St. Peter's day (29), rung for the first time. The dedication service was held on Thursday, at noon, with a supplementary service in the evening. The cost of the new bells is 750l., of which 243l. is wanted.

DISSENTING CHURCH-BUILDING NEWS.

**Nottingham.**—The foundation-stone of a new Congregational Church, at Park Hill, Nottingham, was laid on the 15th ult., by Mr. Arnold Morley, M.P. for the borough. The new church is planned to seat 460 adults on the ground-floor, and is arranged with a view to future enlargement. It consist of a nave and side aisles, divided by stone columns and arches, the latter supporting a clearstory. The style is fourteenth-century Gothic. The building is necessarily lighted mainly from the roof, and hence the side aisles are made narrow, and the clearstory becomes the most characteristic feature in the interior. The nave ceiling is arched, but low-pitched and boarded, and is broken by ornamental arched roof principals. The plastering of the walls is relieved by dressings and arches in stone and red brick. Externally, the materials used are Loughborough red bricks, with Mansfield and Ancaster stone dressings. In the rear of the church are a lecture-room for 150 persons, and two vestries. The contractors are Messrs. G. Bell & Son, of Nottingham, and the architect is Mr. J. Tait, of Leicester.

**Congregational Church Extension.**—It is stated that a gentleman who does not wish his name to transpire has offered, through the Jubilee Fund Committee, to give 1,000l. per annum for five years for Congregational Church extension in London, on condition that 9,000l. a year be raised in addition, or 2,000l. per annum for five years, if 18,000l. additional be raised; or to supplement in the same proportion any sum raised for new work in London less than the sums above mentioned; and, further, to give 100l. for every Congregational Hall, up to twenty, erected in London.

**Wigton.**—Five memorial stones of a new Wesleyan chapel and schoolroom here have been laid. The site which has been bought is 96 ft. by 54 ft. in width. It has been laid out so that the chapel stands in front, facing the street, and behind are the schools, class-room, and vestry. The interior space of the chapel itself will be 60 ft. in length by 32 ft. 6 in. in width, and it is estimated to seat about 300 worshippers, but this space can be added to if occasion requires, by taking down a screen which will be put up to separate the school from the chapel. The contractor for the joiner's work is Mr. William Foster, of Wigton, Mr. Jos. Moore, of Wigton, taking the builder's portion. Mr. Ranger, of London, is the architect.

**Keith (N.B.).**—On the 22nd of June the foundation-stone of a new Episcopal Church in course of erection at Keith was formally laid by Miss Gordon Duff, of Drummar. The church is to be in the old Scottish Gothic style of architecture, and is designed by Mr. Alex. Ross, architect, Inverness. The building is intended to accommodate 300 persons, and will cost about 2,400l. On plan it consists of nave, tower, chancel, organ-chamber, vestry, and heating-chamber. The tower is prepared for a peal of bells.

Books.

*Art in Everything.* By HENRY FAWCETT. London: Houlston & Sons. 1882. This small volume consists of essays originally published in the *Churchman's Shilling Magazine*. We fear the author is a good deal behind the age. In his preface we meet again the old superstition, which we really thought was dead by this time, that the stems and branches of trees suggested the Gothic shaft and vaulting; and the rest of the references to architecture show about the degree of acquaintance with the subject which might have been expected from such a commencement. In regard to subjects unconnected with architecture there are remarks which may have served to suggest passing reflections to the readers of the periodical in which they appeared, but we certainly cannot think them worth republishing.

VARIORUM.

"TRANSACTIONS of the National Association for the Promotion of Social Science. Dublin Meeting, 1881. London: Longmans, Green, & Co. 1882." This volume will be found to contain a large amount of information and opinion in respect of the various subjects treated of by the several departments of the Association. The objection we have to take is that the publication is delayed too long. Nearly

eight months have elapsed since the Dublin meeting, the proceedings of which it records, so that the interest felt in it is greatly weakened. Two or three months would seem to be ample time in which to produce it.—Messrs. Longmans, Green & Co. announce a second edition of "Outlines of the Life of Shakespeare," by J. O. Halliwell-Phillips, F.R.S. The object of this work is to furnish the reader, in a plainly-written narrative, with details of all that is really known respecting the life of Shakespeare: random conjectures and æsthetic fancies being excluded.—Mr. Michael Reynolds's long-promised hook on the subject of Continuous Railway Brakes will be published this week by Messrs. Crosby Lockwood & Co., of Stationers'-hall-court.—"Fun's Comical Creatures," drawn by Ernest Griset (Fun Office, Fleet-street), shows some really comical creatures, accompanied by corresponding letterpress.—The Oracle gives the following lively sketch of the life of James Wyatt, the architect.—James Wyatt was born at Burton, in Staffordshire, about 1743, of a respectable family. Having been brought to the notice of Lord Bageot, then ambassador to Rome, he accompanied that nobleman to Italy, where he had the advantages of such studies that on his return to his native country he found himself without a professional rival. He was often heard to say that he had with his own hand measured every part of the dome of St. Peter, and that, too, at the risk of his life, lying on his back on a ladder swung horizontally, without cradle or side rail, over a void of 300 ft. At Venice he was the pupil for two years of Viscontini, architect and painter: some of his architectural paintings executed at this period were considered to equal any by Paulini. At the age of twenty, Wyatt returned to London, where he was employed to build the Pantheon in Oxford-street, which was then considered a model of symmetry and tasteful decoration. Never, perhaps, was so high a reputation in the arts obtained by a first effort. Applications now poured in on Wyatt from all parts of the United Kingdom and from the Continent. The Empress of Russia gave her ambassador *carte blanche* to induce Wyatt to settle at St. Petersburg, but, unfortunately for English architectural antiquities, Wyatt declined the offer of the munificent Catherine. On the death of Sir William Chambers he was appointed Surveyor General to the Board of Works, which was followed by appointments to almost all the important offices connected with his profession in the Government Departments, and a dispute having arisen in the Royal Academy, which induced Mr. West to resign the president's chair, Wyatt obeyed the King's command to fill the vacant office, which, however, he restored to Mr. West the following year. Among his chief works were a palace at Kew, Fonthill Abbey, Bulstrode, Doddington Hall, Hanworth Church, alterations in the old House of Lords, and in Henry VII.'s Chapel at Windsor. Although educated as what was then known as a Classic or "Roman" architect, and making his successful *début* in England in that style of art, yet he afterwards revived in this country the long-neglected "heavies of Gothic Architecture," as far as he could appreciate them, which was not very far—witness the splendid stained glass broken out of the windows of Salisbury Cathedral, and flung by the cartload into the river, and replaced by cold, hard, staring white glass (a deed which Thomas Cromwell with his spoliators or Oliver Cromwell with his Ironsides might have had the credit of), the tombs torn out of their appropriate places and arranged symmetrically down the centre of the nave; witness again lovely Hurstmonceux Castle, or rather the shell of it, for that is all the zeal and had taste of Mr. Wyatt has left—Grinling Gibbons' carvings, coloured glass, in fact, all the interior, gone; witness, indeed, the "eminent one's" *chef-d'œuvre*, that gingerbread Gothic conglomeration of unfulfilled architectural promises at Fonthill. Mr. Wyatt died on 3rd September, 1813, from the effects of a fall from a carriage. The Kew Palace has been pulled down, so has Fonthill Abbey, and the old House of Lords burnt.

**Royal Albert Hall.**—Madame Christine Nilsson will sing in an Opera and Ballad Concert to be given here this, Saturday afternoon, July 1st, as well as Miss Patti Winter, Madame Trehelli, Mr. Maas, Mr. Mayhrick, and others.

### Miscellaneous.

**Association of Municipal and Sanitary Engineers and Surveyors.**—The annual meeting of the municipal and sanitary engineers of the Midland district was held on the 17th ult., at Goole, when Mr. E. Pritchard, ex-president, of London and Birmingham, presided at the meeting, held at the Lovthor Hotel. Mr. J. H. Taylor, borough surveyor, Barnsley, read a paper on "Extraordinary Traffic on Highways by Traction Engines, and the Loads they draw." A paper, prepared by Mr. James Hall, borough surveyor, Stockton, on the relative cost of macadamised roads and paved streets, was next read, in Mr. Hall's absence, by Mr. Tudor (Goole), after which the two papers were discussed by Mr. Wheeler (Boston), Mr. Tudor, Mr. Cross (Dewsbury), Mr. Escott (Halifax), Mr. Gamble (Grantham), Mr. Whitlow (Soverhy Bridge), and the chairman. Mr. Taylor having replied, a vote of thanks was accorded to those who prepared the papers. The members of the association present then visited and inspected the hydraulic coal-bat lift, the North-Eastern Railway hydraulic swing bridge over the river Ouse, and the new dock, and afterwards dined together.

**Cost of the Electric Light.**—In reply to inquiries, we have been favoured by Messrs. Samuel Brothers, of Ludgate-hill, with some details respecting the electric light as employed upon their establishment. The dynamo machine is worked by an Otto gas engine of 12-horse power, which is, however, far in excess of what is required for the existing lights, and will be amply sufficient for a number of incandescent lamps which are about to be fitted up in the counting-house, private office, and fitting-rooms. The engine and lamps require no skilled superintendence, and are attended to by the head porter. There are altogether twenty Jablochhoff arc lights, five of which are in the front, and the remainder are employed to light up 4,000 square feet of space inside. Each lamp has an illuminating power of 378 candles, equal to thirty-five ordinary gas burners, as verified by the scientific staff of the Metropolitan Board of Works. The Jablochhoff "candles" cost for each lamp one penny per hour, and the gas consumed by the Otto engine costs also one penny per lamp per hour. The total expense per annum is 150*l.*, the lighting of the premises averaging three hours each night.—*Warehousesmen and Drapers' Trade Journal.*

**The Electric Sun Lamp.**—The "Lampe-Soleil" of M. Clerc and M. Bureau, of Brussels, was exhibited on Saturday, in the vaults of the Royal Exchange. The peculiarity of this lamp is that it combines the principles of the arc and the incandescent lights. Into a small block of marble two carbons are inserted at an angle of 40 degrees, and the electric arc is produced at the extremities of these carbons, which are concealed in a space formed by the hollowing out of the under side of the block. The arc light makes the marble incandescent, reducing it to chalk, and the effect of the combination is a steady, sun-like illumination, radiating from a considerable surface, and singularly free from the unpleasant quality of casting strong shadows. The carbons fall by gravitation, and therefore no machinery is required to regulate them as they are consumed. One advantage claimed for the Lampe-Soleil "is that, if the current be stopped, the lamp is not at once extinguished, the incandescent marble giving out light for a few minutes by itself." M. Garnier, architect of the Paris Opera House, in the *foyer* of which the Lampe-Soleil has been used, says, "C'est, selon moi, la plus belle lumière qui puisse être employée pour l'éclairage des œuvres d'art et des galeries de luxe."

**A Memorial of the late Dean of York.**—There has just been erected in the east aisle of the south transept of York Minster a monument in honour of Dr. Dancombe, Dean of York from 1858 to 1880. It is of Caen stone, and is in the Decorated style of architecture. The effigy of the late Dean, of white marble, has been executed by Mr. Boehm.

**Greenock House Joiners' Wages.**—The Greenock house-joiners are at present agitating for an increase of  $\frac{1}{4}$ d. per hour on their rate of wages ( $\frac{1}{4}$ d. per hour). It is stated that the increase has already been granted by several of the masters.

**Royal Academy.**—The President and Council have issued cards of invitation for Wednesday, the 5th of July.

**School of Science and Mines.**—Mr. Muddella, M.P., delivered in the lecture-theatre at South Kensington Museum, on Saturday, the awards gained by the students of the Normal School of Science and Royal School of Mines since its establishment in its present form. Professor Huxley, dean of the new institution, sketched the history of the two schools, which were united and re-organised, less than a year ago, to form the present institution. The result of the change would be greater efficiency. It was, he remarked, lamentable to find how the ordinary methods of education in what was called literature, but often was not literature, pretended to teach science, but really impeded it. They accustomed people so largely to take statements on credit, that the persons taught could not see for themselves. The institution had already 198 students, and might be expected to reach a vigorous manhood. Mr. Muddella, having distributed the awards, expressed gratification at the admirable usefulness of the school. Commenting on the need for science-teaching, he said that England had been far behind her neighbours in this matter, and he was glad that our manufacturers were beginning to realise the fact. The efforts and lavish expenditure of Continental countries,—France and Germany especially,—within the last ten years were astonishing. The Royal Commission on Technical Education would probably make not only an interesting but a startling report; but he did not fear that England would be unable to meet the circumstances of the case, and to continue holding her own with regard to industrial progress. Less than thirty years ago there was no systematic scientific instruction in the country; but now 1,500 teachers and 70,000 students were receiving grants from the Science and Art Department. Two hundred teachers visited South Kensington yearly at the expense of the Government and for educational purposes, and in addition there were 200 students in this institution, many of whom had chosen the teaching profession. Col. Donnelly and General Martin also took part in the proceedings.

**The Walker Art Gallery, Liverpool.**—Besides the permanent collection of pictures, there are at present three additional exhibitions to be seen, each of great interest, in this gallery. The latest of these comprises fifty-three sketches and drawings by J. M. W. Turner, R.A., which have been lent for exhibition for the instruction of art students by the trustees of the National Gallery. In another room are some hundreds of sketches and drawings by the late W. G. Herdman, illustrative of old Liverpool, and in a third room are exhibited the designs of thirty-nine artists and sculptors who have competed for the bas-reliefs for the panels of St. George's Hall. Touching the latter, "A Competitor" writes to the *Daily Post* expressing satisfaction at the announcement that the committee who have the matter in hand are about to ask the assistance of an artist of the highest standing to aid them in awarding the prizes. It is said that several of the designs or models have been sent in in total disregard of the prescribed scale or size published by the council in their printed instructions. This was "one-fourth of the full size of the carving." These designs, it is urged by "A Competitor," ought never to have been received, and he urges their elimination at once.

**Borough Surveyorship, Blackburn.**—At a meeting of the General Purposes Committee of the Blackburn Corporation on the 22nd ult., Mr. J. B. McCallum, C.E., Borough Surveyor of Stafford, was appointed to the borough surveyorship of Blackburn, vacant through the resignation of Mr. Bryan, who has become engineer to the East London Water Company. Mr. McCallum has filled his present post for six years, and was previously engaged as assistant to the borough and water-engineer of Liverpool. The salary of the post conferred upon him is 500*l.* per annum. The chief works carried out at Stafford during his surveyorship have been the construction of the weir at Stafford Mill and the Walton Walk; the cleansing and deepening of the river Sowe; the erection of the Broad Eye Bridge; the creation of Meadow Bridge; the erection of the Wragge Museum, Free Library and Public Reading-room, and School of Art; the preparation of plans for the main drainage of the borough, and the partial carrying out of the same; the preparation of the scheme for supplying the town with water from Sherbrook (Cannock Chase); and the laying out of Coton Field and forming roads.

**Proposed Dock Extension at Burntisland.**—Increased dock accommodation is being demanded here, and several sites for a new dock have been spoken of, among them the bay behind Rossend, the present tidal harbour, and the ballast depot beyond Cromwell Dyke,—the last named receiving most favour, and forming the subject of a plan by Messrs. Meek, C.E., Edinburgh, the engineers of the existing dock. A somewhat novel proposal has just been put into shape by the resident harbour engineer, Mr. R. Henderson. Mr. Henderson has prepared a plan of a dock entirely apart from the present harbour, and situated on the east side of the town, where about 24 ft. or 25 ft. water might be had. Its chief features are as follow:—The entrance would be found off the point of the Lamerlaws, and the last outer pier founded on the Henchboy Rock, where the depth of water at ebb tide is about 1½ fathom. An entrance basin stretches 800 ft., with a width at the pier-heads of 250 ft. From this basin steamers could be admitted into the dock at almost all states of the tide, by a lock 400 ft. long. The area of the dock would be 11½ acres, affording ample space for four hydraulic coal-loading hoists, besides a large amount of quay room for import traffic. Estimates of the cost of the undertaking have not yet been accurately calculated, but it is thought that the whole works and equipment could be carried out for 300,000.

**The Society of Arts.**—On Wednesday afternoon the one hundred and twenty-eighth annual meeting of the Society of Arts took place at the rooms of the society, John-street, Adelphi, when Sir Frederick Bramwell, the chairman of the council, read his annual address. The chairman said that of all the subjects with which the public mind has been lately much exercised, perhaps none (of a non-political character) had given rise to so much controversy as the Channel Tunnel, and the importance of ready inter-communication of nations in its bearing upon art, manufactures, and commerce will, the council believe, have amply justified their invitation to Sir Edward Waikh to open a discussion on the subject before the society. Electricity in all its forms, especially that of street lighting, had engaged the special attention of the society. The number of members of the society still continued to increase. During the year 1273 members had been removed from their list by death or resignation. In the same period 373 had been elected. There was, therefore, an increase of 100. The total number of life and subscribing members and institutions in union which subscribe to the society from their own funds was 3,429.

**The Coffee Tavern Movement.**—Lord Zetland has just erected a new coffee tavern at Richmond, Yorkshire. Some three or four years since, Lady Zetland, who takes a great interest in the movement, determined to try the experiment on a small scale, and one of a new range of shops then being built was taken for the purpose, and shortly afterwards opened. The result proved that it was widely appreciated, and on market days the place has been generally uncomfortably crowded, so much so that about a year ago his Lordship determined to erect a building specially designed and arranged for a coffee tavern on a larger scale. The new premises have just been opened; they are carried out in a style of architecture which harmonises with the quaint and picturesque old Yorkshire town, and stand prominently facing the broad open space in King-street. Messrs. Oliver & Leeson, Newcastle-on-Tyne, were the architects for the former as well as for the present buildings.

**Dartford.**—The foundation-stone of a new Introductory Congregational Chapel was laid at West-hill, Dartford, on the 21st ult. The new building is planned to seat about 300 persons, with vestry, kitchen, and infants' class-rooms, and will be built of red brick, with Bath stone dressings, covered with tiles. The roof chimneys and fittings are of pitch pine. The estimated cost of the building is upwards of 2,000. The works are being executed by Messrs. Naylor & Son, of Rochester, from the designs of Mr. John Sulman, architect, of No. 1, Furnival's Inn, London.

**Sevenoaks.**—In this favourite and increasing neighbourhood, a beautiful estate, overlooking Kippington Park, has just been opened up for building purposes. The contractor for the roads and drains was Mr. W. J. Botterill, Cannon-street, London; and the surveyor, Mr. T. Potter, Sevenoaks.

**A Self-winding Clock.**—The *Journal of the Society of Arts* says:—"In September last a new perpetual clock was put up at the Gare du Nord, Brussels, in such a position as to be fully exposed to the influence of wind and weather; and, although it has not since been touched, it has continued to keep good time ever since. The weight is kept constantly wound up by a fan placed in a chimney. As soon as it approaches the extreme height of its course, it actuates a brake, which stops the fan; and the greater the tendency of the fan to revolve, so much the more strongly does the brake act to prevent it. A simple pawl arrangement prevents a down-draught from exerting any effect. There is no necessity for a fire, as the natural draught of a chimney or pipe is sufficient; and if the clock is placed out of doors, all that is required is to place it above a pipe, 16 ft. or 20 ft. high. The clock is made to work for twenty-four hours after being wound up, so as to provide for any temporary stoppage; but by the addition of a wheel or two it may be made to go for eight days after cessation of winding. The inventor, M. Auguste Dardenne, a native of Belgium, showed his original model at the Paris Exhibition of 1878, but has since considerably improved upon it.

**Kettering.**—The new public baths have been opened. The swimming-bath is 80 yards long by 15 yards broad, and varies in depth from 3 ft. to 6 ft. 6 in. It is lined entirely with blue brick, and is faced with asphaltic. The water-supply is continuous, a stream constantly passing through the bath. The water is filtered before entering the bath. At the north end is a large dressing-shed, and closets, &c., and at the south end are a dwelling-house for the overlooker, a large refreshment-room, and private dressing-boxes for season-ticket holders. The area of ground is enclosed by a fence 8 ft. high. The absence of any river near Kettering makes this bath a great boon to the public, who are using it very freely. The contract for the works was taken by Mr. Barlow, builder, of Rothwell, who has carried them out under the superintendence of Mr. R. W. Johnson, architect and surveyor, of Kettering and Melton-Mowbray. The total outlay is about 1,500.

**Francois Guigon,** a Swiss landscape painter of some note, died early in June, at Geneva, where, seventy-five years ago, he was born. He belonged to the school of Genevan painters which, under the influence of Rousseau, Horace Benedict, Sanssouire, and Toepffer, sought its inspiration in the history of the Helvetic Confederation and in the grand scenery of the Alps.

**South Kensington.**—A two-light Munich window by Messrs. Mayer & Co. has just been placed in St. Mary's Church, Bolton, Kensington. It represents Christ consoling the woman and the Angel at the Sepulchre, illustrating the text "Weeping may endure for a night, but joy cometh in the morning."—Psalm xxx. 5.

**The Sculptor's Libel Case.**—The remarkable case of Belt v. Laves, which has for some days been engaging the public interest, was on Wednesday last adjourned, owing to exigencies of circuit business, to the 3rd of November next. The plaintiff's case is not yet concluded.

**St. Paul's, Hammersmith.**—The foundation stone of the new parish church for Hammersmith will be laid this Saturday, July 1, by Prince Leopold.

**A Gold Medal** has been awarded to Messrs. F. W. Reynolds & Co. for their exhibit of wood-working machinery at the New Zealand Exhibition, Christchurch.

**New Zealand Exhibition, 1882.**—A gold medal has been awarded to Messrs. Elliman, Sons, & Co., of Slough, for their royal embrocation for horses and cattle.

**TENDERS**

For industrial dwellings, Marcom-street, Stepney, for Mr. George Doney, Mr. W. H. Scrymgeour, architect. Quantities by the architect:—  
James Crabbe ..... £5,590 0 0

### An Additional Chapter to the Story of the Government Offices.

THE advent of a First Commissioner of Works new to office and legitimately ambitious to do something in his own sphere of liberal enterprise, the fact that most of the measures affecting the moral and pecuniary interests of Great Britain are now smugged through a jaded House of Commons at the fag-end of a sitting devoted to the twin subjects of Irish and Egyptian independence, the general reluctance felt by men of refined aspirations and cultivated tastes to mix in the turmoil of rough representative assemblies, have afforded an opportunity for adding another chapter to the ludicrous story of the extension and concentration of the Public Offices, with a view to scientific method in the system of their design and to rigorous economy in its execution. Another scheme is about to be approved. Another Bill,—the Public Offices Site Bill,—is on the verge of being sent up to the House of Lords, having for its justification an ostensible plea of concentration and economy, but really being, when viewed in conjunction with facts most carefully concealed from public notice, as extravagant a piece of official "management" as was ever concocted by a First Commissioner of Works, or blindly condoned by a Select Parliamentary Committee. As for the latter, we have already noted the case with which one set of honourable members seated in Committee will undo what another set, similarly seated years and cycles of years previously, recommended, attempted, or did. We must ask our readers to go back to our volume for 1877, where, at page 852, the "Story of the Government Offices" from 1837 to 1877 is given in full, and where at pages 898 and 899 the report of the Select Committee which sat in 1877 "to inquire into the annual expenditure on public offices and buildings, and to see whether the adoption of a more comprehensive plan for the extension and improvement of the public buildings would not be more economical and advantageous than the present system," was criticised, and the evidence of witnesses it examined was exposed. We invoked the attention of the Minister of the day to the historical facts alone

of the miserable tale; they revealed, we said, how the mere business of official architecture is indefinitely impeded or irretrievably quashed by the political shiftings of administration, and by the utter absence of any settled principle for initiating works or for carrying them out when initiated. We patiently enumerated points in the abortive recommendations of successive Parliamentary reports; we maintained that all the land on which the Home, Colonial, Foreign, and India Offices now stand, together with all the land which it was proposed in 1877 to purchase for 1,300,000*l.*, might, in 1855, have been acquired by skilful arrangement for less than half a million of money, and we made that statement on excellent authority after due consideration of its importance. We pointed to Paris, which had been remodelled in at least fifteen years less time than it had taken Englishmen to build one block of four Public Offices. We cried with despair that Death, in the course of exhausted nature, could alone prevent the survivors of that devoted band of representative legislators, who aspire to house the great Departments of the State, from discussing in select committee a comprehensive plan for the extension and improvement of the Public Offices on an economical and advantageous system. We deprecated the enormous cost to the country of forty years' talk, adding that the cheques, the pensions, the honours that had been distributed in connexion therewith by successive Governments could not have possessed a more lavish character had any one scheme of any one committee or any one individual been executed, or were it now in course of execution.

It is necessary for the purpose of continuing the Story of the Government Offices to quote from the Report of the Select Committee of 1877, a committee which included among its nineteen members Mr. Gerard Noel, Mr. Beresford Hopo, Mr. W. H. Smith, Sir Richard Wallace, Lord Eleho, and Lord Lamington, the last-named (then Mr. Baillie Cochrane) being called to the chair. The part of the report which interests us most is the following:—

"Evidence was offered to the Committee to show that the chief departments of the Government should be lodged in proximity to each other, and to the Houses of Parliament.

Three plans have been submitted to the Committee for the concentration of certain public Departments; the first plan is that of Sir Henry Hunt, the consulting surveyor to the Office of Works. He proposes to purchase all the block of buildings bounded by Parliament-street on the east, St. James's Park on the west, Great George-street on the south, and Charles-street on the north. This contains 133,000 superficial feet of building area, and the estimated cost of the ground amounts to 1,300,000*l.*; on this block, Sir Henry Hunt provides accommodation for the War Office, and the Admiralty, and the Council Office; he proposes to remove the old buildings in Downing-street, and to erect houses fronting the Park, for the First Lord of the Treasury, and the Chancellor of the Exchequer; to add a story to the Treasury Offices, to place the

Board of Trade between them and the Horse Guards; to retain the Horse Guards, and to place the Office of Works and the Office of Woods between the Horse Guards and the present Admiralty, and thus to leave the existing Admiralty building at the disposal of the Government. Sir Henry Hunt stated to your Committee that he calculated the whole expense of his scheme, including the purchase of the Great George-street site, at two millions and a half, and that he further estimated that it would set free, and render available for sale, property belonging to the Government, including the existing Admiralty building, as well as release the houses which are now hired, represented by a capital value of a million. This plan, Sir Henry Hunt said, does not provide for the Civil Service Commission, nor for temporary commissions. It appears to the Committee undesirable to add a story to the existing Treasury block of buildings.

Another plan was submitted to the committee by Mr. Mitford, the permanent Secretary to the Board of Works. The witness proposes that the public offices should be placed on the west side of Charing-cross and Parliament-street, and that incidentally to this scheme the narrow part of Charing-cross should be widened, and the Mall extended into Charing-cross at the point where Messrs. Drummond's Bank now stands. On the park side the Horse Guards would form the centre of a group of public buildings, and there would be no encroachment on the Parade.

For carrying out this scheme it would be necessary for the Government to acquire the whole of the Crown property and private property which lies between the corner of Spring-gardens and Coekspur-street and the present Admiralty, together with Dover House, which belongs to the Crown, and a portion of the block bordered by Great George-street to the south and Parliament-street to the east, setting back Parliament-street to the line of the new Home Office. Sir Henry Hunt estimates the probable cost of Mr. Mitford's scheme at three-quarters of a million in excess of that of his own. Mr. Mitford proposes by his plan to obtain an additional building area of twenty-five per cent. over that of Sir Henry Hunt.

The third plan is that produced by Mr. Cates, one of the surveyors of the Office of Woods, and includes one side of Whitehall-place, and the houses in Whitehall-gardens up to Montagu House. It makes use of the land known as the Fife House site, and the vacant space of ground lying between the public gardens on the Embankment to the south of Whitehall-place, and to the west of the public gardens of the Embankment. Here it is proposed to place the War Office, the Admiralty, and most of the other departments provided for in Sir Henry Hunt's plan. Mr. Cates estimates the cost of this site at 850,000*l.*

The result of this was that large sums of money were expended in the acquisition for Government purposes of property in Great George-street, King-street, and Parliament-street, and these sums have been expended with a view to utilising what is known as the Great George-street site. For this purpose property has been bought and paid for at a cost of 241,681*l.*, and this consists of houses still in occupation. In round numbers a quarter of a million of public money has, since 1877, been

spent by successive First Commissioners of Works, with the object of placing new Public Offices on a site bounded by Great George-street, Parliament-street, St. James's Park, and the block of four Offices last erected. But suddenly a new departure is determined on, and if this new departure be not attended by a compact or an understanding for which the metropolitan ratepayers will eventually pay, it will be from no fault of her Majesty's present advisers. For the moment it suffices for the First Commissioner to ignore a comparatively enormous expenditure (made for the purpose of concentrating the War Office and Admiralty on the West-minster side of the Horse Guards) in order that the said two Public Offices may be concentrated on the Charing-cross side of the Horse Guards, at a cost for the site of 460,000*l.*, only 160,000*l.* of which will come out of the national pocket, the remaining 300,000*l.* being for Crown lands, and therefore merely a transfer from one Government account to another. We publish this week a plan of the scheme, as it is proposed to be carried out by the Office of Works, and we shall return presently to a consideration of it. Meanwhile it may be as well to inquire into the eventualities and possibilities connected with the property purchased by Government in the neighbourhood of Parliament-street or Great George-street, and the quarter of a million of money spent there, now to all appearances for no definite or settled purpose. This land, we are credibly informed, is to be offered to the Metropolitan Board of Works. It is actually proposed, if it has not already been publicly announced, to throw upon the Metropolitan Board the duty of widening Parliament-street by the obvious absorption of King-street, and to hand over, for a substantial pecuniary equivalent, Government property recently purchased at a heavy, even an exorbitant cost, in order to obtain, at a vast extra outlay, the very improvement in the approaches to the Houses of Parliament which the scheme of building Public Offices in Great George-street would have of necessity accomplished. It is actually proposed thus to misuse money raised by Metropolitan rates, under powers hastily accorded by the House of Commons to the Metropolitan Board, and ungrudgingly given by the ratepayers, partly because they believe it is to be spent in the improvement and amelioration of the poorer districts of London. In other words, in order to form a spacious approach to the Palace of Westminster, or rather to complete the approach commenced at the very beginning of the last century by the removal of King's-gate, it is proposed to suggest the diversion of money, granted for metropolitan necessities, to contain an enlargement which, if needed at all, is of imperial not metropolitan character. The bait to be held out is, probably, the increased value of frontage space. We cannot, however, believe that the shrewd majority of the Metropolitan Board will be deluded into such a course by any deceitful anticipation that the value of the new frontages created by the widening of Parliament-street will more than compensate for the entire expenditure involved. At the same time, the bait to which we refer, as likely to be held out, is not dissimilar from others at which persons of influence in both the Imperial and metropolitan Parliaments have been previously tempted to nibble.

To come now to the present First Commissioner's scheme, and to the points in which it carries out the recommendations of that Select Committee which reported to the House of Commons on the 6th of July, 1877. It will be seen that the proposed War Office and Admiralty are placed side by side, and the former conveniently adjoins the Horse Guards, but neither of the proposed Departments can be said to be placed in proximity to the Houses of Parliament. By the scheme the present Horse Guards' building is to become, viewed from the Park, the central feature of a rectangular group of Public Offices; but if the latter are ever to contain the required accommodation, they must be raised to a height double that of the Horse Guards. By the scheme the whole of the present Admiralty administration must be evicted, and offices found for it elsewhere for a period of several (at least eight) years, and other minor Departments will be similarly disturbed. Yet some twenty-five years ago Sir W. Molesworth's language was sufficiently clear on this head. "By more than one removal," said he, "or by several partial removals, the expense would be much increased . . . and arrears might be

erated that it would require years to recover." By the scheme it is proposed to erect lofty blocks of many-storied buildings around enclosed quadrangles, three of which out of five are palpably inadequate, even presuming that modern science advocated such a mode of arrangement. On the contrary, every effort has been made of late years to abolish the closed square, to build in such a manner as to allow a thorough draught of air to penetrate interior courts and courtyards. The quadrangles of Sir Gilbert Scott's block of offices, excepting always the central square, are admittedly too small, and the stuffiness and dreariness of the interiors are largely due to the acknowledged inadequacy of his quadrangles. Yet these are very slightly, if at all, inferior in size to the smaller quads of the proposed War Office and Admiralty, and it is not improbable but that the new buildings will have to be carried higher than the India and Foreign Offices. Moreover, the Select Committee of 1877 heard evidence tending to convince the members that the serious defects in lighting and ventilation complained of in Sir Gilbert Scott's building arose chiefly from the limited space allowed to the architect; yet the space proposed to be devoted to the two new Public Offices appears to be relatively even more limited in building area. One statement made to that Committee is also important, for it emanated from Mr. A. B. Mitford, who himself submitted to the Committee a well-considered plan, in which he placed the War Office next the Horse Guards on the Charing-cross side, and the Admiralty in Great George-street, on the admitted plea that the Departments with which the Admiralty transacts its chief business are the Colonial Office and the Foreign Office; yet by this latest scheme of concentration the proposed Admiralty forms one extremity of an extended group of existing and proposed buildings, and the two offices with which it has most to do are at the other extremity. Again, the opening up and prolongation of the Mall to Charing-cross was a happy feature of Mr. Mitford's scheme, and one to which the present First Commissioner seems, almost willfully, to be opposed. Nay, more, by this scheme the latter has placed an official residence crossways in such a position as to effectually prevent extension or opening-up of the Mall at any future time. Lastly, we believe we are correctly informed when we say that the plan which accompanies and is part of the Public Offices Site Bill is chimerical and speculative; and though each of the Departments interested has been naively asked whether the said plan affords it sufficient accommodation, and has answered in the affirmative, we should like to know how the said Departments can possibly judge of requirements which the Office of Works has thought fit to meet in block plan only. We should like to know what guarantees the Government can offer the House of Commons that the two departments can be profitably and efficiently housed on the spot referred to in the Public Offices Site Bill; and whether, if it be ultimately found too cramped for the purpose, another First Commissioner will be permitted to promote, on the score of economy, another Public Offices Site Bill on the other side of the Horse Guards or in Gt. George-street for those portions of the War Office and Admiralty which could not be got to fit in with the present scheme of extension and concentration at Charing-cross. In fine, is it too much to require from a great Department that it should do for the public architecture of the nation what an architectural master does, when he sets the programme of a design to be worked out by his pupils?—is it too much to expect that the Office of Works should first convince itself by plans, sections, and elevations that the scheme it proposes, through the mouth of an untried First Commissioner, is architecturally feasible and safe, both on sanitary and constructional grounds? The possibility of the truth of these incredible circumstances,—the fact, even, that Parliament is asked to sanction expenditure for a site, on the bare hypothesis that it may fit two of the most important Departments of the public service,—should induce suspicion even among the forty or fifty odd members who sit out the present debates, two-thirds of whom at the eleventh hour devotedly support anything and everything the Government desire to carry. It is, therefore, commendable when no one moves,—when the Metropolitan Board of Works, naturally anxious about the fate of its Money Bill, is

excessively silent,—that an attempt should be made to call public attention to the proposals of the First Commissioner. This has been done by the publication, by the Royal Institute of Architects, of the plan as it is proposed to be carried out and completed by the Office of Works (see our illustration, page 50), and of the protest made against it while in committee by the council of that body. Much as they seem to doubt the feasibility of placing two big Departments on so confined a spot, they do not oppose merely with that object; but they urge, as an indispensable feature of such a scheme the prolongation and opening up of the Mall to Charing-cross; and in this, it is hardly necessary to add, we heartily concur.

In our remarks respecting H.M. Office of Works and this latest scheme of concentration, we have no intention of animadverting on the kind of architectural work done in that office. The two gentlemen whose duty it has been to design and see carried out the new Post Offices in St. Martin's-le-Grand and Queen Victoria-street, and the new Central Police Court at Bow-street, and who are occupied upon similar works in various parts of the country, have shown what they can do, and how well they do it. Mr. John Taylor and Mr. James Williams, the present surveyors employed at comparatively small salaries in the Office of Works, are Fellows of the Institute of Architects, and merit the fullest recognition from their colleagues on account of the architectural works they have executed. But their time is wholly occupied with the respective and special duties assigned to them. If they have been consulted at all about this latest scheme of extension and concentration, it has probably been with the object of obtaining assent to preconceived views, not their own, rather than of eliciting useful criticism or professional advice.

The scheme now before Parliament draws its origin from almost forgotten sources; it is based upon an excellent design by Lieut.-Col. Clarke (now Sir Andrew Clarke), the plan of which, published in a Parliamentary paper, dates about the year 1865 or 1866. A fine model of this very design is now being exhibited at the Bethnal-green Museum, and it is well worthy of study. Sir A. Clarke proposed to occupy the whole of the west side of Whitehall from Spring-gardens-passage to Great George-street. In his proposed War Office and Admiralty, he arranged quarters for four squadrons of cavalry; and in the buildings which he proposed to place in Great George-street, he put barracks for a battalion of Guards. Mr. Mitford's plan of 1877 was largely founded on Sir A. Clarke's original design, and Mr. Shaw Lefevre's latest scheme for the War Office and Admiralty is a hush of both, considerably shrunk and spoilt in the cooking. When we venture to hint that no architect can have had anything to do with it, we plead on our own behalf that Mr. Mitford's words before the Committee of 1877 afford sufficient justification for the doubt. In answer to a question put by Mr. Beresford-Hope, this gentleman then said, "If you were building a new War Office or a new Admiralty, it would be infinitely better built and more satisfactory in every way if it were built in the Department. . . . The only additional expense involved would be the hiring of a few temporary draughtsmen." Can it be that, in the natural haste of a new First Commissioner to consummate his temporary alliance with the national architecture, a temporary draughtsman has been brought a little too prominently forward?

But to be serious over a grave question. No one conversant with the progress of Public Works believes that the architecture of this country can improve or develop in face of the contempt with which it is treated by the Government and the mass of the population. In no other great European capital are the modern public buildings so petty in conception and so miserable in execution, as they are in wealthy London. Among no other people in Europe are great schemes, affecting the architecture of the entire nation, devised or suggested without the advice and assistance of distinguished members of the architectural profession. The results of this prolonged neglect are too apparent. Though in the design and construction of country houses, of schools, of churches, of small picturesque buildings of every class, the British architect is avowedly superior to his Continental brethren, yet in all the higher works of architecture, in the setting out of large open spaces, of vast terraces and blocks of building, he is

infinitely their inferior. As it is, many a local architect in a French province, if suddenly called upon to plan a Place des Victoires, a Church of the Invalides, or a Louvre, for his native town, would probably at once acquit himself better of the task than even the most prosperous or most successful architect in this country after months of preparation. The failing or fault is one of a traditional character; it does not arise from inherent incapacity. Both the genius and the money for action exist, but the opportunity is never offered. Yet a British Minister who haggles over a 100,000*l.* for a public work of architecture, will carelessly spend more than a tenth of that sum in moving a "Woolwich infant" from one workshop to another. This is not mere cavil, nor are we attacking the heads of one political party more than those of another. Whig and Tory, Liberal and Radical, are all alike and of one mind on the subject of expenditure for artistic improvements; and though, by dint of ruse, official cleverness, or technical intrigue, the country has often in the end to pay huge sums of money for its national buildings, there is always something unsatisfactory in them,—a something which, if traced to its source, will generally be found due to the petty bickering, the mean suspicion, and the false economy of the party or clique which started them. In any great European capital other than London it is the custom to regard a work of true architecture as a monument of the fine arts, a trophy of the national wealth, and as a mine of instruction for the people. Each fresh chapter to the Story of the Government Offices points only in one direction. If we are ever to have public buildings worthy of the genius of the English people, of a character proportionate to their influence and wealth, we must have a Government Department differently constituted to H.M. Office of Works, and possessing nobler aspirations than those which actuate and have too long actuated the chiefs of that Office. The sole idea of the Metropolitan Board of Works, when called upon to provide a new thoroughfare between Charing-cross and Holborn or elsewhere, was "a convenient cut route," and, from the recent doings of H.M.'s Office of Works, the First Commissioner has apparently no loftier aim. Nor can reasonable men expect anything better. In this country, the First Commissioner of Works is chosen for his political opinions; his only technical advisors are his own subordinates, whose reports he is legitimately enabled to alter, disregard, or suppress; in fact, he is not bound to listen to any professional advice at all. He is a political agent, expected to do his duty to the party that supports him, to vote "straight," and use on behalf of his party the "straight" influence that circumstances have given him. He may be called upon to take the chair in committee on the subject of Irish coercion, or Egyptian control, but no sane person expects him to be conversant with architecture or art, and if questioned thereon by an independent member, it is more often done with a view to invite competent criticism outside the walls of the House of Commons than to elicit from the Minister a thought or an opinion on such matters as those for which the appointment he holds would in other countries exist.

Very different is the action of France in regard to public buildings. Since the days of the great Colbert, the Government have initiated, controlled, and generally superintended the French public works. For a hundred years, in spite of vicissitudes of which Englishmen have no experience, at times victorious at home and abroad, but often beaten on sea and land, her cities and capital invaded, torn by civil wars and tumult, France has, nevertheless, ever stood, in the domain of architecture and art, foremost among the nations of our time. No change of Government or fall of party has destroyed her artistic supremacy. Some of the very laws by which the streets and buildings of Paris are even now controlled, some of the very institutions by which the French Minister of Public Works, or, as he is now termed, the Minister of Arts, is supported and advised, were in force by decrees of the Republic of 1793. The decrees of the first and third Napoleon, of Louis Philippe, and of the Republic of 1871 in the matter of public works, all confirm and develop a similar principle, viz. the attachment of trained professional architects to divisions and sections of the capital, and to the great national monuments and administrative offices; as well as the formation of boards or councils, largely composed of architects engaged

not only on works for the State, but also on works obtained through private practice. A *service* of Historical Monuments, which the British Parliament is now being asked to talk about, was started in France as early as 1830; a *service* of Public Works composed of architects, and some of them bearing names of European reputation, and a *service* of Diocesan Edifices have survived both monarchical and imperial *regimes*. The present Republic, though it has made important changes in other branches of administration, seems never to have even dreamed of breaking the national traditions in this particular. On the contrary, Republican earnestness and energy have recently increased the obligation which French architects and artists owe to the State. There already existed three *commissions* for the services of architecture; but, by a decree published in January last, a Superior Council-General has been appointed to assist the Minister of Arts in all matters relating to the *Services d'Architecture* of Civil Buildings, of Historical Monuments, and of Diocesan Edifices. It is composed of architects holding such positions as that of Inspector-General, who are made members by right; of other architects connected with civil buildings, historical monuments, and diocesan edifices, chosen by the minister under whose presidency the Council meet. The post of member is honorary, and one of the many questions to be submitted for the consideration of this General Council is the "Organisation of the State buildings."

Until some similar kind of advising power be instituted in England,—until some Board, principally composed of men distinguished in architecture and the cognate arts, be appointed and acknowledged by the Government and the country,—the conclusion of the Story of the Public Offices can only resemble its ludicrous course of nearly fifty years' duration. Meanwhile, its continuation bids fair to be as humiliating to the educated classes of the community, as the repeated efforts at so-called extension and concentration have been costly and unprofitable to the nation at large.

#### SEPULCHRAL AND MEMORIAL ARCHITECTURE.\*

AND what of our present architectural design of this class? We have touched upon the leading characteristic forms prevalent in antique and Mediaeval times, and on the painful Georgian period during which the walls of our great Abbey, as well as other churches, were crowded up with monstrous imaginings, using the adjective in a double sense, both in regard to actual measurement and artistic character. It is, however, remarkable how large a part sculpture of one kind or another played in the monuments of this period. It was seldom in every sense good sculpture,—often not in any sense; Flaxman, indeed, executed some beautiful work of this class, and after him (*longo intervallo*) Roubiliac, though the unquestionable talent of the latter could not atone for the pretentious and sometimes grotesque character of his monuments, and his want of simplicity and dignity. And perhaps for one reason it is better that sculpture should not form habitually the prominent feature in monuments (unless it be purely portrait sculpture), for it is hardly possible that there can be the necessary resources, either in regard to genius or money, for producing monumental sculpture of a high average of merit, save in a few exceptional cases. From whatever cause, however, there can be no doubt that monumental design has for the present very much given up sculptural form, and has become in late years decisively architectural and decorative rather than sculptural.

Under such circumstances, the designing of monuments becomes a matter of the expression of feelings and ideas by means of purely architectural form assisted by emblems, either such as have a meaning obvious in itself, or such as have acquired a meaning by dint of long and habitual association. Of this latter class there is much more to be seen in our own collections of monuments, than of original and obviously suggestive forms not derived from history and association. A walk through a large cemetery affords a curious spectacle of the combination of forms and emblems connected with various religions and customs long since passed away. The Egyptian obelisk is cer-

tain to be there in some form or other though it is never to be seen in anything like the size and mass of the ancient examples. Those were the records of kings; private persons can scarcely afford such costly insignia, nor perhaps would cemetery authorities be very ready to allow of anything on so large a scale as compared with the average scale of the average tombstone. Then, as we observed, the Greek stele form is really repeated in the ordinary flat upright tombstone with a head shaped in some characteristic outline. Sometimes we find the Greek stele in its original form and proportions; but this is not often, and is only in recent monuments, since the study of antique forms as models has been revived with more correctness and comprehension of their character. But in general the tombstone is shorter and broader in proportion than the original stele, and decorated on its upper limits with some emblem of post-Christian character; sometimes a cherub's head with wings outstretched across the top of the stone, which was long a very favourite device on tombstones of the early part of the century. A more recent fashion is the carving of a spray of palm or other vegetation apparently resting on the head of the tombstone, or growing down out of it. A form which was much in vogue some twenty or thirty years ago, but is now dying out, was that of an inscription slab laid horizontally on stone uprights lifting it 2 ft. or so from the ground. This may be regarded as a reminiscence of the Mediaeval altar form of tomb, on which the recumbent figure or figures were usually placed; in its modern form it became a sort of cheap imitation, without the figures or the architectural work at the side, in which the slab which was formerly the resting-place of the effigy has become only a field for the cutting out of an inscription in such a position that it cannot easily be read. That is one of the great distinctions between the spirit of Mediaeval and of modern monuments; the former showing the artistic memorial without the catalogue of virtues; the latter omitting the art from the monument and giving the praises of the deceased only. The sarcophagus form has taken quite a new lease of life; it is found over and over again now among cemetery memorials; sometimes in stone, more often now in granite. The strange thing is that we see this ponderous granite sarcophagus placed on the ground, or even elevated on a lofty granite pedestal, an empty sign, while the real receptacle of the body is hollow in the ground. So completely is the illusion carried out, that the visible sarcophagus is often made with the semblance of rings carved on its sides, as if to represent as completely as possible the sham movable character of the block of granite, the material and function of which are thus falsified. Looking at some of the monuments of this class which have been erected (or, perhaps, we might rather say, laid down) of late years, one is filled with astonishment that people should be willing to pay so much as these masses of shaped and polished granite must cost, for a form of memento which, in this way of using it, has not only no beauty, but absolutely no meaning of any kind, and no possible relation to the supposed feelings of Christians towards their deceased friends and relatives. However, we are not urging its use as a receptacle for the body, which would be a step in the wrong direction. But, as it cannot advisably be so used, its sublimity may surely be dispensed with, as an unmeaning sham.

Intermixed with this curious piece of costly and unbecoming Paganism, we find since the ecclesiastical revival the presence not unfrequently of upright tombstones derived from the old quasi-Greek model, but carved into terminations more or less Gothic, quatrefoil and trefoil heads, or gables with cusping in them, and surmounted by the cross, which, of course, in recent tombstones, appears in almost every kind of form, having been revived as a common symbol of churchmanship, after being long held in slight esteem as a badge of what used to be termed "popery." Some of the methods of introducing the cross are pleasing, many are (in point of design) otherwise, and convey too much the idea of a rather poor sort of ingenuity employed in working the desired emblem out of some form at first sight very different. Latterly there has been rather a preference for perfectly simple and unornamental crosses of white marble or granite, as if the form itself were important and suggestive enough without any trickeries of ornament. This is in better taste

\* See p. 2, ante.

than the over-ingenious forms we have referred to, and perhaps there is much to be said for this treatment of the most sacred Christian symbol, as sufficient in itself without any adventitious aid; still, we prefer some suitable decorative treatment, for which plenty of beautiful suggestions and precedents can be found in Medieval art without going into exaggerations of form or decoration. The cross form is also frequently applied now, according to a Medieval fashion, which is an adaptation of the sarcophagus form, or, rather, of the sarcophagus lid; a thick, heavy slab hoveled in a A section, and with the upper edge crossed by a transverse ridge; and frequently in modern, as in Medieval work, this ridge has the form of a long cross, with the points budding into trefoils, worked on it. In one instance we have seen a flat metal cross riveted on to the ridge of the marble slab,—not a happy idea; it takes away the monumental aspect of the thing, and looks as if it might be easily lost or carried off.

These represent the prevalent types of modern monuments in our cemeteries, the remaining one being that which represents the most distinctly architectural form, the small building which is placed not unfrequently over the family vault, with a door for entrance on the occasion when another tenant is brought into that silent home. As a general rule, the Egyptian or Greek style seems to be preferred for these small mansions of the departed. It has been much the fashion to make them with every appearance of solid strength, whether this quality be really there or not; with walls basting and doors with sloping jambs, and when the Greek style is used, it is also with a very solid, heavy treatment, or nearly always. There seems something unnecessarily cold and severe in the Greek forms adopted, something unnecessarily sombre and melancholy in the heavy outlines of those in the Egyptian form; but these forms are certainly preferred in practice. Occasionally we see such a tomb building of Medieval character, looking far more consoling to the association, certainly, than these cold blocks of simulated antique architecture; and we remember to have noticed one in which the building was made to represent a little chapel, with stained-glass windows, by means of which the tombstone and its inscription, and the *immortelles* and other offerings of affection placed there, could be seen through the open grille of the door, which at the same time prevented unauthorised intrusion. This is certainly a more pleasing way of carrying out such a structure than building up a blind cavern above the earth with a closed black door, as if the actual remains were immediately within and were to be carefully hidden from sight.

The French seem to have adopted this form of monumental house, as we may call it, more generally than we have, and this leads us to say a word as to the aspect of monumental art of this class among the French. The most accessible reference to this is furnished by M. Césaire's beautifully-illustrated and interesting volume, entitled "Architecture Funéraire," representing a large number of the modern monuments around Paris, of all shapes, sizes, and degrees of elaboration, and preceded by a very thoughtful and suggestive preface. We have alluded to the ideal character which should, and at all events may be, incident to memorial architecture; and every one will expect that a French writer on such a subject will not be slow to recognise "the idea" much more systematically than most English artists would recognise it. M. Daly proceeds, indeed, to classify his subject with true French method and regularity; and if we sometimes find such method too methodical, the personal of his essay really throws a good deal of light on the subject, and it might be studied with much advantage by those who have to promote and to design monuments, as it would, at all events, suggest a definite principle or idea instead of the confused and apparently aimless mingling of fancies among which our English memorial designers ramble. M. Daly classifies memorials under three heads in the first instance: those which are the expression of religious faith, either that of the deceased or of his friends; then those which are the expression simply of the idea of death, its emblems, and its reality; and thirdly, those which are intended to do honour in an especial degree to the memory of the deceased person, to represent his glorification or apotheosis. This is a very good and perfectly reasonable classification. Upon this follow com-

binations of two or of all of these ideas,—memorials which represent death and faith triumphant over it; which represent death combined with the apotheosis of the person commemorated; and there are those, M. Daly seems to consider, which may represent all three ideas,—the combination, perhaps, of the sarcophagus, the cross, and the bust or figure of the deceased. But if we cannot follow our author entirely through his rather too systematic method, there is certainly in this way of looking at the subject a definite suggestion for a treatment of a memorial less vague than that curious combination of Christian and Pagan emblems which so frequently meets us on English monuments; and the manner in which these various ideas are illustrated in the designs given in M. Daly's work is certainly very interesting, and shows that French architects have given a good deal of thought to the subject. The tomb of which the sarcophagus is the prominent feature is treated in a variety of ways, some of them sufficiently original and effective to atone in some degree for the anachronism of its use. In one example we have it as the upper member of a ponderous horizontal design, granitic in character at least, which shows three well-marked stages, the base spreading outwards towards the ground, the strong horizontal lines thus produced contrasting finely with the vertical lines of the cypresses grouped around. These trees, so much used as adjuncts of cemetery gardening, present mainly upright lines, which serve to bring out with more force the horizontal lines of the order of monuments we are just speaking of. This relation of lines is a point to be thought of in the composition of cemetery architecture. The other tree, which has been most associated with the situation, the yew, is, on the other hand, markedly horizontal in its lines, and, therefore, affords effective contrast to the class of monuments, such as obelisks and spirelets, which are vertical in their tendency. These two trees are, in the solemnity of their dark and heavy masses, emphatically trees of death, sombre and still in their aspect; and they combine well in every sense with the monuments in which the idea of death is the predominant one. But they are equally associated in practice with every description of monument to the dead. This seems a mistake. If we wish to convey in a monument predominantly the idea of Christian faith and hope, surely it is out of place to associate such monuments with the presence of these sad and funeral trees. Rather associate them with what is light and hopeful in nature,—with glad flowers and trees of fresh verdure; though it is, of course, often difficult to arrange for such grouping practically. The idea of faith is, in the French specimens given by M. Daly, chiefly expressed by the addition of the cross. This forms the crowning feature of not a few of the "family vault" erections, of which many specimens are given by M. Daly. In the design of these small, but in every sense monumental-looking, erections, the French architects display considerable variety and a great deal of taste, sometimes considerable power of expressive design. They are mostly founded on Greek forms and detail, treated, however, with much freedom and originality. The only two points we should object to about them, taken *en masse*, are the rather too pretty and "shabby" style of the designs in perforated work in the doors, some of which suggest the idea of the door to a *magasin des modes* rather than to a tomb; and the tendency to the sculptured representation of hanging wreaths upon the exterior of the tomb. This latter feature is, no doubt, aesthetically very much on the same footing as the Roman ornament of festoons, which originally were the prominent carved representations (we can hardly doubt) of actual garlands hung on a building to give it brightness and colour on a festival day. But the precedent is hardly worth following out afresh. In the monuments designed to the especial honour of their subject, the third class ("glorification"), the French architects stand high. They have always had a strong feeling in favour of this kind of artistic honouring of the memory of distinguished men, and they carry it out often very well and very effectively. At times we meet with too curious and weird fancies, as in the monument to Rousseau in the Pantheon, where there is a semblance of a built tomb with doors, nearly closed, through which is protruded, apparently, the hand of the deceased holding out a torch, as if still to light the world. This may sound rather effective, but it looks

curiously weak and sensational in execution. That torch, too, gave but a flickering and smoky glare at the best, which few will accept now. The idea is a "conceit"; and of all things conceits are out of place in monuments. But some of the French monuments of this honorary class are very good. In one case it is a figure, the genius of the place, which stands on a pedestal at the head of the grave, pointing downwards towards the honoured dust beneath. In a good many the idea is a portrait bust of the deceased, below which are emblems of his peculiar work or talent while living, and these emblems are in some cases (not in all) very well and effectively worked into decorative treatment. One of the best treated is that of Alfred de Musset. The space appropriated to the tomb is backed by a coped marble wall, the centre portion of which, thicker than the rest, rises into a kind of stele terminating with a pediment, and bearing beneath the pediment the bust of the poet on a bracket; the lower portion on either side is inscribed with the titles of the poet's principal works,—very strange are the associations suggested by the titles of some of these, in such a situation,—

"Beside the cold *hic jacet* of the dead,"—

and in the centre portion, below the bust, are engraved the poet's own musical lines, anticipating the treatment of his tomb:—

"Mes chers amis, quand je mourrai,  
Plantez un saule au cimetière:  
J'aime son feuillage éploré,  
Le pleureur n'en a point d'autre et chère,  
Et son ombre sera légère  
A la terre où je dormirai."

The tree loved by the poet hangs over his grave. This is an example of a really suitable monument, graceful and expressive of its purpose, and not gloomy.

It is rarely that in an English cemetery we meet anything so well thought out and suitable to its purpose as this. We want to see more original thought bestowed on such memorials, less of the continual repetition of worn-out and often gloomy and unsuitable emblems; calm and repose should breathe around the resting-place of the dead, but not gloom; the aim should surely be rather to counteract that. One may look long through the monuments of our most crowded cemeteries without finding anything that is not commonplace, that is not stale and unprofitable, mere variations (hardly even variations) on worn-out themes. As we have described one good French example, we may also notice one good, though smaller and humbler English example, which struck us with pleasure the other day in wandering through the wilderness of commonplaces in never-mind-which of our suburban cemeteries. It was a monument to a lady artist, a square tapering pillar of unpolished marble,—the old form of the Greek stele, in fact,—carved at the top into very delicate and graceful ornament of Greek type, and halfway down the stone a very delicately-relieved portrait-figure of the object of the memorial, seated with brushes and palette in hand, and beneath, the words "Whatsoever thy hand findeth to do, do it with thy might." Here was something really graceful, feeling, and to the point. It is but too rarely we come across any monument in such good taste, both in feeling and in artistic form. As a parting suggestion, we would observe that some of that scattered and too miscellaneous effect which a collection of monuments incongruous in style often presents, might be obviated by the erection in cemeteries of naves containing niches or wall spaces (external or internal) somewhat symmetrically arranged, in each compartment of which a monument, in accordance with the special wishes of each proprietor, might be placed, all of which, however, would necessarily be reduced to an approximately similar scale, and perhaps subject to a certain degree of supervision as to style. A harmonious architectural effect might thus be produced, very different from that of the motley group of designs which are scattered over the ground in ordinary cases, and in which each monument, while displaying its own special features of design, would contribute more or less towards the total effect.

Mr. Thomas Graham Jackson, M.A., architect, late Fellow of Wadham College, has been elected an Honorary Fellow of that society. Of Mr. Jackson's principal work in Oxford, the New Schools, a full account was lately given in the *Times* and the *Builder*.

## THE POINTED ARCH AND THE LATEST DISCOVERIES IN SYRIA.

The question of the origin and the early history of the pointed arch has recently received what some may consider an illustration from the exploration of Eastern Syria. Although the small building on the top of the Citadel hill at Amman, has been visited and to a certain extent described, by Consul Finn, Colonel Warren, and Canon Tristram, neither of these gentlemen was able to remain long enough on the site to give any detailed description of the work; and it is to the report of Captain Conder, dated in January last that we are indebted for the information that the building, so far from being, as hitherto supposed, of a Byzantine character, is as unlike the Byzantine churches as it is to the Arab mosques of Palestine, and that "it has, indeed, a unique character, and is well worth minute study."

The peculiarity which strikes us as at once the most novel and the most instructive is the occurrence in the same small structure of the three distinct types of the round arch, the pointed arch, and the Moorish or horseshoe arch. Nor is the coincidence the less striking from the fact that the latter types occur in somewhat undetermined, or, as the reporter says, "embryonic, condition." A ready idea of a plan of the edifice may be formed by dividing each side of a square into three, and drawing parallel lines which will thus divide the area into nine equal squares. Of these the central division is an open court, and no signs are left that it was ever roofed over. It thus presents a strong analogy to the open *atrium* of a Classic house. The four angles are occupied by vaulted chambers, and in the north-west angle are the remains of a staircase which originally led to the roof. Four arched recesses, each measuring about 18 ft. square, open on the central court, and the angles between these recesses are covered with elaborate sculpture.

These four opposite arches, which, on a hasty view, might be described as semicircular, have each, however, a slight and almost imperceptible point. It is difficult to attribute the fact to any other cause than that the architect, being aware that it was at the key of the arch that any slight yielding of the structure would become most apparent, and thus cause the greatest disfigurement to the building, introduced that slight geometric artifice which should most easily deceive the eye, in such a case, and preserve the beauty of the building even under slight displacement. At all events, we can recall a similar artifice in the case of more than one long barrelled bridge and culvert in the kingdom, in building which the central part was purposely raised by some inches above the voussoirs. The object was, that if any settlement took place in the middle of the arch, it should not be visible, as it would not come below the line of the voussoirs. It is very possible that this is not an unusual expedient,—we speak of it as a practical one, and the remembrance of it seems to us to throw a new light on the introduction of a very slight, but not inelegant, departure from the plain semicircular arch.

Exactly the same structure has been detected by Captain Conder in the arches of the famous dome of the Rock in Jerusalem; those, that is to say, that support the drum. The arches in the outer arcade of this building are round, and are covered with ancient glass mosaics. The inner row of arches is now covered with a marble casing, so their true structure is not distinctly apparent. But in the photograph taken in 1874 (which has been published by the Palestine Exploration fund), three arches are shown directly facing the spectators, and the slight point can be distinctly detected.

Whatever may be thought of the explanation thus offered, there can be no doubt that in these concurrent examples may be witnessed the birth of a pointed arch. Nor is this the less interesting when we find that another deviation from the exact semicircle, viz., that continuance of the curve of the arch below the horizontal diameter which we usually call Moorish or Saracenic,—in fact, a slight horse-shoe,—is to be found on either side of these almost imperceptibly pointed arches. At the base, and again in the upper part, of the angular abutments of the four arches, are true round-headed arcades, consisting of small semicircular arches, each supported by a pair of columns, connected by one plain abacus or capital. A sort of flat dog-tooth moulding adorns these arcades, and also surrounds the eight Moorish or horse-shoe

arches just mentioned. The face of the larger arches,—those with the nascent points,—are composed of visible voussoirs, but the photograph shows under one of them what appear to be slightly projecting ribs.

The enrichments of the recesses and of the arcades are floriated or arabesque. The horse-shoe arches consist of two plain mouldings, with wider belts of dog-tooth moulding between them. A central mullion rises between seven pairs of superposed circles, each of which is filled with a floriated or arabesque ornament. In both the upper and the lower arcades double spirals, in some cases of very elegant form, occupy what would, if the walls were pierced, be the lights. A belt of circular ornaments runs round the angle, between the extrados of the horse-shoe arches, and the plinth on which stand the twin columns of the upper arcade. There are no figures of birds or of other forms of animal life; in which respect the sculpture differs from that of the famous palace at Maschita, discovered by Canon Tristram, although in many respects there is a similarity between them. In one of the Moorish-headed recesses the central mullion is treated so as in some way to resemble the sacred tree which is found on Assyrian bas-reliefs.

There is thus in this small building an extraordinary association of architectural forms, to which we are in the habit of attributing widely different places and dates of birth. The round-headed arcade might be found in an English abbey, or in an Italian church, and would, in either case, have been regarded as a true local form. The ornamentation, on the other hand, has the Moslem character of avoidance of the likeness of living creatures. But the most remarkable part of the story is the unity of the design. It is not as when Norman Abbot continued the work of Saxon predecessor,—or the line of time can be drawn between the style of Henry and that of Edward. The round arcade, the slightly pointed arch, with its distinct voussoirs, and the Moorish recesses, are so intimately blended in the design as to show the workmanship of but a single hand, the design of a single brain.

In thus saying, however, we must not be understood as committing ourselves to a decided opinion as to the actual date of the edifice in question. Some authorities have assigned it to the sixth century of the Hegira, or twelfth of the Christian era. But in all questions of date have to be included those elements of the local and even of the personal influences which may have caused, in any particular case, what might be regarded as an anachronism, if referred to historic date alone.

The account of the great sanctuary at Hebron which, in our article on Royal Pilgrims and Holy Sites (vol. xlii., p. 538), we intimated as about to be published, has, we are informed, been prepared. It is illustrated by an accurate plan of this, almost the most jealously-guarded of Eastern holy places. Under the peculiar circumstances through which access was obtained to the shrine, it has been proper that the monograph prepared by Captain Conder should be submitted to the Prince of Wales, together with a report, by the same officer, of the interesting discoveries made during the tour of their Royal Highnesses, Prince Albert Edward and Prince George of Wales in Syria. It is to be hoped, in the interests of archaeological science, that the demand of military service in Egypt may not delay the completion of this memoir.

**The Hygienic Exhibition in Berlin.**—A curious question has arisen in connexion with the catalogues of this exhibition, which were about ready, it would seem, when the destruction of the building, &c., took place. The advertisers are being called on by the publishers of the catalogue to pay the amounts contracted for, the latter having, according to the opinion of several legal authorities, completed their part of the contract. It would seem, according to some reports, as if the discussion would be carried before high legal tribunals. Those who pay now without any trouble will have a right to the insertion of their respective advertisements at half price in next year's catalogue. One contemplated feature of the exhibition would have been of practical value, the providing of penny baths for the populace, this small charge including soap and towels. This would have been a valuable illustration of the sanitary laws, the promulgation of which was the *raison-d'être* of the exhibition.

## NATIONAL COMPETITION PRIZE WORKS AT SOUTH KENSINGTON.

To whatever cause it may be due that this year's Exhibition is opened more than four weeks earlier than last year's, the fact is probably none the less welcome to a large number of persons immediately interested in the work of Schools of Art aided by Parliamentary grants. On previous occasions, both the late period of the season when these exhibitions have been held, as well as the unsuitable accommodation provided for them have been matters for regret, whilst the former cause of regret is now checked, the latter remains *in statu quo*. A special gallery known as the "National Competition Gallery," forms part of the main buildings of the South Kensington Museum. Decorative lunettes, typical of different stages of instruction given at schools of art, occupy the upper portion of the walls whereon the students' works have been destined to hang. Above an entrance to this gallery is a long panel, painted by Mr. Prinsep, illustrative of a distribution of prizes to students. In sixteenth-century costumes, functionaries, amongst whose faces may be recognised those of Sir Frederick Leighton, the late Sir Henry Cole, Mr. Watts, R.A., and others, are officiating at the ceremony. Why, then, do not the National Prize drawings annually speak for themselves in this Gallery, adorned for, and nominally dedicated to, them? According to present arrangements, however, the results of the extensive organisation at work all over the country are banished to an ill-contrived gallery of a temporary nature, difficult to find in buildings situated between the new Natural History Museum and the Royal Horticultural Gardens. Curiously enough, the National Gallery proper is actually empty at the time we write.

For some years now an opinion has been current, which the Royal Commissioners on Technical Education have by this time probably verified, that no country can and does display for public scrutiny a collection of students' drawings, paintings, and models, equal in quality and number with that under notice. These works not only exemplify a complete curriculum of instruction in painting, modelling, and drawing in connexion with the industrial arts, but they are evidences of the establishment of a school of designers,—a school which differs in the important degree from such as those at Sèvres or Gobelins, which are confined to one or two particular places,—inasmuch as it virtually exists, and is encouraged to exist, all over the country, wherever peculiar requirements of districts or towns sufficiently manifest a demand for its existence.

Upwards of 320 medals and books are awarded this year amongst 1,300 works. These 1,300 works have been selected from over 214,000. Of the 320 awards, some 105 have been awarded in respect of designs for various articles of manufacture, such as wall-papers, carpets, iron work, lace, silks, pottery, cutlery, and such like. Ten years ago, out of 300 similar prizes, seventy-one were given for designs; and the total number of works submitted was 73,000, or about a third of the number now sent in. The Board of Examiners who have awarded the medals this year is composed of Mr. Poynter, R.A.; Mr. Leslie, R.A.; Mr. Yeames, R.A.; Mr. Marks, R.A.; Mr. Boehm, R.A.; Mr. William Morris, Mr. J. S. Stevenson, Professor Unwin, Mr. T. Armstrong, the Director for Art; and Mr. H. A. Bowler, the Assistant-Director.

As usual, the paintings in oil and water-colours from still-life groups, flowers, and fruit are the brightest spots in the collection; and the highest awards given in these classes are taken by female students. The Bloomsbury Female School of Art has, for some years, maintained a supremacy in flower-painting. Miss Ethel Nisbet (aged 21), of this school, won the Gold Medal by two able water-colour studies (No. 8). The more important of these is a view of white, pale yellow, and orange chrysanthemums, overhanging a broad-lipped porcelain vase, which stands upon the polished surface of a Buhl table. Behind hang yellow curtains, which are parted to disclose two or three shelves, where bits of Chinese porcelain are ranged. A few oranges in a plate help to complete the composition, which supplies opportunity for skill in depicting various materials, in blending delicate tones of color, and in treating *nuances* rather than marked contrasts of light and shade. The Silver Medal in this stage is gained by Walter Langley (aged 38)

of Birmingham. In his work, as the age of the student would lead us to expect, there is more force. The details of his composition (No. 32) are, however, less exacting than those chosen by Miss Nisbet. Langley produces a very effective picture of green and brown earthenware, and cauliflower, on a white cloth, backed on the right with a blue rough curtain, and further on by a skillfully-indicated cutting with ample white margin. Miss Lucy Leavers (aged 20), of Nottingham, is rewarded with a Gold Medal for her group (No. 6) of golden plovers, rabbit, widgeon, and partridges, which have been recently jostled together in the netted string bag hanging upon the panelled wood-work forming the background. The imitation of the fur and the plumage may nearly come up, in point of fidelity, to the mark of an early Eyt. More original, and affording wider scope for broad treatment of effects of light, is the miscellaneous gathering of white hexagons, cubes, fragments of cloth, plush, fringes, glazed and unglazed earthenware pots, which are distributed upon the rough deal box in the painting-room presumably of the Ilkley School of Art (No. 47). This display of materials for a "still life" group is not reduced to customary conventionality by means of simply contrasting a dark background with objects in light. Charles Stephenson (aged 21), who thus leaves the beaten track, gains a Silver Medal for his painting, which is considerably larger than that of Miss Leavers. One of the most advanced stages of instruction is that which deals with the figure either in the shape of paintings, drawings, or models from the nude, and on the present occasion the specimen of student's oil-colour painting (No. 5), from the nude figure, contributed by A. Hitchens (aged 20), of the South Kensington School, is distinguished by a Gold Medal. The work is one of undoubted merit, showing careful observation and an easy, unconstrained power of accurate drawing and painting. As the servants of a healthy imagination these qualities may be turned to good advantage in respect of either pictorial or decorative art. Alfred Bowcher, one of the members of the Training School at South Kensington, gained a Gold Medal in 1880 for modelling a figure from life, and this year he repeats his performance, choosing, however, a curiously ungainly model (No. 323), spirited in action, but not graceful of limb or feature. The pose of the figure is that rather of a fencer, with foil point on the ground, in an advancing, bectoring, attitude, with his left hand on his hip and head well tossed up. In Mark Rogers's (aged 34) group of contributions from the Lambeth School (No. 10) a pleasant artistic spirit is apparent, especially in his high relief of a female head and half-bust, which he calls "Beatrice" ("Much Ado about Nothing"), evidently inspired by an Italian fifteenth-century relief. Rogers has successfully proceeded in this terra-cotta of a charming expression about the eyes and mouth of his Beatrice which lifts it beyond mere student work. His, in fact, is the sort of work which in France would probably be marked *hors concours* instead of being admitted to enter the lists and winning a Gold Medal. Thomas Alison (aged 20), of the Edinburgh School of Art, receives a Gold Medal for his monochrome study (No. 1), of the Apollo Belvedere, swiftly painted and perhaps hardly carried far enough towards completion. It is strikingly in contrast with the beautiful chalk drawing from the antique figure (No. 9), by Arthur Nowell (aged 20) of the Manchester School of Art, for which a Gold Medal is awarded. No less than three Silver Medals and five Bronze Medals are awarded to the Lambeth School of Art for drawings from antique figures alone, yet not one of these Lambeth drawings approaches in degree of finish and grace that of Nowell's "Antinous." It will suffice to say that the remaining stages of purely student work such as painting flowers without backgrounds, painting ornamental casts in monochrome, chalk studies of the life, &c., are duly represented; but no work in these stages gains an award higher than that of Silver Medal.

Turning now to the section of original designs for ornamental manufactures, the places of honour are given to modelled arches sent in by the Plasterers' Company's Prize, to a high-standing falence vase, and to the best design for carpets. Evans (aged 21), of Gloucester, receives the first prize given by the Plasterers' Company for his arch (No. 3), lacking constructive decision and the unity of ornament which certainly mark the less ambitious arch (No. 50),

by Trealeaven, of Westminster, winner of the second prize given by the Plasterers' Company. The Italian arabesques and panels with figures painted by Gibbon, of Coalbrookdale, upon the large vase (No. 4), present scarcely any new points of novelty in design. Their prototypes may be very fully found in the specimens of Italian pottery in the South Kensington Museum. The Gold Medals awarded both to James Meine (aged 22), and to Thomas E. Doran, are somewhat easily earned. James Meine's design for a carpet (No. 7), is carefully drawn and painted, and the different conventional motives, all of a quasi-Oriental type, are well distributed all over the surface; the colour, too, is not unpleasant. But, as a rule, our carpet-designers are so overruled by the exigencies of the machine, that, having designed a square yard of respectable pattern, it seems to be considered that they have done all that is necessary. To a different consideration, however, we may trace a leading element in the "style" of Oriental carpets. In such, large spaces are treated, and not a meagre square foot or yard. The design of pattern in an Oriental carpet is, as a rule, a composition to fill the space, and not a mere sequence of repeated details, repeated, in fact, until there is enough for the required surface. In respect of Doran's patterns for silk hangings (No. 2), they have a very decided likeness to French patterns for brocades of the early eighteenth century, and we could, probably, name a text-book on French textiles where the motives of most of the designs for silk submitted by the Macclesfield School could be found. Students should derive as much suggestiveness as possible from their studies of examples of ornament, &c.; but it is of questionable advantage to make palpable adaptations, if not direct copies, of old examples. And in regard to the courses of acknowledged studies of specimens of "historic" styles of decoration, we may note the many admirable sets of students' work. Frank Stealey (aged 18), of Birmingham, takes a Silver Medal for five sheets of details of wood carving, moulded work, &c., from Aston Hall (No. 26), a second Silver Medal is awarded to Francis Gibbon, of South Kensington, who has sketched (No. 27), a number of Japanese objects (some, especially the raised *Satsuma* ware, of doubtful taste and instructive utility). Of somewhat similar aim are the drawings done from actual measurement of buildings. Ullathorne, of Selby School, sends no less than twelve sheets of laboriously worked out details (No. 52) of the famous Abbey of Selby, giving elevations, sections, mouldings, plans, and what not, with extreme devotion. Others send measured drawings of the "Old Spa House," at Gloucester (No. 74), of the dining-room in "Arbrook Hall" (No. 132), of the north-west tower of St. Paul's Cathedral (No. 259), of ornamental iron gates and other iron work at Edmonton, Aylesbury, Enfield, High Wycombe, and Hamerton (No. 321). From this stage we pass on to the architectural drawings, the comparatively low standard of which, this year, is marked by the fact that a Silver Medal is the highest prize given, and that goes to Walter Carlow (aged 22), of Leicester, for some sketches, plans, and designs. A Bronze Medal is given to Hedley Price, of Nottingham, for a lavishly be-finealised and crucketed cathedral (No. 129), with great windows filled in, lavishly, with tracery work. Robert L. Hay (aged 19), of Glasgow, gains a Bronze Medal for his designs for a Municipal Building of an early Gothic style.

Hanging near at hand are designs for lace, and in these we notice a greater number for hand-made lace than usual. Miss Margaret Douglas's (No. 77) and Miss Emily Heise's (No. 11) designs seem to us to be the best after those (No. 29) by William Hardy, of Nottingham, who receives the Silver Medal in this class of work. The most successful design for wall-papers is that (No. 30) by Edmund Herral, who, with an orderly arrangement of fruits, leaves, birds, trophies of musical instruments, and pendent draperies in gentle tints of light yellows, pinks, and greens, seems to have adopted Mr. Walter Crane as his model. The remaining designs for wall-papers follow in conventional grooves, and there is little noticeable in them that is either fresh or peculiarly attractive. Designs for metal working come principally from Sheffield. They are for salt-cellars, candlesticks, address-caskets, souperens, and jewellery. The rather top-heavy candlestick by Lawson (No. 108) gains a Bronze

Medal. The style of this design is that identified with the late Alfred Stevens, whose consummate genius in dealing with plastic arts expressed in all materials, marble, terra-cotta, wrought or cast metal work, strongly influences many young students of the School of Art in his native town. Evidence of this may be traced in the bronze doors for a Town Hall (No. 149), by Winterbottom, for which a Bronze Medal is awarded. The framing and proportions of the doorway are suggestive of the famous door to "Paradise," by Ghiberti, at the Florentine Baptistery. The chief figure compositions are emblematical of Justice and Wisdom. The merit of the designs lies in the fact that the character of the material adopted has been paramount in the exposition of the ornament. It is too often that ornament alone is invented and applied to a material instead of being of the material, in the true sense of the term. For instance, the Munich school of glass-painters are reproached with using glass, not as medium of transluence, not taking fullest advantage of the brilliancy which pure glass of different colours supplies, but reducing the glass to a semi-opacity or vellum appearance and then dealing with such a ground in the same way as one might deal with tinted paper. As coloured panels fairly illustrating Spenser's lines upon the seasons, the four figure designs (233) by Holgate, of the Westminster Royal Architectural School, are carefully carried out, and proper discretion in the lead lines is shown. But glass, as glass, does not proclaim itself here any more than it does in the Munich painted glass. A clever little Arcadian piper is depicted by Miller (aged 20), but the subject as a desinitory "decorative" panel is no more technically "decorative" than is any little genre or other picture.

It is remarkable that the head school of all the schools of art, namely, the National Training School, with its Government subsidised scholars, at South Kensington, should not make a better display of designs. The highest awards go to students who are practising painting and modelling from the picture or sculpture point of view, and Richard Willis is the solitary student of the Training School who receives a Silver Medal this year for a design. Ten other prizes of lesser degree are awarded for designs to the South Kensington Training Class, and this out of a total of fifty-two awards. Reverting to the remarks we made above, that close upon one-third of the number of prizes gained by students of the provincial schools are gained in respect of designs, we may call attention to the fact that about a fifth only of the number given to the Training School at South Kensington are given for designs. It is surely to the Training School to which the country looks for its supply of masters who may be qualified to teach technical designing in all its branches. We may conclude our remarks by saying that the standard of skill in figure-drawing, modelling and painting, and in painting generally, is, at this school, obviously higher than that required at the schools of the Royal Academy. A measure of the force which has secured this condition might, perhaps with appropriateness, be directed in favour of the primary intention of the artistic instruction given at South Kensington, namely, the improvement of artistic designing for all sorts of industries.

**Books.**—Amongst the books in the Hamilton Collection, sold last week were the following:—*Androuet du Cerceau, Architectural Designs*, a collection of fifty-five drawings on vellum, beautifully executed in Indian ink, bound in blue morocco extra, obl. 4to.—400l. (Quaritch). *And. du Cerceau, "Petites Arabesques,"* forty-six plates, Auzérix, 1650, sm. 4to., blue morocco extra, by Borel, 46l. (Quaritch). *"De Architectura,"* fifty plates, by the same, with his "Opus alterum," sixty plates, and his "Livre d'Architecture," thirty-eight plates, three volumes in one, 1559, 1561, 1582, large folio, Thuanus's very fine copy on large paper, in gilt vellum of that time. This rare volume sold for 260l. (Quaritch). *"Le premier et second volume des plus excellents Bastimens de France,"* by the same famous architect and draughtsman, Paris, 1576-79, two volumes, large folio, Thuanus's copy of this first edition, old calf. The Boarzi copy sold for 650l. about thirty years ago, but this produced 165l. Another of Du Cerceau's works, *"Livres des Edifices Antiques Romains,"* large folio, 1584, again from Thuanus's library, old calf, with his arms, slightly stained.—63l. (Quaritch).

THE HAMILTON PALACE COLLECTION.

It cannot be said that the Hamilton collection sale loses in interest as it progresses. It is not owing solely to what may be really called the extraordinary prices which some of the pictures, the furniture, and decorative objects have so far realised, as to the well-sustained character of the objects exhibited, and we have still the prospect of two other similar magnificent displays. Complete satisfaction may be said to have been given to all concerned. The National Gallery has been enriched by a number of rare and characteristic specimens of Italian art, and more than one collector at home and abroad has been made happy and famous by the acquisition of some of the coveted treasures of the Beckford and Hamilton gatherings. The competition which has so far been roused is scarcely likely to have its keenness dulled by the promise of the treasures yet to come, though expectation is amply compensated for by the exhibition which each week takes place before the sale.

The third portion of the collection, with its additional instalment of Italian pictures, rare foreign pottery, Limoges enamels and choice furniture revealed a further glimpse of the treasures which the palace contained. Never in England, it may fairly be said, since the days of the great sale of Charles I.'s effects have so many noble possessions been brought to the hammer as the Hamilton Palace sale will have dispersed, and never before has the skilled work of the decorative artist, the elaborator of choice woods, precious marbles, bronze, gold and silver, been brought into so immediate competition,—in commercial value,—with what is allowed to be the more lofty art of the painter. Within the last weeks Messrs. Christie's rooms have displayed an appearance such as we have been alone accustomed to see in the great palaces of the Continent and those of our own wealthiest nobility, with this rare exception that not an object has been exhibited that is not worthy of some kind of attention.

Notwithstanding the excessive beauty and value of many of the objects shown in King-street last week, it is not going too far to state that Masaccio's "Last Supper," a panel only 12 in. by 8 in., may be fairly said to have been the greatest treasure of the sale. If any doubt should exist regarding the authorship of this lovely little picture, let us allow the advantage of this point to rest with the painter of the Brancacci chapel, whose well-preserved perfect work in fresco at Florence exists to show how the decorator of a large wall-space can fully understand the conditions exacted. It is somewhat singular that one of the most famous pictures, as we incorrectly term Leonardo da Vinci's fresco of the "Last Supper," painted perhaps half a century after the Hamilton Masaccio, is now a ruin, whilst the same subject by the young Florentine master is absolutely in perfect preservation, and may exist for centuries to show not only a true method of painting, but also to instruct as in those eternal truths that the great painters of the past never failed to inculcate.

Almost as equally interesting as the small Masaccio is the large panel picture of the "Circumcision," by Luca Signorelli. When we consider that both these painters, Masaccio and Luca Signorelli, so well represented in the Hamilton sale, preceded that great artist Michelangelo, who undoubtedly owed not a little to the thoughtful labours of these earlier students, the interest that is attached to, and that we must all feel in, these two pictures, which now belong to the nation, is, it must be admitted, beyond commonplace expression. Of any collection it is something to say that it contains at least one genuine Correggio; that there are no doubted Titians, is even more so; and those of the Hamilton collection are well known. The Antonello da Messina has long been quoted as one of the possessions of the collection. Works by the master who is said to have introduced oil-painting into Italy are of the extremest variety, and if the Hamilton portrait is not of the peculiar vigour of the Louvre treasure, it is of the utmost interest. The Bonifazio Bimbo is another variety of this exhibition, and would, indeed, in any collection be regarded as a treasure. Its preservation is remarkable, and its beauty of treatment and colour are of a character that we have been in the habit of finding alone in the best works of the best-known Venetian painters of the sixteenth century; the large "Jacob's Vision," by Bassano, is also a picture of merit by the great

colourist; the portrait by Bronzino of "Garcia de Medici" is most interesting. The "Laughing Boy," by Leonardo da Vinci, is doubtless to many worthy the respect it seems to command, but in comparison with the great works of the master it is impossible to take more than a share of interest in this little work. The interesting portrait, acquired by the nation, and said to be by Titian, but in reality by Domenico Theotocopuli, claimed by the Spanish school as "Il Greco," but who, in fact, is a Venetian painter, is certainly an historical addition to our collection. The picture is not alone interesting from its being the work of an artist little known in England, but also as showing the methods by which the Venetians painted at the time *il Greco* was in Venice, though there is observable that spirit of caricature that is so often evident in imitations.

China collectors, whether intending or regretfully longing purchasers, had, during the view, a rich treat in the large quantity of curious old Dutch, French, and Italian faience, delft, Rouen, Gubbio, and Urbino wares; several pieces of the richly-lustred Hispano-Moorish majolica. Venetian glass, too, though scarcely of the type which our modern makers have now made so familiar in their skilful copies; among the specimens two curious pairs of dark green altar candlesticks; by the side of the creations of Murano a rare and ancient piece of Oriental glass,—a ewer richly gilt and enamelled with quaint figures,—just such a specimen of Eastern skill as set to work the puzzled ingenuity of the founders of the beautiful trade which, for so many centuries, has made Venice famous.

To a very different order of decorative art belong the specimens of Etruscan pottery, among which the "Beckford Vaso," justly attracted, during the show, no small share of curious attention.

As for the carvings in ivory, it is not often that such treasures are brought under the notice of the public in the sale-room. Criticism might well hover between the delicate little fifteenth century Gothic shrine and the two ivory carvings by Flemming,—as the Flemish artist Duquesnoy is generally called,—with their sturdy Rubens-like exuberance of life and strongly-marked Classic character. For the rock-crystal chandeliers there was, as may be imagined, no lack of admiration.

Among the pieces of furniture composing the third portion of the sale, the series of Boullé and Louis Seize marvels may be said to have been disturbed by the appearance of several superb specimens of sixteenth-century Italian work, Florentine cabinets in *pietra dura* mosaic, works almost of architectural merit and brilliantly arrayed in the harmonies of artistically arranged nature. One cabinet of sixteenth-century Milanese work, overlaid with damascened plaques and ablaze interiorly with rare and precious stones and marbles, jasper and lapis lazuli, scattered with the wildest profusion over the drawers, colonnettes, and panels, amply employed, during the three days' exhibition, one patient attendant to open and shut as the crowds passed by and admired. As for the so-called Soltykoff chess-table, of sixteenth-century Milanese damascene work, in the exquisite beauty of the execution,—manipulative and artistic,—of the architectural motives, it merits the reputation it has long borne in artistic circles. It bears well the historical traditions attached to it. The collection contained several other pieces of damascened work, among these a choice oblong steel coffer.

It is somewhat singular that the only modern work that we have observed in the sale should be by an American. Harriet, or "Hetty," Hosmer, as she is called, the well-known sculptor, the *protégée* of John Gibson. We will remember the execution in Rome of Miss Hosmer's first work which brought her into notice, the little "Puck" of the Hamilton sale. As for the colossal porphyry head of the Niobe and the Laocoon group in bronze, the size of the original, and such objects as the four large terminal busts in old Roman faience, they are possessions such as alone find their place in palaces. With regard to the faience d'Oiron, the so-called "Henri Deux" ware, forming in its size and delicacy of ornament so complete a contrast to the porphyry lusts, it can be understood, with the history attached to its production, how great was the interest excited by the two specimens on view last week in King-street. Of the thirty-five or so pieces known to exist in the world, these two of the Hamilton Collection form part. Of the delicate little salt-cellar,—

only 4 in. high,—a positive architectural marvel of design, with its little colonnettes, panels, mouldings, and mascarons, if, as is the case, there exist two or three other variations of the design; the companion tazza, 4 in. high, though it somewhat resembles, except in the absence of a cover (which we suspect is wanting), a superb cup in possession of the Baron Alphonse de Rothschild, is known to be unique; the bumpy possessor will thus have one more joy added to his treasure by the knowledge of this all-satisfying fact.

The pieces of Limoges enamel, most of which, it may be mentioned, were exhibited at South Kensington in 1862, attracted no small amount of attention, and very rare indeed are the specimens which the sale has now scattered; creations of artists such as the Limousins and Penicand do not come often into the market in the present day, when the museums are gradually monopolising all such treasures of the past. Is it not, perhaps, better that this should be the case? and is it not a constant source of congratulation, both to the art-lover and collector? To art-lovers that the objects are thus for ever preserved, and easy of access and study; to collectors, because they are by this means for ever prevented from suffering the heart-burnings of seeing coveted treasures pass into the more fortunate hands of brother fanatics.\*

THE LATE MR. J. A. HANSOM, ARCHITECT.

MR. JOSEPH AUGUSTUS HANSOM was born in the city of York, on October 26, 1803. In 1816 he was apprenticed to his father as a joiner; but in the following year, having shown an aptitude for designing and construction, his articles were allowed to lapse, and new ones taken out with Mr. Phillips, an architect of some ability in York. The articles having been completed in 1820, he continued on as clerk to Mr. Phillips, doing some small matters on his own account, and teaching a night school, in which latter occupation, while rendering service to others, he contrived to improve a somewhat defective education. It may be here remarked that Mr. Hansom was one of those men who never lost an opportunity of improving his mind, and would take up and study the most abstruse subjects.

On the 14th of April, 1825, he married Hannah Ghin, who died fifty-five years and a half later, and by whom he leaves surviving issue,—Henry John, an architect and district surveyor of Battersea, under the Metropolitan Board of Works; Joseph Stanislaus, a Fellow of the Royal Institute of British Architects, partner with, and successor to, his father; Sophia, married to Mr. George Bernard Mayercock, and Winifrede Mary, the wife of Mr. George Edward Hardman. On the 14th of April, 1875, was kept the golden wedding, when all their children, their husbands and wives, and all their grandchildren, gathered around them.

After his marriage Mr. Hansom settled in Halifax, where he took a place as assistant to Mr. Oates, an architect, where, for the first time, he had the opportunity of working in the Gothic branch of architecture. In this office he made the friendship of Mr. Edward Welch, with whom in 1828 he went into partnership. Together they were engaged on a gaol and a terrace of houses at Beaumaris; churches at Toxteth Park, Liverpool; Acomb, and Hull (all gained in competitions); three churches in the Isle of Man; a dispensary at York, &c. In 1831 both Mr. Hansom and Mr. Welch sent in distinct

\* At Saturday's sale the National Gallery acquired four pictures.—Masaccio's "Last Supper," for 600 guineas; the so-called Titian portrait, to which we have referred, for 320 guineas; "An Allegory," by Pentorno, for 300 guineas; and "The Circumcision," by Luca Signorelli, for 3,000 guineas. Mr. Doyle acquired for the Dublin Gallery the portrait said to be by Leonardo da Vinci, for 205 guineas; and the "Resurrection," by Bonifazio, 220 guineas. Titian's "Holy Family" fetched 1,160 guineas; "Bonifazio's Bimbo," 489 guineas; the "Antonello da Messina" portrait, 495 guineas; the Bronzino portrait of "Garcia de' Medici," 1,700 guineas; Leonardo da Vinci's "Laughing Boy," 2,100 guineas; Bassano's "Jacob's Vision," 200 guineas; "Venetian Admiral," by Titian, 550 guineas; Correggio's "Ecce Homo," replica of that in the National Gallery, 260 guineas; the "Dying Magdalen," by the same artist, 310 guineas; a portrait of "Mary Queen of Scots," 350 guineas. On Monday the Oriental glass ewer was sold for 2,730l.; the Beckford vase for 168l.; the Flemington vases, 636l. and 162l.; the chandelier, 441l.; the Duc de Choiseul's writing-table and *cartoniere*, 5,662l.; the bust of Niobe, 695l.; the Laocoon, 604l. On Tuesday, the "Henri Deux" salt-cellar fetched 800 guineas; the tazza, 1,160 guineas; among the French faience, a Nevers-ware oval dish fetched 145 guineas; the tazza of Limoges enamel, by Penicand, was sold for 2,000 guineas.

designs, but under the joint names, for the Birmingham Town-hall, and Mr. Hanson's design was declared the first in merit. Unfortunately he was called upon by the Town Commissioners to become bond for the builders, a position which, with other conditions, imposed by the Commissioners, eventually placed him in the position of builder as well as architect. He endeavoured to evade such an imposition; but no alternative was allowed but to throw up the work altogether, and, as he put it in a pamphlet issued in 1834, he "was, therefore, obliged to submit or forego the object of my ambition." The result was that he was landed in bankruptcy. In maturer years he always blamed himself for consenting to such terms; but it will readily be understood that to a young man the temptation to acquire reputation was very great.

Coming at such a time of life, the blow was a very heavy one to bear, and for some time he had to content himself with such small works as came in his way, until the late Mr. Dempster Hemming, of Caldecote Hall, struck with the amount of erudition and business aptitude displayed, put him in charge of all his affairs, which included banking, coal-mining, estate management, &c., which he carried on together with his profession. This engagement was to come to an unexpected end. The way Mr. Hemming's large fortune was dissipated is a matter of notoriety amongst readers of *causes célèbres*, and the intimacy came to an end, leaving Mr. Hanson none the better.

It was at Mr. Hemming's wish that Mr. Hanson perfected and brought out his idea for the "Patent Safety Cab." He took out a patent for this in 1836, and subsequently disposed of his rights to a company, the remuneration named being 10,000*l.* It is sad, however, to relate, as in the case of many another inventor, that the purchase-money was never paid. Having put the company in a going and paying state, he retired from the management with the double view of easing the company of expense and of devoting more time to his professional work. After this the company got into a bad state by mismanagement and excessive expenditure, and in 1839 he volunteered to put matters straight within the space of three years. This he did in half the time, and it is believed that for this work he received the sum of 300*l.*, the only money he ever received for all his time, talent, and labour involved. Under his management many improvements were made in the cab as experience dictated. There were, as usual, claimants to the credit of such improvements. The principle of "safety" which he studied is quite lost in the so-called present "Hansom." This consisted in the suspended or cranked axle. The hack seat was not in the original patent.

Appended to the patent is another idea for a cab which was to be entered through the wheel, but no use was ever made of it, as he saw that the construction was hardly likely to stand the strain of heavy traffic without unduly weighting the vehicle.

In 1812, it occurred to him that the building trades and professions were sadly in want of some channel of intercommunication and illustration, and on the last day of the year he brought out and founded the *Builder*. Want of capital forced him to retire from the undertaking, and he had to content himself at the end of a year with a small payment which the publishers offered him for his consent not to contest the right of proprietorship in the periodical. After this he devoted his energies almost entirely to the pursuit of his profession, being principally engaged on ecclesiastical and domestic work, mostly for Roman Catholics, he himself being a most devout member of that Church.

From 1834 to 1859, he worked in partnership with his younger brother, Mr. Charles Francis Hanson; from 1859 to 1861, with his eldest son; from 1862 to 1869, with Mr. Edward Wally Pugh, a union which had a disagreeable termination. At the beginning of 1869, he took his second youngest surviving son, who had been previously articled to him, into a partnership which lasted for eleven years, when, at his own request, he retired from the firm, retaining only a life interest in it. The last two years and a half of his life he devoted to the preparation for death, retaining all his mental faculties to the end, though sadly crippled in body. On June 29th, at a quarter past three, a.m., he calmly breathed his last, surrounded by the whole of his family, after receiving all the comforts which religion could afford him. He

was buried on July 3rd, at the Catholic church of St. Thomas of Canterbury, in Fulham.

His character was one of much power, mingled with still greater gentleness. With strong ideas of his own, he would listen to, and weigh, the views of others with the greatest patience. He was painstaking in his work, carefully guarding the interests of his clients, but never with prejudice to justice. To the clerks and pupils under him he was full of kindness, and many there were who sought every opportunity of evincing the respect they entertained for him.

In addition to works already enumerated, he was professionally engaged on the following:—

St. Walhurge's Church and Talbot Schools at Preston, and the enlargement of St. Ignatius's Church in the same town; the Catholic Cathedral, Bishop's House, and Convent of Notre Dame, at Plymouth; a church at Devonport; the Church of St. François de Sales, at Drocquennoque, Bonlogne-sur-Mer, as well as the adjoining Convent, and the little Pilgrimage chapel of the "Saint Sang" or Precious Blood, on the Route de Paris; the magnificent Church of Our Lady and St. Philip Neri, at Arundel, for the Duke of Norfolk, for whom he built several houses at Arundel, and restored and enlarged Derwent Hall, near Sheffield, adding the beautiful Early-English Domestic Chapel. He also designed the Jesuit Church in Manchester, dedicated to the sacred name of Jesus; and the Church at St. Marychurch, due to the munificence of the late Mr. J. P. Chatto, and which forms part of the group with the Dominican Convent, the Orphanage and Presbytery. The following churches and chapels owe all or much of their beauty to his prolific pencil,—all Catholic,—Hartlepool, Leeds, Chesterfield, Teignmouth, Mount St. Mary, near Chesterfield; Ripon, Torquay, Bedford-Leigh, Ryde, Clitheroe, Clifford, Prescot, Alston-lane, Dalkeith, Lymington, Leith, Howden, Gunnerst, Selby, Madeley, Dornie, Glassburn, Glasgow, York (St. George's), Simpleforth, Darlington, Weston-super-Mare, Cheltenham, Darlington, Walsingham, Liskard, Abbotshigh, Minster Acres, Leicester, Eastingwold, Nuneaton, Atherstone, Princeton, Graveston, the Servite Church in Fulham-road, Oxford; Chideock, Wakefield, Newtownards, Taghmore, Solihull, Dartmouth, Lulworth, Portland, and Dundee. He was at different times engaged on convents at Darlington, Preston, Derby, Atherstone, Glasgow, Edinburgh, St. Marychurch, Dundee, Abbotsleigh, and part at Teignmouth; colleges at St. Asaph, Ampleforth, Mount St. Mary's, part of Ushaw and Beaumont Lodge, and the conversion of Fort Augustus into a monastery, college, and hospital, which is a marvel of contrivance. Also, Lutetworth Town-hall, a workhouse at Hinchley, inns at Grimston, Beaumaris, Strensall, Tadcaster, and Leicester; an insurance office in York; a model farm at Ushaw, and another for Sir Sannel Crompton; a bank at Atherstone; a trainer's house for Sir Richard Bulkeley; schools at Great Harwood, Preston, Chorley, Accrington, St. Helen's, Wigan, Prescot, Derby, Leicester, Brompton, Hammersmith, Mount St. Mary's, York, Blackburn, Liverpool (2), Bradford, Selby, and Glasgow. The spire of the Catholic church at Brook-green, Hammersmith, is also his; and it may be here stated that the spire of St. Walhurge's Church, Preston, is 306 ft. high.

Amongst others he built or made extensive additions to the following mansions or residences:—Lartington Hall, for the Rev. Thomas Witham; Lulworth Castle, for the late Mr. Edward Wild; Darby Hall, for the late Mr. Simon Scrope; Cheeseham Grange, for the late Mr. Edward Riddell; Thornburgh House, Leyburn, for Mr. Francis Riddell; Minster Acre, for Mr. Henry Englefield Silvertop; Bransby Lodge, for Major W. Fletcher Gordon; Bishopsteignton, for Mr. John Robin; Beaufront, for Mr. William Cutthert; Croston, for Mr. de Trafford; one near Leicester, for Mr. Tarville; at Hinchley, for Mr. Harris; St. Asaph, for Sir John Williams; and others at Inatton-Aulho, Strangways, &c.

Other works of his are detailed over the United Kingdom, and designs of his were carried out in Australia and South America.

**Textile Industry.**—Mr. B. H. Thwaite, F.C.S., suggests the formation of a British Society of Textile Industry, on the model of that at Mulhouse, which has undoubtedly had a beneficial influence on the industries of Alsace.

#### DIVERSION OF THE

#### SEA-BORNE TRAFFIC OF THE THAMES.

How much time, temper, and money would be saved by the simple rule, that people should first try to understand what they want, and then say what they mean. It is true that a certain trade that has thriven much of late would be extinguished by such a course; but the country could afford the loss. The meeting of the workpeople interested in the river trade of the Thames, on the 29th ult., most signally illustrates the above remark. What did the promoters of the meeting mean? If it was what they said, their meeting was unnecessary. Every one will agree with them, in spite of the inadequacy of the arguments of their chairman. If they meant something else, what was it? The meeting was professedly called to oppose the erection of a bridge over the Thames to the east of London Bridge. It did so on account of the damage that would be caused by stopping the trade of the river. Any stoppage of that trade every Londoner ought to do his best to oppose. But who proposes to stop it? No one, as far as we are aware. Was there any thing further in the mind of the meeting?

That a direct communication from the north to the south bank of the Thames, east of London Bridge, is a crying need, there is no contradiction. One question is open. What is, all things considered, the best mode of effecting this? The only possible modes are three, to each of them there is a certain amount of objection. Which is the least obnoxious?

The three possible modes,—for the convenience of a steam ferry has not adapted itself to the wants of the locality,—are, a swing or otherwise opening bridge, a bridge so lofty as to allow the river traffic to pass unimpeded below it, or a tunnel. We are not about to enter into the discussion of a question which must be settled on scientific data, and after the preparation and comparison of careful plans, estimates, and tables. But we do not suppose that there was any one at the meeting more prepared than we are at this moment to offer any opinion on the subject. What was the purpose, then, of the assembly? To maintain the undisturbed freedom of river transport? Well and good. It is more than a desideratum, it is a necessity. Will the meeting have any effect in making this more certain?

But there is an ancient and subtle enemy to all improvement, who gives himself the well-sounding name of Vested Interest. On one pretext or another Vested Interest always opposes any plan for the cheapening of the supplies of life, or for the improving the condition of any class, or of any set of individuals. And there were one or two remarks allowed to slip out in the account of the meeting that looked as if it had been called by this disguised but busy individual. Nothing was to be done to interfere with the manner in which any of the waterside industrials gained their living. Now, bridges or tunnels, any direct and constantly available communication from bank to bank, would touch Vested Interest. Boatmen, for instance, might suffer from not being required to ferry over passengers. If this be so, if there be any honest industry that would suffer from a great metropolitan improvement, it may be fair to urge that some compensation is due. That is a matter to be discussed on its merits; but let it be openly so discussed. Do not let boatmen be called together, or call other workpeople together, to complain that the river traffic will be displaced, when they mean that they will have less occasion to row across the Thames. The ridiculously inadequate statement that London would lose 25,000*l.* by the displacement of her river traffic is enough to show that the persons who conducted the meeting were not altogether the most competent to express opinions on the land and water traffic of London.

**Portobello.**—New buildings in connexion with the Portobello Co-operative Society have been formally opened by Ballo Buchan. The buildings, which are three stories in height, are built of stone. On the ground floor are two large shops with a saloon behind, and on the sunk flat is a bakery, which has been fitted up with all the latest improvements. The two upper flats consist of workmen's dwelling-houses. The buildings, of which Mr. James Simpson, Leith, was the architect, are estimated to cost 3,500*l.*

RESIDENCES, COXWELL-STREET AND THOMAS-STREET, CIRENCESTER.—Mr. JOHN BIRCH, ARCHITECT.

THE NEW CHURCH AT FOURVIÈRES, LYONS, FRANCE.

REREDOS, EDINBURGH CATHEDRAL.

We give a view in our present number of the new reredos at Edinburgh. It was erected at a cost of 1,200*l.*, exclusive of sculpture, by the ladies of Scotland, and was executed by Mr. Brindley. The carving is especially good; it is to a great extent founded on some beautiful fragments of Transitional work found at Bridlington, forming parts of a very elaborate cloister. It is all of alabaster, with enrichments in marble mosaic. The design is for the most part that of Mr. J. Oldrid Scott, based on his father's (Sir G. G. Scott) original sketch.

The sculpture is by Miss Grant, the niece of the late president of the Royal Academy,—the subject being the Crucifixion. Other figures are introduced in niches.

The reredos is on a fine scale, and has a striking effect on the interior of the cathedral.

THE NEW CHURCH OF FOURVIÈRES, LYONS.

The Church of Fourvières is well known at Lyons: situated on a hill on the right bank of the Saône, to which many roads lead, it owes its name to the Roman forum, remains of which were found at this place. It is in the Romanesque style. The interior, which offers nothing remarkable to describe, is hung with gifts from all parts of France. It is, in fact, a celebrated place of pilgrimage. So great is the number of persons who resort to the spot that the present new church has been built by the side of the ancient one, the effect of the group being very good. Apart from the pilgrims, numerous tourists visit the spot, and there is something like a small fair carried on in the neighbourhood. The views of the country from this elevated spot are splendid, and telescopes abound.

RESIDENCES, THOMAS-STREET AND COXWELL-STREET, GLOUCESTERSHIRE.

SOME old buildings in Coxwell-street and Thomas-street having been pulled down, are now being rebuilt in the style of the Domestic architecture of the sixteenth century, in order to harmonise with other improvements effected in this quaint and old-fashioned town during the last few years. The residences are being built of the local rubble-stone so frequently used in this stone district, having Box-ground Bath-stone dressings to doors, windows, chimney-heads, &c. The roofs, which are partially concealed by parapetting, are covered with slates well flashed with lead. Each residence contains a sitting-room, parlour, kitchen, three bedrooms, and the usual offices. The works are being executed by Messrs. J. B. & E. D. Bridges, of Cirencester, who restored the mansion-house, stables, &c., under the direction of the architect, Mr. John Birch, of John-street, Adelphi.

MISSIONARIES' COLLEGE, SEVENOAKS.

This building, known as Walthamstow Hall, was lately opened by Mr. Morley, M.P., and we then gave some particulars of it. We now add a view, and for convenience sake repeat part of the description. The building, which was erected under the direction of Mr. E. C. Robins, F.S.A., architect, is situated in Holly Bush-lane, between the Vine Hall estate and Knole Park, on the brow of the hill overlooking the latter. It is built in the prevalent old English style, with red brick and ornamental tile facings, and tile roof-covering, the entrance doorway being of red Mansfield stone, and a bay window rises above it two stories in height.

The grounds are laid out for lawns, gravel walks, and playgrounds, and for kitchen gardens, and are entered by ornamental gates, presented by Mr. E. Pye-Smith, of St. Pancras Iron Foundry. The lodge is not yet erected.

The dining-hall is opposite the entrance-hall in the centre of the quadrangle, and has an open-timbered and panelled pitch-pine roof. The rest of the open quadrangle is occupied by the lavatories and cloak-rooms, fitted up and heated with warm-water pipes, with which the dining-hall and all the corridors are warmed, open fires being provided for the rooms generally.

The kitchen block incloses the north side of the quadrangle and is of two stories, and has

servants' dormitories on the first floor. The kitchen in the centre occupies two stories. Adjoining which are the scullery, larder, pantry, bread and other stores, the housekeeper's room and store-room, and the cooking school.

The first contract for the foundations and drains was taken by Messrs. Punnett & Co., and cost 1,400*l.* The next contract for the carcass of the main building and dining-hall was taken by Messrs. Willcombe & Oakley, and cost 6,300*l.*

The same firm completed the whole building, and laid out the grounds and fenced in the land, at a cost of about 10,000*l.*

The names of the various tradesmen employed we have already given.

THE HYDE PARK CORNER IMPROVEMENT SCHEME.

WHY REMOVE THE WELLINGTON ARCH?

ON Friday, the 30th ult., a deputation from the Council of the Royal Institute of British Architects (consisting of Mr. Horace Jones, president, Mr. David Brandon, vice-president, Mr. E. T. Anson, vice-president, Mr. J. T. Knowles, Mr. Octavius Hansard, Mr. J. Macvicar Anderson, hon. sec., and Mr. William H. White, secretary) waited upon the Metropolitan Board of Works, Spring-gardens, to present a memorial on the subject of the projected improvements at Hyde Park Corner. The deputation having been introduced by Mr. Dalton, the clerk read the memorial, which was as follows:—

To the Chairman and Members of the Metropolitan Board of Works.

MR. CHAIRMAN AND GENTLEMEN,—In compliance with your request that our deputation, which you have kindly consented to receive, on the subject of the proposed improvements at Hyde Park Corner, would be provided with a memorial setting forth the points it is desired to bring under the notice of the Metropolitan Board, we are directed to state that the Council of the Royal Institute of British Architects, having been led to consider the Improvements scheme of the First Commissioner of Her Majesty's Works by Sir Harry Verney's notice of motion on going into Committee of Supply in the House of Commons, and having devoted much attention to the whole subject, venture to express their opinion that, while the general idea of the scheme merits public approval, it is defective in two main particulars, viz.:

- (1.) Inadequate provision is made therein for the relief of public traffic.
- (2.) The removal of the Wellington Arch is unnecessary.

In respect to the first point, the scheme of the First Commissioner, while affording relief for the congestion of traffic at Hyde Park-corner, does nothing to ameliorate the block of traffic at the junction of Piccadilly and Hamilton-place, and, in the opinion of the Council, no scheme is worthy of adoption which does not provide an efficient remedy at that spot. The suggestion which they have accordingly made is the continuation westwards of the straight line of Piccadilly, beginning to increase the width of the road opposite to Park-lane, and doubling its width at the foot of Hamilton-place. This line of road would debouch exactly opposite Grosvenor-crescent, and the approach to Belgravia from the east would thus be spacious and handsome, being nothing less than the prolongation of Piccadilly in a straight line westwards. Thereby the whole of the traffic from Victoria Station and Belgravia going eastwards, and *vice-versa*, would be separately provided for; it would thus be conducted to and from Piccadilly without at all interfering with the traffic to and from Hamilton-place. The Council lay great stress on this point as an essential element in any scheme for facilitating the requirements of public traffic in this part of London.

Respecting the second point, the Wellington Arch in its present position is well placed, forming, in conjunction with the opposite screen at the entrance to Hyde Park, a symmetrical and not ineffective whole. But, placed where the First Commissioner proposes, it would be on a lower level than Piccadilly, central with no adjacent building, and valueless as part of an architectural group. A reference to the model prepared by her Majesty's Office of Works will demonstrate that it is practicable, as far as levels are concerned, to leave the Arch where it now stands, and to reserve the central roadway passing through it for the exclusive use of the Queen. There appears, in fact, to be no valid reason for removing the Arch, and, if this be so, it is surely unnecessary to incur a large expenditure for the purpose of placing the Arch in a less desirable position than the one it now occupies.

We are further instructed to submit herewith a plan illustrating the points to which the attention of the Metropolitan Board of Works is directed by the Council of the Royal Institute of British Architects, and soliciting, in their name, your favourable consideration, we have the honour to be, Mr.

Chairman and gentlemen, your most obedient, humble servants,

J. MACVICAR ANDERSON, Hon. Sec.  
WILLIAM H. WHITE, Secretary.

P.S.—The Council present an alternative plan which in a somewhat different manner accomplishes the two objects they wish to impress on your honourable Board, and which has the advantage of retaining more of the Green Park.

WILLIAM H. WHITE, Secretary.

Mr. Horace Jones (the President of the Institute) addressed the Board on behalf of the deputation, and handed in the plan which we publish, and which, he said, would explain the proposals embodied in the memorial. The Institute had no desire to be discourteous in their criticism of the scheme that had been promulgated by the First Commissioner of Works, but the matter having been brought before them, the Council of the Institute had given it very careful consideration, and it appeared to them that the same advantages, and even greater advantages, than would be obtained by the carrying out of that scheme, might be secured, and a saving of 15,000*l.* or 20,000*l.* effected. He asked that a representative or representatives of the Institute might be allowed to attend a committee of the Board, and explain in detail a general outline of the suggestions which were given in the memorial.

The Chairman asked the deputation if they were aware that this proposition for an improvement at Hyde-park-corner was a Government scheme.

Mr. Horace Jones.—Yes. The Chairman asked further if the deputation were aware that the Board had promised a contribution towards the cost of carrying out the proposals of the Government.

Mr. Horace Jones said he was not aware that it was absolutely settled, and he hoped that the matter might be reconsidered.

The Chairman said the Board had definitely promised to give a certain contribution towards the cost of this scheme, and the subject was down for discussion in the House of Commons that evening. How, then, that being so, could the Board break faith with the First Commissioner and the public by considering a fresh scheme?

Mr. Horace Jones said the public criticised the actions of the Metropolitan Board, and, therefore, perhaps it would be better, even so late, to look at this suggested scheme. Nothing had yet been begun, and an inspection of the plans might prevent their finding out later that they had made an error.

The Chairman asked if it would not have been better for the deputation to have waited on the First Commissioner of Works.

Mr. Horace Jones assured the Board that the deputation attended in no hostile or antagonistic spirit. They simply thought that a better and cheaper mode of accomplishing the objects in view might be adopted than by carrying out the scheme of the First Commissioner, and they submitted their suggestions for the consideration of the Board. He subsequently added that a deputation from the Institute waited upon the First Commissioner on the previous Tuesday, but that they had not succeeded in making that impression upon him in favour of their views which they should have liked to do.

The Chairman said he might inform the deputation that this subject had been before the Board for ten or twelve years past, and certainly it had had full consideration.

Mr. John Jones asked the deputation if by their plan a better gradient would be provided than by the plan of the Chief Commissioner.

Mr. Horace Jones.—Yes.

Mr. Selway said he thought it very desirable that the whole Board Committee should have an opportunity of inquiring into the merits of any suggestions that might be brought forward; and although the Board had had the subject before them for many years, if a scheme was propounded which was an improvement on every former one, he thought they should give it consideration, and even ask the First Commissioner to adopt it. He moved that the memorial be referred to the Works and General Purposes Committee for consideration and report.

Mr. Dresser-Rogers seconded the motion. A deputation from so influential a body as the Royal Institute of British Architects was entitled to be treated with courtesy, and to have their representations fully considered.

Mr. Fowler said he very much regretted that the Board did not have before it at an earlier

date the plan now submitted by the department, because it showed how all the objects of the improvement might be obtained in a better manner, and at a very much less cost.

Mr. J. Jones (who provoked some laughter by saying that the Board was responsible for the "ornamental condition of this metropolis"), Mr. Runtz, Mr. Freeman, Lord Frederick Fitzroy, and Mr. Lloyd also spoke on the subject, and in the result the motion was agreed to.

#### THE PROPOSED MANCHESTER SHIP CANAL.

THE gentlemen interested in the scheme for constructing a tidal waterway from Liverpool to Manchester have, as we are happy to learn from the *Manchester Guardian*, taken the advice which we ventured to urge on their attention (vol. xlii., p. 764). A large and influential meeting, comprising, among other members, the Mayors of Salford, Ashton, Warrington, Macclesfield, Stockport, and Staleybridge, was held on the 27th ult., at the Towers, Didsbury, the residence of Mr. Daniel Adamson. Mr. Fulton, engineer, who has devoted his attention to the scheme in question for many years, explained his plans to the meeting. Mr. Hicks brought forward a number of figures, chiefly explanatory of the statistics of the exports and imports of Manchester. It was resolved, on the motion of the Mayor of Salford, to appoint a provisional committee for the purpose of inquiring into the best means of carrying out the project, and nine gentlemen were named to compose the same. And, finally, a resolution was carried that the provisional committee be empowered to obtain a detailed survey by a competent engineer or engineers, for the purpose of ascertaining approximately the cost of the construction of the proposed tidal navigation. This adoption of the recommendation, "Let Manchester take the best advice on this vital point," is so far eminently satisfactory, and relieves us from the necessity of saying much that otherwise might have been of use.

Mr. Fulton's speech does not add very much to the information which we collected and laid before our readers on the 24th ultimo. He said that the tidal range at Manchester would be 15 ft. at spring, and 12 ft. at neap tides, but did not state why it should be expected to be so much less than the Liverpool range of 27 ft. 6 in. He gives nearly the same figures as to excavation, &c., that we had done, and added that the area proposed for the dock was 12½ acres. This, however, according to the figures which we previously gave, would only provide accommodation for about 2,000,000 tons of shipping, whereas Mr. Hicks took credit for 5,000,000 tons. The approximate estimate was raised from 3,500,000 to 4,500,000. The proposed charge of 3s. a ton on the traffic which the dock would accommodate would amount to 300,000l. per annum, 75 per cent. of which would amount to exactly 5 per cent. on the larger sum. Thus, while restricting a too sanguine estimate, it is evident that there are the elements of an important enterprise. The true question, as we said before, is not whether the scheme is possible, or even whether it may be expected to pay a fair dividend, but rather, is it, all things considered, the best for Manchester? And it is to that point, we would venture to reiterate, that the advice which the provisional committee are empowered to ask should, in the first place, be mainly directed.

The chairman apparently referred to our previous remarks as to the difference between the proposed scheme and the cases of the Clyde and the Tyne, but he said nothing to impair their force. The comparison of the Suez Canal is not a very satisfactory one, as there is little similarity between a cut from sea to sea,—in which, as will be seen by reference to plate 12 in Mr. Vernon Harcourt's newly-published book on rivers and canals, excavation of any depth is quite the exception,—and nineteen miles of continuously deepening cutting from the estuary to Manchester. The main feature of the Suez Canal is that it follows the level of the district through which it runs,—contrary, it may be added, to the advice of Mr. Stephenson, who proposed that it should be varied above that level, and fed from the Nile. The main feature of the Manchester Canal is that it is to run on at a level through a country gradually rising to some 100 ft. above the bottom of the artificial channel. The one question is,—where will it be cheapest and best for Manchester for

the water ladder to be built? And it is to this part of the question that the consideration of the Provisional Committee will, no doubt, in the first place be wisely directed.

#### EXHIBITION OF APPLIANCES FOR SAVING LIFE.

ALEXANDRA PALACE.

THERE is now open, at the Alexandra Palace, a large and interesting exhibition of means and appliances for the protection and preservation of human life. It contains much to interest everybody, and is well worth visiting, although its promoters do not appear to have shown that amount of energy and aptitude which the exhibitors and the public have a right to expect from them. For instance, the exhibition was, after several postponements, opened on Saturday last, without, apparently, much effort being made on the occasion to attract the attention of the public to its importance; and three days after the opening no catalogue was obtainable. Nevertheless, the exhibition is well worth visiting.

An exhibit which will have special interest for our readers is Messrs. Archibald Smith & Stevens's new hydraulic-balanced lift for passengers. Accidents by lifts are of such frequent occurrence, and are so often attended with loss of life or permanent injury to the persons using them, that all improvements in the use of such appliances are cordially to be welcomed. Messrs. Archibald Smith & Stevens claim that in their new hydraulic lift (which is shown at work in the exhibition) they have attained to this desideratum, and their claim appears to be well founded. The ram is so proportioned that the pressure of water beneath it will suffice to raise the load, together with ram and cage, without the latter being counterbalanced, and without the use of any weights, chains, or overhead gearing. We have not space to describe the lift in detail, but we may say that the water used under pressure for actuating the lift may be considered as being in two sections, one section exerting its force to raise the load, and the other section assuming the duty of the balance-weight, and raising the dead weight of ram and cage. The water which is borrowed for lifting the dead weight of ram and cage is returned to the accumulator on the descent of the lift, and thus economy of working is combined with safety. Architects and building-owners will do well to examine the merits of this new lift, six of which are, we understand, about to be supplied by Messrs. Smith & Stevens to the Royal Infirmary, Edinburgh.

Hundreds of lives have been lost through over-winding at collieries, but King's patent detaching-hook, exhibited by Mr. Stephen Hamble, colliery engineer, Derby, seems to be thoroughly reliable and efficient for the prevention of such disasters. Over 2,500 of them are in use, and we are told that 370 lives are known to have been saved by them. Mr. Hamble also exhibits models of patent safety cages, which remain suspended to wire guide-ropes in the shaft in case of the fracture of the winding-rope.

Of appliances to prevent accidents on railways there is a very good display, foremost among the numerous exhibitors in this section being the well-known firm of Saxby & Farmer, who show the union of the block and interlocking systems and electric slot signal, now in use on the Tunbridge Wells and Eastbourne line of the London, Brighton, and South Coast Railway. They also exhibit a full-sized set of facing-points, with patent facing-point lock,— "the duplex detector." It seems to be impossible for accidents to occur where these appliances are used. Mr. W. Parker Smith, M.Inst.C.E., shows his patent automatic screw-brake, and the Heberlein Self-Acting Railway Brake Company show the Heberlein automatic and continuous friction brake, which has been largely used on German and other foreign railways. Both these brakes should be examined by visitors interested in railway matters,—and who is not so interested in these days when everybody travels by railway? Tweedy & Co.'s railway signal interlocking apparatus, Sykes's block system (as used on the London, Chatham, and Dover Railway), Brockelbank's automatic railway coupling, Douglass's patent coupling, and several other appliances for saving the lives

and limbs of railway passengers and officials are shown.

For the saving of life at sea there is a good display of appliances, foremost among the exhibitors being the Board of Trade and the Royal National Life Boat Institution. The Board of Trade exhibit their completely-equipped rocket-wagons, and show, by means of tackle rigged up for the purpose, how a line can be conveyed from the shore to a ship in distress, and how, when that has been done, the crew can be brought to shore in safety. The Life Boat Institution show one of their boats, thoroughly equipped and mounted on its carriage. Nearly 30,000 lives have been saved by the boats of this Institution, or by special exertions for which it has granted rewards. During last year, the boats of the Institution saved 966 lives, and granted rewards to the crews of fishing and other boats for saving 155 lives, making a total of 1,121 lives saved during the year 1881. These are facts which must commend the work of mercy which the Institution is carrying on to the support of the public. Messrs. Bullivant & Co., of Mark-lane, besides their patent flexible steel wire ladders and cables, show their patent "sea-anchor," a very simple appliance for keeping long steamships whose machinery has become disabled head to wind. In view of possible contingencies in which our Navy will be concerned, Messrs. Bullivant's torpedo net will possess interest for many visitors. Messrs. Robert Boyle & Sons' method of ship ventilation (recently described by us), and their air-pump ventilators, are shown at their stand. Messrs. John Gibbs & Son, of Liverpool, also show their patent system of ventilating passenger and cargo vessels, which appears to be simple and efficient.

The War Department exhibit the ambulances and other appliances used by the Army Hospital Corps, while other exhibitors of ambulances are the St. John's Ambulance Association and Mr. Burt, of Swinton-street, Gray's-inn-road, who exhibits Dr. Benjamin Howard's admirable ambulance-carriage for hospitals. Several of these carriages have been purchased by large employers of labour and machinery, so as to be available at a moment's notice in case of accidents to any of their "hands." We described the carriage when noticing the Sportsmen's Exhibition at the Agricultural Hall, a few months ago.

The necessity for the periodical inspection of steam boilers is the lesson enforced by the large collection of photographs, models, and tabulated statements exhibited by the Midland Steam Boiler Assurance Association.

Messrs. J. Berger Spence & Co. show the applicability of their excellent Belvedere concrete to the fireproof construction, not only of the floors of a theatre, but of such portions of the structure as box partitions, &c.; but the orthography of the descriptions on the placards attached to their exhibits should be looked to. Mr. A. D. Danway shows full-sized sections of fireproof flooring; and Messrs. Chubb & Son have on view a fireproof door for party-walls, consisting of a slab of Dennett's patent concrete in an iron frame. Mr. R. Adams, of Great Dover-street, shows his "Anti-Accident" reversible and sliding window, which we have described on previous occasions. The Silicate Paint Company are exhibitors of their innocuous paints.

Among the miscellaneous exhibits, which are very numerous, we may name Spong's fire-extinguisher, and Sir Thomas Dancer's patent saddle-bar, likely to be found of great service by riders in the hunting-field and elsewhere. Mr. Stanley Leigh's lock-holt is a simple little contrivance, easily adaptable to all kinds of fire-arms, which with its use can be kept loaded without danger of accident when they are incautiously handled.

We have only been able to mention a few of the exhibits; but, from what we have said, it will be gathered that the exhibition is a very interesting one. But if it is to meet with the success which its character merits, a little more life must be infused into its management. As at present arranged, the exhibition will remain open until the end of the present month.

**New Zealand International Exhibition, 1882.**—In Class 72 (lithography and engraving) a gold medal has been awarded to Messrs. Unwin Brothers, of the Gresham Press, Ludgate-hill.

**A WARNING TO WORKMEN.\***

"Sanitary science must be the outcome of a clearer knowledge, and its perfection can only be brought about by a judicious instruction of the people."—*Dr. Carpenter.*

**HEALTH** is your sole capital in life. On it depends your own future and that of your wife and children. It is the wall that shuts off the hospital and the poor-house; but it is very easily broken down by a little neglect and carelessness.

Have you ever thought how much sickness there is in the community? How many of your friends at the present moment are laid up with some ailment? What amount was paid out of the sick fund during the last year in your mutual benefit society? Who fill the hospitals and crowd the dispensaries in all our large cities? Who support the 90,000 regularly educated doctors, not to mention the legion of quacks who feed like leeches on the life-blood and purses of the poor? How do the drug-stores on every corner manage to subsist? Who pays the undertaker and the hackman for the cheerless processions which daily cross every ferry to Greenwood and Cypress Hills? These are facts worth the consideration of every working-man,—not in a morbid or gloomy spirit, but in a candid and thoughtful one. Sickness is his greatest foe. It makes a man weak, miserable, and poor. It robs him of his hard-earned wages, and makes him pay out extra money for food, drugs, and doctors, while too often it brings men to the poor-house.

Every year more than a thousand persons die who might be still alive and well if they had only known how to keep in health; while for every death there are also twenty-eight cases of sickness. Professor Chandler estimates that 10,000 preventable deaths take place annually in New York, besides 280,000 preventable cases of sickness. What a vast waste of human lives and strength this represents!

If you have ever had a severe fit of sickness you know just what it costs, both in physical prostration and in dollars and cents. A severe attack of typhoid fever, for example, means four months' loss of time, besides the doctor's bill and cost of medicine. An ordinary "respectable" funeral, without display, will cost fifty dollars. We say nothing of the human anguish, pain, and misery entailed in a thousand instances every year by sickness and death, all of which might be prevented if due effort were made.

You are too sensible to charge upon Providence what is due to the folly of man. You are not an Oriental fatalist, who calmly sits still in the midst of danger, and says, "It is the will of Allah whether I shall die or live." It is your duty as an intelligent man to be wise in season, and to consider those subjects.

"But," you may ask, "how am I to know how to keep my health? I am not a doctor, and cannot be expected to understand these matters?"

This is true, and we do not intend for a moment to urge you not to take the best medical advice when sickness befalls you; but often by taking a few precautions you can avoid the necessity for calling in a doctor.

Here are a few suggestions for the *prevention* of sickness. They include, first, attention to your home surroundings; and, second, to your personal habits.

In regard to the first, one of the earliest physicians, Hippocrates, said that the essentials of health were pure air, pure water, and a pure soil. Your home should, above all things, be free from damp. It should not be built upon made land, or where it can be flooded by rains, or by a rise of tide. Dampness is a certain source of consumption, rheumatism, croup, diphtheria, and other diseases. The warmer your living-rooms are to the ground, the more danger there is of damp. It is better to occupy an attic where you can get the sun and the air than the basement.

Again, new houses are liable to be damp from the evaporation from the plaster and mortar, which contain a large amount of water. A Spanish proverb says of new houses, "The first year for your enemies, the second year for your friends, and the third you may live there yourself." This tells the whole story. Again, cellar air is unwholesome; and this is another reason why basement rooms are bad. It is very unwise to store vegetables in cellars, or anything that will cause impurity of the air.

So much for pure soil. Next for pure air. This is the most vital thing of all. One may live without proper food and drink, and on a damp soil with impunity, but foul air slays like a sword. Every person needs pure air to breathe. Each time we empty our lungs a certain amount of impure air is thrown off. Thousands die yearly for lack of pure air. It is free to all; it costs nothing. Open the window and it flows in abundance to the beggar as to the millionaire, bringing health and life to all,—if only people would not shut and bar it out in their blind, stupid ignorance. When a man gets consumption it means that he has not had enough pure air to feed his lungs. When typhus fever carries him off, it means poisoned by foul air. When his children faint and fall by the way, with scarlet fever and croup or diphtheria, it is foul air that does it.

What is it that makes most people sick? Eating too much and too fast; drinking too much; want of fresh air; want of sunlight; want of exercise; want of cleanliness. Few persons die of starvation,—many do of gluttony. But you will say, "If I get sick I can't help it,—it's only bad luck that brings fever and rheumatism." Not so, my friend. There's no luck in cutting your fingers if you fool with edge tools. More than half the sickness in the world is preventible, as any doctor will tell you. A sick man is a rascal, some one has said, because he has no business to get sick.

Make your children wash their hands and faces before going to school. When they are recovering from sickness, do not let them go back to school or play with other children until they are entirely well. Remember that your children will in time become valuable helps and bread winners: so take care of them while they are young, so that they may grow up strong and healthy.

Bathe as often as you can. Remember "Cleanliness is next to godliness," and a foul body means a foul mind. Keeping the pores of the skin open is a prime element of health. How carefully we groom our horses! and is not a man's health as precious as that of a horse?

Let your wife and children have as much outdoor exercise as they can get. It will be a change and will not do the least harm. Take them to the park, or the battery, or Coney Island when you can, or at least across the ferry or down the bay.

Do not sit in damp clothes if you come home wet. If you feel chilled and cold, soak your feet in a pail of hot water, then go to bed and pile on the clothes till you sweat, and you will escape catching cold. In such cases hot tea or coffee, or soup is better than whisky to warm you. In cold countries tea is preferred to any drink. Liqueur should never be taken by a sick person, unless by a doctor's orders.

Clothes should fit loosely, should be light, warm, and porous, should be adapted to the season as to colour, should be frequently changed, and should be scrupulously clean. The wearing of clothes until they are threadbare is an error.

In cooking, use the frying-pan as little as possible; greasy food is very unwholesome. Avoid pies, too much pork, and liquors.

Eat slowly, chewing the food well, and drink very little liquid of any kind while eating. Tea is not food, and too much of it is drunk by many persons, especially women and children. You cannot make bone and muscle upon "slops." Eat oatmeal and hominy in preference, and give children plenty of milk. Beans are very nutritious.

Do not shut every cranny and crack to keep out the air from the rooms, but let the windows stay open for a time.

Do not forbid the blessed sun from entering your windows. Do not stay in a house that has a bad smell in it.

Do not live in dark, gloomy, close rooms if you can get sunny, cheery ones. Is it not cheaper to give a little more rent to keep death and the doctor away from your door? Does it not pay to keep well? Think how much you have lost by a few weeks' sick spell. Would not the money have gone much further by avoiding sickness? "An ounce of prevention is worth a pound of cure."

Remove all garbage and refuse as soon as possible, especially bedroom slops. Have the walls and ceiling whitewashed or kalsomined once or twice every year.

Do not keep your rooms full of steam on wash-days; for that is a sure way to have your children down with colds or croup the day after. Open the window at the bottom, and

place a board in the vacant space; then sufficient air can come in through the space between the upper and lower sashes without causing too great a draught. Keep the children out as much as possible on wash-days.

Do not souse water over the floors and stairs, even for the sake of cleanliness, as the wood-work becomes saturated with moisture, and continual damp breeds disease.

In looking for apartments, always strive to secure a well-ventilated bedroom. Air the room and bed-clothing every morning. Keep as few clothes, not in use, as possible in the bedroom, and do not sleep in any garment which is worn by day. Have no carpet on the floor, but a strip alongside the bed. Wipe off the entire floor once a week with a cloth dampened in water containing a little carbolic acid.

**THE GLASGOW MUNICIPAL BUILDINGS COMPETITION.**

**THE REPORT OF THE ASSESSORS.**

The following report by Mr. Barry and Mr. Carrick, the architect-assessors on the plans in the final competition for the new Glasgow Municipal Buildings, was submitted to the meeting of the Town Council held on Thursday last, the 6th inst.:

"To the Lord Provost, Magistrates, and Town Council of the City of Glasgow.

Westminster, 26th June, 1882.

My Lord and Gentlemen,—In accordance with our report to you on the 7th of January last, the authors of the ten designs sent in to the preliminary competition, and selected by us therein, were communicated with (but through agents, so that their names are still unknown to us), and they were asked whether they would be prepared to submit matured designs in accordance with the conditions for final competition approved by you. They all signified their readiness to do so, and ten sets of designs were duly received on the 1st of June. Parliamentary work on behalf of the City of Glasgow rendered it necessary for Mr. Carrick to be in London during the month of June, but in order to be in a position to present our report to you with as little delay as possible we arranged to have the designs sent to London for us at once to examine them. We have accordingly done so, and as the result of a very careful examination, and having made an approximate estimate of the cost to carry out each of the designs, we are now prepared, in accordance with clause 1 of the final condition, informing competitors of our functions as assessors, to place the following four designs in order of merit:—1, Viola; 2, St. Roman; 3, Semplice; 4, Gauntlet. We have not the slightest idea who is the author of the design and the set of drawings which exhibit it, sent under the motto of "Viola," which we have placed first in merit; but it is right to say that this design, in our opinion, shows great artistic excellence, while the working out of all the parts of the proposed building shown by the plan and sections are *prima facie* evidence on the part of its author of great constructive ability, and an excellent understanding of the requirements of such a building as regards arrangement, light and air, good intercommunication, sanitary and ventilating arrangements, and a due regard for economy. We have every reason to believe that this design can be carried out in an effective manner to the extent described in the conditions within the sum of 250,000, therein allotted for the work.—We have the honour to subscribe ourselves your obedient servants.

CHARLES BARRY.  
JOHN CARRICK."

By the courtesy of the editor of the *Glasgow Herald*, we are enabled to state that the Town Council unanimously adopted the design bearing the motto "Viola," the author of which was found to be Mr. William Young, of London. It was remitted to a committee to make arrangements for carrying out the plans.

At a meeting of the Municipal Buildings Committee, held on June 29, "The Lord Provost submitted a letter, dated 15th inst., signed by Mr. Honeyman, president, and Mr. M'Lean, secretary, in name of, and by authority of, the Council of the Glasgow Institute of Architects, suggesting that the several competitors in the preliminary competition should be invited by the Municipal Buildings Committee to return their designs for exhibition, and that all the designs should be publicly exhibited after the final award had been made. After fully considering the letter, the committee were unanimously of opinion that it would not be expedient on the part of the Magistrates and Council to take any steps with a view to the exhibition suggested by the Council of the Institute."

\* One of the Sanitary Tracts issued by the Citizens' Sanitary Society of Brooklyn, U.S.

## A CHAT ABOUT PEACH GROWING.

"How are your peaches this year?" "Oh! bad. You remember the storm on that Saturday, some weeks ago; well, it shrivelled them all up, and very few are left. I am so fond of peaches; it is most annoying." "Why don't you put them under glass?" "Look at the cost. I would, if it was not so dear." "What would it cost you?" "Oh! a lot of money. I am afraid to inquire; more than I can afford, I know." "I don't know so much about that. Let us go and see how J.'s are getting on."

J. is a queer fellow. Never does anything in the ordinary way. He has built a wall without bricks; a roof without a gutter; gearing to open lights without ironwork; trains his trees on wires no bigger than tea-twine, and grows them in boxes about the size of clothes-trunks.

We find a peach-house 100 ft. long, only 5 ft. 6 in. high in front, 7 ft. 6 in. high at the back, and 6 ft. wide. You can reach any part without a ladder or even steps. The house next the Loller is the early house, 40 ft. long, and has No. 4 4-in. pipes. The other house, 60 ft. long, is the late house, and has No. 2 4-in. pipes. In the ground 8 ft., centre to centre, are tanks of concrete slabs, 3 ft. long, 3 ft. wide, and 3 ft. deep. In the bottom of each tank is a hole, and under it, in a vertical position, a common 4-in. drain-pipe, with a brick over the top to keep the rubbish out. In the bottom of the tank is 6 in. of broken bricks, with turf grass downwards; so then all this dodging, you will see, is to keep the bottom sweet, and to prevent water-logging. The tank is filled with red turfy loam, and the trees supplied by Mr. Charles Turner, of Slough, who has always been J.'s friend and adviser under horticultural difficulties. So much for the trees; now for the house.

The sides of the tank stand about 6 in. above the ground, and on this J. has laid his sill, bevelled so that the water cannot be on it; only, instead of being outside, as all well-regulated sills should be, to catch all the rain and rot quickly, it is inside, and the rain never touches it; the bars are outside the sill and run down to the ground or nearly so, and a slate stuck into the ground and bedded on the bar with putty, just as a square of glass would be, makes it all right. At the bottom the upright bars are 3½ in. by 1½ in., rebated and chamfered; the roof-bars are the same size, with struts at intervals to prevent raking. The back bars are the same section, the bars are simply nitrated at the angles like a picture-frame. The eaves-plate and the head at back are inside out of the wet: by this arrangement, no gutters are required, and all the rain-water that falls on the roof runs down over the front glass into the border, so that the trees in front are watered by the rain as if no roof was there; the ventilators are sashes hung to loose rails, and are screwed on wherever required; a wooden rod and a wooden cog open a length of 60 feet with great ease, and an oak filler like the joint of a parallel ruler connects the rod with the ventilator, both for the front and the roof. All is glazed with putty. Jones does not believe that putty has been beaten, and his friend, Mr. C. Turner, quite agrees with him. "The house was built," says Jones, "in 1873." "Did you," we say, "employ a local man, or a regular horticultural builder?" "Oh!" says Jones, "I don't believe in local men for special matters like this." "Who was it, then?" we said. "Guess," said Jones. "Was it L.?" "No." "Was it O.?" "No." "Was it L.?" "If you guess again," said Jones, "you will guess wrong." "What did it cost you?" we asked. "Well," said Jones, "the cost of this was mixed up with some other matters, but the builder was here the other day and I told him I had been asked the cost, and I should like to know what one like it could be erected for. He said, 'the cost of tanks, slate, back wall, front, and roof, the two walls wired for trees, with ventilators in front and roof, 10 ft. apart; early house, 40 ft. long, with No. 4 4-inch pipes, late house, 60 ft. long, with No. 2 4-inch pipes, and saddle boiler, would be 235*l.*, and it is made up by taking the front roof, two ends, and a division, at 102*l.*, a wood lattice path at 13*l.*, wiring front and back at 10*l.*, heating with boiler pipes and valves at 50*l.*, stove-hole at 12*l.*, and twenty-four tanks for trees at 18*l.*; the back wall of slate and bars costs 30*l.*, and if any of the above items were omitted, the cost would be reduced in proportion." "When

was it built?" we asked. "Here comes my gardener," says Jones, "he will tell us all about it."

"The house," says Jones's gardener, "was put up in 1873, and the trees planted the same autumn. I picked a few in 1875; since then they have borne regularly about 1,200 peaches and nectarines in all every year. The early-house I started on the 1st of November; in January it was in flower; set in February, and the fruit, about 200, were ripe in the middle of June. (I send you a sample from this house, to show you what some of them are like.) The late-house I started January 18th. It was in flower in April (and a beautiful sight it was), fruit set in May, and they will be ripe about the middle of July, and generally last through August and into September. At present there are about 1,000 peaches and nectarines on the trees, which may be taken as the average."

"Well, but when you talk about starting in November, it must cost a lot for coke to keep up heat all through the winter? What do you suppose, now, the two houses, with their 1,200 peaches, cost you in firing for the whole year?"

"I have not," said Jones's gardener, "kept those houses separate; but I think if I say 3*l.* it will be about the mark."

"And how much time?" we say.

"About two hours a day for one man, taking all the year round," said Jones's gardener.

I fancy I see you jerking your head, and saying, "I would give something to see this peach-house."

How much will you give? Will you give two hours' time and 5*s.* 6*d.* in money? Because, if you will, it can be done for that, and in this way.

Take the train from either Victoria, Charing-cross, or London Bridge to East Croydon; then ask the cabman to drive you to Middleheath, Sydenham-road North: that is Jones's house. Go in at the garden gate (there are no dogs about), and ask for the gardener; take this paper with you; cross-examine the man as much as you like, and if you find I have over-stated anything, write and say so.

W. H. LASCELLES.

## OBITUARY.

Mr. George Somers Clarke.—We hear with regret of the sudden death of Mr. George Somers Clarke (of Cockspur-street), which took place at his residence, Walpole, Chichester, at one a.m. on the 4th inst. He was with the Architectural Book Society on Saturday and Sunday, and returned on Monday, after a pleasant outing to Longleat, apparently perfectly well. We will endeavour in our next to give some particulars of his career.

Mr. Theophilus Smith, a well-known Sheffield sculptor, died on the 4th ultimo, aged forty-four. Mr. Smith was for many years a partner with his father, Mr. Edwin Smith, of the Monumental Works, Sheffield, but afterwards the connexion was dissolved, and he devoted his whole energies to art. As a youth, he was a successful student at the Sheffield School of Art. Mr. Young Mitchell was head-master then, and Mr. Godfrey Sykes (afterwards of South Kensington) the second master. Many well-known men were co-pupils with him at that time, amongst them Messrs. Innocent and Brown, the architects; Townser and Gamble, of South Kensington; E. P. Turner, the painter on tiles; Harry Homs, the sculptor; Hugh Stannus, the Royal Academy's modelling master; Richard Linn, the Crown Derby Porcelain Works designer; whilst the great Alfred Stevens, who created the Wellington memorial, was a constant visitor at the school, and an adviser of every young inquiring and aspiring mind therein. Mr. Smith published several works, principally upon monuments for the dead and artistic ironwork. His huts were always full of power. He had a large connexion amongst the wealthier class of merchants, who build princely residences outside the manufacturing towns of Yorkshire, and few of those stately halls there are which do not contain some samples of his skill. Endowed with great natural ability, Mr. Smith failed, perhaps, in business enterprise and application, and those who esteemed him most felt most that a very brilliant position might have been easily maintained had he used that determination to conquer weaknesses which seemed to intensify rather than otherwise as years went on. He died at Rotherham, and has left a large family to mourn his loss.

## PATENT RECORD, SO FAR AS RELATES TO BUILDING.\*

## APPLICATIONS FOR LETTERS PATENT.

- 2,986. J. McDougall, Glasgow. Apparatus for regulating the supply of water to water-closets. June 23, 1882.  
2,994. R. Jackson & S. Jackson, Broadbottom. Ash-receiver. June 24, 1882.  
3,000. G. Dawson & C. Butcher, Thorncliffe. Kitchen ranges. June 24, 1882.  
3,009. W. S. Morton, Edinburgh. Domestic fireplaces. June 26, 1882.  
3,028. J. W. Cook, London. Temporary partitions in rooms, &c. June 27, 1882.  
3,049. R. Searle, London. Manufacture of artificial stone. June 28, 1882.

## NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

June 27, 1882.

893. A. Jamieson, Blantyre. Apparatus for mixing concrete. Feb. 24, 1882.  
934. J. Carpenter, Southampton. Apparatus for opening, &c., window-sash frames. Feb. 25, 1882.  
980. T. Le Poidevin, Guernsey. Machinery for moulding bricks and tiles. Feb. 28, 1882.  
2,614. C. E. Green, London. Domestic stoves or fireplaces. June 3, 1882.

June 30, 1882.

966. J. T. B. Bennett, Aston. Spring hinges, &c. Feb. 28, 1882.  
2,549. T. Hyatt, London. Building construction, &c. May 30, 1882.

## ABRIDGMENTS OF SPECIFICATIONS.

Published during the Week ending July 1, 1882.

- 5,027. E. R. Hollands, London. Open stoves for fire-grates.

This is an improvement on Patent No. 4,448 of 1881 in making the front bars of the grate to lift with the rake, and allow the fresh fuel to be put in at the bottom of the fire. (*Pro. Proc.*) Nov. 18, 1881. Price 2*d.*

- 5,095. W. R. Lake, London. Machinery for the manufacture of bricks.

The press has two cams, one for giving the pressure and the other for ejecting the brick from the mould. Both are on the same shaft, and actuate the same plunger. The mould is provided with dusts, by which the surplus material is returned to the charging-chamber. A rotor is combined with the plunger to regulate the charge in the mould. (*Com.*) by W. W. Potts, Bridgeport, U.S.A. Nov. 23, 1881. Price 6*d.*

- 5,111. J. R. Hargreaves, Haslingden. Water fittings, &c.

To supply hot water over a house without circulating pipes, a cold-water pipe is connected with the boiler from a higher level than where the hot water is required. The cold water passing into the boiler will force the hot water out. Nov. 23, 1881. Price 6*d.*

- 5,118. H. J. Haddon, London. Roads and pavements, &c.

These are made by mixing sand, hot tar, and pebbles. The ground is prepared with concrete, &c., and the tar and sand are poured over it. A layer of pebbles is then placed on the tar. (*Com.*) by J. Salvat, Morceux, France. Nov. 23, 1881. Price 2*d.*

- 5,162. F. Loßholdt, Frankfort. Ventilating buildings, &c.

Heating-chambers are formed in the ventilation-shaft, in which are gas-burners to induce a current of air. Cows are placed over the top of the shaft to prevent draught. Nov. 23, 1881. Price 6*d.*

- 5,190. G. Harper, London. Apparatus for securing knobs or handles to spindles.

A bayonet joint arrangement is provided between the knob, and an auxiliary adjusting piece or collar. This collar is first screwed on the spindle, and has two slots, in which corresponding projections on the knob are received, forming a bayonet joint. Nov. 28, 1881. Price 6*d.*

- 5,315. W. Clark, London. Securing window-glass.

India-rubber is used to hold the edges of the glass, which is secured to the frame. (*Com.*) by T. Turner, Osage, U.S.A. Dec. 5, 1881. Price 6*d.*

Warley Mount Estate, Brentwood.—On Friday last, the ceremony of opening the new roads on this estate, which is situated within half an hour by express train from Liverpool-street, was performed by Mrs. Makins, assisted by Col. Makins, M.P., and others. The route was gaily decorated. There was a large gathering of the local clergy and other influential residents of the neighbourhood, and addresses were delivered. The first road was named Waldeck-avenue, by the kind permission of B. Collins, esq., secretary to H.R.H. the Duke of Albany. A dinner to the workmen on the estate, 130 in number, closed the proceedings.

\* Compiled by Hart & Co., Patent Agents, 28, New Bridge-street, E.C.

THE NEW PATENT TURRET CLOCK.

SOME ACCOUNT OF A TURRET CLOCK.

In reviewing the manufactures of Messrs. W. H. Bailey & Co., of the Albion Works, Salford, Manchester, there is one department that takes our special attention, and which they term the "Turret Clock and Recorder Department."

We are informed that Messrs. Bailey are at present engaged in the manufacture of about twenty large turret-clocks, which are being sent to various parts of the world. Two, we understand, are for the Jesuit church, Spanish Town, Manila, one of which indicates the time of day at nearly every chief city in the world; and the other will strike the hours and quarters on large bells, in the usual manner.

The clock we illustrate has been recently patented, and is now being fixed at a large iron-works at Bilbao, Spain, for Senor Don J. Martinez de la Rivas. It will be noticed that the construction of this clock is totally different to the hitherto modern turret-clock. The improvements partly consist of a new arrangement of the various parts, whereby the frame carrying the several shafts is made much narrower than in that which may now be considered as the old design of turret-clock. This arrange-

ment is obtained by fixing the drums upon which are wound the weight-ropes on the ends of the shaft, outside the framing, which, it will be easy to understand, allows of much greater range in the angle at which the ropes may be adjusted, as well as giving greater facility for arrangement and attention, also for winding purposes. It will be noticed that there is also a novel arrangement of the fly or flyer governing the striking mechanism. This is accomplished by means of brass rings surrounding the thin discs, to which the discs are attached at suitable points, for adjustment. The clock strikes the hours, and will indicate the time on four 6 ft. dials. The gravity escapement invented by Sir E. Beckett is here designed in a manner which permits the parts to be very substantial and easy of access for oiling, for adjustment, and for examination. The clock is on strong legs, and is entirely self-contained, the whole showing evident care in the design, and is called unique as a specimen of horological engineering.

We have before us a fully-illustrated catalogue of "Recorders, tell-tales, nocturnographs, tide-gauges, and turret-clocks" which have been designed by this firm from time to time, and which are in use in mines, waterworks,

manufactories, and public works both in this kingdom and abroad.

We notice, for example, that on page 18 of this catalogue there is a description of a patent automatic mine-ventilator recorder, an instrument which records automatically the variations in mine ventilation. This instrument was designed by the makers, at the suggestion of Mr. Jos. Dickinson, F.G.S., H.M. Inspector of Mines, and is now successfully working at various coal-mines in the north of England and in South Wales.

We then find illustrated and described the large recorders used at the Sheffield Waterworks, which indicate the fluctuation of the water in the reservoirs. Similar in their object, we have, on page 14, a description of the Southampton Waterworks deep-well recorder, and the electrical water-level indicator, fixed by Messrs. Bailey, for telegraphing to the Widnes Water-offices the fluctuations of the reservoir, some two miles and a half distant. Such recorders usually require to be designed for their special purposes.

The Lord Chancellor has added the name of Mr. Nicholas Joyce, A.R.I.B.A., of Stafford, to the Commission of the Peace for that borough.

### ARCHITECTURE AT UNIVERSITY COLLEGE.

RESULTS of Examination of Work done in Class of Architecture at University College, London, June, 1882:—

#### MODERN PRACTICE.

*Price.*—A. W. Glasson.  
*Second Prize.*—H. W. R. Martin.  
*Second-class Certificate.*—T. Andrews.  
*Third-class Certificate.*—W. H. A. Barry, C. M. Shiner, J. E. Seari, P. Condy, G. P. K. Young.

#### ART.

*Medal.*—W. C. Jones.  
*Price.*—H. W. R. Martin.  
*Second-class Certificate.*—R. W. Hamilton.  
*Third-class Certificate.*—W. J. King, L. Conder, P. Condy, F. P. Oakley.

#### CONSTRUCTION.

*Medal.*—C. M. Shiner.  
*Second Prize.*—G. R. K. Young.  
*Third Prize.*—W. C. Jones.  
*Fourth Certificate.*—H. C. Simmons.  
*Certificate, 1st Class, with Marks entitling to Prize.*—P. Condy, W. J. King, J. E. Evans.  
*Certificate, 2nd Class.*—H. Woodroffe, H. W. K. Martin.  
*Certificate, 3rd Class.*—H. W. Moxon, B. V. Westbrook, W. J. Gibbon, R. M. Hamilton, W. J. Gargery.

### THE NEW HIPPODROME AT YORK.

The new permanent circus erected for Mr. Henry Swann, of Leeds, within the Fulford road, near the Cattle Market, in the ancient city of York, was opened on the 3rd inst. by Mr. Robert Fossett's equestrian company. It is constructed of brick and wood, with iron pillars and supports. The length is 100 ft.; width, 62 ft.; and diameter of the ring, 42 ft. It has an entrance off the main road, and the interior will accommodate 2,000, viz., pit, 300; gallery, 900; promenade, stalls, boxes, &c., 800. The latter are elegantly fashioned, and covered with crimson velvet, and carpeted. There are twenty-four windows for air and light, though a number of gas jets illuminate the circle. Messrs. Spence are the builders; Messrs. Clark & Wood supply the joiners' work; Mr. Baines the carpentering; and Messrs. J. H. Bean & Co. the ironmongery and cast-iron columns.

### BRIGHTON.

At the Brighton Town Council, on Wednesday afternoon, it was decided that the report of Sir Joseph Bazalgette, C.B., C.E., respecting the making of vertical ventilating shafts should be carried out to the full extent of the Corporation's jurisdiction, and that the Borough Surveyor should expeditiously execute the work and obtain sites as well as the consent of the owners of property for that purpose. The Corporation of Brighton have been encouraged in their proposed prosecution of certain newspapers. The guarantee fund has since St. Peter's Day reached over 6,000*l.*, and still increases, so anxious seem the inhabitants to refute the allegations made as to the sanitary condition of the town. We are much disposed to think they had better leave it alone.

