In many departments of productive industry, the nature of the output and the value it attains in the market gauges with very considerable accuracy the worth of the man who works the business, and his remuneration follows that assessment.

It is the misfortune of pharmacy that, in its pursuit, the reward of merit is less easily discernible. Medicine is so far from being an exact science that the importance of the skill and care of a dispenser only emerges into notice in those cases—happily few—in which the lack of them has led to serious or fatal misadventures.

The prudence of the chemist who disregards the admonition "not to be wise above that which is written," and substitutes ʒss. for ʒiss. of liquor arsenicalis, because he knows, from past experience, that the smaller quantity was what the prescriber meant, remains altogether unknown to the patient, and cannot influence his judgment as to the worth of the services rendered.

Putting aside those medical practitioners who despise drugs as instruments in the art of healing, or affect to do so, the great majority of the profession possess but a very limited and defective knowledge of drugs, or even of therapeutics; and, therefore, they lack the power to discriminate between good and bad pharmacy.

Too often they descend to the level of their patients, and accept the guidance of those manufacturers of ready-made compounds, who

rely upon bold advertisement; thus the dispensing chemist is virtually ousted from his work by the girl in the factory.

In the vast field of minor or fancied ailments, for which no one thinks of resorting to medical aid, the evil is greater still: the attitude of a large section of the public is to bar out of the competition the individual chemist with whom they enter upon any personal transaction.

In such a condition of public feeling it would seem hopeless indeed to expect that the use of capital owned by unqualified persons should be proscribed in pharmacy.

Yet we are, or should be, unwilling to loosen our hold upon such poor hopes of independent existence as remain to us.

The law requires that a licence for the sale of intoxicating liquors shall be held by a specified individual, regarding whose character testimony must be forthcoming, and whose place cannot be taken by another without the sanction of the proper authority.

That procedure is found compatible with the fullest extension of company trading. Can any similar system be devised by which the requisite responsibility in our calling can be fixed upon the proper person, while the individuality of the chemist can be maintained?

If the sale of methylated spirit and of patent medicines had been licensed to registered chemists only, the needful machinery would not be far to seek.

But the course of our fiscal policy, and our economic beliefs, have alike been inspired by those maxims of unredeemed selfishness which we call political economy. The chemist's timid plea for a living wage is drowned in the blatant bellowings of the devotees of cheapness. The public views with an indulgent, if not an admiring, eye the career of the company promoter who makes—and loses—a fortune of five millions at their expense; but grudges sorely the few paltry pence we claim in reward of our services. A mad world, my masters!

Amongst the throng of suggestions put forward for the solving of this knotty problem I will only refer to that of Mr. Barnard S. Proctor, who proposes to forbid "company pharmacy" unless the company be under the direction of legally qualified men only.

With that I heartily concur; but his further proposal, to register existing unqualified directors of drug companies, is a grievous mistake. No more fatal blow could be dealt at the advancement of pharmacy than to admit past usurpation as a valid plea for ranking equally with hard-won qualification.

That education and training are essential to the proper conduct, control, and management of the chemist's business is the bed-rock of our position; upon that we must keep our feet firmly planted.

In conclusion, I suggest with confidence that the wiser, bolder, and more logical course seems to be the adoption of a clause similar to that drafted by the Law and Parliamentary Committee, since from it we can fall back, under pressure of superior force, to the position of requiring all company pharmacy to be under the direction of qualified men; and yet a third line remains—that of seeking protection for titles only.

SOAP OF SODIUM DIOXIDE FOR ACNE.—Anhydrous soap containing from 10 to 20 per cent. of sodium dioxide, and made into a paste with liquid paraffin, has been used with marked success by P. Unna in the treatment of various forms of acne. The application is made from once to thrice daily, according to the severity of the case; a thin layer is spread over the affected parts and then rubbed over with a pad of wool, moistened with water, which causes the disengagement of oxygen and produces a lather. The friction is continued until the pain which it causes becomes well marked, when the lather is at once washed off with water. In the intervals of the applications the usual ointments used for acne are employed. In chronic cases, Unna commences by using a soap containing 10 to 20 per cent. of the dioxide, gradually diminishing the strength as the case progresses.—*L'Union Pharm.*, **40**, 391.

PHARMACEUTICAL SOCIETY.

Appointment of Examiners.

The appointment of examiners at the last meeting of the Council of the Pharmaceutical Society has now been formally approved by the Privy Council, as indicated by the following Order of Council:—

AT THE COUNCIL CHAMBER, WHITEHALL,
The 11th day of November, 1899,
By the Lords of Her Majesty's Most Honourable Privy Council.

PRESENT,
LORD PRESIDENT
LORD BALFOUR OF BURLEIGH
SIR JOHN GORST.

Whereas there was this day read at the Board a letter to the Clerk of the Council from the Secretary and Registrar of the Pharmaceutical Society of Great Britain, dated the 3rd day of November, 1899, in the words following:

"I have to acquaint you that at a meeting of the Council of this Society held on Wednesday last, the gentlemen whose names appear on the other side were appointed Examiners for the ensuing year, and I am requested to submit their names to the Privy Council in accordance with the provisions of the Pharmacy Act, 1868.

"Neither of the persons appointed has held office as a Member of the Council of this Society during the year preceding the date hereof."

ENGLAND AND WALES.

William Arkinstall	Alfred James Phillips
John Bretland Farmer	John Edward Saul
Edward H. Farr	Alfred Edward Tanner
R. John Harvey-Gibson	John Millar Thomson
F. Stanley Kipping	Harold Wilson
Ernest Saville Peck	Robert Wright.

SCOTLAND.

Isaac Bayley Balfour	Jonathan Innes Fraser
Peter Boa	James Jack
Alexander Davidson	George Lunan
Leonard Dobbin	James Fowler Tocher.

And whereas by the sixth section of "The Pharmacy Act, 1868" (31 and 32 Victoria, cap. cxxi.), it is provided that no person shall conduct any examination for the purposes of that Act until his appointment has been approved by the Privy Council.

And whereas it appears that the persons appointed are, as required by the Bye Laws of the Society, under the age of 65 years, that none of them have held office as Members of the Council during the preceding twelve months, and that no objection exists to the approval of the Lords of the Council being given to such appointments.

Now, therefore, their Lordships are pleased to approve the appointments of the said persons as Examiners for the year 1900 for the purposes of the Pharmacy Act, 1868.

A. W. FITZROY.

IRON LANOLINE FOR DIPHTHERIA.—O. Katz recommends, in the *Archiv für Kinderheilkunde*, iron lanoline in conjunction with antitoxin, for the local treatment of diphtheria. The ointment is composed of iron sesquichloride, 30; distilled water, 3; lanoline, 50. To be applied several times daily. J. Braun has also used a similar ointment, which he applies by means of wool smeared with the ointment, attached to a rod, with which, by a rotatory movement, the diphtheric membrane is removed, and the affected parts brought in contact with the ointment.—*Oesterr. Zeits. für Pharm.*, **53**, 453.

THE PROBLEM OF "COMPANY PHARMACY."

Agreement among the fifteen thousand persons whose names are on the Register of Chemists and Druggists being now a main desideratum in reference to "the problem of company pharmacy," attention may be directed to the important declaration of the President of the Pharmaceutical Society "that the members of the Council are agreed upon two great points, viz., to protect the titles and uphold the principles of the Pharmacy Act, 1868" (see page 490). That declaration appears to convey a statement of policy sufficiently definite to secure the adherence of all registered persons and to compensate for any disappointment caused by "skilful concealment" of views on that subject. But the policy indicated by that declaration appears to be directly opposed by the provisions of Clause 2 of the Companies Bill that would allow companies to use titles implying legal qualification and also to infringe the principle that persons engaged in the practice of pharmacy, should possess competent skill and knowledge. That fundamental principle of all the Pharmaceutical Society's work has been so much overlaid and concealed by consideration of trade interests that although, from the legislative point of view, the regulated practice of pharmacy has been reduced to the retailing, dispensing and compounding of scheduled poisons, the Pharmacy Act has generally been regarded as establishing a monopoly of the trade in drugs and all the other accessories of a chemist and druggist's business. To the influence of such erroneous opinion may be attributed the distinction made in the Companies Bill between the practice of medicine, etc., and pharmacy; the provisions affecting pharmaceutical practice differing from those affecting medical practice, as if the titles and qualification of pharmaceutical chemists and chemists and druggists related only to matters of trade.

Taking Clause 2 of the Companies Bill as indicating the nature of the provisions contemplated, by the Lord Chancellor and by the House of Lords' Committee, as necessary for the regulation of "chemist companies," it does not go beyond requiring that the business of a company shall be *bona fide* conducted by a duly qualified person. That may be understood as some recognition of the necessity for personal qualification, in order to make the Pharmacy Act effective for the attainment of its object—the safety of the public. At the same time, it involves the assumption, that contributed so largely to the decision of the House of Lords, viz., that the sale of poison is the great source of danger and, consequently, that qualification of the person actually selling is of more importance than qualification of the person who is the proprietor of a shop, and on whose behalf a sale is made. If the transactions referred to by that provision for regulating companies were simply matters of ordinary trade, the possibility of objecting to Clause 2 of the Companies Bill would be considerably reduced. That possibility might perhaps be altogether done away with, in regard to trade transactions, if efficient machinery could be devised for carrying out the intended regulation of "chemist companies." In support of such regulation the argument might be advanced that it would be consistent with the action of the Legislature in passing the Act of 1868 and in taking the assistant qualification as sufficiently providing for public safety. Now that the great majority of registered persons have passed the qualifying examination, the view may be taken that a legally qualified person, actually conducting the business of a "chemist company" as an assistant, would satisfy all the requirements of the Act and secure its object as well as if he were the proprietor of the business. That view of the matter would be a logical consequence of substituting the lower grade qualification that had been required for assistants, for the qualification that had previously been considered necessary for the proprietary exercise of the business. That result of the concession then made to those who took a trade view of the chemist and druggist's business, has gained such force, by the decision of the House of Lords and from the practice of companies, that many legally qualified chemists appear to regard their position as being lost beyond any possibility of recovery, so far as necessary qualification of the proprietor of a business is concerned.

Without admitting that there is an inevitable need for recognising company pharmacy, consideration of the view that some regulation of companies should be adopted, in order to remedy the abuse of chemist companies, will show that there is still considerable ground for objecting to the provisions of Clause 2 of the Companies Bill. Taking, in the first place, the business that is to be *bona fide* conducted for a company by a duly qualified person, the claim may reasonably be made that it shall be conducted in a manner consistent with the object of the Pharmacy Act and with the provisions that apply to individuals carrying on business on their own account. The person whose qualification is to give sanction to that mode of carrying on the business of a chemist and druggist should, therefore, have a more prominent and responsible position in connection with the business than that of an ordinary assistant or manager, who would be the servant of the company that owns the business. Some further regulations might be necessary

in such a case, accordingly as the business carried on was essentially of the nature of trade, *i.e.*, the mere sale of poisons, drugs, and medicinal preparations coming within the scope of the Pharmacy Act, or when it included also the more professional duties of dispensing medicines. If companies are to be allowed to carry on business of this latter kind by the agency of qualified persons, much more stringent regulation would be requisite than in the case of mere trade sales, in order to meet the view of the LORD CHANCELLOR that the public has a "right to know that its medicines are compounded and dispensed by qualified persons." Under existing conditions there is no sufficient guarantee for that being the case; for if companies are to be regarded as outside the scope of the Act they would be under no obligation to employ qualified persons to conduct either the sale, dispensing, or compounding of poisons. Nor would there be any adequate means of ascertaining improper procedure in such cases by companies.

If, therefore, companies carrying on business as chemists and druggists are to be subjected to regulations as the LORD CHANCELLOR thinks necessary, because companies "ought not to be permitted to do what a private person is prohibited from doing," Clause 2 of the Companies Bill does not sufficiently define the regulation necessary for that purpose. But the authority that clause would give to companies for using the title indicating statutory qualification, constitutes a much stronger ground for opposition to it, as being inconsistent with the LORD CHANCELLOR'S conviction "that a company ought not to be permitted to do what a private person is prohibited from doing." Opposition to that clause is still further justified by its proposal to allow companies to use the title of pharmaceutical chemist, which relates more distinctly to a professional practice, viz., the dispensing of medicine and the general practice of pharmacy. If a distinction can be made between that practice and the business of a chemist and druggist which partakes more of the nature of ordinary trade, there might be a possibility of compromise that would satisfy conflicting claims without interference with "any proper vested interest," and, on the other hand, without exposing the public to "the dangers of the practising of unqualified persons as dispensers." The carefully worded remarks of the LORD CHANCELLOR on the third reading of the Companies Bill in the House of Lords last August, may be interpreted as expressing the view that such a distinction is to be drawn: that there is a real difference between the professional duties of pharmaceutical chemists and that part of the business of chemists and druggists which is of a trade character. Regulation of the former would necessarily involve consideration of the qualification of a proprietor of a business—always held by the Pharmaceutical Society to be essential for the practice of pharmacy—and such regulation would naturally come within the scope of a Pharmacy Bill; while regulation of the business of chemists and druggists might perhaps be sufficiently adapted to the conditions of trade, to secure the object of the Pharmacy Act, 1868, and even admit of the personal qualification required by that Act being made an essential condition when a business belongs to an unqualified proprietor.—But as yet no plan has been proposed by which those objects would be secured.

SUGGESTED CLAUSE FOR THE COMPANIES BILL.

A CORRESPONDENT, who has apparently taken seriously to heart Mr. GLYN-JONES'S appeal that every critic of the Council's policy should draft and submit a clause for a Companies Bill, sends the following ingenious clause, which he suggests might advantageously take the place of Clauses 2 and 3 of the Companies Bill, 1899, if that ill-fated measure should ever be resuscitated;—

> In regard to any contravention of the Medical, the Dental, or the Pharmacy Acts in force in Great Britain (*or*, in the United Kingdom), a company or other corporate body shall be deemed to be a person, and shall be in all respect subject to the liabilities attaching to a natural person who infringes any of the provisions of those Acts or either of them.

He asks if this is not the kind of clause that the professions concerned might join forces upon? It does not prohibit the formation of companies to carry on the trading side of the professions, and it would only come into operation when a company or other corporate body (this covers the case of firms in Scotland) did something which the Statutes say an individual must not do. It goes direct to the root of the evil, and should meet with the LORD CHANCELLOR'S approval, inasmuch as it would greatly aid in preventing, if it did not entirely prevent, the compounding of medicines by incompetent persons—an evil his Lordship is greatly impressed with. In regard to existing companies and the "proper vested interests" mentioned in his Lordship's speech, the clause would not prevent those interests being conserved. If, for the convenience of the public, continues our correspondent, a company wishes to have a pharmacy on its premises, the object can easily and legitimately be accomplished—let the company arrange with a registered man to exercise his calling on the premises, which might be better for the company as well as for the registered man; for the one would receive a regular rent and the other might find advantage in a regular *clientèle*. The company, too, would escape all those little liabilities under the Sale of Food and Drugs Acts, Stamp Acts, etc., to which chemists are subject.

The suggested clause also preserves the principle of the Pharmacy Acts, and remedies without unnecessary verbiage the House of Lords' decision of 1881. However perfect that may have been from a legal point of view, so far as the determining circumstances were duly considered, it can be shown to have been contrary to public policy and to the manifest intention of the Pharmacy Acts; besides having given rise to the legal anomaly which the LORD CHANCELLOR has declared to be contrary to common sense. Objection may be made by the medical, dental, and even the pharmaceutical authorities that the clause would not remedy certain defects in their respective Acts, which is true enough. But it is contended that defects in a given Act should be more properly corrected by an amending Act of the same species. The merit of the suggested clause is that it does not deal with defects in any of the Acts quoted, but with a condition arising out of the operation of the Companies Acts, hence a Companies Acts Amendment Bill is the proper place for it. At the same time, the clause does not go beyond upholding the principle of the Pharmacy Act, 1868, as suggested by Mr. BULLEN, Mr. SMITH and — with commendable coherence—by Mr. GIFFORD (see page 519).

ANNOTATIONS.

Registered Chemists and Druggists, before resigning themselves to acquiescence in the view that regulation of "company pharmacy" is inevitable, will do well to consider, before it is too late, what would be the consequence of thus doing away with the provisions of the Pharmacy Act. If Clause 2 of the Companies Bill were enacted as it stands any grocer might convert himself into a company and have a notice posted in his shop that A. B., a duly registered person, there conducted, as his manager or assistant, the business of a chemist and druggist. In that way the number of chemists' shops throughout the country might be, to all intents and purposes, doubled, and the lawfully acquired interests of registered persons correspondingly damaged. Of the remedies proposed for such a state of things, the qualified directorate is probably the most fallacious. It appears to be an attempt to save the shadow of proprietary qualification in a way that would involve loss of the substance. In that respect it is open to objection, because it would curtail the privileges appertaining to qualification, and because it would fall short of securing the public object of the Pharmacy Act, inasmuch as the directors of a company would not be the persons conducting the business of the shop or shops owned by the company. The qualified assistant or manager plan is equally objectionable: from the chemist's point of view, because qualified persons would only be the servants of companies and, in the interest of the public, because it would do away with the necessity for qualification of the proprietor of a chemist and druggist's business, which is the really trustworthy basis of confidence. The only alternative mode of regulating "company pharmacy" appears, therefore, to be protecting the title and upholding the principle of the Pharmacy Act. The plain English of that is qualification of individual proprietors, and its effect would be the abolition of "company pharmacy."

The Pharmaceutical Position in Scotland puzzles a reader of the Journal, who cannot understand why the Pharmacy Act of 1868 should have been described by Mr. J. Rymer Young, in his interpretation of that Act (see *P.J.*, December 17, 1898), as being "practically a dead letter in Scotland." Why, he asks, is an ordinary firm held to be a body corporate north of the Tweed? We are unable to say more than that it appears to be an accepted principle in Scottish law, as illustrated by dicta by Lord Young (in the Leith Depôt case) and others. In a private letter recently received from a Scottish member of the Pharmaceutical Society, he says,:—"It may interest you to know that Scottish pharmacists are only indirectly interested in the Lord Chancellor's Bill; that is, those who really understand the situation. Even if passed to-morrow, it would be entirely inoperative in Scotland, because private firms are not affected by the Bill, and they can do all the things that only limited companies can do in England." The position in Scotland may be as stated; in fact, we know that counsel's opinion has been given to that effect. Assuming the position to be as stated, however, it is interesting since it appears to be another instance of the legal anomaly that has troubled the Lord Chancellor. If firms in Scotland can carry on their business as free from any restrictions imposed by the Pharmacy Act as a joint-stock company, they might, in that case admit unqualified persons as partners and they need be under no obligation to leave their pharmacies in charge of duly qualified individuals; but it is doubtful if they could legally sell poisons in the first part of Schedule A. For a would-be purchaser cannot be known by, or introduced to, an ideal person, nor can an ideal person make entry in a poison book of the necessary particulars, as required by Section 17 of the Pharmacy Act, 1868.

As Regards the Interpretation Act, which applies to Scotland as well as England, it certainly appears—as Mr. Rymer Young pointed out—as though that measure would permit the Council of the Pharmaceutical Society to bring actions under Section 15 of the Pharmacy Act against companies and other corporate bodies in Scotland. All offences under the Act in Scotland are "punishable on indictment or summary conviction," and the expression "person" in the Pharmacy Act would, therefore, seem to include a body corporate in Scotland. We understand, however, that counsel's opinion again blocks the way here. The Interpretation Act states that "in every enactment" the expression person shall include a body corporate, "unless the contrary intention appears," and the legal view referred to is that the contrary intention was made to appear by the House of Lords' decision in the case of the London and Provincial Supply Association. But a common-sense reading of the words of the Interpretation Act does not support that view; the "contrary" is to appear in the enactment under consideration, not in judicial interpretations thereof, and, until the contrary is specifically held by the judges to appear in the Pharmacy Act, 1868, such expressions of opinion as that of Mr. Rymer Young seem to be thoroughly justified. Mr. Young urged, in the address already referred to, that a test case should be brought under Section 15 against a Scottish limited company, the argument being pressed that the Interpretation Act renders a corporation a "person" within the meaning of the Section. Similar views are held by others in the ranks of pharmacy, who hold that—counsel's opinion notwithstanding—there is everything to gain and nothing to lose except the costs of the test case. As regards the latter, even if the case were lost, the money would be well spent, as the present condition of uncertainty as to what the law really is in Scotland would then be terminated.

That Blessed Word "Monopoly" is continually used by the self-constituted opponents of registered chemists, in their endeavours to injure the position of the latter in the eyes of legislators and persons in authority generally. The latest misapplication of the term appears in the *Grocer*, where it is gravely stated that chemists are endeavouring "to extend their monopoly" by attempting to prevent joint-stock companies from trading as chemists when they have a duly registered chemist's assistant upon the staff, also by extending the schedule of poisons which may only be sold by "a registered pharmaceutical chemist." A fine example of a diplomatic lie is the statement which follows, to the effect that chemists sought the aid of the Lord Chancellor, who, however, turned out a "regular Balaam," and instead of cursing the companies sought to bless them by introducing a Bill which made their title to carry on a chemist's trade even clearer than some think it is at present. Referring to the fact that there have recently been a great many discussions on this subject at meetings of pharmaceutical associations, it is quite correctly stated that at several meetings the claim was seriously put forward that chemists want the trade restricted for the public good; they do not desire to reap any personal advantage. The public good is the magnanimous object leading chemists have in view, and that is more than can be claimed for anything that is suggested at meetings of grocers' associations. The hysterical appeal to grocers to see that "the monopoly which the chemists secured by the remarkable reading of the Pharmacy Act of 1868 in the case of the Pharmaceutical Society *v.* Piper" is not further extended is perhaps excusable, allowing for the evidently perturbed state of the writer's mind, but he cannot seriously think that Parliament will relax the present insufficient restrictions on the sale of poisons. To talk of attempts being openly and covertly made in the direction of extending a non-existent "monopoly" is simply nonsensical, and it is equally absurd to say that proprietary medicine manufacturers and retailers will have to keep a sharp look-out during the next session of Parliament, to prevent further interference with legitimate and reasonable trading.

THE WOLVERHAMPTON CASE, referred to last week—in which, by the way, the defendant was fined forty pounds, and not forty shillings, as the compositor took it upon himself to state—is the subject of a communication from Mr. J. H. Coleman, who states that a protest from him concerning the misapplication of chemists' titles was unheeded by local newspapers. He says:—"I wrote a strongly-worded letter, in which I stated that there is no such title as 'unqualified chemist,' that the title 'chemist' was obtained after hard work and study, and that the editor of the *Midland Evening News* insulted chemists by giving the man that title." The letter, however, was suppressed, and the only response made was that the defendant had said he was "an unqualified chemist"; subsequently he was again referred to in the same papers as a chemist. Mr. Coleman asks what is to be done when "such pigheadedness" exists, and newspapers refuse to be fair. The only remedy is to keep pegging away, and urge other chemists to do the same. Every chemist in and about Wolverhampton should have followed Mr. Coleman's example. Protests should be entered, in such cases, by as many individual chemists as possible, as well as by a local association, if such a body exists. If the protests are ignored, copies of them should be sent to the Editor of the *Pharmaceutical Journal*, accompanied by the names of newspapers which have refused to print or notice them. In this connection it has been suggested to the Editor that—because a registered chemist (whose only qualification is that he was in business before August 1, 1868) was convicted at the same time as the herbalist, for selling spirit of nitrous ether deficient in strength—it would be wiser to remain silent with regard to the misapplication of the title "chemist" by local newspapers. But if Wolverhampton chemists are careful of their reputation and title they cannot afford to allow the latter to be applied indiscriminately to any dealer in medicinal articles, even though the reputation of one of their number has been unpleasantly besmirched.

THE CORRECTION NOTIFIED in the foregoing paragraph is, unfortunately, not the only one for which we must apologise to our readers this week. It may be taken for granted that no copy of a newspaper is ever produced without containing more or less serious errors, but in last week's Journal compositors and printers' readers appear to have emulated each other in making and overlooking mistakes. To such an extent did that occur that several words were omitted and wrong letters inserted after the matter had been passed for press. That is to say, after the Editor had marked the final corrections, the compositors wilfully altered what was right and made it wrong. Illustration of that excess of zeal on the part of the printers will be found in the otherwise excellent report of Professor Green's lecture at the Society's evening meeting last week. The most serious error in the report is at page 475, column 2, where line 33 was accidently dropped. The incomplete sentence should read as follows:—"When split up the formula of each product is $C_6H_{12}O_6$; one of these sugars produced by splitting up cane sugar deflects the polarised rays, etc." Other mistakes in the report and elsewhere are obvious, and we can only express regret that the compositors should have allowed themselves to be so carried away by exuberant energy. Such displays of eccentricity are, of course, not unaccompanied by a certain risk of resulting in mischief; it is hoped, however, that the steps which have now been taken will prevent any risk of that kind for the future.

FOOD PRESERVATIVES were under discussion at meetings of the Departmental Committee on Preservatives and Colouring Matters in Food last week, when Sir Herbert Maxwell, M.P., presided, and was supported by Professor Thorpe, Dr. H. Timbrell Bulstrode, Dr. Tunnicliffe, and Mr. Charles Huddart, secretary. A representative of the Grocers' Federation said it was now absolutely necessary to use borax or boric acid for preserving ham, bacon, and butter, on account of the great demand for a mild-cured article. These, he claimed, constitute the most effective preservatives known, especially for stopping fly-blow, and quite seventy-five per cent. of the hams and bacon sold in this country were said to be treated with them. After the bacon or ham has been prepared for cooking by the consumer most, if not all, of the borax or acid is said to have disappeared, so that in actual consumption the percentage present at the time the article is consumed must be small. A Kerry landowner, who has started a creamery for the benefit of his tenants, said that he generally sent to England butter described as "saltless"—that is, butter cured with one pound of boric acid to the hundredweight of butter. The preserved butter must be good, he stated, because impurities can be so easily detected in it, whereas in the heavy salted butter the salt, more or less, covers "sins" in the butter. Enormous figures were quoted by a representative of the London Chamber of Commerce, who said that the trade in Canadian hams had increased since 1889 from something like 300,000 dollars to 1,800,000 dollars in 1898, and that he attributed to the use of preservatives. If the treatment of hams by borax were prohibited, the whole of this gigantic trade from Canada would come to an end. There was also a very large and increasing trade in Australian butter, and that trade hinged upon the use of borax, the butter being washed in a solution of the preservative. The chairman of Hudson Brothers (Limited) said that his firm would have to give up selling cream, if the addition of boric acid as a preservative were prohibited. The evidence, upon the whole, in fact, was decidedly in favour of the use of borax and boric acid as preservatives being permitted to continue. No arguments of any importance have yet been advanced on the other side.

COLOURING MATTERS IN FOOD were dealt with by the representative of the preserved food section of the London Chamber of Commerce at a meeting of the Committee this week. He stated that sulphur was generally used in small quantities for dry fruits; it gave an artificial bloom to Carlsbad plums, for instance. Cochineal was used with many articles, such as jams and jellies; preserved cherries in bottles could not be sold unless they were so coloured. Copper sulphate was used for colouring greengages, peas, and beans; the public would not buy these articles unless they were artificially coloured a bright green. Preserved vegetables coloured by sulphate of copper were alleged to be eaten in all the leading hotels, restaurants, and clubs in London, and it was stated that no one had been injured in health by eating vegetables the colour of which was preserved by that means. The London Chamber advocated the imposition of a *maximum* quantity of sulphate of copper, say, two grains to a pound of peas; the trade would agree to the preserved vegetables being labelled, "These goods are artificially coloured"; but it would be difficult to say that a certain bottle contained so many grains of sulphate of copper. Asked by the Chairman if, on the use of strong poisons for colouring matter being prohibited altogether, the public would not be reconciled to buying things off colour, the witness said the public would rather do without the articles than have them of a pale colour.

THE CONFERENCE ARRANGEMENTS FOR 1900 will, presumably, be attacked seriously after Wednesday, December 6, on which day a representative General Committee will be appointed at a meeting in the Pharmaceutical Society's London House. As will be seen on perusing the letter of the honorary local secretaries at page 518, all pharmacists in London are invited to attend the general meeting, and are also privileged to subscribe to the proposed entertainment fund. Subscriptions are to be limited to two guineas in the case of individuals, or five guineas in the case of firms. Even with those limited amounts it ought not to be difficult to raise the three or four hundred pounds which it is estimated will be required. An important point to bear in mind is that it is not

sufficient to promise a subscription to the entertainment fund; the amount should be sent as early as possible to the Hon. Treasurer, Mr. J. H. Mathews, 68, Queen's Gardens, London, W.

Professor Johann Carl Wilhelm Ferdinand Tiemann died of heart disease at Meran on November 14. According to the *Times*, he was born at Rübeland in 1848, became a Ph.D. of Göttingen in 1870, and in 1882 was appointed professor of chemistry at Berlin University, undertaking from the same date the editorship of the proceedings of the German Chemical Society. Professor Tiemann was the author of numerous important researches having for their object the discovery of the constitution of the camphors, terpenes, and other organic bodies. As a result of his work in theoretical chemistry he was able to found a new and valuable branch of chemical industry, in the manufacture of artificial flavouring matters and perfumes, such as vanillin and ionone, which represent the odours of vanilla and violets respectively. In July last Professor Tiemann was in this country successfully defending his ionone patents against a petition for revocation, and the complexity of the chemical questions at issue may be judged from the fact that the case occupied the attention of Mr. Justice Cozens-Hardy for more than a week. Professor Tiemann was a brother-in-law of the famous chemist, A. W. von Hofmann, and a son-in-law of Kuno Fischer.

Sir William Dawson, the distinguished Canadian geologist, has died suddenly at Montreal. He was born at Picton, Nova Scotia, in 1820, and was partly educated there, afterwards proceeding to Edinburgh University, where he took his M.A. degree in 1842. After spending some time in scientific exploration, under Sir Charles Lyell, and contributing important papers to the Geological Society of London, he became lecturer on natural history at Dalhousie College, Halifax, and, later, superintendent of education for the province of Nova Scotia. In 1855 he was appointed Principal of McGill University, Montreal, and under his guidance that university developed marvellously. He had been President of the Royal Society of Canada and of the American Association for the Advancement of Science, was a Fellow of the Royal Society, LL.D. of Edinburgh University, and K.C.M.G.

Marconi's Wireless Telegraphy is rapidly establishing its position as an ideal means of communication between points far apart. A correspondent of the *Times* writes to say that as Mr. Marconi recently left New York he cabled to the office of his company in London that he would speak to the Needles from the steamship "St. Paul" on arrival in English waters. It was ascertained that the "St. Paul" was expected at Southampton on Wednesday of last week, andarrangements were at once made at the Needles to speak to the Haven at Poole. Signals were sent out at repeated intervals and at last, in the most natural and ordinary way, the bell rang at 2.45 p.m. The question was asked: "Is that you 'St. Paul'?" "Yes." "Where are you?" "Sixty-six nautical miles away." In a few minutes the Needles staff was transcribing four cablegrams for New York, and many telegrams for many parts of England and France, which had been sent from fifty to forty miles by "wireless telegraphy," to be despatched from the Totland Bay post office. This striking practical proof of the indisputable commercial value of Mr. Marconi's system is of very great interest, for, as pointed out by the writer of the letter, steamers, ships, lighthouses, lightships, with land stations all along the coast lines, can not only help commerce by this means, but will add most materially to the security of ocean travel.

Calcium Carbide has now become an object of attention to the Thames Conservancy, and notice has been given by that body to the effect that—whereas calcium carbide presents dangers similar to those presented by petroleum, and whereas by an Order in Council on the 26th day of February, 1897, it was ordered and prescribed that certain parts of the Petroleum Acts, 1871 to 1881, shall apply to calcium carbide in the same manner as if it were petroleum to which the Acts apply, the carbide shall only be carried on the river Thames in metal drums, which shall be strongly made and securely closed, so as to be air-tight and water-tight. The quantity contained in any drum is not to exceed 140lb. avoirdupois. Above or to the westward of Thames Haven, calcium carbide is only to be carried on the river Thames in open barges licensed for the purpose by the Conservators. At the same time, nothing in the Conservancy bye-laws is to prevent the Conservators from giving permission in writing, under the hand of the secretary, for the carriage of small quantities of carbide on the Thames, above or to the westward of Thames Haven, in other than licensed barges, subject to any conditions specified in such permission.

Donations to the Benevolent Fund.—Mr. T. R. Williams, of Messrs. Wright, Layman, and Umney, Limited, has been good enough to interest himself on behalf of the Benevolent Fund of the Pharmaceutical Society amongst his friends in London, north of the Thames, from whom he has made a sixpenny collection, amounting to £4 1s. 6d., which has been handed over to the Secretary, Mr. Richard Bremridge. Mr. W. J. Henson, acting on behalf of the Committee of the Junior Pharmacy Ball, has also forwarded the sum of £10 10s. for the Benevolent Fund.

The First List of Stewards for the Chemists' Ball is about to be printed, and the Hon. Secretary, Mr. William Warren, asks us to state that he will be glad to receive the names of any gentlemen who are desirous of assisting in the capacity of steward. Names received at 24, Russell Street, Covent Garden, W.C., on or before Monday next will be included in the list now in course of preparation.

The "Bogus" or "One-Man" Company, in which 94 per cent. of the share capital may be in the hands of one shareholder who is really the company, is the great danger to be feared by the registered chemist. The Companies Bill does not touch that abuse, but the precedent furnished by such companies might be utilised for the purpose of preventing that abuse by a clause to the effect that a company formed to carry on any profession or business requiring legal qualification shall have one director holding that qualification, and that his qualification as director of the company shall amount to not less than three-fourths of the share capital.

Veils Cause Red Noses, according to a German physician, whom the *Medical Press* quotes as having formulated an indictment of the veil as a cause of acne rosacea affecting the nose. He relates a number of instances in which young women, otherwise in excellent health, developed this distressing condition consequent upon the habit of riding, cycling, etc., in veils. His view is that the lesion is caused by the friction of the skin against the veil, impregnated with moisture from the breath, the effect being exaggerated by the tightness with which it is necessary to attach the veil when indulging in athletic pursuits. The remedy suggested is to abandon the use of the veil or to wear it loose, anointing the nose with lanoline or some other suitable lubricant.

The First Evening Meeting in Edinburgh will be held in the Pharmaceutical Society's House, 36, York Place, on Wednesday next, November 29, at half-past eight. An inaugural address will be delivered by Mr. Peter Boa, Chairman of the Executive of the North British Branch, and the Assistant Secretary will subsequently refer to the recent additions to the Museum and Library in Edinburgh.

CHEMICAL SOCIETY.

A meeting was held on Thursday, November 16, the PRESIDENT, Dr. Thorpe, F.R.S., in the chair. The first paper, by W. J. Sell, M.A., and F. W. Dootson, M.A., dealt with the chlorine derivatives of pyridine, part iv.

THE CONSTITUTION OF TETRACHLORPYRIDINES

It was shown that three tetrachlorpyridines are possible. The action of phosphorus pentachloride on pyridine yields two of them. The proof of their constitution was gone into in some detail.

The most important communication of the evening was that of Wyndham R. Dunstan, F.R.S., and Harold M. Read, on

JAPACONITINE AND THE ALKALOIDS OF JAPANESE ACONITE ROOT.

This makes the fifteenth contribution to our knowledge of the aconite alkaloids that has been made by Dunstan and his co-workers.

The alkaloids of the Japanese aconite-root have been worked on by several workers, but hitherto their results have shown no very close agreement. In 1879 Wright and Luff made an investigation of the crystalline alkaloid japaconitine, obtained from the Japanese root, and gave it the formula $C_{66}H_{88}N_2O_{21}$. Since then it has been stated by Mandelin, Lübbe, Freund and Beck that the crystalline alkaloid aconitine, obtained from *Aconitum napellus*, is identical with japaconitine. Wright and Luff consider them to be distinct, and that japaconitine is the anhydride derived from two molecules of the parent alkaloid.

The authors have taken up the investigation of the alkaloids of the Japanese root, and have come to the conclusion that Wright and Luff were correct in regarding japaconitine as different from aconitine. They do not, however, agree with Wright and Luff as to the composition and properties of the alkaloid and its derivatives.

According to the authors japaconitine crystallises in colourless needles, melting at 204·5° C. Pope has recently examined the crystallographic characters of the three alkaloids japaconitine, aconitine, and pseudaconitine (obtained from *Aconitum ferox*), and finds them different. Japaconitine is almost insoluble in water and light petroleum, and soluble in acetone, chloroform, ether, and in alcohol. Cash is now engaged in investigating the physiological action of the alkaloid; at present he finds it closely resembles aconitine in physiological action.

The composition of japaconitine is given provisionally, and its complete exposition will furnish material for a future paper. It contains four methoxyl groups, one acetyl group, and one benzoyl group. Its formula may be temporarily looked upon as

$$C_{21}H_{29}(OCH_3)_4(CH_3CO)(C_6H_5CO)NO_3$$

Among the salts of japaconitine that have been examined are the following:—

Hydrochloride	m.p.	149-150° C.
Hydrobromide	,,	172-173° C.
Hydriodide	,,	207-208° C.
Nitrate	,,	194° C.
Aurichloride	,,	231° C.

All these salts are lævorotatory; japaconitine resembles aconitine in being dextrorotatory, but its specific rotation is higher.

Japaconitine is hydrolysed by alkalis and by acids, yielding acetic acid and a new crystalline alkaloid, to which the name japbenzaconine has been given. The reaction may be represented by the equation—

$$C_{34}H_{49}NO_{11} + H_2O = C_{32}H_{47}NO_{10} + CH_3COOH.$$

This alkaloid occurs in rectangular plates, melting at 182–183° C. It is about twice as lævorotatory as aconitine. The salts, which readily crystallise, include:—

Hydrochloride	m.p.	253° C.
Hydrobromide	,,	205° C.
Aurichloride	,,	228° C.
A colourless aurichlor derivative	,,	178° C.

Japbenzaconine is itself capable of being hydrolysed by alkalis or acids, with the production of benzoic acid and the alkaloid japaconine, according to the equation—

$$C_{32}H_{47}NO_{10} + H_2O = C_{25}H_{43}NO_9 + C_6H_5{\cdot}COOH.$$

Japaconine cannot be crystallised, and its salts do not crystallise easily. Japaconine hydrobromide has a melting point of 221° C.

On heating japaconitine it melts, decomposing into acetic acid, and a new crystalline base, called pyrojapaconitine, $C_{32}H_{45}NO_9$. This alkaloid is lævorotatory, as are its salts—

Hydrochloride (crystalline)	m.p.	175-176° C.
Hydrobromide, in two forms	,,	208° C.
	,,	241° C.
Aurichloride	,,	161° C.

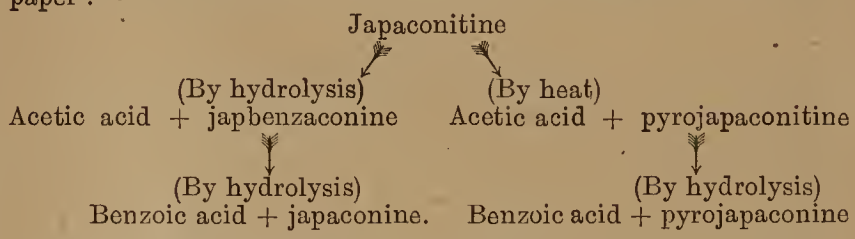
When pyrojapaconitine is hydrolysed by alkalis or by acids it yields benzoic acid and pyrojapaconine, $C_{25}H_{41}NO_8$. This alkaloid and its salts do not crystallise.

The methiodide of japaconitine is decomposed by potash, giving a triacetyl and a monomethyl derivative.

The properties of japaconitine and its derivatives are different from those of aconitine and pseudaconitine and their derivatives, although there is a strong general resemblance running through the three groups.

The Japanese aconite root contains, in addition to crystalline aconitine, a small quantity of japbenzaconine, the first product of hydrolysis. There is a larger quantity of crystalline japaconitine in the Japanese root than of aconitine in the English root. The amount of benzaconine in the English root is greater than that of japbenzaconine in the Japanese root.

The following table will render it somewhat easier to follow this paper:—



The paper drew forth a bright discussion.

In reply to the Chairman's question as to whether any botanical affinity exists between monkshood and the Japanese aconite plant, Mr. DUNSTAN said that the plants were recognised by botanists to be different, the botanical source of the Japanese plant being *Aconitum fischeri* or *A. chinense*. Dr. TILDEN asked how many of the aconite alkaloids were alike in properties. The reply was that both japaconitine and pseudaconitine act in exactly the same way. Their toxic dose is the same. Professor Cash is at work in order to find out whether there are any yet undiscovered differences. As to the difference in physiological action of the salts it has been ascertained that the difference of the kind of action is *nil*; it is entirely one of degree. Mr. DAVID HOWARD'S remarks touched an interesting topic. He spoke of the interesting and obscure problems connected with the relation of the chemical composition of the alkaloids to their physiological action. In the reply it transpired that the removal of the acetyl group from any of these toxic alkaloids causes their toxic power to disappear; indeed, the action on heart, nerve, and muscle disappears.

Professor DIVERS, of Tokio, was present, and expressed the pleasure he felt in again being present after an absence of over a quarter of a century. The Chairman then called for a hearty vote of thanks to the authors for their valuable communication.

The next paper by Professor Walker dealt with

DISSOCIATION CONSTANTS OF VERY WEAK ACIDS.

The acids examined included boric, acetic, hydrocyanic, hydrosulphuric, and carbonic acids. Phenol also was included. The details of the investigation and the figures obtained may be found in the paper. Professor WALKER mentioned that the purest distilled water obtainable, even when freshly prepared for the purpose, has an appreciable electrical conductivity (about 0·7).

This paper called forth remarks from Mr. Vernon Harcourt and Professors J. Millar Thomson and Tilden.

The next paper by the same author dealt with

THE PREPARATION AND PROPERTIES OF SOLID AMMONIUM CYANATE.

This compound cannot be prepared by recrystallisation on account of the extreme readiness with which it passes into urea. When, however, ethereal solutions of cyanic acid and ammonia gas are mixed together and cooled by means of a freezing mixture, the solid ammonium cyanate falls as a voluminous precipitate. In the absence of a freezing mixture the heat of formation rapidly effects the conversion into urea. The substance may also be prepared by diluting the ingredients with hydrogen and air and then mixing.

The substance keeps for months in the dry state, well corked up. On exposure to air it passes into urea in an hour or two. The transformation becomes more rapid as the temperature rises, until at 80° C. the transformation is instantaneous.

The next paper was read by J. Davis, on

DERIVATIVES OF β-NAPHTHOL.

The last paper, on the "Determination of Transition Temperatures," by H. M. Dawson, Ph.D., B.Sc., and P. Williams, B.Sc., was taken as read.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

A special meeting of the above Association was held on Wednesday last to consider the suggestions for proposed legislation received from the Secretary of the Federation of Local Pharmaceutical Associations. Mr. F. Maitland (President) was in the chair, and Messrs. C. J. Park, F. W. Hunt, J. D. Turney, J. Cocks, R. F. Roper, C. T. Weary, J. Barge, H. D. Davey, and G. Breeze (Hon. Secretary) were also present.

The Chairman read the five proposed resolutions submitted by the Federation, and said he was of opinion that the only one to support was that proposing to protect chemists' titles and make it illegal for companies of unregistered persons to keep open shop for selling scheduled poisons. A deputation from the Association had recently waited upon Mr. S. F. Mendl, M.P. (Plymouth), and been promised the hearty support of that member if legislation on the lines of such a resolution should be brought before the House of Commons.

Mr. J. Cocks said he would like to preface his few remarks by saying that he was speaking as an individual chemist and druggist, and not as Secretary of the Federation, the policy of which was to organise, collect evidence, and act accordingly. In dealing with the present controversy he thought the large amount of correspondence and speeches had tended to confuse members in trying to arrive at reasonable and definite opinions. Dealing with titles first, he would ask what is the qualifying examination for? It is an examination ordered by Parliament, thereby guaranteeing an efficient individual to administer to the wants and protection of the public. Having qualified, the Government's agent—the Council—issues to the successful candidate his title deeds and certificate, bearing the hall mark of chemist and druggist. Clearly, if the latter title is usurped, it is in the interest of the public that the law should prevent that being done; consequently there can be only one opinion as to the protection of titles. He thought chemists should try to get all they could by joining hands, and unanimously supporting the first resolution. Referring to the last meeting of the Council, the speaker said it read as though the majority and minority were practically at one, it only being a matter of expediency, for in subsequent remarks of the leader of the majority—Mr. Glyn-Jones—he suggested that the whole directorate should be qualified, which surely, if it means anything, means persons.

After considerable discussion the following resolution, proposed by Mr. J. D. Turney, seconded by Mr. J. Barge, was carried:—

That this meeting supports the following resolution:—To protect chemists' titles, and make it illegal for companies of unregistered persons to keep open shop for the dispensing and selling of scheduled poisons, as in the case of individuals.

Mr. R. F. Roper proposed, and Mr. C. T. Weary seconded:—

That the above resolution in the form of a memorial be sent for signature to every registered chemist in the district, and forwarded to the Pharmaceutical Council.

Messrs. F. Maitland, C. T. Weary, J. D. Turney, and R. F. Roper were elected delegates to the Federation of Local Pharmaceutical Associations.

COLCHESTER CHEMISTS' ASSOCIATION.

A meeting of the Colchester Chemists' Association was held on Tuesday, November 21, when the objects and methods of the recently-formed Chemists' Defence Association were described and explained by Mr. Wm. Johnston, one of the provisional directors. Considerable interest was shown by the members, a large number of questions being asked relative to the actual working of the scheme. After some discussion a resolution was carried, expressing approval of the scheme, and wishing the Association success. The subject of "company pharmacy" was also discussed, the opinion of the meeting being that the titles obtained by examination ought to be protected, and their use restricted to the individual possessors; that all directors of companies keeping open shop for the sale of poisons ought to be qualified, and each shop in charge of a qualified chemist, who should be registered for the purpose and whose name should appear in connection with the business. It was further considered that the Pharmaceutical Society ought to have power to remove from the Register the names of persons convicted of wilful offences under the Pharmacy Act, or the Sale of Food and Drugs Act.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, November 16, a meeting of this Association was held at 73, Newman Street, London, W., the President, (Mr. F. W. Gamble) in the chair. The minutes of the previous meeting having been read and confirmed, the President said he was sorry to have to state that once again on a "Short Papers" evening there was a dearth of communications, the only one submitted being by Mr. H. H. Robins.

Mr. Robins then communicated somo notes on

Bitter Oranges,

which are printed at page 495.

He also exhibited specimens of oranges with the outer part of the pericarp removed by an ingenious machine, which left the pith, and could be fixed so as to take off the rind in one continuous length, or evenly cut up into short pieces. He had also on view specimens of tincture prepared from the three kinds of oranges on the market, Malaga, Seville, and Messina.

The President, referring to the paper, said there seemed to be a general consensus of opinion that the fresh tincture was a great improvement on the old official tincture prepared from the dried peel, but he had heard of complaints from medical men that on dilution with water it developed a certain amount of cloudiness. Their thanks were due to Mr. Robins for his interesting paper; he thought it was to be regretted that more members did not take up that class of work. It was not merely research work that was wanted, but the work of comparison.

Mr. Martin said his firm used a large quantity of tincture of orange in the manufacture of mineral waters, and when the fresh tincture became official they compared it with what they had been using, and found that the old tincture was certainly better for their purpose both as regards strength and flavour.

Mr. Robins said that in making a comparison such as that mentioned by Mr. Martin, it was necessary to be quite sure that the same kind of fruit was used under the same conditions.

Mr. T. Morley Taylor was rather surprised that the old tincture was omitted from the B.P. 1898, because he considered that it was a much better tonic than the new tincture, as the volatile oil which the latter contained was apt to upset the stomach.

Mr. Dewhirst could not agree that tincture of orange was used as a tonic; he did not think it was so used, at least not to any great extent. He wished to know if Mr. Robins had tried to ascertain the amount of oil produced from different peels.

Mr. Robins said he had not done so, but thought it would be both interesting and useful to endeavour to find out the amount of oil present in the several peels.

Dispensing Problems.

A vote of thanks having been accorded to Mr. Robins, a suggestion was made by Mr. Hymans that, in view of the short paper evenings, it would be a good plan for each member to make a note of any dispensing problems that occurred in the ordinary course of business, and bring them forward in the form of a short paper.

Following up Mr. Hyman's suggestion, Mr. J. Fothergill mentioned a case that had come under his notice, in which a mixture containing spirit of nitrous ether and sodium salicylate formed a red colour after it had been dispensed, owing to some chemical change. He wished to know if anyone could give an explanation of the change.

Several gentlemen having expressed their views of the matter, Mr. Fothergill then related the circumstances of a case in which glycero-phosphates of soda, lime and potash were ordered to be dispensed in the form of cachets. The mixture being in a semi-liquid state, how ought the dispenser to act in such a case?

Mr. Martin suggested mixing with liquorice powder.

The President thought that, as a rule, in a case of that kind it was advisable to consult with the prescriber. Of course, it was to the benefit of the pharmacist to foster the idea of prescribing cachets in preference to tablets and compressed drugs generally. In the first place they required more labour in the making, hence a higher charge could reasonably be made. Then, too, cachets were preferable to tablets in that they were more soluble, some of the latter being almost insoluble. In such instances as that mentioned by Mr. Fothergill and others that had come under his own notice, he thought that where the pharmacist could venture to put forward his opinion to the physician, it was advisable to do so, and as a rule he thought that the physician would be very willing to accept any suggestion the pharmacist might make.

Mr. HYMANS, referring to the President's remarks as to the insolubility of tablets, said there were tablets and tablets. He did not think that the pharmacist would be doing the best thing for the public in general by substituting cachets for tablets. The latter was the most convenient and most suitable form of medication, for travellers especially.

The PRESIDENT explained that he did not mean that pharmacists should totally exclude tablets, but he did say it was to the benefit of pharmacists that they should encourage the dispensing of cachets.

Another dispensing problem was mentioned by Mr. LATREILLE, who had dispensed a preparation for the throat, containing zinc chloride, as a clear solution, whereas another firm had turned it out in a flocculent state, and the doctor wanted to know the reason why. The explanation was that the zinc chloride was dissolved in the water, and cleared of its flocculence by the addition of a little dilute hydrochloric acid.

SALE OF FERRICYANIDE.

Mr. HYMANS then related his experience in trying to obtain a quantity of ferricyanide for experimental purposes. He said it was an old thread-bare story, and he thought the idea had been exploded long ago, but recently he went into five different chemists' shops in the West End for some ferricyanide, and could not get it because he was not known, and he was told that it was in the poison schedule. Finally he had to go out of his way to a friend in order to get it.