### LARGE SALES OF LAND AND BUILDINGS AT EALING AND HENDON.

On Friday in last week Messrs. Baker & Sons submitted for sale, at the Auction Mart, several lots of land and buildings at Ealing and Hendon. The property first offered consisted of the freehold land known as the Ealing Park Estate, which was divided into ten lots. The auctioneer, in introducing the property, stated that the estate was now most eligibly situated for building upon, and had been laid out accordingly. He added that an increased value had been given to it as a building site by the new railway station immediately adjoining it, in connexion with the Metropolitan and Hounslow Railway, now approaching completion, and which would shortly be opened for traffic. The first lot submitted comprised a plot of building land on the estate, containing an area of about eight acres. There was a very spirited competition for the lot, which was sold for 4,000*l.*, being at the rate of 500*l.* an acre. Three other lots, containing an aggregate of about eighteen acres, realised 8,900*l.*; and another lot, containing nearly seven acres, was sold for 3,600*l.*, the aggregate proceeds of the five lots disposed of amounting to 16,500*l.* The remaining five lots

were not sold. The next property, which was offered in one lot, consisted of the freehold estate known as the Collindale Farm, at Hendon, comprising a farmhouse, homestead, and 136 acres of meadow-land. This property was described as being favourably situated close to several railway stations, and might profitably be converted into a building estate. The bid-dings commenced at 15,000*l.*, and it was eventually sold for 24,000*l.*, representing about 180*l.* an acre. This was followed by the freehold estate, known as Stonyfield's Farm, at Mill-hill, Hendon, being submitted for sale. It consists of 110 acres of meadow land, with farmhouse and homestead. It was sold for 11,500*l.*, the three properties thus realising an aggregate sum of 52,000*l.*

### VALUE OF PROPERTY IN DOCTORS' COMMONS.

LAST week Messrs. Winstanley & Horwood offered for sale, at the Auction Mart, the freehold property in Carter-lane and Adle-hill, Doctors' Commons, comprising, in Carter-lane, a block of buildings, consisting of warehouses, offices, and other business premises, together with the Swan-with-two-Necks tavern adjoining, and also the premises in Adle-hill, from Nos. 24 to 27 inclusive, the whole occupying an area of 9,200 ft. It was stated that the property was let on lease for an unexpired term of eight years, at a rental of 475*l.* per annum. The property is situated immediately opposite the St. Paul's Cathedral School and residence for the choir boys, and the auctioneer, in offering it, observed that on the expiration of the lease, the rental of which was little more than nominal, the property would offer a valuable and very profitable site for a building scheme. The first offer was 12,000*l.*, and the property was ultimately sold for 18,375*l.*

### ALLEGED INSANITARY CONDITION OF LAMBETH PARISH.

MR. C. W. ANDREW, a member of the Lambeth Vestry, has given notice that at the meeting of the Vestry on Thursday next he will move,—

"That, in consequence of the frequent reports of our medical officer and the inspector of nuisances, we, the Vestry of Lambeth, desire to draw the attention of the Metropolitan Board of Works to the unsanitary condition of the great majority of habitable buildings owing to the amount of sewer gas conducted thereto, and to suggest that this unsatisfactory state of things may be remedied by the compulsory adoption of the principle of inserting an intercepting syphon conjointly with the construction of an air-chamber in the house-drain (at a point between the inlet to the main sewer, and before entering or passing under any building), and the continuation of all soil-pipes to the highest point of the roof, such soil-pipes to be left open at the top for thorough ventilation from the air-chamber, or any other means the Board may devise to prevent the admission of sewer-gas."

Mr. Andrew is, if we mistake not, a builder, and the presumption is that he knows what he is talking about when he speaks of "the unsanitary condition of the great majority of habitable buildings" in this large parish, which includes, besides Lambeth, Vauxhall, and Stockwell, the whole of Brixton, and a great part of Norwood. On this presumption he will do well to bring the matter forward.

### "A LABOUR EXCHANGE."

SIR,—In an article which appears in your issue of last week you refer to a statement of M. Molinari in the *Débats* to the effect that the *Labour News* confines itself to the American labour market, and is simply a well-organised medium for the advertisements of Transatlantic steam owners. You will perhaps allow me to state that this is a complete mistake, the *Labour News* having no special American bearing and no connexion whatever with any American steamship agencies. In common with other lines available for emigrants, some of the Transatlantic companies advertise in its columns, but it simply endeavours, within its present narrow limits of space, to give from week to week "work and wages all the world over." The mistake is no doubt M. Molinari's, but having been referred to without correction by the writer of your article, you will, I hope, allow it to be removed by this explanation.

ALSAGER HAY HILL, Editor, *Labour News*.

### NEWPORT TOWNHALL COMPETITION.

SIR,—As information likely to be interesting to your readers, I may now state that this Corporation has awarded the premiums as follows:—

1st, 70*l.*, to E. A. Lansdowne, architect, Newport; motto, "Work and Win."  
2nd, 30*l.*, to T. M. Lockwood, architect, Chester; motto, "Cœruleum."

CONYERS KIRBY, Town Surveyor.

### APPOINTMENT OF LOCAL SURVEYORS

SIR,—As one of the far too many erroneous selections made in the above appointments, I feel it my duty to bring to your notice that of the Borough Surveyor to Crewe, made last week. Out of 139 applicants, five were selected, consisting of one surveyor, three chief assistant surveyors, none of whom had had less than six years' experience of local board or corporation work, in addition to other professional training; the fifth man,—or, rather, the first, as the Corporation of Crewe placed him,—was no less than a draughtsman in the Locomotive Department of the London and North-Western Railway Company's Works at Crewe. In this gentleman's application, and the one vague testimonial given specially to accompany the same, little mention is made of his having had experience in sanitary work.

I ask you, sir, or any of your readers, if it was ever intended that such important posts as borough surveyorships should be entrusted to the hands of men who are not conversant with the daily callings of such an office,—men who have not worked under the Public Health Act, nor laid a mile of main sewer in their lives? When we consider that the lives and property in a district are influenced to a great extent by the management of the surveyor's department, controlling, as it does, the many sanitary arrangements of the district; and when we remember that in many cases not a single member of a Board can boast of knowing the most elementary principles of sanitary science, it is most essential that the surveyor should have a thorough knowledge of sanitary work, so as to advise his Board thereon, and to discharge the various duties appertaining to his office.

If Boards were more careful in the selection of their surveyors, we should not see the wilful waste of money that goes on in many districts.

A SANITARY ENGINEER.

### Books.

*The Constitution-hill Archway and the Duke of Wellington's Statue.* Harrison, 59, Pall-mall, 1882.

THE pamphlet under this title consists, oddly enough, of reprints from our own pages, 1845-7, and 1881-2, showing how opposed to the tastes and wishes of all whose opinion was worth having is the position of the statue of the Duke on Mr. Burton's arch, the object of it being to invite all who are interested in architectural and artistic proprieties cordially and firmly to say, "No." Our anxious desire is that the arch may be left where it is, and that the statue may be taken down and placed on a fitting pedestal in a proper place.

### VARIORUM.

THE third volume of the new edition, revised and greatly augmented, of the "Imperial Dictionary of the English Language," has been published. Originally produced by John Ogilby, LL.D., the new edition is revised and augmented by Charles Annandale, M.A. It is illustrated by above 3,000 engravings printed in the text. The scientific and technological features of the Dictionary are closely allied with its encyclopedic character. While it does not profess to contain all the terms of every art and science,—nor will these ever be found all collected in any dictionary,—yet it contains far more than the reader is likely to meet with in general literature. It will be found especially full in the departments of zoology, botany, geology, anatomy, medicine and surgery, mathematics, physics, chemistry, mineralogy, astronomy, archaeology, architecture, engineering, machinery, manufactures, agriculture, and commerce. To secure accuracy in the definition of scientific terms, and correctness generally in the treatment of scientific subjects, the articles belonging to the various sciences have been carefully revised by men eminent for their scientific attainments. The book is published by Blackie & Son, of the Old Bailey.—From "Cities of the World," for July, we get notes of a walk

through Rotterdam. The whole of the city is intersected by canals, broad, long, and deep, and capable of accommodating vessels of heavy tonnage. These canals divide the city into so many islands, united by drawbridges, swing-bridges, turning-bridges and a few stone bridges. It is curious to walk through Rotterdam and find everywhere these canals, with streets on either side, and trees along the side of almost every street, and, more curious still, to find that you can never get away from the shipping. In the very heart of the city large ships are discharging their cargoes; the masts of ships are seen among the houses, above the trees, beside the churches, and all along the centre of the main thoroughfares. Many of these ships are built expressly for the Rhine and Holland. They are single-masted, broad, stout, and all highly coloured and ornamented. The prevailing style is bright-green for the hull, with red or white stripes, gilded poops, varnished or highly-polished decks and masts, white buckets, hatchets, barrels, and other things are usually painted a bright red, with white or green stripes. The cabins are models of cleanliness and comfort, with brightly-polished windows, snow-white muslin curtains, and pots of flowers. Besides the novelty of finding "a fleet imprisoned in the heart of a city," there are many things to attract attention in the streets of Rotterdam. The houses have pointed façades, are of all shades of brick, from the darkest red to the pinkest pink; whitewashed stone or wood ornaments the façades; the windows and doors are bordered with broad white stripes, the window-sills are generally full of flowers. The windows are provided with little mirrors, by means of which the inmates can see all that takes place up or down the street without being themselves seen. Brass plates and brass knobs in a high state of polish, adorn the doors, by the side of which bird-cages frequently hang. It is a curious fact that nearly all the houses are a little out of the upright, and lean more or less, while sometimes in a street all the houses will lean slightly in one direction.—From "Architecture," in Cassell's "Popular Educator" for July, we transplant a few lines on the Interior of Ancient Houses:—"The information conveyed to us in the works of Vitruvius has received singular illustration and confirmation within a period less than a century, from the excavations at Pompeii, Herculaneum, and Stabia, cities which were overwhelmed by a tremendous eruption of Vesuvius in A.D. 79, and which contained houses built and inhabited by the Romans belonging to the age of Vitruvius. These excavations exhibit curiously paved streets, having the tracks of carriage-wheels marked on them, and houses built of brick and rubble-work put together with mortar, all the materials being of very inferior quality, except the interior coating of plaster, to which they appear to have been chiefly indebted for their durability. This plaster was composed of lime and pounded marble, a substitute for stucco, and by its use a perfectly smooth and polished surface was obtained, nearly as hard as marble. With this kind of stucco the smallest apartments at Pompeii are found to be lined; and this lining is painted with various and brilliant colours, and embellished with subjects either in the centre, or at equal distances like panels. Painted imitations of variegated marbles, forming, perhaps, a species of scagliola, also decorate the walls of their houses. Few blocks of real marble are found, except in monuments and public buildings; though, in imitation of the wealthy Romans, the Pompeians inserted pieces or slabs of this material in their walls, and employed art to give them higher tints than those they possessed by nature. They also discovered a method of veining slabs with gold; and leaves of this metal covering the beams, walls, and even roofs of the houses, were introduced in great profusion. They covered their floors with cement, in which small pieces of marble or coloured stones were regularly embedded in geometrical forms; and in their best rooms they used mosaic (inlaid work) with ornamented margins and a device in the centre. The doors of their houses, being formed of wood, have been reduced to charcoal by the burning lava, and, of course, are found in an incomplete state; they turned on pivots, and were fastened by bolts which hung upon chains. Bedsteads are found, made both of wood and iron; but their beds were made generally of carpets and vests spread upon the ground. The articles of household furniture and convenience found in these remarkable ruins are utensils of every kind in

silver, brass, stone, and earthenware, with vases of every size and adapted to every use; trumpets, bells, griddles, colanders, saucapans (some lined with silver), kettles, ladles, moulds for jelly or pastry, urns for keeping water hot on the principle of the modern tea-urn, horn-lanterns, spits, and, in fact, every article of kitchen or other furniture used by us, except forks; chains, bolts, scourges, dice (some said to be loaded); a complete toilet, with combs, thumbles, rings, paint, pins, earrings, pearls, &c.

Miscellaneous.

**Endorsing Cheques.**—Before the Recorder, last week, Edward Clarke, an architect, Fair-lawn, Beckenham, was indicted for forging a cheque for 46l. 14s. 8d. Mr. Horace Avory prosecuted; and Mr. Edward Clarke, Q.C., and Mr. Parcell defended. Upon the case being called on, Mr. Horace Avory said, with the permission of the Court, he did not propose to offer any evidence in this case. The relation of architect and client existed between the parties, and it was very probable that the defendant might have supposed that he had power to endorse the cheque. Mr. Edward Clarke having addressed the court, the Recorder assented to the withdrawal of the case. [We have commented before now on the habit, on the part of many persons, of endorsing cheques drawn in the name of other persons. The danger and impropriety of the practice is not sufficiently reflected on.]

**Chancel Screen.**—The new church at St. Peter's, Eldad, Plymouth, is to receive a beautiful addition in the shape of a handsome chancel screen. It has been designed by Mr. George H. Fellowes Pyne, F.R.I.B.A., of Adam-street, Adelphi, W.C., the architect of the recently-erected edifice, and son of the present vicar. The drawings show a high screen, stretching across from arcade to arcade, and dividing the chancel from the nave. Of an early character, the lower parts will be altogether of polished English alabaster, with quatrefoil panels of inlay and mosaic. Above, all will be of wrought iron and brass. This grille work is being executed by Messrs. Ellis & Rice, of Gray's Inn-road, London, and is now in an advanced state. The alabaster screens themselves are being carried out by Mr. Harry Hens, of Exeter.

**Yorkshire Art.**—The stained glass contributions to the Bradford Exhibition by Messrs. Powell Bros., of Leeds, contained in two very large frames, are mainly a central apse window, subject, the Crucifixion; flanked by two windows about to be erected in Lympne Church, Kent, subjects respectively, St. Stephen before the Council and his Martyrdom; a large hall or staircase window, the subject illustrated being Arched; beneath which a central heraldic window, flanked by windows containing portrait medallions of the Prince and Princess of Wales, by whom the exhibition was opened, and two extra ecclesiastical windows, devoted one to St. Dominic, and the other to St. Catherine.

**Rouen.**—The decorations of the ceiling of the new Opera House and Theatre, in the ancient town of Rouen, have been executed by M. Louis Glaise, a prosperous young artist. The compartment over the stage represents the apotheosis of Corneille; the next, the car of Venus; and, in order, the figures of Terpsichore, Music, the Seine, and Oceanus; also portraits of popular people appear.

**Builders' Clerks' Benevolent Institution.** At a general meeting, held at the offices, 27, Farringdon-street, on the 27th ult., Mrs. Sarah Ellen Kelly was elected a pensioner on the Relief Fund, and one of her children, viz., Ellen Kelly, was elected for admission to the Orphan Working School in place of Alice Grace Spencer, whose school term expired at Midsummer.

**Messrs. Gardeners' Loan Collection of Ancient Ironwork** will remain on exhibition at 453, Strand, until the evening of Wednesday next, the 12th inst.

TENDERS

SANITARY PAINT COMPANY,

Liverpool: 51, SOUTH JOHN STREET. London: 34, LEADENHALL STREET.

Proprietors, GRIFFITHS, BERDOE, & CO., Manufacturers of

PAINTS OF EVERY DESCRIPTION, FOR ALL PURPOSES.

ENAMEL PAINT.—Ready for use, in all colours, DRIES QUICKLY with a HARD GLAZED SURFACE LIKE PORCELAIN. Two Coats equal two of ordinary Paint and two of Varnish.

VARNISHES of all kinds, in highest perfection, and thoroughly matured. Brilliant, quick, and hard drying.

SILICATE DISTEMPER.—A Water Paint in all colours, forming a most durable, economical, and effective wall-covering and substitute for wall-papers.

PETRYIFYING LIQUID for Curing Damp Walls.—It effectually prevents penetration of rain, and is a cheap and most effective substitute for OIL PAINT. It renders all kinds of Brick, Cement, Stucco, Wood, &c., perfectly Non-Absorbent and Impervious to Damp, and arrests and prevents decay.

GRIFFITHS'S PATENT WHITE, the only Reliable Substitute for White Lead and Oxide of Zinc. Superior to them in covering power, colour, durability, permanence, economy. Applicable for every purpose for which WHITE LEAD is used, quite unaffected by Gases, does not readily MASTER, ground exceedingly fine, and unites freely with other colours without injuring the most delicate tints.

SILICATE and SANITARY PAINTS in all colours, for House, Ship, and general use, internal or external. Non-Poisonous, Brilliant, and Durable. Having much greater covering power than ordinary paints, are far more economical in use. Are equally effective in all climates, being unaffected by extremes of temperature, and they resist the action of Sea-air and Water. The Colours are exceedingly Rich, Pure, and Permanent. In all respects they are unequalled for every purpose to which ordinary Paint is applied, whether upon Wood, Iron, Cement, or any other substance.

### Salamina, or the Ancient Art of Cyprus.\*

IN an article upon Cypriote Antiquities published recently in our columns, we pointed out the prominent part which had been played by Major A. P. di Cesnola, F.S.A., in the recovery of so many typical art-relics from the silent underground chambers of the dead in the numerous cemeteries of the province of Salamina, or the north-easterly part of the island of Cyprus; and mention was made of the forthcoming literary work by the discoverer of these antiquities, to which it is proposed to direct the reader's attention on the present occasion, now that the book is completed. Elegantly produced, and adorned with upwards of 700 illustrations of the principal objects which fell to the fortune of Major di Cesnola to find from 1876 to 1879, there is little doubt that the volume, which is really an advanced contribution to the somewhat unclassified archaeology of Cyprus,—the meeting-ground of so many artistic cults and influences,—will achieve a literary success. Its value, as an exposition of the hypogeal treasures lying yet undisturbed in the cemeteries of successive races, is considerably enhanced by the introduction from the pen of Dr. Birch, a veteran archaeologist, under whose care at the British Museum a number of carved stone relics and other objects, found at Cyprus from time to time, have been placed. According to his own description, the author's way of digging in ruins appears to have been very simple, although he describes it as uncertain and expensive. He sank shafts a few feet apart at spots which bore indications of temples, palaces, or buildings, abandoning them when virgin earth or rock was reached, but tunnelling if encouraged by the appearance of the works. Digging and exploring in tombs in a different manner was arranged by dividing his men into small parties working separately, and visited when the entrance of each successive tomb was reached and made ready for opening under the eye of their employer. The uniform payment of 1s. a day, to which was added an extra payment, agreeably

to a fixed rate, for the objects found, was made to each man, and, according to the price of wages in the East, this must have been a very high remuneration to the native excavators. Major di Cesnola employed among his workmen members of various creeds, and he freely accords to all those whom he employed a very high character for fidelity and trustworthiness. His desire to exhibit the collection on a large and comprehensive scale has not hitherto been successful; but it is not too late to hope that some day an opportunity may be found of at least a more extended inspection and appreciation than they have yet received.

Of the chapters devoted to the history of Salamina, and to the general idea of the antiquities, reference need not be made here, for some account was taken of these two branches of the work in the article already referred to. The golden antiquities recovered from the tombs were exceedingly numerous, principally of a sepulchral or mortuary character, formed in the most artistic way out of thin sheets or foil of precious metal hammered by the workman, who knew well how to make the most of his material, into shapes of much interest, such as fillets or chaplets for the head and brows of the dead (figs. 1, 2), pricked with indented spots and lines imitating the natural veining of leaves,

FIGS. 1 AND 2.

and resembling exactly the fillets carved in stone around the heads of many large and iconic statues; plates or leaves in the form of the human mouth and eye, piously laid upon the features of the departed friend just previously to the deposition of the body in the tomb, frontals or bands for the forehead, earrings, and even finger-rings of the flimsiest substance. Many of these objects, although manifestly intended for but the transient purpose of decorating the dead, are enriched with archaic ornamentation, such as simple foliage, meanders, fret-work, and radiating lines. A similar practice was found at Warka, in Chaldaea, where golden veils with broad ribbons on each side of the head were found by Mr. Loftus, and at Monteroni in Northern Italy, where Mr. Dennis records the discovery of gold laminae with archaic reliefs. The more durable and substantial articles of golden jewelry comprise necklaces of wire or drops, some of which betray by a close inspection of their details or pendants, the marvellously shameless effrontery of the fair wearers who could display about their necks and arms artistic models of the phallus and

other cognate emblems, demonstrating beyond all doubt the depths of sensuality into which some, at least, of the races of Cyprus were sunk. Perhaps these emblems had come in time to be invested with a figurative signification remote from the obvious and primary meaning which one sees in them now. The earrings of solid make are of very various forms and styles; some of them are adorned with coloured glass beads or gems, and others have their catch or fastening looped into the elegantly-

FIG. 6.

chiselled head of an animal (figs. 3, 4, 5, 6). The lion, goat, bull, cock, and dolphin appear to have been favourite subjects for this class of jewelry. One of the largest and finest of them is formed of solid gold wire twisted to form a body of some bulk, and terminating at one extremity in a female head furnished with ample tresses, and having a noble aspect of countenance. On the wire are strung four rings of massy gold,

enriched with granulations in the so-called Etruscan mode, alternating with three beads of dark red and variegated colours (fig. 7). The finger-rings range over the whole period of Cypriote art; they exhibit many touching instances of feeling, for among them are frequently found rings of so small a calibre that they can only have been worn by the young children of the family. On some are tender words and inscriptions in an unknown script, pricked by loving hands as a souvenir of the giver to the wearer; others bear finely-engraved native or imported antique gems in deep intaglio, of Hittite, Phœnician, or Greek art; not a few derive an absorbing interest from the fact that they are formed of Egyptian or Phœnician scarabei, pierced and set as bezels and signets revolving on a gold or silver wire, and bearing on their base the

\* Salamina (Cyprus): the History, Treasures, and Antiquities of Salamina, in the Island of Cyprus. By Alex. Palma di Cesnola, F.S.A. With an introduction by Samuel Birch, esq., D.C.L., &c. London: Trübner & Co. 1892.

mystical and often unintelligible characters of the hieroglyphics of the Nile. Figures of Venus,—a favourite deity of Cyprus, from which she derives one of her most constant epithets,—are not uncommonly found, formed of gold, probably pendants or amulets; and a peculiarly-twisted fibula, like two turns of a corkscrew, with chased ends, and enriched with inscriptions in the Cypriote character, is represented in this collection by several valuable examples.

Silver relics, from the easily-oxidised nature of the metal, are far rarer now than gold, which is practically indestructible, but in their own day they must have been infinitely commoner and cheaper. Yet the collection shows silver fibulae, snake bracelets, hair-pins, earrings, ear-picks, finger-rings, scoops, spoons, a model in the form of two human lips or a mouth, perhaps the bowl of a spoon, and several objects which must be referred to ornamental or decorative purposes. Bronze, on the other hand, being under certain atmospheric conditions of a very durable nature, contributes largely to the metallic series of Salaminian relics. Perhaps a thousand objects were altogether collected by the indefatigable exertions of Major di Cesnola. They consist of mirrors, vases, and other vessels for culinary or toilet purposes, strigils, patera, weapons of every kind, such as daggers and lance-heads, parts of armour for man or horse, pieces of tripods, candelabra; and, in a word, representatives of every ancient use to which bronze has been applied. One of the rarest bronze objects is a very ancient *serrula* (fig. 8), a spoon-saw,

FIG. 8.

capable of containing about half a pint of liquid in its bowl, which is furnished with a tang now bent out of shape; to which an ornamental handle was affixed; one of the long sides of this fearful instrument is concave, and serrated along the edge with fine indentations or teeth. There can be no doubt that it was intended to be employed for cutting the throat or other parts of the animals that so frequently perished at the altars of the numerous deities venerated at Salamis, and, indeed, throughout the island. The spoonlike cavity caught the life-blood of the devoted victim at the very moment of its gushing from the body. This was found in a tomb at Kitium, on the east coast. Some of the bronze patera are ornamented with Egyptian religious or mystical subjects, and of one of these Dr. Birch has supplied the author with a lengthy exposition. A bronze *d'ui*, or needle-case, containing a needle still threaded with a piece of cotton, probably deposited by the hands of the mourner in the tomb of its owner, may be reckoned among the rarer and more striking objects formed of this metal. Iron, from its perishable nature, is not likely to be very copiously represented in good condition in any ancient collection, hence the swords with leaf-shaped blades and short cross-handles, buckles, and other objects which enter into the category of iron antiquities are here, as generally elsewhere, very far advanced in oxidation and elementary disintegration. Enough remains, however, to show that a very extensive employment of this useful metal obtained among the ancient Cypriote inhabitants, whether they be Phœnician, Egyptian, Greek, or Roman.

Lead, also, is not a metal well adapted for long preservation; its condition, after the lapse of centuries, varies very much with the degree of humidity or of acidity possessed by the surroundings to which it has been exposed. It is well known, for example, that the acid air of London acts in a very deteriorating manner upon lead, and the same may be said of lead exposed to humid and saline earths in the subterranean chambers of a Cypriote necropolis. On the other hand, under favourable conditions of dryness of bed, or a still, neutral condition of

air, leaden objects, 2,000 and 3,000 years old, have been examined at Cyprus and many other sites, still exhibiting a pristine freshness of contour and a sharpness of outline of which actual inspection can alone convince the archaeologist. Among the leaden objects which may be referred to as of peculiarly great rarity, are a stamped group of a gladiator or huntsman in combat with a lion, several bullets inscribed in relief with Greek inscriptions, toy-jugs and ornamental boxes, with simple floral or geometrical patterns upon them. Rarest of all, and of the greatest value as affording criteria upon which to suggest a date, are parts of a toy chariot stamped in lead, with the horse, pole, and wheels partially preserved; the wheels are oval or elliptical, not round, as we should expect, and the spokes have a very peculiar form, being composed of a diameter line along the major axis, with two short bars at right angles to it, trisecting this diameter. These spokes are identical with the arrangement of those upon a chariot-wheel painted on the celebrated Panathœnic amphora found by Mr. T. Burzon at Athens, and discovered by Mr. C. T. Newton, of the British Museum,—where it is deposited,—to be, from the archaic lettering upon it, the oldest extant example of that particular style of vase. Its date may thus be referred to between 400 and 500 B.C. Leaden rolls, many of fairly good size, and inscribed with sentences in the Cypriote character, form a peculiarly valuable class of relics, from the fact that they add considerably to the extant series of Cypriote inscriptions, which is still somewhat meagre.

in the preface, not because he did not find any, nor make researches for them, but he was unable to treat them like small objects which

FIG. 9.

numerous, and divide themselves into the styles of the four great racial classes who successively ruled the island; but there are many in which is shown the blending of the art of one nation with that of another of approximate chronological position. For just as Græco-Roman art is so frequently illustrated by the antiquities of Italy, so Cypriote sculpture shows Assyrian, Phœnician, Egyptian, and even Hittite style, influencing, and in turn influenced by, one another.

It is curious to find a trumpet formed of terra-cotta, about 3 ft. long, so compactly baked that, after the lapse of twenty-three centuries, it may be made to give no uncertain sound when in the hand of a dexterous musician, its voice vying with the note produced by a metallic post-horn of the present day. It is curious, also, to observe the carved beads of music-players, having a mouth-strap passing round the bead under the ears, to keep in position a double flute or pipe not unlike those which the Calabrian or Sicilian youth, even now, fashions with a pruning-knife out of the local reed, one being designed for the sharp notes, the other for the droning accompaniment. No doubt, rude music, often then, as now, was performed upon some of these "scrambled pipes of wretched straw"; but if "lean and flashy songs" sometimes grated on the ancient ear, the fine bronze pipe, which Major di Cesnola found, and which Mr. W. Chappell, F.R.S.A., the historian of ancient music, has rightly described here for him as the only one of its kind that has been found throughout the whole range of classical antiquities, could discourse music sweetly enough in the hands of its skilled owner, whom it accompanied to the silent, tangleless grave. Rings of bronze, sliding round the barrel, according to their position shut or opened notes so as to enable the performer to alter the scale at pleasure, a similar arrangement being noticeable upon the ivory flutes found at Pompeii. The gem of the stone objects is undoubtedly the little tripod basin, covered with Cypriote inscriptions radiating from the centre of the bowl, and having a single character engraved on the bottom surface of each of the feet. The carved sarcophagi, and the tomb-stones with Greek inscriptions, as well as the finely-carved tympanum of a Byzantine doorway, with several scenes from the life of Christ in high relief, of great interest, and show the wide range of time which is represented by this portion of the collection. Of alabaster, serpentine, chalcidony, crystal, and other precious stones, the best pieces are described at length; and the chapters devoted to Assyrian and Babylonian cylinders, carved in jasper, hematite, and scintite or soap-stone,—a fertile subject, not altogether satisfactorily worked out as yet by archaeologists,—Greek and Roman engraved gems, cones, sarcophagi of Egyptian and Phœnician art, pieces for inlaying, and so forth, appear to contain material for the deepest study and reflection.

few of any length or historical importance having been found as yet.

Ivory and bone objects appear to have been very extensively employed in Cyprus for ornamental, decorative, and domestic purposes,—seals, rings, bosses, studs, hairpins, spoons, dice, spatulae, boxes, handles of knives, keys, and bridges of lyres and other musical instruments, frequently fall as spoil to the successful excavator: some carved in a coarse and clumsy manner, and thereby evidencing the decadence of the carver's art; others exquisitely carved during the best period of Greek art; and others, again, manifestly dating from an archaic age. An ivory box, carved with an Egyptian religious scene, enclosing a leaden box like a pill-box, and itself protected from injury by two bowls of terra cotta luted together at the rim, so as to form a modern case or envelope, was found in an ancient tomb; and another tomb yielded an archaic figure carved out of bone, a kind of pin-box, about 10 in. in height (fig. 9), form of a draped female. This opens in the centre, and contained a few small pins of ivory or bone. The art here is very simple, and indicates the influence of Egyptian modes on the taste of a Greek artist, who has disposed the long and sover folds of the drapery with great care, and yet retained a natural position for the vestment. The eyelids, eyebrows, and some other parts of the figure show that the art of painting was called in to assist the carver, the colour having been applied to them with a brush. The hair is gathered up in a knot, and there are small wings on the head, which have led to the conjecture that the little figure may have been intended for a representation of Medusa. The arms were attached to the body by small plugs or pins. Altogether, it is a fine example of the art of the toy-carver 2,000 years ago. Shell remains exist in the form of toilet-boxes, and ornamental rings or pendants, cut from bivalves of convenient dimensions, several having Cypriote and Phœnician inscriptions upon them, which sufficiently attest the high antiquity to which they must be assigned. Of stone remains, the author has not acquired a very large collection, and this is, as he tells us

The glass relics are, with the exception of the terra-cottas, by far the most numerous in the collection. Four thousand specimens, many among them being unique in shape, size, or ornamentation, are a very good number to have risen from the dark chambers of ancient burial-places on the plains and on the hill-sides of the island. There can be no doubt that some of these beautifully-painted glass vases were made at Tyre by Phœnician craftsmen, who were for a long period of time in sole possession of the secret of producing and manipulating this then precious and expensive material. Of these, one in form of an amphora, with golden lining to the mouth, and painted with peacocks, foliage, and flocks of birds, has never been surpassed in any collection. But the hand-painted vessels are far outstripped, in point of beauty of colouring, by those which, originally transparent, have acquired, by long exposure to the effects of time, a brilliant colouring at Nature's hands; for she has enriched them with the ever-shifting, quick-glancing hues and gleams of iridescence, and in this respect no human agency has ever reached, or even approached, the secret of imitation. Of the early

kind of glass, tolerably thick in fabric, of a pale or dark blue, with undulating or zigzag lines, white, yellow, blue, or other colours, many vessels for toilet or perhaps medical uses, resembling wine-vessels or water-jugs, were exported by the makers in Tyre and Sidon to Asia Minor, Cyprus, Greece, Etruria, and, in fact, whithersoever trading enterprise and commercial security were current. Their use appears to date from the fourth century B.C. The finest forms are the alabastron, of cigar-shaped body, with broad, flat lip; the amphora, diota, and hydria. None have much interior capacity for liquids. It is strange to see among the illustrations in the book the familiar modern egg-cup, with the shell of an egg still remaining in it, just as it was placed in the tomb, more than twenty centuries ago, as a last offering to the dead. The cup is of thin glass, streaked in colour, and made with double skin, turned over, like some of the cheap German glass ornamental vases which may be seen in our modern toy-shops. Curiously enough, the practice of depositing eggs as offerings in a tomb has been lately very powerfully illustrated by the discovery of a *cylix* or *cothon* (a two-handed cup), of black ware, at Camiros, in Rhodes, containing the remains of a sepulchral offering of no less than five eggs and two astragali, or knuckle-bones. It is now in the British Museum. Painted glass, glass vessels with large oval or circular depressions, others with tears or drops studded all over their outward sides, and delicately thin bowls moulded with Greek inscriptions or classic ornaments abound. One (fig. 10) bears the heads of Gorgons, and the *petta*, or shield, used by and conventionally attributed to the Amazons, combined with annulets and simple floral decorations. It is finely iridescent with a constant change of tints which is impossible to describe, varying as they do incessantly from gold and opal flashes to blue, green, yellow, and purple tints as the light is

FIG. 10.

allowed to fall upon it. The models of heads in solid glass of various colours, taking the forms of tragic or comic characters, or derived from animals, must not be passed by altogether unnoticed. These little pendants, whether toys or ornaments for women's necklaces no one can say now, appear to be made much in the same manner as the glass-workers now-a-days use to construct their brittle toys and nick-nacks, but the deep blues, browns, and solid yellows of the ancient examples may be sought in vain in the colourless transparencies, or the black of the modern work.

Terra-cotta fetilla share the most important place in this collection of "Salamian things" with the glass in point of numbers. The diversity of the objects, and the great range of time represented by them, are truly remarkable.

FIG. 11.

with wheels that will yet revolve, being as well set as when first made, horns or pipes, statuettes and heads of statuettes in various ethnical styles, and showing every kind of treatment, religious, professional, mythological, tragic, heroic, comic, domestic, and grotesque, such as goddesses, among whom Aphrodite and Eros are pre-eminent, priestesses, musicians, warriors, nuns, animals, centaurs, and miscellaneous groups abound. Not a few of these are designed and executed in the purest and most artistic manner. Of one particular class, that of the musicians, the author records a curious and valuable series. Every one of them carries a lyre or small harp (fig. 12), but these instruments differ from each other in greater or

FIG. 12.

lesser degrees. Among them are females whose physiognomy, stature, costume, and head-gear are undoubtedly Greek, with lofty coronets of elaborate patterns. Another class of harpists are clad in tunic and toga, chiton and peplos, but they wear no lofty coronets, their hair being bound with fillets, and in some cases the heads being covered with veils. Another class is remarkable for wearing robes resembling stoles over their togas. A bracelet, of considerable dimensions, is nearly always represented upon the right wrist of these figures. The finely-modelled clay groups are most varied in character,—fishermen, snake-charmers, plump children, and withered hideous hags, cringing beggars, swaggering dandies, pedlars, actors, pedagogues, gladiators, hermaphro-

dites, boys playing at games or going to school, the figures and attitudes which we are accustomed to attribute to Eros, Psyche, Hercules, Æsculapius, Telesphorus, Genius, Ulysses, Selenus, Somnus or Hypnos, Leda toyed with her Swan, Nymphs and Muses, are richly represented in this branch of the collection, and the critical remarks which accompany the description of the objects indicate an extensive archaeological knowledge on the part of the writer.

Earthen vessels also are, as may be readily imagined, very numerous represented, and as to variety, there is hardly a shape or size familiar to the students of ancient pottery which is absent from the collection; while, on the other hand, there are several examples which are unique, and the employment of which can with difficulty be determined. Many of the larger urns and vases have their archaeological value greatly enhanced by the fact that they carry inscriptions, either scratched or painted, upon their surfaces, in Phœnician, Cypriot, and Greek characters; and from the lamps, which are, of course, of a later period, a large list of potters' names could be compiled. Of the archaic vases, the finer specimens indicate all the peculiarities which were pointed out not long since in our notice of the Vase Room in the British Museum. Two, however, of archaic red ware, Phœnician in feeling, are unique in exhibiting figures of men, birds, and trees, painted in black pigments upon them, in addition to their usual enrichments of concentric hands and disks or annulets. The tree on one of them (fig. 13) is of the sacred or *hom* kind,

FIG. 13.

being the emblematic palm or date which is found to be of significant use over many Asiatic regions, and occurs on Assyrian relics, royal Chaldean breastplates, in Egypt, India, and even China. According to the author, a reminiscence of the *hom* is often seen to this day in the patterns of Turkey carpets, and the Greek *anthemion*, or honeysuckle ornament, has been referred to by some as a variety of this symbol divested of its significance, but retained as a merely ornamental device of harmonious lines. The other vase shows rude figures of men walking, carrying faggots of wood to a funeral pyre. These figures give extraordinary importance and value to the vase on which they appear, for among thousands of vessels that have been found in Cyprus of the same class, no other is known to bear the representation of a man, a bird, or a tree. Passing over the almost endless variety of terra-cotta relics of the island's own or of imported art,—all belonging to the earliest, or, at latest, to the first transitional period,—reference may be made to the *tefines* or sprinklers, in form of animals, which are very numerous, and believed by many writers to have taken the place of the infant's feeding-bottle, of modern times; others, however, believe they see in these objects lamp-feeders and perfume sprinklers. We may refer also to the many curious lantern-like objects with cylindrical bodies pierced with large holes and furnished with a doorway, which may be lamp-holders, or of use for keeping a small charcoal portable fire for warming the hands in winter. Allied to the *tefines* is a curious hydrostatic jug (fig. 14), having the usual orifice of the mouth closed, and finished off in form of a female's head with flowing plaits of hair. A tube is carried up from the

base, the vase requiring to be inverted when it was to be filled. A small spout is placed

FIG. 14.

in the centre of the body, capable of dispensing a few drops of liquid perfume at will. The ornamentation, glaze, colour, and shape of this vessel clearly indicate a very high antiquity. The bizarre form of the *aryballi* and *unguentaria*, the numerous lamps, and the early gold, electrum, and silver coins of Abnaal, Baalmekel, Evelthon, and other kings, are described by the author in a manner which shows that he has deeply prosecuted his researches into the history of the things he has dug up with an incredible labour and fatigue. With this book, and those of one or two other writers on Cypriote antiquities, for a time, at least, we may be content to take it that the illustration of the ancient arts of Cyprus is exhausted, for it will be probably long before any very systematic or extensive excavations are prosecuted in that island, and, even when they are found, it by no means follows that relics will be so carefully classified or so judiciously illustrated by their finders, as the Lawrence-Casola collection has been by the fortunate discoverer of so much that is so instructive and entertaining to the comparative archaeologist.

#### POLYCHROMATIC DECORATION IN THE MEDIEVAL STYLE.

The work on this subject produced by Messrs. W. & G. Audsley\* is a good one of its class; but it seems to us to have come out rather behind its time. There is now no longer any question made either as to the fact of an at least extensive application of colour to the interiors of Mediaeval buildings, or as to the propriety of carrying out the same method of decoration, when circumstances admit of it, in no less buildings of the same type; the work has, in fact, to a great extent been done, and not a few churches have been decorated (and occasionally over-decorated) with very much the same style of colour and detail as that shown in the illustrations to the present work. Indeed, it may be questioned whether the taste shown in these illustrations, though very good in itself and from the author's point of view, will not be regarded by others of the decorative designers of the day as somewhat *passé*, having been superseded by the newly-developed taste for neo-Greek forms. Had the book appeared at the time when the coloured decoration of Gothic churches was a prominent subject of interest and of controversy, it would have passed muster as a very good contribution to the literature of the subject. It is not the worse in itself for not having appeared sooner; but now it is rather like offering people a lesson in what they already know.

The tone of the authors, however, is more reasonable and less uncompromising than it probably would have been if the book had been published, say, twenty years ago. For, at that time, when the fight about colour was in pro-

gress, those who stood up for colour-decoration were colour-mad, and would have sacrificed every architectural detail, in the way of carved or moulding, to the chromatic powers. Imaginary restorations of churches were made, which were described as "a mass of colour," a "blaze of colour," and in other such somewhat exaggerated language; and, unfortunately, actual schemes of coloured decoration were carried out, which were of the most violent nature, and nearly ruined the effect of some of the Mediaeval buildings to which they were applied. And, even in better examples, we have questioned whether the painting of mouldings, for instance, with strongly-marked colours, is not a weakening of their architectural effect from interfering with the contrast and gradation of light and shadow. It is quite certain that both effects,—those of colour and modelling,—cannot be combined in their highest degree; one must give way to the other. If we wish to preserve the effect of light and shadow on a modelled surface, we must content ourselves either with faint tones of colouring (which, however, can never be really effective from a colourist's point of view), or we must confine the application of colour to the fillets and such other flat portions of the mouldings, leaving the rounds and hollows to make their own effect of light and shadow. This way of applying colour as a part of architectural decoration, by only partly covering the actual surface of the wall, leaving it to be seen as the ground on which the colour design is elaborated, seems the most satisfactory way of combining the beauties both of coloured and of modelled architectural detail, and was the method, as we know, practised to a considerable extent by the Greeks. Messrs. Audsley do not seem to wish at all to put colour above architectural detail; on the contrary, they observe that a system of coloured decoration should be subordinate to the architectural lines of the building. They also remark upon the necessity of a flat treatment, and the avoidance of any shading producing the appearance of relief; but such cautions are now mere truisms, accepted by every one who has any sort of claim to meddle with decorative painting. It is, however, not so superfluous to observe that when a building is to be decorated extensively with colour, it should be designed with that view from the first, and would in some respects require very different treatment of detail from that in the case of a building in which colour was not to be applied. It is, we fear, still correct to say, as the authors do, that "this fact is too often overlooked"; which is not only injurious to the completed effect of the building, but unfair to the colourist who is to be subsequently called in to decorate it, and who possibly finds the details of the architecture and the arrangements of lighting and wall space very much at variance with his wishes. The mouldings in such a case should be profiled from the first with an eye to their effect when treated in colour, and the wall spaces arranged with the same view, and on the basis of a distinct general idea as to what the final effect is to be.

The accounts given of the processes of oil and tempera painting on walls, and the practical difficulties to be guarded against, appear to be taken from reliable sources; the most important portions of them are quotations, accompanied by references to further sources of information. The remarks upon the preparing of designs and transferring them to the walls of the building will be practically useful to those who want information on the subject; they are, however, mostly what would present themselves to any one who brought practical common sense and knowledge of geometrical drawing to the work.

The coloured plates form by far the most important portion of the book, and the best-executed. The authors give, in the first instance, a scale of colours most desirable and useful for Gothic decorative work; these are toned colours, avoiding all the so-called primaries, and not presenting even any strong or pure secondaries. The authors do not seem to contemplate banishing the strong colours altogether, but observe that in work in the Gothic style they should be used only in very small quantities, to heighten some point in the design. This dictum, however, does not apply any more to Mediaeval than to other styles of work. The employment of primaries in small quantities only and to heighten the effect of brilliancy without introducing a mass of powerful colour, is as much a characteristic of Saracenic and Arabic design as of Gothic, but the subordinate colours in those styles are more brilliant than the subordinate colours in Gothic decoration. In spite of what is in this book said about Mediaeval colouring, the fact is that the Mediaeval artists occasionally showed the most crude use of strong colours in great masses,—rather in later than in early work, some of which have been restored, with questionable wisdom, in our own time. They are, however, as a general rule harmonious, and so are the colours and tones selected by the authors for their chromolithographic illustrations.

The designs are intended to present samples of various types of coloured ornament of the Mediaeval school; some of them are original, others are from examples from illuminated MSS. and other sources. The first three or four plates are wall diapers based on the brick pattern idea, showing the division of the walls into oblong parallelograms suggesting masonry, and each filled in with some ornament which can be repeatedly stencilled. Some of the filling-in ornaments are a little too sinuous and naturalistic in tendency for their position. A wall-diaper based on those very square and precise forms rather requires all its details treated with a certain squareness and angularity, to be in keeping with the idea suggested by its main divisions. Diapers of more elaborate character follow, geometrical ones based on the lozenge or trellis form, and flowing designs based on geometrical repetition, but in which the geometric base is rather evaded than expressed. Some of these, though recalling forms that are familiar to us in Gothic work, are sufficiently original and very effective and well designed. The band ornaments on Plate XVII. are exceedingly graceful; and it may be observed that, though appearing quite in their place in a book of Gothic design, they have, nevertheless, a very close resemblance to Greek forms. The treatment of conventional architecture in flat colouring shown on Plates XXIV. to XXVII. is ingenious and effective; especially the manner in which the Gothic capital and crocket are translated into forms suitable to flat colouring. We do not too much recommend this kind of quasi-architectural painting as decoration; but if it is done, the drawings here given show very effectively the right principle and practice to be followed in doing it. The specimens of Mediaeval alphabets given in the closing plates, partly original and partly worked out by the authors from Mediaeval types, are very good, and are practically useful for a draughtsman to have by him. The publication generally would have figured as an admirable one at the time of the Gothic revival. The question is, as we have already hinted, whether it is not out of date now, and whether the present change in taste is not disposing the rising generation of architects to the study of other types of ornament. There may, however, still be a sufficient number of the younger generation clinging to the Gothic creed, and to such Messrs. Audsley's book may be recommended as useful for reference, or, as we sometimes hear it more frankly put, "good to crib from."

The style of ornament illustrated in it is unquestionably a better and purer style than such which is practised by the neo-Renaissance designers of to-day; but it must be admitted that its capabilities have been a good deal drawn upon, and the industrious authors of the book before us do not present any new departure. If they had, we should have attached more importance to the publication, and have considered it more at length. But it only represents what has been done before, sometimes as well, sometimes not so well.

#### COMPOSITIONS AND DRAWINGS OF VIOLLET-LE-DUC.

It is satisfactory to see that the memory of so remarkable an architectural artist as Viollet-le-Duc is not without honour in his own country, in spite of his quarrels with and ralleries against the official art-teaching of French schools. A collection of his drawings is being published under the sanction of a committee formed to secure proper credit and recognition for his labours, the first three numbers of which are now before us.\* They are in process of publication in folio wrappers, in that curiously irregular method which seems natural to French publications, one of the wrappers containing the *première livraison*, the next containing the second

\* Polychromatic Decoration, as applied to Buildings in the Mediaeval Style. Thirty-six plates in colour and gold. By W. and G. Audsley, Fellows of the Royal Institute of British Architects. London: Henry Sotheran & Co. 1882.

\* Compositions et Dessins de Viollet-le-Duc, publiées sous le Patronage du Comité d'Étude du Maître. Paris: Morel & Co. In course of publication.

and third; two wrappers containing a heterogeneous mixture of subjects, the perspective view of a design in one number, the details in another, and so on. The whole, when issued, will at this rate be a kind of chaos of drawings of all sorts, which the purchaser or subscriber may then, of course, sort for himself. But it certainly is odd that people who are so much slaves to logical method in essays and reviews and such productions should show such a contempt for method in their way of publishing art illustrations.

However, we must take things as we find them, and pick what we can out of the miscellaneous collection of Viollet-le-Duc's drawings vouchsafed to us; though there is no opportunity in the drawings we have so far for criticising or classifying Viollet-le-Duc's methods of working or the qualities of his design, which latter seem to vary very much. There has been a scepticism among a good many English architects as to whether the eminent Frenchman's designs were equal to his criticisms and theories and to his drawing. There is some little ground afforded for this scepticism in the contents of the portfolios before us. We see in all the specimens (the larger proportion of which are facsimiles) splendid drawing, the display of a power in using the pencil and brush which seemed to have been in itself, as it well might be, a source of pride and enjoyment to its possessor; and a remarkable readiness, freedom, and flow of ideas in regard to design: nothing done is commonplace, all the drawings show fertile invention and a certain power of style which cannot be denied or depreciated. But there is also discernible a want of refinement in details, and at times a failure to realise the essential features and feeling of the style adopted; for, in spite of Viollet-le-Duc's strictures, in various parts of his writings, against archaeological architecture, it cannot be denied that the greater part of his own designs are archaeological in their nature, and in many cases such departures from the precedent of Gothic style as he makes are hardly in the direction of improvements. In fact, the effect of his designs on paper is owing in some degree to the remarkable power and freedom of drawing which they display, and we should be prepared to find that some of them would hardly look so successful in execution as in representation. The first one we open on is a design for a gilt bronze lectern, drawn with the greatest spirit in a difficult perspective position. On a large spreading hemispherical boss below the stem of the lectern are worked the signs of the four evangelists in relief, each in the centre of a quatrefoil, and around the lower rim of this project heads, which we may presume to be those of the apostles. This is carried on a tripod forming the base of the whole, which tripod is not a very fortunate detail, and as a foot or supporter looks decidedly weak. The upper portion, already described, is both spirited and suitable. The stone carved balustrade of the chapel at Pierrefonds is a piece of pure Mediævalism, interesting not so much for the design, as because it is a facsimile of a working drawing. In the production of working sketches Viollet-le-Duc was wonderful. He used the brush largely, in some cases entirely, drawing the object straight off with it without any pencilling, shading it rapidly so as to convey the full idea as to how the object should look, and leaving the lights as he proceeded so as to produce the most charmingly free and effective representation. A figure of St. Michael, forming the apex of the spire of the chateau, is another capital specimen of a sketch for sculpture; this is for *reproduced* work in lead, and shows what a capacity Viollet-le-Duc had for sketching the figure, giving to the whole balance and pose an appropriate action, though the detail may be open to question; in this case, for instance, the bands of the figure are certainly too small. An engraving of his design for the choir-gates at Notre Dame, wrought-iron work, is very free in the flowing scrolls of the main design, which, though conventional in detail, twine about with almost the freedom of natural vegetation; but the springing of all the foliage from a kind of bunch or sheaf of stems in the lower angles of the gates is certainly awkward, and looks like a makeshift. This and other points we come across suggest the idea that the author of these designs did too much, and worked sometimes too fast, and without giving himself time to refine his details. The first number closes with the design for the west front of the Cathedral of Clermont-Ferrand. This is a very aspiring

design in the thirteenth-century Gothic style, with two lofty towers, and very tall slated or leaden spires on them, and an immense rose-window as the principal feature in the centre portion; but, considering this as the work of the leading French architect of his day, it certainly indicates that the spirit of Mediæval architecture has not been caught and reproduced in France as it has been by some of our own leading architects. From the point of view of English criticism, this would be considered a thin and wiry piece of Gothic, very deficient in breadth and power and in the true spirit of Gothic; the main entrance especially is very feebly treated,—the more remarkable in a country where there are so many grand Mediæval portal designs.

The second portfolio contains several more metal designs, shown chiefly in facsimiles of working drawings. One of these, a detail drawing for parts of a bronze font in Notre Dame, is a capital specimen of Viollet-le-Duc's Indian ink brush studies of detail, remarkably free in execution, and very effective in design, though in this, and others in which natural forms are introduced, the author was somewhat too naturalistic, and at all events too indifferent to truth of curve in his artificial branches and foliage. He draws one portion with considerable purity of conventional curve, and then he lets an odd stem butt out at no curve at all, but as if it were a natural sprout. This would have horrified such a designer as Owen Jones, for example; and not without reason. If there is one thing primarily necessary in ornamental design it is that the leading lines and curves in it should be harmonious and thoughtfully considered from the beginning; and this, Viollet-le-Duc, in his desire for freedom, seems sometimes to have quite overlooked. In the details of an ambon at Notre Dame, there is a charming bit of brush detail for wood carving, in which freedom is combined with true line and excellent conventional treatment of foliage. The grille before the choir, in the Cathedral of Clermont-Ferrand, is an example of very pretty wrought-iron design in perfect taste, and entirely free from naturalism; so also is that from the Church of St. Denis, which is much bolder in style, and ought to be an exceedingly effective piece of work.

The perspective view of a "project" for an Academy of Music is so far nearly the only piece of Classic work in the selections, and the only Classic design on at all a large scale by Viollet-le-Duc that we remember to have seen. It is Classic, it is true, "with a difference;" it is Classic treated in a manner of Viollet-le-Duc's own, but it rather disposes us to wish that he had turned his thoughts more to this school of architectural design. This is certainly a much more effective piece of architecture, in regard to detail, than the west front of the Gothic church named above. It is impossible to describe or define the peculiarities of detail without the drawing to refer the reader to. The general effect is that of Classic designed by an architect who is accustomed to group piers and shafts, &c., on a Gothic and not on a Classic principle. Two of the most interesting and valuable items in the collection are specimens of Viollet-le-Duc's beautifully neat, and at the same time effective and picturesque, pen-sketching. One of these is a view of Florence from San Miniato, reduced one-half in size, with an immense amount of detail of the distant city in it; the other, a drawing of the front of the quaint, heavy, Romanesque church at Surgères, a beautiful piece of architectural drawing with the free hand, in thin, clear lines, with sufficient touching to give a little effect to it without spoiling its architectural sharpness and accuracy. We commend this drawing to the attention of some of the gentlemen who pride themselves so much on their proficiency in the "scratchy" style of architectural sketching. Altogether this is a most interesting and suggestive collection of drawings, full of hints, and we hope there are a good many more "parts" to follow, and that buyers of them will be found in England.

**Stoke Newington.**—An estate, comprising rather more than four acres, has been let by tender by Mr. Banister Fletcher, to Messrs. Smith & Goodman, and the Court of Chancery having approved the terms, the roads are being made and the houses built. This will add about 120 houses to the great number now being erected around London.

#### GOUTHIERE, THE CHASER AND GILDER.

We not long since had occasion in these columns to tell our readers something of the life and labours of "Boullée," the ingenious and talented cabinet-maker of Louis XIV.'s court, and whose works, though the world has been recently somewhat astonished to learn were of such excessive costliness, have never, within the last two centuries, failed to command a high commercial value among art-lovers. The same may be said of an artist of more recent times, perhaps even less known to the public at large, but who holds with collectors a position of scarcely less importance for the extremely choice and refined character of his productions,—Gouthière, the bronze-chaser of the end of the last century, some of whose creations in the Hamilton Palace sale have realised sums which, if they appear to the public capriciously exorbitant, scarcely exceed the amounts originally bestowed upon the artist by his wealthy patrons. Thousands of pounds of pieces of furniture, enriched with elaborately-chased bronze-gilt ornaments appear facts to be accounted for only by the familiar caprice of the collector. Such, however, is not entirely the case. There exist, to show us in the present day how work was paid for in the past, the original accounts, by which we see how the skillful artist was remunerated. Gouthière, of whom little personally is known, was largely employed in the extravagant reign of Louis XVI. by a nobility whose magnificence may be said to have often been more noticeable than their taste. Year by year he filled the sumptuous mansions of his patrons with his wonderful work. His powers, indeed, cannot be said to have been overlooked by his contemporaries, and among his warmest admirers was the royal favourite, Madame du Barry, from whom, somewhere about 1771, we have evidence that Gouthière received for work executed by him no less than 36,000 francs. The same year the artist assumed the title of "chaser and gilder to the king." The Du Barry's patronage of the young workman we still see continued in decorating her house at Versailles, and the still more wonderful *parillon* which the frail favourite was setting up at Louveciennes, or Luciennes, as it is termed, at a cost which, even for the extravagance of the close of the last century, astounded the public.

Some slight idea may be formed of the sumptuous taste of this lady (who, like most of the royal favourites in France,—like Diane de Poitiers and the Pompadour,—was a passionate lover of art), when we gather from her bank account a few of the items of her expenditure: For goldsmith work and jewelry, 2,280,763 *livres* (francs); for furniture, pictures, and vases, 115,918 francs; for painters, carvers, gilders, &c., 370,108 francs; the bill of Cagny, the carver and gilder, alone is 90,955 francs; and the gilding of one bed is set down at 5,945 francs. The total comes to hard on 6,500,000 francs.\* The Du Barry,—of whom a cynical contemporary remarked that she spent more than the mistresses of ten kings united,—cost the nation, it has been calculated, considerably over 10,000,000 or 11,000,000 francs. When, in 1791, her diamonds were stolen,—it can be imagined what a talk there was at the time,—they were valued at more than a million and a half; the *commode* in which they had been kept,—a gem in itself, delicately ornamented with inlaid Sèvres porcelain,—was alone worth 80,000 francs. Sums such as these given by the Faubourg Saint Germain were not uncommon in the days that preceded the Revolution, when the Faubourg Saint Antoine was starving. The king is known to have paid the queen's cabinet-maker, Ronzeon, of Neuvicq, no less than 80,000 *livres* for a manometry and bronze-decorated secretaire, to be placed in his study. When it is remembered how far more valuable money was in those days, say about four times its present purchasing power, perhaps the sums given of late, and which have been pronounced so exorbitant, may appear more reasonable.

Gouthière as an artist is as much the creation of this period of luxurions and refined expenditure as was the Du Barry herself, who in her *parillon* at Luciennes found more than ample work for the king's chaser and gilder. In the memorandum of the architect Le Doux the entries against Gouthière's name for work

\* Baron Davillier, "Le Cabinet du Duc d'Aumont," &c. Paris. 1870. 8vo.

executed by him were constant, and some picture can be formed of the bower of the Du Barry by the items mentioned, when we find Gouthière's expenses for the bronze chasings used in the pavilion amounting to 81,730 livres (the oval salon is set down at 31,272 livres, the *salon carré* at 19,706 livres).

As those in any way familiar with Gouthière's work know, it is not as a designer in the great style that he excelled; it is essentially to the details that he devoted his talent; minute medallions, and delicately-chased wreaths of flowers adorning cabinets and other pieces of furniture, the details of chimney-pieces, cornices, door-handles, &c. The fame of Madame Du Barry's pavilion decorated in such style as this can be understood. "It would be impossible to see," remarks a Paris guide-book of the beginning of this century, speaking of the departed glories of Luciennes, "anything more precious or more finished than this bronze work of Gouthière's."

Though not long after commencing this marvel Madame du Barry lost her royal lover, she was not, it would appear, prevented from continuing the decoration, as we should call it, of her home at Luciennes, which Madame Vigée-Lebrun, the witty lady painter of the last century, has spoken of with such admiration, having visited the hostess. "Every day," we quote from the English translation which appeared not long since of the lady's charming "Souvenirs,"—"we took our coffee after dinner in the Pavilion, so renowned for the taste and richness of the ornamentation. The first time I saw it Madame du Barry said, 'It was in this saloon that Louis XV. did me the honour to dine; above it there was a tribune for the musicians and singers who played and sang during the repast.' It was a delightful saloon, the view was splendid, and the chimney-pieces and doors were of the most elaborate workmanship; the locks were masterpieces in their way, and the furniture was of a richness and elegance beyond description." In spite of the growing seriousness of political affairs, up to within almost a few months of her execution Madame du Barry appears to have continued to employ Gouthière in the extravagant decoration of her pavilion at Luciennes. A short time after the death of the poor lady, in accordance with the custom in such cases, the authorities inventoried all her confiscated property; some few objects escaped, among them may be mentioned the familiar picture of the "Cruche cassée," by Greuze, now in the Louvre Museum; the rest were either destroyed or stolen. During many years, it would seem, Gouthière had not received any remuneration for his work, and we accordingly find him after the sale putting in a claim for the sum due to him, amounting in all to the modest figure of 756,000 livres (!). In vain he represented the years of labour he had expended on Madame du Barry's home, and the extreme costliness of the work he had executed for her; the chasing of one pedestal and some accessories he valued at 50,000 francs, the mounting at 46,000 francs, the gilding at 63,000 francs; three other pedestals he set down at 420,000 francs. Though the poor artist consented to reduce his claim to 640,000 francs he received not the slightest remuneration. Many years after, in 1836, Gouthière's son revived the claim against the heirs of the Du Barry, and after considerable litigation received but 32,000 francs.

Like his patron, the worthy old chaser may be said to have been ruined by the Revolution. A few years after his failure to receive any answer to his claim against the Du Barry estate, he made a fresh appeal, but again without success, and in 1806 we find the old artist, the favourite of princes and the aristocracy, dying in positive want, in the workhouse. In the ruin and dispersion of his patron's property, the delicate marvels of design and manipulative skill with which he had enriched their homes were, like so many other artistic treasures, scattered to the four corners of the earth. Scarcely less terrible than the destruction of life during the wild early days of the Revolution were the wanton and wholesale dispersion and annihilation of the property of the aristocracy. In such times, when dear life was in peril, it can be understood that little but their jewelry could be carried away by the *émigrés*, who fled from their country to England, to Italy, and to Germany. What remained behind in their stately town mansions and old country châteaux was confiscated by the revolutionary Government, in many cases totally destroyed or disposed of, to swell the public funds. When

the palace of the Tuileries was sacked, on the night of August 10th, the furniture was thrown out of the windows by the infuriated mob, and at Versailles nearly every piece of movable property was sold to the dealers. A Government commission inventoried all the objects of value and arranged for their sale. Interesting indeed must have been these auctions, when the property of "le nommé Louis Stanislas Capet" (as the king was tersely styled by the authorities) came to the hammer, or a few days later the contents of the wonderful house of "La femme Du Barry," or "La femme Victoire Capet," &c., as the various members of the royal family were termed.

The inventories of the period, the sanguinary 1793, make constant mention\* of such and such articles "to be destroyed," "to be burnt 158 feudal pictures,—*tableaux de féodalité*,"—meriting neither description nor estimation." Sale after sale took place, pictures, tapestries, furniture, bronze, marble, and china literally choked,—we have evidence to show,—the shops of the pettiest dealers in Paris. In the midst of such political excitement as then reigned, it can be understood that few of these treasures remained in France. The emissaries of our country and of Russia were especially active, and carried off almost everything of value. It is easy to see how many of the homes of our wealthy nobility were enriched with the spoils of unhappy France. Hamilton Palace owed some of its choicest treasures to the French Revolution. Among these, the works of Gouthière have always held, in the gatherings of the Duke of Hamilton, a high place, not alone because more than one of the pieces of furniture which the bronze gilt chasings, by Gouthière, so delicately adorn, once belonged to the unfortunate Marie Antoinette, but because they are known to be positively unique creations of an art which is perfect in its kind. Gouthière may be regarded as (he at least so called himself) the inventor of mat gilding, *dorure au mat*, and the story goes that one day Marie Antoinette mistook for a work in gold, a rose of chased bronze gilt, presented to her by Gouthière. The delicate and refined richness of his designs,—for though he sometimes followed the designs of others, he was an artist himself,—may be said to have no equal, and when he united his skill with that of the Chinese in their choice old lacquer-work, it can be understood how beautiful is the result of the contrast of the richly-chased bronze and the black lacquer, and how highly the work is appreciated. His touch is one that once seen can scarcely be mistaken, and though he had not a few imitators, he may fairly be said never to have had a successor. German and Auguste, as bronze chasers, are known among many other contemporaries. Mertineourt, Gouthière's master, is another bronze chaser of the reign of Louis Seize; and Philippe Caffieri, who, though he may be said to belong rather to Louis XV., died when the marked style of that reign had been succeeded by the more classic simplicity that is usually associated with the succeeding period,—a simplicity which, it may be remarked, commenced to assert its reaction against the *rococo* under the double action of the refined Mme. de Pompadour and the discovery of Pompeii and Herculaneum, ten or fifteen years previously to the accession of Louis XVI. There was, however, as may be imagined, a large body of bronze and metal chasers in Paris actively employed in the last century,—decorators of the furniture, mounters of the porphyry and agate vases, the jasper and granite tables with which the French delighted to decorate their apartments. The traditions of the art were continued when the disturbances of the Revolution were over; and the gilt bronzes of the "Empire," meagre as may be their artistic merit, will be found to retain all the honesty and solidity of workmanship which distinguished the older chasers and gilders who, not content with gilding their bronze work, almost invariably overgilt their gilding, *dorure* and *sur-dorure* being an item often noticed in their account.

Gouthière, like Bonlle, like our own Chippendale, and like so many other artistic workmen, merit a higher place in the esteem of the public than they at present occupy. They are the true little masters of art, with whose skill it is the duty of our museums and our art-publications to make us all acquainted. There is a want of such sturdy workmen in the present

day; the traditions in which they acquired their skill, and which they handed down to their successors, have been allowed to decline, and without an emulating acquaintance with their struggles and their creations, we can all hope to rival their industrious and modest careers.

#### SEVENTEENTH-CENTURY IRONWORK.

In connexion with a visit paid by the Architectural Association to the collection of ancient works in wrought iron brought together by Messrs. Gardner, of West Strand, a paper on "The Art of the Blacksmith" was read by Mr. G. H. Birch. We print the latter portion of it:—

During the fifteenth and sixteenth centuries the prominence hitherto given to the hinge sensibly declined. Partly from the reason that it had become the fashion to make more of the wood-work, and to enrich it with carving or moulding, the hinge now played a very secondary part, and in some cases it was simply a band of metal passing behind the perpendicular mouldings of the door, and terminating in a  *fleur-de-lis*, but the door was also thickly studded with nail-heads. In the screen work and grilles of this period of the fifteenth century a like decadence was manifest. The tombs of the great still required grilles to protect them, but the designs of these were generally stiff and poor. The screen of Henry V.'s chantry at Westminster is typical of this, and its very proximity to the grille of Queen Eleanor's tomb makes the decadence the more apparent. But while the hinge and grille decreased in beauty, more attention was paid to locks, fastenings, and door-handles, many of these being very beautiful. There is a very excellent example of a lock at Ely Cathedral, and at Beddington Hall, near Croydon, and in many other places. The railings round the tombs of Edward the Black Prince, Canterbury Cathedral, and Henry IV., and that round the tomb of Simon de Langham, Archbishop of Canterbury, in the Chapel of St. Benedict, Westminster Abbey,—very similar to the two first-mentioned tombs,—make up in strength what they lack in beauty, and seem to have been the prototypes of those miles and miles of iron railings with which we are so familiar in London.

At Arundel Church, Sussex, there is a light and graceful iron grille in the blocked chancel arch; the design consists of upright standards and cross bars, and small cusped arching between, and a battlemented cornice enriched with alternate roses and lions' heads. It is much to be regretted that the full beauty of this elegant grille cannot be properly appreciated in consequence of the ugly brick wall which the Duke of Norfolk has caused to be built immediately behind it, in order to enforce his legal rights to the chancel. The very existence of this grille testifies that whatever those legal rights may be, the parishioners, although debarred the use of the chancel, were certainly not debarred the sight of it through this grille, nor was the effect of a beautiful interior ruined by such an act of vandalism, worthy of the worst days of those Puritans who divided Exeter Cathedral with a brick wall between the nave and choir. Extremes very often meet.

In Germany the open grilles of this period were of excellent design and workmanship. One very common form which they assumed was that of a cross-barred grille with a delicate pattern, occurring at intervals, of a cusped form; sometimes the bars were set diagonally, and there is an infinite variety of form of grille throughout Germany. Louvain, in the Church of St. Peter, has some excellent examples, and in the same church is an ambruby with simple but finely-designed hinges, lock plates, and handles. These ambrubies, of which there are a great many in Belgium and Germany, deserve a very close inspection, in consequence of the extreme beauty of their metal work. In South Kensington Museum there is a very perfect carved oak one, called German, but more properly Flemish. The metal work on this is very original. In England we have but few examples, but there is a very good one in the Church of St. Mary, Richmond, Yorkshire. Nuremberg and Augsburg were the two chief places where this art was carried on. These two cities were then at the zenith of their prosperity, and their trade unimpaired by those devastating wars which reduced them to misery, and from which Augsburg at least never fully recovered.

There is one particular phaso of the smith's

\* Baron Davillier, "Vente du Cabinet du Duc d'Aumont." Paris, 1870.

art in England which deserves more than a passing notice. The great impetus given to the industrial arts by the universal rebuilding which took place after the Great Fire of London exercised a considerable influence on the art of the smith; and there is the peculiarity attaching to the revival that the productions are essentially English, and are, unlike the contemporary work on the Continent, preserving an individuality perfectly marked and distinct. One might almost call it a "school," and it lasted for nearly a hundred years.

St. Paul's Cathedral, which was commenced in 1675, and the choir so far completed that it was opened for service in 1697, possesses some of the finest specimens of this date in the grilles and gates enclosing the choir, and although one is bound to confess that it was to a foreigner and not to a native artist that these are due, yet in many particulars they resemble genuine English work. One has but to compare these gates with others of the same date in France, to directly see the immense difference between them, as in the enclosures of the choir of the Abbey Church of St. Owen, at Rouen, and at the Cathedral at Amiens. The artist's name was Tijan or Tijan, for the orthography is doubtful. In addition to these large gates, the original positions of which have been altered since the re-arrangement of the cathedral, there are several smaller grilles in some of the openings, and escutcheons to some of the internal gates with the arms of the dean and chapter very beautifully worked into the design. The whole of the ironwork at St. Paul's deserves a close inspection. The outer railings, which are partly cast, are of Sussex iron, and were made at Lamberhurst.

Most of the City churches have very good ironwork, especially in the sword-rests and communion-rails, some of the finest of the former being at All Hallows Barking, St. Andrew Undershaft, and St. Mary-at-Hill, and the latter at St. Mary Woolnoth. The altars of some of these City churches are marble slabs, supported on a frame of wrought-iron work. In the Church of St. Michael, Queenhithe, now destroyed, there was a very curious iron bracket,\* with pulley and chain for the font cover, and some wrought-iron hat-rails. Though the hinges and locks of these churches are not remarkable, many of the vanes are curious. St. Lawrence Jewry, has a grid-iron, in allusion to the martyrdom of the saint. St. Mildred Poultry, and St. Michael, Queenhithe, both destroyed, bore ships in full sail, St. Peter's, Cornhill, the cross keys, St. Mary-le-Bow has a flying dragon, and St. Antholin, Budge-row, had a very fine vane surmounted by a crown. The destruction of this church and spire, one of the most beautiful in the City, will ever be a lasting disgrace to those who brought it about. In the Church of St. Dionis Backchurch, at the west end, supporting the organ-gallery, stood square columns of open work, of wrought iron, and with very nicely wrought caps, but this church has also been destroyed, and the pillars probably sold for old iron.† Some of the brass chandeliers, where they have not been made away with, to be replaced by gas standards or brackets, are suspended by iron work more or less ornamented and gilded, a good specimen having existed at the Church of St. Catherine Cree,‡ and there is still one remaining at St. Saviour's, Southwark. At St. Alban's, Wood-street, a curious hour-glass is preserved in a wrought-iron frame, a relic of Puritan times, and though hour-glasses and their stands are not uncommon, it is a comparative rarity when found in a church of the date of St. Alban's, Wood-street.

The smith also found plenty of occupation in making railings and gates for public bodies and for private houses, and wrought-iron bandrails to staircases.

One of the most beautiful specimens of the art of the seventeenth century, is to be seen in a pair of gates at the end of a passage or hall in the building occupied by the managers and trustees of the Bridewell Hospital, Bridge-street, Blackfriars; the wrought leaves and scrolls are very rich, being designed for internal work, and date from very soon after the Fire of London.

The honourable and learned societies of Gray's Inn and the Inner Temple have fine scroll entrance-gates to their respective gardens; and

scattered about in the suburbs, at Clapbam, Chelsea, Fulham, Stoke Newington, Stratford-by-Bow, and Hampstead, are fine entrance-gates, whose designs are doubtless very familiar, since there is scarcely an old brick mansion with red tiled roof and dormer windows and walled garden, that does not possess them. There is considerable beauty about these gates, and the manner in which the upright standards are alternated with panels of scroll-work, and the upper part enriched with scrolls and leaves and the initials of the owner, or his arms, worked in; some of this work, indeed, being very delicate and refined, especially with regard to the foliage. But the chief glory of the English school of this date is the wonderful work upon the gates now preserved at Kensington Museum, formerly adorning the gardens at Hampton Court Palace, and the work of Hunnington Shaw. These are far superior to the gates in St. Paul's Cathedral, for the latter are a little too architectural in their treatment, Corinthian pilasters being freely introduced, while these Hampton Court ones are free from any approach to architectural forms in iron, and rely for effect entirely upon the bold curves and sweeps of the scrolls, the richness of the acanthus-like foliage, and the delicacy of the centre medallions. The wreaths, which are suspended from the top, are wonderfully modelled, some of the flowers introduced being almost as delicate as the natural ones they represent, or rather reproduce, in iron,—one medallion in particular, representing the rose of England, surrounded by small buds and leaves, being truly exquisite. At the top of each of the gates are some fine masks, in some cases surrounded by foliage, and each gate is different in design, although they resemble one another in general form. South Kensington Museum possesses six of these gates, one with a rose, another with a thistle,—this last one is superbly modelled, the peculiarity and bend of the leaf being accurately rendered,—another has the harp of Ireland, but with strings rent and broken, emblematical of the present state of that unhappy country, and three have the initials of William of Orange and Mary Stuart. If William's name in these days may not be quite so popular as it once was, and if he did but little for the country over which he was called to govern by a dominant party, at least he was the means of calling into existence these exquisite works of art, which hold their own against any foreign production, and placed the smith, Hunnington Shaw, foremost among those who, working with stalwart arm, with anvil and hammer, were able to throw life and energy into the dull mass of metal before them.

In the staircase of a house in Lincoln's-inn Fields, No. 35, there is a wonderful specimen of a wrought-iron staircase rail. At present this wrought work terminates at the first floor, but there is evidence of it having been continued to the second floor, a panel having been once sold at Christy's for 40*l.*, which purported to have come from No. 35, Lincoln's-inn Fields, and had been removed in consequence of extensive alterations in the interior. The rail is composed of separate standards with scrolls and leaves, until it reaches the landing, which sweeps round a circular well-hole; round this the standards cease, and are replaced by an extraordinarily fine panel, in which one can recognise the same hand as in the Hampton Court gates; there is the same wonderfully modelled mask with foliage proceeding from it, the same sort of wreath depending in advance of the other work, the rich acanthus foliage partly masking the boldly-designed scrolls beneath, betraying the hand of Hunnington Shaw or his school. The date would also fit, for this house and the next are traditionally supposed to have been designed by Christopher Wren, for the Solicitor and Attorney Generals about 1695-96, the date of the Hampton Court work. The centre oval medallion of this panel has unfortunately gone, and is replaced by some initials in cast iron, but it probably contained some of those beautifully modelled bunches of flowers which appear on the Hampton Court Gates.

There are many of these wrought-iron hand-rails in houses of the seventeenth and eighteenth centuries in London, and at No. 46, in the same square, is a simple but well-designed one.

At No. 5, Bloomsbury-square, the house in which, there can be very little doubt, the elder Disraeli lived, though it has been re-numbered, and standing at the south-west corner of the square and Hart-street, there is still a very fine wrought-iron band-rail, which stops at the

first floor, the principal staircase originally not ascending higher, but a secondary one having been used, and the design consists of a series of scroll standards, in which there are two sorts of foliage used, the lower portion having the acanthus foliage, and the upper part branching out into sprigs of foliage not unlike oak-leaves, and with delicate tendrils interspersed; the lower part of the scroll terminates in the centre with a wrought rosette of five leaves starting from a small central boss, the handrail which it supports being of wood.

Before leaving the locality of Lincoln's Inn Fields, so rich in historical associations of the past two centuries and a half, it will not be perhaps out of place to mention one fact that may not be generally known, with regard to Ancaster, or, to adopt its more correct name, Lindsay House. The most casual observer must have remarked two extraordinary tall red brick piers surmounted by mouldering Portland stone vases in the centre of the west side, and have been struck by the air of departed grandeur with which they are invested: these two giants are the survivors of six, four of which have disappeared, for between the present two in the front were two others, now gone, and two more stood at the sides enclosing the fore-court in front of the house. Between these red brick piers was once some very beautiful ironwork, both curious and quaint, but when it disappeared we know not, nor whether it went, though we know it was there at the commencement of the eighteenth century, and those who are familiar with views of old houses in London will remember that a similar railing existed at Powys House, not the one now called Newcastle House, at the corner of Great Queen-street, but the Powys House in Great Ormond-street, long since pulled down.

Many of the railings in front of old houses in London still show how artistic the smith's work was in these useful protections, before the everlasting spear-head became so universal. The very locality just mentioned, Great Ormond-street, has a very fine example, on the north side, of what the blacksmith in the seventeenth century considered necessary for an area railing, and this, to the credit of those to whom the property belongs, seems not only appreciated, but thoroughly taken care of. *Oh si sic omnes!* Lord Carrington's House, in Whitehall, has a very beautiful railing, with the old extinguishers for the links still attached; these may still be seen in many of our West-end streets and squares, and even in Bedford-row, a once fashionable locality.

There is also another point worthy of observation about these railings: where they return against the hall-door, on either side is placed a very beautifully-designed piece of ironwork, technically called a ramp. In Buckingham-street, Strand, and in many other streets in London, these are still to be seen.

These seem to have been the last expiring efforts of the smith. Birmingham was beginning to assert itself, and cast iron was to reign triumphant, and spear-heads, and spear-heads only, were to be the order of the day. One can point to almost the last effort made, and that is to be found in the railings or low screen in front of Somerset House in the Strand; there is an individuality about this, and a freshness of design, so thoroughly original, which will repay any one who will but stop and examine it. The thought must occur to every one who ever takes the trouble to think, that, supposing the material hitherto seemingly so inexhaustible, was to become scarce, and that the iron mines, like the coal ones, were to show signs of diminution, what an immense mass of material we could fall back upon in London only; for, take an ordinary street, and behold how iron has been wasted.

Happily for our times, we do now appreciate the smith's art, and we still have workers amongst us whose right hands have not lost their cunning. We have but to look around on these walls, covered with the wonderful achievements of past ages, and of different countries, and to note that among them are placed specimens of modern skill, which show that the lessons taught by these ancient examples have not been thrown away, and that there is a future for the art of the smith, and that the nineteenth century, an era which has been called "a servile age of mere copyism without any real art of its own," may prove a turning-point in the history of wrought iron, by utilising its capabilities, and adapting them to the requirements of the age in which we live.

## THE CUSTOM OF HIRING FURNITURE.

OUR readers know very well that we have never confined our articles in any narrow spirit to mere technical questions connected with the erection of buildings, and we feel that so many of our readers have to do with the furnishing of houses that some remarks on the custom of hiring furniture may not be out of place here. In this instance we may strictly call this a custom, because it is a practice widely known and widely made use of. It is not a mere fluctuating practice, but it is a system employed by nearly every furniture dealer in the country. As we have more than once had to remark, the tendency among professional men, such as builders and architects, is to regard a practice which is by no means universal, and is only employed by some firms, as a custom, whereas, when this so-called custom comes to be legally criticised, it is found not to be a binding legal custom at all. But the practice of hiring furniture is now so universally known and adopted that it has recently been declared by the Court of Appeal (see *Crawcour v. Salkor*, 51 *Law Journal*, Chancery Div., 498) to be one of which a court of law is bound to take judicial notice.

This decision was given in the course of last year; in the year 1875 the same question came also before the Court of Appeal, and then this tribunal considered that the custom at that time was not so well established that it ought to be taken judicial notice of. The Bench considered, however, that since that time the custom had become so common a practice that the previous decision of the Court could no longer be upheld. No better example could be found of the way in which mercantile practices can ultimately, if they are sufficiently vigorous, mould and change the municipal law, and equally also it shows how easily judge-made law accommodates itself to the social desires of the community. One of the chief results of the judicial recognition of this custom should not be forgotten by those who have to do with business matters. As a general rule, property in the apparent possession of a man who becomes bankrupt falls to the assignee as the representative of the creditors; for it is, legally speaking, in the order and disposition of the bankrupt. The effect of the judicial recognition of the custom of hiring furniture is to make this well-known legal rule inapplicable under these circumstances, and it negatives it, since, as Lord Justice James pointed out, "the foundation of the rule is to prevent a man from obtaining false credit by the possession of the goods." The long and short of the decision, therefore, is that the mere fact of furniture being seen in a house must not be taken to give rise to any presumption that it belongs to the houseowner. In both the cases out of which this question has arisen the bankrupt was an hotel-proprietor, but we confess we see no reason why the rule, if it applies to hotel-keepers, does not apply to every other householder; nor, indeed, did the Court apparently intend that it should be so confined. Therefore, it is perfectly clear that those who give credit to persons on the strength of a well-furnished house, do so at considerable peril. Further, as the furniture-dealer has never parted with his property in his furniture, and so, on the bankruptcy of the houseowner, can take it back, it is obvious that the legal view of the practice of hiring furniture is one which must help to extend the custom.

While it is, of course, in many cases no small convenience, it is clear that such a custom is, if very extensive, morally a bad one. It enables men to live on credit, to keep up appearances of a better position than they are entitled to, and it tends to relax rather than strengthen the valuable habit of quick ready-money transactions. A man, indeed, may now buy a plot of land, and yet, in reality, if he mortgage it he can scarcely be said to do more than hold it on credit; he may build a house on it and get money advanced upon the completed structure, and so pay for it by other people's money, and he may now without difficulty have it handsomely furnished, and yet not possess as his own a single arm-chair. We confess this is not a very satisfactory picture, and, judging from the universality of the last practice it is becoming more common than was formerly the case. Nor, again, can we believe that this custom is one which is good, either from the artistic or the business point of view. The hirer of furniture in the end undoubtedly pays more for it than if he pays for it at once, and the profit does not go into the workman's pocket. The

quality of furniture for the hirer can never be so good as that which is prepared for the bond-fide purchaser. We refuse, too, to believe that the ordinary hirer of furniture can be as particular in matters of taste as the man who buys it at once, for, as we have said, the best articles are not likely to be let out for hire. Therefore, the tendency of the custom must, if it have a tendency, be against the elevating of household taste, and tend to its deterioration. But be that as it may, the legal effect of the custom is one of some importance, nor can its consequences, in other respects, be considered very satisfactory.

## THE EASTWARD PASSAGE OF THE THAMES.

THE morning newspapers during the past week have contained numerous letters on the subject of the passage from the north to the south bank of the Thames, the greater part of the comments of which were anticipated in our remarks on the subject (p. 44, *ante*). One letter, however, was not so anticipated. It is from the pen of an engineer who certainly yields to no living man in the knowledge of the locality, regarded from the surveyor's point of view, and whose unbiassed opinion is entitled to the greatest respect. Mr. P. W. Barlow puts in a demurrer. So far from taking it for granted that a great traffic naturally exists, which is throttled for want of means of conveyance, he boldly denies that statement. The traffic from the north to the south bank of the Thames, he says, "is a mere ghost." Its non-reality is proved by the failure of the successive attempts to provide for its conveyance. It must be admitted that Mr. Barlow has a strong *prima facie* case. We have all, possibly, taken this need too much for granted, forgetting that, as a rule, in England of all places in the world, things that are much wanted are apt to get themselves done.

Now we should not forget that a work which was at one time not undeservedly regarded as one of the wonders of the world was carried out by Sir Marc Brunel for the very purpose of connecting the north and the south banks of the river. This unprecedented undertaking was completed at a cost of 1,137,1 yard, or 451,000*l.* It was opened to the public in 1843. It is said, and said truly, that the want of approaches checked the development of the carriage traffic; but bad this need for a crossing been so great as it is now, and as it was then said to be, can there be any doubt that the fact would have been indicated by a steadily-increasing flow of passengers? The uncertain part of the work was over; the risk was measured and overcome. The completion of the approaches was matter of money alone; and if the traffic had demanded the completion, we can hardly doubt that the money would have been forthcoming.

Many things, certainly, point in the direction indicated by Mr. Barlow. A good reason may perhaps be invented for the failure of previous efforts to do what we are now told is necessary; but the fact remains that they did fail. The first and famous tunnel was blocked for want of approaches. The second and minor tunnel, the sharp and rapid execution of which reflects so much honour on Mr. Barlow, is forgotten. Never did it attract traffic. Its situation was, apparently, admirable; but there was no demand for its services. In the same way the steam ferry has dropped out of sight. No one hears of it,—no one seems to use it. We are told that it is not suitable for the special traffic of the Thames. Why so? If people came forward to say, "Every step that has been taken with a view to link together the river banks has been a success. Each new line of communication has been pressed upon in such a way as to show that it is worth while to complete the best line practicable," then the question would rightly press for decision "What is the best method to employ?" As it is, Mr. Barlow's remark recalls that of the boy in Andersen's well-known tale of "The Emperor's Clothes." "But he has no clothes on," said the boy, and the people had to confess that he was right. "But there is no demand for means of transport," says Mr. Barlow. It is possible that he is not right. But it looks very much as if he were. Of all things, let us not be so inconsiderate as to not find out the truth of the secret thus whispered until after spending some couple of millions on a bridge.

Since we wrote these lines, we have read Sir J. W. Bazalgette's reply to Mr. Barlow. The statement of the engineer to the Metropolitan Board as to the number and position of existing bridges, is, of course, correct. It is not clear to what Sir J. Bazalgette refers when he says, "the locality is bad." Our preceding remarks as to the approaches to the Thames tunnel agree with those of the latter. But the argument as to the ferry does not seem to us to establish the case for a bridge. If the East London Railway now takes away the foot-passengers from the ferry, what need for further accommodation for them. And, it seems to us that the existence of a large traffic over a ferry would be not only an argument, but an argument *sine quâ non*, in favour of either widening London Bridge or making a new bridge.

The truth is, that it is rarely the case that any attempt to divert traffic from its natural channel has answered. Make the channel more convenient (as in the case of removing the toll from Waterloo Bridge), and the traffic increases. Make a new road for it, and, ten to one, it remains unused. For eight hundred years traffic has converged from other bank of the river towards London Bridge. Three attempts to divert it to a point lower down have failed. We do not say that a fourth attempt must fail. But, at all events, we require some much more definite proof to the contrary than has as yet been offered before we can consent to the experimental outlay of a million or more of money to accommodate a non-existent traffic.

## THE ROYAL PRUSSIAN ACADEMY OF ARCHITECTURE ON FIRES IN THEATRES.

We mentioned some months ago in these columns that the Berlin Academy of Architecture had been requested by the Prussian Government to deliver its formal and detailed opinion on the best means of securing theatres against dangers from fire. The terrible calamity at Nice, followed by the still more ghastly catastrophe at the Ring Theatre, Vienna, had directed the attention of architects in Germany as well as in all other civilised European countries to this subject. A special committee of the Rhenish and Westphalian Union of Fire Brigades had, soon after the Nice disaster, submitted direct representations on the question to Prince Bismarck, and had taken occasion to state that in their view the dangers from fire in theatres might be reduced to a minimum by improved designs and better methods of construction being introduced in the theatre buildings themselves. The German Chancellor requested the Prussian Ministers of the Interior and of Public Works to order an inquiry into the matter, and this they did by placing the entire investigation in the hands of the Royal Academy of Architecture. The first result of the deliberations of this body, dated November 2, 1881, has already appeared in the columns of the *Builder*. The conclusion of the Academy's labours, containing practical suggestions for improving the safety of theatres and other public buildings, has now appeared. It is entitled "Supplement of June 14, 1882, to the Opinion of the Royal Academy of Architecture, dated November 2, 1881." Of this document, which consists of two very unequal parts, entitled "Security against Fire" and "Protective Measures," we subjoin the following translation:—

## A. SECURITY AGAINST FIRE.

1. Danger from fire in theatres is attributable chiefly to the employment, in the fittings and furniture of the auditorium, of materials that are easily inflammable, and which, after being kindled, burn rapidly, and propagate the fire quickly. This is more especially the case under a method

2. Of illumination which develops a great amount of heat, and produces hot gases of combustion, the effect being that as the latter rise to the ceiling, they render still drier and more inflammable whatever easily inflammable objects they may come in contact with on the way.

3. Complete security against fire can only be attained either by removing or avoiding the employment of combustible materials, or by avoiding a method of illumination by "open lights," and substituting for them a system of illumination with lights that are enclosed as far as possible in an air-tight manner.

4. The magnitude of the danger from fire, of course, increases in proportion to the quantity of easily inflammable materials or objects, and to the number of the gas-flames or open lights. The peril accordingly increases in proportion to the size of the stage. And in case of an outbreak of fire, the danger to the audience increases in proportion to the number of spectators, or to the extent to which the auditorium is filled by them.

Hence, the larger a theatre is, the more urgent the necessity of its being built and fitted fire-proof, in order to obviate the dangers in question. In the case of small theatres having only pit or ground-floor seats, or at most only one gallery in addition, likewise in the case of dancing-halls or ball-rooms with a stage annexed,—buildings from which the public as well as the performers can quickly escape if fire breaks out,—the rigour of the conditions which such buildings should be required to satisfy in point of materials and style of structure, may be proportionately reduced.

Remarks on Sec. 1. The question how far combustible materials can be replaced by incombustible in the structure and fitting up of the stage of theatres without injuring or impeding the business of the stage, can only be settled by further experiments and by the test of stage practice itself. Attention, however, requires to be unintermittently directed to the question of the substitution of less dangerous materials for those now in use, and as experience discovers them, their employment ought to be ordered in place of what is less safe. Certain improvements, however, may be mentioned, the adoption of which has already been distinctly shown to be practicable without material difficulty. Thus in all permanent theatres, both on the stage and in the roof, the following parts ought to be constructed of iron, viz., all stairs or steps, scaffoldings, internal structures, pulling ropes, all fixed parts in the construction, the curtain frames and other framework, stands, &c. The same applies to the parts underneath the stage. These latter, moreover, ought to be provided with fire-proof beams and supports on which to rest the flooring of the stage.

All objects of wood and all textile fabrics used on the stage should be protected against catching fire by impregnation with suitable chemicals. It is now possible by chemical means to reduce the inflammability of these materials to such an extent that, when fire is applied to them, they simply glimmer away, and do not communicate the flame any further. The curtains, stage properties, and scenery might likewise be deprived, to a large extent, of their dangerous character as regards fire by the chemical impregnation of the linen before painting or by applications at the back.

Remarks on Section 2. According to the statements of Herr Fölsch, in his work on "Fires in Theatres, and the Measures requisite for their Prevention," p. 106, almost all the fires, without exception, which have broken out in theatres during the performance have arisen from open or imperfectly protected lights. The same author likewise shows that the numerous theatres which have caught fire shortly before the hour for the admission of the public, through some want of caution in lighting the gas or oil lamps, have been destroyed through open and badly-guarded lights on the stage side of the house. There is nothing surprising in this, since we find on the stage a large number of very inflammable objects with numerous jets of flame distributed among them, a brilliant illumination being necessary. Such flames must, in part, at least, be alternately lighted and extinguished, besides being fixed for the sake of the desired artistic effect in various positions about the stage. The slightest false movement, the failure properly to raise or drop a curtain or any other inflammable object, the breaking of a piece of the stage machinery for moving the decorations, is liable to bring easily combustible objects into contact with an open flame, and so to set the place on fire. The danger is materially increased by the general employment of gas. Danger attaches even to what is comparatively the safest method of lighting gas, viz., by means of electricity, for the apparatus at times does not work. An escape of gas then follows, the result often being that the next attempt to light the gas causes an explosion. In such cases inflammable objects at a considerable distance are directly set on fire or driven so as to come in contact with open jets. The danger is perhaps even greater when the gas fails to take light in a few isolated places

which at the time escape notice. The inflammable mixture of gas and air which is then formed, and which will explode as soon as it reaches an open jet, may carry danger to the remotest part of the building. The extensive system of gas-piping in a theatre, too, is liable to be damaged, and thus become a source of danger by the escape of gas. In view of facts like these Herr Fölsch remarks that "while in all civilised countries there is a general prohibition of open flame in dangerous spots, this prohibition strangely enough is entirely ignored in the case of theatres, although, so far as is ascertained there is no country where such an exception in favour of theatres is granted by any statute or other legal authorisation." As a matter of fact, the German Penal Code (section 368, Nos. 6 and 7) contains a paragraph according to which any person who strikes a light, lets off firearms or fireworks in proximity to inflammable objects, is liable to a penalty of 20 thalers (3*l.*) or fourteen days' imprisonment, nor is any exception made to this law in favour of theatres.

It is an indispensable condition for safety from fire in theatres that, so long as large quantities of easily inflammable materials are employed in them, all open lights must be done away with. The means of doing this are supplied by electric incandescent lights. These generally consist of a carbon filament of a quarter to half a millimètre in thickness, and 10 to 15 centimètres in length, inclosed in a hermetically-sealed air-tight glass bell. When the carbon filament is rendered white hot by the electric current, and thereby made to give out light, the glass bell containing it is only slightly warmed, so that even an inflammable substance on touching it does not catch fire. Neither do the conducting-wires constitute a source of danger from fire, inasmuch as, when properly fitted up, they are scarcely sensibly heated while in operation. Nor, again, is there any danger to persons touching the conducting-wires of these incandescent electric lamps, when the lights are properly arranged, as the electro-motor force then employed is but small. For the same reason, even if the conducting-wires are broken, there is no danger, because the Davy arc does not appear at the fractured spot when the electro-motor force employed is small. If, through accident, a lamp is broken, the thin and highly-heated carbon-fibre, with the access of air, burns away so rapidly that there is no danger of anything taking fire. The only imaginable case where a fire could arise from the incandescent light is, when one of the thin branch-wires, running from the main conducting wires to the lamps, is fractured and forced into such a position as to connect the chief wires. In this case, owing to the strong current passing through it, the small wire may be made white hot, and so set fire to any inflammable materials that might be near it. This danger, although not absolutely removable, may, however, for practical purposes, be completely obviated by a good system of insulation and proper management of the current. Incandescent electric lighting is capable not only of meeting all the technical requirements of the stage, but of supplying it with the means of producing certain new effects. The conducting-wire may be readily and without any inconvenience applied at any point of the stage. By the simple turning of a handle or lever, any section of the lamps may be lighted up or turned down or off; and the colour of the light may be the yellowish-reddish tint of ordinary gas. Other colours may be obtained by having coloured glass in the lamps, and the white light may be gradually or suddenly extinguished, or replaced by coloured light. In short, the incandescent system is capable of producing all the effects desired in the way of light upon the stage.

It must be admitted that practical experience in the lighting of the stage with the incandescent system is as yet but scanty. The completest trial so far appears to have been made at the Savoy Theatre in London. No doubt, longer experience and further experiments are required before the incandescent light will be generally admitted perfectly to satisfy every requirement of the stage. In view of the tests the system has already stood, however, we unhesitatingly give our opinion that it appears calculated to reduce the danger of fire on the stage to a minimum without interfering with stage business.

Although the lighting of the auditorium of theatres involves far less danger than that of the stage, it appears desirable that electric lighting should be adopted in that and, indeed, in all

other parts of the house. Whether this should be exclusively effected by incandescent lights, or whether, in the intervals of the performance, the auditorium should be illuminated with the white arc-light, is a question we will not attempt to settle. The defects formerly shown by the arc-light by pieces of the white-hot carbon points shooting off, and the danger thence arising, have already been removed by the rapid advance of technical science, partly by the supply of better carbons, partly by enclosing the lamps in glass balls enveloped in wire netting. Besides the greater security against fire, the electric light in the auditorium has another advantage, in that while developing a comparatively small degree of heat, it does not vitiate the atmosphere like gas. Hence the problem of the ventilation of theatres is rendered easier with a system of lighting by electricity than it is with gas.

In order to be secure against the extinction of the electric light, it is necessary in the case of a large installation to lay down two, or even three, independent illuminating circuits, each with its special engines and conducting wires, and to fix lamps in all the apartments connected with each of the separate circuits. In this way the passages and staircases may be lighted with electricity, as the safety will be equal to that of oil lamps, which may either go out, or even be left unlighted.

#### B. PROTECTIVE MEASURES.

1. In case of a fire breaking out on or about the stage,—such fires, when not instantly put out, commonly, as experience shows, extend with great rapidity,—the hot gases produced by combustion usually, owing chiefly to expansion, penetrate into the auditorium, and first threaten the safety of the persons in the upper parts of the house. Such gases in a short time exert a stupefying effect, and hence they tend to prevent the audience from escaping, and to hinder the firemen entering for the purpose of saving life and extinguishing the flames. Hence the necessity of the adoption of some incombustible, and, as far as possible, air-tight appliance to cut off the stage from the rest of the house, or to close the front of the proscenium against the auditorium. A number of sufficiently large apertures with chimney-funnels of sufficient height are also wanted above the stage in order to draw off the gases of combustion and prevent their entering the auditorium. The appliances for opening and shutting the apertures over the stage, and the mechanism for moving the iron curtain in front of the stage, ought to be accessible from various positions, so that the former may be readily opened, and the latter come down by its own weight.

2. If the gases produced by combustion penetrate into the auditorium, the persons in the upper galleries and tiers of the house are the first to be in danger. Hence these parts of the house more especially stand in need of numerous doors for letting the public out; they should open on to well-ventilated or ventilatable and well-lighted corridors and staircases. The proposal made by Herr Scheffer that a corridor should be constructed behind the gallery, therefore, deserves attention. This corridor, as well as those behind the boxes and pit, ought each to be large enough either alone or with the help of adjoining rooms to contain all the persons of the audience occupying seats on the same floor.

3. The apartments adjoining the stage, and intended for the accommodation of the *personnel* of the theatre, require special means of protection. They ought to be capable of being shut off from the stage so as to be as far as possible proof against fire, and where requisite fireproof stairs should be provided. The doors leading out of these apartments should also open on to a well-ventilated and well-lighted corridor. (Signed) SCHNEIDER.

*The Royal Academy of Architecture,  
Berlin, 14 June, 1882.*

**The Sunday Society.**—The members of the Sunday Society visit the Grosvenor Gallery on Sunday next (July 16th), and on the first Sunday in August the Gallery will be open to the public by tickets, which may be had by all who send a stamped and addressed envelope for the same to Mr. Mark H. Judge, 8, Park-place Villas, Paddington. The Duke of Wellington has renewed his invitation of last year, and visits of the members of the Society will be made to the historical collection at Apsley House during the Sundays of July and August.

## THE HAMILTON PALACE COLLECTION.

It might be imagined, by those who at a distance have followed so far the sale of the Hamilton Palace Collection, that by this time the chief treasures had been disposed of. Such, however, is not the case, and the fourth portion of the sale, placed on view in King-street, and sold at the beginning of this week, worthily took its place by the side of its predecessors. The promise held out by the names of Rembrandt, Velasquez, Van Dyck, Lely, Glaude, and a number of other well-known painters; the expectation to see a fresh series of pieces of furniture which had once belonged to Marie Antoinette, with various other treasures, was amply sufficient to crowd Messrs. Christie's rooms.

Notwithstanding the rarity, amounting in many cases almost to uniqueness, of the objects exhibited week after week, and notwithstanding the very justifiable interest that the visitors to King-street take in these objects, still the pictures assert their own extraordinary position of dignity, in spite of the theories that have been taken with many of their titles.

Genuine portraits by Velasquez are rarities which every day grow scarcer in the sale-rooms, and the Philip IV. of the Hamilton Collection may be said, away from Madrid, to be one of the most characteristic works of the master, not alone as a specimen of thoughtful portraiture, but as a superbly bold piece of technical execution. The rarity and instructive value of such a possession, which now the nation will own for ever, is alone to be appreciated by those whose study has led them to estimate as it deserves the grandeur of the Spanish painter of whom Sir Joshua Reynolds said that he could do in a few hours what it took him (Sir Joshua) weeks to paint.

But the most interesting picture of this portion of the Hamilton sale may certainly be said to be that described in the catalogue as a "Council of Elevation English and Spanish Statesmen," containing, in addition to the portraits of six Spanish and Italian noblemen, the portraits of Earls Dorset, Nottingham, Devonshire, and Northampton, and at the top of the table, on the right hand side, surely Robert Cecil. The work, a carefully-executed picture by the Spanish court painter of Philip III., Juan Pantoja della Cruz (as he should be called in the catalogue), is in the marked style of the Low Country artist Antonio More. It is many years since a picture of such extraordinary interest to the English public has been brought to the hammer, doubtless representing, as it does,—it being dated 1594,—some international incident that followed on the inglorious failure of the Spanish Armada. The portraits are marvels of dexterous minuteness, while the rest of the picture is scarcely less remarkable for the care bestowed on the details of the room decoration. The National Portrait Gallery, in obtaining this intensely interesting picture, has indeed enriched its already valuable collection with a treasure. By Coello, the portrait of the Duke of Alva may be said to have been a most appropriate accompaniment to the Philip IV. and the Spanish Council, while the Murillo, "The Sleeping Christ," is a characteristic example of the master.

In this fourth portion of the sale the French school was well represented, though chiefly in portraiture. An interesting portrait of Henry Stuart, Cardinal York, by the French painter Blanchet; a portrait of Madame de Maintenon, by Lebrun, representing the lady evidently at the outset of the devout period of her later life; a portrait by Vanloo of the gallant Marshal Saxe; a portrait of Marshal de Foix, by Rigaud, the so-called "French Van Dyck," a painter scarcely less industrious as a portraitist than our own Reynolds; the portrait of James, Prince of Wales, and his sister, when at Saint Germain, by Largillière, the very characteristic painter of the flowing robes and powdered wigs of the court of Louis XIV.; a most interesting and faithful full-length of Napoleon I., painted specially by David for the Duke of Hamilton; several Ponsins (the "Entombment," very characteristic); a magnificent Claude,—the "Ariadne and Bæacchus" of the *Liber Veritatis*; an amusing Fragonard, and a capital portrait of the Marquis de Marigny, brother of the Pompadour, by Tocqué; and two pictures very rasbly attributed to the interesting French painter Jean Cousin.

As completing the interest in last week's show must be mentioned four small grisailles

by Van Dyck,—portraits belonging to the famous series of *l'ones* in which the Duke of Buccleuch's collection is so rich; an unmistakable portrait (by Lely) of the courageous Lucy, Countess of Carlisle, though the catalogue merely calls the work "A Lady in a White Dress"; a manly portrait, by the same painter, of David Leslie (afterwards Lord Newark); more than one Van Dyck, but none of superlative merit; an interesting sketch by Ruhens; a so-called Van Eyck, beautiful but doubtful; a Lucas Craucht, dated, it may be mentioned, some ten or so years after the death of the painter; a curious Malaise; several Breughels; and a fine Teniers. Respecting the two Rembrandts of the collection, the "Magdalen" and the "Prince of Guilders," such considerable doubt exists,—notwithstanding the merit, especially, of the former,—that we sorely doubt if the purchaser or purchasers will ever obtain that pleasure from their ownership which may be said to be the first element of possession.

Of pictures by English artists, the full-length portraits of George III. and his queen, Charlotte, by Ramsay,—strangely enough, labelled on the frame as by "Sir Thomas Lawrence" (sic), though the error is corrected in the catalogue; a superb landscape by Wilson; another by Gainsborough; two terribly cracked Etty's, with a few others, formed part of the last week's show, in which certainly the foreign schools may be said to have come out stronger than ours; indeed, in English masters, the Hamilton Collection, as shown, at least, in King-street, cannot be said to have been rich; nor are we even promised any marvels, except, perhaps, among the wonderful series of miniatures to be sold next week.

In this fourth portion of the sale the superb pieces of furniture may be said to have excited with not a few almost as much interest as the pictures. The three cabinets which once belonged to Marie Antoinette, two having her cypher, may be regarded as simple marvels of the decorative art of the eighteenth century. The elaborate and yet perfectly-restrained decorations of chased and gilt bronze from the band of Gouthière, the French chaser of the reign of Louis Seize, setting off the rare black and gold Chinese lacquer, are delicacies of design and manipulative execution which the past seems alone capable of having produced. To those familiar with the artist's fame it can be understood what would be promised by a Gouthière cabinet that once had been in the possession of Marie Antoinette, and the result may be said to have fairly come up to expectation. The condition of these works is wonderful after the perils they must have run through, for, like so many other treasures of the Hamilton sale, they are relics of the wreck of the Revolution. It seems, indeed, a cause for regret that such a figure as that of the little marlie Voltaire, attributed to Houdon, should be parted from surroundings so congenial. There, in the midst of the creations of a world which departed in the cataclysm he had so surely prophesied, the old philosopher of Ferney sardonically smiled as he smiled all through his long life. If the little figure does not possess the wonderful vigour of Houdon's famous seated statue of the philosopher which calmly gazes down upon the public from its place of honour in the *foyer* of the Théâtre Français at Paris, it certainly will charm its successive owners by the vivacity of its execution.\*

**The Sanitary Institute.**—At the anniversary meeting, held at the Royal Institution, on Thursday, July 13th, H.G. the Duke of Northumberland in the chair, an address was delivered by Mr. Edward C. Robins, F.S.A., entitled, "The Work of the Sanitary Institute of Great Britain."

\* At Saturday's sale the National Gallery acquired, for 6,000 guineas, the Velasquez portrait of Philip IV., as also a Steenwyck, for 195 guineas; for the National Gallery of Ireland, Mr. Doyle purchased Fossin's "Rationalism," for 490 guineas; while the National Portrait Gallery acquired the Council picture by Pantoja della Cruz for 2,400 guineas. "The Infant Christ," by Murillo, was sold for 2,300 guineas; the Wilson landscape for 1,000 guineas; the Portrait of Cardinal York for 1,300 guineas; the four Vanduyck grisaille portraits fetched 200 guineas; the sketch by Ruhens 100 guineas (bought for France); one of the Breughels 450 guineas; the Teniers, 600 guineas; Rembrandt's Magdalen, 210 guineas. At Monday's sale one of the Gouthière cabinets was sold for 2,400; the Marie Antoinette cabinet for 9,950; and the companion commode for the same extraordinary sum. We have to correct a clerical error in our last week's issue, respecting the price of the Duc de Choiseul's writing-table, which was sold for 3,950, not 5,950.

## PROGRESS OF INDUSTRIAL ARTS IN GERMANY.

A SEMI-OFFICIAL report, all the more remarkable because it emanates from a Frenchman, proclaims the fact that not only have the German art industries made extraordinary progress, but are now in many instances able to compete successfully with the French on the French markets. The Union Centrale des Arts Décoratifs recently commissioned M. Germain Bapst to travel through Central Europe, and establish relations between this French society and all kindred institutions abroad. He was to visit all the museums, take notes of all improvements and bring back plans and drawings. The mission was a delicate one, as its practical object was that of enabling the French art-manufacturers to resist foreign competition. Nevertheless, it was attended with much success, and M. Bapst established profitable relations between the French Union Centrale and the following gentlemen whose names we give as being among the foremost promoters of art in districts—Baron de Heffner-Alteneck, of Munich; Herr Essenwein and Herr von Schörn, of Nuremberg; the Councillor Herr Graese, Herr Buttner, and Professor Graf, of Dresden; M.M. Fusch, Kulesch, and Burg, of Breslau; Mr. Osteriocke, at Cracovia; and with M.M. Charles and Francis Pulsky, George Rath, Xanthies, Hegedus, Henzelmann, Count Eugène de Zichy, and Count Apponyi, of Pesth.

From these sources valuable notes have been obtained concerning the methodic classification of objects and models, and notably their exhibition in suitable cases and light, two conditions often insufficiently studied by the conservators of museums and schools of art. This is coupled with drawings and plans of all the new museums of Germany destined to receive art or industrial collections. Thus it is modestly argued that if, in the great movement for the development of art study, France is the last among nations to construct edifices consecrated to the union of arts and industry, she may, at least, benefit by the experience acquired in other countries, and will raise a school perfect in its conception, suitable in every sense to all the requirements of artists and well calculated to educate the public and facilitate the studies of craftsmen and artisans.

At Munich, at Dresden, at Breslau, at Pesth, everywhere M. Germain Bapst met a small group of ardent regenerators who, either by collecting and classifying the vestiges of ancient art, or by stimulating the ingenuity and taste of the artisans around them, sought to revive the wholesome art doctrines of the past and harmonise them with the improved methods and increased facilities of modern manufacture. To M. Bapst the Hungarian art-work presented the most attractive features, though he renders full homage to the skill and great efforts of the Germans. At Vienna he was much disappointed, finding that the museums were not classified with the science of the Germans, and failed to display the taste of the Hungarians.

In Germany, M. Bapst thought that the progress achieved during the last four or five years is absolutely menacing the continued prosperity of several French industries. This result has been brought about principally by the increasing efforts and the impetus given by the Dresden school of art and industry. This establishment is directed by Professor C. Graf, and consists of three hundred pupils, who work at industrial drawings and supply models or designs to the manufacturers of furniture, tissues, jewelry, lace, decorative wall-papers, &c. If a manufacturer is in want of some designs or models, M. Graf explains the subject to his pupils, who compete with one another to attain the desired effect. It is the outcome of such a course of studies which is ultimately supplied to the manufacturer, who is thus certain of obtaining a design of merit. Nor does this institution content itself with rendering services to those who desire its assistance; on the contrary, Professor Graf is constantly seeking out industries where the products are not creditable from the artistic point of view. To these inferior manufacturers he addresses patriotic reproaches, and finally supplies them with reproaches, and designs, so that the goods they produce shall no longer offend the artistic taste he has taken such pains to develop.

M. Germain Bapst lays special stress on the excellence of the cabinet work of Messrs. Turpe and Friedrich Bernhardt. The school of

arts and industry seeks to revive in the models that it gives out, the old Flemish-German style of the sixteenth and seventeenth centuries, and these are executed with rigorous minuteness and the most delicate care. In goldsmiths' work, M. Bapst describes Herr Henninger, of Berlin, as a master endowed with great taste. For wall-paper, with designs modern in style, and each admirably suited for its special destination, the work of Herr August Schütz at Wurzen, and of Herr Ernest Schutz at Dessau, is so excellent that we are assured it will "confound both French and Belgian manufacturers." Finally, the silk and cotton tissues of Elberfeld for the covering of furniture are so perfect in style and quality that a large quantity are actually exported into France, and are now competing successfully with the products of the Lyons manufacturers. M. Bapst, impressed by all these facts, entertains the liveliest fears as to the results of the next universal exhibition. He dates the present extraordinary and rapid development of German art industries to the effect produced by the International Exhibition of 1878, and suggests that, as the cost of labour in Germany is only half as great as in France, for goods of equal value, the advantage would be with the Germans.

The importance of these declarations are evident to all, and it is high time that French manufacturers should travel and ascertain for themselves what is being done abroad. To us it is satisfactory to note that on all sides, in all countries, the art revival is displaying its vitality, and growing in strength; but these special facts concerning Germany will add to the interest of the Nuremberg exhibition of arts applied to industry which is now opened. From the architectural point of view, the good taste in the details displayed in building the exhibition palace are in themselves, we are assured, well worthy of a visit. In any case, a curious expedient has been adopted which will attract attention. The basis of all the walls is to be protected by a drapery made of jute saturated in a chemical substance, probably alum, which will render it fire-proof. Perhaps the Nuremberg exhibition will be an appropriate confirmation of M. Bapst's report, and doubtless will draw many visitors curious to test for themselves the full value of the revival in German art industries.

FROM ABROAD.

*The Hercules Bridge at Berlin.*—The *Deutsche Bauzeitung* calls the attention of those interested in the preservation of relics of the art of past ages, to the possibility of rebuilding the above bridge at a point of the stream where the locality would insure such a height as to obviate any difficulties with respect to the navigation of the Spree. Two of the most celebrated artists of a century ago, Langhans and Schadow, were jointly engaged on this work, the removal of which from its present position would seem necessitated by local circumstances.

*The Sanitary Condition of Berlin.*—In an exhaustive report, Dr. C. Skrzeczka has recently described the progress of sanitation in the capital of the German empire up to the end of the year 1880. He dwells forcibly on the improved state of such parts of the city as are in connexion with the sewerage system. As to the water-supply, it seems that many of the springs of the city contain an excessive quantity of chlorine. The activity of the authorities charged with the carrying out of the laws against adulteration has been exercised with respect to the beer which forms such an important element in the daily sustenance of the German nation. The general result of the investigation goes to prove that injurious substances are but rarely met with, such ingredients as are sometimes used in place of hops being bitter products of a harmless character. The growing demand in this country for German beer is therefore not to be regretted.

*Russian Cement.*—According to a circular recently issued by the Russian Government to the leading railway companies, it is notified that there has hitherto existed an ungrounded prejudice against the use of cement of native manufacture, preference having been shown to the imported article, more particularly of English make. It is remarked that the Russian product has given complete satisfaction in its use during the construction of the Alexander II. Bridge over the Neva, the Alexander Bridge over the Volga, and Msta Bridge, on the road built to avoid the ascent at Werobjinskaja.

The Russian cement is described as being of extreme fineness in its triturated state, and the fluid mortar made from it is said to possess an exceptional degree of resistance. Amongst other measures enjoined in the Ministerial circular is a provision for any technical conditions attached to concessions, &c., to be based on the employment of Russian cement when it is procurable; the use of other kinds being only sanctioned when the home-manufactured article is not readily obtainable.

*The Sixtine Chapel at Rome.*—The *Vossische Zeitung* gives currency to a statement that the Pope has decided on considering the above noted chureh as one of the most important monuments of Italian art, and has resolved on ordering the cessation of all religious ceremonies within its walls. The world-renowned frescoes of Michelangelo have, it is stated, suffered so much from dust and from the effect on the air of the burning of numerous candles, that the above step has become necessary for the preservation of these wonderful examples of religious art.

PREMIUMS AWARDED BY THE INSTITUTION OF CIVIL ENGINEERS.

The Council of the Institution of Civil Engineers have awarded the following premiums:—

- For Papers read at the Ordinary Meetings.
- 1. A Watt Medal and a Telford Premium to Dugald Clerk, for his paper on "The Theory of the Gas engine."
- 2. A Watt Medal and a Telford Premium to Joseph James Coleman, for his paper on "Air-Refrigerating Machinery and its Applications."
- 3. A George Stephenson Medal and a Telford Premium to Thomas Fletcher Harvey, Assoc. M. Inst. C.E., for his paper on "Coal-washing."
- 4. A Watt Medal and a Telford Premium to William Proctor Baker, for his paper "On the Various Systems of Grinding Wheat, and on the Machinery used in Corn Mills."
- 5. A Telford Premium to William Henry Wheeler, M. Inst. C.E., for his paper on "The Conservancy of Rivers; the Eastern Midland District of England."
- 6. A Telford Premium to Lovesson Francis Vernon-Harcourt, M.A., M. Inst. C.E., for his paper on "Harbours and Estuaries on Sandy Coasts."
- 7. A Telford Premium to Ewing Matheson, M. Inst. C.E., for his paper on "Steel for Structures."
- 8. The Manby Premium to Henry Joseph Butter, M. Inst. C.E., for his paper on "Forces and Straits of Recoil considered with reference to the Elastic Field Gun Carriage."

For Papers printed in the Proceedings without being Discussed.

- 1. A Watt Medal and a Telford Premium to John George Blair, M. Inst. C.E., for his paper "On the Independent Testing of Steam Engines, and on the Measurement of the Heat used."
- 2. A Telford Medal and a Telford Premium to James Mansergh, M. Inst. C.E., for his paper on "The Lancaster Waterworks Extension."
- 3. A Telford Medal and a Telford Premium to Wilfrid Swanwick Boulton, Assoc. M. Inst. C.E., and a Telford Medal and a Telford Premium to John James Potts, Assoc. M. Inst. C.E., for their joint paper on the "Sacombe Ferry Improvement Works."
- 4. A Telford Premium to Charles Henry Moberly, M. Inst. C.E., for his "Account of some Tests of Riveted Joints for Boiler Work."
- 5. A Telford Premium to Robert Harvey, Assoc. M. Inst. C.E., for his paper on "Plant for the Manufacture of Iodine."
- 6. A Telford Premium to James Barron, Assoc. M. Inst. C.E., for his paper on "Buckie Harbour."
- 7. A Telford Premium to Patrick Walter Meik, M. Inst. C.E., for his paper on "The Bo'ness Harbour and Dock Works."
- 8. A Telford Premium to Harry Pasley Higginson, M. Inst. C.E., for his paper on "The Kawaran Suspension Bridge, N.Z."

The special thanks of the Council were voted to their colleagues, Dr. William Pole, F.R.S., and Mr. B. Baker, for their contributions on "Aerial Navigation," and on "Steel for Tires and Axles."

**Gas Explosion.**—In the evening of the 7th the base of the big lamp at the bottom of Preston New-road, Blackburn, blew up with a loud report, severely injuring a number of persons who were passing, and killing one. The explosion seemed to result from leakage, and it occurred when light was being applied by the lamp lighter, who ran away and escaped unhurt. It shook the surrounding buildings and hurled huge stones 30 ft. into the air.

\* Has previously received a Telford premium.  
† Has previously received the Manby premium.

ARCHITECTURE AND THE ROYAL ACADEMY.

The following is a list of the Royal Academy admissions, July 1882. Mr. R. Phené Spiers, master:—

*Upper School.*—T. J. Dalziel, J. C. Hambling, C. E. Holmes, C. P. Leach, H. W. K. Martin, E. W. Smith, E. A. Woodrow.

*Lower School.*—J. H. Ball, D. W. Bellhouse, W. D. Carø, B.A., H. O. Cresswell, W. J. Gargery, F. Johnson, F. J. Lee, E. S. Norton, P. J. Poppowell, J. G. Sanky, H. A. Satehll, W. C. Rea, F. H. Tulloch, A. F. Vigers, G. G. Wallace, G. W. Ward, W. H. Woodroffe, E. Woodthorpe, B.A.

*Probationers.*—F. S. Capon, E. Crisp, C. D. Fitzroy, A. Forrester, W. J. Gibbon, J. J. Muller, F. P. Oakley, S. B. Russell, J. E. Sears, J. Thomson, W. R. A. G. Tucker, W. F. Young.

A BRISTOL ARCHITECT KILLED.

We regret to record the death, under circumstances of a painfully distressing character, of Mr. J. H. Hirst, F.R.I.B.A., architect, of Small-street, Bristol. A servant at the deceased's residence, Avonhirst, Stoke Bishop, on coming downstairs on the morning of the 6th, found Mr. Hirst lying at the bottom of the staircase. He had apparently been dead for some hours, and subsequent examination of the body disclosed the fact that deceased had broken his neck. It is believed that in retiring to rest on Wednesday night he was either seized with a fit or missed his footing and fell down the stairs. Deceased had been in a weak state of health for some time past, and it is thought that his weakness might have prevented his making an effort to avert his fall. Mrs. Hirst and a portion of the family were away from home at the time. The deceased, who was an architect of considerable experience, had been for many years in practice in Bristol, and brought forward a scheme for constructing a new thoroughfare upon an easy gradient between Colston-street and the top of Park-street, and in connexion with which some rather extensive excavations were made opposite the New Theatre. Some years ago he took a warm interest in the Volunteer movement, and for a long time held a commission in the Bristol Artillery Corps. He was fifty-six years of age, and leaves a widow and numerous family.

Some of the best buildings in Bristol and its neighbourhood are the work of the unfortunate gentleman who has so lamentably passed away. Mr. Hirst originally came from Yorkshire. He has always kept up a connexion with this his native county, and for many years had a branch office at Harrogate, where he built St. Peter's Church, and many blocks of fine buildings. Mr. Hirst was deservedly popular in all the various walks of life with which he was identified, and his loss will be deeply deplored by all who knew him.

Collapse of an Hotel Roof in Manchester.

Just before five o'clock on Saturday evening last, the roof of the Wheatseaf Hotel, 64, High-street, Manchester, fell, causing great destruction and damage to property. The Wheatseaf is a very old building, said to be the oldest licensed house but one in the city. The building is four floors in height, and of peculiar arrangement. Originally it consisted of the front premises and a yard, but subsequently the buildings at the rear were added to it, and the Wheatseaf proper then comprised what is almost a square block, passages connecting the additional buildings. The proprietor is Mr. Wood, and recently he has carried out extensive alterations in the interior of the house, at a cost of some 1,500. An examination of the premises which has been made leads to the supposition that the building fell from the inside. A cracking noise was, it is stated, first heard, and then the fall of the roof followed, the debris bursting through all the floors of that portion of the first block which is nearest Market-street, leaving the remaining portions of the building, or what may be described as the other wings, together with the contents, practically uninjured. The only way of accounting for the collapse, apart from the supposition that the building was struck by lightning (of which there is no proof, although a thunderstorm prevailed at the time), is that it was caused by decay, the supports of the building giving way through age. Fortunately no one was injured.

THE BAVARIAN NATIONAL,  
INDUSTRIAL, AND ART EXHIBITION,  
NÜRNBERG.

OLD Nürnberg, the city of Albrecht Dürer, in which German art, at one period of its history, shone forth with a splendour which has been equalled, but never surpassed, has done honour to its venerable traditions by holding an exhibition which gives an impressive picture of the present state of the arts and industry of Bavaria. The exhibition buildings have been erected in the old park called the Judenbühl, outside the walls of the many-towered imperial city, and at the foot of the old imperial castle, in which the green of trees surrounds the various edifices with a charming frame. The visitor to the exhibition enters the park by a broad avenue of trees, the first object to strike his eye being the reception-hall, a neat and well-decorated villa, through the pillared portals of which may be espied the Oriental splendour of its interior. The art pavilion, which is next seen, is not so happy in its exterior, but any shortcomings in an architectural sense are fully compensated for by its contents. The art exhibition which it contains gives us a picture of the development of the arts in Bavaria since the beginning of this century, consequently the period under King Ludwig I., as well as a view of the present state of efficiency of Bavarian art. By the manner in which this has been done, it is not too much to say that the art pavilion is the pearl of the Nürnberg Exhibition, and which will prove the principal point of attraction, especially for the foreign visitor. Joined to it by a covered lobby is the pavilion for industry and traffic. In the open court inclosed by this building a fountain has been placed, and from it a reading-room and the postal and telegraph offices are reached. The exhibition in the northern wing of this pavilion is especially instructive, being devoted to traffic; the southern wing is filled with objects relating to education. The hall which follows contains two complete railway trains, amongst which is a sleeping-car. This room, again, leads into the machinery hall, of an area of 45,000 square feet.

The most fantastic in its ornamentation is the principal industrial hall, which we illustrate. Although a blending of the Renaissance with the Indo-Oriental style may be objected to by critics, the edifice, as a whole, agrees very well in its appearance with its surroundings. This gigantic building, which is four times the size of the Stuttgart Exhibition of last year, contains in eleven groups the works of over 1,600 exhibitors. The efforts made in this department deserve recognition, if with quantity the quality of the exhibits is taken into consideration. The first place, perhaps, not only in Bavaria, but also in Germany, must be accorded to the art industry of München. Most remarkable are the manufactures of the gold and silver smith, and the products of the furnishing trade. We have no space at this moment to enter into the details of the exhibition, but the above rapid sketch may convey an idea of what is to be seen. The most instructive part is undoubtedly the fine-art department. The number of exhibitors, including the art section, is 2,850. The area covered by the exhibition is thirty acres; that by the buildings alone being over eight acres. It would not be right to overlook the efforts made in providing food and drink for the visitors. The national beverage, Bavarian beer, is well represented, and, let us hope, of the usual excellent quality. The pleasant wine of the Palatinat is also to be fore. There is nothing the Bavarian loves more than music. To satisfy his craving in this respect, concerts take place every evening in front of the principal restaurant. The park is illuminated at night by the electric light.

One point more in connexion with the exhibition must not be overlooked. When it was opened, on May 15th, it was completely ready in all its details. The catalogue, of over 500 pages, was finished the day before the opening. It contains, besides the list of exhibitors, statistical and historical introductions, prefixed to the various groups and sections, and will thus be of permanent value. The exhibition was planned and carried out by Herr Dr. Stegmann.

**Sir John Soane's Museum.**—Professor Hayter Lewis, F.S.A., has been appointed a life trustee to fill the vacancy caused by the death of Mr. Mocatta.

CHURCH (R.C.) OF ST. FRANCIS OF  
ASSISI, MAIDSTONE.

An account of this church, of which we publish a view and plan this week, was given on the occasion of the nave and western portion of it being opened by the late Bishop of Southwark.\* The chancel and the remaining portions have now been completed. Mr. C. G. Wray, of London, is the architect.

Plan of Church (R.C.) of St. Francis of Assisi.

It is expected that the north side of the church, which is at present shut up by adjoining buildings, will shortly be freed from these obstructions, a deep cutting for the new railway from Maidstone to Ashford taking their place, by which an uninterrupted view of the church will be obtained for a considerable distance.

THE NEW HOMES FOR ORPHANS,  
SWANLEY, KENT.

THESE buildings, the foundation-stone of which is to be laid this day (Saturday) by H.R.H. the Prince of Wales, with Masonic ceremonies, are intended for the maintenance and education of orphan boys, and are being erected for the Committee of the well-known "Homes for Little Boys," at Farningham. Admission to the latter, however, being by their regulations restricted to the absolutely homeless, while, on the other hand, admission to the existing Orphan Asylums can only be obtained by the tedious process of election, the necessity for a home at once, where fatherless boys could be received on payment of a small annual sum, was felt to be urgent; and this want the present buildings are specially designed to meet. The boys would be admitted at an early age, and, after benefiting by the advantages that this institution gives, leave it qualified to earn their own living.

As there will here be congregated at the same time boys of all ages, the initial idea of this scheme is,—as will be seen from the accompanying plan and view,—the provision of a number of detached houses in order to facilitate the classification and separation of the boys, and these houses are grouped round a central block of school and workshop buildings.

The buildings are arranged on the site in such a way that the principal rooms may have a southern aspect, and also command a view of the charming scenery in this neighbourhood. They lie high, and are pleasantly situated near the Farningham Homes, and close to the Swanley Junction of the London, Chatham, and Dover Railway.

The reception blocks, or Dame's Houses,—blocks D and F on plan,—are semi-detached, and are each intended for the accommodation of twenty-five boys, who, being very young, would be under the care of a dame, or mother, until they were sufficiently advanced to be transferred, firstly, to the Assistant Masters' Houses,—blocks C and E on plan,—where they would be under the influence of the masters at home as well as at school; and, finally, to that of the head-master,—block B on plan. Here, during the last and most important period of their stay, they, under the guidance of the head-master and two assistant masters, would be especially prepared to make their start in life.

The central block,—block A on plan,—comprises the school-hall, with class-rooms in connexion, on the first or principal floor; and, on the ground floor, the general stores and offices, and also the technical workshops. These are intended to be specially fitted up, as may afterwards be considered advisable by the committee, who desire that the boys shall have the advantage of a good technical as well as general education.

The total accommodation at present contemplated in the blocks, as mentioned above, will be for 120 boys, but ultimately it is the intention of the committee to complete the buildings, as shown on the plan, when they will be able to receive 200 boys; and still be in a position to provide for a future extension, if necessary.

While keeping in view the wishes of the committee, it has been the special aim of the architect to combine the best and most efficient arrangements with compactness of plan and economy of cost; and, although the general structural arrangements are, therefore, of the simplest character, the health requirements of the inmates have been considered.

With regard to the external treatment of the buildings, a simple yet picturesque effect has been aimed at in the general grouping, but the use of expensive materials has been avoided.

The walls are hollow, of stocks, with red facings, and very little stone is used except for sills, steps, &c. The contract for the first portion has been taken by Messrs. Martin, Wells, & Co., of Aldershot, who are carrying out the works under the superintendence of the architect, Mr. Henry Spalding, of 91, Queen Victoria-street.

"CLASSICAL POESY."

THE allegorical figure of "Classical Poesy," by Edmund von Hofmann, and intended for the new Burg-Theater of Vienna, which we illustrate in this week's *Builder*, was one of the best works to be seen in the Austrian section of the International Art Exhibition held in the Vienna Künstlerhaus. The carefully-executed figure testifies by its pure lines and the high standard of its conception to a not common talent. Edmund von Hofmann was born on November 2nd, 1847, and is consequently a young artist, who, independently of the future which is still before him, has already a remarkable past, having distinguished himself by a number of excellent works. The figure of "Classical Poesy" is intended for the centre projection of the Löwelstrasse façade of the new Hofburg-theater, its counterpart being the statue of "Romantic Poesy," also to be modelled by Hofmann. With the figures, by Kundtmann, of Melpomene, Thalia, and Apollo, the two statues of Hofmann's will be the largest which will adorn the new edifice. They are to be 11 ft. high, and in Marzono stone, a hard limestone. The block of stone for "Classical Music" had a weight of thirty tons. Edmund von Hofmann received his education at the Vienna Academy of the Plastic Arts, under the supervision of Professor Zumbusch, whence, having obtained the Roman Prize Stipend, he proceeded to Rome. He has executed some effective sculptures for the new Vienna Town-hall and the new University.

\* See *Builder*, vol. xxix., p. 544 (Oct. 30, 1880).

Wyman & Sons, Printers, Queen St

THE (R.C.) CHURCH OF ST. FRANCIS OF ASSISI, MAIDSTONE.—MR. C. G. WRAY, ARCHITECT.

"CLASSICAL POESY," ALLEGORICAL FIGURE FOR THE NEW BURGTHEATER, VIENNA.

MODELLED BY EDMUND VON HOFMANN.

## CHURCH DECORATION IN 1882.

FIVE HUNDRED POUNDS (and we should think much more will be spent before all is done) have been freely contributed to the decoration of a church in Surrey, and the experiment made in consequence is one which the architect will regard with no little interest. Contributed as a free, and we believe it may be added mainly an unasked, gift, the donation for the decoration of the Church of St. Nicholas, Guildford, is only the last of a series of munificent gifts, which, within a few years, have reared a new and handsome building on the site of one which had become unfit for the wants of the parish; have filled its windows with stained glass, have supported its services by a fine organ, and have rendered the tower vocal by a peal of new bells. As to the disposal of free offerings of this nature, criticism is silenced; although it may be permitted to express a regret that a provision of proper egress from the building, to the want of which attention has more than once been pointedly called, has not attracted the attention of the beneficent in preference to, or, at all events, concurrently with, the addition of ornament to the interior.

The object of the writer, however, is not criticism. It is our wish to attract the attention of those competent to form a correct judgment on the subject to the conduct of what we take leave to regard as a very interesting experiment. And this we wish to do in an architectural sense alone, without inuendo or *arrière-pensée*. There are, of course, many people in this country who regard the introduction of colour into the interior of a church with unmitigated dislike, not so much on architectural as on theological grounds. Into that part of the question we decline to enter. There long has been, and probably long will be, room for the views of opposite schools on this subject. The architect who is familiar with the glorious churches of Italy, or with the sometimes even richer, though less known, ecclesiastical buildings of the Iberian peninsula, will feel disposed to regard the pictorial, rather than the ritual, excellence of a church-interior as that with which he is chiefly concerned. And it is from this point of view alone that we venture a word or two on the subject of interior decoration.

The question, as it seems to us, which is very aptly illustrated by the work in question, is that of the true canon of decoration, taking it for granted that decoration is desirable. It is the more necessary to make up our minds on this now, because there is a considerable conflict between the theoretically correct and the practically possible. The spirit of the old church builders, or even of their earlier predecessors, the builders of the noble temples of Jewish, of Grecian, and of Egyptian worship, has of late breathed in the fiery language of a great art writer, who has insisted on the necessity of the true, the thorough, and the unsparring in architecture, and especially in ecclesiastical architecture. As to the abstract truth of canons such as these we have no doubt. But what the architect has to do, ninety-nine times out of a hundred, is, not to carry out art canons regardless of expense, but to produce the best effect by limited outlay. Thus, all those rules (essentially correct as they may be) which prohibit anything like mechanical ornamentation, and which prescribe that every wreath of foliage, or every graceful arabesque, added as decoration to a building of a certain order, must be the expression of the mind of the artist; must, in fact, be more or less something of a hymn or even of a prayer, crystallised in stone or in pigment, have to be regarded under the control of ordinary common sense. No doubt it would be charming to many of us to use no earthenware but such as bore the flowing touches of the pencil of Raffaello or of some of the masters of the majolica art. But this would, for most of us, simply mean that we had to eat out of wooden trenchers. And the entire advance which has been made in the beauty of the ordinary table service since 1851 has been due, not to the refusal of any ornamentation but such as bears the stamp of the individuality of the artist, but to the improving (under the best artistic direction) of good mechanical procedures, by virtue of which articles of beauty, although cheaply and mechanically produced, may be attained by the million.

On this view of the case, we think that the objection which may be theoretically raised to

the use of stencilling or other mechanical means of effecting decoration in a church tends to vanish. Fresco, as the word is understood in Italy, is as yet generally considered to be impossible in England. At all events, we have grim and grizzly failures to which to point. Some say it is the fault of the climate. Some attribute it to a want of the art element in the English character. For our own part, we are inclined to attribute it in the first place to our manipulation of lime, which is the opposite of the Italian mode, and then, secondly, to the consequent absence of the early and instructive training of the workman. It is when material grows ready to his hand that the native genius duly fed from his cradle. Otherwise he has three chances out of four of being either starved, or converted into a merely mechanical workman. But be this as it may, the fact is that if we were to wait for free hand, or original, bold, and flowing decoration, we should have few buildings that would have any chance of being decorated at all. The very few men whose facile brushes would obey their hands, as do those of comparatively humble workmen in Italy, would not be able to make much impression on the acres of wall that it might be required to decorate. And the free hand work of the untrained workman has more of the grotesque than of any other element, and that by no means a pictorial grotesque.

We come, then, rather in spite of ourselves, to the conclusion that if colour decoration be desirable in any of our churches, the method which has been adopted in the case in question, viz., the use of stencil plates, for giving the outlines of patterns to be filled with colour, is in most cases a practical necessity. And in the present case there are medallions of angels, and figure-scenes in a sort of frieze, which are not altogether mechanical in their production; some of which though quaint, are not without a sort of suggestive beauty of their own.

The main idea of the decorations to which we call attention is that of accentuating the structural lines of the building by strong lines of colour,—not glaring, but laid in with a bold touch. Between the ribs, vertical and horizontal lines simulate, to a certain extent, masonry, viz., they do so in a conventional rather than in a servile manner. The joints of the imaginary stones ramify into foliated luxuriance. Over the east end windows, indeed, a deep red colour has been introduced, with the aim, or at least the effect, of representing ordinary brickwork. This might *per se* be criticised. But the whole progress of the work has been such as to show that a correct opinion can only be formed of it as an *ensemble*. The decorator has evidently felt his way, and the ornament produced one day has sometimes disappeared on another, because it did not accord with something else. Thus a pair of monolithic pillars of clunch, which were almost the most striking feature of the chancel in its original nakedness, had so poor, not to say grubby, an appearance when the scaffolding was removed, and the contrasts with the coloration of the roof became apparent, that the decorator has tinted the stone, and introduced bands with coloured roses, to the improvement, it must be confessed, of the general harmony.

Here, again, theory and practice clash. To paint or colour stone is to sacrifice a true, permanent, and often noble, material to a fictitious, transitory, and inferior mode of finish. That, we think, is a sound canon. But how if the stone, in its natural colour, afford so harsh a contrast to the tinted work as to ruin the harmony of the building? One man will reply "That shows that you are wrong in introducing colour at all." Perhaps that may be true; but that is not the question. Here we have decided on a coloured interior. It seems to follow that we must do violence to the theoretic canon, in face of actual facts, and colour stone, or fail of good effect.

It will be seen that these are not more academic questions, or imaginary difficulties; but real practical dilemmas which turn up in the course of the execution of a work, and which are not to be solved by the simple application of a theoretic rule, but as to which it can only be said *solvitur ambulando*, and as such, observation from time to time has led us (we confess somewhat unexpectedly) to render justice to the taste of the artists and workmen of Messrs. Clayton & Bell, and to recommend those of our readers who have cases of the kind to settle, to pay a visit of inspection to their work.

And, after all, there is, perhaps, a broader view of the case to be taken than we have yet suggested. What is desired as the chief object of such a work as a fine chancel? Effect,—*ensemble*,—tone. Who, among the hundreds who worship in a church, is careful, or perhaps able, to criticise the details of its structure, let alone its decoration? But who is there, on the other hand, on whom the *ensemble* does not produce an effect? On some, no doubt, the effect produced, even by such a gorgeous and stately interior as that of the Church of the Annunziata at Genoa, is much the same as that of a rag of red on a turkey-cock, or a scarlet cloak on a hull. But for them, be they right or wrong, we are not now writing. For others, we feel bound to admit, that the effect of the chancel in question, with its graver harmony of colour, as compared with the original nakedness of the greenish grey brickwork of the interior of the church, is a manifest and notable gain. Not the least advantage gained is the manner in which a more than questionable reredos of gilded wood, and windows of which the intention was, no doubt, better than the execution, have been toned down into happy obscurity.

One really excellent piece of workmanship is the choir screen of brown and white marble, which has replaced a somewhat unsightly dwarf stone wall, between the chancel and the nave. This screen is arranged in a series of niches, with stilted semicircular heads, in each of which a slight tracery of white marble is introduced, as if forming the frame-work of windows. Dwarf columns of green porphyry stand before the intermediate piers. The effect of the screen world, we think, have been every way superior if it had been pierced *au jour*. This, however, is a matter of opinion; but there can be no doubt that it is a fine piece of work as it is. Many, of course, will want to know why there should be a screen at all, and we certainly shall not deny their right to the inquiry. It is remarkable that the first effect produced by the erection of this screen was that it seemed to "kill" the pulpit, which is a graceful stone structure, with marble and porphyry dwarf columns, enriched by bas-reliefs, and which (at a due distance, and without criticism of the drawing of the figures) is a beautiful work. It is probable, however, that the extreme polish of the new marble had a temporary effect, which time will tone down. The decorators, moreover, have stained the stone steps since the erection of the screen, among of those bits of practice which one would condemn by anticipation, but which seem justified by effect. Hammered iron gates are in course of execution for the choir screen, in the hands of a local firm, who are sure to maintain some of the old English traditional skill in this excellent kind of workmanship. When that softening touch of time, which seems more rapidly to fall on churches than elsewhere, has passed over the chancel of St. Nicholas, we think it will be generally admired. At all events, we say to all would-be decorators,—Go and look at it.

A LOVER OF COLOUR.

## A CHAPTER ON CHIMNEYS.

WITH the exception of the Great Pyramid of Egypt (Cheops) and the spires of the cathedrals of Strasburg and Cologne, the tallest buildings in the world are chimney-stalks. Nevertheless, the interest which many may take in chimneys will most likely rest not on their size, but upon their universality, upon their commonness and usefulness. Every one, he who he may, with whatever grand historical personages he may be otherwise connected or disconnected, has relations more or less with some chimney-stalk or other.

Chimneys are the nostrils of a house, and we know how necessary to the life of any object is the breath of its nostrils. In Chambers's "Encyclopædia" it is stated that before chimneys assumed their present form these nostrils of the house were placed at the back of the fireplace, not far above the grate; the vent or flue was short, and turned at the top towards the outside of the wall, through which the smoke found its passage in slits made for the purpose. In those Medieval times, smoke, not of cannon, might every day be observed issuing from the sides of the castle wall. Now the smoke invariably reaches the open air through perforated columns placed upon the top of the walls of the house. So that instead of looking like the nostrils of a building,

The chimneys seem rather to occupy the place of ears, as on a horse's, zebra's, or lion's head. You can give expression to the look of a house by them as in the case of the heads of these animals by the make of the ears. You can fix the character of a house by the arrangement and regulation of the height of the chimneys as much almost as by the order of the design of its front. For all that, comparatively little attention is paid to this part of the building; up among the chimneys is the last place we look for order or classification, or even for symmetry in a land or street of houses; and when we discover the elegant and symmetrical, up there, we are as much surprised as when we find silver spoons in an ashpit. It is curious to observe that while in general it is thought requisite to have the end of all towering and pointed erections, finished ornamentally, the chimney-head should so frequently be left an exception to the rule. The pillar has its capital, the post its cap always,—the topmost concludes with a button; the spire is invariably crowned with a gilded vane or cross; the tower has a cope and pinnacles; the top of the hutch is turned to pomegranate. The chimney-head alone, with rare but honourable exceptions, concludes, even when otherwise elegant in itself, most generally with the old time-battered, weather-streaked, familiar, red tile pot or can.

Meet people consider a "chimney hat" or "tile" an ugly thing on a man's head. I consider a brick can an equally ugly thing on the top of a chimney-head. It is especially ugly when the wind blows it over, and it falls, and hits somebody in the street.

Often these tile cans are hanging over to one side, like Willie with his wig a-gone. Some of them are high, some low; the more reputable are duplex, and have a long lower and short upper part; the less reputable are devoid of the top appanage: they have either lost it in scimmages, or never possessed it. Sometimes two or three are piled up in a line, and the toppling figure they form seems ever ready for decline and fall. Sometimes you observe one which has been halved by accident, and which presents a broken and jagged edge to the sky. On rare occasions you may happen to come across one which has been honoured by having two or three upper portions shoved over it, like the old clothesman of caricature, with his multiplicity of hats, or the fashionable lady described by Goldsmith:—

"Skill'd in no other art was she  
But dressing, patching, repartee,  
And, just as humour rose or fell,  
By turns a slattern or a belle,  
'Tis true she dress'd with modern grace,  
Half-naked at a ball or race;  
But when at home, at board or bed,  
Five greasy nightcaps wrapp'd her head.  
Could so much beauty conscientious  
To be a dull domestic friend?"

Sometimes one stands alone like a sentry. More frequently they are found clubbed together on a stack, like a row of the awkward squad, short and tall, lean and fat, high coloured and cadaverous; some in the attitude of attention, others standing at ease, veterans of the smoke and storm in broken rank and file.

It is no doubt the case that there is a class of old-fashioned and homely buildings the chimney-heads of which the old red tile pot suits, and which nothing else would suit so well. Let it remain and hold high holiday on the top of the thatched cottage and the country manse for ever and a day. But for town buildings, and for all mansions that make any attempt at architectural display, the red tile is an anomaly,—not in keeping; and some funnel of a different pattern, if not of different material, should be substituted for it. It is pleasant to observe that earthenware funnels of really elegant form have been introduced in some instances. There are other forms recently introduced which are not so elegant, and little bits of white or cream-coloured cylinders (like elephants' toes) are among the number which I cannot admire.

To what extent, in fine, are the chimney-heads to be treated ornamentally? Should they, in the general design, be made to occupy a conspicuous or only a subordinate place? Are they just to be made passable so as to escape criticism, or are they to be made notable, so that the eye may be attracted to them as an object to rest on? These are questions the architect may put to himself, and which he must answer according to his lights. It will always be safe for him, however, to put some tidy work upon them in preference to running

over them in a slovenly way. When there are a number of heads to be placed on one building he should also ask whether they are to be placed at random, to suit convenience merely, or are to assume geometrical positions, and be placed as the points of a mathematical figure,—whether he will have them put up without due respect to the site or height of each other, or will have them arranged in order, say, like the couples in a dance. I have sometimes seen an old chimney placed so awkwardly that it seemed as superfluous as a third ear on the head or a sixth finger on the hand. The chimney-heads on an elegant building should, to use as a paraphrase words intended for another subject, "possess grace and naturalness, delicacy and strength, balance and order; they should combine freshness of conception with perfect accuracy of execution, and be both familiar and sprightly."

"The chimneys of Venice," says an acute observer, "are not the least remarkable part of her architecture, and no two are alike. There are many with a slender stem of, perhaps, a yard in length, and calyx-like top resembling a tulip; others almost precisely like the watch towers on the corners of ancient castle walls; others of strictly Gothic style; and some of Doric design and classical proportions. Occasionally there is one with such a slender stem and overgrown top, loaded with a redundancy of ornament, that it is the very insanity of a chimney. They catch the last rays of the setting sun, and reflect the opal glories of its tints."

The head of the chimney may be said to consist of four parts,—the plinth or the base, the stalk or column, the cope or capital, and the funnel or chimney-pot. The inner and concealed parts of the chimney likewise may also be said to consist of four parts,—the freplace, where the grate stands; the throat, immediately above that; the vent, or smoke-channel, which succeeds in the order of ascent; and the chimney-top, or lum-head, as it is termed in Scotch, which is the conclusion of the whole affair.

With regard to the *envelope* of chimneys. It is better to have the chimneys of a house placed in the inner or partition walls than in the outer and carcass walls. There are two reasons for this. One is that they vent better. The hotter the sides of a chimney are the stronger the draught up it will be, and the chimney sides are kept hottest when in the inner walls of the house. The other reason is that heat is economised by having the chimneys in the partition walls. When the chimney is in the outer wall, the side towards the street or open air is generally very thin, sometimes not more than 4 in. thick, and a considerable portion of heat passes through this slender side into the open air. After a shower of rain that part of the gable of a house through which the chimney runs dries more rapidly than the other parts; this shows that the heat is coming through the side of the chimney and getting out of the house. When the chimney is situated in an inner wall, the heat radiates from it into the house on both sides.

Now that the practice of youngsweeps riding through chimneys is discontinued, and there is no longer any demand for projections and roughness in their interiors to make stirrups for their little feet, the inner lining of chimneys should be smooth throughout. There should, moreover, be no abrupt turns, no knees or sudden bends, and no level reaches, but the smoke-channel should be made as easy, direct, and flowing as possible. The cross section of that channel should never be oblong or oval, for as the smoke inclines to circle in mounting the chimney, opportunity should be given to allow of it rising in this way; the cross section ought, therefore, either to be round, or square, or of some concentric polygonal figure.

It will not, and cannot be denied that many chimneys are defective, and do not fulfil their office as they should. Some smoke more regularly into the house than into the air; others have an occasional down-blast in certain acts of the wind. Some others cannot be made clean by any amount of sweeping, and when these are kitchen chimneys the auld wife's cakes are threatened with a deluge of soot and certain destruction, whenever she puts on the griddle to bake. If there comes a soft or thawing day, especially, the premonitory colliery drops never fail to come down upon the first griddleful, and splat the cakes with black.

There are chimneys, again, which require fires like furnaces to rouse them up before they will vent at all.

Perhaps some one may remember being shown at night into a spacious but dingy bedroom, where the furniture had a pall-like look, and where, when the final how was made, and he was left to himself, he saw that there was a new lighted fire in a large grate under a frowning mantelpiece. This fire, which consisted mostly of black coal, was flaring and smoking a deal, but there was little red in it. There was at the same time, he found, a cold draught moving across the room at the rate of fifteen miles an hour. The feeling of the atmosphere was raw and chill, and the visitor became shivery-shakery. The fire seemed to be drawing out the cold damp which always harboured in the corners of the apartment, and the visitor had left a room which was overheated with fire, light, and fumes. He gets into bed as quickly as he can, puts out the auxiliary light, and trusts to the faloxy friend of the fire for relief. It proves but a chimaera, casts a feeble light on the hangings, becomes less, but at last succumbs to that cold draught travelling across the room between the bed, and it flutters and flickers as if uncertain what to do,—flares up, and goes out.

The fact is, that a fire may be drowned out by having too much cold air violently forced upon it. Fire-places which are too large, grates which are too open, have the fault besides of allowing the air to play about everywhere but upon the point where it is wanted; blowers and newspapers held up in front of fireplaces correct this, and direct the air to the points where the fire is lighted.

When complaints are made of chimneys not venting, it should be borne in mind that the smoke goes out from the chimney-top into an uncertain, changeable, and sometimes tempestuous element. Lieut. Maury, in the "Physical Geography of the Sea," says,—"There are many abiding surfaces, irregularities, &c., which produce a thousand eddies in the main stream of the atmosphere," and also, "Each valley, every mountain range, and local district, may be said to have its own peculiar system of calms, winds, storms, &c."

Count Rumford's assertion that every chimney can be made to vent perfectly, must be taken with some deductions. It is well understood that hills, buildings, and such like large objects, in the neighbourhood of a chimney, are apt to affect its venting. In certain acts of the wind they may direct the air obliquely upon the chimney, and with a dip downward, so that it is blown into the mouth of the chimney, and the smoke is driven back into the vent, like a man forced to eat his own words. Placing a slab above the mouth of the chimney may serve to correct this. Or, where the chimney and a building close to it are the same height, or nearly so, the wind which comes over the building, cutting across its ridge, comes straight and sharp as a razor along the mouth of the chimney, when it is blowing keen, slices away the smoke as it ventures out, and when blowing hard and all compact, it acts like a lid, off and on, and stops the mouth of the chimney. The cure for this, of course, is lengthening the chimney and raising it considerably higher than the adjoining building.

With regard to what is called back smoke, that is, smoke from one chimney getting into an adjacent chimney, and through it into the apartment connected with the first chimney, I am told that the routine is this. When a chimney is going, the draught in it is upward and skyward; but when a chimney is empty the draught is downward and houseward, the heat of the apartment in the last case causing the cold outer air to gravitate down the cold chimney. When there are two chimneys standing side by side, one of which is going, while the other is empty, the smoke from the going chimney is at times, in certain acts of the wind, blown across the mouth of the empty chimney, and being caught by the current of cold air running down that chimney, is carried with it into the apartment with which it is connected. The way to cure this and get rid of back smoke is to seal up the empty chimney. In old and frail houses, where the chimneys are shaken, back smoke may be caused by smoke passing from one chimney to another through rifts and chinks in the party-wall between them. There is no cure for this,—the disease in this case, like Mr. Pecksniff's complaint, is chronic.

It may not be out of place to sum up by stating the three approved methods of curing chimneys which do not vent well, applied by Count Rumford and all smoke-doctors since his

time. The first is lengthening the chimney at the top, this increases the quantity of heated air in the chimney, and gives more power or head by increasing the difference between the weight of the air per foot, in and outside of it; the second is contracting the chimney at the throat: this increases the speed with which the heated air passes through it, and gives a heightened initial velocity to the smoke when beginning its course up the chimney. The third is when there is a deficiency of air in the apartment to feed the flame and blow up the fire, putting ventilators into the sides of the apartment, or into the windows or doors.

This imperfect chapter will indicate in a small degree how important for comfort the right construction of chimneys is, and how neatly and correctly all these parts should be built from bottom to top. W. Y. B.

FROM EDINBURGH.

IN our last notice regarding the restoration of St. Giles's Cathedral we referred to the circumstance that no plaster had been used in the nave, as had been the case in the choir. Dr. Chambers has intimated his intention of bringing the choir into unison with the nave, by substituting stone where plaster is used, which will impart a thorough and substantial aspect to the whole interior. The only portion of the walls which will then be left plastered will be the Albany Chapel. A beginning has been made with the new west doorway, and Dr. Chambers has stated his wish to erect a chapter-house, to the east of the south transept. These additions will bring into prominence the poor character of the rest of the exterior. Dr. Chambers has done much and paid much for the restoration of the building, and it is to be hoped that some others may follow up the generosity he has displayed, by thoroughly restoring the whole exterior.

Several years ago a Mr. Ross presented a fountain to the city, which has been placed in West Princes-street Gardens. His widow, who died recently, has left a bequest of 1,500*l.* towards the formation of a covered rock garden and fernery in the same garden. Mr. Morham, the city architect, has prepared designs for the proposed erection.

"The drawing shows a series of three dome-shaped buildings, the central and largest of which is 60 ft. in diameter. The smaller ones, connected with the central building by corridors, 32 ft. in length by 25 ft. in width, take the shape of projecting wings of elongated form, the front elevation of each being domed so as to preserve the general character of the design. The width of the wings will be 37 ft., and the height from the level of the garden 50 ft. The central house will be 47 ft. high. The superstructure, built of iron and glass, will have a frontage of 200 ft.; and it is proposed to place it at the foot of the bank at the east end of the northern section of the west garden, the central portion forming an effective termination for the principal walk. The rockery in this part of the house will take the form of a hollow basin or grotto with winding paths, caverns, recesses, and rugged projections studded with ferns and other suitable plants, the rockwork reaching to a height of 15 ft. One advantage of the design is, that it could be carried out in sections as circumstances permitted, if that should be regarded as desirable."

The President of the Royal Scottish Academy (Sir William Ecton Douglas) has inserted in the *Scotsman* a vigorous protest against the erection of a structure of this kind in such a situation. With this protest we heartily concur. The proposed structure is similar to the Winter Garden for which designs were exhibited a good number of years ago, and which we pointed out to be incongruous with the surroundings. No structures of any kind can add to the beauty of the valley, and a structure of glass and iron in the proximity of the Castle rock would be simply abominable. If the building is to be erected the Meadows would be a suitable place for it; but if the terms of the donation are imperative as to site, the gift should be rejected.

The North British Railway Company have erected a new goods-shed to the south-east of the North Bridge, and the company have asked the permission of the town council to bridge over a part of Cranston-street with a view to improving their communication southward. The effect of this would be to lengthen, in a southerly direction, the subway connecting this portion of the city with the Low Calton. The committee of council, it is understood, are favourable to the request of the company being acceded

to, subject to certain conditions regarding the lighting, &c., of the portion to be added to the subway. At the same time the opportunity is to be taken of pressing on the notice of the company the desirability of forming a new access to the Waverley Station by constructing a light footbridge from Jeffrey-street to the open platform behind the Post-office. The bridge would be carried across the railway on light iron pillars, and be about 500 ft. in length.

A new hotel is to be erected at the north-west angle of Prince's-street and St. Andrew-street, from designs by Messrs. Macgibbon & Ross. The elevations were so bald and unattractive that the authorities remonstrated against their being carried out on so important a site. Unfortunately there is not power to prevent the erection of a building of bad design aesthetically, if it is satisfactory in other respects.

The *Scotsman* has commented upon some startling revelations as to the way in which several prominent members of the Town Council were bribed by the Edinburgh Tramway Company, and gives a list of the persons bribed, which includes an ex-Lord Provost, who is stated to have received 80*l.*; five bailies, who are said to have received from 50*l.* to 300*l.* each, and five councillors, who, it is alleged, were paid sums varying from 15*l.* to 32*l.* each. Our contemporary says that in modern municipal annals there is no story more shameful than that of the way in which the interests of Edinburgh were disregarded, and the funds of a private company taken by public men in furtherance of what was a game of speculation.

NEW HOSPITALS.

**Eastbourne.**—On the 5th inst. H.R.H. the Princess Christian laid the foundation-stone of the Princess Alice Memorial Hospital. The late Princess Alice spent a portion of the autumn preceding her much-lamented death in Eastbourne, and, soon after the sad news of her decease was received, a public meeting of the inhabitants of the town was called, and a decision was arrived at, to erect a hospital to her memory on the Upperton Estate. The cost of the building will be about 5,000*l.*, of which more than 3,000*l.* have already been subscribed. The hospital, which will be in what is called "the Queen Anne style" of architecture, will consist of three blocks connected by corridors. On the ground-floor of the central block will be surgery and operating-rooms, the housekeeper's room, hall, kitchen, scullery, porter's room, larder, and pantry. At the rear will be a large yard with the usual offices, and on the first floor of this portion of the building there will be bedrooms for the nurses. The wings on either side will contain respectively the men's and women's wards, the accommodation provided in each being six beds. These wings, which will consist of only the ground-floor, will be capable of extension should necessity arise. The entire length of the building will be 164 ft. and its width 82 ft. It is contemplated that the hospital, the contractor for which is Mr. W. Gregar, of Stratford, will be completed in March next. The architect is Mr. T. W. Cutler, of Queen's-square, Bloomsbury. The site, which is about an acre in extent, was given by Mr. C. Davies Gilbert.

**Birmingham.**—Operations have been commenced for building a new hospital at the corner of Church-street and Edmund-street, in connexion with the present building in Temple-row being inadequate for the growing requirements of the institution. Mr. W. Robinson, contractor, is carrying out the work, from the designs of Messrs. Payne & Talbot, the architects. The building will be, as regards style, in a modification of "Queen Anne," and it will be executed in dark red brick, with light-coloured stone dressings. In the main features the architects have followed the plan adopted in the Paris hospitals. The principal entrance, which will be very ornate, will be in Church-street, and will lead into a large entrance-hall, and thence into a corridor and staircase-hall. From the corridor a double stone staircase will rise to the top of the building. The whole of the corridors will have fireproof floors, and the wards will be laid with teak. In the basement there will be the wood and coal stores, a room for the preservation of the books, a mortuary, a bath-room, and also a leech-room. The ground-

floor will be mainly taken up with the out-patient department, comprising a large waiting-room, 75 ft. by 35 ft., ample for the accommodation of 200 people; a consulting-room, two minor operation-rooms, surgeon's rooms, secretary's room, and dining-room, besides the entrance-hall previously mentioned. On the first floor there will be a suite of day-rooms, including a smoke-room, on one side for the men, and a suite of day-rooms for the women on the other side. Rooms for the house-surgeon and matron will be situated in the central block. The men's sleeping dormitory is located on this floor, and there will also be a ward in the centre that can be devoted to the use of men or women, as the occasion may arise. On the next floor there will be sundry sleeping wards, and also an operating-room well lighted from the north-east. The kitchens, nurses' rooms, and offices will be in the centre of the block at the top of the house, and will be reached by means of two lifts in communication with the stores-receiving room in the basement; while a third lift will communicate with the dispensary for the conveyance of medicines. The building will form three sides of a quadrangle, and will cover 1,080 yards of land. It is estimated that the new hospital will involve an outlay of about 20,000*l.* Beds will be provided in the new building for sixty-five patients instead of forty-four, as in the present institution.

**Hope, near Salford.**—The new infirmary which has been built at Hope for the accommodation of the sick and infirm poor of the Salford Union is approaching completion, and will be opened in about a month from the present time. The site of the building is about 310 yards in length and 55 yards in width, bounded on the eastern side by an intended street 12 yards in width, and on the southern side by a carriage drive of the same width. The hospital is designed on the pavilion principle, and a continuous corridor 850 ft. long and 10 ft. wide connects the several pavilion blocks with each other and with the administrative block, which latter is placed in the centre so as to be easy of access from the several departments. This corridor is enclosed on the ground-floor level, but on the two upper stories it forms an open gangway for communication between the several blocks. The sides are protected by parapet walls and iron palisading, and in favourable weather will provide a pleasant resort for patients sufficiently convalescent to enjoy the fresh air and a view of the surrounding scenery, which at this point is perhaps in many respects the best to be found in such close proximity to Manchester. All the corridors and gangways are fireproof, the floors being formed of concrete carried on wrought-iron beams and rolled iron joists. Fireproof construction is also adopted in the staircases, which are all of solid Yorkshire stone. In connexion with each of the two double-pavilion blocks, which together will contain 400 patients, an additional staircase of fireproof construction is provided for occasional use as another means of escape in the event of fire or panic. In connexion with these staircases there are spacious open-air balconies on every floor level for the use of the semi-convalescent old men and women patients, for whose use the double wards are intended. The single-pavilion blocks are four in number, each designed to accommodate 100 patients. The eastern or entrance block is appropriated to probationary and other patients of a peculiar type, and is sub-divided on every floor into what are practically separate hospitals. This block, which is approached by a covered carriage-way for the convenient reception of patients in all sorts of weather, provides for eighty patients, and also contains a residence for the head porter and his wife, a registrar office for the adjacent weighing machine, and store-rooms for the patients' own clothing. In connexion with the wards there are twenty-four capacious day-rooms placed to the south, with separate lavatories and other conveniences. The wards provide an average of 80 superficial feet of floor space and 1,000 cubic feet of air or breathing space for each patient. As there is a considerable proportion of Roman Catholic patients among the paupers of the Salford Union, a separate chapel is provided for them in addition to that provided for the Protestant section of the inmates. The central administrative block provides on the ground-floor level a large hall, which can be used as a winter garden or for recreation purposes, the whole length and breadth of the inner area, and about 45 ft. in height; large kitchen,

bakery, scullery, general store-room, nurses' dining-room, servants' dining-room, matron's room and a series of store-rooms for her use; storekeeper's residence and other rooms, medical officers' consulting-room and waiting-room, Board-room, cloak-room, and waiting-room, clerk's office, porter's room, dispensary, and drug-store; and in the centre a spacious entrance-hall, surmounted by a clock-tower rising to a height of 100 ft., having a portico in front, approached by a wide flight of steps from the carriage drive. The rooms on the first and second floors of the administrative block are appropriated to the use of the medical officer, assistant medical officer, matron, nurses, servants, and other officials. The laundry department is situated immediately behind the administrative block, and is separated from it by a wide covered way, having a glass roof as a protection to tradesmen and others when delivering goods, and to the laundresses and servants passing between the two departments with linen, &c.

The wards and day-rooms are all warmed by the patent Manchester grates of Mr. E. H. Shorland, which, when in action, keep up a copious supply of warmed fresh air, drawn directly from the outside, and at the same time extract the vitiated or partly vitiated internal atmosphere, to keep up the combustion of the coal fire. Supplementary extraction-shafts are also provided. The architect of the building is Mr. Lawrence Booth, F.R.I.B.A., of King-street, Manchester, under whose supervision it has been erected. The contract for the execution of the work was let to Mr. William Southern, of Salford, whose tender (43,480*l.*) was the lowest of those submitted for the complete building contract.

#### THE RESTORATION OF MANCHESTER CATHEDRAL.

A MEETING was held on Monday morning in the Manchester Cathedral Library, to hear a report from Mr. Crowther, architect, on the condition of the nave of the cathedral, and to take counsel as to the steps which should be adopted for its restoration. The Bishop of Manchester presided.

Mr. Crowther's report contained the following passages:—

The renovation of the exterior of the church has been in great part accomplished, but little, comparatively, has been done towards the restoration of the interior of the fabric, of which that of the nave is now in progress. Early in the present century the then guardians of the fabric were advised that the whole of the pier arches of the nave and aisles, the great chancel arch, and the superincumbent masonry, including the clearstory, were in so bad a state of dilapidation from the combined effects of time and rough usage as to need extensive reparation, improvement, and strengthening; and the authorities, with the best intentions, entrusted the execution of this important work to the incompetent persons who had reported on it. It will scarcely be believed that the initiative step taken by these iconoclasts was to cut away the delicately-moulded capitals and bases of the columns and bay-shafts, the traceried spandrels over the arches, and the Tudor-leaf cresting of the string-course surmounting them, and roughly hew all the remaining surfaces of the masonry, including the finely-moulded columns and arches, preparatory to coating the whole with Roman cement. A more recklessly-dangerous piece of spoliation it is impossible to conceive, for so far from "repairing, improving, and strengthening" the structure, it was materially weakened by the process, in some vital portions of it to a most dangerous extent. For example, on carefully removing the cement coating from the two most westerly bays on the north side, it was found that the springing stones of the arches immediately resting on the columns had been so much cut away as to leave an area of little more than 14 in. square of solid stone to carry the enormous superincumbent load. A careful calculation of the load which was borne by these stones shows that their reduced sectional area was barely sufficient to sustain it, with the fabric in a state of absolute rest and free from any lateral strain. The wonder, therefore, is that during violent storms of wind, such as that of the great tornado of January, 1839, when the pressure of the wind was equal to 50 lb. on the square foot, and the lofty clearstory must of necessity have been oscillating from so enormous a lateral strain, the whole structure of the nave did not collapse. There can be no doubt that the remaining springers have been cut away to the same extent in order to provide for the cement coating. With equally reckless recklessness the columns themselves, and especially the hauses sustaining them, had been mercilessly cut away, and one of the latter, that, viz., of the most easterly column, was patched up with brick. The

original architecture of these arcades was of great beauty and delicacy, and the work was so admirably executed and put together that although of unusual lightness it was quite adequate to its static requirements, and to withstand the effects of time. But the gifted architect who designed this noble church so constructed the fabric and its various details that not a cubic foot of stone more than necessary was used in the work, especially in this portion of it. A practised eye will at once detect this feature of the construction on examining the masonry of the columns and arches which have been stripped of the cement coating, and fully appreciate the danger to the fabric occasioned by the reckless cutting away of the stonework in order to form a ground and key for the cement coating. . . . The chancel arch with its great piers forming the eastern termination of the nave has been, if possible, more grievously mutilated than the lateral arcades, for the masonry of the piers, which contain winding staircases leading to the roof,—has been in parts reduced to a thickness of 3 in. only,—a thickness miserably inadequate to the weight it carries. The arch itself has not withstood worse usage. Iron hooks have been driven into the joints of the voussoirs, on the western or nave side, and on these a rim of brickwork was constructed. The spandrels and wall above the brick arch were then lined with wooden studs, lathed and plastered, and the whole of the surfaces covered with panelled tracery of meretricious design, worked in Roman cement. The masonry of the arch and heavy wall above it has been seriously shaken and disintegrated by the process of driving in the iron hooks, and the stonework has settled downward in consequence,—depressing the arch about 5 in. or 6 in. from its original contour. There are sufficient remains of the arch mouldings and general design of the whole original composition for the exact restoration of the chancel arch and piers; and, happily, the latter, below the level of the ancient roof loft, have not been coated with cement, and are in a nearly perfect condition. . . . On removing the external and traceried lining of the tie-beam of the most westerly roof principal, it was much started to find that the tie-beam was completely worm-eaten through three-fourths of its sectional area, and that it was no longer performing its office as a tie, but was simply suspended *in situ* by the principal rafters above, and the whole weight of the principal itself and of the most westerly bay of the roof was sustained by the mortising of the rafters into the king-post in the centre, and at the ends by the wall-posts and curved struts. . . . The roof appears to have been extensively repaired shortly before the ceiling was painted, some thirty-five years since, for the purlins are suspended by wrought-iron straps to the principals, and the transverse ribs in like manner to the purlins, from which it would appear that at that time the tenons of the framing were found to be so decayed as to need the help of the straps for their support. The ends of the tie-beams of this principal do not had directly on the clearstory walls, but on a strong oak corbel piece hehved on the masonry, and projecting about 2 ft. into the nave, and into this corbel piece the head of the wall-posts is framed. I cannot confidently say at present whether or not this is the original construction; but it appears to be so from the circumstance that a portion of the traceried spandrel of the curved strut is worked upon it. . . .

So far as I can at present judge, the plain foundation of the principals will chiefly have to be replaced by new timbers on which the ancient castings and enrichments, so far as they are sound, can be fixed as heretofore, and on this assumption, after making sufficient allowance for renewing decayed portions of the latter, I have formed the following estimate:—Estimate of cost of restoring the roof over the nave: No. 7 principals, at 125*l.*, 875*l.*. No. 9 bays at 150*l.*, 900*l.*; removing the lead and roof timbers, 85*l.*; shoring up and scaffolding, 120*l.*; relaying the lead and gutters, &c., 80*l.*; total, 2,050*l.*

The Dean of Manchester said that the responsibility in this matter rested entirely with the parishioners of Manchester, and with the wardens as their representatives. It was quite erroneous to suppose that the revenues of the Chapter estates could in any way be used for the sustentation of that portion of the fabric which was in the custody of the wardens, and which was the property of the parishioners.

Mr. G. Milner, speaking on behalf of the wardens, said that this restoration had been gradually forced upon them, and the further they went in their examination the clearer it became that immediate action was necessary. He was strongly in favour of a complete examination of the fabric, and a complete restoration.

Mr. Lings (the comptroller), Mr. Thomas Rose, and the Rev. H. Cottam (St. Mary's, Crumpsall) having spoken, the following resolution was moved by Mr. G. Milner, seconded by Mr. J. W. Maclure, and unanimously passed:—

"That this meeting, having heard the report of Mr. Crowther as to the repairs required in that portion of the fabric of the cathedral for the maintenance of which the parishioners of Manchester are liable, is convinced that such repairs are imperative and immediately needed, but before asking the public for subscriptions request Mr. Crowther to

prepare a full report as to its existing condition, and to furnish an estimate of the probable cost of a complete restoration of the same."

#### ST. JOSEPH'S (R.C.) CHURCH, BRIDGWATER.

THE newly-built Catholic church in Binford place, Bridgwater, is now completed, and has just been formally opened by the Rev. W. J. H. Clifford, R.C. Bishop of Clifton.

It may be remembered that the newly-built church has been erected at the expense of Mr. Philip Hewett, a native of Langport, who has been residing for several years past at Boulogne, and who expressed his willingness some months ago to Mr. J. Ruscombe Poole, of Bridgwater, to expend a sum of something like 1,200*l.* for the purpose, a donation of 1,000*l.* being given by him at the same time to the funds of the Bridgwater Infirmary.

The new church consists of a sanctuary or chancel, nave, aisle, side chapel, porch, organ-gallery, and sacristy. It is built of brick, with Bath stone dressings, and covered with Bridgwater tiles, from the designs and under the superintendence of the Rev. A. J. C. Scoles, the priest at present in Bridgwater. Early Decorated was the style chosen, which necessitated a simple form of construction, the beauty of which consists in its proportion and general outline. The entrance is through a doorway of solid construction. The nave has three double lancet windows, the chancel having a clearstory. The façade to the river is more imposing, with its three well-proportioned windows, relieved by columns and moulded arches. The wall between the chancel and nave is surmounted by a turret, containing the "sanctus" bell. The end of every gable is surmounted by a boldly-outlined cross. The east end has three windows filled with stained glass to the memory of one of the sons of Mr. York, its donor. In the north aisle a stained-glass window, representing the death of the patron saint (St. Joseph) has been erected by the priest (the Rev. A. J. C. Scoles) in memory of his late father, these stained windows being the workmanship of Messrs. Lavers, Barrard, & Westlake, of London. The altar is of stone, relieved by four marble columns, dividing three handsomely-moulded quatrefoil panels, to be afterwards filled with scripture, representing the three great sacrifices, namely,—of Melchizedek, the Paschal Lamb, and that of the Cross. Mr. J. Kitch, of Bridgwater, is the builder; Messrs. Bradfield & Sons, of Bridgwater, the masons; and Mr. A. B. Wall, of Cheltenham, has executed the carving and canopies.

#### NEWCASTLE-UPON-TYNE.

NEWCASTLE races have this year been transferred from the Town Moor to High Gosforth Park. The beautiful estate was acquired some eighteen months ago by a limited liability company, and comprises upwards of 800 acres, together with the mansion-house erected by Mr. Charles Brandling, M.P., about the year 1760. The latter occupies a commanding situation overlooking the new race and steepchase courses, and consists mainly of a centre building and two wings, in the Classical style of the period of its execution. The new stand has been erected partly in front of the hall, and partly to the east of it. The stand, although continuous, has private subdivisions for club members and for the stewards, but the grand stand occupies by far the largest portion. The whole is 250 ft. long by 47 ft. broad, is capable of accommodating nearly 5,000 people, and consists of a series of terraces or broad steps extending from the surface of the lawn up to the level of the saloon windows, in front of which is a broad balcony. The front rooms on the top floor of the hall have been allotted as private boxes, each having a large balcony forming an upper tier to that portion of the stand in front of the hall. These and a considerable breadth of the lower stand are roofed in, the covering of the front slope being of glass, and the framing of iron and wood, carried upon ornamental metal columns and brackets.

To the east of the grand stand and its inclosure is the second-class inclosure, containing a stand which originally stood on Newcastle Racecourse. This has been removed therefrom and re-erected here in a modified form, so that its steps begin to ascend immediately from the surface of the lawn, in a similar way to the new

grand stand. It will accommodate upwards of 2,000 people. In this inclosure is telegraph-office for the reception and delivery of messages from and to its *habitués*, or the public outside the inclosures.

The contractor for the grand stand and works in connexion with the mansion-house is Mr. George Waddell, of Edinburgh; for the second-class stand the contractor is Mr. John Irving, of Newcastle; and for the saddling-shed, &c., Messrs. Broomhead & Keswick, of Newcastle; are the contractors. The architects for the whole of the works are Messrs. Sept. Oswald & Son, of Newcastle, and the clerk of works is Mr. James Eadie, of Blyndon.

DOCKS AND HARBOURS.

**The Clyde.**—At a meeting of the Clyde Navigation Trust on the 4th inst., the Committee on New Works presented their minutes, recommending to the trustees that the entrance of the proposed Graving Dock No. 2, and the sill, be constructed by the trustees' own employes, under the direction and supervision of Mr. Deas, the engineer,—the depth on the sill to be 22 ft. 10 in. at high water, being the depth of the present dock, and the dock to be in all respects as commodious as the present dock, in so far as that shall be found to be practicable in carrying out the works. It was further recommended that the engineer be authorised to raise the sides of the present dock to the extent of 2 ft., as proposed by him in his report, and that he proceed with the execution of this work forthwith. The cost of the proposed dock is stated at 100,000*l.* The trustees, in the course of the discussion which arose on the report of the committee, differed in opinion as to whether the site and depth of the proposed dock were adequate to the growing needs of shipping, and on the motion of the Lord Provost, the further consideration of the matter was adjourned, in order that Mr. Bateman or some other eminent engineer might be consulted.

**Dover.**—The Bill which the Dover Harbour Board are endeavouring to obtain during the present Session of Parliament for the construction of a deep-sea harbour at Dover is very comprehensive in its character. The present Admiralty pier will form the western arm of the harbour, and, according to the plans, it is proposed to lengthen this by extending it eastwards for a distance of 550 ft. The eastward limit of the harbour will be formed by a pier or breakwater running out from under the cliffs beyond the Castle to a distance extending in a southward direction for about 1,000 ft., the space between the two piers being thus about a mile. Both these piers will converge slightly, and between them, marking off the entire limits of the harbour, will be a large breakwater. This breakwater will begin in the bed of the sea, about 800 ft. from the termination of the eastern arm of the harbour, and extend in a southerly direction for about 1,200 ft., continuing in a south-westerly direction for about 2,100 ft., to within 600 ft. of the western arm. Provision is, therefore, made for two outlets of 600 ft. and 800 ft. respectively. The harbour will thus enclose nearly the whole of the bay, which is sheltered by the cliffs.

**Burntisland.**—At the monthly meeting of the Burntisland Harbour Commission, held on the 4th inst., the tender submitted by Mr. P. Penny, Burntisland, for an alteration of the West Breakwater point, which will enlarge the entrance to 150 ft., amounting to 1,061*l.* 13*s.*, was accepted. Plans for the further widening and deepening of the entrance channel were submitted, and a report by Messrs. Meek & Son, C.E., Edinburgh, on the matter was submitted, and Mr. Henderson, resident engineer, was instructed to procure tenders for having the work accomplished in accordance with his plans.

**Tilbury.**—On Saturday last a large number of gentlemen proceeded to Tilbury on the invitation of the chairman and directors of the East and West India Dock Company to witness the cutting of the first turf on the site of the new docks, the construction of which has just been authorised by the Legislature. The East and West India Docks Company's present system comprises the East India, the West India, and the South-west India Docks at Blackwall, but powers have now been obtained for the construction of deep-water docks at Tilbury, opposite Gravesend, designed to accommodate the lines of large steamships engaged in the West India,

China, colonial, and American trades. "Avoiding," to quote a semi-official account of the scheme, "the sinuous and shallow reaches of the Thames above Gravesend, towage, and pilotage, and enjoying exemption from the London fogs and the consequent risk and detention, the site selected offers exceptional facilities to shipowners, as vessels of the deepest draught will enter or leave these docks at any hour, thus rendering the port of London independent of tides." The new docks will, it appears, have a depth of 35 ft. below high-water mark of ordinary spring tides, and include 15,000 lineal feet of quay berths, and they will be approached by an open tidal basin having 43 ft. depth of water. Passenger communication between Fenchurch-street Station and the new dock station is to occupy about thirty-five minutes, and there are to be frequent trains; added to which provision is to be made for enabling passengers and their baggage to be landed or embarked direct at any time of tide. Further, there are to be special landing jetties, wharfs, lairage, and abattoirs, affording facilities for the live cattle trade. There will be four dry docks, with a total length of 1,730 ft., two having a minimum width at the floor of 70 ft., the sills being 32 ft. below high-water mark, and two with 60 ft. width at the floor with sills 27 ft. below high-water mark. The larger of the dry docks will also afford an alternative entrance from the basin into the main and branch docks, the necessity being thus avoided of relying solely on a single passage lock. There is to be an improved system of coaling large steamers simultaneously from both sides; a powerful floating derrick and shears having a lifting capacity of 100 tons will be erected; and for all the purposes in view the company have acquired 460 acres of land. The works have been designed by the company's engineer, Mr. Manning; and the contractors, Messrs. Kirk & Randall, of Woolwich, have undertaken to complete their task within two years and a half. The ceremony of cutting the sod was performed by the chairman of the company, Mr. H. H. Dohrée, who, in subsequently proposing "The East and West India Docks Company, and success to their new work," after giving a brief sketch of the company's history from its formation in 1795 down to the present time, said that when the new scheme had been fully laid before them the directors had no hesitation in recommending it to the shareholders, its adoption being necessary for their own protection. He added that they now felt sure of its success; that they had gone into the estimates most carefully; that they had ample capital for beginning the work, having 250,000*l.* in hand; and that they had no doubt that they would be able to raise the money required to complete the works thoroughly.

COST OF THE ELECTRIC LIGHT.

MR. ALEXANDER PEEBLES, one of the architect-members of the Court of Common Council, recalls attention to the fact that at a recent meeting of the Commissioners of Sewers, a report of the Streets Committee upon electric lighting, accompanied by an abstract of tenders which they had received for its installation in four districts of this City, was brought up, read, and ordered to be printed and circulated. As some figures there mentioned have been reported in organs of the press, and might be misunderstood, he thinks the subject may be deemed of sufficient importance to publish the following analysis and remarks, based upon the reports referred to. They are now before the public, and he considers himself at liberty to make this communication.

For obvious reasons he omits the names of the firms whose tenders he quotes, which are placed in sequence according to their amount, and so numbered:—

Statement showing the Comparative Cost of Electric and Gas Light (One Year).

**District No. 1,** comprising Newgate-street, Giltspur-street, Smithfield (south-east and north-east sides), Long-lane, Aldersgate-street (from Barbican to St. Martin's-le-Grand), and St. Martin's-le-Grand. Estimated annual cost of present gas-lighting, about 551*l.*, given by the Engineer to the Commission for each of the four districts. For lighting this district by electricity, eight tenders were received, the three lowest being as follow:—6th, 560*l.*, or nearly 1*l.* 3 per cent. more than gas; 7th, 520*l.*, or fully 5 per cent. less than gas; 8th, 498*l.*, or nearly 10 per cent. less than gas.

**District No. 2,** comprising Threadneedle-street (from front of Royal Exchange to Old Broad-street),

Old Broad-street, New Broad-street (from Liverpool-street to London-wall), Liverpool-street (from New Broad-street to Bishopsgate-street), Bishopsgate-street (from Liverpool-street to Cornhill), and Cornhill. Estimated annual cost of present gas-lighting, about 363*l.* For lighting this district by electricity, seven tenders were received, the three lowest being as follow:—5th, 560*l.*, or fully 5*l.* 4 per cent. more than gas; 6th, 410*l.*, or fully 11 per cent. more than gas; 7th, 395*l.*, or fully 9 per cent. more than gas.

**District No. 3,** comprising Leadenhall-street, Aldgate, Aldgate High-street, Fenchurch-street, and Lombard-street. Estimated annual cost of present gas-lighting, about 341*l.* For lighting this district by electricity, seven tenders were received, the three lowest being as follow:—5th, 560*l.*, or fully 6*l.* 4 per cent. more than gas; 6th, 390*l.*, or fully 14 per cent. more than gas; 7th, 380*l.*, or fully 11 per cent. more than gas.

**District No. 4,** comprising Queen-street (between Queen Victoria-street and Cheapside), Cheapside (between King-street and Poultry), King-street, Guildhall-yard, Poultry, Mansion House-street, Royal Exchange (open space in front of), King William-street, Adonis-place, and London Bridge.—Estimated annual cost of present gas-lighting, about 612*l.*; for lighting this district by electricity, seven tenders were received, the three lowest being as follow:—5th, 720*l.*, or 17 per cent. more than gas; 6th, 620*l.*, or 14 per cent. more than gas; 7th, 590*l.*, or 3*l.* 4 per cent. less than gas.

When adding together the estimated annual cost of the present gas-light in these districts, it amounts to 1,867*l.*, while the four lowest tenders for the electric light amount to 1,863*l.*, but in this comparison gas has had the advantage of all the improvements in its manufacture which have been discovered since its introduction, and it is generally understood the gas companies do not regard street lighting as a source of profit, while electric lighting is, comparatively speaking, in its infancy, and in these tenders street lighting is alone included.

In the sums mentioned at this meeting as the cost of electric lighting for one year was included the cost of installation and the removal of the whole apparatus at the end of the year, together with the restoration of the streets, lamp-posts, and gas system; items which obviously should not be charged to this light while instituting comparisons, although interest upon capital and an allowance for depreciation and wear should be made, and in the following statement I have added ten per cent. per annum for these items; but inasmuch as the cost of installation is unduly increased by the charges for removal of the electric apparatus and the restoration of gas, I imagine these annual charges would include thirteen per cent. or more upon the cost of installation.

Statement showing the Cost of Electric Light, including Interest and Depreciation of Plant for One Year.

**No. 1 District.**—5th, cost of electric light, 560*l.*; add 10 per cent. upon cost of plant = 730*l.*, or fully 34 per cent. more than gas; 7th, cost of electric light, 520*l.*, add 10 per cent. upon cost of plant = 688*l.*, or fully 57 per cent. more than gas; 8th, cost of electric light, 498*l.*, add 10 per cent. upon cost of plant = 637*l.*, or fully 51 per cent. more than gas.

**No. 2 District.**—5th, cost of electric light, 560*l.*, add 10 per cent. upon cost of plant = 730*l.*, or fully 103 per cent. more than gas; 6th, cost of electric light, 410*l.*, add 10 per cent. upon cost of plant = 760*l.*, or fully 117 per cent. more than gas; 7th, cost of electric light, 395*l.*, add 10 per cent. upon cost of plant = 775*l.*, or fully 113 per cent. more than gas.

**No. 3 District.**—5th, cost of electric light, 560*l.*, add 10 per cent. upon cost of plant = 730*l.*, or fully 120 per cent. more than gas; 6th, cost of electric light, 390*l.*, add 10 per cent. upon cost of plant = 707*l.*, or fully 107 per cent. more than gas; 7th, cost of electric light, 380*l.*, add 10 per cent. upon cost of plant = 690*l.*, or less than 103 per cent. more than gas.

**No. 4 District.**—5th, cost of electric light, 720*l.*, add 10 per cent. upon cost of plant = 940*l.*, or fully 53 per cent. more than gas; 6th, cost of electric light, 620*l.*, add 10 per cent. upon cost of plant = 918*l.*, or fully 50 per cent. more than gas; 7th, cost of electric light, 590*l.*, add 10 per cent. upon cost of plant = 880*l.*, or nearly 44 per cent. more than gas.

In considering the relative cost of the two lights, the greatly-increased quantity and superior quality of the electric must be borne in mind.

**Fire at a Builder's.**—At an early hour on Sunday morning last a fire was discovered on the premises of Messrs. Dodds & Robb, builders, Brunswick-yard, No. 124, City-road. The men left work at twelve o'clock on Saturday, when the place was reported as safe, and at the time of the outbreak, which cannot be accounted for, there was no one in the building. The building where the fire originated consisted of two floors, about 70 ft. by 60 ft., and in the end it was all but burned out, and the roof entirely destroyed. Messrs. Dodds & Robb were insured. The fire extended to several other properties.

## OBITUARY.

Mr. *Hablot Knight Browne*, an artist more widely known as "Pizie," died at Hove, Brighton, on Saturday last. Born in 1815, at an early age he obtained a reputation for his spirited caricatures and comic sketches, and in 1835 he succeeded Mr. Seymour as the illustrator of "Pickwick." He afterwards illustrated most of the works of Charles Dickens, and contributed graphic illustrations to the novels of Charles Lever, Ainsworth, and to other works.

Mr. *Charles Heath Wilson* died at Florence on the 3rd inst., in his seventy-third year. He was, for a number of years, head-master in the Glasgow School of Art, and to his exertions the success which attended its earlier years was, to no small extent due. A man of high culture and fine artistic taste, Mr. Wilson took a deep interest in everything having for its object to beautify and adorn the city; in particular, he exerted himself greatly in connection with the scheme which resulted in the introduction of stained-glass windows into the cathedral.

## MONUMENTAL.

WE understand that a memorial in alto-relievo, the work of Mr. J. Forsyth, will shortly be placed in St. Paul's Cathedral to commemorate the officers and men of the 7th Royal Fusiliers who fell in the recent campaigns in which that regiment took a distinguished part. This memorial will form a fitting companion to the one already placed there, by the same sculptor, to the memory of the officers and men of the 57th West Middlesex Regiment, who fell in the Crimea and elsewhere. In accordance with the new arrangements initiated by the present Dean and Chapter, all commemorative works must partake of a sacred character, and we understand that the forthcoming embellishment of this edifice will be illustrative of an episode in the history of David, king of Israel, who, in an encounter with the Philistines (whilst besieged in the cave of Adullam), exclaimed,—"Oh that one would give us drink of the water of the well of Beth-lehem, which is by the gate," as recorded in 2 Sam. xxiii. 15. Underneath the sculpture there will be a smaller panel with a military trophy composed of the badge and other insignia of the regiment. The names of those to be commemorated will be recorded on a brass.

## SHOPS FOR THE METROPOLITAN RAILWAY COMPANY.

THE dinner to the workmen employed by Mr. B. N. Smith & Son, Birmingham, was given on Saturday, the 8th inst., at Neasden Works, to commemorate putting on the roofs of the second contract for the new carriage-shops, &c., for the Metropolitan Railway Company. The above contract comprises four buildings, permanent way shop, 325 ft. long, 50 ft. wide, 25 ft. high; builders' workshop, 282 ft. by 50 ft. by 35 ft.; locomotive shops, 260 ft. long by 198 ft. wide, by 35 ft. high; engineer's offices, 100 ft. by 46 ft. by 35 ft. high. The first brick was laid on the 25th of January, 1882. Nearly three millions of bricks have been laid up to the present date. The whole of the work is to be completed by the 31st of October, 1882, and, judging from the progress that has been made, there is reason to believe they will be completed by the time specified. The engineer is Mr. Joseph Tomlinson; the manager, Mr. Henry Charlton, who was also manager for the first contract. The total cost will be about 60,000l. The bricks were supplied by Mr. H. Odell, Hayes; the ironwork is from Messrs. Stanley Hall & Co., 91, Queen Victoria-street; lime, from Messrs. Graves, Bull, & Latrin; stone, from the Howley Park Stone Company.

The dinner was held in the new shop, which was tastefully decorated. The men, numbering 170, sat down to a substantial repast. The chair was taken by the Rev. Craue Wharton, vicar of Willesden; the vice-chair by Mr. Side, manager of the Building Department, Metropolitan Railway Company.

The chairman having proposed the firm, Mr. Charlton said the excellent work that had been done was owing to the subordination of the workmen and the general discipline, and he was pleased to tell them the firm had now work on hand of various descriptions to the amount of 100,000l. The vicar, in replying for his own

health, said he was pleased to be able to tell them a piece of ground had been presented to him by the Metropolitan Railway Company for a new church, and he hoped ere long to be in the midst of them.

## PROVINCIAL NEWS.

*Tipton.*—The gasworks which have been erected by the Tipton Board of Health were opened on the 1st inst. by the chairman of the Board, Mr. Whitehouse. Previous to the ceremony, Mr. Whitehouse and the solicitor to the Board waited on the Mayor of Birmingham and handed his worship a cheque for 94,744l. 12s. 6d., being the amount agreed upon as the value of the mains, &c. Mr. Whitehouse and Mr. Waring subsequently returned to the works at Tipton, where a large number of members of the Board, and the general public had assembled. Mr. Whitehouse said the Local Board had taken a great responsibility upon themselves in raising the heavy loan of 60,000l., to be paid off, principal and interest, in fifty years; but the Tipton people would now make their own gas, instead of being dependent on Birmingham. Wages would be paid now to local workers, the works themselves would add to the rateable value of the parish, and there would be a margin of profit to assist the ratepayers. This profit, he trusted, would be made without any increase in the price of the gas to the consumers. There had been paid over to the Corporation of Birmingham 33,700l., in accordance with the award of Sir Henry Hunt, and for additions to the works since then, 1,044l. 12s. 7d., making a total of 34,744l. 12s. 7d. The Tipton manager was now successfully making gas, and it would be turned on at once. The total cost of the gas undertaking was 67,757l. 6s., made up with the above amount with 25,000l. 6s. for the outlay on the works, contracts, land, and mines, and 8,022l. 6s. 5d. for Parliamentary, law, and other charges. The works are situated half-way between the Dudley Port and Tipton Station on the London and North-western Railway, on land formerly belonging to the Tipton Green Colliery Company, and they were designed by Mr. Thomas Prond, C.E., of Birmingham. Messrs. Howl, Ward, & Howl, of Tipton, excavated the ground and erected the buildings; and the ironwork, engines, &c., were supplied by the Horsley Company. There are eighty-four retorts, with provision for thirty more, and there is power to force 400,000 ft. of gas per day through the pipes. The offices in connexion with the concern are well and strongly built. The meter has been supplied by Messrs. Bent & Son, of Birmingham. The two gasometers are capable of holding 154,000 cubic feet of gas each.

*Birmingham.*—In readiness for the Triennial Musical Festival which takes place next month, the Town-hall interior is undergoing considerable renovation and improvement. Mr. J. P. Norrington, the building surveyor to the Estates Committee of the Town Council, has been for some time past engaged in superintending not only the cleaning and painting of the hall, but in carrying out a variety of important structural alterations, the need of which had long been felt, and which the present was thought a suitable opportunity for making. The alterations are chiefly in regard to the means of egress and the provisions for ventilation, lighting, and drainage. The staircases to the great gallery have been rearranged, so that a much safer and speedier egress than formerly is afforded to the large numbers of people who on special occasions are accommodated in the great gallery. Beneath the orchestra two large additional doors are now provided opening from the floor into the committee room behind. From the committee room a new exit, in the shape of a fairly spacious passage and doorway, has been opened through the back of the hall, and in front of the Chamberlain Memorial. From this passage an additional staircase to the orchestra will be erected, thus providing for a portion of the hall which has always been most inconvenient of access. At the Ratcliffe-place side of the hall a new staircase will be run up to the orchestra, and on either side of the orchestra the passages and doorways have been materially widened. In the corridors alterations have been effected by the removal of obstructions which tended to impede egress in case of a panic, and in various other parts of the hall care and attention have been devoted to the same purpose of facilitating the emptying of the hall in the event of a rush.

## MR. GEORGE SOMERS CLARKE, ARCHITECT.

WE mentioned the lamented death of this gentleman in our last only briefly. Mr. Somers Clarke commenced his professional career as a pupil of the late Sir Charles Barry, R.A., under whom he was engaged in preparing many of the drawings for the Houses of Parliament. In 1849, he, with Mr. J. Johnson, F.S.A., illustrated "The New Palace of Westminster," and many other of his drawings were published in various forms.

On leaving Sir C. Barry's office Mr. Clarke spent a considerable length of time on the Continent, going through France, Germany, and Italy. The number of his sketches testifies to the delight he took in his profession; and it is evident that during this tour he laid the foundation of that intimate acquaintance with, and delicate appreciation of, Italian detail which afterwards characterised his works. He also travelled extensively through England, and prepared, amongst a multiplicity of other sketches, a beautiful series of drawings of Northamptonshire churches, which, however, was never published. Amongst his earlier works were—

Cowley Manor, Gloucestershire, mansion, stables, lodges, &c.; Merchant Seamen's Orphan Asylum and Chapel, Snaresbrook; Brighton Blind Asylum; Swan Downers' Schools, Brighton; Turkish Baths, Jersey-street (this was the first bath built of any pretensions); Forest Hill Park, Windsor, mansion and stables; Foxhush, near Tunbridge, Kent, residence, lodge, and stables; Mounties, ditto; Manor House, Sidmouth, Devon, residence, lodge, and stables; Mount Felix House, Walton, additions, &c.; Maresfield Rectory; Pinehurst, Box Hill, additions, &c.; Kemna, Forest, Heathwood, and Millfields, Chislehurst; residence and stables, a small clergy-house, Chislehurst; Coffee Tavern, Chislehurst; numerous Queen Anne houses on the Manor Park Estate, Chislehurst, for Mr. W. S. Mahoney; Grange Houses, for Mr. E. B. Ricketts, Chislehurst; residence, stables, and lodge, for Dr. Saunders, Chislehurst; farmhouses at Kenworth, Beds.; he also received the premium for the Midland Railway Hotel, St. Pancras; Milton Hall and Parook Lodge, Gravesend; The Warren, Hayes, Kent, residence and stables.

Amongst his City works may be mentioned:—The Auction Mart; General Credit Company; Messrs. Munt & Brown's warehouse, Wood-street; eight warehouses, Cripplegate; a large warehouse, corner of New Basinghall-street, for Messrs. McIntyre & Co.; Messrs. Brett's warehouse, High Holborn. Mr. Clarke restored Dunstable Priory Church, and Houghton Regis Church; and added a new chancel to Trinity Church, Marylebone.

Mr. Clarke was among the architects chosen to compete for the Foreign Office, Law Courts, National Gallery, &c. His largest and principal work was Wyfold Court, Oxon, the seat of the late Mr. E. Hermon, M.P. This work comprised mansion, grange-house, stables, barns, house, school, lodges, dog-kennel, cottages, &c. At the time of his death he was preparing designs for an additional wing to the Law Institution, Chancery-lane, Peplow Hall, and other works.

Mr. Clarke was elected an Associate of the Royal Institute of British Architects in 1845, and a Fellow in 1859, and was at one time an acting member of the Council.

His death was painfully sudden, he being engaged in business within a few hours of his decease. He was held in great esteem by a large circle of both private and professional friends, and especially by the members of his office, to whom he always showed the greatest kindness and consideration.

## THE DESIGNS FOR THE MUNICIPAL BUILDINGS, GLASGOW.

A SPECIAL general meeting of the Glasgow Institute of Architects was held on Tuesday, Mr. John Honeyman, F.R.L.B.A., president, in the chair, and there was a good attendance of members.

Mr. William MacLean, the secretary, reported that the Council of the Institute had sent a letter to the Lord Provost proposing that an opportunity should be afforded competitors for the new Municipal Buildings of publicly exhibiting their designs immediately after the final award, and recommending that competitors should be invited by the Town Council Committee to return their drawings, or some of them, with this view; and that the Council should give the Corporation Galleries for the exhibition, and undertake

such expense as might be incurred. The secretary further reported that the Lord Provost had submitted this letter to the Municipal Buildings Committee of the Town Council, who had declined to carry out the suggestion that the designs should be publicly exhibited; that the Council of the Institute having again considered the matter, resolved that steps should be taken to ascertain whether the competitors, or a majority of them, would wish their drawings to be exhibited. A circular was accordingly being sent to the secretaries of the various architectural societies intimating the refusal of the Town Council, stating that the Institute had resolved to make the necessary arrangements for such an exhibition if a majority of the competitors wish it, and asking the several societies to assist them by bringing before architects the following intimation, viz.:

"The Glasgow Institute of Architects having agreed to undertake the charge of an exhibition of designs submitted in competition for the Glasgow Municipal Buildings if asked to do so by a majority of the competitors, all willing to exhibit their designs, are requested to send intimation to the secretary of the Institute, Mr. William MacLean, writer, 196, St. Vincent-street, Glasgow, on or before Tuesday, the 18th inst."

The President said he had no doubt that the refusal of the Town Council to exhibit the rejected designs along with the one which had been chosen would cause general dissatisfaction, not only among architects, but among all who took any interest in the proposed undertaking. Although the condition hearing upon the point was somewhat obscure, the intention of the promoters no doubt was that there should be no public exhibition of designs until after the final award. Many competitors thought that there ought to have been such an exhibition before the final award. There was considerable diversity of opinion as to this, and there was room for such diversity; but he thought every one would agree that in all important competitions there ought to be an exhibition of the designs after the decision, if not before it. It was only what was due to the competitors, who, of course, had a laudable desire to show what they had achieved,—how nearly they approached success,—what they thought good, or even best, whatever other people might think. It was due also to the public, who were really through their representatives the promoters of this competition, and many of whom took an intelligent interest in it. A competition such as this without an exhibition of all the designs was like a race in which only the winner and none other should be visible. The idea that people were not interested in the idea but the winning design, or boat, or horse, or anything else, was simply monstrous. He was not a competitor himself, and spoke dispassionately; but he must say that he regretted this refusal exceedingly, and all the more because up to this point the Council had acted in such a way as to merit the highest commendation, and the influence of their example would certainly be beneficial in the conduct of future competitions. In the circumstances their Institute seemed to be called upon to do what the Town Council ought to have done.

On the motion of Mr. Sellars, seconded by Mr. Bromhead, the meeting unanimously approved of the action of the Council of the Institute, and remitted to them to make the necessary arrangements for the proposed exhibition, provided, in their opinion, a sufficient number of the competitors are desirous of exhibiting their designs.

NEW POLICE STATION, LEWES.

The old Mechanics Institution and Lecture Hall, West-street, Lewes, with a cottage and builder's yard pertaining, is to be converted into a county police-station; the price given to Mr. Crosskey and Mr. J. Every for the premises and ground is 1,250*l.* for the hall, and 700*l.* for the adjoining parts. The estimated outlay is within 6,000*l.* The accommodation will comprise dormitories for twenty constables, five cells for prisoners, stable, cart-shed, chief constable's apartments, clerk's office, waiting-room, three bed-chambers, superintendent's quarters, living and three bed-rooms, two servants' rooms, six bedrooms, constables' two rooms, charge and store-rooms, lavatories, dining-hall, reading-room, and library. The alterations are to be commenced forthwith, and a great portion of the present fabric will be converted to the usage required, under the superintendence of Mr. Henry Card, the county surveyor.

INTERNATIONAL COMPETITION.

THE *Official Gazette* (Bucharest, July 10th) publishes a decree announcing a public competition for plans of the bridges to be built over the Danube connecting the Kustendje-Cornavoda and Bacharest-Fetesti Railways; and also for plans of a tunnel to be constructed under the Danube at about the same spot. The prizes for the plans of the bridges will be of the value of 100,000 francs, and those for the tunnel will be worth 50,000 francs. The cost of the bridges is estimated at about 20,000,000 francs.

The Roumanian Government invites the principal engineers of the world to compete.

THE SWIMMING-BATH AT THE LEYTONSTONE WORKHOUSE.

At last week's meeting of the West Ham Guardians it was reported that the swimming-bath at the Leytonstone Workhouse was leaking at a costly rate, 2,500 gallons of water having escaped in the short space of thirteen hours, and Mr. Simons, one of the members, said he was afraid that the leakage was affecting the foundations of the house to a very serious and dangerous extent. In the course of a conversation on the matter it transpired that Mr. Angell, the surveyor, had suggested that the interior of the bath should be stripped, and it was proposed and seconded that this course should be adopted, and that the surveyor, under the superintendence of a committee, should carry out the necessary repairs. Some of the Guardians were opposed to the proposal, and it was urged that, as the whole of the work in connexion with the construction of the bath had been executed so recently, and at so great a cost to the ratepayers, the fact of so great a leakage was a reflection on the surveyor and the builder, and that the Guardians ought not to give their consent to the spending of an indefinite sum to repair other people's bad work. The proposal was, however, adopted.

HYDE PARK CORNER.

At the meeting of the Metropolitan Board of Works on the 7th inst., the following report of the Works and General Purposes Committee was then read:—

In pursuance of the reference by the Board of Friday last, your Committee have had before them the memorial presented on that day by a deputation from the Council of the Royal Institute of British Architects, on the subject of the proposed improvements at Hyde Park Corner. The memorial expresses the opinion of the Council that, while the general idea of the scheme merits public approval, it is defective in two main particulars, namely:—1. That inadequate provision is made for the relief of the public traffic. 2. That the removal of the Wellington Arch is unnecessary. The grounds upon which this opinion is based are set forth in the memorial, with which is presented an alternative plan showing how the two objects desired by the Council could, in their judgment, be accomplished. Your Committee have carefully considered the representations addressed to the Board by the memorialists, and they have had an opportunity of ascertaining the views of the First Commissioner of H.M. Works on the subject. They find that the First Commissioner has already explained to a deputation of the Council who waited upon him that, with respect to the only detail upon which that body appeared to be itself agreed, namely, the widening of Piccadilly from a point further to the eastward than is shown in the official plan, he had already made provision in this direction in his instructions for the working drawings. Your Committee learn also that the First Commissioner pointed out to the deputation the grave objections to their alternative plan which had led him to reject many others of a similar nature when considering how best to deal with the question. The First Commissioner was under the impression that the deputation, or at all events the great majority, were convinced as to the objections to their plan, and he has expressed his surprise at the course which the Council have taken in memorialising the Board on this matter. Your Committee fail to see that any sufficient reason has been shown by the memorialists to induce the Board to suggest a variation in the plan which has been already determined upon, and they recommend that a reply be addressed to the Council to that effect.

Mr. Selway, in moving the adoption of the report, said it would be in the recollection of the Board that last week a deputation attended from the Institute of British Architects and presented a memorial, which was accompanied by a plan, on this subject. After

the deputation had explained their views, it came out that they had previously waited upon the First Commissioner of Works, and, not having received much encouragement there, they came to the Board. There would appear to be no impropriety in the Institute addressing the Board on the question, seeing that the Board had agreed to contribute a very large sum of money in aid of this improvement, but having very carefully considered the proposals of the Institute, the Committee could not recommend the Board to apply to the First Commissioner for any modification of the original plan. It appeared that the Council of the Institute itself was very divided as to the plan which should be submitted to the Board, and the plan presented by the deputation was only the plan of a small portion of the Council. The recommendation of the Committee was approved.

DECISION UNDER THE BUILDING ACT.

On the 5th instant a case of some importance was heard before Mr. Ellison at the Lambeth Police-court. The point at issue has before been raised under the Metropolitan Building Act, as to what constitutes a building; and in this case additional interest was manifested from the peculiar nature of the structure.

The summons was against Mr. Robert Clark, of 403, Kennington-road, taken out by Mr. Banister Fletcher, the surveyor under the Act for the district, for his having, on the 28th of March, erected, or caused to be erected, in the forecourt of such house, a certain structure without giving two days' notice before such work was commenced. In that notice the defendant was bound, it was alleged, to give the situation, area, height, and intended use of such buildings, &c., according to the terms of the Building Act, 1835, and whereby he had rendered himself liable to a penalty not exceeding 20*l.*

Mr. Burton, from the office of the Metropolitan Board of Works, appeared to prosecute, and pointed out that in this case defendant had erected, or caused to be erected, a certain wooden structure upon the garden in front of his house, which, although on wheels, was contended to be a building within the meaning of the Act. He believed that the contention of the defendant, from what he had heard, would be that as the structure was upon wheels, it would not come within the provisions of the Act. He (Mr. Burton) desired to refer his worship to the case of Stevens v. Gorsley, in which Mr. Justice Byles gave a decision; but likewise more particularly to a decision given by Mr. Chaucey at this Court, on all fours, as it were, with the present case.

Mr. Ellison said the only question really before him was whether a building on wheels, as this was described to be, was a building within the meaning of the Act. He had no doubt there was the same danger arising from such a structure as another differently built; and he had no hesitation whatever in saying this structure was a building within the meaning of the Act, and he should hold such to be the case until his opinion was upset by that of a superior court. Mr. Ellison imposed a fine of 20*l.* and costs. The money was paid.

HAMILTON PALACE.

Sir,—Will you allow me to correct a statement regarding Hamilton Palace in the article in your recent issue (p. 4, ante) on "London and London's Architects a Century Since," viz., "that Wanstead House seems to have been exactly reproduced (see the illustrated papers) in that palace of the Dukes of Hamilton which even now is giving up its contents to follow in the fatal train to the auction-room."

Wanstead House, as a composition, is a two-story building, with a rusticated basement, and having pavilions of three stories at either end, a centre of corresponding height, with a hexastyle portico, rising from the top of the basement floor, with outside stairs, right and left, leading up to it, the main cornice surmounted by a balustraded base.

The new or north front of Hamilton Palace, designed by David Hamilton, and usually the one given in views such as appeared in the *Illustrated London News* of a week or two ago, is a building of equal height throughout, viz., three stories, the portico and stairs leading to it being similar to that at Wanstead; there the resemblance ceases, the proportion and composition of the two fronts being widely different; the one having a broken outline, the other horizontal in character, with a refinement of feeling and quiet dignity immeasurably superior to its so-called antitype. What the architect might have made of it, had he been unfettered and had an entirely new building to design

\* See pp. 51, 57, ante.

cannot now be surmised; but I have no doubt it would have been worthy of his reputation. What he had to do was to put a new front at the back of an old building, which, in plan, forms three sides of a quadrangle,—now the garden front,—with the entrance-door and hall on the ground-floor; whereas he had to place the grand entrance-hall and state-rooms on the second-floor level, those in the old building being on the ground-floor. That it is a marvellous success will, I think, be allowed by every visitor, coupled with a regret that the effect of the new front cannot be fully brought out on account of its bad exposure.

Of the many works executed by Mr. Hamilton, this is the first time I have heard him accused of being a copyist, and I think it but fair to his memory to free him from such a reproach.

AN OLD PUPIL.

### Miscellaneous.

**The Stafford Surveyorship.**—At a meeting of the Stafford Town Council on the 4th inst., the General Purposes Committee reported that the surveyor, who had been appointed borough engineer for Blackburn, had written a letter dated the 23rd ult. to the Town Clerk giving notice of his intention to resign his position at the expiration of three months. The committee, while regretting the loss of Mr. McCallum's services, recommended that his resignation be accepted, and that an advertisement be inserted in certain papers for a successor at a salary of 200*l.* a year, with an annual increase of 10*l.* for five years. The Mayor, in moving the adoption of the report, expressed regret at losing the services of so efficient an officer. Mr. McCallum had been with them some years, and during that time considerable works of public improvement had been carried out, all of them in a most satisfactory and efficient manner. While they regretted to lose Mr. McCallum, they offered to him their congratulations on the substantial advance he had obtained, as well as to the town of Blackburn on obtaining the services of so zealous an officer. Alderman F. Marson seconded the adoption of the report, and endorsed the remarks of the Mayor. Mr. Holder moved that the recommendation to advertise for a successor at the salary named be struck out, being of opinion that they could obtain the part-services of a gentleman for half the money. This was seconded by Mr. Follows, but ultimately it was resolved that the appointment of a successor should be considered by the Council in committee.

**The Parks Museum of Hygiene.**—We are very glad to hear that the committee, at the meeting of the Council last week, resolved unanimously, on the motion of Dr. Poore and Mr. Berkeley Hill,—"That the Council of the Parks Museum is of opinion that, pending an appeal to the public for funds to erect and endow a Museum, it will be necessary, and they have decided, to remove the collection of articles at present housed in University College to premises more suited for the purpose of display and instruction. This removal will be carried out with all possible despatch." A building committee has been appointed to inquire and report to the Council as to obtaining a suitable building for the purposes of the Museum on a short lease, with option, if possible, of purchasing the freehold at the end of the term.

**The Restoration of Christ Church, Hampstead.**—This church has been decorated and improved, Mr. Ewan Christian acting as architect. The east window, portraying the Acts of Faith, as recorded in Heb. xi., the carved oak Communion-table, with its handsome fittings, the gas pendants, and a new porch (yet to be erected) to the south door, have been all liberally presented by friends. The transfer of the organ to the south side of the chancel, the opening out of a north window in the tower, the erection of a new and commodious free aisle, and an improvement in the system of ventilation, are amongst the works which have been effected. We may add that the balance unpaid is now under 100*l.* out of 5,060*l.*, all contributed by the congregation within the twelve months.

**Proposed Town-hall, Newport.**—An inhabitant writes: "It is reported that one of the least satisfactory plans has been accepted for the new Town-hall, street levels ignored, and the Town Surveyor's opinion set aside."

**The Police Orphanage, Twickenham.**—On Saturday last the Prince and Princess of Wales visited the Metropolitan and City Police Orphanage at Strawberry-hill, and opened a new wing to the building. The Orphanage stands at a distance of about five minutes' walk from Horace Walpole's villa, on the other side of the railway. The institution provides for the maintenance, education, and start in life of 150 boys and 100 girls. Sir Edmund Henderson, in requesting the Prince to declare the "Prince of Wales Wing" open, mentioned incidentally that the area watched over by the London police had increased so much since the Orphanage was opened, little more than ten years ago, that the new buildings erected in the metropolis would make a street extending from that Orphanage to Abergeldie Castle. The police of the metropolis had increased in numbers from 9,000 to 12,000 of all ranks. After thanking their Royal Highnesses for coming down on that occasion, he asked the Prince of Wales to present a silver, on behalf of the officers of the institution, to Mr. F. H. Caiger, the architect of the new wing, to whom they were very much indebted for his gratuitous services.

**Public Servants at Leicester.**—Arising out of the recent visit of the Prince of Wales to open the Abbey Park at Leicester, the members of the Decorations Committee on the 7th inst. entertained the Town Clerk and Borough Surveyor to dinner at the Leicestershire Club, and presented each with a testimonial in acknowledgment of their valuable services in promoting the success of the late demonstration of loyalty and public spirit. A number of visitors were present, and in all about forty gentlemen sat down. The Mayor presided, and proposed the usual loyal toasts, which were most loyally honoured, after which Mr. J. H. Milliken, in very happy terms, gave the health of the Mayor, and his Worship responded in an able speech. Then the Mayor proposed the health of Mr. Storey (the Town Clerk), and Mr. Gordon (the Borough Surveyor), and presented each with an illuminated address, and a handsomely-bound copy of Thompson's "History of Leicester," similar to the one presented to the Prince of Wales. Both the Town Clerk and Borough Surveyor responded in appropriate speeches.

**Liverpool Municipal Archives and Records.**—Sir J. A. Picton having, at the request of the Finance and Estate Committee of the City Council, made a careful examination of the Municipal Archives and Records, for the purpose of preparing a catalogue, he has found them so fraught with matters of interest illustrative of the history and progress of the town in its municipal affairs, the growth of its commerce, its manners and customs, &c., a very small portion of which have seen the light, that he thinks it highly desirable that a selection from them should be published, with the necessary annotations. He is willing to undertake the task, without any view to remuneration, provided a sufficient number of subscribers can be secured to defray the expense of paper and print.

**The Ship Canal, Manchester.**—A meeting of the Provisional Committee for the promotion of the Manchester Tidal Navigation was held at the temporary offices, St. Ann's-square, Manchester, on the 7th inst., when steps in advancement of the undertaking were taken. Messrs. Hamilton Filton, C.E., of London, and E. Leader Williams, C.E., of Manchester, were appointed engineers, and instructed to make the necessary survey, to prepare a joint report and estimate, and to submit the same to a future meeting with the least possible delay. Mr. Henry Whitworth, of King-street, Manchester, was appointed secretary.

**Smoke Abatement Committee.**—A meeting will be held at Grosvenor House, for the presentation of awards, and to receive the general report on the Exhibition of Smoke-statement Appliances at South Kensington, and reports of jurors, on this Friday, July 14th. At this meeting a report will be presented on the general results of the late exhibition, and a programme of operations by which the committee desire to render the work thus begun continuous, progressive, and permanent in its effects.

**Granite.**—In reply to an inquirer, the red granite pedestal on which stands the Rowland Hill Memorial, recently unveiled, came from the Dalhousie quarries of Messrs. Shearer, Field, & Co.

**Serious Gas Explosions in Paris.**—A series of terrible gas explosions took place on Wednesday in the Rues du Pont Louis Philippe and Francois Miron. Forty persons have been injured grievously, and some mortally. At six o'clock in the morning a restaurant, named Garch, whose house is at the corner of the two streets, was busy decorating the balcony with flags when his wife came to tell him she smelt gas in the cellar. He at once proceeded to warn a gas company's agent, but the office was closed, and the employe's who should have been there had gone out to see the preparations for the fete. Garch returned home. An hour later a detonation was heard next door in a barber's shop. The firemen of the Rue de Sevigné were summoned and put out the fire consequent upon the explosion. When they were busy examining the gas-pipes in the cellars of the two houses, news was brought that the gas on the other side of the street was burning. Underground flames darted out of a sewer's mouth. A number of people gathered to look at them. In about twenty minutes after their first appearance a fearful detonation took place. The house opposite Garch's *café* was half blown up, and many other houses were violently shaken. There was an upheaval of the footpath and carriage-way, and paving-stones and splinters of iron were projected like grape-shot.

**Official Regulations for the Safety of Theatres in Austria.**—A telegram from Vienna says that the Minister of the Interior is about to despatch instructions to all the governors of the provinces to prepare a list of regulations to be submitted to the several Diets in the form of a Bill establishing general official control over all matters connected with the theatres within their jurisdiction in accordance with local requirements. The principal provisions will be as follow:—In every town where there is a theatre a local commission is to be appointed, composed of representatives of the municipal authorities, the police, the medical profession, the fire brigade, and impartial experts. These are to exercise a general supervision. Further, a similar local provision, but comprised of members of the Diet, is to be attached to the Stadtholder's office in each province. All new theatres are to be detached from other buildings, and are to contain no storerooms. Every inflammable substance used in the performances is to be impregnated with fire-resisting fluids, and the most minute precautions are to be taken for insuring proper inspection. It will also be provided that there shall be an open gangway between every six rows of seats, that a shaft for the escape of smoke shall be erected, and that the number of the audience shall be strictly limited to the capacity of the theatre.

**Working Men's Club Conversazione.**—The South Kensington Museum was on the 7th inst. for the first time the scene of the annual *conversazione* of the Working Men's Club and Institute Union, Sir Thomas Brassey, M.P., who succeeded the late Dean Stanley as president of the Union, having conceived the happy thought of availing himself on this occasion of the resources of the museum as a place of social gathering. The doors having been thrown open at seven o'clock, the members of the various clubs, to the number of about 800, who had accepted the invitation, had time to inspect the treasures of the national collection before the arrival of their host and hostess, the hour announced for the reception by Lady Brassey being 8.30 p.m.

**Mr. Sage's Establishment.**—A party numbering over eighty of the workmen engaged at Mr. Frederick Sage's works, Gray's Inn-road, dined together at St. Alban's on the 8th. Mr. Sage, who was present, expressed his gratification at the happy relations existing between himself and those about him, and impressed upon them the necessity of doing whatever they were engaged on in the best possible manner, so as to keep up the reputation of the firm.

**Artisans' Dwellings.**—In the House of Commons, on Monday last, Sir S. Northcote (in the absence of Sir R. Cross), asked the Secretary of State for the Home Department whether the Government would endeavour to secure the passing of a Bill during the present session to carry into effect the general recommendations of the Artisans' Dwellings Select Committee. Mr. Shaw-Lefevre, on behalf of the Home Secretary, replied that it was the intention of the Government to endeavour to pass such a measure in the present session.

**Coming-of-Age Festivities.**—Mr. John Fitzherbert Campbell, son of Mr. C. M. Campbell, Mayor of Stoke, head of the firm of Messrs. Minton, and chairman of the North Staffordshire Railway, attained his majority on the 6th inst. The event was one which has created a considerable amount of interest, especially among the workpeople of Messrs. Minton. On Saturday over 2,000 of the workpeople of the firm were conveyed to Rudyard, a picturesque spot about twelve miles from Stoke. They were provided with dinner and tea in a large tent. After dinner, Mr. George Leason, manager of the firm, read an address, and then ten of the oldest workpeople (five males and five females) of the firm presented Mr. J. F. Campbell with a tray, jug, and goblet, executed in hammered silver from the design of Mr. Leo Arnoux, art director at Messrs. Minton's, and specially manufactured by Lambert, of London. The inscription on the goblet is as follows:—Presented to John Fitzherbert Campbell on attaining his majority on July 6th, 1882, by the employees of the firm of Minton's and the Campbell Tile Company, in testimony of their sincere and earnest wishes for his welfare, and respect for Colin Minton Campbell, his father." Accompanying it was an illuminated album, designed by another artist of the firm, Mr. Reuter, containing 1,792 signatures. Mr. J. F. Campbell, suitably acknowledged the presentation, and his father delivered an appropriate address to the workpeople, after which the time was taken up with various amusements.

**Decorative Sculptures for St. George's Hall, Liverpool.**—The *Liverpool Daily Post*, criticising the thirty-nine designs sent in by competitors, says that many of the 250 drawings and models (now on view in the Walker Art Gallery) "are simply of a farcical character." The majority of them are merely stonemasons' conceptions, of the rule-and-compass pattern, and free from any abstruse originality; others are elegant enough in design of commonplace patterns, and full of trashy and *rococo* symbolism of recent invention, so "localised" and rendered down to the taste of the day that it would be pitiful if it were not frequently ridiculous; and two or three only of the designs sent in . . . are fit to be regarded as Classic art, or as in any respect worthy of the work of which they are to form a portion." Our own correspondent takes a more flattering view, and says there is a amongst them some very good designs, well suited to their purpose. It is earnestly to be desired that a good result will be obtained, the authorities having shown every desire to bring this about.

**The Surveyors and Auctioneers' Clerks' Provident Association.**—It will interest many of our readers to know that, although no public announcement of the position of the forthcoming rules of this Association has been made, we are assured that the Committee have not slackened, and are still hard at their work. The requirements of the Friendly Societies Acts, under which the rules must be drawn, are so numerous and stringent as to necessitate great care in their compilation. We are able to state that the rates of subscription have been considerably reduced from the figures placed before the last general meeting, and the superannuation scheme available for members over seventy, which has been a considerable difficulty, has every prospect of being carried through.

**Samuel Pepys.**—An influential committee has been formed for the purpose of obtaining subscriptions towards the erection of an appropriate memorial to Samuel Pepys in the Church of St. Olave, Hart-street. It seems strange that no monument of any kind should exist in the church with which the Diarist was so intimately connected, and where he was buried; and it is thought that many of those who have experienced pleasure in reading the "Diary" will be willing to contribute something in order that the proposal may be carried out satisfactorily. The treasurer is Mr. Owen Roberts, clerk of the Clothworkers' Company; and Mr. Henry B. Wheatley, 6, Minford-gardens, W., is honorary secretary.

**A Painted Window and Memorial Brasses,** from the studio of Mr. Taylor, of Berners-street, were last week completed in the church at Lower Beeding, off Horsham, the gift of Lady Bartolot, in memory of her parents.

**Hove.**—St. Andrew's Church, Waterloo-street, Hove, has had a new chancel added from designs of Mr. Charles Barry, architect. Mr. Geo. Lynn is the builder.

**New Clock at Burnham.**—A new turret clock has been fixed in St. Mary's Church, Burnham, near Rochester, by the well-known firm of J. W. Benson, of Ludgate-hill. It shows the time on four skeleton iron dials, 5 ft. in diameter, with gilt figures and hands, and strikes the hours on a bell of 6 cwt. The frame is of horizontal construction, all the wheels being of brass, and the main wheels 12 in. in diameter with the teeth cut in the same by steam machinery.

**TENDERS**

For the erection of a block of four and a pair of cottages for the Right Hon. W. H. Smith, M.P., at Great Thurlow, Suffolk. Messrs. Sedgwick, Son, & Weall, Watford, architects. Quantities supplied by Messrs. Nixon & Raven:—

**Best Bath Stone.**  
WESTWOOD GROUND,  
Box Ground, Combe Down,  
Corsham Down,  
And Farleigh Down.  
RANDELL, SAUNDERS, & CO., Limited,  
Corsham, Wilts. [ADVT.]

**Box Ground Stone.**  
Is the best for use in all exposed positions, being a well-known and tried weather stone.  
50,000 feet cube in stock.  
PICTOR & SONS,  
Box, Wilts. [ADVT.]

**Doubling Freestone and Ham Hill Stone**  
of best quality, in blocks, or prepared ready for fixing. An inspection of the Doubling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.]

**Douling Stone and Ham Hill Stone**  
of best quality. Prices and Estimates, including delivery to any Station, on application to STAPLE & HANN, Quarrymen, Stoke-sub-Hamdon, Ilminster. Agent, Mr. E. CRICKMAY, Langbourn-chambers, 17, Finchurch-street, E.C. [ADVT.]

**Asphalte.**  
Seysse, Patent Metallic Lava, and White Asphalte.  
M. STODART & CO.  
Office:  
No. 90, Cannon-street, E.C. [ADVT.]

**Asphalte.**—The Seysse and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tin-rooms, and terraces. [ADVT.]

**Immense quantities of**  
DRY WAINSCOT,  
DRY MAHOGANY,  
DRY WALNUT,  
in all thicknesses.

B. J. HUDSON & SONS,  
Whitefish-st., W., and Great Peter-st., S.W. [ADVT.]

**"Lightning."**—Accidents to buildings would be unknown if J. W. GRAY & SONS' Patent System of Conductors, as fitted to the Houses of Parliament, the Royal Palaces, Principal Churches, Cathedrals, and Public Buildings, were universally adopted.—Estimates free on application at 58, Fenchurch-street, London, E.C.—[ADVT.]

### The Public Offices Site Bill in the House of Lords.

HE ill-advised scheme for the location of the proposed new War Office and Admiralty has passed through Committee in the House of Lords; at least, the Lords have so far committed themselves to the support of a Bill for the purchase of the land required, which is a preliminary but very important step.

Lord Sudley, who moved the second reading, repeated the arguments in favour of the scheme the objections to which we have already referred to in our impression of the 8th of this month (see p. 38, ante). Our main and leading criticism, however, was directed to the standing absurdity in connexion with the management of these matters in England, whereby changes in connexion with architecture and with public convenience, which have in their nature nothing whatever to do with politics, are dragged in the wake of political changes, and a project which has been planned and partly initiated by one First Commissioner of Works is abandoned, and the money and time spent over it are utterly wasted, because with a new Government another First Commissioner has come into office who has his own schemes, and is bent upon distinguishing his reign by carrying them out. This state of things is, however, the one reason why there may be some use, even at this stage in the proceedings, in returning to the charge. The present First Commissioner has absolutely ignored the previous intentions of one of his predecessors in regard to the Great George-street site, and the fact that a very large sum of money has been expended in acquiring property in order to carry it out; and therefore it is perfectly possible that the same thing may happen again, and that if there should be a change of Government before the first stone of the proposed offices has been laid, another First Commissioner may in turn annul the present decision, and throw over the money which will have been paid for the new site, in order to return to the Great George-street site. There would be nothing to regret, even on economical grounds, in such a second change, as the money paid for that property is already gone. If the present officials obtain their grant and buy the site now proposed, even then it will still remain

merely a question which of the two votes of money shall be wasted; and the question for common-sense people will then be, which site will be the best architecturally.

On this point, as all our readers who have followed us in our previous criticisms on the subject are aware, we have never entertained any doubt whatever; and although we regret to observe that the House of Lords, as a body, have voted in favour of a plan the result of which will certainly be unsatisfactory, we are, at all events, glad to see that the scheme has not been without decisive opposition in their lordships' house, and that some members of the Upper House understand the architectural view of the matter very clearly. It is always more interesting to follow a debate on this class of subject in the House of Lords than in the representative chamber. In the latter assembly the almost ostentatious indifference to what are sometimes contemptuously referred to as "mere questions of taste," the determination to look at everything of the kind from a merely economical point of view, is most irritating to those who think the beautifying of outer life is really worth something; and the tone habitually taken on such subjects speaks very ill for the average culture of the House of Commons. As an example of this, when the model for the Hyde Park Corner scheme was exhibited at the House, we met with members of that honourable body, some of them men who would have claimed to belong to the rather more cultured section of the House, who were perfectly unaware that there was any absurdity in deliberately setting up the Wellington statue on the arch again, who did not know that any objection had ever been made to it, who even thought that the arch would be nothing without the statue. In the House of Lords there is generally evidence, when such questions come up for discussion, of better knowledge on the part of at least a fair proportion of the speakers, and that is something to be thankful for, at all events.

The debate we are referring to was not without illustration on this point. Lord Strachan and Campbell, in moving that the Bill be read a second time that day six months, pointed out not only the obvious unfitness of the site for producing any architectural effect commensurate with the importance of the buildings and with the proposed expenditure, but also urged, with great propriety, that there was absolutely nothing before them to give any idea as to the plan which it was proposed to carry out in the new buildings, or as to the manner in which it was proposed to treat them architecturally. In some cases such a question might, no doubt, be regarded as premature. Where a site is obviously and admittedly the best or the only one for the purpose, and where it is an open and unencumbered one with which the future architect of the buildings can do

much as he pleases, it may be perfectly reasonable to vote the purchase of the site before giving any special consideration to the plan and design of the building, and to leave that for more deliberate consideration afterwards. But the present case does not come under that category. It is proposed to vote money for the purchase of a site very peculiarly situated, hemmed in by other buildings, and coming close up to an interesting building which is one of the historic structures of that part of London, for the Horse Guards is sufficiently old to be called so, and is certainly a building interesting in more than one way. There are two things that ought to be made clear before this site is purchased; first, whether there is really room on it for the convenient provision for the wants of the two public departments concerned, which is a matter of plan; secondly, what kind of building it is proposed to erect here, what is to be its effect when half crowded out from the main street by the two banking buildings which are to remain standing in front of it, and what will be its effect on the general aspect of the Horse Guards and the stretch of buildings of which that structure forms the centre. The supporters of the scheme inform us that the new building will not injure the effect of the Horse Guards building. We know very well that it cannot but do so. That portion of the buildings adjoining St. James's Park of which the Horse Guards is the centre will assume quite a different aspect when a very tall and probably ornate new building is piled up at one side of the site. The Horse Guards will be at once dwarfed and reduced to insignificance, and a very picturesque incident of London architecture will be spoiled. This would not be an argument to use if there were no other site, of course. But under the circumstances it is not without its weight. Another site has been partly paid for where there would be nothing to get rid of except buildings that no one need regret (for the interesting and valuable houses between Delahay-street and the Park were to be exempted, if we remember right, from demolition), where there would be ample space for a complete plan and for an architectural design which could be treated as a great whole, unencumbered by other buildings in front of it, and which would, at the same time, constitute a great improvement in the architectural surroundings and approaches of the Houses of Parliament. This site is to be thrown away for one on which there is no chance of a fine architectural effect, on which it is doubtful whether there is sufficient space for the purpose, and by the adoption of which a very interesting and picturesque corner of London will be unnecessarily spoiled. Added to these objections, there is this further one, that whereas by the adoption of the Parliament-street site an important public improvement in the widening of the

lower end of Parliament-street would have been simultaneously effected, on the other hand, by the adoption of the scheme now proposed, a very important improvement, long wanted, that of carrying the carriage-way of the Mall through to Charing-cross, will be permanently rendered impracticable. We are aware that this objection has already been made, and has been officially answered to the effect that there is nothing in the scheme to prevent this continuation of the Mall into Charing-cross being carried out also. This reply the First Commissioner has gravely made in the face of the fact that in his plan the line which such a continuation of the Mall would take is blocked by the residential buildings intended in connexion with the Admiralty and War Offices. As we cannot suppose that the First Commissioner would intentionally contradict himself, and say one thing on paper and another thing in debate, we are left only to the conclusion that he had forgotten the effect of the plans drawn in his own department and presumably under his own suggestion.

Besides the opposition of Lord Stratheden and Campbell, Lord Lamington opposed the Bill, implying a question whether the supposed economical character of the scheme, which was its only pretended recommendation, was not more imaginary than real, and expressing a decided opinion that the plan proposed would deface the public park, besides leaving Parliament-street "in its present unsightly condition," which the carrying out of the Great George-street scheme would have necessarily and naturally ameliorated without extra expense. The Duke of Somerset asked the very practical question how far the present public traffic through the Park would be checked by the closing of some of the passages now in public use. The Earl of Carnarvon thought their lordships should have been supplied with fuller information as to the details of the scheme, and objected, and rightly, to the quadrangle system, unless the quadrangles could be much larger than those proposed in the scheme, which the Earl of Redesdale spoke strongly in favour of the Parliament-street site (which we have previously referred to as the Great George-street site), insisting that the object ought to have been to improve the town at the same time that they provided better accommodation for the public offices, and he believed they could make no greater improvement to the town than by taking the Parliament-street site for these buildings. There was certainly enough in these criticisms to show that there is a considerable feeling in the House of Lords adverse to the scheme, and that some important members of that body are quite aware of the practical and architectural drawbacks to it; and if it is the case, as Lord Northbrook observed, that it had been passed without a single dissentient voice by the House of Commons, that only shows the truth of what we have already observed, that the members of the Lower House are, as a body, very indifferent and very ill-informed on subjects of this class.

There will be no end, however, of mismanagement and waste of money, time, and property, in matters of this kind, until their control is made independent of party government and put into the hands of a permanent official selected for his competency and acquirements for dealing with the laying out of public buildings and sites. At present a First Commissioner of Works is like the *nouveau riche* of the Latin satirist,—

"Dirait, adifect, mutat quadrata rotundas."

He is ambitious to do something to distinguish his own term of office, and to have schemes of his own and carry them out, if possible, even if it be at the cost both of architectural propriety and of money and time previously expended in initiating other projects. As long as this state of things lasts, this changing the control of public works with every change of Government, we shall see this kind of mischief done. Until a better system of Government in these matters is introduced, the best thing for us is to have First Commissioners with as little zeal as possible, and willing quietly to go on, in the best manner available, with the schemes initiated by their predecessors. The present holder of the office appears to labour under a dangerous amount of ill-directed zeal; and if things go on in this way, there is no knowing what costly mistakes may not be made before another turn of the political wheel brings in another amateur architect to pull the metropolis about as he pleases.

#### AS TO THE DURABILITY OF BUILDING STONES.

WHILE fully aware of the general attention that has in all times been directed to the durability of stone, we yet question whether the subject has been anywhere exhaustively treated, either in our own country or on the Continent. Although biding closely to the need of experience, we yet should not forget that both chemical analysis and other methods of scientific investigation have made great strides of late, and that it may become essential to the architect to inquire how far they may throw light on the question of durability. We may practically know the difference in the durability of Bramley Fall and of Portland stone, but if we know not only the fact, but its cause, we have made a step in advance. This consideration will have more weight from some observations to which we shall have to refer as to the durability of granite.

For a contribution of much value to this investigation we are indebted to the Director-General of the Geological Surveys of the United Kingdom, Dr. Archibald Geikie, F.R.S. It is from the note-books of geological rambles, and as regarded from the stand-point of the geologist, that the observations to which we have to refer have been extracted. None the less, it strikes us, do they form a very valuable beginning. Our own experience, and we doubt not that of many a reader, is enough at once to contribute some examples to those which have been elaborately investigated by Dr. Geikie; and we look forward with confidence to the reappearance, sooner or later, of a comprehensive scientific work on the durability of building materials, in which chemical and lithological sciences shall have their due parts, side by side with the verdict of experience.

Dr. Geikie's researches have, in the first instance, been directed to the older burial-grounds in Edinburgh; the reason, of course, being, that as tombstones are usually date-bearing monuments, the means of comparing the progress of decay and the lapse of time are unusually precise. To these humble slabs we take leave to add, especially for the benefit of architectural travellers on the Continent, the category of scutcheons and armorial bearings. Many ancient buildings, especially in Italy, are adorned with stone armorial bearings. Of these the herald will be in many cases able to indicate the date with considerable accuracy. And, speaking now only from memory, we should say that a study of lithological degradation in Italy, based on dated works of this kind, will give results so widely different from those obtained by Dr. Geikie in Edinburgh as to point to the primary canon,—that the first division of any study of the subject must be topographical, or, rather, climatological.

Dr. Geikie points out that the effect of weather in a town is likely to be in some measure different from that which is normal in nature. The disengagement of sulphuric acid from the reek and smoke of chimneys is one of the causes of the more rapid decay of stonework in urban, as compared with rural, localities. On the other hand, the range of temperature is likely to be less active in a town. And the incrustation of the surface of the stone with dust, smoke, and other inorganic as well as organic matter, in town buildings, has to be borne in mind, although there may be a question as to the action of such incrustation on the interior substance of the stone.

Around Edinburgh the materials used are of three kinds,—1st, calcareous, including marbles and limestones; 2nd, sandstones and flagstones; 3rd, granites.

With few exceptions, the calcareous limestones in the Edinburgh churchyards are constructed of ordinary white saccharoid Italian marble. There may also be observed a pink Italian shell marble, and a finely fossiliferous limestone, containing *foraminifera* and fragments of shells.

The marble occasionally is employed as a monolith, in the shape of an urn, vase, or the like; but it has been usually fixed in a framework of sandstone. And it is as to its behaviour in the latter case that the observations we have to mention will prove to be novel to most of our readers. Dr. Geikie has, in the first instance, subjected specimens of the marble, both when freshly cut and when long exposed to the weather, to microscopic examination. His view of the process of degradation is that it is of a threefold character. The process of weathering,

he says, in the case of this white marble, presents three phases, sometimes to be observed on the same slab, viz.,—superficial solution, interal disintegration, and curvature with fracture.

With superficial solution we are tolerably familiar. It becomes apparent in the gradual dimness that comes over the polished surface of the marble. This is effected by erosion, partly by the carbonic acid, and partly by the sulphuric acid contained in the atmosphere, and notably in the rain that falls in towns. The rapidity of the process in Edinburgh depends very much upon aspect and exposure to rain. Exposure for not more than a year or two to the prevalent westerly rains is enough to remove the external polish, and to give the surface a rough character. The granules of pure calcite, which have been cut across or bruised in the cutting and polishing process, are first loosened or dissolved, and then drop out of the stone. An obelisk erected in 1864, in Grey Friars churchyard, is cited as an example in which the surface has already become so rough and granular that it might be taken for sandstone. The grains are so loosened that a slight movement of the finger will rub them off. The internal structure of the marble begins to reveal itself. The harder knots and nuclei of calcite project above the surrounding surface, and irregular channels, from which the lime has been carried away in solution by the rain, resemble the bleached and furrowed aspect of the rocks on the side of a mountain.

Solution, or decay of a mountain, seems rather to be hidden than prevented by the formation of a surface-crust. This Dr. Geikie considers to form most rapidly where solution is most feeble in its apparent action. Beneath the stone turns to a loose crumbling sand. In time the crust cracks into a polygonal network, and rises in blisters, exposing the under material to rapid disintegration. A marble urn erected in the same churchyard in the year 1792 is thus crumbling into sand, although it faces the east. The process, which Dr. Geikie describes with elaborate minuteness, must closely resemble that which may be observed to take place with oolite stone in London; as, for example, on the south face of St. Paul's, where thick eaves of a black colour may at times be seen to shell off, leaving partially disintegrated stone exposed to view.

It is the third form of decay, which Dr. Geikie describes as curvature and fracture, as to which, we think, the observations now recorded are the most novel. This most remarkable phase is to be observed in slabs of marble which have been firmly inserted into a solid framework of sandstone, and placed either in an erect or a horizontal position. It appears as a swelling-up of the centre of the slab, which forms, as it were, a blister that finally ruptures. A case is cited of a slab, 30 in. by 22 in., and  $\frac{1}{2}$  in. thick, built into the south wall of Greyfriars Churchyard. The date of the last inscription on it is 1838, at which time it is presumed that the slab was smooth and upright. It has now escaped from its fastenings on either side, though still held firmly at top and bottom, and projects from the work like a well-filled sail, to the distance of 24 in. A series of rents, one of which is one-tenth of an inch in width, has appeared along the crest of the fold. In another case, that of a tomb erected in 1799, facing south, and protected by overhanging masonry from the weather, the inscription has become partly illegible, the stone has bulged out in the centre, and cracks begin to riddle the blister. On another slab, twenty years older, dated in 1779, on the west wall, the process of destruction has advanced to a further stage, and, since it was sketched by the author of these notes, has altogether fallen out and disappeared.

It is the opinion of Dr. Geikie that this mode of destruction is due to the action of frost. As to this we are disposed fully to agree with him, and that from observations of our own which bear on the subject. One set of these regard the durability of marble where frost is unknown, or rare. For example, we can cite a large marble tablet built into the wall by the eastern gate of the little archiepiscopal city of Sorrento, which contains (or did some years ago) a long and perfectly legible Latin inscription, of the date of the Spanish rule in Naples. Again, on the gates of the City of Naples, and on the Castel Nuovo in that city, are scutcheons of arms which have been defaced on some occasion of change of dynasty, and on which the marks

of the chisel are so fresh that it is clear that the absence of armorial bearings is not due to the lapse of time, but to political causes and purposed violence. In these instances, to which a very moderate acquaintance with Southern Europe can no doubt add many more, we have ample proof of the monumental durability of marble, although freely exposed, in a climate where frost is very rare, and never of sufficient intensity to get good hold of the surface of the ground. The other observations refer to the curious permeability of limestones to wet. It may be said, perhaps, that the water which collects on the interior surface of a limestone or marble wall does not percolate, but is condensed by the cold of the wall from the atmosphere. Weeping through solid stone seems, indeed, incredible. But we can cite one instance of a wall made of mountain limestone, thoroughly well built, and 3 ft. thick, in H.M. Dockyard, Pembroke. It is the wall of a snugly. When it was newly built, when the rain drifted on it from the west the wet ran down within the building as if the walls had been of chalk, or some porous substance. We do not assert that the wet did come through the walls. But it appeared so to do. And, at all events, this and other experiences point to a hygrometric condition in the purest and densest limestones which is likely to have a very destructive effect in the event of the occurrence of frost directly after rain.

Dr. Geikie comes to the conclusion that the lowering of the surface of marble by superficial solution may amount to  $\frac{1}{2}$  in. in a century; a reduction to a pulverulent condition in about forty years; and a total disintegration by curvature and fracture in a century. We only add the condition that this must be where frost is energetic in its action.

The endurance of sand-stones and flag-stones is a question of selection. In those which consist almost wholly of silica, the durability is very great. Some of these stones contain as much as 98 per cent. of silica. A tomb of this material is cited which was erected in 1646, and ordered by the Scottish Parliament to be defaced in 1662. The original chisel-marks are still fresh on the surface of the stone (as in the case of the scutechons at Naples), on which the lapse of 200 years has produced little effect, except that of somewhat roughening the exposed faces on the west and north sides.

In cases, however, of striated or coloured sandstones, destruction goes on by solution of the cement or matrix in which the particles of silica are embedded. The most common kinds of matrix are clay, carbonates of lime and of iron, and the hydrous and anhydrous peroxides of iron. In one case of a stone of this kind an inscription, cut in 1863, is no longer legible. We should like to know the depth to which the letters were originally cut;  $\frac{1}{4}$  in. at least has been removed from the stone in sixteen years, which is at the rate of nearly  $\frac{1}{2}$  in. in a century.

The well-known propriety of the rule for setting stone on its natural bed is illustrated by the degradation of laminated flagstones when set on edge. Dr. Geikie cites an instance in the case of stones thus treated of the loss of  $\frac{1}{4}$  in. in thickness in forty years, which rather exceeds  $\frac{1}{2}$  in. in a century. A curious instance is also given of pillars of a concretionary sandstone, which exposure to the air for 150 years has hollowed out into positive troughs, with hollows from  $\frac{1}{4}$  in. to 6 in. deep, and from 6 in. to 8 in. broad.

As to granite, we are referred to the experiments of Professor Pfaff, of Erlingen, described in the *Allgemeine Geologie als exacte Wissenschaft*, p. 317, on granite, syenite, Solenhofen limestone, and bone. From the limestone the Professor found the loss to amount to the removal of a uniform layer of 0.04 millimetre in three years, which gives 0.52 in. in a century. The annual loss of granite he estimated as 0.0076 millimetre per year from unpolished, and 0.0085 millimetre per year from polished surface. This difference of more than 10 per cent. against the latter is contrary to what would have been expected; and it has to be asked for what period of time the more rapid weathering is supposed to continue. The slower rate amounts to 0.30 in. per century. Granite has been employed monumentally in Edinburgh for too short a time to allow of the measurement of its rate of decay there. But in connexion with the subject we may be allowed to recall remarks made in the columns of the *Builder* nearly twenty years ago on the subject

of the rough and granulated surface of the granite on the west face of Waterloo Bridge. The arches and exterior face of that bridge are built of Cornish granite, from the vicinity of Penryn, and the balustrade is made of fine grey Aberdeen granite. A careful and exact admeasurement of the projections of this bridge, compared with the original dimensions, would enable the student to arrive at a correct estimate of the rate of weathering of these two kinds of granite in London. The bridge was opened in June, 1817.

The close of this interesting specimen of the "Geological Sketches" of Dr. Geikie refers to the fact that in the towns and villages in the north-east of Scotland, where the population is sparse, and where comparatively little smoke passes into the air, the marble tablets last longer than they do in Edinburgh, but still show everywhere indications of decay. They suffer chiefly from superficial erosion, but cases may be observed of curvature and fracture.

In contrast to the perishable character here ascribed to granite, to marble, and to any but the purest silicious sandstone, is the durability of the durable material, clay slate. This is employed for monumental purposes in Aberdeenshire. It contains cubes of pyrites, which might have been anticipated to prove sources of destructive chemical action, but which seem to be inert. The stone is easily dressed in thin smooth slabs. A tombstone of this material erected in the old burying-ground at Peterhead, between 1785 and 1790, retains its lettering as sharp and smooth as if only recently incised. The stone is soft enough to be easily cut with a knife. The cubes of pyrites are covered with a thin film of brown hydrous peroxide. The slate is slightly stained yellow round each cube, but its general smooth surface is not affected. While neighbouring marble tablets, 100 to 150 years old, present rough granular surfaces and half-effaced inscriptions, the lapse of nearly a century has produced scarcely any appreciable change upon the clay slate.

The durability of this material, when prepared by nature for the stone-cutter, may be compared with that of the even lumber, but equally durable, substance of artificially baked clay. In the dry and frostless air of Egypt, marble and granite are almost perennial in their duration. But the main revelation of the forgotten history of the past is derived from the baked clay inscriptions of Assyria. The inertness of this substance, its hygrometric resistance, and feeble chemical affinity with any element with which it comes in contact, is the cause of its indifference to the passage of time, or rather to the recurrence of those changes of temperature and of moisture which accompany the revolution of the year. If the value of clay slate, as a material for monumental inscriptions, had been better and larger known, how much would our churches and churchyards tell, which is now wholly unrecorded?

The chief cause of the interest which we took, from the first hint of this publication that reached us by chance, in these researches of Dr. Geikie, was the hope that they would throw some definite light on what we regard as the most difficult, and one of the most interesting questions relating to any monuments in Europe, viz., the age of Avebury and of Stonehenge. Nor are the remarks without direct bearing on that subject. The stone known as "Sarsen" fulfils the requirements above shown to be conducive to the most permanent durability. It is compact, uniform, close-grained silex. We cannot cite any chemical analysis of the stone. But we do know that the Wiltshire farmers have found it so indestructible by the usual instruments of agricultural violence, that they had recourse to the barbarous plan of roasting these priceless monoliths, — heaping faggots on them to make a bonfire, and then throwing on cold water to crack the stones! This argues wonderful resisting power in the "Sarsen," and no one can be familiar with the stone in question without seeing that it affords the least possible advantage to the tooth of Time. Time indeed, as Dr. Geikie observes, is not an agent, except indirectly, in the matter. Mere duration from day to day has little or nothing in it that is destructive, as we see in Egypt. It is because the revolution of the year, and the succession of the seasons, expose a monument to the successive and over-repeated attacks of rain, of frost, of perhaps the scorching draughts of wind-driven sand, and because the incessant repetition of these small causes of decay

produces a great accumulated effect, that we regard time as destructive. But too much attention cannot be given to the consideration that it is the action of severe frost on stone containing water that is the main cause of decay. And we venture to suggest, as a subject for careful chemical analysis, how far the existence of water, or the elements of water, not as moisture, but as chemically combined with lime, magnesia, or other elements, in a stone, may render it insusceptible to the attacks of frost. That idea is, perhaps, a new one; but we feel certain that the hygrometric relations of marble and compact limestones are not by any means clearly understood. The effect of frost on these stones has been shown. This view of the case makes it the more necessary to repeat and to comprehend the experiments of Professor Pfaff on granite. In anticipation, any one would have said that polished granite would be the most durable; and the idea that it would most thoroughly throw off the rain, and thus escape soaking and subsequent frost-splitting, concurs with this anticipation. If the case really prove to be the reverse, we can see no explanation for it, except in the possibility of the bruising of individual molecules of felspar in the process of polishing, so as to make them more readily absorbent. But this is a subject that will repay the most careful experiment.

As to the Wiltshire monoliths, we think that the whole inquiry above mentioned points in the direction of their immense antiquity. The only chance, so to speak, of Time for attacking them is when they are set as to expose the ends of what really is, though not visibly, the bed-course. Those who know Avebury will remember the marks of decay on some of the 18-ft. monoliths that form the sides and roofs of the cells. The inference, seen from the light of the Edinburgh observations, points to enormous age. Let us add that, at a distance from the spot, we have no means of determining the chemical constitution of the "blue stones" in the inner ring of Stonehenge, or their present condition as compared to that of their giant brethren in the trilithons. Here is a subject for careful observation, analysis, and record. And it may prove that a comparison of the chemical constitution and lithological condition of these two kinds of stone may enable the man of science to construct something of an archaeological calculus that will throw light on the date of Stonehenge.

BUILDERS' MACHINERY AT THE ROYAL AGRICULTURAL SOCIETY'S SHOW, READING.

The exhibition of machinery of especial interest to the building and allied trades was this year more limited than usual, owing, doubtless, to the long-continued depression in this particular branch of engineering; there was, however, a considerable number of exhibits well worthy of notice. The saw-benches and wood-working machines shown by the agricultural houses were far behind the times, the designs in many cases being poor in the extreme. This is the more extraordinary, as the steam-engines exhibited by many of the same firms were of the highest class.

Amongst the steam-engines especially suited for saw-mill work, a horizontal compound condensing engine was exhibited by the Reading Ironworks Co. The cylinders are placed one behind the other, the high-pressure cylinder being nearest the crank shaft; the steam-ports are kept short by placing the expansion or outer valve eccentric close up to the main shaft bearing, and carrying the connexion straight through to the valves. The exhaust-valve eccentric is outside the one working the expansion valve, and its rod is connected to a pin, on one side of a hollow wrought-iron sleeve carried in double guides. On the opposite side of this sleeve, another pin connects to the exhaust-valve rod, so transferring the motion of the exhaust eccentric from the centre line of the latter to that of the valve rod, which is situated nearer the centre of the cylinders. The governors are of the Porter type, with ports shaped so as to alter, automatically, the point of cut-off. Variable expansion is applied to the high-pressure cylinder. Taken altogether, this engine must be pronounced a first-class specimen of its type, and a strong contrast to the wood-working machinery exhibited by the same firm, which is very second-rate, both in design and construction. The Reading Ironworks Co. also showed

a brick and tile-making machine in motion. This was of compact design, and mounted on rails, so that it could readily be run to different parts of a field, thus avoiding the expense of carrying the clay to the machine. A pitch chain, in lieu of a belt, connects the pug-mill and the feed-roller.

Messrs. Marshall, Sons, & Co., Limited, of Gainsborough, exhibited a well-designed compound semi-fixed engine, which was arranged beneath a boiler of the locomotive type.

Messrs. Hornsby & Sons, Limited, also exhibited, for the first time, a compound under-type semi-fixed engine and locomotive boiler. The engine was mounted on wrought-iron girder frames, and the whole of the working parts compactly arranged.

We are glad to see the number of makers of this type of engine increasing, as from its extreme economy in working it should be the fixed steam-engine of the immediate future. We may add that the economy of this system is due to the fact that a high pressure of steam, say 100 lb. per square inch, is first used in the high-pressure cylinder, and afterwards expanded down to as low a pressure as possible in the low-pressure cylinder, thus, practically speaking, using the steam twice over.

The largest exhibit of builders' and saw-mill machinery was made by Messrs. Charles Powis & Co., of London. This included a well-designed general joiner, joiner's bench, panel-planing, band-sawing machines, &c. The joiner's bench was arranged for circular and band sawing, grooving, rebating, tenoning, and boring, and is well adapted for establishments of small size. The tenon-cutting was performed by circular saws, two of which were mounted on the saw-spindle in the usual way, and two smaller ones arranged horizontally on vertical spindles. The wood to be tenoned is cramped vertically in a slide arranged to traverse on the top of a long fence, and passed between the two first saws which cut the sides of the tenon, and afterwards between the small horizontal saws which cut the shoulders, thus completing the tenon at one operation. The main frame of this machine is cast in one piece, thus securing rigidity in working. A single-spindle moulding and shaping machine, arranged with idler pulleys, was also shown; by this arrangement the action of the moulding cutters is instantly reversible, thus enabling the cutters always to work with the grain of the wood.

Messrs. Reynolds & Co., of London, showed a considerable number of machines for builders' purposes, including a single deal frame, surface-planer, band-saw, &c. The deal frame is compactly designed, and appeared to work well; the swing frame carrying the saws is made of wrought-iron, faced with steel, the sides and cross-bars being mortised and tenoned together, thus combining strength with lightness. The weighting arrangement for keeping the dooks down when being sawn is simple and effective. The hand-sawing machine shown was of the hollow or cored column type, and fitted with tension spring and the usual adjustments. Panel planing, surfacing, and mortising machines completed the display.

Messrs. H. Wynn & Co., of London, showed a small collection of wood-working machinery, which did not, however, possess any special feature of novelty,—and several of the "Ord" gas engines. These appeared to work well, without excess of noise, and should be serviceable to users of small power.

Mr. Hindley, of Bourton, exhibited a number of neatly-made engines and some sawing machinery. Amongst the engines was a newly-designed vertical, in which we were glad to see Mr. Hindley has increased the size of the cylinder and boiler per nominal horse-power. It is fitted with a Porter's governor, water-tank, foundation, a simple feed-pump, and the usual fittings found in engines of this class. The saw-henches appeared well made, but we should prefer to see a considerable addition of iron in the main framings.

Messrs. Hempstead & Co., of London, showed several well-made engines and some sawing machinery; the latter was not by any means remarkable.

At the stand of Messrs. Abbott & Goosey, of Stamford, we noticed a remarkably cheap light hoist, well adapted for builders' use, or where it is required to raise goods from one floor to another. This hoist is worked by a handle operating a worm and worm-wheel, and the handle being placed in the front of the machine it can be fixed against a wall, or in any desired

position; it is also so arranged that it cannot run back while working.

A useful guard for circular saws was shown by Mr. R. Taylor, of Bury St. Edmunds.

Amongst other machines, Messrs. Ben. Reid & Co., of Aberdeen, exhibited a simple form of root-extractor, which can also be used for lifting stones, &c. By means of a long lever acting on a catch-wheel and pawl, a man is capable of exerting a power of from five to six tons, thus enabling him to lift large tree-stumps or stones sufficiently high to allow a truck to be placed beneath them.

A somewhat novel mixing-machine was exhibited by the Standard Emery Wheel Company, London. This machine consists, briefly, of a pugging or mixing box, in which the mixing-blades revolve, a to-and-fro motion being imparted to this box in addition to the circular motion of the mixing-blades. A saw-sharpening machine was also shown here. In this machine the saw being sharpened was arranged to bevel, instead of the revolving emery wheel, as is the case in most machines of this class. Brick-making machines were shown by Messrs. Whitehead, Pinfold, Fawcett, and others, but most of them are too well known to need description; as are the stone-breakers exhibited by Messrs. Marsden & Hall.

A capital display of brickfield machinery was made by Messrs. E. P. Bastin & Co., West Drayton: this included wash-mills and elevators, pug-mills, chain driving-gear, &c. A horizontal high-speed pug-mill was driven by an independent shaft and intermediate gearing, which is somewhat an improvement over the old form. Taken altogether, the design and construction of the machinery on this stand is in advance of what is usually found in a brick-field.

We must not omit to notice a novel form of self-acting vertical portable engine exhibited by Mr. Mather, of Wellington; it is without eccentrics, piston-rod, or slide-valves. Two fly-wheels are fitted on the crank shaft, and these are made to do duty for travelling wheels. We wait with some interest the further development of this invention.

A considerable number of contractors' and other pumps were shown, some of them in motion; the most novel was a Roof's continuous-action revolving pump, at the stand of Messrs. Hayward Tyler & Co., London. The continuous action of the pump is secured by two peculiar-shaped vanes, revolving in opposite directions in a cast-iron casing; these vanes are so arranged that a constant rolling contact is kept up between them, which makes them, practically speaking, watertight. As each vane revolves on its centre, one half forms a vacuum between it and the outside casing, into which the water flows. As the motion is continued, the opposite end comes round and drives the charge already taken in before it, at the same time creating a vacuum behind it, which in turn is filled with water, and discharged at the next revolution. This constant charging and discharging goes on simultaneously with both vanes, hence a constant and steady flow is the result. The pump exhibited was made in America, and is certainly a remarkably crude specimen of American engineering skill.

Messrs. Priestman Bros., of Hall, as usual, showed one of their patent dredgers and excavators. These are too well known to need description. A new grab bucket for dredging mud, clay, &c., was, however, attached, and also one for dredging sand. The edge of this bucket was arranged with a series of long steel points, which penetrate the sand when dropped on it, but when the bucket is closed interlocked with each other and thus prevent the escape of the material.

Messrs. Batho, of Westminster, exhibited one of Bruce's patent excavators, fitted with a four-segment bucket and an arrangement for forcing the blades of the excavator into hard soil; these should be very useful for harbour work, and for corners where the ordinary form of dredger cannot be applied.

**Kendal.**—Extensive alterations are in progress at the St. George's Schools, Kendal. Four large class-rooms and a parish or vestry meeting-room are being added, with new vestibule and staircase, and the entire range of schools and class-rooms is to be heated by hot water. The architect is Mr. D. Brads, of Kendal.

#### MUSEUM GRANTS.

ALL interested in art must have felt that there was cause for congratulation in the generosity of the special Government grant by means of which the nation has been recently enabled to acquire a number of artistic treasures such as do not every day offer themselves for sale. When it is remembered how largely our national collections have been enriched by private generosity, it is gratifying to see such interest expressed in quarters usually accused of being deaf to any extraordinary claim made upon their funds. It is by this wise and judicious exercise of private and public generosity that our national collections have, within comparatively only a few years, acquired the position they at present hold, and which so justly excites the admiration and envy of less fortunate foreign countries. When, now, very nearly fifty years ago, the engraver John Landseer, the father of Sir Edwin, wrote his "Descriptive, Explanatory, and Critical Catalogue of Fifty of the Earliest Pictures contained in the National Gallery" (1834), the collection could ill vie with those of foreign nations. Thanks, however, to the efforts of successive Directors and Keepers, to Government grants, and to bequests, our National Gallery now holds its place among the finest in the world. As for our museums, fifty years ago the British Museum stood alone, while our South Kensington Museum has, as every one knows well, been called into existence, with its wonderful and almost unique gathering of treasures, within barely twenty-five years. All these are facts with which every one in England is familiar, and of which we have just reason to be proud. Foreign countries, however, are only commencing to notice the fact that where, but a few years since, their galleries and museums were unrivalled by anything certainly that English travellers were accustomed to see at home, now our collections are yearly becoming richer in the very treasures that previously formed the characteristic features of their own museums and galleries. Bequests and purchases of princely magnificence and of almost unimpeachable quality constantly come to swell our national gatherings, while abroad, private generosity is scarcely known,—a direct result of State interference in all matters,—and the grants for purchases, small as they are, and sub-divided among a number of museums, are only grudgingly accorded. Under these conditions the *prestige* of some of the galleries is slowly being threatened, and while we in England are constantly instancing for argumentative purposes the Continental museums, they, on their side, are commencing to point to us and our gatherings to rouse a spirit of national pride and emulation. On our side of the Channel the question of special Government grants for the purchase of works of art has been recently roused by the claim made by the authorities of the National Gallery for funds to enrich the collection under the exceptional opportunities that have been afforded to the art world this season. On their side of the Channel the French have had their attention drawn to the question by the approaching discussion to be held in the Chamber respecting the sale of the Crown jewels, the proceeds of which, it has been suggested, would permanently increase the purchasing funds now at the disposal of the Museum authorities.

An article which recently appeared in the pages of the *République Française*, emanating,—judging, at least, by the initials "O. R.," those of M. Ollivier Rayet,—from high quarters, has urged upon the attention of the French public the consideration of the question of the daily-increasing position of inferiority in which the French museums are being placed by the rapid strides in this direction made by other countries, notably England; and certainly, when each year brings round the report of our Museum authorities, the list of our acquisitions is somewhat striking.

Without bringing into the comparison such gatherings as those of Rome, Florence, and Naples, the Vatican, Lateran and Capitol, the Uffizi, the Pitti, and the Bargello, or the Museo Borbonico, formed in the past, and under conditions which it would be impossible ever to expect to see revived, when the French collections are compared with those of Vienna, the Belvedere, the Ambras, and the Hofburg, those of Munich, the two Pinakotheks and the Glyptothek, those of London, Berlin, or St.

Petersburg, rich though the Louvre, the Cluny, the Luxembourg, Versailles, and Saint Germain may be, it becomes evident to all familiar with the collections of Europe that France has of late not made such advances as its foreign rivals. It is the desire, we have heard, of the present director of our National Gallery to make the collection under his charge eminently representative; and certainly within a few years this laudable aim has been largely attained. Our French friends, however, have scarcely done as much, and had it not been for the generosity of the journal *L'Art*, the Louvre would have been unable to show, as representative of our English school, anything more than one small Bonington and two or three Constables, one presented by Mr. Lionel Constable, the others by Mr. Join Wilson, now some ten years or so since. Of Reynolds, Gainsborough, Hogarth, Turner, David Cox, Wilson, and many other of our painters, there exists not a specimen in the French National Gallery.\* In works belonging to the old German, the Cologne, and Flemish schools the collection is equally wanting; while in early Italian masters, taken as a whole, we are, the French frankly admit, far ahead; in these works we are, says the writer to whom we have referred, "very far inferior to Berlin and London. In German and Early Flemish pictures we are fifth in rank. In Flemish masters of the seventeenth century we must yield the palm to Munich and St. Petersburg. In drawings" (we continue to quote) "numerous and varied as is our Louvre collection, London and Berlin are treading close upon us.† In Renaissance sculptures we are at the head, though Berlin stands very near, and London is not far behind. In small objects belonging to the same period, in bronzes, and in gold and silver smith's work, we come after Vienna, and we are almost on a par with London, though we are superior to Berlin. In the matter of antique marbles, the possession of the pediments and friezes of the Parthenon, the Phigalian marbles, those of Halicarnassus, of the avenue of the Branchidae, and the monuments of Xanthus and Ephesus, assure the British Museum a superiority over the whole world. Munich, again, is superior to us in the possession of the Æginetan marbles; but we come far before Berlin, Vienna, and St. Petersburg."

"The collection of ancient bronzes of the British Museum is very much superior to that of the Louvre; the collections of Munich, Vienna, and Berlin are, in this respect, poor. We do not by any means come first in our collection of vases; the collections of Berlin and London are superior. We have, however, the advantage in terra-cottas." It is, it must be remembered, an eminent archaeologist who thus gives his candid and impartial opinion. "In gems, intagli, &c., we are almost equal to Berlin, but we cannot for an instant rival St. Petersburg. Our collection of coins has long been the most beautiful, and it remains the largest; but in the Greek series, Berlin and London possess rarer specimens, and in a better state of preservation. Our Egyptian museum is by far the finest of all, the second and third rank belonging to Turin and Leyden; our Assyrian collection, however, considerably as it has been of late enriched, is nothing beside that of London."

"In sum," remarks our contemporary, "it will be seen that in modern works of art France holds the first place; in ancient art, England alone stands foremost. In both and all there are compensating possessions. We have a feeble advantage over Berlin and Munich, a greater over Vienna and St. Petersburg."

Certainly, in comparing the sums annually expended by us, by Prussia, and by France, it is easy to understand the advances made by ourselves and the Prussians; France allows, it would appear, very little over 8,000l. annually (202,000 francs).‡ Such a sum can be ill compared with the over 16,000l. (325,000 marks) granted by the German Government for similar purposes,—a sum in which are not included the funds allotted to the new National Museum. With regard to the amounts which we spend, it

is somewhat difficult to come at definite figures, there being so many items, extraordinary grants, bequests, &c., to take into consideration; setting down, however, the British Museum at over 6,000l., the National Gallery at 10,000l.; the South Kensington Museum, at 6,000l., and 1,000l. for the National Portrait Gallery, we reach a total of over 23,000l., which certainly stands very well beside the French 8,000l.\*

The matter, however, of special grants must be taken into consideration. France last year, we learn, granted some 5,500l. for the purchase of M. de Sarzec's Chaldean antiquities, and again this year the same sum for the purchase of four pictures by the late Gustave Courbet, and a further 8,000l. for the Timbal collection, a total for this year of 13,500l., a larger sum than has for many years been granted; adding this figure to that of the annual grant (8,000l.), the grand total in an exceptional year reaches the figure of 21,500l. The Berlin Museums, however, obtain also extraordinary grants; indeed, the Prussian budget is admirably elastic, and in the Crown Prince any expenditure for art-treasures invariably finds a warm advocate. A serious article which appeared in January last in the pages of the *Revue des Deux Mondes*, and treating of the organisation of the Berlin Museums, stated that the mean German expenditure, taking the years between 1873 and 1881, is 26,000l. As a further means of increasing their collection the German Government has generously encouraged by large grants a series of excavations in Greece and elsewhere; the excavations at Olympia alone have, within the last six years, cost an enormous sum, and those of Pergamum, still progressing, more than 12,000l.

The generosity of our Government is scarcely less noticeable, and of late years the special grants that have enabled us to enrich our museums and galleries with numerous treasures cannot but be a matter for just pride. Within only a few days, and in the midst of harassing political events, the large sum placed at the disposition of the authorities of the National Gallery,—report has stated the sum to be 30,000l.,—is only another proof of the importance attached by the Government to the increase of the national collections.

THE NEW AUSTRIAN REGULATIONS FOR THEATRES.

As a pendant to the official report of the Prussian Academy of Architecture, which we published last week in reference to safety from fires in theatres, we reproduce this week the chief portions of the Ordinance recently issued by the Governor of Lower Austria with a similar object. The document is of great length consisting of 114 paragraphs, but all that is essential will be found below. It is entitled "Conditions to be complied with in the case of theatrical representations in new theatres, as well as in the arrangements and working of theatres in general; and the measures for enforcing the exact observance of the same."

In Section I, which is entitled "The Site and Construction of New Theatres," the principal paragraphs are the following:—

**Site.**—New theatres must be so built that they stand detached on all sides, and are at least fifteen metres (that is, 49½ ft.) distant from the neighbouring buildings, objects, or boundaries.

**Walls.**—All the containing walls, staircase walls, and fireproof walls must be constructed of solid or massive materials.

**Shutting-off the Stage from the Auditorium.**—The stage part of the house, including the stage itself, the parts beneath it, and the subordinate rooms around it devoted to stage purposes, such as the dressing-rooms, wardrobes, tailor's room, rehearsal and ballet saloons, &c., must be shut off from the auditorium and its adjacent rooms, passages, corridors, &c., by a fireproof wall, at least 0.60 metre (or 2 ft.) thick, and extending for 0.45 metre (or 18 in.) above the level of the roof, and downward under the stage to immediately beneath the podium. In this dividing wall it is allowable to make, in addition to the proscenium opening, only one connecting aperture, leading, naively, from the vaulted passage in the pit (*parterre*) mentioned in a later section, and this latter opening is to be secured by an iron door, closing of itself.

**Fire-proof Construction.**—Both the stage side

of the theatre and the auditorium must, in all their constructive parts, be built of materials proof against fire.

**Height of the Stage Side.**—The stage part of the theatre must be of such a height that the scenes can find room above without being rolled up.

**Apartments attached to the Auditorium.**—On the outer border of the auditorium it is permissible, as a rule, only to have passages, corridors, staircases, loggia, foyers, or buffets; that is, only such places as will afford means of egress or refuge to the audience.

**Dwelling Apartments and other Subordinate Rooms.**—Except the rooms set apart for the watchmen, the inspector's room, the office, the dwelling apartment for the house-cleaner, and the storerooms for the wardrobe and other articles in current use, it is absolutely forbidden to have in the theatre building itself any dwelling or storerooms, scene-painters' rooms, workshops, or refreshment-rooms, or any other apartments whatever.

**Passages or Corridors in the Auditorium.**—Around the auditorium there must be for each floor or tier, including the pit, a fireproof vaulted passage or corridor, at least 2.50 metres (8 ft.) in width, leading immediately to the exit staircases or way out.

**Tiers.**—In addition to the pit and pit boxes the auditorium must not have more than four tiers at the utmost.

**Level of the Pit.**—The niveau of the highest point of the pit (the top of the central passage) must not be higher than 2 metres above the level of the street, and the passages out from the pit are only to be by inclined planes.

**Stairs.**—Both the auditorium and the rooms subordinate to the stage must on all floors be provided with fireproof straight-armed staircases leading directly into the open air or street. In particular, each tier and gallery in the auditorium must have a staircase on both sides of the house. The stairs of one tier must not communicate with the passages belonging to another. The staircases must be at least 1.50 metres (or about 5 ft.) in width, safe against fire and against falling in, and must be vaulted underneath; they must consist of straight arms, in equal sections without intermediate steps, and have full, solidly built axes. The stairs in the auditorium division of the theatre are to be built in such a direction as will facilitate the clearing of the house in the most rapid manner, and so as to be easily found and accessible by the shortest distance from the inner part of the house. The landings are to have the same breadth as the stairs or their sections.

**Doors of Exit.**—The passages leading out of the auditorium must be sufficiently numerous to enable a full house in ordinary circumstances to be completely cleared in four minutes at the most. The doors of all the ways out must open outwards. Fixed wings of doors are in no case admissible. The doors of boxes may open inwards or outwards.

**Orchestra.—Prompter.**—At least one special passage must be made for the members of the orchestra, and it must not run either through the pit or beneath the stage. The prompter and lamplighter must also have access, or a safe means of egress by way of the orchestra.

**The Court Boxes.**—In addition to being more roomy than the average, the Court boxes must have an ante-room and a special staircase, with covered carriage entrance and vestibule.

**Carriage Entrance.**—The theatre must have the general carriage entrance covered in.

**Fireproof Safety Curtain.**—The proscenium opening must be provided with an opaque fireproof curtain in permanent use, and capable of shutting off the gases of combustion. Only metallic materials must be employed in the fittings of this curtain. No doors or other openings can be allowed in it. The mechanism for moving this fireproof curtain must be fixed on the podium of the stage, and none but metallic substances may be used in it. The watchman who has to manage it must have a perfectly fireproof place to stand in, and a similar avenue of egress.

**Impregnation.**—Non-fireproof parts of the machinery and scaffolding of the stage, the roof, and parts underneath the stage, the scene-shifting appliances, &c., must be made of materials completely impregnated with fire-resisting chemicals.

**Wax and Oil Colours.**—Wax and oil colours are not to be employed in the scene paintings.

**Seats.**—The stalls must consist of seats that turn up, and may be with or without under-

\* In the case of our National Gallery, it may be remarked that we are almost equally deficient in specimens belonging to the French school.

† Could our collection of drawings only be adequately shown, we suspect it would be found to be richer than any Continental collection.

‡ The sum as stated by the *République Française* is 182,000 francs, from which 20,000 francs have to be deducted for the Department of Chalcography, or Government Establishment; 49,000 francs are allowed for the Medal Department.

\* Some exact figures respecting our national collections it would be interesting and instructive to obtain.

neath supports. The width of the space between such supports and the back of the proceeding row of seats must be at least 0.40 metre. The stalls must be at least 0.55 metre in width, and 0.70 metre deep, and for a numbered seat the breadth must be at least 0.50 metre, and the depth 0.65 metre.

*Aisles or Passages.*—In the pit and galleries there must be passages between the rows of seats of 1.25 metre in width, when the seats are accessible from both sides, and of 1 metre in width when they are accessible from one side only. These passages are to be so laid out that no spectator can be more than six seats distant from one.

*The Passages to be kept Free.*—*Flap Seats.*—The passages to the seats must be constantly kept free; they must not be stopped up, nor used as standing-places. The use of flap benches, or of movable seats or stools there, is inadmissible.

*Standing Places.*—It is only in the pit and galleries, or parts of the house specially set apart for the purpose, that standing-places are allowable.

*Orchestra.*—The place occupied by the orchestra must not be used as part of the auditorium.

*Wardrobes or Cloak-rooms.*—The wardrobes or cloak-rooms for the use of the public must not be placed in the passages, but must be in special apartments so arranged as to freely let the public in and out.

*Illumination.*—*Gaslights.*—With gaslights, arrangements must be made so that there may be at least one separate supply of gas direct from the street pipes for the illumination of the auditorium, including the large chandelier and the tier parapets, and another similarly independent supply for the stage side of the house. The gas must be conducted over the house only in iron tubes. Only where iron pipes cannot be used, spiral hose may be applied in exceptional cases. The common india-rubber pipes are in no case to be employed.

*Gas Meters.*—Each of the main gas-pipes must be provided with two gas-meters connected with each other. The meters belonging to the auditorium must never be fixed near those belonging to the stage, but must be placed in different apartments. There must be no taps attached to these gas-meters.

*Electric Lighting.*—When a theatre is lighted by electricity, the installation must be arranged so that the illumination of the auditorium is wholly independent of that of the stage. In the two parts of the theatre the installation must provide two separate systems or independent circuits, each with its own lighting machines and apparatus. The wires must be sufficiently stoned to prevent their being overheated; they must be carried along a groove in the wall and secured against being injured, as well as against the possibility of the audience coming in contact with them. The electric lights must be provided with glass globes, and fixed so that it is impossible for particles of the carbon points to fall out. The motors driving the lighting machine must, in case fire is employed in them, be fixed up outside the theatre building.

*Soffits.*—The flames in the soffits must be perfectly guarded so that no portion of the protective covering can be heated by the calorific that is given off.

*Lighting up.*—The lighting up of the gas flames illuminating the soffits must only be effected when the soffit-sashes are let down.

*Lucifer Matches.*—*Wax Tapers.*—The use of lucifer matches or open burning wax tapers is forbidden without any exception.

*Emergency Lights.*—In the auditorium, as well as in the outer passages or corridors, and staircases, and likewise in the subsidiary apartments on the stage side of the house, if they are lighted with the electric light or with gas, there must be introduced, in addition, another set of lights (oil lamps) against cases of emergency. All doors, in particular those leading out of the inner rooms of the auditorium, must be lighted with red emergency lights, and in such a way that there may at the same time be both direct access of the air from without and a drawing off to the outside of the gases of combustion.

*Heating.*—Theatres used in winter must be warmed by the central heating system, the auditorium and stage being, however, each warmed separately. Ordinary free iron stoves are not permitted within the theatre buildings. In the central system, particularly when air is

used, the openings designed to let the heat out must be furnished with fine meshed wire netting. No readily inflammable objects must be permitted in proximity to such openings.

*Chimneys.*—The stage roof must be provided with one or two openings or chimneys leading directly to the open air, in order, in case of an outbreak of fire on the stage, to allow the products of combustion to escape. The section of these openings should be equal to at least one-fortieth of the surface of the podium of the stage. The closing apparatus to these openings must be so arranged that when set free they may open of themselves by their own weight.

*Fire Telegraph.*—The theatre should be connected with the local fire brigade by a telegraphic signalling apparatus, which should be accessible not only in the parts of the house frequented by the *personnel* of the theatre, but also in the office and porter's lodge. The apparatus should be fixed near the mechanism for moving the fire-proof curtain, and attended to by the watchman looking after the latter. A similar apparatus should be placed in the office and porter's room.

*Water.*—On the stage side of the house, on the hoards, and in the parts underneath and above them, a sufficient number of water-cocks should be fixed and provided with hose of proper length. The watchmen attending them must have a safe means of egress provided for them. The auditorium ought to be similarly supplied with a sufficient number of water-cocks.

*Requisites for Extinguishing Fires.*—On the stage there must constantly stand water-butts filled with water, and with at least four fire-buckets near each. Moreover, there should also be wet coarse cloths and saturated sponges fastened to rods, as well as at least one long fire-hook on each side of the stage; and, again, there should be the requisite number of ladders kept ready at particular spots, and sealed up by the manager. There must, in addition, be on the stage at least two "Extinguishers," kept perfectly ready for use at a moment's notice.

## II. MANAGEMENT.

*Commencement and End of the Lighting.*—The auditorium at the opening of the theatre ought to be already sufficiently lighted. The lights, including the emergency lamps, must not be put out before the audience or theatrical *personnel* has entirely left the theatre.

*Safety Curtain.*—Except while a performance or general rehearsal is going on, the safety curtain is always to be kept down. It must also be let down between the acts.

*Curtains, Drop Scenes, and Views.*—Curtains and views of light material, such as gauze, must be furnished on both sides with ropes by which they can be moved.

*Keeping the Stage clear.*—The stage has to be kept as clear as possible. The decorations and requisites which may be on it at one time must not be more than sufficient for three performances. No persons except those engaged in the performance should be allowed on the stage.

*Keeping the Passages clear on the Auditorium Side of the House.*—All the ways out, corridors, passages, staircases, doors, &c., are to be kept free from all obstacles. The doors of egress, from the beginning of the performance to the clearing of the theatre, must be kept unfastened, and immediately before the close of the performance they must be set open.

*Fireworks.*—*Powder.*—Fireworks, gunpowder, and other explosive materials must under no circumstances be kept inside a theatre. When such things are required for any performance they must only be brought into the building immediately before the performance, and be at once placed under the special supervision of the firemen. In firing shots only stoppers made of calf-hair may be used.

*Testing Impregnation.*—Impregnation must be subjected to special examination by the authorities in order to test its completeness and efficacy before the impregnated articles are used on the stage. In general, too, the durability of the impregnation is to be tested at least twice a year. If the examination leads to an unsatisfactory result, the article concerned must not be employed for theatrical purposes, as a supplementary impregnation by a mere outer application is insufficient. In the Vienna police district the examination of impregnation is to be performed by the highest civil Board in co-operation with the chief of the police; and outside that district by the town council in case of towns with special charter, and by the

political district Board in combination with the communal authorities in other places.

*Regular Ventilation.*—On the days of performance care must be taken that the air in the auditorium and stage is sufficiently renewed. In case of two successive performances on the same day an interval of at least two hours and a half must be allowed to elapse between the first and second performance for the purpose of sufficiently airing the different parts of the house.

*Lamplighters.*—The person entrusted with the lighting up of the theatre and his assistants are to be made thoroughly acquainted with the entire lighting arrangements of the house; they are further to be furnished with exact and authorised instructions as to their duties, and the names of these persons are to be specially deposited with the authorities.

*Firemen.*—The fire service during the performances, together with the attendance at the water-cocks, must be entrusted to the hands of well-drilled firemen and trustworthy watchmen, and must be arranged so as to insure to the utmost possible extent the safety of the house. The men entrusted with the duty of fire-watchmen must under no circumstances be employed for any other purpose during the hours they are on this service.

*Testing of the Fire Telegraph.*—The fire telegraph must be tested every day about noon, so that in case it should get out of order there may be plenty of time to repair it.

*House Regulations.*—Every theatre must be provided with a code of regulations. In this there must be specially mentioned the rules respecting the inspection of all parts of the house before and after each performance; also respecting the use of fire and lights in the building, and in reference to the first steps to be taken in case of an outbreak of fire.

*Responsibility of the Lessee and Manager.*—The lessee and manager is responsible for the exact and conscientious observance of all the conditions laid down in the present Ordinance, or connected with other prescriptions contained in his licence. He is also responsible for the provision of proper measures, so that, in case of fire breaking out, the public in the auditorium may receive proper and timely warning.

## INSPECTION OF THEATRES.

The duties connected with the inspection of theatres are to be discharged by officers representing the chief office of the police in the Vienna police district, and on the part of the fire-police by technical officers appointed by the chief civic council or by the communal council, as the case may be; and, out of that district, by the communal board. These officers must attend at the inspector's office in the house an hour before the commencement of the performance, and are to proceed to inspect every room in the theatre in reference to its arrangements for personal security and safety from fire. Anything they find amiss they are at once to rectify. A medical man (surgeon) must be present at every performance in order to render medical assistance when it may be required. The lessee and manager must deposit the name of this medical man with the authorities.

A final paragraph forbids the authorities to allow performances to go on in any theatre where any of the above rules are not observed. The Ordinance, it is further expressly stated, applies to circuses, rope-dancing performances, fireworks, and all exhibitions of a similar character.

## THE GROWTH OF ANTWERP.

The traveller who, after an interval of two summers, proceeds at the present time on a visit to Antwerp, cannot fail to witness with amazement the total transformation which, within so brief a period, has come over the city. The familiar features of the place have been effaced, and its physiognomy entirely changed. The old quay, running for nearly a couple of miles along the eastern bank of the Scheldt, is no more. The rows of umbrageous trees, beneath whose grateful shade we may once have sauntered amidst vast piles of merchandise, are gone for ever, and with them has disappeared the long line of *cafés, restaurants, estaminets, beer-houses, tobacco-shops, shipping-offices, and other establishments* which had, from time immemorial, formed the river frontage from one end of the city to the other. But for the cathedral, with its lace-work tower and cheerful carillon, the traveller can hardly recognise Antwerp again, so com-

plete is the change which has been wrought within two to three years. It is not simply that the line of houses fronting the river has been removed; whole streets behind them have been demolished, and probably not less than one-sixth of the entire population of the city has been dislocated.

The cause of this remarkable transformation is not far to seek,—it is due to the rapidity of the recent growth of the commerce of Antwerp, a rapidity which, in Europe, is without example. As the British Consul mentions in one of his reports, while the shipping and commerce of Havre or Liverpool have been growing four-fold, those of Antwerp have actually increased sixteen-fold. M. Roymers, the town architect and engineer, says that the traffic has been regularly doubling every eight to ten years. The inward tonnage of vessels for the port of Antwerp in 1850 was, in round numbers, 250,000 tons. In 1865, it had risen to 750,000 tons; while in 1880, it was over 3,000,000 tons. This enormous and, in Europe, unparalleled increase is due to the favourable situation of the great Belgian port, which is more easily accessible than any other shipping centre to the vast population of Central Europe.

The building and engineering improvements undertaken within the past few years in Antwerp are only surpassed by the greatest works of a similar nature that have been carried out in London and Liverpool. Foremost in the changes in the Belgian port is the new quay, which extends, as we have already intimated, along the whole right bank of the river Scheldt, from one end of the city to the other. Its length when complete will be over two miles. The work is being carried out at the expense of the Belgian Government, and the total cost is estimated to amount to more than two million pounds sterling. Of this sum 85,000,000 francs have already been voted by the Belgian Legislature for the construction of the new quay itself, while an additional 15,000,000 francs has been expended in the compulsory expropriation of the proprietors and tenants of the long line of houses forming the old river frontage. The new Antwerp quay is, in fact, a work second only to the Thames Embankment. The new quay will be 100 metres broad, or about three times as wide as the old one. Upwards of one half of the work is already completed. The contractors who have undertaken the whole work are Messrs. Couvreur & Hersent, of Paris.

In addition to the quays, extensive new docks have likewise been begun, the expense being, in this instance, borne by the municipal authorities of Antwerp. The two great Belgian railway systems, the Belgian State railways and the Grand Central Belge, both run up to and alongside all the docks and quays. Some idea of the vastness of Antwerp trade may be formed from the fact that, even two years ago, the number of railway goods wagons which arrived at the docks and quays numbered over a million. There were 863,633 which came by the Belgian State lines, and 157,595 by the Grand Central Belge, numbering together 1,021,228. Of this number nearly three-fourths brought merchandise, and unloaded at the docks and quays.

At the present time the vicinity of the new quay is one in which the builder is busy. New houses, larger and finer than those which have been pulled down, are being erected very rapidly. In fact, in the course of another year or two Antwerp to the traveller arriving by steamer from the river will present the appearance of a brand new city. A terrace of houses, two miles in length, all of them perfectly new, will ere long form the river frontage of the city.

The traffic which passes through this port to and from Germany and other countries of Central Europe is already enormous, and it is every day increasing. The route to England via Antwerp and Harwich has become the favourite one with the Germans, and the traffic has so augmented that the Great Eastern Company, at the commencement of the present month, commenced running a daily line of steamers between the two ports just mentioned. The opening of the St. Gothard Tunnel is another event which has added to the traffic of Antwerp, and particularly to the English trade via Harwich. The Great Eastern Company are now every day bringing considerable quantities of Italian produce to England. This merchandise all comes through the St. Gothard tunnel via Switzerland and Germany to the Belgian port. Antwerp, in fact, has the good fortune of being nearer to Milan by rail than any other

port of Western Europe. The distance is 1,178 kilometres, while the distance from Calais to Milan, via the Mont Cenis tunnel, is 1,354 kilometres, giving to Antwerp an advantage of 100 miles, a matter of no little importance when the extra cost of carriage by rail is considered. The distance from Boulogne to Milan, via Mount Cenis, is 1,311 kilometres, while from Ostend, via the St. Gothard, Milan is 1,258 kilometres distant, so that Antwerp is 50 miles nearer than Ostend and 83 miles nearer than Boulogne. Even if the French and Swiss Governments agree to carry out the proposed Mont Blanc or Simplon tunnel, Antwerp will still be nearer to Milan by the present route, via the St. Gothard, than any of the other ports will be by either of the proposed routes. Moreover, as the latter cannot be completed for at least seven or eight years to come, the Belgian port has the advantage of a start in attracting traffic of which it will afterwards be difficult to deprive her.

Another improvement which is being carried out at Antwerp is the erection of a railway station close to the quay where the Harwich steamers land their passengers, so that before long travellers from England, who wish to proceed on their journey, will soon be able to walk direct from their boat into the railway carriage instead of having to drive through the city as at present.

The effect of the growing importance of Antwerp for the English and Continental passenger and goods traffic has made itself distinctly felt on the English side of the North Sea. In fact, it has led to the foundation of what will ultimately be a new town in the county of Essex. The present accommodation at Harwich has been found inadequate to the increasing trade, and accordingly the Great Eastern Railway Company have erected on the estuary of the Stour, three-quarters of a mile from Harwich, a splendid new quay, where its vessels will land passengers and goods in future. This new port has been named Parkeston. The quay there is 1,800 ft. in length, and is provided with warehouses, 1,400 ft. long and 60 ft. broad. Close by the quay it is intended to erect a new railway station and an hotel, with extensive waiting-rooms for the convenience of passengers passing to and fro between England and the Continent. There are also to be erected bonded stores, customs offices, offices for merchants and workmen, so that, in fact, as we have mentioned, the growth of Antwerp, added to the existing traffic with Rotterdam and other ports, has led to the foundation of a new town in England. Parkeston will, in future, be the port through which a large traffic, not only between London and the Continent, but between the middle and North of England and the Continent, will pass, the company having completed certain extension lines which will bring the port in direct communication with Birmingham, Manchester, Sheffield, Leeds, Nottingham, and the other great manufacturing centres of the kingdom.

The inauguration of the daily service of steamers which has just been opened between Harwich and Antwerp was celebrated last week by a splendid banquet at Antwerp. The guests included, in addition to a number of English gentlemen, the representatives of no fewer than five Continental states, whose Governments and railways are interested in this line of steamers. The company proceeded on a most enjoyable trip down the Scheldt, and in the splendid saloon of the Great Eastern Company's steamer, *Adelaide*, the banquet was served. The first toasts proposed was "The Queen of England, the King of the Belgians, and the Emperor of Germany," given by the chairman, Mr. Gooday, who represented the Great Eastern Company. M. Huger then gave the "Belgian Government and the City of Antwerp." The speaker pointed out the inestimable services both were rendering to the great Belgian port. The toast was responded to by M. Semblanex, Under Secretary of Public Works, on behalf of the Belgian Ministry, and by MM. Allewaert and Cuyllits, Sheriffs of Antwerp, on behalf of the municipal authorities of the city. "Success to the Continental railways concerned," "Prosperity to the Great Eastern Company, and its daily service of steamers to Antwerp," and "The health of the English and Belgian press," were among the other toasts given at this charming féte.

**New Schools** are to be erected at Cheltenham, from designs by Messrs. Chatters & Channon, which were selected in competition.

THE RECENT SMOKE ABATEMENT EXHIBITIONS.

MEDALS AND OTHER AWARDS.

The medals and other awards adjudged to exhibitors in the Smoke Abatement Exhibition opened last year at South Kensington, as well as to exhibitors in the more recent exhibition held in Manchester, were formally presented on Friday, the 14th instant, at Grosvenor House, by the permission of the Duke of Westminster, who himself presided over the large and influential meeting which assembled. His Grace, in opening the proceedings, observed that he was much gratified in being able to claim for the efforts of the Smoke Abatement Committee a considerable measure of success. Their exhibition at South Kensington had been attended by no fewer than 116,000 persons. With regard to kitcheners, the results attained appeared to be very satisfactory, but the question of an open grate still remained an open question, although it might confidently be hoped that an apparatus combining the advantages of consuming its own smoke with strict economy of fuel would yet be produced. Sooner or later such a grate would, no doubt, come to the front, and then the proposal might be forthcoming that the use of such grates should be made compulsory. The work connected with the recent exhibition at South Kensington had been ably sustained by Mr. Ernest Hart, Mr. Coles, and many other gentlemen well known in the scientific world. All that was needed, in his opinion, to perpetuate and keep alive the work which had been done was the establishment of an association to carry on the work of the Smoke Abatement Committee, and to aid and encourage inventors in their efforts for the attainment of the desired results.

Mr. Hart then presented the general report of the committee, which, after detailing the origin of the formation of the committee and the steps taken for the holding of the exhibition, mentioned that the testing of apparatus and fuels was made, as far as possible, under the following conditions laid down by the Committee:—

1. Domestic heating appliances, viz.:—grates, stoves, and kitcheners, and kitchen open ranges, to be tested for heating power, cost, convenience, quality of combustion, and their comparative freedom from smoke and noxious vapours. Various fuels and new appliances for the utilisation of anthracite and other smokeless coals to be tried. Gas-heating apparatus, in which great improvements have recently been made, to be tested and compared.
  2. In regard to the testing of furnaces and apparatus for industrial purposes a greater difficulty presented itself; but trials of some of the more recent improvements in boiler apparatus were to be made with the special object of testing the combustion of fuel and the prevention of smoke, having regard also to evaporative performance.
- The Committee (continued the Report) engaged the services of Mr. D. Kinnear Clark, M. Inst. C.E., to superintend the trials, under the direction of the Executive Committee; and Professor W. Chandler Roberts, F.R.S., drew up a scheme for the chemical testing in connexion with the trials of fuel, grates, and stoves. . . .

The following is a list of the jurors who kindly undertook to act:—

- Prof. Abel, C.B., F.R.S.; Mr. A. T. Atchison, M.A.; Lord Alfred Churchill; Mr. W. R. E. Coles, C.E.; Mr. Thomas Cundy; Mr. T. W. Cutler, F.R.I.B.A.; Mr. W. Eassie, C.E.; Col. Festing, R.E.; Prof. Frankland, LL.D., F.R.S.; Capt. Galton, C.B.; Mr. E. Harris; Mr. Charles Heisch; Mr. Charles Hunt; Mr. T. W. Keates; Prof. Chandler Roberts, F.R.S.; Dr. Siemens, F.R.S., LL.D.; Mr. G. H. Trollope; Mr. Greville Williams; Mr. D. K. Clark, M. Inst. C.E., Attesting Engineer. . . .

At the closing meeting it was announced that there had been made altogether 249 tests, many of them of a detailed and costly character: 45 tests of vacuum-boiler appliances, 42 tests of coal samples, 128 tests of open grates and stoves, and so on through the whole list. A great amount of work had been done, and done with great care, and great thanks are still due to Dr. Siemens, Professors Frankland, Abel, Roberts, Mr. Atchison, Messrs. Harris, Heisch, Cutler, and the other jurors, who had given gratuitously their best time and their most valuable time, in carrying out the work of the jurors, as well as forwarding the objects of the exhibitors generally. The exhibits have been thoroughly cited in all the industrial papers. Among the visitors were reporters from the principal foreign Governments,—men such as Monsieur Trélat, the eminent President of the Society of Civil Engineers in Paris; and from the French Government; Dr. Gustav Wolf and Dr. W. Siemens, who came here from the German Government; and the Commissioners from the American Government. Those gentlemen will make reports on what they have seen here, so that the knowledge of the exhibits will extend to other

Countries as well as our own. The Marquis of Lorne specially requested that a detailed account of the testing should be supplied to the Government of Canada.

The Exhibition has been attended by the Royal Commissioners on Technical Education, the Institute of British Architects (who came in considerable numbers), the Society of Civil Engineers (also in large numbers), the Society of Mechanical Engineers, and the Members of the Coal and Iron Trades Institute. Also large deputations attended from builders and architects; and, in addition, the builders of London sent their workmen in large bodies. The Corporations of the various towns have shown great interest in this Exhibition, and a considerable number, not only of Mayors, but of other public officials, attended personally; and further, the Corporations of Manchester, Birmingham, Sheffield, Oldham, and Leeds, sent official deputations, who have gone through the Exhibition, and who will make reports of a practical character, and present recommendations to their respective corporations. The Committees were very much indebted to the National School of Cookery, especially to Mrs. Clark, the lady superintendent, for sending her staff and making practical trials of the kitcheners. The following is a list of Governments represented by their reporters:—France, Germany, United States, Switzerland, Austria, Hungary, Sweden, Denmark, the Netherlands, China, Canada, and Australia. The total number of visitors to the Exhibition has been 116,000; of these, 46,000 were admitted by payment, there being 66,000 persons to whom we gave free admission.

The testing alone has involved an expenditure of about 1,000*l.*; for, besides the testings at South Kensington, extensive testings have been made elsewhere. We have had testing going on of machinery all over the country, in factories and other suitable places.

As a result of the visit to the Exhibition of a deputation from the city authorities of Manchester, on January 11, it was arranged to practically transfer the Exhibition, so far as it could be transferred, to Manchester, the Corporation having lent the market buildings for the purpose. To this end, the Committee, its chairman, and hon. secretary energetically co-operated.

The testings were conducted by Mr. D. Kinnear Clark on the same bases as those conducted at South Kensington.

Mr. Hart went on to say that it was the object of the Committee from the first that the Exhibition should not be merely a display of objects to interest, but that the relative power of each invention to fulfil the purpose for which it was intended should be tested by experts, and he thought that, as a whole, the tests had been carried out in a very satisfactory manner, and with exceedingly good results. They were now able to say that there was not a house or room in which it was not possible to apply a smokeless kitchener, with an absolute economy of fuel as compared with that of most of the kitcheners now in use. There had also been considerable improvements in open grates. The Committee felt that were they to end their work with the close of the Exhibition they would not have accomplished the ends desired, and it was therefore intended to establish an institute for permanently carrying on the work of the Committee.

Mr. Herbert Phillips, representing the Manchester Committee, presented the report of the Manchester Exhibition, which stated that,—

The Manchester Smoke Abatement Exhibition was the outcome of that at South Kensington. The Committee of the Manchester Noxious Vapours Abatement Association watched the progress of the Committee which organised the latter with much interest, and the abatement of the nuisance produced by smoke being congenial to their special aim, viz., the suppression of vapours from chemical and allied works, they willingly co-operated with the London Committee, and, further, determined to continue the work by endeavouring to transfer, as far as practicable, the Exhibition to Manchester. The London Committee cordially received this proposal, and, in the work of organising, lent the Manchester Exhibition Committee valuable aid. A guarantee fund (the contributors to which will, however, not be called upon) of nearly 2,000*l.* was raised.

The Exhibition was opened on March 17th, by the Mayor. . . . As a demonstration against the smoke nuisance, and as a comprehensive representation of the most approved appliances for the prevention of smoke, the Exhibition was a worthy offspring of that at South Kensington. Every effort was made to utilise the opportunities afforded by the collection of appliances for spreading information respecting them.

Lady Grosvenor then proceeded to distribute the medals and other awards, of which the following is a complete list:—

#### SOUTH KENSINGTON AWARDS.

*Open Grates for Bituminous Coal.*—To Messrs. Brown & Green, for underfed grate, Gold Medal;

Messrs. Clark, Bunnell, & Co., for Ingram's Grate, for goodness of results, both with Wallend and anthracite, Silver Medal; E. H. Shorland, for Manchester Ventilating Grate, Silver Medal; E. R. Hollands, for underfed grate, Bronze Medal; H. E. Hoole, radiating and reflecting grate, with side hopper, Bronze Medal; Messrs. M. Featham & Co., for basket dog-grate, Bronze Medal; J. M. Stanley, for hopped grate, Bronze Medal; T. E. Parker, for Vencolor grate, Bronze Medal; W. H. Henry, for respirator grate, Bronze Medal; Messrs. Doulton & Co., for tile grate, Honourable Mention; Messrs. Rosser & Russell, for fire-clay grate, Honourable Mention; Messrs. George Haller & Co., for Kohler Hot-air Stove, Honourable Mention.

*Open Grates for Smokeless Fuel.*—To the Coalbrookdale Co., for Kyrle Grate, Silver Medal; Messrs. Yates, Haywood, & Co., for back and side draught ventilating grate, Silver Medal; M. Perrett, for radiating stove, Bronze Medal.

*Close Stoves for Bituminous Coal.*—To C. B. Gregory, for smoke-burning furnace, Silver Medal; John Cornforth, for the Little Wonder Stove; Silver Medal; R. W. Crosthwaite (with Gregory's Improvement), Silver Medal; Messrs. J. F. Farwig & Co., for calorigen stove, Bronze Medal; James Dunninghame, for Star Heating Stove, Bronze Medal; Rev. H. J. Newcombe, for air-warming stove, Honourable Mention.

*Close Stoves for Smokeless Fuel.*—To W. Barton, for Premier Grill Stove, Bronze Medal; F. Lonboldt, for anthracite ventilating stove, Bronze Medal; Messrs. Musgrave & Co., for slow combustion stove, Bronze Medal; H. I. Piron, for hot-air stove and ventilator, Bronze Medal; Harry Hunt, for Crown Jewel Stove, Bronze Medal.

*Kitcheners.*—To T. J. Constantine, for Treasure Range, Silver Medal; the Eagle Range Company, Silver Medal; the Radiator Range Company, Silver Medal; Messrs. Brown & Green, Silver Medal; the Falkirk Iron Company, for Dr. Siemens's principle, Silver Medal; Messrs. Newton, Chambers, & Co., for Thorncliffe Range, Bronze Medal; W. Stobbs, for anthracite range, Bronze Medal; Messrs. M. Featham & Co., Bronze Medal.

#### Gas Section.

To Messrs. Thompson Brothers, of Leeds, a Gold Medal for their patent kiln and baker's oven, being a distinctly new application of the use of coal gas, and one calculated to largely promote the abatement of smoke.

*Cooking Stoves* (stoves suitable for families of about twelve persons).—To Messrs. H. & C. Davis & Co., of Camberwell, Silver Medal; Messrs. Beverley & Wylie, of Leeds, Silver Medal; Messrs. J. Wright & Co., of Birmingham, Silver Medal; Messrs. Stark & Co., of Torquay, Silver Medal, in recognition of the principle adopted by them of burning the gas outside the oven in which the cooking is carried on; Messrs. Billing & Co., New Oxford-street, Bronze Medal; Messrs. Leoni & Co., New North-road, London, Bronze Medal; C. Wilson, Leeds, Bronze Medal; Messrs. Waddell & Main, of Glasgow, Bronze Medal. Stove suitable for large establishments.—To Messrs. Slater & Co., of Holborn, Silver Medal, for excellence of material and workmanship.

*Heating Stoves.*—Close Stoves, from which the heat is conveyed into the apartment by conduction from pipes or chambers, through which the heated products of combustion pass: To Messrs. Stark & Co., of Torquay, for Cox's Ventilating Gas Stove, Silver Medal; the Sanitary and Economic Supply Association of Gloucester, for the Euthermic Ventilating Stove, Pattern A, Silver Medal. Open Stoves, or Combustion Fires, in which gas is burned in combination with solid materials, and the heat radiated into the apartment: To Messrs. Waddell & Main, of Glasgow, for Dr. Siemens's Gas and Coke Fire, Bronze Medal; Messrs. G. Wright & Co., Rotherham, for Dr. Siemens's Gas and Coke Fire, Bronze Medal. Gas Baskets, or Fires, from which the heat is conveyed by radiation: To Messrs. Leoni & Co., New North-road, London, for Hanging Gas Fire, Bronze Medal.

*Gas Producers.*—To the Dawson Economic Gas Co., Limited, Gold Medal.

*Apparatus for Heating by Water.*—To W. Stainton, Bronze Medal; W. & S. Dearis, Bronze Medal.

*Mechanical Stokers.*—To George Sinclair, Silver Medal; Messrs. T. & T. Vicars, Silver Medal; the Patent Steam Boiler Co. (Knap's), Bronze Medal; the Chadderton Iron Works Co., Limited (McDonagall's), Bronze Medal; James Proctor, Bronze Medal.

*Fire Bridges.*—To Messrs. Chubb & Co., for their Cast-iron Semicircular Fire Bridge, Bronze Medal; Messrs. Ireland & Lownds, for their Cast-iron Tabular Fire Bridge, Bronze Medal.

*Fire Bars and Grates.*—To the Wavish Patent Fuel Economiser Co., for an Application of Vertical Grates in Steam Boiler Furnaces, Silver Medal; Messrs. James Farrar & Co., for Barber's Underfeeding Step Grate, Bronze Medal; John Collinge, for Blocksage's External Inclined Grate, Bronze Medal; the Great Boiler and Furnace Co., for Mr. Livet's Method of Setting Boilers and for Fire Bars, Silver Medal.

*Furnace Doors.*—To Messrs. W. A. Martin & Co., for a balanced fire-door, Bronze Medal; the Great

Britain Smoke-consuming Company, for Orris's Steam Injector for Consuming Smoke, Bronze Medal.

#### SPECIAL PRIZES.

*Dr. Siemens's Prize, One Hundred Guineas.*—For Best Utilisation of Coal.—Divided and awarded to the Dawson Economic Gas Company, Limited, Fifty Guineas; the Falkirk Iron Company, Fifty Guineas.

*Ladies' Prize, Fifty Guineas, for best Smoke-preventing Coal-burning Kitchener.*—Divided between J. F. Constantine, Twenty-five Guineas; the Eagle Range Company, Twenty-five Guineas.

*Society of Arts' Silver Medal for the best Smoke-preventing Coal-burning Furnace.*—To C. B. Gregory.

#### MANCHESTER AWARDS.

*Open Grates and Close Stoves for Heating.*—To T. E. Parker, Silver Medal; Jaffray & Co., Silver Medal; J. Wadsworth, Silver Medal; Falkirk Iron Company, Silver Medal; W. Thornburn, Honourable Mention; E. H. Shorland, Bronze Medal; Messrs. Hydes & Wigflus, Bronze Medal.

*Cooking Stoves.*—To Messrs. Elliotts, Alston, & Oney, Silver Medal; Messrs. Waddell & Main, Silver Medal; C. Wilson, Silver Medal; R. W. Crosthwaite (with Gregory's Furnace), Silver Medal.

*Steam Boiler Appliances.*—To R. W. Crosthwaite, for Gregory's Smokeless Furnace applied to an upright boiler, Silver Medal; E. Dennis, for mechanical stoker, Silver Medal; Thomas Henderson, for furnace front and fire door, Bronze Medal; James Moore, for system of boiler seating with perforated bridges, Bronze Medal; J. Hampton, for fireproof smoke-consuming bridge, Bronze Medal; B. Goodfellow, for Johnson's Smoke and Fume Washer, Honourable Mention.

*Furnaces.*—To M. Perret, Silver Medal.

Remarks were subsequently offered to the meeting by some of the jurors.

Mr. R. Harris dwelt upon the advantages of using gas for fuel, especially for baking and cooking purposes. The use of gas also furnished a good supply of heat.

Professor Chandler Roberts said, when it was remembered that the smoke cloud over London contained sixty tons of carbon, it was important to know that at least boiler furnaces need smoke no longer.

After a few words from Captain Douglas Galton, Miss Emily Shaw-Lefevre, and Mr. W. R. Coles.

Professor Abel moved that the work having been thus far carried on by the Smoke Abatement Committee, an institute be formed for its continuance. He remarked that because the electric light was coming more and more into use, the gas companies need not despair of a great future, as gas might be applied for heating and cooking purposes. He pointed out how coal was wasted, not only in smoke, but in the quantity of small coal left underground, as it was said it would not be profitable to bring it up.

Mr. Norman Lockyer, in seconding the motion, said it was part of his official duty to observe the sun, but the smoke-fog of London rendered it impossible to make this observation properly more than once a week; sometimes only once a month.

This motion having been carried, Lord Mount-Temple, in moving a vote of thanks to the Manchester Committee, said it was satisfactory to see that science had descended to the chimney-corner and to the fireside.

The Rev. Harry Jones seconded the motion, which was carried, and on the motion of Mr. Hart, a vote of thanks was passed to the chairman.

**Tynemouth.**—A correspondent says:—"At this season of the year, when the question 'where to go' is discussed in many families, a healthful resort is the first consideration, and, if this can be found in conjunction with many other and almost unequalled advantages, the place offering such inducements is well worthy of patronage; and this I submit is the case with Tynemouth. Since the 31st of last December up to the present time, June 30th (half a year), there have been but 21 deaths in the whole of Tynemouth proper,—a population of some 4,000,—a death-rate of under 11 per thousand per annum." Another correspondent points to the same town as affording a satisfactory result from long-continued and careful attention to sanitary matters on the part of the town authorities.

THE UNITED ARCHITECTS' AND ENGINEERS' SOCIETIES OF GERMANY.