The PRESIDENT said this was a question that was continually appearing in the trade journals, but he thought ferricyanide was not in the poison schedule. The *Pharmaceutical Journal* had stated decidedly that it was not a noxious poison. It was a point which, if followed up, would lead to most absurd extremes. Other questions were also asked and answered, and the meeting then adjourned.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of this Association was held at the Exchange Rooms, Birmingham, on the 15th inst., Mr. F. A. SPEAR presiding. Mr. F. H. ALCOCK read a paper entitled

Remarks on Laboratory Chemicals,

in which he gave results of experiments made by himself during the last year or two. The following is a summary:—

ACIDS.

Hydrochloric Acid.—This he had found to contain a great deal of arsenic, and as it was largely used in conjunction with stannous chloride as a test for arsenic, it had been looked upon with suspicion for a long time.

Sulphuric Acid was largely used in the Kjeldhal process for the determination of nitrogen in organic substances, which, when boiled with it, converted the nitrogen into ammonium sulphate, which was subsequently distilled in the presence of alkali. It should therefore be tested for ammonia, as this was used to purify the acid from the nitrates incidental to its manufacture. In place of ammonium sulphate, oxalic acid would be found useful to get rid of the nitrates.

Nitric Acid.—This was used in getting rid of organic matter when testing for lead in urine, and should therefore be free from the contamination of lead. It was a difficult thing to obtain it lead-free unless it was made specially in suitable vessels. The common variety had been found to contain as much as 1 per cent. of iron calculated as oxide.

Glacial Acetic Acid was a source of considerable trouble, because no very good and handy test of strength is recorded in the books, and as it was much used as a test reagent in the B.P. it behoved them to see that it was up to the right strength. Moreover, it was largely exported to Australia, where a duty was charged according to its strength, and therefore it was subject to tests by the Customs officers. They were aware that its specific gravity was not a conclusive test of strength, because, curiously enough, an acid having only 46 per cent. of acetic acid in it had the same specific gravity. He was told that the simple test he suggested some time ago—the use of an equal volume of turpentine, which should form a clear and perfectly miscible solution—had been found useful by the authorities in detecting the presence of even ½ per cent. of water. The lecturer illustrated this by putting half a fluid ounce of each together, and when the President dropped in a few drops of water the two immediately separated into clear and well-defined layers.

Phosphoric Acid.—One sample of this could not be used for laboratory purposes because it gave a voluminous precipitate on the addition of excess of ammonium hydrate. This precipitate was found to be aluminium phosphate with a little lime.

Boric Acid.—This should be soluble in alcohol, and as borax was not, a means was thus obtained of distinguishing the one from the other. As much as 9 per cent. had been found to be insoluble in spirit which consisted chiefly of borax with some sulphate.

ALKALIES.

Solution of Ammonia, 0·880, contained sometimes an undue proportion of iron, which got in the way in some chemical operations. He had found it to exist to the extent of 0·03 per cent. in some samples.

Potassium Hydrate and Sodium Hydrate, in sticks.—An objection was made to the use of parchment paper when these were packed in bottles, as they are much used in making strong alkaline permanganate solution. A little of this might do serious damage to the reagent.

Sodium Bicarbonate had sometimes ammonia salts present in unusual quantities, which occasionally interfered in some chemical operations.

Ammonium Carbonate was sometimes sold in powder, and this could not be too strongly objected to, because he had never found in his experience a sample anything near the official requirements, and no doubt during the process of powdering much ammonia gas was lost, and what remained consisted largely of bicarbonate. This salt should also be free from fixed residue, because its solution was used to moisten precipitates of calcium carbonate during the final stage of ignition in the assay of lime salts; 0·5 per cent. of iron had been found in this.

Lime was much used in the determination of sulphur in coke, but it was difficult to get it reasonably free from sulphate unless specially prepared from marble. One sample contained so much sulphate as to yield no less than 15 per cent. of barium sulphate.

Ammonium Sulphydrate.—The Pharmacopœia required this to be freshly made, and perhaps in many operations it could be dispensed with altogether by passing sulphuretted hydrogen gas through the solution with ammonium hydrate in excess, but so long as it was to be obtained commercially it should be free from such objectionable substances as sulphates. It was difficult to know why this should be present, unless it was that the gas used in making had not first been washed, generated as it was by the action of diluted sulphuric acid upon iron sulphide.

SALTS, ETC.

Iron Sulphide.—This very humble chemical often gave trouble. Sometimes it was found in such a passive condition as to resist the blandishments of dilute acids, and refused to be acted upon by them. It was often said to be "burnt"—that was, prepared at too high a temperature. Again, it had been met with, when, after all chemical action had ceased, a black insoluble residue remained, amounting to 12 or 15 per cent., which resisted the action of both dilute hydrochloric acid and sulphuric acid. On ignition it seemed to contain both iron and sulphur in some peculiar form.

Litharge.—Some use in the laboratory was found for this. It had been met with containing 10 per cent. of metallic lead, owing, no doubt, to imperfect oxidation, or to the fact that the sample had not been sifted.

Stannic Oxide.—He had met with this containing 5 per cent. of lead compounds. These were readily detected by warming the sample with a mixture of ammonium sulphide and hydrate. A black residue is left behind, which will generally be found to consist of lead sulphide.

Calcium Phosphate.—On one occasion a sample was found which could not have been purified according to official requirements, for it contained 9 per cent. of calcium carbonate. As this was a convenient substance to practise on for the determination of the phosphoric radical, such a sample was not calculated to imbue the student with much faith in chemistry.

Red Lead was of great value as a test for manganese in complex mixtures, and also as a quantitative colorimetric test for manganese in steels. It sometimes contained lead monoxide, which lessened its value when so used, and as many samples he had examined contained manganese this would spoil its use for the detection of manganese unless its amount was previously determined, which was not a satisfactory mode of procedure.

Sodium Arsenate.—This was marked "Puriss:" and no doubt would have been found so if in the transference from the stock-bottle into the purchaser's, the attendant had not added a few pieces of glass, which, in a quantity of 4 oz., weighed 60 grains.

This seemed to him a fruitful source of danger, and called for more care on the part of those who retailed such substances, for glass and sodium arsenate were both without colour, and had transparency in common.

Potassium Permanganate was sometimes a source of trouble, and this was not surprising when it was remembered that it was imported in wooden barrels.

Strontium Nitrate.—A perennial source of anxiety to the teacher and perplexity to the student. The latter read that with potassium chromate in an acetic acid solution no precipitate was obtained with strontium salts, but to his great surprise he got a precipitate, and, thinking to have discovered something wrong, he appealed, only to find that it was adulterated with barium salts. As these strontium salts were sometimes used in medicine it was well to call attention to this point.

Saltpetre was not so styled in the chemical laboratory, but a circumstance came to mind which nearly ruined the reputation of a certain teacher of chemistry. It was on an occasion when a test for potassium salts was being applied. The cream of tartar test, the platinum chloride test, and even the less known picric acid test had all failed, and no doubt the beam of delight on the face of the students with the expressions of chagrin on the face of the administrator were in marked contrast. But a happy inspiration suggested an examination of the vessel from which the specimen had been taken. It had been purchased as saltpetre, and was found to consist of the Chili variety, and not true saltpetre. This had occurred so constantly that special attention should be directed to it. It was bought as saltpetre, and that, to the pharmacist, was potassium nitrate, but to others it was not so, for sodium nitrate was sold in enormous quantities under that name.

Potassium Iodide.—A very costly substance, which, by reason of its great solubility in water, was very liable to be abused in the chemical laboratory where students were engaged. It was generally unsatisfactory, containing moisture from 1 to 5 per cent. This, at a shilling an ounce, paid well. It also contained sulphates in appreciable quantities, and conveyed the idea generally that pearlash had been used in the preparation of the hydrate from which the potassium iodide was made.

Hydrogen Peroxide had been found to contain both sulphuric and hydrochloric acids. It was not desirable to have both present, because they limited its use in the laboratory.

Emplastrum Plumbi found a use in the chemical laboratory for the preparation of the stronger soap solution, which, on dilution, was used to determine hardness in water. It had been found to contain undecomposed litharge, and in one instance pieces of the size of flax seeds were removed. Such a sample could not be used with confidence, although it would not greatly interfere with the final solution, which, as it did not keep well, was always standardised at the time of its use.

Rod Metallic Zinc was much used for the reduction of ferric solutions to the ferrous condition before titration with permanganate. As much as 10 grammes of zinc were recommended for 0·15 gramme of iron. If the quantity of iron present in the zinc was at all great the allowance to be made for its presence would be almost as great as the iron present in the solution under examination. A sample shown, which was sold as iron-free, contained 0.1725 per cent. of iron.

Ammonium Chloride.—A sample shown had a distinct pink colour, due to a double-barrelled admixture—the presence of iron in the ferric condition and the presence of a little ammonium thiocyanate, which developed with keeping some time, and was due to the formation of ferric thiocyanate.

Oxalic Acid and Ammonium Oxalate.—These were used for the titration of potassium permanganate, not as officially recommended, for it was feared that would not be a success—(see B.P., page 265)—seeing that the text-books suggested the use of a temperature at or about 60 deg. Cels., which was not mentioned in the official instructions. Of the two the latter was to be preferred for the determination of permanganate solution, for when carefully prepared in glass vessels there was less fear of organic and other impurities being present. The impurity in oxalic acid was of organic origin, for five grammes of it when incinerated left only three milligrammes of residue.

Urea.—This was used in organic analysis and for comparative tests in urine testing. A sample shown contained 3 per cent. of barium carbonate, the origin of which was not known.

Ether was sometimes not up to the mark, but a test suggested by Mr. Gerrard some time ago would detect the hydrogen peroxide or ozone, or whatever it was which was sometimes present, and would liberate iodine from potassium iodide. It was an addition of iodoform.

A discussion followed in which Messrs. Holland, Moseley, Selby, Spear, and Billington took part.

Afterwards Mr. Alcock was heartily thanked for his paper, and the meeting ended.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.

There was a good attendance of the members of this Society at the Liverpool School of Pharmacy on Thursday evening, the 16th instant, the President, Mr. Prosper H. Marsden, occupying the chair. Five new members were elected—Messrs. Harrod, H. Moses, W. Moses, Irving, and C. Wright.

As a miscellaneous communication Mr. Hughes read out

Some Prescriptions

containing interesting peculiarities.

A pill of carbolic acid, ½ grain, and morphine acetate, ¼ grain, required a considerable amount of liquorice powder to mass it, and when turned out was fully of three-grain size, whereas the doctor wished for a small pill.

Oleum rusci ʒiii., hyd. ammon. 20 grs., sulph. subl. 80 grs., lanolinum ʒii., and tinct. quillaiæ, *q.s.*, were to be made into a cream thin enough to be applied with a brush. The result was more like a jelly than a cream, and did not seem very appropriate for application in the way directed.

In the discussion Mr. Cowley accounted for the deliquescent state of the pill ingredients by the known weakness of the morphine base for the acetic radicle, and the somewhat acid behaviour of phenols in general, resulting in free acetic acid being produced, and possibly a morphine carbolate formed, or at any rate a solution of the morphine in the phenol. The addition of some absorbent powder was the only way out of the difficulty, and unless the alkaloid were substituted for the acetate a small pill could not be made.

Mr. Wyatt would use dried powdered marshmallow root, and if a really small pill were required enough shaved beeswax to bind the mass.

A similarly soft pill had been made up by Mr. Morgan from thymol, ½ grain, and menthol, ½ grain. He had massed the two ingredients separately, and then enclosed them in gelatin capsules. The softness in this case was caused by the thymol-*a*-phenol dissolving in the menthol-*a*-camphor.

Mr. Hughes, during a urine analysis, had noticed a heavy whitish precipitate come down on adding the Fehling's solution, but no reduction had taken place, and he would like to know the cause of this change.

Messrs. Marsden and Cowley said the precipitate might be due to mucin or other interfering substance.

The use of Allen's modification of Fehling's test was advised by Mr. Wyatt, the copper solution being mixed with the boiling urine, allowed to cool, then enough saturated and slightly acid solution of sodium acetate poured in, and the whole filtered after a few minutes. To the clear blue solution—an acetate of copper with the glucose—the alkaline tartrate solution is added, and on heating to boiling the slightest trace of glucose is easily recognisable. The boiling of the urine coagulates albumin, and the subsequent addition of the copper throws down phosphates, whilst the acetate of copper in the cold removes creatinine and other bodies likely to affect the identification of the glucose. It was an easily worked test, and very accurate.

The President then called upon Mr. Cowley to give an address upon

Nitrogen and Its Allies.

The elements of the Fifth Group of the Periodic System of Classification—that is to say, nitrogen, phosphorus, arsenic, antimony, and bismuth—were exhaustively treated by the lecturer, who showed their resemblance to one another as set forth by their halogen compounds, their oxides, and their sulphur compounds. The interesting way in which the address was delivered, and the clear explanation afforded by the lecturer as to certain knotty points, which he elucidated by recourse to graphic formulæ, fixed and retained the interest of his audience to the close. Such topics as had a direct bearing on pharmacy were enlarged upon, and nitrogen

iodides, together with the effect of washing with water upon bismuth oxy-salts were discussed very fully.

The President, in complimenting Mr. Cowley on his lecture, remarked upon the interest of nitrogen compounds at the present time from the part they play in modern warfare as component parts of most smokeless powders, and such terrific explosives as lyddite or melinite.

A vote of thanks was proposed by Mr. H. Wyatt, jun., to Mr. Cowley for his contribution, and in answer to a remark of Mr. Cowley's as to the best way of dispensing bismuth oxy-nitrate or oxy-cloride with an alkaline carbonate or bicarbonate, Mr. Wyatt said he should add to the bismuth salt a little of the carbonate and enough hot water to hasten the evolution of carbonic acid gas, and then keep adding successive portions of water to the bismuth in the mortar, rubbing well between each addition, and pouring off the lighter particles so as to levigate the powder; by so doing the theoretical removal of the acid radicle could be performed in practice, and the mixture so made would be more sightly, more efficacious, and do, consequently, more credit to the dispenser than if the bismuth salt were added any way.

Following the remarks of the President, Mr. Wyatt spoke generally as to the composition and mode of action of the commonly known explosives used for military purposes, and of the ingenious mechanical contrivances necessary to overcome their violent action and divert it in the direction required.

The vote was seconded by Mr. Smalley, and accorded to Mr. Cowley, who, in reply, thanked his audience for their attention to what he had been afraid at first might be a somewhat dry and uninteresting subject

Mr. Edward Davies, who should have lectured to the Society at its next meeting, being unable to keep his engagement owing to the recent death of his wife, it was resolved, upon the proposition of Mr. Cowley, to send him a letter of condolence, as he had at all times proved himself a friend to the Society, particularly in its younger days.

The President asked Mr. Wyatt to take Mr. Davies's place on the date mentioned, and to give a lecture on "Arms and Ammunition."

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION.

A special meeting of this Association was held on Monday, November 20, to hear an address by Mr. W. S. Glyn-Jones. Mr. Abraham Foster presided, and there were representatives present from Dewsbury, Heckmondwike, Savile Town, Ossett, and Batley.

After a brief introduction by the Chairman, Mr. W. S. Glyn-Jones addressed the members on the

P.A.T.A. and its Defence Fund.

He said it was his first duty to speak of the work of the P.A.T.A. If the usefulness of that organisation could be gauged from the amount of the increasing work thrown upon the Association, then its existence was more than justified. Before the existence of the P.A.T.A. discontent had been shown by chemists throughout the country, and complaints, more or less spasmodic, had been made by individual chemists in various parts of the country. The P.A.T.A. had brought together over 3,000 retailers, with the result that they had a growing list of protected articles. A number of letters, which they were constantly receiving, showed that their efforts had been appreciated. Apart altogether from the articles which had been added to the protected list, the result of the Association's work was seen in the remarkable growth of the tendency on the part of proprietors to facilitate the trade. It was true that some of the important proprietors had brought forward schemes for protecting profits, which the Association had been compelled to oppose. They had been charged with adopting the "dog in the manger" attitude, and of opposing the efforts of such proprietors to guarantee a profit, because in those cases the Association's organisation had not been used by the proprietors. In no case had this been the reason for such opposition.

Anti-Cutting Schemes.

Every anti-cutting scheme put forward was considered by the Executive on its merits. The main question asked in reference to such a scheme was, did the proprietor propose an adequate rate of profit? and secondly, was the scheme a workable one? In other words, would that profit really be secured. He need not say anything to them at Dewsbury about Mr. Beecham's scheme, but perhaps a word of explanation was necessary in reference to the position of antagonism taken up by the Association towards the scheme which the proprietors of Seigel's Syrup were now adopting. The P.A.T.A. opposed Seigel's Syrup scheme because the profit which they sought to secure was far too meagre. To ask the chemist who paid 12s. or 12s. 3d. per dozen for an article to sign an agreement not to sell that article below 1s. 0½d. was almost tantamount to an insult. It had been argued that a retailer could buy in £5 parcels direct from the proprietors at 11s. 6d., and thus be guaranteed a profit of a penny. Anyone who knew what an immense number of proprietary articles chemists were called upon to stock would recognise how impossible for them it was to buy such articles direct from the maker. There should be a margin between the proprietor's bottom price and his minimum retail price, which would permit of the goods reaching the chemist through a wholesale house, and which would enable both the wholesaler and the retailer to be adequately remunerated for their services as distributors. It is impossible to admit that there was such a margin between 11s. 6d. and 12s. 6d. He therefore hoped that until, in some way or another, that margin was increased, the trade, especially members of the P.A.T.A., would decline to come to terms as to the price at which they would sell Seigel's Syrup. A direct result of the Association's work was that it was now, he was glad to say, almost impossible to successfully introduce a proprietary article to the drug trade without first placing that article upon the P.A.T.A.'s list and guaranteeing a profit.

The Collection of Subscriptions.

He was sorry to say that the Association was given more trouble in connection with the collection of the retail subscriptions than was, in the interests of the Association, wise. A subscription of five shillings was a small one, and they would see that if it had to be applied for many times, and certainly if it had to be specially called for, there was a danger that too large a portion of that subscription would be swallowed up in expenses. The Committee had, therefore, with the kind assistance of a number of the wholesale houses, adopted a scheme whereby members could sign a form requesting one of their wholesale houses to pay their five shillings subscription to the Association each year when it became due, the order being so worded that it was possible for the chemist to countermand it at any time. He had some of those forms with him, and he hoped that every one of their members in Dewsbury would relieve the Association of unnecessary trouble by filling them up. It would also save them the trouble and expense of remittance. It was a regrettable fact that there were at least 5,000 chemists in business who were reaping the benefits of an association paid for and supported by 3,000 members, and the Executive were glad of the opportunity which the Defence Fund would give them of providing some distinct advantage over and above non-subscribers.

Objects of the Defence Fund.

They would see from the copies of the circular the details of the scheme. He hardly thought it would want much advocacy from him. Every man who kept a retail shop for any time had to reckon with the chances of being prosecuted under one of the many Acts affecting his business, and he knew of no business which was so liable to such risks as that of the chemist and druggist. They could, of course, have no sympathy with any man who wilfully or fraudulently committed an offence against any of the laws of this country, but he doubted whether there was a chemist in business who was absolutely certain of not inadvertently breaking the law upon some technical point or another. Thousands of offences were being committed every week through ignorance of those technicalities. He was also bound to say that he considered the responsible officers were too ready to seize upon trivial and technical offences in order to get convictions, rather than deal with serious cases committed with fraudulent intent. In some instances, it appeared to him to be a question of the local authorities securing a certain number of convictions a year, and they appeared to find it easier to reach that number by taking up what appeared to be trivial if not vexatious prosecutions. For a subscription of 10s. 6d. a year members of the P.A.T.A. would be defended in these cases. The value of the defence, under the direction of a solicitor who had made a special study of trade legislation, and if necessary, with the help of expert witnesses, could not be gainsaid. The recent triumph of chemists

in the south-west of London when charged by the Vestry under the Foods and Drugs Act with putting an excess of an expensive ingredient into a prescription, proved this, but he doubted whether a conviction would have been avoided in these cases had it not been for the assistance of Dr. Attfield's evidence. The insurance against loss due to a mistake in dispensing or retailing was also a very solid advantage which they were offering to their members. He had often thought that, when in the past an accident of this kind had happened, by which one of their trade brothers had perhaps been ruined through a mistake on the part of an assistant, that there was sufficient *esprit de corps* in the trade to have produced a fund which would have recouped the unfortunate chemist. By the means of their Defence Fund they were now providing such mutual help. It should be remembered that in addition to *bonâ-fide* cases, where a chemist was actually liable, they were always open to bogus claims being made for so-called damages, and here again the legal assistance offered by the Association would be of immense advantage. Cases were often lost for want of expert evidence, or of legal advice of the right kind. The case referred to in the circular, he thought, was one of such cases. A boy had eaten food in quantity and kind sufficient to kill any ordinary mortal, and in addition it is alleged that the chemist gave him 8 gr. of atropine. He did not die, as by the laws of all medical science he ought to have done, but the poor fellow suffered, and an action for damages was brought, not against the commissariat department, but against the poor chemist who was said to have given him the 8 gr. of atropine. If the chemist had given him the atropine, and the boy is still alive, we hope that at the next meeting of the British Medical Association they will have them both on show. We think that if the defence had been provided with a very clever lawyer and analyst, it might have been possible to convince even a County Court Judge that the result of taking 8 gr. of atropine would not have been two or three days' absence from work only. He had said that many offences were committed against the law through ignorance, but he was aware that ignorance was not a sufficient plea in defence. It would be the duty of this new organisation, by means of circulars and otherwise, to keep its members posted as to the various Acts of Parliament under which they might be liable, and in addition to these benefits, a member would always be able to obtain, through the Association, the advice of its solicitor upon any legal matter pertaining to his business in which he was in doubt. It might be argued that the Chemists' and Druggists' Association had come to grief, after an existence of some years, and that it was not a very hopeful sign, but the essential difference between this scheme and the plan adopted by the former association was that under this scheme each member who paid his subscription could feel sure that his case, if he should be unfortunate enough to have one, would be dealt with. Under the old organisation an immense amount of trouble and expense was entailed, because the Executive had to be called together to consider every case reported to them upon its merits, and although the chemist had paid a subscription for many years, he could not feel certain that his case would be defended. Convictions had been given against the trade which, he thought, would have been reversed on appeal, and it would be the duty of this Association, in cases where there was any doubt as to the meaning of the Act of Parliament, and it was considered of interest to the whole trade to take such a case to the Higher Courts and get a final decision. He hoped he had said enough to show the advantages of their scheme, and that all the chemists of Dewsbury would avail themselves of these advantages by becoming members.

At the close Mr. Jones expressed his willingness to answer any questions, and intimated that the Executive Committee would be glad to receive suggestions from the Dewsbury Association. The memorandum of association had only been registered on the previous Friday, and the Dewsbury chemists were the first he had had the pleasure of speaking to.

The Chairman asked for further information respecting share subscriptions.

Mr. Jones replied that members were simply asked to pay 5s. towards the £1 share, and to be responsible for the remaining 15s. The subscription of 10s. 6d. a year was irrespective of the guarantee.

Mr. Stead (Heckmondwike): And if a man is not a member of the P.A.T.A. his subscription is a guinea a year instead of 10s. 6d.?

Mr. Jones replied in the affirmative, and went on to state that in some districts the local authorities were much more active than in others in getting up prosecutions. He mentioned a case at Fulham in which four or five chemists were prosecuted by the Vestry for putting too much potass. iodi in medicine. This was a most serious charge to bring against chemists. Dr. Attfield gave evidence for them, and all the cases were dismissed. There was little doubt that if these cases had been brought in the country all the men would have been convicted. All the gentlemen, with the exception of himself and Mr. Johnston, who had signed the memorandum were members of the retail section of the Committee. They would act as directors until the annual meeting of shareholders.

Mr. Walker (Dewsbury): Will these gentlemen act as directors without payment?

Mr. Jones: Oh, yes. I don't know what will be done by the shareholders. That has not been thought out at all. That matter will have to be considered when permanent directors are appointed.—Answering a further question, Mr. Jones said the election would take place by voting, and went on to suggest that it would be advisable to appoint a fair number living in London as directors so as to save expense. The matter of investing the money, said the speaker in answer to a question, would have to be considered by the directors. It was owing to the strong advice of their solicitor that they decided to form a limited company.

Mr. Broadhead (Batley) agreed with the idea of a defence scheme, and thought it would meet a long-felt want—it touched the spot. There was a point he wanted clearing up in reference to the P.A.T.A. As it was at present formed it included a mixed lot of chemists and grocers. Grocers who were members of the P.A.T.A. would simply apply for a share and pay the extra subscription, and when they were prosecuted they would come down on the Association.

Mr. Jones pointed out that there was a rule which prohibited anyone being a member of the Chemists' Defence Association who was not a registered chemist. No one could be a member unless he held a share. Rule 11 said that every member should hold at least one share. If a member's subscription was more than one calendar month in arrear he would forfeit all benefits. They could not make a member forfeit his share.

In reply to Mr. Gledhill (Secretary), Mr. Jones said that after the reserve fund of £1,000 had been formed the directors would apply part of the profits in payment of a dividend of 5 per cent., and credit the balance, if any, to members in proportion to the amount of their respective subscriptions. There was something more in this. They might do so well that the authorities would cease to bring cases against them, and the public cease to bring actions for damages. They would not want the whole of the 10s. 6d. a year as subscription. In that case the balance could be applied in reducing the subscription.

Mr. Day (Savile Town) was of the opinion that it would have been better if it had been definitely stated.

Mr. Jones, in answer to further questions, said the present staff of the P.A.T.A. would do the secretarial work, but mentioned that when the Association was properly launched it could be decided how the work should be done.

Mr. Barker (Heckmondwike) next mentioned the Defence Fund formed at Birmingham some years ago, and Mr. Jones said that the object of the Association was to defend cases, and, if necessary, appeal to a higher court. There was, however, the same difficulty there as with the P.A.T.A. The man who subscribed did so for the good of the trade at large, and he could not feel sure that he would receive a benefit which the man who did not subscribe received. And so after an existence of about twelve years it wound up in 1883.

Mr. Stead said he was a member during the whole time that fund was in existence. It was wound up because of the apathy of the trade generally.

After further remarks Mr. Stead moved that the Association tender its heartiest thanks to Mr. Jones. The Dewsbury Association were fortunate in being the first to have had the honour of hearing Mr. Jones explain the scheme. The Defence Association was worthy of their most serious consideration—especially the consideration of the younger members of the trade. By becoming members of this Association they would get good value for their money. As business men, when they fully looked into the matter they would see that their money would be wisely invested.

Mr. Cussons (Ossett) seconded the proposition, which, after being supported by the Chairman, was carried unanimously.

Mr. JONES, in returning thanks, thought it would be quite possible when they had a sufficiently large number of members enrolled to make arrangements with fire insurance companies whereby a considerable reduction could be affected in premiums. They had already been approached by a large insurance company with certain proposals. He congratulated the Dewsbury Association on the lively interest they took in matters affecting trade, and asked them not to be disheartened by criticism. The Pharmaceutical Society realised, and would realise more fully, that their safety depended upon their keeping alive active associations throughout the country.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

This Association met on Tuesday, November 21, at the Bradford and County Restaurant, when Mr. Glyn-Jones read a paper on "The Chemists' Defence Fund." The chair was occupied by Mr. H. G. ROGERSON, the President, and there was a large attendance.

The PRESIDENT, in introducing the lecturer, said that although they might not agree with Mr. Glyn-Jones upon every phase of pharmaceutical politics, there was no question that every one of them thoroughly appreciated his organising abilities, and were grateful to him for what he had done for the profession.

Mr. GLYN-JONES having explained the scope and details of the scheme (see pp. 506*b* and 516), a discussion took place, in which the PRESIDENT asked if the new Defence Association would take up the cases of any of its members who might be prosecuted under various Trades Marks Acts. Mr. STEAD asked if the Association was likely to take up the fire insurance as well as plate-glass insurance, while Mr. BLAKE wished to know if the Association would deal with questions relating to the Inland Revenue.

Mr. WATSON (Shipley) asked if the new Association would interfere in any way with the work of the Pharmaceutical Society, which they all looked to as the chief source of help.

Several other gentlemen also spoke, approving of the objects of the Association.

Mr. GLYN-JONES, in reply, said that the Executive would be quite prepared under Rule 1 to give all the advice they possibly could to any member who was threatened with an action under the Trade Marks Act—and he should think he might say that they would be prepared to do for the members exactly what the old association would have done. In the scheme the hope was expressed that a satisfactory arrangement would be made in reference to plate-glass insurance. The fact was that the Council of the Association had already been approached by a plate-glass insurance company of considerable standing with a proposal whereby they would issue policies in the name of the Defence Association at rates which it was assured would be at least 25 or 30 per cent. below ordinary charges. That, of course, would not be compulsory on any member, but the society would take *en bloc* those who wished to be insured, and make this substantial reduction. With regard to the question as to the patent medicine stamps, that was intended to be covered by the mention of the words "Excise laws affecting the trade." The cause of offence which had been referred to in that regard was one with which the Committee thought they would most frequently have to deal. As had been said, the Association would have nothing to do with defending a chemist or anyone else against any action brought by the Pharmaceutical Society. The work of the Association would not in any way conflict with the work of the Pharmaceutical Society. Mr. Glyn-Jones then dealt with the financial aspect of the subject, and expressed the opinion that there should be five hundred members before the Association could take the dispensing risk.

A hearty vote of thanks to Mr. Glyn-Jones concluded the proceedings.

VESICATING LIQUID.—Powdered cantharides, 100; chloroform, *q.s.*; white wax, 1. The cantharides are exhausted with the necessary amount of chloroform, the solution evaporated to 100 Gm., in which the wax is dissolved. Keep in well-stoppered bottle. (2) Powdered cantharides, 50; ether, *q.s.*; acetic ether, *q.s.*; flexible collodion, 25. The cantharides are percolated with the ether mixture (100 Gm.), the percolate evaporated to 75 Gm. and mixed with the collodion.—*Oesterr. Zeitschrift fur Pharmaeie*, **53**, 644.

LETTERS TO THE EDITOR.

The Conference Meeting in London.

Sir,—A preliminary meeting of London pharmacists was held (by kind permission) at 17, Bloomsbury Square, on Wednesday, October 25, for the purpose of considering the best means of promoting interest in the forthcoming meeting of the British Pharmaceutical Conference in London. It was resolved that a general meeting of pharmacists, both wholesale and retail, be called for Wednesday, December 6, at 3 p.m., at 17, Bloomsbury Square, London, at which a large and representative general committee should be formed for the purpose of making the necessary arrangements. It was decided to invite subscriptions for an entertainment fund from all pharmacists in the London district, and it was agreed that such subscriptions should not exceed two guineas from an individual or five guineas from a firm. We hope the meeting will be largely attended by both sections of the trade, and any person unable to attend the meeting, but who is desirous of co-operating in giving the Conference a hearty welcome next year, is invited to send the amount of his subscription to Mr. J. H. Mathews, hon. treasurer of the entertainment fund, 68, Queen's Gardens, London, W., by whom they will be duly acknowledged.

WILLIAM WARREN,
HERBERT CRACKNELL,
Hon. Local Secretaries to the British Pharmaceutical Conference.

London, November 18, 1899

Chemists and Members of Parliament.

Sir,—On Friday last, November 17, a deputation (consisting of Messrs. C. J. Park, G. Breeze, Hon. Secretary, and myself as President) from the Plymouth, Devonport, Stonehouse and District Chemists' Association, waited on Mr. Mendl, M.P. for Plymouth, soliciting his support to the amended clauses of the Companies Bill if it should be introduced noxt session in Parliament. We submitted the clauses which would protect chemists' titles and make it illegal for companies of unregistered persons to keep open shop for the sale of poisons. After some discussion, Mr. Mendl, who appeared to thoroughly grasp the subject, not only promised us his hearty support, but voluntarily offered to form one of a deputation, if necessary, to the Lord Chancellor or the Government Department which had charge of the Bill, as he considered chemists not only had a moral, but legal claim to have their titles equally protected as those of surgeons, dentists, etc. My object in writing is to induce, if possible, other associations, and where none exist, small deputations of chemists to wait on their parliamentary representatives and solicit their assistance. It is really surprising what can be done in this way with very little effort to further our cause; and if similar means are adopted throughout the country, our position will be assured. We are all agreed that a new Pharmacy Act up to date is highly necessary, which at the present moment seems impossible, and if legislation affecting chemists can only be obtained in piecemeal fashion, it is better than nothing at all, and worth trying for.

Stonehouse, Devon, November 21, 1899. F. MAITLAND.

The Company Pharmacy Problem.

Sir,—As it seems, and to my mind is, desirable that all connected with pharmacy should state their views, I think they cannot do better than say Yes or No to the Annotation beginning "The Position Taken Up" in *Ph. J.*, November 18, 1899. That puts the thing clearly and concisely, and is what we ought to ask for and try by all proper means to get from Parliament. Do not let us ask for less than we really want, but let us ask for all that we want, as it seems very probable that we shall get less than we ask for.

Bollington, November 17, 1899. J. HERBERT ANDREW.

Sir,—I quite endorse the position you take up as stated on page 483 of the last issue of the *P.J.*, regarding company trading, and think it would be nothing short of suicidal to try for less. It is quite time that chemists should agitate for a recognition of their services more akin to that accorded to their continental brethren than is at present bestowed on them, and anything I can do to help on the cause I shall be glad to do.

Forest Hill, S.E., November 20, 1899. E. CLARKE.

Company Pharmacy: Its Abolition or Regulation.

Sir,—Chemists generally will be decidedly gratified that the Council has taken a new departure by giving a full-dress debate on the company question before the electors, and I hope that the same practice will be maintained with regard to all questions of first-rate importance, as such a system will undoubtedly tend to largely increase the popularity and usefulness of the Society. With regard to chemists and the limited liability principle I do not think chemists' titles and the principle of the Pharmacy Act are at all proper factors for limited liability treatment; at the same time, as the President pertinently reminded us, we are living in 1899, and not in 1867, and that in dealing with this question it means dealing with considerable vested interests which, as we all know, are held in considerable reverence both by the average Briton and the average legislator. In the face of this consideration, therefore, I think it is desirable that the regulation of company pharmacy should be carefully considered as to whether it is possible so to regulate companies that they may correspond exactly with the individual chemist. If it is found possible to securely effect this I should have no hesitation in advocating such an arrangement, both on the score of expediency, and because the question is urgent. With regard to company regulation my suggestion towards a solution of the subject is that no company should be considered legal with less than a qualified directorate of five, the title of the company to be that of the lowest title on the board, in the event of the board consisting of mixed titles. There is no doubt this company regulation question is a very knotty problem to solve, and if after careful consideration by the Council and its legal advisers it is not considered possible to bring companies *securely* within the four corners of the Pharmacy Act with absolute protection of titles, then I would refrain from attempting company regulation, and nail the flag "No Company Pharmacy" to the mast, relying upon time and persistent effort to effect the just and reasonable reform.

Ashby-de-la-Zouch, November 20, 1899. G. W. Bullen.

Sir,—As one of the "infinitesimal number" who carry on business strictly on the ideal conditions upon which the Pharmacy Act should be conducted, I feel it incumbent upon me to give Mr. Glyn-Jones (who I must thank for his candour in telling us how he carries on his business under an assumed name, etc.), the bit of plain English that is wanted so much from critics of the Society. It is "that the Pharmacy Act shall be something or nothing to us." If nothing, so let things be as they are. If something, let us oppose tooth and nail any such thing as unqualified pirating of our business and title. I wonder how long law would tolerate, as we do, any company of unqualified persons practising and calling themselves solicitors with the aid of one qualified person? I take it that we can only stop this by a system of licensing all qualified and registered men, such licence being only allowed to be given to those who are going into business for themselves or in partnership with another qualified and duly licensed person, and then we should exclude the unqualified pirate. To practise as a solicitor, the Law Society takes an annual fee as a licence, and I am told no one can practise without such licence—if so, why cannot our Society do the same thing? Is there no such power? If not there ought to be. I had always regarded our certificates and yearly subscription as a licence until I found we could please ourselves whether we paid our subscription to belong to the Society or not, as we thought fit.

Torquay, November 18, 1899. Wm. Jno. Rawling.

Sir,—I agree with the statement made by two writers in last week's *Pharmaceutical Journal*, that there has been enough discussion on abstract principles, and I will, therefore, confine these remarks to the policy to be pursued. Mr. Glyn-Jones believes there are three courses open to the Council (*vide* p. 493), and argues in favour of a clause which would permit companies of unregistered persons to use chemists' titles and keep open shop for the dispensing and sale of poisons subject to certain conditions, the main one being that the business should be under the control of qualified directors. I do not believe the qualified director arrangement would be entertained by Parliament for a moment. The duties of directors and the means by which they may be shirked or delegated are well known to our legislators, and the proposal, even if it was accepted by pharmacists, would probably be rejected by Parliament. Of what use, it would be asked, is the pharmaceutical qualification of a director who lives in London, say, to a business carried on in Birmingham? There is in addition a danger to our position in making the admission this proposal would involve, viz., that qualified proprietorship is not essential. That admitted, the qualified director proposal would probably be brushed aside, and the question settled by the abandonment of the necessity for the Pharmaceutical Society's qualification for keeping open shop and the establishment of a system of registration of qualified persons employed where poisons are sold and dispensed. Sooner or later, too, there would be some system of inspection to ensure the carrying out of the law. This seems to me the probable course that events would take if we were to recognise the right of companies of unregistered persons to keep open shop for dispensing and selling poisons.

If we are prepared to accept that solution—and through the "bogus company" it would mean recognising the right of any unqualified individual to keep open shop for dispensing and selling poisons—then we need not trouble ourselves further, for it is the course that Parliament will be most ready to adopt. If not, it will take us all our time to escape that danger, and avoid helping it forward by the dangerous admission I have referred to. If that proposal is adopted we will always have to face the results of that action, whether success attends it or not, and Mr. Walter Hills' hopes that we may some day have legislation which will place pharmacy in a higher position will be doomed. I appreciate the motive which actuates those who would attempt this compromise, but if the view I take be correct, these is no middle course open to us, we must either fight or surrender. Assuming that the intentions of the 1868 Act are correctly indicated in general terms in the preamble it is not quite correct to urge in opposition to those who would stand by the intentions of the Act that they are asking for more than the Act gives. The only offer in the shape of compromise that occurs to me which would not involve a sacrifice of principle is that a limit of time should be granted to existing company pharmacies. Very little is heard now of the clause in the Companies Bill that would make practice as doctors, midwives, etc., illegal for companies, but I think chemists should still try to get themselves included in that clause, and endeavour to have another clause introduced which would restrict the use of chemists' titles to registered persons. Bearing in mind the probability of a general election next year, it will be our duty to consider carefully what action should be taken at that time, and to be prepared accordingly.

John Smith,
Liverpool, November 21, 1899. *Local Secretary.*

Sir,—I am often requested to fancy myself in a position of responsibility—*e.g.*, a very esteemed correspondent says: "If you were President of the Pharmaceutical Society what would you be prepared to take to the Government, asking them to adopt, and, if they refused, to fight them in Parliament. I think you would need to have—in the present case—a clause which, if the Government would not adopt, you felt you would have a reasonable chance of getting Parliament to force upon the Government." We have now Mr. Glyn-Jones insisting upon the duty of anyone who discusses policy to give at the same time a draft clause for the benefit of the Council.

Granting for the moment it is right we should labour under this onerous condition, and whilst accepting the challenge I will point to the really urgent necessity for clear thinking and plain speaking.

Now the principal note of Mr. Glyn-Jones's paper is a demand for plain English and "no ambiguity," therefore one would expect his paper to be characterised by these very desirable attributes; but is it? 1. His text: He has had to go back twenty years for an excuse for playing a game of run away. 2. "There we have the clearest indication that the Government have no intention," etc. Good heavens! What did he expect from the Government? Does he fancy the Government needs no education on what company pharmacy means? 3. "I know it will be urged that my suggestion will be useless," etc. Knowing this, surely an apostle of plain English and practicality would have given us a clause showing his suggestion to be feasible. I have defied, and I again defy, the wit of man to devise such a clause as shall have the effect of showing that a qualified directorate is not inconsistent with individual responsibility under any circumstances whatever.

4. Critics of the the "Council's policy" are addressed, though the Council has no policy! It is engaged in formulating one. We are asked for clauses, and the "wonderful panacea" is unproduced—*i.e.*, we may not know what it is until accepted or rejected by the Committee. I protest against this method of evolving a policy. The six extraordinary facts for clause framers are adequately dealt with in your Editorial of the 18th inst., still I would like to empha-

sise the fact that "we have suffered enough from ambiguity already."

Well, I desire a policy decided upon, which would be practically the decision of the Law and Parliamentary Committee last month. I would let this pass through the hands of expert draftsmen, and I would then have our President take it to the Government. I would bring to bear every possible influence to gain its acceptance, and, if unsuccessful, employ every source the Society could command to enforce the clause or its equivalent. Why? Because this should be the "irreducible minimum," as it was the fundamental intention of the Act of 1868, and the only valuable thing in that Act.

After laying myself bare for destructive criticism, I may be permitted to support the position by dealing with my esteemed friend's (Mr. Glyn-Jones) paper, which, I ask, should be kept in mind during my remarks. We are said to have three policies open to us—but, his third not being entertained should not appear; whilst he manages to shut off the first by a simple stroke of the pen—one would think it could not so easily be disposed of. He thus leaves himself, by this assumptive reasoning, with only one possibility of dealing with this question—viz., *regulating companies to practise pharmacy.*

I say there are two clear policies possible. 1. Standing to our guns and regaining, or rather, keeping, our rightful position. 2. Abandonment—*i.e., a policy of scuttle!* There cannot be anything between. I say that no one can bring forward a single argument in favour of company pharmacy, and substantiate it Why? Because company pharmacy and personal qualification and responsibility do not cohere. Would it be sensible to go to the Lord Chancellor and ask him to make them cohere? Has Mr. Glyn-Jones ever thought what the Lord Chancellor would be likely to accept? I submit there are only two courses open to his logical mind. The first one, to allow the contention that we have a righteous claim, which he has allowed already. 2. If we have not the courage to ask for simple justice then we have not a leg to stand on. Our qualification becomes in his mind one of the type of engine or tramcar drivers. As illustrative of my contention that the case resolves itself into one or other of these two propositions, take the exceptional cases which have been mentioned—perfectly proper combinations *apparently*, but really not so. The essential feature to keep in a "title and practice" is unlimited liability and responsibility. No reasoning can make limited responsibility right in regard to a qualification; but the end and aim of limited liability law is to do that. Let us not deal sophistically with our problem, but face the naked issue. Do not clothe the subject so as to make it appear something different, and then deal with that different thing.

By all means let us have plain English, and also plain facts. "We are all agreed on what we ought to have, but there has been enough discussion upon abstract principle. The time has come for dealing with the matter practically." Going in for something which will bring "immediate direct results." How do these lines of least-resistance reasoners go about it? Why, simply by dropping my idealistic (which is the shortest way of calling it the only practical) principle. Reminiscent this of Lowell—

"I *don't* believe in princerple
But oh I du in interest."

We are told that the majority of chemists do not object to legitimate companies. I have already shown legitimate to be an impossible word in that relation; but, surely, it is not so much what the majority thinks, as to know what *is right, what is truth:* we want to know what is the sound position, the impregnable position to take up. I protest against any policy of abandonment of principle.

I beg to refer to the matter of personal interests. It is possible that the application of my idealistic fancies might eventuate seriously for me; but in searching for right methods all personal considerations must be ignored. Acts of Parliament are not made for individuals, or even to suit sectional bodies. I would say—

"Go put your creed into your deed,
Nor speak with double tongue."

Blackburn, November 21, 1899. R. LORD GIFFORD.

Impurities in Hypophosphites.

Sir,—In your "Answers to Queries" column last week, under the heading "Malt Extract and Hypophosphites," I notice the recommendation that the "hypophosphites used should be free from sulphates," as the presence of that impurity gives rise to an unpleasant odour. I pointed out in 1894 that a sulphuretted odour frequently arose from certain impurities in the hypophosphites, which impurities might be completely removed by carefully precipitating the solution of the mixed hypophosphites with a solution of barium hypophosphite. The precipitate generally consists chiefly of sulphate, but there may be present in addition sulphites, phosphates and phosphites. Mr. W. A. H. Naylor, in a subsequent investigation of this subject, proved conclusively that sulphate impurities played no part in the development of a sulphuretted odour, but that in every case a disagreeable flavour followed the use in a hypophosphite preparation of a salt containing *sulphite* as an impurity.

London, November 22, 1899. F. C. J. BIRD,

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.*

Brown Oil for Veterinary Use (A. W. B.—36/11).—Linseed oil, 2; rape oil, 2; Barbados tar, 1; turpentine, 1; oil of amber, 1.

Manufacturers of Optical Instruments (W. H. B.—36/1)—By "Elliott Bros." we presume you mean the opticians. Their address is 101 and 102, St. Martin's Lane, W.C.

To Blacken Copper (J. H. — 36/8). — Clean the surface thoroughly, then apply a little liq. antim. chlor. Watch the formation of the deposit, and as soon as the desired colour is obtained, rub off the liquid and burnish with a soft rag.

Makers of Magic Lanterns (W. H. B.—36/1).—Watson and Sons, 313, High Holborn, W.C.; John Wrench and Son, 50, Gray's Inn Road, W.C.; J. H. Steward, Strand, W.C.; Clarkson and Co., patentees of the Duplex regulator, 28, Bartlett's Buildings, Holborn Circus, W.C., are among the chief houses in this branch of the opticians' trade.

Dilution of Alcohol (W. H. B. W.—36/1).—There is no simple arithmetical formula or factor that you can use for accurately calculating the requisite dilution of spirit with water. The contraction of volume introduces an error which requires a complex algebraic formula to solve it. You would find it more convenient to consult a "table," or to use a "spirit rule."

French Polish (G. O. P.—36/9).—This is best applied with a pad of soft rag made up into a sort of ball by packing pieces of absorbent rag or cotton wool inside a piece of very fine linen and tying the whole up tight. The pad is thoroughly moistened with the polish, then rubbed with a circular motion over the surface of the wood until the gloss appears. Brush polish is good carriage varnish applied by means of a camel's hair brush.

Ferri et Quininæ Citras (W. W.—36/6).—Your calculation is quite correct, and there is no reason why you should not adopt the plan you propose. It would be advisable, however, to evaporate the solution to a low bulk in order to remove ammonia and then redilute the product in accordance with the calculation based upon the quinine present. If you wish to make quite certain that the product would comply with the official requirements you could assay a measured quantity of the concentrated solution, and dilute in accordance with the results of the assay. This would remove any doubt about the possible loss of quinine.

Cleaning Rain Water (J. B. B.—36/14).—The dirty scum your customer complains of is probably due to suspended foreign matter derived from the rain water running from a roof, possibly into a dirty tub. If the rain be caught in a clean vessel, as it falls, it will not contain any impurity. If he employs steam, he could easily fit a cooling worm on to his exhaust steam pipe, and by this means obtain any quantity of soft water pure enough for his purpose. Or he could soften his main water with slaked lime and sodium carbonate; such softened water will answer perfectly for washing the most delicate white fabrics.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

EFFECTS OF CANNABIS INDICA.

Dr. W. E. Dixon has examined the physiological activity of various samples of crude Indian hemp and of some derivatives of that substance. He concludes that hemp exerts its effects differently according to the preparation used, fresh hemp, for example, being diuretic, whilst the dried possesses little such action. Its effects vary according to the manner in which it is taken into the system; when smoked exhilaration is most manifest, whilst when taken by the mouth in small quantities exhilaration is generally not observed. It is recommended that where an immediate effect is desired the drug should be smoked, the fumes being drawn through water. In fits of depression, mental fatigue, nervous headache, and exhaustion a few inhalations are said to produce an almost immediate effect, causing sense of depression, headache and feeling of fatigue to disappear, and the subject being enabled to continue his work, feeling refreshed and soothed. Other results claimed are to give staying power and alter the feelings of muscular fatigue which follow hard physical labour. Absorption does not occur for one to two hours when the drug is taken by the mouth, but the effects produced are more lasting than when it is inhaled. Hemp taken as an inhalation is placed in the same category as coffee, tea, and kola, being free from danger and without alarming effects. In fact, Dr. Dixon has come to regard it, in this form, as a useful and refreshing stimulant and food accessory, and one whose use does not lead to a habit which grows upon its votary. If taken by the mouth hemp must be classified with the narcotics, and when given in that way the nervous effects produced may be such as to cause serious alarm, though no danger is to be apprehended whilst the heart remains regular and strong. "It is to be feared, however, that cannabis indica can never become popular until its active principle has been isolated, that is, the isolation of a compound of fixed strength. Like any other stimulant or sedative narcotic, hemp may be abused, as when taken to produce an intoxicant or deliriant effect, but this abuse is rare, and there is reason to believe has been grossly exaggerated." Finally, from a frequent observation of hemp, both subjective and objective, the author affirms that hemp is soothing and stimulating, being a specially valuable cerebral stimulant when inhaled. He believes it to be an exceedingly useful therapeutic agent, one not likely to lead to abuse, and producing in proper dosage no untoward after-effects.—*Brit. Med. Journ.*, Nov. 11, 1899, p. 1354.

ANATOMY OF ENCEPHALARTOS.

W. C. Wordsdell has read a paper before the Linnean Society, in which he shows that the chief features of the anatomy of certain species of *Encephalartos* is the presence of several vascular cylinders in the stem, a character found also in *Cycas* and *Macrozamia*; in addition, the medullary system of vascular bundles forms, as in *Macrozamia fraseri*, Miq., a complex network, intimately united with a corresponding network of mucilage-canals. The system of mucilage-canals in the pith is continuous with that of the cortex, but the medullary bundles form an independent primary system. The mucilage-canal system is probably of use as a storehouse of moisture during the dry season, when the roots and foliage die away. A younger seedling plant of *E. horridus*, Lehm., was found to exhibit in the hypocotyledonary region, the transitional region between stem and root, at one point a curious large cauline, and partially concentric strand, and several smaller strands or bundles lying farther out in the cortex. Those are thought to represent the rudiments of the outer vascular cylinders. The character of the strands and the region in which they occur (which is that where the first-formed tissues are located, and where, therefore, ancestral characters would be sure to preponderate) tend to show that the collaterally-constructed vascular cylinders were originally derived from vascular cylinders possessing a concentric type of structure such as is met with in the stems of such fossil plants as the *Medulloseæ*. In the opinion of the author the ancestry of modern Cycads must be looked for in that fossil group.

PARSLEY AS A POISON.