The architectural and engineering professions of Germany have never been separated as we find them in England, and in their societies the two professions are, in most cases, united. No other country in the world has so many architects' and engineers' societies and clubs as the German Empire. For some years past all the local societies have been connected together in one general and comprehensive union, which has its annual meetings, and forms a medium of communication between the members of the separate institutions. The local societies belonging to this union, together with the number of members in each, are returned as follows, at the latest date. The Architects' Society of Berlin has 1,796 members; that of Dresden, 96; and that of Leipzig, 31. The Hanover Society of Architects and Engineers has 929 members; the Bavarian Society, 743; the Kingdom of Saxony, 481; Hanburg, 329; that of the Lower Rhine and Westphalia, 219; the Middle Rhine, 180; West Prussia, 156; East Prussia, 147; Frankfort, 131; Breslau, 127; Saxony (Province) Anhalt and Thuringia, 126; Brunswick, 103; Alsace-Lorraine, 102; Schleswig-Holstein, 98; Bremen, 87; Cassel, 77; and Aix-la-Chapelle, 65. The Baden Technical Society numbers 248 members; Oldenburg, 62; Lubeck, 58; Cörlitz, 45; and Osnabruck, 43; and, finally, the Württemberg Society of Architecture, 246. The total number of members in these local societies is, therefore, 6,725; and this is the present strength of the Architectural and Engineering Union of Germany.

FROM ARROAD.

*Asiatic Building Materials.*—According to a foreign journal, there has been existing for the last eight years at Tokio, China (in the suburb of Enkagavin, on the left bank of the River Sumida), a cement factory, originally established by private enterprise, but shortly afterwards purchased by the Ministry of Public Works, and extended. The fuel used is anthracite, from Kā. A burning produces 100 casks, each of 520 lb. weight, and lasts during two days, the quantity of anthracite used in the process amounting to about 900 lb. The annual production amounts to upwards of 2,250 tons. There are thirty workpeople employed, the total expenses of the construction being 25,000 yen (5,000*l.*). There was a sum of 30,000 yen (6,000*l.*) spent in trials before a serviceable cement was produced. The working expenses are 30,000 yen (6,000*l.*) per annum. A cask of 520 lb. is sold for 6 yen (24*s.*), so that a clear surplus of 27,600 yen (about 5,500*l.*) is realised every year. The cement is usually kept a few months before being sent out. The following is an analysis of the article at two distinct times:—

	1874.	1876.
Silicic acid.....	26.13	26.35
Argillaceous and oxide of iron	11.12	10.00
Lime .....	56.23	53.70
Magnesia .....	6.10	6.59
Alkalies .....	0.90	0.89
Carbonic acid .....	0.21	traces
Water .....	—	1.40
Phosphoric acid .....	—	0.28
Insoluble substances .....	—	traces
	100.69	99.22

The cement made in 1874 was able to withstand a pressure of equal to 240 English pounds per square inch, after a lapse of six weeks.

It is stated that German cement is in considerable favour in the Chinese market, its price being lower than that of the English article. It is also incidentally remarked that unless the Chinese cement manufacture is developed on a much more important scale, there is ample scope for a considerable increase in the exports of cement from Germany to the Celestial Empire. The habitual cautious dealing of John Chinaman is illustrated by the advice given to German manufacturers in the remarks we are quoting to keep up the standard of their qualities, as the buyers in China make careful tests before purchasing cement.

A paragraph lately appeared in a Continental building journal, stating that a shipment of bricks had been received in London from Japan, which had been sold readily. The extreme hardness and slightly appearance of these bricks had got them into favour in the American

market. The United States Government has now put a duty of 20 per cent. on these bricks, so there must be, it is supposed, a certain quantity available for exportation.

*Method of Determining the Strength of Quarry Stones.*—One of the leading Continental organs of the building trade calls attention to the possibility of arriving at the strength of stone without resorting to the troublesome and costly tests usually required to arrive at that result. Herr Müller, of Magdeburg, asserts that the strength of a stone is in a certain proportion to its specific gravity. As the latter point can be determined by a trial made on a small piece, it is suggested that with the tables of relative strength, there should be no difficulty in getting at the result required. The following calculations of specific gravity and weight at which demolition takes place are appended to the remarks we have quoted:—

LIMESTONE.	
Specific gravity.	Weight in pounds per square inch.
1.500	711.15
1.700	1323.30
1.900	2133.45
2.100	2844.60
2.250	4266.90
2.350	5689.20
2.450	8533.80
2.600	14223.00
2.650	19912.20
2.700	25601.40
SANDSTONE.	
1.870	2133.45
1.950	2844.60
2.350	4266.90
2.100	5689.20
2.200	8533.80
2.300	9956.10
2.570	12801.20

The strength of granite lies between the limits of about 5,000 lb. and 21,000 lb. per square inch, and that of porphyry between 13,000 lb. and 19,000 lb. per square inch, the specific gravity being between 2.5 and 3.0. The heaviest building stone is basalt, with specific gravity as high as 3.1 and a strength up to about 27,000 lb. per square inch.

THE DESTRUCTION OF THE ARCADIA THEATRE OF ST PETERSBURG.

THE St. Petersburg papers contain some particulars of interest respecting the fire which destroyed the above-mentioned theatre on the 4th instant. The "Arcadia" was situated in Novaya Derevnia, or New Village, and was a favourite suburban resort of the population of the Russian capital. The edifice was of wood, and the progress of the flames was terribly rapid. Though the most strenuous efforts were made to save the building, they were utterly fruitless, and the entire theatre, with its contents, was, in the space of twenty-five minutes, reduced to ashes. The fire broke out at two o'clock in the afternoon, while a rehearsal was going on within the building. The flames, however, did not originate inside the theatre, but at a spot outside, and the circumstances raised a strong suspicion that the conflagration was the work of an incendiary. Indeed, it is stated that during the fire a number of sheets of paper which fell near the neighbouring restaurant, *à la cascade*, were saturated with petroleum. The rapidity of the fire likewise convinced the authorities that there must have been a considerable quantity of highly inflammable materials lying in different parts of the building, and the police have, therefore, been carrying on inquiry with a view to detect the perpetrators of the supposed arson. The actors and actresses had barely time to get outside the theatre before the whole building was enveloped in flames. The wind carried the fire across to the restaurant, which was also completely destroyed. Not a bit of decoration, scenery, or costume could be saved. The only parts of the building not absolutely consumed were the iron fittings, which the fire left in a molten condition. None of the actors or actresses were injured, but the firemen were less fortunate. One man was suffocated, and two others received dangerous wounds from falling beams, and were nearly burnt to death. The total loss is estimated at 400,000 roubles of which only 80,000 roubles are covered by insurances. The latest reports state that one of the proprietor's relatives, who was some time since dismissed, has been arrested on suspicion of having maliciously set fire to the place. He had more than once been heard to use threats

against the owner of the Arcadia. Further researches have already corroborated the suspicions against the arrested person.

VALUE OF BUILDING SITES IN THE CITY.

ON Wednesday Messrs. Fox & Bousfield let by Auction, at the Mart, Tokenhouse-yard, a number of building sites in Fore-street, on what is known as the Blackden Estate. The property was described as being situated between Moor-gate-street and Cripplegate Church, and well adapted for the erection of warehouses, shops, and premises for wholesale and retail businesses of any description. The property was offered on building leases for terms of eighty years, one of the conditions of letting being that the lessee of each lot is to expend a certain amount named in new buildings on the site leased. It was stated that the materials on the ground of each lot would be included in the letting. There were six lots submitted, the first lot being 66 and 57, Fore-street, and 119 and 120, London-wall, and covering an area of 2,819 superficial feet. The auctioneer stated that 5,500*l.* was to be expended in new buildings on this site. The highest offer was a ground-rent of 980*l.* per annum, and the lot was withdrawn at 1,100*l.* The next lot, containing an area of 2,409 ft., consisted of 46, 47, and 48, Fore-street, having a frontage to that thoroughfare of 50 ft. The amount to be expended in new buildings was stated to be 4,500*l.* The lot was let at an annual ground-rent of 300*l.* Lot 3 consisted of a building site, being Nos. 42 and 43, Fore-street, and containing an area of 1,381 ft., with a frontage of 28 ft. This lot was let at an annual ground-rent of 180*l.*, the sum of 2,500*l.* to be expended in new buildings. Lot 4 comprised Nos. 38, 39, and 40, Fore-street, covering an area of 1,898 ft., with a frontage of 43 ft. 8 in. It was let at an annual ground-rent of 220*l.*, 3,000*l.* to be expended in new buildings. The next lot was described as a very valuable building site, consisting of Nos. 23, 24, 25, and 26, Fore-street, situate in the midst of the wholesale Manchester-markets, near the Midland goods station, and only a short distance from the proposed new station at the corner of Golden-lane and Barbican, in connexion with the Regent's Canal Railway. It contains an area of 3,852 ft., with a frontage of 73 ft. For this site, on which 7,000*l.* is to be expended in new buildings, there was much competition, and it was ultimately let at a ground-rent of 610*l.* per annum. The last lot, adjoining the preceding lot, contains an area of 9,222 ft., having a frontage of about 88 ft. to Fore-street, and was described as forming a fine site for the erection of a grand block of warehouse or manufacturing premises. The sum to be expended on this site in new buildings was announced to be 17,000*l.*, and it was let at an annual ground-rent of 900*l.* With one exception, all the sites offered were thus let, at an annual aggregate ground-rent of 2,210*l.*, the total amount to be expended in new buildings on the respective sites being 24,000*l.*

BUILDING ON THE KENSINGTON HOUSE ESTATE.

KENSINGTON House is being rapidly dismantled, and in the course of a few weeks will have been entirely cleared away, when the erection of the new mansions intended to be built on the site, and on the adjoining grounds, about seven acres in extent, will be at once commenced. There will be an approach from High-street, 45 ft. in width, to the central portion of the estate, which will be triangular in form, with roads, 40 ft. in width, on the east, west, and north sides, and another road of the same width, in the centre, running north and south. The estate will be laid out for the erection of seventy-five high-class residences, eight of which will stand upon the site at present occupied by Kensington House, with frontages to High-street and Kensington Gardens of 25 ft. 8 in. in extent. There will also be fifty-five houses, with 25 ft. frontages to the new roads on the east, west, and north sides of the estate, and fourteen houses facing the central road. A portion of the estate in the centre will be reserved as an open space, and ornamentally laid out as garden ground. The grounds extend westward a considerable distance beyond Kensington House, at the rear of the houses on the south side of High-street,

and on a portion of the estate, at the north-west corner, stables will be erected for the use of the residents, which will be approached from a road off High-street. Similar stables will also be erected at the south-east angle.

The whole of the eight sites facing Kensington Gardens and High-street have been disposed of to parties who are about to build their own houses, the designs for which have been prepared by different architects. The owners of the estate will themselves commence the erection of forty houses as soon as the site is cleared. The designs for these houses have been prepared by the architect to the estate. They will be in the Old English style of architecture, faced with red brick and terra-cotta dressings and ornamentation. They will contain five floors, in addition to the basement, and will have extensive accommodation, each house having three spacious reception-rooms and thirteen bedrooms.

#### INTERIOR OF THE CHURCH OF SAINT FRONT, PÉRIGUEUX, FRANCE.

We have recently spoken of the very handsome and valuable book published as a memorial of the late Edmund Sharpe, and which illustrates and treats of the remarkable hoary churches erected in the department of Charente. The first of such churches, although not illustrated in the volume referred to, is that of St. Front, Périgueux, and we have thought we should interest many of our readers by giving a view of the interior of this remarkable building, which has been recently restored. We will not now stop to discuss the way in which this has been done. In very early years we sketched the church both in and out, and we have an opinion on the subject. On the present occasion, however, our brief course is historical.

At the end of the tenth and the beginning of the eleventh century, a large number of emigrants from Venice formed a colony in the centre of France, and brought with them the arts and the taste of their country. The Church of St. Mark, at Venice, commenced A.D. 977, had just then been completed, itself prompted by St. Sophia at Constantinople. The French artists and artisans, excited by the accounts of the marvels of St. Mark's, sought to erect a monument of the same kind when Bishop Protaise, then in Périgord, sought to raise a building which should be the finest thing in the country. St. Front was commenced about the year 985, and it is known that in the year 1000, money having failed, the Countess Emma de Périgord built the absis of the church.

The church at Angoulême, and some others illustrated in the book to which we have referred, followed St. Front in arrangement, the main feature of which is a central cupola carried on Byzantine pendentives, and with another cupola surmounting each of the four arms of the cross, the plan being practically the Greek cross.

The restoration of St. Front, which has been going on during a number of years, has been effected under the direction of M. Abadie, the diocesan architect.

#### LITTLEHAMPTON WATERWORKS.

In 1876 the Local Board of Health of Littlehampton, Sussex, determined to adopt means of supplying the town with water, and thereupon took steps to get the proper authority from the Local Government Board for the purpose. The town is situated on the south coast of Sussex, between Worthing on the east and Chichester on the west, and four miles south of Arundel. It contains at present a population of about 4,900, and is bounded on the west by the river Arun.

Hitherto, although well situated as a watering place, it has remained stationary as regards facilities for buildings and accommodation for sea-side visitors. Since 1876 the authority has been roused into a state of activity and energy, and aided by the liberality of the Duke of Norfolk, has now established water-works and a system of sewerage, both of which were much needed in order to develop the attractions of the town as a healthy sea-side place.

The facilities that are promised by railway intercourse with London and Portsmouth, and all along the South Coast and the beautiful scenery about Arundel, must attract to it not

only residents in the neighbourhood, but visitors from afar. The intercourse with the Continent will, no doubt, be increased, and measures will probably be taken at no great distance of time to form wharfs and quays, and possibly for the construction of a floating dock, for which there are great facilities in the river Arun, by the side of the town.

The Local Board, having determined to provide the present population with water, acting under the advice of Messrs. Grantham & Son, engineers, sank a well, 6 ft. in diameter and 60 ft. deep, into the chalk on the ridge of land on the north side of the town parallel to the sea, and about half a mile from it. The well was sunk through brick earth and sand about 30 ft., and the remainder through chalk. It was lined with east-iron cylinders to a depth of 60 ft. From the bottom of the well a boring was made 9 in. in diameter, with the view of procuring soft water from the green sand, but after proceeding 500 ft. from the surface, the Board was advised to discontinue the boring. In sinking the well a stratum of chalk, containing flints in irregular layers, was passed through, containing water, and it was found that the general strata of the chalk inclined from the high ground on the north towards the sea on the south. The Board, having given up further boring, was advised to sink another well, also 6 ft. in diameter and about 80 ft. deep, and 12 ft. from the first well, but communicating at the bottom with it. From the bottom of the second well two adits or headings were driven across the dip of the chalk for an aggregate length of 76 yards. These headings are shown on the ground plan. They intercept the water in the crevices, and will furnish a sufficient supply for the present population, and afford the means of a future extension.

Upon the completion of these wells and headings the Local Authority entered into contracts for the construction of a tower upon which a cast-iron tank was placed, covered with an iron roof, and surrounded by a gallery to facilitate the painting and repair of the tank. The first stone was laid by the Duke of Norfolk on August 14th, 1880. The tower is built of brickwork to the height of 81 ft. from the surface of the ground. A vertical section of the tower and engine-house are represented, together with the ground-plan, in the plate. The section shows the tank, roof, and staircase to the top. The height of the tower is sufficient to supply water to the tops of all houses on the highest ground in the town. The tank is estimated to contain 80,000 gallons of water, which is pumped up a 10-in. rising main, by a single engine and boiler of 14-horse power, a total lift of 140 ft. Double-acting pumps are placed in the well first sunk, which can be pumped dry in order to examine them, the water being shut out from the bottom by means of a valve worked from the surface.

The pipes for distributing the water have been laid all through the streets of the town, and are provided with the necessary hydrants, sluices, stopcocks, &c.

As the sewerage has been referred to in this paper, it may be stated that the system of sewers has been laid all through the town, having an outfall into the Arun beyond the pier-head.

The contractor for the water-pipes was Mr. Hayter, of Portsmouth. Mr. C. Chamberlain constructed the tower and roof, and Messrs. Laidlaw, of Glasgow, undertook the contract work of erecting the engine, pumps, and tank. Mr. W. Burns was the resident engineer.

#### TIMBER IN THE CONSTRUCTION OF CHURCHES.

##### HOLY TRINITY, GEDNEY HILL, LINCOLNSHIRE.

WITH this issue we present our readers with a drawing of a timber church, or, rather, of a church with a timber interior, and in doing so we would offer a few remarks upon works of this kind. It is rather noticeable that in a country like this, where large forests existed from the earliest days, timber was so little used in the construction of churches by the Mediaeval builders. That stone was the material most generally adopted, if not altogether exclusively, was owing, doubtless, to the remembrance of the early Saxon churches having been pillaged and burned, and the determination of the architects of that period to adopt a material more capable of resisting those attacks in future. Still, however, we have some examples

in various parts of the country, showing how wood was used late in the fourteenth and fifteenth centuries, and the durability of it is proved by the condition of the work in the present day. These works may be divided into two classes,—first, where wood was used entirely; and second, where it was combined with stone. Of the first of this kind there are examples at Berford, in Worcestershire, a very charming example of ancient carpentry, with some good fittings inside. This is framed, after the manner of the country, with strong timber uprights, framed into a cill, and resting upon a stone plinth. A similar arrangement exists at Marton, in Cheshire, a small and picturesque building, consisting of a nave and chancel, with south porch, covered with low-pitched roofs, and surmounted by a simple bell-cote at the west end. These walls are of solid timber uprights, probably 9 in. or 10 in. square, and about 1 ft. apart, with massive oak gills, resting on a chamfered stone plinth. The general aspect is pleasing, but can scarcely be dignified by the name of architecture. A much larger and more important church, which has been recently restored, that of Little Peoven, in the same county, has a nave and aisles, chancel, and small porch, and was built in the first part of the fifteenth century. It is of solid timber framing, with simple square-headed windows, having enquoiselled tracery. The interior is much more striking in character than the exterior, and the effect of the octagonal columns or pillars, with the arched braces forming the north and south arcades, and the curved braces to the tie-beams of the roof, is admirable.

Of the second class of churches, our illustration from Gedney Hill, in the south of Lincolnshire, forms a good example. Here we have outer walls and windows of stone, together with a somewhat massive tower of the same material, with only the internal work of oak. The posts or pillars between the nave and aisles are solid and good, and rest upon stone plinths. These posts carry the longitudinal beams, and with them are framed tie-beams. Here, again, the arched braces to the posts, &c., produce a charming effect, and reminds one almost of the wooden walls of old England. The roof is flat,—little more than a square pitch. There is no chancel-arch, but a good screen separates the chancel from the nave. It is altogether in good and substantial repair, having been restored some years ago, under the direction of Mr. James Fowler, of Louth. At this time it was whitewashed throughout, and fitted with the usual box pews. These have no given place to open seats of a better character. There are numerous other churches of the same character throughout the country, but those named will be sufficient to illustrate our remarks, and, we hope, will draw attention to an interesting class of buildings. For mission rooms and small country chapels it is a question whether, in our woodland districts, and where stone is a scarce and costly article, this style of work might not be revived, as it is at once simple and inexpensive. There cannot be a doubt as to the picturesque form such buildings might assume, and so add to the beautiful objects for which our country is so greatly celebrated.

#### HARPUR TRUST.

APPLICATIONS and testimonials were received from between 90 and 100 candidates, in response to the advertisements in our own and other journals for a Surveyor to the London Estate of the Harpur Trust. This estate comprises part of Bedford-row and a number of streets in the neighbourhood, stretching at the north-west, nearly to Queen-square. The income is mainly devoted to the support of the schools at Bedford, Sir William Harpur's native place. The committee appointed for the purpose selected six candidates deemed best fitted for the office, and the election by the Governors took place at Bedford on the 13th inst. The choice fell upon Messrs. Lander & Bedells, the final vote giving them a majority of four over Mr. S. Flint Clarkson, of 36, Great Ormond-street.

**Egypt.**—Mr. Jas. Wyld, of Charing-cross, is at once to the fore, of course, and supplies a clear and apparently careful plan of Alexandria, and many of the isthmus of Suez and Lower Egypt. At the present moment they can but be prized.

**ANNUAL MEETING OF THE ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.**

This Association held its twelfth annual meeting in London on the 29th and 30th ult. and the 1st inst., the last of the three days being devoted to visiting several places of interest in the metropolis. On the two former days the meeting was held in the lecture-hall of the Institution of Civil Engineers, Great George-street, Westminster. There was a fairly numerous attendance of members representing towns all over the kingdom, from Southampton and Exeter to Carlisle and Newcastle.

Mr. W. S. Till, the borough engineer of Birmingham, last year's president, presided at the commencement, and after the transaction of some routine business, introduced

Mr. C. Jones, of Ealing, the president elect, who at once read his inaugural address, in which he alluded to the questions of sewer ventilation, of by-laws and the staff necessary to secure their being carried out, which might be provided for by the payment of fees by householders. The power to charge fees, he considered, was necessary if the by-laws were to be carried out, and he expressed his gratification that West Ham had, by the persistent energy of the Association's first president, Mr. Lewis Angell, obtained this concession during the present session. He also expressed a hope that some independent member of Parliament would bring in a Bill to confer this power upon sanitary authorities generally. The Local Government Board would offer no opposition to such a clause, although they would not themselves introduce it.

Mr. Lemon moved a vote of thanks to the President for his address. He agreed with the President that the by-laws ought to be enforced, and thought that the duty of taking proceedings against any one who infringed them should rest with the officers of the department concerned, and not with a committee, and as a precedent for this he quoted the district surveyors of the metropolis. Mr. Lemon also dwelt on the necessity of providing surveyors with larger staffs if supervision of buildings was to be carried out properly, and stated that, although under their by-laws it was his duty to give a certificate that a house was completed in accordance with the by-laws, he had never given that certificate yet, and never meant to do so, because he never could get his Corporation to give him sufficient assistance to see that all the by-laws were properly carried out by the builders.

Mr. Angell seconded the vote of thanks, and stated that they had hitherto refused at West Ham to adopt the model by-laws,—though very much urged to do so by the Local Government Board,—because it would be unwise to adopt rules that could not be carried out without a large staff, unless the Local Government Board gave them the means of providing the staff. As West Ham had now the power to charge fees on buildings which would provide for the payment of building inspectors, they would immediately proceed to appoint inspectors, and he hoped to carry out the by-laws efficiently.

Mr. Lobley expressed his pleasure at finding that the President had given very good reasons for a single system of sewers to a certain extent, and that he was not too strong in the modern gospel of a separate system. The value of rain water in cleansing drains was very great, and ought not to be thrown away.

Mr. Gordon thought if they had a paper on the separate system it would be well to invite the medical officers of health to take part in the discussion.

Mr. Parry spoke of the separate system as carried out at Reading, and

Mr. Jerram urged that it would be mischievous to carry out the separate system in every house.

Mr. Spencer said the question of certificates was a difficult one. For many years he had refused to give certificates, but of late he had, like Mr. Lobley, given a qualified certificate, that was to say, that the house drainage was completed, so far as he knew, to his satisfaction.

Mr. McKie believed that the secret of sewer ventilation was to keep it moving. As to certificates, it was his custom when everything had been carried out according to the deposited plans, so far as could be seen, to give a certificate that there was sufficient open space to the houses.

Mr. Reid, citing in proof the drainage of

Gloucester, thought that often when smells were complained of as coming from the ventilators, the smells were due not so much to the ventilated sewers as to old ones which they took up, or to house-drains.

Mr. H. O. Smith's experience was that there was nothing like a continuous flow and constant flushing.

Mr. White coincided with the remarks of the last two speakers.

The motion was then put and carried unanimously, as was also a cordial vote of thanks to Mr. Till, the outgoing president.

Mr. H. O. Smith then read a paper on the 152nd section of the Public Health Act, 1875, and the dedication of private streets as affected by Sir George Jessel's decision in the case, *The Attorney-General (at relation of West Ham Local Board) v. Bidder and Others*.

A long and interesting discussion followed, and a vote of thanks was accorded to the author of the paper.

On Friday morning Mr. Hanson exhibited to the members his automatic sewage-machine, worked by the flow of the sewage from the main outfall, and automatically regulating the quantity of chemicals added to the sewage. He claimed for the machine that it saved labour, regulated the addition of chemicals, and provided for the effectual agitation of the chemicals and the sewage. The machine is to be seen in operation at Wakefield. A number of questions having been asked and replied to, a vote of thanks was accorded to Mr. Hanson.

Mr. Sugg then read a paper on "Gas as an illuminating Agent compared with Electricity." Laying down the principle that artificial lighting must be a prolongation of the light of day, he contended that gas properly used fulfilled this condition, and pointed to the lighting of the House of Commons and of Reading Town-hall as proofs of this statement. The only adverse criticism on the lighting of the latter was by a gentleman connected with architecture, who gave it as his opinion that the gas-lighting was a failure because it was so exactly like daylight. He believed the advantages of gas to be much too great for it to be superseded by the electric system at any time.

Mr. Shoobred then read a paper dealing chiefly with the rules recommended by the Society of Telegraphic Engineers and of Electricians for the prevention of fire risks and dangers to life in connexion with electric lighting.

Mr. Parry, the borough engineer of Reading, confirmed the statement in Mr. Sugg's paper as to the success of the system of gas-lighting adopted in the Town-hall of Reading.

Mr. Lemon attributed the recent improvement of gas-lighting to the introduction of the electric light, and expressed his pleasure at the existence of a competition between two different systems of lighting.

Mr. Angell said that his experience of gas companies had not prejudiced him in their favour, but he was nevertheless of opinion that gas possessed great advantages over electricity for general street-lighting. But he thought the electric light well adapted for docks, lighthouses, and railway stations.

Mr. Spice, at the request of the president, spoke, confining his remarks chiefly to commenting unfavorably upon the tone of Edison's latest work on the question.

Mr. Sugg and Mr. Shoobred replied to a vote of thanks which had been unanimously passed, and in doing so answered a great number of questions on points of detail which had been put by various members of the association, among whom were Messrs. Escott, Lobley, Spencer, McKie, and Eays.

Mr. Jerram (Walthamstow) next read a paper on "Sanitary Legislation." The paper dealt with various defects which experience of its working has proved to exist in the Public Health Act, and suggested that the Council should take the matter into consideration with a view to taking action to get these amended.

The President, Mr. Angell, Mr. Lemon, Mr. Gordon, Mr. McKie, and Mr. Reid took part in the discussion which followed, and ultimately it was arranged that, the subject being too important to be properly dealt with in the time left for discussion, the paper should be brought up for consideration at each of the district meetings during the year, the district secretaries being requested to communicate the result of the discussions to the Council to guide it in taking such action as might be deemed desirable.

The proceedings concluded with a vote of

thanks to the President, moved by Mr. Pritchard and seconded by Mr. White.

In the evening the members made an inspection of the headquarters of the Metropolitan Fire Brigade, and on the following morning visits were paid to Mosses, Doulton's works, and to the House of Commons, where the ventilating arrangements were inspected, and a limited number of the members ascended the Clock Tower to inspect the works of the great clock.

In accordance with a resolution moved by the President on Friday morning, the next annual meeting of the Association will be held at Oxford, and the following year it will probably be held at Newcastle.

**THE AUTHORISED NEW RAILWAYS OF THE SESSION.**

THE METROPOLITAN OUTER CIRCLE.—WATERLOO AND CHARING CROSS.—MERSEY AND SOUTHPORT EXTENSION LINES.

THE labours of the Parliamentary committees in the investigation of railway and other Bills which have been promoted during the present session are now fast drawing to a close, and amongst other undertakings which have received the sanction of both Houses within the last few days one of the most important is the Metropolitan Outer Circle project, under which it is proposed to construct a railway belt of about twenty-five miles in length, stretching around the country on the north side of London, from Acton and Ealing on the west, to the Royal Albert Docks on the east side. The line will commence by junctions with the Great Western and Metropolitan District railways, near Ealing, and from this point it will proceed for some miles in a northerly direction, passing through the parishes of Twyford (in Middlesex), Willesden, Harrow-on-the-Hill, and Kingsbury, and intersecting in its course the London and North-Western and the Metropolitan lines. The course of the line is thence north-east in the direction of Finchley and Hendon, where it crosses the Midland line, and continuing eastward it intersects the Great Northern Railway a short distance northward of the Alexandra Palace. From this point the line is continued for about four miles due east, passing through the parishes of Edmonton and Tottenham, and twice crossing sections of the Great Eastern Railway, and also passing over the river Lea. The course of the line is then south-east, through Walthamstow, Sparesbrook, and Wandsworth, the railway immediately skirting the south end of Epping Forest, where the sections of the Great Eastern Railway, on the east and west sides of the Forest, are intersected. The line from this point proceeds directly south to its terminus at the Albert and Victoria Docks, passing through Ilford, Manor Park, Barking, and East Ham. A prominent feature of the undertaking is the effecting of junctions with the Great Western, London and North-Western, Midland, Great Northern, Great Eastern, and London, Tilbury, and Southend Railways, so as to provide for an interchange of traffic with all those several lines.

The Bill authorising the construction of a railway from near Waterloo Station, under the Thames, to Northumberland-avenue, to be worked by electricity, has also finally passed both Houses.

The Mersey Railway Bill, and the Southport and Cheshire Lines Extension Bill, both of which were strongly opposed before the committees of the Commons and Lords, were both sanctioned last week by the Lords' Committee, after having previously been passed by the Commons. The opposition to both these projects was grounded on the alleged great injury which their execution would do to buildings and other property in the localities affected. The Corporation of Birkenhead were the principal opponents to the Mersey Railway Bill, and they alleged that the railway and its working would injure the streets, and shake the town-hall and other buildings. The Corporation further opposed the Bill on the ground that the railway in connexion with the tunnel under the Mersey would destroy the steamboat ferry traffic between Liverpool and Birkenhead, on the security of which the Corporation had based their municipal debt. The Bill was, however, passed, a condition being that the railway company are to pay the Corporation the sum of 50,000*l.* in compensation, 20,000*l.* to be paid on the completion and opening of the line,

and the remaining amount by six annual payments of 5,000*l.* each.

The Southampton and Cheshire Lines Company's Bill was for powers to extend to Southampton their already authorised line from Liverpool to Birkdale, which is about a mile from Southampton. In connexion with the undertaking the company propose to construct a park, 47 acres in extent, between the proposed railway and the houses facing the shore. A large number of witnesses were called both in favour of and against the Bill, many of them surveyors and engineers. The evidence against the Bill was to the effect that the construction of the line would very seriously depreciate the value of house property in the neighbourhood which the line would pass, several owners of which had spent sums varying from 7,000*l.* to 10,000*l.* in the erection of their houses. It was also urged that the houses were not built on any very firm foundation, and that the vibration from the railway would endanger their stability. In the result the Bill was passed, the committee stipulating that the park and recreation-ground were to be well laid out and maintained by the railway company, and that ample access must be provided across it to the shore.

#### THE ARCHITECT AND SANITARY SCIENCE.

In the course of the address made at the Royal Institution, on Tuesday, the 11th, mentioned in our last, Mr. E. C. Robins said,—Dr. Frankland's investigations have proved that when water contains foul matter for any length of time decomposition takes place in water, and the surrounding air is contaminated by the bubbles of gas generated, breaking and releasing the infectious particles along with it, and thus it is that the architect learns, what he never would have discovered for himself, the necessity of devising means for the ventilation or disconnection, by air as well as by water, of the house-drains from the main sewer, which has led to the introduction of ventilating-traps, and of intercepting cross-current air-ventilated manholes to house-drains, even where water-traps exist, to obviate the fatal consequences likely to ensue where neither air nor water traps or manholes exist, which, nevertheless, is still the case in the great majority of dwelling-houses in the land.

Through the influence, therefore, of sanitary science, as we understand it, mechanical contrivances have been devised whereby, as Professor Corfield puts it, "a house may be brought into such a condition of safety, that we can say with perfect certainty that if typhoid poison is in the main sewer it will not get into the house; and further, that if typhoid fever is taken into the house, when such preventive measures are taken, it will not spread."

But this sound principle is not only applicable to drainage; it is most important to remember it in water-supply. Thus, sanitary science, having first revealed the ready absorption by water of bad gases, mechanical means have been devised by practical sanitarians to prevent the drinking-water in our cisterns and wells from becoming contaminated. It was, and still is, common to find the only supply cistern fixed over the closets for the convenience of having the ball-levers and service-boxes in the same for their supply, and the trumpet-shaped overflow waste-pipe, untrapped, was fixed in direct communication with the soil-drains,—through which sewer-air was laid on to the surface of the drinking-water, to be absorbed by it, and to poison the unconscious family drinking the same. All this is being amended now. Separate cisterns are provided for drinking-water. No water can be drawn from those supplying the closets. Every cistern waste discharges into the open air over a trapped gully grating. Galvanised iron or slate cisterns are preferred to lead, and unlined lead-pipes serving the various supply-taps.

Professor de Chanmont assures us that parallel with the progress of medicine and the collateral sciences advances have been made in sanitary science which amount to important revolutions, so that it has become possible to lay down certain principles which are capable of practical application to the great advantage of us all. In short, the ablest medical and sanitary authorities have decided that by good sanitary appliances and surroundings, resulting in the maintenance of the purity of the air

within and around our dwellings, typhoid fever, diphtheria, sore throat, and cholera might be rendered exceptional diseases, instead of being, as they now are, the fruitful sources of illness and death, to the alarming extent of one-third of the whole mortality of the United Kingdom.

In further illustration of the uses of sanitary science, as it has been formulated by the experimental researches of professors of physics, chemistry, and hygiene, the popularisation of which researches is the special work of this Institute, let me detail to you the experiments of Dr. Pettenkofer and Dr. Renk at the Hygienic Institution at Munich. Dr. Renk, in a letter promising to send me a pamphlet (in which he has laid down his opinion of sewer gases and the hygienic estimation of them, also some hints how to keep them out of our houses in a better way than has been done hitherto), proceeds to give me a description of his experiments on "the entrance of ground air into houses." By means of a differential manometer, invented by Recknagel, he discovered that, in a house at Munich, the air in the ground beneath the paving of the cellars was always under a higher pressure than the air of the cellar itself, from which result he inferred that the ground air is always in motion from the soil into the house,—the pavement being bricks laid in mortar was permeable by air. This higher pressure of the air under the house he found was caused by the wind and by the difference in temperature between the inside and the outside of the house.

It happened that in and under the cellar paving a draught channel for ventilating purposes was situated, being constructed of bricks and mortar, and covered with stone slabs. The channel was connected with the chimney of the boiler which generated the steam for the heating apparatus. This draught channel had a very great influence on the ground air to a distance of six yards from its walls, and the ground air was more attracted by the current of air passing through the draught channel than by the air in the basement of the house. Moreover the air of the cellar was, in like manner, for a certain distance from it, drawn into the same draught channel current, and with increasing rapidity the nearer it approached the channel.

This experiment suggested to Dr. Renk a means of keeping ground air out of houses,—that is, by permeable tubes connected with the chimney of the kitchen fire, up the flue of which a constant current is being kept up, thereby a sufficient draught is created to withdraw the ground air from the soil and carry it above the roofs.

In connexion with these experiments were others illustrating its passage through walls of houses of different materials, upon which tables of data are derived, and which give to the architect and engineer the means of calculating the degree of permeability for air that the materials he employs possess.

It is my practice to avoid boarded floors on basements, and the air spaces under them required to prevent dry rot. It is better to cover the whole area of the ground covered by the house with a layer of cement concrete 6 in. thick which is practically impervious to air or moisture, and to lay thereon a wood block pavement formed of brimmed blocks, 7 in. by 2 in. thick, with wrought edges and top surface, set in pitch and jointed with cement powder brushed into the interstices, and set with water.

The architect to the Ecclesiastical Commissioners, Mr. Ewan Christian, first suggested and carried out a plan for rendering walls impervious, by simply building the enclosing wall of a house with a hollow space of about an inch and pouring into the same liquid asphalt, thus forming a vertical damp course, rising from the horizontal asphaltic damp course commonly laid in walls 3 in. above the level of the ground to prevent damp rising in the walls themselves.

So far we have been considering the helpfulness of sanitary science in relation to sewer gases, and the ventilation of drains, water-supply, and the withdrawal of ground air from the basements of houses. But when we have succeeded in ventilating our drains, water, and subsoil out of our houses instead of *into* them, we have still to consider, as I showed in my lecture at Eastbourne, on "The Revelations of Sanitary Science," how to maintain the purity of the rooms we inhabit, and defile with our own breathing, house-warming, lighting, and cooking.

To raise the standard of efficiency, qualifications of candidates for diplomas should not simply depend on the replies written or oral to a few test questions of the examining body, but by some evidence of preparatory study, as shown by previously-acquired certificates of elementary general competency.

The Conference of the Society of Arts, on Technical Education, of 1868, thus expressed itself:—

"Believing that our defects are far more due to the ignorance of those who direct works than to imperfect technical education, want of skill, or incapacity in those who execute them, we consider,—That with a view to the development of a system of scientific education, it is desirable that schools be established, having for their main object the teaching of science as a mental discipline. These science schools should prepare some youths for the higher courses of a college, and other less ambitious pupils for their professional pupilage."

Now, as I have elsewhere stated, in England all the best things are reserved for the upper ten thousand, and because a classical education was associated with a refined culture, therefore all our public and private schools became preparatory schools for the universities, as if the whole country consisted of noblemen and county families, to the entire neglect of the scientific necessities of the period.

The thorough mastery of any one branch of higher scientific education, to the extent to which the dead languages or pure mathematics is now carried in the universities, would be found a full and sufficient means of mental expansion, but the absence of efficient teachers to an equivalent extent will long stand in the way of such a development.

But I am happy to think that, contemporaneously with the spread of knowledge in sanitary matters in particular, has come a feeling of backwardness in technical education generally, and during the last five or ten years, science schools of the character suggested by the Conference of 1868 have been built, and are being erected throughout the country, by municipal authorities, as at Nottingham; by trade guilds, such as the City Companies of London and Bristol; and by private benevolence, of which Josiah Mason's College, at Birmingham, is an eminent example; so that very soon the means of obtaining technical information will be within the reach of every man worth his salt.

The proposed introduction into the ordinary curriculum of our primary schools of such elementary, scientific, and practical courses as may help towards the development of individual cleverness, by a general raising of the technical standards, and a selection of the fittest for higher training, cannot be otherwise than eminently desirable, and will leave no excuse for any candidate for examination being entirely without that preparative training which is, or should be, the aim of all test examinations to foster and encourage.

The recent establishment of compulsory examinations for admission to the Architects', Surveyors', and other Institutes, will certainly help to bring about a change in this matter, and soon it is to be hoped that, just as candidates for entry to the technical educational advantages to be hereafter obtained at the Central Institution of the City Guilds will be required to produce certificates of having passed preliminary examinations at other schools of lower grade, so admission to the examinations of our professional institutes should be ultimately given only to such students as shall be able to produce similar educational certificates of competency up to a certain point, which can only be fixed from time to time, as the means of obtaining such certificates shall have been increased. . . . .

I may here observe that a chair of Hygiene is associated with some of the foreign universities.

In my recent tour of the technical schools on the Continent, I visited a very remarkable institution in Munich, founded by the king and entirely under the control and management of Dr. Pettenkofer, one of the professors at the University, from whose plans it was built and fitted up in a sumptuous manner, replete with every apparatus and appliance. It is called the "Hygienische Institut," and I spent several hours with his chief assistant, Dr. Renk, by whom I was taken through the physical and chemical laboratories, and shown the various experiments on ground air, which I have already

detailed to you, and which he had been two years in working out. It is to this institution that officers of health have to repair and complete their courses before being considered properly prepared to undertake responsible official positions in relation to the public health. And it would be a gratifying circumstance if, in the legislative enactments of this country, something besides the mere appointment of officers should be required; and that certificates of competency from an appointed tribunal should be required of all candidates for office under the Public Health and Nuisances Removal Acts. And it may not be too much to hope that, just as no district surveyor can be appointed under the Metropolitan Buildings Act unless he shall have first passed the compulsory examination entrusted to the Royal Institute of British Architects by that Act, so the certificate of the Sanitary Institute of Great Britain shall be, by law, required of all would-be officers of health.

2nd. This brings me to the consideration of some points in which sanitary legislation seems to need improvement. But first let me remark that it would be a very narrow view of the work of the Institute if it were to show towards others the same jealousy which it has deprecated in its own case. The Sanitary Institute should be ready to aid to its utmost all efforts for the improvement of the sanitary condition of the masses. There are many philanthropic schemes afloat which it should be the pleasure of this Institute to assist and encourage by its sympathy and advice, and otherwise as opportunity may occur, and by the personal co-operation of its members.

The National Health Society, the Ladies' Sanitary Association, the Parkes Museum, the Sanitary Protection Association, the Sanitary Assurance Association, &c.—these societies have collected funds and formed valuable and influential coteries of the patrons and patronesses of sanitary work, whose hearts and whose purses are open to the appeal of those whose slender means would deprive them of the advantages of good sanitation, if it were not for the co-operative principle underlying the two latter societies' labours, and enabling them for a small fixed fee to give the professional advice required.

The fact that a few rich people, who could afford to pay for more elaborate reports and supervision, may also seek to obtain these advantages, ought not to influence our judgment of their general usefulness and value.

Mr. H. C. Stephens has shown, in an ably-written paper, the way in which the law, as it now stands, operates as an obstruction to sewage disposal. He has shown that under the Public Health Act of 1875, owners and occupiers derive rights which prevent local sanitary authorities from carrying out systems of drainage involving the separation of the rainfall and surface water from sewage. The bad effects of the present system have necessitated the appointment of a Royal Commission to consider if any and what steps can be taken to lessen the evils attendant on the present outfall arrangements of the metropolitan drainage.

The 10th clause of the abstract of Mr. Stephens' paper puts the matter clearly, thus:—"Though, under the 24th section of the Public Health Act, it is competent for local authorities, at the expense of the ratepayers, to alter or construct anew the drainage of houses, if such drainage is not adapted to the general sewage system of the district, there is, notwithstanding, no power in the Public Health Act, or elsewhere, enabling local authorities to decline to approve plans by which excreta and house-waste, with the rainfall combined, are shown to be received into carriers common to all."

So long as the rainfall accompanies the waste and soil drainage, so long will the impracticability of economically converting the latter into agricultural uses remain. Consequently, a sanitary measure of urgency and importance is rendered impracticable from rights arising under the Public Health Act.

The combined system of drainage dates from the Fire of London, after which it was first instituted. But, as London grows, the difficulties will increase, and are increasing, and sewers, forming elongated cesspools in dry weather, must increase in number, till the time comes when Prof. Corfield's suggestion will be the only cure remaining for great cities; that is to say, the old sewers shall be exclusively used for rainfall, and a new system of soil drainage on the latest principles of sanitary

science, with complete and constant flushing arrangements, automatic in action, shall be constructed.

The provisions of the Public Health Act should be broad enough to allow of the trial of this "separate system" on a smaller scale than will eventually become necessary.

Again, so long as we hold to any water-carriage system, and none is so readily adaptable to householders' uses, a good supply of water all the year round is an absolute necessity, whether it is constant or intermittent is of much less consequence than is commonly supposed. The enforced use of waste-preventers has so improved their manufacture, that a sufficient flush can be obtained in spite of their use, and the regulation of the size of the service-pipe from the cistern, in proportion to the height above the closets, will effect all that is required in a house.

But the influence of the Institute may be beneficially used in favour of the public, and especially the humbler portion of it, by getting a revision of the Water Companies Act, which has granted to them injurious powers for self-aggrandisement quite inconsistent with public purposes of a sanitary nature. I do not enter into the question of the cost of the water, which should obviously bear some relation to the quantity supplied, and not rates and taxes; that is likely to be taken up more effectively by other bodies than this Institute. But I do contend that so long as a house is supplied by cisterns filled once a day, the water companies have no right to interfere in the use of that water so supplied. Where there is constant service, and no intervening cistern, it may be necessary to look to every point at which water may escape; but the inconvenience of leakage from high pressure is its own punishment for indiscretion in the use of imperfect apparatus.

As the case now stands, difficulties are thrown in the way of using water, the result of which is that an insufficient quantity is used for the purposes of a healthy water carriage of the excreta of dwelling-houses, rendering more than ever necessary the proper ventilation of sewers and drains.

Another, and a pressing want of the day is greater uniformity in the by-laws governing the action of local authorities. This subject has been well thrashed out at the Royal Institute of British Architects in London, as well as provincial architectural societies, and has been the subject of annual conferences, and is likely to be re-opened at the next conference of the Royal Institute.

The inconsistencies at present prevailing are very perplexing, and even the model by-laws of the Local Government Board are open to considerable improvement; but the subject is too large and technical to enter on at this time. One instance in my own practice is enough.

In Croydon I was required to make my house soil-drains 4 in. diameter, to enter 6-in. pipe sewers. In London we commonly use pipes 6 in. diameter. At Bristol, no drain from any single closet is allowed to be less than 9 in. diameter,—a difference of from 1 ft. to 4 ft. 6 in. in the sectional area for the same purpose, or nearly five times.

#### BRIGHTON.

THE contemplated Corporation improvements in the Madeira-road, under the eastern cliff at Brighton, suggested by Councillor Weston, are about to be brought into prominence and at once commenced. They will include sheltered seats under ornamental pavilions, facing a grass-covered slope leading to a raised terrace, with two glazed pavilions at the extreme ends, each 100 ft. long, the centres covered by a roof supported by cast-iron columns, the whole occupying 360 ft., made of asphalt. The roof projecting 4 ft. beyond the body of the building would form a terrace 15 ft. wide, and give an attractive feature, besides being a shelter, the cost of the scheme not exceeding 2,000*l.*, the whole being illuminated by the electric light. As the Kearsall proposal, we are informed, is to be introduced again in the coming year, it is incumbent that the municipal authorities should adopt some project for the accommodation of visitors and invalids, and endeavour to reclaim the character of the place. Competitive designs have therefore been invited to include public baths, such as at Harrogate. The Mayor has announced that up to July 12, 7,377*l.* 18*s.* have been contributed or promised to the

guarantee fund for circulating the vindication of the "slanders" on the sanitary condition of Brighton. The whole of the materials for the sheds and enclosures used at the Royal Agricultural Show in Preston Park have been sold by auction by Mr. Simmons, jun. (Simmons & Son).

#### THE EXMOUTH DOCKS.

FOR a long time the docks at Exmouth, which were opened in 1839, have been in a very dilapidated condition, and although not actually closed, were wholly unfitted to meet the business requirements which it was intended they should supply. But during the past two years, gradually though surely, a change has been taking place, until at last the time is fast approaching when the docks will once more be in a fit state to meet all the requirements of the shipping trade of the port, and further, be in a stronger and better condition than they ever were. Of the importance of the docks to the trade of Exmouth there can be no question, and for the satisfactory transformation in the state of affairs the townspeople have to thank the enterprise of Mr. G. Ellett, a gentleman who for nearly a quarter of a century has been intimately connected with the shipping trade, and whose knowledge and experience lead him to believe that, properly worked, Exmouth Docks will prove a financial success. The Exmouth Docks Act was obtained in 1864; previously to that the coals and other commodities brought to the town by water were landed on the beach or in the head of the river near the station. In that year, however, a company was formed for the construction of a dock and jetty. The Act enabled the company to raise 60,000*l.* in 5*l.* shares, and 15,000*l.* in debenture shares. It further gave them very considerable powers.

The company commenced the building of the present docks, and acquired at the same time a large extent of ground adjoining, suitable for stores and business premises. In April, 1869, the docks were formally opened for traffic; but, as already stated, before they were actually in use misfortune came upon them, for a considerable portion of the wall facing the gates gave indications of shifting, and had to be secured by the aid of wooden piles. When opened, only about 450 ft. of the dock, on the side nearest the town, was available as a quay, and this was connected with the railway by a branch-line. For some time a fairly brisk trade was carried on in coal, grain, manure, timber, and other articles, but matters did not progress smoothly, and the company after a while got into litigation with Mr. Turnour, the holder of the debenture shares, the secretary, and others. In 1880 Mr. Ellett, who had all along held the view that the docks could be made to pay, entered into an agreement with the trustees of Mr. Turnour for the purchase of the debenture shares, on condition that the Chancery suit was withdrawn, and he also subsequently purchased the *elegit* obtained by the secretary for the security of his cost. In 1881 Mr. James Mountstephens, of Torquay, was instructed to examine the docks, and prepare plans for the necessary reconstruction where needed. This was done, and it was found that in order to make the property worth anything at all a considerable outlay must be incurred. However, it was resolved that the work should be proceeded with, and a contract was entered into with Messrs. Redway, Son, & Carter for carrying it out. The weakness of the old walls was due, to some extent, to the fact that white lime had been used in their construction, and one of the preliminary steps taken by Mr. Ellett for the reconstruction of the docks was the erection of lime-kilns close at hand for the burning of the lime. Has stone from Lyme Regis, a material which has been proved in other places to be admirably adapted for works of this kind. The jetty has been entirely rebuilt, and the new structure is a substantial erection of pitch-pine, carefully cross-cut, and the outer piles are sheathed with yellow metal. The walls at the entrance to the docks, where the gates will be hung, have been entirely rebuilt in a substantial manner, and it has been found necessary to rebuild about three-fourths of the dock walls, while the remainder have been thoroughly repaired and secured with a heavy walling of cross-cut timber. The entrance is also piled in the same way. For a very long time there have been no gates to the docks, but new ones, formed of greenheart, are in course of construction. The stone used in the rebuilding of the

walls has been specially selected from Mr. Mountstephen's quarry, at Churston. A double line of rails has been laid down to the jetty, and a travelling steam crane provided for discharging cargoes at the jetty or in the docks. The works are expected to be completed, and the docks reopened for traffic, about August 1st. The extent of the quays under the new arrangement will be 1,500 ft., and if this is found insufficient it is intended to carry jetties into the dock, and so increase the accommodation. It is also intended to carry the rails around the dock, so that the whole of the quays will be in direct communication with the London and South-Western Railway. The docks and the entrance to them are being dredged, so that any vessel that can come over the bar will be able to discharge at once at the jetty and dock. The work has been carried on under the management of Mr. Geo. Lavis (foreman to Messrs. Redway, Son, & Carter) and Mr. John Short (clerk of the works), and the personal supervision of Mr. James Mountstephens.

#### THE COST OF THE LYRWYD WATER-WORKS FOR LIVERPOOL.

IN pursuance of a resolution passed by the Liverpool City Council, the Water Committee have just issued a statement of expenditure and particulars of contracts entered into in connection with the new waterworks at Wyrnwy. The first of the particulars given is the appointment of wages paid, stores issued, and materials used at the Llanwyddn Works and Quarry, and the pipe line works, for the year 1881. This statement includes items of 11,599l. for permanent works at the embankment; 5,261l. for temporary accommodation works, including workmen's hall, provision stores, houses, stables, offices, and other buildings; 4,258l. for machinery; 3,825l. for miscellaneous plant; and 3,366l. for horses and harness, which with other items, make a total of 32,790l., being 12,145l. for wages, and 20,645l. for material. At the Llanwyddn Quarry, the amount spent for wages for the year 1881 was 1,730l.; and for material, 1,375l., making a total of 3,105l. The expenditure on the pipe line works for the year 1881 includes items of 45,832l. for cast-iron pipes; 4,359l. for pipe-laying; 1,524l. for tramway construction and removal; 1,675l. for machinery; 3,398l. for miscellaneous plant; and 2,545l. for horses and harness. These, with other items, make a total for the pipe line works of 67,363l., being 9,381l. for wages, and 57,982l. for material. The amounts expended in the purchase of land, compensations, easements, and costs up to the 31st of December, 1881, are as follows:—Land for Wyrnwy watershed and reservoir, including costs, 80,977l. 10s. 1d.; compensations under Act of 1880, &c., 15,000l.; pipe line (land, easements, and costs), 4,622l. 18s. 10d.; total, 100,600l. 14s. 11d.

The foregoing gives the general expenditure for the year 1881. For the three months ending the 31st March, 1882, the expenditure in these works was as follows:—The apportionment of wages paid and materials used includes items of 6,188l. for permanent works; 1,056l. for temporary accommodation work; 1,866l. for machinery; 990l. for miscellaneous plant; and with other items the total is 10,907l., being 6,153l. for wages and 4,801l. for materials. At Llanwyddn Quarry for the three months the amount of wages paid was 2,967l.; expenditure on materials, 2,139l.; making a total of 5,106l. At the pipe line works for the three months the items of expenditure included 2,555l. for the Hiramant Tunnel; 13,549l. for cast-iron pipes; 2,260l. for haulage of cast-iron pipes; 4,381l. for pipe-laying; 972l. for tramway construction and removal; 1,612l. for miscellaneous plant; and 542l. for superintendents, inspectors of pipes, clerks, and office expenses; making a total of 26,013l., being 8,500l. for wages, and 17,204l. for materials. The expenses on the Mersey Crossing borings has been so far comparatively small, the salaries and materials used amounting only to 211l., while on the Oswestry Reservoir and contingent works surveys the expenditure in wages was 132l. The amount expended in the purchase of lands and easements up to the 31st March in relation to the pipe line was 2,688l.

The committee append a list of contracts entered into up to the date of this return (May 21st, 1882), which shows that the total amount of the contracts is 297,886l. The particular contracts are:—For making and delivering

(13 1-6th miles) cast-iron socket-pipes, from Messrs. Cochrane & Co., 63,494l.; for (5½ miles) pipes, from Messrs. Cochrane & Co., 34,981l.; for (9½ miles) pipes, from Messrs. D. Y. Stewart & Co., 55,855l.; construction of Hiramant Tunnel (2 miles), from Mr. F. McCalloch, 28,500l.; leading, laying, and fixing (8½ miles) iron socket-pipes, from Mr. J. Jowett, 10,708l.; making and delivering (10½ miles) cast-iron socket-pipes, from the Widnes Foundry Company, 65,066l.; construction of Cynnydd and Llanforda Tunnels (1½ mile), from Mabbutt & Owen, 21,900l.

#### RECORD OF BUILDING PATENTS.\* APPLICATIONS FOR LETTERS PATENT.

- 3,095. H. Conolly & A. E. Hubert, London. Overflow of water-closets. June 30, 1882.  
3,096. H. Conolly, London. Water-waste preventers. June 30, 1882.  
3,103. W. A. McI. Valon, Ramsgate. Bricks and tiles. July 1, 1882.  
3,127. G. Hodson, Loughborough. Manufacture of artificial stone, &c. July 3, 1882.  
3,168. M. Kellow, Pearshyendraeth. Cutting and dressing stone, &c. July 5, 1882.  
3,185. J. G. Tongue, London. Ventilating drying-rooms, &c. (Com. by H. Wattell, Tourcoing, France.) July 5, 1882.  
3,191. W. C. Gibson, Newcastle-on-Tyne. Manufacture of a certain description of bricks, &c. July 6, 1882.  
3,198. T. N. Sully, Wellington. Walls of houses, &c. July 6, 1882.  
3,229. U. Bromley, G. Crowe, and W. James, Chester. Flushing apparatus for water-closets, &c. July 7, 1882.  
3,230. J. C. Morris, Manchester. Stair-rods. July 10, 1882.  
3,301. T. S. Webb, London. Preserving from corrosion the surfaces of ships, piers, bridges, &c. July 12, 1882.  
3,316. W. R. Lake, London. Underground conduits for gas or water, &c. (Com. by A. Knandt, Essen-on-the-Ruhr, Prussia.) July 12, 1882.  
3,324. C. Portway, Halstead. Gas-stoves. July 13, 1882.

#### NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

- July 4, 1882.  
1,749. C. Major, Bridgwater. Construction of roofing tiles. April 12, 1882.  
2,806. S. Deards, Harlow. Securing sheets of glass, &c., for roofing purposes. June 14, 1882.  
July 7, 1882.  
2,728. M. Cockburn, Falkirk. Public washing houses. June 10, 1882.  
2,794. C. Hulseberg, London. Boilers for heating greenhouses and other buildings, &c. June 14, 1882.  
2,772. R. W. Hitchings, London. Machinery for making slabs of plaster, &c., for ceilings. June 13, 1882.  
2,815. A. B. Brown, Edinburgh. Apparatus for ventilating, &c. June 15, 1882.

#### July 11, 1882.

- 1,109. T. W. Hollivell, Brighouse. Securing sheets of zinc, &c., to roofs or sides of buildings. March 7, 1882.  
2,116. A. W. Kershaw, Lancaster. Ventilators. May 5, 1882.  
2,783. H. J. Haddan, London. Machinery for cutting and dressing stones. (Com. by A. McDonald, Massachusetts, U.S.A.) June 13, 1882.

#### July 14, 1882.

- 1,113. R. Pearson, Kingston-upon-Hull. Combination stretch-traps. March 8, 1882.  
1,143. E. P. Phillips, London. Spring hinges. March 9, 1882.  
1,697. J. Mathisen, Christiania, Norway. Door-locks. April 3, 1882.

#### ABRIDGMENTS OF SPECIFICATIONS. Published during the Week ending July 8, 1882.

- 5,184. E. W. Buller, Birmingham. Knobs and their attachments to spindles.  
A rectangular tubular shaft is placed in the free knob in which is a spring with a tooth on its free end, and when

the spindle is forced into the sheath, the tooth engages one of the ratchet teeth on the spindle. To attach metal necks to earthenware knobs, when the spindle is passed through the neck into the knob, lead is run into the inside of the knob around the spindle. Nov. 23, 1881. Price 6d.

5,213. J. Nicholl, Halifax. Apparatus for heating conservatories, &c.

This consists of two cones which form the walls of water-spaces. The heat is applied by a Bunsen's burner, and the products of combustion pass to pipes radiating through the water to the exterior. (Pro. Pro.) Nov. 23, 1881. Price 2d.

5,224. E. V. Harris, Winchester. Window-sashes.

The sashes are swung upon pivots, which are so constructed that the sash can be lifted out of its pivots when required. Nov. 23, 1881. Price 6d.

5,229. J. Thomas, Bangor. Dams, retaining walls, &c.

A light iron casing is made of the required shape, placed in position, and filled with concrete. The casing is made strong enough to withstand the pressure of the concrete and to resist being corroded through until the concrete has set. No. 30, 1881. Price 6d.

5,276. J. Teer, Salford. Fire-grates.

These have a perforated fire-clay back and an air-chamber behind the back to which air is admitted from below the grate. A cover is fitted over the fire, which compels the smoke, &c., to enter this air-chamber, where it is consumed. (Pro. Pro.) Dec. 2, 1881. Price 2d.

5,279. T. Ivory, Edinburgh. Apparatus for heating and cooking by direct radiation from surfaces of metal, &c.

This uses the burners known as "Hofmann's tube burners" made in the form of narrow boxes, having one of the ends pierced downwards with small holes for the issue of the gas. (Pro. Pro.) Dec. 2, 1881. Price 2d.

5,299. H. Green, Preston. Removing obstructions and openings by frost in gas, water, and fire-pipes.

A solution is made of hydro-chloric acid, &c., and lime, which is filtered and evaporated to dryness as a saturated solution. This is poured down the pipes. Dec. 3, 1881. Price 6d.

5,064. E. Houan, London. Fireproof floors.

These are made with an iron framing formed of flat bars united by screw-bolts and nuts and concrete. Nov. 19, 1881. Price 6d.

5,319. S. Sturm, Cologne. Increasing the heating power of domestic stoves and fire-places.

A number of horizontal perforated metal diaphragms are placed in the flue of the chimney, which prevent the heat passing off so rapidly. (Pro. Pro.) Dec. 5, 1881. Price 2d.

5,324. W. Saunders, London. Implement and receiver for cleansing floors, &c.

The implement is a modification of a squeegee in which the indiarubber is in the form of a roller, and water is conveyed to the roller by a flexible pipe leading down the handle. The receiver is like a dust-pan, but the outer edge is inclined downwards to prevent the mud and dirt from falling out. (Pro. Pro.) Dec. 6, 1881. Price 2d.

5,377. D. G. Cameron, London. Water-closets, &c.

The water held in the pan is sealed, and an overflow is arranged behind the seat, which leads into the chamber below. A large valve is arranged to allow of the discharge of the contents of the pan, and the chamber below is trapped. The flush is delivered, and an after-flush provided, by the pressure of water acting above and below a flexible diaphragm, with an air-chamber above. There are two valves,—one for the flush, and the other for the after-flush, the closing of the first opening the second. Dec. 8, 1881. Price 6d.

5,381. D. Gill, Weston-super-Mare. Water-closet apparatus.

The outlet from the basin to the trap is actuated by a swing-valve which is actuated by a float in a small chamber to which water is admitted. The flushing rim is made separate from the basin. The closet is ventilated by a junction-pipe in connection with the flushing-pipe and an up-shaft air-pipe. A self-adjusting valve is placed in the junction-pipe, which closes the air-pipe when the closet is flushed, and closes the flushing-pipe when the flush is over leaving the air-pipe open. Dec. 9, 1881. Price 6d.

**A Caution.**—At the Westminster Police Court, on the 8th inst., Mr. William Miller, decorator, of Appleford-road, Westbourne Park, was summoned by Inspector Lightfoot, of the Westminster District Board of Works, for having on the 9th of June placed a quantity of white-washing material over a public grating communicating with a sewer. Mr. Warrington Rogers, who prosecuted for the Board of Works of the Westminster District, stated that the material consigned to the sewer by the defendant amalgamated with road refuse and formed a kind of cement or concrete, which blocked up the traps of the sewers and prevented the proper flow of sewage. The defence was that they had been so hurriedly done by getting rid of some dirty water. The inspector said that the consistency of the material was quite equal to that of mud, if not thicker. Mr. D'Eyncourt thought there was proof of a very dangerous practice, and inflicted a fine of 20s. and costs.

\* Compiled by Hart & Co., Patent Agents, 23, New Bridge-street.

[THE SANITARY CONDITION OF LAMBETH.

At the meeting of the Lambeth Vestry, on the 13th inst., Mr. Andrew moved the following motion:—

“That in consequence of the frequent reports of our medical officer and the inspectors of nuisances, we, the Vestry of Lambeth, desire to draw the attention of the Metropolitan Board of Works to the unsatisfactory condition of the great majority of habitable buildings, owing to the amount of sewer-gas conducted therein, and to suggest that this unsatisfactory state of things may be remedied by the compulsory adoption of the principle of inserting an intercepting siphon, conjointly with the construction of an air-chamber in the house-drain at a point between the inlet to the main sewer, and before entering or passing under any buildings, and the continuation of all soil-pipes to the highest point of the roofs, such soil-pipes to be left open at the top for through-ventilation from the air-chamber; or by any other means the Board may devise to prevent the admission of sewer-gas.”

Mr. France seconded.  
Mr. Bygrave dwelt upon the importance of improved sanitary appliances, and expressed a conviction that if the suggestion of Mr. Andrew tended to lessen the spread of disease, Lambeth would have reason to be thankful to that gentleman.

Mr. Sharpley remarked that a man who devised a scheme to prevent the euroachment of obnoxious inhalations into dwelling-houses would prove an undoubted benefactor to the human race. At present private houses were the only means by which public sewers were ventilated.

Mr. Bennett hoped the matter would be thoroughly thrashed out in the Sewers Committee. To his mind the defective manner in which drains were laid had much to do with the nuisances that arose in the metropolis.

Mr. Fowler remarked upon the healthy condition of Lambeth, and said that, with the view of ascertaining the merits of the plan proposed by Mr. Andrew, he should like to see a model of it prepared, and every investigation made with respect to it.

The motion was agreed to.

SALE OF FREEHOLD GROUND-RENTS AND FREEHOLD HOUSES IN ISLINGTON.

ONE of the largest sales of the above class of property which has been held in London for some time past took place on Tuesday in last week, in the large room at the Cannon-street Hotel, when Messrs. Debenham, Tewson, & Co. submitted to competition the Barnsbury Park Estate in Islington. The property was described as consisting of the valuable freehold ground-rents amounting to 812l. per annum, secured upon the whole of Barnsbury Park, Barnsbury-square, Mountford-terrace, Mountford-crescent, Upper Park-street, Brooksbury-street, Henry-street, Barnsbury-mews, and Brooksbury-mews, a large portion of Liverpool-road, Thornhill-road and John-street, and Offord-road, extending over an area of about twenty-seven acres, and comprising upwards of 300 houses, including numerous shops, workshops, and other business premises. The particulars stated that the property would be sold, as regarded most of the lots, with reversion to the rack-rents in 26½ years, and as respected three of the lots in seven years, and that these rents were estimated to produce at the present time nearly 14,000l. per annum. The property was divided into 85 lots, 46 of which consisted of actual ground-rents, ranging from 6l. to 100l. each, and producing 812l. per annum, as already stated; the remaining 39 lots consisting of freehold residences in Barnsbury Park, Barnsbury-square, and other portions of the estate, let on leases for terms expiring in 26½ years, at a peppercorn rent, after which the purchasers would be entitled to the rack-rents, the total estimated annual value of which was 4,392l. One of the conditions of the sale provided for the preservation of the garden in Barnsbury-square as a pleasure garden for the use of the owners and occupiers of the houses in the square. Mr. Tewson, the auctioneer, in commencing the proceedings, observed that the sale was originally intended to take place at the Auction Mart, but the large attendance proved that there was no room at the Mart large enough. In advertising to the great value of the property, he said that the rack-rents

were, in every case, believed to have been fairly estimated, and based upon the actual rents at present paid by the occupiers, but that with the growing increase in value of property in the district, it was reasonable to conclude that higher rents might be expected on the expiration of the ground leases. Every lot was sold, the total proceeds being upwards of 73,000l.

THE SEWERAGE OF SLOUGH, BUCKS.

The sewerage works in this town, which were commenced in the summer of 1878, and carried out under the advice of Mr. R. B. Grantham, M.Inst.C.E., were completed in August, 1880, and the house connexions are made nearly throughout the town. A new system of sewers was laid down, and kept entirely distinct from the drains discharging the surface and storm water.

The sewage is conveyed to tanks at a pumping station erected on the west side of the Railway Viaduct between Windsor and Slough, and is thence pumped by a 10-h.p. engine to a piece of land near Dorney Common, about one mile and three-quarters further west.

The works were let in four contracts: No. 1 to Messrs. James Watt & Co., for the engines, pumps, and rising main; No. 2 to Messrs. Jones & Jepson, for the sewers; No. 3 to Mr. Wood-bridge, of Maidenhead, for the tanks and engine-house; and No. 4 to several contractors for various small works. Mr. F. Smith was clerk of works.

The population now connected to the sewers is 5,500, and the normal daily flow of sewage is about 70,000 gallons a day, or about 13 gallons per head. The area of land acquired by the Board is about 25 acres, but at present it has been found sufficient to lay out about half of this on the broad irrigation system. The sewage is pumped up about four days per week in dry weather, and the quantity of land to which sewage is daily applied is about eight acres.

The subsoil of the farm is gravel, and no difficulty has been found in disposing of the sewage, which disappears within a short time of application. There are no under-drains and no effluent, and, it is stated, no cause for complaint. Good crops of mangold and Italian rye grass have been grown and are now growing.

By separating the sewage from the surface-water, the sewage of 5,500 people is regularly and effectually disposed of upon a total area of thirteen acres, or more than 400 people to the acre, without nuisance or offence of any kind.

Complaints were made when the house-drains were first connected of the offensive smells from the sewers. Ventilation is now effected by connecting the sewers with the lamp-posts, the shafts of which are 4 in. in diameter at the bottom, and 2½ in. at the top. In addition to these, iron up-shafts, 6 in. in diameter have been fixed to the dead side-walls of the houses with Archimedian-screw cowls fixed on the top.

Where these means have been adopted the sewers, we learn, have been rendered inoffensive, and it has been determined to increase the number of the ventilators.

FIRE-RISKS FROM ELECTRIC LIGHTING.

The Committee of the Society of Telegraph Engineers and of Electricians, appointed on May the 11th, 1882, to consider the subject of fire-risks arising from electric lighting, have formulated a set of rules and regulations for the prevention of these risks:—These rules and regulations are drawn up, not only for the guidance and instruction of those who have electric-lighting apparatus installed on their premises, but for the reduction to a minimum of those risks of fire which are inherent to every system of artificial illumination.

The chief dangers of every new application of electricity arise mainly from ignorance and inexperience on the part of those who supply and fit up the requisite plant.

The difficulties that beset the electric engineer are chiefly internal and invisible, and they can only be effectually guarded against by “testing” or probing with electric currents. They depend chiefly on leakage, undue resistance in the conductor, and bad joints, which lead to waste of energy and the production of heat. These defects can only be detected by

measuring, by means of special apparatus, the currents that are either ordinarily or for the purpose of testing, passed through the circuit. Bare or exposed conductors should always be within visual inspection, since the accidental falling on to, or the thoughtless placing of other conducting bodies upon such conductors might lead to “short-circuiting,” or the sudden generation of heat due to a powerful current of electricity in conductors too small to carry it.

It cannot be too strongly urged that amongst the chief enemies to be guarded against are the presence of moisture and the use of “earth” as part of the circuit. Moisture leads to loss of current and to the destruction of the conductor by electrolytic corrosion, and the injudicious use of “earth” as a part of the circuit tends to magnify every other source of difficulty and danger.

The chief element of safety is the employment of skilled and experienced electricians to supervise the work.

The rules are signed,—F. H. Webb, secretary.

COMPENSATION CASES.

FARDELL v. METROPOLITAN AND METROPOLITAN DISTRICT RAILWAY COMPANIES.

THIS was a case arising out of the completion of the Inner Circle by the Metropolitan and Metropolitan District Railway Companies, heard on the 12th inst. in the Lord Mayor's Court. The claimant was Mr. Thomas S. Fardeall, carrier, contractor, and job-master, 4, The Crescent, Minories.

Mr. Philbrick, Q.C., and Mr. Francis Turner appeared for the claimant; and the defendant companies were represented by Mr. Webster, Q.C., and Mr. Moulton.

The claim was in respect of loss of business, &c., through the above-named premises being required for the purpose of carrying out the communication between Aldgate and the Mansion House. The jury having viewed the premises,

Mr. Philbrick, in opening the case for the claimant, said Mr. Fardeall was a licensed carman and contractor, to which he had added the business of a job-master, and the premises in question comprised his residence and offices, and were the headquarters and centre from which a very extensive business was carried on. He took the premises in The Crescent, Minories, with a fourteen years' lease from Christmas, 1873. Mr. Ellis was the lessee, having the premises from the Corporation for 55l. a year, subject to the usual covenants. Mr. Fardeall, about the same time obtained premises adjoining from the Trinity House for the purpose of a stabling, depot for vans and horses. He also had premises adjoining rented from Mr. Hilbury. These stables or lay-byes were necessary, as the police would have interfered if the vans had been allowed to stand in the street. He had also five or six other stables in different parts of London connected by telephons with the head office. Altogether, about 120 horses were employed in the work. It was important that a carman should be near his customers, and also near the line of traffic between the City and the docks. The claimant was agent for the Great Eastern, Great Northern, Midland, and also did business for the South-Eastern and other companies. After making every possible allowance, the net profit arising from the business was something like 7,700l. a year. The amount they claimed was made up as follows:—The premises were estimated at 4½ years' purchase for the remainder of the term, which, with 10 per cent. added for compulsory sale, would be 3700l.; fixtures, 641l.; cost of removal, 50l.; the stables adjoining, 400l., which had been expended on them, making in all, 8841l. In addition to this he claimed for loss of business one year's profits, or 7,700l.

Mr. Slater, accountant, was examined as to the value of the business. He said the gross total earnings for the last three years was 64,900l., of which 32,800l. consisted of large contracts. Since the change of residences, the business was less by 3,700l. per annum.

On the second day of the case, Mr. Webster addressed the jury on behalf of the company, contending that his claimant could have no difficulty in obtaining other and equally suitable premises for his business in the Minories, and that he was only entitled to fair compensation for any loss or inconvenience he might sustain.

The Recorder then briefly summed up, and the jury, after a brief deliberation, awarded the sum of 1,140l.

THE CO-OPERATIVE WHOLESALE SOCIETY (LIMITED) v. THE METROPOLITAN AND METROPOLITAN DISTRICT RAILWAY COMPANY (CITY LINES AND EXTENSIONS) JOINT COMMITTEE.

THIS was a claim for a leasehold interest in premises consisting of a frontage, 118, Minories, and a warehouse, 3, America-square.

Mr. Grantham, Q.C., M.P., appeared for the

claimants; and Mr. R. E. Webster, Q.C., and Mr. Moulton for the defendants.

Mr. Grantham, in opening the case, said the claimants, whose head-quarters were in Manchester, took these premises in 1874 on a 28 years' lease from December 25th, 1873. The manager of the society, after looking about the neighbourhood for suitable premises, found that the rent of these was very moderate in comparison with what was to be obtained elsewhere. The landlord, being very anxious to let, came down in his demands from 400*l.* to 250*l.* a year, to which the claimants agreed, and undertook to lay out, and did lay out upon them, 640*l.* Finding that they would very soon have to remove, as the railway was coming, and being anxious to keep together their business connexion, which had become very profitable, they secured other premises in Leman-street, to which they removed, leaving those in the Minorities empty. They took this course rather than make up a claim against the railway companies, and now they came forward in the most honest and straightforward manner possible, and made a claim for the value of the lease only, asking nothing for injury to trade.

Mr. Webster, after the statement, had a brief colloquy with Mr. Grantham, and he then stated that the defendant company had no knowledge until after what fell from Mr. Grantham that it was in consequence of the railway companies coming that the claimants took other premises. As Mr. Grantham stated that he could prove that it was a *bond-fide* removal in consequence of the fear of the railway coming, he (Mr. Webster) had agreed to consent to a verdict for 1,000*l.*

The surveyors engaged in the case were,—Mr. Edwin Fox, Mr. E. Eason, and Mr. E. F. D. Fuller, for the claimants; and Mr. J. R. Bonny, Mr. E. N. Clifton, and Mr. E. Farmer, for the railway company.

CITY OF LONDON REAL PROPERTY COMPANY v. THE METROPOLITAN AND METROPOLITAN DISTRICT RAILWAY COMPANIES.

On Monday last this case was decided before the Recorder (Sir T. Chambers, Q.C.), M.P.) and a special jury.

Mr. Webster, Q.C., and Mr. Freeman, instructed by Messrs. Tatham & Co., appeared for the plaintiffs; Mr. Matthews, Q.C., Mr. Bidder, Q.C., and Mr. Gye, instructed by Messrs. Burchell, represented the defendant companies.

The plaintiffs claimed compensation for the compulsory acquisition of certain building land situate in Great Tower-street, between Mark-lane and Mincing-lane, and which was required for the completion of the Inner Circle line. The site in question had been cleared of its old buildings by the plaintiffs, with the view of carrying out extensive improvements, and it was urged by their learned counsel that as they had acquired the whole lesshold interest, the railway companies would be saved a great deal of trouble, as they would not have to deal with a number of separate interests. The actual area at first proposed to be taken was 6,440 ft., and the net rental which the plaintiffs expected to derive was 7,400*l.* Twenty years' purchase was the least that might be expected in connexion with such property, but they asked only nineteen years' purchase, which came out at 140,600*l.* Deducting 3,150*l.* for ground-rent, made the sum 137,450*l.* The expense of the new building contemplated was reckoned at 22,400*l.*, which brought the amount down to 115,050*l.*, and adding the usual 10 per cent. for forced sale, made the total claim 136,540*l.*

After a three days' hearing in March last, the case was adjourned with a view to an arrangement; and on Monday Mr. Webster intimated that the companies had agreed to acquire only 4,242 square feet of the land, and to pay for the space 63,600*l.*, or at the rate of about 15*l.* per square foot.

A verdict for that amount was accordingly entered.

SCOTCH NEWS.

*Valc of Leven.*—The ceremony of laying the foundation-stone of the Ewing-Gilmour Institute,—Mr. W. E. Gilmour's magnificent gift to the Valc of Leven,—took place on the 24th ult., and was performed with Masonic honours. The ceremony of laying the stone was performed by Brother J. M. Martin, P.G.M., who was presented by Miss Campbell, of Tillichewan, with a handsome silver trowel—the gift of Mr. Gilmour. Miss Campbell also gracefully performed the ceremony of "naming" the Institute. Thereafter, Brother Martin addressed the assembly. He congratulated Brother Gilmour on the successful issue of the day's proceedings, and stated that it was a cause of profound thankfulness when a neighbourhood such as this was blessed with gentlemen like Brother Gilmour, who, deriving his wealth from the people, was not forgetful of their interests. The Institute will consist of one large reading-room, smoking and reading room, hall, committee-room, coffee-room, and lavatories, with attendant's apartments.

The cost of the building, with the fund invested for the supply of newspapers and various magazines, will be about 5,000*l.*

*Dundee.*—A special meeting of the Dundee School Board was held on the 22nd of June, Professor Moncur in the chair, for the purpose of considering the terms which they would offer to the Town Council for the acquisition of a site for the erection of the Harris Institution, the gift of ex-Bailie Harris to the School Board, on behalf of the town. The site proposed to be acquired extends to 121 poles, and lies on the east side of Courthouse-square. Mr. Maclaren, the architect, submitted a plan showing the proposed site of a school sufficient to afford accommodation for 1,000 scholars. After full consideration, the Board instructed the clerk to make offer to the Town Council of 3*l.* 10*s.* per pole for 120 poles, upon the footing that 20 poles thereof would be taken off their hands by the Town Council and Police Commission jointly, and thrown into Courthouse-square for widening the same, at the same rate of fee-duty,—namely, 3*l.* 10*s.* per pole.

THE NEW GOVERNMENT OFFICES.

SIR,—As the daily press, from the great journal downwards, has quoted liberally from your "Additional Chapter to the Story of the Government Offices," it may be hoped that the love of art has so permeated the general public that they at last take some interest in such proposed architectural works as they will have to pay for. Just ten years ago, when the erection of the Natural History Museum, a new National Gallery, the new Post Office, Court of Justice, and several other Government buildings was announced, I remember that there was then as now much the same feeling of dissatisfaction with the way in which things were managed at the Office of Works. A correspondent in the *Times*,—believed to be Sir Henry Layard,—said:—"Never has the violation of common sense in the determination of what our public buildings are to be been so conspicuous as at the present time. Arrangements are being made for building the public offices in Downing-street, the South Kensington Museum, &c. The plans for the War and Admiralty Offices are being considered, Heaven only knows how or by whom. The First Commissioner of Works takes his orders from the Treasury, which, by fits and starts, lets him have his own way or stops proceedings. But the Treasury is the constitutional authority for finance, and if it goes into architecture it steps beyond its province. The First Commissioner is not chosen for any architectural qualifications. He is a Minister directly responsible to Parliament for the expenses upon the national buildings and the administration of a proper system. But the working of the present 'no system' is to permit the First Commissioner for the time being to indulge in any whims of his own, though he may have protested that he knows nothing of art. At one time 'costliness and extravagance,' at another 'meanness,' at another 'vacillation and uncertainty.' Sometimes, however, months of labour and expense upon plans and estimates ordered by this officer are thrown away by a vigorous First Lord of the Treasury changing the style from Gothic to Renaissance, as in the case of the Foreign Office, or from Renaissance to Gothic or Romanesque, as in that of the Natural History Museum."

Here, then, is "confusion worse confounded." And it may be reasonably asked who in the midst of it all is responsible to the paymaster? The perfunctory style of the discussion in the House of Lords on the 14th inst. shows that it is needless to expect it from Parliament.

The writer of the letter I have quoted from urges a permanent advising council,—to consist of three architects, one named by the Government, one by the Royal Academy, and one by the Royal Institute of British Architects; of three artists, one a painter, one a sculptor, and one a decorator; one surveyor; together with two laymen, one being a member of the House of Lords, another a member of the House of Commons,—in all nine members. To insure responsible attendance to the duty, let this council be paid. A very moderate tax on the expenditure upon the public buildings,—say a farthing in the pound,—would amply suffice. This council would act as a jury to give a verdict on behalf of the public, and the First Commissioner would be the judge to adopt it, or to give good reasons for rejecting it. The operation of

this plan would be as follows:—The First Commissioner having got his plans and estimates of an intended edifice would summon the permanent council. Their report would be made and published, and the plans and models exhibited to the public. He would then report to the Treasury, and the cost of the proposed building would be submitted to Parliament. By this means caprice, extravagance, vacillation, and meanness would be prevented, Parliament would know for what it was voting public money, and the public would have the means of expressing its opinion on buildings which are always to be before its eyes, to gratify or disgust them.

Instead of this, or some similar and intelligible arrangement, which would be the best guarantee that the national buildings should exhibit the highest architectural art, the best materials, and the most perfect construction, the public is compelled to rely upon the unchecked, irresponsible notions of the permanent secretary of the Office of Works, who in the Committee of 1877 gave the following answer to Mr. Beresford-Hope:—

"If you were building a new War Office or a new Admiralty it would be infinitely better built and more satisfactory in every way if it were built in the Department. . . . The only additional expense involved would be the hiring of a few temporary draughtsmen."

Well! Mr. A. B. Milford has evidently any amount of pluck, and perhaps our oracle is prepared to assert that the New Post-office, a work of the Department, shows as much advance on previous architectural works, and as much originally, as the New Natural History Museum by Mr. Waterhouse, or the Loudon University building in Burlington-gardens by Mr. Pennethorne.

H. DE STUART.

SCULPTURAL COMPETITION, ST. GEORGE'S HALL, LIVERPOOL.

SIR,—In your last week's number you make a short reference to the competition for the sculptural panels, St. George's Hall, Liverpool, specifying more favourably of the design sent in than the local paper. As one of the competitors, I should like to say that no notice has been given us to the calling in of a professional arbitrator in decision, neither have we heard of any name mentioned. For my own part, I should not have entered into it, but I have had a great deal to do with the building, and am, I believe, nearly the only surviving one of those engaged in its erection in the year 1843. My father, the late James Kelsey, assisted by myself, made the full-size models in London for the Corinthian capitals and other portions of architectural sculpture; and my father, in 1844, went to Liverpool by the wish of the original architect of the building, H. Lonsdale Elmes, and completed the whole of the external architectural sculpture, which was done in 1846. The year after, Mr. Elmes died, and things were almost at a stand-still until 1849. In August, 1849, I was, by the wish of Mr. W. H. Wordley, who had been resident drawing clerk for Mr. Elmes, engaged to execute the models for the interior decorations, which we carried on under the superintendence of Mr. Wordley and the then town surveyor, Mr. J. Wightman. In the year 1851, Professor C. R. Cockerell, R.A., took the building in hand. Under his directions I completed the various models and works required, having two of the rooms in the building for a studio. All these works were completed in the year 1856. The panels now in question were often spoken of, particularly between myself and Mr. W. H. Wordley, who has since died; and I think the designs we have sent in embody some of the ideas then entertained.

We have taken a comprehensive view of the matter because we considered that to design only seven out of twenty-eight would be unsatisfactory. With these views we have sent twenty-eight outline designs and nine quarter full-size models illustrating nine of the outlines.

COMPETITORS.

*Messrs. Chubb & Son's Works*—Messrs. Chubb & Son, the eminent safe and lock manufacturers, have decided on removing their business from Wolverhampton to London. Their works in Wolverhampton have been established over fifty years. Having, however, acquired extensive premises in London, the firm propose to concentrate their business in the metropolis.

**PURCHASES BY THE ART-UNION OF LONDON.**

The following are the principal works selected by prizeholders of the Art-Union of London:—

From the Royal Academy.—Astepe, Mrs. Laura T. Alma Tadema, 75*l.*; A Pine Wood, Stuart Lloyd, 45*l.*; A Vexed Question, L. C. Henley, 40*l.*; Dread Winter, John Pigott, 40*l.*; A Little King, W. Tyndale, 40*l.*; Evening, Miss C. J. Weekes, 36*l.* 15*s.*; The Last Road, Hector Caffieri, 35*l.*; An Anxious Moment, Norman Taylor, 30*l.*; "The Winds and the Waves of the Ocean," Davidson Knowles, 30*l.*; "Multiplication is Vexation," G. W. C. Hutchinson, 30*l.*; Pouchers, Edwin Holmes, 25*l.*; On the Beach, Mumbles, near Swansea, T. Griffiths, 20*l.*

From the Society of British Artists.—Mothers and Children, G. A. Holmes, 100*l.*; Moel Wyn, Festiniog Valley, Jas. Peel, 75*l.*; Waterfall on the Dinas, South Wales, J. B. Smith, 75*l.*; A Sandy Road near Grafton Bridge, Derbyshire, Geo. Turner, 65*l.*; "Boys will be Boys," Walter S. Stacey, 60*l.*; Rastie Flirtation, J. T. Peelo, 50*l.*; The Casbah, Algiers, Ph. Pavy, 50*l.*; Collecting Dead Leaves, W. Luker, 50*l.*; Sunday Afternoon, Jas. Gow, 50*l.*; The Highest Bidder, Jas. Hayler, 50*l.*; Towing over the Tide, W. L. Wyllie, 40*l.*; Mat of the Morning, S. Walters, 40*l.*; Five o'Clock Tea, Sydney Muschamp, 35*l.*; Rest by the Way, W. Bromley, 35*l.*; Sussex Flats, A. Gledning, jun., 35*l.*; Trawlers going down Channel, G. S. Walters, 35*l.*; Driving the Cows to Marsh, T. F. Goodall, 35*l.*; Early Morning, Lynnmouth, North Devon, Mrs. Harriet A. Seymour, 30*l.*; The Old Well at Eshing, Ralph Todd, 25*l.*; Springtime, A. Quinlan, 25*l.*; Bridge, Haring-Girl, H. Caffieri, 25*l.*; The Mill-Weir, Edward R. Taylor, 25*l.*; Corrie's Coal Derrick in Bagship Reach, W. L. Wyllie, 25*l.*; Passing Clouds, H. Maurice Pace, 25*l.*; Noon, T. P. Wainwright, 20*l.*; Beating up Thames, Claude T. S. Moore, 20*l.*; Bonlogne Milk-Girl, H. Caffieri, 20*l.*

From the Grosvenor Gallery.—Good-night to the Flowers, E. P. Staples, 100*l.*; In the Heart of Dartmoor, J. Whipple, 31*l.* 10*s.*; "Tiger, Tiger, burning bright," &c., J. W. Taylor, 30*l.*

From the Royal Scottish Academy.—Windy Weather, Loch Inch, Inverness-shire, W. B. Brown, 45*l.*

From the Royal Society of Painters in Water-colours.—Near the Rialto, looking towards the Palazzo Foscari, Venice, W. Callow, 42*l.*; Bridge over the Duddon, Antum, C. Rigby, 31*l.* 10*s.*; The Ear Rock, Mullion Cove, Cornwall, S. P. Jackson, 20*l.*

From the Institute of Painters in Water-colours.—Classeywell Pool, near Prince Town, Dartmoor, Philip Mitchell, 20*l.* 6*s.*

From the Royal Albert Hall.—For the Abbot's Table, F. Andreotti, 42*l.*; "The Skies, they were Ashen and Sober," J. Anderson, 30*l.*; Near Hartland, Devon, J. E. Meadows, 25*l.*; In Burnham Beeches, A. Morris, 20*l.*; Morning on the Loddon, A. Morris, 20*l.*; A Stitch in Time, J. G. Faed, 20*l.*

From the Royal Hibernian Academy.—The Pretty Cup-bearer, A. F. Patten, 18*l.* 18*s.*

**RATING OF BUILDERS' PREMISES.**

On the 10th inst. the Assessment Committee of St. George's, Hanover Square, considered appeals against the Supplemental Valuation List. Amongst the appeals heard was that of Messrs. McLachlan & Sons, of Clapham Common and St. James's-street, who appealed against an assessment made upon workshops, &c., recently taken by them in Johnson-street, Westminster. The case had been before the Committee under a Provisional Valuation List in January last, when they refused to allow the deduction of one-third to which factories are entitled under the Valuation Metropolis Act, but treated it as a house, and only allowed a deduction of one-sixth. On the re-hearing of the case on Monday last, the Committee allowed the appeal, thereby conceding the principle that a builder and contractor's premises, in which machinery is used, is entitled to be classed as a "Factory" under the Valuation Metropolis Act. Mr. W. H. Blanch, Assessment Valuer and Rate and Tax Adjustor, of 8, Stationers' Hall-court, conducted the appeal on behalf of the appellants.

**Practical Engineering.**—In addition to the lectures on "Physical Science," now being delivered in the new Science Theatre of the Alexandra Palace, by students of the College of Practical Engineering, Muswell-hill, the college staff will be reinforced by a number of eminent practical engineers, who will give lectures on some of the most important topics in civil and mechanical engineering. The first of these lectures will be on the difficult subject of "Waterworks" by the Hon. W. J. McAlpine, past-president of the American Institution of Civil Engineers.

**SUBURBAN BUILDING LAND.**

Mr. CHARLES BELTON, on behalf of the United Land Company, Limited, has recently purchased six of the most valuable building estates in the neighbourhood of the Metropolis, viz. :—

1. The Kilburn House Estate, comprising about thirty acres of freehold building land, with frontages to Edgware-road, Priory Park-road, and Willenden-lane, nearly adjoining Alec Keene's, &c.

2. The Oaklands Hall Estate, late the residence of Sir Charles Murray, adjoining the Oak Lodge Estate, Kilburn, with valuable frontages to West End-lane, Palmerston-road, and Kingsgate-road.

3. The King's-road Estate, Fulham, consisting of nearly twenty acres of freehold building land, with three excellent houses thereon, and extensive frontages to King's-road, Hurlingham-road, &c.

4. The Elmhurst Estate, Upton, close to West Ham Park, consisting of about sixteen acres of very eligible building land, with extensive frontages to the King's-road.

5. The Bruce Grove Estate, Tottenham, consisting of about thirty acres of freehold building land, adjoining the Great Eastern Railway Station.

6. The Harrow-road Estate, Kensal-green, consisting of about twenty acres of freehold building land, with extensive frontages to the Harrow-road, leading to the Edgware-road.

The whole of these properties are well placed, and will have main drainage, well-made roads, and curbed footpaths, the contracts for which will be shortly entered into to enable the land to be offered to the public in the ensuing spring.

The cost of these six building estates, including works, is upwards of 200,000*l.*

**CHURCH-BUILDING NEWS.**

**West Bromwich.**—On the 4th inst. the new Church of St. Paul, which has been erected at Gold's Hill, was opened for divine worship. The sermon was preached by the Very Rev. the Dean of Lichfield, who referred to the circumstances under which the new church had been erected. He said these circumstances were very remarkable, and could not be made too public. The congregation which would worship in that building was originally gathered in schools erected by the firm of the late John Bagnall & Sons. The schools were, however, sold about three years ago to the West Bromwich School Board, and this new church, which would be consecrated in the autumn, had been built to receive that congregation. The history of the church was curious, and he might almost say unique,—it was literally a church that had been transplanted there from another site. It was originally erected by Messrs. John Bagnall & Sons for the workmen employed at Cappon Fields Blast Furnaces, and the memorial window which adorned the present edifice was placed in the old building twenty-seven years ago by the workmen as an offering of gratitude to the firm for the gift of the church. Ultimately the services were discontinued in the church at Cappon Fields, and since then the vicar of St. James's (the Rev. R. Wall) purchased it, and it had been transferred piecemeal to the new site, at a cost of something like 2,200*l.*, which amount would include the furniture and fittings. The church, which is a plain structure, will seat about 300 persons.

**Eastbourne.**—The new Church of All Souls, Eastbourne, was consecrated on the 6th inst. by the Bishop of Chichester. The style of the building is described as being Lombard Byzantine. The subsoil being very bad, the concrete foundations had to be carried down to a depth of from 17 ft. to 20 ft. The building consists of nave, north and south aisles, chancel, chancel aisles, apse and tower, the latter connected with the church by a short arcade. The external dimensions are 127 ft. by 68 ft. by 51 ft. to ridge of nave; internal ditto, nave, 86 ft. 6 in. by 33 ft. by 39 ft. to plate, or 49 ft. to top of open timber roof. The north and south aisles are each 75 ft. by 13 ft. by 18 ft. to plate, or 26 ft. to top of lean-to roof. The chancel is divided from the nave by an arch 24 ft. wide, 37 ft. high, and measures 19 ft. by 33 ft. by 38 ft. to wooden ceiling. The apse, having a 12 ft. radius, contains seven windows with spherical stone vault over and a reredos in Caen stone. The north chancel aisle, 19 ft. by 13 ft., is arranged as a vestry, whilst the corresponding south aisle contains the organ, a fine instrument by Bishop & Sons. The campanile at the south-west corner is 16 ft. square by 83 ft. in height, and contains a clock with four faces by Dent & Co., and a peal of five bells by Mears & Stainbank.

The materials of the church are Keymer bricks and buff bricks from Tamworth, with red and buff terra cotta by Gibbs & Canning, of Tamworth. Internally the walls are lined with Burham bricks and the stone arcading is in white and blue Corsham. The latter, as also the pulpit, desk, font, and mosaics were executed by Farmer & Brindley, of London. The corona of sixty jots, the hanging lamps, and the pulpit rail were made by Hart, Son, & Peard; the tile floors and writing by Simpson & Sons; the iron railing by Johnston Bros. The contractor for the general work was Mr. James Peerless, of Eastbourne, and the clerk of works Mr. Walter Peart. The total cost has been about 18,000*l.*, and the whole of the work was carried out from the designs and under the directions of Messrs. Parr, Strong, & Parr, architects, London.

**Bath.**—On the 3rd inst. the Rev. Canon Bernard laid the corner-stone of a new chancel, which, together with a vestry and an organ-chamber, is to be added to St. Stephen's Church, Lansdown. The dimensions of the work are,—chancel, 27 ft. by 21 ft. 6 in.; vestry, 14 ft. by 17 ft. 6 in.; organ-chamber, 12 ft. by 17 ft. 6 in. The chancel will have an apsidal end, and will be lighted by three two-light windows; on the right side the organ-chamber will be built, and on the opposite side it is intended to erect the vestry. As far as possible the general harmony of the building will be preserved, although in making these additions, a purer style of Decorated Gothic will be used. The work is from designs of Mr. Wilcox, architect, of Bath, and Messrs. Morgan & Lovell, also of that city, are the contractors. Their contract amounts to 1,440*l.* A new organ, to supersede the one at present occupying the gallery underneath the tower, will be built by Mr. Vowles, of Bristol.

**Lochgilthead.**—The committee chosen to further the erection of a new church on the site of the old one met on the 7th inst. to select a plan. Two plans by Mr. Baldie were approved of, but the committee left themselves to be guided by the decision of the Baird Trust as to which of them should become the building plan, also to abide by any modification of either plan the Trust may suggest or decide upon. The architect's estimate of the cost of the building is 2,300*l.*

**Kendal.**—The parishioners are about to remodel the interior of St. George's Church, Kendal, and to re-seat the whole with open seats. A heating apparatus and a new organ are to be placed in the church, and the choir-stalls are to be removed to the east end. The architect is Mr. D. Brade, of Kendal.

**Miscellaneous.**

**The Worcestershire Art and Industrial Exhibition.**—This undertaking, which has been in preparation for the last six months, was opened on Tuesday by Lord Beauchamp. Originally projected as a local exhibition of art and industry confined to the county, it was so warmly supported,—upwards of 6,000*l.* having been readily subscribed within the county as a guarantee fund,—that it was determined to extend its range as to the art portion. At the private view this portion of the exhibition was pronounced more excellent than anything that had hitherto been attempted in the provinces, the Manchester Art Treasures Exhibition, of course, excepted. It contains a great many valuable loan pictures. The South Kensington Museum has contributed eight cases of valuable articles. The art needlework, which is especially noteworthy, has been arranged with great labour and care by Lady Alwyne Compton. The collection of local products of industry, which occupies two-thirds of the interior of the building, includes some high-class specimens of Worcester ware, the Worcester Royal Porcelain Company contributing the larger share. The exhibition building, which is close to the central railway station, is divided into four courts, with a central nave of 250 ft. by 50 ft. At night the electric light will be used both inside and outside the exhibition, which will be kept open for three months.

**Kirkcaldy New Public Hall.**—The committee appointed to select a plan for the new Public Hall to be built in Pathhead have adopted a plan prepared by Messrs. Campbell Douglas & Sellars, architects, Glasgow. It is estimated that the total cost of the building, including site, will be about 3,000*l.*

**A Pulpit for Canada.**—Messrs. F. & J. Morgan have just completed, at their yard, Fairview, Cheltenham, a stone pulpit for St. Matthew's Church, Quebec. The main outline of the design is circular, broken by the projection of massive square brackets placed at right angles. These, with the inverted conical superstructure, reach the floor, which is approached by winding steps from the rear, and is supported by columns, caps, and bases. A projecting string course, from which angle corbels depend, carries the statues, and the body of the structure, which is openly arched. Its clustered shafts are wrought in rare and highly polished marbles, the arches are deeply moulded and enriched, the spandrels diapered, and the whole surmounted by a boldly-carved capping-course carrying the circular contour of the design is carried upwards by the disposition of the statues of St. John Baptist, St. Peter, and St. Paul. The massive substructure is intended to idealise the rock upon which the Church was founded; and the statues, the most powerful exponents of the preached gospel. The pulpit is a memorial to the Rev. George Hamilton, late curate of St. Matthew's, Quebec, and is to be erected in that church. The architect is Mr. Alfred Drew, of Margate. The marble columns were supplied by Mr. Boulton, of Cheltenham.

**Memorial of a Borough Surveyor.**—A monumental brass in memory of the late Mr. D. J. Humphris, for many years churchwarden of the parish of Cheltenham, and who filled various other responsible offices in the borough, has just been completed by Messrs. Marshall, by whom it has been exhibited prior to its erection in the parish church, where it will be placed on the north pier of the chancel arch. About 500l. were raised for the purposes of a memorial to Mr. Humphris, but at the request of the family the larger part of this sum was devoted to the clearing off of the debt on the parish church restoration, to which work Mr. Humphris had especially devoted himself. The brass has been designed by Mr. G. F. Cox (Messrs. Engall, Sanders, Cox, & Pearson), a former pupil and assistant of Mr. Humphris. The inscription commences as follows:—

"In memory of Daniel James Humphris, Architect and Borough Surveyor, who, for a period of twenty-one years consecutively, filled the office of Churchwarden of this Parish. This monumental brass, and the stained-glass window in the chancel, were erected by his fellow-townsmen to commemorate the self-sacrificing exertions of a most devoted and meritorious public servant, and the distinguished qualifications he possessed for the appointment he held for so many years with the unabated confidence and esteem of the parishioners."

**The Warley Mount Estate, Brentwood.** The new roads on this estate were opened on the 7th inst. The sewers and house drains in the roads having been completed before the roads were finished, notwithstanding the fact that the sewers are from 9 ft. to 11 ft. below the surface of the road, and in some parts in running sand, no difficulty was found in keeping the work to exact lines and inclination. Stanford's patent joints have been used. At the end of each straight line of sewer an inspection and ventilation shaft has been constructed, and at the head of each sewer one of Bowes, Scott, & Read's self-acting flushing syphons will be introduced.

**Withington.**—The foundation-stone of the Withington Congregational Church, Palatine-road, was laid on the 8th inst. by Mr. W. E. Melland. The church is being erected on the designs of Mr. R. F. Tolson, architect, Manchester, the contractors being Messrs. W. Southern & Sons, Salford. The building is Gothic in style. The church, when finished, will accommodate about 1,000 persons. The total cost of the building (including chancel) will amount to nearly 10,000l.

**Homes for Orphan Boys, Swanley.**—Owing to unfavourable weather, the ceremony of laying the foundation-stone of these buildings, which was to have been performed by H.R.H. the Prince of Wales, had to be postponed. We last week published illustrations of the proposed buildings.

**Glasgow Municipal Buildings Competition.**—In our advertisement columns will be found an intimation from the Glasgow Institute of Architects desiring all competitors who wish to exhibit their preliminary sketches to at once send a statement of the wall space required by them.

**Flameless Combustion.**—At the *séance* of the Society of Chemical Industry at Owens College, on Thursday in last week, a new theory of combustion was practically illustrated by Mr. Thomas Fletcher, of Warrington, the results being so totally unexpected that many present would, and in fact did, go away with the impression that some deception was being practised. According to the *Warrington Guardian*, Mr. Jacob Reese, the inventor of the Reoso fusing disc, has stated his belief that if it were possible to produce combustion without flame, the temperatures and duty obtained from any fuel would be enormously increased. It has remained for Mr. Fletcher to not only prove the possibility of flameless combustion in more than one form, but also to demonstrate practically the enormously high temperatures which can be obtained by this means. Taking a half of iron wire about 3 lb. in weight, Mr. Fletcher placed it on a slab of fire-clay, and directing a blow-pipe flame on it for a few seconds, he suddenly blew the flame out. The temperature increased so rapidly that in a few seconds the wrought iron fused and ran into drops, and this temperature was steadily maintained. The room was darkened, but the closest examination did not show a trace of flame, although the fact that the gas was burning was proved by repeatedly relighting and extinguishing it. How far this discovery can be utilised remains to be seen, but it would appear that the presence of flame, usually considered to be a sign of combustion, is really an indication of imperfect results, and the best duty is to be obtained only when the flame is totally absent.

**The Nichols' Commemoration Column, Southampton.**—A handsome lamp column and drinking fountain have been erected at the junction of the important thoroughfares known as the Six Dials, in St. Mary's, Southampton. They have been presented by Mr. Jonas Nichols, one of the municipal representatives of the ward, as a gift to the town, in commemoration of his son attaining his majority. The column is the work of Messrs. Steven, Bros., & Co., of Upper Thames-street, London, and Milton Ironworks, Glasgow. It occupies a raised position in the centre of the circus formed by the intersection of the six thoroughfares. The pedestal of the "Sidney" column,—for that is the name which it now bears,—is about 3 ft. square, with ornamental plinth, standing upon a Portland stone base, surrounded with a granite stone kerthing, the space between the kerthing and the base being filled with patent vitrified paving bricks, supplied by Mr. Joseph Hamblet, of West Bromwich, laid in radiating panels, thus forming an excellent platform, 12 ft. in diameter, for persons desirous of using the fountain, or as a refuge from the street traffic. At each side and at the top of the pedestal are four elegant semicircular troughs, for the purpose of receiving the waste water and to prevent splashing. These intersect immediately under the heads of four gracefully-moulded dolphins, forming the corners of a very pleasing base to the lamp-column above. The height of the light above the roadway is 22 ft. The painting and gilding have been executed by Mr. C. Vaughan, of Southampton. The whole of the work has been carried out under the supervision of the Borough Surveyor of Southampton (Mr. W. B. G. Bennett).

**The Work done in a Technical School.**—There is now on view in one of the rooms of Gresham College, Basinghall-street, a small but interesting collection of specimens of handwork executed by some of the pupils of the Technical School at Islington, in Westphalia. They have been sent over at the instance of Mr. Philip Magnus, Director of the City and Guilds Institute, and one of the Royal Commissioners on Technical Education, as illustrating the work done in the numerous schools of the kind which exist throughout Germany by apprentices and "improvers" in various handicrafts. Some of the work shown is very good indeed, especially when it is remembered that the workers are mostly lads of from thirteen to nineteen years of age. The specimens include modelling in clay and wax, wood-carving, metal-chasing, and turning in wood and metal. The exhibition will remain open daily from ten to four up to and inclusive of Wednesday next, the 29th inst., and will be found worth visiting by some of our readers.

**A new Mission Chapel** has just been opened at Leckhampton, Cheltenham, from designs by Messrs. Chatters & Channon.

**Proposed Cemetery for Newington.**—At the last meeting of the Newington Vestry a letter was received from the Burial Board, informing the Vestry that for some time past they had been taking steps to find a suitable site for a burial-ground for that parish. During the past ten years they had reviewed several plots of land, but the situation of these sites and the price of them were such that the Board did not think it advisable to submit any of them to the consideration of the Vestry. Very recently they had their attention called to some land on the high road to Craydon, consisting of 43 acres,—the area required by the Act,—and this land could be readily adapted for the requirements of a cemetery. The owner was willing to take 29,000l. for the land; but the whole of the frontage might hereafter be disposed of for building purposes. This would realise 6,000l., and would reduce the cost to, say, 23,000l. A further expenditure of 6,000l. would be required for boundary-walls, chapels, and laying out the ground. There would also be the cost of maintaining a staff; but it should be remembered that for this outlay the Board would receive fees for interments. If the parish possessed a cemetery, and the same inducements were offered to the bereaved to bury their dead there as existed in other parishes, there would be no less than 1,500 interments in the course of the year. Supposing the fees charged to be on the same scale as in Lambeth and Camberwell, the receipts would amount to 1,800l. or 2,000l. per annum. A rate of 4d. in the pound would be required for the first four years, and they reminded the Vestry that some such provision would have to be made before long. Mr. Styler wished to know if the offer of the land treated it as agricultural land or building land. [Mr. Churchwarden Chester: As building land. If we do not take it, it will be taken up by other persons.] It was resolved to defer the consideration of the scheme until the next meeting of the Vestry. The parish, unlike its neighbours, Camberwell and Lambeth, is without a cemetery of its own.

**Proposed Town-hall for Lambeth.**—At the last meeting of the Lambeth Vestry, Mr. F. H. Fowler moved, "That a select committee be appointed to consider the propriety of obtaining a new Vestry-hall with the necessary offices." He observed that all who had to attend the present Vestry-hall in the discharge of their parental duties were aware of the very inadequate accommodation which the building offered for almost every purpose. While other parishes had borrowed money from the Metropolitan Board of Works for the purpose of building large edifices for the use of the Vestry and the inhabitants, Lambeth had contented itself with its old Vestry-hall, and its associated discomforts of bad ventilation and insufficiency of accommodation. There was no library in the building, and the consequence was that if a member wished to get up information respecting any subject, whether it related to the School Board, the Asylums Board, or any other board, he had no means of doing so, inasmuch as the hall contained no books of reference. He thought that Lambeth, the largest and most influential parish on the south of the Thames, ought to have a proper Vestry or Town Hall, where public meetings might be held when occasion demanded and where local representatives might meet with comfort to themselves and with credit to the great and important parish in which they lived. He concluded by moving the resolution. Mr. Doubleday seconded the motion, and said he felt quite sure that a Town-hall would pay in the long run a profit of 1,000l. or more every year. The motion was carried, and a committee nominated to consider the matter.

**Statue of Mariette Bey in Boulogne.**—A statue to Anguste Mariette, better known as "Mariette Bey," was unveiled on the 16th inst. in Boulogne, where the distinguished Egyptologist was born in 1821. It is erected on the Esplanade skirting the ramparts of the Haute Ville, looking to the Sons-Prefecture, and stands upon a base consisting of a pyramid upon the sides of which are inscribed the names of Mariette's principal discoveries. The town was *en fête* on the occasion of the ceremony. The citizens of Boulogne, in honouring the memory of Mariette, have conferred honour upon themselves.

**Competition.**—The plans submitted (in competition) by Mr. T. Searanck Archer, of 2, Gresham-buildings, have been selected for the new swimming-bath, &c., to be built at the Royal Masonic Institution for Girls.

**The Society of Chemical Industry.**—The annual meeting of the Society of Chemical Industry was held on the 5th inst. at the Owens College, Manchester, Professor Roscoe, the president, in the chair. Professor Roscoe said that they had now 1,140 members on the books, English and Continental scientific and professional chemists. Last autumn two sections of the society were formed, and during the winter had been in active working, the metropolitan portion under Professor Abel and that in Liverpool under Mr. E. K. Muspratt. Speaking of the importation of manufactured colours, by which we lost the profit on an industry of three millions annually, he said the Germans and the Swiss were still distinctly before us, not only in the means of obtaining the highest technical training in their universities and polytechnic schools, but, what was even more to the point, before us in the general recognition of the value and importance of such training and the successful prosecution of any branch of applied science. However, although England was apt to be late in taking up such views, she was, as Mr. Forster said, generally not too late, and the recent establishment of colleges and technical schools, as well as the appointment of the Royal Commission on Technical Education, to which he had the honour to belong, showed that the country was now alive to the necessity of the case.

**Land, Chiswick.**—Mr. Walter Hall, Land Agent, of No. 28, Southampton-buildings, Chancery-lane, has sold in one lot the whole of one side of the Barrowgate-road, Duke's-avenue, Chiswick, just outside the gates of Chiswick House, the property of the Duke of Devonshire. The estate, which comprises five acres of valuable building land, having a magnificent frontage, was advertised in our columns for sale by auction on Tuesday last, but in consequence of an offer being made on the morning of the day fixed for the sale, the property was sold privately at a price which, we learn, was sufficient to induce the owners to forego the chances of an auction-room.

**Ladybank (N.B.).**—The new parish church was opened for public worship on Sunday last. The plans of the structure were prepared by Mr. Walker, architect, Circus-place, Edinburgh, and are Gothic in design. The site is the most conspicuous in the centre of the town, and consists of an acre, one-fourth of which is taken up for the church and three-fourths are held in reserve for the manse. The church is seated to hold 400 in the area, while a gallery can be erected at any time to accommodate 107 more. The walls are of freestone.

**Ventilation.**—Messrs. Robert Boyle & Son's system of ventilation is the one applied at the Police Orphanage, Twickenham, a new wing of which was opened on the 8th of July by H.R.H. the Prince of Wales. Messrs. Boyle are also to ventilate the new Royal Courts of Justice Chambers at present being erected in the Strand, their plan being the one accepted.

**Social.**—On the 8th inst. the employees of Messrs. G. H. & A. Bywaters made an excursion to Hastings, where 130 sat down to dinner at the Castle Hotel, Mr. Taylor presiding. The senior member of the firm, Mr. George Bywaters, was present, and expressed the pleasure it always gave him and his brothers to meet them on such occasions as that.

For repairing, cleaning, and painting the chapels, lodges, and mortuary, and for altering the iron entrance-gates at the Tooting Cemetery, for the Lambeth Burial Board.  
 Mr. Harley M. Grell, surveyor, 17, Aldchurch-lane.—

### On Quoins and some Questions collateral.

NOUGH was probably said in the article on "Tasto in Brickwork" (June 17), as to the natural propriety of the end or angle of a brick wall being emphasised as a termination. This is merely an application of what may be admitted as an architectural axiom, that every structural transition naturally receives, if it should not be said rather to naturally demand, acknowledgment by visible differentiation, by accentuated outline, or expressive moulding. A sudden termination of a wall-certain is a more

decisive case of interruption, which is equivalent to transition, than simple change from one member to another,—as from shaft to capital, or from frieze to cornice. We have seen how the blind exigencies of construction introduce a certain difference by the interposition of the fragmentary brick, "the closer," at the end of a course, which answers its immediate purpose at the expense of weakening expression. The problem is even so forced upon us, how the exigency can be provided for in a manner to conciliate the requirement of enhanced expression of vigour. Of this problem there is one solution yet to specify even as regards pure brickwork, while it is equally applicable to proper masonry. This consists in the advance of the work for a limited breadth beyond the general plane of the wall; by this means a vertical line is obtained which, by the usual effect of well-managed repetition, whether in rhetoric or brickwork, strengthens the expression of what it manifestly insists on, in this case the vertical line of the end or angle. By such an emphatic pronouncement the disturbing suggestion of a cessation that is unprepared for, if not unexpected, and therefore liable to be violent, is precluded. Here, again, the Greeks, as in so many other cases, are our masters and instructors, and nowhere better than in that peculiarly complex structure the Erechthium. The flank-walls of this temple on either side eastward are finished by a slightly projecting return of the anta, which answers to an angle column of the eastern portico, and, by predominance of verticality, brings the uniform horizontal progression of the courses of masonry to an authoritative pause or stop. The western

anta of the north portico returns not upon a flank wall, but upon the end of a wall, upon the opposite side of which it is repeated in a position where it cannot, as having no column to answer to it, be strictly entitled an anta; the ornamental mouldings of both are made continuous, alike at summit and base, by extension across the narrow recessed end of the wall between them. Still another variation of the thoroughly organic union of anta and wall is given at the angles of the engaged colonnade of the western front. In some of these examples we have an anticipation of the principle and the beautiful effect of the compound pier of later ages. In all of them we observe that the wall seems spontaneously to develop into a new adjustment to accommodate a new exigency, even as in a natural growth a reed-stem thickens towards the bulge of a node. Organic modification of such a type is very different indeed in effect from the unhappy Roman invention of the pilaster, which, especially as employed by Palladio and his imitators, justifies the accurately descriptive words of Pope already quoted, and appears as nothing better than a thin slice stuck upon a wall, and as little capable of standing independently of it as of asserting a true structural adherence. A pilaster is seldom more objectionable than when it is employed in a vain hope of making use of its services near an angle; the wall, when allowed to reappear at the angle, will assert itself as having passed uninterrupted behind flat slabs beyond which it is emergent. Inigo Jones fought against the difficulty by setting coupled pilasters at the angles of the upper story of Whitehall, but he does not come out altogether a conqueror. The wall still appears stronger than his pilasters, which, in consequence, are only slightly less conspicuously otiose than usual. When the masonry is executed with rustic joints, the fictitiousness of any aid to be ascribed to the pilaster is self-declared, and its pretensions to constructional union are visibly repudiated. This characteristic needlessness clings to the pilaster; it is no objection to it when employed confessedly decoratively, on a small scale, or in mere furniture, but where proper architectural responsibility is in question, the pilaster may usually be most prudently dismissed,—most conscientiously denounced. It may be thought to be most endurable when, as we sometimes see it, it embraces an angle; and, in this case, it, at any rate, most nearly personates an unobjectionable pier; but, in truth, even so it only becomes equivocal, either in its own or a different character, and is neither one thing nor another; to become consistent it must divest itself of those proportions; it would be well if it also escaped from the specific capital, which declares it to be a column modified for the worse, and incongruously prompting suggestions of an independence which it is no longer capable of, but that is of the very essence of the

character of a column. There is as little to be said in favour of distinct pilasters adjoining at right-angles and making the corner of the building a re-entering angle; the incongruous seems to reach its acme when a column scarcely engaged in the wall, and at a trifling interval from the pilaster, protrudes its assistance, but only contributes to aggravate an ill-articulated huddle.

These are hard words, but the student may be trusted to verify them by observation or recollection; or let him, indeed, turn for illustrative example to what is always a welcome reference, Fergusson's "History of Modern Architecture." The Library of St. Mark at Venice is the masterpiece of Sansovino at Venice, and it is with some touch of remorse that any disparaging reflection is made upon a building which has been regarded time after time with so much delight. Yet this pleasure was not unqualified by objections, which return in force at the sight of Mr. Fergusson's illustration at page 96 of his work. On both upper and lower arcade, column, pilaster, and wall are grouped, but cannot be said to be combined, at the angles, and the weakest member is nearest to the angle, and both entablatures finish on their weakest member. The artist was evidently unsatisfied with his work up to this point, and became conscious that more decisive emphasis was required. The stratagem of reinforcement which he resorted to scarcely fulfils his intention. Each angle of the cornice is surmounted by a lofty pinnacle, but this, in its isolation, has the unfortunate effect of rather insisting on the independence of the pilasters below it, which the entablatures had in some degree succeeded in combining with their associated columns. It was a wise hint, given by the most eloquent public speaker of our day, that it is always well, before beginning an oration, to have a well-settled scheme how it is to be concluded; this being more important for ultimate effect than even the most skilful arrangement of transitions from one leading topic to another. Architects, like orators, it may be thought, have been too frequently content to leave terminations to reconcile themselves with the central treatment as best they might. Even the Vandramini Palace at Venice (p. 93), and the Pesaro (p. 98) still less, does not fully recognise the claim of the bounding vertical line at the return of a façade to distinctly specialised emphasis.

In the so justly admired Grimani Palace (p. 27), it is only when seen from the angle that the weakness of the terminal coupled columns, as compared with their associates towards the centre, is not objectionable. Palladio is a serious offender in the way of the faults which we have been denouncing. His Valmarina Palace at Vicenza (p. 28) combines them in every form, but much is to be forgiven to him for the sake of the glorious arcades of his town-hall in the same city, where the diff-

culty in question is so fairly recognised and grappled with as to disarm criticism. "If, indeed," says Fergusson, "all Palladio's designs were as beautiful and appropriate as this, we should have little fault to find, either with the style he adopted or his mode of applying it" (p. 117).

The strengthening expression which is given to Giotti's campanile at Florence by the octagonal projections at the angles is the saving of a design which otherwise was in danger of appearing even insecure from associations of flimsiness with superficial ornamentation, from its tallness unrelieved by expansion towards the base, and from the excessive solidity of the unpierced portion at the summit. What happy effect may be due to a simple rectangular projection at the angles, will be seen by comparing Fergusson's "Illustration of the Campanile of S. Andrea, Mantua," with that figured after Street on the opposite page (224) from the Palazzo Scaligneri at Verona. The chief objection to such projections in simple brickwork is that they too obviously imply a vertical joint or what seems a continuous vertical joint at the junction with the face of the wall. This is by no means a fatal objection, but, such as it is, it is evaded by the invention of quoins as constituents of a finishing member.

The simplest problems in the employment of stone quoins to accentuate angles and complete the framing in of a façade, are presented in constructions of pure masonry. In such a case where a wall presents stretchers uniformly, the alternate longer quoin will overlap half a stretcher, but what additional length is conceded to it must depend on various considerations of propriety and taste. It may only be as long as the ordinary stretcher, and left to assert individuality by exceptional projection beyond the plane of the wall; but in this case the shorter quoin will be restricted to half the length of the same modulus. Whether this is objectionable will depend in some degree on the form of the stretcher,—the proportion of its height to its length; and its absolute dimensions will also have to be taken into account. In such construction the breadth of the shorter quoin will inevitably carry a suggestion of the thickness given to the wall of which it is the only evidence. The effect, therefore, can scarcely but be unfortunate if its absolute dimensions are mean and insufficient in this relation. If again it is exactly square, which it will be, if, under the supposition, the proportion of the stretcher is a double square, another inaptness will accrue. The sense of repose which it is the very purpose of a border of quoins to conciliate, will be disturbed when it appears that they would not pile independently even as securely as the ordinary blocks. The eye will insist on passing upon the quoins in their relation to each other, and no holdness of projection will compensate for even a vague suggestion of liability to topple.

This suggestion will be still more readily provoked if, while the shorter quoin presents an exact square, the longer above it is either shorter or much longer than a double square. If it is much longer it will suggest overbalance, and if shorter it will contribute to the instability of slenderness. Therefore it is that it will be found to be, that it will be observed to be, for the interests of repose by those who will have regard to executed examples, that the shorter quoin should be somewhat longer than the ordinary stretcher, and the longer have but moderate projection beyond it. But it will be observed that the projection of the longer quoin in relation to its height will ultimately be governed by the dimensions of the ordinary stretcher, of which it has to cover exactly half, unless a variation is made at this point, which is not desirable. In consequence of this, it would seem, has to be given in the first instance to the most effective proportions of the system of quoins before the oblong face of the masonry blocks is resolved on, even if, upon making comparisons, certain concessions may seem desirable from either side.

In the ordinary process of masonry development, the quoin, which is short in front, is long on the return; and in like manner the long quoin in front shows as short on the other side. Some effects result which are uncomfortable, that is, to recur to our primary consideration, which vitiate repose. It is appropriate that a long quoin should be the base of the system, but the propriety holds good for both sides of the angle of the building; again, it has the better effect for a short quoin to be surmounted

by a frieze or a broad string-course, and again, the effect is secured on one side, only to be visibly forfeited close at hand on the other.

This mischief is at its minimum when even the shorter quoin has a length considerably in excess of its height, but, even so, it is far from being obliterated; the reversal of sequence when the quoins are viewed from the angle is most disturbing, and especially where upon one face a plat-hand or a frieze of necessity rests upon a short quoin or a short quoin is immediately superimposed upon a base line. This difficulty, of course, does not occur when the return of the wall is masked and the quoins are only visible on one face, but otherwise a difficulty it is, which will have its effect in a certain unsettlement of the desirable impression of perfect coherence and solidity, whether the spectator, whose satisfaction is thereby reduced, may be aware or not of the seriousness of his loss, or of the quarter in which the pecan incoherence originates. The remedy obviously lies in the direction of an exact duplication, of making the longer and shorter quoins on one side continuous with longer and shorter on the other; then the system on both sides of the angle will rise from a long quoin, and so also conclude as may be desired. It is needless to say that a variety of proportionate adjustments will be required to secure the harmonious combination of such a system with the general design and also with other details of construction; these cannot be entered upon here where the immediate concern is the discussion, not of practice, but of principles, that practice will do well to be observant of, for it will have to acknowledge sooner or later that they are its masters. It may be observed, however, that the same propriety will control the dimensions of the angle blocks of simple rusticated masonry without quoins, the longer shorter as longer, and the shorter as shorter on both faces.

The predominant form of the quoin is liable to fall into comparison spontaneously with that of the general façade, or more immediately of a special story,—a direct contradiction as between a very square general outline of façade or story, and a very flat oblong of the quoin, or *vice versa*, will assuredly tell us a violent discord. It is more important to observe this from the relation which we have seen between proportions of quoins and of the blocks of the general masonry; it is manifest at a glance how the long front of the Pitti Palace is harmonised by the long proportions of the vast stones, not only of the colossal basement, but of the general construction. The majestic Farnese Palace at Rome exemplifies the admirable effect obtainable by the successive variation of quoin, both in magnitude and proportional forms between basement and upper stories. We observe even the refinement of gradually reducing the thickness of the quoins of the lower story as they approach its cornice-like string-course, as if on the principle of the diminution of a column; a transition is thus softened to the reduced system of quoins of the story above, but the licence requires justification; it would scarcely be agreeable when masses less imposing were to be dealt with.

The variation of the heights of quoins from one story to another involves corresponding change in the courses of masonry, which on their part are consistently reduced in the case of very large structures, in harmony with the reduced height of the stories. By this means quoins may give distinct yet gracefully reserved intimation of what is more forcibly pronounced, and still most effectively in the entirely rusticated façades of several of the finest palaces at Florence.

The combination of the stone quoin with brickwork has led to many an architectural misadventure. Here, of course, the height of a particular course exercises none of the control which it asserts in the case of masonry. The question merely arises,—How many courses of bricks shall be responded to by the height of a quoin? There is no escape from the primary difficulty that no true bond can be expressed or understood between the quoins and the brickwork; proper union or tie is vitiated by the continuous joint through several courses where the bricks meet the deeper masonry. This fault is aggravated by every increase in the number of the quoins makes the inconsistency of associating the two kinds of work still more palpable. The very strength of the masonry causes the brickwork to appear flimsy by contrast, and

liable to the same catastrophe which is proverbially threatened by a new and strong patch upon a weak material. When this objectionableness is obviated in the best way, and to the greatest extent, that the case admits of, the only resource for helping out the harmony of the two constructions seems to lie in assigning a form to the quoin of which the proportions of height and length fall into some easy gradation with those of the particular type of brick which is associated with it. A brick of a somewhat, or more than somewhat, flatter proportion than is usually employed, would be favourable to that degree of flatness in the quoin which would seem to give it best hold on the brickwork; such a brick, it may be added, would give a degree of refinement to the general work which strikes us on a visit to some Continental cities,—even to the Hague, and of which the explanation, at first enigmatical, can never escape our regard after it has once been divined.

#### THE RESPONSIBILITY OF BUILDING OWNERS FOR THE NEGLIGENCE OF THE CONTRACTORS' WORKMEN.

WHEN the well-known case of *Bower v. Peato* was decided in 1876 it undoubtedly introduced a most important exception to the well-known legal principle, that if a man employs a competent contractor to do work for him *in vivo*, by the negligent way in which the work is done, causes injury to the property of a third person, he is not liable. For, as probably many of our readers are aware, the exception which was introduced by *Bower v. Peato* was to the effect that one who orders work to be executed from which, in the natural course of things, injurious consequences to his neighbour must be expected to arise, is bound to see that proper care is taken in the execution of the work, and he will be liable for want of such proper care. This exception has seriously increased the responsibilities of many persons who order work to be done which is at all liable to injure adjoining property, and considering the nature of much town work, it requires no unusual knowledge to understand the danger incurred by many innocent persons. A recent case, one which we have chronicled briefly in our columns, is now reported in the regular law reports, and it shows that the courts have made this exception wider than it was under the previous decision. We are referring to the case of *Perival v. Hughes*, 51 *Law Journal Reports*, Queen's Bench Division, p. 388, which contains an important judgment of the Court of Appeal. The main effect of that decision is to apply the exception contained in *Bower v. Peato* to the whole job, so to speak, on which the contractor is employed, and not to those parts of it which are clearly likely to cause injury to the property of another if great care and precaution be not taken. Of course, if A and B are two adjoining house-owners, and C, a competent contractor, is employed by B to do work on, we will say, the foundations of the house, and his workmen are so careless that they injure A's property, it is exceedingly hard upon B that he should have to pay damages if A sues him. C is more properly the person to bear the consequences of this injury; yet, again, C may say that having obtained the services of a competent workman, it is equally hard upon him to pay A's losses, so that, in fact, the whole question is one which involves loss to one of three innocent parties,—A, B, and C. The importance of the increased width of the exception is made more clear by showing how the rule was applied to the facts of this particular case. Mr. Hughes desired to rebuild his house, and for that purpose employed a competent architect and a competent builder. The new house was to be one story higher and one lower than the old house. Before the completion of the works, the workmen, in order to erect a staircase, cut into the party-wall of the house of a third person, and injury was thereby caused to the plaintiff's house. The workmen, in thus cutting into the party-wall were acting contrary to orders which had been given to them. Now the operation which, in itself, was likely to cause danger, was taking down the old house and excavating below the adjoining houses: in regard to this proper precautions had been taken, and this part of the work had been safely performed. "Then," said Lord Justice Holker, who differed from the two other members of the Court, "there was nothing else which would

produce danger to the plaintiff's house"; and he considered that, as the putting up the staircase was not, in itself, an operation at all hazardous to the plaintiff's property unless the workmen exceeded their duty, the exception of Bower v. Peate was not applicable. On the other hand, the majority of the Court decided that they must look and see what was the whole undertaking of the defendant; it was, in fact, to pull down the old house and to build up a new one. Some part of the work was admittedly hazardous, and therefore the defendant "would be liable for every act committed or omitted to be done during that period (i.e., of the performance of the whole work), whether by the contractor and his servants or by himself."

As we have said, the determination of the question in any way must be a hardship to one of three innocent parties, and therefore, though we may think the decision hard upon the owner of the new house, it is only a hardship, which, if shifted from his shoulders, some one else would have to bear, for the workman, the actual negligent person, being a man of straw, is not worth suing. To consider the work as a whole will certainly, in many instances, prevent uncertainty as to who is to bear the loss of injuries caused immediately by careless workmen. But that the decision does make the law harder for the building owner no one can very well doubt; indeed, in large houses, what with liabilities for obscuring light and responsibilities for the acts of contractors' men when there is any danger to the property of a neighbour in the operations, the fate of the building owner is not particularly enviable. The neighbour, on the contrary, is in a better position, because he has a substantial person to obtain damages from, and not, as in many cases, a contractor who, on the threat of litigation, will probably threaten to go through the Bankruptcy Court, or, lastly, an impecunious workman. We may fairly suppose, in fact, that all such actions as these against the building owner are commenced when the contractor is unable to pay. The only consolation for the building owner is that he may make an agreement with the contractor that he will repay him all costs and expenses to which he may be put by the negligence of the workmen. No such agreement can, of course, prevent his neighbour from suing him for damages under the authority of these cases, but he may be able to recover over against the contractor, which may or may not turn out to be a valuable right.

#### THE HOUSE OF LORDS ON COMPENSATION FOR INJURIES TO LAND OR HOUSES.

THERE is probably no subject of what may be termed a legal nature which also is connected with the ownership of property, and more especially of buildings, of larger general interest than that of compensation for property compulsorily taken by the promoters of some industrial or public undertaking. There are few of our readers, we suppose, who have at all made their mark as architects or surveyors, who have not from time to time had to direct their attention to this subject, and many of them, we know, have had a good deal to do with such matters either as arbitrators, witnesses, or managers of the lay part of some compensation case. Taken as a whole, the general principles by which the question of compensation is governed are clear enough, and have so little of legal technicality about them that most of those who have paid any attention to this subject have mastered the rules on which it is based. It is certainly not our intention, therefore, to write a treatise on compensation, but as a recent decision of the House of Lords has thrown a good deal of light upon one branch of this subject, and has reduced to order some decisions which were somewhat difficult to reconcile with each other, it may interest our readers if we call their attention to the case of the Caledonian Railway Company v. Walker's Trustees (Law Reports, 7, Appeal Cases, p. 259).

Let us, first of all, state the result of some previous decisions, each of which was given by the House of Lords. The first to be noticed is that usually known as Ogilvy's Case, or, more correctly speaking, the Caledonian Railway Company v. Ogilvy, which was decided in 1856. In that case Mr. Ogilvy considered that he was

entitled to compensation for his property being injuriously affected, because, at a short distance from the entrance to his grounds the railway crossed an important public road on a level. But the communication between the property and the road was not cut off, and access would not be in the least prevented, except from one side, when the gates happened to be temporarily closed, owing to the passing of a train. Various complaints were also made of the inconvenience sure to arise from such matters as the noise of the passing trains. But the House of Lords did not consider that this was the subject of compensation: it was chiefly in the nature of a personal annoyance which Mr. Ogilvy would suffer, together with other passers by, and it was also a mere prospective liability. This decision was practically affirmed by Brand's case, or, rather, of the Hammersmith Railway Company v. Brand, in 1869, which decided that the authorised use of locomotives did not give rise to a claim for compensation. Then, in 1874, came Rickett's case, or more properly Rickett v. The Metropolitan Railway Company. In this instance Rickett was the owner of a public-house in Crawford-street, London, which was called by the extraordinary name of the "Pickled Egg." On the other side of the same street was the Clerkenwell Workhouse, a large block of buildings, and on the further side of it another street more or less parallel to Crawford-street, called Coppice-row. Between these two streets was a covered way, which ended very nearly opposite the Pickled Egg. Some other street was connected with Coppice-street, and many passengers came down there and debouched from the pathway right opposite the Pickled Egg, which apparently had great attraction for these wayfarers. For twenty months the carriage-way in Coppice-row, and another street which led into it, was blocked up, but the footways were at all times open to passengers. However, Rickett complained not only of a temporary but of a permanent loss of custom, as persons had ceased to use this particular route after they had got out of the habit of so doing during the construction of the railway. But the House of Lords held that this was a mere loss of custom, and was not an injury to the house of Mr. Rickett,—injury to the custom of the Pickled Egg being held distinct from injury to the house as a building. Then, in 1874, came McCarthy's case, or the Metropolitan Board of Works v. McCarthy, which was briefly to this effect. Property had access to a highway in front and to the river in the rear. The highway by water was taken from the owner by reason of a permanent dock being placed between the building and the river. Here, however, the Lords held that the property was permanently and injuriously affected for whatever purpose it might be used, and, therefore, that compensation should be given on account of this injury. But it will be clear that there was a decided resemblance between Ogilvy's case and McCarthy's case, because in both the access to a property was interfered with. The judgment in the latter case when read *in extenso* makes the likeness between the principles underlying both cases more noticeable. We will now turn to the case which has lately engaged the attention of the lawsuit. Walker's Trustees possessed a property which had a frontage to Canal-street, Glasgow, and had by that street a direct, straight, and practically level access for all sorts of traffic to Eglinton-street, one of the main thoroughfares of the city. The works of the railway company cut off this direct access entirely, and a distant and more circuitous road, crossing the railway with rather a steep gradient, was substituted for it. These were the main facts upon which this case depended for the fact of another direct access having been made somewhat less convenient did not form one of the debatable points. The House of Lords decided that the railway company was bound to give compensation to the owner of the property in question as it was injuriously affected. Although there is a likeness to the previous Caledonian Railway case, there seems in all these cases, and especially in this last one, to be one clear *ratio decidendi*. In this last case, and in McCarthy's case, the access by the particular route was absolutely taken away; it was impossible in either case for a person to approach the premises of the old and now obstructed road, to do so was an absolute impossibility. On the other hand, in Rickett's case, and also in Ogilvy's case, there was still the same channel of approach open, although not in so convenient a manner, there was no

element of impassability, only one of inconvenience. This, therefore, seems a very material distinction between these classes of cases, and there therefore seems no reason why we should suppose that because a man may now certainly obtain compensation for the direct access to his property being cut off, even though he may reach it by a new and round-about route, therefore that he can obtain compensation if there exists a temporary obstruction, such as a train passing over a level crossing. On the other hand, it is impossible not to perceive that such a thing as level crossing near a gentleman's front gate may materially diminish the value of his property, and, in fact, that the property is "injuriously affected." The passing of rails over a road is, however, not in itself an obstruction. Therefore, we again come, as it seems to us, to the element which is required to exist in order that a man, whether he be the owner of a house alone or land alone, may obtain compensation if a way to that property is interfered with. He must show that there is an actual obstruction, that the way itself cannot be used, and that it is not simply an inconvenience in the use of that way of which he complains, even though such inconvenience may naturally depreciate the value of his property. If the new way is, however, but very little longer, then this would simply be a reason why the amount of compensation to be awarded should be small.

#### THE PART PLAYED BY LOMBARD ARTISTS IN ROME.

AMONG the recently-published foreign artistic books referred to in these columns not long since, mention was made of Sig. Bertolotti's interesting study on the Lombard artists, architects, painters, sculptors, and others, who, during the active centuries of Italian art, worked in Rome ("Artisti Lombardi a Roma nei Secoli XV., XVI., XVII."). Sig. Bertolotti's book, the result of patient research in long unrequited sources of information, is the continuation of a series of studies he has already published on the Belgian and Dutch, the sub-Alpine and the Sicilian artists who have each and collectively colonised, or aided to build up the Papal capital. Rome in this respect for centuries, has served as the gathering point of the artistic world. The Classic interest gathered round the Eternal City stored with its treasures of art, the religious significance attached to the residence of the Papacy, the sumptuous magnificence of the church afforded to the artists, not only of the peninsula, but of every nation, an almost unbounded field for their industry and study. Indeed, at one time it may be fairly said that no other city in the world contained within its walls so many artists. This peculiar *prestige* of the Papal capital has by no means died out, and Rome is still the sighed-for goal of every artistic student.\*

Among the numerous artists employed in Rome, few,—especially among the architects,—have taken, during centuries, a more conspicuous place than the Lombards. Lombardy, as every one conversant with the story of architecture in Italy well knows, early possessed active schools, whose pupils we find scattered almost over the whole of Europe; the *magistri comacini* hold a high place in the history of architecture, and it was from the Lombard mountains and valleys that descended over Italy a crowd of artists who have left behind them the traces of their skill. By nature the Lombard,—and to this day he retains the character,—is industrious, active, hardy, and migratory. In Rome, where, during many centuries, the artistic activity was great, the Lombard colony was, at all times, important. Sig. Bertolotti has devoted his attention especially to this colony, and taking each branch of the artists, he lays before his readers the mass of information he has been able to gather relating to various Lombard architects, sculptors, painters, goldsmiths, stuccatori, intagliatori, ebenisti, bronze-casters, embroiderers, &c., employed in Rome from the fifteenth century,—previously to which information is unobtainable,—down to the close of the seventeenth century. Divided into the cen-

\* John Hoare, of Bath (the father of Prince Hoare, whose name is so intimately connected with the commencement of the Royal Academy), is generally considered as being the first English artist to visit Rome with a view to study; he, at least, was the first of a long line of English artists who have now for 150 years regularly colonised the Papal city.

tures, and then again into the various branches above mentioned, the work becomes to the antiquary, and as a work of reference, of much interest. To the general reader, however, Sig. Bertolotti's two volumes will scarcely be found to afford much that is entertaining. The author has gathered his materials, he tells us, largely from the religious legal and criminal registers, or, as we should now say, the notices reports of the capital, and the lengthy minutes of examination, trials, assessments, quotations of wills, and so forth, somewhat tend to rob the work of the interest it would possess had it been arranged with more regard to literary exigencies. The author only claims to bring forward hitherto unpublished information with a view not only to drag from oblivion the names of a number of unknown artists, but to aid in the correction of the existing biographies of the more famous artists. In this direction, Signor Bertolotti has eminently fulfilled his task and merits the gratitude of all lovers of truth.

It is an old story that artists in the past were far less sensitive as regards their work and position than they now are, and for some generations have been. One feature that is noticeable in all the early periods is the frequent mention as artisans and workmen, of individuals whom we should now term artists. Architects we find named in the accounts as simple masons, *muratori*; painters did not disdain to adorn with their brush the banners and the essent or marriage coffers of their employers; and sculptors we find designated as carvers, and so on. This feature, noticeable in English and French artistic history, we also meet with in Early Italian art.

It is practically with the fifteenth century, that second period of archaeological study, during the pontificate of the learned and cultivated Nicholas V. that commences the regular migration of Lombard artists to Rome. Martin V. and Eugene IV. had prepared the way for the architectural activity of the succeeding reigns which a period of peace further aided. The Romans, it will be noticed, have never distinguished themselves in the walks of art. When, therefore, the capital, in the artistic zeal of the Renaissance popes, was re-built and decorated, it is Florentine and Lombard artists who will be met with as the directors and workmen. The Tuscans, as nearest Rome, are the first in the field, but we soon find the Lombard element prevailing. Trained in the sturdy traditions of their ancestors, who, at the birth of art in Italy, had learnt the secrets of working in stone and marble, it was but natural that it was to them that the inhabitants of the plain turned when in want of artists and artisans. The secrets of their art, transmitted from generation to generation, the Lombard *comaschi*, here to Rome, and out of the ranks of the humble *muratori* and *scalpellini* many an artist sprang, modestly content, however, still to be termed nothing but a master-mason or stone-carver. In the fifteenth century we often meet in the accounts rendered with references to master-masons, master-*carpentarii* or carpenters, often none other than distinguished architects and sculptors. During the busy fifteenth and sixteenth centuries it is especially as architects that we find the Lombards employed, and Sig. Bertolotti gives us a lengthy list of names he has met with in his researches in connexion with the building and restoration of St. Peter's, the Vatican, the Campidoglio, the castle of Sant' Angelo, and a host of other important works in the papal capital, bridges, fountains, roads, &c. We even find the architects employed during siege time as *bombardieri* and the sculptors' talents turned to the production of stone balls.\*

Throughout this and the following century the custom is invariable, and the accounts reproduced by Sig. Bertolotti curiously prove the fact,—for the architects to employ the materials of the Classic buildings for their modern works. Antique stone and marble were, as well known, used by the sculptors and *intagliatori*, who found that to drag their material across the mountains was needless, when easily-worked quarries existed so near. In one year alone Nicholas V.,—perhaps one of the most devoted lovers of antiquity and learning of the

\* The peaceful architectural use that has been made of these military stone balls is well known to the profession, and it would not be difficult to trace their first application to decorative purposes down to the present day, when we see their imitations adorning the gateways of our modern "Queen Anne" houses. The villas of Italy and the châteaux of France will be frequently found adorned with these rude implements of war.

whole Renaissance period,—dragged from the Colosseum, we learn, 2,500 cartloads of travertine and tufa; and Sig. Bertolotti further gives us a number of lengthy extracts from the papal registers. Thus we meet with constant reference to *chava a Chuliseo*; *chava a Templum pacis*, &c. In spite of the prohibition of Pius II.—the worthy and learned friend of the artists, Piccolomini—the apostolic chamber continued, we see, their pillage. The Colosseum, the Thermes of Caracalla, Diocletian, and Constantine, were the chief field; and in the time of Alexander Borghia, the excavation and demolition of the antique buildings were regularly farmed out. In this busy fifteenth century the Lombard artists at Rome not only distinguished themselves as architects and sculptors, but as goldsmiths, armourers,—Brescia was famous for its arms,—its *morsari* or *loriners*, as we should term them, and its embroiderers.

The pontificate of Sixtus V. forms an epoch in the architectural history of Rome, and busy times, indeed, were they for the artists in the employ of the Pope and his court. Great as were the overwhelming figures of the sixteenth century, the Lombard artistic colony again stands out conspicuously, headed by Domenico Fontana, whose fame and fortune only further increased the already large body of Lombard artists resident in the city. The Fontana family, remarks Sig. Bertolotti, worked in themselves furnish ample material for a book; but their fame being so well established, our author, in accordance with his plan, proceeds only to give us some so far unpublished incidents and facts. Among the accounts are given that for the transport of the famous *guglia*, or obelisk of St. Peter's; that for the moving of the equally famous horses on Monte Cavallo, and the restoration of the column of Antonine; the total of the expenditure made by the architect for Sixtus V. being set down as over a million scudi.

Of Carlo Maderno,—we pick out of the interminable list of unknown names given by the author, those most familiar,—Signor Bertolotti finds little new to tell us: "*e quasi nulla è ignoto*"; "he produced too much in Rome, and almost nothing of his is unknown." Giacomo della Porta, Signor Bertolotti considers as of Lombard origin. The long chapter filled with its somewhat dry details devoted to the Lombard architects of the sixteenth century serves, certainly, to show how largely Rome is indebted for its architectural glories to the Lombards, in spite of the overshadowing names that have left their mark on the wonderful century, Peruzzi, San Michele, Giulio Romano, Sansovino, Palladio, Michelangelo, Vignola, Vasari, Ammannati, and so many others.

Of the Lombard painters, some interesting notices are supplied, but the names he gives are known but to the diligent student of Italian art. The sculptors present a stronger contingent. They appear to have formed part of the Roman Academy of St. Luke, though it is doubtless that sad misunderstanding that so often exists between the different branches of the arts that we find before long a separate guild of sculptors.\*

Among the goldsmiths,—the Lombards had long earned a high reputation for their skill in this art,—Benvenuto Cellini, introduced as a great star round whom are grouped a whole host of Lombard workers, serves the author to give some most interesting particulars respecting the artist; among these, the very lengthy but invaluable inventory of his *bottega* or shop. The *Vin del Pellegrino*,—near the superb and familiar palace of the Cancelleria,—was the headquarters of the goldsmiths just as at the same time with us Goldsmiths'-row, Chesapeake, or in Paris the *Quai des Orfèvres*, near the Pont Neuf, or in Florence the *Ponte Vecchio*. Even to this moment there still hang on in the *Via del Pellegrino* a few goldsmiths who keep alive the traditions of the old days. Sig. Bertolotti has much to tell us of Caratosso, a Lombard goldsmith spoken of not only by Cellini but also by Vasari, and a great favourite of those three typical popes, Julius II., Leo X., and Clement VII.; while mention is also made of a hand of Lombard goldsmiths who worked in Spain in the sixteenth century. The chapter is closed by a curious account of the famous and symbolic *rosa aurea*, or golden rose, the sacred gift which the popes solemnly sent on the fourth Sunday in Lent, and then sent to the sovereigns who were their allies. From

\* Down to recent days the sculptor, John Gibson, almost boasted that he knew "nothing about painting."

originally a simple piece of goldsmith's work the symbol, it appears, grew with centuries into a costly work of art. Clement VII., it may be remembered, sent in 1524 one of these golden roses to Henry VIII.\*

Many details are given by Signor Bertolotti of the Lombard *intarsiatori* and *ebanisti*.—Lombardy, it appears, was early famous for its workers in braid wood,—*spadari*, sword-makers, cutlers, and armourers, in speaking of whom the author quotes a lengthy account of the manufacture by a Cremonese of a regular *mitralense*, ordered by Pius V. to fight against the Turks; further details are given of the Lombard typographers, booksellers, and binders. Of the Lombard embroiderers and weavers, Signor Bertolotti has much to tell us; the many churches and their wealth gave full employment to a large number of hands, notwithstanding that much of the work was of Spanish, French, and Flemish origin. The weaving and working of silk, it must be remembered, was introduced into Lombardy early in the fourteenth century; Sixtus V. having introduced it into Rome only in the sixteenth century with the weaving of wool.

In the seventeenth century we meet among the Lombard artists with Giovanna Fontana, and again with the Maderno family in connexion with numerous engineering works, while a long and curious notice is given to Longhi, members of a family famous as architects,—who occupied, it appears, in 1611 the house of Michelangelo. Many documents are given relating to the unfortunate Francesco Borromini who, it will be remembered, ended his life by his own hand. In this active seventeenth century the number of churches and palaces, the work of Lombard architects, is wonderful; though architecture is in full decadence, it is impossible to deny the talent of the artists. The Fontana, Maderno, Borromini, Longhi, and Pozzo were architects who hold a high place in history; had they but lived a century earlier they would have been really great; they serve alone, however, to show the decadence, by the exaggeration of the beautiful.

Among the Lombard painters Michelangelo da Caravaggio holds the first place in the seventeenth century, and a lengthy account is given of him, chiefly made up of very disconnected quotations from lawsuits and other legal documents, and mention is made among other artists, such as Francesco Mola, Scordinea, Parone, Stella, and Sacchi, of the sculptor Ercole Ferrata, whose very lengthy will is here printed *in extenso*. As in the previous century the goldsmiths continue the reputation of their predecessors, though scarcely in the same direction; the *Vin del Pellegrino* is still crowded with Lombards, and a long list of names is given by Sig. Bertolotti, as also of the armourers, embroiderers, and other artists who still kept alive the Lombard fame as skilled artisans.

In these three centuries in which we have seen them, the Lombard colony had grown wealthy, and possessed several corporations, numerous churches, and more than one hospital. As builders, masons, and architects' assistants, they had almost enjoyed a monopoly, and from their number more than one artist had worthily taken his place by the side of the great names which make the fifteenth and sixteenth centuries the golden age of Italian art; as artisans the Lombards had held high the reputation they for centuries had enjoyed.

Signor Bertolotti, with the patience of a Benedictine, has gathered a mass of information which cannot fail, in years to come, to constitute to the curious student a most interesting source of reference. The two volumes are supplied with what renders almost any book valuable,—an exemplary index. How many interesting names and facts could be rescued from oblivion, if some English author as industrious as Signor Bertolotti would bring to light from the archives of the great cathedrals and other buildings, some notice of the clerks of the works, master masons, and other assistants to the great architects,—those non-commissioned officers, the back-bone of the army of art, who have erected the glorious creations that exist in our country.

**Desks and School Furniture.**—The desks and other school furniture required at the Harpur Trust Schools for Girls, Bedford, and the Princess Helena College, Ealing, were supplied by Messrs. G. M. Hammer & Co., Strand.

\* The last golden rose was, if we are not mistaken, recently sent to a great personage in America.

CONTINENTAL GATHERINGS.

Those who visit Paris this autumn, and who may remember the gay French capital before the sad days of the war, will see again on its old site the Hôtel de Ville; if not the same characteristic Renaissance pile which, for 300 years, had been the witness of so many ecstasies, joyous and painful, in French history, a building professedly in the same style as the Italian Boccador's design, though larger and unmistakably modern. The exterior of the building is, as we have more than once announced in these pages, now completed, and a few days before the great July fête when the new building was inaugurated, the last scaffold-pole, with a tricolor flag attached to it, was removed amidst the cheers of the whole body of workmen. Once again the Parisians have their town-hall, and the destruction of their Hôtel de Ville is merely looked upon as "an interruption in its existence." The admirably representative nature of the banquet held on the occasion of the inauguration of the building shows how thoroughly the French municipality understands that their prosperity is closely knit up with the various sections of the community; in addition to the guests usual on such occasions, the prefect invited a member of each of the numerous trades which had assisted in the re-building of the Hôtel de Ville, a delegate from the trades-committees, a medical student from the hospitals, a member of the police force, a fireman, an *Invalide*, or, as we should say, a Chelsea pensioner, and a workhouse inmate. Somewhat different this from a London city banquet. As we have more than once reminded our readers, the Paris Hôtel de Ville is not yet completed, nor will it be for two years to come. The whole interior remains yet to be finished.

Although it has more than once been announced that the ruins of the Tuileries were to be removed, the final sanction of the French Chambers has only just been given. It is now decided that so sad a remembrance of the days of the Commune shall no longer remain in the heart of Paris. There is small ground for archaeological regret at this step. Very little remained of the palace which Pierre Lescaot built for Catherine de Medici, while in historic memories, familiar as is the name of the Tuileries, in its three centuries of existence, it perhaps owes its chief interest to its connection with the latter days of Louis XVI., and even more to the late Emperor Napoleon. At other times it has been singularly deserted by royalty. The little-known early connexion of the spot, when the tileries were still worked which gave the palace its name, with the patient efforts of the Protestant potter, Palissy, add, perhaps, as great an interest to the site as any that history has succeeded in weaving round the name of the palace that will soon be but a memory of the past.

A memory somewhat more distant in the story of the French capital has of late been revived. In digging the foundations of the new Post-office the men came upon a mass of remains of animals belonging to what geologically is known as the Quaternary period. M. Guadet, the architect, at once handed over these relics to the Natural History Museum, and they are found to have belonged to the horse (*Equus caballus*), the deer (*Cervus elphas*), and the mammoth (*Elephas primigenius*). Though of the utmost interest, the find is no novelty in Paris. Cuvier, the French Owen, discovered in Paris his famous mammoth; and elsewhere in the capital remains have from time to time been brought to light of the prehistoric times when marshes and forests covered the site of modern Paris. At the present moment it is curious to light upon the relics of so primitive a period.

Some time since reference was made in these pages to the Church of the Sacré Cœur being erected at Montmartre. The French Chamber have, it appears, prohibited the continuance of the works, which have now reached a very forward state. The matter, unfortunately is complicated with religious and political questions in a manner such as can be little understood in this country. The pecuniary situation of the so-called "Vœu National" is satisfactory in spite of the enormous expenses that have had to be met. Hard on ten millions of francs (400,000*l.*) have been so far devoted to the foundations alone. When the church was first projected the nature of the ground was unknown, and it was proposed that the building

should rest on a huge bed of concrete; no sooner, however, had the work commenced, than the soil, composed of sand, clay, and shells, was found to be entirely unsuited to support the weight of the proposed building. It was not till a depth of considerably over 150 ft. had been bored that solid rock was struck. Eighty-eight large pillars, some 10 ft. to 15 ft. square, were then built to serve as the foundation, the whole representing over 30,000 cubic yards of masonry. Hard upon three years were occupied in this work,—terminated in 1878; since then these pillars have been united by triple arches, and on this solid foundation the work progressed, the walls now having risen about 40 ft.; the total height, according to the original plan, was to have been about 230 ft. Now that the Government has prohibited the continuance of the works, it is not easy to see how the matter will be terminated; but the great difficulty as regards the foundations having been overcome, the building, of course, may be turned to any use that may be thought fitter than that on which the clerical party had determined. It has been illustrated in these pages.

On the meeting at Geneva of the Fourth International Congress of Hygiene, an exhibition, we hear, will be held in September next. All the various inventions and appliances relating to the important question of hygiene will be represented, and we may expect that a further advance may be made in the progress of a science, to the teachings of which in all its bearings too much attention cannot be paid.

Not long since, at Roncen, an interesting lecture was delivered by Dr. Napais on the "Hygiene of the Workshop." After reviewing in turn the very different and often dangerous surroundings in which the workman has so constantly to exist, the lecturer very properly drew attention to the fact that he has it in his power, apart from the protection that the laws and sanitary science give him, largely to reduce the dangers to which he is subject. Two most important features in the question the lecturer considered to be,—first, the supply of adequate industrial dwellings to supersede the too often unhealthy houses of the workman; and, secondly,—a point which can alone be hoped to be corrected by the spread of education,—the vice of excessive drinking, subtly robbing the workman not only of his power of saving, but of the very skill of hand on which his living and happiness depend.

An archaeological discovery of more than usual interest has recently been made in Poicon, near Sanxay, a Gallo-Roman halcyon station. The ruins, covering an area of over twelve acres, consist of the remains of a temple, a theatre, a number of baths, and accompanying hostleries; in fact, a classic watering-place, with the usual concomitants of pump-room, assembly-rooms, and hotels, as we should now say. The first discovery made was of an aqueduct, traced for over a mile to the ruins. Our informant, the *Journal des Débats*, states the temple to be one of the largest known,—meaning, we presume, in France. Adjoining the temple are the bath-houses, extending considerably over a length of 100 yards, and comprising the usual accommodation, hot-air-rooms, covered walks, gardens, and porticos. On the further bank of the river Vanne the remains of the theatre have been brought to light, hacked up, as is customary, by the hill. A large number of Roman and Gaulish coins have been found. It is presumed that the buildings belong to the period of the Antonines,—second century before the Christian era,—and that the station was destroyed during the invasion of the Visigoths in the fifth century. Conducted under the Curator of the Museum of the Société des Antiquaires de l'Ouest, M. de la Croix, we may expect that the excavations will yield much interesting information.

From a somewhat more distant Roman colony, the Dobrodjka, a recent archaeological commission, despatched by the Austrian Government, has been able to enrich the Bukarest Museum with a large number of most interesting relics. The delta formed by the Danube in the north-east of Bulgaria, though fertile in some parts, has never been thoroughly explored, in spite of the classic interest attached to the spot. To Tomos, the Kussendjé of to-day, it was that Ovid was exiled, it will be remembered, and here he wrote his "Tristia," and those object "Epylistes from Pontus," that show how severely the cultured poet suffered during his absence from Rome. The district,—a very unhealthy one,—is covered, it appears, with Roman re-

mains, which the Austrian commission to which we have referred has thoroughly explored.

Though archaeology has never found any opponents in the ranks of refinement, there are those who not unjustly deplore its sometimes exclusive influence. In the study of architecture, while a wide acquaintance with the work of the past is absolutely essential, too lengthy a devotion to its study, it is claimed by some, is injurious to the development of that cultivated originality which is the spirit of all art. Deplored not so much the prominence of the more technical archaeological studies in this year's architectural exhibition at the *Salon*, as the marked eccentricity of so many of the "original" designs, our contemporary *L'Art* has recently been expressing its views on the subject. "We certainly seem to understand the utilisation of the past in a somewhat curious manner. Almost better, perhaps, completely to forget it if such are the results obtained from its study; one would be tempted almost to exclaim, with a professor of the Ecole des Beaux Arts, in a lecture recently delivered by him, 'our enemy is archaeology.' So far, however, from this being the case, the evil lies in our ignorance of what our predecessors have done, and this deficiency is daily becoming more evident in the clumsy and unconscious use made of the forms of the past. Thus, in France, Greek is now fixed on as the style suited for law courts and such buildings, Roman for municipal buildings, Renaissance for our theatres, *hôtels-de-ville* and private houses, Gothic for our churches, and all without respect for principles, without the slightest regard to climate or the nature of the materials employed. It would seem to be time that the State, which has already shown a warm interest in the encouragement of the industrial arts, should recognise that their inferiority is in great part due to the insufficiency of the education given in architecture, the influence of which for good and for had has at all times been, and is, very considerable on all the productions of contemporary art. The supporters of the existing system are warm in its defence, and point to the numerous pupils, French and foreign, who crowd the benches of the Ecole, but the result obtained is the most important question. Do our modern houses and edifices generally supply our requirements? and are they not from almost every point of view,—excepting in rare cases,—inferior to those of the past? and do we profit as we should do by our study of the works of our predecessors? Scarcely. Perhaps it would be better to admit this than allow ourselves to be blinded by the facts." We are afraid that the strictures of the writer are only too well founded.

The publication known as the *Deutsches Künstler Jahrbuch* for the current year affords some interesting information respecting art matters in Germany. Such works, like our own "Year-book of Art" and the corresponding French "*L'Année Artistique*," are growing, as time passes on, most invaluable means of comparison and sources of reference. The German "Year-book" is indeed what its title indicates, a statistical handbook for art-matters generally. A review is given of the whole archaeological work of the year, the discoveries and purchases made, the buildings restored,—Um, Aix-la-Chapelle, and Strasburg cathedrals, most important items,—the list of the various academies, schools, societies, not alone of Germany, but of Austria and Switzerland. An interesting account is given of the Imperial German Archaeological Institute founded in Rome now over fifty years ago, and which has, as our readers well know, afforded through its admirable publications so many interesting acquisitions to our knowledge of classic art and existence. The Institute, in addition to its reports published in Italian and German, has no fewer than five annual hurrahs, each of the value of 150*l.* The "Year-book" further gives a complete and detailed list of the public collections of Germany, not alone those of Dresden, Munich, and the capital, but of the smallest towns. We learn that there exist nine superior technical art-schools at Aix-la-Chapelle, Berlin, Brunswick, Darmstadt, Dresden, Hanover, Karlsruhe, Munich, and Stuttgart, schools in which the pupils are instructed in the most complete manner as architects, engineers, chemists, &c. To the Academy of Fine Arts at Berlin a lengthy description is devoted; the educational establishment is composed of the *ateliers* (as in France), the Academy properly so-called, and the schools.

oak, may be cut to great advantage or the reverse. To cut a large balk of oak to advantage for ornamental uses, it is necessary to cut it so as to pass obliquely through the larger septa or silver grain, thereby producing the feathering or fine flowered appearance so well known in the oak and also in other valuable and fancy woods. Attempts are often made by grainers to rival the natural grain, but success is rare by painters or stainers, and the same may be said of paper-stainers, even when the natural wood is utilised as the pattern or model. In structure the oak has defined characteristics like the ash, elm, and chestnut, and these, through experience, are known to the workmen, who are in the habit of operating upon them with edged tools. The sections of a number of building timber trees show that the wood is composed of separate layers, circles or rings, surrounding the pith. These layers or rings are not, as a rule, regular in their thickness. With a good pair of eyes, or with the aid of a magnifier, a number of rays constituting fine divisions will be at once discovered, spreading from the pith or core to the bark, with pores between, in some cases empty and in other instances filled with a vegetable substance. The British oak and other foreign varieties exhibit very distinct annual rings, one side being porous and the other compact. The *Q. robur*, or common oak, is easier to work than the *Q. sessiliflora*, but in strength, elasticity, toughness, and hardness all combined, it is generally conceded that the *sessiliflora* is superior for ship-building, though heavier and more difficult to work than the common oak. It would lead us too far afield in the present article to enter into a statement as regards the relative durability of different woods used for building purposes, and the theory of staining as it affects oak and other bearing building timber as compared with iron or other materials. As regards crushing strength, tensile strength, working strain, and working load, and other tests applied, British oak shows good results when the wood is well selected. As regards crushing strength, it may be taken as an axiom that wet timber is not nearly so strong as dry, and that the square is the strongest form of rectangular pillar. It may also be accepted, as far as experiments have gone up to the present, that the limit of elasticity of timber is not accurately defined, the coefficient of elasticity depending on the dryness of the timber. Though oak or other timber railway bridges have shown short lives in America, it must be remembered they were hurriedly erected, and nearly always of green or unseasoned timber. In the British Islands, however, we have several instances of very long-lived oak timber bridges, of bridges which, by ordinary care or repairs, have stood a remarkably long time,—indeed, for centuries. Some of our best authorities conclude that the working load on piles depends more on the nature of the ground than upon the actual strength of the timber. As piles in foundations under masonry are buried deep in the ground, the latter, of course, supports an uncertain share of the weight of the superstructure, hence it is difficult to determine the exact distribution of the weight resting on piles and on the surrounding soil. Elm for piles under the water or for support in unstable foundations on land, has a good historic character to its credit for durability, but the majority of our old architects were in favour of oak, and used it plentifully for palings and framings in foundations for stone as well as timber bridges over rivers. In the treatises of Alberti, Palladio, Seramozzi, Serlio, and in other authors, in addition to those already mentioned in the course of our subject, interesting information will be found respecting the use of oak timber. We said that elm for piling purposes under the water or for wet situations, bears a good historical character, and we may add that the fact was instanced in the case of the piles of old London Bridge, many of which were elm, and after a lapse of 600 years the timber showed no material decay. When the qualities of toughness and elasticity are also considered, and when sudden and repeated shocks are to be sustained, undoubtedly the ash is superior to all other British timber, consequently it is useful in carriage and cartwork, machines, implements of husbandry, &c., but for building purposes it is not suitable, for it is too flexible and not durable enough. For general purposes, the British oak stands pre-eminent as a useful and ornamental timber.

As there are some other varieties of oak timber, some found in the British Islands and

others imported, and more or less used in connexion with building, a little information about the relative qualities of the principal kinds will not be out of place. The common British oak, when young, is very tough, and the wood often cross-grained, and rather difficult to work. The dry or well-seasoned wood is hard, and it requires the cutting-tools of the workman to be kept in good order to produce a satisfactory finish. The young wood does not joint well with glue, while seasoned woods of most kinds generally do, save those that contain an oily matter, like some strong-smelling, aromatic, or odorous woods,—for instance, rosewood. These last-named kinds require a good drying-out process, or an exposure before the fire before gluing their joints. The Durmast oak, which is to be found in the south of England, which is often used in building, is a native of France, but it is much less strong than the common British oak. There is a fox-coloured or brown oak, mostly to be found in Lincolnshire, which, though not as endurable as the common oak, yet it is a useful timber for sundry purposes in carpentering and building. Among the chief foreign varieties of useful oak timber trees are the Riga oak, the Dantzig, red American oak, white American oak, Adriatic oak, &c. The Austrian oak attains a much greater altitude than the British tree, but the wood is whiter, more soft, and less valuable. Among the American kinds, the chestnut-leaved oak is remarkable for its beauty of form and height. The wood is however, cross-grained, but very serviceable in special cases; for instance, the wheels of carriages, &c. The *Quercus obtusiloba*, or blunt-lobed iron oak, is valuable as a ship-timber. The *Quercus alba* is a great favourite in America. It is a white oak attaining an immense size in some of the States, and is suitable for both house and ship building, the wood being tough and flexible, and has good lasting qualities. In a word, it may be said that oak of the best quality is more lasting or durable than any other timber tree attaining a like size. There are several European, American, African, and East Indian oaks of the evergreen kind, some of them useful timber, but mostly known perhaps through their properties, resources, or extracts as articles in commerce, dyeing, medicinal, or other economical uses. The *Quercus suber* is an important tree being the cork oak of commerce. The bark of the younger trees is imported for tanning purposes, but the bark of our native oak has from time immemorial been used for similar purposes, as also the saw or wood dust of the tree. From the Kermes oak, or *Quercus coccifera*, was obtained the original famous crimson dye, or, rather, from the insect associated with this oak. Similarly to other insects in the British tree, in this oak lives the *Coccus ilicis*, or small scale-shaped insect, which, when immersed in vinegar and dried, produces the colouring matter from which scarlet dyes were usually obtained before the discovery of the Cochineal insect of Mexico, the *Coccus cacti*. It is curious to find the early use of scarlet in the offerings of the Tabernacle. Again, we have Plutarch quoting from Simonides a description of sail given by Ægeus dyed with the flower of the *prinos* or evergreen oak. Further, we have mention of the *coccus* in Theophrastus and Pliny. The oak, native and foreign, as a living tree, or as a building and ornamental wood, despite its hardness, is not more than other hard or softer woods, free from the attacks of wood-boring beetles and sea-worms. The termite or white ant is the most destructive on land, and the *Teredo navalis*, or marine worm, stands confessedly so in destructiveness to the timber in salt water, or that used in shipping, piling, and harbour works. Indeed, the *teredo* appears to have been known to Homer and Ovid, not to speak of other early authors. The gall-fly, or *cynips*, of various species, attack the oak, British and foreign. Many observers know those excrescences on the oak called galls. The insects or flies, in order to deposit their eggs, produce the puncture in the different parts of the tree. Each species forms a nidus peculiar to itself, varying in size from that of a pea to that of a nut, and sometimes larger. The shapes and colours vary and are variously disposed. Some are under the surface of the leaves, on the leaf-stalks, under the flower, on the smaller branches, bark, buds, and occasionally on the acorns. The imperforated, or those in which the worm has died, are the galls which are most esteemed. *En passant*, we may observe that, mixed with sulphate of iron in water,

they form ink, or brown and black dyes, according to the proportions used. The progress of chemical science within the last half-century has greatly limited the utilisation of plants for dyeing and for other manufacturing uses, and the British oak, as well as other native and foreign trees and plants, have been similarly affected.

The subjects of the seasoning, preservation, and dry-rot of timber would need a treatise to describe the details. As regards oak, the same advice holds good as that written of other building timber. There are numerous artificial solutions and processes, steaming, water seasoning, and crossoting, the latter applicable as a preservative under certain conditions of use. After all that can be said, the fact remains that, for general carpentry, joinery, and furniture purposes, the old natural process of atmospheric seasoning, of cutting it and keeping it in stock for a considerable time, well ventilated, is the best, wherever it can be done. Well-selected and well-seasoned oak or other building timber needs to be well placed, and a practical knowledge of building includes the regulations of its disposition and safety under the various conditions of its use.

In conclusion, we will now observe that the oak has a magnificent history in all its aspects, historical, artistic, and mechanical. In Classic architecture and sculpture, the oak leaf as a foliage was utilised as well as the acanthus, the olive, and the vine; and in our own British Decorated Gothic the oak-leaf stands prominently in the capitals along with the ivy, white-thorn, vine, and other native plants. The workmanship of the Gothic oak roofs, porches, rook-lofts, screens, pulpits, and other ecclesiastical oak fittings and furniture, told well for the skill of the British craftsmen, and the same may be written of the oak staircases, groings, and panellings in connexion with our old Domestic architecture. The design and execution of the carpentry, joinery, and furniture was a fit accompaniment to the masonic architectural marvels. Constructive carpentry of course originally led the way, but stone and timber, oak and oolite in Britain, for long centuries kept pace together. We will bring our theme to a close in the words of William Tighe, whose canto on the oak, as well as his other three cantos on the rose, vine, and palm, have never received the attention they merited. To a poetical faculty and a love of nature, Tighe added patient observation, practical knowledge, and statistical information in other directions. His notes to his cantos are, perhaps, more valuable than his muse, but of the oak he sings throughout enthusiastically and nobly,—

“ Long may  
The remnant, Britain, of thy forest scenes,  
Inspire the meditating bard, or fill  
The painter's eye with nature's bold design;  
Such as Salvator would have mark'd with iron  
And gaunt banditti, near the foaming lapse  
Of cataracts, that o'er the sombre rock  
Have cast the headless and speckled Oak,  
Or such as, after Hexham's bloody field,  
Received the flight of royal Margaret.

Not Lithuania nor the swampy wilds  
Of Transatlantic forests can supply  
The elastic fibre, and the stubborn limbs,  
Of British growth.”

Long live the oak, and may its fecundity, strength, and durability be typified in our trade, commerce, and national character.

THE SOCIAL SCIENCE CONGRESS.

The special questions in the Health Department to be discussed at the Nottingham Congress, September 20th—27th, are the following:—

1. How does the employment of mothers in mills and manufactures influence infant mortality; and ought any, and if so what, restrictions to be placed on such employment?
2. What reforms are desirable in the administration of hospitals?
3. What are the advantages of a system of notification of infectious diseases, and what are the best means of carrying the same into execution?

The following are arranged for the Art Department:—

1. On the new Royal College of Music.
2. In what way can the influence of art be best brought to bear on the masses of the population in large towns?
3. What are the proper limits of conservatism in regard to ancient buildings?

PROPOSED FURTHER EXCAVATIONS AT  
EPHESUS.

THE SITE OF THE TEMPLE OF DIANA.

AN influential, though rather thinly-attended meeting, was held in the Mansion House on Monday afternoon, by the permission and under the presidency of the Right Hon. the Lord Mayor (Sir J. Whitaker Ellis, bart.), to promote the resumption of the important excavations made by Mr. J. T. Wood, on the site of the Temple of Diana at Ephesus. Letters cordially approving of the object of the meeting, but regretting the inability of their writers to attend, were read from the Prince of Wales, the Duke of Connaught, the Duke of Albany, the Archbishop of Canterbury, Cardinal Manning, the Earl of Shaftesbury, the Bishop of Durham, the Dean of Westminster, the Rev. Canon Farrar, Sir F. Leighton, P.R.A., and other gentlemen. Mr. Beresford-Hope, M.P., Mr. Alderman M'Arthur, M.P., Professor C. T. Newton, of the British Museum, Professor T. Hayter Lewis, Professor Donaldson, Professor Roger Smith, Mr. Watkins Lloyd, and Mr. R. P. Pullan were amongst those present.

The Chairman, in opening the proceedings, said he had very great pleasure in allowing that meeting to be held in the Mansion House. The famous Temple of Diana at Ephesus, one of the seven wonders of the world, had been hidden from view for many centuries, and its exact site was unknown to the modern world until Mr. Wood, after six years of patient search, found the remains of the temple in the year 1869, more than 20 ft. below the present level of the ground. He understood that the trustees of the British Museum, who had previously supplied the means to explore some of the public buildings in the city of Ephesus, then authorised the exploration of the ruins of the temple, and five years were devoted to the work, with the aid of Government grants to the amount of 12,000*l.* In the year 1874 very important excavations at Babylon and Nineveh were being carried on by the English Government, and the Trustees of the British Museum resolved to suspend the work at Ephesus, as they thought it inexpedient at that time to apply to Government for a fresh grant for that purpose. Mr. Wood had from year to year applied for a grant to continue and complete the exploration of the site of the temple, but the times had been unfavourable for such enterprises, and there was little or no chance of Government aid being now rendered to the work. In the meantime, those portions of the site of the temple which remained unexplored were most likely to bring to light most valuable and interesting sculptures, which were cast by the fall of the temple beyond the limits of the present excavations. An influential committee, he was glad to say, under the patronage of H.R.H. the Duke of Albany, had now been formed, to resume the excavations by subscriptions, and Mr. Wood would explain to the meeting how he proposed to spend the funds which might be raised. Of the many interesting meetings which had been held in the Mansion House during his (the chairman's) year of office, there was none which was of greater interest than the one which he then had the honour to address. There had been, of course, meetings of greater public and social interest, but there was nothing more interesting than the pursuit of the history of the past as exemplified by architectural monuments. Just as Professor Owen was able to take a bone and describe from it the animal to whom it belonged, what the said animal lived on, and when he lived, so learned men were able, by the study of ancient remains, to make clear many obscure points in history. He therefore sincerely trusted that the movement to prosecute the explorations on the site of Ephesus would be attended with success.

Mr. A. J. B. Beresford-Hope, M.P., said he was glad to have the opportunity of supplementing by a few words the interesting remarks made by the Lord Mayor. Mr. Wood would tell the meeting what he had done, and would tell them what he meant to do, but he would not tell them of the infinite toil, labour, and heart-seeking energy and earnestness which he had thrown into the work. People who saw the beautiful sculptures from the Temple of Diana at Ephesus in the British Museum, all clean, neat, and white, would agree in saying what a delightful thing it was to have them, but the excavations which unearthed those treasures were not done in kid-

gloves. The reason why the fragments which had been found at Ephesus were so perfect was that for many centuries they had been buried beneath some 20 ft. of river mud,—beneath the bed of the Cayster. By following a clue given by an inscription which he chanced to light upon, Mr. Wood had succeeded in making a most ingenious series of discoveries, which would be found most graphically described by his friend Mr. Newton, of the British Museum, in his essay on the subject, first printed in the *Edinburgh Review*. Mr. Wood's excavations, it should be remembered, had to be done by men very difficult to control,—not by those respectable blackguard Christian drunkards the English navvies, but by lazy, unreliable, and treacherous Turks. But Mr. Wood had controlled them, and the results of his work were before the public. But it might be asked by some captious critic,—“If Mr. Wood's discoveries are what you say they have been, why does not the British Museum go on with the excavations on the site of the temple? Is not there a taint of suspicion in seeking to carry on by public benevolence a work abandoned by the British Museum?” As a trustee of the British Museum, he (the speaker) was able to say that that was not the case. At the present time ironclads and excavations would not lie down together. The lion ate up the lamb in this instance, and that a Government grant would be obtained for carrying on the excavations at Ephesus was, he believed, beyond hope. The British Museum, out of its slender grant for such purposes, had large demands made upon it at the present time for explorations at Nineveh, Carchemish, and other historic sites upon which great discoveries had been made, and where it was believed we were on the threshold of still further discoveries. He sincerely trusted that Mr. Wood would be enabled to pursue his explorations, because the Temple of Diana at Ephesus was not a mere duplicate of the Temple of Minerva at Athens, and still less so of the temples at Paestum and Agrigento, but it possessed features which stamped it as being the type of another and a different school of architecture, all the details of which could no more be mastered by the study of other known temples than the plan of a Norman cathedral could be taken as a safe guide to that of a Decorated building. Mr. Wood would tell the meeting of his great discoveries, and he would be followed by Professor Newton, great master as he was of archaeology, who had also been at Ephesus, and had seen Mr. Wood at work.

Mr. J. T. Wood next addressed the meeting. He said his task was a very easy one, for he had to speak in a very good cause, which only required a plain unvarnished statement to be made to convince his hearers that it was well worth while to continue the excavations at Ephesus on the site of the temple. As there were probably some present who might not be able to call to mind exactly how the temple was found, he would, with the aid of the map exhibited, explain that point. He found, in reading ancient authors for information as to the position of the site of the temple in relation to the city of Ephesus, that they did not afford him any information, but directly contradicted each other. When, therefore, in 1863, he began his search for the temple, he had no idea on which side of the city to look for it, but he made experimental excavations on all sides, particularly towards the north-west, in which direction, in the opinion of eminent scholars, the remains of the temple would be found, but he met with no success there. After digging for more than a year with his own slender means, the trustees of the British Museum advanced him a small sum to continue the work. Without going into all the details of his subsequent operations, he might say that he explored the great theatre or Odeon, and in the course of the work he came upon the wall against which St. Paul must have rubbed his shoulder in trying to enter the theatre. He also came upon an inscription, which turned out to be a very opportune discovery, inasmuch as it confirmed him in the opinion he had arrived at as to the direction in which to look for the temple. The inscription, which was a very long one, was now in the British Museum, accessible to those learned in such matters, although not yet open, as it some day would be, to the public view. It described a certain number of golden images which were voted to Artemis, by order of one Salutaris, in the time of Trajan, in the year 104. These images, thirty of which were described in the inscrip-

tion,—there might have been more, for the inscription was imperfect,—were ordered to be taken from the temple on certain days and brought through the city, entering the latter by the Magnesian Gate, and returning through the Coressian Gate, so making the whole circuit of the city. On finding that inscription he saw that he must discover those two gates before he could make much progress in his search for the temple, and he set to work and found the gates. He found that the road leading through the Magnesian Gate gave him the best clue, as the road was paved with marble, with four distinct ruts which had been cut into it by the wheels of chariots. The road through the Coressian Gate, not promising much, was abandoned. Having written to the trustees of the British Museum reporting the clues he had obtained, those gentlemen saw that he had very good prospects of success if he continued his explorations, and they, therefore, advanced him sufficient money to proceed with the work until he came to a still wider road, following which for some distance he came, upon the angle of the peribolus wall,—a boundary defining the limits of the sacred precinct of the temple. In the wall he found an inscription stating that it was built by Augustus. He now knew that he could not be far from the remains of the temple itself. The destruction of the temple was achieved by the Goths about the year 262 of our era. It was known that the Christians did their best to destroy every vestige of it, and, therefore, instead of being able to trace the positions of the whole of the fallen columns, he could only trace the positions of four of them.\* The Christians broke up the columns and made lime of them, in their endeavours to build a church on the site. Besides the remains of the columns mentioned, he had found a portion of the wall of the cella, and a piece of the lowermost step. When he came to excavate the area at the foot of the steps, he found very little remaining, and, unfortunately, at that time (1873-4) the trustees of the British Museum stopped their grants in aid of the continuance of the excavations. The thirty-six sculptured columns, of which remains had been found, were placed eighteen at each end of the building. The sculptured columns mentioned by Pliny were described as being sculptured upon their lower part with figures in full-life size. In the course of his explorations he had succeeded in finding the remains of five sculptured drums. In all probability the columns were not sculptured to a very great height, each column illustrating three separate subjects, and if there were a separate subject represented on each drum, there were originally about 108 of these beautiful sculptured drums. There was not the least doubt in his mind that if the excavations were continued more of these beautiful remains would be found. But, as he need hardly say, the most beautiful of the sculptures which adorned Greek temples were generally found in the frieze and in the tympanum in each pediment of the temple. In the course of his diggings he had come upon two stones which he believed to have been part of the frieze of the temple. Objection had been taken to his view of the matter on the ground that if they ever did form part of the frieze, the frieze must have been considerably higher than was ordinarily the case in Greek temples. But it should be remembered that the Temple of Diana at Ephesus was unique among Greek temples. He thought he was warranted in assuming that further excavations would reveal further remains by the fact that in one small trench which he had opened a considerable distance beyond the general line of excavations, he had found the topmost stone of the cornice, with a stone belonging to the cymatium overlying it. The probabilities were great that a great deal of the remains of the temple remained undiscovered owing to the fact that the topmost stones of the temple would be projected to a greater distance from the steps than the fringe of 30 ft. at present excavated beyond the line of steps. He had carefully estimated the cost of the proposed further work of excavation, and a sum of from 4,500*l.* to 5,000*l.* would be required. If, as he firmly believed, further excavation led to

\* In vol. xxx. of the *Builder* (1872), p. 106, we published a plan of the temple, together with a view of the remains of one of the columns, 6 ft. 1 in. in diameter, discovered by Mr. Wood in 1871. In the same volume (p. 726) we published a view of a portion of one of the drums of a sculptured column (Pliny stated that the Temple had 127 columns, of which were, he says, *colossæ*, i.e., sculptured in relief, one being by Scopas).

further important discoveries, the money would be well expended. Personally he was willing to make any sacrifice in the matter that the committee were likely to expect of him.

Professor C. T. Newton, Keeper of the Greek and Roman Antiquities in the British Museum, said he had been desired to move the following resolution:—

"That the complete excavation of the Temple of Diana at Ephesus is an object well worthy of support from the nation, which now possesses, in the British Museum, the only portions of the beautiful sculptures as yet discovered of the temple, and that a subscription list be at once opened for the purpose."

He wished to say a few words on the probable chances of further discoveries at Ephesus, and what he had to say was from his own personal knowledge of the site where Mr. Wood had dug for so many years, and which he (the speaker) visited year after year, watching the progress of the work being carried on under Mr. Wood's direction. He had enjoyed the further advantage of having had under his charge in the British Museum those precious remains of sculpture, architecture, and inscriptions which were the fruit of Mr. Wood's long and laborious enterprise. In the course of the years that he had had these remains under his care, he had had the advantage of hearing the remarks which had been made upon them by the most learned archaeologists, not only of this, but of all European countries, and he had learned a great deal more about them than was at first apparent on their discovery. He was convinced that the more those remains were studied, the more they would be found to contribute important evidence as to the history of Greek sculpture, and also to that great body of documents, Greek inscriptions. The practical question which the meeting had before it, and as to which the British public had a right to call for some sort of evidence, was, What is the chance of finding more interesting marbles in this great mass of soil, averaging 20 ft. in depth, and already excavated for some distance on each side of the site of the temple? Mr. Wood, in concluding his remarks, had stated a very important fact, viz., that he had found a portion of the cornice at a point almost on the extreme margin of the site. Now all Greek temples, so far as he had ever seen or heard, when they fell down, owing to earthquake or other causes, fell outwards, and the consequence was that the superincumbent mass of stone forming the architrave, frieze, and cornice was projected to a considerable distance. A sufficient area all round the site of the temple had not, he thought, been explored, and it would be a great pity, after the vast excavation had been made in the centre of the site, to be unable, owing to want of funds, to continue the exploration for some distance further round the excavation. Such further excavation was, he thought, calculated to lead to further important discoveries. He spoke from experience on the point, for when he explored the site of the Mausoleum at Halicarnassus he found very little indeed on the actual site of the monument. After the site had been ransacked he was advised to abandon further labours, but he went on working away from the centre, and was before very long rewarded by the discovery of the fragments of the colossal horse now in the British Museum. The presumption, therefore, was that continued excavations would lead to further important discoveries, for although it was no doubt true that the Christians broke up the remains of the temples with sledge-hammers, and burst the pieces to make lime, there was no doubt that a great many large and important fragments escaped the general destruction. Just at the time when Mr. Wood had announced the discovery of a Doric portico close to the temple, he (Mr. Newton), like one of the three Fates, had to cut short the excavations by telling Mr. Wood that there was no more money available for the work. That Doric portico ought certainly to be explored. Again, within the peribolus or sacred precinct there were many accessories to the temple, all of which were of great interest. Within the sacred precinct of the Temple of Diana at Ephesus there stood, we know, a temple dedicated to Augustus (the Augustæon), of which Mr. Wood had found a portion in the shape of a beautiful pavement. On the site of this building they might expect to find statues of Roman emperors. Mr. Wood had not properly explored the site of this building, probably because he (Mr. Newton), when he was there, said "Don't let us waste any portion

of our slender funds in exploring this Roman building." But the remains of this building and of the Doric portico ought certainly to be thoroughly explored. Indeed, it would be a national reproach if we did not thoroughly explore the whole site of the sacred precinct of the temple. Possibly a thorough exploration would lead to the discovery of tablets or slabs similar in character to those found by the French at Delos, containing lists of the treasures of the temple. The great temples of antiquity were banks in which people deposited their wealth, and from which other people received loans on giving proper security. Of all these banks of antiquity, the one which had the highest reputation in the ancient world was the Temple of Diana at Ephesus, which was to the ancients what the Bank of England is to us, viz., the one place where, if a man deposited his money, he is sure to get it back. There was, therefore, great interest attaching to the search for the archives of this great banking establishment of the ancient world. There was great reason for supposing that such tablets as he had spoken of were set up somewhere in the precincts of the temple. The great crop of inscriptions which Mr. Wood gathered at Ephesus was as yet very imperfectly appreciated, because it had taken years and years to put together the fragments which he had collected, and it was only within the last month that a letter from the Emperor Antoninus Pius had been considerably improved. Mr. Hicks, who was associated with him (Mr. Newton) in the publication of the Greek inscriptions of the British Museum, was now engaged upon Ephesus, and when the work appeared it would be seen that if Mr. Wood had done nothing more than to discover the inscription already mentioned, the outlay which had been incurred had been well bestowed. The outlay, amounting to about 12,000*l.* in all, was most insignificant for a country like England, particularly when it was remembered that the whole of that sum was not voted by Parliament, but that a considerable portion of it came out of the sum allotted to the British Museum for the purchase of works. So important did he (Mr. Newton) consider Mr. Wood's work at Ephesus, that he was content to sacrifice his grant for a few years in order to provide a portion of the necessary funds. But the whole sum of 12,000*l.* was nothing compared with what the Germans had spent at Olympia, and what had already been achieved at Ephesus was due not to any national effort, but was the result of the energy and enthusiasm of one man. He cordially moved the resolution the terms of which he had read.

Professor Donaldson said he had very great pleasure indeed in seconding the proposition. In years gone by he had travelled all over Asia Minor, and could fully bear out what had been said as to the possibilities of further discoveries being made. He had no doubt that if Mr. Wood returned to continue his excavations some very interesting fragments of the temple would be brought to light.

Mr. R. P. Pullan supported the motion, and said that, as a fellow-excavator and explorer, he felt bound to testify to Mr. Wood's wonderful perseverance. He saw him at Ephesus when he was digging in the Odeon, when he had found the Magnesian Gate, and again when he had found the corner of the peribolus wall. The discovery of the remains of the temple was a great triumph for Mr. Wood, for a more unpromising site for the excavator could hardly be conceived.

Professor T. Roger Smith said he was happy to be allowed the opportunity of supporting the motion. Nothing in the present day was more remarkable than the way in which the records and monuments of the past were being brought to light. We had seen Olympia explored; we had witnessed the grand discoveries that Mr. Newton had made (and which had been so briefly alluded to) at Halicarnassus; and then we had had the extremely interesting discoveries of Dr. Schliemann; but he thought that, of all the discoveries of recent years, there was none of which we might be more justly proud than the discovery of the Temple of Diana at Ephesus. He sincerely trusted that the movement would have a successful result, and that the necessary sum of money would be raised to enable Mr. Wood to carry on and complete his investigations, which there was every reason to believe would be crowned by important discoveries.

The resolution was carried unanimously.

Mr. Alderman M'Artbur, M.P., moved, and Professor T. Hayter Lewis (hon. sec. to the fund) seconded, a vote of thanks to the Lord Mayor for presiding, and for allowing the meeting to be held in the Mansion House, and the meeting terminated.

#### THE WORCESTERSHIRE EXHIBITION.

UNDER the presidency of the Earl Beauchamp, Lord Lieutenant of the County and City of Worcester, and supported by a distinguished list of vice-presidents, an exhibition was opened at Worcester on Tuesday, the 18th inst., in the large building originally built for the Worcester Engine Works Company, at a cost of nearly 100,000*l.*, close to Shrub Hill Railway Station, on the Great Western and Midland Railways. In 1872, the property was acquired by the West Central Wagon Company, Limited, who carried on the business until 1875. Since that time the building has not been used. The conversion of the building from a huge deserted factory into an exhibition building has been the work of some months. In February, Messrs. H. Rowe & Son, architects, were instructed to prepare specifications of the repairs; and tenders were speedily obtained. That of Messrs. Binnian & Son, of Kidderminster, for 955*l.*, was accepted. Additional tenders of Messrs. Binnian have since been accepted for the creation of orchestra, lavatories, and other adjuncts. An ornamental iron verandah for the entrance to the building was supplied by Messrs. Hardy & Padmore. The entire cost of adapting the building may be set down at about 2,000*l.* Rarely have so many important objects been brought together for the purpose of a county exhibition, and it is not too much to say that the show will well repay a long journey on the part of the visitor. The sections are—1, Fine Arts, under the chairmanship of the Very Rev. the Dean of Worcester, Lord Alwyne Compton, with a sub-division of art needlework, presided over by Lady Alwyne Compton; 2, Industrial, under the chairmanship of Mr. Henry Willis; and 3, Historical, under Rev. Canon Butler. The important towns of Dudley, Evesham, Kidderminster, and Stourbridge, contribute local committees towards the management, and nothing seems to have been omitted, on the part of those who have promoted the affair, that could be material to its success. The honorary secretaries have indeed worked indefatigably since the inception of the undertaking, and the city may be congratulated upon having had the services of two so able men as Mr. R. W. Bims and Mr. C. M. Downes. In the Fine Arts section, there are three galleries containing bronzes, and marble and plaster groups. Among them we notice the "Caractacus" of J. H. Foley; Marochetti's marble bust of the late Lord Hampton; Boehm's "Leonora"; Canova's bust of Napoleon I. Almost in the centre of the nave is T. Brock's bronze group entitled "A Moment of Peril," lent by the Council of the Royal Academy, by whom it was purchased for the nation under the terms of the Chantry bequest. The sculptor is a native of the city. The South Kensington Museum has, with generous liberality, lent eight cases filled with a large number of choice specimens of art, each one being described with date of origin, style, and value. The objects consist of Indian armour, such as shields, daggers, sheaths, maces, sabres, and knives, Indian silver work, jewelry, and jade, among which are boxes, sprinklers, vases, and some handsome dress weapons; Japanese lacquer-work of great antiquity and elaborate design; Oriental pottery of various forms, all beautiful and many remarkable for originality of shape and colouring; Italian bronzes, chiefly ewers, statuettes, and sandsticks, many of an early period; some wonderful pieces of early hammered ironwork; and electrotype reproductions of royal, collegiate, and corporation plate. Mr. F. Elkington lends two cases, one of magnificent Chinese enamelling on metal, early *cloisonné*; the other of Japanese enamelling of the same kind. One of these latter specimens is a vase of the finest antique *cloisonné* executed at the period when the metal wire tracery was very minute in detail, and the art of the enameller had reached its highest point of perfection. Lord Beauchamp's Sèvres china (Case 16), some showing the handwork of Castel, Pfeiffer, and Prevost, others of turquoise blue and Bleu-de-Roi; his Limoges enamels (Case 17), and the copiously illustrated series of enamel plaques, old Worcester porcelains, blue and white porcelains, and

Battersea enamels, easily and justly claim a very high degree of praise, and speak volumes for the taste of their possessors and for the liberality with which they have contributed their treasures towards the exhibition which their county or their country has inaugurated. The transfer printed porcelain of Worcester, in black or colours, made at first at Battersea by Alderman Jansen, and Worcester enamel painting, 1751-83, are represented by many valuable and typical examples of pottery. Among the miscellaneous art-pieces in this section we may refer more especially to Captain Castle's collection of choice blue and white porcelain; Mr. M. Tomkinson's Japanese ivory carvings, and Mr. Dyer Longstaffe's ivory diptychs. Of the latter, one is attributed to the date of about A. D. 1200. The subject is the Crucifixion with the Tau-cross. It may be compared with a sculpture in the College at Durham. A stole in the same case (No. 25), and attributed to the remote period already mentioned, should have properly been placed in the art-needlework court. To this section the Venicco and Murano-Venetian Glass Company contribute some clever and beautiful glass.

Around the sides of the fine-arts galleries a very important collection of ancient and modern paintings in oil colours has been grouped in a most instructive manner by Mr. Pollen, of the South Kensington Museum. Gallery No. 1 is devoted to the old masters and deceased British painters. Among them may be specified Lely's portrait of Blow, the music composer,—a figure painted on copper by Angelica Kauffman. A goodly series of masters' and artists' names testify to the extreme desire which the exhibitors have universally manifested of freely lending the most valuable of their art-treasures towards the enhancement of this portion of the exhibition. Passing rapidly in review these paintings, we have only to notice the portraits of William, Lord Craven, and of Lord Stafford, by Vandeyck, a portrait by Hogarth, works of Ary Scheffer, Sir J. Reynolds, Landseer, Etty, Sir Geo. Hayter, Grouze, Lely, Rubens, Gainsborough, Rembrandt, Ghirlandajo, Van Eyck, Holbein, and Quintin Matsys, to show how representative the exhibition is, and over how wide a field of art the examples range. Of the modern school exhibited in the Gallery No. 3 the works of Mr. B. W. Leader, a Worcestershire artist, claim especially the attention of the visitor for the clear transparency and sense of air and light which they possess. In this gallery also are many from the brushes of Messrs. G. F. Watts, T. S. Cooper, Professor Richmond, Val-Prinsep, T. E. Dicksee, Ansdell, Holl, and other members of the Royal Academy. In Gallery No. 4 are specimens of Rubens, Teniers, Ruyssdael, Wouverman, Rembrandt, and Gerard Dow; Ang. Kauffman's portrait of herself; Teniers, Gainsborough, Guercino's Samson giving the honeycomb to his parents; Morland's portraits of the Gunnings, Elizabeth as the ironer, and Maria the starcher; Paul Veronese's "Adoration of the Magi"; and a large number of fine and well-known paintings. The total number reaches to nearly 500. The water-colours are also numerous, among the artists being D. G. Rossetti, R. Doyle, Copley Fielding, Birket Foster, and J. M. W. Turner. Several charcoal drawings by D. Cox are interspersed with these. The portrait of the late Lord Beaconsfield, by Millais, in the possession of Mr. W. H. Smith, M.P., will attract considerable attention when it is exhibited in this section. The final sittings for the portrait had not been given when the illustrious statesman was seized with his fatal illness in the spring of last year. It will not be placed in the Worcester Exhibition until the last week of August. The total number of objects coming under this division of the fine-arts section is 720.

Art-needlework occupies a prominent position in the exhibition. It consists of 245 numbers gathered together and arranged in an instructive display by Lady Alwyn Compton, assisted by Mrs. G. E. Martin, Lady Catherine Berkeley, Mrs. Goldingham, Lady Georgina Vernon, and other members of the special sub-committee. The rich stores of this favourite Medieval employment which are still extant throughout the country have been considerably drawn upon to furnish this remarkable, and, indeed, unique branch of the exhibition, and those individuals and bodies who have the privilege of possessing typical specimens of the needle's art have contributed them with great generosity on this occasion. Out of the great number of entries in the catalogue, we can only find space here to

draw attention to a few examples. A cope, two dalmatics, and a chasuble (Nos. 49-53), all of the fifteenth century, and of extraordinary beauty and execution, appear to be of the best period of Flemish art. The subjects are derived from the life of our Lord. This comes from St. Mary's College, Oscott. A chasuble of old flowered stuff (No. 94) is attributed to the fourteenth century; on the orphreys is depicted in silken stitches the history of St. Joachim and St. Anna, the parents of the Blessed Virgin. Nos. 95, 96, are two other chasubles of the same century, the one bears Gothic flowers and fleurs-de-lis, embroidered on satin; the other is composed of cloth of gold and crimson, with orphreys of red velvet enriched with small figures under fine Gothic canopies. The examples attributed to Rhodian (No. 125), Cretan (Nos. 120, 126), and Bulgarian (No. 127) needleworkers are interesting for comparison with the productions of better-known schools. Lord Arundel of Wardour sends the "Westminster Vestment," a chasuble of Flemish work, dated 1468-1509; and the Principal of Stonyhurst College sends, among other early vestments, a chasuble made up of old orphreys of two periods, the middle and end of the fifteenth century. In the front is a representation of the tragic death of St. Thomas of Canterbury, under a canopy formed of one bay of Canterbury Cathedral. The side-strips of the back are of the same style of work, and were probably made by or for the monks of Canterbury as they represent events in the lives of SS. Thomas, Dunstan, Alphege, and Odo, saints especially venerated at that place. The modern specimens of needlework are all beautiful and artistic. As one looks at them the hope arises that this art, now too frequently despised or neglected by English ladies, may hereafter become as popular among them as it was in the sixteenth and seventeenth centuries. The needle-worked miniature portraits of royal and historical personages of the seventeenth century are valuable, not so much for the fidelity of their portraiture, as that they indicate very clearly the popularity of the art as an educational accomplishment at that period. For the same reason, great interest attaches to the lace canopy said to have been worked by the ill-fated Queen Anne Boleyn and her ladies for the christening of the Princess Elizabeth (No. 156), and the christening robe and mantle said to have been worn by that princess, which have been preserved in the Lawson family, descended from Queen Katherine Parr; these are exhibited by Mrs. Dent, of Sudeley Castle. Samplers and objects of infant attire or domestic employment abound in this division of the attractive and prominent exhibition.

The Historical Section, in the centre of the First Court, is surrounded by the Fine Art Section which has just been noticed. It consists of a very copious and representative collection of portraits of Worcestershire worthies and historical personages connected with the county. The portraits include members of the Royal family and nobility, bishops and ecclesiastical dignitaries, officers of state, statesmen, divines (orthodox and unorthodox), historians, and artists. There are three portraits of Richard Baxter, the great Puritan of Kidderminster, whose effigy in marble by Brock, the Worcester sculptor, has been lately erected in that town. The archaeological objects connected with this section are, *inter alia*, charters, books (both manuscript and printed), coins, tokens of Worcestershire tradesmen, standard weights and measures, casts of Worcestershire seals, antiquities found in excavations recently made in the county, armor, views, and miscellaneous prehistoric, ancient, and Medieval relics, illustrating the past condition of the shire and its borders. Among all this great collection of materials, out of which, as the Rev. Canon W. Butler eloquently remarked at the Guildhall dinner given by the Mayor of Worcester in recognition of the press view, a new history of Worcestershire might well be written, we have room to mention but very few special points. Mr. W. de Gray Birch, F.S.A., has arranged five cases of charters and a special series of manuscripts, including *fac-similes* of Anglo-Saxon charters, formerly belonging to the archives of Worcester Cathedral, and relating to the ancient landed property of the see; some early paleographical and historical pieces selected from the library of the Dean and Chapter; a selection of the most ancient and important charters and Royal privileges bestowed by English sovereigns on the corporation of the city; the borough charters of

Bewdley and Evesham; and an extensive series of documents belonging to the corporation of Droitwich, many of which throw a new light upon the history of the salt-making industry of that ancient site. In succeeding cases may be observed, among a vast number of valuable objects that cannot be here enumerated, a series of Royal autographs; another of early block-books and rare printed books, belonging to the Rev. F. Hopkinson and others; some choice books and illuminated MSS., belonging to the President (Lord Beauchamp) and others; a large assortment of Worcestershire geological and palaeontological specimens; a selection of works of local interest exhibited by the Worcester Public Library Committee; R. Baxter's great work entitled "Saints' Everlasting Rest," with his autograph dedication to the high bailiff and burgesses of Kidderminster, in whose possession it still remains; British, Roman, Saxon, Danish, and Medieval weapons, ornaments, and pottery, from various excavations and local finds; and, finally, in Court No. 2 is an arrangement, by Mr. J. S. Haywood, of old English furniture to illustrate a rush-strew room in a Worcestershire house of the eighteenth century. In this the carved oak chairs, the Worcester china tea-set, the spinning-wheel, the wooden grenchers, and the pewter plates and dishes, tinder-boxes and mirrors, stands of flint-lock guns, leather hottles, *et hoc genus omne*, vividly recall to the spectator a similitude of what must have formed the every-day common-place of our ancestors' lives. The industrial section, we fear, cannot be described on this occasion. We can only say the show of glove making by machinery, the shoe of wool-combing, carpet-making, horn-turning, needle-polishing, and other machinery, the potter's wheel and the Parian china moulder's bench, the carriages, food products, paper, salt, iron, tinned and japanned ware, and, above all, for beauty, the modern Worcestershire pottery and glass will well repay a lengthy visit to the faithful city which is now *en fête* for the auspicious event which has already achieved a moral, and we trust will achieve a practical and financial, success. When the fortunate owners of so many rare and valuable objects of art, and the manufacturers of the staple productions of a shire which may be favourably contrasted with any in England, so cordially unite in their respective contributions to so practical an end as a county exhibition, it is not likely that intelligent visitors,—those seeking technical instruction in the arts,—and even holiday-makers, will be wanting to throng around its courts. If the authorities, who undertake the management of the exhibition, act upon a happy suggestion made at the opening ceremony by the president, and organise a series of lectures in connexion with the exhibits, this rich collection of works of art and industrial products may be turned to more immediate and direct uses, and thereby not merely the amusement of the rich, but the education of the artisan will be advanced, and the contributors will reap the satisfaction of having "helped to place within the reach of the artisan and mechanic a fine collection of art-treasures which gives them an admirable opportunity of studying the practical application of the principle of beauty of design." These are the sentiments upon which hinge the life and success of the exhibition.

#### THE RUSSIAN CHURCH, DRESDEN.

FOLLOWING up the accounts we have recently given of the growth and progress of Russian house-building, we publish in our present number an illustration of a characteristic specimen of Russian church architecture. Its architect, Harald Julius von Bosse, of St. Petersburg, has strictly followed the traditions of that style, and on that account alone the church forms a conspicuous landmark among the architectural monuments of Dresden. But it possesses also other features, not the least of which is the close adhesion to the rules of old Russian church building. The architect was assisted in his work by Herr Karl Weissbach and Herr Ernst Becher. The frescoes are by Mr. James Marshall. Room is provided in the church for 300 worshippers. The cost of the building, close upon 25,000*l.*, was defrayed by voluntary contributions, chief among whom was that from Herr Simon von Wikulin, Russian State councillor, a resident of Dresden, over 21,000*l.* The site was given by another Russian, of German extraction, Herr Alexander Wollner. The church was opened a few years ago.

THE BUILDER, JULY 29, 1882.

THE RUSSIAN CHURCH, DRESDEN.—HERE HARALD JORDUS VON BOESE, ST. PETERSBURG, ARCHITECT.

THE BUILDER, JULY 29, 1882.

PROPOSED CHURCH OF ST. SAVIOUR, WOOLCOT PARK—MR. JOHN BEVAN, ARCHITECT.

Whitman & Co., Photo engravers, 25, Abchurch Lane.

THE EVANGELICAL PROTESTANT DEACONESSES' INSTITUTION AND TRAINING HOSPITAL, TOTTENHAM.

We give illustrations of the design selected in the recent competition for the above proposed building submitted by Mr. E. C. Robins, F.S.A., being a perspective view of the principal front towards Tottenham-green, and plans of ground and first floor.

The line of frontage is nearly the same as that of the old building, which is to be removed, leaving only the more modern men and women's wards, which will be incorporated with the new structure.

A quadrangular arrangement has been adopted. The administrative block is that shown in the view given towards the west; at the northern end of which is the director's house, and at the southern end the out-patients' block of single-story buildings. The hospital block faces the east, and the fine garden grounds in the rear, and is connected with the front block by the assembly-room in the northern side of the quadrangle, and by the kitchen block on the southern side.

There are five entrances from the public road, viz., the entrance to the director's house, the principal entrances in the centre of the administrative block with *porte cochère*, the accident ward, the out-patients', and the carriage entrance to the rear of the hospital block beyond the old wards.

The administrative, or western block, is three stories in height (except where a basement occurs at the southern end), in the centre of which is the principal entrance; on the left is the porter's room and the apartments of the resident surgeon; on the right is the reception-room, the lady superintendent's room, and the dispensary.

On the eastern side of the corridor are the chief staircase, the board-room, the linen and bread store-rooms, lavatory, and w.c.

The rooms over, on the first floor, are the separation ward, the workroom, the sisters' sitting-room, the lady superintendent's room, and store-room adjoining, all overlooking the green.

The sisters' separate bedrooms for thirty sisters, with bath-room and w.c., occupy the second floor.

The usual accommodation is given to the director's house.

The out-patients have a large waiting-room, to be entered by the accident-ward entrance or round the south-west corner next the old wards. Conveniences for both sexes are provided. The semicircular room at one end is the consulting-room with two doors. There are entrance and exit doors from the waiting-room to the wide corridor, between it and the accident ward (lighted by skylights), whence patients can leave by the accident entrance or pass on to the dispensary double-hatch, returning round railing provided, and then out either by the way they came or by the accident entrance. These out-patients will not enter the building beyond the dispensary lobby, on the other side of the closed end of which is the sisters' dispensary hatch. An out-patients' ticket-office is provided.

Accident cases, on stretchers or otherwise, enter by the wide doorway, and can be taken at once through the corridor into the men's wards, or by the lift fitted up in the old hospital lobby to the women's ward, first-floor.

The present staircase here is to be removed, and the new staircase at the south end of the western corridor to be used instead, access being arranged therefrom to both the old and new buildings. A food-lift is also provided, and ward kitchens, one over the other, where shown.

Alongside the accident entrance are the steps to the basement, in which are the various store-rooms, heating and steam pumping apparatus from the deep well, &c.

The southern block contains the servants' hall, and kitchen, scullery, and other domestic offices. A special coal-cellar is provided for the kitchen use, and a food-lift for patients in the hospital block, balanced by a coal-lift adjoining.

A sisters' serving-lobby communicates by a hatch with the kitchen, in easy communication with the sisters' dining-room, which is in the centre of the ground-floor of the hospital block, overlooking the grounds, which contain some fine old trees. Over the kitchen offices are the ten probationers' dormitory and bath-room, on the first floor, and the servants' dormitories, &c., on the second floor.

The hospital block, on the eastern side of the quadrangle, is two stories high, and contains four large sick-wards, for twelve beds in each, allowing 1,200 cubic feet to each bed, with the usual overlooking nurses' room and ward scullery to each. Those on the ground-floor are children's wards. It will be observed that the axis of the wards is nearly north and south, but that, to obtain the cross-ventilation by windows (which is so necessary occasionally to resort to, and which no other ventilation can entirely supersede, though it must not be exclusively depended on), they are set at an angle parallel with the old wards, as shown.

The bath-rooms, lavatories, water-closet, and slop-closets are situated at the angles of the wards, and are not only cross-ventilated, but the lobby has inlets and outlets for warmed air, raising the temperature above that of the ward, so that the tendency shall be to withdraw the air from the ward, and not the reverse, as is far too common.

Open fire-stoves, with fresh warmed air passing vertically through them, are in every ward, which is also heated by the waste steam from the steam-pump boiler after it has served the kitchen for cooking purposes. On either side of the sisters' dining-room are the patients' visitors' and sisters' visitors' waiting-rooms, clerk's office, medical and hospital stores, &c. The staircase is in the centre of the western side of the block. The patients' lift occupies the well-hole, and is easy of access, either from the rear garden carriage-entrance, or from the main front entrance, by the covered corridor across the quadrangle.

The first floor of this hospital block contains the first and second class wards and separate chambers for paying-patients of both sexes. The sick wards are like those below, but between them are arranged the private room wards, with lavatory and water-closet, &c., opposite the staircase.

The northern enclosure of the quadrangle is formed by the large hall for 250 persons, which is accessible from the first floor to the galleries provided.

The simplest materials will be used in the construction generally, dependence for effect in the design being entrusted to the general outline and to its fitness for the ends in view, rather than to expensive details.

Arrangements are to be made for withdrawing the vitiated air and warming the incoming fresh air, and for producing in all seasons a continued exchange of pure for expired air. The sanitation of the building generally will otherwise be attended to.

ST. SAVIOUR'S, WOOLCOT PARK, BRISTOL.

THE consecration of this church, with the exception of the part unfinished on the south side, has taken place recently, and we now give an interior and an external view of it. The church has been erected from the plans of Mr. John Bevan, of Bristol, whose design was selected in a limited competition on the award of the late Mr. Benjamin Ferrey, F.S.A. Mr. Bevan had previously identified himself with the ecclesiastical architecture of the city by the churches of St. Nathanael and St. Werburgh, Baptist Mills. The style of architecture of St. Saviour's is Early French Gothic of a massive type, and having to depend for effect more upon the proportions of his building than upon ornate carvings or elaborate decorations, the architect has been very successful in his design. At the west end, and springing from the gable, is a lofty bell-turret containing two bells, and with a canopied niche at the apex containing a figure of our Lord as the Good Shepherd. The principal entrance is through a narthex at the west end. The width of the nave, with north aisle, is 41 ft., and the length 93 ft., while from the floor to the apex of the roof is 38 ft. The chancel is 38 ft. long by 25 ft. wide and 52 ft. high, having on the south side two sedilia, piscina, and credence-table; and on the north side an ambry, or locker. The nave is divided from the aisles on either side by six arches and columns with capitals. The chancel-arch is 20 ft. wide and 38 ft. high to the point of the arch. The nave and aisle roofs are open-timbered, with plaster between the rafters, and the chancel and organ-chamber roofs are boarded with moulded ribs, dividing them into bays and panels. The whole of the roof-timbers are left without stain or varnish upon them, with the

hope of their being stencilled with colour at no distant date. The nave is lighted by two-light windows in the aisle-walls, and by three-light windows in the clear-story. The west window of the nave and the east window of the chancel are large and, though somewhat severe in treatment, handsome, and thoroughly characteristic of the period of work adopted. These are all filled with cathedral glass of pale tints, in geometrical patterns, by Mr. Ben Gray. The church is paved throughout with tile, that in the chancel being more ornamental than the rest. The pulpit is octagonal in form and divided into panels, with columns of polished Devonshire marble, supporting carved capitals at the angles; Irish green and other marbles being used for inlays. The centre panel contains the subject of the Sermon on the Mount, the other panels emblematical foliage. The re-table is of alabaster, supporting a cross, with a dossal behind it. The steps to the sacarium are of polished Devonshire marble, presented by the builder. The warming of the church is by means of hot water, circulating at low pressure; this portion of the work having been carried out by Mr. Vincent Skinner. The carving, so far as it has gone, was executed by Mr. Sheppard. The builders are Messrs. Cowlin & Son. Their contract for the building as it now stands was £4,100, but they are bound under an agreement to complete the entire building for a further sum of 730, should they be called upon to do so within a period of one month from the present time; but these sums do not include heating apparatus, pulpit, lectern, and other fittings.

BUILDING IN BERLIN.

BERLIN, which has doubled its population within twenty years, and which now numbers nearly 1,200,000 inhabitants, has naturally in recent years been the scene of very extensive building operations. A statement which has just been presented to the municipal authorities helps to give some idea of the scale upon which the building trades have been recently employed in the capital of the German empire. The chief burgomaster, in proposing to the Council the issue of a new Four per Cent. Municipal Loan for 45,000,000 marks, or 2,250,000, sterling, gives a survey of the city expenditure on the new systems of drainage, &c., since the year 1875. It appears that upon that object the total sum spent within the past seven years has been 71,600,000 marks, or 3,580,000, sterling. The municipality had purchased eleven large estates in the vicinity of Berlin for the purpose of receiving the sewage of the capital, and the expenditure on them had been 21,500,000 marks, or 1,075,000, sterling. Since the year 1878 no less than 10,580,000 marks (529,000, sterling) had been expended on new bridges in the city over the various arms of the river Spree. The Central Police Office is another work the city is about to undertake, the total cost of which will be 300,000, sterling. Three new infirmaries or hospitals, having a total of 1,000 beds, are also to be built, at a total cost of 175,000, sterling. The new waterworks, only built a few years ago, are already insufficient to supply the wants of the growing city, and are to be enlarged, at a cost of 130,000. The great Central Cattle Market, commenced in 1878, has already had 550,000, spent upon it, but will in the end cost a considerable additional sum. It is also intended shortly to commence new and extensive market-halls, for which the Council are asked to grant 500,000, sterling as a first instalment. A sum of 87,500, is also asked for new streets. Another great work, which was only completed a few months back, is the City Railway,—an incalculable boon to the inhabitants, who, in spite of the increase of tramways and omnibus lines, would have been badly off for the means of travelling from one part of the city and suburbs to another but for the new Stadtbahn. The increase in the number of dwelling-houses is quite on a par with the progress evinced by these great public works. Berlin every year requires sufficient new dwelling-houses to accommodate nearly 30,000 people.

EDWARDS, ARCHITECT.

SIR,—Could any of your correspondents oblige me with a few particulars of an architect of the name of Edwards, who built Tehidy House, in Cornwall, for the Basset family, about the years 1734—1736? WALTER H. TREGILLAS.

The objects discovered during the progress of the above works have been of a specially interesting character, as the marine animals,—mussels, &c.,—discovered, go to prove that at one time the North Sea deposited its living denizens on the spot where the busy emporium of North German commerce now stands. Numerous remains of ancient walls have been found, some of them in a fair state of preservation, which throw light on some hitherto unsettled points in the municipal history of the city.

#### CONTINENTAL ARCHITECTURAL PUBLICATIONS.

RECENT improvements in various forms of illustrative art have done much to encourage the development of literary enterprise in connection with architectural research. The range of this extensive subject has afforded ample scope for the efforts of those intelligent workers who have chosen particular subjects for their respective themes, and in many cases there has been contributed a sum of artistic information which enables the careful observer to grasp, without difficulty, many salient points affecting subjects of the highest interest. Thus, without any evident co-operation on the part of the various writers, our information on several important branches of art-history is more complete than might be supposed.

Capacity of observation, combined with clearness and precision of description, is, perhaps, one of the most striking features of Continental (more particularly German) artistic literature; and as no branch of art is more capable of gaining advantage from the lucid treatment of its history than architecture, a cursory glance at several recent foreign publications may not be unprofitable.

The capital of the Austrian Empire is known to contain many objects of interest to the student of architectural history, many of which are called to mind by the illustrated volume in course of publication at Vienna, in which Herr Neumann, jun., has (by means of photographs) reproduced such works as the portal of the Lichtenstein Palace, the vestibule and staircase of the palace of the Hungarian guard, &c. The former was executed by Luke von Hildebrand, and the latter by J. E. Fischer von Erlach. It is evident that the period during which these architects flourished was also fortunate as to artists skilled in plastic decoration. In the portions of the work already issued, the Geymüller Palace, and that of Prince Kinsky, have also been portrayed, as well as the portal of the Rathaus in the Wipplinger Strasse.

The merits of the more recent school of Viennese architecture (which, in a great measure, owes its development to the important municipal improvements of late years) have been duly recorded in a work dealing with the private and public buildings of modern date in Vienna. In the latter category, the Opera-house and the Palace of Justice have been chosen for illustration in the first place. These two buildings afford an interesting contrast, the former being in the richly-developed style of the early French Renaissance, while the latter displays the more massive character of the German Renaissance. Some of the leading architects of the capital have been assisting in the production of this important and valuable work; amongst them, Tischler, Von Lützow, Obermayer, Bültemeyer, and Irachowina.

Artistic enterprise has, however, not been confined in Vienna to the delineation of the features of interest within its own walls, but has furnished a contribution of general value to architectural literature in the shape of a work dealing with a number of interesting buildings in all parts of Europe. It includes representations of the Marini Palace at Milan, the Alcazar at Toledo, the Rathaus at Augsburg, the Belvedere at Vienna, the Bevilacqua Palace at Verona, the gate of Salamanca University, the Campanile of San Giorgio at Verona, &c. The intention of the work is partly to disseminate, by means of photographic reproduction, such plans or representations as are only to be met with in rare works, and the more extended circulation of which would be of practical value to the profession.

Germany has lately done a good deal of service in the direction in which the Austrian technical world has been displaying commendable activity. In a volume entitled "Palace Architecture of Upper Italy and Tuscany, from the Fifteenth to the Seventeenth Century,"

Professor Reinhardt, of Stuttgart, has thrown light on an epoch of considerable artistic interest. The work on which Professor Nicolai of Dresden was engaged until his death, has been continued by Henmann. It deals with "The Ornamental Features of Italian Art during the Fifteenth Century," and serves to illustrate many points dealt with in Professor Reinhardt's work. The clearness of outline necessary for the efficient delineation of the delicate ornamentation of the period indicated has, it is remarked by a Berlin journal, been most successfully accomplished in the photographs accompanying the volume. These have been taken under the immediate direction of an architect of undoubted skill, whose opinion as to scale and position has evidently been of great assistance in the somewhat difficult task of reproducing such works as are contained in it.

The German Renaissance is, however, the period of artistic history which seems to have recently received most attention in that country. Amongst the most noted specimens of this epoch is the portal of the castle chapel at Dresden, which justly occupies a prominent place in Herr Fritsch's work, "Monuments of the German Renaissance." Various other objects of interest are depicted, such as the Castle of Aschaffenburg, the façade of the Salzhaus at Frankfurt-on-Main (with its curious wood-carving), &c. The Munich Renaissance has been treated as a separate topic by Herr Bauer, who has collected much interesting information on that subject.

In conclusion, there has to be recorded the volume due to the joint exertions of three Dresden architects,—Haedel, Adam, and Gurlitt,—which deals with the castles and family seats of the kingdom of Saxony. Though some buildings of modern date are illustrated, many of the ancestral castles depicted are of the period of the German Renaissance. The photographic representations of Kriebstein, Ehrenburg, Moritzburg, and other seats are spoken of as being particularly striking, the delineation of the Alhrechtsburg, at Meissen, also doing full justice to the architectural features of that historical structure.

#### THE LARGEST LOCK IN THE WORLD.

It will be of interest to all those who either support or oppose the scheme for a ship canal to Manchester to know what is, at present, the largest lock in the world. In a statement recently submitted to the Congress of the United States this is said to be on the St. Mary's Falls Canal. "The canal is slightly over one mile in length. There are two locks to overcome the same elevation, one being the largest in the world. It is 515 ft. in length, 80 ft. wide, and 18 ft. lift." The estimated yearly expense of working it is 25,000 dollars. On the Louisville and Portland Canal, which is 2.15 miles long, are two locks 372 ft. long and 80 ft. wide, with 12 ft. and 14 ft. lifts. These locks were worked by hand in 1879; 3,168 vessels of all classes passed through the canal in that year. A tow-boat, a dock, and steam-dredges are maintained. The expenses for 1879 were 30,928 dollars, of which 14,453 dollars were for dredging. The North Sea Canal is stated in the same report to be sixteen miles in length, and from 130 ft. to 400 ft. in width. The level is below that of the sea. There are two sets of locks of large dimensions, and an artificial harbour constructed under great difficulties. The depth, originally 23 ft., is to be increased to 26 ft. by 1884. The cost of the work was 10,800,000 dollars. From November, 1877, to August, 1879, 4,862 vessels passed through the canal. The working expenses for the only year for which they have been obtained were 75,569 dollars. There are eight miles of canal to each lock-lift. On the Des Moines Canal, 7.6 miles long, there are three locks, suitable for the longest steamers on that river. The annual expenses are above 30,000 dollars, including a large amount for dredging. A detailed estimate of the number of minutes occupied in each of the eight operations involved in the process of going through one of these large locks amounts to 20½ minutes. At St. Mary's Falls the approaches are not completed, and cause material delays, yet lockages do not occupy half an hour each. The reporter concludes thus:—Probably, in almost every location where water is to be had, a better ship-canal can be made with a few locks, and at a far less

cost than a sea-level canal. A small part of the money saved by the locks will, in most cases, make a broad and deep canal, where ships can go safely and rapidly, and pass each other anywhere without delay; instead of narrow deep cuts, commonly dangerous and always expensive, where ships must move slowly, and wait to pass each other. The question must be decided in each case whether the large amount required for the construction of a lock will save a larger amount some other way, and whether the delay at each lock will save a greater delay in some other way.

#### THE HISTORY OF ARCHITECTURAL DRAWING.

DID the Greeks and Romans, our masters in architecture, make drawings of the edifices they designed? Was the art of architectural drawing in existence among them? The question is one which we have no means of satisfactorily answering, but the researches of the most competent authorities make it clear that the ancients followed some different practice from the usage of modern architects in this matter. It can only be conjectured what their method was. It appears probable that drawing was not practised, and that instead of that it was the custom of the architect to make a model of each edifice he designed. The actual construction was carried out under the designer's own direction, he being present and himself prescribing every detail of the work, the measurements and the profile, to the operative masons and sculptors, and often executing portions of the work with his own hand. We have, however, proof that the art of drawing plans was not altogether unknown to the Romans. Paper, in the modern sense of the term, did not exist, but, in place of it, plates of marble were probably employed. The remains of at least one ancient sketch has, in fact, been preserved to us. We refer to the fragments of the plan of the ancient city of Rome, which are built into the wall upon the staircase of the Capitoline Museum, and to another tablet lately discovered. The age of these fragments cannot be placed later than the times of the Emperor Severus or Antoninus. The relics are, moreover, of value, as they make known to us the existence of certain buildings of which we otherwise have no trace. The next oldest relic of a similar kind which has come down to us is that of the Abbey of St. Gallen. This contains, on parchment, the drawing in simple lines of the normal plan of a monastery, with all the buildings belonging to it. The age of this document is certainly not later than the fifth or sixth century, and it was produced at the Court of the Frankish kings. After this, we find in the regulations of the lodges of Mediaeval times certain strict directions enjoining upon builders the duty of exactly following the sketches of the edifices they are engaged upon. Another section prescribes that the rules for tracing and laying out of carved work, &c., are to be kept strictly secret. On the other hand, within the lodge, it is recommended that the fullest possible instruction should be imparted. By a very fortunate accident the old working drawings of the towers of the cathedrals of Cologne and Ulm have been preserved. They are believed to date from about the year 1350 A.D., and are now kept at Cologne. They were discovered by Herr Möller, who published facsimiles of them.

It is not before the age of the Renaissance that we have any architectural plans *in extenso*. Belonging to this period are the collection of hand-drawings in the Uffizi, at Florence. Lately, too, the architect, Von Geymüller, has published the plans of Bramante and Raffaello for St. Peter's at Rome. These documents are mostly drawn with a pen in simple outlines on parchment or paper. From the sixteenth century the drawings which have come down to us are more frequent, and they are more complete in their style of representation.

With regard to the masters of the late Renaissance, we have a number of plans by Palladio and others. In the Museo Civico of Vicenza, Palladio's native city, there is a rich collection of his drawings preserved. They are on rough paper, and boldly drawn with the pen in sepia, and show a little shading. In the Church of St. Petronio at Bologna, at the end of the southern side aisle, there is a room with about thirty plans, by celebrated architects of the fifteenth to the seventeenth centuries, for

a facade for that church. The style is mostly Gothic, a style which, however, was not understood by Peruzzi, Giulio Romano, and other masters of Late Renaissance. The non-Gothic drawings of Palladio and Alberti are better. Possibly there may be plenty of other old drawings scattered in different collections. In those mentioned, all that is attempted is the representation of the ground plan and facade. The style of representation is very simple, being only linear. The instruments and other aids to the draughtsman were, in the times we have spoken of, of a very limited and imperfect description.

It is only from the sixteenth century onwards, after the invention of printing and wood-engraving had rendered possible the publication of the works of Alberti, Vignola, and Palladio by Scamozzi and others, that complete architectural drawings date. It was only after the doctrine of projection had been worked out that architectural draughtsmanship was able to attain the perfection it presents in the present day.

**THE BUILDERS' ACCIDENT INSURANCE (LIMITED).**

The first annual meeting of this company was held on Tuesday last at the offices, 27A, King-street, Covent-garden, Mr. Stanley G. Bird, the chairman of the Board of Directors, presiding.

The Secretary for the Southern District, Mr. E. S. Henshaw, read the following REPORT OF THE DIRECTORS FOR THE YEAR ENDING MAY 31, 1882.

1. The directors, in presenting their first annual report and balance-sheet, consider that the result of the first year's business is a matter for congratulation.

2. It should be remembered that the company was founded to insure its members against what was mainly a new risk, of the extent of which no one had any accurate idea.

3. The directors therefore, with the benefit of the information and statistics placed at their disposal by the various Builders' Associations, and of the opinion of those whose judgment was entitled to respect, fixed at the outset a scale of premiums which they considered, and the result has shown to be, amply sufficient. It may, however, be stated that other companies, who commenced business after this company, appear to have accepted a similar basis of calculation, as they at first charged a similar rate of premium.

4. Whilst some companies have offered, and continue to offer, to take risks at rates lower than those originally charged, and lower than those hitherto charged by this company, the directors did not consider that it would be to the interest of the members of this company to make any alteration in the rate of premium for the first year; and it is obvious that many reasons which have weight with the directors of a trading company, who have to show a large business and earn a dividend for shareholders, have no application to a company such as this one, established on mutual principles, where the insured themselves alone participate in the profits of the business.

5. The directors, however, with the experience of one year's business, have now reduced the rate of premium by 25 per cent., and on all re-insurances during the current year they hope to be able to allow a further rebate equal to 10 per cent. upon the amount paid in premiums upon policies existing on the 31st day of May last.

6. In order to meet the objections entertained by some members to disclosing the amount paid weekly in wages, the directors have arranged to insure an aggregate sum paid in wages; but they would impress upon members intending to avail themselves of this method of insurance, the necessity of being careful to note when the amount covered by the insurance has been expended, as the policy then expires, and the Company has no right, until a claim under the policy is made, to inquire how much of the amount covered by it has been actually paid away.

7. Up to the present time the directors have issued 829 policies, insuring an aggregate amount of 2,500,000, per annum paid in wages, and they have received 130 notices of accidents from policyholders, of which 15, estimated at 600l., belong to the year ending 31st of May, and still remain for settlement.

8. From the annexed balance-sheet it will be observed that the preliminary expenses of forming the company amounted to 1,072l. 1s. 3d., which amount the directors propose to spread over a period of five years. After, therefore, debiting the present year with 214l. 8s. 2d., one-fifth of the preliminary expenses, and deducting the proportions of premiums upon current policies, attributable to the period subsequent to the 31st of May, there remains a balance of 2,704l. 13s. 4d. to the credit of the revenue account. This amount, however, is chargeable with the payment of the above-men-

tioned unsettled claims for compensation, for which the directors set apart 600l., leaving, say, 2,100l. as a net profit; out of which will be for the members in general meeting, as provided by the articles of association, to vote such a sum for the remuneration to the directors as they may determine.

9. It rests with the general meeting to decide what bonus should be declared, but the directors recommend that it should not exceed 10 per cent. upon the amount paid in premiums up to the 31st of May last. The balance remaining should be carried forward to the credit of the current year.

10. The auditors, Messrs. Bunke & Clewe, retire under the articles of association, but are eligible for re-election, and their remuneration must be fixed by the general meeting.

The following statements of account were also submitted to the meeting:—

**GENERAL REVENUE ACCOUNT,**  
May 31st, 1882.

Dr.	£.	s.	d.
To Claim Register Account,—			
Compensation paid .....	329	1	3
„ Preliminary Expenses, viz. :—			
Printing, advertising, postages, show-cards, travelling expenses, salaries, legal charges, and incidentals, 1,072l. 1s. 3d., to be extended over five years .....	214	8	2
„ Working Expenses viz. :—			
Advertising, printing, stationery, travelling expenses, postages, salaries, agents' commissions, rents, and incidentals .....	819	7	1
„ Law charges, estimated .....	105	15	9
„ Balance carried forward .....	2,704	13	4
	<b>£2,203</b>	<b>5</b>	<b>7</b>
Cr.	£.	s.	d.
By total amount of premiums received from 1st of June, 1881, to 31st of May, 1882 .....	5,863	9	3
Deduct proportion for time unexpired on premiums running at 31st of May, 1882, as per register .....	1,695	11	4
By interest on investments .....	4,167	14	11
„ Bank interest .....	28	5	0
	<b>£2,203</b>	<b>5</b>	<b>7</b>
By balance brought forward .....	<b>£2,704</b>	<b>13</b>	<b>4</b>

\* Note.—This amount is subject to payment of the unsettled claims for compensation up to the 31st of May, 1882, estimated at 600l. 13s.

**GENERAL BALANCE SHEET,**  
31st May, 1882.

We have examined the foregoing accounts, with books and vouchers, and find the same correct.

(Signed) **BUNKE & CLEWE, Chartered Accountants,**  
Auditors,  
Birmingham, July 12th, 1882.

London, July 25th, 1882.

The Chairman, in moving the adoption of the report and balance-sheet, said,—Gentlemen, you have heard the report and balance-sheet read; it is now my duty to propose that they be adopted, and in doing so it is necessary that I should make a few remarks upon them. I think we may look upon the report as a very satisfactory one, especially as it is our first. You will find that the amounts that have been paid for compensation have been remarkably small, but I think it is only fair to tell you that you must not count upon our being so lucky in the future, because each day, almost, brings forth something which tells us that we must not rely upon our claims being so few or small in amount as hitherto. We find that in all cases

that are contested the sympathies of judges and juries go very strongly with the plaintiff. There is a very great deal of judge-made law on the subject, and we find that the construction put upon the Employers' Liability Act by the judges is very different indeed from that which we were assured would be its scope when it was before Parliament. As you will remember, the National Association of Master Builders, by whom this company was started, opposed the passing of the Employers' Liability Bill, on the ground that its provisions were open to too sweeping an interpretation, but we were assured by the late Attorney-General, Sir John Holker, and others, that the liability of employers would be limited as far as possible. As it is, we now find that the liabilities of builders under the Act are very much greater than we believe is the intention of the Act, and instead of liability being limited to accidents arising from want of proper supervision and direction on the part of foremen, we now find that builders are liable for mistakes or carelessness on the part of men to whom they delegate no responsibility. For instance, the effect of some recent decisions is that if an accident happen in the course of his work to a bricklayer's labourer, the employer is liable, the bricklayer being regarded as a man in authority over his labourer. On this, and other grounds, the chances of the company making large profits in the future are becoming more remote, although, at the same time, the effect of such decisions as those to which I have referred is to render it still more incumbent on the part of builders that they should insure themselves against losses arising from accidents. No doubt, some of you have seen it stated in the newspapers that Mr. Broadhurst and others are agitating for the amendment of the Employers' Liability Act, in the direction of greater stringency against employers. I think that if the subject comes before Parliament again this company ought to co-operate with the National Association of Master Builders, with the view of obtaining some amendment of the Act in the interest of the masters. In one or two contested cases in which this company has been concerned, we have suffered very great hardship from the fact that the plaintiff's solicitor would not pay the hearing fees when the case was appointed to be tried, and the consequence has been that the judge would not hear the case, although we were at the expense of putting in an appearance with solicitor, counsel, and witnesses,—an expense which was, of course, futile; and this is a hardship which would be more felt by individual builders whose cases were not in the hands of this company. If, therefore, the Act is to be brought under review by Parliament, I think we, on behalf of the master builders, should seek to get the Act amended so as to make it compulsory that in contested cases the costs of hearing should be guaranteed or paid before the case is heard. This may appear to be a small matter, but it really bears very materially upon the prosperity of this company, and, indeed, upon the prosperity of the building trade generally. Although we have great hope and good grounds for believing that this company will continue to be successful, we must not be confident that its success will be so great, or that the claims upon it will be so few, as they have been hitherto. You will notice in the fifth paragraph of the Report that we propose to give a rebate of 10 per cent. off all premiums paid last year by builders who re-insure with us this year, and this, in addition to the reduction of 25 per cent. which we have now made on all new premiums. We find that the business of the past year has been so profitable that we should be able to declare a bonus, which we think should not exceed 10 per cent. upon the amount paid in premiums. We hope that the reduction which we have made in the rate of premiums will bring us a large accession of new business, and that the further rebate which we propose will be the means of causing all our friends to re-insure with us. I may say that up to the present time we have only had an intimation from one builder who declines to re-insure with us. During the year we have had a great many notices of accidents,—no fewer than 130. With regard to forty-seven of these, the time for giving notice had expired. Some of the cases were very serious ones, one of them involving a claim of 200l. We have settled seventeen cases in committee, and our solicitors have settled two other cases. Of the claims

unscuttled on the 31st of May, four have since been settled. There are still claims pending amounting to about 290l. I have no more to say, gentlemen, but beg formally to move that the report and balance-sheet be adopted.

Mr. Howard Colls seconded the motion, which was carried unanimously.

Mr. A. Thorn moved that a sum of 500l. be appropriated to the remuneration of the directors.

Mr. D. Cross seconded the motion, which was unanimously agreed to.

The Chairman, on behalf of himself and his colleagues, thanked the meeting, and observed that the directors had met thirty-five times during the year, the individual attendances being 275 in London and 97 in Liverpool, making a total of 372. These attendances were entirely independent of the almost daily attendance of himself and some of the other directors; nor did the figures include the numerous attendances preliminary to the formation of the company.

With regard to the question of bonns, Mr. Cross said that the chairman had, in allusion to the comparatively small amount of the claims on the company during the past year, very wisely laid stress on the inadvisability of assuming that they would be able to depend on the continuance of such favourable results as had already attended their efforts. He, therefore, proposed "That there be no bonns declared this year, and that there be no rebate allowed on last year's premiums." He thought that the considerable reduction which had been made in the rate of premiums was as much as any reasonable man could expect. He thought that it was desirable to have as large a reserve fund as possible, for a large reserve fund would heget confidence in the ability of the company to meet exceptional demands upon its funds.

Mr. Harrison seconded this motion, which was supported by Mr. Holmes-Wood. The Chairman explained that the directors had suggested a bonus of not more than 10 per cent. upon the amount paid in premiums, because they felt that it was only right that those who had insured with them when the success of the company was only problematical, and who had paid larger premiums than were paid by insurers in other companies which had been established since this one was founded, should have some return for their outlay and risk. The company, it should be remembered, was based on the mutual principle, and they would be quite within their rights if they divided the whole of their profits, year by year, as they made them. If a bonus of 10 per cent. were paid, in addition to the extra rebate of 10 per cent. on last year's premiums to re-insurers, there would still be carried to the reserve fund, out of the profits of the past year, and after allowing for directors' remuneration and all other expenses, a sum equal to 17 per cent. of the total amount received in premiums during the past year.

Mr. John Robson moved, as an amendment, "That the sum of 10 per cent. on the amount of the premiums paid last year be returned to insurers as a bonus." He contended that unless this was done, they would be breaking faith with their customers. Mr. A. Thorn seconded the amendment, which was supported by Mr. Holmes-Wood, who withdrew his opposition to this part of the motion. On the amendment being put, thirteen hands were held up for it and only two against it. It was therefore declared to be carried, and was subsequently unanimously adopted as a substantive motion. The Chairman asked whether the meeting intended to instruct the directors to allow to re-insurers the rebate of 10 per cent. off all premiums paid by them last year. Mr. Harrison said that as the meeting had decided to abandon the principle of having a very large reserve fund, it was obviously to the interest of the company to get and to keep as much business as possible. He therefore begged to move that the directors be recommended to return to re-insurers a rebate of 10 per cent. on the amount of their last year's premiums. Mr. Cross seconded the motion, which was unanimously adopted.

On the motion of Mr. Holmes-Wood, seconded by Mr. A. Thorn, Messrs. Bunkle and Clulee were reappointed auditors, and their remuneration was fixed at twenty guineas, inclusive of travelling expenses.

Mr. F. J. Dove said that up to the present

time they had not required the services of their referees (Mr. George Plucknett, J.P., and Mr. Thomas Clay), but at the request of the directors those gentlemen had attended several board meetings, for which he moved that thanks be tendered them, together with an honorarium of ten guineas each.

This having been seconded by Mr. W. J. Adamson, and unanimously carried, Mr. Plucknett thanked the meeting on behalf of himself and his colleague.

Mr. Harrison, in moving a vote of thanks to the Chairman for presiding, said he thought the building trade of the country was to be congratulated upon the formation and success of the company. No better form of co-operation than that which it exemplified could be conceived, and he was glad to be able to gather that the claims which had been made upon the company hitherto had been met in a liberal and not in a litigious spirit, so that they were not likely, he hoped, to get the reputation of being hard task-masters, but rather that of being a corporation willing to deal with cases with the same consideration which they would all desire to show in their several and individual capacities.

Mr. Holmes-Wood cordially seconded the motion, which was put and carried in due form, and the Chairman having returned thanks, the meeting terminated.

PROPOSED TUNNEL UNDER THE ELBE.

UNDER the river Elbe, at Hamburg, it has been proposed to build a tunnel to connect that city with an island a third of a mile distant. The great Hanseatic city, which has hitherto been a free port, is shortly to lose that privilege, and to be included in the Zollverein or German Customs Union. It is intended, however, to make an exception in favour of the island in question, which bears the name of Steinwardor, and to permit it to retain the privileges of the free port. Large bonded warehouses will be built there for the accommodation of merchandise before paying duty, and in order to bring the island into closer connexion with the city, the above-mentioned scheme for a tunnel under the river has been started. The tunnel would be 500 metres or nearly a third of a mile in length. This will be upwards of 300 ft. longer than the Thames Tunnel. The cost of the Elbe Tunnel is estimated at about 900,000l.

THE VENDOME COLUMN.

A FAVOURITE amusement with visitors to Paris had long been the ascent of the Column of Vendome, whence they obtained a splendid bird's-eye view of the great city. This pleasure the authorities have found it necessary to deprive travellers of in future. It appears that the practice of ascending to the gallery near the fine statue of Napoleon on this monument was resented to not by sightseers only, but by a steadily increasing number of persons whose sole aim was suicide. Since the year 1850 no fewer than eighty-two visitors have thrown themselves from the top of the column and been dashed to pieces at its foot. The height from which they leaped is 140 ft. It was not found possible to prevent this terrible form of suicide except by totally prohibiting the public from ascending the monument, and this has accordingly been done.

ADULTERATION OF CEMENT.

THE above question is attracting a certain amount of attention in Germany at the present moment. One of the leading technical journals recently published (omitting names) an exact copy of a letter sent to a cement manufacturer offering him a supply of finely-sifted blast-furnace cinder for mixing with cement, and citing the fact that this article is regularly supplied to one of the largest manufacturers in Germany. The matter has recently been much discussed in technical and industrial circles, so that a considerable interest was taken in the meeting of the German Cement-makers' Union, which took place on the 6th inst. in Berlin. This assembly was convened, it would seem, for the express purpose of discussing the best means of putting a stop to such adulteration on the part of certain producers. The meeting was attended by representatives of nearly all

the German cement-makers, and it is remarked that the deliberations were marked throughout by a friendly spirit, and by a desire to arrive at a solution of a definite and satisfactory nature. Dr. Dellbruck, the chairman of the Union, presided, and it was generally acknowledged that proceedings of the nature referred to on the part of certain manufacturers were calculated to injure the reputation of German cement in both homo and foreign markets. It was further argued by some speakers that even if the admixture of certain substances with cement resulted in increasing its strength, yet it was inadvisable to sanction a practice which opened the door to adulteration of a more serious nature. A resolution was at length unanimously adopted to the effect that (leaving open the question whether the additions of certain substances to cement after burning improved or deteriorated its quality) all such admixtures should be considered as adulterations, and should be treated as such, unless the bags and casks bore a statement that such an admixture existed in their contents. Only such additions as gypsum, &c., necessary for giving certain properties to cement would be allowed, and then only up to the extent of 2 per cent.

The representatives of the factories which had used the admixture referred to then declared their intention of adhering in future to the principles laid down in the resolution which had been adopted. It was decided to forward to each cement manufacturer in Germany a copy of this resolution, with a request for an expression of the acceptance of the general principle thus laid down. It is proposed to publish, after a lapse of about three months, the names of those makers who shall have refused or neglected to signify their concurrence in the policy of the union.

A report is to be presented to the Government giving details of the steps which are being taken to prevent the continuance, on the part of manufacturers, of the adulteration which had called for the action of the central body.

"OWEN JONES" PRIZES, 1882.

THIS competition was instituted in 1878, by the Council of the Society of Arts, as trustees of the sum of 400l., presented to them by the Owen Jones Memorial Committee, being the balance of the subscription to that fund, upon trust to expend the interest thereof in prizes to "Students of the Schools of Art who, in annual competition, produce the best designs for Household Furniture, Carpets, Wall-papers, and Hangings, Damask, Chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department.

Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design" and a bronze medal.

The following is a list of the successful candidates:-

1. Thomas E. Doran, School of Art, Macclesfield, Design for Silk Hangings.
2. James Meine, School of Art, Kidderminster, Design for an Axminster Carpet.
3. Thomas Linnell, School of Art, Leicester, Design for Tapestry Hangings.
4. Alexander Park, School of Art, Glasgow, Design for a Carpet.
5. John Sykes, School of Art, Leicester, Design for a Wall Paper.
6. Frank E. Adams, School of Art, Macclesfield, Design for Furniture Silk.

CONTRACTS WITH CORPORATIONS.

Sir,—It having been decided upon the statutes that contracts are not enforceable against municipal corporations, nor, in some cases, against Boards of Guardians, unless they are duly executed and sealed with the common seal of the Corporation or Board, it becomes an interesting question whether the reverse holds good, viz., whether a tender made by a person intending to contract with a Corporation or Board, duly submitted and accepted by mere resolution of such Corporation or Board, and properly entered on the minutes, but not sealed, is capable of being enforced, as a complete contract against the person making such tender. The opinions of your correspondents who write on the jurisprudence of building would be esteemed a favour by yours, H. A.

## OBITUARY.

MR. HENRY HILL, F.S.A., J.P., &c., who was buried in Kensal-green Cemetery on the 21st inst., had long been an occasional contributor to this journal. Under the signature "F.S.A.," he, on many occasions, gave us flying accounts of the congresses held by the Royal Archeological Institute, and last year some comments of his on the procedure of the vergers at York led to a correspondence, both in our own pages and locally, which was productive of good in more places than one. Under the signature "CLARRY," he was a useful contributor to *Notes and Queries*. Mr. Henry Hill had been a member of an eminent firm of stockbrokers, Messrs. Hill, Fawcett, & Hill (Thackeray's "Dale, Spigot, & Dale"), but retired from it some years ago with a fortune. Being a popular member of the Masonic Lodge to which he belonged, of the "Cocked Hat Club," and similar social as well as intellectual bodies, a large number of friends met spontaneously, in addition to his relatives and those intimately connected with him in life, to see the last of one with whom many pleasant and not always unproductive hours had been spent. His death was terribly sudden and wholly unexpected.

William Ellis, a well-known Yorkshire sculptor, was found dead in his bed at Sheffield, on the morning of the 19th inst. The day before he had visited the exhibition of pictures at the School of Art of the Sheffield Society of Artists, and appeared in his usual state of health. He had, however, been subject to fits of syncope, and it is supposed that he died whilst asleep. He was fifty-eight years of age, and an artist of great ability and talent. His marble busts have ever ranked high, whilst, as a young man, he was for years a valued assistant in the studios of several of our best known London sculptors. Unendowed with business tact, however, his life for some time past has been one of continuous poverty, a perpetual struggle with an empty purse and bare cupboard!

## SALE OF HOUSES AND BUILDING LAND IN CAMBERWELL.

AN extensive sale of freehold houses and building land in Camberwell, which will occupy six days, was commenced last week at the Auction Mart, the sale being conducted by Mr. Robert Reid. The property, which is sold under an order of the Court of Chancery, comprises 700 houses situated in Albany-road, New Church-road, Camberwell-road, Camberwell-green, and other parts of Camberwell. It embraces several public buildings, including the South London Conference Hall, and the St. Giles's and Middle-Class Schools. Also ten licensed public-houses and the Camberwell Brewery. It was stated that the entire property produces a rental of 14,000l. per annum. In addition to the houses as above stated, the sale also includes thirteen large plots of building land, varying from 4,900 ft. to 19,000 ft. each, and covering altogether an area of upwards of thirty-two acres. The property is divided into 243 lots, and the portions disposed of at the first and second day's sale, last week, consisted of ninety-four houses and two plots of land in Albany-road. The large room at the Auction Mart, in which the sale took place, was much crowded throughout both days' sale. The auctioneer, before offering the several lots, observed that the rents of the houses were undoubtedly much below their real value, as was proved by the rentals of other properties in the same locality. This was owing to the owners having been satisfied with the rents which had been paid for several years past, and which had never been advanced, although they were about 30 per cent. below the average rentals of property in Camberwell. The sale then commenced, when from the activity in bidding it was soon proved that there was a great demand for the property. All the lots comprised in each day's sale were readily sold at what was considered full prices, being sought to pay from 6 to 7 per cent. on the outlay. One of the lots sold on the first day's sale, consisting of a licensed beer-house, known as the "Dun Cow," the rental of which is 30l. per annum, was sold for 900l. The value of building land in the neighbourhood of Albany-road was indicated by the price which was paid for two plots. One plot, consisting of 6,829 superficial feet, was sold for 710l., being at the rate of 4,260l. an acre; and another plot, containing 11,737 ft.,

was disposed of for 1,160l., being at the rate of about 4,500l. an acre. The first day's sale realised an aggregate sum of 23,615l., and the second day's sale 18,025l. The sale will be continued and concluded next week.

## VALUE OF CITY PROPERTY.

THE great value of property in the neighbourhood of the Bank of England was shown at a sale which took place at the Auction Mart on Tuesday, when an offer of 52,000l. was refused for freehold premises covering a ground-area of 2,623 superficial feet. Messrs. Debenham, Tewson, & Co., conducted the sale. The property consisted of Nos. 57 and 58, Threadneedle-street, containing the ground and four floors, having a frontage of 29 ft. to Threadneedle-street. It is now in the occupation of the General Post Office, on a lease for a term of sixty years from September, 1858, at a ground-rent of 1,000l. per annum, to which the purchaser would be entitled for the residue of the lease, which terminates in 1918, after which the particulars stated that he would receive the full rack-rental, moderately estimated at 5,000l. per annum. The property was described as forming the very centre of the most valuable part of the city. The biddings, commencing at 20,000l., appeared to be confined to two gentlemen present, and were brought up to 52,100l., when, there being no higher offer, the auctioneer withdrew the property at 52,200l., stating that the sum which had been offered did not by any means reach the value which had been placed upon it.

## THE NEW METAL EXCHANGE BUILDINGS.

AMONGST other new buildings in the City which have followed upon the reconstruction of Leadenhall Market, are the new Metal Exchange Buildings, which have just been erected in Whittington Avenue, Leadenhall-street, immediately adjoining the entrance to the market, and which were opened for the first time for business on Monday last, when the half-yearly meeting of the Metal Exchange Company was held in the principal room of the Exchange.

The building stands upon the site of Old Leadenhall, said to have been formerly occupied by Whittington. The principal elevation of the building, on the west side of the Avenue, is 51 ft. in length, the structure, including the numerous offices which it contains, extending to a depth of 123 ft., the rear of the building abutting on the west wall of the old City monastery. The Whittington Avenue frontage is 68 ft. in height, and contains four floors besides the basement. The ground-floor is carried up with polished red granite piers, on grey granite bases, with an ornamental arched entrance to the exchange-rooms, 9 ft. in width. The rest of the elevation is in Portland stone, elaborately carved and ornamented. The first floor contains a range of four three-light elliptical windows, together with a central projecting bay window, continued in the several upper floors to the top of the building, the central portion of the elevation above the cornice being surmounted by a pediment or gable. The second, third, and fourth floors have two-light windows, all the windows of the several floors being enriched and ornamented with carved and fluted pilasters.

The whole of the ground-floor of the building, to the extent of upwards of over one-half of its entire depth, is intended to be entirely devoted to the purposes of the Exchange. On the left hand side of the entrance, which leads into the exchange-rooms, is a waiting-room, with lavatories on the right-hand side. The exchange-room is 60 ft. in length and 38 ft. in width. The walls are panelled, the panels being divided by fluted pilasters, having carved capitals. In addition to a range of windows on the north side the Exchange is lighted by a handsome lantern light, extending almost the entire width of the apartment. The lantern light is surrounded by an ornamental cornice and carved ceiling, resting on fluted columns. Immediately adjoining the exchange or principal room, at the west end, is the reading and telegraph room, and also a spacious committee-room. The floors of the exchange and other rooms in connexion are all laid with oak. The whole of the ground and first floors of the building are fire-proof. The portions of the

building apart from those used for exchange purpose contain fifty-two spacious offices, to which there are approaches in Whittington Avenue and also from Gracechurch-street, along a new thoroughfare to be called Leadenhall Avenue. All the offices have fresh-air inlets on the Tobin principle. The sanitary arrangements, which are ample and complete, have been carried out by Mr. George Jennings, of Lambeth; the gas-fittings are by Messrs. Strode & Co.; and the hot-water apparatus by Messrs. Bailey & Sons.

Messrs. Edmeston & Sons, of Old Broad-street, are the architects, and Mr. T. Boyce, of the Eagle Works, Hackney, is the builder. Mr. James Cornish is foreman of the works.

## SALE OF AN EXTENSIVE BUILDING ESTATE AT CLAPHAM.

LAST week, Messrs. Debenham, Tewson, & Co. submitted for sale at the Auction Mart, the valuable building estate, known as West Side, Clapham Common. It was described as comprising a superior family mansion, with out-buildings, and extensive pleasure grounds, together with nineteen acres of land. It was stated to possess exceptional advantages for building upon, possessing long frontages on three sides, one to Webb's-lane, being 1,648 ft. in length, another to Battersea Rise, of 506 ft., and a third fronting Clapham Common, 495 ft. The competition for the property was close. The first offer was 20,000l., upon which advances were made in rapid succession, and the estate was ultimately sold for 45,000l., being at the rate of about 2,400l. an acre. It was stated in the room that the property had been purchased by a syndicate, and that it will be immediately laid out for the erection of residences.

## THE MEASUREMENT OF GLAZING.

KEYLOCK V. SPRULES.

THIS was a case arising from a question of measurement in glazing, heard in the Green-wich County Court on the 21st of July last, before Mr. J. Pitt Taylor. The plaintiff was Mr. Keylock, glazier, of 71, Evelyn-street, Deptford; the defendant, Mr. G. H. Sprules, Cannon-street.

Plaintiff had agreed to prime and glaze certain sashes at per foot, and had rendered defendant an account for doing the work amounting to 367. 5s. 2d. Defendant had paid him 204. 7s. 7d., and also 1l. 10s. as an allowance for priming, in settlement, claiming to be justified in paying for glass supplied only; but plaintiff demurred to this, and now sued for balance, 4l. 7s. 7d.

Mr. Laidman, who appeared for the plaintiff, asserted that it was a universal custom in the trade to charge priming and glazing sashes to the full outside dimensions of sash, instead of size between rebates, and that his client had pursued this system of measurement successfully for twenty years, to which the judge replied that, if so, it was because he (the plaintiff) had never been found out.

Mr. Wallcutt, builder, of Lewisham High-road, New Cross, who represented the defendant, stated that he had had a long and practical experience the other way, and endorsed this by referring the judge to a standard trade price-book, and handed in a glazing account for work by a London firm, showing that the present system was to charge the size of the squares, but in fractional parts of inches to allow the glazier the full inch; that by the way the plaintiff measured a difference was made against the defendant of about 300 ft.; that full allowance had been made, and 1l. 10s. paid for priming, although priming was agreed to be included in the price quoted by the plaintiff; and was about to call one of his witnesses when—

The judge ruled that it was a clear case of over-charge, and gave verdict for the defendant, with costs of four witnesses.

**The Safety of Cairo.**—Five well-known artists, Messrs. Carl Haag, Frank Dillon, Walter Severn, R. M. Chevalier, and R. Dowling, make an appeal on behalf of Cairo. They say,—"We who, while painting the streets of the old town, the stately mosques, and unrivalled tombs of the Caliphs, have almost become worshippers of the beauty of the place, positively shudder to think that these splendid specimens of Oriental architecture may in a few days be heaps of ruins. The Government may have good reasons for following a particular policy, but we venture to think that nothing,—no political considerations,—can justify the delay which is taking place in providing for the safety of Cairo."

**BUILDERS' BENEVOLENT INSTITUTION.**

The thirty-fifth annual meeting of this Institution was held at Willis's Rooms, St. James's, on Thursday, Mr. George Plucknett, J.P., in the chair.

The annual report stated that, notwithstanding the augmentation of the yearly payments to the pensioners, a larger number of annuitants now receive the benefits of the Institution than at any previous time have been dependent on the funds of the charity. The labours of the Committee were encouraged by an offer from Mr. George Godwin (who had promoted the welfare of the Institution from its commencement) that if twenty other persons would give ten guineas each he would give a further donation of a hundred guineas. That offer was taken up by Mr. George Bart, J.P., the president of the Institution for the past year, with the generous spirit in which it was made, and through Mr. Bart's energy and liberality the project was most successfully achieved. The Committee were thereby enabled to increase the number of pensioners on the books of the Institution. The committee point out that, in consequence of the death of many gentlemen who had for many years been subscribers to the Institution, it is important that its friends should enlist new subscribers, so that the annual income may be maintained in such a way as to enable it to meet the increased expenditure consequent on the augmentation of the pensions. Among the good friends of the Institution who had died during the past year were Mr. J. Simpson, Mr. J. M. Macey, Mr. George Jennings, and Mr. T. F. Odell. By Mr. Simpson's death the Institution had lost a colleague who took an earnest interest in the charity. The annual ball thanks to the energy of the gentlemen who acted as stewards, had resulted in a profit to the funds of the Institution of 68*l.* 15*s.* 6*d.* During the past year eight pensioners had been elected (seven men and one woman), and five pensioners (three men and two women) had died. In conclusion, the report stated that Mr. J. T. Chappell had consented to become President of the Institution for the ensuing year, and that the annual dinner would be held at the Freemasons' Tavern on November 2 next.

The balance-sheet, duly certified by the auditors (Messrs. J. H. Hunter, J. Cruttenden, and R. J. Ward), shows that a balance of 1,349*l.* 15*s.* 4*d.* was brought forward from last year; that the annual subscriptions amounted to 806*l.* 18*s.* 6*d.*, and the donations to 1,453*l.* 10*s.* 6*d.*; that 643*l.* 2*s.* 8*d.* was received in dividends on 21,438*l.* Stock; making a total, with interest on deposit account and profit on ball, of 4,347*l.* 3*s.* 9*d.* The total expenditure amounted to 2,158*l.* 19*s.* 8*d.*, including 1,779*l.* 9*s.* 6*d.* paid to pensioners, 15*l.* burial money, and 364*l.* 10*s.* 2*d.* expenses of management. There remained a balance at bankers of 2,188*l.* 4*s.* 1*d.*, 1,250*l.* of which was on deposit, and 938*l.* 4*s.* 1*d.* on drawing account.

On the motion of the Chairman, seconded by Mr. Thomas Stirling, the report and balance-sheet were unanimously adopted, Mr. Stirling observing that the position of the Institution was very satisfactory, the income being larger than last year, while the expenditure was less.

Votes of thanks were passed to the President for the past year, and to the Vice-Presidents, Trustees, Treasurer, and Auditors, and it was unanimously resolved that Mr. J. T. Chappell be elected President for the coming year.

**THE PROPOSED NEW PUBLIC OFFICES**

**A COMPETITION CONTEMPLATED.**

In the House of Commons on Monday last, in reply to questions put by Lord Elcho and Mr. Aylmer,

Mr. Shaw-Lefevre said now that the new scheme for the War Office and Admiralty had been adopted by Parliament, the property acquired in Parliament-street would not be required. That property had been purchased for 240,000*l.* He was informed that it had been bought on most reasonable terms, and that by acquiring that property from the Government at cost price, and by purchasing the remaining land required, Parliament-street could be widened by a public body without loss. He trusted that the work would be undertaken by the Metropolitan Board of Works, but in the event of their not doing it, he was in hopes that it could be done by some other means.

Lord Elcho understood that there was to be an architectural competition in respect of the War Office and Admiralty. He wished to know whether it was intended that it should be a limited or an open competition. He would strongly urge upon the Government to make it an open competition.

Mr. Shaw-Lefevre said that he had not yet

decided what form the competition for the new buildings should take. Some of the best architects declined to compete if it were an open competition, on the ground of the great expense of preparing designs. He was told, however, that it would be possible to adopt a plan of having a double competition; first, sketch designs, and then a selection of five or six of the best for the complete design. The matter was not yet decided.

**THE "BLACKSMITH'S ART," AND TECHNICAL EDUCATION.**

SIR,—I read with very great pleasure Mr. G. H. Birch's paper as reported in the *Builder*. But during a long experience in the trade, I have yet to learn that there is any truth in one remark made by him, that "Happily for our times, we do now appreciate the smith's art." It may be true that there are many passive admirers of such work, but the real patrons and virtual connoisseurs of the art are very few and isolated indeed, and beyond a few well-known firms, who find a limited amount of employment, there is little demand for genuine art-smith work. The demand is for those cheap and nasty abortions that vainly attempt to simulate good art, and so we have had and flimsy imitations of iron specimens, formed of sheet-iron, tin-plate, wire, and round rods, bent, and stuck together with clumsy rivets, lead, solder, and even cement and putty, in a rickety and wretched fashion, subversive of all art, instead of genuine forged and welded work, drawn out and tapered in due proportion, beaten up and curled in bold relief, curved in elegant scrolls, and bent in graceful, free, and ever-varying contour, all neatly yet strongly welded, dovetailed, and riveted together in such masterly manner as marks at once the cunning hand of the artist, and every part of the work in accord, complementing and relieving each other without either confusion or monotony, and embodying the very love and favour of the true-soled craftsman, who wrought his poems in iron, even as others have written theirs with the pen.

But for such work there is no demand. The true art-smith is not desired. No one wants such an ornamental dremmer in this sordid, profit-grinding, and most mechanical age. Why, sir, the whole country is full of shams; and every mart is selling its "art productives" at from a farthing per pound or a penny per yard.

The art wanted is that of a long-winded, strong-limbed biped,—a human machine, that turns out its work like corn from a mill. "I want," said an employer, "a fellow strong in body and weak in brain." Quantity is the desideratum, not quality. Or, if the art-smith be employed, sir, is it not to dab together in some sippy and slop-shop manner the Cheap-Jack barbarisms of some frenzied or idiotic fellow who imagines that he alone is an apostle of art? Mr. Birch speaks as an architect, I infer, with little knowledge and no experience of the practical art-workers who have literally heged from door to door for employment, only to meet with contemptuous rebuff and insolent sneer, as well as disappointment and denial. During the twenty years that I have been connected with the business, as workman, foreman, manager, and designer, I have met with many such, and know of many who, meeting with no demand for their art, have left it by compulsion for other branches of trade. I write of houses, steady, and able men, who were capable of working out almost anything in metal. The men that there is a demand for are men of mediocrity, who do not excel the capacity of their incompetent superiors, and drudges who work out in silent obedience the absurd designs given to them, without either suggestion, hope, or ambition other than servile submission to the whims of his masters, who, in their own default, are ever ready to blame the "British workman." From time to time we have an outcry of the great lack of intelligent and able workmen; and now there is quite a mania for technical education, just as years ago there was a similar outcry, when the science and art classes in connexion with the South Kensington Departments and the Society of Arts competitions for art-workmen were instituted. How is it? Have these schemes failed? Where are the thousands of workmen and students that have attended these classes, with their prizes and certificates? Why! no master cares for them; no one looks at them; no one hears of them; and they are of no value to the holder!

The schemes were most laudable, and well calculated to effect their purpose; and I, with others, am deeply grateful for the good information and teaching there received, as well as the hunger for more that it created, as in the immortal Oliver. But how is this loud clamour again and again about the incompetent and unintelligent workman? These schemes have failed, just as the present scheme for technical education will probably fail, not through the default of the workman, who receives no encouragement or demand for superior intelligence or ability. The default is that of the employers and their clients, who neither patronise nor encourage high-class workmen. The client patronises the biggest pennyworth, ignoring the fact that the value is in inverse proportion, and the employer acts on the same rule. The managers and foremen are selected either for their plausibility, good penmanship and good address, or for their driving and bullying powers, and not for their practical ability or technical qualifications; and both masters and foremen, deficient themselves, are not only incapable of judging of the merits of things that they cannot understand, but also dread the really intelligent, well-educated, and able workman, who is better qualified than themselves in every point but in the matter of capital, position, and opportunity. Workmen are not slow to detect this, and others reason,— "What is the use of my going, like Brown, and wasting my time in studying and money in books? He is no better off for it, and gets no more pay than I do"; and, sir, *cut bone!* Educate the workman, indeed! No, sir; educate the masters.

These reformers begin at the wrong end. What we want is that the employers and their customers and consumers or purchasers be educated to that point at which they shall be able to distinguish between good work and hotch-work, and between shams and meritorious art; or until they will tolerate good men. Create a demand for them, and encourage them, and they will soon be forthcoming. When you find a man of ability, however poor, or whoever he may be, if honest and of good character, instead of greeting him in your usual, "Can any good thing come out of Nazareth" way, test him! Do not ask if he is an R.A. or an F.R.S., or if he has had a university education! For these are by no means guarantees of universal qualification. Do not inquire if he is a member of a noble family,—holds a commission in the army,—or possesses testimonials from lords and legislators, and innumerable clergymen; nor require him to be a distinguished foreigner; but seek to know if he can do the work he professes to do, and if so, try him!—and by so doing you will soon discover more intelligence and refinement in British workmen than you give them credit for!

And so with his compeer the able designer and draughtsman, who has devoted long years of study and experience to the mastery of his art, who, instead of mere copyism and pilloined designs, evolves from his own ingenious mind creations, novel, original, and beautiful. Too often in poverty and painful obscurity, he is neither encouraged nor required. His position is occupied by some hoy draughtsman who can trace or copy designs filched from other catalogues; or else some poor hundler, at a similar rate, who, selecting portions of this design, and bits of another design, of various styles, jumbles them all together in inconsistent and incongruous ornament,—a sort of metal patch-work or hotch-potch of odds and ends of such sort as any man of taste or honesty would be ashamed of. The qualifications and superior ability of the honest artist are repudiated, and should be by any means get employ, it is only for a short time, until a few good designs are made, to which his employer generously signs his own name, and so, not only robs the man of all due credit for his work, but, by so doing, prevents the real designer from becoming known and obtaining other chances of employment. And the pay, sir! I have known such a clever artist to be offered the munificent reward of 25*s.* per week. Encouraging, is it not? Very! "Happily for our times, we do now appreciate the smith's art." Again, the poor artist applies for a vacant situation, and submits examples of designs, which are retained, although he obtains not the situation. Years after he discovers that they have adopted and published the submitted designs, without giving either pay or credit for them. There are thieves abroad, Mr. Editor; but this is a kind of theft that the law excuses.

AN OLD ART-WORKMAN.

## THE LATE MR. G. SOMERS CLARKE.

SIR,—As an old pupil of the late Mr. George Somers Clarke, whose loss we must all deplore, I may perhaps be permitted to add my testimony of respect to his memory.

Mr. Clarke was an architect of great power and culture, singularly unaffected, and possessed of considerable industry. His urbanity and kind consideration to those in his office were marked characteristics. To you, Sir, all who were associated with Mr. Clarke must feel grateful for the considerate and gentle nature of your remarks in reference to our late friend.

I was closely associated with Mr. Clarke from the year 1854 until 1862, and during this period he entirely rebuilt Cowley Manor, Gloucestershire, for the late J. M. Hutchinson, esq., of Lothbury, and also designed the singularly beautiful Italian garden, with terraces, waterfalls, pavilions, and termini, &c., belonging to the same. The style adopted was pure Italian. Mr. Clarke subsequently designed a small Turkish bath, which was attached to the mansion, which was of a very perfect character, and about the same time he carried out a large warehouse in Wood-street for Messrs. Munt & Brown. He also designed the Merchant Seamen's Orphan Asylum at Snaresbrook, together with the chapel, the gift of Lady Morrison. These works contain much evidence of his perfect acquaintance with Italian Gothic detail, and were the outcome of much study both as to planning and design. About the same time he designed the Brighton Asylum and Schools, which also bear evidence of his intimate acquaintance with a style of which they form graceful examples.

The Turkish Baths in Jermyn-street was an important work of novel character, and I recollect how much careful study he gave to this work, the style adopted being one in which Mr. Clarke had previously little acquaintance, and also to the great industry he exercised in making himself acquainted with the Turkish and Moresque styles of architecture, together with the Roman mode of arranging the various apartments and hypocaustum. This bath is second to none in correct design and excellence of arrangement. Mr. Clarke, in carrying out the details of the building, was greatly assisted by the late Mr. David Urquhart, of Turkish celebrity, the late Mr. George Wilt, the late Mr. Erskine Rolland, and Mr. Thudicum, all of whom possessed experience in the arrangement of such establishments. Mr. Clarke used to send me to attend the Institute library in order to consult the works of Gérauld de Prangey, and other writers whose names I seem now to have forgotten, so that the architectural details of the building should be perfect. It seems but yesterday that I met in this bath the late Mr. E. M. Barry, only a short time before his sudden and lamented decease, and in the conversation we had together he expressed himself greatly pleased with the arrangements and design of this unique work.

In your notice of his works you omit to mention the building he designed for the London Printing and Publishing Company in St. John's-street-road, since pulled down for the purposes of the Metropolitan Railway. This was a work of much merit, designed in the German Gothic style, and I think was illustrated in your journal.

Mr. Clarke also altered the Haymarket Theatre for the late Mr. Buckstone; he also prepared in competition designs for the Banstead Asylum, which, though unsuccessful, were marked by much originality of design and careful planning.

As a surveyor, Mr. Clarke was not wanting in acumen and judgment, but it is as an architect and artist that he will be best remembered. He was a great sketcher, and almost invariably used the camera lucida. His touch was singularly delicate, which is the more remarkable when we recollect that he had lost the first joint of the thumb of the right hand by a gun accident. EDWARD POWER.

**Brindley & Co.**—We observe in our advertisement columns that the old-established firm of Joseph Brindley & Co., slate merchants, have opened an office and show-rooms at 61, King William-street, City. This firm, which has been established in London for sixty-two years, was lately turned into a private company, under the Limited Liability Act, and are now largely extending their business.

## THE LATE HABLOT BROWNE.

SIR,—I do not know whether any one has hitherto remarked that the late Hablot Browne, the "Phiz" of many of Dickens's and other authors' works, was originally an architectural artist.

On looking through the plates of Winkles's "Cathedrals" (notably the illustrations of Canterbury Cathedral), the name of "Hablot Browne" will be found as the draughtsman of several of the engravings.

As architectural drawings they are not especially striking, and in many instances they are incorrect, but possibly they belong to an early period of his career, and hence he found that figure-drawing was his speciality rather than architecture.

Winkles's work was, I believe, first issued in monthly numbers, somewhere about the year 1836 or 1837. FRANCIS T. DOLLMAN.

## COMMUNICATIONS BETWEEN NORTH AND SOUTH OF THE THAMES, EAST OF LONDON BRIDGE.

SIR,—I shall be glad if you will give me space for a few words on the above subject. I have read your recent excellent article, but there is one point which does not seem to be sufficiently looked at by Mr. Barlow, and that is, that all the communications shall be free. What the Committee for improved communications want is that whatever shape such communications assume, whether tunnels or ferries, they shall be absolutely free, both to foot-passengers and every class of vehicle. All the schemes heretofore have been subject to heavy tolls, hence their apparent failure. An Act was passed in 1872 for a common ferry from Greenwich to the Isle of Dogs for the passage and conveyance of horses, carriages, cattle, goods, wares, merchandise, &c. Some of us remember the cumbersome boat that was provided, which lay rotting for years on the foreshore at Greenwich. No wonder the public did not use it, as the scale of tolls for vehicles named in the said Act are as follow:—

For every two-wheeled chaise or other carriage of like nature, drawn by one horse, the sum of 6s. For every wagon, whether drawn by three or four horses, the sum of 10s. That further modes of communication are needed, any one interested in the subject would see if he would stand a short time near King William's Monument, London Bridge, and note for himself the traffic going east and that going west; he would not need to be told that for the enormous trade of the East of London additional means of communication are requisite; moreover, it seems anomalous that the 2,324,000 people west of the Monument require for their traffic no less than twelve free bridges, whereas, on the other hand, for the 1,509,000 inhabitants eastward of the Monument (to which we should add the 296,290 of West Ham) there is for their carts, vans, carriages, &c., only the one mode of crossing the water, viz., by London Bridge. It is contended by Mr. Barlow and others that they do not require increased modes of communication. The statement refutes itself. The merchants and traders of the East End of London urge that their trade is crippled, and that they suffer very much for the want of free communication other than the long and tedious route *via* London Bridge.

SAMUEL TRICKETT,  
Treasurer to the Committee.

## LOCAL BOARD SURVEYORS.

SIR,—The enclosed cutting from the *Wolverhampton Evening Express* of Monday, July 15, shows a far from solitary instance of what is done by the Local Board surveyors in this district,—a practice which is increasing, and might be stopped by members of the Boards refusing to sanction such proceedings. It is all very well for a man to draw a good salary for his, in many cases, light municipal duties, and then to follow a private practice either openly or through his assistants: thus enabling him to work at one half, or even less, of the usual commission, and by such means, together with ensuring the passing of the plans, taking the work from the hands of local practitioners and ratepayers; but, as the solicitor in the case observed to the judge, "It was a disgraceful practice, and the sooner it was abandoned the better," in which the judge appears to have

concurred, by giving a verdict against the surveyor.

It is to be hoped that Local Boards will take care to prevent such doings, and in the meantime a few words from the *Builder* would make known the impropriety of such conduct.

A PROVINCIAL ARCHITECT.

**THE PERQUISITES OF A LOCAL BOARD SURVEYOR.**—At the Oldbury County Court, before Mr. W. D. Griffiths (Judge), Joseph Davis, surveyor to the Oldbury Local Board, brought an action to recover the sum of 15*l.* 10*s.*, balance of commission for superintending the erection of two houses and stabling in Tifford-road, on behalf of Messrs. John & Cornelius Bagnall, ironmasters, Langley. Mr. Wright (Messrs. Wright & Co.) appeared for the plaintiff, and Mr. Shakespeare represented the defendants. The houses were erected in 1875, and the plaintiff alleged that he was employed by the defendants to draw the plans and superintend the erection of the buildings at a commission of 2*½* per cent. He received 10*l.* on account during the building, and the claim was for the remainder of the amount. In cross-examination the plaintiff stated that as surveyor to the Local Board he only inspected a building after the foundation had been made, and then again when the building was finished. He had 170*l.* per year as surveyor to the Local Board. Plaintiff said he prepared the plans in this case, and on his advising the Board they were passed. It was not for the Local Board Judge said it would have been odd if the plan had been rejected. Mr. Wright said he thought it was a very wise arrangement. The Judge said it was, for persons who were going to build, because they would be sure to get their plans passed. It might be very good for them, but it was not for the Local Board. Mr. Shakespeare said the system of a surveyor advising the Board to pass plans that he himself had prepared was one very much to be deplored. It was a disgraceful practice, and the sooner it was abandoned the better. He was surprised that the Local Board should allow such a state of things to exist. For the defence, it was contended that the plaintiff refused to superintend the building after it was one door high. The Judge said he was inclined to think the plaintiff's case had failed; he should accordingly give a verdict for the defendants.

## VARIORUM.

**THE "DRAPER'S DICTIONARY"** (Collingridge), by S. William Beck, is an attempt to give particulars relating to the history of textile fabrics in a handy and convenient form, and to clothe the statements with the literature of the subject. Although it is for the most part compiled from compilers, it is a useful book, and moreover a pleasant.—The *Sunday Review* for July (Trühner) includes a full report of the last annual meeting of the Sunday Society, and of the debate in the House of Commons on the proposed extension of Sunday opening.—A writer in "Our Homes and How to make them Healthy," for August, speaks thus as to parsonages:—"In discussing the arrangements of an ordinary country parsonage, it is necessary to bear in mind the special circumstances which distinguish this class of house from other houses of similar dimensions. The principal distinctive feature about a parsonage is, that it is inhabited by a succession of owners whose circumstances may be, and frequently are, widely different. While the amount of the income of the living remains fixed within certain limits, the actual income possessed by any one occupant may, on the one hand, be restricted to that amount, or, on the other hand, it may be considerably greater by reason of private means possessed by the incumbent. The tenure also of a parsonage is peculiar. It, together with the glebe, belongs to the incumbent absolutely so long as his incumbency lasts. While, however, the incumbent's tenure is freehold so long as it endures, he (or his executor), is liable to his successor to deliver up the building at the determination of his incumbency in a perfect state, without allowance even for wear and tear. The effect of this system makes the incumbent at once both tenant and landlord. The necessity, therefore, for building parsonages in the most substantial manner possible is obvious. Another no less important consideration involved by the peculiar circumstances of the holding, is that the size and character of the house must always bear a due proportion to the value of the living. In building or altering a parsonage, regard must always be had, not to the special circumstances or requirements of any one particular incumbent, but to the reasonable requirements of an incumbent solely dependent on the income belonging to the living. It will readily be

understood that if this rule were not strictly observed, a rich incumbent of a poor benefice might burden his successors with a house costly in maintenance and repairs, and quite beyond their means to keep up. Again, an unmarried incumbent might build a house in every way suitable to his own requirements as a bachelor, but utterly inadequate for the accommodation of a married person with a young and numerous family."

We get from *Cassell's Illustrated Universal History*, for August, a brief account of the foundation of Alexandria:—"Entering Egypt at Pelusium, Alexander found his fleet already there. The Egyptians crowded to welcome him, and, leaving a garrison in the city, he marched across the desert to Memphis. Here the satrap Mazakes immediately surrounded himself, and an immense treasure came into the hands of Alexander. The whole of Egypt, indeed, submitted with alacrity, as a relief from the insulting despotism of the Persians. The Macedonian hero rested himself for some time in this ancient and magnificent city, offering sacrifices to the god Apis and other Egyptian deities, and entertaining the people with gymnastics and musical performances. He then sailed down the western branch of the Nile to Canopus, situated at its mouth. Seeing the advisability of removing the seat of government from Memphis to some spot upon the coast which would be more within his power, he determined to found a new metropolis on the shores of the Mediterranean. Hence arose the famous city of Alexandria, afterwards one of the most splendid and important capitals of the world,—the great seat of commerce for Europe, Africa, and India, and an intellectual centre of the Greek race, which for several ages exercised a powerful influence over the philosophy and religion of the civilised world. Alexander himself marked out the circuit of the walls, the direction of the principal streets, and the sites of numerous temples, which were to be dedicated to Grecian and Egyptian deities. The site was on a narrow tongue of land stretching between Lake Mareotis and the sea, and the plan of the city was made to include the adjacent isle of Pharos, which was joined to the other part by a causeway. Two harbours were formed,—one on each side of this causeway,—for ships coming by sea; and Lake Mareotis was utilised for the reception of exportable produce from the interior. The nucleus of the population was mainly derived from the neighbouring town of Canopus. During the rule of the Ptolemies, Alexandria grew immensely in size, in grandeur, in population, and in wealth. Its Museum was celebrated in all civilised lands, and the Library of Alexandria (the destruction of which has been the subject of contradictory statements) contained the finest collection of Greek classics in the world. In this most interesting city, the East and West may be said to have mingled as in a common centre; and from the consequent interchange of ideas between the more ancient and the more youthful communities of the world, Christianity itself received some of those elements which rank among the philosophical influences of a later epoch."

Miscellaneous.

**Palestine Exploration Fund.**—Captain Conder, R.E., last week addressed a large party assembled by invitation of Mrs. Grear, of Grove House, Regent's Park, on the researches and discoveries recently made by him in the expedition from which he has just returned. The chair was taken by Col. Warren, C.M.G., R.E., who explained the difficulties encountered in the progress of the work, and the resolution with which Captain Conder had met them. The points of principal interest were,—first, the rude stone monuments discovered in Moab, of which Captain Conder found no fewer than 700, many of them bearing distinct traces of having been used as altars of sacrifice or libation; among them may be, in fact, no other than the altars of Balak. At Amman he found a monument which he suggests may be the bedstead of Og, being a great cromlech on a hill close to the city. The second point on which he dwelt at length was his great discovery at Kadesh, the sacred capital of the Hittites. This discovery was made from the description of its conquest by Rameses II. The Bishop of Huron, who was present, spoke strongly on the importance of these explorations, as to which we not long ago offered some comments.

**The Law Courts, New and Old.**—In Committee of Ways and Means on Monday evening, the House of Commons proceeded to consider the Civil Service Estimates. On the vote to complete the sum of 117,200*l.* for the new Courts of Justice, &c., Sir R. Cross inquired when it was proposed that the new Courts should be opened. Mr. Shaw-Lefevre said some delay had been caused by the death of Mr. Street, the architect. He hoped, however, that the buildings would be thoroughly completed, and that the judges would be able to enter upon their duties in them, on the first day of term after the Long Vacation. Mr. Slater-Booth hoped the right hon. gentleman would be able to give some assurance to the Committee that the present law courts in Westminster Hall would be pulled down. Mr. Shaw-Lefevre had not yet consulted the Government on this matter, but hoped that the course indicated by his right hon. friend would be pursued. There was a certain obligation to the public that the old Courts should be pulled down so that the exterior of Westminster Hall might be seen. What the general effect would be was at present a matter of doubt. He believed Sir Charles Barry was of opinion that the general architectural effect would not be altogether satisfactory, and that he had contemplated another wing of the Houses of Parliament, but in regard to this no decision had been arrived at. The vote was agreed to.

**A Window for New Zealand.**—A very handsome stained-glass window, which is about to be sent to New Zealand for the music warehouse of Messrs. Milner & Thompson, of Christ Church, New Zealand, has been on view in the show-rooms of Messrs. Heaton, Butler, & Bayne, of Garrick-street, London, who have designed and executed the work. The window consists of a large circular-headed centre panel and two side panels. In the centre are two figures representing the lyric muse, Euterpe, and the god Apollo with the golden lyre. In the upper portion of the same window are medallions, supported by Cupids holding a scroll, with the legend, "From heavenly harmony this universal frame began." The names of eminent musicians are introduced into the side windows. This glass is of special interest, inasmuch as it is the first specimen of high-class work that has been sent to this colony. The window will be exported by Messrs. H. Cohn & Co., of London Wall.

**Messrs. Chubb & Son**, the patent lock and safe makers, are about to transfer their lockmaking factory from Wolverhampton, as we have already mentioned, to the large Patent Safe Works built by them, a few years ago, in Glengall-road, Old Kent-road, London; but they want a little further explanation. At the London works they have room for 1,000 workmen, and already possess extensive boiler and engine power, together with a quantity of powerful machinery. They propose to add special machines for making certain parts of their locks, leaving the more complicated and delicate work to be done, as now, by hand. Messrs. Chubb have made about one million locks and many thousands of safes since commencing business, sixty-four years ago. The average length of time each workman (including boys) has been in their employ is seventeen years. Messrs. Chubb are evidently good masters.

**A Parochial Experiment in Dusting and Cleansing.**—The Works Committee of the Clerkenwell Vestry have made a report of the operations and results of their staff doing the dusting, watering, &c., of the parish during the past year, from which it appears that the total cost amounted to 5,460*l.* 10*s.* 10*d.*, the receipts to 1,295*l.* 1*s.* 6*d.*, making the cost for the year 4,165*l.* 9*s.* 6*d.* This sum is stated to be only 220*l.* above the average of the previous six years, and the committee remark that this slightly increased cost is more than compensated by the greatly increased efficiency with which the work is performed by their own staff.

**Prizes for Good Plumbing.**—On Monday, the 17th, the prizes awarded for success in the recent public competition for practical plumbing, instituted by the National Health Society, and carried out at South Kensington, were presented at a meeting of the Society. To Mr. Geo. Taylor, Duke of Westminster prize, 5*l.*; to Mr. John Wise, National Health Society's prize, 5*l.*; to Mr. George William Hamlin, second prize of 3*l.* The competition followed on the series of lectures given by Mr. S. Hellyer, at the Society of Arts. The prizes were awarded on the adjudication of Mr. George Shaw.

**London and Middlesex Archeological Society.**—By permission of the rector and churchwardens of St. Olave's, Hart-street, a general meeting of the Society will be held in the church, on this Saturday, the 29th, at half-past two p.m., when the following Papers will be read:—"On the History and Antiquities of St. Olave's," by the Rev. A. Povah, M.A.; "The Worthies connected with the Church," by Mr. Henry B. Wheatley, F.S.A. The Society will next proceed to view (by the courtesy of the Vicar, Canon Thomas, M.A., and the churchwardens) the Church of All Hallows, Barking. An account of the building will be given by the Rev. J. Maskell, M.A.

**Mr. Ruskin's Sheffield Museum.**—Mr. Ruskin met the Mayor of Sheffield and a number of influential gentlemen last week, to discuss the question of enlarging St. George's Museum. This museum is situated at Walkley, a suburb of the town. Its contents, all of which belong to Mr. Ruskin, are so numerous, and the house is so small, that only a comparatively small portion can be exhibited. It is now proposed to erect a large and suitable building by subscription. If this be done, Mr. Ruskin expressed his willingness to put the museum on a legal basis, so as to insure its permanence to the town, and said he hoped to devote much of his time to making the museum the most perfect of its kind in the world.

TENDERS

For second portion Gloucestershire Second County Lunatic Asylum, Barrowed, near Gloucester. Messrs. John Giles & Gough, architects. Quantities by Mr. C. H. Goude:—

Drew, Chalford .....	£40,212 0 0
Bowers & Co., Hereford .....	38,330 0 0
Davies, Cardiff .....	38,050 0 0
Smith, Birmingham .....	38,002 0 0
Barnsley & Sons, Birmingham .....	37,890 0 0
Horsman & Co., Wolverhampton .....	36,890 0 0
Sanders, Southampton .....	36,868 0 0
Lovatt, Wolverhampton .....	36,645 0 0

Accepted for the Fulwood and Whittingham waterworks, Mr. John James Myres, C.E., 15, Chapel-street, Preston, Lancashire. Quantities by the engineer:—

Contract No. 1, Storage Reservoir .....	£8,028 13 2
Robert Simpson .....	48,028 13 2
Contract No. 2, Conduits .....	£775 13 2
Robert Simpson .....	48,028 13 2
Contract No. 3, Iron Pipes .....	£6,598 0 0
W. Allsup & Sons .....	48,028 13 2
Contract No. 4, Laying Iron Pipes .....	£1,985 0 0
Walmley & Co. .....	48,028 13 2
Contract No. 5, Service Reservoir .....	£2,120 18 5
James Jemson .....	48,028 13 2
Contract No. 6, Buildings .....	£1,107 6 0
Battersley Bros. .....	48,028 13 2
Contract No. 7, Compensation Reserve .....	£1,136 19 2
Robert Simpson .....	48,028 13 2

For building new Board School in Oxford-gardens, Notting-hill, for the London School Board. Mr. E. R. Robson, architect:—

Oldrey .....	£10,992 0 0
Higgs .....	10,325 0 0
Lawrence .....	10,199 0 0
Nightingale .....	9,961 0 0
Onibwate .....	9,797 0 0
Pritchard .....	9,709 0 0
Stimpson & Co. .....	9,485 0 0
C. Wall .....	9,450 0 0
Atherton & Co. .....	9,400 0 0

For additions and alterations to residence, North-hill, Highgate, for Mr. Roger Gaskell. Mr. Stephen Box, architect. Quantities by Messrs. Walker Bros.:—

Lawrence .....	£1,441 0 0
Wall Bros. .....	1,335 0 0
Smith & Son .....	1,249 0 0
Holmes & Sons .....	1,197 0 0

For the erection of a detached house, with stable, in the St. Nicholas-road, Upper Tooting, for Mr. W. S. Bidlake. Mr. H. Wakeford, architect:—

Williams, Bisham-hill .....	£1,650 0 0
Smith & Son, Warwick-street .....	1,395 0 0
W. Johnson, Wandsworth-common* .....	1,371 0 0

\* Accepted.

For taking down and rebuilding 31, Castle-street East, and premises in the rear, for Mr. R. L. Cripps. Mr. A. E. Hughes, architect:—

Palkner .....	£2,787 0 0
Cooper .....	2,578 0 0
Burningham & Co. .....	2,327 0 0
Cheffins .....	1,980 0 0

\* Less 60*l.* for old materials.

For shop-front at York Town, Surrey, exclusive of plate glass, for Mr. H. Savage. Mr. F. G. Norry, architect:—

Alcock (accepted) .....	£275 0 0
-------------------------	----------

For alterations and additions to National Schools, Camberley, Surrey, for Rev. F. M. Middleton. Mr. Friends T. Dullman, architect. Quantities by Mr. T. W. Davis:—

Alcock .....	£631 10 0
Watson .....	550 0 0

Accepted for new store and warehouse, Booth, Luddenden:—

Roland Gaskroger, Mount Tabor (masons' work), J. & S. Murgatroyd, Luddenden (carpenter and joiners' work), Jous Alderson, Luddenden Foot (plumber and glaziers' work), G. & T. Alderson, Luddenden (slater and plasterers' work).	
---	--

For the erection of new schools (to accommodate 1,400 children) at Nunhead-passage, Lambeth division, for the School Board for London. Mr. F. R. Robson, architect. Quantities prepared by Mr. T. T. Green.

Scrivenor & Co.	£16,388 0 0
Hart	16,130 0 0
Shepherd	15,896 0 0
Nightingale	15,869 0 0
Higgs & Hill	15,484 0 0
Oldrey	15,442 0 0
Marshall	15,318 0 0
Peto Bros.	15,279 0 0
Downs	14,990 0 0
Tongue	14,743 0 0
Jerrard	14,735 0 0
Kirk & Randall	14,735 0 0
Perry & Co.	14,585 0 0
Wall	14,189 0 0

For the new infirmary, Canterbury. Mr. Cowell, architect.

Jones, Gloucester	£3,880 0 0
Stiff	3,675 0 0
Cornelius	3,649 0 0
W. Cozens	3,474 0 0
J. Cozens	3,468 0 0
R. Haston	3,428 0 0
Denne Bros.	3,385 0 0
Adcock	3,383 0 0
G. H. Deane	3,300 0 0
Bourne	3,290 0 0
Wallis & Co., Maidstone	3,279 0 0
Wise	3,279 0 0
Gaskin (accepted)	3,146 15 0

For repairs, &c., at No. 7, Colchester-road, Kennington, or Mr. Binell, Mr. H. I. Newton, architect.

R. & H. Pickersgill	£115 0 0
Wood	95 0 0
Simpson (accepted)	89 0 0

For the erection of the first portion of Emmanuel Church, Hornsey-road. Messrs. Frederic R. Farrow & W. Swinfen Harris, architects. Quantities by Mr. Clement Dowling.

G. H. & A. Bywaters	£4,985 0 0
Dove Bros.	4,437 0 0
Williams & Son	4,310 0 0
L. H. & R. Roberts	4,237 0 0
Lathey Bros.	4,235 0 0
Boyes	4,229 0 0
Hook	4,042 0 0
Gaisford	3,993 0 0
Taylor & Grist	3,813 0 0

For Waterhead Board schools, Oldham, exclusive of foundations and retaining-wall, which are in progress by schedule. Mr. Thomas Mitchell, architect.

S. Ashton & Sons, Oldham	£5,737 0 0
W. Lees & Sons, Oldham	5,334 0 0
T. & W. Meadows, Stockport	5,319 0 0
C. Schofield & Co., Oldham	5,309 0 0
W. A. Peters & Sons, Rochdale	5,235 0 0
Jackson & Randall, Oldham	5,138 0 0
Dyson & Sons, Oldham	5,027 0 0
Holmes & Webster, Ashdon	4,668 0 0
Gaines Company, Oldham	4,586 0 0

\* Accepted.

For the erection of Bryn-hellog, Forest-hill, for Mr. W. P. Appleton. Mr. Herbert D. Appleton, 264, Wool Exchange, architect. Quantities supplied by Mr. F. T. W. Miller, 6, Guildhall-chambers.

Patman & Fotheringham	£3,943 0 0
H. & R. Roberts	3,794 0 0
W. Smith	3,779 0 0
Colls & Sons	3,593 0 0
Clarke & Breezy	3,582 0 0
Merritt & Ashby	3,553 0 0
Nightingale	3,587 0 0
Howard & Dorrell, 28 and 29, Russell street, Covent-garden (accepted)	3,383 0 0

For building a cottage at Mile-end, Colchester. Mr. W. Scargill, architect.

Grwood	£260 0 0
Gladwell	180 10 0
Dupont (accepted)	177 0 0

For pulling down and rebuilding 108, Union-road, Rotherhithe, for Mr. Brodie. Messrs. Snook & Stock, architects. Quantities by Messrs. Linsell & Giffard.

Fresley	£700 0 0
Smith	697 0 0
Everett	670 0 0
Pritchard	658 0 0
Wells	655 0 0
Eldridge & Gee (accepted)	645 0 0

For the erection of shops and houses in the High-street, Peckham. Mr. E. George Wyatt, architect. Quantities by Messrs. Quill & Haskard.

Nightingale	£12,430 0 0
Merritt & Ashby	12,222 0 0
Hook	12,069 0 0
Shepherd	11,880 0 0
Bentley	11,686 0 0
Wall	11,083 0 0
Gibbs & Flew	10,500 0 0

For painting, &c., Angler's-gardens School, for the London School Board.

Boyes	£262 0 0
McQuinn	191 0 0
Grover	190 0 0
Dearing & Son (accepted)	182 16 0

For building dwarf wall, with railing, at Hornsey-rise, for the Islington Vestry.

Porter	£145 0 0
Cave	121 0 0
Toop	115 0 0
Powell	113 12 6
Quirk	100 0 0
Dearing & Son (accepted)	97 10 0

For the erection of a residence and making road to same at Datchell, Bucks, for Mr. William Shipley. Mr. A. A. Hudson, architect.

Joseph Higgs, Upper Park-place, London (accepted).

**TO CORRESPONDENTS.**  
H. K. R. (1881, 2 in.)—G. M. H. & Co.—W. A. R. & G.—G. O. H. Lord E. D. & Son—C. H. O.—W. S.—H. H.—J. R.—B. & Co.—W. J.—S. & Co.—W. Bos.—Y. & R.—M. J. A.—R. M.—S.—C.—S.—W.—C. P.—D. H. T.—C. & Son—J. W.—C. W.—J. H.—U. & Co.  
All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.  
Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

**NOTICE TO SUBSCRIBERS.**  
THE INDEX and TITLE-PAGE for Volume XLII. (January to June, 1882) were given as a Supplement, with the Number for July.  
A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.  
CLOTH CASES for binding the Numbers are now ready, price 2s. 6d. each, also READING CASES (Cloth), with Strings, to hold a Month's Numbers price 2s. each.  
THE FORTY-SECOND VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.  
SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 9s. 5d. each.

**CHARGES FOR ADVERTISEMENTS.**  
SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.  
Six lines (about fifty words) or under..... 4s. 6d.  
Each additional line (about ten words)..... 6d.  
Terms for Series of Trade Advertisements, also for Special Advertisements in front sections, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.  
SITUATIONS WANTED.  
Four Lines (about thirty words) or under..... 2s. 6d.  
Each additional line (about ten words)..... 6d.  
REPLIES TO ADVERTISEMENTS.  
Addressed Box..... Office of "The Builder."  
Cannot be forwarded, but must in all cases be called for, and the Office Receipt produced.  
THE CHARGE FOR A BOX IS AS UNDER:—  
For "Situations Wanted" Advertisements..... 3d. per Week.  
For all other Advertisements..... 6d. per Week.  
PREPAYMENT IS ABSOLUTELY NECESSARY.  
\* \* \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. 2.  
DOUGLAS FOURDRAINER, Publisher.  
Addressed to No. 46, Catherine-street, W.C.  
Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.  
The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

**TERMS OF SUBSCRIPTION.**  
"THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum, PAYABLE. Remittances payable to DOUGLAS FOURDRAINER, Publisher, 46, Catherine-street, W.C.

**Best Bath Stone.**  
WESTWOOD GROUND,  
Box Ground, Combe Down,  
Corsham Down, And Farleigh Down.  
RANDELL, SAUNDERS, & CO., Limited,  
Corsham, Wilts. [Adv.]

**Box Ground Stone.**  
Is the best for use in all exposed positions, being a well-known and tried weather stone.  
50,000 feet cube in stock.  
PICTOR & SONS,  
Box, Wilts. [Adv.]

**Doubling Freestone and Ham Hill Stone**  
of best quality, in blocks, or prepared ready for fixing. An inspection of the Doubling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [Adv.]

**Doubling Freestone.** Of best quality, supplied from their own Quarries and Kilns by STRAY & HANS, Stoke, Ilminster. Agent, Mr. E. CUMKAY, 35, Devonshire Chambers, Bishopsgate-street, With-out, London, E.C. [Adv.]

**Asphalte.**  
Seyssel, Patent Metallic Lava, and White Asphalts.  
M. STODART & CO.  
Office:  
No. 90, Cannon-street, E.C. [Adv.]

**Asphalte.**—The Seyssel and Metallic Lava Asphaltic Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouseroofs, flat roofs, stables, cow-sheds and milk-rooms, granaries, tin-rooms, and terraces. [Adv.]

### The Working Man's Home Question again and the Railways.

EW things tend more directly to oppose the progress of improvements in fine, and even more notably in mechanical, art, than the common idea of the natural opposition between theory and practice. That the two differ, of course, no one denies. But the point to bear in mind is, that they differ as do two constituent parts of one machine, in the

absence of either of which the remaining action, though not quite arrested, is wasteful and imperfect. When a man is spoken of as a man of theory, the fact may be that he is a bookish man: as such the field in which he can do most service to his plans is that of abstract work. Put a De Morgan to drive a locomotive, and he will probably drive his train to a smash. Ask the most experienced engine-driver to solve an elementary mathematical question as to the proportions of his engine, and he will be simply dumb-founded. But if it should happen that the great mathematician should not only speak with contempt of the ignorance of the wary and experienced driver, but should further proceed to instruct him as to the way to drive a train, the result would be as unfortunate as if the driver were to say, "You may be all very well in your study, professor, but you know nothing practical about engine-driving, and I think it a waste of time to listen to anything that you may say about the steam-engine." It is obvious that by taking either of these courses true progress is hindered. It is by the outcome of careful experience, under the control of science, that the best results are to be attained. But they will no more be obtained by the latter apart from the former, than by the former apart from the latter.

It is, however, a marked feature of the English character to show impatience of this scientific control. The "unreadiness" which has been of old laid at our door is a result. When we came out of the Crimean War we were fitter to conduct such an operation than when we went into it. We had been beaten into form. This shows extraordinary pluck and pluck of character. But it is a great waste of national resources.

This want of scientific control has been signally illustrated by the proceedings of two Parliamentary Committees during the past week. Matters which, we do not hesitate to say, any competent man who, like Robert Stephenson and Isambard Brunel, gained his experience by

practice under the guidance of science, could determine on sound principles, have been fiercely debated, and compromised on terms that only ensure the renewal of the struggle. One of these relates to the important social and building question of the provision of workmen's trains on the North Kent line. We have before now called attention to the cardinal element which railway communication forms in the distribution of house accommodation. Here is an instance that presses for settlement. The claim that, if a railway company occupies for its stations the site of the former homes of many of the industrial classes, it ought in some way to repair the injustice by affording them transport on the line on favourable terms, is one of which the justice is palpable. What is required for a fair discussion of the subject? Just this; to know exactly the cost of such transport. It will then be comparatively easy to determine the amount of net profit upon it (taking into account the interest of capital specially laid out for that end), that the company should receive or should waive. Has this been ever attempted? On the contrary, the decision has been handed over to the Board of Trade, which is entirely without the requisite data on which to come to any conclusion on the subject. And, to mark still more forcibly the unpractical character of the compromise, it is to hold for two years! Where will the workman be, either during the two years of suspense, or when the whole matter would be fought over again, at the end of the term of truce?

If we deserve in any way the commendation of a Manchester writer, as "a journal well known for its clear and trenchant articles on questions affecting transit," it is mainly for the following reasons. First, we regard the whole question of transit as one of supreme importance. It vitally affects the welfare of the productive classes. As regards the trades connected with building, it has the double importance, first, of affecting the price of materials and of labour, by the cost of transport, both of goods and of passengers; secondly, of affecting the distribution of building in various localities. Therefore, the subject demands profound study. Then, it is certain that there are mechanical rules that determine the *maxima* and *minima* of cost, of speed, and of convenience of arrangement. No sound views can be arrived at without these rules are clearly ascertained. Thirdly, comes the practical question of the wants of any particular locality, or class of men. These last questions are not to be settled by the scientific writer, but by the practical and experienced manager. But they will be only guessed at by him, unless he is first provided, by the man of science, with those economic limits within which he must work, as to which practice alone can tell him little or nothing.

Without attempting more than an indication of the rough limits within which such a discussion must be confined, we would point out,

first, that a load of third-class passengers, full in number, regular in time, loading and unloading itself, and walking away from the station, each man, moreover, provided with an annual ticket, so that he makes no demand on the time of the ticket-takers, is at once the cheapest and most remunerative load that a railway can carry. A third-class carriage, nine yards long, will contain fifty passengers, and weigh, with them, 11 tons 14 cwt. The percentage of paying load to gross load is 28.7 per cent., a little more than one quarter. A mineral wagon, six yards long, will carry, on the average, if quite full, 8 tons of coal, which, with the weight of the wagon itself, makes 12 tons 9 cwt. This gives a percentage of 64.26 paying load to 100 gross load. But the mineral wagon has almost invariably to return empty. This alters the proportion to 47 per cent. paying load, and, in fact, the average of the wagons of the great trunk lines gives 44 per cent. paying load of coal out of 100 tons gross load. Equal weights of train, then, will carry 28.7 tons or hundred-weights of passengers, and 44 tons or hundred-weights of coal. So that if the ton of coal is carried for 3d., the ton of passengers (subject to certain minor corrections into which we will not now enter) can be carried for 3d.; which comes to one-twentieth of a penny per mile per passenger. We do not assert that this is the actual cost, but the figures are approximately reliable.

On the other hand, it is left too much out of sight how great is the cost of stoppages. On the Metropolitan Railway it has been calculated that the cost of propelling a train from Moorgate-street to Praed-street, a distance of four miles, with seven intermediate sudden halts, is as much as would take the same train without a stop for more than five times the distance. Thus if, on the one hand, it be inferred, from the low mineral tariff, that the workman can be carried in full trains for 1-20th of a penny per mile, the mere fact of interposing seven stations in four miles to pick up or to drop the men as convenient, brings up the cost to upwards of a penny. This, however, is a statement in excess, as it is not the whole cost of transport that is increased by the stoppages; but mainly the two items of locomotion and wear and tear of way, which make together 40 per cent. of total cost. At all events, the 20th of a penny, which would be applicable over a long and unbroken run, is raised to nearly one halfpenny by the numerous stoppages.

It must not be supposed that we are now attempting to lay down the law, and to say that such and such is the exact cost of the conveyance of such a load of passengers. We have taken, for instance, every seat as filled. In point of fact, there are usually three empty seats out of four provided. The economy of the workmen's trains mainly lies in their being full. But we wish to point out how questions of this kind come under the control of distinct

mechanical laws, at which it is possible to arrive with precision, and that in ignorance of such laws, any discussion of the cost at which the North Kent Company can be justly expected to carry workmen is little more than perilous.

This view of the case is remarkably illustrated by the long delay and frequent divisions, turned often by a casting vote, of the Select Committee of the House of Commons on railway rates and fares. Very unfortunately, more than one prominent railway director sits on that Committee; a fact that tends to deprive the report, whatever it may be, of the character of impartiality. Nor will much weight attach to the decision of a majority of one or two out of twenty-three members. But it is hardly to be credited that during the sittings of this Committee in 1881 (which fill a Blue Book of 800 pages, besides a supplement of 350 more) but one engineer has been examined, and that to this gentleman, who appeared on behalf of a canal company, not a single engineering question was put by the Committee.

Not only is that so, but the evidence of the railway managers, so far as it goes, was directed to the positive discrediting of that scientific control to which the managers of foreign railways attach, properly, so much importance. Mr. Rendel's analysis of the working charges of the Indian railways was produced by a member of the Committee, who cited the testimony of Mr. Crawford, the chairman of the East India Railway Company, as to the practical improvements that had been introduced in the working of their line, owing to "the method which the companies now had of ascertaining the exact cost of every item of the work." The manager of the Great Western Railway only regards that as "a curious calculation, but I do not see how it would enable you either to get more profit, or to reduce your expenses, or to increase your trade." The manager of the London and North-Western Railway disdained any knowledge of Indian railways, thinking that "there is no fair comparison to be drawn between Indian and English railways." So far does this gentleman carry his view as to the utility of the comparative study as to the working of railways, that he actually stated the net returns on the French railways at 4, instead of 5½, per cent. on capital. In the same way, he says about American railways:—"I know nothing about them specifically." Thus, so far from eliciting that clear, scientific evidence, in the light of which the vexed problems as to terminals, preference rates, and the other matters discussed by the Committee, would almost settle themselves, the teaching of the evidence is to discourage that scientific knowledge, and thus further to perplex a question which, if dealt with in the manner that a true comprehension of its character would indicate, is by no means one of great complexity.

In saying this we do not for a moment undervalue the immense amount of detail which presses on the attention of the railway managers, and with which nothing short of immense practical experience will allow any one to deal. We cannot but admit the practical impossibility of setting forth, *à priori* and in a book, the details of those rates and charges which the managers tell us amount to millions. But it is one thing to give to the practical man full rule and discrimination as to practical details, and another to furnish him with those scientific and mathematical data within the limits of which all profitable work must lie. "It clearly cannot be in the interest of the public that a railway company is to be compelled to do a certain portion of its work at a loss, and therefore to handicap the other traders with a higher charge in order to make up that loss." By the alteration of one word, in this very just remark, the witness, Mr. Grierson, would at once make himself the spokesman of the great body of railway freighters. He should only say, "allowed," instead of "compelled," and we are altogether at one with him. But how does this fit with the statements by the same witness? "I know, speaking for myself, that we are carrying some of the traffic for Mr. Taylor at rates which do not more than pay our working expenses." "I think it is clearly in the interest of the public that they," the railways, "should compete with the sea." "We must either charge a competitive rate with the sea traffic, or give up the traffic altogether." This is said in explanation of a charge from London to Exeter of 38s. 4d., and of a charge

for the same class of goods, of 24s. 2d. from London to Plymouth, which is fifty miles further.

For very much of the comfort of life in this country we are indebted to the engineers who designed, and carried out, our railways; to the bold traders who advanced the capital; to the careful managers who direct the details. At the same time, it cannot be contended that the administration is incapable of improvement. The rates of fare and freight we are now paying are from 14 to 16 per cent. higher than is the case in France, and France is on the point of a great reduction. In punctuality, and even in safety, there is great room for improvement. On the other hand, the remuneration offered by the shareholders is wretchedly low,—only 4½ per cent.—against 5½ per cent. on the cheaper-rated railways of France. And connected with this is a general discontent, on the part of the principal freighters, as to irregular charges. It may well be the case, as is argued by some who have watched the railway system from its cradle, and analysed the returns not only of English but of foreign railways, that it is possible at once to content the freighters and to improve the property of the shareholders. That may be too good to be true, but, at all events, it is a statement which, backed as it is, demands adequate investigation. What we lament is, that when inquiry is instituted into a part of the subject, as in the case of the North Kent Bill, and of the Railway Rates Committee, sound judgment should not even be attempted. A party fight, *pro* or *con*, freely takes place in Committee. Men of the special science that must determine the question of profit and loss, in the last resort, are not even asked to appear before the Committee, or, in the rare exceptional cases, are not asked any scientific questions. We have abundant evidence, more especially from the manufacturing parts of England, that this mode of dealing with the complaints of the freighters will not satisfy the country.

Since this was in type, the Committee on Railway Rates have agreed on their Report. We have not time to analyse it to-day, but as far as the six recommendations which are reported in the daily press go, they seem to be fair and reasonable. But we have the means of knowing that the independent members of the Committee are disappointed with the result of their labours.

#### THE BOOLAK MUSEUM.

LITTLE did we suspect when some few weeks since we spoke of the scheme which had been determined on to explore the Delta of the Nile,\* that the march of political events would render any such undertaking impossible, perhaps for many years to come; and now it seems that it is not alone the further researches of the archaeologist that will by recent events be arrested. The collections of a generation of diligent antiquaries are threatened, if not with absolute destruction, with the scarcely better fate of dispersion. The announcement has gone the round of the artistic world that it is the intention of Arabi Pasha to dispose of the Boolak Museum. Stories have reached us of the courageous conduct of the director, M. Maspero (who succeeded, it will be remembered, the late lamented Mariette Bey), and who, in the midst of the utmost danger, has, captain-like, refused to abandon his ship. All who are aware of the exceptional value of the contents of the museum must have trembled to hear of the imminent danger which the collected treasures of twenty years' toil are at present running. Coupled with the threatened fate of that storehouse of Arabic art, the city of Cairo, the dispersion of the Boolak Museum, which has revealed so many secrets of the unknown past, adds only a further horror to the many that have accompanied the recent outbreak in Egypt. Should such a thing occur at Cairo, nothing can replace its treasures of architecture and decorative art, as delicate as any that flourished contemporaneously with our exquisite Gothic. Some knowledge of the pecuniary value of the contents of the Boolak Museum promises, it would appear, to prove the safety of the collection, and in this hope we must thankfully trust.