J. E. Harting has communicated to the Linnean Society particulars of several cases in which parrots have been poisoned by eating parsley. After commenting on instances in which plants that are innocuous to man have proved fatal to some of the lower animals, he mentioned in support of the converse case that the berries of the yew and privet, which are generally considered to be poisonous to man, are greedily eaten by blackbirds, thrushes, bullfinches, and other birds; while, on the other hand, several cases are on record of pheasants having been poisoned by eating yew leaves. The immunity of goats from yew poisoning was thought to be remarkable in view of the fact that deer and cattle have died after eating the leaves of that tree, although it had been stated that the ill effects were due to the leaves having been eaten in a desiccated state, and not while growing on the tree.

CORROSION OF WEIGHTS.

E. T. Allen publishes some notes on a remarkable case of metallic corrosion, the objects of attack being gold-plated brass weights. They had been put away for the summer in an iron safe and were then in good condition, but when the boxes were opened it was seen that moisture had gained access. The ivory points of the tweezers and velvet linings of the boxes were white with mould and a white coating was apparent on the top of every weight. The weights proved to be abnormally heavy; when the coating was scraped off it was found to be insoluble in water, but soluble in hydrochloric and nitric acids. The nitric acid solution gave no precipitate with silver nitrate, and the hydrochloric acid solution gave no precipitate with ammonia, but it yielded a white precipitate with potassium ferrocyanide. The ammoniacal solution yielded a brownish-white precipitate with ammonium sulphide. Heating on platinum foil revealed the presence of a certain amount of organic matter, and the white substance proved to be a compound of zinc—either the hydroxide mixed with mould or a zinc salt of some organic acid. Apparently the zinc—the more positive metal—in the brass of the weights had been attacked by water and mould, while the copper and gold remained unaffected.—*Chem. News*, **80**, 246.

FLEXIBLE AND STYPTIC COLLODIONS.

W. T. Caldwell suggests the following modified formula for flexible collodion:—Glycerin, 2 parts, by weight; Venice turpentine, 5; lard, 10; collodion, 83. The turpentine and lard are said to give elasticity, and the glycerin suppleness. When the preparation is applied to the skin, the film does not contract unduly or crack. The author also proposes to use glycerin in preparing styptic collodion with the object of insuring perfect solution of the tannin in the U.S.P. formula. So far as can be gathered from his somewhat vague note, he rubs tannin, 20 parts, with glycerin (? 2 parts), then adds 94 per cent. alcohol, 5 fl. pts.; ether, 25; and collodion, *q.s.* to make 100 fl. pts. By adding 15 parts of carbolic acid to 85 of this styptic collodion, an excellent antiseptic preparation is obtained.—*Pharm. Era*, **22**, 667.

COMPANY PHARMACY: ITS ABOLITION OR REGULATION.

BY W. S. GLYN-JONES.

The interest taken by your readers in the above subject is my excuse for returning to it. The tone of the discussion is, I think, distinctly hopeful, and is likely to have a practical outcome so long as those who take part in it maintain a spirit of tolerance and give credit to those holding opposite views for having the best intentions in the interests of chemists and druggists. My suggestion that critics should produce a clause seems to have met with general approval, with a result that the discussion is narrowing down to practical issues. From remarks made by various of your correspondents I fear that I did not make my position sufficiently clear, and I should like to deal with the matter by taking up the alternative suggestions sent out by the Federation for the consideration of the various local associations. In doing so I hope to reply to criticisms on my last paper made by your various correspondents, in their proper connection.

SUGGESTION ONE—TITLES AND PRACTICE.

"(1) To protect chemists' titles and make it illegal for companies of unregistered persons to keep open shop for selling poisons, as in the case of individuals."

I would divide this into two sub-divisions:—(*a*) Title; (*b*) Practice. (*a*) I think we shall have a strong case in asking that no corporate entity shall use our title. However a company may be constituted, I think "it" cannot be a pharmaceutical chemist, or chemist and druggist, for the good reason that "it" cannot pass examinations. For a company to call itself a chemist would be equally absurd as it would be for "it" to take the title Bachelor of Arts, or even Bachelors of Art. The title is something which applies to an individual, and should, I suggest, only be used by him or her. Having taken that position, I expect those who do not agree with me to say that logically I ought to accept the second part (*b*) of this first suggestion, which would make it illegal for companies of unregistered persons to keep open shop for selling poisons, as in the case of individuals. And they are right. "In law" a company may be considered to carry on a business or keep open shop. "In fact," a company, a corporate entity—an "it"—which could not pass an examination, cannot and does not do anything of the kind. Either the shareholders do it and should be made responsible for any penalties which they may incur for so acting, or they appoint one or more directors who, on behalf of the company, keep open shop. This is a view which, as I pointed out in my former paper, was taken up by some of the judges who gave the decision in the notable case governing company pharmacy. (*b*) The first question to be considered in connection with the second sub-division is: Shall we seek to prevent qualified persons using company machinery? Mr. Lord Gifford is one of the comparatively few who take up the position that no company, however constituted, should own a shop kept open for the sale of poisons. He says there can be no legitimate company pharmacy. I have already admitted that, in an ideal state of pharmacy, Mr. Lord Gifford's position would be tenable. If the profession of pharmacy, which the founders of the Pharmaceutical Society had in their minds, was to-day carried on under the ideal conditions which they sought to impose, Mr. Gifford's contention would be a strong one; but we must remember that the 1868 Pharmacy Act did not create such a position. It provided for the safe distribution of a comparatively few poisonous articles, and, as it has oftentimes been pointed out, it is simply an Act which treats chemists and druggists as the proper people to sell by retail such dangerous articles. I think that from Mr. Gifford's ideal standpoint it might be equally well argued that no company of ship-owners should be formed unless each of the shareholders held a captain's or master's certificate, or that no colliery company should exist unless each of the shareholders is a mining engineer. Mr. Gifford must forgive me for unceremoniously brushing that position aside. I am convinced that, however desirable it may be, it is unobtainable, and I think the majority of your readers hold this view. My answer to the second part of Suggestion 1 (Practice) would be:—That whilst no attempt be made to prohibit people who were not qualified holding shares in a limited company formed to finance retail pharmacy, we should satisfy ourselves that in the case of such companies some responsible person or persons should be appointed by the company to "keep open shop" for "it," and that this person (or persons) should fulfil the conditions imposed under the 1868 Act upon any individual desiring to keep such open shop. I shall have to explain how this might be done in dealing with the remaining suggestions.

SUGGESTION TWO—TITLES ONLY.

"(2) To apply for protection of titles only."

I would strongly advise anyone who has any idea of adopting this suggestion to carefully read what "An Ordinary Pharmacist" says on the subject under the heading "Protection of Titles Only," on page 502 of last week's Journal. I think that to confine our efforts to titles alone would be suicidal. I agree with "An Ordinary Pharmacist" when he says that such a suggestion would stand no chance of being received by the Government. I am further of opinion that the protection of the title only, apart from satisfactory regulations protecting the practice, would be comparatively of little use.

SUGGESTION THREE—QUALIFIED DIRECTORS.

"(3) That all the directors of a company shall be qualified."

I pin my faith to this suggestion as being an effective method of preventing unqualified people using company legislation to enable them to do what otherwise the Pharmacy Act declares to be illegal. I have frequently been met, especially during the past week, with the following expression of opinion from our members:—"All I care about is that seven unqualified people shall not be allowed to do what either one of them singly is prevented from doing by the Pharmacy Act." And I heartily agree with that. One, if not our chief, grievance is briefly stated as follows:—A man either makes no attempt, or has made one or more unsuccessful attempts, to qualify as a person who shall be enabled to (1) use the title of chemist and druggist, or pharmaceutical chemist, as the case may be; (2) keep open shop for the sale of poisons; (3) conduct the actual sale of a poison. He cannot, as an unqualified individual, do either of these things, but with the help of six unqualified persons he may become a company—an "it"—and "in law" this impersonal thing may assume the title, and keep open shop; but "it" cannot conduct the actual sale, so "it" employs a qualified assistant, not to keep open shop, but to do the selling for "it." In the case of such a company, who "in fact" keeps open shop for the sale of poisons? Mr. Justice Bramwell says it is not the company, the impersonal thing, nor is it the assistants. He says it is the director, and, in fact, we know that it is the unqualified person who provides himself with the six dummy shareholders who is really the culprit. If you can get the Government to adopt Mr. Gifford's suggestion and prevent a company, having either of the above three things for its objects, being formed, the evil would be remedied; but I again repeat it is at least twenty years too late to expect the Government to do anything of the kind. We can, however, reasonably ask them to provide that the shop will be kept open—in other words, the business conducted—by one or more qualified individuals, and, in my opinion, we must seek to get this by insisting that a company having either of these things as part of its object, shall appoint one or more qualified directors, in whom shall be vested the fullest powers of controlling both the capital and the business. We can surely ask as much in the interests of the public safety, and in order to prevent an unqualified person of the stamp we have referred to circumventing the Pharmacy Act. Mr. John Smith, criticising this suggestion, says:—"I do not believe the qualified director arrangement would be entertained by Parliament for a moment. The duties of directors, and the means by which they may be shirked or delegated, are well known to our legislators, and the proposal, even if it was accepted by pharmacists, would probably be rejected by Parliament. Of what use, it would be asked, is the pharmaceutical quali-

fication of a director who lives in London, say, to a business carried on in Birmingham? There is, in addition, a danger to our position in making the admission this proposal would involve—viz., that qualified proprietorship is not essential." His contention is perfectly sound, unless the clause which we suggest would prevent "dummy" directors, and I can assure Mr. Smith, and those who may share his doubts, that it is quite possible to draft a clause which would absolutely prohibit the state of things which he prophesies would come about as the result of the employment of irresponsible directors.

Suggestion Four—Qualified Managing Director.

"(4) That the managing director only need be qualified."

I do not think that this would be satisfactory, because I cannot admit the right of any unqualified person to be a member of a board of directors controlling a business where poisons are sold. In other words, I agree that "no unregistered person should be permitted to exercise any control over the retailing, dispensing, or compounding of poisons."

Suggestion Five—Qualified Manager or Assistant.

"(5.) That a company shall be allowed to carry on the business with a qualified manager or assistant, who shall be registered for the purpose, and whose name shall appear in connection with the business."

I have said enough to show that I could under no circumstances approve of this suggestion. I strongly object to the contention which would allow of a qualified manager or assistant acting as the servant of unqualified directors. It would in no way benefit our present position, or prevent an unqualified individual making use of company machinery in order to enable him to carry on our business. We have already the power to insist, under the Pharmacy Act, that in every shop where poisons are sold there shall be a qualified person to conduct the sales.

An Ordinary Pharmacist's Five Courses.

I think that we should be wise to ask for a clause in the Companies Bill which would prevent the use of titles by any kind of limited company, and which would insist that in the case of companies keeping open shop for the sale of poisons there should be a director, or directors, who should be in sole control, and that these should be registered persons. Having secured that, I admit the necessity for an amendment of the Pharmacy Act, which would enable us more effectively to enforce its present conditions, not only against companies, but, unfortunately, against a large number of our own people. "An Ordinary Pharmacist," in his paper (No. 4), gives a list of five alternative courses, which, in his opinion, the Council might adopt. I think that the three alternative courses mentioned by me in my former article really combine his five. Whether they do or not is not a matter of practical importance. I have already dealt in this article with the first three of the courses he mentions; the fourth commences with a word which at once prejudices me against it.

The Fourth Course.

"(4) Wait to see what the Government proposes to do in the next Session of Parliament, and then oppose what seemed to be antagonistic to the interests of registered chemists, whilst not conferring any real benefit on the public."

Wait! Wait!! Wait!!! We have been waiting with a vengeance for twenty years, with disastrous results, and my first inclination is to vote against anything which means waiting. I am convinced it would be the worst possible tactics to *again wait* until the Government have further committed themselves to a clause, and then go to them asking them to undo what they have done, and, failing that, oppose them. I do not say that it will not be necessary to oppose them, but, as our Editor has said: "The further opinion that the wisest and most politic course would be for chemists to offer their assistance to the Government in drawing up a suitable amending clause, will also commend itself to most minds as reasonable."

The Fifth Course.

"(5) Pass a formal resolution, expressing the views of the Council, and depute a limited number of members to negotiate with the Government on that basis, after which a clause embodying what seemed feasible might be drafted and submitted to the Council for approval."

There is here some hope of agreement between "An Ordinary Pharmacist" and myself. I desire that the Government should be asked to receive a deputation from our Council, and I have no objection whatever to that deputation expressing to the Government the opinion that no company should be allowed to do those things which the Pharmacy Act lays down can only be done by qualified individuals. I have no objection to that deputation stating that in the opinion of our members no company should be allowed to keep open shop for the sale of poisons; but I ask that, in what I consider to be the inevitable event of the Government refusing to take such a course, the deputation should be immediately prepared with an alternative clause for regulating such companies, and if any better suggestion can be made for an alternative clause than that which I am advocating I should only be too delighted to adopt it. I do object, however, to such a deputation going to the Government unless it is prepared to negotiate upon some such basis, involving regulation of companies, in the event of our meeting with a direct refusal by the Government to insert the clause which would mean prohibition. I candidly confess that I do not see the practical utility of passing such a formal resolution expressing our views. The Government already knows them, and it has not acted upon them. Still, if any one of our members thinks that we have not yet had a refusal by the Government to act upon the suggestion made in the clause submitted by the Law and Parliamentary Committee, at the last meeting of the Council, I have no objection to their minds being set at rest by adopting some such course as I have outlined in this paragraph. I should like to add that before any expression of opinion is sent to the Government, or any deputation meets them, a conference should be arranged with the Irish Society, and, if possible, we should act together and lay before the Government proposals satisfactory to both Societies.

THE PRESENT POSITION OF PHARMACY.*

BY PETER BOA,

Chairman of the Executive of the North-British Branch of the Pharmaceutical Society of Great Britain.

We are on the threshold of important changes in some of the conditions regulating the entrance to our calling. Our Society is to relinquish the First Examination which it at present holds, and in lieu thereof it will receive certificates of specified educational bodies holding examinations. Algebra, Euclid, and a modern language have been added to the subjects which the present examination includes, and the standard has been raised. The examination, therefore, will be somewhat more formidable. However, it need not be passed all at one sitting. A candidate may obtain the requisite certificates at two examinations. There can be no doubt that the First Examination, as it is at present conducted, is a simple and convenient arrangement for intending entrants. When a youth thinks of adopting pharmacy for his career the first thing he does is to ask a pharmacist how he is to proceed to obtain entrance. The pharmacist tells him that he must pass the First Examination, and it is an easy matter to inform him how to enter himself for it. The simplicity of the procedure attracts inquirers, I believe, in many cases. The system of accepting certificates from a multiplicity of examining bodies may by and bye be quite as convenient, but at first I feel sure it will give rise to a lot of trouble and irritation. A busy pharmacist cannot be expected to have at his finger ends the ways of getting at the various bodies whose examinations are recognised. He may give the inquirer a copy of the Society's Syllabus of Examinations—as the Society does not advertise, he will not get

* Inaugural Address delivered at an Evening Meeting held on November 92.

one unless he applies for it—but that will not help him. A youth fresh from school has no great liking for writing letters as to examinations. His father probably is a busy man, who has no time to make inquiries. This pharmacy business is designated too troublesome, and the youth is absorbed by a calling with a less complex entrance. I may be wrong in anticipating trouble. I hope my fears may prove groundless.

The Apprentice Difficulty.

At present many pharmacists complain of not being able to obtain apprentices. Should the new method of passing the First Examination prove troublesome at first the scarcity of apprentices will be intensified. Some say that is as it should be. We want to limit the entrants. Too many are in the business already. That may be so. I am not prepared to express an opinion in that connection. This I will say, that I am surprised the supply of apprentices has kept up as well as it has done when the inducements are considered. Unless in a few pharmacies the hours of business frighten even the most enthusiastic of those who entertain the notion of becoming pharmacists. I quote from the lettering on the door of a good pharmacy:—"Hours, 8.30 a.m. to 9 p.m.; Saturdays, 10.30 p.m. Attendance on Sundays, 10 to 10.45 a.m., 1 to 2, and 6 to 8.30 p.m." Some pharmacists tell me they simply cannot get an apprentice; others tell me they get one readily when they have a vacancy. Hours, I find, are the differentiating factor. Banks, law, insurance, absorb most of our best youths. The prospects are quite as good as in pharmacy, and the hours about one-half. I often hear a desire expressed for a better educated, more luxuriously brought-up class of entrants to our calling. These cannot reasonably be expected so long as our hours of business remain as they are. I consider the long hours of business obtaining in pharmacy out of date, unnecessary, and a hindrance to pharmacy's best interests. In saying this I am alive to the probability of your wanting to know how they can be shortened. Probably by combination; but that, experience teaches, is among us difficult to get. It is a pity that our hours of business should frighten away desirable youths—not only on our account, but on their account. There is no more delightful occupation than pharmacy. Its never-ending variety is a continual entertainment to a thinking man. When a man has been engaged in pharmacy for ten years his stock of general and useful knowledge is probably unequalled by that of a corresponding man in any other business. Personally I cannot imagine a pleasanter occupation than pharmacy.

Pharmaceutical Education and Examination.

The course of education which has to be undergone before the Minor is passed is well designed to fit those who qualify for carrying on their after work. We have, it is true, a very large percentage of failures in the Minor Examination, and this is taken by some to point to defective systems of education. I am not prepared to admit that these failures are due to defective educational facilities. The examination itself is a fairly stringent one, and it is carried out on the basis of a high standard. The percentage of failures, although regrettably high, fluctuates very little from examination to examination and from year to year, and there is wonderful uniformity in the passes and failures in both London and Edinburgh. This steady uniformity, to my mind, is an assuring indication that the examination is not being conducted in any haphazard or slipshod manner. When the number of subjects which have to be got up and kept up is considered, it must be admitted that the examination is a very heavy one. In fact, I believe it is the heaviest examination in this country. The question of dividing it has been raised. It is divided as it is, but the interval between the two portions is too short to be of much service as a relief to candidates. The subjects have been extended from time to time since the present system of conducting the Minor was introduced, and now the strain upon a candidate is considerable in keeping them all simultaneously up to examination point. Should a further extension of any of the subjects be deemed expedient, it is very likely that the question of relieving this strain will be considered. Many find comparatively little difficulty in undertaking the examination as it is, but to others it is a severe tax on their mental powers. The majority of failures, however, so far as I can judge, are due to candidates coming up too soon. It is a perfectly natural thing for a candidate to endeavour to pass as quickly as he can, and, as we have not a compulsory curriculum, the time when is practically left to his own judgment. In his haste he is liable to get knowledge without understanding. The tendency to this has increased within recent years. Men pass very young now. It is a credit to their perseverance and their head that they do, and the possession of some undigested information must not be regarded too severely. Examiners are occasionally blamed for failures. This is with me tender ground, and you can scarcely expect me to criticise or defend. It would be kindness, however, to the members of the Board of Examiners to remember always that they are only human. The majority of failures occur, so far as I have observed, in the simplest things.

Some Curious Examples.

I hope I shall not be accused of telling tales out of school if I give you examples. During the last examination I gave to each of two men on two different days the following as part of their practical dispensing:—

℞ Magnes. Sulph., ʒss.
Fiat pulvis, et divide in chartulas, iv.

My object in giving this was to see (1) that the candidate knew that ʒss. meant 240 grs, (2) that in accordance with the direction he powdered the salt, (3) that he weighed the powders, and (4) that I might observe his manipulation. You will be surprised when I tell you that two out of the four men divided the salt ordered into six powders instead of four. These are not exceptional cases. They may be taken as typical ones. In the oral examination the same want of attention to simple details is experienced. We have on our materia medica table a specimen of carrageen, or, as it is commonly called, Irish moss. This I showed to a candidate, and he immediately told me that it was "Irish moss, *Chondrus crispus*, natural order Algæ." On asking him if it were quite correct to call it a moss, he said "No; it is a lichen." On my asking him if he knew where it grew, he told me it grew on the rocks in mountainous districts. Another candidate who readily told me its name, natural order, and composition assured me that it could not live in the sea, but that it grew on the rocks above high-water mark. Such men as these last have come up rather soon; many candidates do. They come up to see what the examination is like on the chance of squeezing through. I have nothing hard to say against them for this—I was once a student myself. It is, however, doubtful discretion. Failure is taken lightly in such cases. After having had a disappointing candidate one day during last examination, I got one who was, as the saying goes, "very well up." I was so grateful for the change that I could not help saying to him that he appeared to know something of the subject. He replied very good-naturedly and with evident appreciation of the humour of the situation, "I should think I do. You ploughed me last time." I almost think he regarded me as his benefactor.

Division of the Qualifying Examination Advisable.

Division of the Minor Examination into two portions, with an interval of at least three months between them, would almost certainly lead to a higher standard of real knowledge being attained. A student very naturally may be expected to go more thoroughly into two or three subjects than into half a dozen. Such a division of the qualifying examination is a matter which would require to be very carefully arranged. Probably the first portion might suitably consist of the scientific subjects—botany, chemistry, and physics; and the second portion the technical subjects and practical work. Fewer subjects and a higher standard would suit all

candidates. Some have great difficulty in keeping a number of subjects in their mind at once. Such men are frequently possessed of good ability to grasp thoroughly one or two subjects at a time. Division would suit them, and it would make no difference to those who do not suffer from their defect, if it can be so designated. The scientific subjects are a fine mental training, leading students into the method of observing, thinking, and understanding things in a systematic way. Their precedence of the technical subjects might, therefore, be expected to bring about a clearer apprehension of the latter. The increased fee for the Minor, which will be charged after the July examination of next year, will probably operate towards preventing premature presentation. I am not, however, sanguine that it will. After all, it is only five guineas more than the present fee, and the return fee is to be the same as it is now. Until we have an enforced course of study we need not expect but that a number will always come up on the minimum of preparation calculated to give them a chance. I must not be apprehended in saying this to mean that our students would get better teaching by an enforced curriculum than they get now. I question whether they would get as good, but they would get it spread over a longer period, and what is taught them might be better assimilated. The teaching obtainable at the present time by students of pharmacy is excellent. They will not, however, take enough of it.

VALUE OF THE QUALIFICATION.

The value of the Minor qualification has very materially increased since the introduction of the five-guinea fee. If it increase in proportion after the advent of the ten-guinea fee, the qualification will be, in common parlance, cheap at the price. The fee may not have had anything to do with the increase in the value of the qualification. Its rapid advance in value was, however, so suggestively synchronous with the imposition of the larger fee that their connection cannot well be disregarded. It is convenient, but scarcely correct, to speak of the ten-guinea fee. Although that is the sum to be paid on entrance for the Minor, only one-half—or the same sum as now—is the fee for examination, the other half being in the nature of a registration fee. The Society, as you know, is saddled with the responsibility of prosecuting, in the public interest, persons who are reported to have infringed the Pharmacy Act. As to whether the Society should hold this responsibility or not, this is not the place to express an opinion. The responsibility may be a privilege, but it is a costly one. When the Society prosecutes, at the instance of a legal officer of the Crown, an unqualified person, say, who has sold a scheduled poison to someone who is thereby enabled to commit suicide or murder, it never gets credit for serving the public, but is instead invariably deluged with abuse for endeavouring to establish a monopoly on behalf of its members, and such a prosecution means a heavy bill of costs to the Society. Prosecutions for infringement of the Pharmacy Act, although primarily intended to conduce to the safety of the public, have their value in protecting the interests of qualified persons. No provision was originally made to meet the outlay which they entail. For many years the expenses on their account were small. In recent years they have become seriously heavy, and it has become necessary to make some provision for the future in regard to their probable still further increase. Since examination became compulsory, connection with the Society has been optional. A person who passes the qualifying examination may join the Society, or he may not, just as he pleases.

THE SOCIETY AND THE TRADE.

The Society, in fact, has no further control over him. As it has happened, only about one-third of those whose names are on the Register have joined the Society, and it follows as a deplorable sequence that the subscriptions of those who join the Society have to be partly expended in maintaining the rights of the many who remain outside and pay nothing. Since two-thirds of those who have qualified in the past have shown themselves regardless of their obvious duty, it seems only just and reasonable to arrange now for levying an assessment, at the time of passing the qualifying examination, sufficient to prevent the Society from being out of pocket in caring for the material interests of the possessor of the qualification. It seems to me a pity that our Society has not some control over persons whose names it places on the Register. In law and medicine, societies and licensing bodies have powers to take their members or licentiates to task for doing anything which is derogatory to the dignity or honour of these bodies, and they exercise those powers frequently and strictly by suspending, temporarily or permanently, offenders' qualification. Our Society, no doubt, can remove a person from membership, but it has not power to cancel his qualification. To a person who can offend to this extent the cancelling of his membership is a small matter. If his qualification were cancelled, it would be a different story. The person on the Register has at present the whip hand on the Society. If the Society had a disciplinary power, it would have the whip hand of him. I venture with some timidity to entertain the opinion that it would be well if the Society had power to control the conduct of those who hold its qualifications. We are more and more coming into confidential relationships with medical men and their patients. Why, therefore, should not pharmacists be pledged to fidelity in all things relating to their business, and their licensing body provided with powers to bring them to book in case of unbecoming conduct, such as supplying inferior medicines, supplying drugs or appliances for immoral purposes, covering unqualified persons so as to enable them to carry on business, and such-like practices? The Society might reasonably ask those powers; it might readily get them; if obtained, they might be found very useful—more useful probably than many of the numerous suggestions which have recently been made for the Society's benefit.

MEDICINE AND PHARMACY.

There can be no doubt that strained relations between members of our calling and physicians are created from time to time by a want of regard on both sides for each other's interests. In Edinburgh and the east of Scotland, pharmacists and physicians confine their operations to their legitimate spheres. The former do not prescribe, and the latter do not compound medicines. The result of this is, I believe, highly satisfactory to the public, as well as to prescribers and dispensers. Unfortunately, in some towns in Scotland, and in many across the Border, physicians supply the medicines which their patients require, and chemists in these towns prescribe, and advertise quack medicines—so it is alleged. I have seen a letter in a medical journal from a practitioner to the effect that his income was being seriously affected by a prescribing chemist, to whom he said the people seemed to prefer to go. Physicians and chemists in these towns have been educated and trained, like their brethren in other towns, for the work in which they are expected to engage, but in practice they have largely exchanged their respective duties, and the consequence is that these duties are discharged in a manner that is inefficient, and a source of danger to those who are the subjects of them. The safety of the public, and the credit of the two classes involved, demand that this sort of thing should cease. The person who should, but does not, write prescriptions is the primary factor in the case. There is no use in a few setting examples, and possibly thereby making martyrs of themselves. The movement must be general and compulsory to be effective. That our Society has no controlling power in regard to the conduct of registered chemists is used as an argument against the legitimate dispenser. What guarantee is there, it is asked, that prescriptions will be treated in good faith and honourably compounded? If our Society were to obtain the disciplinary powers which I have indicated I believe it would be an important step towards the abolition of medical dispensing. The division of labour in this matter is practically universal in educated sections

of the community. If this be found best in the quarters best able to form an opinion on the subject, surely it cannot be the worst in other places—as one might be led to infer from the prevailing practice. I do not think it fair to blame either side; they are only continuing a state of things which they have found existent. It would be well, however, for both to set their house in order before the public, on its own initiative, rise up and demand that this be done.

THE USE OF THE MICROSCOPE.*

BY G. T. W. NEWSHOLME.

In dealing with the use of the microscope from an educational point of view, it may be pointed out that, in its true sense, education consists of drawing out and strengthening and developing the various faculties and powers with which we are endowed. To train the eyes to see and the hands to handle is no small part of the education of our youth, and in this relation what instrument or means can there be so valuable as the microscope? A person working with the microscope is learning something about the object he is viewing; but more than that, he is learning to see to a degree which those who do not use this instrument cannot understand.

The successful microscopist must have acquired, in a high degree, delicacy of touch, lightness, accuracy, flexibility, and steadiness of manipulation. The value of an educated hand is not properly appreciated, and yet from time to time we become practically sensible of it. It would be an easy matter to give many illustrations of its value, more particularly in relation to the practice of surgery. In every relation of life an educated eye to see and a trained hand to perform are of great importance. It may be claimed for the microscope a superiority over all other means of training these two organs.

As to training the intellectual faculties, it is not possible to work honestly and industriously in any department of natural science without profitably exercising the intellectual faculties. An untrained person is liable to see a little and to imagine a great deal; but the habit of accurate observation essential to the use of the microscope develops a corresponding care to interpret correctly.

The use of the microscope for cultivating the faculty pertaining to the sense of the beautiful is another important factor in education. In the education and development of the artistic sense the microscope takes us to the beauties of the Creator's work. In the perfection this instrument reveals to us there is never a line out of drawing or a colour or tint too few or too many, and, unlike man's work, the more God's work is magnified and the clearer becomes the detail, the more beautiful does it appear.

The use of the microscope in the education of the young (and I would have microscopy taught in every school in the kingdom) cannot but have the most salutary influence upon their sense of proportion and of harmony, and help them in the appreciation of all that is beautiful.

As to the use of the microscope in everyday life applied to our daily work, there are many persons who go through life and follow their several callings without knowing the amount of knowledge which the microscope would let in upon their pursuits. On the other hand, there are many in professions and trades of various kinds to whom the microscope is well nigh indispensable.

The science of biology, at least, in its modern aspect in relation to botany and zoology, owes its very existence to the microscope, and the great advances in our knowledge of minute structure and growth in quite recent years have taken place in consequence of the many improvements in microscopes themselves and in microscopic methods of research, notably, the employment of various methods of staining. Indeed, at the present day it would be quite impossible to teach these sciences without the microscope.

Bacteriology, one of the most modern of sciences, owes everything to the microscope. It would be impossible to say how much the medical profession and the whole world have benefited by the discoveries in recent years of the existence of certain bacteria, the causes of many diseases.

In the science of chemistry the microscope plays a most important part. Minute quantities can be recognised and many delicate chemical reactions detected.

In the practice of medicine and surgery it is the indispensable instrument of the medical man.

In the practice of pharmacy it is all important. In these days of severe competition adulteration and substitution are rife. The importance of being able to tell the difference, say, between true and false ipecacuanha; between ginger which has been deprived of its active principle, and nothing but woody fibre being sold, mixed with a small quantity of the genuine article, and sold as the finest ginger; the difference between the various kinds of arrowroots, the value of which range between 4d. per lb. and 3s. 6d. per lb.; or of the various substitutes and mixtures sold for or as finest ground pepper; and many other articles I could mention.

One could hardly find any trade in which the microscope does not play an important part. Its influence has been demonstrated over and over again. We know how important it is to us in buying our clothes, drapery goods, etc., that when we want silk or wool we don't get cotton, and yet I dare say many of us do not put to the test the knowledge we possess even in this matter, but I assure you adulteration in wearing apparel is equally rife with that in food and drugs, but at present unfortunately the law does not cover these articles.

In dealing with the application of the microscope to various branches of trades and professions, I am leaving to the last one of its most important ones. I mean its application to the examination of steel and iron. Sheffield may, I think, take full credit for this. The pioneer in this work was her distinguished citizen Dr. H. Clifton Sorby. Work commenced many years ago, but unfortunately not followed up by others until recent years, when another distinguished member of the Sheffield Microscopical Society—Professor Arnold—did great work, and I think he should have the credit of putting metallurgical miscroscopy on a satisfactory basis. This reference would not be complete without my recognising the splendid work done by Mr. B. W. Winder, of Sheffield, and also that of Mr. Thomas Andrews, F.R.S., of Wortley. Sheffield has a world-wide reputation for its steel, and the gentlemen whose names I have mentioned have done not a little in enhancing that reputation.

Notwithstanding all that has been done, there are still vast untrodden fields of discovery waiting to be explored, and the humblest worker may, by diligent and honest labour in the field of microscopy, add his contribution to the great array of facts which are daily accumulating.

I trust I have succeeded in conveying to your minds who are at least some of the people to whom the microscope should appeal. You will admit that the class is a numerous one, and that a microscopical society in a town like this should, instead of its having even the large number of 154 members, have at least ten times that number. Everyone who uses a microscope for business or pleasure should join a microscopical society and attend fairly frequently its meetings, so that he may be kept well posted up in all that is new in the microscope itself and in microscopical methods that may be helpful in his special pursuit.

A microscopical society should be the common meeting-ground of all interested in microscopic science. The society by its meetings should afford the opportunity to every earnest worker to bring the fruit of his labour into contact with other minds, either to be confirmed or corrected, so that he may be set on the right path by someone who has gone over the ground before. The meetings should permit the opportunity of making known to each other many of the ingenious devices and clever expedients which suggest

* From the Presidential Address delivered to the Sheffield Microscopical Society on Monday, November 13, 1899.

themselves in practice, and which often make the difference between the successful and unsuccessful microscopists. Every encouragement should be given to members to bring notes and queries to the meetings.

Many observations and suggestions, in themselves valuable, are lost frequently because the opportunity has not been afforded for their notes to be recorded in a permanent form. For this purpose every society should publish a periodical report of its works. The Sheffield Microscopical Society's transactions of last year are a step in the right direction, and the yearly publication will be of great value.

Another feature of great importance to a microscopical society should be the formation of a library of the standard works of reference in microscopical literature and the formation of a museum of typical slides and specimens. In Sheffield, we have already made a very small beginning in this direction, but the lack of funds limits our extension. It is almost impossible for each microscopist to possess himself of copies of books which are essential to him if he is to do good work. The museum, I think, might grow perhaps more easily than the library if each member could think of the society when mounting slides, and mount a duplicate one at the same time. A society may be helped in many ways—first, by becoming a member and worker with the microscope, and so contributing a quota to the share of work which the society may accomplish. Still, I hope no one will be deterred from joining a society because he has not hitherto worked with the microscope. Secondly, by paying his annual subscription, which, though small sums to him, helps to swell the fund of the society and to greatly increase its power for usefulness.

I cannot better conclude my address than by quoting, as an inducement to the study of microscopy, the following words from the presidential address of Dr. C. T. Hudson at the meeting of the Royal Microscopical Society, February 13, 1899:—"To gaze into that wonderful world which lies in a drop of water, crossed by some atoms of green weed; to see transparent living mechanism at work, and to gain some idea of its mode of action; to watch a tiny speck that can sail through the prick of a needle's point; to see its crystal armour flashing with ever-varying tint, its head glorious with the halo of its quivering cilia; to see it gliding through the emerald stems, hunting for its food, snatching at its prey, fleeing from its enemy, chasing its mate (the fiercest of our passions blazing in an invisible speck); to see it whirling in a mad dance to the sound of its own music, the music of its happiness, the exquisite happiness of living—can anyone who has once enjoyed the sight ever turn from it to mere books and drawings without the sense that he has left all fairyland behind him?"

THE RELATION OF THE WHOLESALE TO THE RETAIL TRADE IN PHARMACY.*

BY F. CURRY.

Pharmacy as a trade occupies a special and unique position. It is not only a trade—it has also its professional aspect. And from this fact the position it holds relative to the public is somewhat of a responsible character. In the articles it handles the public have no criterion of value; they tender their prescription and the price, and leave more or less to the conscience of the pharmacist its careful and proper preparation. An ordinary tradesman, dealing in general articles, is open to severe criticism from his customers—and criticism with knowledge on their part; but in the case of a chemist this is not always, or often, so. The public cannot judge of the quality or reliability of their purchases by their appearance, or even their effect as medicines. They have to repose upon the skill, knowledge and integrity of the chemist to a far greater extent than is necessary in buying their provisions or other articles of daily need. It is most essential, then, from this point of view alone, that the relation between the wholesale and the retail should be all that may be desired. Men connected with pharmacy have to handle potent and deadly drugs, the lives of their clients repose in their hands, and are staked upon their caution and knowledge a hundred times a day. How little do we ourselves sometimes realise this!

The Present Condition of Pharmacy.

In the opinion of some, pharmacy is in a most deplorable condition, and the outlook is altogether of a very discouraging character. I, myself, incline rather to favour these views, though I am aware that there are many, who from their high standing in our ranks are well qualified to judge, who are decidedly optimistic in the view they take of the future of our business. But I think that perhaps their position, more or less unique, above the storms and vicissitudes that overtake their humbler brethren, is in some degree accountable for their happy forecasts. If, on the contrary, they could look at affairs from a less elevated position, many of their sublime notions would vanish, and they would come to see that, considering the majority, at all events, their opinions are entirely erroneous. It is not the actual present that is so alarming, but the tendency of the times, and all that the future holds in store if present lines are followed, that strike a note of consternation into the minds of those who look into the future. The severe competition, driving down profits to almost vanishing point; the evils of company-trading; the gradual development of the average chemist and druggist into a mere huckster of packed goods; the restrictions and regulations imposed upon him, are some of the too numerous causes for our despair. The condition of things that obtains now was unknown to our fathers; what, then, will it be when we ourselves have grown old? It is, of course, asserted that a new generation will meet new difficulties, that the man will adapt himself to his environment; and this, in the main, is doubtless true. However, I cannot but think that the present tendency is to the utter extinction of the pharmacist, as a pharmacist (into what he will ultimately develop I dislike to think) unless some particular evils are speedily redressed. It has been these considerations, therefore, that have induced me to bring to your notice the subject in hand, as I am convinced, among the numerous questions at issue, that of the relation of the wholesale to the retail is no unimportant one.

Wholesale and Retail—Ideal and Real.

We have briefly to consider in what relation the former should stand to the latter in an ideal community, and to inquire whether the existing relationship is of such a character; if not, to intimate in what particular way it needs to be altered. In my own opinion the existing state of affairs is very far from satisfactory, nor do I think that at any time the relations between the two sections have been as they should be. In olden days, as far as I can judge—and the hasty preparation of this paper has prevented me from obtaining reliable information—the relation that existed was much the same as obtained between the retailer and his customers. A great deal was accepted on faith. There were no certificates of the genuineness of the article demanded or given then; it was bought in good faith and resold as it was bought; and as too often the trader relied upon the gullibility of the general public, it is much to be feared that the wholesale trader, as well, trusted much to the technical ignorance and general credulity of his customers, and thus was able to sell to them goods of indifferent quality. But of this we have little to do; and however this may be, one great difference exists between the wholesale section of the trade then and now. The wholesale houses did business solely with their retail customers. Their primary idea was to cultivate good fellowship between the house and its business connections—so much so that the heads of the firm would themselves take provincial rounds on purpose to be able to personally call upon their friends and inquire as to the state of trade. They rigidly adhered to legitimate wholesale trading, and would not for one moment entertain the idea of supplying a private individual unsupplied with a guaran-

* Read at a meeting of the Chemists' Assistants' Association on November 23, 1899.

tee that he was engaged in business in a *bonâ-fide* character. How absolutely foreign to such a firm was the notion of *themselves* owning retail shops! Their methods of doing business were characterised by extreme politeness and cordial friendliness. None of that commercial keenness or frigidity, so noticeable in modern times, was apparent. At Christmas time, the festive season of the year, messages of goodwill were exchanged, and often something more tangible; while on the marriage of one of the retail gentleman's sons or daughters it was no uncommon thing for the wholesale firm to send a graceful acknowledgment of the happy event. It is illustrative of the amicable feeling which existed between these two branches of trade. To further emphasise this it is enough to say that, generally speaking, it was most unusual for a retail man to change his wholesale house—different, indeed, to this time, when the eternal rage for cheapness sends the chemist from one firm to another to buy in the cheapest market. I admit the necessity of the times has much to do with this; but that is a side issue with which we have little to do.

Actual Position of a Wholesale House.

The actual position in the commercial world of a wholesale house should be that of an intermediary between the actual importer or manufacturer on the one hand, and the person who retails in a suitable condition the commodities required by the public on the other. This applies to the wholesale druggist, as well as to other trades. It is, of course, quite probable many of you will fail to see the necessity of a middle man at all, but I venture to think that his existence is an instance of the specialising of labour which tends to the general good of the trader and the community at large. From his position, the wholesaler should be able to buy, in suitable quantities, the crude drugs as they come to the market, prepare and sort them in such a way as will be for the convenience of the pharmacist. He should select barks, roots, herbs, and all the thousand and one things that comprise the materia medica, and sort them into their varying grades of quality, so that a purchaser, requiring a particular article in a particular condition, shall be able to obtain it with a minimum of trouble. To him should be entrusted the powdering of drugs, their preparation, as far as may be necessary, into suitable forms for dispatch to the druggist, who will in turn convert them into galenical preparations. For example, the sorting of cinchona barks into those qualities suitable for making official preparations and those not so suitable, the washing and bleaching of calumba root, the selection of various qualities of opium, the distilling of essential oils, and many other processes too numerous to mention, which readily suggest themselves. In the carrying on of such a business there is ample scope for all the energies the wholesaler will be able to bring to bear upon it, but when he outsteps the limit of his proper sphere he at once becomes an evil. He enters into the arena and competes with both of those he is supposed to unite. He becomes more or less of a manufacturer, preparing some of the chemicals for which small plant and less specialised labour are required. It is not in this direction, however, he becomes the greatest evil. It is when he opposes the interests of the retailer that the harm he does is most felt. Not only are the drugs bought and sorted, powdered or prepared in their various ways, but they are made into tincture or extract, syrup or liquor, and these, in their turn, are made into pill, digestive syrup, or cough linctus, Liquor Electro-Lightus cum Thundero et Tornadibus Co., as the case may be. Nor does the enterprising wholesale house stay here. It puts the pills into boxes, the syrup and linctus into bottles, and puts a label on them (printed with name and address free on orders of three dozen and upwards), and hands them over to the qualified chemist ready to sell to his customers.

Evils of the Packed Goods Trade.

It is impossible to describe the evil influence this has upon the trade generally. I am positive the baneful effects of this practice cannot be over-estimated, and the trade is swelling every day. The condition of affairs I have so briefly alluded to is becoming more and more pronounced. No pharmacist thinks now of making his tinctures, his blue-pill, his ointments; all these, until practically every article or preparation he requires in the exercise of his calling, is put down in a book to be ordered when the representative of the wholesale house calls upon him. There are many establishments, illustrative of the commercial pharmacist in distinction to the more professional class, in which nothing is ever manufactured that can possibly be bought. I have heard of such cases, where even there was no stove or apparatus for heating, beyond the sealing-wax jet and a spirit lamp, in the shop, and yet there was a large business done, with a greater turnover than falls to the lot of the average pharmacist. I do not blame the wholesale houses for the existence of such places as these, I rather blame the tendency of the times, and incline to respect the large drug firms who recognise the change that has come over business and cater for this class of trade. At the same time the house cannot expect to have both the legitimate chemist and his greatest enemy. It must not expect favour from the man whose whole training and inclination alike turn him from such a course. If it is necessary for such a class of traders to exist in the interest of the great public, then I have nothing to say but to ask "Why is it imperative that men should be trained, made to qualify by examination, simply to hand over the counter some tincture or pill, powder, lotion, or linctus, in the preparation of which they have taken no part, and of its composition they probably have little knowledge." That the wholesale of to-day is encouraging and fostering this tendency is an undoubted fact. You have only to read the monthly lists as they are published, or study the advertisement columns of your trade journals, to become convinced of this. It positively makes one weep to see this retrograde movement, this development of a highly-trained and well educated body of men into mere hucksters, and no amount of assurances that trade is better, businesses are dearer, and money more plentiful will ever lead me to believe that the business is flourishing when it contains within itself the very germs of decay. There is nothing to prevent the annexation of such a "store" business to a drapery or a grocery establishment. How utterly hopeless does it seem to press for the higher education of the pharmacist, to urge the necessity for a curriculum, while chemists themselves, by falling into these ways, are hastening on their own ruin; at all events, forming a barrier themselves to any further progress! There is but one way, and that is to make each man fully alive to his own interests, as well as to make him a skilled and able pharmacist, capable of understanding the preparation of every compound he handles, to educate higher and higher, to raise the standard of examination, and thus to inculcate, slowly, it is true, but surely, into the minds of the public that a chemist is a highly-trained and thoroughly educated man, in whom they can safely repose their trust for some of the most absolute necessities of their lives. But, first of all, it is necessary to make the pharmacist himself aware of all that he might become. By further training will come the desire to exhibit in his business the education, and its refining influences, he has received, so that the possibility of the craft falling into the position of simple salesmen will become more and more remote. To follow in the course I have endeavoured to describe is suicidal, absolutely fatal to our very best interests, and it is high time that those firms who have so closely identified themselves with this movement should understand that the policy is unwise for them as it is unjust to our calling.

Wholesale Encroaching on Retail.

Not only in this way, that of taking from us and doing for us that part of our business we can and should do for ourselves, does the wholesaler invade our province. Oh, no! In his wonderful business capacity and increasing commercial enterprise, he takes to opening retail shops and actually opposing on their own ground his own supporters. No doubt he has found this answer, or his tact and wisdom would prevent his continuing in this way; but what are we to say of the standard of commercial morals of to-day that permits such proceedings? I have endeavoured to point out, though

I fear the attempt has met with but poor success, to you gentlemen, in what particular way the wholesale and retail trades are not in their proper relationship to each other, but I am unable to suggest to you a remedy. I do not know what course would be for our advantage to take. I have simply to point out these facts; that they do exist you yourselves know, and trust that in the discussion which I hope may follow some further light will be thrown upon this question. But of this one particular, which I have endeavoured to emphasise, I would most earnestly request your careful consideration, and that is, the buying of packed goods. I do not know of anything more fatal to a chemist's high-standing in the eyes of the public, nor of anything more calculated to hasten his ruin, his utter extinction, as a class. Surely it must be seen that the personal aspect of our business is its greatest safeguard; it is this which makes it more or less elevated in the eyes of the world. But when a member of the craft deliberately sets himself to hack away one of the chief supports of his position, and even existence, whom can he blame for the darkening times that loom before him but himself? He can no longer speak confidently of the quality and curative properties of those eternally to be confounded semi-proprietary remedies. Are there not enough liquor this and mixture that, with some enterprising firm's name following, on the market without the chemist encouraging the wholesale putting up of specialties? And yet every week sees converts to this method of doing business, the wholesale houses waxing fat, and the retailer, with decreasing sales and lessening profits, wonders how it has all come to pass. I do not, for one moment, believe that it is essential from an economical point of view to give this portion of our business to the wholesaler to do. My own experience teaches me otherwise, that there is ample scope for the business genius of the pharmacist in the manufacture of his own preparations, and where there is business genius there is financial benefit accruing therefrom. Ignoring the risk of repetition, I would say that the great factors at work in modern social life have much to do with the growth of the evils I have described, and account for the present relations existing between the wholesale and retail trades. I need not here allude to them. But the facts remain, a great change has come over our business, and that for the worse. This singular grasping on the part of the wholesale is contrasted with the woeful apathy on the part of the retail. Both are to be censured, both are making the future for business darker and less hopeful. To restore in some measure the relationship that existed between the wholesale and the retail, and to still further improve it, will, I venture to think, alleviate the present trying position and banish one of the greatest of those too numerous evils that assail the pharmaceutical craft to-day.

SELECTED PRACTICAL FORMULÆ.

Odourless Petroleum.

According to the *Revue Scientif.*, petroleum may be deodorised by shaking it first with 100 Gm. of chlorinated lime for every 4·5 litres, adding a little hydrochloric acid, then transferring the liquid to a vessel containing lime, and again shaking until all the chlorine is removed. After standing, the petroleum may be decanted.—*L'Union Pharm.*, **40**, 413.

Floor Varnish.

Shellac, 15; gum anime, 5; colophony. 7·5; alcohol (95 per cent.), 60; yellow ochre, 15; umber 1.—*Pharm. Post.* **32**, 416, after *Neueste Erf. und Erfahr.*

Remedies for Perspiring Feet.

(1) Balsam of Peru, 1; formic acid, 5; chloral hydrate, 5; absolute alcohol, 89. To be applied by means of a pad of wool. (2) Alumnol, 4; aristol, 4; starch, 15. To make a dusting powder. (3) Borax, 75; salicylic acid, 75; boric acid, 2; glycerin, 100; alcohol 100.—*Pharm. Post.*

Abee's Diuretic Tea Species.

The following is stated by H. Geyer to be the composition of this diuretic remedy: Squill, 2·34; juniper berries, 3·5; caraway, 2·4; fennel fruits, 2·48; parsley fruits, 5; elder flowers, 10·02. *Pharm. Central.*, **40**, 306.

Manganese Silver.

Copper, 67·25; manganese, 18·5; zinc, 13; aluminium, 1·25, are melted together. In appearance, the resulting alloy is equal to new silver, and it is more workable than that metal for casting. Its electrical resistance is four times greater than that of new silver.—*Pharm. Cent.*, **49**, 363, after *Journ. der Goldschmeid.*

Catheter Paste.

For lubricating catheters, Kraus recommends the use of a paste of the following composition:—Tragacanth, 2·5; glycerin, 10 phenol water (3 per cent.), 90. This paste facilitates the passage o the catheter, and is easily washed off in warm water.—*Oesterr. Zeits. für Pharm.*, **53**, 451.

Nickel-plating Bath.

Nickel sulphate, 1 kilo; neutral ammonium tartrate, 725 Gm.; and tannic acid, 5 Gm., are dissolved in 3 to 4 litres of boiling water, the solution filtered and made up to 20 litres with water. This bath may be used for all metals.—*Pharm. Centralh.*, **40**, 218.

Powders for the Teeth.

Camphor Dentifrice.—Camphor, 50 centigrammes; powdered soap, 1 Gm.; saccharin, 2·5 centigrammes; thymol, 5 centigrammes; calcium carbonate, 50 Gm.; oil of sassafras, 1 to 2 drops. Wintergreen oil or cassia oil may be substituted for the sassafras oil, if preferred. *Violet Tooth Powder.*—β-naphthol, 5 centigrammes; saccharin, 2·5 centigrammes; calcium carbonate, 1 Gm.; powdered soap, 50 Gm.; ionone and oil of cananga (mixed in the proportion, 15 : 1), 2 drops. *Astringent Tooth Powder.*—Myrrh, 1 Gm.; sodium chloride, 1 Gm.; powdered soap, 50 centigrammes; calcium carbonate, 50 Gm.; otto of rose, *q.s. Menthol Tooth Powder.*—Menthol, 10 centigrammes; β-naphthol, 5 centigrammes; saccharin, 2·5 centigrammes; calcium carbonate, 50 Gm.; powdered soap, 50 centigrammes; otto of rose, *q.s.*—*Bull. de Pharm. de Brux.*, **43**, 270, after *Odontologie.*

Cement for Decayed Teeth.

Mix zinc oxide with sufficient eugenol to make a firm paste to be used to fill the carious cavity.—*Bull. de Pharm. de Brux.*, **43**, 279, after *Odontologie.*

Formotannin Hair Wash.