The story of the formation of the Boolak Museum affords in itself a not unrepresentative chapter of modern Egyptian history; the indifference and apathy with which the collection

has at all times been regarded by the natives, by the late Khedive Ismail Pasha himself,—without whose aid, however, it is frankly admitted the museum could never have been formed,—are only characteristic of the nation among which the late lamented Mariette Bey passed so many years of his life in the organisation of the museum which remains a monument that will do more to honour his memory than even the costly statue which, within a few days past, has been unveiled in his native town of Boulogne. The museum, installed in a series of warehouses, is far from being lodged in a suitable manner. Ismail Pasha had, it would appear, originally intended that it should be sumptuously housed, and many thousands of francs,—bondholders' francs, we suppose,—were expended some years ago in the erection of a house for the museum; a mass of ruined walls, lying on the road from Cairo to the Pyramids, is the sole result of this expenditure. In its present quarters the museum is, it appears, in dangerous proximity to the Nile, and had not recent changes been made with a view to raising the floor-level, the annual inundations of the Nile could not have failed in time to have seriously injured the collection. As it is, the objects are much affected by the prevailing dampness. There seems, however, a certain fitness in the situation of the museum, the Nile floating majestically by, as it has done century after century, with its river life the same that the Egyptians and the Israelites saw. Those who have visited the spot all agree in speaking in unmeasured terms of the beauty of the situation of the museum, pleasantly removed from the bustle, the noise, and the luxury of Cairo, the city of the Thousand-and-One Nights.

It is the especial feature of the Boolak Museum that it differs materially in its character from every other museum of Egyptian antiquities. It is a museum organised specially with a view to aid the study of Egyptology.\* The mode in which the collection was formed gives it this special character. Apart from a small gathering purchased by Saïd Pasha, it is entirely the result of the excavations conducted during twenty years past under the direction of the late Mariette Bey. The European museums, as every one knows, have mostly been formed in a far from consecutive manner. The Boolak Museum, on the other hand, is the result of a series of researches made on a regularly organised plan, directed by one man, and that man Mariette Bey. Of each period of history the museum contains all the information which research has been able to gather. In his invaluable catalogue, Mariette Bey has shown how the greater part of the European museums have been formed by the purchase of collections gathered largely without any coherence. No idea can be formed, he urges, of the Egyptian excavations, if it be imagined that their sole result has been the collections that form the pride of the European museums. For every relic there exhibited, twenty others have been left behind, as imperfect or too difficult to move. At Boolak, on the contrary, all the fragments found have been specially studied, and, however mutilated, are regarded as worthy of being placed in the museum. The result may be found by the general public to be somewhat solemn and severe, but to the student the collection is invaluable.

Not long since great changes were made in the museum with a view to ensuring its greater security from the possibilities of inundation. The interval was taken advantage of to rearrange many of the objects, in spite of the very restricted and inadequate quarters in which the museum is lodged. With the laudable desire of arousing in the native mind a proper interest in the productions of their ancestors, Mariette Bey arranged his gathering in a popular rather than exactly scientific order, but the changes were taken advantage of to effect a re-arrangement. Great difficulties had to be grappled with in the organisation, according to a chronological order; even greater difficulties presented themselves in the way of dividing the collection, as is the case in Paris, and more particularly in Berlin, into separate "civil," "religious," and "funerary" rooms. The largest gallery is filled with thousands of the statuettes, bronze objects, gold and silver vases, and various other relics such as are to be

\* Before going further, we would desire to express our indebtedness to the interesting notes of M. Gabriel Charbonnet, the Boolak Museum's publisher, the pages of the *Revue des Deux Mondes* in September, 1880.

\* See *Builder*, vol. xliii., p. 470.

found in every public collection; but, it may be observed, nowhere in such profusion or in such a state of preservation as here. In two other rooms are disposed a series of mummies, scarabei, amulets, arms, &c., found in the tombs, the *bric-à-brac* of a civilisation whose every relic possesses to us its value. The real interest of Boolak is not centred in these objects, specimens of which every museum possesses. The collection of busts and statues is one of the features of the greatest originality.

We possess, it is evident to all students, but very indifferent specimens of the sculptor's art in Egypt. Herodotus and Diodorus Siculus assure us that the Egyptians did not produce their statues as Greek traditions have directed. They divided the figure into twenty-one and a quarter different portions, the execution of which was confided each to a different workman. The result was so precise that the parts when put together exactly corresponded. Where the work was of exceptional importance, the different parts would be executed in precious metals, the head in gold or ivory, the rest of the body in bronze or alabaster. All traces of such statues have, it can easily be understood, long since vanished, or what few have been spared are but very inferior specimens. Many of the statues discovered possess the strong evidence of being portraits, some so markedly that a foreign type is recognisable in the features. Egypt we know was never entirely a self-governed country; its national life in the past, as in the present, was continually subjected to foreign influence. Too rich and beautiful not to excite the envy of neighbouring nations, it has ever been a prey to foreign invasion, but while under alien rule the people, it is to be remarked, none the less preserved unchanged their marked character.

One of the heads of the Boolak Museum,—a fragment detached from its trunk,—M. Mariette has not hesitated to regard as the portrait of Menephtah, the son of Ramses II., the Pharaoh who perished in the Red Sea. The bust of his father serves as a pendant, while round these two are clustered the granite features of Thomes III., Queen Taia, and many other interesting Egyptian rulers. It would, indeed, be a task beyond the limits of our space to describe all the curious relics of the Boolak Museum. The jewels of the Queen Hah-Hotep have been often described; of the scarabei there is but little to be said; they rarely possess interest except when hearing some historic name. Of the papyri of the Boolak Museum it requires a *savant* to speak; some are in a marvellous state of preservation, and are decorated with all the delicacy of skill and colour that give such a beauty to the Mediæval missals of Europe. The Egyptian Pantheon is, of course, represented at Boolak by an immense collection of gods and goddesses, in bronze, granite, porphyry, wood, and porcelain, facts which give some idea of the condition of the industrial arts in Egypt. The technical skill of the workmen, we have evidence, was great; of their processes,—they cancelled in a manner which, if it has been equalled, has never been surpassed,—as of their tools, we know nothing. All this portion of the museum, however, may he said to possess only a secondary interest, though it is impossible to pass over in silence the table of Saqqurrah, which confirmed, on its discovery, in so remarkable a manner, the dynastic lists of Manetho, or, again, the stèle of Sâu or Tanis, a "document" scarcely less precious than our own treasured Rosetta stone.

Perhaps the chief interest of the Boolak Museum may be said to centre in the two rooms,—devoted, one to the relics of the Ancient Empire, the second to those of the Hyccos or Shepherds.

The "Salle de l'Ancien Empire" is in itself a museum, containing, as it does, the oldest relics, perhaps, of human art. Twenty years ago the ancient empire was almost completely unknown. The studies of the Egyptologists stopped short at a great distance from this far-distant past. M. Mariette may be looked on as the Columbus of this new old world,—the oldest, perhaps, of which we possess any traces. His researches brought to light a series of "documents," as our French neighbours would say, of the utmost interest. To judge by the specimens we so far possess, civilisation under the ancient empire had no infancy. Like Popsy (if so flippant a comparison may be permitted), it seems, 6,000 or 7,000 years ago, to have "grown" on the banks of the Nile with the rapidity of the river-plants which come to perfection in a few years

and then die down. From its first commencement this civilisation seems to have arrived at perfection; but it disappears as it came. At the end of the sixth dynasty Egyptian civilisation collapses suddenly, only to reappear, four centuries and a-half later, in the eleventh dynasty. During this long lapse not a relic or a fragment shows us the existence of the Egyptians. It would seem as if the Nile had, during those long generations, unintermittently covered the country up, as it does for the few months annually. Nothing is stranger than this long interlude in the history of a people, the most industrious builders of the whole of mankind. No invasion explains the gap, for no ruined buildings of an earlier date attest the passage of an enemy. "Egyptian civilisation," as Mariette puts it, "sank in a cataclysm only the more inexplicable as it has left nothing standing, not even ruins." When, four centuries later, civilisation holds up again its head, its character is deeply changed, it is no longer the genial spirit of the earlier days; in its artistic creations we can trace the grimness of the new ideal. After the representation of the happy scenes of earthly life, we have brought before us the painful travels of the soul in its journey to immortality. Mystery, therefore, it will be seen, shrouds the origin and the close of the so-called ancient empire.

It is strangely characteristic the art of this period as we see it at Boolak; it is essentially what we have come to call realistic; it is the crude representation of facts robbed of any of that high-souled ideal that forms the characteristic of Greek art; and this is the reason of the indifference with which so many regard all Egyptian art. In no manner can its inferiority be shown more strikingly than when by luck one may chance to light upon some creation even only feebly influenced by Greek teaching. Egyptian art is not beautiful in the ideal sense of the word. We are astonished at its creations, it is, as it has been described, "seen" art—not "thought" art. But the antiquity of its creations, and the spell that time throws round all it touches, place Egyptian art beyond the reach of criticism. In these rooms at Boolak it requires but a feeble gift of imagination to picture the sixty centuries that are gathered about one, and to imagine the gods those distant people adored, the poems they learned, the arms with which they fought, the wives and daughters they loved and wept for.

The more closely the creations of this mysterious ancient empire are studied, the more clearly it becomes evident that they were far from being the products of a civilisation in its infancy. Plato would seem to have been aware of this when he spoke of seeing paintings and sculptures executed, he states distinctly, 10,000 years previous to his time. But all is conjecture. Our prehistoric studies are too uncertain to allow of any positive statements respecting a period of which we possess such few remains. Perhaps it is in these distant days that belongs the Sphinx, and beside it the equally mysterious temple which in form resembles no other building in Egypt. It is simply an enormous one of masonry formed of blocks such as even in Egypt have no equals. The mode in which this mysterious temple is built is an enigma; the stones are laid without order, and the interior seems to have been hewn out. It has been suggested that the work is the production of the period of transition between the time when man inhabited the caves, and that in which architecture first makes its appearance. In the days of Cheops, we learn from a stèle, the temple required restoration. The oldest monument, the date of which is known, is the stepped pyramid of Saqqurrah of the first dynasty; it bears, however, no trace of being the production of a half-fledged civilisation. The "Salle de l'Ancien Empire" is certainly by far the most interesting portion of the Boolak Museum, it shows us a glimpse into the history of a world undreamt of till within a few years.

The "Salle des Hyccos" is scarcely less interesting. The fate of Egypt, as has been justly remarked, has been inevitably to find itself under foreign rule. The researches of archaeology only tend further to prove this fact, at the same time that it becomes evident how surely and completely their conquerors were absorbed by the Egyptians and their civilisation. Thus it is with the great invasion of the Hyccos, who, on the authority of Manetho, spread over the land at the close of the fourteenth dynasty devastating everything, the Huns and Vandals of ancient Egypt. Twenty years ago this

character given to the Shepherd invaders was accepted implicitly, in spite of the evident exaggeration of the historian, whose statement that the invaders destroyed everything before them is amply disproved by the existence to this day of numerous monuments erected long before the advent of the Hyccos. These pretended iconoclasts, research proves were humble worshippers at the Egyptian shrines.

It is in the "Salle des Hyccos," in the Boolak Museum, that the story of these Shepherd conquerors can best be followed. There we learn that, like their captives, they erected huge monuments. At Tanis, Mariette discovered numerous remains of the work of their day, and more than one strongly stamped with the peculiar character of the foreign race.

The importance attached to the two rooms containing the relics of the ancient empire and the rule of the Hyccos will be at once seen. It was in the arrangement of these rooms that the most important modifications were introduced at the time of the recent changes made at Boolak just previous to the death of the late director. Mariette gathered in the former of the two rooms everything connected with the mysterious epoch in which civilisation made its first appearance on the banks of the Nile, and, perhaps, in the world. In the second room he gathered together the relics of a period which till recently has been utterly misrepresented.

The Boolak Museum is not, it will be understood, merely a collection of archaeological objects gathered without an aim and shown without system; it is the result of a long period of learned and earnest research, doggedly followed out and amidst the most trying difficulties, the work of a single man who, in twenty years, brought to light these treasures, buried for so many centuries under the dust of time. It is scarcely remarkable that the collection should bear a strong idiosyncrasy. And yet the Boolak Museum is but a small portion of Mariette's labours scattered over the length and breadth of the land. Mariette Bey was, indeed, a true archaeologist.

Historic archaeology is a science, which, as bo plainly showed, requires followers not alone merely intellectually strong, but gifted with exceptional energy of character and firmness of will. Egyptology is a branch of archaeological research which demands in a large measure these qualities; it is the study of a history which carries us back further than the researches of the Indian, the Assyrian, the Chaldean, and the Sanskrit scholars. But much yet remains to be discovered. It is only in its general features that the subject has been so far approached, the details are each day being filled in. Even those historical periods with which the Egyptologists are comparatively familiar, contain many an unfiled gap. Egyptian art, religion, and philosophy only offer so far a series of unsolved problems. The elements of the science exist, the foundations have been laid, the process of erection is determined on, but that is all; there yet remains much to be done before Egyptology can venture to place itself beside the great discoveries of the century. It is, perhaps, alone in Egypt, on the spot, that the subject can be fairly studied in all its bearings, and it is in such a museum as that at Boolak that more can be learned in the course of a few hours' study than elsewhere could be acquired after much laborious research.

Placed as it is at Cairo, on the banks of the solemn Nile, the Boolak Museum is a bond which unites the living present with the distant past. It is an institution, though of foreign organisation, purely Egyptian. It contains the history of a land interesting to every civilised nation. The refined portion of the world would deeply regret to see the Boolak Museum dispersed. Years ago its fate caused constant pangs of fear to its director; but of this fact we may be sure, that should Boolak lose its museum, Cairo, with all its romance, its beauty, and prestige, would lose one of its brightest gems. Beside the grandeur of its mosques, its shady picturesque streets, and its over-towering historic Pyramids, Cairo would be wanting in one of its greatest features were the city of the Thousand-and-One Nights to lose its museum at Boolak.

**Sunderland.**—Messrs. J. & T. Tillman have been appointed architects for the erection of the new buildings of the Sunderland and Durham County Institute for the Blind, which are to be erected in Villiers-street.

### THE PRELIMINARY REPORT OF THE INSTITUTE COMMITTEE ON THE LAW OF LIGHT.

THE Committee of the Royal Institute of British Architects, which was appointed in April, 1881, to inquire into the question of the law of light and air as it affects buildings, and to make such practical suggestions with respect thereto, as may seem expedient, has just issued a short Preliminary report, prefaced by some remarks from the members of the Committee on the scope and aim of the inquiry. Considering that it is more than a year and a quarter since this Committee was appointed, it is somewhat disappointing after the lapse of this time to be presented with no more than the merest outline of a report. As members of the Institute and others are requested to forward further suggestions on the subject, it will evidently be a long time before any final report is in the hands of the profession, and longer still before any practical steps can be taken to obtain an alteration in the law consequent upon any such report. As we said, this preliminary report is prefaced by observations from members of the Committee. Since, however, an important discussion took place at the Institute before the Committee was appointed, upon which we commented at the time, it appears unnecessary to consider these individual opinions at length, or the able historical summary of Mr. Goddard, the author of a deservedly well-known legal work on easements. In may not be out of place, however, to consider the draft report which we assume, so far as it goes, represents the collective opinion of the Committee.

The first head of the report states that "the Prescription Act requires modification, more especially in respect of its conferring an inalienable (indefeasible?) title to light" against reversioners and persons under disability. From this it is evident that, speaking generally, the Committee do not propose any abolition of the Prescription Act so far as it affects the right to light, or, we may assume, of the common law either, which, it may be well to point out, was not abrogated by the Prescription Act, but only supplemented by it, as was decided in the well-known case of *Aynsley v. Glover*, in the Court of Appeal (Roscoe's "Digest of the Law of Light," p. 9). As we stated when the Committee was appointed, we do not believe that any substantial change in the principle of this law can be brought about, especially as the tendency of the Legislature is to shorten existing periods of prescription. That reversioners and persons under disability should be disregarded in this matter of the law of light has always appeared strange, not to say unjust, and therefore we see no reason why this suggested modification should not take place. But it is after all a very small change.

The second head of the report is to the effect that an owner of a dominant tenement should give notice to adjoining owners of all new lights opened or increased by him. That is, we presume, of all new lights and old ones increased. Thereupon the servient owner may register his objection to the light in question. But the criticism suggests itself, why should such a notice and objection not apply to all lights which have not yet existed for the regular statutory period. Again, this objection should, in the opinion of the Committee, be registered in a County Court, and should have the same effect as a physical obstruction to the light itself, in preventing the creation of an indefeasible right to the light. In regard to this latter notice, which we should prefer to call a "notice of interruption," for an objection without an interruption has no legal force, we do not see why the owner of the servient tenement should not take care of himself, and why the owner of the dominant tenement should be obliged to give notice of a new or of an enlarged light. As long as the owner of the servient tenement can prevent the right accruing in a less barbarous manner than the present, the main object is attained. If persons begin to walk across a man's field, so as to commence the creation of a right of way, he can stop them by obstructing their path or by putting up a notice; the trespasser is not required to give notice that he is about to commence the habit of walking across a certain field. As long as a man has the means of protecting himself, it is his own fault if he does not do so, the law should not treat him as a mere child. Subject to this criticism, the suggestion seems to be

a reasonable one, but whether the County Court is a fitting place for the registry seems doubtful. We should prefer the local District Registry of the High Court. But if ever we get to registering titles to land the proper place would clearly be such a land registry. The scheme, however, would require much working out, for it is obvious that plans must be deposited with every notice of interruption, accurate verbal description of the light must be given, and all this would cause expense, and would require a special clerk in every registry. That it is, however, a change which is not only feasible, but might be useful, seems hardly open to doubt.

With the third proposal, however, we are wholly unable to agree. It is that a special tribunal should be created to deal with all questions of light. Such a suggestion has been made before, in regard to cases arising under the Building Acts, but it has never been found practicable. With regard to such special tribunals to try questions of light, there is one cardinal objection, that it is impossible to have a different tribunal to deal with every different branch of law, especially of a branch of law which does not create so much litigation as some other branches. For example, more disputes arise annually out of charter-parties and policies of assurance than there do out of alleged infringements of the right to light. There is no special tribunal, again, for patent cases, nor for disputes between builders and building-owners. The proposal is, in fact, absolutely and clearly impossible. Moreover, we are not satisfied that the present tribunal is an unsatisfactory one. There is no question that interlocutory injunctions can be obtained with great rapidity, and as the existing block of Chancery cases is dealt with this Division will be able to proceed even more quickly with such cases. Moreover, we may point out that such cases may now equally well be brought in the Common Law Division. The expenses are less there than in the Chancery Division, and all the remedies, either by injunctions or damages, are equally within the jurisdiction of a common law judge. It is, in fact, quite unnecessary that so-called light-and-air cases should be so largely tried in the Chancery Division. We think, however, that a move in the right direction would be the appointment of a rota of professional assessors, one or two of whom might sit with the judge during the trial of such questions to give him the benefit of a professional knowledge. In the Admiralty Court, and in the Wreck Commissioners' Court, such assistants constantly sit. Their province is not to decide or give a judgment, but to assist the judge and to elucidate technical questions during the bearing of the case. Naturally, however, the opinion of the assessors has very great weight with the judge in regard to his ultimate decision.

Again, we do not think that it would be advisable to adopt any absolute angle in regard to the amount of light, though that of 45° often furnishes a useful test. If a man has a right to light, it is obvious that he should be able to recover if he is deprived of a substantial amount of such light, so that he is thereby injured. It is true that it often is a matter which requires prolonged and careful investigation and weighing of conflicting evidence, but once this has been done a satisfactory decision is usually the result.

A change which would, we think, improve the existing law, but which is not suggested by the Committee, is that in no case shall a judge either order a building to be pulled down or prevent it from being completed, even though it infringes a right to light, if the owner of the dominant tenement can be fairly compensated by damages. Since Lord Cairns' Act (21 and 22 Vict., c. 27) was passed a judge of the Chancery Division can give damages, or can grant an injunction, and a judge of either Division of the High Court has, since the passing of the Judicature Act, still more undoubted discretion. But what is desirable is the laying down of the principle that where damages are a reasonable recompense for the infringement of a right of light, they should in all cases be given rather than that an injunction should be issued. The result of the judicial decisions on this point is that the Court will generally award damages if it can, but the decisions are unfortunately by no means uniform on this point (see "Digest of the Law of Light," p. 44). Therefore, there should be an enunciation in the Statute Book of the principle

which has been indicated above, so that less discretion would be left to the judges. These are the chief criticisms which occur to us in regard to this preliminary report. We should have been glad, we confess, if the Committee had followed the course of procedure adopted by the Legislature, and have taken evidence not only from England and Scotland, but from America and the Continent. If they had occupied the past year by so doing, and then, as is frequently done by Parliamentary committees, have reported so much evidence as was taken before making a final report, it would have been more satisfactory than the present issue of individual opinions,—preliminary observations, in fact, of members of the Committee, accompanied by a very meagre preliminary report not based, so far as we can discover, on any independent evidence. We can but hope, for the credit of the Institute, that a final report will be issued with the least possible delay, though it is clear from this preliminary report that no great or important change in the existing law will result from the deliberations of this Committee.

### SHORING AND UNDERPINNING.

IN producing a small and compact essay (it hardly can claim to be called a "Treatise") on the above-named subject,\* Mr. Stock has done something to supply a manifest want in the literature of practical architecture and surveying. His little book, however, though well and sensibly written, is not quite so important as it at first appears, since it is in reality rather a statement of what is usually done in ordinary cases, and of what has been done in some cases of special difficulty, than an attempt to show what is the best method of procedure on a definite principle. The book is, in fact, a compilation to a great extent. The author quotes at some length, for instance, Sir G. G. Scott's remarks on his work in shoring and restoring St. Mary's at Stafford, and reprints almost, if not quite, at full length, Mr. Seddon's interesting and valuable description of the shoring of Grosmont Church tower, with the illustrations, both these being apparently taken word for word from the "Transactions of the Institute of Architects," from which also an account of M. Flach's treatment of Bayeux Cathedral is extracted. These extracts come under the head of "Shoring of Medieval Structures"; but to one of the most remarkable and important pieces of work of that kind, the shoring and lifting of the nave wall of St. Alban's Abbey, of which there is no account in the "Transactions" aforesaid, no reference whatever is made; a curious omission in a book written for the present day, seeing that the operation in question was the largest and most important of the kind that has been carried out in this country, and that some useful lessons might have been deduced from it. We gave a short but careful account, from notes on the spot, of the manner in which the shoring had been constructed and the lifting force applied (in the *Builder* for 1878, p. 465). The author does not seem to have been aware of this; but he does name at the head of his list of references "The *Builder*, March 15, 1861." There is no number of the *Builder* of that date; a publishing-day fell on March 16th of that year, which number, however, contains no reference to the subject in hand. The volume for 1861 contains more than one report of lectures and discussions on the subject, relative to Bayeux and Chichester; whether it is to any of these the author refers we do not know. The *Builder* for 1859 also contains (p. 341) some account of "a new method of shoring," with an illustration. As no professed object of Mr. Stock's book is to put together information which otherwise is only to be found scattered about in different places, this explains and justifies to some extent the large amount of quotation in the book; but it is a pity in that case that his very first reference should be wrong, and that he should have omitted all mention of what we believe is the only published account by an eye-witness of so important a piece of work as the shoring of St. Alban's Abbey.

In treating of the shoring of Medieval structures the author has, however, given good authorities, though at second-hand. In the first portion of the book, on the shoring and under-

\* A Treatise on Shoring and Underpinning, and generally dealing with ruins and dangerous structures. By Cecil Under Stock, Architect and Surveyor. With Illustrations. London: E. F. Batsford, 1882.

pinning of ordinary buildings, such as street houses, the descriptions are clear and well written, and the illustrations well executed, though a little too small for the best practical purposes of reference. But it appears to us, from internal evidence, that here again the author has been working a good deal at second-hand, and that his authorities in this case have not been eminent architects applying special consideration and knowledge to the matter, but that he has gone upon the ordinary practice of contractors, and upon what is currently approved or allowed by district surveyors. We imply no slight against the practical and scientific knowledge of the latter body of professional men, whose average of knowledge and ability in London is certainly high; but every one knows that a surveyor may, and often does, passively permit a method of construction as legally sufficient and not calling for his actual interference, which he might, nevertheless, by no means actively direct as the best possible way of doing the work. The author frankly admits that he "has been greatly assisted by the kind co-operation of Messrs. J. & J. Greenwood, the Contractors for the shoring executed by the Metropolitan Board of Works." If this means anything, we presume it means that his recommendations are more or less founded on the actual practice of the said contractors, who, no doubt, have had a great deal of practical experience. Mr. Stock also dwells largely, and not, perhaps, quite wisely, on the great opportunities presented in London for studying shoring in actual operation. In London, he says, the student has only to turn "sharply round the corner of a street, and he will run against a huge obstruction in the middle of the footpath, the feet and sole-piece of a system of raking shores. He will doubtless at once take out his note-book and rule, and jot down the scantlings and position of the separate struts," &c. If he does, he will occasionally note down some queer things; but, on the whole, he will find the occupation somewhat monotonous, as, in fact, there is, for the most, one accepted practice of doing these things, which is repeated over and over again with little or no variation. This, however, the author says, "is the best way to gain practical knowledge upon anything: see the work begun and carried out to the end, go into its object, criticise it if possible, and consider whether, from your knowledge of the subject, it could not have been better done some other way." Only he says, and very truly, that the student who goes to get information from talking with workmen must go "well armed with terms," for, as a rule, the workman takes it for granted that you understand the phrases he uses, and will vouchsafe no explanation concerning them. This peculiar inability to describe anything except in the usual phraseology of the craft is characteristic of the operative in almost every branch of labour, and is one of the distinctions between the craftsman and the man of science: the latter can give you intelligible equivalents for technical terms; the workman not only cannot do so, but cannot even understand why words intelligible to him should not be intelligible to every one.

There is no doubt the author is right in the importance which he attaches to the actual study of a system of construction in operation, as opposed to mere book knowledge. But the study and recognition of principles in the first instance is a very important preliminary to the study of the operation itself, and to the acquisition of that kind of knowledge which can be obtained from interviewing the workman or the contractor. There seems to be too much indication, in the present work, of putting the cart before the horse in this respect: of the author having accepted the prevailing practice as the rule to go by. It is only on this supposition that we can account for some of the criticisms and recommendations which we meet with in Mr. Stock's pages. For instance, in describing the manner of placing a rider shore, which is made to spring from the back of the next lower shore when the building is too high for the top to be reached by a raking shore in one length, he says:—"In some cases the foot of this rider is made to rest upon a large cleat nailed to the back of the shore below; but the best method is to let it rest on another piece of timber of the same scantling, which, secured to the back of the shore below, goes down to the sole-piece." The best method! It is the only allowable method: the contractor who rested a riding-shore on a cleat depending merely upon nails

would be rated as incompetent to be trusted with such work, and the surveyor who should permit it as coming *à fortiori* under the same condemnation. The idea of allowing the highest shore of the system to depend solely on the cross-strain of the nails driven through a cleat, and of only mildly suggesting that it is "better" not to do this, is really too absurd for serious criticism.\* Then we are told that when an upper shore is too long to be trusted to bear stiffly without strutting, it is strutted from the lower shore or from the wall-piece by planks nailed on side of the two pieces of timber. So it is, as a matter of fact; it may be seen in every street in London where shoring is being carried on, and a more clumsy, unscientific, makeshift dodge could hardly be imagined. Mr. Stock will not find that in "Tredgold," to whom he refers as one of his authorities. Of course the shore should be strutted, where strutting seems necessary, by a solid piece inserted between the two shores; that is the only proper and workmanlike way of doing it. No doubt the planks and nails are used constantly, and in ninety cases out of a hundred there may be no failure; but it is the hushness of a didactic work on such a subject to show the best way of doing it, not to record the save-trouble contrivances of contractors and workmen. The faith of the average contractor in cleats and nails is exhibited in other points with a simplicity which is quite touching. The author describes

the manner of abutting the raking shore against the wall-piece, by bringing its upper end to bear on a short needle let through the wall-piece and into the wall, and projecting to take the head of the shore, which, as he rightly points out, should be forked to receive it, in order to guard against the possible fall of the shore in a high wind, should any movement of the wall have left it loose enough to fall. So far, good; then he adds that for further security a cleat is nailed on to the wall-piece immediately above the needle (as shown in fig. 1 in the accompanying diagram). This also is usually done, and it may produce satisfaction to the eye of the workman, and, perhaps, of a surveyor who

\* Almost equally curious is the recommendation by Sir G. Scott, in his remarks before referred to, not on any account to trust to the floor of the church as a base for heavy shoring. It is supposed that the members of the Institute of Architects really required such a recommendation as that?

is the slave of custom; but the cleat when thus applied is absolutely useless, it is a mere piece of nonsense. If, from a new subsidence of the wall, any strain came upon the shore sufficient to bend the needle upwards or make it give way, that same strain would be sufficient to tear away the cleat from its nailings or to bend the nails. If the cleat were placed as in fig. 2, let partially into the wall-piece, it would then be of real use in such a case, bringing the strain on a new portion of the wall-piece; but for any such failure to occur, the needle must either have been unsound or of too thin scantling to begin with. Again, we are told that a cleat is to be nailed on the sole-piece (fig. 3) to prevent the shore from slipping. If the shore means to slip, the nailed cleat may prevent it if the strain is not very great, but it is quite a chance, and a most unscientific construction, trusting to the mere power of the nails to resist shearing stress. The firmest construction of all, of course, would be to let the foot of the shore into the sole-piece, as a principal is let into the tie-beam, and then wedge up under the sole-piece; but the author gives a valid reason against wedging, at least in the case of a decidedly rotten and insecure wall, as tending to shake the wall in driving the wedges, and bring about the very catastrophe which the shoring is intended to prevent. It is for this reason that the system of levering the shore up to its bearing with a crowbar is in such cases preferable to driving wedges. But this system may be combined with a more satisfactory method of securing the foot of the shore, by notching the sole-piece as shown in fig. 4, sufficiently far back from the intended position of the shore to allow the heel of the shore to clear the notch when it is first put in position, and after it is levered up to its bearing the cleat can be inserted as shown, and if necessary, tightened up by a slip of hard wood inserted at A. It will then be a really firm construction, not depending on nails for its security.

It may not be necessary to take this trouble in small jobs; but in large ones nothing ought to depend on the transverse strength of nails, or the capability of the wood-fibre to resist being torn by them; and a book of this kind should seek to recommend the best and most trustworthy system, not merely that which may be actually in practice. For the same reason we object to the statement that needles, in preparation for underpinning, may be placed at from 6 ft. to 7 ft. apart. That is practically done, but it is the extreme of safety limit; 4 ft. to 5 ft. is the preferable limit to recommend.

The author deserves every credit for having been the first, we believe, to produce a separate work on this subject, which is so important at present when so much rebuilding of old streets is going on; and there is no doubt that his book will be of practical use in calling the attention of young architects especially to the subject, and also as an assistance to them in preparing—

"For the pass-examination at the In-sti-tute."

(to adapt a line from a well-known operetta) as the methods described are those which are in vogue with the metropolitan surveyors at present, and represent therefore exactly what the aspirant for a surveyorship is required to learn. It is one thing, however, to recommend what will "do," and to bring together useful information as to common practice; and another thing to point out the best methods, and the defects of those sanctioned by common practice. The latter should be the object of a complete treatise on the subject, and the present work does not fulfil it, and therefore cannot be regarded as permanently a text-book on shoring, though it is unquestionably useful, as far as it goes. If it reaches a second edition the author may be able in the mean time to consider the subject from a more general and scientific point of view, as well as to enlarge the number of examples, and thereby increase its value materially. A good many, however, will thank him for the information which he has brought together in the present small volume, the rather as there was nothing hitherto in a compendious form.

**Birmingham Borough Asylum.**—A very handsome brass eagle lectern has just been presented to this asylum in memory of the late medical superintendent. The work is from Messrs. Jones & Willis.

FIFE HOUSE:  
A RETROSPECT AT WHITEHALL.

You must no more call it York-place. That is past;  
For, since the cardinal fell, that title's lost:  
'Tis now the king's, and call'd Whitehall.

"PROPOSALS for taking this Land on Lease will be received by the Commissioners of Her Majesty's Woods." Such is the announcement which, at this juncture, thrusts itself upon one who may seek for a quiet half-hour within the shadow of Inigo Jones's masterpiece in the western quarter of the town. Passing through some fine old gates with railings on a dwarf wall, which it is a comfort to know have already excited the acquisitiveness of more than one connoisseur, one enters a large neglected waste lying between Whitehall-place on the north, the Embankment Gardens on the east, and Middle Scotland-yard with Whitehall-yard on the west and south. Containing fine old trees, massed shrubs and gentle declivities here and there, its former propinquity to the river when Boards of Works and Embankments were not, is sufficiently indicated by the ghost of a lifeboat which rests upon its keel in the midst. Two or three children are at play, innumerable birds chirp their evensong, but all else, even to the squared stones scattered about, speaks of a time that is gone for ever. Readers of this journal will be familiar with the site, if not with the actual garden, in connexion with the much-voiced question of the Government Offices Bill.\* We do not propose here to touch upon a matter which is fully treated elsewhere in these columns. Still, with the ominous inscription, "Site for the Hotel Metropole," standing up from what was the neighbouring garden of Northumberland House, it may be well to trace its every trace as obliterated by the combined labours of surveyors, architects, and builders, to devote a few words to the historical associations whose memory lingers around.

Whitehall-yard itself is the survival of the court that lay within the entrance-gate of King Henry VIII.'s "Palace at Westminster," as he by statute (28th Henry VIII., cap. 12) named the palace which he established on and around the York-place of the fallen cardinal. The existing residence he so improved and enlarged, in the Tudor style, as in a manner to rebuild it. Upon the accession of King James I., Whitehall, with its neighbour "Scotland," the present Scotland-yard, underwent further changes. It is readily conceivable that King James VI. of Scotland cared little to perpetuate an abode which proved a standing monument of homage due, and sometimes paid, to the Emperor of Britain by the sovereigns of what is now the north-western part of Scotland. But with Whitehall the case was different, and there he employed the constructive genius of an Inigo Jones. Of his plan nothing was carried out but the Banqueting-house, which balanced, though it did not harmonise therewith in design, Holbein's gate across the thoroughfare which led southwards into King-street.† The troublous times of King Charles I.'s reign prevented him from resuming his father's proposals. Of his sons, the one expended what little he could spare from less worthy objects upon a palace at Winchester, the other had neither inclination nor opportunity to promote the new scheme. In William III.'s reign the palace was twice attacked by fire,—in 1691, and again in 1698,—on each occasion in consequence of a maid-servant's negligence, the later fire raging for upwards of seventeen hours spared hardly anything but the Banqueting-house, and the finest out-door statue that London possesses. There are three or four sets, all diverse, of Inigo Jones's plans. One will be found in Campbells' "Vitruvius Britannicus," 1717; another was published by Kent in 1727; and another, showing the four fronts, by Lord Burlington, in 1748-B. There is also a set at

Worcester College, Oxford. Those in the "Vitruvius" are considered by some not to be genuine. Wren drew up plans for furthering the conception. One set he made for King Charles II., and two others, after the later fire for King William III.

Taking the palace as it appears in Fisher's drawing of 1680, we see that the principal court was entered by the gate that stood between the recent hideous addition to the northern side of the banqueting-house and Lord Carrington's house, the site of the former Wardrobe. Towards the river the court extended as far as the wine-cellars, beyond which a passage led to the pantry and kitchen, upon its left the great hall and chapel. At this date the cellars, hall, and chapel are replaced with the office of the Medical Board, and Nos. 4, 5, and 6, Whitehall-yard. The white house on the northern side of the yard between what was Lord Stuart de Rothesay's house, now the museum of the United Service Institution, and an entrance to Lord Carrington's stables, was the Confectionary. The offices, opposite, of the Board of Trade, having an elegant doorway of George II.'s time, stand over the old Exchequer Office, and retain in their basement some fine old stonework. By the side of Viscount Gage's, No. 4 in the yard, may yet be seen a piece of old wall. To the south of the Banqueting-house was the extensive privy garden, stretching as far as Montague House and Richmond-terrace. In it were set up the famous dial constructed by Francis Hall in 1669, and the bronze figure of King James II., carved by Grinling Gibbons in 1666. The latter, which now faces the entrance of the Board of Trade, is vulgarly but erroneously believed to point to the spot where King Charles I. suffered martyrdom.\* The remaining space, bounded on the south by the howling-green of King Henry VIII., on the north by a further court and Scotland-yard, on the east by the river, and on the west by the cockpit, tennis-court, the tilt-yard and its gallery, was taken up with about sixty sets of apartments, whose occupants are named in Fisher's plan. Lady Villiers, for instance, lived in the rooms east of the gate at the northern end of King-street; the Duchess of Cleveland had lodgings by the privy stairs. Here, as on one memorable evening spoken of by Pepys, she was exposed to inundations from the Thames. With a lively recollection of such mishaps King Charles II. begged the House that his expected wife "might not find Whitehall surrounded by water."† It was no uncommon thing, indeed, for the Treasury chambers over against King-street to suffer from flooding even at a more recent period. The Dukes of Monmouth, Ormond, and Albemarle had chambers between the tennis-court,—and now stands the Privy Council Office,—and the tilt-yard, where was until lately the Adjutant-General's Office, Horse Guards. The old Treasury chambers were behind Gwydyr House, the office of the Charity Commission. The rooms of James, duke of York, occupied the site of the house in which Sir Robert Peel died, in Whitehall-gardens. Lord Fielt's honso was erected over the "small beer cellar" of Hollar's print, No. IV., a little to the east of the United Service Museum. Here, singularly enough, one stands not upon English ground, but on the very soil of Scotland. The story runs that that nobleman was at great pains to cover all the land with earth, &c., which he caused to be brought in vessels from the further side of the Tweed. His executors leased the house to Lord Liverpool, who died here in the year 1828. Fife House, which was subsequently used for the purposes of the India Museum, together with Little Fife House adjoining it, were pulled down soon after the expiration of the crown lease in April, 1864. Their gates, opening into Middle Scotland-yard, with the stables along the southern side of the garden, are all that remains of them at Whitehall, though part of the staircase of Fife House is preserved in the South Kensington Museum. To the east of their site still stand two old buildings, which are well worthy of inspection. They are the ancient "Beer Buttery" of the Palace. The ground floor, built of stone, contains one or two good doorways, and in the southern of the two,—the Almonry Office,—is a fine Perpendicular window. Before Fife House was built, the

water flowed up to a walled terrace that ran along the riverside from the battery as far as the public stairs. The archway beneath the northern of the two houses,—the Queen's Treasury,—formerly opened upon this walk from York-place and Scotland-yard. Upon the building of Fife House some of the foreshore was reclaimed, as far east as the inner paling of the Embankment-gardens extending to the stairs. The causeway, blocked with refuse and rubbish may yet be traced. The house known as the Queen's Treasury had been given over for the use of Queen Caroline, wife to King George II., and afterwards for that of the Consort of his successor. The Almonry Office had been the treasury of the Princess Dowager of Wales. In the year 1805 it was granted to Queen Charlotte for the offices of her secretary and comptroller. This building will have to make room for the forthcoming building operations. Sir John Vanburgh's house, the "Goose-pie" of Swift's satirical lines, and which he had built for himself from the ruins of Whitehall, was situated to the south-west of Fife House. Hollar, Vertue, E. Rooker, J. T. Smith, with other artists, made many interesting pictures of most of the places I have here mentioned. One of the finest views ever presented in London was that from the western end of Whitehall-place, looking due east across the low wall which stood at the further end, to St. Paul's in the distance, a vista since destroyed by the interposition of the monstrous South-Eastern Railway bridge.

Walking around this garden, one's thoughts naturally revert to some of the scenes and events of which it is a mute survivor. Summoning to the sessions of things passed, we may conjure up for a few moments the magnificent "fall-blown dignity" of Wolsey, the feasts with which he would entertain his sovereign at York-place, and one of which, described by his faithful Cavendish, yet lives as of yesterday in the pages of Shakspeare; we see him, deserted and dishonoured, take hoat at the stairs for the home at Esher, which he had established near his other palace upon the opposite bank of the river; by-and-by Anne Boleyn, all rejoicing, is welcomed to a palace from which she is shortly to be hurried to the Tower Green. Seated at a window by the Exchequer, the weakly son of Jane Seymour listens to Ridley preaching in the privy garden beneath. Soon the tournaments and passenges-at-arms, in which his right royal sister so much delighted, give place to the drunken revelries of her successor on the throne; these varied, it is true, by the exquisite masques upon which Jonson bestowed all the resources of his fancy and Inigo Jones stands forth, horrible, beyond all the rest. A king comporting himself with "the placid courage that has half-redeemed his fame," and which inspired the pen of even such an opponent as Andrew Marvell, is beheaded in the open street before the Banqueting-house, the populace sending up to Heaven such a cry as had never been heard before! Passing by the affected austerities of the Puritans, we linger awhile in the company of those who crowd the pages of Pepys, Evelyn, and Grammont. We may smile at the first-named relating with what pleasure he saw the lace petticoats of my Lady Castlemaine banging in her garden, or recall the description that Evelyn gives of how King Charles spent his last days at Whitehall. More anxious times are near at hand. A young queen and her infant son are sent away by stealth one winter's night in a coach to the ferry at Millbank; with the child asleep in her arms she stands for hours by the tower of Laubeth church seeking its small shelter from the rain. The next day she is followed by the king who, in the impetuosity of his flight, takes hoat at the privy stairs and drops the Great Seal into the river. Not long after, his daughter Mary returns as a royal consort to the home of her childhood, going about from room to room in the ease of security and the pride of possession, but with no regard for the occurrences which must have been present to her mind, or for the father whom both she and her sister had deserted. Reflections like these are awakened by the prospect which just now lies around the site of Fife House, a prospect that adds yet one more example, were indeed, such an addition needed, to the mutability of human affairs, in which our sovereigns, in common with the moanest of their favourites, have had their appointed share.

\* See the *Builder* for August, 1877, et post.

† This gate was taken down in 1750. William, duke of Cumberland, intended to set it up, with two wings, in the Long Walk at Windsor, where he was ranger. His project failing, parts of the gate were incorporated in some of the keepers' lodges. Of the eight bust-medallions, in terra-cotta, the work of Terregiano, which adorned its two fronts, two are preserved at Hampton Court, three (re-touched by Flaxman when a youth) at Hatfield Priory, near Wilham, in Essex, and two in lodges at Windsor. The King-street gate, at the end of Downing-street, was pulled down in 1723.

\* The inventor published an account of the dial in a scarce pamphlet printed at Liège in 1673. A view of "The grand Pyramidal and Multifid Dial" is in the Crace collection at the British Museum.

## A FEW REMARKS ON THE "HOLY PICTURES" IN HOLY RUSSIA.

If the ecclesiastical architecture of Russia appears to a visitor as being the most remarkable of the sights that meet his eye in that assemblage of all that is odd and incongruous, the idols or pictures of saints with which some of them abound, and all are supplied, must strike an Englishman as certainly the most extraordinary objects which have yet presented themselves to his gaze. The joss-houses of China, the weird and wonderful temples with their idols in India, from Bombay to Delhi, hardly seem to the observer so strange as the holy pictures in the churches of Russia. In Asia we see the results of some very ancient systems of symbols in which the life has gone out, and left a dead form now surrounded with other attributes than it ever possessed when living. Thus we know that the many-armed idol of Brahma simply represented the infinity of his power, by no means pretending to be the portrait of a monster. For all this a little study prepares us; a little reflection helps us to trace the grand ideas of the old primal faith in the grotesquerie of later Brahminism. But we are not prepared to understand the reduction of Christianity to a level below that of Brahminism. It is, however, if painful, instructive to watch the decline of the pure and simple faith of the early Christianity, until we come to the virtual polytheism of the orthodox church.

But it may be objected, what has the holy picture to do with the *Builder*? The reply is, "Everything, in Russia, at least"; and to prove the truth of this assertion we must begin from the beginning.

It is hardly necessary to remark that there are many saints in the Russian calendar, in fact, there are so many that the year has not days enough to accommodate them, so that several have to be crowded into one day. The 22nd of February, for example, does duty for twelve different saints; nor is this an isolated case. When a child is born into this land of saints, one of those whose day happens to coincide with that of his birth, is chosen from the crowd who would, any of them, be happy to stand sponsor or patron saint. The saint being chosen, the child is called after him or her, and a picture is bought of the said saint or saintess (guaranteed like), and hung in the eastern corner of the room where the child lies. Before this picture, called an *obras*, a little glass vessel is suspended, filled with sacred oil, feeding a wick which burns before the picture on Saturday evenings and on the evenings of all church festivals. In the higher grades of society, this picture takes either larger or smaller dimensions, but no room in any Russian house is without one. Some of the more learned or refined reduce the picture to a very minute miniature; some, again, and especially the rich merchants, have the most obtrusive saints imaginable all over their houses.

We have supposed a boy born into Holy Russia, and his godfathers and godmothers provide him with a patron saint or good angel, who will see him safely through all the chances and changes of this mortal life, who will say prayers for him, if the patronised boy perform the required ko-too to the saint, and in every important event of his life he will play the patron's part. On building his house the picture is brought to the site contemplated and invoked to aid the work. When the roof is finished a large (very large) garland, bigger than Jack-in-the-green, is raised on the apex of the roof. Within that garland, snugly ensconced, sits the patron saint in miniature. When the rooms are finished, the holy pictures are hung with their lamps in the proper corner, and impart safety from evil influences of all kinds. The possessor grows rich, lets his house, and builds another, to which he retires with his penates. Suddenly there is a cry of "Fire!" The *pojarniks*, or firemen, are sent for, but before they can reach the spot an act of touching faith is performed. The proprietor sends for the priest, deacon, and some inferior power in the church, who arrive on the scene of destruction in full canonicals, with the *obras*! This picture is presented to the fire, held up, high up, in the hands of the priest, so that the fire shall have no excuse about not being aware of its presence, and if the flames be extinguished, then it is the work of the Saint, whose irresistible picture came, was seen, and then conquered. The result may

never be ascribed, save inasmuch as they were passive instruments of the picture, to the *pojarniks*.

When the pious Russian marries, his *obras* and that of the bride are introduced to each other, and are freshly blessed by the priest. They occupy stations on the same screen in the marital chamber, while a fresh one is executed for the cabinet of the master of the house, and when he dies his *obras* is carried by some trusty servant or friend at the head of the funeral procession, after which it becomes the property of his eldest son, and is never left, by will, out of the family.

The *mujik* has his *obras*, which he invokes for a good harvest, and occasionally chastises for neglecting to listen to his prayers. The merchant on leaving home for "town" in the morning hours barchanded to the east, crossing himself devoutly before beginning the business of the day. He goes to his shop or office or store, and there his patron saint is found in glory, surrounded with a superfluity of gilding, often adorned with expensive flowers, being also at certain times propitiated by a little wax taper, for which all the saints seem to have a weakness.

In the homes of the wealthy merchants, besides the saints in the corner, the lady of the house frequently has a picture-gallery, not of portraits of her children but of their saints. These are generally set in frames of massive gilding, and for the most part their surface is covered over with plates of silver or gold, with apertures left, through which the faces peep out. All these pictures are set into one gorgeous, golden frame, and being so overlaid with gold and silver and other ornaments, the effect, especially when the lamps and little tapers are lighted up, is very startling. Before this screen a good mother says her prayers, prostrating herself, and touching the floor with her forehead, in her passionate appeals to each saint separately, on behalf of the son or daughter who may be specially under the tutelage of such saint or saintess.

Such being the influence of the saint in private life, and such his connexion with a family, it is no matter of surprise that churches should be raised to special saints in districts under their immediate protection, while a reference to the calendar with its overcrowded population of holy men and women, will at once explain the mystery of the number of churches in the large towns, especially in Holy Moscow. Often the picture of the saint in whose honour a church is built is placed over the chief entrance outside the church over the porch; but whether this be the case or not it is generally well known to whom the edifice spiritually belongs; thus, in driving through Moscow, a visitor is apt to be startled by his driver suddenly seizing his hat, and violently crossing himself, ejaculating the whole time in a manner that recalls vividly Shakspeare's,—

"Swears a prayer or two and sleeps again."

Two men may be in animated conversation or altercation in the street, when one of them recognises a church to his saint, suddenly stops short, pulls off his cap, and bursts into a variety of gestures, bowing, rapid crossing, and sometimes even prostration, before a church, while his companion regards the whole scene with supreme indifference. It is not his saint. At last this extreme devotion comes to an abrupt end, and he resumes the dispute which it had interrupted with all the vigour he had shown in the beginning of the contest, and at the precise point at which it had been dropped.

Again, if the houses be thus sanctified by the presence of these holy pictures, and the sleeping-rooms and cabinets of the wealthy be thus profusely decorated, we should be led to expect something very magnificent, as far as carving and gilding are concerned, in the interiors of the churches; nor are we disappointed. The grand feature of most Russian churches is a screen with three doors partitioning off the high altar from the body of the church. This screen is gorgeous to the highest degree, being overlaid with elaborate carvings, sumptuously gilt, and bearing many pictures. When those of the four Evangelists preponderate, the arrangement is often that one picture covers each door, the centre door being double, like the folding-doors of our drawing-rooms, would naturally require two pictures, one on each leaf or fold. There is an ascent of some steps from the body of the church to the screen, and at the top of these

steps a railing, behind which are three desks,—one in the centre for the priest, another on his right hand for the deacon, and the third for the precentor, who leads the chorus and gives the key-note in various parts of the service, which is *all singing*. At a certain part of the ceremony the folding-doors are thrown open, revealing the Holy of Holies, magnificently, gorgeously decorated, and invariably provided with a dove of white in a blaze of golden glory. In the midst of this imposing scene stands a richly-ornamented altar, covered with an embroidered cloth all sparkling with gold and silver lace. The priest has assumed a purple cap hooded with gold, something between an imperial crown and a mitre; his dress is of silver tissue or cloth of gold, richly ornamented; he wears a rich gold chain (gilt) with a massive cross. At the end of the Mass all persons present are expected to kiss another, a larger cross, which he extends to them.

The interior of the church is filled with pictures hanging round the walls, sometimes painted in fresco on them, and occasionally, but rarely, possessing artistic merit. They often represent passages from Scripture history, but more frequently scenes from the lives of Russian saints. We have been told that no good painter will paint a saint, not from any contempt of the holy character of the canonised gentleman or lady whose portrait may be required; on the contrary, the painters themselves are often devotees also, and believe in the pictures as much as the most illiterate *mujik*. The reason for not wishing artists of fame to produce holy pictures is a sacred fear lest the idolon should become the idol (which, however, it has most emphatically done), lest the attention of the worshipper should be drawn to the excellence of the picture rather than to the higher excellences of the saint; consequently, most of the precious pictures are what would be irreverently pronounced "precious dabs" by the uninitiated. The holy picture, like holy water, must be blessed by the priest before it can be efficacious, and owes none of its efficacy to its style or execution. In short, the less merit the picture possesses the more merit have the priests.

In all early mythology the female element in the human soul has been represented under the forms of various goddesses. We need not refer to all the names of the ladies of the Pantheon or in Valhalla, but one in each system seems to have been better known than the rest: in the Hellenic system, Venus and the Teutonic Freya. In both races the want was supplied in the new regime by "Our Lady," the "Mother of God," in which form and under which latter appellation the Virgin Mary is to be found all over Russia. Sometimes she is represented with the infant Saviour, sometimes as adoring the risen Christ, but of all saints and saintesses she is certainly the favourite. Some pictures of her, exhibited in one of the churches in the Kremlin, are so holy as to be considered useful in certain diseases, and numbers of people press to them to kiss portions of the canvas left bare of gold or silver plating for that purpose.

One of these pictures of the "Bojemat," or Mother of God, at a sort of chapel built before, or rather in, the Iversky gate, near the Kremlin, has a very exalted reputation for sanctity. If any one be very ill or dying, she is sometimes sent for to the house of the sufferer, but as she never travels without six horses and attendants (clerical and lay) in proportion, this is an expensive remedy, and is said not always to be successful. When the carriage with the sacred picture inside, with priests in full canonicals, drawn by six black horses, with harebeated riders, drivers, and attendants, drives through Moscow, then all people take their hats off, all bow low as the carriage passes, many kneel on the ground, and some fling themselves down on the track of the wheels and touch the earth with their foreheads. The excitement throughout Moscow is universal, and the picture's progress is a triumph.

But far more touching is the sight of the picture on a visit to another, or receiving another picture at the Iversky. When this solemnity occurs, the priests are in high feather; the Bojemat is gently lifted from her place and put *vis-à-vis* with her visitor, rather close to the visitor, and all present retire to a distance leaving them, from motives of delicacy, in undisturbed communion. When so solemn an occurrence takes place, mounted *gens-d'armes* keep the ground that the press of the piously-minded may not interfere with the decorous

and solemn stillness which prevails until, at the end of the interview, high mass is celebrated, and then the visiting picture drives home to her convent.

On the same side of the Kremlin, but at the remote extremity of the long wall fronting the Gostinny Dvoer, or bazaar of the town, is another gate, one actually leading into the Kremlin itself, while the Iversky only leads into the grand plohod, or platz, or place, before the northern wall, over which another picture stands of such miraculous antecedents as to deserve rather more respectful treatment than any of the rest, and until a few years back soldiers belonging to the fire brigade were posted to compel all such as were not "devoutly and religiously disposed" to take their hats off, if belonging to the barcher division of humanity, or to lower their parasols if of the softer sex, when passing under this Spaskie Vorot, or "St. Saviour's Gate." Non-compliance with this requirement would have been punished by transportation to Siberia in the old time, but now that the gojarniks are removed, there is no danger in going under with your hat on, save that of being stoned to death by the pious mnjiks. There are two legends about this picture, both referring to one epoch of history, and to the one grand event in the picture's existence.

When Napoleon I. visited Moscow, he was bent on destroying this picture; and on being told that it was indestructible became the more resolute in making an end of it. He ordered a party of men to advance on the gate and tear down the picture by main force, but it was impossible. Some of the men fell down, others tumbled over them, the officer commanding the party was stricken with blindness, and so time was lost until the evening, when all these efforts were discontinued. In the morning the Emperor was told that the picture was still hanging in its place. Full of rage, *more suo*, he ordered up a gun to blow the thing to pieces. In those days artillery was not so perfect as now, and guns were fired by a instock having a burning match affixed to one end, which, igniting the powder used as priming, discharged the piece. When the "gunner held his instock yare," down came such a torrent of rain as extinguished the match and Napoleon's ire at the same time, sending him to seek shelter, where fresh events soon caused him to forget gate, gun, and picture.

The second version of the same story is more characteristically Russian. It tells how, when Napoleon came to destroy the world-famed picture, various obstacles presented themselves, until at last he ordered scaling-ladders to be brought, and the picture taken down. While the ladders were being brought, a thick fog set in, and when it cleared away the picture had "cleared away" too! It had vanished as neatly as though it had never been there. Full of rage, Napoleon caused great search to be made, and offered immense rewards for it. In vain! At last he left Moscow, and some time elapsed, what with the rebuilding of the wooden town, and various other occupations of the Muscovites, before attention was directed to the vacant space where the picture ought to have been, and where its absence was regarded as a disgrace to Moscow. Large rewards were offered by the ecclesiastical authorities, as had before been done by Napoleon for the discovery of the whereabouts of the picture. Still all in vain! At last it was resolved to have another picture painted to replace it. The new effort of art was brought on a certain day, when in the presence of great masses of the people the priests were to consecrate and bless it as soon as it should be placed *in situ*. All was ready. An immense concourse was assembled to witness the imposing ceremony; the priests had begun their solemn chant, and workmen ascended ladders to draw up the new inmate to the niche, when, lo! the old picture was discovered calmly placed as before the advent of Napoleon, and as cool as if nothing had happened.

But there is an under-plot to the legend. Not far from the gate, a monastery, during Napoleon's visit became the scene of a most unheard-of transaction. The monks were startled at prayers by seeing in their church, without being aware of how it got there, the picture from the Spaskie gate. Of course, they said nothing about it, and no rewards on the part of Napoleon or any other person could bribe them into the betrayal of the confidence placed in them. After Napoleon's departure, when rewards again were offered, the monks still main-

tained a discreet silence, probably thinking (and the event showed how correctly) that a picture that knew where to hide would know when to leave cover. On the day that the picture reappeared over the gate, it had disappeared rather abruptly and shahhly, without a sign of gratitude for the asylum which the monks had granted and kept secret, without a word of adieu even to the good monks, she was off. It is said that the convent became very rich. Here, however, a little too much is said in winding up the story, giving it a strong flavour of that other land of miracles, the "Emerald Isle" the final observation being that "the monks grew rich, their monastery flourished, but as they never divulged the name of the place where the picture sought sanctuary, nobody knows where that monastery is to this very day!"

Of course these are not isolated stories, there are numerous tales, as startling, of cures wrought by pictures, of the miraculous escape of pictures from the perils of water, fire, and thieves, of a picture turning the fury of the Tartars upon themselves, diverting it from a monastery; but our purpose is not to hold a religious feeling or belief up to ridicule. It is a natural law in religious history that a phase of simple faith should degenerate into irrational superstition, to be succeeded, very often, by infidelity before actual truth is arrived at. The Russian peasant is simple and ignorant; his mental condition would not enable him to grasp any more abstract faith; hence, in all probability, that of the present system is the best adapted to his mental state, and is, doubtless, preparing the way for something higher.

There are no pictures older than the beginning of the seventeenth century, the majority being imitations of a very late style, itself an imitation of an ancient one. The attitudes and drawing remind one of the execution of the Bayeux tapestry, and some figures in Anglo-Saxon MSS. They are usually extremely dingy in colour, save the brand-new paintings in the more modern churches, which are glaring in blue, scarlet, and gold.

With so many demands on the powers of the saints, it is only natural that the trade in holy pictures should be brisk. Whole lines of shops in the Gostinnoy Dvoer or bazaar, answering to streets in any other town, are devoted to the sale of these works of art (?), and to the frames and decorations belonging to them. Also the various articles for the splendid service of the Russian Church are to be found here in profusion. Sometimes the metal coverings, which conceal every part of the picture except those meant to represent flesh of the face and hands, are of holdily-executed plated wax, sometimes of solid sterling silver, sometimes of fine ducato-gold, consequently the price of such armour varies greatly. The size of the pictures also varies from the unobtrusive brass of the polished noble, not more than 2 in. by 1½ in. in surface, to the ostentatious display of costly characteristics of the merchant, manifested in a holy picture 3 ft. by 2 ft. 6 in., blazing in gold. Again, for the humbler classes, cheaper forms of pictorial sanctity may be observed, so that in this portion of the bazaar prices for saints range from a kopek (about a farthing) to 5,000 or 6,000 roubles, or as many hundred pounds.

Mention has been made of the tapers burnt in honour of the saints before their pictures. They deserve, perhaps, more respectful treatment than the very slight notice we can bestow upon them. They are a source of very considerable revenue to the church, the lower officials of which are allowed to sell the tapers, which the priests are paid to bless. The consumption of wax throughout Russia is something enormous, and the sizes of the candles consumed vary from the thinnest possible taper, as thick as an ordinary drawing pencil, to the majestic columns of wax burnt on high holidays in honour of such important members of the community of saints as St. George, St. Nicolas, St. John, and a few others. These latter are as thick as a stout man's arm, and are set in massive silver candlesticks standing free on the floor of the church. Round the tops of these candlesticks are small holes into which the little tapers of the poorer worshippers are inserted. In the same way there are occasionally narrow pieces of wood with similar holes affixed to the lower portion of the more popular picture for the reception of small tapers. Not only does the church profit by the sale of the candles, and enrich herself by the fees for their receiving, the requisite blessing prior to their illumination

before a picture, but the butt ends of the burnt-out tapers, and the drippings of wax from the many candles and tapers all over the church, are carefully collected and melted down again to form fresh candles to be resold to the public.

These candles represent, very frequently, the prayers and desires of persons far remote from the church in which the holy picture is enshrined. Thus it is not unusual for a friend in some distant town to write to another at Moscow with a request that he may buy for him a candle, and burn it in his name before the picture of St. Dmitri at Moscow; he will indicate the size and price, feeling sure that all will be as he wishes, for no Russian would decline or neglect so sacred a duty. Before proceeding on a journey, the Russians propitiate their suits with these holy tapers, and feel sure that they will be duly watched for and taken care of. Nor is it only for good purposes that holy pictures are invoked by means of holy candles. Thieves and other evildoers bribe their attendant "angels" (?) to help them in all sorts of swindles, robberies, and other crimes, by lighting candles at their pictures. A case is on record of a clerk intending to rob his master of 10,000 roubles, at Moscow, sending an accomplice to Kazan to light a candle worth 3 roubles, before the celebrated picture of the "Mother of God" there, while he performed the same rite in Moscow before a well-known picture to the same holy individual in a church in the latter city. The time was well calculated; the crime was committed while the two candles were burning, the Kazan scoundrel praying for the success of his accomplice. The robbery was eminently successful, having been completed before either candle burnt out, and, of course, the "Bojenat" became highly popular for thus aiding her devoted adorners through thick and thin.

It is difficult to arrive at the actual statistics of the consumption of wax in Russia, but it must be enormous. The bees of Little Russia and the Ukraine supply the greater part of the demand.

The private picture, sanctifying the home and every room belonging to a Russian, is called technically the *obraz*, while the more public picture, such as we find in churches, monasteries, and convents, are termed *ikons*. The screen to which we have alluded as dividing the Holy of Holies from the body of the church, is the *iconostas*. The door in the centre, called the Imperial gate, is sacred, and no one, save the Emperor and the officiating priest, are ever allowed to pass through it. The deacons, deatchok (or under deacon), and the chorus, pass through the doors to the right and left, but not through this holy door. At the celebration of high mass, it is flung open, disclosing the altar with the high priest before it, just at the moment when the transubstantiation of the elements is supposed to have taken place, and then the high priest, elevating the host, stands under the arch. This is solemn and picturesque, while the solemnity and pictoresqueness are increased by the simultaneous prostration of all the worshippers there present.

The Christian Church throughout the world professes to abhor idolatry, but there are some observances in forms of Christianity, near home than Russia, that tread so closely upon image worship as to cause pain, and perhaps even anger, in the hearts of other Christians, and, if it were possible in these days of perfection, to give rise to a feeling of contempt for their erring brothers. We sincerely hope that these remarks may be productive of no such feeling. We are not writing a discussion on the tenets of the Greek Church, nor do we aim at anything beyond an unvarnished tale of what the value of the holy picture is in the eyes of the orthodox believer. We may be pardoned for adding that the more learned priests justify the use of pictures as not being "graven images," and therefore not coming within the letter of the prohibition in the Decalogue. They are, they say, necessary on account of the constant want of the untaught peasant to be reminded, by some external symbol,—something tangible,—of the existence of a higher life within. We believe this argument of the Russian priest to be the key to the external and symbolical religion, the remnants of which we turn mythology. Nothing is despised by the wise, and it may be that valuable teaching for our more advanced position, as we naturally regard it to be, may still be extracted by careful hands even from the holy pictures of Russia.

### THE GERMAN ARCHITECTURAL AND ENGINEERING UNION.

On the third Monday in August, the 21st inst., the Fifth Annual Congress of German Architects and Engineers will assemble in the city of Hanover. From the programme which is lying before us, it is evident that this will be one of the most enjoyable *réunions* which the members of these professions in Germany have ever had the opportunity of attending. We recently gave in the columns of the *Builder* the names of the various societies belonging to the Union, whose members, as we then pointed out, number upwards of 6,000. It is expected that more than one-tenth of these will be present at the coming Congress. Most of the chief railways of the German Empire,—from Tilsit, on the borders of Russia, to Strassburg, on the frontiers of France,—have willingly agreed to reduce their fares, and to make other concessions to gentlemen proceeding to the Congress. In Hanover itself, the local society has appointed a special committee to receive guests, and supply them with such information as to apartments, &c., as they may require. The office of the Reception Committee will open on the 18th of August, in Hartman's Tunnel, opposite the railway station at Hanover. The General Inquiry Office will be in the Old Rathhaus, Köbelinger Strasse. The general meetings will be held in the large hall of the Old Rathhaus. The sittings of the Architectural sections take place in the same hall, while those of the Engineering sections will be held in the smaller hall of the same building. The preliminary public reception of the visitors is arranged for the evening of Sunday, the 20th inst., at eight o'clock, in the Old Rathhaus, when the guests will be entertained at the expense of the municipality of Hanover. At nine o'clock on Monday morning the opening general meeting takes place. Among the agenda we find a paper by Herr Kymlymann, on "The Value of Exhibitions for the Technical Arts." This will be followed by reports on the following questions:—(1) Improved methods of supplying and employing water for agricultural, manufacturing, and commercial purposes; (2) the practical training of technicians after the completion of their academical studies; and (3) subdivision of the Government examinations in architecture. The first sitting will wind up with the discussion of new proposals for improving the organisation of the Union. At eleven o'clock the members adjourn, when they will be entertained at a *dîner* in the extensive saloon in the basement of the Rathhaus, known as the Rathskeller. At twelve o'clock noon the sectional sittings will commence. In the Architectural Department the subjects to be dealt with are:—(1) The restoration of Medieval monuments; (2) report on measures for securing theatres against dangers from fire; and (3) the construction of fire-proof buildings. In the Engineering Department the subjects are:—(1) On the correction of the tidal sections of rivers with special reference to the Lower Weser, by Herr Franzius; (2) report on the employment of steel in architectural structures; and (3) report on the measurements of flexion in iron bridges. At two o'clock the members will proceed to inspect some of the most interesting buildings in the city according to a special programme. At six in the evening a banquet will take place in the saloon of the charming Tivoli Gardens. The first day will conclude with a *soirée* at nine p.m. in the saloons of the Artists' Club, attached to the museum. On Tuesday, the 22nd inst, the sectional sittings commence at nine a.m. At noon a special train will convey the members on an excursion to Brunswick, for which the Architects' Club of that city have arranged a special programme. After inspecting the chief buildings of interest, the party will be entertained at a banquet, and return to Hanover by special train, leaving at eleven at night. On Wednesday, the 23rd, the sectional sittings commence at ten o'clock, and conclude with a general review of the results arrived at. The rest of the time will be spent in festivities and excursions. At two o'clock a banquet takes place in the Palma Gardens. At five p.m. there will be a *corso*, or festive procession of carriages through the city of Hanover to the suburb of Herrenhausen, till recently the residential palace of the kings of Hanover. At nine in the evening the members will be entertained by the Artists' Club, and in various other

places in the city. Thursday, the 24th inst., the last day of the Congress, will be devoted to a grand excursion to Bremen and Bremerhafen. The special train leaves Hanover at six o'clock in the morning, arriving in Bremen at half-past eight, when breakfast will be served in the restaurant attached to the railway. The members will then divide into two bodies. The architects will inspect the chief new public and private buildings of this important Hanseatic port, and under the guidance of the Bremen Architects' Club, who will entertain them in the city. The engineers will proceed to the outlying ports of Geestemünde and Bremerhafen, where they will inspect the important new works on the docks and quays. At half-past two they will take luncheon at the Logirhalle, returning to Bremen at half-past three. At five o'clock both sections of the excursionists will re-assemble at the railway station, and will proceed for a drive through the city. At half-past seven they will be entertained at a final banquet at the Artists' Club, after which they will spend a convivial hour in the celebrated Rathskeller of Bremen Town-hall, returning to Hanover at midnight. We have entered thus minutely into the programme of this meeting, because we think it cannot fail to be of interest to English architects to know how their German contemporaries conduct their Annual Congress. There is a bappy mixture of festivity and business which can hardly fail to make such a reunion one of the most agreeable character.

### DR. SCHLIEMANN'S NEW EXCAVATIONS AT TROY.

The wife of Dr. Schliemann, a Greek lady, who is an intelligent and enthusiastic assistant of her husband in his archaeological researches, has just described in a letter, addressed in Greek, to the Athens journal *Hestia*, some of the results of that explorer's latest excavations on site of ancient Troy. The writer says, "Close to the spot which we consider to be the site of Troy there are the remains of two buildings, which, in the opinion of our two architects, Dr. Dörpfeld and Herr Offer, represent two temples. The appearance of the two buildings is so different that they cannot be said to resemble any of the well-known ancient temples with the exception of that of Hera at Olympia. This, according to Pausanias, was erected probably about 1100 B.C. The first of our two temples at Troy is 30 metres in length and 13 metres in width, while the walls are 1.4 metres in thickness. The other temple is 20 metres long and 7 metres broad, the walls being 1.2 metres in thickness. It is noticeable that the walls are built in a different manner. In the first there are no joinings of clay, but in the second there are large commissures filled with clay, which is also slightly burnt. The inference is that the two temples were built at different periods, and that that first described is older than the second. As I have above mentioned, the breadth of the first temple is 13 metres and the length 30 metres, it is scarcely credible that the roof could be solid and without any supports, though of the latter, at any rate, there is nothing now to be found. Throughout the entire "Iliad" of Homer we find no mention of such supports; while in the "Odyssey" where they are spoken of they are described as being of wood. Assuming now that there had been wooden supports in the first temple, they could not have stood on a floor of clay. There must have been a stone foundation beneath them; yet nothing of the kind is now to be discovered on the spot. The internal arrangement of these temples is very interesting. They both have a forecourt on the south-west side. In the first temple this is 13 metres long and 10 metres wide. It is separated from the sacred part by two high walls, forming a majestic entrance. In the middle of this sanctuary there is a circular layer of clay 4 metres in diameter and 0.6 in thickness, upon which, probably, a seated image was placed. Close to the two temples, in the north-east, there is a third temple which, so far as concerns the style of its construction, is like the two others. It has a forecourt, and it seems surrounded by a corridor. Our two well-informed architects think that these three buildings were temples; but my husband thinks, since they present great similarity to the houses mentioned in the "Iliad" (VI. 316), that they really were only houses, and that they were perhaps built, by command of Paris, by the best architects of the

Troas. In this city, destroyed by fire, we see Pergamos with its splendid edifices, that being, according to Homer's description, the same as sacred Ilios. Of gold articles we have here found but few, among them being a very thin diadem and a set of earrings, which are of the same sort as those we dug up some years ago. The nails we have here met with appear to be of quite a different description. They cannot possibly be taken for keys. We have also found some vertebrae, bolts, and spindles, as well as vessels with owls' heads. None of these objects, however, have any great value. The most valuable of all our discoveries is to be found in the three temples or houses themselves, which are quite novel in their style of construction. It is perfectly established that the Troas of Homer was situated at the spot now called Hisarlik, as my husband contended some years ago. Through the kind intercession of the German embassy at Constantinople we also received permission to conduct a series of excavations at Bunbarsi, which some philologists still think was the site of the Homeric Ilios. This place is three hours' walk from the Hellespont. At that place, too, we found bolts and Greek vessels as in Hisarlik. We believe that that place was the site of the ancient Gergi, which at one time is said to have had 2,000 inhabitants."

### THEATRES ABROAD.

The catastrophes of Nice and Vienna have led to official examinations in several parts of the Continent as to the safety of theatres in their present condition. Amongst the improvements being made for the purpose of greater security are the extensive alterations in the internal construction of several leading Hamburg theatres. At the Carl Schultze Theatre two massive stone staircases have been added to the previous accommodation in this respect. They are each 6 ft. 6 in. wide, with an easy ascent, and lead to doors capable of affording nearly instantaneous egress to a large number of people. The stage is cut off from the auditorium, the iron curtain being so arranged that it can be let down in a few seconds by even one man, and iron doors are so placed as to shut off the stage from the dressing-rooms, &c. The cloak-rooms have also direct egress into the open air, so that under no circumstances should any stoppage of the means of egress be occasioned, however quickly the audience should be leaving the building. In order to avoid the dangers incidental to stoves behind the scenes, the hot-water system of heating is applied to that as well as to the other parts of the house. The stage and the body of the theatre have separate gas communications, the gas meters being outside the building in each case. There has been in some parts of the house a reduction of the number of available seats, in order that the circulation of the audience may be less impeded. There is a fire-telegraph on the stage, and the system of hydrants is on the most complete scale. The auditorium and refreshment-rooms are being completely renovated against the re-opening, which takes place on September 1st.

The Thalia Theatre at Hamburg has been provided with a new iron curtain, the trials of which have been eminently satisfactory. Its light weight (30 cwt.) contributes to the ease of its working. The curtain is not left in its rough state (as is done in some instances) but is artistically painted.

The Stadt Theatre is also getting a new iron curtain, and the works at the Variété Theatre are stated to be in a very forward condition, so that its opening has been fixed for the 15th inst.

A new theatre is projected in Warsaw to replace the present small building which has been sold to be transformed into a market. The plans are ready and the site has been presented by the municipal authorities. The cost of the work is estimated at upwards of 30,000.

The Theatre de los Recreos Matritenses at Madrid (destroyed by fire about a month ago), is described as having been a structure which by no means fulfilled the requirements as to safety now so universally admitted as being necessary. Some neighbouring buildings were also destroyed. No doubt this occurrence will cause official attention to be still more closely directed in Spain to the protective measures which have been found necessary in other parts of Europe. In this instance the theatre had

been, it seems, disapproved of by the authorities.

Some further particulars have been received of the burning down of the theatre at Montevideo on the 11th of June last. The occasion was a festival performance in honour of a former resident in the country, the departed hero of Italy, General Garibaldi. The *Imparcial* now reports that not only was the theatre entirely destroyed by the conflagration which took place on that day, but that there was likewise a terrible loss of life. No fewer than twenty-one persons were burnt or crushed to death in the fatal stampede, while as many as 103 of the spectators received burns or other injuries of a more or less severe description.

#### THE ARCHITECTURAL ASSOCIATION'S THIRTEENTH EXCURSION.

The Architectural Association's excursion this year will be to Kettering and neighbourhood, and will commence on Monday, August 14th, and terminate on Saturday, the 19th. The President, Mr. Edward G. Hayes, will generally conduct the excursion, and the various buildings visited will be described by him, by Mr. James Fowler, by Mr. J. A. Gotch, and by other gentlemen. The head-quarters of the excursion will be at the Royal Hotel, Kettering.

On Monday, August 14th, Oakham (Church, County Hall, &c.), Buxton-on-the-Hill (Hall), Exton (Church and Hall), Wing (Church), and Lyddington (Church and Bede House), will be visited.

For Tuesday, the 15th, Loddington (Church and Manor House), Rothwell (Church, Market, and Manor Houses, &c.), Stoke Albany (Manor House), and Wilbarston (Church), are on the programme.

On Wednesday, the 16th, visits are to be paid to Warkton (Church), Weekley (Church and Hospital), Boughton House, Geddington (Church and Cross), Newton-in-the-Willows (Church), and Rushon (Hall, Church, and Triangular Lodge).

On Thursday, the 17th, Drayton House, Lowick (Church, &c.), Lyveden ("Old and New Buildings"), Brigstock (Church, Manor House, &c.), will be visited.

Friday, the 18th, will be spent in visiting Rockingham Castle, Grettton (Farmhouses), Kirby Hall, and Stanion (Church).

On the concluding day, Saturday, the 19th, the members will meet at the Old Church at half-past nine, and after luncheon at the Royal Hotel the party will break up.

Mr. C. R. Pink, of Castle-hill, Winchester, is the hon. sec. to the Excursion Committee.

#### OVER-BUILDING IN THE METROPOLIS.

AMONG the items in the report which was read at the annual meeting of the shareholders in the Northern and Eastern Suburban Industrial Dwellings Company, held last week at the offices, in Finsbury-pavement, reference was made to the over-building which had been going on all round London, leading to a falling off in the income of the company from rents during the year. In consequence of this falling off, the directors recommended that a dividend at the rate of 5 per cent. only be declared. In moving the adoption of the report, the chairman observed that the shareholders of that, as well as those of other companies which dealt with property were aware of the large amount of over-building which had been going forward in various directions around London during the past year or more. Hence the company found that it had not been so easy to let their houses as formerly. Tottenham had suffered in this respect like other districts, and in order to keep their tenants the company had reduced their rents, which accounted for the decreased income during the year. He added, however, that they had one satisfaction, and that was, that their estates were better occupied than many others in the same locality, and in other neighbourhoods. During the last few months their lettings had been considerably on the increase. He believed the depression from which they had suffered was but temporary, and that they were passing through one of those periods of fluctuation that all estates had to experience at one time or another. The directors had not engaged in any new purchase during the year. The cottages that were now nearly completed under the last contract were about being taken over, and beyond

that the company only had a small portion of freehold land, which they would probably let or sell. A dividend at the rate of five per cent. was declared in accordance with the recommendation of the directors.

#### HOLBORN FIRE BRICADE STATION.

A STAFLY building erected in Bloomsbury by the Metropolitan Board of Works, to supersede the Holborn Station of the Metropolitan Fire Brigade, is now completed. It occupies a good position, and has an unobstructed approach and "get out,"—an exceedingly important matter in a building devoted to such uses.

The piece of ground upon which the station is built is irregular in form, and is open all round. The principal front faces Hart-street, close to the intersection of that street by Southampton-row, near the south side of Bloomsbury-square, and at the point where Hart-street runs into Theobald's-road. Orange-street, leading from Hart-street to Red Lion-square, is on one side of the building, Theobald's-road on the other, the rear boundary of the buildings and yard being in Drake-street. It may thus be seen that, by Hart-street, Southampton-row, and Theobald's-road, there will be ready access to Oxford-street, Holborn, Gray's-inn-road, and thoroughfares leading to all parts of London. There is a wide open area on the west front of the station.

The station has a total frontage of about 340 ft. The principal features in the west front are an effective gable, with a large three-light window, and a square tower 80 ft. high; on the ridge behind the gable is a tall *flèche*, covered with lead, that crowns the ventilating-shaft. From the top of the tower the view commanded is, practically, over all London, and if a conflagration is considerable, and either the fire or smoke proceeding from it can be seen, the men will know, before they start, by what route they are likely to reach it soonest, and be comparatively independent of directions on the way. The front to Theobald's-road is curved and scarcely secondary in effectiveness to the entrance elevation.

The foundations are about 20 ft. below the ground-level, and upon concrete laid upon the natural gravel. Some rubbish, but no "made ground," had to be removed. The principal wall is 3 ft. thick at the bottom diminishing upward. The walls are on concrete all round.

The building has a basement, and four floors over it. The basement is used for stores of various kinds. The establishment, for whom accommodation is provided, embraces two engines (room provided for four), thirteen married and four single men firemen, and one coachman, two fire-escapes, one currioc carrying apparatus for extinguishing chimneys on fire, four horses with stabling, fodder store, &c. The engine-room is 34 ft. by 27 ft., and has two entrances, each 9 ft. wide, with segmental heads. It is lined with enamelled bricks, and is a good example of that kind of work. It has three courses of blue Staffordshire bricks at the base, followed by six courses in chocolate colour; a dado, of 2 ft. 6 in., in buff, and a string of brown, above which the bricks are white enamelled. A watch-room, 15 ft. by 14 ft., adjoins the engine-room. This room has means of telegraphic communication with all the fire and police stations of London. On the first floor the officer in charge has three rooms; the remainder of that floor, and the second and third floors are appropriated in pairs of kitchens and bedrooms for the men. Each of the kitchens is provided with a dresser, cupboard, and sink. There is a washhouse, fitted with coppers and troughs, at the top of the building, and the coachman's house and stables, in the rear of the main building, are roofed flat, and asphalted, providing an area of 800 ft. super. as laundry drying-ground. The ventilating shaft is utilised for drying the hose after service. They are suspended loose from the top of the shaft.

The principal external walls are of Teynham red bricks, and the copes, sills, facings, and dressings, of red Mansfield and Portland stone; the walls have a plinth, 3 ft. deep, of blue Staffordshire bricks. Two friezes of ornamental bricks are carried round the walls between the floors. The walls stand 40 ft. above the ground level, and are finished with a cornice of red Mansfield stone. The high-pitched roof is covered with Broseley tiles, and crowned with a ridge of the same material.

The dormers, clustered chimney-stacks, and gables are very effective features in the elevations.

The building is from the designs of Mr. George Vallany, Superintendent Architect of the Metropolitan Board of Works; Mr. E. Hall is clerk of the works; Mr. C. W. Reading, of Pimlico, contractor; Mr. Thrush, contractor's representative.

#### A PORTION OF THE PRINCIPAL ENTRANCE, TARRAGONA CATHEDRAL.

THE Cathedral of Tarragona, of which we have gathered a few particulars, is considered to possess much interest on account of the history of its foundation and its antiquity. It was commenced in 1124 by St. Oleguer, and in 1282 Archbishop Olivella added to it the present baptistry chapel and the existing central portion of the front in the Romanesque style, and which, it is supposed, was formerly the door from which entrance was gained by the cloisters. The central part of the front contains, amongst other works of the sculptor's art, a large carved rose and a terminal in the upper portion, and in the lower a projected gallery of four pointed concentric arches, resting on eight *dosserets* devoid of pinnacles, surmounting as many gigantic statues of apostles and prophets placed in an array facing those *dosserets* and statues set in their turn on *entresacs* terminating in needle-like pyramids and flanking the entrance. This gallery rests upon a base of small ogive arches and pillars.

The lintel, cut of one block of marble, measures 22 ft. 4 in. The pillar supporting it in the centre is 19 ft. 5 in. high, and is surmounted by the image of the Virgin. The jambs of the portal are solid pieces of marble, and profusely carved throughout. The tympanum is open-work, filled with stained glass, containing the figure of Jesus, seated between the sun and moon, with hands raised, blessing two angels in the act of worshipping. The frieze represents the resurrection of the body through a series of sepulchres giving forth their dead at the sound of trumpets blown by angels, and between them and the lintel are displayed the torments suffered by the wicked. The figure of the Virgin, upon the pillar which divides the porch, is an interesting work, its most attractive features being the arrangement of the drapery, the necklace, and its graceful attitude. The image is slightly mutilated. The figures of the apostles and prophets, like the figure of the Virgin, are of white marble, nine of them being by Joan Bartonien, and the others by Jaume Castells. They were completed in 1375. There has been want of skill in placing them, and which has failed to insure their perfect preservation. It is a popular tradition in Spain that each century has dislocated one statue, but matter-of-fact history does not appear to bear out tradition. The large doors which close the porch are of oak, strongly lined on both sides with iron of a floral pattern, and adorned with locks of splendid finish, making the whole decoration look more like needlework than the handiwork of the smith. The whole is a valuable specimen of the locksmith's art, and was executed at the expense of Archbishop Don Gonzalez Heredia (1510). We give an illustration of a portion of the porch.

**Monument to Sir E. Lansdowne.**—A mural tablet of marble, sculptured by Mr. Woolner, has been placed about twenty paces from the grave of Sir Edwin Lansdowne, in a bay on the south side of the crypt of St. Paul's Cathedral, in which is John Rennie's tomb, and next to that where Sir Christopher Wren was buried. In the upper part of the monument is a medallion portrait in profile, supported, as it were, by corbels, on which appear copies of the heads of the lions in Trafalgar-square. Above the medallion is a moulding enriched with fern-leaves, and over this a painter's palette and brushes. The lower part of the monument is a bas-relief from one of the painter's works,— "The Shepherd's Chief Mourner." Beneath, on a bracket, is the family crest,—the head of an eagle holding a key in the beak. The inscription, in small inlaid and gilded letters, reads:—"Sir Edwin Lansdowne, B.A., son of John Lansdowne, A.R.A. Born March 7, 1802. Died October 1, 1873. This monument is erected by his surviving brothers and sisters. 'He hath made everything beautiful in his time.'"

## ON SOME EAST ANGLIAN EARTHWORKS.

CASTLE ACRE, ELY, MIREHAM, BUNGAY.  
BY G. T. C.

## CASTLE ACRE.

CASTLE ACRE, the castle on the cultivated land, the Acre of Domesday and the succeeding century, is a place of some historic and very great archaeological interest: historic, as a strong castle of the great Earls of Warren, and archaeological because its earthworks are on a large scale and of a composite character, concerning the date and origin of one part of which there has existed great difference of opinion.

Castle Acre stands upon sloping ground, on the right or north bank of the river Nar, which there flows down a broad and rather steep-sided valley, across a meadow of irregular breadth, which at one time must have been an impracticable morass, and is now irrigated as a water-meadow. The village is placed upon the Peddar-way, a road, the directness of which indicates a Roman origin, and which leads from Norwich to Castle Acre, and thence, twenty miles in a straight line, to Holme, on the Wash, where is a small Roman camp, and near to which was Brannodunum (Bracecaster) a well-known Roman station.

It is evident that the original encampment was a Roman work upon the Peddar-way. Much of this remains, and a part of it is little changed. It was in plan roughly rectangular, about 350 yards north and south, by perhaps 420 yards east and west, but its southern side being governed by the course of the river, is irregular, and the eastern side may have been somewhat shorter than the western. The western bank is the most perfect. It is steep and straight, about 12 ft. high on its inner and 20 ft. on its outer face, which is guarded by a deep and broad ditch. It is formed of chalky gravel, very firm, and extends from the village street on the high ground down to the margin of the river-meadow. At the lower end it turns parallel to the river, eastward, nearly or quite at a right angle. A few yards at the upper end are wanting, having been levelled for the formation of the village street. It is evident that the north bank lay along the course of the present street. At its west end it has been levelled and its site built upon, but toward its east end a part remains, though somewhat altered, and near, or quite in its centre, a later gateway, of about the reign of Henry III., marks the place of the original entrance, exactly on the line of the Peddar-way.

Opposite to this, in the centre of the southern face, are traces of another gateway, denoting the original southern entrance, and in front of this a causeway, and at present a bridge, carrying the road which points to Norwich and to the Roman Castrum. The eastern bank of the camp remains, but has been altered considerably, and somewhat diverted by later operations. This was the Roman encampment, placed, as was not unusual, on a sloping ground, with one side to the river, which also, curving northwards, covers, to some extent, the adjacent end. There is no trace of Roman masonry, nor have any considerable Roman remains been found here. Probably the camp was used to protect the party engaged upon the construction of the road, and this made, it ceased to be of importance.

The western half of the camp, that west of the Peddar-way, seems to have been left unaltered; but the eastern part has been so altered as to present traces only of its former condition. In its north-eastern quarter has been dug a large and deep circular ditch above 180 yards diameter, and 30 ft. to 40 ft. deep. The contents of this ditch having been thrown inwards, form a conical mound 25 ft. to 30 ft. high, and 40 yards across at its table-top. This top, however, is not level, but slopes considerably towards the south-east, falling as much as 15 ft., as the ditch also falls; this makes little or no difference in the height of the mound, measured from the bottom of the ditch. This, the proper ditch of the mound, coincides at its northernmost point with the general line of the north bank of the encampment. From the outer side or counterscarp of the ditch at the north-west quarter, is seen a trace of a bank and ditch, passing westward, which no doubt are a part of the defences of the old camp; and opposite, to the north-east of the mound, is a sort of triangular work placed on the outer side of the ditch of the mound, and having a ditch of its own which communicates at either end

with the circular ditch. This earthwork is, very evidently, the original north-east angle of the camp, somewhat altered to accommodate it to the later castle. These two outworks cover very nearly the northern part of the mound. Towards the south is a much larger area, forming the principal ward or court of the new fortress. This is enclosed within two very broad and lofty banks which spring from the outer edge of the circular ditch at about 80 yards apart, covering about a fifth of the circumference of the mound. These descend southwards and are slightly rounded so as to meet in a flatish side upon the river bank, and thus include an area about 100 yards east and west by 110 yards north and south. Outside these banks is a ditch of great depth and breadth, communicating at its northern ends with the ditch off the mound, and at its southern part dying out, being replaced by the steep bank of the river meadow.

It will be evident from the above description that we have here a burh such as Queen Ethelflæd threw up at Tamworth in 913, or as was formed in 921 at Towcester by Edward the Elder, and such as was in common use among the Northmen, whether Angles, Saxons, or Jutes, in the tenth century, and probably much earlier. In this instance, as at Tamworth and many other places, the simple burh with its court or courts is complicated by the wish to turn to account an older earthwork. Here not only the two northern projections from the burh represent parts of the older camp, but also the eastern bank of its main court evidently represents the eastern bank of the encampment.

Mr. Harrod, one of the latest and most clear-sighted of East-Anglian antiquaries, takes, I am aware, a different view. He supposes the burh and its appendages to be the earlier work, due to the Britons, and the rectangular encampment to be later, modified by its Roman authors to suit the British defences. The question is an important one, since it bears upon nearly all the more considerable East-Anglian earthworks, besides many others in other parts of England and in Normandy.

Whatever may have been the origin of these earthworks, they were certainly occupied in East-Anglian times. Acre, under the Confessor, belonged to Toche, and was granted by the Conqueror to William Earl Warren, with a very large Norfolk property. What the earl found at Acre, beyond the earthwork, in the way of defences, is unknown; probably a timber structure, defended by strong palisades. He at once made it his chief Norfolk seat, proceeded to improve its defences, and, before the death of his wife in 1085, founded a priory for Cluniac monks a little lower down the river. The parish church, mentioned in Domesday, he gave to the Priory at Lewes. Also, he either found or established a chapel, with monks, within the castle, which was afterwards transferred to the new Priory. The first earl died in 1089. Possibly he began the castle; but it is scarcely probable that he lived to finish both that work and the Priory. Probably both were completed by his son, the second earl.

The first step was to establish a shell-keep upon the mound. This was a wall irregularly circular within, and irregularly polygonal without, and each angle was capped, after the Norman fashion, by a broad flat pilaster of about 6 in. projection, of which several remain. The wall was about 7 ft. thick and 12 ft. high inside to the rampart wall, outside it was carried 20 ft. or more, lower, as a revetment-wall, so that it there appeared full 30 ft. high. Much of this wall remains, on one side about 90 ft.; and in its northern part is an oblique passage, probably a guard-robe. The central part of the area is at present hollow, as though foundations had been removed. Mr. Harrod describes the keep as divided into two parts, with steps leading up from the lower or eastern part to the other. In the upper half he found the foundations of a rectangular tower, 50 ft. by 40 ft., with walls on one side 5 ft., and on the other 13 ft. thick. These would be about the dimensions of a small keep. But a rectangular keep upon a mound is unusual, and upon a mound within a shell-keep unheard of. At this time there is no visible trace of either steps or tower. From the wall of the keep three or four walls radiated down the slope across the ditch, and thence were continued along the centre or ridge of the earth-banks, so as to include the two courts, and probably along the northern bank westward as far as the

main and outer northern entrance. These walls not only protected the several wards, but prevented the besiegers, who might have gained the wards from circulating along the ditch of the keep. Of the wall of the south ward a considerable fragment remains towards the river, and there are indications that it extended as far as the south gate. It is sufficiently clear that the castle area included the whole eastern half of the Roman camp, the wall running from the north to the south gate, and including the road between them. This accounts for that part of the present village being still called the Bailey. The western half of the camp is called with less propriety the barbin, inasmuch as it cannot be said to have covered the entrance.

The entrance to the main ward was at its north-west corner, where its curtain joined the counterscarp of the ditch of the mound. Here are remains of a gatehouse which, in 1781, was flanked by two drum towers; and it is probable that here was the way to the keep by a flight of steps, as at Cardiff and Tickhill, built against the cross wall of the ditch. In front of this gate the main ditch is crossed by a causeway, which, no doubt, takes the place of a draw-bridge. There may also have been a gateway at the opposite or north-east corner of the ward leading into the triangular ward. There also remains a fragment of a wall crossing the ditch between the main and the triangular ward, but this wall is far too slight to be of Norman date. In the main ward are traces of foundations,—probably the gate, hall, chapel, and lodgings. Besides the gateway into the south or main ward, the outer ward or bailey was entered by the entrance of the original encampment. Of these the north gate remains, and is a poor specimen of Early English or Early Decorated work. The gateway has a high pointed arch, between two small half-round towers. The rest of the building and the lateral walls are gone. No well has been discovered in the castle; probably there were several, water lying at no great depth. Blomfield quotes from a charter of Stephen the signature of a witness as "Geoffrey de Balio, ante portam castelli." This refers to the inner gate, and shows that even then the space between the inner and outer gates was known as the Bailey.

Earl Warren's castle, though a formidable fortress, was not destined to stand the brunt of war; at least, there is no record of its having been actually besieged. The male line ended with the third Earl, whose daughter and heiress carried the castle, first to William of Blois, a natural son of King Stephen, who died childless in 1160; and, secondly, to Hameline Plantagenet, a natural son of Geoffrey of Anjou, who died 1201. Both husbands bore the title of Earl of Surrey, which Isabel's descendants by Hameline continued to bear until 1347, when Castle Acre passed with an heiress to the Fitzalans, Earls of Arundel and Surrey, whose heiress married a Howard; but just before the change Castle Acre was sold to Sir Thomas Gresham, who probably was attracted by the fact that the advowson of the church of Gresham was held to be a member of the manor of Castle Acre. It had for a long time been a mere ruin. In 1347 the herbage in the castle ditch was valued at 5s. per annum; 300 acres of arable land at 75s. 3d.; 8 acres of meadow at 12d. per acre; 15 acres of pasture at 4d. per acre; rents of assize at 13l. per annum; market and fair at 13s. 4d.; pleas of court at 60s. Cross gives a view of the keep taken in 1772, which shows the walls in a far more complete state than at present. The north gateway, which he also gives, is but little changed.

Edward I. was at Castle Acre several times, and finally in 1297, but whether he lodged at the priory or in the castle is unknown.

The castle is mentioned in 1135 in a charter by the second earl.

## THE MOUND OF ELY.

Ely, or Elye, is described by Bede as a sort of island girdled by marshes or by waters, and deriving its name from the abundance of eels taken therein. Eels, indeed, may well have abounded in the sluggish and muddy waters by which Ely was formerly surrounded, though its present aspect is by no means suggestive of "moorish fen," or marsh ague. It is, or was, evidently enough an island, but it rises more than 100 ft. above the Fen level, and the ascent to the village-city is both long and steep. The surrounding fens and meres, now drained and

cultivated, are separated from the centre of the isle by moderately high ground extending for considerable distances, and the bed of clay which forms its base is capped by a thick layer of dry sand and gravel.

A spot so advantageously placed for residence and defence must have been inhabited by the earliest settlers in that side of the country, and its value must have been much enhanced by the invasions to which the district was subjected, probably both during and before the Roman conquest, by those who gave name to the Saxon shore. The British Iceni had their capital on the hill of Norwich, and although their traces there or in the eastern shires generally, are very slight and scanty, Ely was, no doubt, occupied by them, and some of the more irregular of the raised roads or causeways connecting the higher lands and smaller islands of the Fen are supposed to be their work.

Under the Romans the station at Caistor separated the "Vesta Icenorum," and from thence roads radiated to Brannodunum (Brancaster) on the Wash, to Durobrova (Caistor) on the Nene, to Cumborithum (Cambridge or Grantchester) on the Cam, to Camalodunum (Colchester) on the Coln, and to Sitomagus (Danwich), and Garianonum (Yarmouth or Burgh) on the sea-coast and at the mouth of the Yare. The great Akeman-street ran past Ely, and numerous rectangular earthworks, more or less obliterated, and with here and there fragments of Roman masonry, show the occupation of the territory from the Thames northwards to the Wash to have been complete.

It was the possession of those Roman works that enabled the post-Roman Britons to make so gallant and long-continued a resistance against the freebooters from England, and it was not till the middle of the sixth century that the Gyrrwas, as they called themselves, gained full possession of the Fen country north and south of the inlet of the Wash. Of the Suth-Gyrrwas, or that south of the Wash, Sudbury was probably the southern, and Norwich the northern, capitals, but Ely was certainly a place of importance, and the centre of a considerable private estate, as appears from what is related by Bedo of the foundation of its earliest religious houses.

Towards the middle of the seventh century, Tunherht, "Principes Austrahum Gyrviurum," an East-Saxon ealdorman, was the possessor of a large domain, of which Ely appears to have been the "caput," and which, upon his death, came to his widow, Ethelthwyth, daughter of Anna, king of the East Angles, who became the wife of Egrif, afterwards King of Northumbria, and who founded a monastery at Ely before her death in 679.

This monastery, which attained to a great reputation, was destroyed utterly by the Danes in 870, and again founded in 970. A second, or, perhaps, a third foundation, took place about a century later, and here the celebrated Byrhtnoth, who fell in the battle of Maldon in 991-3, was buried, having already given a large endowment to the church. Probably both Tunherht and Byrhtnoth had a residence at Ely, and there is but one place where this could have been situated; upon the large moated mound a few yards south of the church and within the precincts of the land conveyed to the monastery. This burh is thought to be that designated in Eligbrig, one of the East-Saxon names of Ely, though it is held that hyrig is usually applied to a collection of huts or houses, burh to a fortified mound. However that may be, there can be little doubt that the burh, which still remains, and is the property of the Dean and Chapter of the church, was the private residence of some great East-Saxon thane, at least as early as the beginning of the tenth century if not much earlier. That the burh is Saxon, that is, neither British nor Roman, is evident from its aspect and details.

This mound is a very distinguished feature in the place, and occupies the summit of one of the two natural summits of the isle, the other, a short furlong to the north, being covered by the cathedral. The mound is, as usual, a truncated cone, partly artificial, and placed upon the top of a natural hill. It is not above 40 ft. high, though said to be 120 ft. above the Fen level. Its table summit is 70 ft. diameter, but its slope is a less steep angle than usual, probably from the looseness of its material. Its base, therefore, covers a very considerable area.

As the ground to the east falls rapidly from its base, a ditch was scarcely necessary, but to the north the ground is high, and the ditch was probably deep, though, as the ground here is

partly huilt upon and partly enclosed and laid out as a garden, it is impracticable to examine it closely. Probably the ditch, having long been unneeded as a defence, has been filled up. The court or area appended to the mound was of large extent, and lay to the south, on the sloping ground. It was included within a bank and an exterior ditch. The bank commenced on the north-east side of the mound and ended upon its south-east side, including rather more than half of the circumference, so that the mound, as at Castle Acre, formed part of the exterior line of defence. Between the mound and the cathedral is the head of a deep comb, which there commences and descends, opening towards the east. At this time the abbey barn stands a little to the west and almost upon the skirts of the mound, being built probably in part upon its ditch. A little to the north-west is the great gatehouse, "Ely Porta," in the place, probably of the original entrance to the burh. The mound has always been the property of the Church of Ely, and is still included within its precinct. It is planted, and its top is reached by a winding walk. Locally it is known as Cherry Hill; but this is supposed to be a modern name.

It is remarkable that, although this mound is undoubtedly a Saxon burh, and intended for defence, it is never called "the Castle Hill," and seems never to have been so used by the bishops. There is no trace of masonry upon or in connexion with it, and it is never mentioned in the records as a castle or a moat, or in any other way. Even Bentham does not allude to it. The pipe-roll of 1st Henry I. mentions the bishop as accounting for certain of his knights who kept his ward in the Isle of Ely, as they were doing for Norwich Castle; but the Isle is not a castle, although it may be that its natural strength was found to make the castle unnecessary. That the burh was not employed as a fortification in the eleventh century is pretty clear from the fact that there is no mention of a castle in the various operations connected with the attack of the Isle of Ely by the Conqueror, and its defence by Hereford and the English in 1069 and 1070. Subsequent records, though they very frequently relate to Ely, make no mention of any castle there; but an inquiry taken in 1229 states the area of the prison close at sixteen acres, and adds that it contained a garden of six acres and a windmill. There can be but little doubt that the windmill stood upon the mound.

#### MILEHAM CASTLE.

In the northern part of Norfolk, in a district where the names of the parishes mostly terminate in "ham," upon the road between Elmham and Swaffham, or, more properly, between Norwich and Lynn, about six miles east of Castle Acre, is the village of Mileham: so called, it is supposed, from its mill. If this be so, the mill was probably worked by wind power; for Mileham stands high between the sources of the Nar and a tributary of the Wensam, and its streamlets are inconsiderable. Laundryke, or the Devil's Dyke,—no doubt one of the defensive earthworks, named originally from Woden,—runs north and south a little east of the village, gives name to the Hundred of Launditch, and may possibly be connected with its earthworks. This was probably one of the many lines of defence thrown up by the invading Angles to keep back the British Iceni, showing, according to Mr. Green, that there was a period when the former were content to retain what they had acquired, and to act upon the defensive only.

The Mileham earthworks, designated locally by the name,—no doubt, comparatively modern,—of Hall Yards, are somewhat peculiar in figure and fashion. A broad but very low mound, about 24 yards across at the top, and about 12 ft. in height, is surrounded by a light ditch, circular, and about 100 yards in diameter. On the outer side or counterscarp of this ditch, towards the north, is applied an oval, or rather an ear-shaped enclosure, about 120 yards by 80 yards, placed broadside against the ditch of the mound, of which it covers about a third of the circumference. This appendage is protected by a low bank and ditch, the latter communicating with the ditch of the mound.

Outside the works, forming a circle of about 600 yards diameter, is another bank and ditch, also of no great height or depth. The mound is nearly in the centre of this circle, or perhaps a little nearer to its south-west quarter.

In the centre of the mound are seen the

foundations of a rectangular building, about 50 ft. square, and evidently the remains of a Norman keep. A cross wall, running nearly east and west, divides the interior into two parts. The material is flint rubble, the walls thick, and their present top a little below the level of the top of the mound. The work is evidently founded upon or below the natural surface of the soil, and probably what now remains was not intended to be seen. The curtain to the outer area is thought to be indicated by a fragment of masonry towards the north, upon the road, which, with the keep, are the only remains. Probably the outer circle was walled, but of this there is now no trace visible.

North of and beyond the road is a bank running in a straight line 208 yards east and west, and turning southward at each end for 126 yards, where it is cut off by the road. There is also an exterior ditch. This, it is evident, is the northern half of a Roman camp, intersected by the road, the southern half of which has been altered and superseded by the earthworks of the castle. It is pretty evident, from the relative position, no less than the character of the two sets of works, that the Roman work is the older, and that the mound and its appendages are later alterations of the fashion of those described in the "Anglo-Saxon Chronicle," and, in short, that we have here, as at Castle Acre, a burh, the work of the East Angles settlers. The masonry, especially the fragment of the keep, belongs to a later age and to the Norman lord.

It appears that Mileham was a part of the extensive private possessions of Archbishop Stigand, and as such was taken by the Conqueror, who held it at Domesday, its keeper being William do Noiers, a person much trusted by William for the care of forfeited estates. Mileham had been the capital manor of a large estate, and, no doubt, the residence of an English lord. Attached to it were several cervices, or sub-lordships, and those of the Hundreds of Launditch and South Greneho, with forty or fifty knights' fees. The property was granted, either by William or Henry I., to Alan the son of Plasid, lord of Oswestry, and progenitor of the earls of Arundel and of the Scottish house of Stewart. Alan, or his son William Fitz-Alan, built the castle, turning the English earthwork to account in the new works, if, indeed, the castle was ever finished. It is remarkable that, although the masonry shows that there actually was a keep, or the commencement of a keep, and although there is reason to believe that a castle was actually built, no mention of it occurs in any known record. Mileham was the seat of an Honour, and the place under which other lordships and many knights' fees were held for many centuries; but the place mentioned is the manor, and never the castle. The Fitz-Alans were powerful lords, and held several castles, as Arundel, Oswestry, Clun, and others, frequently named in their inquisition, but of Mileham Castle nothing is said. The manor occurs in all the later inquisitions down to the time of Henry, earl of Arundel, who sold it, in 1559, to Sir Thomas Gresham, who also purchased Castle Acre.

There was a sub-manor in Mileham called Burghwood, which is said to have given name to a family who acted as castellans to the castle for the earls of Arundel. The father of Sir Edward Coke held this manor, and Sir Edward himself was born at a house within or at no great distance from the castle.

There is a short and very indifferent account of Mileham in the *Gentleman's Magazine*, vol. lxxxix., part 1, p. 513, with a pretty good plan and a very exaggerated elevation. Also in the "Transactions" of the Norfolk Archaeological Society is an account of it by Mr. Carthev.

#### BUNGAY CASTLE.

On the borders of Norfolk and Suffolk, just within the latter county, the river Waveney, their boundary from the sea at Yarmouth for fifty miles, to its source near Redgrave, by one of the most remarkable of its many folds, embraces a broad and long peninsula of meadow containing above 400 acres, the neck or isthmus of which is of moderately high ground, and not above 450 yards broad. Completely to secure so valuable a pasture, advantage was taken of the position to throw up upon the isthmus a moated mound, between which and the river the ground is further occupied by a spacious hase-court or ward, also protected by

a lofty earth-bank and a deep exterior ditch. The works gave occasion to, and form the nucleus of, the town of Bungay, and are but a few yards distant from St. Mary's Church. The name of the town is thought to preserve that of "Bonna," its supposed founder: "gay," in East-  
Anglian nomenclature, is a "gate" or enclosure.

Bungay, under the Conqueror, had become a considerable place, containing three churches within its limits and two outside them. The burh and manor had belonged to Godric, but the soko was the private estate of Archbishop Stigand, with much other Norfolk land. William seized upon it as his own demesne, and included it in the immense extent of territory given over to the care of William de Noiers. Soon after donesday, Bungay, with many Norfolk and Suffolk manors, was granted to Roger le Bigot, one of the Conqueror's most distinguished followers. The town itself was valuable, and there were productive water-mills and an important fishery.

Roger, no doubt, found here a strong place, as strong places were then understood in England and in Normandy, and either he or his son inclosed the mound within a revetment of masonry, and in its centre constructed a rectangular keep, a very unusual arrangement. Probably the mound was not considered high enough to form the base of a regular shell keep, and was merely revetted to carry a parapet as an additional defence, containing a sort of small inner ward round the keep. That the parapet, however, was more than a mere breastwork is evident from the height and strength of the two gate towers which still remain, and which, though later than the keep and the original revetment, must have been parts of a circuit corresponding to them in strength.

"The Castle of Bungay,  
Hard by the river Waveney."

became known as one of the strong places in eastern England, and was made much of by the house of Bigot. Norwich, which they often held, was, no doubt, a larger and stronger castle, but Norwich was a royal castle, of which they were but castellans, whereas Bungay was their own.

Hugh, the third baron, was created Earl of Norfolk by King Stephen in 1135, but having changed sides, Stephen attacked and took Bungay in 1140, at Pentecost, as related in the annals of Waverley. On the accession of Henry II., Earl Roger surrendered his castles, which, however, not being adulterine, were restored to him in 1163. Later in the reign, in 1175, the earl, being in rebellion, was defeated in the field by Hugh de Lucy, and his castles of Walton, Framlingham, and Bungay were taken. Walton was then destroyed. Richard I. restored Bungay to Roger, the earl's son, on a payment of 1,000 marks. During the reign of Henry III., Earl Roger was always in opposition and often in rebellion, and Bungay, falling into the king's hands, was destroyed, and appears so to have remained till the reign of Edward I., when, in 1293-4, Roger, the fifth and last earl, had a licence to enhatle his house, "Mansu sum de Bungay." On his death, Bungay fell to the Crown, and in 1312, or earlier, was granted to Thomas de Brotherton, the king's fifth son, with the earldom of Norfolk. Edward de Montacute, who married Alice, Earl Thomas's daughter, held the castle as early as 1308, and with it four water-mills and two windmills. Montacute's daughter, Joan, married William de Uford, earl of Suffolk, and the castle remained in the Uffords till 1381. In 1475, John de Mowbray, duke of Norfolk, had the castle by descent from the Brothertons, and finally it came to the Howards, and Jockey, of Norfolk, who fell at Bosworth, was lord of Bungay. The attainder of Thomas, duke of Norfolk, brought Bungay into the hands of the Crown; and it was afterwards granted by James I. to the Howards, earls of Suffolk. It was afterwards sold, but has been repurchased, so that the castle now belongs to the Duke of Norfolk.

The Benedictine nunnery, of which the ruins remain, attached to St. Mary's Church, was founded by Gundreda, widow of Roger le Bigot, and Roger de Glanville, her second husband.

The mound, motte, or burh of Bungay, stands on the edge of the present town, and is much obscured by buildings, enclosed yards, and gardens, placed against it; it is about 10 ft. high, and about 46 yards diameter on its level top. The original mound was evidently circular, but it has been enclosed all round by a revetment or retaining wall, which is said to be a polygon, and perhaps may be so, though of an

irregular character. The parapet appears modern.

In the centre of the area is what remains of the keep. This is a mass of masonry, about 60 ft. square, with walls 12 ft. thick, once, perhaps, faced with ashlar, but now entirely composed of flint rubble, so that anything like close accuracy of measurement is impracticable. What remains is about 12 ft. high, and evidently composed the ground floor or basement; there was no underground chamber. The north and east walls are perfect, and nearly all the south wall; most of the west wall is gone. Each face seems to have been broken by three pilasters, 12 ft. broad, and 1 ft. projection, the flanks meeting over the angles, which are solid. The central pilaster is seen on the north and south faces, but is obscure on the east face. In the east wall are two loops, the splayed recesses of which are 6 ft. broad and 12 ft. apart. In the north wall is a semicircular recess, 13 ft. broad, with a loop. Close west of this is a small modern door, probably representing a loop; there are no openings in the south wall. The entrance was probably in the west face, inside the building; at the two eastern angles, are traces of ashlar.

The well remains open in the court about 18 ft. south-south-west of the south-west angle of the keep. It is about 3 ft. square, lined with rubble, and at present 20 ft. deep and dry. West-south-west of the keep, at about 40 ft. distant, is the gateway of the inner ward. The arch is gone, but there remain two half-round flanking towers, with prolonged sides. They are of 7 ft. internal diameter, with walls 7 ft. thick, and are open at the gorge. They are later than the keep, and probably of the time of Richard I. or John.

The outer or great ward of the castle lay to the south and west, and was evidently contained within a very broad and lofty bank and a deep ditch. The ditch seems to have opened at each end into the ditch of the mound, and to have covered from one-third to one-half of it. Much of the bank has been thrown back into the ditch, and borses built upon the site, but enough remains to show the magnitude and general direction of the whole. There is no visible trace of masonry on the bank, but it must certainly have carried a wall. The earthworks seem to indicate two courts, and there is a gap which may represent the outer gate on the west side.

#### A BAZAAR IN THE EAST.

Not the East of glowing sun and vivid colouring,—of opalescent sky, of gilded domes, and minarets,—where nature throws such a jewelled mantle over the prosaic and sad attributes of poverty that they become almost poetical and picturesque,—but in that East of our great city, where too often, alas, we meet, in all its unredeemed ugliness, the grim scarcrow of dire distress. It is so often in the interest of progress,—of humanity,—we are obliged to show the darker shadows of the picture, that it is with positive relief and pleasure we exhibit now and then the brighter side.

In this East, a little army of good men and true are (with the same unflinching courage, the indomitable perseverance that animates our soldiers on land, our blue-jackets at sea) waging their war. With no grant from Government, no pomp or pageantry to nerve them to great deeds, no outward applause,—for they are mostly those who "do good by stealth, and blush to find it fame," a reason that prevents me alluding to them by name. They are men honourable in the church, in the medical profession, in the sister services, and there are others also, who, irrespective of position, are all zealous workers in the same good cause; men who, as Mr. Wilson remarked, are all united,—whatever their political opinions may be,—all "true blue," in fact, when the question is for the good of humanity; and they have their unflinching contingents, their ever-ready helpers of the other sex, and from the deep sources of society. The lady of fashion, the deaconesses who, though in the world are "not of the world," and the woman of less elevated rank, but who is yet more intimately acquainted with the actual wants and sorrows of those of her own status in society than we are. Then there are those who are seeking not only to elevate but to amuse. The fancy fairs in the West have been such a success this year,

why should not the East have the gratification of seeing what it could do on a smaller scale? So the occasion of the distribution at the fifteenth annual flower show was eagerly seized to give them a "hazard"—a *multum in parvo* affair—with prettily-decorated stalls, and hearing a family resemblance to its more full-blown sisters in the West. The spot chosen was the large school-rooms in Granby-row, in the parish of St. Mathias, Bethnal-green. The object was also that the money laid out by the visitors should be returned them, as it is to be expended in a heating apparatus for their church in the winter.

I have not a vague idea even yet of how, what with tunnels and changes of trains, and the traversing of a network of streets, I arrived at my destination, and, after a little jocular chaffing, but nothing in comparison to what I expected we should have to run the gauntlet of, found ourselves in our bazaar. No cross-legged Turks, no jewelled pipes, no, alas! no attar of roses, no glittering stuffs that look but garments fit for the lovely princesses of the "Arabian Nights"; but articles of solid utility in the way of clothing, and toys for the children, of whom there is always an astoundingly plentiful crop in Bethnal-green. There was a room where all the flowers were exhibited. One of the prizes, a fuchsia of enormous size, trained by a bedridden person; and a little apple-tree raised from a pip, tobacco-plants, creepers of all kinds, &c. One of the prizes was won by one of our best velvet-weavers. In another room were cases with medals exhibited, several from the Peninsular War, some from the relics of bygone "braves," others from living owners, but all proving whatever their actual dwelling-place, Bethnal Green was evidently their nation. Pieces of chain-armor from India, snuff-boxes with pictures of Louis XVI. and others, evidently lent by some of the descendants of the Huguenot exiles of La Belle France. There were other pictures, too. The crowd grew denser towards eight o'clock in the evening, and then the doors were closed, whilst Mr. Briggs, their excellent and energetic rector, mounted the platform, and, with his sister, and Dr. Gills, and some other gentlemen, distributed the prizes. It was a sight to see the waves of upturned faces. Then, after the distribution, the good-natured crowd surged about and made their little purchases with much less chaffering than I have seen amongst finer folks. There might have been a good deal of noise, as the big drum was rather rashly entrusted to two sturdy young Britons; there might have been rather more hubbub than marks the calm repose of the Vere do Veres, but no one could go away without feeling he had never seen more forcibly illustrated the proverb "One touch of nature makes the whole world kin." Gentle and simple see in that small space how much there is of excellence in either, and can say of each other, as *Captain de Hatry* and *Sau Gerridge* do in "Caste," "Well, after all, there's something in him." CARLEON.

#### THE BRIGHTON AND SUSSEX EYE INFIRMARY.

The building in which the work of this institution (founded half a century ago by the late Dr. Pickford) is carried on is being internally reconstructed. The old building in the Queen's-road has been entirely removed; and on the ground-floor, in the main body of the building, is being constructed a large ward for men, its dimensions being 38 ft. 6 in. long by 24 ft. wide, and 16 ft. high. This will give accommodation for twelve or fourteen in-patients. Immediately above will be a ward of the same dimensions, except as to height, which will be 2 ft. less, for women. To secure perfect ventilation, these wards are built upon arches, and ventilating shafts and flues, upon the most approved principles, are constructed in every available angle of the building, whilst the heating arrangements (by stoves) will be in the centre of each ward, both of which will be connected with the kitchen by a hydraulic lift. In the basement will be a sitting-room and bedroom for the caretaker, the dispensary and waiting-room for out-patients, the surgeon's room and "dark room" for examination of the diseased or injured eyes of those who may seek the assistance of the institution. With the exception of the last-mentioned room, all the apartments in the basement will be light and airy,—the plans having been very carefully

prepared by the architect, Mr. Somers Clarke, jun., of Dean's-yard, Westminster. They will be reached by a short and easy flight of steps at the southern (or right-hand) side of the building. On the ground-floor will be an entrance-hall (18 ft. 8 in. by 13 ft.) with a matron's room, and spare ward for special cases on the right-hand side of the hall. On the opposite side will be the Board-room, 25 ft. long; with a male convalescent room over. At the rear of the entrance-hall will be the main wards already alluded to and described; and on the second floor, corresponding with those on the ground-floor, will be the nurses' room, and another spare ward for special cases. The present front elevation, which is of the Corinthian order of architecture, will remain standing, but the flight of long steps leading to the building will be reduced to three in number; the new "ground-line" being placed at that level. The massive fluted columns will be lengthened at the base to correspond with this alteration, thus giving the façade, which will be 36 ft. high to the eaves, and 46 ft. to the ridge, a loftier appearance.

The work in hand will (according to the *Brighton Herald*) be finished and the Institution ready for the reception of patients by the end of the present year, the contract (4,350*l.*) being in the hands of Messrs. Cheesman & Co., of Brighton.

#### ST. JOHN'S WOOD SYNAGOGUE.

THE St. John's Wood Synagogue, just now consecrated, occupies a site at the corner of Abbey-road and Marlborough-place. The architectural character of the building is Byzantine, freely treated. The building is faced with red Foreham bricks, with terra-cotta and Dumfriess stone dressings and ornamental details. The elevation facing the Abbey-road consists of a colonnade of arches, supported by red Dumfriess stone columns, with enriched capitals. This colonnade is flanked by two turret-towers, with a gable between. The elevation to Marlborough-place is of a more simple character, but treated with the same architectural effects. The colonnade is approached by a broad flight of steps, leading into a vestibule 13 ft. wide by 27 ft. long. At each end of this vestibule is a staircase leading to the ladies' gallery, situated on the first-floor level. Under the stairs on one side is the secretary's office, and on the other side, gentlemen's cloak-rooms, retiring-rooms, &c.

The ground-floor of the synagogue is entered from the vestibule by three large doors, opening outwards, and can also be approached from the east end, where additional doors have been provided, so as to afford every facility for ingress or egress.

The first floor has been, as before mentioned, appropriated to the ladies' galleries, which are very wide, and have broad passages behind the seating, so arranged as to prevent crowding, to insure decorum, and, in the event of panic, to afford an easy means of egress. The galleries have no fewer than four doors devoted to their use. The west gallery is carried over the vestibule, and forms an architectural feature of the interior. Off the landings of the staircases are ladies' retiring-rooms, lavatories, &c.

On the second floor is a large committee-room, with lavatories and retiring-room attached.

The synagogue proper consists of a centre nave and two aisles, the galleries being supported upon coupled iron columns of ornamental design; these columns are carried up to the ceiling. An ornamental screen forms the gallery front, enriched with a vine-leaf running ornament, and ornamental iron panelling. The west end is formed by a series of arcades in harmony with the other portions of the gallery, and the east end is devoted to the Ark or sanctuary, which is formed in a deep arched recess approached by a flight of marble steps. The chamber for the reception of the scrolls of the law, is approached from the sanctuary recess, and is of a very ornamental character, its entrance being flanked by marble columns with enriched capitals, supporting a tympanum, and decorated with symbolical enrichments. The windows are filled with stained glass from the architect's design, and executed by Mr. William Gibbs, of 387, Kingsland-road. The seating has been executed by Messrs. Cohen & Sons, of Curtain-road. The almsmer, or reading-desk, is of pitch-pine, having the choir

behind and the warden's seats in front. A pulpit has also been provided, and has been executed from the architect's design by Messrs. Cox, Son, Buckley, & Co., of 28, Southampton-street, Strand. The dimensions of the synagogue proper inside the walls, are 58 ft. by 45 ft. 6 in., and the height of the ceiling is 31 ft. 6 in.

Owing to the necessity for consecrating the building before the members of the congregation and their friends leave town, the time has been limited to complete the decorations of the building, but a portion has been executed by Mr. Rich, of Fortis-road, Kentish-town, under the direction of the architect, which, although simple in character, evidences an appreciation of harmony and colour.

The heating and ventilation have been carefully considered. Pure air is admitted into the building in a vertical direction, either at a cold or warm temperature, and the impure or vitiated air is carried off by means of ventilating ducts which have been provided over and under the galleries and in the main ceiling, an upward current being induced by means of Bunson's gas-burners. The heating is by means of Weeks & Co's (King's-road, Chelsea) new hydro-chloric coils, the furnaces, &c., being placed in a fireproof compartment in the basement. The gas has also been very carefully arranged, and the lighting of any portion of the building is under immediate control, and can be turned on or regulated at pleasure from the exterior, so that the congregation will not be disturbed during service by attendants entering the building for the purpose of lighting the burners. This portion of the work has been carried out by Mr. D. Cohen, of 8 & 9, Chiswell-street, Finsbury. The gasfittings throughout have been supplied by Messrs. Defries & Sons, Mr. Coleman Defries having presented the candelabra for the sanctuary. The memorial light was presented by Mr. Isadore Spichman.

The synagogue will accommodate, on the ground-floor, about 240 male worshippers, and in the galleries about 250 ladies.

A separate house has been built for the beadle, containing every convenience. The cost of the building, exclusive of the purchase of the site, furniture, &c., will be about 8,000*l.* The builders are Messrs. Kirk & Randall, Woolwich, and Mr. H. H. Collins, F.R.I.B.A., is the architect.

#### FROM ABROAD.

*The Berlin Hygienic Exhibition.*—At a recent meeting of the central body, it was recommended by the select committee charged with the question of reconstruction, that the new building should be of iron and glass, and should be erected upon the site of the one which was destroyed, the original plans being followed as far as possible. It was further stated that the work could be completed by May, 1883. The cost of the new building is estimated at equal to 10,000*l.* The Emperor and the municipal authorities of Berlin have sent contributions towards the expenses, which will be repaid, no doubt, out of the receipts, the amount calculated upon for exhibitors' space, entrance-money, being fully equal to meeting all cost of construction and maintenance.

*Permanent Industrial and Art Exhibition at Cologne.*—At Ehrenfeld, a suburb of Cologne, a building has just been completed, which is intended for a permanent exhibition. The structure is described as being executed in solid masonry on a large scale, and as having a tower which will render it an object of interest to any one looking from a slight distance at the general features of the city. The site occupies about 9,000 square yards, and further space has likewise been reserved for trials of agricultural implements.

The building itself contains fifteen spacious rooms, six vaulted cellars, five covered halls, machinery annex, with boiler-house, reading-room, concert and assembly rooms, &c. The wine and beer saloons, in the old German style, are, as might be expected, to be found amongst the features of the exhibition. The display of objects of interest is as yet on a small scale, but includes exhibits of machinery and furniture, as well as some *objets d'art*.

*The Ruins at Kolndseck on the Rhine.*—These interesting ruins are receiving skilful attention at the present moment, one of the arches having suffered considerably since it was partially restored in 1840. The expenses of the work are being borne by the present owner of

the spot, a princess of Hesse. Under the direction of the Burgomaster of Remagen, the approaches have been improved, and basalt steps placed at spots where the ascent is particularly steep. Portions of the surrounding trees have been cleared, in order to allow of a better view being obtainable of the romantic scenery of the district.

#### LIVERPOOL ARCHITECTURAL SOCIETY.

By invitation of Mr. J. C. Edwards, a number of the members of the Liverpool Architectural Society paid a visit to the Pen-y-bont Terracotta Works at Raubon, on Wednesday, the 26th of July. They were conducted over the works by Mr. J. C. Edwards, Mr. E. Lloyd Edwards, Mr. Richardson (chief of the designing department), and Mr. Bryan (general manager), who thoroughly explained the successive stages of manufacture. Commencing with the clay-getting, the party were conducted first to the huge pit from which the clay is obtained, and where clay-getting in its various forms was in operation (*en passant*, it may be said that the stock of clay is practically unlimited). Thence they were taken to the grinding and pugging-mills, through the engine-house, and from these in succession through the brick-making department,—"wire-cut," patent pressed, and moulded bricks of every type being in process of manufacture; next through the drying-sheds, where all the waste steam is made available for the purpose; and thence into the portion of the works where ordinary thick quarry-tiles are made, and through the terra-cotta department, where huge blocks, destined for the main cornice of the *Manchester Guardian* Offices, the Rainhill Lunatic Asylum, and other prominent buildings, were being turned out, together with every conceivable form of moulded work required throughout a building, including balustrading, heads and bases of columns and pilasters, carved panels, swags, pedestals, terminals, vases, ridge-tiles, &c., made to order for buildings in every part of the country. A visit was then paid to the modelling-rooms, where a number of men and boys were at work modelling in plaster of Paris, from designs either made by Mr. Edwards, or sent to him by architects to be carried out. The foundation of this department was understood to be due to the energy of the general manager (Mr. Bryan), who gained his knowledge in the South Kensington Schools, and has here raised a school of modelling of which any man might be proud, the material upon which he has had to work being entirely local talent, in the shape of National School-boys, who have been trained to a pitch of excellence which is surprising. The party next went through the drawing office, where a number of draughtsmen were at work, presided over by Mr. Richardson (a pupil of Mr. Verity, architect). The drawings of works in hand were inspected, and then the roofing-tile department was gone over. Here the manufacture of roofing-tiles in all its branches was thoroughly explained, and the encaustic tile department entered. This portion of the works is under the management of Mr. Denny, who very clearly explained, in a practical manner, the entire process, which was generally pronounced to be of a most interesting character; then the clay-mixing rooms (for colours other than those of the natural clay), the fitter's shop, where the intricate patterns for encaustic tiles are made, the pattern-room, where thousands of patterns of moulded bricks, &c., are stored, and the tile storeroom, were successively explored, and in the latter numerous entirely new samples were exhibited, which were very favourably commented upon. The tile-glazing process and firing were then explained, and finally several kilns just being drawn were entered and the contents examined.

Many acres of land are covered by the works, and they are a surprising instance of what can be done with capital and energy combined, the whole being the result of only ten years' work, and having been built up bit by bit as the trade was found to develop.

**A shocking Accident** has occurred at Gateshead. As the workers at Scott's brickyard were having their dinner a portion of a burning kiln fell upon them, killing two boys on the spot. The men received severe injuries in their efforts to rescue the boys.

THE LONDON AND MIDDLESEX  
ARCHÆOLOGICAL SOCIETY.

A GENERAL meeting of this Society was held on Saturday last, when a visit was paid to the Church of St. Olave, Hart-street, Crippled Friars. There was a good attendance of members and visitors, amongst those present being Mr. Pittman, Mr. Garratt, Mr. Lambert, Mr. Goodman, Mr. W. Ash, Mr. Craze, Mr. Brabrook, Mr. Thrupp, Mr. Price, Mr. Edwin Nash, and Mr. G. H. Birch (one of the honorary secretaries). The Rev. A. Povey, rector, in a paper on the church, said there was a tradition about a cripple in France who dreamed that he saw a venerable old man who told him that if he went to St. Olave, in London, he would regain his strength. He proceeded on his way, and on his arrival was at length directed by a citizen to St. Olave's, Hart-street. The cripple, it is said, rolled his body over the threshold into the yard, and immediately rose up restored to strength. Whether that were true or not, the essayist said it was certainly true that King Olaf, after whom the church was named, was famous in his lifetime for his victories over the Danish invaders. The first account they had of the living was that in the year 1319,—the reign of Henry II.,—an inquiry was made about the monastery. The church, however, was not to be regarded as earlier than the reign of Henry IV. The foundations of the chancel consisted of masonry stone, while the columns and arches were of Purbeck of an inferior quality. The ceiling was of oak, a part of it having been renewed in 1633. The vestry minutes contained some curious items. In the year 1713 instructions were given for the footmen to be placed in one of the galleries and the maid-servants in pews sufficiently remote for the purpose; also that none should be admitted to the ancient's gallery except parish officers. The old communion-table was placed in the church 121 years ago, having been obtained by voluntary subscription. The present reredos was designed by Sir George Gilbert Scott, and placed there by the present rector, the pulpit, a very fine old specimen of carving, having been brought from a neighbouring church. Amongst those who slept in the vaults beneath was the wife of Samuel Pepys, on whose monumental plate are written the following words:—"She would not bring any offspring because she could not bring forth any equal to herself." The registers date back to the year 1576, and amongst those who signed their names in them were Samuel Pepys and the celebrated Earl of Essex. Mr. H. Wheatley afterwards read an amusing paper on worthless connections with the church, referring chiefly to the curious gossip of the old diarist, Pepys, to whom, as we have lately mentioned, it is proposed to erect a monument in this church.

The visitors afterwards proceeded to the Church of All Hallows Barking, at the eastern end of Great Tower-street, a building which is much larger and much lighter in appearance than the church of St. Olave. Although it escaped the fire of 1666, not a large portion of it can be called ancient. The original church was in the Norman style, but nothing remains of that style now except the foundation; the rest is debased Gothic. The secretary read a paper prepared by the Rev. Joseph Maskell, who was travelling on the Continent, in which it was stated that the first grant in connexion with the church was made by Walter, the bishop in the reign of Stephen, the grant being afterwards confirmed by Henry II. The church existed under its present name as early as the Norman period of English history, and the mms came thither from Barking, in Essex, up to the time of the demolition of the monasteries. Alderman John Cope founded the chancel, and amongst those who were interred in the vaults of the church was William Tim, the first collector and editor of Chaucer's poems. Many eminent men were born in this parish, including Bishop Andrews, William Penn, the founder of Pennsylvania, who first saw the light on Flower-hill, and the late Lord Chief-Justice Bovill, who was born in Catherine-court in the year 1810. The chantry of St. Mary was founded by Richard I., whose lion heart is still to be seen in a case at Romen. Edward I. confirmed these privileges, and also set up in the church an image of the Virgin Mary, he having been told in a vision that, by so doing he would conquer the Welsh and the Scotch and be victorious in all his battles. The pulpit and sounding-board were set up in the reign of James I.

BRISTOL AND GLOUCESTERSHIRE  
ARCHÆOLOGICAL SOCIETY.

On the 25th ult. this Society held its seventh annual meeting, at Stow-on-the-Wold, under the presidency of Sir John Maclean, F.S.A., the out-going President.

The report of the Council, which was submitted, stated that there were at present 446 annual members and 74 life members. The income of the society for the financial year 1881-2, including last year's balance, was 469*l.* 12*s.* 9*d.*, and there was now a balance of 169*l.* 1*s.* 10*d.* in the treasurer's hands. Since the last report of the Council the society had held its annual summer meeting at Cheltenham, its annual winter meeting at Gloucester, and three local meetings, two in the Forest of Dean, and one at Berkeley Castle. These meetings produced more than sufficient materials for the sixth volume of the society's transactions. The Council had to announce the loss of more than 700 volumes of the Transactions for the years 1877-81, owing to a disastrous fire at the printers. It was gratifying to be able to announce that during the last year Lord Fitzharding had very liberally and courteously given his consent to the very valuable MS. of John Smyth, the antiquarian, written in the early part of the seventeenth century, and the ancient MS. Register of the Abbey of St. Augustine at Bristol, which are preserved in the monument-room at Berkeley Castle, being printed by the society for its members. During the present year a very valuable work, "Archæological Handbook of the County of Gloucester," would be privately printed by Mr. G. B. Watts, one of the members of the society and a member of the Council. By a careful personal survey of the whole county, Mr. Watts had been enabled to discover a great number of Roman and British camps, &c., which had hitherto been unknown. These were all shown in the maps which would accompany the work. The Council regretted that, with such a work on its hands as Smyth's MSS., it would be unable for the present to print the account of Flaxley Abbey, by Mr. A. Crawley Boevey. They deeply regretted the retirement of Mr. Palmer Hallett (as one of the general secretaries), whose eminent services entitled him to deep and lasting gratitude on the part of the members. The kind consent, however, of Dr. Caldicott, head-master of the Bristol Grammar School, had enabled the Council to accede to Mr. Hallett's wish to retire. With regret they announced the resignation of Mr. J. Reynolds as local secretary for Bristol, and desired to nominate Mr. E. Strickland in his room. The following members of the Council retired by rotation.—Mr. J. T. D. Niblett, Mr. G. B. Watts, the Rev. Canon H. A. Ellacombe, the Rev. W. B. Oakley, Mr. W. Cripps, and Dr. Paine. The Council also regretted the resignation of Mr. J. Bellows, and nominated in his room the Rev. S. E. Bartlett. In the room of Dr. Caldicott, Mr. H. J. Reynolds was nominated on the Council. The Council, having heard that it was in contemplation by the Dean and Chapter of Bristol to destroy the ancient Minster-house, had thought it proper to appoint a committee to protest against such destruction. The retiring president then introduced the new president (Mr. E. Rhys Wingfield), who delivered an address.

The Rev. R. W. Hippisley, rector of Stow-on-the-Wold, proposed, and the Rev. D. Royce seconded, that the following gentlemen be requested to accept the position of members of the Council:—Messrs. J. D. T. Niblett, G. B. Watts, the Rev. Canon H. N. Ellacombe, the Rev. W. B. Oakley, Mr. W. Cripps, Dr. Paine, Mr. J. Reynolds, and Mr. R. Bramble. This was carried unanimously.

Sir W. Guise moved, and Mr. Niblett seconded, a vote of thanks to the retiring president (Sir J. Maclean).

The motion having been carried with acclamation, Sir John replied, saying that he had felt no difficulty in carrying out the duties of the office.

The members subsequently visited the parish church. On the south wall of the nave there is a large picture of the Crucifixion, by Casper de Crayer, the contemporary and friend of Rubens and Vandeyck. The ancient cross in the Market-place was next visited. Originally it was a very fine piece of work, said the Rev. D. Royce, but till a few years ago it was used as a lamp-post. In 1878, however, the inha-

bitants of Stow restored it, to commemorate the munificence of the late Mr. J. C. Chamberlayne, who gave 2,000*l.* to obtain a supply of pure water for the town. Breaks being taken, the party proceeded to Nether Swell and Upper Slaughter Churches, and inspected some earth-works. The annual dinner took place in the evening, and afterwards some papers on local subjects were read.

On Wednesday, the 26th, the members proceeded in breaks to Icomb-place, a large and interesting old manston, and the Manor-house of Icomb in former times. Here a paper was read by the Rev. D. Royce, of Nether Swell, one of the local secretaries of the association. The residence, which is quadrangular in plan, is thought to have been built in the middle of the fifteenth century, and it was for a long time the seat of Sir John Blacketts. In Icomb church there is a chantry, and the Icomb Manor estate (whose proprietors are traceable from the time of Edward III. to the present day) is still liable for the repair of that chantry. Mr. Royce and Mr. Waller, of Gloucester, conducted parties over the building, pointing out its most important features. Bledington Church was next visited, and was described by Mr. Cutts, who carried out the partial restoration which the edifice has recently undergone. It contains Norman, Transitional Norman, and Early English work, but is mostly later; the tower, as is the case at Upper Slaughter, is built within the church. A long drive took the members to Chastleton-house, a large early sixteenth-century residence, now belonging to Miss Whitmore-Jones. Chastleton Camp was next visited. The Rev. D. Royce was of opinion that this was originally a British camp, but it was afterwards altered and used by the Romans. Sir John Maclean doubted if it was ever a British camp. A *conversazione* was held in St. Edward's-hall, Stow-on-the-Wold, in the evening.

A concluding meeting was held on Thursday, the 27th, when it was decided that the next annual meeting of the society should be held at Bath. The choice of a president for the Bath meeting was left to the Council. Subsequently a large party took breaks for the third and last day's excursion. The first halt was at Salmons-bury Camp, near Bourton-on-the-Water, where a piece of wall was exposed. They next proceeded to Farmington, where they were met by the vicar, who pointed out the various features of the church. A few miles further driving brought the party to Northleach, an old and decayed town, once a great centre for Cotswold weavestaplers, and afterwards the home of cloth-weaving. An inspection of the parish church followed, a descriptive paper being read by the Rev. D. Royce, of Nether Swell. The next place visited was Hampnett, where there is much Norman work and a fifteenth-century tower. At Notgrove the manor-house was visited. Here lived the Gloucestershire family of Whittingtons, from which the celebrated Dick Whittington came, and in the chancel of the church are two effigies of members of the family. Near to Notgrove Station a British barrow was inspected, and a paper by Mr. G. B. Watts was read.

THE ROYAL ARCHÆOLOGICAL  
INSTITUTE.

MEETING AT CARLISLE.

The Royal Archæological Institute of Great Britain and Ireland commenced its annual meetings at Carlisle on Tuesday last. Lord Talbot de Malahide, president; Mr. Freeman, the historian of the Norman Conquest, who presides over the historical section; Mr. Evans, who presides over the antiquities section; and Mr. Beresford Hope, who will be president of the architectural section; the Bishop of Bath and Wells, Dr. Collingwood Bruce, Precentor Venables, Mr. Tucker (Somerset Herald) and other archaeologists are among those attending the meeting. The opening address was delivered by the Bishop of Carlisle as president of the meeting. The address dwelt at length upon the interesting nature of the antiquarian and archæological associations of the city of Carlisle, which a high authority (Mr. Freeman) had said "stand out beyond those of almost any other English city on the surface of English history." The bishop observed that the time had gone by in which archæology could be confounded with antiquarianism of the Monkbarns type. We recognised that archæology, being in reality the science of past time, was the basis of history, of

politics, even in a certain sense, of religion itself.

Lord Talbot, in moving a vote of thanks to the Bishop of Carlisle for his address, intimated his intention to retire from the presidency of the Institute. Having now occupied that position for about thirty years, he thought that he had earned his retirement.

Mr. Freeman expressed regret at this announcement, and hoped it was not too late for Lord Talbot to consider the matter.

His lordship replied that he would not desert the Institute in a pinch; but he asked them to take his case into consideration.

The proceedings of the meeting were thus brought to a close.

A perambulation of the city was afterwards made, and several places of interest visited. The Mayor of Carlisle, Mr. R. S. Ferguson, gave a conversation in the evening, at which Mr. Freeman read an interesting paper upon the position of Carlisle in history.

On Wednesday there was an excursion to the Penrith district. A party, numbering nearly 300, inspected the objects of antiquarian interest with which the district abounds. Short addresses were delivered by Mr. Evans, President of the Antiquarian Section; Professor Stevens, of Copenhagen; and Mr. Clark, of Dowlais. In the evening the Antiquarian Section met under the presidency of Mr. Evans, when Lord Talbot de Malahide read a paper on the antiquities of Algeria.

#### THE ST. PANCRAS WORKHOUSE COMPETITION.

A MEETING of the Board of Guardians of St. Pancras was held at the Vestry-hall, under the presidency of Mr. Commissioner Kerr, on the 27th ult., when the vexed question which has agitated the parish during the last four or five years, of whether an enlarged workhouse shall be erected on the site of the present workhouse or a new additional workhouse be erected elsewhere, was brought to a termination,—that is, if the Local Government Board do not further interpose. The arbitrating architect, Mr. Arthur Cates, pronounced in favour of the plans of Messrs. Young & Hall and of Mr. H. H. Bridgman, as being the only ones complying with the requirements of the Local Government Board, and recommended the guardians to select either of these competitors as architect for the new workhouse buildings. A report to this effect was now presented to the guardians, and on putting the names to a show of hands there were nine for Mr. Bridgman and seven for Messrs. Young & Hall. Mr. H. H. Bridgman was, therefore, declared elected, subject to his plans being accepted by the Local Government Board. It is believed the works will cost considerably over 100,000*l.* It will be remembered that the Guardians in the first instance, acting before they called in professional advice, selected the design sent in by Messrs. Wilson, Son, & Aldwinckle. Mr. Wescott moved that a cheque for 150 guineas be drawn for Mr. Arthur Cates, the consulting architect; and four cheques, for 75*l.* each, for each of the unsuccessful firms of architects who had competed. This was adopted.

#### THE NEW GRAMMAR SCHOOL BUILDINGS AT SHREWSBURY.

The new buildings at Kingsland, Shrewsbury, which have been occupied for some little time past by the boys of the famous Grammar School belonging to the town, were formally opened by Lord Cranbrook on the 25th ult. By the removal to the new site, which has been accomplished after much consideration, the school acquires advantages of residential comfort and playing space which were lamentably lacking in the historic buildings in Castle-street, passed by every visitor who enters the town from the railway station. Instead of the painfully apparent cramping character of the former situation, endeared to thousands by the proud associations of a distinguished public school, the new school and grounds occupy twenty-eight acres of beautifully picturesque land on an eminence overlooking the river Severn, and the work has been accomplished at a cost of upwards of 40,000*l.* The principal building has been constructed in what is recognised as the Queen Anne style of architecture, and the structure is one of the features of the town.

Singularly enough the school is not an entirely new erection, but has been converted from a block which years ago fulfilled the purposes of the workhouse for the Aetacham Union. It is superfluous to say that the conversion has been complete, and the provision for its future occupants of the most elaborate kind. The length of the school is 180 ft., with a breadth of 50 ft., and the three stories are chiefly devoted to class-rooms, the principal one in the second floor running two-thirds of the entire length of the building. To the west of the school is a house, built for the head-master, and in the rear of this are two houses for the accommodation of the second masters. In the grounds stands a commodious cricket pavilion, and a boat-house has been fitted up on the edge of the river. Messrs. Treasure & Son, of Chester-street, Shrewsbury, executed the contracts for the school and head-master's house, the estimates for which were respectively 14,000*l.* and 11,000*l.*, from the designs of Mr. Arthur W. Blomfield. Mr. W. White, F.S.A., was the architect for the under-master's houses, and the contract for 11,000*l.* was undertaken by Mr. Oliver Jones, of Shrewsbury. In our volume for the latter half of 1881 (xli., pp. 330, 332) we gave a view and plans of one of the under-master's houses.

#### THE NEW GRESHAM ALMSHOUSES AT BRINGTON.

In consequence of the ancient Gresham almshouses in Whitecross-street being required for City improvements, new almshouses in connexion with this charity are now in course of erection at Brixton by the Mercers' Company, acting as the Gresham Committee. The site of the new buildings is in immediate contiguity to the Corporation almshouses, in Shepherd's-lane, and has been purchased from the Corporation by the Gresham Committee for that purpose.

The foundation-stone of the buildings was laid a few weeks ago, by one of the Gresham Committee. The block, which consists of eight separate houses, is 180 ft. in length and 24 ft. in height, consisting of one floor only. The elevation is of red Suffolk brick, with Portland stone windows, entrances, and dressings. Each house has an arched entrance, with large two-light moulded mullion windows, above which there is a projecting cornice, the elevation being surmounted by eight gables, and the roof is covered in with red Broseley tiles. In the centre of the elevation there is a slab in Portland stone, containing a carved representation of the Mercers' Company's arms, under which is an inscription recording the date of the erection of the houses.

Each house contains a living-room, 14 ft. by 12 ft., together with a bed-room, 14 ft. by 9 ft., and kitchen, coal-cellar, and other conveniences. At the rear of the buildings each house has a piece of garden-ground about 40 ft. in depth.

The buildings have been designed by Mr. G. Barnes Williams, architect to the Mercers' Company. Messrs. Ashby & Horner are the contractors, and Mr. Thomas Hopkins is foreman of the works.

#### "PEDAL" ACTION CLOSET.

A SIMPLE arrangement for actuating a closet with a pedal in place of a handle, has recently been patented by Mr. S. H. Terry, and is being manufactured by Messrs. J. Tylor & Sons, of No. 2, Newgate-street.

Amongst other advantages of this arrangement are claimed cleanliness, economy of time, and increased simplicity of construction, there being actually fewer moving parts than in a hand-action closet. The mechanism is entirely self-contained, consequently no extra skill is required in fixing it, as is the case with treadle-action closets, which require joints and fulcrums to be fixed beneath the floor. Treadle-action closets having inaccessible moving parts, subject to corrosion, are liable to derangement and consequent waste of water; the action of this closet being non-automatic, there can be no more waste of water than with the old-fashioned handle-closet, and when fitted with Messrs. J. Tylor's regulator-valve, which closes after the passage of a certain volume of water, whether the lever be held up or not, deserves the notice of corporations and water companies on the score of economy of water. In applying this action to valve-closets, the weight-lever is prolonged and carried through the riser,—the sink brass dish, the handle, and its attachments, being done

away with. This type of closet can be had with the pedal in front or at the side, as may be desired. The action is also being fitted to actuate "syphon," "waste-preventer-water-cistern-closets," "earth-closets," as well as ship's "above-water-line" closets, at a cost which is almost identical with that of handle-closets.

Mr. Edward Griffith, C.E., of 18, Alington-street, has adopted this type of closet, and, amongst other places, has put one into H.R.H. the Duke of Albany's house, Claremont. It has met with the approval of Mr. Robert Rawlinson, C.B., and others.

#### BUILDING PATENT RECORD.\*

##### APPLICATIONS FOR LETTERS PATENT.

- 3,340. A. Drammmond, Edinburgh. Securing glass to astragals and sash-bars. July 14, 1882.  
 3,344. W. S. Laycock, Sheffield. Self-acting window-blind apparatus. July 14, 1882.  
 3,358. A. W. White and J. H. Evans, London. Bell-traps for drains. July 14, 1882.  
 3,361. T. Hughes, Market Drayton. Metallic halving bars and fittings. July 15, 1882.  
 3,371. H. A. Williams, Lincoln. Pulleys for window-blind rollers. July 15, 1882.  
 3,416. T. J. Baker, Newark. Chimney-tops or ventilators. July 18, 1882.  
 3,444. E. L. Ransome, San Francisco, U.S.A. Artificial stone or concrete pavement, &c. July 20, 1882.  
 3,459. A. Dix and T. H. Dix, Rock Ferry. Apparatus for checking cords of blinds, &c. July 20, 1882.  
 3,461. J. Shank, Barnhead. Valvular details of domestic apparatus for the supply, &c., of water. July 21, 1882.  
 3,472. J. Solomon, London. Prevention of chimneys smoking. July 21, 1882.  
 3,486. J. Leather, Liverpool. Ventilating appliances. July 22, 1882.  
 3,487. E. Edwards, London. Apparatus for maintaining a constant draught in chimneys, &c. (Com. by A. Marquis, Bordeaux.) July 22, 1882.  
 3,511. W. Wright, Plymouth. Flush cisterns, &c. July 24, 1882.  
 3,550. C. S. Beauchamp, London. Automatic apparatus to ensure safety in case of fire in theatres and buildings. July 26, 1882.  
 3,554. J. L. Thomasson, Worcester. Ventilators. July 26, 1882.  
 3,565. H. Morris, Manchester. Apparatus for adjusting ventilators, &c. July 27, 1882.  
 3,573. A. L. Liberty, London. Construction of ornamental windows, blinds, &c. July 27, 1882.

##### NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

July 15, 1882

- 1,522. J. B. Denton, Westminster, and G. Butler, Turinham-green. Apparatus for flushing sewers, &c. June 29, 1882.  
 1,579. D. Summerfield, Aston. Locks and latches. March 31, 1882.  
 2,447. R. Hony, Edinburgh. Apparatus for opening and closing window curtains. March 24, 1882.

July 21, 1882.

- 1,325. C. Slagg, Leeds. Drain and sewer pipes. March 18, 1882.

July 25, 1882.

- 1,351. J. Rettie, London. Binding for scaffolding. March 20, 1882.  
 1,357. J. Thom, Wolverhampton. Securing door-knobs to their spindles. March 21, 1882.  
 1,434. E. G. Banner, London. Sewers. March 24, 1882.  
 1,973. R. Boyle, London. Ventilators for buildings, &c. June 22, 1882.  
 3,049. R. Searle, London. Manufacture of artificial stone. June 28, 1882.

July 28, 1882.

- 1,432. W. Bartholomew, London. Flushing tanks, &c. March 24, 1882.

##### ABRIDGMENTS OF SPECIFICATIONS.

Published during the Week ending July 22, 1882.

- 5,351. T. Rowan, London. Warning and ventilating.

A lamp is placed in a tube or passage, one end of which is open to the outer air, and the other end terminates in a

\* Compiled by Hart & Co., Patent Agents, 23, New Bridge-street.

ering box, in the bottom of which is water, while the top of the box is filled with coke, &c. From this box the air is passed to the room to be ventilated. Dec. 7, 1881. Price 6d.

5,379. J. C. Baker, Liverpool. Ventilating apparatus and buildings, &c.

Instead of drawing the air out of ships, buildings, &c., at a point, the ventilating-pipe has numerous branches issuing in all directions over the place to be ventilated. Dec. 9, 1881. Price 6d.

5,446. J. J. Royle, Manchester. Gas-fittings, including lamps, &c.

This is an application and adaptation of the union joint described in Patent No. 2,339 of 1879 to a pipe attached to a gas burner, and turned downward so as to have a lead burner nearer to the table or floor. Dec. 13, 1881. Price 6d.

5,466. W. Bash, S. Bash, and U. S. Domsa, Manchester. Locks and latches.

The "sliders" of the lock project through the case, and on the bolt or latch which secures the same. Steps are made in the catch to prevent the picking of the lock. Dec. 14, 1881. Price 6d.

5,503. J. Milne, Edinburgh. Fire-lighter.

This is made of asbestos in form of a ring, with a shallow flat vessel inside in which is paraffin oil and a wick. The vessel is lighted and the apparatus is put inside the fire till the coals are kindled. (Pro. Pro.) Dec. 16, 1881. Price 2d.

5,510. L. H. Barnett, London. Castors for distends, &c.

These have two wheels supported by a horizontal frame, and act on a vertical axis. (Pro. Pro.) Dec. 16, 1881. Price 2d.

5,515. J. D. Taylor, Halifax. Traps for sewers and drains.

These are syphon-traps, around the inlet-pipe of which mercury is allowed to escape from escaping. (Pro. Pro.) Dec. 16, 1881. Price 2d.

5,526. T. Fletcher, Warrington. Plastic composition for fire-resisting purposes.

Instead of fitting fireplaces with bricks, a plastic compound is used, consisting of a mixture of solution of silicate soda or potash with ordinary fire-clay. (Pro. Pro.) Dec. 17, 1881. Price 2d.

5,527. J. C. Millard, London. Cocks and lvs.

This is chiefly applicable to ball-valves. The supply-pipe runs the body of the cock at the side, and rises up inside the valve. The outlet is the annular space between this pipe and the outer case of the body. The valve fits on the top of the supply-pipe, and is actuated by a ball. (Pro. Pro.) Dec. 17, 1881.

Published during the Week ending July 29, 1882.

5,524. E. A. Ripplington, Aston. Gas-stoves.

This improves gas-stoves in a variety of minute details, which are shown in thirty-three figures in the drawings, which are not capable of being condensed. Dec. 12, 1881. Price 8d.

5,554. B. C. Cross, Dewsbury. Apparatus for fastening, releasing, and preventing the rattling of window-sashes, &c.

A plate is fixed to the window-frame, behind which is a ring plate carrying a knob, which protrudes through a hole in the fixed plate, and engages a hole in the edge of the sash. A movable bar is arranged to withdraw the knob from the hole. This is actuated by a pedal lever in the room. On the pressure of the foot on this lever the knob is withdrawn and the sash is free to move. Dec. 1881. Price 6d.