Tannin, 5; formalin, 20; sulphuric acid, 5; spirit, *q.s.* The tannin is dissolved in the formalin, and the sulphuric acid added; the precipitate thus obtained is thrown on a filter and washed ti free from acid and dried. Five parts of the dried precipitate i dissolved in 100 parts alcohol (95 per cent.), and perfumed.—*American Druggist.*

Thymol Carbonate.

J. F. Pool prepares this body in the following manner: Carbonyl chloride, obtained by the oxidation of chloroform by means of potassium bichromate and sulphuric acid, after being washed and dried, is led through a solution of thymol in 20 per cent. caustic soda solution. The thymol carbonate separates out as a layer of a deep yellow, syrupy fluid, which thickens on exposure to cold, but does not crystallise. The preparation is insoluble in water, soluble in alcohol, ether, and chloroform, and of neutral reaction. It gives no thymol reactions.—*Oesterr. Zeits. für Pharm.*, **53**, 373, after *Nederl. Tijdschr. v. Pharm.*

QUALITATIVE EXAMINATION OF POWDERED VEGETABLE DRUGS.

With a view to rendering Professor Kraemer's notes on the qualitative examination of powdered vegetable drugs (*See ante*, pp. 183, 204, 222, and 245) more practically useful, a table of contents has been prepared (which may be used as an analytical key) together with an index to the subject-matter of the notes. In both cases the figures refer to the numbered paragraphs.

TABLE OF CONTENTS.

INDEX OF SUBSTANCES.

The figures refer to the numbered paragraphs in Professor Kraemer's paper. (See *ante*, pp. 183, 204, 222, and 245.)

ERRATA.

The following corrections refer to Professor Kraemer's notes which appeared in recent numbers of the *Pharmaceutical Journal* (See *ante*, pp. 183, 204, 222, 245). The figures refer to the numbered paragraphs, not to pages.

191. For "effected" read "affected."
302. For "358" read "359."
303. For "303" on second line of paragraph read "299."
349. For "358" read "359."
366. For "358" read "359."
463. For "285" read "286."
563. For "363" read "563."

PHARMACEUTICAL SOCIETY.

EVENING MEETING IN EDINBURGH.

The first evening meeting of the present session was held in the Society's Hall, 36, York Place, Edinburgh, on Wednesday, November 29. Mr. Peter Boa (Chairman of the North British Executive), presiding.

The Assistant-Secretary said it had been expected that the inaugural address would be delivered by Professor Thomson, of Aberdeen, but he had asked them to allow him to defer giving them an address till the opening of next session. His place had, therefore, been taken by the Chairman of the Executive, Mr. Boa.

The Chairman said he could assure those present that he very highly esteemed the privilege which had been afforded him of addressing them that night. Had it not been that, owing to circumstances which they had heard explained, the pleasure of listening to an address on a specific subject by a distinguished scientist had been postponed till next session, he should not have ventured to entertain the idea of doing what he was to do on the present occasion. It seemed to him a wise arrangement to get an outsider to deliver an inaugural address. In addressing those who are engaged in the same occupation, one was confronted by the difficulty of creating and sustaining an interest in what was said, that was if the subject selected was related, as in the fitness of things it ought to be, to the common calling. They could all readily imagine how easy it would be for a pharmacist to deliver an attractive and highly edifying address on the composition and manufacture of adhesive plaster to a Society of Bone Setters. He (the Chairman) might, probably with more pleasure to himself than satisfaction to his audience, have addressed them on "the delights of fly-fishing for trout," and the beneficial results of an occasional indulgence in this pastime on the health of a closely confined pharmacist. None of his predecessors however, have ventured to give an inaugural address on the healthful results of golfing, although some of them have been devotees of the game. They were all more or less controlled by conventional usages. He admitted their influence on himself, and in deference to their indications he should confine his remarks to matters relating to the calling in which they were all engaged. They might be better informed in regard to some of them than he. This, however, he might say, that if he succeeded in saying anything which gained their approval it would be a satisfaction to him; and he felt sure that should he be uniformly dull they would extend to him their kindly toleration.

Mr. Boa then proceeded to deliver the

Inaugural Address,

which is printed in full at page 523. In conclusion, he referred to some matters of more immediately local interest. He said those engaged in pharmacy in Edinburgh had always stood well by each other and he was glad to say that in recent years they had come together more than ever. A very stimulating factor was the meeting of the British Pharmaceutical Conference, which was held in Edinburgh in 1892. At that meeting every one made every other one's acquaintance and the social intercourse was so much enjoyed that a local trade association was formed with the object of "fixing"—to use a photographer's word—and continuing that general good fellowship. It was unnecessary to say how successful it had been in that respect. In its more serious aspects it had used its influence to obtain concessions and redress when trade interests have been threatened or damaged. If the Conference did as much good and left as pleasant memories in other towns when it met as it did in Edinburgh, he should say long life and prosperity to it. The Junior Association, which had existed now in continuous activity for over twenty years, was still vigorous, and had issued a syllabus which promised interesting communications on various subjects during the winter. He was glad to be able to say that promises of contributions to the evening meetings during the session had already been obtained. Several nights, however, were still without provision, and he hoped sufficient material would be received, shortly, to fill them all. He looked to the members to make the session worthy of comparison with any that had preceded it. The meetings were for the treatment of scientific subjects. Politics are not allowed except perhaps in moderation in the opening address. After the science, however, all manner of subjects could be discussed over the tea and coffee upstairs. Only those who attended knew how pleasant that after-talk was. It afforded an opportunity for social intercourse which was valuable in furthering community of interest. He bespoke a good attendance at the evening meetings. It was a great encouragement to a contributor to find a good audience. And, moreover, they did an injustice to their common politeness if they permitted a contributor to come forward while they remained away.

Mr. Ewing, in proposing a vote of thanks to Mr. Boa, said he would not enter on any criticism. He agreed with a good deal of what Mr. Boa had said. He agreed with what he said about long hours, and hoped the younger members, who had received his statement with so much enthusiasm, would bear that matter in mind when they entered into business on their own account; the future of pharmacy lay with them. With regard to the qualifying examination, he agreed with the view that it would be an advantage to have it divided; he would go further, and say he thought they should follow the example of the Universities, and when a man passed satisfactorily in one subject not call upon him to pass in the same subject again. The question of apprentices was a very pressing one at the present time. He believed that the great difficulty was long hours and the want of the Saturday afternoon holiday. He did not think the Preliminary examination would be such a hindrance; he believed the value of the qualification would increase, and that there would be fair remuneration for those who entered the calling and gave their minds to it.

Mr. Gilmour (Dunfermline), in seconding the vote of thanks, said that Mr. Boa had addressed them on a subject brimful of interest to every one of them. With regard to the Minor examination, he had always tried to impress upon young men that the calling of a chemist and druggist differed materially from that, say, of a draper. It was essential that they should cultivate habits of observation from the very beginning. Everything they handled had a history, and they should try to find out that history, and when the examination came everything would be easy. He sympathised very much with the reference to long hours. But the hours on week-days were just what they made them, and they could educate the public to any hours they chose to adopt. He quite agreed with the proposal to divide the Minor examination, and he would support any suggestion of that kind. Even doctors were on a better footing in this respect than chemists were, for they were not asked to go up a second time for a subject in which they had already passed, and were not open to the disadvantage of risking failure on the second occasion.

The vote of thanks was cordially awarded, and Mr. Boa expressed his thanks.

Donations Received.

The Assistant-Secretary then drew attention to specimens of betulin, pyro-betulin, and pyro-betulin anhydride, and its various applications to glass etching, photo. process blocks, and antiseptic surgical dressings, in illustration of processes devised by Mr. Wheeler (Ilfracombe). He also exhibited seeds from Jeddah, said to be used by natives as a remedy for eye complaints, sent by Mr. Murray, of Duncan, Flockhart, and Co. He also drew attention to books added to the library.

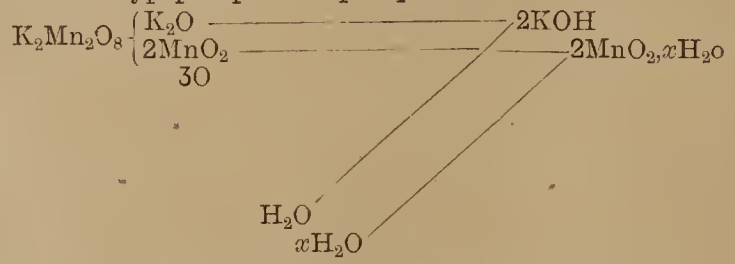
On the motion of the Chairman thanks were awarded to Mr. E. M. Holmes (Curator of the Pharmaceutical Society) for specimens sent, and to donors of books and other specimens.

The meeting then terminated.

THE STUDENTS' COLUMN.

EXPLANATORY NOTES ON THE B.P. 1898.

Sodii Hypophosphis.—The manufacture and constitution of this salt were dealt with in the last series—see *P. J.*, January 29, 1898, p. 100. Among the qualitative tests the reducing action is shown by its action upon solution of copper sulphate. The hypophosphite becomes phosphate by taking up oxygen from water, the hydrogen of which reduces the copper sulphate and partly combines with the copper to form a red insoluble copper hydride. This compound is unstable at the temperature of boiling water, and hence decomposes when the reaction mixture is boiled, the hydrogen being evolved as gas, while the copper remains in the form of a finely divided reddish precipitate almost indistinguishable in appearance from the hydride. The test with lead acetate, to detect the presence of more than traces of phosphite and phosphate, is based upon the insolubility of lead phosphite and phosphate in water. Traces of these impurities are almost inevitable in the commercial salt, since the hypophosphite is so readily oxidised, but most trade specimens give a very considerable precipitate with lead acetate. Potassium permanganate in both acid and alkaline solution oxidises sodium hypophosphite to phosphate. In the official test for purity 0·5 gramme of sodium hypophosphite is boiled with 25 C.c. of water and 1·15 grammes of potassium permanganate. The manganese then appears as a bulky brown precipitate of hydrated manganese dioxide, and the solution becomes alkaline from the formation of potassium hydroxide. Under these conditions each molecule of permanganate—taking the official formula $K_2Mn_2O_8$—yields *three* atoms of oxygen available for the oxidation of hypophosphite to phosphate.



Compare "Students' Page," *P.J.*, November 27, 1897, p. 472. Since each molecule of hypophosphite requires two atoms of oxygen, one mol. wt. $K_2Mn_2O_8$ (313·74) will be decolorised by one and a-half mol. wts. of $NaPH_2O_2$ (87·44 × 1·5 = 131·16). The weight of potassium permanganate in the official test, 1·15 grammes, should therefore be decolorised by

$$\frac{131{\cdot}16 \times 1{\cdot}15}{313{\cdot}74} \text{ grammes pure } NaH_2PO_2$$

$$= 4{\cdot}808 \text{ grammes.}$$

This amount in the 0·5 gramme of salt taken for analysis would correspond to a little over 96 per cent. purity. In addition to phosphite and phosphate, however, the salt so rapidly absorbs water that this standard of purity is seldom reached by commercial samples. The official formula relates to the anhydrous salt. When crystallised from water or alcohol it contains one molecule of water $NaPH_2O_2,H_2O$, and is still deliquescent. A test should therefore be introduced to limit the amount of absorbed water in addition to the other impurities.

Tinctures.—Tinctures may be shortly described as preparations obtained by treating crude drugs with alcohol so as to extract the constituents of the drug soluble in that menstruum. There are, however, among the official formulæ a number of tinctures which do not strictly conform to this definition. These exceptions include on the one hand:—

(1) Alcoholic solutions of definite chemical substances or proximate principles, which are for convenience placed among the tinctures. They include

Tincture of perchloride of iron.
" " chloroform and morphine.
" " iodine.
" " quinine.
" " " ammoniated.

(2) Tinctures made, not from the crude drugs themselves, but by the solution in alcohol of previously prepared extracts of the same drugs. This proceeding is adopted in order to secure more uniformity in composition than would be obtained by using the crude drug, or, in other cases, to obtain standardised tinctures by the dilution with alcohol of standardised extracts or other preparations. This group includes the following:—

Tincture of belladonna.
" " camphor, compound.
" " Indian hemp.
" " cinchona, compound.
" " nux vomica.
" " opium, ammoniated.
" " podophyllum.

The group of tinctures has been subjected to numerous important changes by the 1898 Pharmacopœia. Omitting the standardised tinctures, which will be dealt with separately, these changes may be thus summarised:—

Omissions.—These include—

Tincture of chloroform, compound.
" " ergot.
" " acetate of iron.
" " galls.
" " larch.
" " lobelia.
" " valerian.
" " green hellebore.
" " ginger, strong.

Of these tinctures several had fallen into disuse. *Ammoniated* tinctures of lobelia and valerian are still official, while the ergot is displaced by an ammoniated tincture (*vide infra*). Tincture of acetate of iron is not required, since there is a liquor of the same strength. The corresponding tincture of perchloride of iron is, however, not omitted, although there is a liquor ferri perchloridi, probably in deference to the popular demand for "tincture of iron" or "tincture of steel," which is sold by retail in large quantities.

Additions.—There are only three—

Tincture of ergot, ammoniated.
" " Virginian prune (wild cherry bark).
" " quillaia.

The ammoniated tincture of ergot replaces the plain tincture of the same drug, while the tincture of quillaia is intended to be used as an emulsifying agent.

The remaining tinctures have been nearly all altered, either in alcoholic strength or in the proportionate quantity of drug employed. The changes in alcoholic strength have been made for reasons which were discussed in the article on tinctures in the previous series (see Students' Page, *P.J.*, April 9, 1898). The changes in the proportionate quantity of drug are due mainly to the desire to bring the tinctures, so far as their doses are concerned, into two groups. The first comprises the tinctures from potent drugs which have now a dose of 5 to 15 minims, with the exception of tincture of iodine, while the second includes the tinctures of drugs which are comparatively non-toxic: these have a dose of ½—1 fluid drachm. To secure this result some tinctures have been weakened and others made stronger. Thus the tinctures which were made with 2½ ounces of drug to one pint have been mostly strengthened to 4 ounces to the pint, and their doses changed from ½—2 to ½—1 fluid drachm. At the same time, the tendency of these changes has been to arrange the strengths in groups of 1 to 4, 5, 10, 20 parts of alcohol, these proportions being more readily adaptable to the decimal system, on which the metric weights and measures are based, because 100 is divisible by 4, 5, 10, and 20 without fractional parts. The student should not omit to tabulate the tinctures, classifying them in various ways so as to bring out their salient features. The monographs have been considerably shortened in the present Pharmacopœia by giving in the Appendix (p. 440) the two general 2 processes by which most of the tinctures are prepared These differ from the corresponding processes given in the 1885 Pharmacopœia and represent a great advance in pharmaceutical manipulation.

* NOTE.—The series of articles should be read in conjunction with the series referring to the 1885 B.P., and published in the *P.J.* during 1897-8.

PROFESSIONAL AND TRADE INTERESTS.

To establish a respectable qualification for the practice of that portion of the medical art which is concerned with the preparation of medicine has been the object of the Pharmaceutical Society for more than half a century, and, though the attempt has been but partially successful, in some respects a very considerable advance has been made in the desired direction. That the action taken by the Society in that connection should, at the outset, have met with considerable opposition is not surprising, for the business of chemists and druggists was then of a very heterogeneous character, and though some of them had taken up the dispensing of medicine and the general practice of pharmacy as their principal occupation, the trade in drugs and chemicals formed the chief part of the business of many persons known as chemists and druggists. Moreover, the business was open to anyone without regard to competence for performing duties appertaining to the practice of pharmacy, and when legislative regulation became necessary in the public interest, it was opposed by a very large number of those engaged in business as chemists and druggists, who preferred to be considered as belonging to a trading community, and to be free from legislative interference. The continued prevalence of that preferential consideration of trade interests has to a great extent interfered with recognition of the fact that, "protection of those who carry on the business of chemists and druggists" can only be looked for on the ground that their business is of a professional character, and their fitness for conducting it in the interest of the public of a sufficiently high order. The influence of trade interests has operated to impede pharmaceutical progress: it has brought opposition to every attempt to improve education and to give the legitimate occupation of the pharmacist a wider definition: but by so doing it has rather injured than promoted the trade interests of chemists and druggists.

Particular reference to a variety of circumstances which have led to the trade view of the chemists' position would be superfluous on this occasion, as readers of the Journal are sufficiently familiar with them. The more important point to be considered is that chemists and druggists have been incorporated and recognised by the State on a professional basis, out of regard for what is held to be expedient in the public interest. From that point of view, the exercise of the business and the use of a title, implying statutory qualification, have been made subject to the conditions of examination as to fitness for satisfying public requirements and to the registration of persons certified to be competent for the discharge of their duties. However much therefore the business of many chemists and druggists may partake of the nature of ordinary trade, that circumstance cannot lessen their claim, as legally qualified persons, to be entitled to the exclusive use of their title, and to the exclusive exercise of that part of their business which has been made the subject of statutory limitation. The trade in drugs and preparations which are not included in the Poison Schedule of the Pharmacy Act, is as open to all persons as the trade in secret remedies and other professed medicinal preparations or packed proprietary articles, which may be described as grocers' goods. In regard to that trade the legally qualified chemist cannot and does not expect preferential consideration: if he has to carry on such business he must meet trade competition as he can. But the business of retailing, dispensing, and compounding poisons, which is the only fraction of pharmaceutical business that has been reserved to legally qualified persons, is outside the range of free trade, and is exclusively their province.

Disregard of that important and distinctive feature of the chemist and druggist's position has given rise to great misconception, and it requires to be pointed out at the present juncture, when the privileges of qualification are in danger of confiscation and the trade aspect of the business is being forced into undue prominence with that object. Legally qualified persons are themselves much to blame in this respect for not having attached greater value to their qualification as being of a professional nature. In Parliament the same oversight has been committed, and the sale of poison has been regarded only as a matter of trade, without considering the more important matter of dispensing, even as confined to scheduled poisons. In the House of Lords case again, only the sale of poison was considered, and the extraordinary contrast between the provisions of the two Bills introduced by the Lord Chancellor, in reference to pharmacy and medical practice, gave evidence of the chemist and druggist being regarded only as a trader. That fact was noticed at the time in the *Apotheker Zeitung*, as an illustration of the poor appreciation of pharmacy prevailing in England, and it was spoken of as showing, on the part of representatives of the nation, a want of understanding the matter which tends to degrade the qualified pharmacist to a position that would be destructive to pharmacy and detrimental to the public interest. Whether the present imminence of that contingency can be averted by some suitable compromise between trade interests aud professional interests, or even by a separation of them that would leave the sale of poisons, as a matter of trade, to police regulation, while securing to qualified pharmacists a more reasonable recognition of professional privileges, is a question that now demands serious attention from every point of view.

ANNOTATIONS.

AS A CONTRIBUTION to the views expressed in reference to "company pharmacy," the following abstract of a long letter on the subject may be of interest as stating an extreme opinion:—"'Ordinary Pharmacist' has touched the marrow of the question by his statement that nothing less than reversal of the House of Lords' decision can satisfy, or would be of any use to, registered chemists and druggists who look upon their business as one requiring professional qualification. I am convinced that they should take the position that the House of Lords' decision was entirely wrong and contrary to the manifest intention and purport of the Pharmacy Act. It therefore requires to be upset, since it has the effect of a legal precedent involving repeal of an Act of Parliament by judge-made law founded on error. My reasons are that—although a company can keep open shop, etc.—a company is not a qualified person—that a company cannot be a chemist and druggist within the meaning of the Pharmacy Act—that a company cannot sell poison, or dispense poison, or compound poison, or do any of the other acts to be done by a person entitled to keep open shop for those purposes to which the Act relates." In the face of those impossibilities I see no possible reason for allowing a company to keep open shop for doing what it is physically unable to do. Neither have I seen any reason why a person subject to that disability to perform any of the functions for which open shop is kept, should keep open shop at all, or that he should be permitted to do so if employing as a servant a person who is qualified to perform those functions. On what principle can the servant qualify the master?

NO CLAUSE IN A COMPANIES BILL can be expected to result in a settlement of all the difficulties that beset pharmacists, and it is worthy of consideration whether it might not be opportune for steps to be taken forthwith to draft a Pharmacy Bill embodying matters that appear suitable for inclusion in a Companies Bill. For, though a measure on the lines of the Companies Acts Amendment Bill, 1899, is expected to come before Parliament in 1900, it is far from certain that the clause referring to pharmacy will reappear. The numerous objections that have been offered to that clause, and the variety of the modifications suggested, may not inconceivably operate in the direction of inclining the promoters of the Bill to drop the thorny subject altogether. Chemists would then be left to fight for their own hand, and the only way open to them would be the promotion of a Pharmacy Acts Amendment Bill. Even if a clause dealing with pharmacy did appear in a Companies Bill, there is no particular reason why a clause dealing with companies should not appear simultaneously in a Pharmacy Bill. In fact, that would tend to deepen the impression that chemists are seriously resolved to put an end to the existing unsatisfactory state of affairs. Obviously, any Pharmacy Bill promoted now would need to deal with much more than the company difficulty. In addition to clauses placing the use of pharmaceutical titles and the practice of pharmacy on a satisfactory basis, it should contain proposals for modification of Section 16 of the 1868 Act, and any other portions of the existing Statutes, which have proved more or less unworkable or unsatisfactory in their operation.

THE MAIN POINT which would require to be brought prominently forward in a Pharmacy Bill is that none but registered chemists must be allowed to conduct, direct or control the retailing, dispensing, or compounding of poisons. In view of the position taken up by the Lord Chancellor, in regard to the dispensing of medicine, it might not be inopportune to attempt also to prevent any but registered persons from dispensing medical prescriptions, but there ought to be no two opinions about the dispensing of poisonous remedies. The proprietor of every open shop where poisons are retailed, dispensed, or compounded, should, of necessity, be a duly qualified individual; he should not be permitted to delegate any of his professional duties to other persons not similarly qualified, and in employing assistants or apprentices should superintend their work so that it may really count as his own. Those requirements represent the dominant and essential principle of the Pharmacy Acts, and "Observer," whose letter appears at page 458, asserts unmitigated nonsense when he contends that they do not. His letter is published as an extreme instance of the product of pseudo-philosophic mind run riot. He makes assertions which cannot be sustained by facts, and apparently betrays his absolute ignorance of what the 1868 Act really provides.

MENTAL OBFUSCATION appears sometimes to have been an inevitable consequence of studying the details of the Pharmacy Act, and "Observer" appears to have surpassed all other achievements in that direction by tying himself up into a knot about ownership and management. With profuse use of italics he endeavours to show that ownership of a business—for the exercise of which an individual qualification is required by Act of Parliament—is not the principle of that Act, and that qualified ownership is laid down in the Act not with the view to securing qualified ownership, but entirely with a view of securing something else—*i.e.*, qualified managership. This remarkable contention makes one dizzy, and it appears to require something of the faculty of second sight for its apprehension. The letter in which it is put forward also appears in its general tendency to be of such a nature as to excite astonishment that it should have been written by a pharmaceutical chemist, or even by a registered chemist and druggist. But the utterly befogged state of our correspondent's mind may be inferred from his question as to what is the principle of the Pharmacy Act, since "Observer" cannot be supposed to have overlooked the preamble of the Act.

THE POSITION OF PROFESSIONAL PHARMACISTS is to become absolutely impregnable, according to this erratic genius, when it is fully recognised that there is no necessity whatever—so far as the public safety is concerned—for the proprietor of any pharmacy to be legally qualified in accordance with the Pharmacy Acts. Anything more preposterous than that statement is utterly inconceivable by anyone able to grasp the facts of the case properly. Probably he is not the proprietor of a pharmacy or engaged in the practice of pharmacy at all, and would succeed better as an amateur lawyer, with a mission to read into Acts of Parliament what those who framed them never put in, and what nobody else could possibly extract therefrom. A full and fair reading of the 1868 Act is undoubtedly required before anyone can form an independent opinion as to what its dominant and essential principle is, but in considering that or the judicial interpretation of it something more is also required—freedom from bias and some knowledge of affairs, past and present. Whilst, therefore, "Observer's" lucubrations are permitted to see daylight in our pages, readers are warned that they do not carry the least weight, and the writer may be warned that, if he proceeds much further in his mistaken efforts to prove what does not exist, he may soon arrive at the point where the Pharmacy Act of 1868 and its intention will appear to him nothing but a myth. His efforts are well-intentioned, no doubt, but so are those of the squarers of circles, flat earth theorists, perpetual motionists, *et hoc genus omne*.

MR. GLYN-JONES rendered good service in defining the phrase "company pharmacy" at the end of his first paper (see page 473) and perhaps his pharmaceutical instinct naturally moved him on that occasion to give a first place to the "dispensing" of poisons. That is a very necessary point to bear in mind, because dispens-

ing is the particular duty of persons legally qualified under the Pharmacy Acts, the one to which their qualification relates and on account of which exclusive enjoyment of the privileges conferred by that Act is to be claimed by registered chemists and druggists. In the paper contributed by Mr. Glyn-Jones this week the same prominence is not given to dispensing, and the function of legally qualified persons is throughout spoken of merely as "the sale of poisons"—*i.e.*, as a matter of trade, and not in the sense that such function is of most importance, both to the public and to persons possessing a qualification that confers at least some degree of professional status. That distinction is now a matter of more vital importance in connection with the question as to "company pharmacy" than the mere sale of poison regarded as a trade transaction.

The Wholesale Druggist is shown by Mr. F. Curry (see p. 527) to be, at times, the reverse of a benefactor to chemists and druggists, and there is no doubt that he is thoroughly justified in directing attention to the evils of the packed goods trade. Everything is done nowadays to tempt retail chemists to perform the happy despatch, from a professional point of view, by encouraging them to do less and less of the duties which properly pertain to their position. The crude drugs are tested for him by the wholesale house, they are converted into galenicals for him, the galenicals in turn are packed in bottles or boxes of convenient size for retailing, wrapped, labelled, and everything done short of actually handing the goods over the retailer's counter, which the drug store, grocer, draper, or "universal provider" can do as well as the chemist. Qualified chemists who are so blind to the trend of events, so oblivious to everything but their own immediate convenience, as to be content to sink their professional status and throw themselves bodily into the arms of the wholesale dealer, cannot reasonably complain if they are thought lightly of. As to the position of the up-to-date wholesale firm which encourages that kind of business, the less said about it the better. It is doubtless hard to allow business to escape and easy to do as others do, but the views of the founders of certain old-established firms, if they could be formulated, would be of interest in this connection.

The Present Position of Pharmacy is summed up in an interesting fashion by Mr. Peter Boa (see p. 523), who discourses pleasantly on the difficulty of obtaining apprentices, the necessity of a compulsory curriculum, and the question of dividing the Minor Examination and various other topics of general interest to pharmacists. Emphasis is rightly laid on the value of the Minor qualification, and attention is usefully directed at the present time to the meanness which keeps so many registered chemists outside the ranks of the Pharmaceutical Society. The suggestion of the desirability that disciplinary powers should be vested in the Society is not new, but it is none the less worthy of repetition. It ought to be possible for any registered chemist found guilty of infamous conduct in a professional respect to be struck off the Register by the Council of the Society. Such a power would not be likely to be abused, but would, nevertheless, prove a very efficacious whip for evil-doers. Mr. Boa is of opinion, also, that the calling into existence of such disciplinary powers would tend towards the abolition of dispensing by medical men, presumably after counter prescribing, etc., had been put down with a strong hand. That may or may not be; in any case, the disciplinary powers ought to exist, and Mr. Boa is to be congratulated on again directing attention to the matter.

The Local Arrangements for the reception of visitors to the British Pharmaceutical Conference meeting in London next year are now beginning to assume definite form. The honorary secretaries of the Local Committee have already had a preliminary meeting, and have now issued a circular letter inviting the attendance, on Wednesday next, December 6, of local officers of the Pharmaceutical Society and others in and around London at a representative meeting of all who are interested in the Conference. The meeting will, by permission, be held in the Society's House, 17, Bloomsbury Square, at 3 o'clock on the afternoon in question, and as the business to be transacted is of importance to the success of the Conference, it is hoped that a satisfactory response to this invitation will be made. For the purpose of the meeting the London District has been considered to include all places within about twenty miles of the metropolis, and in some instances, where important towns are just outside that boundary, the limits have been made to deviate a little from the strict geometric rules appertaining to circles. Thus, St. Albans on the north, Reigate on the south, Windsor on the west, and Gravesend on the east, are, for Conference purposes, deemed to be metropolitan, and are given an opportunity of associating in the work of welcoming the provincial members of the pharmaceutical body to London in July next.

The Formation of Committees—a strong and influential General Committee and of a smaller Executive Committee—will be among the principal objects of the meeting on Wednesday next; and it is also expected that Mr. J. H. Mathews will be able to report that the Entertainment Fund, which was established at the preliminary meeting of the Local Committee on October 25, and of which Fund he was appointed Treasurer, is exhibiting a steady progressive growth. We are requested to state that the co-operation of any pharmacist in the "London District" who desires to see the Conference meeting of 1900 successful will be heartily appreciated. Contributions to the Entertainment Fund (which are limited to a maximum of two guineas from individuals and five guineas from firms) should be sent to Mr. J. H. Mathews, 68, Queen's Gardens, Hyde Park; suggestions and similar communications may be sent to the Hon. Secretaries of the Local Committee, 17, Bloomsbury Square, W.C.

The December Evening Meeting in London will be held at 17, Bloomsbury Square, on the second Tuesday in this month—that is to say, on the 12th instant, at 8 o'clock precisely. Professor J. Millar Thomson, F.R.S.—a member of the Board of Examiners for England and Wales—has been good enough to promise a lecture for that evening on a very interesting subject—viz.. "Some relations of water to other substances." The attractiveness of the lecture will be enhanced by experimental illustrations. No doubt most students associated with the Society will make an effort to be present; but the lecture will, both on account of the subject and the personality of the lecturer, attract many students of a larger growth, who, though they may have no longer before them the fear of a Board of Examiners, are mindful of the fact that the exigencies of life are sometimes more inexorable than the severest examiner, and that scraps of post-graduate knowledge have a marketable as well as an intrinsic value.

The Benevolent Fund Election takes place on December 12, and the voting papers have now been posted. Subscribers are asked to decide who are the four most deserving persons of six approved and most deserving candidates. The difficulty of doing this—and, indeed, the hardship entailed upon the candidates in being forced to submit to such competition—furnished Mr. Hampson with a text for some of his most eloquent denunciations of the voting system. The difficulty has, however, been pretty equitably solved by the electors in years gone by, and the present election possesses no special problems. A number of the general subscribers are personally acquainted with one or other of the candidates—a result which might be expected in a fund restricted to a certain class—and this renders the difficulties of election less pronounced and the hardships of candidature somewhat softened.

THE CONDITIONS AND INSTRUCTIONS FOR VOTING, printed on the voting paper, should receive careful attention. Many papers are spoiled each year because some subscribers do not trouble to read the red-inked and type-displayed directions. Unsigned and informal papers are a feature at every poll, but it is rather a reproach that the Society's Benevolent Fund election, decided by persons who are trained to accurate observation, should be so largely tinged with the conventional faults of the careless general public. Mention should also be made of the fact that persons subscribing to the Fund up to December 11 may vote at the next day's election—that is, if there be time to post a voting paper to them.

POTASH WATER, though not now official in the British Pharmacopœia, ought nevertheless to contain an appreciable quantity of potassium bicarbonate if its name is to be justified. Neglect of that precaution has led several chemists and other dealers in aërated waters into trouble at Swindon Petty Sessions, where quite a number of defendants were charged with selling carbonated water containing little or no potassium bicarbonate when potash water was asked for. Only nominal fines were imposed on the retailers charged, but manufacturers were more severely dealt with. Some of the defendants were proceeded against under the Sale of Food and Drugs Acts, others under the Merchandise Marks Act, but in all cases the magistrates made it clear that it was essential that the public should be able to get what was asked for, in making purchases. It has formerly been contended that when the man in the street asks for soda water, he wants plain carbonated water, free from sodium bicarbonate, but in some of the cases under consideration plain carbonated water was supplied when potash waters was asked for. If, therefore, the purchaser got what he really required, since things which are equal to the same thing are equal to one another, it would appear as if soda and potash waters were identical in the public mind. But though that impression may prevail in certain quarters, chemists and druggists should be at some pains to prove the contrary and, on the whole, it seems desirable that potash and soda waters should contain potassium and sodium bicarbonate respectively, in suitable proportions.

A WEIGHTS AND MEASURES REPORT recently issued by the Board of Trade shows that more than nine thousand standards of weight, capacity, etc., have been verified at the Standards Department during the twelve months terminating in August last. For the purpose of explaining the principles of the metric system in schools, the department has given orders for the preparation of a set of educational models of metric weights, measures, and weighing and measuring instruments, similar to those used in trade. The Board of Trade is also stated to be in communication ith some Government departments, with the view of ascertaining how far the metric system of weights and measures might be officially adopted in contracts. A number of local authorities, of which a list is given in the report, have now provided their inspectors with the metric standards legalised by the Order in Council, dated May 19, 1898.

THE CHEMISTS' DEFENCE ASSOCIATION, LIMITED, has now fairly commenced operations, and the reports of meetings held in different parts of the country agree in showing that the new scheme has been favourably received on the whole. Mr. Glyn-Jones s a plausible speaker, and his success in securing support for his latest venture—or is it his latest but one ?—seems to be only second to that which attended the establishment of the Proprietary Articles Trade Association. It is noteworthy that the defence of members of the new organisation in cases under the Pharmacy Acts is apparently to be limited to prosecutions by the police under Section 17 of the 1868 Act, since it is specially stated that the Association will in no case defend, or assist in the defence of, any of its members against proceedings taken by the Pharmaceutical Society for the enforcement of the Pharmacy Acts, nor is any member to have any claim—for compensation, costs, or otherwise—in relation to such proceedings. The limitation is a wise one, as members of the Pharmaceutical Society could hardly have been asked, with any show of reason, to pay for defending themselves against themselves.

THE MASTER OF THE SPECTACLE MAKERS' COMPANY, Sir Reginald Hanson, M.P., in an address at the Northampton Institute to number of candidates who had presented themselves for examination for optical diplomas, is reported to have said that there was no doubt the technical instruction imparted under the ægis of the Company would have a very marked effect upon the style and conduct of the optical trade. There would, he hoped, be an improvement in the methods employed, as it was very necessary that the optician should be qualified to exercise skill and discretion in his business. It was important also, he continued, that practical opticians should be proficient in the mechanical requirements of their calling, while it was even more essential in the interests of the public that they should be thoroughly competent to distinguish between those cases in which glasses could be supplied by them and those which required the skill of an oculist. Finally, it was insisted that the optician should in no sense take the place of the ophthalmic surgeon. The moment he found the defects of an eye were incapable of being remedied with the aid of the appliances with which he was conversant, it was his bounden duty to seek surgical advice.

BORIC ACID IN MILK, according to Dr. Alfred Hill, medical officer of health for Birmingham, has caused the death of a kitten. He has told the Committee on Food Preservatives that the kitten got lighter and lighter when fed on the doctored milk, and died in about five weeks, leaving no doubt in the experimenter's mind as to the physiological effects of the drug. Formaldehyde, which is taking the place of boric acid as a preservative, was described as a still more potent drug, injurious to health because it hardened albuminous matters and rendered them more difficult of digestion. At the same time, Dr. Hill said it was useless to prosecute persons for selling food containing preservatives, as medical men would come forward and say they were not injurious. Thus do the authorities differ, whilst the public runs the gauntlet of the various dangers to life and, somehow or other, survives the ordeal, seeming little if any, the worse for being exerimented upon by food preservers.

THE FEDERATION SUGGESTIONS submitted for discussion by local pharmaceutical associations, and printed in the *Pharmaceutical Journal* a fortnight ago (see *ante*, p. 488), have attracted a very large amount of attention throughout the country. As a result there has been a flood of reports of meetings at which the company pharmacy problem has been discussed and, though extreme pressure on space has compelled us to condense the reports considerably, the pages of this week's Journal will be found to reflect very accurately the state of feeling in pharmaceutical circles. That state, it is satisfactory to note, is much less mixed than there was reason to suspect, and the apparent apathy of the chemists and druggists of Great Britain is now seen to be probably due to the fact that everyone has been contentedly relying upon the Council of the Pharmaceutical Society undertaking, as a matter of course, to defend his title and practice. It is, however, just as well that such a silently prevailing feeling should find expression, and there is little reason, therefore, to begrudge the large amount of extra space which it has been foun necessary to devote to political matters in this week's issue.

MIDLAND PHARMACEUTICAL ASSOCIATION.

Mr. W. S. Glyn-Jones, Secretary of the P.A.T.A., attended a meeting of this Association, held at the Great Western Hotel, Birmingham, on the 23rd ult., and delivered an address dealing with the

CHEMISTS' DEFENCE ASSOCIATION,

in terms somewhat similar to those reported in last week's *Pharmaceutical Journal* (see p. 516). Mr. JEFFREY POOLE, President, occupied the chair, and there was a large attendance of members.

In the course of the discussion, Mr. W. JONES said that as a member of the Executive Committee of the old Trade Association he was pleased to see it resuscitated on the lines proposed. It was quite time that some association of the kind was brought into existence, and, as far as he could judge, the proposals now brought forward were on business lines. It was questionable, however, whether a subscription of 10s. would be sufficient. As regarded the old association, it was found absolutely impossible to do for 5s. all that had been promised, and this it was that led to the wreck. It was a great misfortune that the association should have come to an end, for it was doing a splendid work. Those who had drawn up the present proposals had, fortunately, provided against an abuse which prevailed to a large extent under the former *régime*. It was a custom for a man, directly he received a visit from an inspector, to rush to the Association with his subscription, so as to be able to claim its assistance. Rule XIV. effectually provided against this, and laid it down that none could obtain any benefit who had not been members for three months and paid their subscriptions. The way it was proposed to deal with cases—viz., to send them to the Secretary, who would at once forward them to the solicitor—was far more simple than the plan pursued in the old days. Then they had what was known as a Law and Parliamentary Committee, consisting of Mr. Arblaster, Mr. Barclay, and himself, and they were called together as frequently as six times some days. Such a plan would, of course, be absolutely impossible in London. He extended his support to the Association, and was glad that it had been formed.

Mr. A. SOUTHALL also supported the Association, and said he was glad to find that those responsible for it had avoided the pitfalls which caused disaster to the old association, which did a good work in frightening the officers under the Food and Drugs Act, and thus lessened considerably the number of prosecutions. In the same way the new Association would prove a blessing, and should be universally supported for this reason. Every effort should be directed to making it a permanent organisation, and it should be supported by at least half the chemists of the country.

Answering Mr. F. A. Spear, who put a question as to the number of members who belonged to the old association, Mr. W. JONES said there were 5,000. With the 10s. subscription in vogue at the outset, the work went on smoothly enough, but then it was sought to enlarge the area, and a reduction to 5s. was decided upon. The work then increased at an enormous rate, and more than swallowed up all the receipts.

A question was put as to whether the Association would defend in cases of tooth extraction or when a man was wilfully in the wrong?

Mr. SPEAR inquired whether it was proposed to employ an analytical chemist to conduct analyses of samples for the benefit of members?

Mr. F. H. ALCOCK said he saw many reasons for such an Association. He had suggested something of the kind some years ago to Mr. Hayden, who was then secretary of the Trade Association. Mr. Hayden, however, gave up the idea of having it in association form, and conducted it as a sort of individual enterprise. The idea was that an analyst, a medical man, a lawyer, and himself could form a committee which could make itself extremely useful to the pharmacist. In addition to defending the retailer against the Food and Drugs inspectors and others, who constantly worried them, such a committee could have tested any preparation about which the pharmacist was in doubt. Although Mr. Hayden did not look at the matter in the same light, he (the speaker) was nevertheless convinced that such a body would have been of the greatest assistance to the retail pharmacist, who could have appealed to it quite apart from being frightened into subscribing.

Mr. GLYN-JONES said he was pleased to find that the scheme met with the approval of the Midland Association. On the question of advice, which had proved such a difficult matter in the case of the old association, they had endeavoured to make the new organisation work mechanically. Applicants for advice would write to the Secretary, who would transmit the application to the solicitor, and on receipt of the solicitor's reply the Secretary would forward it on to the applicant. With regard to the stamping of medicines, Mr. Glyn-Jones said he was driven to the conclusion that there were a number of things stamped to-day which need not be stamped if the matter was fought out with Somerset House. It might be worth while for the new Association to fight some of these doubtful cases. He could give no pledge as to the provision of advice about trade mark registration, but it was a matter which the Association might be disposed to take up. They could not be expected to fight cases in which trade marks were concerned, but they could at any rate give members advice in the first instance. An essential point of difference between the old association and the present was that the latter, in addition to protecting members against prosecutions, was prepared practically to insure them against risks through accidents occurring through dispensing or in retailing medicines or drugs. It was quite another matter whether they could be expected to defend an action brought for the alleged unskilful extraction of a tooth. Under the rules he should not think this was provided for. All they were prepared to do was to take the risk of actions resulting from mistakes in their own proper trade of dispensing or retailing medicines or drugs. Rule XIV. had been inserted precisely with the object mentioned by Mr. Jones. They wished to avoid against the chemist standing aloof until he was in trouble, and then rushing to the Association with 10s. 6d. in order to secure advice and assistance, worth perhaps £10. The fact should not be overlooked that the Association did not undertake to pay any fine or costs. It only undertook to provide legal assistance for the defence, and it would either send its own solicitor or, if the member preferred, give a sum not exceeding £10 to enable him to provide his own defence. In the old association it was necessary really to decide whether a man was guilty or not before the conclusion was come to as to whether he should be defended. Every man was entitled to a defence, and the Association had no right to say he had been guilty of fraud until everything had been said that could be said in his favour. When a man was found guilty of wilful wrong-doing the Committee had power to refuse to accept any further subscriptions from him. The analysis of goods purchased from wholesale houses was a matter that might well receive attention. It was also hoped that some satisfactory arrangement might be made by which members would be enabled to effect plate-glass insurance at a reduction on the usual rates, and he saw nothing to prevent a similar arrangement being made in the case of fire insurance.

The PRESIDENT said he thought the scheme should appeal to Birmingham, where of late they had been troubled by the authorities in a large number of very trivial cases. Samples had been taken of drugs and tinctures that were used only on very rare occasions. He proposed the following:—

That having heard an explanation of the proposed scheme, this meeting of chemists is of opinion that such an institution is desirable, and merits the support of the members of this Association and of chemists generally.

Mr. PERRY seconded the motion, which was agreed to unanimously.

COMPANY PHARMACY.

The PRESIDENT next invited members to consider the five methods of action suggested by the Federation of Local Pharmaceutical Associations in connection with the company pharmacy problem. (See *ante* 488.)

Mr. GLYN-JONES asked that any suggestions made should be on practical lines, and such as a responsible minister might be asked to legislate upon. It was useless registering a pious opinion about their rights and wrongs; what they were asked to do was to say what the Society should do at this juncture with reference to the question of company pharmacy. It was important to remember that, somehow or another, the Government had come to the conclusion that the time had come for amending the law. For years the Pharmaceutical Society had tried to get something inserted into their own Act to remedy the evil of company pharmacy, but now, in a Bill dealing with companies generally, the Government proposed a clause which affected chemists in particular. It was clear that what the framer of the clause had chiefly in mind was the protection of the public, and little attempt had been made to give pharmacists what they considered to be their rights. If he thought for a moment that they could ask the Government to make it illegal for any company to carry on the business of chemist and druggist or keep open shop for the sale of poisons, he would do so at once, but there was not the slightest chance that such a request would be listened to. Whether they liked it or not, the public had recognised company pharmacy, and the Government had recognised it, and was prepared to deal with it. They were, however, going

to deal with it in a way that was not satisfactory to pharmacists, and it was essential that they should make their views known. To his mind, the suggestion to protect chemists titles and make it illegal for companies of unregistered persons to keep open shop for selling poisons, as in the case of individuals, was out of the question. If by a company of unregistered persons they meant a company which had in it one shareholder who was not qualified, then he did not think they could succeed. He did, however, think they had a right to ask that no company should use their title. He did not see how a corporate entity could be a chemist, or that it could call itself such, any more than it could take the title of B.A., for instance. But when it came to the question of keeping open shop it was twenty years too late to say that companies should not do it. Those responsible for the conduct of the Society should have done this immediately after the judgment given against them in the House of Lords in 1881. It was too late now, after money had been invested in the businesses, to say that judgment must be reversed. It was not too late, however, to ask that companies should be placed upon all fours with the individual, and that their businesses should be under the control of qualified assistants. They would have a very weak case if they went to the Government and said no one should share in a chemist's business who was not qualified, because it would be difficult to show where the danger to the public came in. He did not think they ought to admit the right of any man to act upon a board of directors of any company keeping open shop for the sale of poisons unless he was qualified. If they did they gave away one of the main principles of the Pharmacy Act. The suggestion that they should apply for protection of titles only was one he did not think they ought to accept for a moment. Such a request would not be listened to for a moment, because the Government were not interested in their titles so much as they were interested in the public safety. He could not accept the suggestion that the managing director only need be qualified, and the suggestion that a company should be allowed to carry on business with a qualified manager or assistant ought not to be considered for a moment. They had a right to say that the man at the helm of a business kept open for the sale of poisons should be qualified, that he should have sole control, and that if the public chose to invest money in pharmacy they must be prepared to do it knowing that the business must be controlled by qualified men. It would be an easy matter for big concerns, such as the Army and Navy Stores, to form a subsidiary company for the drug department, and put it in the hands of qualified men. If thoroughly united he was of opinion they might get the clause withdrawn, for the Government did not seem to be sufficiently in earnest about it to face a lot of opposition. But they wanted the clause improved rather than thrown out, and to his mind they would be making a mistake not to seize the present opportunity of securing a favourable change.

Mr. C. THOMPSON thought it was manifestly unfair, after they had had all the trouble of going through the examinations, that seven men collectively should be allowed to do what they could not do individually. In his opinion the Council was not sufficiently close in touch with those in charge of the Bill, and he suggested that local secretaries and pharmaceutical associations up and down the country might do good work by laying their view of the matter before their various members of Parliament. His own opinion was that they should stick to their Pharmacy Act for all it was worth.

Mr. W. SOUTHALL thought the large firms would get out of the difficulty by appointing dummy directors.

The PRESIDENT said he was a convert to Mr. Glyn-Jones's ideas with regard to qualified directors. Now that the Government had taken the matter in hand, if pharmacists did not make their influence felt, they would have company pharmacy thrust upon them in a form even more unsatisfactory than if the management was left in the hands of qualified assistants.

Mr. PERRY announced himself as one who did not think it hopeless to expect that companies could be excluded from the practice of pharmacy. In his opinion some attempt should be made to protect their position as practising pharmacists, and to prevent any unqualified collective assemblies from carrying on the business.

Mr. A. SOUTHALL said they had argued in that way for the last twenty years without much effect. The "widows' clause" in their own Pharmacy Act was an awkward fact against them. Under that unqualified executors had power to carry on a business. There was little hope of being able to close the companies altogether, and efforts should be directed to regulating them. They should insist upon a qualified and financially responsible director, as well as a qualified assistant to do the dispensing. They could not expect a great deal more than that.

Mr. GLYN-JONES, replying to the point raised about dummy directors, said it was impossible to devise any legislation which could not be got round.

Mr. C. THOMPSON, referring to the suggestions sent to the Lord Chancellor, said they might as well have been pitched into the waste-paper basket for all the use his Lordship seemed to have made of them.

No resolution was come to.

The PRESIDENT proposed, and Mr. PERRY seconded, a vote of thanks to Mr. Glyn-Jones and, that having been accorded, the meeting ended.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of this Association was held at 73, Newman Street London, W., on Thursday, November 23, Mr. H. HYMANS, Vice-President, occupying the chair in the absence of the President. The minutes of the previous meeting having been read and confirmed, five gentlemen were nominated for membership.

Mr. A. LATREILLE then read a paper on

THE RELATION OF THE WHOLESALE TO THE RETAIL TRADE,

contributed by Mr. F. CURRY, who was unable to attend. The paper is printed at page 527.

The CHAIRMAN said they had listened with mingled feelings to Mr. Curry's interesting paper. The author had mentioned the personal character of the chemist' business. To his mind that struck the key-note of the whole matter. In no other class of business did the personal element enter so largely as in the business of a chemist. The success or failure of a chemist's business in a great measure depended on his personal influence with customers. With regard to the encroachment of the wholesale on the domains of the retail trade in respect to the preparation of tinctures, extracts, etc., he thought that the retail chemist was largely to blame. For some years past competition had been so keen and profits had decreased to such an extent that when some onterprising wholesale firm demonstrated that it could supply galenical preparations put up ready for handing to the customer at a less price than the chemist could make his own preparations, the retail trade was only too ready to make the extra profit. Other wholesale firms, owing to competition in other directions, soon took up the business, until at the present time there were very few retail chemists who standardised their own preparations, the majority depending almost entirely upon the wholesale house. It was difficult to suggest a remedy for the present state of things. He (the speaker) had been on the road himself, and he found that if a chemist could see 2½ per cent., or less, difference between one firm's prices and those of another he would change his wholesale house without hesitation. He did not seem to consider the quality of the articles; simply the price. It appeared to him that the average chemist gave up the professional side of his business and went in for the purely commercial, pushing proprietary goods to the neglect of his own personal business. The chemist seemed to foster that kind of trade, hence he contended that it was not the wholesale firms who were to blame for the present state of things, but the fault lay with the chemists themselves, in helping to keep up the demand for proprietary and factory manufactured preparations.

Mr. T. MORLEY TAYLOR, thought the chairman had given a very excellent and right explanation of the subject under discussion. All the evils that the retail trade suffered from were undoubtedly the fault of its own members. There would have been no stores, no company pharmacy, no anything detrimental to the interests of pharmacists generally, if the individual qualified chemist had been true to himself. It was a peculiar position that the retail chemist held. He held a position towards his customers very different from the position the wholesale firm holds towards the chemist. The chemist's customers have no knowledge of what they are buying, whereas the chemist has—or ought to have—a knowledge of the goods supplied by the wholesale house. Retailers naturally fostered trade in the direction in which it paid them to do so, and it rests with retail chemists to destroy or uphold their trade as at present carried on. The way chemists stocked packed goods was certainly one cause of the present state of things. But the public was only willing to give a very low price for goods, consequently they were served with articles of low quality. Wherever possible however, the chemist ought to foster the demand for first-class stock, and ought to keep it.

A vote of thanks was accorded to Mr. Curry, and the meeting then adjourned.

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION.

At a meeting of the North-East Lancashire Chemists' Association, held at the White Bull Hotel, Blackburn, on Tuesday, Nov. 28, an address was given by Dr. Cunliffe, of Blackburn, on

Druggists and Drug Distribution.

Dr. Cunliffe said: I do not at all feel certain whether the title of my address this evening is sufficiently broad to embrace all the points I am intending to bring before you, or sufficiently narrow to eliminate all questions not relevant to the subject. It may be asked at the present time why medical men in general or myself in particular should take the slightest interest in the present position of pharmaceutical politics. The answer is one particularly easy to give, for the whole position of affairs at the present time, as affecting chemists, has a great and material bearing upon medical politics. The question of the protection of the pharmaceutical title, great as it necessarily is, and bound up in the general question of defence of all titles, owing to the great differences that exist in the nature of your employment and ours—differences from a commercial point of view—render it almost a secondary question. The Lord Chancellor has pointed out that great commercial differences exist between medicine and pharmacy, sufficient to make it necessary to legislate for these interests from two different standpoints. This opinion is, of course, purely personal to the Lord Chancellor himself. I—and I feel confident that I may include you also—am not prepared to accept that such material differences do exist, or, if they do exist, should be allowed to do so in the interests of the public. Medical politics are at the present time necessarily wide in their bearings, and I think the profession can claim, without being in the least egotistical, that the objects aimed at are primarily intended for the benefit of the public. The only portion of this subject which at all interests us to-night is that relative to two points—first, the distribution of drugs amongst the public for its own benefit and safety; and secondly, the right the public undoubtedly possess to be able to recognise readily, and with ease and certainty, the legally qualified and competent person. Now, gentlemen, the day has long gone by when we could with the slightest advantage to ourselves discuss the propriety of

Free Trade in Deadly Poisonous Substances.

The Pharmacy Act of 1868 and other subsequent Acts are ample evidence of the continued recognition by Government that distribution of these powerful substances in small quantities amongst the public must be subject to stringent regulations. The presence in the Statutes of such Acts as "The Sale of Food and Drugs Act," with its subsequent alterations, the existence at the present time of a Commission of Enquiry into the adulteration of foods, conclusively shows us that either these Acts have been inadequately framed, that commercial morality has sunk to such a low ebb, or that the science of business has risen to such an exact point, that these Acts are unable to afford what the Government considered to be necessary—namely, protection to the public against injurious and unnecessary adulterations. We are thus enabled to see how in this free trade country of ours the principles of free trade are not allowed to act to the injury of the health of the community. This is the condition of affairs that exists in regard to the healthy as well as the sick; but drugs are intended for administration to only the sick and ailing, and if we consider necessary such a comprehensive scheme of protection for the healthy, how much more stringent ought our regulations to be when they have to be applied to the distribution of the necessaries for the sick and ailing! I hardly need point out to you the necessity for adequate protection. Glaring instances on the other side are only too frequent. We find that the public are supplied with highly-spiced farinaceous compounds labelled as "mustard" and totally incapable of producing rubefacient action! As far as its use as a condiment is concerned, this adulteration is not serious; but when we consider how often it is used for medical purposes, and its great value in this respect if pure, adulteration becomes a serious matter. Chemists ought to be in a position that anyone purchasing this article from them could rely on its

Absolute Purity.

We find preparations of camphorated oil largely deficient in camphor, and in a number of cases made from mineral oil! In this case we have a really serious issue. There ought to be no doubt as to the quantity of camphor in the preparation. The substitution of mineral renders it useless for the purpose, and we must bear in mind that this oil is often employed in cases of "life or death." When we find seidlitz powders varying altogether from the proper composition, belladonna plasters not made according to our pharmacopœial standard, and other instances which it is not necessary to specify, we must conclude that either our scheme of protection has broken down, or that commercial competition has rendered it impossible to maintain a proper standard of quality. This condition of affairs is not only inconvenient, but very often, in serious cases of illness, it is attended with no inconsiderable amount of danger. We have a position of affairs which ought not to be tolerated longer than necessary, and it is a position which in its regulation comes most decidedly within the realms of medical politics. But the protection of the public and its drug supply, from a medical man's point of view, ought to be carried much further than the mere restriction of the scheduled poisons to qualified individuals and freedom of adulteration of ordinary drugs. Very few people, with the exception of medical men and chemists, have the slightest conception of the enormous present-day traffic in emmenagogues used simply as ecbolics. It is impossible, of course, for anyone to defend this abominable distribution. Its utter suppression is the only course which ought to be advocated. At the present time it is impossible to suppress it. It would be dangerous to attempt to regulate it, and knowing, as we all do, that steps will have to be taken to meet this growing evil, we must recognise that there is a legitimate demand for these drugs as medicinal agents, and their distribution can only be thoroughly protected when confined to a body of distributors whose numbers are sufficiently small to meet the requirements, and whose individual responsibility sufficiently great to bring them easily under control. Again,

The Protection of the Public

at the present time is a different thing altogether to what it was in 1868. The Education Acts have had a material influence upon the public at large, and, though we must admit that the education of the community is not what it might be and what it most probably will be in another thirty years, any measure of protection which we may consider at the present time must be based to a large extent upon future requirements. During the last thirty years education has had one very important effect so far as drugs are concerned. People are too apt to believe as true what they read in print. Our newspapers are far too full of advertisements of quack nostrums, and, regrettable as it undoubtedly is, religious papers are amongst the worst offenders, for many who would ignore an advertisement in a "daily" would credit the same in a religious paper. This peculiarity has been utilised to the fullest extent by advertisers of these quack remedies, and this state of affairs has rendered possible the conduct of large businesses solely concerned with drug distribution. Were this trade solely confined to the harmless drugs, aperient pills, etc., perhaps no considerable amount of harm to the public at large would result; but with this great created demand for drugs there has been steadily growing alongside the production of drugs of greater therapeutic power. These are now also being distributed regardless of their ultimate effect. Antipyrine, antifebrin, phenacetine, sulphonal, and others are being recklessly distributed; the public are being induced, by glaring advertisements, to consume them in large quantities. Fatal cases have already occurred, and yet there is no protection accorded against these powerful agents, distributed almost universally, and which are so injurious for regular administration amongst neurotic people. So much for the necessity of the protection of the public and the right of medical men to be heard on the subject. Our next consideration must be

How can the Public be best Protected.

As the law at present stands, a company can carry on the business of a chemist and druggist, and can use their titles. As far as the titles themselves are concerned, there can be no doubt that no one, individually or collectively, has the right to use a title earned by qualification, unless he himself has earned that qualification. Unfortunately for you, the protection of the public is not limited to its foods and drugs. It extends also to its accumulated capital, and herein lies the great difficulty that has to be faced. The company laws at present in force and the Amendment Bill at present under consideration have for their central idea the protection of that capital which the public can utilise either in carrying on commercial operations or for purposes of speculation. This ought to be the scope of the Company Acts, and it is rather to be regretted that an individual qualification, and all the personal considerations it brings along with it, should have to be settled under an Act which only deals with, practically

speaking, accumulated savings. It is owing, however, to company law that your present embarrassed position has arisen; consequently, you are entitled to ask that a company Act should rectify that position. You are entitled to ask that a company Act should protect your title, whether such Act controls the practice or not. Do not misunderstand my remarks upon this subject. These points you are entitled to ask for yourselves, but there are further points that would have to be considered in the interests of the public. We have to protect adequately the distribution of drugs, and, according to a contributor to your own official organ, there are a number of considerations, not the least of which is

The Drawing Up of a Clause.

Will you allow me to deal with these facts in detail? First, "it is 1899, not 1867." Under that head we ought to bear in mind that the habit of taking drugs has increased; that the public read more, but still are as easily gulled; and that the character of present-day drugs is far more potent, and most probably will become still more so. Secondly, "the clause must be one that the Government will adopt." The Government will adopt any clause which can be shown to them to be necessary in the best interests of the public. Thirdly, "we ought not to impose a condition upon a company which is not imposed upon an individual." This is perfectly true. "Parliament will sanction nothing which savours of trades unionism." The question of trades unionism is foreign to the present position. Parliament has already instituted the qualification of a chemist and druggist as a public safeguard. These facts, along with the question of a very-often-required loan to commence business with, are what we have to bear in mind. Other points might have been added to them, but we will take them as they are, and ask ourselves on what lines ought this clause to be framed. Ought it to be a recognition of companies with a qualified assistant? Ought it to be a recognition of a company of qualified individuals? Or ought it to be an absolute refusal to recognise companies in any shape or form? The difficulties that attend the first two positions are practically insurmountable. A company of qualified individuals could only exist during their lifetime. At their death their lawful heirs would be entitled to their heritage, and once Parliament had granted the rights of a company it would be impossible for them to still occupy that unsatisfactory position.

The Third Position

is the only one chemists can take up. It is the only one that they ought to be allowed to consider, for why should chemists be the only persons dependent upon individual qualification who have their interests limited by a company liability law? The practice of pharmacy does not require a great amount of capital for its exercise. There is no necessity for the limited liability laws to be taken advantage of by chemists for their pharmaceutical work, and if that position can be made clear, and chemists be induced to abstain from the many privileges which the limited liability law may give, they could with the greater force command opposition to limited liability companies. I have already pointed out that the capital employed by companies is the savings of the public, and it is hardly fair that the necessity for public protection should call into existence a body of pharmacists, and that then the public saving should be employed in opposition to these pharmacists. Further, let us consider the amount of protection involved in the qualified assistantship. It is in no way real. If an accident occurs the company could dismiss their servant, obtain the services of another, and carry on its work with very little injury. With the chemist an accident spells ruin, or, at all events, great loss. In conclusion, how can the public be best protected? Is it by increasing unnecessarily the number of distributors of drugs over whom you have to maintain a perfect control? Common sense at once shows that the smaller the number the easier controlled they will be. Is it by allowing capital and business considerations to so keenly compete with the chemist and druggist that existence cannot be maintained without sophistication of his wares? Is it by these means you are going to maintain the freedom of your drugs from adulteration? The whole situation is absurd. I hope you will now see why I have come to the conclusion that the only way of efficiently safeguarding drug distribution is by limiting it, in whole or in part, to chemists and druggists, so that you can the easiest maintain the purity of the drug and protect the public against unwittingly consuming articles deleterious to itself.

Councillor Shorrock (Darwen) proposed a vote of thanks to Dr. Cunliffe for his excellent paper. He said the support of the public would certainly be accorded to the views put forth by Dr. Cunliffe. It was a difficult matter to get Acts of Parliament to suit their purpose exactly, but all chemists would agree with the lines laid down in the paper.

Mr. Wells, in seconding the proposition, said he hoped the paper would be widely read by the public and taken to heart by chemists, and that something good would come of it for chemists at large.

The resolution having been carried with acclamation,

Dr. Cunliffe, in reply, said he would like to draw attention to one point he omitted from his address. Under the Adulteration of Food and Drugs Act lately they had seen it stated on the highest authority that the fines at present inflicted were totally inadequate when employed against companies with a large amount of capital. To his mind it seemed that if they were going to extend the power of distributing drugs amongst large companies one of two things would have to occur. They would either have to increase the fines, when they would unduly press upon chemists; or they would, practically speaking, have to impose fines upon chemists, which would be a material thing to them, but not the slightest punishment to large companies. His sympathies were with the chemists entirely with regard to their struggle, because he thought it was a struggle that had been forced upon them, and one in which they deserved the sympathy of every right-minded person.

The Secretary stated that he had received a circular from the Federation asking the Association to consider some half-dozen proposals which they said were before the country. None of those proposals fully met the views of the Executive, and they therefore suggested that a resolution on the subject should be passed.

Mr. Holt proposed—

That the Secretary be instructed to write to the Federation that in the opinion of the Association no policy should be entertained other than that brought forward by the Law and Parliamentary Committee.

Mr. Lomax (Darwen) seconded the propositiou. He thought the policy suggested was the best of the four suggested. Everyone was agreed, except the companies, that the title of chemist should be restricted to those qualified by examination. With reference to the other part, it was made clear that the intention of the Legislature in 1868 was that the practice of pharmacy should be given to those qualified by examination, and to them only. The position of the Lord Chancellor in the matter seemed to him to be ambiguous and peculiar, but he supposed it represented the law at present, and they must put up with it. But they ought to send their protest to the Federation, and eventually to the Pharmaceutical Society. He was not in opposition to the Federation—indeed, he rather thought that body was at least trying to do something to benefit chemists. Mr. Smith, of Liverpool, had shown some energy, and he thought they would see more done this year than ever before. He was surprised at the action of ten men on the Pharmaceutical Council, but he could only think there must have been some personal interests at stake from a company point of view. It was to be hoped those gentlemen would see the matter in its widest sense, and forego their interests in companies for the benefit of all concerned. He thought they were only fighting for what was just and right.

The resolution was carried unanimously.

FORFARSHIRE AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of the Association was held in Lamb's Hotel, Dundee, on Wednesday, November 22. Mr. C. Kerr presided. The following were present:—A. B. Anderson, John Anderson, Bailie Doig, John Doig, Ferrier, Gray, Ross, James Russell, and J. W. Russell, Dundee; Jack, Naysmith, Robertson, and White, Arbroath; Skinner, Broughtyferry; McFarlane, Forfar; Buchan, Friockheim; Ford, Kirriemuir; Peebles and Thomson, Lochee; Davidson, Montrose; Harley, Perth; Kermath, St. Andrews; Fernie, Newport.

Mr. Kerr said: The chief business of this meeting is to take into consideration the Companies Acts Amendment Bill, which is to regulate limited companies. As you are aware, one section of the Bill proposes to make it illegal for a company to carry on the profession or business of physicians, dentists, and midwives, but leaves out chemists. Now, when we consider that the present-day pharmacist has to pass such a high-class examination before he is registered, and becomes by law the only person allowed to handle poisons, we think it unfair that chemists should not have the same protection as medical men and midwives. I have no doubt we are all at one on that point. I come now to Section 2 of the Companies Bill, which proposes, in brief, that any company may carry

on the business and use the titles of chemists if they employ a qualified chemist. As you will have seen from the last meeting of the Pharmaceutical Council, there were two sides taken on the question of amending this clause, and the object of our meeting should be to help the divided Council to come to a decision. There is one point on which the Council are in unanimity of opinion—namely, the protection of our titles, which imply qualification. I am sure you will agree with them in this, and if this were all that is required to protect our interests there need be no discussion. But I think we should claim more.

The Present Pharmacy Act

declares that no person shall keep open shop unless qualified by examination and registration. Now, we know there are many companies who are doing large businesses in pharmacy who are not on the register. Then I say the law is evaded, and has been evaded too long. We do not forget that this question was fought by the Society years ago, in the case of the London and Provincial Stores. In this case the judge gave a wrong decision as to the real intention of the Pharmacy Act when passed into law. There is not a shadow of doubt but that the framers of the Act meant the proprietor of the shop to be the qualified man, and if the Council of the day had done it duty, it would not have rested on that wrong decision. But they were not supported at that time by the chemists of the country as they should have been, and the membership of the Society being comparatively small to the whole body of chemists, we can understand the Council's diffidence in not risking more law expenses; but it was a great pity the whole body of chemists were not stirred to see the danger that threatened, and has followed, from that decision. Now there is evidently a stirring up of dry bones such as never was before. One vast improvement in the affairs of the Council is the discussion in open meeting of the Council of matters in which we have a vital interest. Whether the Council will be able to get a satisfactory clause inserted in the Companies Bill is doubtful. Failing that, then, the chemists of the country must ask for a new and independent Pharmacy Bill; and I have no fear, if rightly gone about, we would succeed in passing a new Bill. We in Dundee have got the promise of Parliamentary support in this should our Bill not clash with public interests. Now, it would not be difficult to show that the public interest will be better served in getting their supplies of medicine from qualified and responsible proprietors than by limited companies of non-qualified directors and shareholders, whose chief concern is to get big dividends. And these dividends are mostly got by selling the cheapest rubbish that can be picked up at the drug sales. Unfortunately, the public cannot judge quality in drugs as in other goods, so the chemist who wants to build up his business on fair, honest lines has a hard struggle. But to come back to the business on hand. I cannot think that the Law and Parliamentary Committee will be able to get

A Clause in a Companies Bill

that will meet all our wants. However, we are asked by the Federation to consider the question, and come to a decision that will help the Council. What we have to do is to form a resolution that will be approved by this meeting. You know a majority of the Council did not approve of the clause drafted by their Committee, and they have been requested to reconsider it. But that should have no bearing on our decision. Here we must think and act for ourselves. The Pharmaceutical Council would, I think, have accepted the Committee's clause with the addition of three words which I now propose we should add to that clause as follows:—

> No company of unregistered persons shall carry on the business or assume the titles of chemists implying registration under the Pharmacy Acts, and if any company of unregistered persons contravenes this enactment it shall be liable to the same penalties as those enacted in the case of individuals under the Pharmacy Act.

That, I think, should satisfy the majority. Companies, limited or otherwise, of qualified and registered directors (and there are such) could never be interfered with as the law stands, but bogus companies, such as "Shoes, Limited," will not be put down till we can enforce the idea of the original framers of the Pharmacy Act, "the qualified proprietor."

Bailie Doig opened the discussion which followed. He said that if qualified chemists cared to form a limited liability company no possible objection could be taken to it, but we must insist upon qualification in all members of the company, otherwise the whole foundation of the Pharmacy Act was undermined. For himself, he would prefer a new and independent Pharmacy Bill, as the tendency under the present arrangement was not fair to the chemist and discouraging to our young men. He proposed the following addition be made to the resolution:—

> Failing the insertion of this clause, the Pharmaceutical Society should do its utmost to block the Government Bill.

Mr. Buchan said that if the resolution meant that, say, seven or fewer directors might control fifty or one hundred shops—that could not be considered a satisfactory state of matters.

Mr. Jack said the problem was a difficult one, and the fight would be a hard one, owing to the wealth of the stores.

Mr. John Anderson said he thought the dignified position for chemists to take up was to refuse to admit that bogus companies had any standing whatever as chemists, to insist upon more energetic defence of our rights by the Pharmaceutical Society, not only in the case of these bogus companies, but also in cases where there was no pretence of a company, but a single proprietor of no qualification who simply opened a pharmacy and put in a qualified man. They wanted the Pharmacy Act carried out in its integrity and not adapted to suit the unqualified outsider.

Mr. Ferrier was disposed to move as an amendment that this meeting adopt the clause which was considered at the last meeting of the Pharmaceutical Council beginning "No company." He said the conflict was between qualified chemists and companies, and unless strong measures are taken, and that quickly, the chemist pure and simple will become extinct. If you allow a company to carry on dispensing with a qualified chemist, how can you prevent the company assuming the title?

Mr. Ford hoped the Council would take action promptly, as it would be a good thing to discover what our strength really was.

Mr. Kermath approved of stirring up the Council to take action. They could rely upon the Council getting the best legal advice. We, on our part, will see that our representatives in Parliament are properly informed of the issue.

After some further conversation the resolution proposed by the Chairman was unanimously agreed to, with the addition proposed by Bailie Doig.

The Poison Schedule.

Mr. Ferrier moved the following resolution:—

> This Association considers the time has now come when there should be an addition made to the Poison Schedule.

He said this was a question of great importance, not only to the public, but to chemists as well, and they ought to draw the attention of the Pharmaceutical Council to it. In that, as in some other matters, Ireland is ahead of this country, as, in addition to carbolic acid, their list includes all oxalates. Then, in Australia the list of scheduled poisons is quite a long one.

Mr. Ford thought they might be benefited by a stricter application of the powers they already had. He knew ironmongers still sold arsenic.

Mr. Kermath said the arsenic sales might be wholesale transactions, but even if so they ought to be controlled.

Several speakers referred to the delay in scheduling carbolic acid, and hoped the Committee of the Association would see that the matter was not dropped. Mr. Kerr said Sir J. Leng was prepared to put further questions in the House of Commons if necessary. Resolution agreed to.

Dispensing in Hospitals and Surgeries.

Mr. J. W. Russell moved that the Pharmaceutical Council should be asked to take the necessary steps to get dispensing in hospitals and doctors' surgeries put under the regulations of the Pharmacy Acts. He said, however it might be in other parts of the country, there was an increasing number of doctors in Dundee going in for dispensing their own prescriptions, and he was afraid that in some cases at least the dispensers employed did not hold the legal qualification which those in charge of a dispensary should have.

Mr. Kermath thought this question would require to be handled carefully. Nothing should be said to cause unnecessary irritation.

Mr. Jack said it was a question of the public safety. It was altogether wrong that one man should be prescriber and dispenser and also furnish the death certificate. Recent events had brought the seriousness of this prominently before them. The resolution was agreed to.

Mr. Donaldson (Montrose) said in view of their next annual meeting, he had much pleasure in inviting the Association to meet in Montrose. He believed they could count on a hearty reception, and their visit might arouse a little more interest in the Association among the chemists there.

Mr. Kerr thanked Mr. Davidson for the invitation, which they would accept with pleasure.

This concluded the business, and Mr. Kermath proposed a vote of thanks to Mr. Kerr for presiding.

DERBY AND DISTRICT CHEMISTS' ASSOCIATION.

In response to a circular received from the Federation of Local Pharmaceutical Associations a meeting was held at Smith's Restaurant, Victoria Street, Derby, on Tuesday, November 21, Mr. COPE (President) in the chair. Messrs. Southern and Birkinshaw (Belper), Stevenson, Hefford, Warrington, Hart, Readman, Emitt, and Dawson (Hon. Secretary) were also present.

Three new members were elected—Messrs. Moss, Booth, and Clarke.

The CHAIRMAN, in his opening remarks, reviewed the state of company pharmacy as it now exists, and explained the efforts of the Pharmaceutical Society to remedy the evil. He pointed out that there were two distinct sides to the question—one of which was to abolish company pharmacy altogether, and the other to permit its existence under more stringent regulations. He did not think there was any hope of sweeping the companies away altogether.

The clause as formulated by the Parliamentary Committee of the Pharmaceutical Society was taken as a basis for discussion, the question of titles being first considered.

Mr. HART proposed the following resolution:—

That it shall be unlawful for any company to assume or use the title o pharmaceutical chemist, chemist or druggist, or any other designation implying registration under the Pharmacy Acts.

Seconded by Mr. WARRINGTON, and carried unanimously.

Considerable difference of opinion was expressed as to the best means of successfully regulating a pharmaceutical company. Some members favoured the idea that the board of directors of a company should consist of not less than a fixed number of qualified chemists, others that the managing director should be qualified, and that his name should be used in connection with the business.

The following resolution, however, seemed to meet the views of the members better than any. Proposed by Mr. COPE, seconded by Mr. HART, and adopted:—

It shall be lawful for chemists to avail themselves of the Companies Act, provided always that the directors and managers responsible for the conduct of a company's business are legally qualified persons, and such persons may use their title of qualification for the benefit of such company, so long only as it is used in connection with their own names.

GREAT YARMOUTH CHEMISTS' ASSOCIATION.

A special general meeting of the above Association was held at the Angel Hotel on Thursday, November 23, at 8 p.m., (1) to consider the circular of the Federation of Local Pharmaceutical Associations dealing with company pharmacy; (2) to hear an explanation of the newly-formed "Chemists' Defence Association." The President, Mr. W. S. POLL, occupied the chair, and there was an excellent attendance. After considerable discussion it was unanimously decided:—

That chemists' titles ought to be protected; that all the directors of a company should be qualified; and that this expression of opinion should be forwarded to the Federation of Local Pharmaceutical Associations.

Mr. JOHNSTON, assistant secretary of the P.A.T.A., then explained the scheme of the Chemists' Defence Association and, judging from the number of questions asked, the scheme excited a great amount of interest amongst the members. It was decided to discuss the matter fully at the December meeting. A hearty vote of thanks was passed to Mr. Johnston at the conclusion of the meeting.

MEETING OF BLACKPOOL CHEMISTS.

A meeting of Blackpool and South Shore chemists was held on November 20 at the Palatine Hotel, Blackpool, Councillor JOHN LAURIE, M.P.S., who is also a Vice-President of the Blackpool Tradesmen's Association, presiding. Amongst other business, the attention of those present was directed to the proposals for legislation in connection with

THE COMPANY PHARMACY PROBLEM.

Mr. C. H. TURVER, the Local Secretary for Blackpool, read a letter from the Federation of Local Pharmaceutical Associations suggesting the terms of alternative resolutions for consideration.

The CHAIRMAN, in opening the discussion, said that anything short of making it illegal for a number of members to do what is at present grossly illegal for an individual would leave matters not better than they are at present. He strongly urged the adoption of the first clause in the suggestions sent by the Federation—that the sale and keeping of open shops for the sale of poisons, and titles implying registration under the Pharmacy Acts, should be entirely restricted to qualified men. That this was not the case at present was a great anomaly, and that anything short of this measure would do no good. He did not believe in compromise in this matter. The statement that chemists would not get all they asked for was an argument for asking plenty, not the reverse. It would be time to submit to a lower standard when they were obliged to. He believed that if the difficulty in proving the legal qualification of men in charge of stores owned by limited liability companies could be brought clearly home to members of Parliament they would see the only reasonable course would be to make the proprietor or proprietors consist only of qualified men. There exists more real need for the handling of poisons and general practice of pharmacy to be in the hands of duly educated and registered persons than that of midwives or medicine. An error in diagnosis by a doctor's assistant might be rectified by his principal the next day, but what hope was there for a patient who got an overdose of a poisonous drug? At present, limited liability companies who had no qualification whatever, evaded the law by engaging so-called qualified men, but how many of the public know either the name or qualification of the majority of these men? What was there to prevent an unqualified John Jones, of Oldham, one day, posing as Tom Brown, M.P.S., of Blackpool the next? Many of these men were here to-day and gone to-morrow. The practical difficulties in the way of verifying effectively the qualification of managers and assistants in large limited liability companies owning several, perhaps hundreds of, shops were insuperable. This difficulty vanished when a qualified man or men were direct proprietors of their businesses. Such men were directly responsible for them and their proper control. They were public men who could easily be registered and their movements checked in a way no servant of a company could be.

Mr. SANKEY thought it was not likely that the Council could induce Parliament to make such a drastic alteration as this proposal would involve. It was no uncommon thing for chemists to trade under other names. Medical men never did this; however valuable a practice had become under a famous name they always practised under their own: at the same time he hoped the Council would get as much as possible.

Mr. TURVER was prepared to allow companies to practise if the directors were all qualified, but, after hearing the discussion, thought it better to ask for the clause mentioned. Parliament was very unwilling to create or bolster up anything in the shape of a monopoly, but he thought scarcely sufficient stress had been laid on the fact that the present state of affairs was one of grave danger to the public, quite irrespective of any injustice to the pharmacist. In the interest of the public alone every care should be taken that the handling of potent medicaments be confined to men duly qualified in every way for the important work they have to do. At present there are establishments where no one knows what the qualifications of the persons responsible are.

A warm discussion followed, in which Messrs. Billington, Jackson, Ashton, Johnson, and others took part, and it was stated that the objection was not so much to company trading *per se*, but to a number of persons being able to do what was illegal in an individual.

The following resolution was then proposed by Mr. J. JACKSON, seconded by Mr. ASHTON, and carried unanimously:—

That it is the opinion of this meeting that it should be made illegal for unregistered persons to sell or keep open shop for the sale of poisons or assume any title implying registration under the Pharmacy Act, 1868, whether registered as limited liability companies or otherwise.

The question as to forming a local association was brought forward, but postponed until January next, when it is intended to hold a dinner, at which the question could be discussed. A vote of thanks to the Chairman concluded the proceedings.

PRESTON CHEMISTS' ASSOCIATION.

A special meeting was held at the "White Horse" Hotel, Preston, on Thursday, November 23, when Mr. C. A. ARKLE presided over a representative gathering. The HON. SECRETARY, Mr. F. A. Williamson, reported the receipt of a communication from the Executive Committee of the Federation of Local Pharmaceutical Associations, asking the opinion of the chemists of Preston and district upon certain suggestions (see *ante*, p. 488).

The CHAIRMAN did not think any of the suggestions met the views of the Association entirely. At the best they only went

half way. Having passed examinations and having known what they must expect from the Pharmacy Act, chemists must have some definite ground to go upon. He favoured a resolution that they would defend their titles to the utmost, titles which gave to them the right to be called chemists and druggists, with all the privileges attaching thereto. Nothing short of that ought to be done. It had been set up by some that they had been defeated upon this very issue. As a matter of fact, the point had never been raised in a court of law, and he most emphatically suggested that the Council be empowered to proceed at once to introduce a Bill of its own in the House of Commons, irrespective of other parties. The Pharmacy Act was passed in the interests of the public but—he appealed to any fair-minded man—how could the safety of the public be guarded by drug stores under the control of a directorate, not one of whom might be qualified? Because seven men banded together they could call themselves chemists and druggists, and with the title take all the privileges it conveyed. It was for this reason the Council should seek to protect their titles and privileges. To apply for protection of titles only would be very bad policy, and to his mind he could not see how they could separate the two, having regard to the Pharmacy Act. A test case should be taken to the Law Courts on this issue alone, and if necessary it should be carried to the House of Lords. As to the Law and Parliamentary Committee's clause, he was entirely in favour of it, and was astonished at the attitude adopted by some of the recently elected members of the Council. They seemed to have turned round completely into company-mongering, and he would welcome the return of Mr. Michael Carteighe to the chair. He was the only strong man who had occupied that position during recent years.

After a brief discussion,

Mr. Williamson said it was impossible to get over the fact that in the Pharmacy Act the preamble set forth that it is expedient for the safety of the public that individuals dealing in drugs should be educated and registered. They could not educate and register a company. He moved the adoption of the Law and Parliamentary Committee's clause as a resolution.

Mr. Stuart, in seconding, said he was of opinion that it was the duty of the Preston chemists to support the Council, but even that body did not come up to their standard. It was true the proposition did, and if it received the support it merited in different parts of the country they would know what to do with the other ten members of the Council next May

Mr. Gifford (Blackburn) said it afforded him great pleasure to support the motion. Some chemists seemed to fancy that the Companies Bill would result in a settlement of all their difficulties; nothing of the kind. What they could do was to assert the professional character of their calling so far as present Acts of Parliament went, or, on the other hand, they could stamp the chemist's calling as a trade. That was the question for pharmacists of the present time to face, and he would ask the examined chemists of the country to accept their responsibility. Mr. Hills, their respected ex-President, speaking at the Council meeting of the Pharmaceutical Society, asked whether chemists were going to put themselves in an untenable position, or were they going to that they had been recognised as a body which should be included in the Companies Acts Amendment Bill, and to try as practical men to help the Government to do something in their own interests and in the interests of the public? Now, which was the "untenable position"—the straight, plain, English, upright policy, or the wriggling, turning position? Let chemists try and look at the consequences of their different methods in the light of history. What was the reason that pharmacy had positively degraded since examination and qualification became compulsory? What had been the cause of the humiliating position occupied by chemists to-day? In his opinion what stood out above everything else was the fatal omission to keep the underlying principles right. Everything else had been done but that. They had stiffer examinations, and talked of a curriculum. But while occupying their minds with those things the foundation had been neglected. It was amazing that the ridiculous decision of the House of Lords was not tackled at once and fought to the last. Let it be made clear that the apostles of abandonment of principle could not support their position; on the other hand, without principle they as chemists were a body without a soul; with nothing to hold on to. The Lord Chancellor was the one man who had helped them more than anybody else. That blessed sentence of his in which he said that company pharmacy and personal qualification did not cohere was worth anything. Did it not say in plain English, "Have we to consider personal qualification or company pharmacy?" And that was the issue before British and Irish pharmacists to-day. They were determined to have what they had earned—the title and practice of pharmacy—so far as the Acts of Parliament went. That there was every reason to think justice would be done was evident by the readiness of members of Parliament to support them when the case was put properly before them—as at Plymouth, for example. It was urged that by their conduct they might miss an opportunity, and cause the clause to be simply dropped. He did not think so. But what then? It was simply deferred. They had not admitted the principle of the Lord Chancellor's clause, and that was the all-important matter. Once give it up, and they were beyond redemption. Whenever the case of the chemists was laid bare even the man in the street would allow their claim to be a just one. Mr. Hills said he was speaking some time ago to an eminent member of the House of Commons—a Queen's Counsel—on this very point, and he said, in considering any matter of this kind, the members of the House of Commons would have two points before them, and be swayed by two considerations. He should like to remind Mr. Hills that it was an axiom that in the establishment of a precedent legal advice was of no value whatever. They must judge for themselves the possibilities, and act accordingly. The fact needed to be driven into the minds of all chemists that the Pharmaceutical Society was a typical democratic institution, admirably adapted for voicing the interests of the profession as well as safeguarding the public. It was the bounden duty of every chemist to be a member of the Society, for the chemist in the back street should remember it was he, and not the chemist in Mayfair, that the Legislature desired to understand, and if the bulk of the chemists chose they could make the Pharmaceutical Society absolutely irresistible in any claim for just treatment.

The Chairman said he entirely agreed with the proposed resolution, for to separate the titles from the privileges which they now enjoyed under the Pharmacy Act would mean sacrificing their rights. He was dead against making any arrangements with companies or pandering to them in any way. There was certainly a large amount of trade to be done by companies, and let them stick to it. At present, companies were poaching on chemists' preserves, and, as such, had no right to be there, and, in his opinion, ought to be made to disgorge what they had obtained. The introduction of side issues was a mistake. One thing only chemists desired—viz., the protection accorded to them under the Act. The Parliamentary Committee ought to be most strongly supported. It was impossible to follow in their entirety the Federation's suggestions, because they did not meet the full wishes of the chemists. For the last fourteen or fifteen years they had been neglected. There had never been a test case, for they always seemed afraid to carry a case to the far end. They must urge upon the Council to include in Clause 3 of the Companies Bill chemists and druggists and pharmaceutical chemists, and if they did not succeed in that, then it was their duty to oppose it tooth and nail.

The motion was then put, and the resolution was unanimously agreed to.

WOLVERHAMPTON PHARMACEUTICAL ASSOCIATION.

At the Star and Garter Hotel, Wolverhampton, on Monday night last, the local chemists and druggists met for the purpose of considering Bills before Parliament. The chief question down for discussion was the question of

Company Pharmacy.

The meeting was convened by Mr. Gibson, local secretary of the Pharmaceutical Society, who was unanimously voted to the chair, and there were also present Messrs. Stanway, T. Read, Leonard J. Read, Fleeming, Phillips, Coleman, Wilcox, Burnett, Cullwick, Martlew, Lowe, Beardmore, Godsell, Johnson (London), Perry, Thompson, and others. Letters of apology were received from Messrs. Hamp and Bowdler.

The Chairman stated that he had called the meeting in compliance with a circular received from the Federation of Local Pharmaceutical Associations (see *ante* 488). The five suggestions contained therein had received more or less support throughout the country, and he should have pleasure in asking Mr. Thompson, of Birmingham, who was a member of the Executive Council of the Federation, to address the meeting.

Mr. Thompson said the great point of the Federation was not to formulate any policy, but to consider collectively the policies of the various associations, and submit them to the proper channels.

Speaking as an ordinary chemist, he observed that he belonged to the party which believed in no surrender. They had a perfect right to take the Pharmacy Act of 1868 and stick to it in order to protect their titles. He considered it should be impossible for seven unqualified men to carry on the business of chemists and druggists. If one unqualified man could not do so he saw no reason why seven unqualified men should be able to do so.

The CHAIRMAN said the suggestions embraced in the circular had been brought forward in connection with the Companies Bill which was brought into Parliament at the beginning of the Session, and would in all probability be brought forward again. That Bill excluded chemists from the privileges extended to members of the medical profession, midwives, and dentists, and they as registered chemists felt that this was grossly unfair.

Mr. T. READ, who was the only person present representing a company, said he supposed it would make no difference to him if his firm could not use the title of chemists. He thought the meeting would have to consider how the question stood in the country generally. They wanted as chemists to conciliate reasonable opposition, but he was of the opinion that previous legislative attempts had failed because there was very little opposition in some cases. If the trade went to Parliament and asked for too much, it would seriously hinder their prospects of success. What required stipulating, it seemed to him, was that at least the main partner or the managing director of a company should be a qualified man. In that case the public would have a fair guarantee of safety. In many cases of necessity directors were often taken into a company, and it sometimes arose that a concern wanted a man with the necessary capital, although he might not have the necessary qualification. If, however, his duties were confined to the counting house, and were in no way concerned in the dispensing of medicines, he did not see how the public would be prejudiced. That would not be an abuse of the Companies Act, and certainly would not be any infringement of the Pharmacy Act. If they wanted to prevent these bogus companies he thought they would be right in insisting that the managing director himself should be qualified. He did not think they had a right to disfranchise a man as a chemist because, for business purposes, or family reasons, he chose to make his concern into a limited company. He himself had certainly not forfeited his right or standing because as a chemist he had decided to co-operate with other persons in the business. He thought the chemist and druggist qualification was a personal one, and he was of opinion that they got the personal element by the managing proprietor being a chemist. If a man advanced money to a friend, assuming that he was floating a company, the friend would certainly desire to take some part in the business. Now, if they imposed restrictions such as had been suggested, would it not be grossly unfair to that friend, if a managing director was a qualified man? The public would be just as well protected. That, it seemed to him, met the spirit of the Act.

Mr. JOHNSON, of London, spoke at some length on the suggestion that all the directors of companies should be qualified. He said the protection of the public was the primary object of the Pharmacy Act, and if the companies were governed by qualified directors, and the technical work of the establishment conducted by a qualified assistant, then the public would get all the protection they could. Under the Companies Act directors had vested in them complete power as to the ordering of the business, and to him it seemed logical that they should be qualified. It was not necessary to have seven directors; three, he believed, would be sufficient, but he thought that they should be qualified both financially and under the Pharmacy Act. They wanted to get satisfactory amendments to the Companies Act, and to do this Parliament must be approached in a reasonable manner. It was certain that at the end of the nineteenth century Parliament was against granting fresh monopolies, or extending present ones. He hoped they would insist upon companies trading in poisons not being allowed to use the titles of chemists and druggists.

Mr. PHILLIPS subsequently moved that the following suggestion be adopted as a resolution :—

> To protect chemists' titles, and make it illegal for unregistered persons to keep open shop for the sale of poisons as in the case of individuals.

The companies, he said, should not be recognised, but regarded as interlopers, who monopolised their business against the spirit of the Pharmacy Act. He expressed the opinion that the safety of the public would be best assured by every chemist's shop being under the direction of a fully qualified proprietor.

The motion was seconded by Mr. GODSELL, and after further discussion, the resolution was carried.

FORMATION OF A LOCAL ASSOCIATION.

Mr. COLEMAN then moved that a local association of chemists be formed.

Mr. BEARDMORE seconded, and the motion was carried *nem. con.*, a committee consisting of Messrs. Gibson, Phillips, and Coleman being formed to make the necessary arrangements.

THE CHEMISTS' DEFENCE FUND.

Mr. JOHNSON then explained to the meeting the principles of the Chemists' Defence Association.

The scheme was received with approbation, and Mr. BEARDMORE moved :—

> That this meeting of Wolverhampton chemists, having considered the objects and constitution of the Chemists' Defence Association, expresses its approval of the same, and regards the Association as a boon to the trade.

This was seconded and carried, and a hearty vote of thanks to the Chairman for presiding brought the meeting to a close.

HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION.

A special meeting of this Association was held on Wednesday, November 22, the PRESIDENT (Mr. G. M. Cobb), in the chair. The object of the meeting was to consider the proposal for a

CHEMISTS' DEFENCE FUND,

the principal speaker being Mr. W. S. Glyn-Jones (see *ante*, 506 and 516). A lengthy discussion ensued, and it was finally resolved, on the motion of Mr. HEBDEN, seconded by the PRESIDENT, to unanimously support the scheme.

THE COMPANY PHARMACY PROBLEM

was then introduced by the SECRETARY reading a circular from the Federation of Local Pharmaceutical Associations, asking for the views of the members (see *ante*, 488).

Mr. GLYN-JONES, on the invitation of the President, stated his views of the matter, and urged that inasmuch as twenty years had been allowed to elapse since the decision of the House of Lords, during which time companies have carried on the business of chemists and druggists, chemists could not now go in for a clause making it illegal for any company to keep open shop for the sale of poisons. A qualified directorate and qualified assistants were all that could reasonably be expected from the Government.

Mr. Hebden was somewhat of the same opinion.

The PRESIDENT then moved and Mr. W. R. FIELDING seconded,

> That we support the Federation suggestions 1 and 3—namely, to protect chemists' titles, and make it illegal for unregistered persons to keep open shop, and that all the directors of a company shall be qualified.

The motion was carried and a vote of thanks was accorded to Mr. Glyn-Jones.

BIRKENHEAD PHARMACEUTICAL ASSOCIATION.

At a meeting of Birkenhead chemists, held on November 28, at the suggestion of the Federation of Local Pharmaceutical Associations, to consider the various clauses which have been suggested as most desirable to be submitted for embodiment in the Companies Bill, Mr. Ellithorne was voted to the chair.

Mr. JOHN SMITH, of Liverpool, addressed the meeting and, after hearing various arguments on both sides, it was unanimously decided that the clause most worthy of support was :—

> To protect chemists' titles, and make it illegal for companies of unregistered persons to keep open shop for selling poisons as in the case of individuals.

The feeling of the meeting was that this was what registered men should insist on as their moral right. Of a number of gentlemen who were unable to be present, but sent in their views, the majority were of the same opinion.

At the same time it was proposed that a local association of chemists be formed, not so much with the idea of holding meetings regularly, as being a united body able to speak and take action when necessary. This was agreed to, Mr. H. B. MORGAN, local secretary of the Pharmaceutical Society, agreeing to act as secretary *pro. tem.*

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

At a general meeting of this Association held on November 28, the following resolution was passed:—

It should be necessary that the directors or the actual managing director of any limited company carrying on the business of a chemist and druggist shall be qualified under the Pharmacy Act, 1868; and each shop belonging to such a company should be under the direct control of a qualified assistant, whose name shall be prominently published as responsible for the conduct of such shop.

WREXHAM AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting was held on Wednesday, November 22, when it was resolved to join the Federation of Local Pharmaceutical Associations. On the question of company pharmacy it was unanimously resolved:—

That whereas individuals since 1868 are required to serve apprenticeships and to pass examinations before being allowed to use titles, to keep open shop, dispense medicines, and sell poisons, nothing short of deception to all such individuals qualified under the Pharmacy Act of 1858 is apparent when the separate directors of a company are exempted.

It was also resolved:—

That whereas no prosecution of an unqualified director of a company has ever been made, it be recommended to the Pharmaceutical Council to at once institute proceedings against offenders.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL ASSOCIATION.

A meeting was held on Wednesday, November 29, at the Rutland Institute, to consider a number of suggestions from the Federation of Local Pharmaceutical Associations on the question of legislation in regard to company pharmacy. The chair was taken by the President, Mr. G. Squire, who opened the discussion, and it was unanimously resolved:—

That in the opinion of the Sheffield Pharmaceutical and Chemical Society it is absolutely necessary in the interests of the public that the Pharmaceutical Council should draft a clause for insertion in the Companies Bill embodying the protection of chemists' titles, and making it illegal for companies of unregistered persons to keep open shop for the sale of poisons as in the case of individuals.

After some further discussion, it was also unanimously decided that the following resolution should be sent to the Council of the Pharmaceutical Society:—

That inasmuch as a company cannot be examined and registered in accordance with the provisions of the Pharmacy Act, it should be unlawful for any company or other corporate body, as such, to assume or use any title implying registration under those Acts; that all companies or other corporate bodies should be liable to penalties for doing what would be an offence under Section 15 of the Pharmacy Act, 1868, if done by an individual, and that it is not desirable in the public interest that any individual who is not registered under the Pharmacy Acts should be permitted to exercise any control over the retailing, dispensing or compounding of poisons.

LETTERS TO THE EDITOR.

The Preservation of Pharmacentical Titles.

Sir,—As some of our members seem inclined to disparage the preservation of our titles, as compared with that of the practice of pharmacy, may I point out that titles are highly valued by those who have recently obtained them. They are our standards of proof of professional capacity. A pharmaceutical chemist's establishment was the place where the public were led to believe that a prescription could be most carefully dispensed. Is the title "Pharmaceutical Chemist," as well as that of "Chemist and Druggist," to be sacrificed to unqualified persons in the form of a company? I trust some stand will be made against these agressions of this modern Moloch of Free Trade. Titles have never been ceded by us to companies, although we have had to acquiesce in the House of Lords judgment in the London and Provincial Supply Association case, as regards practice, but they are now being used by limited liability companies, and latterly with great boldness, especially the title pharmaceutical chemist. It is only during the present year the Lord Chancellor in his two Bills affecting pharmacy introduces the words "use the description of a Pharmaceutical Chemist or Chemist and Druggist," as I notice in the amendment proposed by him to the 1898 Pharmacy Act (*P.J.*, July 23, 1899, p. 96d) these words "use the description of" are conspicuously absent, the other wording of his amendment suggested to be introduced into that Act is in other respects similar to his recent clause in the Companies Bill. The addition of the words claiming our titles in the Companies Bill of last session is significant; *an enemy hath done this since*, who wants to claim what is not his. Titles are truly personal—obtained by qualification, examination, and registration—the terms drug store, medical hall, etc., are not. We ought, therefore, to certainly preserve our professional birthright; with this and the Wheeldon case judgment, protecting the man actually practising pharmacy, we should be able to defy companies, but I for one should object strongly to losing the prestige of my title, obtained by much study and sacrifice of time and money.

A. F. Goode,
London, November 29, 1899. *Pharmaceutical Chemist.*

The Company Pharmacy Problem.

Sir,—It is not fair to expect the Government to draw up an Act in a free country like Great Britain that will restrict free trade in drugs, and I do not think any Act can be passed which will prevent companies from carrying on business. Under present conditions chemists are even *worse* in their habits of carrying on business than companies, and matters will not be improved by an Act restricting the carrying on of a drug business excepting by a qualified man. The profits of a company are quite equal, if not greater, on every article sold than the cream of the retail drug trade, simply because *they buy*. I am not a holder of shares, nor in any way connected with a drug company, but I like fair play, and if a body of chemists could not form a society and draw up a simple but concise Act for the interests of the trade, it is a pity that they ever undertook a duty which was beyond their capacity. The Pharmaceutical Society should *not* exist, it will be always too weak to do any good; but if the Charter was handed back to the Government, then the latter would be compelled to control, and select capable men from the ranks to carry out the wishes of Parliament. I do not write to annoy, as I have been a regular subscriber to the Society for over twenty-three years, and I can clearly see that not the slightest improvement has taken place, and never will, under present conditions. The trade is becoming more demoralised, more disreputable, and more unreliable; therefore, if those in the trade are in earnest, let Government control us, and recollect companies *will prosper always*, but dispensing will be done on German lines, and hospitals and infirmaries will be severely dealt with for outdoor distribution.

Gloucester, November 25, 1899. E. G. Hughes.

Sir,—In response to your suggestion in Annotations of 18th inst., *re* company pharmacy, I agree with R. L. Gifford, and protest against any policy of abandonment of principle, and would also endorse what J. H. Andrew says in this week's Journal with regard to the Annotation of November 18, "The position taken up." I do not think any registered chemist, with any grit in him, should be content with less.

South Woolwich, November 25, 1899. Neil C. Sinclair.

The Society's Examinations.

Sir,—Although personally unknown to Mr. Gilmour, I cannot let his able address (see *ante*, p. 461) pass without expressing sincere approval and commending to the attention of the Council of the Society the following passages in that address:—

As regards the Minor itself, it was defective alike in form and process.

As it stood, the Minor was about the most primitive and antiquated examinational mechanism in the country.

Touching the scope, it was neither properly scientific nor adequately technical.

Those passages stand vividly forth on account of their truthfulness. Just a few weeks ago a young gentleman, having the Society's "hall mark," came to me to ask what substance they put in the battery of an electric bell. He had no idea what a Leclanche or bichromate cell was. Compare this with the present day third-year-science schoolboy. The Minor is not thorough enough, it never will be so long as they examine the candidate in all his subjects in two days. Mr. Gilmour does not give us his opinion on the Major Examination, for which I am rather sorry. The standard of questions set at this examination is anything but what it should be, if we are to keep the prestige (and whatever else we lose we cannot afford to lose this), our examinations give us. The Major is an honorary examination; it means bread and butter to no man. Take the physics as an example. These are Nos. 3, 4 and 6, in last October examination papers, 50 per cent. of what the candidate is expected

to do. I ask those who set these questions—Is it possible to set easier ones in the subject? They are not up to the standard of a London Matriculation or Senior Cambridge local paper. The Society must bear in mind that it is not as we view our examinations, it is as others view them. When we are entering upon a new era in our preliminary education, it behoves the Society not to leave for another five or ten years that which should be attended to at once. These remarks are not made in any antagonistic spirit towards the Society, but rather as a friendly criticism.

November 21, 1899. EDUCATIONALIST (8/27).

What is the Principle of the Pharmacy Act?

Sir,—You say the President's declaration "that the members of the Council are agreed upon two great points, viz., to protect the titles and uphold the principles of the Pharmacy Act, 1868," should secure the adherence of all registered persons, and I earnestly hope it will. You further say "The plain English of that is qualification of individual proprietors." But is not the whole difficulty created by and centred in a difficulty as to what the principle of the 1868 Act really is? The Society contended that the principle of the Act was *qualified ownership*, but the House of Lords emphatically declared that it contained no such principle, and that the object and policy of the Act did not require that it should. Whether we like it or not, therefore, we are compelled to accept it as settled law that *qualified ownership* is not the principle of the Act. This goes to the very root of the matter. A full and fair reading of the Act will show quite clearly that the view that *qualified ownership* is the dominant and essential principle of the Act *is a fallacy*. Undoubtedly in the mind of the framers, and it may be even actually in the Act itself, the principle of qualified ownership is to be found. But it is all important to observe that qualified ownership *per se* has no practical value at all. The owner of a London pharmacy may reside in New York or Timbuctoo, or may be incapacitated for business by age or infirmity. What is the value of qualified ownership in such cases? Obviously so far as the purpose of the Act—the public safety—is concerned it is of no value whatsoever. It would be easy to multiply illustrations of the fact that qualified ownership *per se* has no value, and is of subordinate importance. In short, qualified ownership is laid down in the Act entirely with a view to securing *qualified management*. The latter is the *essential* and *fundamental* and *predominant* principle of the Act, and when that is *adequately secured*, everything else is of secondary importance. The absolute demonstration of this view lies in the fact that the Act itself provides for *qualified management* apart from qualified ownership. The real truth is, as Mr. Glyn-Jones indicates, you cannot prevent unqualified ownership by legislation, for it is impossible to prove who is the actual owner. But you can stop unqualified management, and you can secure *qualified management*. There are several excellent precedents in British legislation in this connection. Is it not therefore of most pressing importance to consider whether this is not the great principle to aim at? When it is thoroughly accomplished I am persuaded the position of professional pharmacists will be absolutely impregnable. In pursuing this line we should be acting on what the House of Lords has declared to be the only essential principle of the Pharmacy Act, 1868, and the principle which, I firmly believe, common sense and a plain English rendering of the Act clearly bring out as its essential feature.