5,571. A. M. Clark, London. Manufacture of roofs or coverings.

The canvas or other base of these floor coverings is covered with a mixture of ground animal fibre, mineral earth, and a binding material such as varnish. Wood fibre is also used in the manufacture of animal fibre. (Com. by C. T. Meyer and V. E. Meyer, Jersey City, U.S.A.) Dec. 20, 1881. Price 6d.

5,572. E. A. Brydges, Berlin. Adjustable supports for small looking-glasses, &c.

These are formed of bent wire, the ends of which fix in the back of the glass, &c. (Com. by U. Scherer, Fürth, Germany.) Dec. 20, 1881. Price 2d.

5,576. H. S. Cregren, Bromley. Heads and fittings for air-inlets, &c., of soil-pipes and chimneys.

The box is fitted, through the bottom of which the pipe enters, so that the box forms a trough round the pipe. The top of the box is grating, but the part immediately above the pipe is solid, so that any stones or other solid matter fall down into the trough and does not fall into the pipe. Dec. 20, 1881. Price 4d.

5,603. O. Trossin, London. Furnaces or fire-places for the consumption of smoke.

The coal is cooked in a hot chamber communicating with the fire-chamber above the grate. The gas produced in this hot chamber is carried by pipes to the fire where it is burnt. (Pro. Pro.) Dec. 22, 1881. Price 2d.

Mr. J. Pape Symes, who, for fourteen years, has superintended the engineering works Messrs. Wailes & Robinson, of Nunston-road, about to sail for the Cape for the benefit of his health, accompanied by his wife and family, a mark of the esteem in which he is held by the employers of the firm, has been presented them with a gold watch and an address, and another testimonial has been presented to him by the apprentices.

CLAIM UNDER THE EMPLOYERS' LIABILITY ACT.

ACTION AGAINST AN ARCHITECT.

LAST week, at the Wandsworth County Court, a bricklayer's labourer, named Robinson, brought an action against Mr. Nunn, of Trinity-road, Wandsworth, claiming damages for injuries sustained by falling from a ladder while at work on premises belonging to the defendant, alleging that the injury was caused by the negligence of those in the defendant's employ.

On behalf of the plaintiff it was stated that on the 24th of March he was employed at some houses which were being built for the defendant in Trinity-road, Upper Tooting. It was part of his duty to assist the carpenters and bricklayers by taking up bricks and wood to them. A wall had been built to the height of 13 ft., when he was told to take up a piece of quartering. The ladder was only 3 ft. 4 in. above the scaffolding, instead of being the height of a man, and was consequently too short. It would not have reached the scaffold at all had it not been on a "horse." He carried the quartering in his right hand, and when he put out his left hand to reach the last rung of the ladder, as he thought, he missed his hold, and fell. He broke his right arm by the fall, and sustained other serious injuries, which compelled him to attend as an out-patient at St. George's Hospital between ten and eleven weeks, and he had not since been able to do any work. Some time after the accident he saw the defendant, who offered to pay him 17s. a week if he would sign a paper, which he refused to do. Amongst the witnesses called for the plaintiff was Mr. Walter Greenbrough, a builder and house decorator, who said he was acquainted with the building of scaffolding and the placing of ladders. He said that a ladder should be 5 ft. 6 in. or 6 ft. higher than the scaffolding or landing. No one of experience would go up a ladder only 3 ft. 4 in. above the level. It was stated in the course of the hearing that the foreman placed the ladder where it was.

On behalf of the defendant witnesses were called to prove that the ladder was about 5 ft. above the scaffolding. It was also stated that the plaintiff was not asked by any one in authority to take the quartering up, but took it up on his own account.

Mr. Nunn, the defendant, was called, and stated that he was an architect, and that he was building these houses for himself, and personally superintended the work. The height of the ladder above the scaffolding was between 4 ft. and 5 ft., which he considered sufficient for safety. The plaintiff was in the employment of the foreman of the bricklayers, and he (the defendant) had nothing to do with him. He explained, with regard to offering the plaintiff money, that he had been informed the men intended to subscribe 15s. a week for the plaintiff, and he thought he might do the same thing, and did so.

The Judge said that under the first subsection of the Act he must hold the defendant liable, owing to the omission in the placing of the ladder. He gave judgment for the plaintiff. Damages 50l. and costs.

GLASGOW MUNICIPAL BUILDINGS COMPETITION.

Sir,—For your further information, I beg to say that the Council of the Glasgow Institute of Architects has now received official notice that the Municipal Buildings Committee of the Town Council, having again considered their representation as to the exhibition of rejected sketches, unanimously adhere to their former decision.

Further, that they have resolved to recommend to the Town Council that all the designs submitted in the final stage be publicly exhibited; and also that either the Corporation Galleries or the City Hall be given to the Glasgow Institute of Architects for a fortnight free of charge, for the exhibition of the rejected designs. The course before the Institute, therefore, is now clear, and the success of the proposed exhibition will depend on the cooperation of competitors themselves.

It should be borne in mind that the Glasgow Institute is undertaking the trouble and responsibility of this exhibition entirely because it is thought that the interests of the profession demand it, and because they have been appealed

to by architects in all parts of the country. It acts as an impartial professional society, not as a body of unsuccessful competitors. Neither the president nor the secretary, nor others on whom the burden of the work will chiefly fall, were competitors in either of the competitions. Some expressions in professional journals seem to make this explanation necessary.

WILLIAM MACLEAN, Secretary.  
Glasgow Institute of Architects.

"DEMAND" VERSUS TECHNICAL EDUCATION.

Sir,—I am glad to find that your correspondent, an "Old Art Workman," coincides with what I have repeatedly maintained in the *Builder* and elsewhere, "that it is the master who most requires technical education, and that in this country we begin things at the wrong end." Let us, however, rightly comprehend the due order and sequence of things in the production of the finer kinds of work. The masters would east the onus of bad taste on the purchaser; "we," they would say, "respond to the demand." And this brings us to the head and front of the offending, and to my main contention. Can there be the slightest doubt that if, as in times past, there were again to be a great demand for wood-carving and art-workmanship of every kind, there would be an eager and effective response both from masters and workmen? Demand is the great technical educator. It was "the demand" that made the great art epochs. Without this demand, technically educate men as you will, it will be in vain.

W. CAVE THOMAS.

SAFETY IN THEATRES.

Sir,—Will you permit me the use of your columns to call attention to simple and efficient ventilators for roofs over the stage, which can be used either independently of, or in conjunction with, the curtain and hydraulic apparatus, explained in my letter on the subject of "Fireproof Curtains," published in your columns on the 11th of March last.

Ventilators of any required size open upwards at the apex of the roof into a perpendicular position by means of the same hydraulic arrangement that raises or lowers the curtain as therein explained. Attached to the ventilating-gear is a weight which gradually descends when hydraulic pressure is withdrawn, causing the ventilators to open into the position mentioned. The hydraulic main is always ready for an emergency. The ventilators cannot be closed, or, if in conjunction with the curtain, the latter cannot be drawn up in order to proceed with theatrical business unless the main is properly charged. Thus, in the event of fire it does not depend upon an official to charge the main in order to open the ventilators and lower the curtain. On the contrary, it is the discharge of the main by opening any one of the valves fixed for the purpose within or outside the building, as explained in my last letter, on which reliance is placed; this arrangement being preferable in consequence of its simple and certain action over any other known form of mechanical appliance; it is under the control of any one, and, unless wilfully, cannot be easily disarranged without all officials on duty being aware of it.

JOHN H. TYLER.

Miscellaneous.

Cooper's-hill Engineering College.—The distribution of prizes to the successful students in the eleventh session of Cooper's-hill Engineering College, took place on the 28th ult., in the presence of a large gathering. Lord Enfield, Under-Secretary of State for India, distributed the prizes. Messrs. H. B. Taylor and G. Wylie were appointed scholars of Cooper's-hill; Mr. G. Wylie, third year student, was appointed Fellows scholar; Mr. H. M. J. Bacon gained a foundation scholarship in engineering; Mr. H. R. Hackman, the Argyll scholarship in natural science, given by the Marquis of Hartington; Mr. S. P. A. Dyson, the Public Works Committee of the Council of India scholarship in applied mechanics; and Mr. A. E. Orr, the president's scholarship in mathematics. Lord Enfield, who was received with cheers, said the report appeared to be everything that was satisfactory. The Secretary of State had agreed to sanction the expenditure of a sufficient sum of money to construct suitable laboratories, a new class-room, and a specimen room with proper machinery. The ranks of the students were about to be increased by the removal to Cooper's-hill from Nancy of half the students' under training there for the Forestry Department in India.

**Social Science Association.**—The annual business meeting of this association was held on the 19th ult., the treasurer, Mr. Joseph Brown, Q.C., in the chair. A report, dealing with the action of the council in regard to various questions taken up during the past twelve months, was presented and ordered to be circulated. These questions include copyright, married women's property, settled land and conveyancing bills, foreign marriage laws, Irish poor laws, administration of hospitals, and notification of infectious diseases. Lord O'Hagan was elected a permanent vice-president of the Association, and Mr. Hastings, M.P., was re-elected to the office of president of the council. The following were appointed secretaries of departments for the ensuing year:—(1) Jurisprudence and Amendment of the Law, Mr. H. N. Mozley, Mr. R. Denny-Urlin, and Mr. A. Herbert Safford; (2) Education, Mr. Rowland Hamilton; (3) Health, Mr. H. H. Collins, Mr. Edward Scaton, M.D.; (4) Economy and Trade, Mr. George Baden-Powell, M.A., Rev. S. A. Scinthal, Mr. Edward J. Waterston; (5) Art, Mr. H. C. Boyes, and Mr. P. H. Rathbone. Mr. Westlake, Q.C., was re-elected foreign secretary, Mr. Joseph Brown, Q.C., treasurer, and Mr. Andrew Dunn and Mr. A. Edgar, LL.D., were appointed auditors for the ensuing year. The standing committees of departments were also elected, and a financial statement was presented, showing a balance carried forward of 187l. 16s. 6d.

**Crystal Palace.**—The award of scholarships and prizes to students in the ladies' division of the Crystal Palace School of Art, Science, and Literature, was completed on Saturday, when Mr. Edwin Long, R.A., Mr. Joseph J. Jenkins, F.S.A., R. Soc. P.W.C., and Mr. G. Elgar Hicks, adjudicated on the work of the students in the art classes. The medal for water-colour painting (landscape, architecture, &c.) was given to Mrs. Edward Milner (née Hamilton), the certificate to Miss S. E. R. Horton, to whom the scholarship in art was adjudged; the medal for water-colour painting from the life to Miss Jane M. Bethune, the certificate to Miss Lina Newall; the prizes for drawing from the antique to Miss M. Flood Page; the certificate for drawing from the life to Miss E. S. Norton. The scholarship in music has been adjudged to Miss Alice Ferrier; the scholarship in modern languages, literature, &c., to Miss Elsie Atkins.

**Regent's Park.**—An influential deputation from the inhabitants of Marylebone has waited on the First Commissioner of Works to urge him to throw open to the public the fourteen acres of ground, extending by the ornamental water from Hanover-gate to York-gate, for more than half a mile, which is now enclosed and reserved for the use of key-holders. Mr. Shaw-Lefevre said that by the Act of 1851 the ground in question had passed from the Crown to the people, and he was himself of opinion that it would be most desirable to throw the piece of ground open. Hitherto the lessees of the Crown Estate had objected to this being done, alleging that if the ground were made public, their property would be depreciated in value. However, the question should now again engage his serious attention and that of the Government. He thought he saw his way to remove all difficulties, and by opening this ground to confer a great boon on the public.

**Sudden Death of an Architect.**—Mr. W. Carter, Coroner for East Surrey, has held an inquiry at the Coroner's Court, Lambeth-road, into the death of Mr. David Thomas Childs, aged fifty-one years, architect and surveyor, of Jernyn-street, Piccadilly, and Grove-crescent, Spring-grove, Kingston, Surrey, who was found dead in a second-class carriage on the London and South-Western Railway, near Raynes Park, on the morning of the 27th ult. The deceased left Sarbiton at 9.50, and as the train neared Raynes Park deceased became very ill. The train stopped at the station, where the officials were informed of the circumstances. The train, however, went on, and shortly afterwards Mr. Childs expired. The jury returned a verdict of "Death from natural causes."

**Medals.**—Messrs. Robert Boyle & Son's system of ventilation for buildings and ships was awarded the gold medal (highest prize) at the International Exhibition of Means and Appliances for the Protection and Preservation of Human Life, Alexandra Palace, London, July, 1882.

**Monumental.**—The committee for erecting a statue of the late Lord Frederick Cavendish have entrusted the commission for the work to Mr. Albert Bruce Joy.

**Proposed Fine Art and Industrial Exhibition in Manchester.**—The *Manchester Courier* says that suggestions have of late been thrown out in local art circles as to the desirability of holding an art exhibition in Manchester on a scale commensurate with the importance of the district. The multifarious forms in which art has of recent years found development, however, impose the condition that an art exhibition, if it is to be truly representative, must take a much more comprehensive range than that of paintings and water-colour drawings, and that to meet the expectations of the present generation it must include art in whatever form it may find expression, whether on the painter's canvas, in the embellishment and decoration of the mansion, the works of the sculptor and the potter, the skill of the carver and metal worker, or in any of the numerous other forms, to which of recent years it has been applied. The chief difficulty in the way of holding such an exhibition has been that of finding a suitable building for an exhibition of so comprehensive a nature, and it was not until recently that the gentlemen who have interested themselves in the matter could see their way to overcoming it. The erection of the St. James's Hall, however, has pointed the way out of the difficulty, and arrangements have been concluded for holding the exhibition in the above hall in the months of October and November next. Several of the best-known firms connected with art-manufactures have undertaken to become exhibitors. The services of Mr. Alfred Darlyshire have been secured as an art director, who will arrange and superintend the collection, and Mr. W. Ordyn has been appointed to fulfil the duties of secretary.

**The Ancient Monuments Bill.**—In the House of Lords, on the motion for going into Committee on this Bill, the Marquis of Salisbury said that, as the Bill interfered very seriously with the rights of property, the House ought to have some assurance that the schedule had been framed by competent authority after due inquiry. The Lord Chancellor, in reply, said that the Bill had been for several years successively before Parliament, and had been very carefully considered by the Office of Works. He had reason to believe that the Bill was the result of an arrangement which had been come to by all persons interested in ancient monuments. Lord Talbot de Malahide expressed approval of the measure, which did not, however, go as far as he could wish. Most countries had a law for the protection of their ancient monuments. A few years since there was an attempt, which had proved most successful, to extend this law to Ireland. By this means pre-historic monuments, both lay and ecclesiastical, in Ireland had been secured from destruction. The Rock of Cashel he might mention as one of the relics of antiquity which had been preserved. The House then went into Committee on the Bill. The various clauses were agreed to with amendments. On the schedule, the Marquis of Salisbury moved to exclude from it an ancient monument, the property of the Duke of Richmond, who had expressed himself as perfectly willing and able to protect the relic from destruction. The Lord Chancellor opposed the amendment, which was negatived.

**The Welding of Cast Steel.**—At a meeting of the Royal Scottish Society of Arts, held on the 31st ult. in Edinburgh, Mr. Benjamin Aitken, foreman smith, read a paper on "The Welding of Cast Steel." The ordinary method, he remarked, of welding cast steel was to heat it a very little more than blood red; if heated much above that it would break off or crumble away, and thus become useless. In welding cast steel they must have some flux that would have an annealing influence on the steel, and allow it to be heated up to a welding heat, and at the same time retain its form and quality. After alluding to various compositions used for this purpose, including Drake's, which was sold at some 35s. per cwt., he said it had been discovered that stucco, which sold at 3s. 6d. per cwt., answered the purpose admirably. In using it they must be careful not to let the steel be too highly heated before applying the stucco, and always be careful to form the flux as early as possible. He had found that by this method steel not only retained, but in many instances improved, its quality. Several examples of steel welded in the manner described were produced and favourably commented on by the meeting, and a committee was appointed to report on the paper.

**A Ship Canal through the Mull of Kintyre.**—The Duke of Argyll was present on the 25th ult. in Glasgow at a large and influential meeting of gentlemen favourable to the improvement of the east and west lochs of Tarbet, in the county of Argyll, and to the formation of a canal between the two lochs. The proposal submitted to the meeting was to form a canal through the Mull of Kintyre, and thereby provide a direct outlet for shipping traffic from the Firth of Clyde to the west and north of Scotland. His Grace, who presided, explained that the canal would be two miles in length, and the saving it would effect for vessels going to the west and north of Scotland would be about 115 miles. The channel was proposed to be 50 ft. in width and upwards of 18 ft. in depth, and the cost was estimated at from 150,000l. to 200,000l. Calculations have been made showing that vessels to the amount of about 500,000 tons a year are expected to take advantage of the canal, and, estimating the charge for the use of the canal at 6d. per ton, this would give a revenue of 12,000l., which was considered a good return upon the outlay. Resolutions were afterwards passed in favour of the formation of the canal, and a large and influential committee was formed to carry out the undertaking.

**Opening of Wanstead Park.**—On Tuesday afternoon Wanstead Park, lately acquired by the Corporation of the City of London, under circumstances which we have already mentioned, was formally and unostentatiously opened by the Epping Forest Committee. The park consists of 182 acres of low-lying wild common land, formerly the property of Lord Mornington's trustees, and is situated between the southern extremity of Epping Forest and the northern portion of Wanstead Flats, so that in point of fact it forms a southern continuation of the gigantic metropolitan playground opened in May last by Her Majesty the Queen. It is not, however, intended that the unrestrained liberty enjoyed by the public in their use of the Forest shall be as completely extended to Wanstead Park, which is meant to be used simply towards the means of such enjoyments as may be found and permitted in the London parks.

**Destruction of Pollok Castle by Fire.**—On Monday night Pollok House, the residence of Sir Hew Crawford Pollok, at Newtonmearn, near Glasgow, was entirely destroyed by fire. The building, which was oblong in shape, was in the French Renaissance style of architecture, and was erected about 200 years ago. An addition was made to the structure by Sir Robert, and in 1856 a further addition was made by the late Sir Hew Pollok. The house was four stories in height. The fire is supposed to have originated in the loft which occupied the top of the house, and it is conjectured that it must have been caused by the ignition of several birds' nests which had been built in the chimney leading to the dining-room. Owing to the inadequate supply of water, little could be done to arrest the progress of the fire. The loss, which has been roughly estimated at 30,000l., is partially covered by insurance.

**The "Heathen Chinese" Again.**—In New Zealand, as in California, the Chinaman abounds, and there, too, he has to resort to strategy to make good his position. It is related that in Otago, where Scotchmen are in a majority of the colonists, a contract for grading a road was to be let, and the lowest bid was signed "M'Pherson." Notice was sent to the said M'Pherson to meet the Board and complete the contract. In due time they met, but behold M'Pherson was yellow in hue, and had an unmistakable pigtail. "But," gasped the President, "your name can't be M'Pherson?" "Alle lighte," cheerfully answered John, "nobody catch um contact in Otago unless he name Mac." The contract was signed, and the Mongolian M'Pherson, it is stated, did his work as well as if he had really hailed from Glasgow.

**"Prizes" to Architects.**—The Guardians of the Kidderminster Union, addressing architects and "builders," invite plans, with estimates of cost, for increasing the present work-house premises at Blakebrook, Kidderminster, so as to accommodate 420 inmates. They say "Prizes of 25l. and 15l. respectively will be awarded for the first and second best plans, but no remuneration will be paid to any person competing beyond such prizes." Estimates are required. The cool impudence of the invitation can only be justified by the fact that there will be found persons to respond to it.

**Progress of the Inner Circle Railway Completion.**—On the 21st ult. a train was run for the first time on that portion of the Inner Circle Railway which lies between Aldgate Station and Trinity-square, Tower-hill, which is about a third of the whole line that is to be constructed to complete the Inner Circle. After the meeting of the Metropolitan Railway Company, at the Three Nuns Hotel, Aldgate, a special train was in waiting at the Aldgate Station, for the chairman and directors, the Lord Mayor, Mr. Alderman M. Arthur, M.P., and such of the shareholders who wished to inspect the line. The station at Trinity-square, which was reached in about two minutes, was gaily decorated with flags. On Tower-hill a marquee had been erected, in which luncheon was served. Sir Edward Watkin presided, supported on his right by the Lord Mayor, and on his left by Mr. M. Arthur, M.P.

**Meeting of Bricklayers in Birmingham.** A general meeting of bricklayers was held on Tuesday in the Temperance Hall, Birmingham, under the presidency of Councillor W. J. Davis, for the purpose of considering in what way the organisation connected with the trade might be improved. Among those who addressed the meeting was Mr. E. Coulson, general secretary of the Bricklayers' Society. On the motion of Mr. G. Harris, seconded by Mr. W. Nash, a resolution was adopted expressing belief that the principles of trade-unionism had conferred unlimited benefits on the bricklayers of the country, and conducted materially to their well-being, and urging the bricklayers of the district to unite with the bricklayers' societies in Birmingham.

**Gateshead: Opening of New Board Schools.**—A public meeting to inaugurate the opening of the new schools just completed in South-street, Durham-road, Gateshead, was held on the 20th ult. The new buildings stand in a densely-populated and rapidly-increasing district. The schools are arranged in three departments for 284 boys, 284 girls, and 310 infants, and in addition there are two rooms for pupil teachers' classes for thirty each, for total accommodation provided being for 940 children. The cost, as completed, has been 4,150*l.*, or near 4*l.* 10*s.* per scholar (the architects' estimate to the Board being 5*l.* 5*s.*), and the works have been finished in two months less than the specified time. Mr. Edington has acted as clerk of the works; the contractor being Mr. Alexander Thompson, of Gateshead; and the buildings have been erected from the designs and under the superintendence of Messrs. Oliver & Leeson, architects, Newcastle.

**A Domestic Exhibition,** which will include scientific apparatus and domestic appliances, grouped under the headings of the dwelling, foods, clothing, and water-supply, is fixed to be held at the Alexandra Palace during the autumn of the present year. It is announced that steps are being taken by a committee for the purpose of holding a Conference on Domestic Economy in connexion with the Exhibition.

**The National Association of Master-Builders of Great Britain** held its half-yearly meeting on Wednesday, the 20th July, at the George Hotel, Nottingham. The president, Mr. Stanley G. Bird, occupied the chair, and several matters of importance to the building trade were discussed. It was arranged to hold the next half-yearly meeting at Liverpool.

**A Threatened Strike Averted.**—Notices were posted on Saturday at Festiniog slate quarries, announcing the reduction of four hours weekly in the hours of labour. This is the result of a conference between a committee of the workmen and employers, and the committee has averted a threatened strike of 9,000 men.

**Exhibition at Trieste.**—An Industrial and Agricultural Exhibition was opened at Trieste on Monday last by Archduke Charles Louis, who, in reply to an address read by the president of the exhibition, expressed the pleasure which it gave him to thus personally convince himself of the great progress made by Austrian products in recent years.

**Reconstruction of the Philharmonic Theatre.**—We understand that the plans prepared by Mr. Frank Matcham for the reconstruction of the Philharmonic Theatre at Kingston have been passed without alteration by the Metropolitan Board of Works and the Lord Chamberlain, and that the work is to be commenced forthwith.

**Water Supply.**—Mr. Stephen Harding Terry, C.E., an Inspector from the Local Government Board, has held an inquiry at St. Thomas the Apostle, near Exeter, relative to an application from the Local Board for sanction to borrow 600*l.* for works of water supply, viz., raising and covering the service reservoir. The plans were explained by Mr. Samuel Churchward, surveyor to the Local Board. No opposition was offered to the scheme, as to which the Inspector intimated he should report favourably. The Inspector then closed the inquiry, and proceeded to visit the reservoir and water-works in company with the chairman and surveyor.

**Willenhall.**—At the fortnightly meeting of the Local Board, on the 31st ult., a report was presented by the Sanitary Committee in which they stated that after thoroughly inspecting the land for the proposed sewage-farm, they had instructed the surveyor to make a plan in accordance with their views; and they further recommended the Board to empower the committee to take the necessary steps for the purpose of obtaining the land marked on the plan, containing 30 acres 3 roods and 35 perches, if possible by agreement.

TENDERS

For house at West End Lane, Kilburn, for Mr. Thomas Hobson. Mr. Henry John Hanson, architect. Quantities by Mr. R. Smith:—

Messrs. B. Cooke & Co.	£3,050 0 0
B. E. Nightingale	2,991 0 0
J. D. Hobson	2,783 0 0
Ladies' Bross	2,739 0 0
John Grover	2,724 0 0
William Smith	2,495 0 0
Stimpson & Co.	2,469 0 0
Thos. Greenwood	2,442 0 0
H. J. Danicos	2,393 0 0
Richens & Monart	2,280 0 0
Turtle & Appleton (accepted)	2,550 0 0

For new roads, sewers, and surface water drains for the British Land Company, Limited, on their Tottenham estate. Mr. Henry B. Mitchell, surveyor:—

Ryder, Pinner	£3,743 0 0
Harris, Camberwell	2,885 0 0
Killingback, Camden Town	2,950 0 0
Dunmore, Hornsey	2,526 0 0
Weszy, Hornsey	2,525 0 0
Keble, Regent's Park	2,499 0 0
Jackson, Leyton	2,393 0 0
Wilson, Walthamstow	2,312 0 0
Pull & Sons, Bromley	2,295 0 0
Bloomfield, Tottenham (accepted)	2,190 0 0

For alterations and additions to Latham House, Upper Clapton. Mr. H. Shaw, architect. Quantities by Messrs. Stoner & Sons:—

Dale	£465 0 0
Boyer	429 0 0
Barber & Lutwyche	390 0 0
Harper	375 0 0
Shurmer	360 0 0

For erection of new church, Aberaman, near Aberdare, for Sir George Elliot, Bart., M.P. (labour portion only). Mr. E. H. Lingen Barker, architect:—

Coleman Bros., Cheshill	£1,318 0 0
Shepherd, Cardiff (accepted)	1,935 0 0
Wilkins & Williams, Aberaman	1,910 0 0

For the erection of a private residence, Chiswick. Mr. E. J. May, 3, Great James-street, architect:—

Adams & Sons (accepted)	£1,450 0 0
-------------------------	------------

For the erection of a dwelling-house, with coach-house and stable, at Rutland Park, Perry-hill. Mr. J. W. Garrard, architect:—

Hollidge & Stewart	£927 0 0
Clark	912 0 0
Raffle	870 0 0
Kemp	819 0 0
Watson	750 0 0
Walker	733 0 0
Nicolls	718 0 0

For roads and sewers, South Park Estate, Wimbledon. Mr. George Pooley, surveyor:—

Wm. Carter, Ashted	£1,610 0 0
Edmond Hill, South Wimbledon	1,397 0 0
Wm. Nicholls, Wood-green	1,413 0 0
Jas. Bloomfield, Tottenham	1,412 0 0
Jos. Midehall, South Wimbledon	1,210 0 0

For additions to National Schools, Lee-common, Great Missenden. Mr. Arthur Vernon, architect, Great George-street, Westminster. Quantities by Mr. E. C. Richardson:—

Fischer	£755 0 0
Lockett	634 10 0
Silver	628 0 0

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline putting out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume XLII, (January to June, 1882) were given as a Supplement, with the Number for July 5.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also

READING CASES (cloth), with Strings, to hold a Month's Numbers price 2s. each.

THE FORTY-SECOND VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.

SUBSCRIBER'S VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under..... 4s. 6d.

Each additional line (about ten words)..... 0s. 6d.

Terms for Series of Trade Advertisements, by Special Arrangement on Frost, Post, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

FOUR LINES (about THIRTY words) or under..... 2s. 6d.

Each additional line (about ten words)..... 0s. 6d.

REFILES TO ADVERTISEMENTS.

Addressed Box — Office of "The Builder," Cannot be lowered, but must in all cases be called for, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements..... 3d. per Week.

For all other Advertisements..... 6d. per Week.

PREPAYMENT IS ABSOLUTELY NECESSARY.

\* \* \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to

DOUGLAS FOURDRINER, Publisher.

Addressed to the Editor, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied twice from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum; Remittances payable to DOUGLAS FOURDRINER, Publisher, 45, Catherine-street, W.C.

**Best Bath Stone.**  
WESTWOOD GROUND,  
Box Ground, Combe Down,  
Corsham Down,  
And Farleigh Down.  
RANDELL, SAUNDERS, & CO., Limited,  
Corsham, Wilts. [Advr.]

**Box Ground Stone.**  
Is the best for use in all exposed positions, being a well-known and tried weather stone.  
50,000 feet cube in stock.  
PICTOR & SONS,  
Box, Wilts. [Advr.]

**Doubling Freestone and Ham Hill Stone** of best quality, in blocks, or prepared ready for fixing. An inspection of the Doubling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [Advr.]

**Doubling Freestone**, Of best quality, supplied from their own Quarries and Kilns by SPYKE & HAYN, Stoke, Ilminster. Agent, Mr. E. CRICKMAY, 35, Devonshire Chambers, Bishopsgate-street, White-court, London, E.C. [Advr.]

**Asphalta**  
Seysse, Patent Metallic Lava, and White Asphalta.  
M. STODART & CO.  
Office:  
No. 90, Cannon-street, E.C. [Advr.]

**Asphalta**—The Seysse and Metallic Lava Asphalta Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tin-rooms, and terraces. [Advr.]

**SANITARY PAINT COMPANY,**  
Liverpool: 51, SOUTH JOHN STREET. London: 34, LEADENHALL STREET.

Proprietors, GRIFFITHS, BERDOE, & CO., Manufacturers of

**PAINTS OF EVERY DESCRIPTION, FOR ALL PURPOSES**

**ENAMEL PAINT.**—Ready for use, in all colours, DRIES QUICKLY with a HARD GLAZED SURFACE LIKE PORCELAIN. Two Coats equal two of ordinary Paint and two of Varnish.

**VARNISHES** of all kinds, in highest perfection, and thoroughly matured. Brilliant, quick, and hard drying.

**SILICATE DISTEMPER.**—A Water Paint in all colours, forming a most durable, economical, and effective wall-covering and substitute for wall papers.

**PETRYIFYING LIQUID for Curing Damp Walls.**—It effectually prevents penetration of rain, and is a cheap and most effective substitute for OIL PAINT. It renders all kinds of Brick, Cement, Stucco, Wood, &c., perfectly Non-Absorbent and Impervious to Damp, and arrests and prevents decay.

**GRIFFITHS'S PATENT WHITE,** the only Reliable Substitute for White Lead and Oxide of Zinc. Superior to them in covering power, colour, durability, permanence, economy. Applicable for every purpose for which WHITE LEAD is used, quite unaffected by Gases, does not readily BLISTER, ground exceedingly fine, and unites freely with other colours without injuring the most delicate tints.

**SILICATE and SANITARY PAINTS** in all colours, for House, Ship, and general use, internal or external. Non-Poisonous, Brilliant and Durable. Having much greater covering power than ordinary paints, are far more economical in use. Are equally effective in all climates, being unaffected by extremes of temperature, and they resist the action of Sea-air and Water. The Colours are exceeding Rich, Pure, and Permanent. In all respects they are unequalled for every purpose to which ordinary Paint is applied, what upon Wood, Iron, Cement, or any other substance.

### American Activity among the Ruins of Assos.

THE Archeological Institute of America has published the first series of its classical papers, an octavo of 300 well-filled pages, liberally and handsomely illustrated. It consists mainly of a Preliminary Report of Investigations at Assos during the year 1881, the first year's work of an expedition sent out by the Institute. This is written by Mr. J. T. Clarke, who was assisted on the site more or less constantly by three architects,

three graduates of Harvard College, chosen from numerous applicants, by Mr. Eliot Norton as volunteer, and Mr. J. S. Dillon, who furnishes a report on the geology of Assos and the Troad. Mr. W. C. Lawton contributes notes on the inscriptions found, and general archaeology. The pioneers took the British Museum and Louvre in their way, and by the middle of April were settled at work well supplied with instruments, a library of 400 volumes, general apparatus, and,—not least important,—canned food. The work was carried on far into November, with as little interruption as was allowed by Turkish officialism, fast of Ramadan, and holidays of Greek saints. It speaks highly not only for the resources but also for the energy at command, that so much was done in the time, and that so explicit a report of what was done should so soon be given to the world. When it is added that not only is this investigation to be continued, and the general results embodied in a monumental work, but that the leading American colleges are already engaged in establishing a permanent school of Classical studies at Athens, upon the model of those of France and Germany already active there, it is impossible not to feel that the New World is repaying its obligations to the Old with admirable zeal. It is perfectly comprehensible that the Old World may experience a slight movement of apprehension at the prospect of losing the lead in such enterprises; the enterprises will be the gainers if emulation is thus stimulated. In the meantime, cordial greeting is due, and be it paid, to laudable and well-directed exertions; what also is due is careful study of such reports as that now before us, with a view to gather, and if it may be, also to give instruction or suggestion at least as to the precise information that is expected with most interest.

The name of Assos is familiar from its occurrence in the Acts of the Apostles. St. Paul, on his way from Macedonia to Jerusalem, left his companions at Troas to go on by ship round Cape Lecton and take him up at Assos, whither he proceeded across the promontory on foot. About half way he would leave the temple of Apollo Sminthens,—lately recovered for art by the Dilettanti Society,—between him and the sea just before the road turned inland. The surveys and views given in the report exhibit his course as he approached his journey's end and the view that presented itself. He must have crossed the Greek bridge over the river Satnioeis, of which the piers, very artfully constructed with doubly-joggled courses to resist the sudden force of a swollen stream, still remain; he was then not half a mile from the street of tombs that led by a gradual rise to the principal gate, or, skirting the town, descended by a very steep incline,—“the steepest and stoniest imaginable,”—to the port. The Satnioeis is separated from the gulf to the south throughout its course by a long narrow mountainous belt, precipitous towards the sea; the plain which it waters, thus confined on one side, is far smaller than that of the Scamander northwards, but was celebrated in antiquity for its fertility. Assos was thus truly a city on the Satnioeis, and Mr. Clarke argues with much force that it is to be identified with the Pedasus, which Homer refers to as a seat of the Leleges on that river. The political history of Assos is all but a blank; it is not enumerated among the tributary allies of Athens. After her fall, it is found in the occupation of a Persian satrap, Ariobarzanes, who is in cordial alliance with her enemies, the Lacedemonians, and he even abets the projects of Agesilaus against the great king, from whom, in concert with other satraps, he ultimately revolts. He seems to have obtained the command of the entire Troad as well as of Phrygia; his statue was found prostrate on the acropolis of Ilium when Alexander the Great visited it, and an omen for his enterprise,—favourable, of course,—was drawn from the circumstance by his ever servicable diviner Aristander. After this the most interesting incident connected with Assos is the residence there of Aristotle with his friend, the tyrant Hecmæus.

The acropolis of Assos is formed by the crater of a volcano, which was choked by a second flow of trachyte, the city being built upon a lower but still elevated plateau around it. The summit was crowned by the temple which it was the main object of the expedition to examine; “the peak rose so steep that, standing within the peribolus of the fane, one could look down into the holds of the vessels in the port beneath, and so high that the foundations of the temple were at an elevation half as high again above the sea as are the finials of the slender spires of Cologne above the Rhine, or the apex of the great pyramid of Gizeh above the Nile” (p. 80).

This temple is remarkable as being the only Doric Greek temple in Asia Minor, except one of quite late date at Pergamon. Additional interest attaches to it, moreover, from certain peculiarities in the treatment of the style, which are open to be interpreted as either provincialisms or marks of an intermediate stage of development. The site and ruins had been described by many travellers before 1835, when M. Texier was commissioned by the minister Guizot to study the antiquities of Asia Minor, and made the examination which led to the removal of the sculptured slabs which are now in the Louvre. These are engraved and described, together with the architecture of the temple, with such detail in the vast work on the results of his expedition, published at the expense of the Government, that further exploration might at first seem needless. But Texier, unfortunately, acquired a repute as endowed with a special talent for inaccuracy, from comparison of his work in other more accessible places, for instance, at Old Smyrna (p. 10), and this more than justified a plan for going over his work again, and would have done so even had there been no other additional work to be done in the neighbourhood. It must be sadly said, after perusal of the present report, that even the best friends of the late so genial architect and archaeologist will serve his memory best by accounting and apologising, as well as they may, for his deficiencies rather than by vain attempts to disallow or extenuate them. Even a compatriot, M. Perrot, characterises the plan which he gives of another site as “une mauvaise plaisanterie;” at the same time, it is apparent that Texier took none of the pains of a pretised impostor, as he in all frankness mentioned the short number of hours which had sufficed to put him in possession of materials for such a display of minute information. This candour, no doubt, betrays a mischievous light-heartedness which artists and archaeologists who take matters seriously will not be inclined to encourage, and can only condone with an effort. The following inaccuracies fill out certainly a formidable indictment. The remains show the orientation of the building to have varied considerably from the east to the south; Texier places it thirty degrees to the north of its true direction. The temple has only two steps, the French elevation shows three; the width of the building, given there as 13 mètres, is, in fact, 14-035 on the stylobate and 14-555 metres on the lower step. These errors are particularly unlucky, as it is precisely in the three points of dimension on plan number of steps, and orientation, that the temple coincides so remarkably with the Theseum at Athens. “The excessive sack-like entasis of the shafts, which has given rise to so many wild theories, did not exist.” “The mouldings indicated by Texier as existing above the frieze are wholly imaginary; corner blocks of the corona proving this were found, while

the constructive impossibility of interposing a continuous band of trachyte of only 0.103 metres (=4 in.) thick, between the mighty stones of the Doric entablature is evident from the French restoration itself,—scaled though they are there to the millimetre as if accurately measured.

Now every item of this indictment may be true, we fear must be; indeed, we do not doubt it is positively true; but even so we object to the introduction into the discussion of terms which do not advance the particular discussion in hand, and tend to heat tempers to a degree unfavourable to renewal of discussion on other points. Texier, after all, rendered services which should exempt him from contemptuous treatment. The most moderate expostulation, we are sure, will induce Mr. Clarke to wish unwritten and desire to withdraw imputations of "deliberate falsification" (p. 107), and "unparalleled effrontery;" may we add also to give credit to his predecessor less grudgingly for his correct recognition of a sculptured architrave,—an anomaly which it tried him so severely not to be able to get his architectural friends and colleagues at Paris to fairly submit to examination. However, the severity of the present explorers may not be without one valuable result if it helps to commit them to the extreme of scrupulous completeness as well as of conscientious accuracy in their own drafts and comments.

From the reference to the Theseum it will be seen that the temple was on a small scale; its length on flank did not exceed the breadth of the Parthenon. Not a single drum of a column remained in position, but when the remains of the stylobate were cleared of earth, not only were the weathered traces of the flank columns found, but the position of the cella wall was shown by fine lines indicating its outer edge, engraved on the stones which formed its foundations, and continued on some surfaces of the natural rock which came up to the level. These incised foundation stones were returned at the back of the naos opposite to the second flank columns, thus showing a quite unusual absence of what, antithetically to the pronaos, has been called the epinaos, a blind but open recess between ante.

The study of Greek architecture involves twofold functions which are analogous to those which occupied the earlier astronomers; the investigation of the theory of the ancient designers must be based upon a collection of accurately-measured details of the ancient designs; it is, of course, very difficult for the speculative to withhold from framing hypotheses as to the principles of great artists, even while allowing the insufficiency of materials; the insufficiency of the materials may, indeed, only be discovered by the failure of repeated and persistently varied attempts to divine their secret, to wring from them the explanatory hint which will not only bring what facts are already in possession into order, but also guide all further explorations. But as in astronomy, the theorist must at last wait for the observer, or must himself be content to undertake the functions of an observer, before he can hope to indulge himself to any good purpose in his beloved speculation. Newton himself had to set aside his theory of the lunar system until more perfect records of past observations came to his hands. When Mr. Penrose undertook the survey of the Parthenon it was an incalculable advantage that the principle of application of curvature had already been recognised in some of its leading lines, and warned that it might be expected in others; but otherwise it was with as much wisdom as self-restraint that he carried through his work of minute measurement without disturbing himself at the time by endeavours to frame an ulterior theory as to the schemes of proportion which the original artists relied on and worked by.

Mr. Clarke, in his preliminary report, supplies a certain number of dimensions of the Doric temple, and incidentally instigates a comparison of them with a view to identify "a unit of measure employed in the building." His observations imply that he expects to find that principal dimensions,—as, for instance, the length and breadth of the naos, the width of its door, thickness of wall and diameter of column, and so forth,—were set out by a foot-rule, and that a comparison of the dimensions of these parts will betray the relation of this particular foot to the metrical system. Should this prove to be the case, it would prove that the architect of the temple of Assos, whatever might be

the case with his contemporaries, worked upon a very different system to the architects of the Parthenon. Mr. Penrose found that the standard Greek foot measured most accurately the breadth of that temple on the top step, a breadth of 100 ft.; but it was such if he could detect its direct application to a single dimension of a leading division or detail elsewhere. An examination of the figures supplied by Mr. Clarke go far to show that it was the same at Assos. The foot-rule, as we all know, is the norm of all modern construction. The standard foot and its subdivisions measure off accurately all parts of a building and of every article of furniture within it. The contrast, therefore, of ancient and modern methods is most decisive; the ancient method of proportional evolution, of which the theory and its application have been fully made out in the case of the Parthenon, has received there its fullest justification. How far it is applicable at present is a question; it may be a bow of Ulysses which demands heroic powers to bend it. To what extent it was applied at Assos may prove to be difficult to ascertain; but, at least, there are certain glimpses of it.

It is noticeable, says Mr. Clarke, that the width of the side and rear of the pteron (that is, of front and flank colonnades) is as nearly as possible 1.10th of the length of the stylobate; this relation of the most important divisions of the plan, he justly assumes, excludes, by its striking exactness, the assumption of a coincidence; but his farther assumption must be passed upon. He continues,—"It is hence extremely possible that a system of decimal feet was employed, or that 3.0335 metres contains an entire number of the original unit of measure." The length of the stylobate is 30.335 metres, which is assumed to be 100 ft. of 0.30335 metrical. The difference between this and the 0.308211 of Boeck is, indeed, but small, 0.00486—3.16ths of an inch.

But the Greek foot, as determined by Mr. Penrose, equals 1.01341 of the English foot (=0.30479 metres), and by this proportion the Greek foot equals 308866; which may be taken as coincident with the hundredth part of the length of the lower step of the temple at Assos, 30.885 metres.

It seems, therefore, more probable that the primary dimension of the temple was set out upon this longest dimension of the plan.

Still, it is remarkable that it is on the top step, more properly the stylobate, that we find established the definite and simple proportion of length to breadth which is usually provided in the plans of Greek temples. 13 : 6 :: 30.335 length of stylobate : 14.001 to compare with 14.035, the measured breadth. The difference equals as much as 1/4 in. nearly, but this may not be enough under the circumstances of the ruin to vitiate the inference. In the Parthenon a simple proportion, 4 : 9, is established as here, on the stylobate; in the Theseum, which otherwise has so much resemblance to this temple, on the lower step. There are six columns in front and thirteen on the flank, which seems to have suggested the proportion given to the stylobate; there are, in consequence, five inter-columns on the front and twelve on the flank. Had the columns been spaced equally, front and flank, the oblong of their lines of centre would have had the proportion, 5 : 12. As it is, the actual proportions of the stylobate alone oblige the columns, if we should not rather say were adopted to enable the columns, to be spaced more openly on the front than on the flank.

From the length of the stylobate... 30.335  
Deduct one diameter of column... 0.915

29.420 ÷ 12 = 2.451 for average flank columniation.

From the breadth of the stylobate... 14.035  
Deduct one diameter of column..... 0.915

13.120 ÷ 5 = 2.624 for the average front columniations.

If the columniations by the angles were contracted absolutely, that is, independently of greater dimension being given to the angle columns, those intermediate would, of course, be still further widened; and this relative extension would be greater in the case of the front columniations, already abnormally wide.

The difference between the two sets of average columniations (2.624—2.451=0.173 is as much as between 6 in. and 7 in.

Unfortunately the stylobate is so entirely

destroyed at both ends, that all evidence of spacing of the angle columns is so far lost. This is an example of the too frequent disappointment of excavators,—the unlucky failure of testimony at critical points; the breaking short off of a clue precisely where perplexity is greatest as to which turning to take, which alternative to decide on. It only remains for the explorers to check a murmur, be thankful for what has escaped destruction, and to take care that what evidence can be recovered is at least done full justice to. The loss of the stylobate on both fronts leaves us without direct information whether the columns at the angles were of ordinary or enhanced diameter, and whether the rule of those on the flank, and the front followed the adjacent interval on the front followed the rule of those on the flank, and was uniform with the others beyond it, or whether it was reduced in span in accordance with the practice in other Doric temples. A chance still remains for obtaining a solution of this problem. It seems likely that between the results of the present expedition, and that of the French, all the architrave stones, of one front at least, have been recovered. We may expect that in the promised "monumental publication" of the Americans the accurate details and measurements of each stone will be set forth; the angle architrave stones will be betrayed by including a complete gutta tablet or regula at one extremity, and if the lengths of the others are uniform, they will mark intervals from centre to centre of columns. So, again, it is possible that careful dimensions of all the capitals found may exhibit some as so far exceptional in breadth of abacus and diameter below coquina, that they must have belonged to stouter columns.

Had Texier examined the capitals which he recovered, and after a fashion measured, with a little more care, he would have escaped a sharp rebuke from his successors for overlooking one quite unexamined peculiarity; the flutes or channels of which there are only sixteen, and upon the lowest annulet of the necking, and here by their relation to the faces of the abacus they betray the curious fact of being set, not with centres of channels, but with arrises parallel to the axis of the building. We must, however, still await a specific report whether this disposition of the flutes was unvaried both on front and flank.

It was by another very unusual arrangement, as we have seen, that the walls of the naos westward were returned without any recess or epinaos, and at the same distance from the columns as on the flank. On the proper front the ante of the pronaos ranged with the third flank column, precisely as in the Theseum, Parthenon, and numerous other examples.

The interior of the cella measures approximately 17.865 by 6.765, which gives the long proportion, accurate to between 2 in. or 3 in. of 3 by 8. No indication was found of this apartment having been divided by a cross wall, yet it seems strange that a mosaic pavement, which we should expect to find was just in front of the place of the statue, should have been restricted to the half of it nearest to the entrance. It is composed of black and white marble cubes, and is hypothetically ascribed to a late restoration. But the border is less suggestive of the developed ware ornament than of the spirals of Mycenaean or Orchomenos; and the alternate diamonds of the centre, white and black between white and black borders, accord rather with primordial than with the later taste, of which a good example is given in a mosaic from the gymnasium.

It is stated that the shafts of the columns are without entasis, and it must be accepted as proved that they were destitute of any such exaggerated curvature in profile as Texier exhibits; but it is not quite clear whether Mr. Clarke appreciates the difficulty of determining the existence or non-existence of entasis when only the unmatched scattered fragments of different columns have to be dealt with. A reference to the appendix of the fourth part of the "Antiquities of Ionia" will help to explain this; Mr. Penrose there sets forth in detail the calculations and comparisons by which he certified at once the height and the entasis of the columns of the temple of Athene Polias at Priene.

The height of the column seems not yet to be certainly decided; but as shown,—and any error must be but trifling,—it is a little less slender than that of the temple at Ægina; like that, it is nearly equal in height to half height of the façade, and thus, at least, comes nearer

to the Attic principle of giving it an excess than to the Sicilian Doric. It is more openly spaced than the Theseum or the *Æginetan* boxstair; a difference which rather exaggerates the heavy effect of the entablature. The type of the capital is most especially archaic in its flatness and projection; already at *Ægina* a decided approach was made to that erectness of profile of the echinus, which brought this member in Athenian architecture into perfect harmony with the composed and dignified character of the style.

Minor peculiarities of the entablature are the omission of guttae, the alternation of broad and narrow mutules accordingly as they surmount metope or triglyph; the triglyphs above columns were also narrower than the intermediate ones. The absence of guttae may be most probably a true omission, but the variations of mutules and triglyphs, so far as not due to the contingency of termination at the angle, are doubtless to be regarded as instances of arrested development; of a pause in that progress to full discipline of all the elements of the order, which ultimately established a canon of uniformity that trusted for relief to refinement of outline and elegance of enriched details, sculptured or coloured.

The most startling divergence from general treatment of the order is in the bold sculpture bestowed upon the architrave. This has been long known from the very good engravings of Texier; the American explorers have discovered several in addition, including some very important portions of the series. The consideration of these is a subject apart. As matter of architectural history it would be interesting to know,—but the knowledge is likely to elude us,—whether this treatment followed established precedents or was an original departure from the better practice of a perfectly plain architrave, which happily became universal, or nearly so.

The Nereid monument of Xanthus, in Lycia, seems to have had a sculptured architrave, but this Ionic structure is of much later date. It is remarkable that the Lycian antiquities supply another parallel in a bold series of sculptures of incertain application,—bears and lions and other animals and satyrs in the same crouching position to enable them to range,—which is given to a Hercules at Assos.

This notice, however, is now quite long enough for what only professes to be a preliminary report. We shall await with interest the completed details that are promised, and further results of continued exploration of remains which Colonel Lenko considered to present the most perfect idea of a Greek city that is anywhere obtainable.

Geologists will be interested in the report, which may be studied in conjunction with the valuable essay of Professor Virchow on the geology of the Troad. As regards inscriptions found, a bronze tablet has been preserved to show that there was a period when the citizens of Assos could strain the usual conventional sycophancy of an address,—it is to "the God" Caligula,—from fulsome to profanity. It is pleasant to turn from the craven invocation of "the Saviour and God Caesar Augustus," to another inscription which preserves a more honourable expression of natural sympathy engraved below the bas-relief of a dog; the following is a literal translation:—

Annens Here has his playmate the dog Parthenope buried; Such for the solace she gave giving requital in turn. Even for dogs has affection its meed, as now also has this one, Still to her master attached, here been allotted a tomb. Looking hewon, make thyself a true friend, who, with zealous affection, Will, as he loved you in life, care for you also when dead.

**Penzance Scientific and Industrial Exhibition.**—A Scientific and Industrial Exhibition is to be held in Penzance just after the close of the Royal Cornwall Polytechnic "Jubilee" Meeting at Falmouth. The Exhibition is projected for the purpose of bringing together a display of apparatus and products illustrative of the modes of working and results attained in the various departments of science and industry. Examples, models, diagrams, or descriptions of obsolete or disused machines or processes possessing historic interest, will be eligible for exhibition; but the committee more particularly desire a collection of the most approved modern appliances in use at the present time. It is proposed to open the Exhibition on Monday, the 25th of September, and to keep it open during one week. Short lectures, descriptive of some of the exhibits, will be given at intervals.

GENERAL ART-EDUCATION.

THE phrase, "art-education," implies two distinct forms of cultivation; the instruction in the art of delineation or shaping, whether in drawing on the flat or in modelling surfaces, and the more decisively intellectual power of conceiving forms and ideas, and of truly appreciating and understanding already existing creations of art. If we were to put it in a more epigrammatic way, we might say that art-education was concerned either in teaching us to draw what we see, or to see what we want to draw. The latter expression is illustrated by the story of Fuseli saying to a student who was looking vacantly before him, "What do you see, sir?" and on receiving the answer, "Nothing, sir;" rejoining, "Then you ought to see something, sir; you ought to see before your mind the form you are intending to draw, and if you do not you will never be a painter." Fuseli, it is certain, saw before his mind's eye occasionally very strange shapes, and it would have been well for him if he had looked a little less at them and a little more at the material facts of Nature, which he said "put him out." But for all that there is truth in his remark, as indicating how the mind, in original composition, should command the pencil, and not trust to the pencil, in its gyrations on the paper, evolving an idea. The same criticism was made by Mr. Street, in one of his lectures, in regard to architectural drawing. To see some people draw, he said, you would suppose that they looked to the pencil to guide them, instead of their own will guiding the pencil.

These two sides of artistic attainment,—the power of drawing what is seen, and the power of original production, stand on a very different footing in their relation to the powers and the requirements of the mass of the people. To expect the power of original production, in a sense that would be worth anything, from any but a very small minority of mankind, would be out of the question even with the most perfect system of artistic instruction. Few men, either writers or artists, have really original ideas; the majority among them who succeed to a respectable extent merely repeat previous ideas in a slightly modified form, with more or less of their own manner of execution; and even manner of execution is copied from others, consciously or unconsciously. Many works so produced may be very agreeable to themselves, and give legitimate pleasure to many people, but they have no permanent value, and do not last beyond their own day. The power to produce even these, however, requires the same degree of technical instruction as is required to make a great and original artist: the training must be given to all who feel moved to seek it; the genius will show itself where it exists; training cannot evolve it, but can only furnish it with the power of expression.

Even those, however, who can produce independent works which are not characterised by originality of genius and of manner, are a minority in regard to the mass of mankind; at all events, this kind of power even is not acquired without almost entire devotion of time and energy to it, which cannot be given except by those who intend to live by it, or who are of independent means. To the majority outside of these lines a training in art has another kind of value. It is a means of education, of calling out faculties of the body and mind which would otherwise lie dormant, of opening sources of intellectual pleasure, and of giving, by means of the power of drawing, a more accurate perception of the forms of objects, and a capacity for representing and describing objects in a manner far more direct and more universally intelligible than any written description can be. This practical value of drawing, it is needless to remark, has been borne witness to by not a few employers of labour, who have given it as their experience that a workman who could draw and could properly understand a drawing, was always more capable, more useful, and better able to understand his instructions than one who could not. The practical value of drawing may be recognised, even apart from its operation on the understanding, in its power of promoting greater dexterity of manipulation in operations quite apart from that of drawing in itself. One of the best amateur artists of the day, as is well known, is an eminent surgeon, who has declared that he first took up etching because it was a recreation which would have the effect of rendering his hand more delicate

for his important professional work. One of the best remarks in regard to this result of training in drawing was one we heard given by a lady who was a candidate for a School-board election, and was asked somewhat indignantly, by one of her working-class constituents, what was the use of teaching drawing in the Board Schools to girls who were going into service, for instance, and why their education was not confined to things that would be useful to them in their future life? The reply given was that there was no more common complaint against female servants than about their clumsiness in handling fragile things, such as glass and china, and their continual breakage of such articles in consequence; and that a training like drawing would probably do more to render the hands more safe, careful, and sensitive in touch, than any other influence that could be named. The lady who made this sensible and shrewd answer, on the spur of the moment, we are glad to say, gained her election, and is now an active member of a large School Board. Of course, it might have been said in addition that a knowledge of drawing would give a domestic servant even greater advantages than that, in providing her with a more interesting and sensible occupation for her leisure times than flirting with "policeman X"; but the answer cited in favour of drawing was perfectly true as far as it went, and probably the best practical reply to the style of criticism which evoked it.

It is the comparative prevalence now of this idea of drawing as an educational influence on the mind and the hand, which has led probably to the wide-spread change in the ideas of art-instructors and of educated persons generally in regard to the manner in which drawing should be taught at schools or to children at home. The idea of education in drawing, in the days when men now in middle life were at school, consisted in the production of copies of landscapes or of heads, executed by pupils who knew nothing of the anatomy of the head, nothing of the perspective or of what may be called the construction of the landscape, and made to look presentable, or what was supposed by parents and guardians to be presentable, by the touching up of the master. This idea of drawing is certainly not extinct yet, but it now only lingers in second-class schools and in families where there is no pretence of understanding or caring about art, save in a merely perfunctory manner. The influence of the principles the promulgation of which is more due to the teaching of the South Kensington Schools and of their branch schools in various parts of the country, than to any other source, has permeated far and wide, and has to a great extent revolutionised the artistic training given in our schools.

The essence of the change which has come about is this,—that it is now recognised that learning to draw does not mean merely learning to copy on one flat surface the marks on another flat surface; in other words, making a drawing from another drawing, but that drawing means the power of representing on a flat plane any object or group of objects that is placed before the draughtsman, and that no one can be said really to draw who does not understand how to represent the outlines of any object, however complicated, by lines on a sheet of paper, put in by the lucky help of a natural quickness of the eye, which may at times enable a pupil to draw what looks right by a happy chance, but in accordance with a definite and scientific knowledge of the relation of appearance to reality, and of the method of representing this relation on paper. That is the one-half of the now recognised truth about artistic instruction; and the other and equally important half of it lies in the recognition of the fact that no study of Nature at second-hand, from a "first," "second," or "third" drawing-book, can give real training in the knowledge of what Nature really is, and of the beauty, delicacy, and infinite variety of natural forms; that Nature must be studied seriously and zealously from her own realities, and not from copy-books; and hence that to draw one sprig or flower correctly from Nature is more to the purpose, and teaches more, than to draw a whole landscape from a flat copy executed by another hand. The latter process neither teaches drawing nor teaches a knowledge of Nature; it only teaches a trick of hand which can be mechanically repeated. The study of a fine landscape-painting by means of copying it has, of course, as far as it goes, the same sort of value in relation to the superior landscape-painter's art which it has in relation

to Nature; it gives the student an insight into the manipulation of colours, and teaches him how the greater painter produced his effects, just as the study of Nature herself teaches him how Nature produces her effects, and how to reproduce them. But the modern system recognises that even the greatest landscape-painter's work is only a translation from Nature, not to be studied with a view of understanding Nature herself, but with a view of understanding the painter and his method, and perhaps of learning from his work something about the way of studying Nature, and the means by which some of her effects may be reproduced, and gaining some new hints to be turned to account in the student's own studies from Nature.

Thus, at the present moment, the idea of instruction in drawing is a much more serious one than in the days when pupils made sketches and masters furnished them up. The best instruction in drawing is now directed to insuring that the pupil thoroughly understands what he is doing, and why he is doing it; that he understands the meaning of each line that he makes, and the construction of the object which he draws, and that his eye for form, proportion, and perspective is cultivated step by step as he proceeds. The system adopted in the South Kensington first-grade drawing-books, which we noticed some time ago, is admirably calculated for this object of making the pupil think, and exercising mind, eye, and hand simultaneously. In those books the effort is made to prepare the student for drawing from actual objects, and at the same time to supply to some extent the training of eye and hand which such drawing furnishes, and to lead up to it by examples and a method especially selected for those ends. The student is exercised first in drawing simple geometrical forms which cultivate in him the perception of size and contour and proportion, as well as neatness and accuracy of hand; and both in these and in the more advanced and difficult objects which present problems in perspective and foreshortening, the invariable rule is that the copy shall be made on a different scale from the original; so that nothing can be measured or mechanically copied. It would be difficult to imagine any system wider apart from that on which the so-called teaching of drawing was once based in even our best schools, and the gradual and increasing adoption of such a system as this cannot but have a most notable result on the general power of drawing among the rising generation of children who are put through it.

In regard to this subject of art-instruction some very interesting information is put together in a little book by Mr. Hulme,\* whose name is known to our readers in connexion with some able works on artistic design, especially in relation to the adaptation of floral forms in art. Mr. Hulme's book gives his general ideas as to what art-instruction should aim at, which are in the direction of that scientific method of which we have been speaking; and gives a brief account of the system pursued at various important educational establishments in different parts of the country. The information given in this portion of the book gives an account of the method pursued at the Board Schools, the University Local Examinations, at the various military and engineering colleges, at the leading public schools, and in the more theoretic professional teaching at the Universities; and at such more specially artistic schools as the Royal Academy, the Slade School, the South Kensington School, and the Institute of Architects,—the latter referring, of course, to the work-appointed for prizes and medals, as the Institute is not an instructing body otherwise than in this sense.

It is surprising and satisfactory to learn from this interesting *résumé* how prevalent now is the scientific system, as we may call it, of teaching drawing in the principal educational institutions in which it is taught. We find evidence that in almost all these instances, where drawing is taught, it is taught upon a fairly good method and on sound principles. The defects of the old system or want of system appear to survive mainly in the smaller middle-class schools, where naturally reform in such subjects is slow to make its way. Probably the reform would be accelerated not a little if it were once fairly recognised that there is a practical value in the power of drawing, for men who are in trade and commerce even, and that

\* Art-instruction in England. By F. Edward Hulme, F.L.S., F.S.A. London: Longmans, Green, & Co. 1882.

it is not a mere elegant accomplishment for ladies and gentlemen. In the larger public schools, such as Eton and Rugby, the mistake is that drawing is only voluntary, although it appears to be well taught to those who desire and seek to learn it. As Mr. Hulme says, few schoolboys are likely to do anything voluntarily in the way of work. And as drawing taught on the scientific method really is work and not mere trifling with brush or pencil, it may be surmised that only a very strong turn for drawing on the part of the pupil, or the direct orders from home on the part of the parents, lead to the filling up of the drawing class. Among University men of the present day, from which class most or all of the masters at our large schools are recruited, there still linger the remains of the old superstition, that drawing should be an "extra" something, like dancing; an elegant accomplishment, not to be put on a level with classics and history and other serious studies. The next generation of schoolmasters will probably know better themselves; to those of the present generation it may be urged that drawing is a most important element in mental and bodily training, and that up to a certain point, that is to say, as far as concerns the practical handling of the pencil and the practical power of copying an object when seen, and of representing in correct perspective an object which it is desired to represent,—so far as this, drawing can be almost as certainly taught generally as writing, and ought to be so as a part of every man's education. The question of artistic feeling in the higher sense is a different one; it only exists at all in a portion, perhaps a minority, of boys and men; though a preliminary training in practical drawing might not infrequently bring out evidence of latent artistic taste where it would never have shown itself or been suspected had not the capability for the expression of it first been imparted. The true solution of the problem for general schools would be, as Mr. Hulme observes, a compulsory class supplemented by a voluntary one. The elements of drawing, scientifically taught, should be as much a compulsory subject as grammar or writing; and when once this is established we should not have the curious spectacle, which we have sometimes seen, of a great publishing firm, which would on no account publish bad and ungrammatically-written books, being quite willing, nevertheless, to publish books containing illustrations violating the first rudiments of the grammar of drawing and perspective, and seeing nothing to be ashamed of in this; and after the course of a few generations of compulsory teaching of drawing, people will read about the men who could not draw in the present day, as we now read about barons and knights and gentlemen of old time who could not write their names. When the elements of drawing are once made compulsory, then the voluntary class of drawing could be filled by those who have shown such special aptitude and developed such a love of art as to render it desirable that their talent should receive further cultivation, even if it were at the expense of some of what are now considered more regular school studies. There ought to be an effort to make some such distinction in reference to special tastes and powers as boys rise higher in a school, and the head authority should surely take some general survey of the reports of the under-masters, and see whether these indicated any special aptitude which could be developed within the machinery of the school. Mr. Hulme quotes a significant instance of a case where he gave a boy's character as "in every respect admirable; most sorry to lose him;" while a master in another department endorsed the same boy's papers, "uniformly idle and indolent; so long as this apathy continues he cannot hope to succeed in anything." As a fact the boy succeeded as an artist, and a comparison of the two reports might have led a discerning Head to see that, in reality, the boy had special aptitudes which it was worth while specially to cultivate, and which the pupil himself was probably cultivating as well as he could. Another point Mr. Hulme touches upon is the questionable position in which the art-instructor still often finds himself in relation to the other masters of the school. This is one of the old superstitions. We can remember when at school that, while every other master who had not the prefix of "reverend" enjoyed the "addition" (as it was called in Shakespeare's day) of "esq.," the teacher of drawing, who was a trained artist, and, as a teacher, in advance of his day, appeared

in all the school-papers as "Mr. ——" only! This would now, we hope, be called snobbish; but it is only fair to remember that there is another side to the matter, in regard to the freedom and equality of social intercourse among the masters at a school. As far as the purposes of social life go, general culture, especially that of University life, does give a polish of mind and manner such as art-training by itself certainly does not necessarily give, and it is for the art-masters to take heed that they do not neglect the general culture of their minds in the special study of their own subject. This is certainly the case in some instances, and it is impossible that a man who lets himself run in one groove in this way can take with ease a place in social life along with men of broader culture.

The first chapter of Mr. Hulme's book, which gives his general views on art-instruction in schools, should be read by those interested in the matter; it contains a great deal of good sense, and little that we should be disposed to call in question or to dissent from, and there are many very useful hints for the consideration of those who are called upon to instruct beginners in drawing. One remark we may quote, on account of the practical exemplification it gives of the value of collections of casts, if only as stimulants to a love of art. Their presence, the author says, is always an advantage; the merest beginners learn something from looking at them, and are led to anticipate the time when they may be able to draw them; and he was struck by the spontaneous remark of a cabinet-maker who was doing some repairs in the class-room, and who looked round at the head of Zeux, the Parthenon frieze, and the Venus of Milo, and said, "Ab, sir, what would I have given when a boy to have even worked at my trade in the same room with these!"

#### THE CONTRACTS OF CORPORATIONS.\*

THERE is probably no legal question which more clearly shows the necessity for a code of English law than that of the rights and liabilities of corporations on contracts not entered into under seal. It might be possible to set the whole matter at rest in comparatively a few sentences; but it remains one of the most doubtful questions which can be considered by a lawyer. Mr. Pollock, in his admirable work on the law of contracts, concludes his remarks on this subject by saying—"It is much to be wished that the whole subject should be reviewed and put on a settled footing by the Court of Appeal, and that those cases which are already virtually examined should be expressly declared to be no longer of authority." We would, indeed, prefer to see the matter settled with many other legal questions by a code which should have received the sanction of the Legislature. But as the subject is one which largely interests the readers of the *Builder*, and as, indeed, many of the decisions which have been given on the subject have arisen out of contracts for some kind of building or plumbing work, or in respect of the supply of materials, it may not be amiss to state in a few words how the subject now stands. The old law was, that a corporation could not enter into a binding contract except under their common seal, and though such a practice has been declared by a well-known judge to be "a relic of barbarous antiquity," we are by no means sure that a hard-and-fast rule such as this is not the most satisfactory. It may often cause hardships; but as every one knows the rule, any one who enters into a contract with a corporation without it being sealed does so carelessly, and cannot be pitied if he suffers for his heedlessness. But this rule soon became relaxed, to the extent that contracts as to small matters of daily necessity need not be under seal, from what has been termed "the principle of convenience amounting almost to necessity." Thus, for example, when a municipal corporation were the owners of a graving dock in which ships were placed in turn,—the dock being, in fact, let to the ship-owner by the corporation for the repair of vessels,—and a ship entered the dock under the ordinary unsealed agreement, some breach of contract took place, and the Court de-

\* There was a question lately in the *Builder* as to the right of a corporation against the contractor. These abstract questions can seldom be answered without misleading the questioner who has not stated the facts of a case; but probably the following short general sketch as to the contracts of corporations may be useful.

decided that, though the contract was not under seal, yet this did not prevent it from being a binding one. The ground of decision was the principle already stated, the agreement for the safety of the ship being an act of daily necessity to the Corporation. It is clear, indeed, that to go through the formality of sealing a contract each time a ship might wish to enter the dock, perhaps for a short examination of its condition, would be obviously and inconveniently absurd. But the exception to the rule in regard to trading corporations has been placed on a much wider footing, for all contracts made in the ordinary course of business are valid without being under seal. This exception was finally declared to be the law in the year 1839, in a case in which, said Chief Justice Cockburn, the Court was asked to hold that the old rule as to corporations contracting under seal applied to corporations constituted for the purpose of trading; the contrary, however, was now, he stated, to be considered as settled law. So that in this very case, when a colliery company contracted with an engineer for the erection of a pumping machine and engine for use in the colliery, and paid him part of the price, and he refused to deliver the machinery in question, it was held that the company could maintain an action against him. Conversely, if the company had received the engines and had not paid the engineer for them he could have sued the company for their price; or again, if the company had refused to take the engines, and the engineer had suffered damage in consequence, equally he could have maintained an action for breach of contract. But the consequence of this decision is that a number of cases to be found in the legal reports must be considered as practically overruled, whilst another and opposing series must be considered as good law. Thus, on the one hand, a decision that in an action for the non-delivery of iron pipes to a waterworks company, the contract was invalid not being under seal, is a wrong judgment; and one, that in an action against a gas company for the supply of meters it was immaterial that the contract was unsealed, must be considered as correct. So much for the law as regards trading corporations, where the exception is new so broad as to be almost a rule, but where difficulties often arise in deciding whether a certain contract is incidental to the general course of the business of the company.

There is, however, much greater difficulty in regard to contracts of non-trading corporations. In regard to some of these it is clearly settled that a contract is invalid unless under seal, and that is when by the Act of Parliament under which they have come into existence they are bound to make contracts under seal. Thus a local board, which is a sanitary authority under the Public Health Act, must, in order that its contracts may be valid if they are in respect of agreements above a certain value, have them sealed. But if even such corporation had made an important contract not under seal for the construction of drains and sewers, had paid for them on the completion of the work, and they had turned out to have been made badly and improperly, on the principle that when a corporation has done its part of the contract it may sue on it though not under seal, an action would lie against the contractor, though he could not sue the corporation if they did not pay him that which was due. This is, no doubt, a hardship, and the mere fact of so many existing exceptions to the general rule makes the oversight of a contractor in not having a sealed contract less blameworthy than it would otherwise be.

But, again, there are other non-trading corporations, such as guardians of unions, whose contracts are not strictly ordered by Act of Parliament to be in writing, and here there is a still stronger contrast between the cases, which have, curiously enough, never yet been reviewed by the Court of Appeal. The exception, however, seems still to hold good, so far as regards contracts for work to be done or goods supplied in order to carry out the purposes for which the corporation exists, and where the work has been done or the goods supplied. Thus, in a case which has always been regarded as the leading support of this proposition, water-closets were erected at a workhouse by the direction, and with the approbation, of the guardians, and Mr. Justice Weightman, in a lengthy, able, and elaborate judgment, decided, on the above principle, that the plumber was entitled to recover for this work. This case was approved in a more recent

decision, in which the facts were that coals had been supplied to a workhouse; and, on the other hand, there exists an important case in which extra works executed, but not ordered under seal, also again for the guardians of a poor-law union, were decided not to be such as could be paid for unless under a sealed contract. It is true that this decision was given before that of Mr. Justice Weightman, but it cannot be said that, so long as it remains not actually reversed by a Court of Appeal, the law can be stated to be certain and without doubt. "It would, perhaps, have been better," said Mr. Justice Weightman, in the Cuckfield Union case, "and have avoided the uncertainty which now exists, if the old rule had never been relaxed." But the relaxation was made under pressure of what may be considered as practical and common-sense justice; and there is little doubt, we think, that, when possible, courts of law will endeavour to do substantial justice, even though the contract may not be under seal. The law is, however, very calculated to mislead contractors and others, because whilst they may recover, as we have seen, against some corporations for work done and goods supplied, yet against others which have, under recent Acts of Parliament, certain powers placed in them, they cannot so get their money because the Act of Parliament has a stringent proviso as to contracts being under seal. Our readers may remember that within the last two months we called attention to the case of Young v. the Corporation of Leamington, who were an Urban Sanitary Authority, and against whom the contractor was held to have no right of action. If, on the contrary, he had done work at the poor-house for the parish, undoubtedly he could have successfully maintained an action. Such an anomalous state of the law is intolerable. Either the judicial exceptions to the old rule are founded on a wrong principle, or else the Public Health Act, and any other Acts which contain similar clauses, are too stringently framed. That contractors do not as a body take some steps to have them considered certainly surprises us, because, having such strong judicial decisions to support them as are contained in the cases relating to unions and other corporations, they have good ground for saying that these Acts require amendment. It, no doubt is in the public interest that public contracts in which public money is spent should be as carefully prepared and executed as possible; but when public officials enter into contracts which should be sealed, and are not sealed, and so a contractor who has done work is unable to recover his just debts, although he would be able to do so against almost any other but a regular municipal corporation, then some kind of fine should be inflicted on these persons. If some such proviso were inserted in the Public Health Acts, it would be not only a defence to the public, but guard contractors against the carelessness of public officials whose duty it is to see contracts under these powers carried out in the manner which the Legislature has directed.

#### THE RAILWAY MOVEMENT OF 1881.

ALTHOUGH the railway returns for 1881 are not yet issued, an abstract containing some of their leading features is given in No. 29 of the Statistical Abstract for the United Kingdom. The general upshot is that while gross revenue has increased by 101l. per mile, or from 3,411l. to 3,512l., working expenses have increased in a higher ratio, or from 1,877l. to 1,902l. per mile. The net result, —1,610l. per mile, —is varied to 1,744l. per mile by receipts for miscellaneous items, against 1,893l. per mile in 1880; and the average cost per mile, which in 1880 was 40,613l., has risen in 1881 to 41,000l.

Thus the net earning on capital, which, in 1880, was 4.38 per cent., sank in 1881 to 4.27 per cent., which is almost exactly the average return since 1860,—the first year in which the data requisite for the calculation were given in the "Railway Returns." But the volume of traffic has risen, in this period of twenty-two years, from 2,661l. to 3,512l., per mile, or by 31 per cent. The capital cost per mile has risen during the same time from 33,393l. to 41,000l., or by nearly 23 per cent. The difference between these two increments, half of which, to say the least of it, might have been expected to be net gain, has been exactly swallowed up by the increase of the working expenses.

The steady increase of the capital cost per mile from 1863 (when it was at its minimum of

32,804l.) to 1881, (when it had reached 41,000l.), has been forty per cent. in eighteen years. In the former year the great trunk lines of railway were, as a rule, completed; and the branches and subsidiary lines which have since then been added to the system ought, it might have been supposed, to have been constructed at a lower price, thus lowering the average cost. Such has been the case with the well-arranged railways of France, which, in 1867, had cost 28,592l. per mile, a figure which was reduced by 1877 to 25,780l. per mile. In this latter year the goods and passenger mileage receipts in the two countries were equal, viz., 2,887l. in France and 2,881l. in England,—which latter amount was raised by the mineral traffic to 3,686l. It is difficult to understand the difference of the movement in the two countries, unless it is to be traced to the disastrous effects of non-remunerative traffic in England. The average return of net earning on capital in France, which, in 1841 was 3.11 per cent., has risen to 5.36 per cent. in 1877; while in England, as has been seen, it has not in 1881 exceeded the mean for the whole period under return.

Regarded by the light of this historic progress, the decline of a little more than 2½ per cent. (from 4.38 to 4.27) in the earning power of the English railways for the year 1881 is somewhat alarming. No rule of business is more generally admitted than that profits increase as the volume of business increases. It is quite intelligible why this should be the case. Fixed charges, which are little affected by the increase of traffic, are spread over a larger area, and thus the same price leaves much more profit for 200 than for 100 units of sale. In France, the increase of volume from 2,741l. per mile in 1867 to 2,887l. per mile in 1877 was attended by an increase in earning power of from 5.10 to 5.56 per cent. The Belgian railways, on the other hand, have, by constant increment of their capital cost, been brought into a condition verging upon bankruptcy. Experience is of no value at all if facts of this grave nature do not lead the English shareholders to demand fuller and more businesslike accounts than those with which Parliament has been content. And this is more signally true when we reflect that the figures above given cover all the railways of the United Kingdom. Among them are to be found some of which the advances as rapid and satisfactory as on the French lines. If we compare the net earnings on capital in two distinct groups of English lines, we shall find this strikingly manifested. The average net earnings on capital of the London and South-Western, the London, Brighton, and South Coast, and the South-Eastern Railways in 1871, together with that of the Metropolitan Railway in 1874, were 3.66 per cent. In 1880 the average net earnings of the same lines were 5.15 per cent. on capital,—an improvement of property at the rate of 40.6 per cent. in nine years. The average net earning power of the London and North-Western, the Great Northern, the Midland, and the North-Eastern Railways in 1871 was 5.80 per cent. In 1880 it had sunk to 5.20 per cent., showing a depreciation of value on the whole aggregate capital of these companies of 11.7 per cent. in nine years.

If this very glaring contrast, illustrated as it is by the returns of the French railways, does not stimulate the shareholders in the lines which are so steadily depreciating to look like men of business at what directors call their policy, it will be of little use to go to the trouble and expense of publishing any accounts at all.

**Royal Association on for the Promotion of the Fine Arts in Scotland.**—The distribution of the works of art purchased for this year by the Committee of the Royal Association for the Promotion of the Fine Arts in Scotland took place on the 5th inst. in the Masonic Hall, Edinburgh, Councillor Walcot, in the absence of Lord McLaren, presiding. The chairman stated that the subscriptions received for the year amounted to 3,937l. 10s., a decrease on those of last year of 24l. 3s. The prizes, which were then balloted for, consisted of 32 works of art selected by the committee from the late exhibition of the Royal Scottish Academy, and comprised 29 paintings, 9 water-colour drawings, and 1 bust in marble. There were also 25 statuettes in statuary porcelain, after Sir John Steel's colossal statue of Burns in New York. The balloting was conducted by Mr. John Cowan, Beeslack, and Mr. Campbell Penney, C.A.

RESISTANCE NEEDED TO THE PRESSURE OF THE WIND.

In anticipation of the next quarterly volume of the "Minutes of Proceedings of the Institution of Civil Engineers," the report of a very interesting debate on resistance to wind-pressure has just been printed, in the convenient pamphlet form customary for such productions. The debate itself has possibly more value than the original contributions,—one from an American, and one from a French engineer,—on which it was based. At all events, these papers would have been none the worse if the writers had made themselves acquainted with the articles on the subject which have from time to time appeared in the columns of the *Builder*. For example, a knowledge of the two remarkable observations which we cited (September 4th, 1880) of the force of the storms of February 20th and November 16th, 1877, at Holyhead, might have modified some of the conclusions of the writers. We have now to call attention to one other valuable contribution to the study of a question which all the speakers admit to require much study, by several gentlemen who took part in the discussion; and notably to a law approximately determined by Mr. Thomas Stevenson. What, however, renders it an indispensable duty to call attention to the debate is the fact that two of the speakers, each of them a man of admitted eminence, are reported to have made such wholly contradictory statements as to the simple mathematical formula according to which existing tables of pressure have been computed, as to be enough to perplex and confuse the student of this important subject; and that, perhaps, all the more so, from the fact that this grave contradiction appears to have been unnoticed.

Mr. Hawksley, a past President of the Institution, stated very briefly and very clearly the general solution of the problem of the relation between the velocity and the pressure of wind. Without imposing on our readers more mathematics than we can help, we may say that we have gone through Mr. Hawksley's work step by step, and fully agree with its outcome; adding only, that the table takes no note of a small increment of pressure due to the compression of the wind-current itself, which does not, however, amount to more than about 2½ per cent. at a very high velocity. The ultimate result of Mr. Hawksley's algebra is the very simple and elegant formula " $p = (\frac{v}{20})^2$ , nearly;" where  $p$  = pressure in lb. per square foot, and  $v$  = velocity in feet per second. Dr. Pole, four pages further on, gives an equivalent formula, viz., " $p = \frac{v^2}{400}$  nearly," but he states this to be expressed in miles per hour.

The consequence of this, which, by itself, might be a mere clerical error, is, that Dr. Pole goes on to observe that the pressures tabulated by Smeaton are double those arrived at by a true formula, and that they are "deduced by the formula,  $p = \frac{v^2}{200}$  nearly." And this is not the limit of the mischief; for Mr. Airy (p. 91) cites an empirical formula recommended by the wind-pressure commission as " $\frac{v^2}{100} = p$ ;" where  $v$  is the maximum sum of the wind in miles per hour; so that the formula seems to be based, first on the formula given by Dr. Pole, and secondly, on the assumption that the maximum velocity at any portion of an hour is double that for the average of the hour. The wholly inadequate nature of the last assumption is evident to any practical man. Mr. Rogers Field (p. 97) has shown a variation in the ratio of maximum to mean pressure, during an hour, of from 1.5 to 1.9, to 1. That being the case, it is of no small importance to be quite sure whether Smeaton's allowance is, as stated by Dr. Pole, twice that demanded by theory.

The simple fact is, that the formula  $p = (\frac{v}{20})^2$ , or  $p = \frac{v^2}{400}$  nearly, is correct when the velocity of the wind is calculated in feet per second; and that Smeaton's tables appear to answer to a formula which at sixty miles an hour would be  $p = \frac{v^2}{200}$ , with the velocity stated in miles per hour. One hundred feet per second is equal to sixty-eight miles per hour, and it is obvious that the formula must vary according to the measure of speed employed. The subject is so important to the architect that we subjoin the two tables, one that of Smeaton, generally in use, graduated

in miles per hour, the other that of Mr. Hawksley, which we give as fully reliable, graduated in feet per second. We are obliged to give the tables in sequence, and not in parallel lines, as in order to do the latter, we must recalculate one of them, which then would cease to be that of the author cited, and become our own. But we may mention that the pressure at 100 miles per hour, which, according to Smeaton's table, is 49.20 lb. per square foot, according to Mr. Hawksley's formula is 53.8 lb. per foot. And we think the higher figure is the true result.

The tables are as follows:—

L.—SMEATON.

VELOCITY.		PRESSURE	
Miles per hour.	Feet per second.	Pounds per square foot.	
1	1.47	.065	Hardly perceptible.
2	2.93	.029	
3	4.40	.044	Just perceptible.
4	5.87	.079	
5	7.33	.123	Gentle pleasant wind.
10	14.67	.492	
15	22.00	1.107	Pleasant brisk breeze.
20	29.34	1.968	
25	36.67	3.075	Very brisk.
30	44.00	4.429	
35	51.34	6.027	High wind.
40	58.68	7.873	
45	66.01	9.963	Very high.
50	73.35	12.300	A storm or tempest.
60	88.02	17.715	A great storm.
80	117.36	31.490	A hurricane.
100	146.70	49.200	A hurricane that tears up trees, carries buildings, &c., before it.

Mr. Hawksley's table is as under:—

VELOCITIES IN		PRESSURE IN
Feet per second.	Miles per hour.	lbs. per square foot.
10	6.8	0.25
20	13.6	1.00
30	20.4	2.25
40	27.2	4.00
50	34.0	6.25
60	40.8	9.00
70	47.6	12.25
80	54.4	16.00
90	61.2	20.15
100	68.0	25.00
110	74.8	30.25
120	81.6	36.00
130	88.4	42.25
140	95.2	49.00
150	102.0	56.25

The general impression left by the discussion is pretty much the same as that which we endeavoured to enforce in our own previous papers on the subject. It was summarised by the President, Sir W. G. Armstrong, who "desired to express his strong opinion of the urgent necessity for experimental investigation in connexion with wind-pressure." There were, however, one or two contributions to the future positive knowledge of this subject which it is desirable to distinguish from calculations and arguments founded either on old or on imperfect and partial data.

Of these, that which strikes us as the most valuable accession to the general theory of wind-pressure was made by a member of an illustrious family of engineers, who may be said to have made resistance to storms their special province. Mr. Thomas Stevenson, who has already enriched science with the marine dynamometer, and with observations on the force of the sea (to which we referred when describing the principal lighthouses of our coasts), brought forward the result of researches on the law of variation of wind-pressure at different heights. In 1876 Mr. Stevenson made a series of observations on the Calton Hill, Edinburgh, with the view of determining the coincident wind-pressure at heights varying from 276 ft. to 1,600 ft. above the sea level. In 1878, furnished with a grant of 50*l.* from the Government Research Fund, he made experiments at small elevations of from 10 ft. to 50 ft. The result of his labours,—supposing it to be verified by independent observation, and illustrated by some mathematical theory of the principle underlying the law obtained,—will hereafter form a leading chapter in an exhaustive work on the pressure of the

wind. It is to the effect that (when a height of 15 ft. above the surface of the ground is passed) the increase of pressure is denoted by a parabola with the vertex 72 ft. below the level of the ground. Hence Mr. Stevenson deduces the

$$\text{formula, } V = v \sqrt{\frac{H+72}{h+72}}$$

which, for the standard height of 50 ft., at which he recommends that all anemometers should be placed, becomes

$$V = v \sqrt{\frac{H+72}{122}}$$

It further appeared that if  $x$  were taken as the velocity of the wind at  $H$  feet above the ground, the parameter of the corresponding parabola was  $(\frac{H}{2} + 72)$ , and, as  $x$  varied, the parameter would vary as  $x^2$ , or as the square of the velocity of the gale.  $H$  and  $p$  are, of course, the heights in feet of the higher and lower stations above the ground, and  $V$  and  $v$  are the respective velocities at these levels.

It is remarkable that, in a discussion on this subject in the theatre of the Institution of Civil Engineers, due attention should not have been called to the experiments made in 1846 on the resistance to railway trains at different velocities, and to the full debates in which Mr. Robert Stephenson, Mr. Brunel, Mr. Bidder, and other engineers took part, on these experiments. Velocities of as much as seventy miles an hour were attained at that time by the locomotive; and although the results obtained were calculated in pounds of resistance per ton of train, in which shape they now form the bases of the tables in our works on locomotion, the conversion of this into pounds per square foot is not impracticable; and a verification of theory up to a very high velocity is here attainable.

Many of our readers, however, will turn with more eagerness to such remarks as apply to the resistance of definite structures to storms of approximately known violence. It is to this practical outcome that the architect may naturally be most ready to turn. Mr. E. A. Cowper, who rarely speaks on a mechanical subject without adding to the knowledge of his hearers, referred to two chimneys near Birmingham, one of which did come down in a storm and the other did not. We wish that he had mentioned the dates; for being, in 1839, familiar with the locality, we are inclined to think that by the chimney at King's Norton, near Birmingham, he must refer to a very beautiful chimney which, in that year, stood at the Lifford Chemical Works, close to the crossing of the Birmingham and Worcester Canal by the Birmingham and Gloucester Railway. That chimney, however, was not 406 ft., but 368 ft., high. It was built of curved bricks, specially moulded for the purpose, in,—if we remember rightly,—four gradations of size. It was one of the most perfect examples of brickwork ever reared in England. The draught that it caused was enough to hold up a heavy plank, if laid vertically against an opening into a flue connected with the chimney. It answered its purpose of keeping the whole of the works free from gaseous effluvia perfectly, and the vast train of smoke which it threw, stretching for nine miles before it struck the distant hills formed an anemometer on an unusual scale. The fall of this chimney we believe to have been due to the stoppage of the works. The fires were put out,—the draught ceased. The chimney became weak; probably the sulphuric acid and other gases had exerted an eroding effect on its materials. We saw it on one occasion bending to its fate, and on another, broken, as Mr. Cowper says. But we hold that had the works been uninterrupted the chimney might even now be standing.

We may add a curious incident which occurred at the completion of this fine chimney. The man who ascended to remove the scaffolding, having done his work, threw down the rope, and remained on the top of the stack, 368 ft. above the ground, without any means of escape! Incredible as it may seem, this is not a singular instance of absence of mind among these "Steeple Jacks," as they are called. We were not on the ground at the time, although we knew the place well soon after, and, therefore, cannot speak with certitude, but think that a rope was sent up to the man by the agency of a kite. But it was either on that, or on a similar occasion, that when all the bystanders were struck with awe, the wife of the isolated man called out to him to cut the top row of his stocking, put his knife in the foot of it, and let it unravel its way down. "It'll haul," she

cried, "it 'll hand sure. I knitted every stitch of it myself." And a rope was sent up by the yarn thus unravelled.

On a chimney like this, the effect of such a law of increase of velocity as that indicated by Mr. Thos. Stevenson would be notably perceived. During the erection of such a stack observations of no small value could be made; and, indeed, copper rods might be built into the outside of the tube, so as to allow of ascent for purposes of observation. According to Mr. Stevenson's formula, if there were what Smeaton calls a "pleasant brisk breeze" of ten miles an hour at 15 ft. above the level of the ground, the speed of the same wind at the level of the chimney-top would be 22.47 miles an hour, and the corresponding pressure would rise from 1 lb. to over 3 lb. per foot, less the reduction for the cylindrical surface. This pressure, of course, is very moderate. But with a storm the increased proportion becomes very serious.

The chimney at the Port Dundas Works, Glasgow, has previously been referred to in the *Builder* as the tallest chimney and one of the loftiest masonry structures in the world. Its height is 454 ft. above the ground. If the wind were blowing, as before estimated, at ten miles an hour at the surface of the ground, its velocity at the height of the top of this chimney would be 24.59 miles an hour, and the pressure in proportion.

So important do we consider the two investigations of Mr. Hawksley and Mr. Thomas Stevenson, above explained, that we have computed a table of reference for the architect, based on the formula proposed. We have taken as our starting-point the velocity of sixty miles an hour at the level of 15 ft. above the ground. We very much question whether this has ever been exceeded in this country, except in such wholly exceptional cases as the architect can no more be called on in duty to provide against than he can against the not wholly impossible danger of earthquake. In any situation, however, where any evidence is forthcoming that a greater speed has been attained at this level, it will be proper to make a corresponding correction in the table. But assuming this speed, which is that assigned by Smeaton to "a great storm," we have applied Mr. Thomas Stevenson's formula to determine the coincident speed, and the corresponding pressure, at heights of from 50 ft. to 450 ft. To the pressure thus obtained we have added, in a separate column, the factor of safety of + 33 per cent. The resulting pressures are high, but we think that no physicist will venture to say that they are (if we accept the purely scientific value of the first formula, and the experimental authority of the second), unlikely to occur in such a storm.

ORIGINAL TABLE OF RESISTANCES TO WIND.

Height above ground.	Speed of wind.	Pressure.	Factor of safety.	Total.
Feet.	Miles per hour.	Pounds.	Pounds.	Pounds.
15	60.0	19.41	6.92	26.53
50	70.8	26.93	8.97	34.90
100	84.44	49.83	13.61	54.44
150	95.4	45.74	15.23	60.93
200	105.6	59.98	19.99	79.97
250	115.2	71.40	23.80	95.20
300	124.0	82.90	27.63	110.53
350	132.0	87.98	29.52	117.50
400	139.2	104.24	34.74	138.98
450	146.9	117.50	39.16	156.66

We think that the above table will be found to explain many facts that may at present be regarded as contradictory. The moment that the idea is grasped that the velocity of the wind increases with height above the ground,—a fact as to which there can be no debate, whether the increase of velocity follows Mr. Stevenson's parbola or not,—it becomes apparent that no observation, whether of speed, of pressure, of resistance, or of overthrow, has any exact value unless the height at which the observation was made be noted.

Thus in the case of the Tay Bridge, the destruction of which has given the impulse to the inquiries with which we are dealing, the height of the rails above the water was 92 ft. To this has to be added the depth of the girder, but as this was not a plate but a lattice, it would require an examination of the drawings to ascertain the mean height of the centre of exposed surface. Taking it roughly at 100 ft. above the water, it will be seen from the preceding table

that the pressure at this height was 40.83 lb. on the superficial foot, if the storm was moving at sixty miles an hour at a height of 15 ft. from the ground. Now, the speed of the storm of the 28th of December, 1879, was measured at different points. The measurements all differ, but the respective heights of the several anemometers are not given. It is possible that if this were done a closer accordance would be evident than now appears. The respective shelter or exposure of each site to be taken into account. At Soham, near Sunderland, the speed of the wind was forty miles per hour; at Aberdeen it was sixty-three miles per hour; at Glasgow it was seventy-one miles an hour, actually rising, it is stated, in the three minutes from 7.15 to 7.18 p.m. to 120 miles per hour. Now, if, on these measurements, we estimate the speed of the gale which struck the bridge at seventy miles per hour at the level of 15 ft. above the surface of the river, the velocity of the blast of wind that struck the girder must have been close upon 100 miles per hour. To allow the factor of 33 per cent. of safety against such a blow makes the requisite strength of the structure, as against the wind, come to a resistance of between 60.93 lb. and 79.97 lb. per square foot. It is tolerably clear that if Mr. Thomas Stevenson's law had been known and accepted at the time of the construction of the Tay Bridge, a very different view would have been taken by the designer of the wind-force against which he ought to provide. And we may add that had this law been discovered between the dates of the erection and of the overthrow of the bridge, and brought before the scientific world during the inquiry which took place as to the catastrophe, a very great mitigation of the blame which the engineer took to himself would have been the result.

It will now, we trust, become apparent that our scientific knowledge on the subject of the provision that ought to be made by the architect for resisting the force of the wind is very considerably advanced by the discussion at the Institution; far more so, in fact, than in the haste of debate some of the eminent men who took part in the discussion were ready to admit. That the collection of more observations is desirable we fully agree. And we think that Mr. Wilfrid Aïy put the thing in the right light when he spoke of the value of the evidence of scaffolding men. The question of the breadth of the wind-waves might certainly be far better illustrated by synchronous marine observations than by any other method as yet attainable. On the other hand, any measurements of either velocity or pressure taken at sea would require very careful correction for the error due to the motion of the vessel itself. We look forward with hope, moreover, to the results of the experiments promised by Mr. B. Baker.

But while such interesting questions as those that regard the comparative pressure due to the velocity of the general storm-path across a country, and the points of intensified pressure in that general path, whether resulting from eddies or from the effect of obstacles in driving the wind into a funnel, are almost wholly unsuspected, we cannot but think that it is possible to overrate their importance. Against the whirlwind or cyclone, when it assumes such a force as to lift a wagon and horses from the ground, it is clear that no strength within the limits of ordinary human practice can ever be provided.

On the other hand the specific weight of the atmosphere, which is the first element in the problem of wind-pressure, is well known. The pressure of a fluid striking a plane perpendicularly, and then escaping at right angles to its original path, is known. That being the case, there can be no question as to the general formula, which, apart from all manner of local disturbances, connects the speed of a great wind-wave with its pressure. And now that we are taught not only to look at the width, but at the depth of the wave, and to assign to each successive altitude its due increment of pressure above that stated on the ground surface, or at the normal height of 15 ft. above that surface,—by the addition of the factor of safety we consider that the danger arising from the local intensification of portions of the general wave may be adequately met,—the problem assumes a very definite practical form.

We shall be glad to receive any corrections, if such should prove needful, of the table which we present to our readers. Meanwhile we confess

that the study, of which the above columns are the outcome, has given considerable relief to our own anxiety. That the architect has a more formidable enemy with whom to reckon than we have been accustomed to think, we fully admit; but the first thing is to know the exact force of that enemy, and as to that we venture to hope that by the co-ordination of the valuable work done by Mr. Hawksley and by Mr. Thomas Stevenson, we have contributed something that may be of permanent service to the profession.

THE SUBSTITUTION OF BUILDING FOR MONOLITHIC WORK:

AS INDICATED IN THE EARLIEST BOOKS OF THE HEBREW SCRIPTURES.

IN a recent article on the Tombs of the Giants (vol. xlii., p. 693) we suggested the idea that "the account of the iconoclastic reform under Hozekiah (2 Chron. xxxi. 1), when the holy places and the pillars were destroyed, unmistakably indicates the destruction of the two classes of structures known as the dolmens and the menhirs." Drawing the same inference as the above from the recent discoveries of rude stone monuments in Western Syria, the July quarterly statement of the Palestine Exploration Fund opens with a paper on the rude stone monuments of the Bible. We shall not attempt a complete abstract of a paper which is to some extent exhaustive of the inquiry, so far as reference to the Sacred text is concerned. But it may interest many of our readers to be told of some of the most definite references, in the Pentateuch and the other books of the Old Testament, to the holy places of a worship more ancient than the Law of Moses. And from the inquiry emerges a wholly unexpected light as to the religious character, if not as to the exact date, of the substitution of building proper for unencemented megalithic work.

The earliest reference to a rude stone monument cited in this interesting article is one to which we referred in our own pages (Gen. xxviii. 11). This is directly described as a makôm, or holy place, where Jacob erected, and poured oil upon a metzabah, or menhir. Captain Conder suggests the identity of the spot with that where Abraham "builed an altar to the Lord" (Gen. xii. 8); and we may add that the difference of spelling in the two words translated altar and pillar, which is only the substitution of the y for the r, is one of those of which the Aramaic tongues present such frequent examples as to lead to the idea that local dialects, subsequently fused into a homogeneous speech (as in the case of shiloh and shiloheth), were the original causes of the presence of several of quasi-duplicate letters in the Hebrew alphabet. This takes us back to the date 2175 B.C. Comparing verses 7 and 8, it seems that Abraham built two altars, the first at the makôm of Sichem, which is probably on Mount Gerizim, and the second in the vicinity of Bethel, or, more properly, Beth Elolim. About 175 years after the erection of the first altar by Abraham, Jacob (Gen. xxxiii. 20) appears to have erected, or perhaps reconsecrated, an altar on the original site near Shechem; and it is to be noted in this verse that the verb is spelt with the y, and the noun with the r. Before this we have the account of the erection of a stone as a metzabah by Jacob, at the place subsequently known as Mizpah; and the accompanying ceremonial, not only of the foundation of a cairn, but of a feast, probably a sacrificial feast, on the top of the cairn (Gen. xxxi. 45, 46). Again we find the same patriarch (Gen. xxxv. 7) revisiting the makôm of Beth-el, and erecting or re-erecting the altar; and a little after (verso 14), either in the same spot, or not far from it, we find him venerating a monolithio altar (the word metzalah is repeated, with the addition, eben), at the makôm of the debir, or wood, and both pouring a libation, and pouring (the verbs employed differ as well as the nouns) oil or fat upon it. Here we have an instance illustrating the use of the cup-shaped hollow in the menhirs, as well as one, as far as we are at present informed, unique, of the festal consecration of a cairn. The erection of a pillar at the grave of Rachel would not in itself be very instructive, but is of interest if regarded in connexion with the other instances cited.

Another class of references consists of those which seem to indicate the erection of megalithic circles. Among these are cited the altar and

the twelve menhir, erected by Moses at Mount Sinai (Exodus xxiv. 4), where the two forms of the word occur in the same verse. The first with the *y*, and the second with the *y*. Erecting stones, which are here first mentioned as being built with lime (*gyp*), that is to say, set in mortar, and the erection of an altar which is distinctly spoken of as constructed of stones, in the plural, together with the prohibition to which we before referred (vol. xlii., p. 634), to cut or hollow these stones, appear to denote a wholly different phase of religious rite. The monolith has disappeared in this passage, whether as a menhir or as an element of a circle. It cannot for a moment be supposed that the change of language is unintentional, or, at least, that it is not highly significant. None the less so because, forty years later than the visit to Sinai (Joshua iv. 9), we find the single stones again used, and erected as a circle. We may observe that it is gratifying to suppose that the stones here mentioned were no larger than a man could carry, in which case their permanence as a memorial would have been precarious. The twelve men selected by Joshua as representatives of the tribes may without impropriety be regarded as each the head of a working party, strong enough to transport stones adequate for the purpose of a monument.

For any further references, and they are many, to the erection of altars, we refer our readers to the number of the Palestine Exploration Fund's quarterly statement which we have cited, or to the sacred volume itself. The great stone mentioned in the field of Joshua the Bethshemite was apparently an ancient sacred monolith; and the stone Ezel (1 Samuel xx. 19) would appear from its name to have been a gigantic boulder, perhaps something like the "big stone" at the village of Northfield, near Birmingham, which gives its name to the rustic inn. The erection of the "Stone of help," Ebenezer, by Samuel (1 Samuel vii. 12), is, however, connected with the offering of a sacrifice.

It is, we think, undeniable that we find in the above passages references to a change in rite or worship. How early the first erection of the monoliths may be, can, of course, be only approximately illustrated by these passages. But we find the custom of erecting, venerating, and pouring libations on single stones, in connection with makdams, or holy places, practised by Abraham and by Jacob, and we find instances of a not wholly unlike nature in the cases of Joshua and of Samuel. At the same time, in the Book of Deuteronomy we find the opposite form of building with mortar, for the sake of monumental durability, and the use of an altar, not of a single stone, but of stones; while the injunction to build a metzebah adamah, an altar of earth (Exodus xx. 24), is of the same date as the Decalogue, although the permission to rear an altar of unheven stones (the plural is used in the Hebrew, though not in the A.V.) is appended. As to the metzebah built by Noah it may be inferred from the verb used, translated built, that it was of stones in the plural, and not a monolith. As to these delicate critical indications, however, it must be borne in mind that they may perhaps rather point to the date at which the several books of the Hebrew text assumed the present exact form than to any other note of time. When monolithic altars were in use, a writer would speak of rearing them, and when they had been displaced by altars of fitted stones, he would speak of building them, in the natural use of the words, used without any thought of the weight which might thereafter be held to attach to the one or the other verb.

It seems, however, clear that the intent of the Decalogue and of the accompanying injunctions was to prohibit the use of the monolithic altar, and that in express terms when it had been hollowed for the reception of the libations, whether of oil, of wine, or of blood, of a more ancient worship. This is in strict accordance with the injunctions in the treatise Avoda Zara of the Mishna as to matters that have been connected with idolatry. The recent discoveries in Moab have thrown a wholly unexpected light on the subject; and it is probable that we can as yet only dimly anticipate the effect that these discoveries may produce on our archaeological theories, if not on the exegesis of the Hebrew Scriptures.

**Building in Winnipeg.**—It is reported that 5,000,000 dolrs. will be spent in Winnipeg this year in building.

#### THE ART OF THE ARABS.

It is a strange contrast that offered at this moment when our guns are thundering in Egypt,—the use of the most recent applications of modern science in the invasion of a country whose civilisation our archaeologists have shown us is the oldest in the world, the parent stock from which has been developed through long generations all that we are most proud of. If it is the land of the Pharaohs that our troops have, for the second time within a century, invaded, it is scarcely of them and their times that we think now. There are those,—and, indeed, with all it is to some extent inevitable,—to whom at this moment the interest of the country we are now occupying is centred in its connexion with the great oppressors of the Israelites and their even earlier predecessors. But it is not solely their warlike civilisation and its creations that are most threatened by the recent course of events; it is not alone the monuments of a nation which was antique and already on the decline at the hour that Abraham came forth, when the empires of Chaldea and Assyria loom up confusedly, and whose cities at the moment we commence to trace in the patriarchal life of the Bible the first formation of human society, were hoary with the centuries of their existence; it is not the monuments of those distant generations that are threatened; they have stood the brunt of time and wars ago after age,—it is the more fragile creations of an art nearer our own time, more within the ken of our every-day existence.

The Egypt of to-day, if to the antiquary it is still the land of the Pharaohs, if he can still trace the resemblance of the race to the silent pictures drawn thousands of years ago on the walls of many a tomb, the land, it must not be forgotten, is in the hands of the Arabs. They it is whose civilisation has now for centuries imbued the country over which once ruled the Pharaohs. The chief artistic interest roused in Egypt has been allowed to centre exclusively round the contemporaries of the mysterious mummies which fill our museums. The course of history has given to the land of the Nile other claims to the interest of artists and archaeologists besides those connected with pyramids and obelisks, sphinxes and sarcophagi, incised wall decorations, and papyrus. The place held by Egypt in the history of the development of our art and civilisation has, thanks to the researches of successive toilers, since the commencement of the present century, become comparatively familiar. Greece has ceased to be regarded,—except in our educational system,—as the point of departure of our modern civilisation; the Egypt of the Israelites, so long wrapt in profound mystery, has been brought before us. Research, historic and romantic, has revealed to the artistic and literary world the Egypt of the Greeks and Romans; but in the generations that were to follow, the land of the Nile was to pass through another great and influential crisis, and, with the Mussulman or Arab conquest of the seventh century, was again to be the centre of a great artistic and civilising movement. "The first century of the Hegira," says Fergusson, "forms a chapter in the history of mankind as startling from the brilliancy of its events as it is astonishing from the permanence of its results." It is a period not so familiar, but which possesses marked interest from the direct influence its art and learning exercised on Western Europe.

It is only within the present century, as Viollet-le-Duc has remarked, that the attention of the artistic world has been directed to the various expressions of Oriental art; our conception of its creations is still inextricably connected with vague poetic visions of the Alhambra and the French colony of Algeria. M. Coste, for many years architect to the Viceroy of Egypt, was perhaps the first to study in any adequate manner the remarkable architectural marvels which the Arabs had erected in Egypt.\* But M. Coste, however patient and accurate in his professional studies, may be said to have been only a pioneer on the road. The familiar studies of Owen Jones, and more recently of M. Bourgois, are both of a more purely technical than archaeological interest, but more information may be gathered from Girault de Prangey's works on Arab architecture.†

\* Coste, P., "Architecture Arabe: ou Monuments du Kaire." Measured and drawn from 1817 to 1828. Paris, folio, 1837-39.

† Bourgois, "Les Arts Arabes." Paris, 1873. Folio; and the same author's "Elements de l'Art Arabe," Paris, 1878-80. G. de Prangey, "Monuments Arabes

In the seventh century, Egyptian difficulties, as at the present moment, would appear to have been somewhat complicated with religious questions, for the Arabs were called in by the persecuted dissenters from the Greek Church to aid them against their more uncompromising orthodox brethren. The step was a rash one. In vain the Greek governor, Makaukas, held the field during a month; although at the head of 100,000 men, he found himself forced to treat with the invaders. "By the Almighty (ropied the governor in answer to an indignant letter from the Byzantine Cæsar) how few they be, these Arabs are stronger and more powerful than we with our multitude. One man among them is worth as much as a hundred of ours, for they seek death, which is dearer to them than life." In 641 Alexandria capitulated, the Arab commander, Amr, razing the walls. The fall of Alexandria,—as Washington Irving says, in his "Life of Mahomet,"—decided the fate of Egypt. From this date, Arab art and civilisation were to flourish by the banks of the Nile.

It is difficult for us in the present day to conceive the vitality and brilliancy of this Arab civilisation when we see its existing state of collapse. In the field of literature and art the Arab world rose to a splendour which is only the more surprising as it is contemporary with the period in which Europe was still struggling in the twilight of the Middle Ages. It is impossible to imagine these conquerors from Arabia the simple wild horsemen of to-day. It has not unaptly been suggested that some undiscovered civilisation must have existed among them. In Arabia there have been found the ruins of antique monuments which the present inhabitants attribute to an epoch anterior to Mahometanism. But this is a question resting on data too vague to even approach. More mysteries than this lie in the strange rise and course of both Arab art and Arab literature; a mystery lies in many points of the double and parallel development of Mussulman and Christian art, both of which possess many decorative symbols in common. Which borrowed from the other? We are perfectly aware that the Arabs laid the Byzantine arts heavily under contribution; they were Greek architects, painters, goldsmiths, enamellers, weavers, and embroiderers whom they employed. They borrowed also again, from the Persians, who had been the pupils of the Greeks since the time of Alexander the Great, and who, even when the national dynasty of the Arsacides and the Sassanides shook off the political yoke of their conquerors, remained under the artistic influence and were half Byzantine. The Christian art of Byzantium itself was the outcome of the disaggregated relics of the earlier arts of Assyria, Egypt, Phœnicia, and Greece, as well as the composite variations which prevailed in each of the different provinces of Asia Minor. Christian art appropriated to its use a portion of the symbols of which Pagan art had made use; it continued in a modified manner its forms and its ornamental dispositions, giving more preponderance to such features as best corresponded to its own peculiar symbolical exigencies. Arab artists acted in the same manner with respect to Christian and Persian art. Its cupolas, its arcades, its columns, Arab art appropriated to its own use. All along the line of conquest it gathered what it found in each country in which it settled, being strongly influenced by the artistic traditions of that country.

Thus the geometric ornamentation which constitutes so essentially the character of Arab art, it would be very rash to speak of as peculiar alone to its creations. Such forms are to be met with in the oldest monuments in the East, in India, in Syria, in Asia Minor, long before the appearance of the Arabs.

M. Viollet-le-Duc has urged that the term "Arab art" is open to question; historically speaking, it is very vague. We have determined, it is true, to give this name,—varied by the synonym of Saracenic,—to the art scattered over those countries conquered by the followers of Mahomet from Asia to Spain, and hence the expression is thoroughly accepted.

The moment of the Arabs' appearance on the scene in the seventh century was one of sad decline in the arts. The constructive secrets of architecture were, in many cases, almost lost;

d'Egypte," measured in 1845. Paris, 1846. More recently Georg Ebers, in his "Egypten in Bild und Wort," has given to its creations. Such forms are to the Arab conquest of Egypt (Leipzig, 1879). An English translation of Ebers's work is now in course of publication.

the Arabs possessed even less acquaintance with the traditions of the past. Their Greek and Persian architects found it either easier, perhaps through the ignorance of their workmen, to imitate, and especially to rob wholesale, the Romano-Christian or Romano-Persian monuments. They often used no columns, cornices, or friezes, but what they pillaged from some existing Classic work. New symbolic necessities, however, soon gave new and original dispositions to the simplest and most rudimentary artistic elements. Here lay the true Arab genius,—the power of eternally repeating in an embroidery of decoration the same line, just as in their music we find the incessant repetition of the same rhythm.

It is a statement constantly repeated, and generally accepted, that the Arab's religion forbade the representation of any living thing, man or animal. The question cannot be said to have been satisfactorily settled. It would certainly seem that, in their religious edifices, such representations were proscribed, but only after a certain date. Of the two great sects into which Mussulmans are divided, that of the Sunnites is entirely opposed to images, whilst that of the Shyites admits them. In Persia this latter sect prevails, and there its exigencies satisfied demands established by the traditions of a brilliant past civilisation.

We will pursue these observations hereafter.

EPPING FOREST.

A RETROSPECT AND A PROSPECT.

The battle which, for something like four years, the Corporation of the City of London has been waging on behalf of the people in obtaining the preservation of Epping Forest for their perpetual use and enjoyment, was brought to a peaceful and satisfactory close on the 24th day of July last, at the offices of the arbitrators, when the final award was signed. The City Solicitor, in referring to what may be called the legal history of the forest, said, "Under the orders of the arbitrator, the conservators of Epping Forest have purchased 1,842 acres and 23 perches. The Corporation of London had previously purchased 3,551 a. 2 r. 34 p., and to this I have to add 181 a., the balance of exchanges, making a grand total of 5,530 a. 3 r. 17 p., at an expenditure of 256,275*l.*, which in all probability will be slightly increased before the figures are finally closed."

The story that the heights and hollows of Epping Forest have to tell goes far back into the pre-historic eras. There was a time when the rhinoceros and hippopotamus rolled and swam in the muddy lagoons of the Rodding and the Lea; when the elk and hison ruminated in the groves of High Beech, and the elephant and his big brother, the mammoth, reigned supreme over the wildernesses of Essex. Even at this present day, elephant-hunting is far from uncommon among the geological preserves in and around the Forest. The late Sir Antonio Brady collected many spoils of the chase, among these the teeth and jaws of mammoths of every size and age, the largest tooth measuring 10 in. in length. Geology was a science unknown to the learned Camden, who, in his "Britannia" (1610), discoursing of Essex county, quotes Ralph, the Monk of Coggeshall: "In King Richard's time were found two teeth of a certain giant of such a huge bigness that 200 such teeth as men have now-a-days might be cut out of them. These I saw (quoth Ralph) not without wondering!" Camden was sceptical, and hinted at whales; but Norden, in his "Description of Essex" (1549), writes as having seen the marvellous molars and believing in them.

There are also to be found in the Forest marked indications of the existence of man in those remote ages. Flakes, fresh as when first struck off from the flint blocks, are far from infrequent. Three superb, wholly polished celts were found last February during draining operations in the vicinity of Leyton, close to where for so many years Sir A. Brady had disinterred the bones of the mammoths.

To come nearer to historic times, Mr. B. H. Cowper, wandering one summer day in 1872 among the glades in the neighbourhood of Loughton village, came upon certain remains which seemed unquestionably to form part of an ancient earthwork, with an outer ditch or moat, and an inner embankment. The very oldest inhabitant was at fault. Nobody had ever heard of, far less seen, this relic of hygone times.

In 1875 the ground was carefully surveyed by Mr. D'Oyley, of Loughton; but up to the present time neither coin nor weapon nor implement of husbandry, not even a potsherd nor a human bone, has been met with to tell when or by whom the earthwork was raised. From these mysterious mounds to Amhreshury Banks,—another ancient earthwork in the Forest,—is a pleasant walk of two miles through dingle and dell. It has been generally assumed to be a British work, though such works are not usually rectangular, as it is. On the 30th May, 1881, the Epping Forest Field Club, having obtained the permission of the Forest Committee of the Corporation, commenced to cut sections through Amhreshury Banks. The excavations occupied nine days, and were carefully watched by members of the Club. Many small fragments of pottery were found which "might be British," some which "might be Romano-British," and a fragment of a rim, hand-made, which "must be British." But these "finds" had no story to tell. We know that London, at the landing of Cæsar, was surrounded almost up to the walls by dense forests, and Amhreshury Banks,—so sayeth one legend,—was the "fortress in the woods" of Boadicea; while another claims it as the last stronghold of the Roman general Cassivelaunus.

In the year 896 the light of history first throws a gleam upon the Forest, when the Lea was much deeper and broader than now, and when the Danes sailed up in their war-ships to Ware, and Saxon Alfred raised two fortresses to impede their return, one near High Beech and one in the vicinity of Broxbourne. As we approach the era of the Norman invasion definite mention is made of Waltham,—the home in the weald,—which dates its origin from the days of Tofig, a Dane, at whose wedding feast at Clapham, Hardicantute, "all fordrunken," fell down with the wine-cup in his hand and died. Tofig being a mighty hunter, built a lodge where Waltham town now stands, "the place having plenty of wild deer." Edward the Confessor had a hunting-seat "built of stone and leaded," called the Bower, at another part of the forest, now known as Havering-atte Bower. He loved the spot much, because it afforded him solitude for his devotions, until they were disturbed by the singing of the nightingales. Camden writes:—"I cannot justify that report how he was hindered and troubled in his praying by the multitude of singing nightingales, earnestly desired of God their absence. Since which time never nightingale was heard to sing in the park." To Waltham Forest down to the days of James I. came all the Kings of England who loved to chase the "beasts of venery."

"The first of them is the hart, the second is the hare; one of them is the boar. The wolf, and not any more," rhymes the "Book of St. Albans," written, it is said, by Dame Juliana Berners, horn within the borders of the Forest. The abhots of Waltham were renowned for their splendid hospitality, of which Henry III., in his hunting expeditions, used to take a mean advantage, by claiming food and lodging at their manor-house for himself and family without remuneration, whenever,—and that was often,—he was hunting in the neighbourhood. At the invitation of Edward IV., the mayor, corporation, and leading citizens, accompanied by their ladies and dames, and all in gallant array, used to hunt with the king in his forest of Waltham, and when the chase was done the company rode back to London, and made merry in the Drapers' Hall. Chingford was the favourite resort of Queen Elizabeth. It included two manors, one which belonged to St. Paul's Cathedral from the time of the Confessor until its enforced surrender to Henry VIII. The church of Chingford (St. Paul's) is now disused. "The present building" (*Gentleman's Magazine*, 1796) "seems not very ancient, not more so than about the time of Henry VII. The whole has been put into a state of very sound repair, so as to appear almost unaltered, even to time itself." Alas! for the vanity of human procreancy, the venerable church has been tumbling down piecemeal for many years; its brasses monuments remain in the chancel. At last the roof of the nave fell in, and total ruin seemed inevitable, but its picturesqueness saved it, and it was restored in 1873. At the foot of the hill on which it stands is the manor-house, now a farm-house. The other manor, Chingford Earls, at the compilation of Domesday Book, was held by Orgar the Thane. Each manor included meadow and forest land, with pannage for

1,000 hogs. The manor-house of Chingford Earls was the building now known as Queen Elizabeth's Lodge, in which the manorial and forest courts were wont to be held. It is a tall, irregular, half-timbered structure, with gabled ends and high-pitched roofs. "The staircase built out from the house," writes Thorne in his "Environns," "is of large proportions, with massive timbers; the stairs, of solid oak, about 6 ft. wide, are in fours, there being to the twenty-four steps six broad landings." The story goes that when the Virgin Queen visited the lodge, she used to ride upstairs to the great chamber on the second floor. Elizabeth paid at least one visit to Loughton Hall, on the eastern side of the Forest, as also did James I. and Queen Anne when a princess. All that is left to tell of the hygone glory of the hall, which was burned down nearly fifty years ago, are its great hand-wrought iron gates, the avenue that leads from the garden door to the chancel, the few remains of the old church, and the tombs of the lords of the manor in the desolate churchyard. One of the most striking features of the Forest district is High Beech Hill, from which can be seen Waltham Abbey and the windings of the Lea, the woods of Hertford, the uplands of Cambridge, the hills of Kent and Surrey, and the heights of London. While residing at Beech Hill House Tomnyson wrote the "Talking Oak":—

"Once more the gate behind me falls,  
Once more before my face,  
I see the mould'ring abbey wall  
That stands within the chace,  
Beyond the lodge the city lies  
Beneath its drift of smoke."

In 1837 John Clare, the Northampton poet, was placed in the private asylum of Dr. Allen, at Paternall, High Beech, one of the early reformers of the treatment of the insane. From this place he escaped in 1841, and reached Peterborough, after being four days and three nights on the road, in a penniless condition. In his "Asylum Poems" he writes:—

"I love the forest and its airy bounds,  
Where friendly Campbell takes his daily rounds."

A favorite walk along with friendly Campbell,—son of Campbell the poet,—was "Buckett's (Buckhurst) Hill, a place of furze and clouds," and hoasting of an ancient hostelry,—the Roebuck,—in front of which the stag was uncarved on each returning Easter Monday. Upwards of 180 years ago Tom D'Urfey satirised the Epping Hunt,—

"Once a year into Essex a hunting they go,  
To see 'em pass along O! it is a pretty show,  
Through Chaeppside and through Fenchurch-street,  
And so to Aldgate Pump," &c.

In the early part of the present century it was not uncommon to see 200 men in pink following the hounds through the Forest, and "there was as great a show as their used to be at Epsom races." The Epping Hunt has long been doomed to oblivion. In 1827 Tom Hood introduced his verses on the Epping Hunt thus:—"The author of the following pages has endeavoured to record a yearly revel, already fast hastening to decay. The Easter chase will soon be numbered with the pastimes of past times. Its dogs will have had their day, and its deer will be fallow. A few more seasons and this City Common Hunt will become uncommon." It has virtually ceased to be, and it was full time it should, when the "roughs" installed themselves as the patrons, and mounted police inspectors as the men in pink. The meeting-place of the sham hunts of late years has been the King's Oak Inn, on the east side of High Beech Hill. The name, according to tradition, was derived from an oak planted there by Harold when on his way from Waltham to the fatal field of Hastings. Here, on the 6th day of May, 1882, Queen Victoria planted a sapling oak, and spoke the few but memorable words, "It gives me great satisfaction to dedicate this beautiful forest to the enjoyment of the people for ever." One of the latest acts of the Corporation in connexion with the Forest was the purchase of Wanstead Park for 8,000*l.* Wanstead Manor was the gift of Ælfric to the monks of Westminster, and passing through many hands is now the property of the people. The original manor-house was demolished and rebuilt about the middle of the sixteenth century. Here, for many days, the Earl of Leicester entertained Queen Elizabeth, and Sir Philip Sidney wrote a masque, "The Lady of May," for the occasion, commencing, "Her Most Excellent Majesty walking in Wanstead Garden, as she passed down into the Grove, there came suddenly among the train

one apparelled like an honest man's wife of the country, here, crying out for justice and desiring all the lords and gentlemen to speak a good word for her, she was brought into the presence of Her Majesty." After this stage direction, of a sort, the masque commences, on the merits of which the queen is asked to decide:—

"Judge you, to whom all beauty's force is lent;  
Judge you of love, to whom all love is bent."

In this present year of great book and picture auctions, it may be interesting to know that in the inventory taken of the contents of the house at the earl's death, three portraits of Henry VIII., others of Queen Mary and Queen Elizabeth, forty-three pictures in all, were valued at 11l. 13s. 4d., and the entire library, which consisted of an old bible, Foxe's "Acts and Monuments," much worn, seven psalters, and a service-book, at 13s. 8d. In 1665 Pepys "took coach to Wanstead, the house where Sir H. Mildmay died, and now Sir Robert Brookes lives . . . a fine seat but an old-fashioned house."

In 1683, John Evelyn went to see the new proprietor's "prodigious cost in planting walnut-trees, and making fish-ponds many miles in circuit" &c. The house was taken down and rebuilt in 1715, the architect being Colin Campbell.\* Defoe visited it soon after it was finished,— "It is all of Portland stone in the front, which gives it a most magnificent effect at a distance. As the fore-front of the house looks through a long row of trees, so the back-front respects the gardens, from which you fall down an easy descent which lands you upon the terrace, and gives a most beautiful prospect to the river, which is all formed into canals and openings to answer the views from above. . . . I have not room to say half what might be said of this truly noble palace." The purchase of the last possessor brought the contents of Wanstead House to the auction stand: 41,100l. was the result of a thirty-two days' sale in 1822. No purchaser having been found for the house, it was pulled down and sold piecemeal, and the fine old trees were cut down; but the ornamental waters, the grotto, and some of the avenues still remain for the delectation of many million proprietors.

From the year 1549 to 1882 is a long wait. On the 23rd of July, in the first-mentioned year, a book was made and sent to the commons (people) of all the realm "because of their rising and pulling down of inclosures, the which was sometime (formerly) commons unto the poor men, and great men took them in and enclosed it to them and made parks in divers places, and as this time the commons (people) have risen and pulled up hedges and palings, this book was sent to them that they should be content gently, and within a short space it should be mended." In four days after this proclamation there was hanged one (of the "risers") that came from Romford, on a gibbet at the well within Aldgate. This Romford man doubtless projected the freedom of Epping Forest. Willingale, his successor after the lapse of 300 years, in fence-breaking, lived to see the Forest free, and "was one of those," in the language of the City Solicitor, "of whom it will be recorded that they had well served their country and the State."

We, in imagination, aided by the earliest of English guide-books, start on a trip to Epping Forest on a bright morning of August, 1720. We make our way through the crowds that are thronging to the markets round the Leadon-Hall, who are arrested in their progress for a few minutes to permit a covered wagon to pass from an archway into the street. "The carrier of Epping, in Essex, do lodge at the Prince his Arms, in Lendenhall-street. He cometh on Thursdays and departeth on Mondays." We secure our seat, and are favoured with the company of a well-informed gentleman of about sixty years of age, who tells us he is setting out on a Tour through the islands of Great Britain. As our wagon slowly rolls through Aldgate, we bid farewell to "the City's love and charity" that are beginning to show how stony they are now that the gilding begins to wear off. Over against the end of Houndsditch my companion, a True-born Englishman, has a good word to say of the plum-pudding of the Pye Tavern and the punch of the Three Nuns. He knew them well, for he lived in the time of the Plague

\* A native of Scotland. Appointed architect to Prince of Wales 1725, and surveyor of the works of Greenwich Hospital 1726.

without Aldgate, about midway between Aldgate Church and Whitechapel Bars. Talking about the Plague, we pass through Mile-end-green and enter the village of Bow, where a large manufactory of porcelain is carried on, which, my companion said, though not so fine as some made at Chelsea or Dresden, is much stronger. Crossing Bow Bridge we came to the village of Stratford, which is greatly increased of late years, and my companion pointed out the fine seats, most of them built by citizens of London, who drove to town in their own carriages, that bespangled the western part of the Forest. On we went between great fields of potatoes until we came to the Green Man at Leytonstone, which had formerly been a lodge on the edge of the Forest, where we halted to bait, and then went on underneath the shadows of the trees through Woodford and Loughton, and late in the evening entered Epping and put up at the Old Lion. The landlord informed us that in his father's time Secretary Pepys had lodged there, and "had some red herrings to breakfast, while his boot-heel was a mending, by the same token the boy left the hole as big as it was before"; then he and his company "to horse for London through the Forest, where they found the way good, but only in one path, which they kept as if they had rode through a kennel all the way." But here our imaginary trip ends, our daydream is dispelled by the shriek of the locomotive that has sped us and an army of holiday-makers in a few minutes from the heart of the City into that of the greenwood where the sun is shining, and the birds are singing a welcome to the thousands of toilers from under the City's "drift of smoke." Here we cannot do better than quote Mr. Robert Hunter, honorary solicitor to the Commons Preservation Society,— "The favourite parts of Epping Forest are, indeed, crowded on the great holidays to an extent which would certainly prevent us from classing them amongst Nature's solitudes. The vans, the drinking, the donkey-riding, and the swings are mere accidents which will disappear or assume their proper position as education and refinement spread. So let the thousands wander at their own sweet will through the groves where centuries ago the brother of Garth drove the bogs to the acorns, and Wamba's cousin cracked rude jests, and the twang of the bowstring of some friend of Locksley sent a terror to the breasts of the fat friars of Waltham, and death to the heart of the high-deer, until the shadows of night begin to gather, and the nightingales, despite the malison of the Saxon king, fill the darkening glades with song."

#### THE CARLISLE MEETING OF THE ARCHÆOLOGICAL INSTITUTE.

THE members of the Royal Archæological Institute, the commencement of whose proceedings in Carlisle we mentioned last week, appear to have had a very interesting and successful meeting. This is the second time that the Institute has visited Carlisle, its first visit to the border city having been made twenty-three years ago. The success of the present meeting is in no small degree due to the mayor, Mr. R. S. Ferguson, F.S.A., who has been able to render assistance not always to be looked for at the hands of municipal dignitaries. Fine weather has also conducted (as it always does on such occasions) to the success of the meeting.

In the address of welcome which was presented on behalf of the corporation, it was pointed out that since the former meeting in 1859, considerable changes have taken place in the city, mainly in connexion with the great extension and development of the railway system, but also in the opening out of new streets and the erection of new buildings. In the progress of these works many interesting antiquarian discoveries have been made, by which additional light has been thrown on the history of the past and generally an increased interest has been awakened in all matters connected with antiquarian and archæological research.

The Mayor, after handing the address to the President of the Institute, said,— "It was not my intention to have said anything upon this occasion, but I have a little story to tell you which comes so *apropos* that I cannot omit it. For some years it has been known to us who dabble in the monuments of this city that one of our books, and a very valuable book too, known as Order Book B, had been missing out of our

records, and any inquiries that we could make gave us no particulars of where this missing book was. That missing book has, within the last hour, been restored to the Corporation. Its being restored is the result of the general rake-up for curiosities that was made for the occasion of the visit of this society. The book was in the hands of a gentleman who has held on more than one occasion the office which I now hold. It had been given to him some two years ago, and I think he had never looked into it until he was considering what he could send to the museum. He then found that he had in his possession this book, which is of the very greatest value to the Corporation in more ways than one; and I am happy to say that by the restoration of that book the Corporation of Carlisle possess a complete series of muniments from the date of the governing charter of Charles I. The series is now unbroken. We had long given up hopes of finding it; and it is a fortunate circumstance, and one we owe to the visit of the Archæological Institute, that we can to-day say that our records are complete."

Mr. Robert Ferguson, M.P., said that as he happened to be mayor of the city on the occasion of the former visit of the Institute, he had great pleasure in joining in the welcome on the present occasion.

Lord Talbot de Malahide, President of the Institute, having briefly replied,

The Rev. Canon Simpson, Vicar of Kirkby Stephen, read an address of welcome from the Cumberland and Westmorland Archæological Society, in which it was stated that the former visit of the Institute was one of the chief causes of the formation of the local society.

After a few words of welcome from the High Sheriff of the County (Mr. George Routledge),

The President of the meeting (the Right Rev. the Bishop of Carlisle) delivered an interesting opening address, in the course of which, dealing with local antiquities, he said,— "It is impossible to pass from village to village in Cumberland without having the condition of things during the days of border warfare brought home very clearly to the imagination. It is not so much the existence of houses of defence like Roso Castle and Naworth, and the fact that almost every house of any magnitude contains its ancient tower, or peel, though now frequently disguised by modern improvements,—not this so much as the fortress churches, which bring back vividly the pugnacious and unsettled condition of the country a few centuries ago. Such churches as those of Great Salkeld, of Dearham, of Newton Arlosh, of Burgh-by-Sands, tell a strange archæological tale. Perhaps in some respects the church of Burgh-by-Sands is the most interesting of those which I have mentioned. It may add that the tale which this curious church tells is rendered more, rather than less, clear by a recent careful restoration. There you have the tower with its impregnable walls, the iron gate between it and the nave, the north aisle with its windows high above the ground, and with a western entrance commanded by an aperture in the impregnable tower, through which a small gun within the tower would pour forth its contents, if necessary, upon an attacking party with great comfort and sense of security to those who manned it. Altogether these fortified churches tell a strange and interesting tale. One of the grounds upon which Henry VIII. was petitioned to spare the Abbey church of Holme Cultram was that it was the only place of defence of the inhabitants against the marauding Scots. But the interest which is connected with monuments of border warfare and records of early English and Medieval history appears to me almost to vanish by comparison with that which attaches to the relics of the Roman occupation."

Referring to archæology in its bearings on architecture, his lordship said,— "Architecture without archæology is manifestly mere confusion. There is plenty of knowledge, of course, which still remains the property of the architectural expert; but the larger number of educated persons, on going into a building like our cathedral, feel themselves at home with the different styles of arches and windows that it contains; they will not grossly confound one date with another, they will see at a glance the rough history of the building, and so far forth they will prove the existence in their minds of archæological knowledge. May I give an amusing instance to show that in this respect improvement has been made in recent years? In the course of your visit to Carlisle, you will

doubtless see the Fraternity. The recent restoration has brought into prominence the pulpit, in which in olden days the reader stood for the edification of the brethren at their meals. It would be difficult now to mistake the purpose of the pulpit; but till lately it was popularly known as "the Confessional," and in order to carry out this view, the artist who has drawn the pulpit for "Billings's Illustrations of Carlisle Cathedral," has represented a woman kneeling on the floor below! . . . I will conclude my archaeological remarks with one or two reflections extracted from a stone. The stone shall be one in the walls of the Church of Burgh-by-Sands, to which I have already incidentally referred. It is a stone which has apparently been in its present place for many centuries, and must have looked much as it does now when King Edward I. was here, and when he died hard by. Plenty of rough work in the way of horder warfare that stone has seen. But there are certain marks upon it which open up another chapter in its history; experts will tell you that it is a Roman stone, and a very little experience will enable any ordinary eye to detect this fact. The stone then has been taken, like many others which you may single out here and there, from the old Roman station, the existence of which the name of Burgh attests; and so we see that when our stone looked upon Edward I., or when Edward I. looked upon it, it was already an antiquity of respectable standing; it had then been quarried, say, 1,000 years, and had witnessed many and strange vicissitudes of men and things. But if we trace the stone further still, and consider how it came to be in the quarry from which it was taken by the hands of the Roman soldier or quarryman, we shall find perhaps that it was formed from pre-existent materials belonging to a condition of the world not one thousand, but a thousand thousand years previous; and so we have archaeology beyond archaeology, and archaeology beyond that: our stone tells us not merely of Medieval Britain, nor even of Roman residence in Britain, but it bears in its structure evidence of formations and transformations going on under the influence of the powers of nature in the dim distance of the mysterious past. All things are comparative, and the portion of history with which archaeologists are concerned is an almost inappreciable moment in the life of this stone. Under the influence of such a contemplation archaeologists may well feel that after all they belong to the present more than to the past.

The proceedings of the inaugural meeting concluded, a large number of the members took part in a perambulation of the city. When the party had assembled, the Mayor ascended the steps of the Market Cross (which dates from 1682) and pointed out the townhall and picturesque guildhall, which looks over the green market, formerly used as a bull ring. He explained that the guildhall is an Edwardian building, held of the corporation by cullery tenure, and that each of the ancient guilds have a room in it. These guilds are formed by the merchants, hutchers, shoemakers, tanners, skinner, and gloves, smiths, weavers, and tailors. Leaving the market-place, the members wended their way to Carlisle Castle. A hall was first made on the edge of the moat, now dry, which runs across the south front of the building, and the Mayor, who as the leader of the party was received by Colonel Watson and other officers of the garrison, proceeded to explain the situation of the ancient fortress, which occupies a strong position on a bluff or headland of red sandstone, rising to a height of some 60 ft. above the level of the river Eden, and must have been a place of considerable importance in the time of the Romans. He pointed out how the castle had been connected with the walls of the city, and showed where at one time, outside the castle walls, a noble row of ash-trees had been planted, forming an avenue leading to what was once the Castle Orchards, from near the entrance of a part which had acquired some fame as Queen Mary's Tower, but which, he observed, an economical Government went to the trouble of sweeping away, and did not even go to the expense of making a plan. They had also cut down the ash-trees, which were some of the finest in the country.

Mr. G. T. Clark, F.S.A., then offered some observations on the gatehouse called William de Irelly's Tower, forming the main entrance of the castle. Mr. Clark, in some preliminary

remarks, said it was no new thing for the Institute to be cordially welcomed by the corporation of a city, but it had never been their habit before to meet a mayor who was so strong an archaeologist, and who was as well acquainted by his studies with ancient Carlisle as his official duties made him acquainted with the Carlisle of the present day. Among these studies he had paid particular attention to the castle. He hoped they would make the most of the gleam of sunshine now appearing, which proved it was not a mere fiction of the Border ballads, but really in Nature that,—

"The sun shines fair on Carlisle wall."

Mr. Clark went on to say that the gatehouse was very peculiar and worthy of notice from the fact that the barbican had been added to the side. The gateway had apparently been so constructed that a little doorway at one side could be opened and a sortie made upon any besiegers attempting to mine the walls. The gatehouse was originally approached by a drawbridge across the moat, but at the end of the last century this bridge was removed and replaced by the bridge of stone on which the members of the Institute were now standing. He pointed out over the entrance of the gateway an obliterated coat of arms, possibly that of Richard III. From the general mixing of the styles of architecture, it was probable, he said, that Carlisle Castle had been built at least twice,—by Rufus and by Henry I., but it was difficult to point out which was the work of William or Henry. The stone was also of a very friable nature, and did not afford many indications useful in fixing a date.

The members then passed under the ancient gateway, into what is now the drill-ground, and covered with a layer of gravel, but which the Mayor explained would be a picturesque green in the older times. Passing into the inner ward of the castle, the members clustered in the open space in front of the massive Norman keep, which Mr. Clark asserted must date from the time of Rufus or Henry I., although it had undergone many changes externally as well as internally. A thorough inspection of the time-worn building was made,—from the deep and dark dungeons at the basement, to which the flaming candles stuck in the niches of the walls gave a grim and fearful aspect, to the gun platform at the top of the tower.

Having inspected the West Walls and other ancient fragments, the visitors dispersed, to reassemble in the evening at a *conversazione* given by the Mayor in the County Hall. In the Lower Hall, Dr. Freeman, as President of the Historical Section, read an interesting paper on "The Place of Carlisle in English History."

On the second day (Wednesday, the 2nd inst.) there was an excursion in the Penrith district, the first place visited being Kirkoswald Church, situate a little over half a mile from Lazby Station. The church has recently been restored under the supervision of Mr. Cory, of Carlisle. The Mayor, in the absence of Mr. Cory, who was unfortunately very ill, read some notes relating to the fabric.

After an inspection of the church, the excursionists were summoned by sound of bugle to proceed on foot to Kirkoswald Castle adjoining. Though now a heap of ruins, the castle of Kirkoswald was once a place of considerable importance, and, in the time of the Dacres, one of the finest baronial residences in the north. Dr. Taylor, of Penrith, said the castle had been originally founded about the year 1201 by Randolph Emrayne, and, after many changes, had finally passed into the possession of the powerful Dacre family, after whose rapid decadence the castle fell from its high estate, and the work of despoilment and spoliation began. The site presented no natural advantages as a defensive position, but the castle had been surrounded with a remarkably fine moat, which was probably constructed by the Dacres about the year 1500. Mr. Clark subsequently gave some observations on the castle, pointing out that it had been a splendid type of border stronghold, and built not only for the defence of the district but also of the property appertaining to it. At one time the castle possessed a magnificent hall, which, if we relied on history and tradition, could not have been exceeded in baronial magnificence and in the splendour of its internal decorations by any existing in the north in the sixteenth century. The main feature of the ruins now remaining is a tall slender tower, tolerably entire.

The visitors were next driven through the villages of Gambleshy and Little Salkeld, to the

famous "Long Meg and her daughters." This is a fine specimen, taking rank as the fourth in England, of the great stone circles. The number of stones that remain, including Long Meg herself, is sixty-seven, of which twenty-seven are upright. Long Meg herself is about 12 ft. high; on her are what is known as "cup and ring markings," which, however, are but faintly delineated. The party having gathered round Long Meg, Mr. J. Evans said he had been asked to give an opinion on this curious collection of stones. So far as he could say it appeared to be one of those very interesting stone circles found in different parts of England and in other countries. Of course, it was certain their presence was dependent, to a certain extent, upon there being large stones in the district. In this way we had the great temple of Stonehenge, built, in the main, of great blocks of stone found on the spot. Certainly, at Stonehenge, a number of stones had been brought from a distance, but the bulk had been found *in situ*. There had been many disputes about the use of these circles, and the subject had given rise to a vast amount of discussion. They had been regarded as burial-places, as temples, and as places for holding moots, but he would not detain them by giving any opinion on the subject. The Mayor said that within a short distance of where the party stood,—some three or four fields off,—a smaller circle of about eleven stones had been found, and in the centre of these there had been discovered a cinerary urn full of burnt bones. On these stones there were markings precisely similar to those on Long Meg, and much more plain. The Mayor added that there was a curious superstition concerning the stones. A legend was current that a farmer in the neighbourhood at one time commenced to blast the stones, but that night the most terrible storm prevailed that had ever been known in Cumberland. The farmers since then had been very jealous of the stones, so that if even any of the party were seen clipping them they had better look out. [Mr. Clark: That warning ought to be printed in the Transactions.] Professor Stevens said that such markings as those on the stones were found not only in Britain, but in many other countries, especially in Scandinavia, and he could only refer them to a very learned work on the subject by the late Sir J. Simpson. He would add that the discoveries which had been made of late in various countries had led to a conclusion, against which so far as he knew, there was no objection, and which appeared to be entirely trustworthy, namely, that these markings were wholly symbols,—religious symbols pointing back to the worship of a God or the Sun. These markings go back to the earliest ages,—they went back to what we commonly call the Stone Age, the oldest age to which we can go, and extended through the Stone Age, through the Bronze Age, and through the Iron Age. Whatever these tokens might signify, they were exceedingly old, and went back to the cradle of the settlement in all the Aryan lands. Dr. Bruco said that these markings frequently existed in burial-places in Northumberland, and were usually found in the presence of a native British camp. He was of opinion that the markings were of the same signification as the fir cone ornaments were with the Etruscans and the Romans, and he could not help thinking their design was the principle of vitality,—they pointed to the belief in a resurrection and a rising again. People travelling in India saw them to-day.

The party once more entered the vehicles, this time to be driven to Brougham Castle, where, upon assembling in the outer ward of the castle, they were addressed by Mr. G. T. Clark, who pointed out that the very curious pile stands on the right bank of the Emont, just at the point where it is joined by the Lowther, so that the combined streams cover the fortress on the north, as do the two waters and the marshy ground between them on the west front. The castle, he said, derived great interest from the fact that it was close to the large rectangular camp which marks the site of the Roman "Brovacum." One of the most curious parts about the castle, he observed, was the gateway, which was composed of two parts,—one shutting on the north-east, and the other on the north-west angle of the keep, each with its own defences and gates, the buildings on the north communicating with both. Above the gate is the inscription, "This made Roger." Mr. Clark, however, principally directed the attention of the visitors to the keep, which, he said,

in its present state, was of unusual height, but the uppermost floor had apparently been added at a more recent period than the base. The walls were 11 ft. thick at the base, and at least 10 ft. at the rampart level. In the angles near the top he pointed out several erueiform loops much resembling those at Kenilworth, and a mural oratory. On entering the keep the attention of the visitors was directed to the traces of an arcade with slender piers and trefoiled arches, of an unusual character to be found in a Norman keep. Altogether, he said, the keep was very curious, and would well repay a careful examination.

The visitors, after partaking of luncheon at Emont Bridge, proceeded to Mayhugh, a circle of stone mounds covered with herbage, with a monolith or stone 12 ft. high in the centre, which Scott thought a monument of Druidical times. It is a short distance from the "Round Table," on the way to Yanwath, and on the right side of the road. On reaching the monolith, Canon Simpson addressed the party, and said that originally there were three stones where the one they were standing beside stood, and those were beside two others at the entrance to the circle, one on each side. The person who occupied the place about 100 years ago came to the conclusion to destroy the stones, and he employed two men upon the work of destruction. One of these men hanged himself, and the other was put in a lunatic asylum. That was what they got for attempting to destroy these ancient monuments. He hoped that by the Ancient Monuments Bill punishment would be meted out in some shape or form to anybody else destroying ancient monuments.

On the third day (Thursday, August 3) the members paid a visit to the Cathedral, where Dr. Freeman delivered an address, some portions of which we give under another heading.

On subsequent days there were excursions to Dalston Hall and Rose Castle, to the Roman Camp at Birdswood, to Lamercost Priory, to Hexham, to Abbotsford, and to a number of other places.

Mr. John Evans, as President of the Antiquarian Section, delivered a valuable address on the antiquities of the district; and among the papers read in the same section were one on "Crosset Stones," by the Rev. Thomas Lees; one on "Lamp Niches," by Sir Henry Dryden; and one on "Doorway Legends and Inscriptions over Doorways of Old Houses in Cumberland," by Dr. M. W. Taylor. In the Historical Section the Rev. Canon Venables read an interesting paper on "The Vedications of Churches."

In connexion with the Congress an interesting museum of antiquities was opened in the County Hall. It was arranged under the superintendence of the Mayor of Carlisle and the Rev. T. Lees, assisted by Mr. Ready and Mr. W. T. Ready, of the British Museum.

#### CARLISLE CATHEDRAL.

On Thursday, the 3rd inst., the members of the Royal Archeological Institute visited Carlisle Cathedral, where Dr. E. A. Freeman observed that if a learned man had been suddenly dropped from the clouds into this Cathedral garth, and began to think how much he could find out for himself without any man or book to guide him, he would very readily find, if he lifted up his eyes to the windows of the upper part of the Cathedral tower, that he was in England. He would see perpendicular windows which could not be found anywhere but in England. He would know at once that he was under the shadow of a great church, and it would not take him long to find out what was the character of the church. It would not take him long to find out it was a regular church. He would see there were the buildings on the right, parallel to the nave, and he would at once feel they were the refectory, and he would be helped to that conclusion if he had been dropped down at Furness and Calder Abbeys before he came to Carlisle. He would see it was not a Cistercian church by the arrangement of the buildings, because in the Cistercian churches the refectory was not parallel to the nave. Then he would doubt, probably, whether it were a Benedictine church. As a matter of fact, it was not Benedictine: it was a church of the Austin canons. He would not be able to say positively to what order it belonged; but he would be able to say it was a great English church of some order of monks and not of

the Cistercian order. A further question might be whether it was merely a collegiate or conventual church or the church of a bishop. He did not think there was anything to tell him it was a see,—any episcopal palace. Some local antiquary should be able to tell them whether there was ever an episcopal palace in Carlisle, and there commonly was in episcopal cities, and if not how thro' never came to be one,—whether it was connected with the long vacancy of the see after the first bishop, or whether after bishops had got feudalised and turned into barons they did not care to have a house in the city. As to the time of the building of this church he would say, "Here we have a Norman minster, not say, of the smallest size or the greatest, but a moderate-sized Norman church, of which we still have fragments of the nave." He would like to have information to know under what circumstances the nave came to be shortened, but our inquirer could not doubt that there was a much longer nave once than is to be seen now; and if he were told that it was a church of Austin canons he might begin to guess even from the outside a little further. He might, perhaps, guess that the nave had been the parish church, that being the common custom among the Austin canons. That was a point which distinguished this church from other standing cathedral churches in England proper, with a few exceptions. The nave was the property of the parish, and was used as the parish church. The inquirer would see himself that here had been a church in the twelfth century, a comparatively small church, and that a vast and magnificent choir of the thirteenth or fourteenth century had displaced the original eastern limb in a very remarkable way. And he would also see that somebody had in later times gone and destroyed the history of the place by sticking in that grand doorway where no grand doorway was or never ought to be, that the history of the past had been wiped out in order to bring in the pretty things of the present. Here was the refectory, there was the walk in the cloister, and there was the dormitory. There was a little door in the transept originally, but no grand door was there, because there was no grand entrance. Why had the church not been left to tell its own story, to tell every man that the dormitory had come up against the church, and leave the signs that there were of it instead of giving us that new masonry? No doubt the new doorway was a fine thing of its kind, but why not leave them those fragments of history which they came from place to place to make out? It was disappointing when they came to a place to find that some ingenious man had done his best to wipe out the history of it, and that there had been a perfectly wanton sacrifice of the building to make the thing pretty. A doorway was wanted, no doubt, but why not stick it somewhere else and not destroy the historical fragment? From the cathedral garth the party moved into the cathedral, where Mr. Freeman first of all remarked that the nave had not been very early nor, on the other hand, very late Norman work. If it was the work of Bishop Athelwulf, who was Bishop of Carlisle for a long time, he should be well pleased, as he was a sort of friend of his. Turning to the choir, he pointed out the manner in which it had been widened and otherwise enlarged, and remarked that no doubt when the grand choir was built it was intended some time to pull down the nave and rebuild it, or it might be that the nave being the parish church was not thought about, and the choir was enlarged without regard to the nave at all. Moving into the choir, Mr. Freeman took his stand near the pulpit and pointed out the beauties of that part of the building. The east window, he said, was the grandest window of the kind in England, and he supposed the world. There was a very big window in a church at Perugia, in Italy, that somewhat reminded him of it, but here they had the finest piece of tracery to be seen anywhere. The next to it was that in the Abbey Church at Selby, in Yorkshire, but that had only seven, whereas this had nine bays, and if his memory did not fail him, the bays at Selby were wider. He pointed out the peculiarities in the construction of the roof, no attempt having been made to vault it. He next drew attention to the series of lancet windows in the aisles, remarking that they were rather more perfect than they ought to be. One or two windows had been put in. It was a very curious thing that if there was a piece of history in a building marking its age

there came a wise modern architect, a man of taste, with his head full of his own ideas, who felt himself as much above history as the King of Rome did above grammar. This modern architect came and said, "I am the only person who am upon a level with the original architect. I am the only person who knows what he would have done." So the work must be swept away. The wise man of taste must wipe out every thing and bring it back to what he supposed it would have been in his pet century. This wiping out of history, this destruction of the history of an ancient building was called by the strangely sarcastic name of "restoration." "Restoration" commonly meant wiping out of history and building up according to the fancy of some architect to whose tender mercies the building may have been handed over. Soit was here. These windows were not the original thirteenth century windows,—they were windows of the nineteenth century, something else had been stuck in and so wiped out history. He expressed some doubts as to the propriety of fencing off the choir from the nave, remarking that he was tossed to and fro on the subject, between the past and the present. In such a case the past was the least harmless, but the case of Carlisle was different, as so little of the nave remained it was necessary to use the choir as the church till somebody should rebuild the nave. If anybody did that he hoped they would build it in nineteenth-century architecture, and not thirteenth.

Mr. Micklethwaite expressed his belief that the Cathedral dated back as far as the time of Cuthbert, and that the parish church was the most ancient part of it. With regard to the alteration of the doorway upon which Mr. Freeman had inadvertently, he defended the course that had been taken, remarking that it was quite proper the building should be altered to suit the convenience of the time, but he thought Mr. Freeman had spoken excellently well about the windows.

#### CONGRESS OF ITALIAN ARCHITECTS AND ENGINEERS.

The fourth annual congress of the Architects and Engineers of Italy will be held in December next at Rome. It has been arranged that the opening of the Palace for Fine Art Exhibitions shall take place during the time of the Congress, whose members are to take an official part in that ceremony as well as in that of the First International Exhibition of Art in the Italian capital. The exact dates of these events are not yet announced. It is open to foreign as well as Italian architects and engineers to attend the Congress, provided they notify their intention to the Committee by the 15th of September. The Committee is also ready to receive suggestions as to the questions to be discussed at the Congress up to the 15th of August. The decision of the Committee on these and other points will be made known along with the publication of the definitive programme of the proceedings on the 30th of October. It is already arranged that the period for which the Congress is to sit shall be seven days. There will be a series of excursions to celebrated spots, in order to enable the visitors to inspect various buildings of ancient and modern date in the city and its suburbs.

#### MUNICIPAL IMPROVEMENTS IN VIENNA.

In no previous period of history have such extensive municipal improvements been carried out in Vienna as within the twenty years from 1861 to 1880, both inclusive. The total amount of expenditure for that period was 7,891,994*l.*, or nearly eight millions sterling, giving an average annual outlay of nearly 400,000*l.* The objects on which these large sums have been expended are as follows:—The city waterworks system, 2,397,137*l.*; school buildings, 741,640*l.*; the new town-hall, 739,705*l.*; street pavements, 649,366*l.*; purchase of land to widen streets, 621,697*l.*; main drainage system, 441,024*l.*; contribution towards Danube regulation, 385,193*l.*; enlargements of city boundary, 293,109*l.*; municipal offices, 273,919*l.*; bridges, 237,242*l.*; central cattle market, 179,528*l.*; central cemetery, 163,450*l.*; churches and parsonage-houses, 154,618*l.*; market halls, 137,335*l.*; city baths, 128,493*l.*; park gardens, 87,744*l.*; city works, 72,930*l.*; city storehouse, 67,428*l.*; other public buildings, 67,317*l.*; and Danube embankment, 48,082*l.*

Whitman & Bass Photo-Litho

STAINED GLASS DOOR PANEL.—DESIGNED BY MR. G. C. HAITE.

Wynne & Sons, Printers.

**ENTRANCE LODGE, STOCKTON HOUSE, WILTS.**

The Entrance Lodge of which we give a view is now being carried out by Messrs. Soper & Son, of Salisbury, under the direction of the architect, Mr. B. Edmund Ferrey. It has been designed in character with the house, one of the most interesting Elizabethan mansions in Wiltshire, where extensive restorations, alterations, and additions have been progressing during the last five years, for Major Yeatman-Biggs, R.A., under the superintendance of the late Mr. Ferrey and Mr. B. E. Ferrey. The lodge is built of Chilmark stone, and the roofs will be covered with Broseley tiles. All the windows will be fitted with Bart & Potts's wrought-iron casements.