November 25, 1899. OBSERVER (10/23).

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.*

Botanical (C. C.—36/33).—*Veronica buxbaumii.*

Lowson's 'Botany' (S. H.—9/28).—The book was reviewed in the *Pharmaceutical Journal* of January 21 last.

Removal of Tree (J. W. S.—10/15).—You should ascertain, by application to the County Council, what it will be necessary for you to do in the matter.

Toilet Jelly (H. H. M.—36/30).—Have you tried the effect of increasing the proportion of glycerin and spirit? You do not say what is the perfume you use.

Tincture of Lithanthracis (H. W. M.—36/24).—We do not know what it is composed of. It is probably a proprietary preparation.

Dispenserships (T. H. P. C.—36/29).—The Minor qualification is sufficient for any such position as you mention. We believe a medical examination is insisted upon.

Liquor Taraxaci (E. A. T.—36/23).—Succus taraxaci is invariably given where liquor taraxaci is prescribed. Strictly speaking, however, liquor taraxaci is a synonym for extract taraxaci liquidum, and is so given in Gray's 'Supplement.'

Sale of Benzene, etc. (A. M.—36/21).—The provisions of the Petroleum Acts, under which the sale, etc., of benzene, etc., is regulated, apply to Scotland equally with the rest of the United Kingdom.

Testing Olive Oil (S. M.—36/18).—If the oil gives no blackening by Conroy's test, properly applied, it will be free from cotton seed oil. Have you tested your ether? Possibly it is not quite pure. If not, it may give rise to the reaction. Try a blank experiment.

Shaving Paste Recipe (W. C. H.—36/17).—Heat the soap on the water bath with a little water; mix in the carbolic oil, and stir thoroughly; adding more water, if necessary, to produce a cream-like mass when cold. A little pimento oil and oil of *Myreia aeris* will best blend with the odour of the phenol.

Perfume for Violet Powder (J. C.—36/20).—Oil of bergamot, 9; essence of ambrette, 6; oil of rose geranium, 3. Mix. This is improved by a little essence of musk, but as you specify a cheap formula, probably you will prefer it without. For a high-class perfume, ionone, with a little terpineol and otto of rose, is better.

Makers of Celluloid (E. E. H.—36/19).—The following are among the chief makers of various forms of celluloid:—"Bayerische Celluloidwaren Fabrik," 13, Paper Street, E.C.; The British Xylonite Company, 3, Fore Street Avenue, E.C.; Dr. P. Hunaeus, 16 to 20, Farringdon Avenue, E.C. You will probably obtain particulars of what you require by applying to any one of these.

Books on Food Analysis, etc. (R. T.—36/16).—Muter's 'Short Manual of Analytical Chemistry'; A. Wynter Blyth's 'Foods: their Composition and Analysis'; Pearmain and Moore's 'Aids to the Analysis of Foods and Drugs'; and A. H. Allen's 'Commercial Organic Analysis,' are among the most useful books. To obtain a thorough training in this branch of analysis you should become a pupil in the laboratory of a practising analyst.

Formalin as a Meat Juice Preservative (F. D. P.—36/15).—There is no evidence to show that formalin, even in the small quantity necessary to obtain a sterile product, is absolutely harmless; on the contrary, it is possible that it may adversely affect the digestibility of the substance. We should advise you to employ sodium chloride. Probably no antiseptic preservatives are absolutely without a retarding effect on the process of digestion. Formaldehyde, boric acid, and other substances have a very wide application for the purpose, but in the present stage of our knowledge of their physiological effect in minute but frequently repeated doses, their use is not to be recommended for such an article as you name, presumably to be used by invalids. (See page 538.)

Corrections.

Mr. R. LORD GIFFORD, of Blackburn, thinks the compositor rather confuses his arguments printed at page 520, by making him say "employ every source the Society could command," and further, "regaining or rather keeping." The first ought to read "every resource," etc., and the second "keeping or rather regaining."

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

CULTIVATION OF INSECT-FLOWERS IN ALGERIA.

The cultivation of the pyrethrum plant for the production of insecticide powder has been attended with encouraging results at the botanical station of Rouïba, in Algeria. Trial cultivations have been made with the white pyrethrum of Dalmatia, a plant that is more vigorous and more prolific in flowers than the Caucasian or the Persian varieties. At the present day, two-thirds of the insect powder obtained from pyrethrum that is used in Europe is produced in Dalmatia. The plant (the exact species is not given in the note) requires a clayey-sandy soil, somewhat light; it can withstand drought. It is right to irrigate only in case of extreme dryness of the soil. In Algeria it is necessary to sow in the nursery from the beginning of autumn, and to transplant in the spring. The plantation is arranged so that the plants form rows one metre apart; each plant is separated from the next by a distance of fifty centimetres. The plant flowers in May, and is harvested in the course of the summer. Six to eight hundredweights of dried flowers are gathered per hectare. The powder is obtained by pounding the flowers in a mortar.—*Revue des cultures coloniales*, **41**, 315.

ATOMIC WEIGHT OF NITROGEN.

G. Dean gives an account of work in connection with the determination of the atomic weight of nitrogen, in continuation of that of which a preliminary notice has already been communicated (*Proc. Chem. Soc.*, 1898, **14**, 174). He deduces from the results of previous workers, a mean value of 14·034 for the atomic weight of nitrogen, but points out that the means of the determinations by chemical methods of individual workers vary from 13·975 (Pelouze) to 14·05 (Stas). The ratio of the densities of oxygen and nitrogen, as determined by Lord Rayleigh and by M. Leduc, is 16 : 14·003. As those variations seemed to be too great, it was decided to try a new method which would involve as few atomic weights as possible, and only those which are known with the highest accuracy. Silver cyanide was selected as the compound containing nitrogen, and the ratio between a given mass of it and that of the potassium bromide required for the complete precipitation of the silver contained in it determined with all the precautions insisted on in such work by Stas. The cyanide was decomposed in some cases by dissolving it in nitric acid, in other experiments sulphuric acid. The ratio between the purest silver and the sample of potassium bromide used was carefully determined, so that the ratio found was really Ag : AgCN. This was found to be 107·93 : 133·962, whence CN = 26·032 and N = 14·031 if C = 12·001.—*Proc. Chem. Soc.*, **15**, 213.

LIQUID HYDROGEN AND SEED GERMINATION.

Sir W. T. Thiselton Dyer has made some experiments, at the instance of Professor Dewar, on the influence of the temperature of liquid hydrogen on the germinative power of seeds. The seeds formerly selected by Brown and Escombe, when experimenting upon the effect of the temperature of liquid air on seeds, were chosen so as to represent different families. The number they used was too large for the present investigation, on account of the costliness of liquid hydrogen. Barley and wheat were taken for the sake of comparison with Brown and Escombe's results. The question of shape and bulk next influenced the selection; wheat and barley are roughly ellipsoidal and medium in size; the vegetable marrow was added because it is relatively large but flattened, and mustard, which is small and spherical. Composition was next considered, so in addition to these oily and farinaceous seeds a pea was taken, on account of its nitrogenous composition, and partly because of its spherical shape. Lastly, a very minute seed, the musk, was chosen. All the seeds were supplied by Messrs. Sutton, of Reading, and certified of good germination. They were sealed up in a glass tube cooled first in liquid air and then transferred to hydrogen. In this way a temperature of −250 or −252° C. was reached, and maintained for half an hour, and later for an hour another set of seeds being cooled only in liquid air for comparison. On opening the tinfoil packages in which the seeds had been wrapped they were found to be as fresh and bright as before treatment. They were sown in a cool greenhouse, without heat, on July 27. On August 1 they had all germinated. Again a packet of seeds was cooled, this time without graduation of cooling, and actually immersed in liquid hydrogen for upwards of six hours. The temperature reached was −453° F. below melting ice. These seeds germinated without exception. Professor Dewar considers that there is no doubt about the seeds having actually been brought down to the temperature of the liquid hydrogen. It seems probable that plant structures are deficient in thermal transparency, and they are notoriously indifferent conductors. Nevertheless it is difficult to believe that in the case of such small bodies as seeds, their being brought to the temperature with which they are surrounded can be more than a question of time. It is not impossible, however, that even at low temperatures the thermal capacity of at least the seed-coats may be considerable.—*Proc. Roy. Soc.*, **420**, 361.

OXYDASES IN THE VINE.

To the list of plants already found to contain oxidising ferments the vine is now added. According to C. Cornu, all the organs of every variety of the plant examined contained the oxydase. The ferment is more active in the spring than in the autumn.—*Journ. Pharm. Chim.* [6], **10**, 342.

EXPERIMENTS WITH MILK PRESERVATIVES.

In some recent experiments with animals on the physiological action of minute quantities of boric acid and of formalin, as employed as food preservatives, H. E. Annett has thrown considerable light on what is a most important, but, so far, undetermined question. Five kittens were fed on milk containing 80 grains of boric acid per gallon. In four weeks all were dead. Five kittens were fed with milk containing 40 grains per gallon; two died in the third week, and the rest in the fourth. Five control kittens received pure milk, none died. The diminution in weight in the animals receiving the boric acid milk was very marked and brought into significant relief by comparison with the increase in weight in those fed on the normal fluid. It was seen, in a day or two, that the kittens treated with the boric milk were losing appetite. Diarrhœa, inactivity and depression followed, then rapid emaciation and death. With milk containing formalin similar results were obtained. Of five kittens treated with milk containing 1 part of formaldehyde in 50,000 of milk, three died in five weeks; the average increase in weight was 177·6 Gm., compared with 251·1 Gm. of four control kittens treated with normal milk; with milk containing 1 : 25,000 of formaldehyde, another series showed an average gain of 196·6 Gm., as against 325·7 Gm. gain by kittens fed on normal milk. Of a third lot treated with milk containing 1 part of formaldehyde in 12,500 of milk, two died in the fourth week; the average gain in weight was only 96·4 Gms. against 312·5 Gms. with the "controls" fed on normal milk. The younger the animals were, the more susceptible they appeared to the influence of the formalin. The experiments are only preliminary, but the fact cannot be denied that they have a very distinct bearing on a matter which is, literally, of vital importance.—*Lancet*, **2**, 1899, 1282*a*.

"COMPANY PHARMACY": A REPLY TO Mr. GLYN-JONES.

BY CLEMENT FIELDING,
Pharmaceutical Chemist, Halifax.

Among the various suggestions made by Mr. Glyn-Jones in his article in the *Pharmaceutical Journal* of November 18, 1899, page 473, there is (contrary to the opinion of Mr. Glyn-Jones), only one course that should be adopted, namely, absolute consistency.

It is quite true that we cannot expect the Government, in dealing with companies, to go beyond the principle of the 1868 Act, nor do we as chemists desire this. Indeed it is the very principle of that Act which we wish to see carried out, namely, the protection of the public, by prohibiting the dispensing or compounding of medicines, and the sale of poisons by unqualified or irresponsible bodies or persons, as well as the consequences of that principle.

When it is considered that practically every individual chemist has had to undergo a curriculum to qualify himself to protect the public in these respects, it would in any country in the world be admitted that it is only natural justice that those who have with difficulty earned certain privileges, should have those privileges conserved to them. With this object, one of the two following clauses should be adopted by the Council, and strenuously supported :—

1.—It shall be unlawful for a company to carry on the profession or business of a physician, surgeon, dentist, chemist, or midwife, and if any company contravenes this enactment, it shall be liable on summary conviction to a fine not exceeding five pounds for every day during which the contravention happens, provided that nothing herein contained shall prohibit the sale by a company of drugs, chemicals, or other articles usually sold by chemists, but shall only prohibit a company dispensing or compounding medicines or selling the poisons which individuals are prohibited from selling by the Pharmacy Acts, 1852 and 1868.

2.—(*a*) No company may carry on the business or use the description of a pharmaceutical chemist, pharmacist, dispensing chemist, or chemist, or other description implying qualification under the Pharmacy Acts, 1852 and 1868.

(*b*) The words "carry on the business" used in this section, shall, however only mean the dispensing or compounding of medicines and the sale of poisons prohibited in the case of individuals by the said Pharmacy Acts, and shall not extend to prohibit any company from selling drugs, chemicals, or other articles usually sold by chemists, except as aforesaid.

These clauses it will be seen follow as far as possible the wording of sections three and two respectively of the proposed Companies Bill.

Anything short of this is absolutely useless, and in case of deviation therefrom it would be a saving of time and trouble if the agitation were allowed to drop. As to the suggestion that pharmacy as a whole is like human nature, a bundle of inconsistencies, that is no reason why the law on the subject should be the same. If any individual chooses to derogate from the law he does so at his own risk, and should take such steps as will put him in a position to be within the law. Making suggestions with a view to regulating company pharmacy is of no use, because such a course would be as much contrary to public policy as in the case of physicians, surgeons, dentists, or midwives, on the ground that if companies are regulated for that purpose they can, by limiting their liability as provided by the Companies Acts, escape full liability for the consequences of any wrongful acts. A member of a company could say "what does it matter if any member of the public does brings an action against my company for damages or negligence? I am liable only to the amount of the shares I hold in the company, and if it winds up I have sufficient money put aside and invested to enable me then to begin business on my own account and that cannot be touched by any action against the company."

Again, it is contrary to the spirit of the Pharmacy Acts that a company should be authorised to sell poisons because (as in Part I. of poison schedule) the purchaser has to be known to the seller, and the purchaser cannot, of course, in any case be known to a company nor even in the usual case to the qualified servant of a company, who generally skips about from town to town, either to suit his own caprice or at the sweet will of the company, which might have branch establishments in a dozen different towns.

Then again, why midwives should be protected and not pharmacists is absolutely unintelligible. Neither of the clauses before suggested in any way prohibits the carrying on by companies of the business of vendors of drugs or chemicals, or other articles usually sold by chemists, but only seeks to conserve hard-earned privileges to those who have earned them; privileges which, as recognised by the Pharmacy Acts, are the only means by which the public can properly be protected. There are not wanting many complaints that nowadays the examinations are becoming exceedingly difficult, and doubts are already expressed as to whether the game is worth the candle, but what will it be like when parents find that companies consisting largely of unqualified individuals are gradually lowering the standard of the profession and depriving qualified men of their rights, for it cannot be expected that the general public will in their own interest discriminate between responsible and irresponsible practitioners; indeed, it was because of such lack of discrimination on the part of the public that the Pharmacy Act, and indeed, any other qualifying Acts have had to be passed. The suggestion that qualified directors should be insisted upon is futile in every respect, because it is well known that directors usually meet only once a week, and often only once a month, or at longer intervals, and by that means no evil whatever would be remedied. The suggestion in the Court of Appeal in the London Provincial Supply Association case, that in case of sale or keeping open shop by a corporation, the directors and not the corporation would be liable, was quashed by the Law Lords, who said they should—if satisfied that "person" included "corporation"—have had no difficulty in imposing the prescribed penalty on the corporation itself, and expressly stated that they felt none of the difficulties felt by the Court of Appeal in this respect.

The proposed Companies Bill also inflicts the fine named therein on the company itself and not on the directors. (Sec Section 3.) It is of no use thanking the Government for the attempt by the proposed Companies Bill to provide for qualified control, for the Bill only insists on control by a qualified manager, which is, however, the law at present as decided by the House of Lords in the last-named case. The only additional proposition made by the Bill is to paint the qualified manager's name on the shop door.

Though qualified directors might have absolute control of the buying of poisons, or chemicals, they could not in the nature of things have absolute immediate control over the dispensing of medicines or the sale to the public of poisons.

As to not interfering with vested interests of companies, it is clear that if we do not insist on these two things being in the hands of qualified men having control as the keepers of open shop, etc., it means absolute surrender. In all other respects no vested interests need be touched, but the vested interest of legally qualified chemists would be conserved.

THE ASSAY OF EXTRACTUM BELLADONNÆ LIQUIDUM.

BY F. H. ALCOCK.

By following a similar plan to the one suggested for Extractum Ipecacuanhæ Liquidum, it is found that a result is obtained which can be utilised as a means of assay. As an example, five cubic centimetres of liquid extract was mixed with ten cubic centimetres of ether, and five cubic centimetres of diluted sulphuric acid, and the ethereal layer removed. As this was of a greenish colour, a suspicion arose that the preparation was not solely made from the root, which was, perhaps, confirmed by the fact that the colour of the extract was unusually dark. Owing to this greenish colour being imparted to the ether, a second washing was adopted, and the ether residues, after washing with a little water, were evaporated in a tared dish, and found to weigh 0.125 gramme, and to be free from alkaloid. Thinking that washing with chloroform might remove more non-alkaloid matters from the acid alkaloidal liquid, it was shaken up with ten cubic centimetres of this solvent,

when a brownish resinous precipitate made its appearance, which was removed by straining through a small pledget of cotton after removal of the chloroform. This resinous matter was found to be soluble in alcohol, and of a non-alkaloidal nature. The evaporated chloroform solution did not increase the weight of the ether residue. On now rendering the clear deep reddish-brown coloured liquid alkaline with ammonium hydroxide, and shaking out with ether chloroform three times (with care, twice suffices), the whole of the alkaloid was removed from the liquid, and the mixed solutions evaporated spontaneously at the temperature of the laboratory, 68°F. As evaporation proceeded, beautiful acicular crystals, one quarter of an inch long, were seen to dart across the liquid, and when all the solvent had evaporated, the residue was a pretty sight to see. Not a particle of colour was to be seen, and fan and fern-like clusters of crystals lined the floor and sides of the flat-bottomed glass crystalling dish. These were dried *in vacuo*, and afterwards weighed. The amount was 0.038 gramme. On applying the heat of a water-bath to the dish, the crystals seemed to fuse and pass to a varnish-like mass, but whether continued application of heat really affects the product has to be found out; it certainly mars the crystalline beauty. By titration, the alkaloid residue came out 100 per cent., and, of course, was quickly and easily dissolved by the cold acid, the solution being colourless. A series of experiments on the application of this method to nux vomica preparations and other similar galenicals is in progress, and will be concluded in a few days.

INCOMPATIBILITY AND SOME OF ITS LESSONS.*

BY WALTER G. SMITH, M.D.

Ex-President Royal College of Physicians, Ireland; Physician to his Excellency the Lord Lieutenant; King's Professor of Materia Medica and Pharmacy, School of Physic, T.C.D.

Part 1.—General. (*Concluded.*)

Until recently, the real nature of chemical equilibria escaped attention, and chemical processes were too largely regarded as belonging to the phenomena of non-reversible processes.

A chemical equation is often read (by students) in only one direction, from left to right, and the products on the right-hand side of the sign of equality are taken as final and unchanging. But this is found not to be the case, and we must therefore keep before us the possible interaction of all the molecules that may exist in the system under consideration.

Now the arrow symbols in the above general equation represent the important and fruitful idea that, *in principle*, reactions are Reversible or Reciprocating. That is to say, where AD and BC are produced, they act upon each other and reproduce, in part, the original compounds AB and CD. Hence, when two salts are dissolved in water, four salts really exist in the solution.

In this manner an interchange goes on until the opposing reactions have attained equal velocities.

By "velocity" is meant the rate of chemical material transformation, and accordingly the word has a different meaning in chemistry from what it has in mechanics, and their only common factor is time.

The fact that the reaction needs time for its completion involves hat, beside the cause producing it (*i.e.* "moving force" or "affinity"), a resistance comes into play. The nature of the resistance can be most varied, whilst the "moving force" is definite for a given state of matter (van't Hoff). (Cf. C. Johnstone Stoney's paper "On the Appreciation of Ultra-visible Quantities," *Phil. Mag.*, 1892, p. 425.)

In the language of the kinetic molecular theory no condition of equilibrium between substances capable of mutual reaction can be regarded as static, but rather must it be reckoned as a dynamic equilibrium. When the "peace of dynamic equilibrium" (Mendeléeff) is attained we simply mean that the reaction progresses with the same velocity in the one direction as in the opposite direction. Therefore reversible reactions evolve (exothermal) or absorb (endothermal) but little heat.

We cannot observe the velocity of chemical change either from left to right of the equation, or from right to left alone, for we can measure merely the *difference* between these values.

The state of equilibrium and the reaction velocity are dependent not only upon the active masses of the reacting substances, but further upon a number of factors, *e.g.*, temperature, pressure, electrification, and illumination, which collectively may be regarded as being associated with the introduction of energy *into* or the abstraction of energy *from* the system.

Of these factors, temperature is the most influential, for all experimental measurement has shown that the velocity with which a chemical system strives to reach its state of equilibrium increases enormously with the temperature.

Most reactions double or treble their velocity for a rise of 10° in T.

Examples of Reversible Reactions.

Simple solution is a reversible change.

$$\text{Water} \rightleftharpoons \text{Steam.}$$

$$2H_2 + O_2 \rightleftharpoons 2H_2O.$$

$$H_2 + I_2 \rightleftharpoons 2HI.$$

$$FeX_3 + KI \rightleftharpoons FeX_2 + KX + I.$$

This reaction proceeds comparatively slowly in solutions, is not complete, and is reversible (Mendeléeff.)

$$\underset{\frac{1}{3}\text{ mol.}}{\text{Alcohol}} + \underset{\frac{1}{3}\text{ mol.}}{\text{Acetic Acid}} \rightleftharpoons \underset{\frac{2}{3}\text{ mol.}}{\text{Ethyl Acetate}} + \underset{\frac{2}{3}\text{ mol.}}{\text{Water.}}$$

This ratio will remain constant for years.

Further illustrations are afforded by the varying reaction of renal and vesical urine; by the stratification of calculi; and by the precipitation of phosphates from urine by heat and re-solution on cooling.

In urinary chemistry it is important to remind ourselves that the reaction between urates and phosphates is a reversible one. With acid phosphates, biurates yield quadriurates; with basic (monohydrogen) phosphates quadriurates yield biurates. With a certain proportionate mixture of the two classes of phosphates the uric acid salts will be therefore in equilibrium.

$$2M\bar{H}\bar{U} + MH_2PO_4 \rightleftharpoons [M\bar{H}\bar{U}H_2\bar{U}] + M_2HPO_4.$$

$$[M\bar{H}\bar{U}H_2U] \rightleftharpoons M\bar{H}\bar{U} + H_2\bar{U}.$$

$$\text{Quadriurate.} \rightleftharpoons \text{Biurate: Uric Acid.}$$

As examples of non-reversible reactions may be cited gunpowder and other explosive compounds, which can be suddenly converted into gas. Gunpowder is explosive because when the reaction has once been started it spreads, and gains acceleration from the lively development of heat.

Solid CO_2 is not explosive because, in vaporising, the action is reduced to a standstill almost immediately by the cooling down.

In most phenomena of explosion it has been observed that a slow reaction takes place below the T. of explosion, and that a given T. accordingly does not mean a sudden setting in of a reaction which has no existence below it. Since equal ratios of velocity accompany equal differences of T., we conclude that a reaction which takes place at any temperature *must also take place at any other temperature.*

* Reprinted, by permission, from the *Practitioner*. Continued from page 501.

Velocity of reaction may proceed.

(*a*) Simultaneously and uniformly throughout the mass capable of reaction; or by

(*b*) A progressive "wave of reaction" (combustion) (van't Hoff). Velocity moderate, a few metres per second, started by local causes and advancing progressively.

(*c*) Explosive "wave of reaction" set up by pressure.

In the latter case the velocity may vary from about 1,000 to nearly 3,000 metres per second.

PART II.—SPECIAL.

INCOMPATIBILITY has been variously defined by writers, and I propose to define it as "any unintentional change which notably interferes with the elegance, usefulness, or safety of a prescription."

The subject of so-called therapeutical incompatibility is not included in this definition, for it belongs to a different sphere, and its principles are taught by the science of pharmacology.

Neither do I intend to refer to what is often termed pharmaceutical or physical incompatibility, such as errors of solublity, precipitation of resinous or oily solutions by the addition of water, choice of pill excipients, and such-like matters.

My observations will deal with the chemical aspects of prescribing, from a practical and everyday point of view. Even with these limitations the subject of incompatibility is a broad and almost endless one.

For the number of possible combinations is infinite, and no rules will provide against all possible or even likely cases. Moreover, new drugs bring with them new problems, and some of the recent complex synthetic preparations, *e.g.*, antipyrin, do not readily lend themselves to general rules, and have a number of special incompatibilities.

We may accept as a primary rule:—Have as little chemical action as is possible take place among the ingredients of a prescription, unless such is clearly ordered or intended.

This rule holds good, although it must be admitted that some chemical precipitates may be dissolved in the stomach with comparative facility. If only on the ground of elegance such precipitates should be, and can readily be, avoided.

It is worth while to observe the chemical change between two substances can sometimes be much retarded, or even prevented, by forming a *dilute* solution of one of them in a mucilaginous or syrupy liquid before adding the other.

The *order of mixing* the ingredients in a prescription is often of material importance, *e.g.*:—

Corrosive sublimate	gr. ss.	The ammon. carb. would precipitate with the $HgCl_2$ if directly added to it. But if the $HgCl_2$ and KI be first dissolved and the ammon. carb. be added to this solution no precipitation occurs (Scoville).
Ammon. carbon.		
Potass. iodid.	áá gr. v.	
Aquæ	ad ʒi.	
M.		

Again, mix (in order as named):—

Corrosive sublimate.....	gr. iii
Water.....	ʒij
Mucilage	ʒi
Lime water	ʒij

Contrast with the effect of adding the lime water to the corrosive sublimate *before* the addition of mucilage.

Tr. ferri perchlor.	mlv	Most of the iron remains in solution. But if the spirit of ammonia were added *before* the syrup, all, or nearly all, the iron would be precipitated.
Syrupi	ʒi.	
Aquæ	ʒv.	
M. et adde		
Spir. ammon. arom.	ʒij.	

The classes of incompatibilities are grouped under two headings, viz.:—

I. HOMOGENEOUS SYSTEMS, *i.e.*, unattended with any visible *change of form*. There may be colour alteration.

II. HETEROGENEOUS SYSTEMS, *i.e.*, attended with a visible *change of form*, viz., the production of either a gas (or volatile substance), or a precipitate.

The formation of a gas or volatile substance naturally is favoured by a rise of temperature. The chief gas concerned in incompatibilities is carbon dioxide; more rarely, H_2S, or SO_2. But since precipitates, *i.e.*, insoluble compounds, formed at ordinary temperatures, afford by far the largest class of chemical incompatibilities, it is very essential to acquire a clear knowledge of the ordinary rules of solubility. This will enable us to understand and to avoid most of the common pitfalls.

The important elements in the B.P. number thirty-two, and of these about twenty are concerned in incompatibilities.

Generally speaking, whenever an insoluble body can be produced by the mutual interaction of any two bodies it will be formed, because a chemical reaction tends to the production of the most stable body possible under the given conditions. The ordinary tables and charts of qualitative analysis are based upon the rules of solubility. For example, Group I., metals precipitated by hydrochloric acid, is only another way of looking at Rule 5, and so on for the other groups.

RULES FOR SOLUBILITY IN WATER.*

(1) All metallic (basic) OXIDES, HYDROXIDES and SULPHIDES are insoluble, except those of the alkalies (K,Na,NH_4,L), and alkaline earths (Ba, Sr, Ca).

Lime, CaO, is sparingly soluble, 1 in 800; vegetable bases (alkaloids) are mostly insoluble, and do not form carbonates; hence they are usually precipitated from their salts by soluble hydroxides or carbonates. Sulphides are easily decomposed by acids and yield H_2S.

(2) All normal (neutral) metallic NITRATES,† CHLORATES, and ACETATES are soluble; silver and mercurous acetates sparingly.

Quinine acetate is insoluble. Some basic (oxy) acetates and nitrates are insoluble, *e.g.*, bismuth subnitras, $BiONO_3$.

Normal bismuth nitrate, $Bi3NO_3$, is decomposed by water, but is stable for a time in solution in glycerin.

Subacetate of lead precipitates gum, most vegetable colouring matters, and many organic acids. NITRITES are mostly soluble, but are unstable.

(3) All normal PHOSPHATES, ARSENATES, ARSENITES, CARBONATES, and BORATES are insoluble, except those of the alkalies. Lithium carbonate and phosphate are sparingly soluble.

The acid salts are often soluble, *e.g.*, of Ca and Mg.

The phosphates of Fe and Ca, arsenate of Fe, and carbonates of Fe, Ca, Zn, Pb and Mg are the insoluble salts of this group in the B.P.

(4) All normal SULPHATES are soluble except those of Ba, Sr, Pb, $PbSO_4$ is the only one of importance in pharmacy. Calcium, silver and mercurous sulphates are sparingly soluble.

SULPHITES are mostly insoluble, except those of alkalies.

(5) All CHLORIDES and BROMIDES are soluble except AgCl, AgBr. NH_2HgCl (white ppt.), Hg_2Cl_2 (calomel), Hg_2Br_2, and Cu_2Cl_2. Lead chloride and bromide are sparingly soluble.

Some bromides and chlorides, *e.g.*, $SbCl_3$, $BiCl_3$, and $ZnCl_2$, are decomposed by water (hydrolysis), and an insoluble oxychloride or bromide is precipitated.

Liq. bismuthi is incompatible with Ac. hydrochlor. dil. or Ac. nitr. hydr. dil., and it should be prescribed in neutral or alkaline solutions.

(6) Most IODIDES are soluble, except those of lead, mercury, silver, bismuth, and Cu_2I_2.

HgI_2 (red) dissolves easily in solution of KI, forming a colourless double salt (HgI_2,2KI).

(7) Most OXALATES, except those of alkalies, are insoluble, *e.g.*, calcium and cerium.

---

* Probably no substance is absolutely insoluble in water.

† Urea nitrate is readily soluble in water but is insoluble in strong colourless nitric acid, a fact often witnessed in the clinical testing of urine.

From the above rules it will be seen that *nearly all alkaline salts are soluble*, and hence alkalics may generaly be neutralised by acids, and their salts may be prescribed in any combinations, *inter se*, without fear of precipitation. Acid tartrates of potassium or ammonium, acid oxalate of sodium, and picrate of potassium are very sparingly soluble.

On the other hand, the majority of the mercurous, lead and silver salts are insoluble.

Salts of the *same acid* radical do not, as a rule, mutually decompose each other. They often combine to form double salts, *e.g.*, the group of alums, and Mayer's solution (HgI_2,2KI). Magnesium sulphate should not be prescribed along with Rochelle salt (soda tartarata), for, after some time, magnesium tartrate will be precipitated. Potassium iodide and potassium chlorate may interact and form irritant potassium iodate.

Alcohol.—In regard to alcohol as a solvent it is not possible to formulate exact rules, but it may be useful to observe that most acetates, benzoates, nitrates, salicylates, valerianates and halogen salts (chlorides, bromides and iodides) are soluble in alcohol, while most other salts are insoluble, except those which are diliquescent (Scoville). Alkaline chlorides and nitrates are insoluble in alcohol.

Solution of magnes. sulph. (1 in 2)	℥ss.
Sp. æth. nitrosi	℥ss.

This becomes solid after a few minutes.

Glycerin.—Its solvent powers lie between those of alcohol and water.

Homogeneous Systems,

i.e., neither a precipitate formed at once, nor a gas liberated. Colour changes may occur.

(1) *Acids and Bases*, in the free state.

(*a*) Generally speaking, these bodies are chemically and therapeutically incompatible, and it is inadmissible to prescribe, *e.g.*,* lactic acid with lime water. This has been prescribed as a gargle.

Lin. tereb. acet. with Lin. camph. ammon., Ac. nitro. hyd. dil. with Spir. ammon. aromat.

(*b*) But if the resulting salt be soluble and poisonous, the toxic action persists in spite of chemical neutralisation, *e.g.*, oxalic acid and alkalies ("salt of lemon"). Lime water is the antidote for oxalic acid (Rule 7).

Hydrocyanic acid and alkalies.

The physiological action of KCN substantially agrees with that of HCN.

Alkaline bicarbonates are not decomposed by HCN. This is a favourite and proper combination.

(2) *Halogen compounds*, *i.e.*, of Cl, Br, I.

The order of affinity for hydrogen and metal is:

$$Cl \rightarrowtail Br \rightarrowtail I.$$

Hence free Cl or Br will liberate iodine from iodides.

The order of affinity for oxygen in combination is:

$$I \rightarrowtail Br \rightarrowtail Cl.$$

There is no known oxide of bromine.

Chlorides are the most stable group, and alkaline iodides are more unstable than the corresponding bromides and chlorides. It is important to become familiar with some decompositions of iodide of potassium: *e.g.*—

(*a*) By free Cl or Br.

$$KI + Cl = KCl + I.$$

Free Cl can be detected in chloroform by addition of KI (or CdI_2, B.P.) and starch mulcilage.

(*b*) By nitric or nitrous acids:

$$3KI + 4HNO_3† = 3KNO_3 + 2H_2O + NO + I_3.$$

It is easy to detect KI in urine by this means.

The free iodine is evidenced by starch, or the rose red colour imparted to chloroform when agitated with the urine. The test for nitrates in drinking water is based upon the same principle.

H_2O_2 or ozone liberates iodine from KI, and hence the guaiacum test cannot be applied to the detection of blood in presence of KI.*

Slow decomposition occurs between KI and Bism. subnitras. A common change is with Sp. ætheris nitrosi, which frequently contains free acid, or with Liq. ethyl nitritis, or, amyl nitrite. These combinations are better avoided, even after neutralisation.

Acid salts in conjunction with nitrites favour decomposition.

$$C_2H_5NO_2 + KI + KHT = C_2H_5OH + K_2T + NO + I.$$

(*c*) By *inorganic* ferric salts.

$$Fe_2Cl_6 + 2KI = 2KCl + 2FeCl_2 + I_2.$$

This is an unsuitable and very irritant combination, owing to the free iodine. The undesirable change does not occur with ferric acetate, nor with the "scale preparations" of iron. Therefore, Ferri et amm. citr. and KI are quite compatible.

Alkaline bromides are not decomposed by iron salts, unless the solution be very acid.

KI can, of course, be suitably given along with Syr. ferri iod.

(*d*) Observe the action of KI upon copper sulphate (*see* Heterogeneous Systems).

(*e*) Note the action of free Cl, Br, or I, respectively, upon Liq. ammoniæ (*see* Heterogeneous Systems).

(*f*) "Colourless" tincture of iodine, so-called. This is an impossibility, for free iodine always forms a coloured solution.

The means adopted for decolorising (!) depend upon formation of either:

(i.) A colourless iodide, *e.g.*, by action of the fixed alkalies; sulphites; thiosulphate (hyposulphite) of sodium.

Upon *aqueous* solutions of iodine, viz., Liq. iodi fortis, B.P., the action of potash (or soda) is:

$$6KOH + I_6 = 5KI + KIO_3 + 3H_2O.$$

Similarly, with bromine and chlorine, when heated. This reaction is the basis of the B.P. processes for preparing KI and KBr.

With *alcoholic* solutions of iodine, *e.g.*, Tinctura iodi, iodoform CHI_3, is also formed and precipitated as a fine yellow powder (hexagonal crystals). This is Lieben's test for alcohol, and is used in B.P. for detection of chloral-alcoholate in chloral.

$$C_2H_5OH + 4I_2 + 6NaOH = CHI_3 + NaCHO_2 + 5NaI + 5H_2O.$$

(ii.) An organic substitution compound, *e.g.*, with tannin, or with phenols (carbolic acid; resorcin).

(*g*) Note particularly the incompatibility between Syr. ferri iodidi and potassium chlorate.

This requires a little time for its development, and so may be overlooked.

The following prescription was ordered for a child:—

Pot. chloratis	℈ii.
Syr. ferri iod	iv.
Syr. simpl.	℥iv.
Sp. chlorof.	mxx.
Aquæ ad	℥ii.

The mixture gradually darkened and in a few hours deposited iodine in abundance. In this condition it was given to the child, with the result that serious symptoms set in, terminating fatally. The dispenser was unjustly blamed by the prescriber.

Neutral Syr. ferri iod. (or, in presence of pot. citrate or pot. acetate) is not decomposed, but if, as frequently happens, it contains some free acid, the solution becomes yellow, or brown, and iodine is abundantly liberated:—

$$KClO_3 + 6HI = KCl + 3H_2O + I_6.$$

Chloric acid is, possibly, first liberated. Ultimately hydrated ferric oxide may be thrown down, and possibly some irritant potassium iodate may also be formed.

* The illustrative examples are selected from actual prescriptions. The corresponding experiments are performed by the students in the Practical Pharmacy Class in T.C.D.

†*Pure* dilute nitric acid does not set free iodine.

* Pot. iodidi	gr. 72
Vin. colch.	m 72
Æth. ozonic (Robbins)	℥vi.
Syr. aurantii	℥vi.
Aquæ ad	℥vi.
M.	

Upon one occasion a yellow crystalline ppt. was formed; and upon another, the bottle burst with explosion.—(*Ph. J.*, [3], 12432.)

This reaction, then, may also be partly a heterogeneous one. Potassium chlorate is compatible with ferric salts.

(3) *Ferric salts and acetates.*

The mixture (Basham's mixture) becomes blood red,* from formation of ferric acetate. Therapeutically, quite admissible and harmless; as is likewise ferric meconate produced when Tinct. opii is combined with Tinct. ferri perchloridi.

Ferric chloride strikes a deep red with antipyrin, and violet purple with salicylates.

(4) *Formation of nitro- and nitroso-compounds.*

Resorcin with sp. æth. nit. = dark red.

The solution made from the subjoined formula turned a permanent dark red, and produced severe irritation upon the skin:—

℞	Hydrarg. perchlor.	gr. iv.
	Resorcin	3i.
	Spir. Chlorof.	aa 3ii.
	Spir. æth. nitr.	M.

Antipyrin with spir. ætheris nitr. = green.

This reaction (using $NaNO_2$) is given as a test for phenazone (antipyrin) in B.P. The incompatibility may be avoided by prescribing them in alkaline solution.

Sodium salicylate (or Bism. salicylate) with spir. æth. nitr. = red.

Bismuth subnitrate gives a red compound with salicylic acid or sodium salicylate. Acetanilide (antifebrin) *slowly* develops a yellow or red colour with sp. æth. nitr.

It is better to avoid any of these combinations, and nitrites should always be prescribed in as simple a form as possible.

(5) *Glycerin and borax.*

Borax is decomposed by polyhydric alcohols, *e.g.*, glycerin, glucose, and honey (mel boracis). In *aqueous* solution, borax reacts alkaline, but Glycerinum boracis reacts acid, and contains free boric acid, and therefore is incompatible with carbonates.

$$2C_3H_5(OH)_3 + Na_2B_4O_7 = 2C_3H_5BO_3 + 2NaBO_2 + 3H_2O.$$
$$C_3H_5BO_3 + 3H_2O = C_3H_5(OH)_3 + H_3BO_3 \text{ (boric acid).}$$

It will now be seen why glycerin of borax is compatible with cocaine hydrochloride, whereas aqueous solution of borax would precipitate the cocaine.

Borax forms a tenacious jelly with mucilage.

(To be continued.)

* According to Mendeléeff, *normal* ferric salts are colourless, or nearly so (*e.g.*, iron-alum, ferric oxalate, ferric phosphate), and the brown or yellow colour is really due to basic ferric salts.

BRITISH PHARMACOPŒIA, 1898.

INDIAN AND COLONIAL ADDENDUM.†

The British Pharmacopœia of 1898 is already largely an Imperial British Pharmacopœia; for medical and pharmaceutical authorities within the seventy areas of administration which comprise India and the British Colonies were invited to aid, and did aid, in the compilation of the book, and, it may be added, have very generally expressed their satisfaction at the manner in which their recommendations have been embodied in the volume.

But included in the recommendations were many locally important drugs for which local recognition only, within the respective areas of administration, was requested. To have delayed the publication of the Pharmacopœia until, by necessarily slow correspondence, full local information respecting those drugs could be obtained, and locally satisfactory pharmaceutical preparations of the drugs be devised, was obviously undesirable.

Immediately, however, after the issue of the Pharmacopœia in May, 1898, steps were taken to obtain trustworthy descriptions of the drugs in question, and these, with appropriate notes, were printed and laid before the Medical Council at its succeeding Session in November, 1898, in the form of a thirty-two page, wide-margin, quarto pamphlet, entitled "A Report on the proposed Indian and Colonial Addendum to the British Pharmacopœia of 1898." The Council ordered that copies of this "incomplete draft Addendum, freely open to additions, omissions, and alterations," be sent, either through the Indian and Colonial Offices by the continued kind permission of the Right Honourable the Secretaries, or, with the concurrence of those Secretaries, direct from the Medical Council, to medical and pharmaceutical authorities in India and the Colonies. Nearly nine hundred copies, or an average of twelve copies to each of the seventy areas of British administration, were thus distributed before the end of the succeeding February, 1899. Each copy was accompanied by a printed official explanatory covering letter from the Editor.

On abstract of the replies (fifty-three from the seventy areas) and the results of 250 quarto pages of letters from the Editor (transcripts of which have been laid before the Chairman of the Committee), with some intimation of what is still required before the Addendum can be completed, together form the present Editorial report.

† A report of progress, by the Editor—Dr. John Attfield, presented to the Pharmacopœia Committee of the General Medical Council on November 29, 1899

INDIA AND THE COLONIES.

Areas of Administration.

INDIA.—Ajmere-Merwara, The Andamans, Assam, Bengal, Berar, Bombay, British Baluchistan, Burma, The Central Provinces, Coorg, The Deccan and Madras, The North-West Provinces and Oudh, The Punjab. Total, fourteen or fifteen.

AFRICAN COLONIES.—Basutoland, Bechuanaland Protectorate, Cape of Good Hope or Cape Colony, Gambia, Gold Coast, Lagos, Natal, Saint Helena, Sierra Leone. Total, nine.

AUSTRALASIAN COLONIES.—British New Guinea, Fiji Islands, New South Wales, New Zealand, Queensland, South Australia, Tasmania, Victoria, Western Australia, Western Pacific. Total, ten.

EASTERN COLONIES.—Ceylon, Hong Kong, Labuan, Mauritius, Seychelles Islands, Straits Settlements. Total, six.

MEDITERRANEAN COLONIES.—Cyprus, Gibraltar, Malta. Total, three.

MISCELLANEOUS COLONIES.—Falkland Islands. One Administration.

NORTH AMERICAN COLONIES.—British Columbia, Manitoba, New Brunswick, North-west Territories, Nova Scotia, Ontario, Prince Edward Island, Quebec: forming the eight Provinces of Canada. Newfoundland. Total, nine.

WEST INDIAN COLONIES.—Bahama Islands, Barbados, Bermuda Islands, British Guiana, British Honduras, Jamaica and Turks and Caicos Islands, Leeward Islands (Antigua, Dominica, Montserrat, Saint Christopher and Nevis, Virgin Islands), Trinidad and Tobago, Windward Islands (Grenada, Saint Lucia, Saint Vincent). Total, eighteen.

Total British Dependencies in India and the Colonies, seventy, more or slightly less, according to combinations.

All correspondents and contributors have been reminded that the Medical Council desires to publish an Indian and Colonial Addendum as a part of the British Pharmacopœia of 1898, hence that only drugs which are already fairly well known can find a place in that Addendum; and that drugs of which little is known or the investigation of which cannot be completed soon, may possibly be included in the next Pharmacopœia or in an Appendix thereto, and that certainly reports respecting them will always be welcomed by the Council, but that publication of the Addendum cannot be much longer delayed for their insertion.

INDIA.

The interests of the provinces of India, in relation to the imperialisation of the British Pharmacopœia, were centred in a special Committee appointed by the Government of India in 1894. The Committee consisted of Surgeon-General R. Harvey, D.S.O.,

Officiating Inspector-General of Civil Hospitals, Bengal (President); the Medical Storekeeper, Calcutta; and the Senior Medical Officer, British Troops at Calcutta. These officers assembled in the capital of British India, themselves drew up two reports which furnished important contributions to the Pharmacopœia of 1898, and received from the Principal of the Madras Medical College a report in reply to a letter written by the Secretary of the Committee and laid before the Madras College Council, and which report included nearly all the drugs that now appear under "India" in the draft Addendum. With the issue of these reports the labours of the Committee came to an end, and the three reports were in due time transmitted through the Privy Council to the Medical Council.

The officers who, at the instance of the Madras College Council, drew up the third report just mentioned were Surgeon-Captain (now Surgeon-Major) F. J. Crawford, M.D., Professor of Materia Medica in the College, and R. Hollingsworth, Esq., Lecturer on Botany. With these authorities there is now (1899) associated Lieut.-Col. H. St. Clare Carruthers, the Government Medical Storekeeper, a highly-skilled enthusiast in all matters pertaining to the treatment of drugs and the production of efficient pharmaceutical preparations. Through the Surgeon-General with the Government of Madras, C. Sibthorpe, C.B., voluminous correspondence has passed between the Editor and Major Crawford, who, in a letter received at the Medical Council Office on November 5, 1899, says, in relation to the whole of the Indian drugs of the draft Addendum and their preparation: "I shall soon write to you further and perhaps be able to state when a final communication may be expected from us."

Surgeon-General C. Sibthorpe, C.B., also forwards a statement showing that *Picrorrhaza kurrson*, Royle, *Adhatoda vasica*, Nees, and *Alstonia scholaris*, R. Br.. are being investigated by an Indigenous Drugs Committee in Madras.

Some voluminous but unofficial correspondence has also passed between the Editor and Dr. George Watt, C.I.E., Secretary of the Indigenous Drugs Committee, Calcutta. The members of this Committee are, it is believed, framing a letter which will convey to the Medical Council their views on the general question, and probably will also forward documents showing the course they are adopting to secure much-needed chemical, physiological, and therapeutical investigation of Indian indigenous drugs. Such a Committee can obviously give valuable aid to the Medical Council in the early production of the first, as well as in the compilation of every future, Indian and Colonial Addendum to the British Pharmacopœia, and as Indian contributors to the text of future British Pharmacopœias.

Surgeon Major-General Bidie (Retd.) has contributed a long report, which is already in the hands of the Pharmacopœia Committee of the Medical Council. It includes notes on each of the Indian drugs of the draft Addendum, and also on *Thevetia neriifolia*, Juss., and *Ipomœa hederacea*, Jacq.

Mr. David Hooper, one of the authors of 'Pharmacographia Indica,' has been good enough, in response to editorial appeal, to contribute information on many of the Indian drugs of the draft Addendum.

Mr. David Kemp, long resident in India, has published pharmaceutical notes on eleven of the Indian drugs of the draft Addendum.

Dr. E. M. de Sousa, Member of the Council of the Burma branch of the British Medical Association, and writing also from what as a pharmacist of Rangoon he has observed of medical practice in Burma, considers that the Pharmacopœia of 1898 suffices for the requirements of the province.

AFRICAN COLONIES.

From Basutoland comes an official statement that "the British Pharmacopœia of 1898 suffices for the medical and pharmaceutical requirements of this territory."

From the Bechuanaland Protectorate no reply has been received.

From the Cape of Good Hope, or Cape Colony, come several official and unofficial communications. They show that while the British Pharmacopœia of 1898 suffices broadly for present needs, many South African plants have known medicinal value, and are being investigated, both locally and in England, with a view to probable inclusion in a future Pharmacopœia, either text or addendum. The Secretary of the Colonial Medical Council in Capetown, writing on August 9, 1899, by desire of the President, states "that the Council is extremely anxious to do all in its power to help the object, and the question is now engaging earnest attention." The Secretary of the Eastern Province Branch of the British Medical Association, writing from Grahamstown on June 26, 1899, makes a similar statement. The *South African Medical Journal* for April and for May, 1899, publishes several contributions on the subject, Dr. Hewat, of the Cape Medical Council, drawing attention to the following drugs as probably worthy of official recognition: *Monsonia ovata, Monœcia monodelphia, Matricaria glabrata, Garuleum bipinnatum,* and *Lastrea athamantica;* also *Mylabris bifaciata.*

The Natal Medical Council has taken the matter in hand, and, "as soon as the Council is in a position to report on the subject will do so." Sixty Zulu medicines have been sent from the Protectorate, through the Natal Administration, to England for investigation.

From neither Gambia, the Gold Coast, Lagos, or St. Helena has any reply been received.

The Colonial Surgeon of Sierra Leone considers that the value of the Addendum would be great, but that the West Coast of Africa affords neither chemical, pharmaceutical, nor medical opportunities for the investigation of the powerful, the mildly diaphoretic, or the other native drugs.

AUSTRALASIAN COLONIES.

The Australasian drugs of the draft Addendum were introduced under medical advice and responsibility, but with the concurrence of authorities in pharmacy. The *Chemist and Druggist of Australasia* has reprinted the text of the Queensland and Victorian sections and the chief prefatory paragraphs of the draft, has invited and received special contributions from experts (G. Watkins, E. C. Blake, H. G. Smith, R. T. Baker, J. H. Maiden, P. Bancroft) respecting the included drugs, and has gone to some trouble to ascertain how often those drugs and their preparations have been called for in the chief pharmacies of the Australasian colonies. The resulting details will be useful when the Addendum comes to be settled. But pharmaceutical data as to the frequency of use of a drug, valuable when the medical question is one of exclusion of an old drug, is obviously of less value when the question relates to the inclusion of a new drug, the introduction being a medical matter and necessarily antecedent to the general employment of the drug. An editorial note in the same journal includes two remarks which go to the root of the relations of the Australasian Colonies to the projected Addendum. "One of the most striking features of the practice of pharmacy in Australia is the very small variation from the practice of the Old Country. . . . *The climatic conditions do not differ very greatly from those of the Old Country.*" Another journal, *The Australasian Journal of Pharmacy*, also reprinted the paragraphs of the draft Addendum.

The authorities in British New Guinea have not yet replied.

The Chief Medical Officer of the Fiji Islands supports the inclusion of *arachis oil*, which has been used with satisfaction for the past ten years, in place of olive oil, at the Hospital and other Government institutions. He and his official medical colleagues also strongly recommend the insertion of the dried rhizome of *Piper methysticum*, the local "Yaqona" (yang-gona), or "Kava Root," or "Ava Root" (see *Pharmaceutical Journal*, 2nd Ser. Vol. IV., p. 85, 1862). Several dozens of cases of the abandonment of the alcoholic habit have taken place in this colony by the adoption of regular doses of the cold aqueous unfermented infusion. Twelve pounds of the dried rhizome have been received at the Medical Council's office.

In New South Wales the officers and members of the Eastern

Suburbs Medical Association of Sydney strongly support the proposed complete imperialisation, sooner or later, of the British Pharmacopœia, on the lines now being followed. The Pharmaceutical Society of New South Wales, acting on an official communication from the Health Department, as well as on the general invitation from the Medical Council, has appointed a committee to deal with the subject of the Addendum.

The New Zealand Branch of the British Medical Association, the Otago Pharmaceutical Association of New Zealand, and the New Zealand Pharmacy Board, have the draft Addendum before them.

In Queensland the Pharmacy Board has confirmed the previous medical and pharmaceutical action as now reflected in the draft Addendum, and has decided to supply such further descriptions as have been desired.

From South Australia comes an opinion from the Council of the South Australian Branch of the British Medical Association that the British Pharmacopœia of 1898 suffices for the medical and pharmaceutical requirements of the province. The Pharmacy Board of South Australia, replying through the Government Colonial Surgeon and the Colonial Office, consider that the materia medica of the British Pharmacopœia of 1898 fills all requirements.

The Council of the Pharmaceutical Society of Tasmania expresses the opinion that the British Pharmacopœia is sufficient for all purposes at present, "as we can adapt it to our climatic and other requirements," but cordially approves of the principle of an Indian and Colonial Addendum, and would contribute to any fund for defraying the costs of researches on colonial drugs having fairly good local reputation. The Court of Medical Examiners are not prepared to take further steps in the matter.

The "Victoria" drugs in the draft Addendum were recommended by the Victorian Branch of the British Medical Association in conjunction with the late Government Botanist, Baron von Mueller, the late Mr. J. Bosisto, C.M.G., and five representatives of the Pharmacy Board and the Pharmaceutical Society of Victoria. For the further consideration of the Addendum, representatives of the Medical Societies of Victoria and of the Melbourne Medical Association have been conjoined with representatives of the Pharmacy Board and the Pharmaceutical Society of Australasia, and have furnished the Premier with a report for transmission through the Colonial Office to the Medical Council. Replies to each of the queries raised in the draft Addendum have been forwarded. The inclusion of *Acaciæ Cortex* is supported and a description forwarded. *Aconitum napellus*, cultivated experimentally in Victoria, corresponds with that cultivated in Britain. The inclusion of *Duboisia* and *Duboisine* is proposed to be deferred, for the reasons mentioned in the draft Addendum. As to *Eucalyptus Suppositories*, *Syrup*, and *Tincture*, it is agreed that, like the official *Lozenge*, they be made with the official gum; but "this Committee would prefer to see the true 'red gum' (of *E. rostrata*) alone official." *Fennel* grown in Victoria does not differ from the official. As to *Kino eucalypti*, "this Committee entirely approves of the proposed use of 'Botany Bay Kino' in the Australasian parts of the Empire when it possesses the characters and responds to the tests of the official Kino." [*Grindelia robusta* was recommended by the Queensland authorities.—Ed.] A Committee of the Faculty of Medicine of the University of Melbourne concludes that besides *Duboisia* and *Fœniculi fructus*, the *Acaciæ cortex* and *Kino eucalypti* of the draft Addendum may be omitted.

The Medical Authorities in Western Australia have no suggestion to offer.

The many islands of the Western Pacific are administered by the High Commissioner of the Fiji Islands. See Fiji Islands.

EASTERN COLONIES.

From Ceylon comes a comprehensive report by Dr. Van Dort, strongly supported by the Principal Civil Medical Officer. Nearly every one of the drugs of the draft Addendum is reviewed, and the following statements are made:—"With few exceptions the drugs are well known in this island, are of great repute, and largely used in native practice. . . . European practitioners [in Ceylon] testify to their real value and to their fitness to supersede. . . . . the various official European drugs for which they have been proposed as equivalents. . . . Nearly all are indigenous." Dr. Van Dort says that many other indigenous drugs have reputation in Ceylon, but mentions only three as being known to and used by him, namely:—*Ipomea turpethum*, R.Br.; *Justicia adhatoda*, Linn., *vel Adhatoda vasica*, Nees [*vide Madras*, Ed.]; and the *Hygrophila spinosa*, T. And., *vel Asteracantha longifolia*. Dr. Van Dort and the Principal Civil Medical Officer were thereupon requested by the editor, writing from the Council's offices on June 1, 1899, to obtain details concerning the best pharmaceutical forms of these or other Sinhalese or Tamil drugs used by the Vederales, or native doctors, and to obtain any further general medical opinions from European practitioners that would be likely to be useful. A reply, dated November 9, 1899, and received in London on November 25, shows that a Sub-committee of the Ceylon Branch of the British Medical Association sent a private circular to the qualified medical practitioners in the island, requesting opinions on the above and other drugs, with the result that the recommendation to include the foregoing three drugs is confirmed. The President of the Branch, Dr. Allan Perry, who also is Principal Civil Medical Officer, sends a copy of the report by the Sub-Committee. Of this report two sentences may be quoted:—"Even if the native drugs of proved efficacy are never likely to supersede the official drugs of the British Pharmacopœia, the importance of being able to substitute the former for the latter in remote villages where European drugs are not always available, or in dispensary practice as a measure of economy, does not seem to have been recognised hitherto in its proper light." Again:—"Your Committee, fully impressed with the importance of a systematic and experimental study of native drugs, from a strictly medical as well as from a commercial point of view, beg to recommend that the subject be brought before the notice of the Ceylon Government by the Association, with a view to secure its assistance in carrying out a properly organised scheme for such study." The formation of a special central Research Committee is then recommended, with the object of aiding the Medical Council in producing, in due time, an Imperial British Pharmacopœia. The Report concludes with an acknowledgment of the services rendered by the pharmacists who had prepared fluid extracts and tinctures of the drugs for the Committee.

The suggestions from Hong Kong in 1894 having been embodied in the British Pharmacopœia of 1898, the hope is now expressed by the resident officers that the drugs of the draft Addendum will be made official, and that the requirements of the Colony will then be fully satisfied.

From Labuan, Mauritius, and the Seychelles Islands no communication has been received.

From the Straits Settlements comes the opinion of the Colonial Surgeon-in-Charge, Singapore, dated April 13, 1899, that the British Pharmacopœia of 1898 suffices for the requirements of the Colony. On October 17, 1899, the Principal Civil Medical Officer finds "the universal opinion to be that the British Pharmacopœia of 1898 suffices for the medical and pharmaceutical requirements of this Colony."

MEDITERRANEAN COLONIES.

The Cyprus authorities have no suggestion to offer.

The Surgeon of the Colonial Hospital in Gibraltar reports to the Governor that native remedies are derived from plants represented in the British Pharmacopœia of 1898, and that in any case the limited vegetation could not furnish a constant supply of the local remedies.

The Chief Government Medical Officer in Malta replying through the Governor, strongly recommends the inclusion in the Addendum of "*Cucurbitæ semina*, Melon pumpkin seeds," as an agreeable, safe, and certain tænifuge. He encloses a complete botanical de-

scription, and regards the seeds of this *Cucurbita maxima* as quite distinct from those of *C. pepo*. This remedy is extensively used in Malta in preference to kousso and male fern, both of which grow in the Colony, and to the pomegranate bark, and is more easily taken than either. The dose is four ounces of the cleaned and peeled fresh seeds pounded up to a creamy consistence by aid of a very little water gradually added. It is almost inviting to take, but a little flavouring or sugar may be included if desired. The remedy should be taken in the morning, fasting, the patient having had a small dose of castor oil the preceding evening. The seeds should in no case be more than a month old.

MISCELLANEOUS COLONIES.—No reply has been received from the Falkland Islands.

NORTH AMERICAN COLONIES.

The medical and pharmaceutical interests, in the Addendum, of the eight provinces of Canada are centred in an influential Committee sitting in Montreal. The Editor has corresponded with Drs. Adami, Bazin, Blackader, and Prof. Morrison, but the Committee includes presidents of various medical and pharmaceutical societies and associations, professors of pharmacology, therapeutics, chemistry, botany, and pharmacy, editors of journals, and other representative men. A draft report including some thirty or forty drugs and preparations has been circulated for comment throughout the Dominion, a copy being sent to the editor of the Addendum. This Report, together with voluminous "Suggestions" by Prof. Morrison, has been printed in the *Canadian Pharmaceutical Journal* for March, 1899, and reprinted in the British *Pharmaceutical Journal* for September 2, 1899, pages 230 to 233. An endeavour will be made to secure, without undue delay, harmony of treatment between the Canadian portion of the Addendum and the United States Pharmacopœia of 1900. On October 28 last the editor received from the Secretary of the Canadian Committee a letter stating that "very shortly we expect to send you a revised draft report." [The latter came to hand on December 1, 1899.—Ed.]

No official reply from Newfoundland has yet been received.

WEST INDIAN COLONIES.

The Governor of the Bahama Islands has brought the desires of the Medical Council before the Medical Authorities of the Colony, but no report has yet been made.

The Medical Authorities of Barbados have no suggestion to offer.

The Secretary of the Bermuda Branch of the British Medical Association reported to the Colonial Secretary of Bermuda that the respective papers should be brought before the Association, but no further communication has yet been received.

In British Guiana the Acting-Surgeon General, after consulting other medical authorities and the Chemists and Druggists' Association, is of opinion that the British Pharmacopœia of 1898 suffices for the medical and pharmaceutical requirements of the Colony.

In British Honduras "the British Pharmacopœia of 1898 suffices for all requirements so far as this colony is concerned."

From Jamaica, including Turks and Caicos Islands, valuable contributions to the British Pharmacopœia of 1898 were received and were incorporated. Presumably, therefore, no further addition is yet desired.

From the Leeward Islands, the Medical Officer of No. 2 District, Montserrat, states that several of the plants mentioned in the draft Addendum grow wild in the islands, and that he will welcome the official recognition of those drugs. The British Pharmacopœia will then meet all requirements. No direct replies have yet been received from Antigua, Dominica, Saint Christopher and Nevis, or the Virgin Islands.

The Governor of Trinidad and Tobago referred the draft Addendum to the Surgeon-General and to the Pharmaceutical Society of Trinidad. The Secretary of the Medical Board of Trinidad replies that the many popular local remedies scarcely deserve official recognition. There appear, however, to be some local drugs of considerable reputation, but they have not been even cursorily examined pharmacologically, and their investigation would take far too long for their possible inclusion in the forthcoming Addendum.

As regards the Windward Islands, the Administrator of Saint Lucia states that: "The Members of the Medical Staff are unanimous in the opinion that there are many plants growing in St. Lucia which possess valuable medicinal properties; but they do not make any general recommendation for the official recognition of any of them." The Colonial Surgeon points out that Gresbach's 'Flora of the British West Indian Islands,' and Duss's and Heckel's 'Flore Phanéragameque des Antilles Françaises,' deal fully with the subject.

Writing from St. Vincent, also for Grenada, the Colonial Surgeon reports to the Administrator that the British Pharmacopœia of 1898 suffices for the requirements of the Colony.

GENERAL CONCLUSION.

It will be seen that fifty-three of the seventy British Administrations of India and the Colonies have already communicated to the Medical Council their views respecting an Indian and Colonial Addendum to the British Pharmacopœia, and, so far, without exception, concur in supporting the broad principle of imperialisation of the great national book of medicines; while every one of the seven important classes of Colonies or Provinces which form the British Empire beyond the boundaries of the United Kingdom, heartily joins with England, Scotland, and Ireland in doing all that can be done from time to time to promote the ultimate production of an Imperial British Pharmacopœia.

JOHN ATTFIELD, F.R.S.,

Editor of the Pharmacopœia, and of the forthcoming Addendum, for the General Medical Council.

General Medical Council Office,
299, Oxford Street, London, England.

Extract from the Report of the Pharmacopœia Committee of the General Medical Council, received and adopted by the Council on December 5, 1899.

RESPECTING THE INDIAN AND COLONIAL ADDENDUM.

"Fifty-three of the seventy British Administrations of India and the Colonies have already communicated their views to the Medical Council. The Committee desire to express their cordial thanks to those who have thus contributed much valuable assistance, and to note with gratification that in many Colonies the British Pharmacopœia in its present form has completely satisfied all requirements."

PHARMACY IN THE ISLE OF MAN.

We have been favoured by the Manx Attorney-General with a copy of the Pharmacy Bill which has been prepared by him—by command of the Lieut.-Governor of the Isle of Man—and passed by the Manx Legislative Council, on November 23. The full text of the measure follows:—

THE PHARMACY BILL, 1900.

MEMORANDUM EXPLANTORY OF OBJECTS OF THE BILL.

This Bill deals with the sales of poisons and compounding the prescriptions of medical men. Persons selling poisons or compounding medical prescriptions are required to be qualified as pharmaceutical chemists or chemists and druggists. Persons recognised as pharmaceutical chemists (or chemists and druggists) are those qualified as such under the Pharmacy Act, 1868 (an Act of the Imperial Parliament), or under the Pharmacy Act (Ireland), 1875 (an Act of the Imperial Parliament), or any Act amending the same passed previous to the promulgation of this Act. Chemists and druggists are defined by the 5th section of the Bill, and include all persons registered as such under the provisions of the Pharmacy Act, 1868, and all persons who up to July 5th, 1899, have carried on in this Isle the business of a chemist and druggist by keeping open shop for the compounding of medical

prescriptions. Provisions are also made for the recognition of asistants under certain circumstances. Persons selling or keeping open shop for the sale of poisons or compounding medical prescriptions, or using any title or description implying the possession of a qualification to practise pharmacy, without being a pharmaceutical chemist or a chemist and druggist are made liable to a penalty not exceeding £10. Nothing in the Bill is to affect any legally qualified medical practitioner; or any member of the Royal College of Veterinary Surgeons of Great Britain as to dispensing medicines for animals under his care, or the dealing in patent medicines, or wholesale dealers. The Bill contains regulations to be observed in the sale of poisons, and provides that the Adulteration Acts, 1874 to 1895, shall extend to medicines.

Preamble.—Whereas it is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing, or compounding of poisons or medical prescriptions, and persons known as "chemists and druggists," should possess a competent practical knowledge of their business; and, to that end, that from and after the day herein named all persons not already engaged in such business should, before commencing such business, be duly qualified as herein provided:—

We, therefore, your Majesty's most dutiful and loyal subjects, the Lieutenant-Governor, Council, Deemsters, and Keys of the said Isle, do humbly beseech your Majesty that it may be enacted, and be it enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Lieutenant-Governor, Council, Deemsters, and Keys, in Tynwald assembled, and by the authority of the same, as follows (that is to say)—

1. **Short title.**—This Act may be cited as "The Pharmacy Act, 1900."

2. **Definitions.**—In this Act the following expressions have the meanings hereinafter respectively assigned to them (that is to say):—"Pharmaceutical chemist" means either—

(*a*) A duly registered pharmaceutical chemist within the meaning of the 31 and 32 Victoria, chapter 121 (being an Act of the Imperial Parliament, and hereinafter referred to as "The Pharmacy Act, 1868"); or

(*b*) A person registered as a pharmaceutical chemist under the provisions of the 38 and 39 Victoria, chapter 57 (being an Act of the Imperial Parliament applicable to Ireland only and hereinafter referred to as "The Pharmacy Act (Ireland), 1875"), or any Act amending the same passed previous to the promulgation of this Act.

"British Pharmacopœia" means the book so called published from time to time by "The General Council of Medical Education and Registration of the United Kingdom," in terms of section 54 of the 21 and 22 Victoria, chapter 90 (being an Act of the Imperial Parliament).

3. **Persons selling or compounding drugs and poisons, or assuming the title of "Chemist and Druggist," to be qualified.**—No person shall sell or keep open shop for retailing, dispensing, or compounding poisons or medical prescriptions, or assume, use, or exhibit, the name or title of "pharmaceutical chemist," "chemist and druggist," or "chemist," or "druggist," or "pharmacist," or "dispensing chemist or druggist," or any name, sign, title, description, or addition, implying the possesion of a qualification to practise pharmacy in this Isle, unless such person shall be a pharmaceutical chemist or a chemist and druggist within the meaning of this Act, and conform to such regulations as to the keeping, dispensing, and selling of such drugs and poisons as are hereinafter provided.

4. **Articles named in Schedule A to be deemed poisons within the meaning of this Act.**—The several articles named or described in the schedule A to this Act, and also any other articles which for the time being shall be deemed to be poisons within the meaning of the Pharmacy Act, 1868, shall be deemed to be poisons within the meaning of this Act.

5. **Chemists and druggists within meaning of this Act.**—"Chemists and druggists" within the meaning of this Act shall consist of all such persons as may be duly registered as such under the provisions of the Pharmacy Act, 1868, also of all persons who at any time before, and up to the 5th day of July, 1899, have carried on, in this Isle, the business of a chemist and druggist, in the keeping of open shop for the compounding of the prescriptions of duly qualified medical practitioners, and also until the 31st day of December, 1901, of all persons who, for the period of one year immediately preceding the said 5th day of July, 1899, have within this Island, and for the period of nine years prior to the beginning of such year have, within this Island, or in any part of the United Kingdom, been continuously engaged as assistant to any person carrying on the business of a chemist and druggist in the keeping of open shop for the compounding of the prescriptions of duly qualified medical practitioners, and from and after the said 31st day of December, 1901, of all such last mentioned persons who shall have obtained from the Master, Wardens, and Society of the Arts and Mystery of Apothecaries of the City of London a certificate of his qualification to act as assistant to an apothecary under the provisions of 55 George III., chapter 194, being an Act of the Imperial Parliament.

6. **Protection of titles, and restrictions on sale of poisons.**—Any person or persons who shall sell or keep an open shop for the retailing, dispensing, or compounding poisons or medical prescriptions, or who shall take, use, or exhibit the name or title of "chemist and druggist," or "chemist," or "druggist," or any name, sign, title, description, or addition, implying the possession of a qualification to practise pharmacy not being a pharmaceutical chemist, or chemist and druggist, or who shall take, use, or exhibit the name or title of "pharmaceutical chemist," "pharmaceutist," or "pharmacist," not being a pharmaceutical chemist, or shall fail to conform with any regulation as to the keeping or selling of poisons made in pursuance of this Act, or who shall compound any medicines of the British Pharmacopœia, except according to the formularies of the said Pharmacopœia, shall for every such offence be liable to pay a penalty not exceeding ten pounds.

7. **Reserving rights of certain persons.**—Nothing hereinbefore contained shall affect any legally qualified medical practitioner who, in order to obtain his diploma for registration within the meaning of the Medical Act, 1899, shall have passed an examination in pharmacy; or prevent any person who is a member of the Royal College of Veterinary Surgeons of Great Britain from dispensing medicines for animals under his care, or extend to, or interfere with, the making or dealing in patent medicines, or with the business of wholesale dealers in supplying poisons in the ordinary course of wholesale dealing; and upon the decease of any pharmaceutical chemist or chemist and druggist actually in business at the time of his death, it shall be lawful for any executor, administrator, or trustee of the estate of such deceased to continue such business, if and so long only as such business shall be *bonâ fide* conducted by a duly qualified assistant, and a duly qualified assistant within the meaning of this clause shall be a pharmaceutical chemist or a chemist and druggist within the meaning of this Act. Provided always that registration within the meaning of this Act shall not entitle any person so registered to practise medicine or surgery, or any branch of medicine or surgery

8. **Regulations to be observed in the sale of poisons.**—It shall be unlawful to sell any poison, either by wholesale or by retail, unless the box, bottle, vessel, wrapper, or cover in which such poison is contained be distinctly labelled with the name of the article and the word "poison," and with the name and address of the seller of the poison; and it shall be unlawful to sell any poison of those which are named in the first part of Shedule A to this Act, or may hereafter be added thereto in terms of section four of this Act, to any person unknown to the seller, unless introduced by some person known to the seller; and on every sale of any such article the seller shall, before delivery, make or cause to be made an entry in a book to be kept for that purpose, stating, in the form set forth in Schedule B to this Act, the date of the sale, the name and address of the purchaser, the name and quantity of the article sold, and the purpose for which it is stated by the purchaser to be required, to which entry the signature of the purchaser and of the person, if any, who introduced him shall be affixed; and any person selling poison otherwise than is herein provided shall, upon a summary conviction before a high-bailiff or two justices of the peace, be liable to a penalty not exceeding five pounds for the first offence, and to a penalty not exceeding ten pounds for the second or any subsequent offence; and for the purposes of this section the person on whose behalf any sale is made by any apprentice or servant shall be deemed to be the seller; but the provisions in this section which are solely applicable to poisons named in the first part of the Schedule A to this Act, or which require that the label shall contain the name and address of the seller, shall not apply to sales by wholesale to retail dealers in the ordinary course of wholesale dealing, nor shall any of the provisions of this section apply to any medicine supplied by a legally qualified medical practitioner to his patient, nor apply to any article when

forming part of the ingredients of any medicine dispensed by a person registered within the meaning of this Act, provided such medicine be labelled, in the manner aforesaid, with the name and address of the seller, and the ingredients thereof be entered, with the name of the persons to whom it is sold and to whom it is delivered, in a book to be kept by the seller for that purpose.

9. **Adulteration of food or drink to extend to medicines.**—The provisions of the Acts of Tynwald, intituled "The Adulteration Acts, 1874 to 1895," shall extend to all articles usually taken or sold as medicines, which shall for the purposes of such Adulteration Acts be considered articles of food or drink, and every adulteration of any such article shall be deemed an admixture injurious to health, and any person who sells any such article adulterated shall, unless the contrary be proved, be deemed to have knowledge of such adulteration.

10. **Application of penalties.**—All prosecutions for the recovery of fines or offences against this Act shall be at the suit of the inspector under the Adulteration Acts aforesaid, or of any chief constable, or inspector, or sergeant of police, and shall be proceeded with summarily before a high-bailiff or two justices of the peace; and all fines when recovered shall be paid to the Treasurer of the Isle of Man, to be carried to the general revenue thereof.

11. **Copy of "The Registers of Pharmaceutical Chemists and Chemists and Druggists," etc., to be evidence.**—A printed copy, purporting to be a copy of 'The Registers of Pharmaceutical Chemists and Chemists and Druggists' for the time being, and purporting to be printed and published in accordance with the provisions of the Pharmacy Act, 1868, or any certificate purporting to be under the hand of the Registrar for the purposes of the said Act, and to be countersigned by the President or two members of the Pharmaceutical Society of Great Britain, shall be evidence in all legal proceedings and before all persons that the persons therein specified as registered are registered under the provisions of the Pharmacy Act, 1868, and the absence of the name of any person from such printed copy shall be evidence, until the contrary be made to appear, that such person is not registered according to the provisions of such Act.

12. **Copy of 'Register of Pharmaceutical Chemists for Ireland' or 'Register of Chemists and Druggists in Ireland,' etc., to be evidence.**—A printed copy purporting to be a copy of the 'Register of Pharmaceutical Chemists for Ireland,' for the time being and purporting to be printed and published in accordance with the Pharmacy Act (Ireland), 1875, or any Act amending the same passed before the promulgation of this Act, or any document purporting to be extract therefrom, or from the original registers certified under the hand of the Registrar appointed under and by virtue of the said Act, and to be countersigned by the president or two members of the council of the Pharmaceutical Society of Ireland, shall be evidence in all legal proceedings and before all persons that the persons therein specified as registered are registered according to the provisions of the said Act, and the absence of the name of any person from any such copy shall be evidence, until the contrary shall be made to appear, that such person is not registered in such register according to the provisions of the said Act.

13. **Copy of 'British Pharmacopœia' to be evidence in legal proceedings.**—A printed copy purporting to be a copy of 'The British Pharmacopœia' for the time being, and to be published under the direction of the General Council of Medical Education and Registration of the United Kingdom shall be evidence in all legal proceedings, and before all persons without further proof, and shall be deemed, until the contrary shall be made to appear, to be a true and correct copy of the 'British Pharmacopœia.'

14. **"Registers of Pharmaceutical Chemists, etc.," to be deposited in Rolls Offices.**—The Treasurer of this Island shall, as soon as possible after the publication thereof in each year, purchase out of the funds of the general revenue of this Island, a copy of the last published edition of 'The Registers of Pharmaceutical Chemists and Chemists and Druggists' (published under the provisions of the Pharmacy Act, 1868), of 'The Register of Pharmaceutical Chemists for Ireland (published under the provisions of the Pharmacy Act (Ireland), 1875), and of the 'British Pharmacopœia,' and shall deposit such copies in the Rolls Office; and the copies so deposited shall be open to inspection by the public, upon payment of the fee of one shilling, upon all days and during all hours upon and during which the Rolls Office is open for the transaction of public business.

SCHEDULES.

SCHEDULE A.—PART I. (SECTION 8.)

Arsenic, and its preparations.
Aconite, and its preparations.
All poisonous vegetable alkaloids, and their salts.
Atropine, and its preparations.
Cantharides.
Corrosive Sublimate.
Cyanide of Potassium, and all metallic cyanides and their preparations.
Emetic Tartar.
Ergot of Rye, and its preparations.
Prussic Acid, and its preparations.
Savin, and its oil.
Strychnine, and its preparations.
Vermin Killers, if preparations of poisons the preparations of which are in Part I. of this schedule.

PART II.

Essential Oil of Almonds, unless deprived of its prussic acid.
Belladonna, and its preparations.
Cantharides, tincture and all vesicating liquid preparations of.
Chloroform.
Chloral Hydrate, and its preparations.
Corrosive Sublimate, preparations of.
Morphine, preparations of.
Nux Vomica, and its preparations.
Opium, and its preparations, and preparations of poppies.
Oxalic Acid.
Precipitate, Red (red oxide of mercury).
Precipitate, White (ammonated mercury).
Vermin Killers, compounds containing "poisons" prepared for the destruction of vermin, if not subject to the provisions of Part I. of this schedule are in Part II.

SCHEDULE B.

Date.	Name and Address of Purchaser.	Name and Quantity of Poison Sold.	Purpose for which it is required.	Signature of Purchaser.	Signature of Person introducing Purchaser.

PHOTOGRAPHIC NOTES.

TONING AND FIXING BATH COMBINED.—Burton states that during a period of twelve years in Japan he has used Aristo paper; and not a single copy has become yellow or bleached. He does not wash the print before toning, and uses the bath once only. The bath contains no lead, but is rich in gold, and therefore dear. The following formula gives sufficient solution for a sheet of paper, 45 × 55 Cm.:—Sodium thiosulphate, 60; borax, 5; gold chloride, 0·15; water, 250; calcium carbonate, 2 Gm. The carbonate remains undissolved and prevents the bath becoming acid; filtering is unnecessary. In about ten minutes the copies have a beautiful brown tone, when they must be well washed.—*Brit. Journ. of Photography.*

PLATINUM TONING OF ARISTO AND CELLOIDIN PAPER.—Gilson advocates the use of the following method for toning Aristo paper. Solution A. Chrome alum, 10; sodium chloride, 40; water, 1,000. For toning, take solution A, 50; potassium platinous chloride, 1; water, 950. A reddish brown to black tone is obtained; the print is immersed without washing, and if a number of prints are toned at one time, they must be kept in motion. When the desired tone is obtained the print is immersed in a bath of water containing a little ammonia or soda, and the fixing bath to which the print is brought should also have a trace of alkali added. It is advisable to heat the platinum bath to about 20° C.—*Amateur. Photograph.*, **13**, 142.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, DECEMBER 6, 1899.

Present :—

Mr. WM. MARTINDALE, President.

Mr. G. T. W. NEWSHOLME, Vice-President.

Messrs. Allen, Atkins, Bateson, Carteighe, Corder, Cross, Glyn-Jones, Harrington, Harrison, Hills, Johnston, Park, Savory, Southall, Storrar, Symes, Warren, and Young.

The minutes of the last meeting were read and confirmed.

Pharmacy Legislation.

Dr. SYMES, having referred to the fact that the proposed Companies Bill would affect Ireland equally with Great Britain, asked if it would not be desirable to seek the co-operation of the Council of the Pharmaceutical Society of Ireland in any action which might be determined upon.

The PRESIDENT said most probably that would have to be done, but the Council was not in a position to do so at present.

The Late Mr. Thos. Hodsoll.

The PRESIDENT said he had to announce with great regret the death of Mr. Thos. Hodsoll, Islington, who for many years acted as Divisional Secretary for the Hoxton Division, and always took great interest in the affairs of the Society.

Appointment of Examiners.

The SECRETARY reported the receipt from the Privy Council Office of the usual letter approving the appointment of the Examiners for the ensuing year.

Superintendents of Written Examinations.

The following gentlemen were appointed superintendents and deputy superintendents of written examinations :—

Centre.	Superintendent.	Deputy.
Birmingham	Thompson, Charles	Jones, William
Brighton	Gwatkin, James R.	Savage, William W.
Bristol	Keen, Benjamin	Allen, Benjamin
Cambridge	Peck, Arthur	Coulson, Horace
Canterbury	Bing, Edwin	Bing, Charles
Cardiff	Munday, John	Coleman, Alfred
Carlisle	Hallaway, John	Pattinson, Michael H.
Carmarthen	Lloyd, Walter	Phillips, George
Carnarvon	Jones, John	Davies, Robert
Cheltenham	Barron, Wm.	Palmer, Frank T.
Darlington	Robinson, Jas.	Hutchinson, Rev. E.
Douglas (I. M.)	Radcliffe, John C.	Young, John
Dundee	Kerr, Charles	Hardie, James M.
Edinburgh	Stephenson, John B.	Henry, Claude F.
Exeter	Lake, John Hinton	Milton, Thomas C.
Glasgow	Watson, David	Dunlop, Thomas
Guernsey	Nickolls, J. Bate	De La Rue, F. H.
Hull	Bell, Charles B.	Stoakes, Benj. M.
Inverness	Ogston, William	Bethune, W. J.
Jersey	Cole, George	Baker, John T.
Kirkwall	Stewart, Duncan	Webster, Rev. D.
Lancaster	Vince, James	Arkle, William
Leeds	Reynolds, Richard	Branson, F. W.
Lincoln	Birkbeck, John T.	Elmitt, George
Liverpool	Smith, John	Buck, Anthony S.
London	Taylor, Geo. S.	Allen, Charles B. Moon, Harry
Manchester	Kemp, Harry	Swinn, Charles
Newcastle-on-T.	Clague, Thos. M.	Owen, Alfred E.
Northampton	Bingley, John	Mayger, W. D.
Norwich	Sutton, Francis	Corder, Octavius
Nottingham	Sergeant, F. Ross	Beverley, R. H.
Oxford	Prior, George T.	Thurland, Henry
Penzance	Symons, Netherton H.	Buckett, A. H.
Peterborough	Sturton, John Gilbert	Sturton, Frank Ainsworth
Plymouth	Hunt, Freeman W.	Woods, Wm. H.
Sheffield	Squire, George	Pater, Joseph B.
Shrewsbury	Cross, William G.	Blunt, Thomas P.
Southampton	Dawson, Oliver R.	Wilson, Harry
York	Sowray, Joseph	Saville, John

Elections.

The following persons, having tendered their subscriptions for the current year, were elected "members" of the Society :—

Fry, Samuel, Bishops Waltham.

Tod, James Arnold, Portobello.

Restorations to Register.

The names of the following persons, who have severally made the required declarations and paid a fine of one guinea, were restored to the Register of Chemists and Druggists :—

Joseph Waddington Graves, 48, Lower Eldon Street, York.

John Eddy Knight, 12, Rendezvous Street, Folkestone.

Finance Committee.

The report of this Committee, including the recommendation that certain accounts be paid, was read.

The PRESIDENT, in moving the adoption of the report and recommendations, said the Society was in rather a better financial position than this time last year.

The motion was unanimously adopted.

Benevolent Fund Collections.

The PRESIDENT announced that Mr. T. R. Williams, the representative of a wholesale house, had interested himself and his friends in the Benevolent Fund, and had sent the Secretary £4 1s. 6d., as the result of a sixpenny collection made in the metropolitan district north of the Thames. They were much obliged to Mr. Williams, and hoped his example would be followed by others possessing similar opportunities of coming into association with registered persons. Ten guineas had also been received from the Committee of the Junior Pharmacy Ball, and £12 had been collected by Mr. Stamp, of Hampstead. The election of annuitants was coming on, and it was very desirable that funds should come in.

Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £145 in the following cases :—

The widow (64) of a chemist and druggist, who has had four previous grants; a sufferer from chronic rheumatism. (London.)

A life member (65) and subscriber to the Fund for twenty-one years; forty-five years in business. (Ipswich.)

The widow (69) of a founder and subscriber, who died in 1898.

The widow (66) of a chemist and druggist who has had a grant for several years past. (Crewe.)

The widow (39) of a registered chemist and druggist who died in August, leaving three young children unprovided for. (Kettering.)

A chemist and druggist (66) who was formerly an associate and prizeman. Unable to obtain employment owing to failing sight. (London.)

A former associate and subscriber (58) who suffers from epilepsy. (Horncastle.)

The widow (65) of a chemist and druggist, who has had several previous grants. (Auchterarder.)

A former chemist and druggist and subscriber (75), who is now entirely dependent on his relatives. (London.)

A registered chemist and druggist (67), and former subscriber, who has had several previous grants, and who is only able to do occasional work. (Shirley.)

One case was deferred for further information, and one was not entertained.

The VICE-PRESIDENT, in moving the adoption of the report, remarked that the list was rather a long one on the present occasion. A certain sum had been given to one gentleman on the condition that his friends also came to his assistance, and he was glad to report that this assistance had been rendered, thus placing the gentleman in question in fairly comfortable circumstances.

The report was unanimously received and adopted.

Library, Museum, School, and House Committee.

The report of this Committee stated that several donations to the Library and Museum had been received (see *P.J.*, November 11, p. 455), and the Committee had directed that the usual letters of thanks be sent to the respective donors. The Librarian had presented his usual report including the following particulars regarding attendance at the Library :—

Attendance.	Total.	Highest.	Lowest.	Average.
October	438	31	4	17

Circulation of Books.	Total.	Town.	Country.	Carriage Paid.
October	158	84	74	16s. 8½d.

The Committee recommended that the undermentioned books be purchased for the Library in London:—

Richter, Organic Chemistry, 3rd edition.
Thorpe, Quantitative Chemical Analysis, 12th edition.
Watson, Text-book of Physics, 1899.
United States Dispensatory, 18th edition.
Semmler, Tropische Agricultur.

The Curator's report had also been received and included the following particulars:—

Attendance.	Total.	Highest.	Lowest.	Average.
October	367	29	6	13

The report of the Committee also stated that the School staff had attended and reported. The sub-committee charged with the consideration of the modifications necessary after August, 1900, in the scholarships regulations, had submitted certain recommendations, which were adopted. It was recommended that the examinations for the Jacob Bell Scholarships and the Manchester Pharmaceutical Association Scholarships be held on the third Tuesday in June, in London, Edinburgh, and Manchester. The Committee did not see any sufficient grounds for acceding to an application which had been made to hold a first examination in Lerwick, having regard to the fact that examinations for leaving certificates under the Scotch Education Department are held all over Scotland. The consideration of the invitation to appoint representatives on a General Committee of the International Assembly in connection with the Paris Exposition of 1900, had been deferred for further information. A letter had been received from Dr. Ladenburg, announcing the receipt of the Hanbury medal.

The President moved the adoption of the report and recommendations, and that was at once agreed to.

Mr. Glyn-Jones asked whether the Committee had considered the suggestion he recently made, that members of the Council should be supplied with copies of the reports of committees. It was then pointed out that in many cases there would be a difficulty about it, as the Committees met just before the Council meeting, but he noticed that this Committee met on November 8.

The President pointed out that, in the report of this Committee last month, there was a paragraph pointing out why Mr. Glyn-Jones's suggestion was not practicable, and that report was adopted.

Additional Local Secretaries.

The following additional local secretaries were appointed:—

Aberdeen ..... Cruikshank, John
Dunfermline ..... Gilmour, David
Leigh (Lancashire) ..... Boardman, F. J.

The President said he wished to express the thanks of the Council to Mr. Strachan, who had been for many years the zealous local secretary for Aberdeen, for the very valuable assistance which he had rendered the Society while fulfilling that office.

Assistant Local Secretaries.

The following Assistant Local Secretaries were also appointed:—

Birmingham	North	Poole, Jeffrey
	Central	Jones, William
Dundee	Lochee	Russell, John W.
	Broughty Ferry	Park, William
Glasgow	North	Russell, James A.
		Riddell, James H.
	South	Dunlop, Thomas
Liverpool		Buck, Anthony S.
		Grace, Walter A.
		Walker, Francis
		Hudson, Thomas H.
		Thompson, C. J. S.
Nottingham	East	Rayson, J. T.
	West	Gill, W.
	Rushcliffe	Chambers, John W. P.

Correspondence.

The Secretary announced that an application had been received from Mr. L. N. J. B. Verdier, that his certificate from the Toulouse Academy (University of France) be accepted in lieu of the "First" examination. This application was referred to the Board of Examiners.

A letter had been received from M. Crinon, of the Association Générale des Pharmaciens de France, stating that the Ninth International Pharmaceutical Congress would be held in Paris.

Also a letter from M. Bocquillon Limousin, Treasurer of the Pelletier-Caventou Monument Fund, thanking the members of the Council for their subscription to the Fund.

Both letters were referred to the Law and Parliamentary Committee.

The Company Trading Problem.

The President said he had to report the receipt of a number of communications from local associations conveying resolutions on the subject of "company" trading. Memorials from several provincial districts had also been received on the same subject. The substance of nearly all those communications had already been made public, through the medium of the *Pharmaceutical Journal*, so that there was no occasion to read the actual documents received; but he thought the Council would like to obtain a general idea of the views expressed in them, and he had, therefore, had an epitome of the correspondence made, which he would ask the Secretary to read.

The Secretary then gave the following epitome of the correspondence:—

From Newcastle-on-Tyne.—The local Association, on November 8, passed a resolution expressing the conviction that the public interest required the personal qualification of responsible owner or owners of a pharmaceutical business. The meeting expressed a further opinion that *bonâ-fide* pharmacists should be able to conform to the foregoing principle without disadvantage to themselves.

From Dundee.—The Forfarshire and District Chemists' Association met on November 22 and passed three resolutions:—(*a*) Urging the insertion in the Companies Bill of a clause prohibiting the carrying on of a chemist's business by a company of unqualified persons; or, in the alternative, suggesting that the Society should block the Government Bill. (*b*) Suggesting that additions should now be made to the Poison Schedule. (*c*) Expressing the opinion that the Council should get dispensing in hospitals and doctors' surgeries put under the regulations of the Pharmacy Act.

From Burton-on-Trent.—A meeting of registered persons in the district was held on November 22, and arrived at the opinion that no company should be allowed to carry on the business of a chemist and druggist or use the titles. The meeting was also of opinion that chemists should be exempt from jury service.

From Leeds.—At a meeting of the Leeds Chemists' Association on November 23 a draft clause for insertion in the Companies Bill was adopted. The clause provides that no company shall carry on the business of a chemist and druggist or use titles unless its "controlling shareholders" are qualified.

From Preston.—At a meeting of the Chemists' Association, held on November 23, a resolution was passed in support of the recommendation of the Law and Parliamentary Committee, which was sent back by the Council on November 1 for reconsideration.

From Hanley.—The North Staffordshire Association met on November 23. Resolved that titles must be protected and selling of poisons by companies of unregistered persons stopped.

From Dover.—Conveying a resolution adopted by a special meeting of the local association expressing approval of the clause drafted by the Law and Parliamentary Committee.

From Grimsby.—Resolutions expressing the opinion that:—(*a*) Carbolic acid should be scheduled as a poison. (*b*) Doctors' dispensaries should be placed under the same poison regulations as chemists' shops.

From Bradford.—Resolution passed by the Bradford and District Chemists' Association on November 28 in favour of permitting the practice of pharmacy by companies if the directors or the managing-director be qualified, and each shop be under the direct control of a qualified assistant.

From Sheffield.—Resolution passed at an extraordinary meeting of the Sheffield Pharmaceutical and Chemical Society, held on November 29, expressing the opinion that it should be unlawful for companies to use titles, or to escape the liabilities imposed upon natural persons by Section 15 of the Pharmacy Act, 1868; and that no unregistered person should be permitted to exercise control in the retailing, dispensing, or compounding of poisons.

From Manchester.—A petition signed by 289 registered persons carrying on business in Manchester and the neighbourhood, urging the promotion of legislation to render it illegal for limited companies to use chemists' titles; and that any attempt to regulate company trading should be strenuously opposed. The petition is sent through the local secretary at Manchester, and the signatures have been obtained by the Manchester Pharmaceutical Association.

From Warrington.—A similar petition, signed by every chemist in business in Warrington.

From Linlithgow.—A petition, signed by all the chemists in the county, urging the Council to promote a clause for the purpose of protecting chemists' titles and prohibiting the keeping of "open shop" by companies of unregistered individuals.

From the Midland Pharmaceutical Association.—A resolution, passed on December 1, asking the Council to aim at the protection of titles, and the prohibition of practice by companies unless the business is under the sole control of qualified directors.

From the Leamington, Warwick, and Kenilworth Chemists' Association.—Demanding that the Council should secure:—(*a*) That in every sense the word "person" in the Pharmacy Act, 1868, should include "persons"; and (*b*) that the right of erasing from the Register the name of persons guilty of "covering" should be granted to the Society.

The Federation Suggestions.

The Secretary of the Federation of Local Pharmaceutical Associations had also sent a bundle of correspondence on the company question, as the result of the circular sent by the Federation on November 13 to all local associations. The correspondence had reached the Secretary too late for classification, but a rough analysis had been supplied by Mr. Cocks showing the trend of opinion throughout the country. Of the replies received, the voting was as follows:—(*a*) In favour of protecting both titles and practice, 50; (*b*) titles only, 11; (*c*) qualified directorate, 15; (*d*) qualified managing directorate, 3; (*e*) qualified manager, 4.

Mr. HILLS asked if there was any means of finding out whether the fifty bodies who had voted in favour of asking for protection both for titles and practice were in favour of the clause which was before the Council last month—*i.e.*, an absolute prohibition of all company trading in poisons, because he noticed that a certain proportion of the resolutions objected to companies, excepting those consisting of qualified persons?

The PRESIDENT said he did not know that the details asked for by Mr. Hills had yet been worked out, but he proposed to refer all these communications to the Law and Parliamentary Committee for consideration. That Committee had a very difficult task before it, and the views of the members of the pharmaceutical calling throughout Great Britain would afford valuable assistance, more especially when those views were the outcome of a careful and intelligent consideration of the question at issue. He was glad to find the local associations manifesting a praiseworthy interest in the important subject with which the Council had to deal, and that the manifestation had taken the practical form of sending to the Council the result of their discussions and their deliberations. But resolutions were sometimes easier to draft than to act upon, and he hoped he should not give rise to disappointment when he said that the Law and Parliamentary Committee was not at the present moment prepared to report on the matters referred to it. A certain course had been agreed to which it was not expedient to make public just now, but if any members of the Society should on that account be disposed to think that the Committee was desirous of shirking its difficulties, he might take that opportunity of stating most emphatically that there was not the slightest ground for any such suspicion. Speaking for himself, he should most certainly not concur in any course which would lead to a chronic condition of waiting. But, as his distinguished predecessor—Mr. Carteighe—had occasion to say sometimes, it was necessary to repose a certain amount of confidence in the Council, and it was not always desirable, from a political point of view, to let the world know what was going on in the committee-room. To adopt a military simile, the Law and Parliamentary Committee was now engaged in the very delicate work of conducting a "reconnaissance," and he thought he was only acting as a prudent general would in saying nothing as to the direction in which the operation was proceeding. He would, therefore, move that the communications received from various parts of Great Britain on the subject of company trading be referred to the Law and Parliamentary Committee.

Dr. SYMES said there were other matters referred to in some of those communications as well as company trading. For instance, it was suggested that the poison regulations existing in chemists' shops should be made compulsory in dispensaries.

The PRESIDENT said his intention was certainly to refer the whole of the communications to the Committee. He would add "etc." after the words "company trading" to make the matter clear.

The proposition was then agreed to unanimously.

Carbolic Acid.

Mr. STORRAR asked if any further communication had yet been received from the Privy Council on the carbolic acid question.

The PRESIDENT said not yet. He had been recently to the Privy Council Office, and was informed that the matter was still under consideration, the Privy Council being in communication with the Agricultural Department, which was going to report on what it considered to be necessary.

Mr. BATESON asked if more pressure could be brought to bear in the matter.

The PRESIDENT said it did seem peculiar that the Privy Council did not act more promptly, as fresh cases of poisoning by carbolic acid were constantly being reported in the Press.

General Purposes Committee.

The Council went into Committee to hear and discuss the part of the report of this Committee, which dealt only with legal business. On resuming, the report and recommendations were unanimously adopted, and special resolutions were passed authorising the Registrar to take proceedings against the persons named therein.

Suggested Alteration of Bye-Laws.

Mr. CARTEIGHE said the Council would remember that a month ago he suggested a minute dealing with the fees paid to examiners and kindred subjects. At that time he was under the impression that no alteration would be needed in the Bye-laws for some years, but on looking into the matter he found it would be necessary as soon as the altered conditions with regard to the Preliminary examination came into force, to repeal some of the ancient Bye-laws, and this would therefore have to be done in the course of next year. This would be a convenient time for making any changes which were desirable, and as it was a lengthy process, the Bye-laws having to be read three times by the Council and then submitted to a general meeting, it was well to begin in good time. There were certain Bye-laws to which their friends in the north took exception, which were made many years ago, and hardly suited the present conditions, and he personally should be very glad to look carefully into the matter and see if any improvement could be made. The object was not to get money out of candidates, but simply to keep things in order. He would therefore move that a sub-committee consisting of the President, Vice-President, Mr. Carteighe, and Mr. Hills, be appointed to consider and report to the General Purposes Committee what alterations are necessary or desirable in the Bye-laws.

The proposition was agreed to unanimously.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, DECEMBER 9, 1899.

THE COUNCIL MEETING.

Though the agenda for the meeting last Wednesday did not contain any mention of a report from the Law and Parliamentary Committee, there was a full attendance of members, Mr. Grose alone being absent, in consequence of sickness in his family. After the minutes of the previous meeting had been read and confirmed, Dr. Symes referred to the circumstance that the proposed Companies Act Amendment Bill would apply to Ireland as well as to Great Britain, and suggested that on that account the Pharmaceutical Society of Ireland might be invited to co-operate with the Council in any action that might be determined upon in regard to that Bill as it affects pharmacy. In reply the President said that most probably that would be done, but at present the Council was not in a position to do so.

Mention was made by the President of the recent death of Mr. Thomas Hodsol, of Islington, who had for many years acted as a divisional secretary and took great interest in the affairs of the Society.

The Secretary reported that the Privy Council has approved the appointment of examiners, made at the last meeting of Council.

Several appointments of superintendents and deputy superintendents of written examinations were made as stated at page .

The report and recommendations of the Finance Committee were adopted on the motion of the President, who remarked that the Society's financial position is rather better than it was last year.

The President announced that a sum of £4 1s. 6d. had been sent to the Benevolent Fund by Mr. T. R. Williams—who had collected small contributions in the Metropolitan district north of the Thames, while acting as the representative of a wholesale house, and thanks were expressed to him for the interest taken in the Fund;—also that another contribution of ten guineas has been received from the Committee of the Junior Pharmacy Ball, and that £12 has been collected by Mr. Stamp, of Hampstead.

On the recommendation of the Benevolent Fund Committee, ten grants, amounting to £145, were ordered to be paid. See page 560.

The report of the Library, etc., Committee, included recommendations as to modified regulations relating to the scholarship examinations that would be required after August, 1900, see page 561, and that there is no sufficient reason for holding a first examination at Lerwick; the consideration of an invitation to appoint representatives on a General Committee in connection with the Paris Exhibition of 1900 was deferred, and a letter had been received from Professor Ladenburg acknowledging receipt of the Hanbury Medal.

In reply to Mr. Glyn-Jones's inquiry whether his suggestion, that members of Council should be supplied with reports of the proceedings of committees, had been considered, the President said that the impracticability of carrying out that suggestion had been pointed out last month.

Several local secretaries and assistant local secretaries were appointed as stated at page 561, and the President expressed the thanks of the Council to Mr. Strachan for the valuable assistance he rendered during many years when he was local secretary for Aberdeen.

Among the correspondence was an application by Mr. Verdier that the certificate of the Toulouse Academy (University of France) should be accepted, in lieu of the first examination—from Mr. Crinon of the Association Générale des Pharmaciens de France, in reference to the Ninth International Congress proposed to be held in Paris next year—and a letter from Mr. Bocquillon Limousin, thanking the members of Council for subscriptions to the Pelletier-Coventou Fund.

The President then announced that a number of memorials and other communications relating to "company" trading had been received from local associations the substance of most of which has already been published and an epitome of the views expressed was read by the Secretary, see page 561, the result of which was that fifty associations were in favour of protecting both the title of chemist and druggist, and the right of qualified persons to practise. Eleven were in favour of protecting the title only; fifteen approved of a qualified directorate, three of a qualified managing director, and four of a qualified manager, showing a very considerable majority (fifty) in favour of fully maintaining the principle and provisions of the Pharmacy Act as compared with those (thirty-three) who are disposed, in some degree, to recognise "company pharmacy" as admissible.

In reply to Mr. Hills' inquiry whether the fifty associations in favour of protecting both titles and practice, supported the resolution that was before the Council last month, involving absolute prohibition of "company pharmacy" or whether they refer only to companies consisting of unqualified persons, the President said he did not know whether that point had been ascertained, but he wished all these communications to be referred to the Law and Parliamentary Committee for consideration, The President added that expression of the views of members of the pharmaceutical calling throughout the country would much assist the Committee in its difficult task, and expressed his approval of the practical form in which the results of their deliberations were being sent to the Council.

Though at present the Committee was not in a position to report upon the subject, he hoped that would not give rise to disappointment, and desired to take that opportunity of stating most emphatically that the Committee would not shirk, and that he would not concur in any course leading to a chronic state of waiting. But some confidence must be placed in the Council and in himself as acting like a prudent general. Dr. SYMES mentioned that the application of poison regulations in dispensaries and other matters were referred to in the communications as well as "company pharmacy," and the PRESIDENT replied that the whole of them would be considered.

In reply to Mr. STORRAR'S inquiry whether a further communication had been received from the Privy Council Office as to carbolic acid, the PRESIDENT said that he had been informed the matter was still under consideration, and that the Privy Council is communicating with the Agricultural Department, from which a report as to what was considered necessary might be expected.

In reply to Mr. BATESON'S inquiry whether pressure could not be brought to bear, the PRESIDENT said the hesitation of the Privy Council seemed peculiar in face of the circumstances that cases of poisoning by carbolic acid are so constantly occurring.