**THE CERTOSA AT PAVIA.**

The Certosa at Pavia has been described as "the most magnificent monastery in the world." Whether this is an exaggeration or not, there can be no doubt that it is one of the noblest monuments in Italy, and it is with great regret that we have heard reports to the effect that it is not receiving that care and attention which so superb and interesting a building merits. We trust that we have been misinformed, and shall be only too delighted to be in a position to contradict the rumours which have come to us, from several different sources, of "fallen arches," "water pouring through roofs," "accumulations of rubbish and dirt," &c., which seem like the first warnings of a building falling into ruin. To the ordinary run of people a few drops of rain finding their way through the roof of some cloister, or a few heaps of rubbish accumulating in corners of a dilapidated building, may mean little, but to an architect they speak volumes. The general public may regard the giving way of an arch or two in a vast building a matter of little account; but those who understand such things can tell lamentable histories of public monuments where such things are neglected. "A stitch in time saves nine" is more true of buildings than even of garments. If "little defects" of this kind had been attended to, if roofs had been mended when they began to leak, and arches tied up or mended when they showed signs of falling, the enormous sums of money spent upon the restoration of Mediaeval buildings, which has been such a marked feature of our time, would have been entirely unnecessary and those munificent donations of hundreds of thousands of pounds towards the restoration of our cathedrals might have furnished our dismal manufacturing towns with noble ministers in place of the meagre 5,000 churches which rear their thin walls and spiky gables in the midst of vast factories and huge warehouses. The Mediaeval buildings of Italy are, as a rule, in an excellent state of preservation, and it would indeed be a sad misfortune if they were not to be preserved in such a condition. We hear that a society is being formed in Italy for the purpose of looking after ancient monuments. We trust that the members will place before themselves the absolute necessity of arresting the first symptoms of decay in those vast buildings, many of which, like the Certosa, have ceased to be of practical use at the present time.

The Certosa at Pavia was founded in 1396, and the greater portion of the church was erected immediately afterwards. It is very remarkable because it shows, in work of the same date, the traces of both the Romanesque and Renaissance styles, although the general design is Gothic. The facade is later than the other portions of the church, and was commenced in 1473, and carried out from the designs of Borgognone. Probably, however, the upper portion of the front is of a slightly later date, and it seems as if the design had been simplified, either through funds being insufficient to carry out the work in the extremely elaborate manner in which it was commenced, or in deference to the views of the architect appointed to continue and complete it. Be this as it may, there can be no doubt that, delicate and elaborate as the lower portion of this front is, it is rather the architecture of the painter or sculptor than that of the architect. One hardly likes to criticise such a beautiful work, but from a strictly aesthetic point of view the sculpture of this front seems to be too like painting, and the architecture too like sculpture,—in fact, one

might almost suppose that a painter had modelled the sculpture and a sculptor had designed the architecture. The upper portion of the front, though far less beautiful in detail, is more satisfactory from an architectural point of view, and is superior in general composition. The whole of this splendid facade is constructed of marble. There is a kind of tradition that Peter Arler, of Gmünd, was for some time architect to the Certosa, but there is nothing about the building that bears a resemblance to his known works, the church at Kolm, or the choir of the Cathedral at Prague. Another tradition ascribes the merit of the design to Henry Arler, the architect of Holy Cross Church, Gmünd, and reputed architect of Milan Cathedral; but there is nothing to carry out this suggestion.

**DESIGN FOR GLASS PANEL.**

This design is given as an example of domestic stained glass, suitable for the panel of an entrance or hall door. A door divided into two panels, size as shown, with a change of subject in the pot, would come very effectively.

**THE NEW GAILETY THEATRE AT HASTINGS.**

The New Gailety Theatre at Hastings has been opened. In connexion with it are a restaurant, shops, offices, and other buildings, the whole of which have been erected for Mr. George Gaze, the sole proprietor, from the designs of Messrs. Cross & Wells, of Hastings and Chancery-lane, Mr. C. J. Phipps, of London, being consulting architect with regard to the theatre portion of the buildings.

The buildings have a frontage of 71 ft. to Queen's road, and 118 ft. to Albert-road.

The restaurant occupies the corner of the block, and contains a good bar on the ground-floor, grill-room on the first-floor, smoking-room, and residential rooms over, with kitchen and offices at the top of the building.

On the south side of the main entrance in Queen's-road are two shops and the entrance to Queen's-avenue, a new arcade recently built in rear of the theatre. In Albert-road are three shops.

Over the first-named shops and entrance to the arcade are three suites of large offices, with lavatory, &c., on each floor, and attendants' rooms on the upper floor.

The entrances to the stalls, dress-circle, and upper circle of the theatre are from a spacious vestibule in the centre of the building in Queen's-road; those to the pit stalls, pit, amphitheatre, and gallery from Albert-road. The staircases are wide, and fireproof, and all parts of the house communicate by passage-ways to every staircase. In addition to the ordinary staircases to the gallery, there is a second relief staircase, 5 ft. wide, from the gallery and upper circle. It is stated that the house, when full, can be emptied in three minutes. The house will seat comfortably 1,200 people. There are three rows of orchestra stalls (for about 50), a good pit, and four rows of pit stalls; a dress circle to seat 165; an upper circle for about the same number, and a good gallery. There are spacious refreshment-rooms and retiring-rooms to all parts of the house.

The width of the proscenium is 25 ft., and the depth of the stage is 30 ft. Ample accommodation is provided in the way of dressing-rooms, &c., over the side shops.

The materials used are Fareham brick facings and Portland cement dressings, which are found to stand the sea air better than Bath stone, the foliated work being carved in position, and not cast in the ordinary way.

The whole of the building has been executed by Mr. W. J. Rodda, builder, of St. Leonard's-on-Sea, his superintendent of the works being Mr. L. Dillon (formerly clerk of works to the recently-built new baths). The ornamental fibrous plaster work in ceiling, proscenium, box fronts, &c., is by Messrs. G. Jackson & Sons, Rathbone-place, London. The sm-burner and gas-fittings are by Messrs. Vaughan & Brown, of Kirby-street, Hatton-garden. The decorations (extremely well done) are the work of Mr. Edward Bell, of Lissou-grove. The fire appliances are by Merryweather & Sons. The act-drop has been painted by Messrs. Grieve, of Macklin-street, Drury-lane. The stage machinery is by Mr. J. George, and the upholstery by Mr. Whiteley, of Westbourne-grove.

The theatre was successfully opened on the 1st of August, Mr. Henry Turner, of Drury-lane, being manager for the proprietor.

**THE UNIVERSITY OF EDINBURGH AND MR. JAMES FERGUSSON.**

On the 1st inst. the degree of LL.D. was conferred by the University of Edinburgh on Mr. James Fergusson, F.R.S., who is so widely and honourably known by his writings on architecture.

Professor Kirkpatrick, Dean of the Faculty, in presenting Mr. Fergusson to the Chancellor (Lord Glencorse), said,—I have the honour to present to you, my Lord Chancellor, for the degree of Doctor of Laws, Mr. James Fergusson, Doctor of Civil Law, and Fellow of the Royal Society, the distinguished historian of architecture, whom the Senatus Academicus of the University of Edinburgh have deemed eminently worthy of this distinction. Born at Ayr, and partly educated in the High School of Edinburgh, and partly in England, Mr. Fergusson afterwards went to India, and was there engaged in mercantile pursuits. But after a few years he abandoned these for the more congenial study of art and architecture. Not only among architects, civil and military, but among all lovers of culture where the English language is spoken,—Mr. Fergusson's name is a household word. In the year 1845, and several previous years, he travelled very extensively in India and in many other countries for the purpose of studying various styles of architecture. The results of those studies and unwearied researches have been very numerous and very valuable. (Having enumerated Mr. Fergusson's works, Professor Kirkpatrick continued:—) Mr. Fergusson is one of the foremost authorities of the age on the very interesting and important subject of military architecture or military engineering. So far back as 1849, Mr. Fergusson published a most valuable essay upon the then entirely new system, upon the subject of fortifications or defences by means of earthworks, a system which was afterwards adopted by the Russians at Sebastopol, by the Americans during their civil war, and subsequently, I think I may say, by all the great military nations of the world. In connexion with his great distinction in this province, Mr. Fergusson has, since 1859, acted as one of the Commissioners appointed by her Majesty the Queen to superintend our national coast defences. Lastly, but perhaps not leastly, must be mentioned Mr. Fergusson's distinguished labours as a natural philosopher. Within the last few years, Mr. Fergusson has published a most valuable work upon the descent and oscillations of rivers, of which I need only say that it is a standard work upon this subject. Among many other distinctions, I must mention the gold medal with which Mr. Fergusson was presented in 1871 at a great meeting of the Institute of British Architects, presented to him with the approval of her Majesty the Queen, as being the foremost living British authority upon the subject of architecture. On these grounds, I ask your lordship to confer upon Mr. Fergusson the degree of Doctor of Laws, of which he is pre-eminently worthy.

**ARCHITECTURE ABROAD AND IN THE UNITED STATES.**

**ROYAL INSTITUTE OF BRITISH ARCHITECTS.**

MR. ARTHUR J. GALE, architect, of Surrey-street, Strand, the first recipient of the Godwin Bursary, and who selected America as the scene of his inquiries, has reported to the officers of the Institute his return, after an absence of three months. Mr. Gale speaks warmly of the courtesy he experienced at the hands of several American architects.

**Memorial to an Officer of the 19th Regiment.**—A painted window, of a somewhat curious character, has just been erected in the church of Preston, near Brighton, representing the colours of the 19th regiment, with the engagements, military trophies, and the regimental badge, surmounted by the Crown. The window, which is supplied by Mr. Taylor, of Berners-street, is placed in memory of Captain George V. Macdonald by his brother officers.

## WORKMEN'S DWELLINGS IN GERMANY.

The subject of these remarks is not one upon which it is to be taken for granted that England has nothing to learn from other nations. The problem of cheap and efficient labour has been solved by Germany in a manner which has enabled the manufacturers of that country to secure and retain a hold upon even our own markets for many articles in which economy of production is of primary importance. Hence it may not be amiss to examine what is now doing amongst German philanthropists in the direction indicated.

The physical gain derived from commodious dwellings finds its parallel in many natural phenomena, and requires no detailed proof. Mental advantages of a not less important character are connected with the practical application of this principle. As Dr. Tomei remarks (in a paper prepared for a recent Industrial Congress in Germany) a clean and comfortable dwelling encourages its occupants to ornament it as far as they can, and is a magnet which attracts the bread-winner from dissipation. If his dwelling is a place where he is comfortable, he will soon give up the tavern, and will economise his personal expenses so as to furnish his rooms with such adornment as become his station.

This important subject has recently attracted special attention in Germany, in connexion with the competition instituted by the "Concordia" Society for the best design for a workman's house. As this question is most readily solved from a strictly practical point of view, the facts cited by Dr. Tomei are a valuable guide, and though a certain allowance must be made for the divergence of national habits, still much may be learned from the results he brings forward.

The Portland cement factory at Lebbin has in connexion with it a colony, as it is called, which has grown from a small beginning, which consisted in the erection of several workmen's houses. Those who had been longest working at the factory had certain preferential advantages, but, in all cases, the possession of such saved capital as was necessary was insisted upon before permission to build was granted. The dwellings built by the factory proprietors are mostly detached buildings, containing from five to seven separate sets of apartments. These buildings have grounds round them neatly laid out, which, in conjunction with the curtained windows of the houses, produce on the whole a neat and pleasing effect. The materials used are bricks, both burnt and air-dried.

The houses with five dwellings are thus divided:

*Lower Floor.*—Two dwellings, each containing two rooms, 14 ft. 8 in. by 14 ft. 8 in., and 12 ft. 4 in. by 14 ft. 8 in.; one room, 8 ft. 5 in. by 14 ft. 8 in.; and a kitchen, 10 ft. by 12 ft.

*Upper Floor.*—Two large dwellings, and one of smaller size. Each of these dwellings consists of a kitchen, a living room, and a bedroom.

In the houses containing seven dwellings, the lower floor contains four dwellings, and the upper floor three, as previously described. The dwellings on the lower floors have in most cases separate entrances, while the upper floors are reached by a common staircase. There is a small stable attached to each house, and the separate occupants of the apartments have each space in it for pigs as well as storage for wood, &c. The arrangement of houses thus described is capable of being applied alike to private and public requirements. Thus, in the lower stories of various houses are the post-office, the infants' school, the infirmary, &c. In addition to these separate houses there are some blocks of seven houses, each of which is capable of accommodating four families. A building runs parallel to these houses devoted to purposes similar to those for which the stables in the detached houses are intended. There is an orphanage attached to the colony, and a general co-operative store supplies the principal necessities of life to the inhabitants. The work-people are allotted dwellings in these houses for a monthly rent equal to 4s. or 4s. 6d. A field for planting potatoes is also at their disposal, and laundries with mangles form a part of the general plan.

The personal comforts of the unmarried workmen and of those whose families live at a distance are provided for in the colony. A large lodging-house has been established, with from four to six beds in each room, and the men are

charged only what is sufficient to cover the washing of sheets, &c. The house steward provides coffee and milk at about 1d. a glass every morning. Dinner, of a good nourishing character, is served for about 1d. Of course, the factory is obliged to supplement the receipts in order to prevent loss, but this low scale of charges is instituted in order that the workmen who live at a distance may be able to devote the greater part of their earnings to the support of their families, and not be under extra expense from having to reside at a distance from their work.

The usual benefit societies exist, and are supported, to a certain extent, by the profits of the co-operative stores. The amusement of the workpeople is duly provided for by means of a bowling-green and by vocal and orchestral societies.

Where economy is a primary necessity, it is impossible (according to Dr. Tomei's arguments) to give any serious consideration to the plan of having separate houses for each family. Where, however, there is a possibility of workmen being able to build their own dwellings, he admits that the question of having joint habitations is open to discussion. He remarks, with justice, that it is inadvisable to give more rooms for each separate household than are necessary for health, as the trouble of keeping too large a set of rooms in order often leads to untidiness and neglect on the part of the occupants.

The guiding principles of Dr. Tomei's views are evidently in harmony with the almost patriarchal system which is frequently to be met with in Germany. Kindness being a more powerful inducement than severity to continued and intelligent exertion on the part of the employed, he argues that the trouble and expense to which employers of labour go to secure the happiness of their workpeople are not lost, but are repaid by the quantity and character of the work produced.

PROPOSED PUBLIC BUILDING WORKS  
IN DUBLIN FOR UNEMPLOYED  
LABOUR.

LAST week a deputation from the Labourers' Association here waited upon the Lord Mayor and Municipal Council.

Mr. Murphy, one of their number, said that there was a very large number of unemployed persons in the city, 9,000 people receiving relief through the unions. The only work here now for labouring men was at paving and sewerage, but there was nothing like sufficient work to meet the requirements of the unemployed. He attributed the cause to the agitation in the country, which had led to such widespread distress. The merchants who had hitherto employed labour were now, from that cause, unable to do so. For the last couple of years the merchants of the city had received no money; they were now on the verge of bankruptcy, the exceptions being those who were living on the capital they had accumulated in more prosperous years. It was said that the tenant farmers had saved 20,000,000l. in consequence of the agitation, and he asked, Where had it all gone to? The labourers had received no portion of it. It was the circulation of money that was wanted, and no country could be prosperous while its labourers remained without employment. Wages were lower than ever, and in their hour of need the labourers now applied to the Corporation for aid. If they wished to relieve them they could build labourers' houses for the use of those who could not pay as much as the artisans were obliged to pay. A clause had been proposed for insertion in the Land Act, having for its object the emigration of the surplus population of the country, and that was opposed by the advanced section of the Irish members, who urged that, because the country had once contained 9,000,000 of people, it should now support an equally large population. He thought such opposition was unwise, and he was in favour of the emigration of those who could find no employment, and who could not be otherwise provided for. The position they were in now amounted to this: they were near eating each other in the streets of Dublin.

The Lord Mayor said the Corporation would attend to the practical propositions of the deputation. It should not be forgotten that since he came into the Corporation the latter had spent in public works, in which the labourers,

of course, had a share, 200,000l. They now proposed to spend over 50,000l. in improvements. The Corporation paid 600l. a week in labourers' wages, and they contemplated the formation of new streets. There would be a new street in connexion with the swivel bridge, and another at Cork-hill. The exhibition project, too, contemplated and involved an expenditure of 10,000l. or 12,000l., and on that they were spending 400l. or 500l. a week. The Council would take into consideration the wise suggestion for the erection of dwellings for the labouring classes who were not able to pay as high a rent as the artisans. He would draw particular attention to the fact that 100,000l. had been voted by Parliament for the construction of a new museum in Kildare-street. The plans were in, all the preliminaries were perfected, and there was no excuse for the Government not taking immediate action in this matter and pushing forward these works. The Government could also give employment by building the new sea-wall along the Kingstown line, giving the citizens of Dublin a sea drive, and an approach of which they had been deprived by the railway company. There was thus work for the expenditure of thousands of pounds in giving employment. As for the practical suggestion of the deputation, the Council would take it into consideration.

The deputation having retired, Mr. McEvoy moved, Mr. Verker seconded, and it was resolved,—“That the Artisans' Dwellings Committee be informed that the Council have received a deputation upon the subject (amongst other matters) of dwellings for the labouring classes, and that the Council would be prepared to receive favourably such suggestions as the Committee may make on the subject.”

## NEW ASSOCIATION AT DÜSSELDORF.

The financial result of the Exhibition at Düsseldorf in 1880 was satisfactory, inasmuch as a surplus of 10,000l. was left. This sum has been devoted to the foundation of an association intended to rival the societies which have done so much in South Germany for the advancement of industrial art. The new organisation will devote its attention to the collection of objects illustrative of art as applied to practical uses, and to the establishment of classes in connexion with subjects of a kindred nature. It is also contemplated to have an information office which will answer any questions as to technical subjects which the members of the society may wish to ask. A complete library of technical literature will be established, and finally a journal will be started, which will be the official organ of the society, and will, it is anticipated, be widely circulated amongst manufacturers and others interested in the various objects of the association.

## EPPING FOREST TRAMWAYS.

A MEETING of the shareholders took place on Tuesday, August 1st, at the office of the company, the chairman, Mr. Mark Shephard, presiding. There was a large attendance. Mr. C. B. King, one of the company's engineers stated that, although the rails had only been delivered a few weeks, about 500 yards of line were already completed, and the first section will be opened for traffic in about three weeks' time.

The company intend to apply in the next session of Parliament for power to use steam, and for this purpose the line is very substantially laid.

Mr. Hammock, a director, mentioned that at Batley, in Yorkshire, where both steam and horse power have been in use, it had been proved that a saving of 2½d. per mile had been made by the adoption of the former. The engines were constructed by Merryweather & Sons, who have had experience in this branch of engineering.

Messrs. B. Cooke & Co., of Battersea, are the contractors for the works, and Messrs. Merryweather have the contract for the cars.

Mr. Thomas Armstrong and Mr. H. Bowler (the director and assistant-director for Art of the Science and Art Department) have been instructed to visit the Art Schools of Germany and the Industrial Exhibition at Nuremberg, and to prepare a report on German art-teaching.

### THE LONDON AND SOUTH-WESTERN BANKING COMPANY'S NEW BUILDINGS AT PECKHAM.

The premises occupied by the London and South-Western Banking Company at Peckham, being on the line of improvements now going forward at Gamberwell and Peckham, their removal is necessary for the widening of High-street. The company are at present erecting spacious new bank buildings on a site immediately opposite to Rye-lane, Peckham, and these when completed will be of a very ornamental character.

The buildings will have a frontage to High-street of 50 ft. length, and 40 ft. in height to the cornice. The buildings will have a deep basement, with three stories above the ground-floor, the upper story consisting of arched dormers in the roof. The east end of the frontage, which is carried to a height of about 60 ft., terminates with an ornamental tower. The ground-floor portion of the frontage consists of red Aberdeen polished granite columns and piers, resting on grey granite bases, and supporting a projecting cornice in Portland stone. Between the first and second floor windows there are double columns and pilasters, in Mansfield stone, with Portland stone bases and capitals, surmounted by a dentilled cornice, also in Portland stone. The windows of the several floors have carved architraves and panels, surmounted by ornamental pediments. The west portion of the ground-floor will contain two shops, the entrance to the banking-house and other apartments in connexion with the business of the bank being at the east end of the frontage under the tower. The building is carried to a depth of 100 ft. from the High-street frontage, the business of the bank being intended to be conducted at the rear of the premises. The arched entrance to the bank, in Portland stone, is flanked on each side with Aberdeen polished granite columns. This entrance leads into a corridor, 11 ft. in width, from which the banking-house is reached. The corridor, as well as the banking-house, will be richly decorated and finished. The floors of both will be paved in Rust's mosaics, and along each side of the corridor there will be a range of fluted scagliola columns. The banking-house will be 46 ft. by 32 ft., and carried round the apartment will be twelve scagliola columns, uniform with those along the corridor. The walls will be divided into panels, with an enriched coved cornice; and in the centre an artistically-executed hexagonal lantern-light. The height of this apartment to the ceiling will be 18 ft., and to the apex of the lantern-light 25 ft. The other apartments on the ground-floor will consist of the manager's private room and waiting-rooms. The upper floors will contain the manager's residence, together with the servants' apartments, kitchen, &c.

A chief feature in the basement will be the strong-room, a fireproof apartment, built on a bed of concrete 3 ft. 6 in. in depth, the walls being 1 ft. 9 in. in thickness, of Stourbridge fire-brick, built in Portland cement and hoop-iron bond. The safes, doors, and fittings of the strong-room will be furnished by Milner's Safe Manufacturing Company, of London and Liverpool. The basement also will contain the heating apparatus for the bank.

The architects are Messrs. James & J. S. Edmiston, of Old Broad-street, the contractor being Mr. Shepherd, of Bernondsey. The estimated cost of the building is 12,000l.

### THE FALL OF A CHURCH TOWER.

The terrible accident at the village of Langen Lipsdorf, near Berlin, in which a church tower that was nearly completed fell in a heap, bringing down all the scaffolding, and killing some and severely injuring others of the thirty workmen engaged upon it, has been the subject of legal and professional inquiries, with a view to ascertain the cause of the disaster. The tower was to be of a total height of 112 ft., and at the time of the accident about 70 ft. had been finished. The dimensions were small, the sides being respectively 14 ft. 9 in. by 14 ft. The two lowest stories of the tower were together 24 ft. 6 in. high, and their walls were 3 ft. 1½ in. thick in front, 2 ft. 10 in. at the sides, and nearly 2 ft. 4 in. at the back. The outer facing consisted of erratic granite shaped into blocks of 6½ in. and 8 in. in height and breadth. The internal facing was of brick. The space

between the facings was filled with fragments of brick and stone. The mortar employed was made with Saxon brown or meagre lime. The third and fourth stories of the tower were together 23 ft. high, and the walls, 21 in. in thickness, were built in the same way as those below. The fifth story, 16 ft. 6 in. high, had its walls constructed entirely of brick. The work had already been finished thus far. The tower was now to be capped with a simple spire of wood and slate, surmounted by a cross. Preparations were already going on for the commencement of the woodwork of the spire when the calamity occurred. The entire structure suddenly collapsed. The front wall of the tower fell completely as far down as the springing of the arch over the entrance-door, about 8 ft. from the ground. Of the back wall adjacent to the body of the church about 26 ft. was left standing. The side walls both fell. The parts left standing rose obliquely from the level of the springing of the front arch in a steep and stair-like fashion, to where they joined the back wall. On the top of the heap of ruins lay the diagonal beams of the scaffolding and the brickwork of the fifth story of the tower. Below lay the scaffold planks and granite stones and fragments of the lower stories. This position leads to the inference that it was the walls of the lower stories of the tower that first gave way. This inference is confirmed by the observations of the workmen who happened to witness the collapse. According to the report of the authorities, one cause of the accident was the use of very inferior mortar. The mortar employed was composed of five parts of sand to one part of lime. This material had practically not set or bound the stone and brickwork together. Another chief contributory cause was the fact that the bond of the masonry work was in a very high degree imperfect. Out of 640 granite blocks used in the facing, there were only thirty bonders having a length of about 15 in. There was, therefore, only one bond to every twenty stones. The interior brick-facing too, was, for the most part, only half a brick in thickness, and the bricks were laid so that there was only one bond to two, or often three, stretchers. The filling in between the facings was also very badly done, there being many small fragments of brick and stone, with insufficient mortar, and that of the ridiculously inferior quality above described. Altogether it is obvious that this was a very bad case of scamping, which is likely to cost the contractors very dearly.

### ESSEX ARCHAEOLOGICAL SOCIETY.

The Essex Archaeological Society, which was inaugurated at Colchester in December, 1852, commenced the celebration of its thirtieth anniversary at Colchester on the 1st inst. The members of the St. Paul's Ecclesiastical Society, and other visitors, were invited to share in the business of the meeting.

The members were conducted over the castle by Mr. F. M. Nichols, of Lawford Hall, who pointed out the principal features connected with it. At noon the annual meeting of the society was held in the library of the Castle. Mr. G. Alan Lowndes, of Hatfield Broad Oak, the President, occupied the chair, and Mr. H. W. King, hon. secretary, read the report of the Council for the past year.

On the motion of the Rev. G. C. Berkely, seconded by the Rev. H. Hayes, the report and balance-sheet (which were of a satisfactory nature) were adopted.

Mr. C. Forster Hayward moved that the thanks of the meeting be given to the president, vice-presidents, council, and officers for their services during the past year, and that they be re-elected, with the addition of Capt. Budworth in the place of Dr. Bree. Mr. Hayward said the services of their president were too well known to need comment. Mr. Lowndes was always ready to meet them and to assist them in every way, and the same might be said of the other gentlemen included in the resolution.

Mr. Benton seconded the vote of thanks, and it was carried unanimously.

The President said he was extremely obliged to them for the honour they had conferred upon him by his re-election. It was a great pride and pleasure to him to occupy such a position, although he felt that he filled it very unworthily. The principal work that had fallen upon him had been in editing the history of Hatfield Broad Oak. This had been a labour of great

pleasure, and he was glad to find that those papers written by his father, and edited by himself, had been so much appreciated by the society.

Mr. King also briefly acknowledged the compliment paid him. He said he served as hon. sec. with very great pleasure and cheerfulness, and he hoped he should be able to do so as long as he was spared. He believed that Mr. Chancellor and himself were the only members of the Council who were at the inaugural meeting of the society, so that it would be understood he was rather an old servant.

After the transaction of other business, the meeting proceeded to make a perambulation of the town, and inspected the following places of interest.—St. Helen's Chapel, St. Martin's Church, Holy Trinity Church, the Balkeke Gate, Guard House and Roman Walls, Schere Gate, St. John's Abbey Gate, St. Giles's Church, St. Leonard's Church, and St. Botolph's Priory. By the invitation of Mr. James Round, treasurer of the society, a *conversazione* was held in the library at the Castle from eight till eleven p.m., when several papers were read and discussed.

On Wednesday there was an excursion, starting at ten. The places visited included Chappel, Colne Church and Priory, the churches of Great and Little Tey, Marks Tey, Copford, and Stanway.

### SIR FRANCIS DRAKE IN LONDON.

"In the night of the 22nd of January, 1569, William Hawkins, junior, esq., Governor of Plymouth, writing to the Privy Council, says,— "It may please your honours to be advertised that there is, this present night, arrived into the port of Plymouth one of the small barks, the *Judith*, of my brother Sir John Hawkins's fleet, from the Indies." The captain of this privateer of 50 tons had brought back nothing but his ship after months of exploiting in the Spanish Main. His name, not mentioned in the above report, was Francis Drake, who ten years afterwards entered the harbour of Plymouth on board his good ship *Hind*, which had circumnavigated the globe, and stepped ashore not far from the spot where a monument to his memory is about to be erected. This same *Hind*,—

"The great ship which round the world has run,  
And match'd in race the chariot of the sun,"

was by Queen Elizabeth's orders drawn up in a creek near Deptford. The queen dined on board the ship, and knighted the captain.

Within a century ago any one wandering among the network of lanes and alleys "without Temple Bar," whose site is now occupied by the Courts of Justice, might have noticed a tavern of evil repute, the wreck of the Ship Inn, standing in a gloomy, ruinous yard, to which it had given its name, 300 years ago. Robert Chambers, in his "Book of Days," mentions that "Ship-yard denotes the sign of the 'Ship,' a house established in honour of Sir Francis Drake, and having for its sign the bark in which he circumnavigated the world." This statement is incorrect. Drake was not knighted until April, 1581, and the inn was known as the "Ship" ten years previously, for in 1571 "an inn near Temple Bar, called the 'Ship,' was granted to Sir Christopher Hatton." An explanation of Chambers's error based upon rumour is to be found in Walpole's "Dictionary of Engravers." In his mention of Faithorne, the distinguished engraver of the time of Charles I., he says,— "Faithorne set up in a new shop at the sign of the Ship, next to the Drake, opposite to the Palsgrave's Head Tavern without Temple Bar." Here the "Drake" is mentioned as an inn apart from the "Ship." Forty years ago these three houses of entertainment had vanished, leaving in their places a filthy public-house and a den in which beer was retailed.

Only one of Drake's dwelling-places in London is recorded. Stow, in his survey of "Downegate [Dowgate] Ward," says, "On the east side of this Downegate-street is the great old house called the Erber, near to the church of St. Mary Bothaw. Geoffrey Scroope held it by the gift of Edward III." After passing into the hands of many noble proprietors, "it was lately new built by Sir Thomas Pullison, Mayor, and was afterwards inhabited by Sir Francis Drake, that famous mariner." No doubt the neighbourhood was much frequented by sea-faring men, for Stow, in explaining the name of the church hurt down in the Great Fire and not rebuilt, writes, "St. Mary Bothaw,

or Boatehaw, by the Erher,\* hath the addition of Boathaw, or Boat haw, of near adjoining to an haw or yard, wherein of old time boats were made and landed from Downtage to be mended." The fire devoured the famous mariner's house shortly after the *Hind*, which had been fitted up as a banquet-hall, had been broken up. The name of Nelson is attached to several London streets and squares, and to more than a score of taverns and public-houses. There is one Drake-street, but not named after him, "for whose fame the ocean sea was not sufficient room."

#### THE BERLIN ROYAL THEATRE AND OPERA HOUSE.

The architectural changes consequent on the suggestions of the Government officials have been designed with a view to facilitate the immediate egress of the audiences in case of fire. They are now being carried out by Herr Hense, under the superintendence of Herr Persius. The complicated requirements of the modern stage are being duly kept in view. As in the other instances to which we have lately referred, the iron curtain forms a prominent feature in the proposed measures of safety. In both the houses named it is made of corrugated metal. Instructions have been given for a daily trial of the iron curtain to insure its being in working order. It has been found possible to let down the iron curtain of the Royal Theatre in sixteen or seventeen seconds, and to wind it up in two minutes.

In both houses additional entrances for the public have been constructed, and some seats have been taken away from near the entrances of the pit in order to make the egress more free. The stage has further been separated from the auditorium by massive walls and iron doors. To complete the isolation, such drains as may require to be laid down will be of iron, and will be provided with appliances to enable them to be closed in the event of fire, it being thus contemplated to prevent the passage of sparks which might cause a conflagration to spread.

The iron curtains have the following dimensions:—Opera House, 52 ft. 6 in. in width and 41 ft. in height; Royal Theatre, 39 ft. 6 in. in width and 39 ft. 6 in. in height.

The works at the Royal Theatre are in such a forward state that the theatre is expected to re-open for the season on August 25th.

#### PROPOSED SUBSTITUTION OF WOOD FOR STONE PAVEMENT IN COUNTY DUBLIN.

At last week's meeting of the Drumcondra Commissioners at Holly Park House, Mr. R. M'Mullen presiding, Mr. Leonard, C.E., read a report on the expediency of adopting some system of road covering other than macadamising. He said that he had given special consideration to the question of wood pavement, using Irish heech, of which an abundant supply could be had in the county Dublin, and in dealing with it he had considered four matters, namely, convenience, safety, durability, and cost. With regard to the first, all things being equal, wood pavement possessed advantages over any other kind, and was far easier and safer for horses than granite or asphalt. In places where wood pavement had failed, he believed the process of laying had been the cause of failure, or through the action of percolating water being overlooked. About 6,912 yards would have to be laid down, about 6 yards in width, giving an area of 41,472 square yards to be paved. The cost would be only about 10s. a yard, so that the total cost would be 20,736l. He recently saw in Birmingham wood pavements which had been laid down over fourteen years, and they were now just as good as new.

Mr. M'Mahon said the report was an admirable one. The roads were at present in a most unsatisfactory state, notwithstanding the cost of repair was extremely large, being between 1,300l. and 1,400l. a year for the carriage-way alone. If they borrowed 20,000l. for this work they could pay it off in thirty years, and at the end of that time they would have magni-

\* Why the house was so called Stow does not explain, nor does Thornbury in "Old and New London." The word "erber" is a form of "arbor," an arbour or garden; "He led him to a fair 'erber,' the gates were of clean crystal." That King Edward's riverside pleasure-house should be named "The Arbour" is no more inappropriate than styling the royal hunting-lodge in Waltham Forest "The Bowyer."

ficent roads, which would cost scarcely anything to keep in repair.\*

The subject was referred to the Roads Committee.

#### BUILDING PATENT RECORD.

##### APPLICATIONS FOR LETTERS PATENT.

- 3,613. A. C. Henderson, London. Stoves for heating by hot air and water. (Com. by Benson & Co., Paris.) July 31, 1882.  
3,614. T. Hyatt, London. Illuminating gratings. July 31, 1882.  
3,638. A. Stevenson, Chester. Apparatus for filtering, &c., currents of air. August 1, 1882.  
3,688. W. Thompson, Crompton Fold. Door knobs. August 2, 1882.  
3,696. W. Ney, London. Prevention of noise in window frames. August 3, 1882.  
3,701. C. E. Hanewald, London. Apparatus for preventing down draught in chimneys, &c. (Com. by F. Haszelmann, Munich.) August 3, 1882.  
3,702. L. Roth, Wetzlar, Germany. Manufacture of cement. August 3, 1882.

##### NOTICES TO PROCEED

have been given by the following applicants on the dates named:—

August 1, 1882.

- 1,498. W. R. Lake, London. Metallic shingles for roofing purposes. (Com. by C. Constock, New Canaan, U.S.A.) March 28, 1882.  
1,575. W. R. Lake, London. Manufacture of metallic roofing shingles. (Com. by R. Seaman, New York, U.S.A.) March 31, 1882.  
1,584. G. L. Shorland, Manchester. Fire-places. April 1, 1882.  
1,740. A. Browne, London. A stove. (Com. by L. Breglia, Dresden.) April 12, 1882.  
3,198. T. N. Sully, Wellington. Walls of houses, &c. July 6, 1882.

August 4, 1882.

- 1,785. T. Rowan, London. Apparatus for ventilating. April 14, 1882.

##### ABRIDGMENTS OF SPECIFICATIONS.

Published during the Week ending August 5, 1882.

- 5,633. R. G. Garvie, Aberdeen. Machines for spreading sand, salt, or other material on streets, roadways, &c.

To insure uniform spreading of the material, a hopper is arranged at the back of the cart, through which the sand, &c., is forced by a shaft with stirring blades. It is then discharged through the whole length of a screen by endless chains, which draw the sand from the mouth of the hopper and distribute it. Dec. 23, 1881. Price 6d.

- 5,655. B. J. B. Mills, London. Apparatus for beating water.

This is a portable apparatus, and consists of small tubes coiled round a central gas-burner and enclosed in a suitable metal case. The water passes through the tubes to be heated. (Com. by L. J. Robis, Paris.) (Pro. Pro.) Dec. 24, 1881. Price 4d.

- 5,663. W. R. Lake, London. Apparatus for extinguishing fires in theatres, &c.

The cock on the main water pipe is kept closed by a weight connected thereto by a cord, when this is burnt the water is automatically turned on. (Com. by H. S. Maxim, Brooklyn, U.S.A.) (Pro. Pro.) Dec. 24, 1882. Priced.

- 5,677. J. Barrett, Eastburn. Opening and closing doors in connexion with hoists.

Cams are mounted on the head of the hoist, corresponding with the number of the floors served. As the hoist is approaching a floor the proper cam actuates mechanism which opens the door on that floor. Dec. 27, 1881. Price 6d.

- 5,679. J. Gillingham, Chard. Fireplaces and stoves.

When the fire is lighted, and the chimney warmed, and the draught established, the register-door is closed, and the draught made to pass through the fire into a chamber below the grate, and thence through side-flues to the chimney. (Pro. Pro.) Dec. 27, 1881. Price 2d.

- 5,703. F. Brown, Luton. Cooking-stoves, &c.

To enable the coal to be fed in at the bottom, the bottom of the fireplace is curved upwards till it meets the back, and a trough is formed in front, on which the fresh coal is placed, and then pushed backwards into the fire. The damper in the flue is connected with the sliding plate, by which the top of the fireplace is closed over, so that when this is shut the damper is also closed. A double-cylinder stove has the fire in one cylinder, and the products of combustion are passed into the other, through which air passes in pipes to be warmed. Dec. 28, 1881. Price 3d.

- 5,735. T. Drake, Huddersfield. Hot-water heating apparatus.

A conical-shaped boiler is heated by a gas-jet, and to the apex and base of the cone are attached the ends of a coil of pipe, through which the water circulates. The coil is placed in a perforated metallic case. Dec. 31, 1881. Price 6d.

\* If this be correct they must have made some wonderful discoveries in county Dublin.

Compiled by Hart & Co., Patent Agents, 23, New Bridge-street.

#### UNDERTAKERS' MONUMENTS.

In my various wanderings through this country and abroad, churchyards and cemeteries have always had a special attraction for me. I have loved to roam in these abodes of the departed, and gaze on their stately marble monuments, with their lettering, telling of loved ones who have passed away, or to wander in the ancient churchyard of some old picturesque village, where the "iron horse" has not yet reached, along, perhaps, with the venerable sexton who points out to you the "old and curus urns," and strive to decipher some of the quaint doggerel and rhyme to be found engraved on them, one of which I call to mind; it is in memory of a stonemason, and runs thus,—

"Here lies John Trollope,  
Who caused the stones to roll up,  
When God Almighty took his soul up,  
His body went to fill the hole up."

Another curious one, and which is evidently in memory of a blacksmith, is as follows,—

"My sledge and hammer lie declined,  
My hammers, too, have lost their wind,  
My fire's extinct, my forge decay'd,  
And in the dust my bones are laid."

My coals are spent, my iron gone,  
My nails are drove, my work is done,  
My fire-dried corpse here lies at rest,  
My soul (smoke-like) soars to rest."

There seems to me a charm in these old churchyards that is lacking in our large cemeteries, where the eye is so frequently distressed by seeing monuments falling down, many broken, and others on the verge of decay, at least one-half of them appearing to be unsound, and the dates on the stones showing they have only been erected a few years; in fact, monuments erected during the last few years appear to be the very ones that are decaying, whereas those erected a score or more years ago (although dirty and discoloured, which is inevitable in our climate, more or less) are still as sound as when first put up. Why, I would ask, is this? Is the material deteriorated of late years, or is it the fault of the sculptor or mason who executes the work? I have studied this matter a good deal for some time, and have elicited many useful facts from those in the trade, and others, concerning it, and will endeavour to show what I deduce as the cause, and to suggest a remedy.

The material now to be obtained I believe to be as good, if not better, than ever, if properly selected, as, although the English climate is very trying, there is both stone and marble to be got that will resist it; and good granite, if polished, we know to be virtually everlasting, although this, of course, is very expensive for ordinary work; but the trade has of late years gone a great deal out of the hands of the sculptor and mason, to whom it properly belongs, and into those of undertakers and shopkeepers,—i.e., the drapers' and mourning warehouses with undertaking combined, who, of course, know nothing whatever of the trade, their knowledge consisting in pocketing at least twenty per cent. of the total cost of the monument. And what do they do for this? Simply take the order for the monument from their customers and give it to the sculptor or mason to execute, and pocket this handsome percentage for doing what?—why, nothing at all. I am assured, on good authority, that on one of the monuments at Kensal Green Cemetery no less a sum than 200l. had been paid to the undertaker for commission; in another case the undertaker was regularly receiving fifteen per cent. on all works executed for or through him, and as the business was transacted through his foreman, he had five per cent. besides. Afterwards the foreman succeeded to his master's business, and he then not only required the fifteen and five per cent. both, but a further five per cent., making twenty-five per cent. commission, or one quarter of the total sum paid for each monument. And these instances could be multiplied, if needed, a hundredfold by those "behind the scenes."

It is, then, very difficult to fathom the cause of the dilapidated and broken monuments that meet our eye on every side in the cemeteries? I think not. The mason saddled with this heavy incumbrance of commission, and with competition all round him, purchases the cheapest and most easily worked material that he can, without regard to durability. He naturally thinks that if the undertaker or shopkeeper has twenty per cent. for doing nothing, he at any rate is entitled to twenty per cent. for his trouble in carrying out the work, thus making forty per cent. profit to come out of the work,

## GLASGOW INSTITUTE OF ARCHITECTS.

The members of the Glasgow Institute of Architects held their annual excursion on the 3rd inst., the place of rendezvous being Dunfermline. Amongst those who availed themselves of the day's outing were Messrs. James Sclars, vice-president; John Baird, past-president; Campbell Douglas, past-president; William Laiper, F.R.I.B.A.; Alexander Petrie, T. L. Watson, John McLean, William Forrest Salmon, F.R.I.B.A.; James Morris, A.R.I.B.A.; and William McLean, secretary. The party arrived in Dunfermline, having travelled by rail, at 11:45, and were met by Mr. G. Robertson, F.S.A., Scot., and Mr. A. Blair. They first visited the Abbey and Palace ruins, spending a good deal of time in the study of the details of the architecture. Some of the members of the party seemed to be much struck with the fine specimens of Anglo-Norman and Gothic architecture which are to be met with in connexion with the old Abbey Church. In the course of the day the excursionists drove to Pitfrane, Broomhall (the seat of the Earl of Elgin), Rosyth Castle, and Inverkeithing. On returning to Dunfermline, the company dined in the City Arms Hotel.

## THE SELECTED DESIGN FOR THE GLASGOW MUNICIPAL BUILDINGS.

Mr. W. Young, the author of the design bearing the motto "Viola," has been entrusted with the execution of these buildings, which are estimated to cost 250,000*l.* (Inclusive of internal furniture, decorations, &c. The Scotsman puts the total expenditure at 500,000*l.*) The buildings, which are designed in the Renaissance style of architecture, will have frontages to George-square, George-street, John-street, and Cochrane-street. The principal elevation is towards George-square. The central portion forms the approach to the quadrangle, over which is the Council Chamber, emphasised by coupled Corinthian columns, backed by pilasters and surmounted by an upper order of columns, crowned by a pediment. This pediment has 60 ft. of frontage, and the apex rises 96 ft. above the street level, while on each side of it springs a helix tower rising about 20 ft. higher. The entrance to the quadrangle is immediately below the Council Chamber, as is also the main staircase on each side leading to the floors above. In approaching the quadrangle there is a spacious loggia, having three wide archways. The central archway, intended for carriages, is 25 ft. in height, by 12 ft. in width. One on each side, 17 ft. high, in a corresponding style, forms an access to each of the principal staircases. Over the Council Chamber are the upper and saloon stories, which are lighted from the roof. The two under stories of this, as well as the other fronts, are mainly faced with rusticated stonework. In relief of this massive part of the structure are coupled Ionic columns and pilasters, between which the windows are placed. The grand tower rises, behind the central pediment, to a height of 190 ft., surmounting the apex of it by 96 ft. At the base, which is 35 ft. square, and for some 20 ft. above the apex of the pediment, the treatment of the tower is plain rustic masonry without openings. On the top of this there are two stages formed of Ionic pillars, above which runs a colonnade of pillars of the same character. The colonnade is about 14 ft. in diameter, and is capped by an elongated dome of stone. The central front projects about 7 ft. beyond the line of the building, and between it and the wings on either side is a recess forming a screen. At the wings, which, like the front, also project beyond the screen, are towers rising some 48 ft. above the front balustrade. The George-street facade has received nearly as much attention from the architect as the principal elevation. It may be mentioned that generally all round the block the third floor is architecturally emphasised. In this front the banqueting-hall is thus represented with a double row of massive Corinthian pillars, supporting a handsome entablature, surmounted by a balustrade. The wings here, as in the other fronts, are formed by a repetition of the tower front in George-square, and are similarly treated. In order still further to secure harmony of design, a screen is introduced between the wing towers and the centre. The leading feature of the John-street elevation is the Dean of Guild-

court, which is placed in the third floor. On this side the design corresponds with that on George-square, but the details are of a much simpler character. Down this street are the gas and water offices, with handsome entrances. The centre is surmounted by a plain pediment, flanked by balustrades, along the whole length of the edifice. In the Cochrane-street facade the committee-rooms on the third floor are defined by a repetition of the Corinthian pillars rising over the basement story, and carrying entablature, cornice, and balustrade and rusticated belfries at the ends. Piercing this front is a carriage-entrance, 22 ft. in height by 10 ft. in width. The elevations to George-square, George-street, and Cochrane-street, are enriched by groups of statuary. In George-square, including those in the tower, there are 27; in George-street, 24; and in Cochrane-street, 18; while John-street, being mainly occupied with business offices, receives a simple treatment which does not require their aid. The pediment in the central front at George-square bears emblematic groups in relief representing Britain and the Arts and Sciences. On the quadrangle fronts, which form an interesting feature of the building, great care has been bestowed. The general treatment is strictly in harmony with that of the street elevations,—an Ionic base surmounted by Corinthian pillars,—but the details are less ornate. In regard to the internal arrangements, two spacious staircases lead to the Council-chamber and the Banqueting-hall. The dimensions of the chamber are 65 ft. by 30 ft., with a recess in the centre, giving a width at that point of 40 ft. The windows are all on one side, but as there is a circular dome into the open air, there will be an abundant supply of light. In size the hall is 103 ft. by 54 ft., and it has a circular roof 50 ft. high, while connected with it are seven saloons for the reception of guests, &c. It may be mentioned that the roof-line of the building is 7 ft. higher than that of the General Post Office, and that the tower is 55 ft. higher than that of the Merchants' House, the two principle structures at present in the square.

## GLASGOW MUNICIPAL BUILDINGS COMPETITION.

At a meeting of the Committee on New Municipal Buildings, Glasgow, held on the 27th of July, Mr. William Young, the author of the design marked "Viola," was introduced, and the town clerk reported that, under the remit made to him at the last meeting of the committee, he had met with Mr. Young, and had fully discussed the conditions under which his appointment as architect of the proposed municipal buildings should be made. After fully considering these conditions, it was unanimously agreed that Mr. Young should be appointed architect, subject to the following conditions:—

1. That he shall receive, in respect of his whole professional services and expenses as architect, a commission of five per cent. on the actual cost of the works executed from his designs and under his superintendence, but excluding from such costs salaries and allowances to clerks of works, measurers, and other outlays and payments which, by the practice of the profession, are excluded in fixing architects' commission, and that the amount of such commission shall be paid by instalments of the amounts after specified, viz.:

For the first year .....	£3,500 0 0
For the second year .....	2,500 0 0
For the third year .....	2,000 0 0
For the fourth year .....	2,000 0 0
For the fifth year .....	2,000 0 0
	£12,000 0 0

the said payments to be made half-yearly at Martinmas and Whitsunday in each year till the work is completed,—which completion, it is assumed, will not extend beyond five years from the present date. On the work being completed, Mr. Young shall receive whatever balance may be due and payable to him at the time when the building is handed over to, and taken possession of by, the Corporation.

2. That, in addition to the commission above specified, he shall receive from the Corporation repayment of the railway fares paid by him in travelling between London and Glasgow in relation to the municipal buildings, but no further or other charges of any kind.

3. That he shall, with the approval of the magistrates and Council, appoint an efficient clerk of the works, whose salary shall be paid by the Corporation.

4. That he shall submit to the magistrates and Council the names of three measurers resident in

Glasgow, and the Magistrates and Council shall select, and appoint one of the three whose names are so submitted, to act as measurer of the said buildings, and the remuneration of such measurer shall be paid by the Magistrates and Council.

5. That the Magistrates and Council shall be at liberty, and power is hereby reserved to them, from time to time, to ask advice from the City Architect, or any other architect or professional adviser on all points or matters on which the Corporation may desire to be advised, both as to the design and mode of execution of the work, and to represent to Mr. Young their views and wishes in regard thereto, and he shall, so far as practicable, give effect to such views and wishes.

6. In the event of any difference of opinion arising between the Magistrates and Council and Mr. Young, in regard to any matter connected with the proposed building, the same shall be referred, at the instance of either of the parties, to Mr. Charles Barry, architect, London, when failing, to the President for the time being of the Royal Institute of British Architects, whose decision shall be final and conclusive, and shall not be subject to review by any court or other tribunal.

Mr. Young expressed himself satisfied with the arrangements above set forth, and it was agreed that the same should be reported to the Magistrates and Council, and, after being confirmed, should be officially communicated to and accepted by Mr. Young. The City Chamberlain was instructed to make payment, in terms of the seventh condition of the final competition, of 150*l.* to each of the ten competitors. Mr. Young was informed that the Corporation are desirous of having the buildings proceeded with without delay, and the committee remitted to the City Chamberlain to warn away the tenants on the property at present on the site, and to Mr. Carrick to have the buildings taken down, and the materials disposed of as early as possible.

The Lord Provost, at a meeting of the Town Council on the 7th, in moving the adoption of the minutes, hoped it would go forth throughout the laud that this competition was conducted on the most honourable principles. The minutes also showed with what carefulness the committee had proceeded to ascertain whether Mr. Young was altogether competent for the work to be performed, and he thought the Council would be satisfied they had the utmost reason to believe that Mr. Young was a gentleman into whose hands they could with perfect safety entrust these great buildings.

Mr. Martin said he thought the Town Council should keep the appointment of measurers in its own hands. It was not to be supposed that a stranger, comparatively speaking, should have a thorough knowledge of the measurers of Glasgow.

The Lord Provost thought it right to say that Mr. Barry and Mr. Young met for the first time in London. They had never seen each other before. Mr. Barry had heard of Mr. Young by name, but he had never seen him. The same remark held good with regard to Mr. Carrick. The minutes were approved.

## The Technological, Industrial, and Sanitary Museum of New South Wales.—

The Colonial Government are making rapid progress with the organisation of this museum, which has been permanently established in the Garden Palace at Sydney, the building in which the International Exhibition of 1879 was held. Arrangements are now being made for the shipment of contributions to the museum from manufacturers in this country, which, for the most part, consist of sanitary appliances and articles connected with building. These contributions are being forwarded to Sydney free of cost by the Government, on the recommendation of the British Committee. This committee have issued a circular, in which they say that "large numbers of houses are being erected in the city of Sydney and other cities and towns of the colony,—in one suburb alone six hundred houses having been built last year. The authorities are paying great attention to sanitary matters, and the principal object of the Government in establishing and maintaining the Museum is to provide a means whereby the Colonists may become acquainted with improved apparatus and appliances for building and domestic purposes." Manufacturers and others wishing to avail themselves of the opportunity of sending specimens, models, plans, books, illustrated catalogues, &c., should apply to Mr. Mark H. Judge, 8, Part-Place-villars, Paddington, the acting member of the British Committee, for the necessary forms.

OBITUARY.

*Mr. Edward L. Paraire, Architect.*—We have to record the death of this gentleman, which took place at the age of 56, on the 1st inst., at 35, Mornington-crescent. Mr. Paraire was of a French family, but was naturalised in this country. His name was last before the public in connexion with an action he brought against the owners of the plot of land in Leicester-square, afterwards occupied by a panorama, the particulars of which we gave at the time. For some years he was in partnership with Mr. Finch Hill, during which period the firm executed a number of buildings, including the Britannia Theatre, the Holborn Theatre (the Duke's), the Philharmonic (Islington), the Oxford Music-hall, the Royal Cambridge Music-hall; the Presbyterian Church, Camden Park-road; the Baptist Chapel, City-road; the Club-room, Lord's Cricket Ground; Royal Oak, Bayswater, and many other taverns. Since the termination of the partnership he had prepared designs for the London and County Bank about to be erected at the corner of New Oxford-street, not yet commenced. The "Horseshoe," Tottenham-court-road, is also one of his works.

THE METROPOLITAN BOARD OF WORKS AND LONDON THEATRES.

The Metropolitan Board of Works have been successful in the first case in which they have put in force the powers conferred upon them by the Metropolitan Management and Building Act (Amendment) 1878. This was with regard to the Lyceum Theatre, upon the owner of which the Board served notice requiring him to make certain alterations. The owner appealed, and the question then went to arbitration, Sir Henry A. Hunt, C.B., being the arbitrator appointed by the Home Secretary. After hearing the evidence on both sides, and making two inspections of the theatre, the arbitrator recently made an award by which he confirmed the principal requisitions made by the Board. The most important of these requisitions are the entire reconstruction of the gallery staircase in Exeter-street, which is very defective in some particulars, the carrying up of the proscenium-wall above the proscenium opening and through the roof, and the separation of the carpenter's shop above the auditorium from the audience by fire-resisting materials. The Lyceum Theatre was built in 1834 by Mr. Samuel Peto, from the designs of the late Mr. Samuel Beazley, and possesses advantages, as regards position, which are enjoyed by but few of the London theatres. The works required by the Board will be put in hand at once, and will, it is expected, be completed before the re-opening in the beginning of October next.

Arbitration cases are also pending with regard to Drury Lane Theatre and the Royal Music Hall, Holborn, Sir H. A. Hunt being in both cases the arbitrator appointed by the Home Secretary. Notices have also, we understand, been served by the Board upon the owners of the Gaiety Theatre, the Vandeville Theatre, the Opera Comique, and the Court Theatre, but it is not expected that in these cases the parties will proceed to arbitration, but the alterations will be carried out by the owners in the terms of the notice.

LICENCES TO OPERATIVE PLUMBERS.

At a meeting of the Birmingham Town Council held on the 1st inst., Alderman Cook presented a memorial from the master-builders against the scheme for the insurance of water-fittings. It stated that though they fully appreciated the efforts the Water Committee were making to prevent the present waste in the town, they were unanimously of opinion that this might be accomplished by an efficient system of inspection without the control of the fittings and repairs being taken by the committee into their own hands, to the detriment of the builders and plumbers of the town. The memorial was received. Mr. T. Martineau then presented the report of the Water Committee, and moved that the regulations for the laying on of water, the execution of repairs and fittings, and the schedule of prices, should be approved, subject to such alterations in detail as the committee might feel desirable to make. One of the most important points they had had to consider was as to the persons who were to become

licensed plumbers, and a question had arisen as to the expediency of giving licences to operative plumbers. The committee had thought it right to do so, and they had reason to believe it would give satisfaction to the workmen. It was objected to by the master plumbers, on the ground that the committee would be placing the men on the same footing as the masters, and that this would create a difficulty. That objection, he thought, was based on a misapprehension of the intentions of the committee, and to correct it they issued a second circular, in which they stated plainly that they did not want to make a rule that the master plumbers must employ licensed workmen, but only that builders and decorators should do so. The master plumbers were supposed to know their trade, and might execute their work by any workmen they liked; but with regard to people such as decorators and builders the case was different. It was with those men that the causes of complaint had arisen, because they had employed inefficient men, such as gas-fitters and tinkers, and it was thought desirable to make it compulsory that they should employ licensed workmen. Alderman Cook proposed that the following be added to the resolution, "And taking into consideration that the principle of insurance of fittings is an experiment, the Water Committee be requested to limit any agreement in relation thereto to a period of not more than two years, in order that the Council may obtain experience of the working of the principle before committing themselves finally to the scheme; and further, that the committee be requested to confer with the plumbers and builders in order to carry the scheme into effect with the least possible interference with private trade." Mr. Martineau accepted this amendment as a rider to the resolution of the committee, which was adopted by a large majority.

CHEESE-ROOM ROOF.

SIR,—What is found to be the lightest, coolest, most durable, and cheapest covering for cheese-room roofs outside and inside? I have a very old thatched roof, but with oak timbers, and think some sort of tiles will be best. Although not so cool as thatch, old oak rafters are had for nailing either battens or laths. I want it as light as possible.  
OLD ROOF.  
\* \* \* We printed some letters on the subject of light roofs not long ago.

ST. PANCRAS WORKHOUSE COMPETITION.

SIR,—With reference to your announcement as to the above competition, permit us to state that Mr. Cates, the referee, did not report that the gentlemen named were the only ones who had complied with the requirements of the Local Government Board.  
WILSON, SON, & ALDWICKLE.

PROVINCIAL NEWS.

*Carlisle.*—The Carlisle and Cumberland Banking Company (Limited) are making extensive alterations to the bank premises in Devonshire-street, formerly occupied by Messrs. Mackie, Davidson, & Co. The ground-floor is being transformed into shops, and the upper floors into suites of offices, caretaker's rooms, &c. The contract for the whole of the works is in the hands of Mr. Thomas Milburn. Mr. George D. Oliver, of Carlisle and Workington, is the architect.—The drill-shed of the 1st G. R. Volunteers is to have a new roof. The old wooden one (being in a dangerous condition) is to be replaced by an iron one. The height of the building is also being increased, and other improvements are in progress. The tender of Messrs. Pratchitt Bros., of Carlisle, has been accepted for the ironwork, and that of Messrs. W. & H. Davidson for the rest of the works. Mr. Geo. Dale Oliver is the architect.

*Driffield.*—A special meeting of the Local Board was held on the 24th ult. for the purpose of considering a minute from the Waterworks Committee, recommending the adoption of certain plans and specifications for the construction of waterworks, prepared by Mr. Bruce, C.E., of Hull. The works are estimated to cost 5,000*l.* Mr. W. O. Jarratt proposed the adoption of the minute, which was seconded by Mr. Whitto. Mr. Forster proposed as an amendment that the opinion of the parish should be taken on the matter before the works were further proceeded with, but after a long and

warm debate, the original motion for the construction of the works was carried, the voting being 7 to 4.

*Warrington.*—At a meeting of the Warrington Town Council, on the 1st inst., Alderman Davies made a speech in favour of the Manchester tidal navigation scheme, and moved,— "That this Council views with satisfaction the promotion of an improved tidal navigation of the river Mersey up to Manchester, and that support be given to the scheme, feeling that any such improvement will be conducive to the interests of the town and trade of Warrington, and be the best means of enabling the Corporation to prevent the floods to which the lower parts of the borough are subject." Alderman Keen seconded the proposition, which was warmly received and carried unanimously. A petition on the subject to the Board of Trade was also adopted.

*Bristol.*—The new Bedminster Police-station was formally opened on the 24th ult. The buildings have been erected from plans prepared by Mr. H. Crisp, architect, Bristol. The premises occupy the site of the old station on the Causeway, and cover an extensive area, having a frontage of 108 ft. to the street, and extending backwards 150 ft. to New Charlotte-street. The buildings, which are constructed of Pennant stone, with freestone dressings, form three sides of a rectangle. The structure is in the castellated style, and a prominent feature in the design is a central square tower, rising to the height of 50 ft. above the ground. In the tower is placed a large illuminated clock, the gift of Mr. E. S. Robinson. The ground-floor of the northern wing of the building is devoted to the charge room, and this apartment, like all the others in the edifice, is floored with quartz-finished concrete, laid down by Messrs. Homan & Rogers, of Manchester and London. The cells are seven in number, and each is 12 ft. long, 12 ft. high, and 6 ft. wide, and is floored with Claridge's asphalt. The walls are lined with white glazed bricks (supplied by the Farnley Iron Company, Leeds). The locks and fittings of the doors are of extra strength, and have been furnished by Messrs. Murrell, of London. The cells are warmed by Haden's (Trowbridge) heating apparatus. The general contractor was Mr. Wm. Veals, Upper Maadlin-street.

*Weston-super-Mare.*—The second wing of the West of England Sanatorium, at Weston-super-Mare, which has just been completed, has been erected by Mr. A. J. Benven, of Bedminster, Bristol, from the designs and under the superintendence of Messrs. Price & Wooler, architects, Weston-super-Mare. The building stands in three acres of ground, at the back of which are the sands, forming excellent halting-ground for the patients. The section which was opened about ten years since consists of the quarters for women and children, and offers accommodation for fifty patients, and the central part, which includes the main entrance. The part now completed is built upon exactly the same plan as the first section, and will be for men, it offering accommodation for fifty more patients, making 100 in all. The building, which is Collegiate in style, forms a quadrangle. In the entrance-hall is a carved open screen, erected to the memory of the late Miss Hicks, of Bath. Over the screen is a gallery which leads from the men's to the women's block. On either side of the doorway is a stained-glass window, by Mr. Bell, of College-green, Bristol,—one representing "Faith" and the other "Hope," the former the gift of Mrs. Birkett and the latter that of Mrs. John Harvey. The passages are laid with Maw's tiles. Adjoining the kitchen is a drying-room, with furnaces, and a hot-water supply for use in baths, which are provided for every patient, in both sections of the building. The upper story is reached by means of a substantial stone staircase, lighted by a window, the design also of Mr. Bell, and filled with cathedral glass. Attached to the Sanatorium, on the southern end, is a chapel in the Early English style, which will seat 120 persons, including the accommodation in the gallery. At the west end are nine stained-glass windows, executed by Mr. Gibbs, of London, a stone pulpit, and also a fine organ. The chapel, it should be added, was built some years since. The heating of the building was carried out by Messrs. Jones & Hudson, of Redcliff-street, Bristol.

*Brighton.*—At a meeting of the Brighton Sewers Board on the 1st inst., a report was read from the Surveyor (Mr. P. C. Lockwood) embodying some suggestions made by Sir J.

Bazalgette, with reference to the intercepting sewer, in his report as to the state of the Brighton sewers generally. The Committee resolved, "That the Surveyor to the Board do prepare plans and an estimate of the cost of constructing an outfall for storm-water at Roedcan, as suggested by Sir Joseph Bazalgette." They also decided to call the attention of the Hove Commissioners to the recommendations of Sir Joseph Bazalgette, and requested them to cause catchpits of sufficient size to intercept the road detritus, to be formed under the street-gullies in Hove. The Board adopted the recommendations of the Committee.

#### ROMAN CATHOLIC CHURCH-BUILDING NEWS.

**Bath.**—On the 6th ult. the new church at the Roman Catholic College, Prior Park, was opened. It was the intention of a former Roman Catholic Bishop of Clifton (Dr. Baines) to build a church for the college (of which he was the founder), and he made considerable preparations to that end. It was left, however, to his successor, Bishop Baggis, to lay the foundation stone in 1844. The walls had been carried about half-way up to the roof when the events which led to the closing of the college in 1856 necessarily stopped the building of the church. The college was re-established by Bishop Clifford in 1867, under the presidency of the Rev. Dr. Williams, and in 1871 the building of the church was resumed and carried on to its present stage. It is not yet finished, but it is in such a state as to allow of its opening. The church stands between the two colleges of SS. Peter and Paul, and harmonises very well with the familiar elevation of Prior Park. It is, of course, constructed of Bath stone. The church is regarded as the most perfect model of a Roman basilica existing in England. On the north and south sides the basement of the church is formed of an arcade of eleven arches, above which rises one order of the Corinthian style of architecture, between which are the windows lighting the aisles. Above these is a series of pannels which are to be filled with scenes from the lives of SS. Peter and Paul. The porches are at the western ends of the north and south arcades, and upon these will eventually rise two towers, which have at present been carried as high as the heltry floor. The south porch is the public entrance, the north one giving access to St. Paul's College and to the park, and will be used on occasions of processions. The massive doors are of oak, very handsomely carved and panelled. The east end of the building terminates in a semicircular apse surmounted by a fine dome. Passing to the interior, the nave is separated from the aisles by a range of Corinthian columns raised on pedestals, seven on each side; above these rises the grand cornice, with but a single break on either side, and the nave is covered in with a richly-pannelled semicircular ceiling, the windows lighting the nave being groined into it. Between the pilasters on the walls of the aisles, corresponding with the columns, are arches, blank on the south side, but opening to chapels on the north. The apse is semicircular, having three-quarter columns round it, and lighted by a lantern in the dome. Overlooking the chancel are two trifunous over the side entrances. As is usual in churches of the basilica form, the seat for the clergy, which is of oak with carved stall-ends, runs around the apse, the high altar standing detached. The aisles are narrow and are intended only for processions or as passages to the various chapels. The north aisle terminates at the east end, in the chapel of the Blessed Sacrament. The south aisle leads to the sacristy, octagonal in form, and lighted by a lantern. The organ-loft, which has yet to be built, will be at the west end of the nave. The total length of the church is 120 ft., that of the chancel being 43 ft.; the breadth of the nave is 27 ft. 6 in. in the clear of the columns, and the height 45 ft. The altar is composed of very rich Italian marbles, the sepulchre for the relics being seen through a beautiful pierced cross of statuary marble. It was made in Rome for the church, and rests upon three steps, also of marble. Only two of the chapels on the north side are as yet ready for their furniture. The first of these, occupying three bays, is dedicated to St. John the Evangelist, and is being finished as a memorial to the late Rev. Dr. Bonomi, Vicar-General of the Diocese. In the recess at

the back of the altar is to be fixed a mosaic by Salvati, representing St. John. The next chapel is of one bay, and is dedicated to St. Joseph, and has been finished as a memorial to the late J. J. Scoles, the original designer of the church (who will be remembered by some of our readers as a practising architect), by his son, the Rev. A. J. Scoles, who has completed his father's work. Mr. Bladwell has been the contractor for the whole of the work, except the ceiling, which was entrusted to Mr. P. J. McManus, of London.

#### STAINED GLASS.

**St. John's Wood.**—The east window of the chancel of St. Stephen the Martyr, Avenue-road, has just been filled with stained glass. The artist, Mr. W. G. Bailey, has treated the five lights with white Perpendicular glass, which relieves the subjects. The Adoration of the Magi and the Shepherds fill the centre three lights, and the two remaining outer lights contain each two subjects, namely, the Annunciation, and the Child Jesus in the Temple, and the Agony in the Garden, and the Three Maries at the Holy Sepulchre. In the tracery above the five lights are St. Stephen the Martyr, patron of the church; St. John the Baptist, patron of the district; and St. Paul the Apostle, patron of the See of London. At the foot of the window is the legend,—"To the glory of God, and in memory of Alfred Swaine Taylor, M.D., F.R.S., and Caroline, his wife. This window is erected by their daughter and son-in-law, Edith and Frederic Method, A.D. 1882. The effect, during some parts of the day, will be materially improved when the west window of the nave is also filled with stained glass, as the full glare of light through it now detracts from the effect of the new work.

**Deynock.**—A four-light window, representing the Nativity, Presentation, Crucifixion, and Ascension of Our Lord, has just been erected in the parish church of Deynock, near Brecon, in memory of the Rev. David Parry, late vicar of the parish. The work is from the studios of Messrs. Mayer & Co.

#### Miscellaneous.

**The Welding of Cast Steel.**—On the 2nd inst. a committee of the Royal Scottish Society of Arts, Edinburgh, accompanied by several of the members, visited St. Margaret's Works to witness the welding of cast steel by the process recently described to the Society by Mr. Benjamin Askew, and of which we have already made mention. The welding is done by means of powdered stucco used just as smiths are accustomed to use sand in other weldings. Four pieces of cast-steel scraps from two different makers were welded into one square bar, which was afterwards broken. The fracture showed no mark of the joining, but the grain of the two qualities of steel could be distinguished. Two old files were welded together and hammered into the shape of a chisel, which was hardened, tempered, and sharpened, and then used to cut an inch bar of iron. The process is so simple that any skilled smith may practise it; he must use heat enough to flux the stucco, but not so much as to fuse the steel.

**Turner Drawings and Sketches at Glasgow.**—A new series of sketches and water-colour drawings, selected from the Turner Collection in the National Gallery to replace the set recently withdrawn, has just been lent to the Parks' Committee by the trustees of the National Gallery, and are now on view in the Corporation Galleries, Glasgow. A short time ago a portfolio of facsimile reproductions of early Italian engravings was presented to the Galleries by the trustees of the British Museum. These have now been framed and exposed in one of the upper galleries.

**Wick Harbour.**—A deputation from the Pulteney Harbour Board have been in London arranging with the Treasury officials for a loan to carry out the new works for the extension and improvement of Wick harbour in accordance with plans prepared by Mr. Barron, C.E. They have been successful in their mission. The Government has arranged to lend 30,000l. for starting the new works, reserving consideration of further advances till the results of the expenditure of that sum are seen.

**Featherstone.**—On the 18th ult. the Archbishop of York re-opened the ancient and interesting Church of All Saints, at North Featherstone (now so-called), near Pontefract, which has been closed for about two years, while undergoing restoration. Messrs. Healey, architects, of Bradford, took the restoration in hand, and with the aid of Messrs. Smith & Freeman, of South Featherstone, builders, have brought the work to a successful completion. Christ Church, Oxford, is the lay rector, and this wealthy society gives 300l. to the work of restoration. The south portion has been entirely rebuilt, and the tower, which contains three bells, partially restored. The font, which is supposed to have been brought from Pontefract during the time of the Civil Wars, bears a curious inscription, and also the name and coat of arms of John de Baghill. During the work some very interesting discoveries came to light. The roof, which before permitted the rain to come through, has been replaced by an open one of oak, and the walls have been cleansed and repaired.

**Presentation to Mr. E. Melville Richards, C.E., late Borough Surveyor.**—On Thursday last a deputation of magistrates and councillors waited upon the above-named gentleman at his private residence and presented him with an address handsomely illuminated and engrossed on vellum, expressive of their high appreciation of his past valuable services as their borough surveyor. The address is signed by upwards of 300 magistrates, councillors, and influential ratepayers of Leamington.

**London and Middlesex Archaeological Society.**—The annual excursion of this Society will take place on Thursday, August 17th, to Silchester, where members and friends will assemble at two p.m. Mr. J. G. Hilton Price, F.S.A., will explain the famous antiquities of the place, and others are expected to assist. The South-Western Railway has kindly consented to issue return tickets from Waterloo to Basingstoke at a reduced rate.

**The War Office** have instructed Messrs. Clark, Bunnell, & Co., Limited, of Rathbone-place, to supply several iron buildings for stores for shipment to Egypt. The employees of this company had their annual dinner on Saturday last, the London men going to Teddington, and the men at the Paris Works going to Montmorency, near Paris, and the New York employees to Manhattan Beach.

**New Steelworks at Worlington.**—At Worlington, on the 4th inst., Mr. R. H. Hodgson, contractor, of Worlington, received the contract for the erection of the new steel works for Messrs. Cammell & Co., of Sheffield, which are to be added to the present Derwent Ironworks at Worlington. It is expected that a start will be made next week. The contract will amount to close on 50,000l.

**Working Men's Exhibition.**—A Working Men's Exhibition is to be opened by the Lord Mayor, on Saturday, September 23rd next, at Brunswick House, Vauxhall. The applications for space are numerous, and intending competitors should at once apply, enclosing stamped envelope for rules, to the secretary, Mr. E. E. Smith, at Brunswick House, Vauxhall.

**Bristol.**—At a meeting of the Town Council on the 8th inst., Mr. Thos. Howard, M. Inst. C.E., announced his intention of shortly resigning his appointment of Engineer to the Bristol Docks, and Mr. J. W. Girdlestone, Assoc. Inst. C.E., was appointed as his successor. Mr. Howard will still be retained as consulting engineer.

**Liverpool.**—The *Liverpool Daily Post* announces that Lord Sefton has given a site in Ullet-road, between Sefton Park and the Cemetery, for the church which is about to be built in memory of the late Mr. Robert Horsfall. Mr. J. L. Pearson, R.A., has been instructed to prepare plans for the memorial church.

**New Bakery at Wanstead.**—Mr. H. W. Nevill has commenced the erection of a new bakery at Harrow-road, Wanstead Flats. The architect is Mr. W. T. Farthing, and the builder Mr. J. Woodward, of Wilson-street, Finsbury.

**Valuations.**—Mr. Wm. Ewe, of Union-court, Old Broad-street, who has recently completed the valuation of Alton Union, has been instructed to re-assess the whole of the property in the Reading Union.

**The Wagon Lift** at the extensive works of the Great Eastern Railway Company, at Shore-ditch, and which has been specially noticed, was constructed and put up by Messrs. Lewis & Lewis, of Cambridge Heath-road.

**Technical Education.**—The Coach and Coach-harness Makers' Company, in continuation of their action in former years, offer for 1883 a number of prizes for competition among persons engaged in the trade of coachmaking, whether clerks, foremen, workmen, or apprentices. Each of the prizes will be accompanied with the certificate of the company. The following is a list of the prizes offered:—For freehand drawings of foliage or ornaments from Nature, or models in ink or crayon, in outline (not shaded) 1st prize (among former prize-winners and others, no limit as to age), the Company's silver medal and 4s.; 2nd prize (excluding former prize-winners, no limit as to age), the Company's bronze medal and 3s.; 3rd prize (for apprentices and others under twenty-one years of age), the Company's bronze medal and 2s.; separate prizes for sons of British coachmakers being educated and trained as master coachbuilders, a silver-gilt medal. For working drawings of one-horse wagonette: 1st prize (for apprentices and others under twenty-one years of age), the Company's silver medal and 3s.; 2nd prize (for apprentices and others under twenty-one years of age), the Company's bronze medal and 2s.; separate prizes for sons of British coachmakers being educated and trained as master coachbuilders, a silver-gilt medal. For full-sized working drawings on paper of a gentleman's phetion, mail or spider shape: 1st prize, the Company's silver medal and 15s.; 2nd prize, the Company's bronze medal and 10s.; 3rd prize, the Company's bronze medal and 5s.; separate prize for sons of British coachmakers being educated and trained as master coachbuilders, a silver-gilt medal.—*City Press.*

**Milner's Safe Company.**—The eighth annual meeting of this company took place last week, at the Cannon-street Hotel, Mr. C. T. Ritchie, M.P. (chairman), presiding. A report was presented stating that the net profit, after making all proper deductions, was £2,157.11s. 4d., from which must be deducted interest on debentures, 1,730l., leaving 20,418.11s. 4d. The directors proposed to declare a dividend of ten per cent. per annum, which, with 3,500l. paid by way of interim dividend, would absorb 14,000l., leaving a balance to be carried to the reserve fund of 6,418.11s. 4d. It was proposed to transfer in further liquidation of the good-will account, 2,000l. from the reserve fund, which would then stand at 10,339.10s. 7d. The debenture loan had been, since the last general meeting, reduced by a further sum of 1,500l. at the third annual drawing, under the debenture trust deed, leaving the debenture loan at 41,700l., of which the company held 10,000l., reducing the amount practically to 31,700l. The directors had considered it in the interest of the shareholders to recommend the payment of a dividend of ten per cent. per annum, rather than a larger dividend, which the earnings of the company would justify. Sir H. B. Loch, K.C.B., seconded, and the report was adopted unanimously.

**The Sewerage of Brighton.**—The *Lancet* of this week publishes the report of Mr. Bailey-Denton on the sewerage system of Brighton, with special reference to the ventilation of the sewers. This exposition of facts given by him will, he trusts, "serve to show that no amount of money expended in palliations such as those recommended by Sir Joseph Bazalgette will render the sewerage of Brighton what it ought to be. As a health resort Brighton is often frequented by invalids, who are especially sensitive of bad smells; and unless the sewers have a constant discharge, associated with a perfect system of sewer ventilation, the present evils will be maintained." Mr. Bailey-Denton concludes his report, after stating that ventilation can be readily effected at a moderate outlay, by saying that so long as Brighton remains with a tide-locked sewer extending along the whole length of its frontage to receive surface-waters as well as sewage, without making an effort to prevent their detention, there will be cause for the strictures made by the *Lancet* on the sewerage of Brighton.

**Decoration of Glass without Heat.**—Ernest Dumas has presented a favourable report upon the decoration of glass by the method of M. Lutz-Knechtle, of Frogen, Switzerland. He adds zinc white or ultramarine to a solution of silicate of soda or of potash, so as to produce colours which can be applied to the glass in various ways. These colours dry very quickly, and will bear hard washing.—*Chron. Indust.*

**Sewerage Works at Shepton Mallet.**—The *Shepton Mallet Journal* of the 4th inst. contains a report of what took place at the last meeting of the local Board of Health. Included in the minutes of the Sewerage Committee was the following passage:—

"The question of the use of clay versus cement was discussed at a committee meeting on the 20th of July, when Mr. Catley stated that the contract provided that cement should be used in jointing the pipes, but that he had power as engineer to alter the material, and that at certain places where pipes had been laid through water, there clay in his opinion was preferable, and in a few joints of the sort he had authorised the contractor to use clay instead of cement."

On this head, however, Mr. Spire, the clerk of works, in a report made to the Board on the progress of the works, says:—

The branch line at West Shepton from the manhole by Mr. John H. Puller's garden, doors to the road opposite Mr. E. H. Stone's Farmhouse, not being satisfactory, has been re-opened, and it was found that three powerful springs of water had opened in the trench and burst the joints of some of the pipes. This water has now been carried down the trench by means of extra pipes placed at a lower depth, the sewage pipes have been carefully relaid principally in cement, and well puddled with clay, and I am of opinion this line of pipes will now be found properly watertight.

**Public Offices Site Act.**—On Saturday last was issued the "Public Offices Site Act." Its execution will effect some considerable alterations in Spring-gardens and Charing-cross in connexion with the erection of the new buildings for the Admiralty and War Departments, and will involve the removal of St. Matthew's Chapel, Spring-gardens. The schedules annexed to the Act show the number of houses to be purchased in Spring gardens, Whitehall, and Charing-cross. The Commissioners of Public Works are empowered to acquire the land specified for the new public offices. The Commissioners of Woods may, with the approval of the Treasury, provide out of the land revenues of the Crown a new Office of Land Revenue Records in lieu of the existing office. The passage and right of way at Spring-gardens will be closed.

**Compensation Case.**—A compensation claim, at the instance of the trustees of the parish estate of St. John the Baptist upon Walbrook, against the Metropolitan and Metropolitan District Railways, was heard at the Guildhall, before the Recorder and a special jury, the property of the claimant being required for the completion of the Inner Circle scheme. The claimant was Mr. H. Mathews, architect and surveyor, Cloak-lane, Cannon-street, who had an unexpired term of nine years of his lease to run, and who claimed 2,000l. as compensation from the companies for the compulsory surrender of his rights. Skilled witnesses were called for the companies, who valued the property at from 2,200l. to 2,314l. In the result the jury awarded the sum claimed, 2,000l.

**The Temple and the New Law Courts.**—The Strand Board of Works have received a communication from the Benchers of the Middle Temple, asking permission to construct a subway from the Middle Temple to the New Law Courts. The Board granted the application on condition that the public should have the use of the subway, and that it shall be closed at a definite hour at night, so that it shall not be a refuge for bad characters.

**Etchings of Old Southwark.**—Messrs. Nichols & Co. have arranged with Mr. Percy Thomas to make an etching of the old White Hart Inn Yard, Southwark. This inn dates back for some five centuries, is often mentioned by Shakespeare, was the head-quarters, in 1450, of Jack Cade, and in our own times has been described by Charles Dickens as a scene in *Pickwick*.

**Haworth.**—There has lately been placed in the floor of the chancel of the new parish church a brass, designed and executed by Messrs. Hart, Son, Peard, & Co., in memory of Charlotte Brontë, the eminent authoress, who for many years resided at the vicarage, and where her works for the most part were written.

**TENDERS**

For repairs, &c., at Chestnuts, Crouch-end, for Mr. Hicks. Mr. J. Farrer, architect.	Repairs, &c. New Porch. Southcott	£148 0 0	—
	Ogden	114 0 0	£83 0 0

### The Activity of the Building Trades in 1881, as shown by the Parliamentary Returns.

It is beyond the limits of the *Builder* to pursue into any great detail the general movement of the trade, commerce, and finances of the country, except in so far as the study may throw light on the probable activity of the building trades, the price, import, and distribution of building materials, and that change in the localisation of industrial activity which so immediately affects both the amount of rents and the demand for the construction of new houses. As to this, we have more than once called attention to the fact that the builder

follows closely on the heels of any movement that increases the shipping activity of special ports, towns, and harbours; and, indeed, that building may be said to march hand-in-hand with maritime activity.

It is, in this view, a matter for no little consideration to observe that the year 1881, for the first time in the present century, has witnessed, as far as statistics may be relied on, a direct check to our mercantile maritime movement. From the year 1800 to 1840 the growth of our shipping was without parallel, example, or approach in the history of the world. The tonnage that left our ports in 1840 was rather more than twenty-four times the aggregate amount of that which left our ports in 1800. Nor were these exceptional years; that marvellous increase was not made by fits and starts, but was as steady as it was swift. It was mainly due to the application of the steam-engine to industrial purposes, and to the immense preponderance which the possession of our coal-fields, and the command of machinery unknown elsewhere, gave our manufacturers in the markets of the world. As far as our inland communications went, our roads and their service were at their acme of perfection; our canals did the heavy work of transportation very cheaply, and our railways were just commencing their activity.

From 1840 to 1880 remarkable progress was no doubt made, but it followed a much diminished rate of annual increment, when we compare, not bulk with hulk, but percentages of growth.

Our export tonnage was multiplied rather more than sixfold in this period. It may almost be said to have been created in the first forty years of the century; it was increased fourfold in the next thirty years, but the amount reached in 1872 was increased by only 36 per cent. by 1880. With that year, as far as figures yet go, the crest of the wave was reached. The tide has turned, and a sensible ebb has set in. We are far from asserting that the check is permanent; nor do we wish to take the disagreeable office of predicting misfortune. But it is idle to shut our eyes to facts; and the facts, as far as they are represented in the Statistical Abstract of the United Kingdom for 1881, are such as we now cite. The total tonnage of British and foreign vessels (sailing and steam), which entered and cleared the ports of the United Kingdom, from and to foreign countries and British possessions, in 1881, should have been, if the average increase of the last fifteen years had been maintained, about 800,000 tons more than in 1880. On the contrary it was 786,518 tons less, being a movement in arrear of almost equal amount to the expected movement in advance. The fact that this phenomenon has now occurred for the first time in the century is one that demands very grave consideration.

One other fact may be cited, in abatement, to some extent, of the menace of the foregoing. The diminution in the tonnage of cargo-laden vessels is not so great as the general diminution. For the last fifteen years the proportion of vessels entering or clearing our ports in ballast has steadily diminished, as compared with that of the cargo-laden vessels. In 1867, out of 32.7 million tons of shipping, 28.1 million tons were cargo-laden. In 1881, out of 57.9 million tons of shipping, 49.5 million tons were cargo-laden. The tonnage of cargo-laden vessels entered and cleared in 1881 was only 117,550 tons less than that in 1880. The number of men employed in the British and foreign trade was very slightly less in the latter year than in the former. But the vessels on the register, although 661 fewer in 1881 than in 1880 had a tonnage of 156,000 tons more. And the activity of the ship-builders, so far from having experienced any check from diminution of traffic, has increased. The number of vessels built and first registered in the United Kingdom in 1881 was larger than has hitherto been known in any one year, with the sole exception of 1874, and was actually 24 per cent. more than in 1880.

If the great barometer of shipping tonnage thus points to change, the no less important indications afforded by the statistics of our mineral produce give the signal "set fair." The coal raised in 1881 was five per cent. more than the yield of 1880. The estimated value of the coal won, at the place of production, has followed the same ratio. The increase in the total value of the coal and metals produced in the latter year is not much less in proportion; the yield of 1881 being almost exactly the

double of that of 1860. Putting these various returns together, it seems pretty clear that our home trade is increasing more than our foreign trade, a sign which, in itself, is one of comfort and of hope. Not that we would have the foreign business less, but that we would have the home business more. The activity of the builder is far more likely to be measured by that of the miner than by that of the shipper. In fact, while our purchases from the foreigner (so far as they can be measured by the total value of imports and exports) are 1.42 millions less in 1881 than in 1880, our sales to him are more by 10.6 millions sterling of value. This turn in the tide, at which we are convinced most men of business will rejoice, is not only promising in itself, but also to a great extent explains why the decrease in cargo-laden vessels is so much less than that in the general mercantile tonnage. In 1880 the excess of imports over exports was 124,000,000. In 1881 it was only 100,000,000. Without entering into any debatable matter with reference to the balance between our incoming and our outgoing business, it is tolerably certain that the more nearly an actual balance is approached, the less necessity will there be for the departure of vessels in ballast from our ports. It is, then, possible to reconcile a decline in shipping tonnage with an advance in national prosperity; and such, we venture to hope, is the true outcome of the returns.

It is, however, the fact that the gains arising from any profession or trade, including the property on railways, canals, mines, gasworks, waterworks, &c., as far as they are measured by the income-tax returns, are less by rather more than three per cent. in 1881 than they were in 1880,—less, in fact, than in any year since 1874, when the amount returned under this head was about 400,000L. more than last year. The owners' value of lands and tenements has increased by more than 2½ per cent. in the year; the occupiers' value is nearly stationary. On the whole, the income-tax returns show that the slight decrease in our wealth within the year of 1,200,000L., is the balance between the natural increment from economy,—spending less than our income,—and the decrement in the activity of trade. These returns, however, are not exactly parallel to those as to shipping and mining, as they are made up to the 5th of April, 1880, instead of to the end of 1881. The increase in the value of lands and tenements is due in no small degree to the builder, the valuation of houses in 1880 being 5,000,000L. more than in 1879. Since 1860 the value of houses has increased in England from 66,000,000L. to 100,000,000L.; and in Scotland, from 6,000,000L. to 11,750,000L.; while in Ireland it has sunk from 3,450,000L. to 3,160,000L. The extraordinary activity of building operations in Scotland, showing a duplication of value in fifteen years, must be due in no small degree to the immense impulse given to the industry of

the Valley of the Clyde by the improvement of the navigation of that river. And, considering the intense and increasing interest which our great manufacturers are taking in the subject of inland waterborne communication, as to which not a week passes without some fresh indication, we think that the difference in the annual value of English, Scottish, and Irish house property is pregnant with significance.

#### MEASUREMENT AND DESIGN.

At one of the Royal Academy exhibitions, not long ago, we were reminded by Mr. Marks, in his own peculiar vein of dry humour, that "science is measurement," the sentiment being illustrated by the representation of an aged and cautious *surveyor* carefully measuring the separate bones in the skeleton of a bird, with a view to establishing and noting down its proportions. The ornithologist's position in this case was a perfectly logical one, and the motto might, no doubt, be much more widely applied, and would include subjects coming under our special domain. To the engineer, for instance, science is measurement,—measurement of strain, of forces, of co-efficients of friction; almost everything which he does is reducible to measurement in one way or another, and the more accurate his measurement the better will his work be, and the more likely to prove durable. As has been indicated in an important article in our last number, there seems every probability that it was to insufficient and theoretically inaccurate measurement of wind-force that the lamentable fall of the Tay Bridge was, in a measure at least, to be traced, and that it was at least most improbable that its unfortunate engineer, though he cannot be held altogether free from blame, would have allowed so inadequate a margin of strength if he had been in possession of a more trustworthy theory on which to estimate the pressure of wind. And of course to that portion of the architect's work which is essentially practical the dictum applies as fully as to that of the engineer, in theory at all events; though, in fact, the architect is less often called upon to deal with structures in which the question of strength and stability occupies so completely the foremost place, and requires such nicety of calculation, because it is very seldom that he is called upon to build for practical security alone. The mere demands of architectural effect necessitate, in many cases, a larger margin of stability than an engineer would consider it his duty to allow consistently with the economics of construction. Apart from this, however, of course the architect's practical work is concerned with calculation and "measurement" in the same way as that of the engineer.

The question about which there has been, and no doubt will continue to be, much more difference of opinion, is, how far this element of measurement enters into and influences the other side,—the artistic side,—of architecture. There are, of course, two different relations of measurement to architectural design; that in which measurement is applied to ascertain the proportions of old buildings, and that in which it is used to evolve and regulate the proportions of new ones. Of the use of measurement with the former object we were reminded again by the account of the labours of some American students, whose first report of their work in Asia Minor was noticed at some length in our last number. The employment in which our American allies have shown such praiseworthy zeal and desire for exactitude is exactly analogous to that of Mr. Marks's ornithologist measuring the skeleton. Measurement is the most certain or the only way of arriving at exact conclusions in regard to the main dimensions of an edifice, and the proportions of its details so far as they are measurable, and of gaining ground on which to base any theory in regard to the canon of proportion which may have been followed by the original builders, or as to whether or not they did follow any canon of proportion. In this respect the more recent students of architectural remains in Asia Minor have no doubt valid cause to complain of their French predecessor who has left such an unfortunate character for inaccuracy; though if all draughtsmen and measurers who had published inaccurate drawings of architectural remains were to be arraigned in like manner, the list of defaulters would be a very long one. There is no class of illustrative drawing among which such extraordinary and perverse in-

accuracies are to be found than among architectural drawings and engravings, which appear to become more wild and inaccurate the further back we go from the present time. The drawings of Villars de Honecourt form a notorious instance, in which a Gothic architect bent on building in the style of his day apparently found it absolutely impossible to draw buildings which he saw before his eyes, not in decay, but in a comparatively fresh stage of their existence, without putting in his own fancies, inextricably intermingled with vague representations of something like the actual detail. When the time came that Gothic buildings were sketched, as they occasionally were, by draughtsmen of the Renaissance school who had no eyes to see correctly the Mediaeval detail, and when the drawings were subsequently translated into engraving by engravers who further misrepresented the drawing, which was itself a misrepresentation, the results were, in a different way, just as curious and as wide of the mark. In modern times the scientific spirit which has exercised such an influence over almost every department of human life and human work, has had its effect on architectural sketching and drawings as well as upon more important studies, and of late years architectural students have been over and over again exhorted to measure in addition to sketching, and to make measured sketches their chief work in carrying away records of existing buildings; and the feeling in favour of greater accuracy and conscientiousness in these matters has so far spread that probably we shall never again have to complain of such inaccuracies and absurdities in architectural illustrations as those which, at one time, were contentedly accepted without question or criticism.

These conscientious efforts to secure accuracy suggest, however, one or two lessons for us in regard to the limits which are placed to the measuring system in illustrating architecture, and the snares into which it may lead the practitioner. One of these is the desire on the part of the draughtsman to find a geometrical system in the building which he measures. The very act of illustration by means of measurement seems to lead the mind in the direction of looking at everything from a geometrical point of view. One or two coincidences of measurement suggest a special theory of proportion, and that once suggested to the mind it is wonderful what a tendency there will be in the dimensions subsequently taken to accommodate themselves to the supposed theory. Fractions of inches, or even of feet, which do not fall in properly, will be dismissed as trivial, or as due to settlement, or some other cause of disturbance; and with these little helps and accommodations a very consistent and beautiful key to the law of proportion of the structure, and the theory of its builders, may be made out, published, and adopted by as many readers as are predisposed to take similar views, or are from any other cause easy of conviction. The strength of mind to resist all these snares, and to confine the operations to recording with the greatest possible exactitude the actual dimensions existing, leaving it to be seen afterwards how far they will lend themselves to any consistent theory, is not given to all. In saying this, we are, of course, not controverting the idea that there has been a use of strict modules of proportion in architecture, or that some such cases have been rendered obvious by measurements of the structure; but we hold that the temptation to imagine and thereupon to discover their existence is very great, and has certainly not always been resisted.

One thing, however, every one may admit, viz., that where geometric proportions do exist in a building, measurement properly conducted may and will discover them, unless the building should have been so shaken in its lines by disturbance and settlement that its geometric proportions are practically destroyed. But there are qualities in most architectural monuments that are worth anything, as there are in most works of art of every kind, which measurement cannot thus accurately discover and represent. Even the more prosaic and practical details of ornament included under the head of mouldings present great difficulties in regard to their accurate reproduction, which can only be fairly met by the agency of special contrivances for recording them automatically. And still more is this the case when we come to that class of detail which represents the higher form of ornamental work, rising in scale from sculptured

foliage or other ornament to the highest class of ornament, decorative sculpture. If this work is to be reproduced and illustrated, we know that something more than the mere measure rule and compass must come in here. We know that there must be the mind to appreciate the expression and style of the work, the sensitive eye to detect the little minutiae of modelling which no measuring can hunt out or give expression to, and the trained and delicate hand to transfer the outline and the effect to paper. In dealing with this part of the work we are in the region of purely artistic production, and experience constrains us to admit that though science may be measurement, art is not measurement. Mr. Penrose could give us the mathematical expression of the curves of the Parthenon columns and entablature, and they could be drawn out again from their elements as thus expressed; but not the most accurate measurement (and none could have been more accurate than his) could have given us in measured dimensions the mathematical expression of the *Thesens*, nor could any hand reproduce it with the same precision with which the proportions of the building could be reproduced by measurement. Art, as we have observed, is not measurement; and if so, may not the converse question be added, "Is measurement art?" And how does the answer to that question affect some theories as to architectural and decorative art?

Architecture is believed by many people to be an art,—not, like engineering, a science alone; a creed of which, it is needless to say, we are adherents. It is also a belief held by some, though not so numerous a body, that architectural design, to be true and permanently satisfactory, must be based upon regular ratios of proportions in regard to height, length, and breadth, and in the proportions of details to the whole. The advocates of this view of architectural design (many of whom, it may be observed, are not practical architects) are severe against what they call the haphazard way of designing to which, those, they say, are reduced who do not pin their faith to any theory of proportions. Such persons are only able to design by trying various effects and proportions in sketches, and finally accepting what seems best to the eye; whereas the man armed with a theory of proportion has his way marked out for him, and has only to decide the dimensions of one or two leading lines of his building, and the other proportions follow as a matter of course. Without saying at once whether this is or is not the best way of producing buildings that are satisfactory to the eye, it seems certain that this kind of design by calculation is not "artistic" design in the sense in which the words are generally used. As we have seen, the higher we rise in the scale of art, so far as the accessories of a building are concerned, the less possible is it to reduce these to measurable expressions, and to illustrate them by means of measurement. If this is the case in regard to the parts, are we then to take it that the case is just reversed when we come to the whole, and that the building itself is higher in the scale of art when its method of "design" is capable of expression in figures, and depends upon the exact observance of minutely measured proportions. There is no doubt that if we take any well-known and well-designed style or order in architecture, we find certain general proportions of parts which cannot be widely departed from without offending the eye and the judgment of every practised architect; just as in the human figure we find a certain normal proportion of parts which cannot be widely departed from without a similar unsatisfactory result. In both these cases, however, we believe it is impossible for any one to assert positively, or at least to prove his assertion, that the proportions which seem satisfactory to us in the building and in the figure acquire this satisfactory character from any source but that of the habit of eye, coupled with the knowledge which experience gives us as to the proportionate strength required in different portions of the human frame or of the built structure. We are accustomed to see the column, capital, architrave, and frieze of any one of the Greek orders exhibiting certain general proportions of scale, and to see any of the members of that order of architecture decidedly differing from the customary scale would annoy our taste; but this is probably only a matter of habit of perception, unless in such a case as, for instance, making the columns much too thin for stability. In that case our knowledge of the strength of

materials would come in, and the result would seem unsatisfactory, whether we were used to such proportions or not, if the column were actually doing the work of a support, and not merely part of a superficial imitation of construction. And, therefore, no doubt, things being as they are, the man who had studied the general proportions of the orders would be more readily able to make a design satisfactory to our taste than he who had not. We should feel a slip from these recognised proportions just as disagreeable as we feel a slip in grammar when we hear it; yet the rules of grammar are not part of the inner and necessary nature of things, but the result of custom and general agreement as to the relations of words; and so with the architectural design. In like manner an artist would have more readiness and power in drawing figures of the highest type if he had arrived by study and observation at a clear opinion as to the best normal proportions of the figure, which merely means the proportion embodying the most typical form selected from the average of the best available specimens of humanity.

But in both these cases it is one thing to have a settled idea as to the best proportions of the order, or the Gothic bay, or the figure; another thing to make a necessity of carrying out these proportions according to minutely-graduated dimensions, the relations of which can be expressed in figures, and their existence thereby proved to the understanding, but which the eye has no power to take certain cognisance of. If a painter told us not only that the general proportions of the heads, bodies, and limbs of his figures were in accordance with the best canon of proportion obtained by observation and measurement, but that their features were also minutely regulated in the same way, and that only thus could the true human expression be attained and represented by the artist, we should anticipate the result in a set of faces, handsome perhaps, but rigid in feature and monotonous in expression, and we should be disposed to answer him with Bacon's saying, that a painter doubtless may make a more beautiful face than ever was in reality, but that he must do it "by a kind of inspiration, as a musician produces an air, and not by rule." And may not the same answer apply to architecture? If a man tells us that there is a special proportion in all the parts of his building, so that all, down to the smallest detail, follow a certain rule of ratios of proportion, and that this has been so conscientiously carried out that a difference of an inch in the entire width of the building would impair its harmony and consequently its beauty, and that proportions of mouldings have been carried down to a small fraction of an inch, it is certain that a mind not prejudiced in favour of any mathematical theory of proportion, but judging by the power of observation of a trained eye, would regard as useless pedantry a theory which dealt in proportions so minutely balanced that the eye could not estimate them, and the mind could only be made to understand their existence by a process of calculation and expression in figures,—a theory which told him that the relations of height to breadth were calculated by inches or by still more minute fractions of the module adopted, when his experience told him that these proportions might vary even as much as a foot, or a whole module, one way or another, without the spectator being able to say positively, from the evidence of the eye alone whether the demands of the theory had been fulfilled or not. Bacon's remark about music, to which we referred just now, has, in fact, a more direct bearing by analogy on the subject than many people are aware of,—more direct than Bacon himself was aware of. For modern investigations have placed it almost beyond doubt that our musical scale itself is in the main arbitrary; that, with the exception of the fifth, which is settled by its occurrence in the harmonic series and by other considerations, the other intervals might have been almost anything else which the original and half-conscious framers of the scale had chosen to make them; that the satisfaction of our ear with the scale as it exists is chiefly that of habit (to a great extent inherited); and, more significant still, that a large proportion of the intervals and combinations preponderant in music are theoretically wrong and incompatible with each other, and that intervals and harmonies which are represented by the same written signs ought theoretically to vary in two or three different ways according to their relation to the con-

text, and that by a very delicate and trained ear their differences from what the notes theoretically ought to be are, in some cases, even quite perceptible. All this, or most of it, has been discovered since the greatest musical compositions (the architecture of sound) were put together, and the great composers mostly knew nothing about these facts, and cared less. They wrote from the sense of melodic feeling and expression, and from the gradually increasing sympathies and habitudes of the cultivated ear in regard to harmonic combination, and the mathematical part of the matter has been discovered since. The older composers were very much bound down to rules in another sense,—rules as to the progression and succession of harmonies,—and the great composer of each succeeding epoch has broken through and set aside some of these rules, showing that good effects could be produced apart from their observance, and thus approximating more and more continually to the conclusion which has even been deliberately expressed, that "whatever has a good effect is right."

The analogy between music and architecture has been so often (and not unreasonably) drawn that there is less reason to apologise for the question whether there may not be a great deal in regard to even the superior forms of architectural design which may be judged in the same way as we judge about music. Looking at the matter in this way, we may be at least allowed to imagine that architectural beauty, like musical beauty, is evolved from a sense of beauty and harmony of contour and proportion in a trained mind, acting through the eye, without the necessity of mathematical rules of proportion to guide such an eye; that in architectural proportion, as in musical proportion, "whatever has a good effect is right," and that this "good effect" is evolved and appreciated by the feeling and the eye, and not by formulae; and we might even venture to suggest that if the Greeks were really so much under the dominion of a mathematically expressed theory, as some people suppose, the monotony of expression, which is, perhaps, the one serious shortcoming of their exquisitely refined architecture is actually due to this subordination to an arbitrary theory, just as the comparative monotony of expression in music is due to their compliance with arbitrary rules, from which the composers of the romantic school, like the architects of the romantic school, emancipated themselves.

We may pursue the subject further in another manner, by considering the proper influence of measurement and measurable proportion in architectural detail and ornamental design.

THE ART OF THE ARABS.\*

THEIR secular art, the art of their palaces and their houses, is broader and more tolerant. We are all familiar with the effigies on their coins, the figures and animals engraved on their vases, and painted in their manuscripts. With the Arabs, however, their rigorism strangely fettered their artistic skill. It cannot be said that the Arabs have ever shown the power of carving or designing a plant; in their hands it possesses none of the realistic character we see in Classic art and its direct derivatives. This, of course, is the great feature of Arab art, which is merely conventional in its representations, using flat patterns as it does flat colouring varied only by simple lines. But their artists work with the utmost neatness, and their repetition of geometric forms is positively bewildering in its methodical variety and refined beauty. As a detail it is beyond doubt that the Egyptian hieroglyphs suggested to the Arabs the use of inscriptions as a form of decoration. Their art, sober, delicate, and, at its birth, frail, was, we have evidence, far less geometric than it eventually became. Their architectural surfaces were bare, broken only by a few small windows, arcades, or some slight ornamentation placed without much geometric precision, but invariably expressive of a refined fancy. Later on they covered their surfaces more fully, and geometric symmetry is more studied. The decoration is a wealth of splendour, but merely the variation and repetition of the simplest geometric forms; the slightest change of line permits of an infinite variety of

ornament, and what we admire, is after all chiefly the work of an indomitable patience.\* Very different is the spirit to that in which some choice detail of foliage or some saint-protecting niche or canopy was sculptured by a contemporary artist in the Gothic cathedrals of the North.

By their conventional representation of the beauties of nature, it is difficult for us to understand how their artisans conceived its expression; it would seem, as has been suggested, as if their sentiment was analogous to that by means of which music is felt, and that their creations were the combinations of notes, of figures, and of lines; compositions, the basis, the support, and the source of which was geometry, forced on them for their decorative elements by the exigencies of their religion.

One element in the formation of their art must not be overlooked, the surroundings in the midst of which the Arabs lived. For the Arab, as far as the early Jew, the only monument he knew was the tent, his only luxuries his tissues and arms. His habits were in no harmony with the richly-sculptured surfaces of the Greek and Roman art he abhorred, and remains of which he met in every direction. Forbidden to use for decorative purposes the representation of man and animals, there alone remained geometry, the creative element of all the principles on which the material order of the universe is based.† Their art, therefore, is essentially decorative and all superficial; in architecture Arab art shows itself essentially the art of a poor people; it builds rapidly and not too well, with fragile materials, largely using coloured tiles as easily made, effective in decoration, and costing less than sculpture; but it is to be noted that, wherever there existed important monuments built of solid materials, there the Arab conquerors built their mosques with equal strength. In India, in Egypt, their architecture is massive. In Persia, where the anterior civilisation had but a feeble architecture, the Arab architecture is equally fragile. In Spain and Africa the Moorish architecture is purely decorative, a fact which constitutes its inferiority, and the reason why it is impossible to form a judgment of its spirit by a mere acquaintance with its Moorish creations. The interest of Moorish Spain and Algiers, roused by poets and by travellers alike, the romance of the Alhambra, is still, as it was when the West was first made acquainted with the East, almost entirely the sole conception formed of Oriental art. All its creations, as has been urged, are seen through the glamour of the Alhambra. A familiarity with Arab art is alone to be gained by a study of its productions as they are to be seen scattered over the vast area which their armies conquered, stretching from India to the South of Europe. It is an art to be judged by other standards than those by which we criticise the art founded on the model of Greece. It is an art profoundly influenced by its surroundings, by the climate, by the spirit of the people, by the life they led.

Ebers has remarked that the Arabs in Egypt never used in their edifices any Pharaonic relief, a fact which, doubtless, may be attributed to some superstitious fear. He describes the old mosques as originally in no way houses of prayer, but formed of an open court-yard, surrounded by a portico supported on columns, those most decorated being invariably turned in the direction of Mecca, the city where rest, as is well-known, the remains of the Prophet. The minaret, so essential a feature of the Arab mosque, was not, it appears, in use at the outset, and it would be very difficult to exactly decide on its origin. Was it suggested by the obelisk? by the architectural piers which flank the doors of the Egyptian temples? by the towers or observatories of Assyria? by the strange Phœnician tumular edifices? the legendary columns of Solomon's temple, which were Egypto-Phœnician-hebraic? by the towers of the Christian churches or the donjons of our feudal castles? The first minarets appeared at Damascus in the eighth century.

The oldest mosque, that of Amr the first conqueror of Egypt (in Cairo) bears no trace of what we understand as arabesque ornamentation.

\* M. Bourgoïn's two works on Arab architecture cited before, will be found to afford the most valuable information relating to the elements of Arabic decoration. M. Bourgoïn has dissected the apparently complicated mode of interlacing-Saracenic decoration, and has shown its simple formation to rest on purely geometric forms. To those studying the decorative arts, M. Bourgoïn's works will be found to be of the utmost value.  
† Viollet-le-Duc.

\* See p. 202, ante.

tation. Arab decoration was not, as we have seen, a sudden creation; such as we find it, it was elaborated from existing elements after the time that all imitation of living nature was proscribed from the temple.

It is a peculiar feature of Arab architecture that it will be found to copy everywhere, as has above been remarked, the monuments existing in the countries conquered by their armies. In Egypt, in Arabia even, the primitive architecture preserves a marked and borrowed style,—Persian, Assyrian, and Phœnician,—to such a pitch that a strange analogy will even be found between these edifices and certain Etruscan tombs; the generally differing styles of both being derived from a common source. Other constructions, again, such as fortified gates, have a marked Roman character, and singularly resemble the military European architecture of the Middle Ages; they possess the same strength and solidity, and doubtless were copied, some from the buildings erected in Syria by the Crusaders, others from the military architecture of the Byzantines. In other directions the Byzantine style is again traceable, notably in the bulbous cupolas.

When, at length, the Persians, become Muslims, adopted an architecture many features of which,—the broad ogival arcades and the long slender bays,—were handed down from the Greco-Roman period, the Islamites adopted the new Persian style, which we soon see spreading throughout the whole Mussulman territory. As it is impossible not to perceive, there are often striking analogies between certain characters of the Arabo-Persian style and that of our Northern Ogival or Gothic.

The use of brilliant colours for decorative purposes, introduced in mosaic, in tiles, and bands of stones of various colours, is, as is well known, a leading element of Arab architecture,—an element introduced with the Renaissance into the architecture of Italy. At the outset the Arabs used the glass mosaics of the Byzantines, and imitated very closely in their tissues and carpets and rugs the Greek stuffs. Later on the Syrian and Persian fabrics appeared to them more appropriate to their tastes and symbolic ideas, they adopted their use, and applied not a little of their style to the design in their stuffs. This it is not difficult to confuse the early Arab tissues with those of Byzantium, but later on the Mussulman decoration assumes a character of its own which is markedly distinct.

Islamite art preserved zealously almost all the great industries which existed in Persia and in the Egyptian territory when in the seventh century the Arabs took possession of the country; their tissues, their pottery and glass, their metal vases, their arms, ivories, inlaid and carved woods, leather work, and their delicate book illuminations. It is none the less certain, however, that little by little the exclusive rigorism of the sect of the Sunnites, became fatal to art. Even with those who tolerated the representation of the human figure, scruples seem often to manifest themselves; for on a large number of metal vases, of pieces of pottery, and even of illuminations, the face is not expressed; the oval of the head will be found left void. The representation of the animal caused far less embarrassment to the devotees, to judge by the works of art which have been handed down to our time.

Islamism, however, it cannot be denied, exercised on art a fatal influence by impelling it in one and that a special direction. Throughout the civilised world each people had till their time personified the various forces and phenomena of nature under the forms of divinities. To each of these was given the features and the costume of the race, surrounded by the animals and the plants of the country, introduced into legends typical of the national customs. Art under these influences became great, it became an important factor in the civilisation of the world, one of its most active agents. Islamism dealt a fatal blow by breaking this living tradition, by severing the bond which united God to man, to the animals and to the plants, and reducing all the decorative forms to a mystic and geometric abstraction. But even under these numbing influences the human intellect struggled violently to assert its power. In the works of these simple artists and artisans there is still evident the effort to express the force of nature. The beauty of the vegetation, the melancholy of the desert, the deep blue of the sky, the grandeur of the setting sun, the splendour of the peacock in his glory, we feel sure, stirred

their artists as they traced their brilliant designs, as they painted with their bright colours their gorgeous tiles and illuminated manuscripts, and wove their brilliant stuffs, and circled with their red bands the delicate minarets of their mosques. Music in colours, such has Islamite art been defined, and its efforts show singularly the earnestness of its artists in the use of the simple means at their disposition, when we see how profoundly it stirs our sense of admiration. But, after all, in spite of the exquisite beauty and variety of Sarcenic art, which authorities have found in many details to excel even that of Gothic in its best days, how far behind our vast, our powerful, and perfect artistic conceptions of ideal beauty does this art of the Arabs fall.

#### THE WATER SUPPLY OF ALEXANDRIA.

At a time when the word "Egypt" finds an anxious echo in so many English homes, it cannot fail to be of both general and special interest to give information as to any of those physical facts which, taken together, make up the outline of the situation in which our troops will so soon find themselves. And from this point of view it is of especial interest to watch those points when Eastern and Western civilisation come into contact, or it may be into collision. In no respect is there so broad a contrast between the principles (if we cannot say the habitual practice) of the East and of the West, as in what relates to sanitary measures. We may say that in the countries tenanted by the more intelligent Western nations it is agreed that there is such a thing as sanitary science, and that attempts are made, however inadequate and however spasmodic, to carry out these principles in practice. In the East, on the contrary, there would seem to be no admission of any such doctrine. Climate, race, religion, or all—we do not wish to say anti-sanitary,—but fail to find a more expressive or appropriate word. The luxuriant languor produced by the beams of an Egyptian or a Syrian sun is wholly incompatible with any sustained energy in the construction or the visitation of drains and sewers. Bathing, no doubt, is in Mahomedan countries, a luxury as well as a religious observance; but there is a great difference between the ablutions prescribed by Islam and the devotion shown by the Englishman to the morning "tub." While as to the most obvious precautions for preventing the distribution of germs of disease,—Bismillah, many a Moslem, not to add many a Jewish doctor, will be only too apt to regard them as somewhat profane, as a flying in the face of Providence, and as an infidel doubt of the truth that "what is written" (in the book of fate) "is written."

In Syria all this has borne a fruit which must go for much in any sane forecast of the future of that country. The supplies of water are so poisoned by the neglect of sewerage that fevers of more or less venomous nature are all but unavoidable. And there is ample evidence to show that the mere precaution of the use of condensed water makes a difference in the death-roll of European troops much more important than the result of a great battle or even of a series of battles.

Alexandria is for the most part supplied with water for domestic purposes by a canal. The old canal of Alexandria is often referred to in the Napoleon correspondence at the time of the seizure of Malta and of Egypt by the French in 1798. It was probably of date coeval with the foundation of the city. Mehemet Ali, when Pasha of Egypt, conceived the statesman-like idea of enlarging this ancient aqueduct into a true canal, fitted to discharge the three important functions of water supply, irrigation, and navigation. In 1842 this enlarged canal, called after the Pasha the Mahmoudieh Canal, was connected by a lock with the River Nile at Atfeh; and in 1849 M. Linant de Bellefonds, a French engineer, erected at Atfeh steam pumps and machinery for pumping water from the Nile into the canal. This, however, was intended only as a subsidiary source of supply, and, in point of fact, M. Linant de Bellefonds, in his "Mémoires sur les principaux Travaux publics en Egypte," which is the source of most of the information now accessible on the subject, complains that owing to the habit of feeding the boiler furnaces of the pumping machinery with old chopped straw, only about one-sixth of the calculated duty is performed by the engines.

The true feeder of the Mahmoudieh Canal is

the Canal de Khatab, which falls into the former also near Atfeh, its course being nearly right angles to that of the larger waterway, which is about parallel to the shore line of the Delta. But the Khatab Canal is almost torrential in the movement of its waters, which have a fall of 24 ft. in their course. Owing to this, it brings down such a quantity of mud and silt as to render it essential frequently to clear the Mahmoudieh Canal from its unwelcome contributions. This, however, has been wholly neglected, and the Mahmoudieh Canal is now so choked as to be impassable for vessels, and to yield very little water for irrigation; while as to the supply of water for domestic use at Alexandria, it is necessary to keep the canal so full,—up to the very top of its banks,—as to endanger the latter, and to make it a very easy matter to cut off the supply of Alexandria.

The population of Alexandria (without, of course, making any allowance for our troops) is stated in the last returns that we have seen at 214,000 souls. Comparing the water-supply of Toulouse and Besançon with that of other and more generally known towns, M. Linant de Bellefonds arrived at the allowance of one cubic metre of water per diem for ten souls. This is almost exactly 22 gallons per day per unit of population. Toulouse allows 80 litres, or 17½ gallons, and Besançon 100 litres, or 22 gallons, the latter thus being taken as the guide in the case of Alexandria. At this rate, 214,000 metric tons of water per day, or nearly 9 cubic feet per second, is required for the population,—a supply which ought to be increased by at least 20 per cent. under present circumstances. Alexandria is one of the few habitable cities which does not receive from the sky in the course of the year a supply of rain-water adequate for the wants of its population, if properly caught and kept.

There can be little doubt that by the exercise of a little wise forethought the measures which are now demanded for the service of our own troops may be so carried out as to confer lasting benefit on the inhabitants of Alexandria. The clearing out of the Mahmoudieh Canal is an operation which is demanded, so far as we can rely upon the very competent authority of M. Linant de Bellefonds, for the security of the water-supply of the city. To do the least that can be done would be a poor economy. Engineering science indicates that the Canal should be restored to a condition in which it may fulfil its two originally designed duties of water supply, irrigation and navigation. The prolongation of the channel to link together the Rosetta and the Damietta branches of the Nile, which was designed by M. Linant de Bellefonds, would no doubt be an admirable measure for Egypt. It is not demanded for our own immediate need, as, although its economic value would be considerable, its military use is less important for a power that commands the sea. In 1798 the essential element of dominion over Egypt was wanting to Napoleon. Before he had been a twelvemonth in possession of the country, notwithstanding the most arbitrary and severe regulations (admirably as they are calculated from the military point of view alone), his clear-sighted genius had convinced him that the holding of Egypt was a matter of days for a military force cut off, as was his, from its base. The only aid to this effect, however, that is to be found amid a cloud of regulations, embracing every conceivable detail, from the foundation of an "Institute of Egypt," to the order for the discontinuance of the *sous-pieds* to the soldiers' pantaloons, is in a despatch to the Directory, when, demanding a fresh supply of 6,000 men, with specified quantities of fusils, sabres, munitions, saddles, and other implements of all kinds, he quietly remarks,—"If you cannot find the means to make these things reach me, you had better make peace, as I shall be reduced in six months to 15,000 troops, which is not a number adequate for the occupation of the country." That he did not stick at trifles in order to spare his troops is remarkably illustrated by the despatches, in which he urges Kleber and Desaix to "faire couper cinq ou six têtes par jour," in order to check the natives how to behave (as *conduire*), and in which he requests the Sultan of Darfour to send him 2,000 black slaves "à mon compte."

In spite of the gigantic character of the military genius of Bonaparte, his expedition to Egypt must be put down as a costly blunder. But from the records of his incessant activity, and of the provisions of a genius which foresaw

everything,—except the battle of Aboukir Bay, and the subsequent landing of Sir Ralph Abercrombie,—there is very much for us to learn. The cynical had faith displayed towards the Grand Master of Malta,—and, indeed, towards any person in authority whom Bonaparte found it advisable to address,—is as much without excuse as (it is to be hoped) it is without example. But of the eminent value of the labours of the engineer Bonaparte was to the full aware; and we hope that the able men now in command of our expedition will, in this respect, take a leaf out of the book of one who, despite the frightful defects in his character, was one of the greatest captains the world has ever seen.

The allowance of twenty-two gallons per head of population per diem for the discharge of the Canal at Alexandria requires a considerably larger quantity to enter the canal. It is a remarkable fact that no cross-section of this work is given in the atlas to the "Mémoires" of M. Linnat de Bellefonds, nor have we been able to discover the dimensions in the Library of the Institution of Civil Engineers. Assuming the width at 40 ft., as the evaporation in Egypt is as much as 13 ft. per annum, we cannot put it at less than half an inch per diem at the present season. This gives a quantity of 8,800 cubic feet per mile, which is equal to 12,400 metric tons per diem, in addition to the figures above given.

In the event of such a restoration of the canal as is demanded by the wants of civilisation, it will become of primary importance to ascertain whether any attempt was made by M. Coste, the engineer of Mehemet Ali, to puddle the waterway. The enormous discrepancy pointed out by M. Linnat de Bellefonds between the calculated and the actual duty of his pumping machinery, seems to us to point rather to defect of puddle than to the use of straw as fuel. But this is only a suggestion, made in the absence of more exact information.

#### CONTINENTAL GATHERINGS.

In these days, when so few matters practically are free from the keen attacks of criticism, art, from all time has been a fair field for severe strictures, could scarcely be expected to escape. The shuttlecock is gaily kept flying backwards and forwards, from critic to critic, from school to school, a general standard, it may be remarked, being thrown to the winds, what is abused by one is lauded by another; the various systems of art-education in vogue, or advocated by different authorities, it can easily be understood, have not fared better; and it does, indeed, seem difficult to please, not every one, but even any one. Of the sister arts, perhaps, architecture may be said to have come in for the severest attacks from the modern critics. It is not alone its creations that are criticised, it is its modes of instruction that are found fault with. In France,—to judge at least by a Parisian contemporary, the esteemed *Gazette des Beaux Arts*,—it would appear that there are influential authorities who deem, from an observation of recent exhibitions, that far too much attention is being paid to drawing in architecture, a detail in the many other serious items embraced in the education of the young architect,—a necessity, it is true, as a means of expressing his ideas and conceptions, but dangerous when made to take too prominent a place in his studies. It is to the importance given to mere graphic skill, to the "get up" of the drawings, that is attributed the absence from the yearly exhibitions of the more prominent members of the profession. It is an old quarrel, not only in France, but with us. Even here, to award prizes to architectural drawings, which are merely the scheme of the real work to be carried out, is thought by some overstepping the mark.

It is not alone from across the Channel that complaints reach us from time to time concerning the condition of contemporary architectural studies. The "Backwardness of American Architecture" recently formed a striking leader in the pages of an excellent New York contemporary, the *Critic*:—"Although in painting, and, perhaps, in sculpture also," remarks the writer, "the United States are improving from year to year, it is astonishing how architecture drags behind. An enormous

quantity of building goes on here. Wards spring into being in a few years. Burned cities rise again before the ruins have done smoking. But the edifices, although sometimes loaded with ornament and constructed of costly materials, are seldom the work of an architect in the true sense of the term as now used,—namely, a master of building; as one says, a master of fine art. They are the works of masters of mechanical and technical art as opposed to the fine arts. In New York it will be the merest chance if the next public building or costly edifice does not fall into the hands of men who are not able even to sensibly fit modern European ideas into architecture." Our American contemporary very properly complains of the complacency with which the public regards its ugly buildings. A lavish expenditure on the part of the wealthy seems incapable of producing any satisfactory result; while the experiment tried by the Union League Club,—the wonders of which, it will be remembered, were fully described and illustrated not long since, in the pages of one of the Anglo-American magazines,—only showed how grievous may be the elementary mistakes in architecture made even by a body of men of taste. "It is evident," remarks our contemporary, "that in the building committees appointed there is seldom or never a majority competent to select the best architect and get from him work that is worth the money expended." It would appear also that in order to obtain work the architect has not infrequently to stultify himself; under such conditions how is it possible for him to work well?

Pretentious communities require pretentious buildings, conditions under which it is difficult to expect results of a high character. Were a more modest and an honest course pursued, our contemporary urges, a marked improvement could not fail to assert itself. "Millionaires would not build palaces in six months, but would employ architects to do work quietly; hasty work would be discontinued. The main point is, that the demand should be a demand of taste. Architects cannot be independent,—cannot educate the public,—cannot wait till they are dead for recognition. They depend almost as directly on the public as the actor, and their audience is neither so numerous nor so ready to be pleased with what is set before it. Until the public shall reform,—until the press shall begin to call owners and architects to account for vulgar, stupid, and ridiculous work,—there is no hope for American architecture. At present it represents the mere brutal force of money more than anything else. It shows, also, restlessness, vagueness of purpose, smattering of foreign styles. No wonder that many people prefer the barren monotony of bricks and mortar to the ineffectual efforts of our unhappy architects. And along with a thorough and searching criticism, such as the press can give, must go, on the side of architects and owners, the most elaborate drawings and models of projected buildings. For, alas! the building one in a place is there practically for ever. Criticisms are forgotten, and people accustom their eyes to the ugly mass. Then associations give it dignity, and the city is saddled with a dull and pointless building, to which the citizens cling with a fervour worthy of a St. Peter's or an Alhambra."

A few days since a most agreeable and original entertainment was given in Paris by M. Bartholdi, the French sculptor, to a number of guests on the platform of the scaffolding,—to which the luncheon was hauled up by ropes and pulleys,—of his colossal figure of Liberty, the figure it will be remembered, which is eventually to be erected in New York Bay to commemorate the alliance of France and America in the War of Independence. We have classic evidence that the Colossus of Rhodes measured about 105 ft. high; the colossal figure of San Carlo Borromeo on Lake Maggiore is only about 3 ft. higher. The American figure of Liberty is to be no less than 137 ft. in height from its feet to the extremity of the torch in its right hand. The work is now rapidly progressing, and the completion is promised for the end of next year. The portion which is set up reaches above the knees, over 38 ft. As may be imagined, in the execution of so gigantic a work the difficulties to be grappled with are not a few. In addition to the large number of models which have had to be made by the artist himself, a huge framework, a skeleton of the figure has had to be built up, this requiring, as may be imagined, a scaffold

of no small dimensions. Over the framework is laid a thick layer of plaster, to which again is attached, in pieces, the model cut in wood across the grain, so as to enable the bronze plates,—of which the figure is to be built up,—to be hammered, while hot, to the requisite shape; the plates, 2½ millimètres, about 3-32 of an inch thick, being eventually riveted together. This method has been adopted in preference to casting the figure in bronze, from motives of economy. According to Pliny, the famous Mercury of Zenodorus,—a colossus some 110 ft. high,—and which gave its name, it may be mentioned, to the Colosseum of Rome, cost some forty millions of sesterces, hard on 180,000 of our money. M. Bartholdi reckons that the expense of his figure will not exceed 28,000. The proceeds of a most successful lottery have already covered any possible contingencies. The statue completed, its power of resistance to the wind having been taken fully into account, it will be set up on a pedestal about 165 ft. high, erected by the Americans. Some idea, therefore, may be formed of the feature the figure is likely to be in New York Bay. With the huge suspension Brooklyn Bridge spanning the North River on one side, and on the other the figure of Liberty on Bodloe Island off the Battery, New York Bay will be a sight to be seen by the lovers of the extraordinary.

It was one of the wisest dearest to the heart of Garibaldi to see the Roman Campagna reclaimed from its uselessness and danger to the health of the capital. The work promises slowly to progress. Within a short time the municipality of Rome have published the report of Dr. Giuseppe Pinto on the hygienic position of Rome and the surrounding *campagna*. "At the moment of proceeding to the great hydraulic work of draining the Roman *campagna*, and improving the hygienic condition of the capital, one of the first operations to be undertaken," writes the Doctor, "is to drain the valley of the classic Arno, on the Via Appia, at about 500 paces from the Porta San Sebastiano. Without this preliminary and useful work, it is scarcely possible to hope for the development of the neighbourhood of the Aventine. The sum set down in the budget, 65,000 lire (2,600), for draining the basin of the Arno is insufficient. The general hydraulic works and partial replanting once executed, then habitable centres can be established. It is the political aim of Rome, as the capital of Italy, says Dr. Pinto, that the malaria, the result of causes more accidental than natural, should disappear, and the adjoining country become inhabitable during all seasons of the year, in order that the commercial and industrial existence of Rome may no longer suffer, and that the vital movement of the nation towards the capital should in no way be compromised."

The Architects' and Engineers' Congress, to be held in Rome, in December next, has been announced in these pages, and, as has been stated, the new National Gallery of Modern Art will then be thrown open, if not indeed earlier. The King of Italy signed, not long since a decree, establishing the institution. It is to be situated,—of all appropriate places in the city of so many artistic memories,—in the Thermes of Diocletian, so familiar to all Romans as the cloister of Michelangelo, overshadowed by the picturesque cypresses which are almost the first feature the stranger remarks on arriving in Rome by its modern entrance, the somewhat prosaic but handsome railway-station, round which the new life of the Italian capital is now centring. A sum of 100,000 lire (4,000) is to be devoted annually to the purchase of works of contemporary artists. In spite of the existence of our Chantrey fund with its equal sum, when are we in England to own a modern National Gallery such as the French possess in their Luxembourg, the Belgians in their new Palais des Beaux Arts, the Germans at Berlin, the New Pinakothek at Munich, and now the Italians in Rome?

On Thursday in last week was opened at Paris, in the Palais de l'Industrie, the seventh biennial exhibition of the Union Centrale des Beaux-Arts. The exhibition this year is, as we announced some time since, specially devoted to tissues, wood industries, books, and printing. As previously, there are two distinct sections,—the modern and the retrospective, this latter containing a most characteristic and valuable series of loaned objects. We hope, at a later date, to be able to speak at some length of this exhibition, which is of exceptional interest,

## HYDE PARK CORNER IN PARLIAMENT.

ALTHOUGH the debate on this matter on Saturday last, initiated by Lord Elcho, terminated in the agreement of the Committee of Supply to the preliminary vote of 3,000*l.* for reconstructing the reservoir now in the Green Park on another site, we hope the matter is not yet to be regarded as settled, especially as the last speaker on the occasion, Mr. Warton, pointedly suggested the desirability of giving more consideration to the subject. Other schemes besides the official one may require the removal of the reservoir; though the objection made to that vote, that it was asked for without the slightest indication as to where and in what form the reservoir was to be re-erected, was a perfectly pertinent one. The whole action and spirit of the present First Commissioner of Works in this and other matters call for very decided interference. We have had a great deal of mischief done by predecessors in the office, but we have hardly had any one who seemed possessed by such determination to thrust his schemes upon the public on the strength of his own confidence in their excellence, and to chop and change things at his own pleasure.

It is a pity that the opposition raised in the House to the scheme in question, and the rival scheme proposed by Lord Elcho, presented very weak points which could not but afford scope for effective reply. Lord Elcho made the mistake of proposing far too much, and of unnecessarily moving the park screen, just as the First Commissioner unnecessarily removes the Wellington Arch,—the removal being in each case to a less effective position. Lord Elcho should have left all that alone, and confined himself to pointing out how the traffic could be inexpensively relieved by continuing Hamilton-place under the angle of Constitution-hill,—a scheme which, as has been pointed out by a correspondent in our own columns, is perfectly practicable. Lord Elcho's plan also showed this feature, and that is the only one in his plan which really bears on the main point in a practical sense. His road, however, is very poorly laid out, in no regular curve of any kind, and, therefore, even in regard to this part of the scheme, his plan did not show it to the best advantage. It is exceedingly unfortunate, too, for the Institute of Architects that they should have gone into opposition in a manner which left the First Commissioner so many points open for retorts, which we will not recapitulate here, being bound to maintain a certain *esprit de corps* in regard to the only representative body of British architects, but which we cannot say we think were unreasonable.

That, however, is beside the real question. We will merely notice the points in the First Commissioner's reply which require notice. He referred to the old scheme for making a tunnel under the Green Park from Hamilton-place to Constitution-hill as unsatisfactory. Tunnels are always unsatisfactory in such a case; we only refer to the point because a good many persons seem to have confounded this "tunnel" scheme with what we may call the "bridge" scheme which we have referred to, and they have imagined that this was only the tunnel idea revived. There are, if not "insuperable difficulties," at least insuperable objections to the tunnel scheme, but there are no insuperable difficulties, and hardly any difficulties at all, in making a road over which Constitution-hill can be carried on a bridge. The First Commissioner said it was a condition for relieving the traffic that the arch should be removed, because otherwise Grosvenor-place could not be widened, which was necessary in order to relieve the block. It has been pointed out already that Grosvenor-place could be widened for carriage traffic by the width of the footway adjoining the arch, which could easily be removed by providing another foot-passage leading up to Piccadilly by the east side of the arch; and certainly it is an easier and simpler thing to move a footway than to move the arch. But the widening of Grosvenor-place is not the essential point. It is astonishing that it should be necessary to point out that the block at Hyde Park Corner simply arises from the fact that for the space between Hamilton-place and the arch, all the north and south traffic is turned along the east and west route. That is the whole difficulty about which such rare's nests have been made: and the only thing wanted to relieve it is to get the north and south traffic off

that piece of road, on which it has, by common sense, no right to be. That can be attained by continuing the road in its proper direction and running it under Constitution-hill, and the whole of the First Commissioner's big job of pulling down and re-building will not do one thing more to relieve the carriage-traffic than that simple plan would effect. But what about the unfortunate foot-passengers? The matter seems to have been looked at entirely from the point of view of people in carriages. If this Government scheme is carried out, all the thousands of foot-passengers who daily traverse Piccadilly east and west will be pelt to inconvenience, delay, and even danger, for perhaps generations to come. Let any one who has the capability of realising the effect of traffic on a plan look at the official plan, and say if this must not be its inevitable result. This seems to have escaped the notice of Lord Elcho, who might have made a far more effective point than any in his speech, if he had brought forward this serious and perfectly avoidable public inconvenience which is to be inflicted. Such matters seem to be beneath the consideration of the Office of Works, but the fact will be discovered and will become matter for serious and continued complaint if the scheme is carried out.

As to the injury to the effect of the arch in its proposed new position, the authorities seem to have no more clear idea about that than about the inconvenience that will be inflicted on foot passengers. What no one seems to realise is, that the arch will be shunted downhill, and that it will stand on the side of a slope with the ground higher on one side of it than on the other. These would be strong objections in any case; they are stronger when the removal is shown to be quite unnecessary. And no one who understands the feeling and *motif* of Classic architecture can possibly doubt that the arch standing opposite to and parallel to the Hyde Park screen makes a far better grouping,—the two objects flanking the main roadway into London, and mutually assisting each other's effect,—than if the two were entirely dissociated from one another. The First Commissioner quoted Mr. Street's authority to the effect that the arch would not be impaired in appearance by the proposed removal. If he had quoted Mr. Street in regard to some question about the treatment of one of our cathedrals, we could have understood it. That Mr. Street had any claims to be considered in any special degree an authority on Classic architecture, or on the laying out of sites, we certainly did not know. How much the judgment of those who are forcing on this matter on the general question of taste is worth, may be surmised from the fact that it was deliberately proposed to put the equestrian statue up again, after rebuilding the arch, and thus to make over again one of the silliest blunders that has ever been made in such matters. This intention, however, we are glad to hear, has been abandoned.

It is the assertion of the First Commissioner, upon which he has more than once laid stress, that his plan had "given general satisfaction" to the members of the House and to the press. In regard to the latter point, we have observed that the opinion of the daily journals is by no means unanimous: one important evening paper, for instance, more than once condemned and protested against the plan in the strongest terms; and we ourselves might, perhaps, be excused for thinking, without vanity, that the opinion of a journal especially devoted to architecture was of considerably more weight in regard to such a subject than that of a whole mass of general daily papers, the writers in which rarely even endeavour to understand matters of this kind. How much their opinion is worth on the present subject may be judged from the ridiculously inaccurate way in which the discussion was reported in some of them, in which various schemes were all mixed up and confounded together, while one paper spoke of the statue and the arch as being "no doubt only too well fitted for each other," quite unaware that the arch was the work of an eminent and cultivated architect, which had been nearly ruined in its effect by a bad and disproportionate statue never intended for it. The members of the House, whose "general satisfaction" is quoted, do not as a body know much more about such matters than the newspapers; and it is certainly significant that the only architect who is a member of the House, Mr. Peattie, expressed decided disapproval of the scheme; so that there are very important deductions to

be made from the First Commissioner's claim to have given general satisfaction. We shall, at all events, endeavour to promote a wholesome dissatisfaction with his scheme,—with the greatest respect for himself personally,—as long as it seems of any use to do so.

We give elsewhere some notes of the discussions on the subject which have taken place in Parliament during the past few days.

## FOREIGN PICTURES.

It seems but a few years ago that the London picture season was said to commence with the opening of the Royal Academy on the first Monday in May, and to end with the close of that august institution, in the last week in July. In those days, about thirty years ago, the exhibitions that lovers of pictures looked forward to were the Royal Academy at Somerset House (and a little later in Trafalgar-square), the Suffolk-street Gallery, as it was and still is called, the Old and New Water-Colour Societies, and the annual exhibition of the collected pictures purchased by the Art-Union of London. These exhibitions, with the addition of now and then some Bond-street or Egyptian Hall show of a characteristic work by a popular painter, composed the whole of the summer artistic attractions, until later in the year the British Institution in Pall-Mall opened its doors to the lovers of old art, when such collections were offered to their inspection as have ever since, to those who recall them, seemed the greatest artistic treats in their memory. It is true that most of the treasures many remember to have seen at the British Institution have since been shown to the younger generation at Burlington House, and not a few, owing to the liberality and patriotism of our collectors, are now hanging on the walls of our National Gallery.

At the exhibitions of modern art in the past we had to be content with the works of English artists alone. It was very rarely that the work of a foreign painter found a place in our London public galleries, and the mass of lovers of art in England were scarcely in any degree familiar with the work of modern foreign artists. Indeed, it may be said that this year's picture season has been the first to really familiarise the London public with foreign art, and in all conscience we must admit that there has been no lack of means of acquiring that kind of information. Not only has the past picture-season been characterised by the number of foreign pictures that have been exhibited, but by what may fairly be said to be the extraordinarily high prices that have been realised by works of art. In this respect, it appears that season after season adds something to the commercial value of certain pictures, and notwithstanding startling prices that we have for years heard of as given for the works of famous masters, we have almost reached a point when we cease to be surprised.

Certainly it may be said that the interest of the past picture season has chiefly centred in the great acquisitions made by the nation at the Hamilton Palace collection sale, of more than a dozen choice works by the great old masters. But markedly characteristic in our modern English art is the absence in any of our exhibitions of any strikingly representative picture, excepting always the fact that a great English portrait-painter has again shown to the world the ability of the English school to assert its traditional supremacy in this direction.

The collection of Mr. Watt's works at the Grosvenor Gallery has been another feature of the past picture season. We have more than once in these pages spoken in praise of the practice of gathering together the works of single painters, as being so advantageous in obtaining a correct appreciation of the merit of the artist, and we are happy to find the practice spreading. The collected works of the late Mr. Palmer afforded a great treat to the lovers of landscape art, and there have been several other collections of almost equal interest, not the least of which has been that of Miss North's floral studies at Kew, which she has generously presented to the nation and,—important point,—thrown open to the public on Sundays. We are happy to see that this charming artist has just departed for another floral tour in pursuit of her beloved art. For the first time in the history of painting the American artists have made a decided mark out of their own country. Mr. Sargent's Spanish pictures, of which we spoke in reviewing the Paris Salon, not only

being exceedingly fine, but promising much more from so young a painter; and there are several others of his countrymen whose works, if less fascinating, may obtain an enviable fame in this country.

It would occupy considerable space to merely enumerate the commercial exhibitions in Bond-street, the neighbourhood of St. James's-street, and the City, that have occupied the attention of art-loving people during the last picture season; and those who have a taste this way, and may have simply followed a fashion, have been able to become familiar with the works of foreign artists unknown to many of us until this year. To all greatly interested in pictures, the lovely landscapes of Corot and of Diaz have long been familiar. It is not alone the works of such men as Corot, Meissonier, Millet, Dupré, Frère, Gérôme, and a few other names that have long been before the world, but we have [this year seen, almost in perfection, the modern Italian school, the works of Sigor Costa, Francesco Vinca, and a number of others, and we have been made more familiar with the French painter De Neuville. We have had opportunities of seeing not only the works of M. Munkacsy,—they have certainly been sufficiently advertised,—but the works of Knaus, of Vibert, of Bréton, of Vantier, and a host of other foreign artists, many of their pictures now reposing in our country, and others that have been seen on their way to adorn the palaces that are rapidly springing up in America.

It cannot be said that one is tired of the artistic pressure that has been brought to add to the weight of our amusements, but it is not difficult to foresee the possibility of too great an amount of increase in this direction. If we are to have more, or even as many, foreign pictures to amuse us and to excite our love of accumulation, it certainly seems to suggest the possibility that our English artists might perhaps with reason be disposed to complain. Whether they do so or not just now, must surely be owing either to a contentedness in their own prosperity or an amount of courage in disregarding rivalry that we hope is sufficiently well founded. That the American painters, at all events, do not rest quite so complacently in this respect, is shown by their seriously discussing just now the desirability of taxing at so much the square inch (!) all imported pictures, on which already very heavy duties are laid, but although in a country like England, advocating, as so many of us do, the fullest exercise of free trade, we are not likely to tax the introduction of foreign art, yet certainly English painters have to look at least to their laurels, if in their comfortable security they have no fear for their pockets.

#### FROM CHRISTCHURCH BAY.

REFERRING to our description of the coloured decoration of the Church of St. Nicholas, Guildford, which, as we are told, excited much interest in the locality, a correspondent writes to us from Bournemouth, to call attention to the fact that the stone capitals in the chancel of the noble priory church of Christchurch, Hants, are painted, and that of the very same colour and tint with those recently so treated at St. Nicholas. Nor is this a comparison of minor importance. Christchurch, among its other rare peculiarities, possesses that of unusual precision of date. Not having been utilised as a cathedral, the stalls and miserere in the chancel are new,—allowance being made for natural decay (which has been somewhat more rapid on the north side of the choir, which is exposed to the full heat of the sun, than on the south side, which is sheltered from the rays) just as it was when the monks went out. We do not at this moment remember another church in which that is so remarkably the case. On the other hand, the Late Perpendicular style of the chancel alone, as at Christ Church, Oxford, but down to the very woodwork of the stalls, shows that this portion of the edifice cannot have been very long built before it ceased to be used as a monastic church. Thus it is not to be imagined that the bosses in the stone roof, or the capitals of the lofty columns, have been retouched since the Tudor times, and it is sure that in those times the colour must have been fresh. It is now in some places faded, in others more or less bright, especially the gold. Ent in the cavetto mouldings of the capitals, where

the sun when at the hottest can strike with only an enfeebled power, the colour is in some cases so full as to be yet evidently what it was originally intended to be. And here, as before observed, the tint is identical with that employed by Messrs. Clayton & Bell.

An architectural rarity, which may justly claim the title of a hijon, looks down on Christchurch from the wooded summit of the northern side of the bay. This is Highcliffe, the seat of Louisa, Marchioness of Waterford, which was built by her ladyship's father, Lord Stuart de Rothsay. This building is in some sort a permanent museum; as exquisite specimens of French or Flemish work, bought by the noble builder abroad, and set in his own work, adorn the edifice. There is a projecting oriel window carved in Caen stone, which was hought in Rouen, numbered stone by stone, taken down, transported and re-erected at Highcliffe in a galle end designed expressly for the setting of it. Again, a sort of curtain connecting two re-entering angles of the building, has a parapet of pierced stone, formed by old letters that make an inscription, each letter standing out against the foliage that casts a green sheen through the apertures.

It is a satisfactory piece of intelligence, as regards the safety of this charming mansion, that one of the fierce storms of the present year broke through the bar which the confluent rivers Stour and Aron have formed parallel to the beach, behind which the water ran for some mile and a half or two miles from its proper mouth, as if with the express intention of undermining the cliff which bounds the Highcliffe estate. This danger, by no means an imaginary one, is now no longer menacing. But what an idea does it give of our river conservancy, or rather of the absence of any such provision, that this mischievous process should have gone on unchecked for so many years, with the further results of heading up the floods in the river valley, and preventing their natural outfall into the sea, to the great loss and damage of the farmers.

#### MELROSE ABBEY.

IN connexion with its recent meeting at Carlisle, the Royal Archaeological Institute visited Melrose Abbey, where Mr. Kerr read an interesting paper descriptive of the history and architecture of the buildings. In the course of his observations he said that the name indicated the original appearance of the locality, being composed of two Gaelic words, *Mall* and *Rhoss*, or *Ross*, signifying a hare promontory. The name was formerly spelled *Milross*, now *Melrose*. The site was formed by the winding of the river Tweed through a narrow valley with rising grounds on either side. The locality had been distinguished from an early period, as it bounded in ancient remains of Roman buildings, ecclesiastical and baronial structures, cairns, and tumuli indicating the site of feuds and more formidable conflicts. In drawing attention to the abbey buildings, he would remark that where they now stood was not the site of the original monastery of Melrose, which was situated at old Melrose, nearly two miles further east. The site was still pointed out as the Chapelknope, but not a vestige of the buildings remained. Some carved red stones were dug up there a few years ago, indicating that the more recent buildings were in the Norman style. In the earliest period Bede stated that the churches were all of oak and thatched with reeds. The old abbey was supposed to have been founded towards the end of the sixth century, and afterwards dedicated to St. Cuthbert, its third abbot. It continued to be recognised as an abbey till 1136, when the present one was founded; afterwards it was referred to as St. Cuthbert's Chapel. The early ecclesiastics were Culdees, who existed up to the middle of the twelfth century, when they were merged into the Austin Canons, the order which they most resembled, and were afterwards only noticed occasionally until about the middle of the fourteenth century, when they finally disappeared. The present abbey was considered to have been a new institution, founded by David I. in 1136. None of the buildings of the period, if they did exist, could be identified, and it was probable that they were not so extensive as the subsequent erection. The Abbey of 1136 was ten years in building, and according to the "Chronicle of Melros," was dedicated to St. Mary in 1146. It was colonised by monks

of the Cistercian order from Rievall, in the North Riding of Yorkshire, who were the first of the order introduced into Scotland, and continued as its head while it existed in this country. The "Chronicle of Melros" was begun by the order establishment in 735, and continued down to 1270. The remains before them appears to have belonged to buildings erected after the demolition of David I.'s structure in 1322. Between this date and 1510 the present abbey had arisen which continued the Cistercian arrangement. There was one exception here to the general rule, by placing the garth or cloister court upon the north instead of the south side of the church. There were, however, examples of this deviation in England, as at Gloucester, Dore, St. David's, &c. It had been remarked that it was difficult to trace the progress of the styles of Scotland, on account of the sudden transitions that existed occasionally in the same building; but this was readily accounted for, from the frequent destruction of these during the invasions from England. The church presented unity of interest throughout, and as religious teaching and education was committed to its care, it became necessary even for the church's existence that her establishments should be placed in an efficient state as early as possible. The buildings were, therefore, restored according to the best examples, whether in style or arrangement. If the political situation of this country was such as to admit of architects, or master masons, being got from England, English features appeared; but if not, these were obtained from France. Thus they had in Melrose work of English character up to 1385, when the abbey was partially destroyed by Richard II., and from this period until 1510 the work in some places showed indication of French feature. He described the extent of property, which was large, which attached to the abbey, and other matters. Along with the decay of the reputation of the monks, from their indulgence in luxury and the grosser propensities, the abbey suffered many reverses, amongst the most prominent being its destruction in 1322 by Edward II. In 1385 it was burned by Richard II., and in 1545 it was literally destroyed, with the best of its outlying buildings, by the Earl of Hertford. To secure a portion of the nave to be used as a parish church the plain buttress and sub-vauling (which they saw) were introduced into other fittings in 1618, and continued in use till 1810. He pointed out various interesting architectural features of the ruins, and exhibited a drawing of a restoration of the grand east window. Around were the graves of several persons whose names appeared in history. Upon the south side is the grave of Alexander II., upon the north the graves of the Douglases,—the dark Knight of Liddesdale, and the hero of Otterburne." In the small chapel to the south of the altar is the grave of Sir Blyf Evers, and nearest the wall that of Sir Bryan Latoun (sometimes said to be that of Michael Scott, the wizard) who were killed at the battle of Ancrum Moor in 1545. At the entrance to the cloisters is the burial-place of the house of Yair, and opposite to it are the graves of the Kerrs of Koppilaw. The remainder of the paper was descriptive of particular features of the ruins.

Mr. Micklethwaite followed Mr. Kerr and spoke on the ecclesiastical and other aspects of the subject. Pointing to the rich and elaborate carvings of various parts of the ruins, he said it was an extraordinary place for the order of Cistercian canons, who in their churches gined at being plain. He described the subsidiary buildings, and from the chancel pointed out the doorways in the transepts and aisles, and described the buildings into which they led. In the guide-books the positions of the nave and choir had been reversed. The choir was really on the other side of what was said to be it. In the exterior view of the east window there were two figures which were said to be those of David I. and his Queen Matilda. He did not think the figures were correctly described. His opinion was that the figures represented the crowning of the Virgin.

**Glasgow Municipal Buildings.**—The authors of the design bearing the motto "Gauntle," one of the four specially selected in the final competition of ten, are Messrs. Thos. Worthington & J. C. Elgood, 110, King-street, Manchester.

SPECIAL LEGISLATION FOR THEATRES  
IN AUSTRIA.

The Commission appointed by the Governor of Lower Austria, and consisting of official representatives, architects, engineers, and scientists, which, in the first place, had to suggest measures of safety, upon the adoption of which by theatrical managers the granting of official licences to them was made dependent, have now also completed the second portion of their task. They have drawn up a set of regulations indicating the general conditions for the construction, arrangement, and working of theatres. Valuable material had been submitted to them in the form of opinions of engineering, architectural, and sanitary authorities, as well as numerous propositions for the prevention of fires in theatres, and foreign rules and regulations. On the basis of the resolutions passed by the Commission, the Governor of the province has published an order which deals with the question under seven different heads: 1, Conditions of construction; 2, the arrangement; 3, the working; 4, facilities for the construction of small theatres; 5, inspection of theatres; 6, theatre safety commissions (local and provincial); 7, general regulations. Under sections 1 to 6, it is ordered that new theatres are to be isolated, and erected at a distance of not less than 50 ft. from other buildings. The stage must be separated from the auditorium by a wall 2 ft. thick throughout, reaching from below the orchestra floor to above the roof, and having, besides the proscenium opening, only one means of communication. A vaulted corridor, at least 8 ft. 3 in. wide, must run round each tier of the auditorium, from which the public may leave by straight stairs leading to the open air. Every tier must have separate stairs on each side, and the stairs of the various tiers must not communicate with each other. Great stress is laid upon the point which deals with the impregnation (with non-flammable substances) of all objects on the stage,—furniture, decorations, &c. Sections 5 and 6 deal with the introduction of such rules as are necessary for continuously controlling the complete carrying out and permanent application of the conditions imposed. The control includes daily inspection by the building and fire-brigade authorities of the police; the appointment of local committees of supervision, who have to examine existing theatres periodically, and to report thereon; and, finally, the appointment of a provincial commission, acting with the provincial authorities, and exercising a continuous control by periodical examinations. In order to give full force to the above regulations, a special Bill is to be submitted to the Lower Austrian Landtag at its next session, which is intended to rectify existing defects.

## THE AMSTERDAM EXHIBITION OF 1883.

The establishment of direct water communication with the North Sea has done much to restore to the Venice of the North the marine supremacy it enjoyed in the times of Dutch commercial supremacy. This return of Holland to a more important mercantile position than she had occupied of late years is being celebrated by an International Colonial Exhibition, which bids fair to take its place amongst the most comprehensive and interesting of those displays as yet witnessed.

The fact that the official journal has already made its first appearance indicates that the exhibition is intended to be something more than a mere show, and that it will to a certain extent partake of the nature of the special exhibitions and congresses which have done so much towards the development of industrial art in England and upon the Continent. Important traffic facilities both by sea and land have been arranged for.

According to the official announcements already made, this exhibition is intended to follow in the wake of those of London, Paris, Vienna, Philadelphia, Sydney, and Melbourne, but special prominence will be given to colonial subjects. The following is the general plan of the undertaking.

1. The Colonial portion (which forms the basis of the exhibition), in which the different systems of colonisation and of colonial agriculture, as well as the manners and customs of trans-oceanic countries, will be shown. Their industrial progress will also be illustrated and an attempt will be made to delineate what still

remains to be done in the way of commerce and industry. Colonial flora and fauna will also be represented.

2. The export trade will be dealt with in a very comprehensive manner. Under this head will be grouped illustrations of many industrial processes in connexion with the transformation of raw materials into finished products.

3. Works of art from the most ancient times will be gathered together with a view of constituting an instructive *ensemble*, showing the ideas which have been developed in the succession of nations under the influence of civilisation. In this manner the comparative study of the fine arts at different periods and amongst different nations will be materially facilitated.

4. Temporary exhibitions (which have of late years done so much in the cause of art and industry) will form important features of the Amsterdam scheme. They will have special reference to horticulture, agriculture, &c., and Holland will itself contribute in a large measure to the expected success of this branch of the exhibition.

5. With an intelligent appreciation of the special advantages the conjuncture affords for scientific and artistic congresses, prospective arrangements have been made for *réunions* and conferences on subjects affecting education, arts, sciences, hygiene, political economy, international jurisprudence, and in which men of distinction in various branches are expected to take part. Colonial economy (as regarding the relations of colonies with the mother country) will form a prominent feature of discussion.

Nine galleries of the principal building are already built, and special attention is now being given to the portion of the exhibition in which the greater part of the machinery will be placed. The support of the various nations of the world which have been invited to take part in the display promises to be on a scale fully commensurate with the activity and intelligent energy shown by the administrative council.

PALACE OF COUNT DON PEDRO  
ANSÚREZ AT VALLADOLID.

VALLADOLID is commonly called the City of Don Pedro Ansuéz, and from this circumstance some are led to infer that this nobleman was the founder of the city. Authentic accounts, however, do not hear of the correctness of this supposition, for the existence of Valladolid can be traced to times anterior to the reign of King Alfonso VI. But Count Ansuéz, who enjoyed the protection of the King for his attachment during the persecutions carried on by his brother, Don Sancho, received the city as a reward for his services, and improved and embellished it in such a manner that he acquired the reputation of being the founder of that splendid city. Don Pedro and his wife, Dona Elo, erected several magnificent edifices. Among these may be cited the cathedral, Nuestra Señora de la Antigua, San Nicolas, and the bridge over the Pisuerga, as well as the palace in which they resided, and part of which we illustrate in this week's *Builder*. The palace, which stands on a site formerly outside the ramparts of the city, has now been converted into the hospital bearing the name of Santa Maria de Esneva, and forms one of the most important features of Valladolid. Count Ansuéz is buried in Valladolid Cathedral, and his tomb bears the following pathetic inscription:—

"The lives of the departed  
Admonish the living;  
But such is the change of the times  
That the mere mention of the dead  
Is offensive to the living generation."

## CHÂTEAU AT HYÈRES.

THIS château stands upon an eminence two miles from the town of Hyères, and commands a magnificent view of the Mediterranean. It consists of three reception and six bed rooms, with dressing and bath rooms.

It is built of local stone, with freestone dressings, from quarries near Toulon, and is fitted internally with pitch-pine.

It is surrounded on three sides by a broad verandah, and has every modern English appliance.

The builders are MM. Bosquet, from Marseilles, and the clerk of works is Mr. Gilling. The architects are Messrs. W. G. Habershon & Fawcner, 33, Bloomsbury-square, London.

THE COMPETITION FOR THE HOUSE  
OF THE GERMAN IMPERIAL PARLIAMENT.

HERR WALLÖT'S DESIGN.