Mr. CARTEIGHE, referring to a former suggestion, said that at the time he was under the impression no alteration of the Bye-laws was necessary, but on looking into the matter he found that when the altered conditions in regard to the preliminary examination came into operation, some of the Bye-laws would have to be repealed. That would be a convenient opportunity for any desirable changes, and as there were certain Bye-laws made many years ago to which exception was taken by their friends in the North, as being scarcely adapted to present conditions, the matter might be carefully considered with a view to possible improvement. The object of the Society was not to get money out of candidates, but to keep order. He moved that the matter be considered by a sub-committee consisting of the PRESIDENT, VICE-PRESIDENT, Mr. CARTEIGHE, and Mr. HILLS, which would report to the General Purposes Committee, and a resolution was passed to that effect. After the legal report of the General Purposes Committee had been discussed, a resolution was passed authorising the Registrar to take proceedings in various cases.

PERSON AND PERSONS.

AMONG the misconceptions prevailing as to the Pharmacy Act, 1868, even with persons who might be expected to be better informed, is the supposition that the judicial difficulty experienced in 1880 as to the meaning of the Pharmacy Act was due to the singular form of the word "person" having been used in the Act instead of the plural form. That, however, is entirely a mistaken view, and if the word "persons" had been used in the Act the present position in regard to companies would not have been any different from what it is. The conclusion that a corporation or a company—which must for the purpose of limited liability consist of at least seven persons—is to be regarded as outside the provisions of the Pharmacy Act was not arrived at by the Law Lords because a company consists of more than one individual, but because a company or corporation is, from the legal point of view, an entity or ideal person. The reason for regarding such a person outside the Pharmacy Act was not that it consists of seven or more persons, but the fact that it is not a "person" that could conform to the requirement of being examined in order to be qualified or to satisfy any of the requirements of the Pharmacy Act in respect to the registration of persons who were carrying on the business of chemists and druggists before the passing of the Act in 1868. To the capacity of ordinary common sense, those circumstances have appeared to be sufficient proof that the Pharmacy Act was intended to apply to individuals, in the sense that individuals only are, or can be, capable of the qualification required by the Act for certain purposes, while that corporations, or companies, being as persons, incapable of that qualification are, therefore, subject to the prohibitory provisions of the Act because they are not qualified or qualifiable persons. The Law Lords on the contrary took the view that the word "person" in the Act is used in such a way that it does not "include" ideal persons, companies, or multiple individuals: consequently that such persons are free to do anything and everything that the Pharmacy Act prohibits an individual from doing. Lord Chief Justice COCKBURN was the only judge who decidedly objected to that view, as being contrary to a common-sense consideration of the intention and policy of the Pharmacy Act; but all the other judges who took a different view also admitted being under very great difficulty as to the view that should be taken, and they all agreed in declaring their inability to comprehend what really is the meaning of the Act. The essentially individual nature of the qualification required by the Pharmacy Act—in the case of persons selling poisons, or keeping open shop for that purpose, and for dispensing or compounding medicines containing poisons within the meaning of the Act—should have served to demonstrate that the object of the Act would be defeated if the word "person" was not made to apply to the legal entity constituted by the incorporation of several persons as a joint-stock or limited liability company. But the circumstances of the particular case to which the trial related were of a nature to divert attention from that consideration. The fact that the chemist's shop carried on by the company had been bodily bought up, together with its legally qualified keeper, as a going concern, contributed plausible support to the contention that, so far as the interests of the public were concerned, there was no difference between the business carried on by the company with the former legally qualified keeper of the shop, acting in the capacity of manager to the company, and that which had been carried on by the same person before the company acquired the business. But whatever plausibility there may appear to be in that argument, so far as the public interest is concerned, it has no kind of weight in answer to the claim that the privileges acquired by registered chemists through legally prescribed qualification, have also to be considered as a matter of justice.

ANNOTATIONS.

"Preparation" is a term which appears to have a strangely confusing effect upon the minds of those who are not familiar with its application in a pharmaceutical sense to the form in which a medicinal agent is made suitable for administration. In that sense a calomel pill is a preparation of calomel, and the calomel contained in the pill may form only a small fraction of its weight or bulk. That is the sense in which the term "preparation" is chiefly employed in the Poison Schedule of the Pharmacy Act. The only exception is in the case of vermin killers, some of which are with less propriety referred to as "preparations" of poisons in one or other part of the schedule. In both cases a "preparation" is little else than a mixture of a particular article with other materials chosen to suit the purpose to which it is to be applied, and just as a mixture of some strychnine with meal and fat, etc., suitably put together for killing rats, may be called a preparation of strychnine, so the mixture of nicotine, alcohol, and camphor, in question at the Mansion House last week, may be termed a preparation of nicotine, though it is not intended for medicinal use. Tobacco, however, is not a preparation of nicotine, though it contains nicotine. Neither is opium a preparation of morphine, both being natural products and not artificial mixtures: opium is a poison within the meaning of the Pharmacy Act, while tobacco is not. But a mixture of alcohol and camphor with 35 per cent. of nicotine, undoubtedly comes under the head of preparations that are poisons within the meaning of the Pharmacy Act, and the sale of such a mixture is a sale of nicotine, just as the sale of a soothing syrup containing morphine has been held to be a sale of morphine.

The Reports of Association and other meetings called to discuss the company pharmacy problem are this week more numerous than ever, and it has, therefore, been found necessary to curtail them within the barest limits. It may be as well to point out that on occasions like the present, when the object in view is simply to gauge the feelings of registered chemists, all that is necessary is to report the result of the various discussions. Any facts that can be quoted or arguments advanced in connection with the company pharmacy problem, have been quoted and advanced again and again during the past twenty years; it is vain, therefore, to occupy valuable space every week by printing speeches in which such repetitions occur. That is to say, unless good reason can be shown for so doing. No such reason presents itself in connection with any of the reports which have been abridged this week, and they have, therefore, been dealt with as briefly as possible. In this connection, also, it seems desirable to direct the attention of the responsible officers of associations to the fact that they are the proper persons to decide what portion of the associations' proceedings is most suitable for publication. Official reports of pharmaceutico-political matters are, in every way, more satisfactory than those prepared by non-technical reporters—the essential points stand out more clearly as a rule, the risk of error is much less, and there is not the same temptation to make the reports unduly long. Moreover, other things being equal, an editor is more likely to publish an official report of a meeting without condensing it, than a report by a professional reporter who may be interested in making the most of his opportunities. Secretaries of associations, therefore, are advised, as far as possible, to prepare their own reports of meetings for publication.

The Federation of Local Pharmaceutical Associations has scored heavily in connection with the attempt of its chairman and secretary to secure a consensus of pharmaceutical opinion, which should serve as a useful foundation upon which to base any proposals to influence legislation. There appear to be some fifty-seven local associations in existence at the present time and, of those, thirty-six (see page 568) have, so far, recorded their views. In addition, the registered chemists of thirty-five towns and districts, where associations do not exist, have also been induced to express definite opinions. Altogether, seventy-one towns and districts are thus represented and it is significant that, in every instance but two, there is agreement upon the point that the assumption and use of chemists' titles should be restricted to individuals registered under the Pharmacy Acts. The two exceptions are the Chester Chemists' Association and the chemists of Abingdon; neither of those bodies appears to have considered it necessary to express any opinion regarding the question of titles. Fifty-one towns and districts have declared against companies of unregistered persons being permitted to retail, dispense, or compound poisons. Of the twenty-eight which have expressed the opinion that the directors of any companies formed to carry on the business of a chemist and druggist should be registered individuals, eleven only agree to that course as an alternative to the prohibition of the dispensing and sale of scheduled poisons by companies of unqualified persons. That is to say, the chemists of only seventeen towns lack confidence in the justice of their cause and have voted absolutely for the recognition and regulation of companies. But even those seventeen are firm on the question of restricting the use of titles, and an important minority in each case would prefer to support the rest of the country in its policy of "no surrender." The reports of other meetings may shortly be expected and, before long, it will doubtless be possible to record the views of the chemists of Great Britain as a whole, on the subject of company pharmacy.

The Pharmaceutical Society's second evening meeting in London, for the present session, will be held at 17, Bloomsbury Square, W.C., on Tuesday next, the 12th inst., the President in the chair. A lecture will be delivered on this occasion by Professor J. Millar Thomson, F.R.S., one of the Society's Examiners, who will take as his subject "Some Relations of Water to Other Substances." The lecture will be illustrated by experiments, and the chair will be taken at eight o'clock precisely.

The Pharmacopœia Committee has reported to the General Medical Council that up to the present date, 28,500 copies of the British Pharmacopœia of 1898 have been printed, and of those 27,613 copies have been disposed of; it has therefore become necessary for a further issue of 3,000 copies to be authorised. The Committee notes with satisfaction that the expenses incurred in the preparation of the Pharmacopœia have been more than met. A Conference has been held between the members of the Sub-Committee and the representatives of the Pharmaceutical Societies of Great Britain and Ireland, and on the recommendation of the Joint Committee a number of debatable points have been referred to experts for further investigation and report. With the view to the more speedy production of the Indian and Colonial Addendum, the Pharmacopœia Committee has deemed it advisable to discontinue for the present the preparation of the annual reports on the progress of pharmacy. A detailed Report on the Indian and Colonial Addendum has been presented by the Editor, Dr. John Attfield, and is printed at page 554 *et eq.* Fifty-three of the seventy British Administrations of India and the Colonies have already communicated their views to the Medical Council. The Committee expresses cordial thanks to those who have thus contributed much valuable assistance, and notes with gratification that in many Colonies the British Pharmacopœia in its present form has completely satisfied all requirements.

"OBSERVER'S" QUOTATION from Lord Selborne's judgment is quite correct so far as it goes; but it does not sustain his assertions, although detached from its context. Our correspondent overlooks the fact that the opinion it conveys was formed by Lord Selborne only as a means of escape from a difficulty which his Lordship recognised as a serious one. Our correspondent also overlooks the fact that this opinion was arrived at by Lord Selborne mainly from the consideration that there is in the Act a provision for a special case in which unqualified individuals might carry on the business of a deceased chemist and druggist. He also overlooks the fact that Lord Selborne was under the impression that there is no difference between such conduct of a business and the carrying on of a chemist's business by a company of unqualified persons. Lord Blackburn's dictum relating to the sharing of profits derived from vending poisons or poisonous drugs is not very sagacious, to say the least; neither is it in any way germane to the paramount question as to the necessity for a vendor of poisons being qualified; his Lordship's further dictum as to nobody else than a qualified person intermeddling with that trade (as he calls it) is contrary to the manifest intention of the Act that nobody but a qualified person should sell poison, while the conclusion that there is not anything in the context or in the object of the Act to show that the word "person" should apply to a "person" constituted of several unqualified individuals, is manifestly opposed to the purport of the provision that it shall be unlawful for "any person" to sell poison, etc., unless qualified within the meaning of the Act. The present contention is that the judge-made law, which now operates as a legal precedent exempting a company of unqualified persons from the provisions of the Pharmacy Act, is founded upon error, though it is binding as a legal precedent, and therefore requires to be reversed for both reasons. The question as to whether the Act contains the principle of qualified ownership, and the question as to whether the object or policy of the Act requires that it should, were neither of them decided by the House of Lords' judgment, which went no further than to declare that it was "impossible to infer" that a larger construction should be put upon the word "person": moreover that decision applies to the circumstances of the particular case before the court and only so far as the general question at issue was considered and understood.

THE "SETTLED LAW" as to "qualified ownership," referred to by "Observer" as being the outcome of the House of Lords decision, is that—notwithstanding the provisions of the Pharmacy Act—a company is a "person" that may keep open shop for retailing, dispensing, or compounding poisons. That such a foundation for procedure to remedy the evil registered chemists have so long suffered from, has not the necessary coherence with common sense to be relied upon, has been clearly perceived by the Lord Chancellor. Moreover, when it is considered that the recognition of a company, as a "person"—above the law—opens the door for any unqualified individual to evade the Pharmacy Act by means of the bogus or one-man application of company machinery, the continued endeavour, in some quarters, to justify the usurpation of registered chemists' privileges by "company pharmacy" appears to cohere with common sense as little as the idea of a company carrying on practice that requires individual qualification by examination.

THE EVILS OF THE ONE-MAN COMPANY SYSTEM were referred to in severe terms by Lord Russell, in summing up a case a few days ago. An undischarged bankrupt had constituted himself a company, and had thus been able to obtain large credit. Referring to the matter, Lord Russell said that for a man who was an undischarged bankrupt to be able to get together the necessary number of dummies and form a company under the protection of the law was a scandal, and how long such a scandal would be allowed to continue he did not know. If a man, being an undischarged bankrupt, obtained credit to the amount of twenty pounds without revealing that fact, he was guilty of an offence, and yet seven undischarged bankrupts could clothe themselves with an Act of Parliament and obtain credit, not merely for a few pounds, but for thousands, without committing an offence.

THE PREVENTION OF TUBERCULOSIS was the subject of a suggestive address by Sir Richard Thorne Thorne, chief medical officer of the Local Government Board, last week. He said that the difficulty of successfully dealing with the terrible scourge of consumption was intensified by the serious housing problem, which was presenting itself in our great cities. If people could only be made to realise that it was a necessity to health for them to live amid open surroundings, the death-rate from tuberculosis would steadily decrease. The millions which were yearly spent on the treatment of zymotic diseases would be far better employed in opening up the towns, and thus stamping out the causes of the evil which doctors could only relieve and modify. Another step which would appreciably lower the number of deaths from tubercular affections was the proper supervision of the growth and preparation of various articles of diet. Milk was one of the most dangerous of all foods, for probably some ninety per cent. of our milch cows were tubercular. In a herd of forty selected beasts belonging to the Queen, thirty-four were thus diseased. Such a state of things was most dangerous to the health of the community, for the bacilli were too minute to be readily detected, and passed with ease through the udder of the cow into the milk-pail, and thus into the human organism. Still another means of reform was to be found in a systematic drainage of the subsoil. If that were carried out, and the other matters to which he had referred were duly attended to, Sir Richard thought it would speedily be seen that consumption did not run in families, although it certainly did run in houses.

"PHARMACY MADE EASY" is the heading of a column in a New York paper, which dissects the claim of a "self-styled Brooklyn professor" to be able to fit pupils to pass the pharmaceutical examinations within three months. The legal requirements in New York State include four years' practical experience, but young men "anxious to ameliorate their present material and intellectual condition," though "so situated as to be unable to secure a higher education through the ordinary channels of public or private institutions of learning," are informed that they can be prepared for the position of licensed pharmacist in the short time mentioned. The "professor," as an inducement, states in his typewritten letters that there is hardly any trade or profession which offers to "an ambitious yet poor young man" a better opportunity than the profession of pharmacy "to reach a higher social plane." Judging from that statement, we must assume that pharmacy in New York promises to become what the clerical profession has been held to be in England—a short cut to gentility. But, to return to the main subject, the "ambitious yet poor young man" is told that he can be prepared for the position of licensed pharmacist, entitling him to a salary of twelve dollars to twenty-five dollars a week, without interfering with his present business position, and for a tuition fee of only fifty dollars, payable in instalments. The result, foreshadowed in glowing terms, is that youthful ambition is to be rewarded, within a few short years or even months, by the happy ownership of a prosperous drug-store, thus reaching "the goal of financial independence which so many are vainly striving to reach in other professions." The name of the "professor" does not appear on the list of graduates of the New York College of Pharmacy, and the President of the New York Board of Pharmacy characterises the whole affair as a "most impudent fraud."

THE SUBJECT OF UNQUALIFIED DISPENSERS came up for consideration at the meeting of the General Medical Council on Tuesday. Mr. Teale brought up a report from the Committee which had been appointed to deal with the matter, after the receipt of certain

communications relative to unqualified dispensers forwarded by the Privy Council. In that report it was stated that two bodies possessed a certain amount of authority in the examination and certification of dispensers—the Pharmaceutical Society and the Society of Apothecaries. Having carefully considered the whole matter, the Committee believed that the transition from the small amount of dispensing which a medical man could without difficulty perform himself, to the larger amount requiring the services of a special dispenser, was so gradual that it would be impossible to draw a line and say at what point a qualified person became indispensable. In those circumstances the Committee did not see its way to recommend any course to be taken by the Council at the present time in reference to this question, but it endorsed the reply sent by the Executive Committee to the Privy Council:—"That, while they fear that occasional accidents may arise from the employment by qualified medical practitioners of careless or incompetent dispensers, the cases, in their opinion, are very rare, and it appears to the Committee that probably the best protection is afforded to the public by the responsibility of the practitioner for the acts or defaults of the servants whom he employs." The report of the Committee was received and entered on the minutes, and as the complaint giving rise to the report came from the Privy Council and had formed the subject of several questions in Parliament, it was resolved to forward a copy to her Majesty's Government.

Pharmacy in the Isle of Man is to be placed in the same position as in Great Britain and Ireland, the Manx Legislative Council having passed a Pharmacy Bill, based on the British and Irish Pharmacy Acts, which recognises the right of all persons registered under those Acts to practise pharmacy in the island. The full text of the Bill—which has been kindly furnished to us by the Manx Attorney-General, Mr. G. A. Ring—is given at page 557 *et seq.* It is interesting to note that it is thought expedient for the safety of the Manx public that the compounding of medical prescriptions, as well as the retailing of poisons, should be restricted to duly qualified persons—*i.e.*, (1) pharmaceutical chemists or chemists and druggists registered under the provisions of the Pharmacy Acts of Great Britain or Ireland; (2) persons who have carried on the business of a chemist and druggist in the Isle of Man, prior to July 5 last; (3) persons who have been engaged as assistant to any person carrying on the business of a chemist and druggist for certain specified periods; and (4) persons who are qualified to act as assistant to an apothecary. It is not proposed to institute examinations or to establish a special Register of qualified persons for the island; carbolic acid is not included is the schedule of poisons; and nothing appears in the Bill which would have the effect of prohibiting corporate bodies from using pharmaceutical titles or carrying on the business of a chemist and druggist.

The Reply to Mr. Glyn-Jones contributed this week by Mr. Fielding (see p. 550) is brief, but will probably be convincing to all who are not disposed to accede to the proposition that the Pharmacy Acts should virtually be repealed in the interests of unqualified individuals who happen to possess control over a certain amount of capital. Mr. Fielding's position is that the Council of the Pharmaceutical Society—as representing all registered persons, as well as members of the Society—should insist upon the inability of companies to fulfil the professional duties of pharmacy and upon the necessity of prohibiting such bodies from dispensing or compounding medicines or from selling scheduled poisons. That is a consistent position to occupy, and Mr. Fielding is fully justified in protesting against the tendency to become inconsistent because absolute consistency is not always possible. The object of British pharmacists should be to remove as many as possible of the inconsistencies which pervade the law affecting their profession, not to seek to import more into it. If, therefore, our law-makers seem disposed to allow registration under the Companies Acts to continue to be a short cut to registration under the Pharmacy Acts, the sooner we revert to absolute consistency and ask for the repeal of the Pharmacy Act of 1868 the better.

BRITISH PHARMACEUTICAL CONFERENCE.

A general representative meeting of London pharmacists interested in the forthcoming meeting of the British Pharmaceutical Conference was held in the Council Room of the Pharmaceutical Society, 17, Bloomsbury Square, W.C., on Wednesday, December 6, at three o'clock. The President of the Pharmaceutical Society (Mr. W. Martindale) was voted to the chair.

The minutes of a previous preliminary meeting having been read by the Hon. Secretary (Mr. H. Cracknell), his colleague, Mr. W. Warren, read a number of communications from gentlemen unable to be present, and announced that the following had promised subscriptions to the Entertainment Fund.—Messrs. W. G. Allen, Elias Bremridge, H. Collier, A. W. Gerrard, W. Harvey, Idris and Co. Limited, T. H. W. Idris, F. H. Lescher, Theophilus Nicholls, R. A. Robinson, and C. Umney. He also mentioned that Mr. Idris, on behalf of his firm, offered the Conference facilities for viewing the firm's aërated water factory at Camden Town, providing refreshments, and also carriages to convey the members of the Conference to and from the works.

The Treasurer (Mr. J. H. Mathews) also announced that he had received promises of subscriptions amounting to about £30, but some of the items were included in the list mentioned by Mr. Warren.

The Chairman said the next business was to suggest the date of the Conference meeting, and he asked that it might be fixed so as not to clash with the July examinations and with the August Council meeting.

Several suggestions were made, and it was finally resolved, on the motion of Mr. M. Carteighe, seconded by Mr. E. N. Butt:—

That it be recommended to the Secretary of the Conference that the meeting should be arranged to take place as from July 24, 1900, the reception to be held on the previous evening, July 23.

A question was raised as to whether it had been decided to hold the Sessions of Conference in the Pharmaceutical Society's house.

The Chairman explained that it was so decided at Plymouth, when the Conference accepted the invitation to hold its next meeting in London.

Appointment of General Local Committee.

The following gentlemen were then appointed as the General Local Committee, with power to add to their number:—Messrs. C. B. Allen, W. C. Allen, Arkinstall, Leo Atkinson, Dr. J. Attfield, P. C. Baker, F. Bascombe, I. Bourdas, J. W. Bowen, Elias Bremridge, R. Bremridge, E. N. Butt, M. Carteighe, H. Collier, A. J. B. Cooper, H. Cracknell, A. W. Gerrard, W. S. Glyn-Jones, Goldby, Professor H. G. Greenish, W. Gulliver, C. Hanbury, A. W. Hanson, J. F. Harrington, W. Harvey, W. Hills, E. M. Holmes, D. L. Howard, M. Howell, J. Humphrey, J. C. Hyslop, T. H. W. Idris, G. Knight, F. H. Lescher, Peter MacEwan, W. Martindale, J. H. Mathews, J. E. Langford Moore, W. A. H. Naylor, Theo. Nicholls, R. H. Parker, A. J. Phillips, F. Ransom, R. A. Robinson, W. P. Robinson, G. S. Taylor, C. Umney, J. C. Umney, J. S. Ward, W. Warren, E. A. Webb, Edmund White, and A. Wigginton.

Mr. Carteighe moved that the President of the Pharmaceutical Society (Mr. W. Martindale) be elected Chairman of the General Committee. This was seconded and carried. Mr. F H. Harrington, President of the Western Chemists' Association, was elected Vice-Chairman.

The meeting then resolved itself into committee, and the following were appointed as the

Executive Committee:—

Messrs. R. Bremridge, M. Carteighe, H. Cracknell, J. F. Harrington, W. Martindale, J. H. Mathews, J. C. Umney, and W. Warren.

Mr. W. A. H. Naylor (Secretary of the Conference) pointed out that all gentlemen who wish to join the General Committee should become members of the Conference It was also pointed out that individual subscriptions to the Entertainment Fund are not actually limited to two guineas, but that smaller amounts would be welcomed.

THE COMPANY PHARMACY PROBLEM.

DURING the past two months the company pharmacy problem has been discussed by most of the local pharmaceutical associations throughout Great Britain and, through the agency of the Federation of Local Pharmaceutical Associations, meetings of chemists have also been called to discuss the matter in several towns where associations do not at present exist—Burton-on-Trent, Darwen, Motherwell, Norwich, Reading, Ripon, Rochdale, Rothesay, Shipley, Stalybridge, Weston-super-Mare. In other towns the local secretaries of the Pharmaceutical Society have ascertained the views of the local chemists by means of a personal canvass, or by letters addressed to each chemist individually.

Restriction of Titles to Individuals.

The following thirty-five associations are agreed with regard to the necessity of restricting the assumption and use of chemists' titles to individuals registered under the Pharmacy Acts :—

Birkenhead Pharmaceutical Association.
Bradford and District Chemists' Association.
Bristol Pharmaceutical Association.
Burnley and District Chemists' Association.
Bury Chemists' Association.
Cambridge Pharmaceutical Association.
Colchester Chemists' Association.
Derby and District Chemists' Association.
Dewsbury and District Chemists' Association.
Dover Chemists' Association.
Edinburgh District Chemists' Trade Association.
Falkirk and East Stirlingshire Chemists' Association.
Forfarshire and District Chemists' Association.
Great Yarmouth Chemists' Association.
Grimsby and District Chemists' and Druggists' Association.
Halifax and District Chemists' Association.
Inverness Chemists' Association.
Leamington, Warwick and Kenilworth Chemists' Association.
Lincoln Chemists' Association.
Manchester Pharmaceutical Association.
Midland Pharmaceutical Association.
Newcastle-on-Tyne and District Chemists' Association.
North-East Lancashire Chemists' Association.
North Staffordshire Chemists' and Druggists' Association.
Nottingham and Notts. Chemists' Association.
Plymouth, Devonport, Stonehouse and District Chemists' Association.
Preston Chemists' Association.
Scarborough Chemists' Association.
Sheffield Pharmaceutical and Chemical Society.
Spalding Chemists' Association.
Swansea and District Chemists' and Druggists' Association.
Tunbridge Wells and District Chemists' Association.
Wolverhampton Pharmaceutical Association.
Workington Chemists' and Druggists' Association.
Wrexham and District Chemists' Association.

The registered chemists of the following thirty-four towns and districts appear to be virtually agreed upon the same point :—

Belper.
Blackpool.
Bridlington Quay.
Burton-on-Trent.
Canterbury.
Carlisle.
Dartford.
Darwen.
Dudley.
Ely.
Galashiels.
Harwich.
Hertford.
Hitchin.
Ilkley.
Keith.
Kingston-on-Thames.
Lewes.
Lichfield.
Linlithgow County,
Motherwell.
Norwich.
Reading.
Ripon.
Rochdale.
Rothesay.
Salisbury.
Shipley.
Stalybridge.
Stockport.
Streatham.
Swindon.
Tewkesbury.
Weston-super-Mare.

Prohibition of Dispensing, etc., by Companies.

The following twenty-five associations have expressly declared that the retailing, dispensing, or compounding of scheduled poisons by companies of unregistered persons should be prohibited :—

Birkenhead.
Bristol.
Cambridge.
Dewsbury.
Dover.
Falkirk.
Forfarshire.
Grimsby.
Halifax.
Inverness.
Leamington.
Manchester.
Newcastle-on-Tyne.
North-East Lancashire.
North Staffordshire.
Nottingham.
Plymouth.
Preston.
Scarborough.
Sheffield.
Swansea.
Tunbridge Wells.
Wolverhampton.
Workington.
Wrexham.

The registered chemists of the following twenty-six towns and districts have expressed the same opinion :—

Blackpool.
Bridlington Quay.
Burton-on-Trent.
Canterbury.
Carlisle.
Darwen.
Dudley.
Ely.
Galashiels.
Harwich.
Hertford.
Keith.
Kingston-on-Thames.
Lewes.
Lichfield.
Linlithgow County.
Motherwell.
Reading.
Ripon.
Rochdale.
Rothesay.
Salisbury.
Stalybridge.
Streatham.
Swindon.
Tewkesbury.

The Cambridge, Dover, North-East Lancashire, Preston, and Swansea Chemists' Associations would prohibit the retailing, dispensing, or compounding of poisons by all companies, whether consisting of registered persons or not. So would the chemists of Darwen and Reading, whilst the North Staffordshire Chemists' and Druggists' Association and the Grimsby Association would entirely prohibit the practice of pharmacy by companies of unregistered persons.

Registered Persons as Directors and Managers.

The following twelve associations are of opinion that the directors or managers of any companies formed to carry on the business of a chemist and druggist should be registered persons. The associations indicated by an asterisk (*) have also given expression to the view that companies of unregistered persons should not be permitted to retail, dispense, or compound scheduled poisons :—

Bradford.
Burnley.
Chester.
Colchester.
Derby.
Edinburgh.
*Falkirk.
Great Yarmouth.
*Halifax.
Lincoln.
Midland.
Spalding.

The registered chemists of the following sixteen towns and districts have expressed the same opinions as the associations in the foregoing list. The asterisk has the same significance here as in the former case :—

Abingdon.
Belper.
*Canterbury.
Dartford.
*Dudley.
*Galashiels.
*Harwich.
Hitchin.
Ilkley.
*Lichfield.
Norwich.
*Rothesay.
Shipley.
*Stalybridge.
*Swindon.
*Tewkesbury.

The Bradford, Colchester, Derby, and Edinburgh Associations stipulate, in addition, that each shop should be in charge of a registered chemist, as also do the registered chemists of Dartford, Harwich, Ilkley, Norwich, Rothesay, Stalybridge, and Swindon.

Associations that have not yet Decided.

The following twenty-one Associations do not appear to have passed any resolutions on the subject recently:—

Aberdeen and North of Scotland Society of Chemists and Druggists.
Bolton Pharmaceutical Association.
Bournemouth and District Pharmaceutical Association.
Brighton Association of Pharmacy.
Dumfries and Maxwelltown Chemists' Association.
East Aberdeenshire Chemists' Association.
Exeter Association of Chemists' and Druggists.
Glasgow and West of Scotland Pharmaceutical Association.
Hastings and St. Leonards Chemists' Association.
Hull Chemists' Association.
Leeds Chemists' Association.
Leicester Chemists' Social Union.
Liverpool Chemists' Association.
Newport and Monmouthshire Chemists' Association.
Northwich Chemists' Association.
Oxford Chemists' Association.
Southampton Chemists' Association.
Streatham and District Chemists' Association.
Sunderland Chemists' Association.
Western Chemists' Association (of London).
Windsor and District Chemists' Association.

The results of some meetings, however, have not yet been received, and other meetings are yet to be held.

THE FEDERATION SUGGESTIONS.

It will be remembered that, about a month ago, a circular letter, containing certain suggestions for discussion, was sent—by the Executive Committee of the Federation of Local Pharmaceutical Associations—to all secretaries of local associations and to all local secretaries of the Pharmaceutical Society. The five suggestions, each of which had previously received some measure of support, were proposals:—

1. To protect chemists' titles and make it illegal for companies of unregistered persons to keep open shop for selling poisons as in the case of individuals.
2. To apply for protection of titles only.
3. That all the directors of a company shall be qualified.
4. That the managing director only need be qualified.
5. That a company shall be allowed to carry on the business with a qualified manager or assistant, who shall be registered for the purpose, and whose name shall appear in connection with the business.

Seventy-five replies have been received by the Hon. Secretary of the Federation, and sent on by him to the Council of the Pharmaceutical Society. According to Mr. Cocks' analysis of those replies, the chemists of fifty towns have voted for the first course, eleven for the second, fifteen for the third, three for the fourth, and four for the fifth. Seven meetings voted for the first and third courses, a proceeding which probably means that, in the opinion of those present, if companies of unregistered persons cannot be prevented from keeping open shop for the sale of poisons, they should at least be compelled to have registered chemists as directors. The chemists of one town, absurdly enough, express approval of the first, second, fourth, and fifth suggestions, and say they would also support the third if they thought there was any prospect of Parliament falling in with it. The replies received from the chemists of seven towns indicate that they did not arrive at any decision.

TUNBRIDGE WELLS AND DISTRICT CHEMISTS' ASSOCIATION.

At a meeting of this Association held on November 30, it was moved by Mr. A. NICHOLSON, seconded by Mr. OGLE, and carried *nem. con.*

That this meeting, in view of the fact that in 1868 Parliament deemed it necessary for the protection of the public health that chemists should pass a qualifying examination previous to registration, considers it most desirable in the public interest and in justice to qualified chemists, that the titles of chemists should be protected (as in the case of the legal, medical, and other professions), and that it should be made illegal for companies of unregistered persons to keep open shop for the selling of poisons and dispensing prescriptions; and that the above resolution be forwarded to the Council of the Pharmaceutical Society.

BURY CHEMISTS' ASSOCIATION.

At a meeting of this Association held on November 22, it was decided:—

That chemists' titles should be protected and that the Pharmaceutical Council be requested to use its best endeavours to get a clause to that effect inserted in the Companies Bill.

It was also the opinion of the meeting that "cash chemists," "drug stores," and similar titles should be covered by the clause.

CAMBRIDGE PHARMACEUTICAL ASSOCIATION.

A meeting of the above Association was held at the Bull Hotel, Cambridge, on December 1, Alderman DECK in the chair, for the purpose of discussing the company pharmacy problem. Mr. A. SIDNEY CAMPKIN, J.P., opened the discussion, and concluded his speech by moving a resolution urging:—

That chemists' titles should be protected, and that, as in the case of individuals, it be made illegal for companies of unregistered persons to keep open shop for the sale of poisons.

Mr. H. F. COOK seconded the proposition, which was agreed to, *nem. con.*

CHESTER CHEMISTS' ASSOCIATION.

At a meeting of this Association held on November 29, it was resolved:—

That in the opinion of this meeting no action will meet the requirements of the Pharmacy Act which does not provide that directors of companies shall be qualified chemists, as is required of individuals under Section 15.

DOVER CHEMISTS' ASSOCIATION.

On November 23, at the meeting of this Association, it was unanimously resolved, on the motion of Mr. W. J. BARNES, seconded by Mr. ED. THOMPSON:—

That the clause as drafted by the Law and Parliamentary Committee of the Pharmaceutical Society receives the approval and support of this meeting.

FALKIRK AND EAST STIRLINGSHIRE CHEMISTS' ASSOCIATION.

At a meeting of this Association, held on November 29, it was resolved:—

That chemists' titles should be protected, and that it should be made illegal for companies of unregistered persons to keep open shop for selling poisons.

In the event of the Legislature not agreeing to the foregoing view, it was considered that any company carrying on the business of a chemist and druggist should have on a directorate of seven not less than two qualified chemists, or a proportion of one-third qualified if the directorate was not made up of that number, and in all cases the managing director should be qualified by examination, and each business place be under the charge of a qualified manager.

GRIMSBY AND DISTRICT CHEMISTS' ASSOCIATION.

At a meeting of this Association it was resolved to support the first of the Federation's suggestions, viz.:—

To protect chemists' titles and make it illegal for companies of unregistered persons to keep open shop for selling poisons as in the case of individuals.

Many of the members were of opinion that not only should the selling of poisons be restricted to registered persons, but also all articles in the B.P.

INVERNESS CHEMISTS' ASSOCIATION.

At a special meeting of this Association, held on November 27, it was resolved, on the motion of Mr. MACLEOD, seconded by Mr. JUNOR:—

That, examination being the absolute condition of qualification or registration, companies must not use the title of pharmaceutical chemist or chemist and druggist, and must not dispense or retail scheduled poisons unless the individual members of such companies are qualified.

LEAMINGTON, WARWICK AND KENILWORTH CHEMISTS' ASSOCIATION.

A meeting of this Association was held on November 24, when Mr. J. T. BARRETT proposed, Mr. E. BLOOMFIELD seconded, and it was carried unanimously:—

That we demand of the Pharmaceutical Society that they shall ask of Parliament or the Lord Chancellor that in every sense under the Pharmacy Act, 1868, the word "person" should also read "persons," and that persons should be liable to the same law as a person.

It was also proposed by Mr. J. T. BARRETT, seconded by Mr. H. HULTON, and carried unanimously:—

That we propose that the Pharmaceutical Society should demand that the same rights be granted to it as have already been granted to the Medical Council, namely, the right to strike off the Register the name of any person who acts as a cover to an unqualified person or persons.

LINCOLN CHEMISTS' ASSOCIATION.

The members of this Association have passed the following resolution:—

That no company should be permitted to carry on the business of a chemist and druggist, or assume or use the title of pharmaceutical chemist, or pharmaceutist, or pharmacist, or chemist and druggist, or chemist or druggist, or dispensing chemist or druggist, or any other title implying registration under the Pharmacy Acts, unless all the directors and secretaries be qualified.

MEETING OF BURTON-ON-TRENT CHEMISTS.

The chemists of Burton-on-Trent have unanimously resolved:—

That no company should be allowed to carry on the business of a chemist and druggist, or assume or use the title pharmaceutical chemist, or pharmaceutist, or pharmacist, or chemist and druggist, or chemist, or druggist, or dispensing chemist or druggist, or other title implying registration under the Pharmacy Acts, unless each member of the company is so registered.

MEETING OF CHEMISTS AT NORWICH.

The chemists of Norwich assembled at the Royal Hotel in that city on Thursday, November 30, when Mr. FRANCIS SUTTON, borough analyst and local secretary to the Pharmaceutical Society, occupied the chair, and the subjects of trade defence and company pharmacy were discussed. Mr. W. Johnston was present on behalf of the Chemists' Defence Association, and went fully into the details of same. The rules, etc., were freely discussed by the chemists present, after which a resolution was passed, expressing approval of the Association, and recommending that it receive the support of the trade. A debate on the company pharmacy problem followed. The impression of the meeting seemed to be that, however desirable suppression of companies might be, there did not appear to be any probability that such a consummation could be attained. The following resolution was moved by Mr. GARDINER, seconded by Mr. BETTS, and passed unanimously:—

That this meeting of Norwich chemists is of opinion that the Council of the Pharmaceutical Society should make a recommendation to the Lord Chancellor to endeavour to amend the Limited Liability Company Act on the following lines:—

That no company of persons not registered under the Pharmacy Acts shall keep open shop for the sale of poisons unless such company shall be controlled by a director or directors registered under the Pharmacy Acts and holding a reasonable proportion of the shares in such company.

That no company unless controlled by a director or directors qualified as above shall use chemists' titles protected by the Pharmacy Acts.

That Limited Liability Companies authorised as above to keep open shop for the sale of poisons shall cause the name of the manager of each shop or place of business where poison is sold to prominently appear in or on such place of business or on the labels on all poisons sold.

MEETING OF DARWEN CHEMISTS.

At a meeting of registered chemists held at Darwen on November 30, it was unanimously resolved:—

That the clause for the Companies Bill submitted by the Law and Parliamentary Committee of the Pharmaceutical Society should be supported.

MEETING OF MOTHERWELL CHEMISTS.

At a meeting of registered chemists held at Motherwell on November 21, if was resolved:—

That chemists' titles should be protected, and it should be made illegal for companies of unregistered persons to keep open shop for the sale of poisons.

MEETING OF READING CHEMISTS.

At a meeting of registered chemists held at Reading, on November 22, it was resolved:—

That the Council of the Pharmaceutical Society should be recommended to adopt for insertion in the Companies Bill, the clause submitted to the Council by the Law and Parliamentary Committee.

MEETING OF RIPON CHEMISTS.

The chemists of Ripon have met and resolved:—

That chemists' titles should be protected, and that it should be made illegal for companies of unregistered persons to keep open shop for the sale of poisons.

MEETING OF ROTHESAY CHEMISTS.

The chemists of Rothesay have held a meeting and decided:—

That chemists' titles should be protected, and that it should be made illegal for companies of unregistered persons to keep open shop for the sale of poisons.

It was also agreed that if such companies are to continue to carry on business as chemists and druggists, the managing director, manager, or responsible assistant in each shop, should be a person registered under the Pharmacy Acts.

MEETING OF ROCHDALE CHEMISTS.

At a meeting of registered chemists, held at Rochdale on November 28, it was unanimously resolved:—

That a company or other corporate body should not be allowed to assume or use any title implying registration under the Pharmacy Acts of Great Britain or Ireland, and that any company or other corporate body contravening this enactment it should be liable, on summary conviction, to a fine not exceeding £5 for every day during which the contraventious happen, and that anything which would be an offence under Section 15 of the Pharmacy Act, 1868, or under Section 30 of the Pharmacy Act (Ireland), 1875, if committed by an individual, should be an offence if committed by a company or other corporate body, provided always that nothing should be done to prevent the formation of a company of persons registered under the Pharmacy Acts of Great Britain or Ireland, to retail, dispense, or compound poisons.

MEETING OF SHIPLEY CHEMISTS.

At a meeting of the registered chemists of Shipley on November 27, various suggestions for dealing with company pharmacy were considered. It was deemed esential that all companies should be under the control of duly qualified men, and that the following clause, or one of a similar purport, should be included in the Companies Bill:—

It shall be unlawful for any company to assume or use the title of pharmaceutical chemist, or pharmaceutist, or pharmacist, or chemist and druggist, or any other title which may imply registration under the Pharmacy Acts, unless the whole of the directors or other persons in whom is vested the control and management of the business of such company are duly registered under the Pharmacy Acts.

It was also resolved that for the purpose of effectually protecting chemists' titles it should be enacted:—

That the application of the title of "pharmacy" to any establishment should be deemed to imply that the proprietor is registered as a pharmaceutical chemist, and that the similar use of the title of "drug store" should be deemed to imply that the proprietor is registered as a chemist and druggist.

It was further thought the provisions of the Pharmacy Acts as to the sale of poisons should be more rigorously enforced, so as to ensure that all such sales should be made by or under the supervision of a registered chemist.

MEETING OF STALYBRIDGE CHEMISTS.

At a meeting of registered chemists, held at Stalybridge on November 23, it was resolved:—

That none but legally-qualified persons should be allowed to dispense prescriptions; sell, dispense, or compound poisons, or keep open shop for those purposes and use the title of pharmaceutical chemist or chemist and druggist in connection with that business.

In the event of companies of unregistered persons being permitted to continue to carry on the business of chemists, it was thought that the directors should be qualified persons, and that there should be a qualified manager for each shop. In addition it was thought that an attempt should be made to obtain better control of qualified persons, and that Section 16 of the Pharmacy Act, 1863, should be amended so that at least one executor or trustee of a deceased chemist's business should be a qualified chemist.

MEETING OF WESTON-SUPER-MARE CHEMISTS.

At a meeting of registered chemists held at Weston-super-Mare, on November 28, it was considered that the time has not arrived for the pharmaceutical community at large to propose any lines of action, and that it is wiser to wait until the Council of the Pharmaceutical Society has produced a new clause. At the same time it was thought that chemists' titles must be protected.

MIDLAND PHARMACEUTICAL ASSOCIATION.

A special meeting was held at the Great Western Hotel, Birmingham, on December 1, to discuss the company pharmacy problem. The chair was taken by the PRESIDENT (Mr. Jeffrey Poole). Amongst the letters of apology read was one from Mr. J. T. Cattell, who expressed the opinion that chemists should protest against the company business in every possible manner, both in public and behind the counter, with a view of getting their titles and qualifications more fully and generally acknowledged. Mr. J. Spilsbury wrote to the effect that unless chemists insisted on trading under their own names there would still be a loop-hole for evasion of the Act by encouraging covering. After a prolonged discussion, the CHAIRMAN proposed:—

That the Council be asked to draft a Clause providing that companies shall not use our titles, and shall only carry on the business of a chemist and druggist provided the business is under the sole control of qualified directors, whose names shall be conspicuously displayed in some prominent position in the pharmacy, and appear on all labels and other printed matter used in the business.

Mr. BARCLAY formally seconded the motion, which was opposed by Messrs. BARRETT and PERRY, but ultimately carried.

NORTH STAFFORDSHIRE CHEMISTS' AND DRUGGISTS' ASSOCIATION.

At a well-attended meeting of the above Association, held at Stoke-on-Trent, on Thursday, November 23, the following resolution was unanimously passed, after a long and animated discussion.

That in the opinion of this Association, Chemists' titles must be protected, and that it shall be illegal for companies of unregistered persons to keep open shop for selling, compounding, and dispensing poisons, as in the case of individuals.

At times there were strong divisions of opinion, but it was felt desirable to pass one unanimous resolution, with the result stated.

SCARBOROUGH CHEMISTS' ASSOCIATION.

At a meeting of this Association, held on November 27, Mr. H. Chapman moved, Mr. Cross seconded, and it was carried unanimously:—

That this Association urges the Pharmaceutical Society to use its influence in inserting in the Companies Bill (*a*) That the titles be protected, and (*b*) That it will be made illegal for any company of unqualified persons to use the title of chemist, or druggist, or to sell poisons.

SPALDING CHEMISTS' ASSOCIATION.

The members of this Association are of opinion :—

That chemists' titles should be protected, and all directors of companies carrying on the business of a chemist and druggist should be qualified under the Pharmacy Acts.

WORKINGTON CHEMISTS' AND DRUGGISTS' ASSOCIATION.

The chemists in business at Workington held a meeting on Friday evening, November 24, at which all the members of the trade in the town were present; it was unanimously decided to form an association to be called the "Workington Chemists' and Druggists' Association." Mr. Wm. Carruthers was elected President; Mr. J. Thompson, Vice-President; and Mr. J. R. Mason, Secretary and Treasurer. It was arranged that meetings for the discussion of matters affecting the trade be held at regular intervals. After some discussion, *re* the company pharmacy problem, a circular containing suggestions for proposed legislation thereon, received from the Secretary of the Federation of Local Pharmaceutical Associations, was read, and the suggestions therein considered. A resolution proposed by Mr. F. J. Birkett, and seconded by Mr. G. T. Archibald, to the following effect:—

That chemists' titles should be protected, and that it should be made illegal for companies of unregistered persons to keep open shop for selling poisons,

was unanimously agreed to.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of this Association was held on Thursday, November 30, at 73, Newman Street, London, W., the President (Mr. F. W. Gamble) in the chair, when a paper was read by Mr. H. Hymans on:—

The Occurrence of Sodium Sulphate in Nature,

which will be printed in next week's Journal.

Mr. Hymans had also on view a number of specimens of thènardite in large rhombic crystals, agglomerated into masses. Several of the specimens were quite colourless, while others were of a whitish translucence, with a faint bluish tint. Some of them were mingled with clayey soil, but the majority consisted of practically pure sodium sulphate.

The reading of the paper was followed by an interesting conversation *re* the natural mineral and chemical deposits of the world.

The President congratulated Mr. Hymans on having compiled so interesting a paper. He thought it was one that would reflect credit on the Association. He should like to know why such large deposits of sulphates accumulated in various places. It was certainly strange that any mineral or chemical could accumulate in any part of the globe in so great a state of purity as some of the specimens exhibited by Mr. Hymans.

A question was raised by Mr. Fothergill as to whether the blue coloration of the thènardite was caused by a trace of copper sulphate.

Mr. Hymans said that could not be so, as it did not contain any mineral.

The President suggested that it was due to some optical effect, and Mr. Hymans was inclined to agree with that view.

Various other points were discussed, and the conversation then drifted to the subject of spectacles and the different kinds of glass employed by opticians. Finally, a vote of thanks was accorded to Mr. Hymans, and the meeting adjourned.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

A meeting of this Association was held in the Chemical Theatre of Owens College on Wednesday, 6th inst. In the absence of the President (Mr. G. S. Woolley) through illness, Mr. Harry Kemp presided, and said that although the illness of the President was not serious, yet it was sufficient to keep him at home, and for the same reason they were also without the presence of their Secretary (Mr. Walton). Mr. Rymer Young was absent in London on Pharmaceutical Council business, and he wrote regretting he was unable to be present.—Professor Weiss, who lectured on "The Method in which Plants Protect Themselves," in his opening remarks welcomed the pharmacists present to Owens College. They wanted members of the Pharmaceutical Society to feel that they had a sort of home there, and he hoped they would feel more so as their members became recruited from their pharmacy classes at the college. He took it as an augury that they would by their presence appreciate his remarks, and he should always be pleased when opportunity offered to add to the interest of their meetings. Want of time had prevented his preparing a lecture of more particular interest to pharmacists; but he hoped to remedy this on a future occasion. The lecture took a popular form, the Professor commencing by throwing on the screen sections of diatoms, laminaria, cacti, etc. The pictures of the red sea-weeds were very beautiful, as also were those of higher plants, and the liability of the latter, under certain conditions, to the attacks of fungi, as also the manner in which they were protected from such attacks, were demonstrated.—A hearty vote of thanks was accorded to Professor Weiss for his interesting lecture, on the motion of the Chairman, who also informed the audience that no fewer than 289 chemists on the Register in the Manchester district had signed the petition on the subject of company pharmacy. He thought that this spoke well for the unanimity of the chemists of the district on this particular question.

PHARMACEUTICAL SOCIETY OF IRELAND.

At Dublin, on November 27, the usual fortnightly meeting for the discussion of scientific subjects was held at 67, Lower Mount Street, Mr. W. F. Wells in the chair. Amongst those present were Dr. J A. Walsh, Messrs. George Brown, H. O'Connor, J. Smith, D. M. Watson, J. T. Turner, W. V. Johnston (Hon. Secretary), etc. The minutes of the last meeting were read and confirmed. An apology for non-attendance was received from Mr. G. D. Beggs. The President it was stated was absent through indisposition. Some routine business having been transacted, the members proceeded to the consideration of "Dispensing Difficulties," and examined in detail a number of uncommon formulæ obtained from various sources Mr. Boardman, Inchicore, sent in two contributions, as follow:—

(1)	℞	Chlorodyni	ʒiss.
		Acidi Gallici	ʒiii.
		Tr. Kino	ʒii.
		Mist. Cretæ ad	ʒvi.
(2)		Liq. Carbonis Detergens Adepis .... aa	ʒss. M. ft. Ung.

and the President submitted for Mr. H. O'Connor three samples of a mixture, one of which was made up by himself, another by a different person, and the third by an English house. The preparations was as follows;—

℞	Uurotropin	ʒii.
	Liq. Strychniæ	♏ 36.
	Quin. Sulph.	Gr. xii.
	Acid. Sulph. Dil.	ʒii.
	Acid. Phosph. Dil.	ʒiss.
	Syr. Limonis	ʒss.
	Aqua ad	ʒvi.

Mr. Boardman's contribution was spoken to at considerable length. The prescription to which the President called attention was stated to have been written by a Dublin medical man. The patient got three bottles of the mixture; one from the President's pharmacy, one from another local house, and the third in England. In each case there was some peculiarity observable, but the solution was of the same strength, although the crystals were much heavier in one than in the other, probably due to its lying quiet in the shop.

Dr. Walsh referred to a difficult prescription which he had received, and in connection with which he had had to send to Ger-

many. He spoke of a doctor who prohibited the eating of salt meat by the patient after the latter had taken a dose of calomel.

Mr. O'CONNOR said that the chemists' responsibility ought to cease when the patient took the powder.

Several other members called attention to various dispensing difficulties encountered in daily practice. It was decided to invite Mr. Ray to give an expression of opinion in the matter.

Mr. WATSON was in favour of individual experiment, and thought that each member should send in a report on the matter spoken upon.

Mr. JOHNSTON concurred and said this was his idea all along.

Mr. WELLS said some years ago at the evening meetings the members were asked to hand in some questions and to bring them to the subsequent meetings when they could be fully discussed. He was glad to see that the idea had come up again.

Mr. TURNER showed an American prescription, and remarked that he had copied it out with the idea of ascertaining what should be charged for it.

Mr. JOHNSTON: Put it in the trade Press and we will find out. It all depends on the time the prescription would be handed in.

Dr. WALSH said the question was more suitable for the Dublin Branch of the Chemists' Federation to deal with. He thought the prescription would, under ordinary circumstances, take about two hours to make up.

Mr. JOHNSTON having given his experiences of an Enniskillen prescriber was followed by Mr. WELLS, who showed how a little forethought on his part in regard to a suspected mixture gained a new customer for him.

Mr. BROWN hoped there would be a further similar discussion, and it was resolved to take a note of the prescriptions referred to and to subject them to practical investigation and report the result at the next meeting. This concluded the business.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

The third meeting of the session was held in the Lecture Theatre, at 17, Bloomsbury Square, at 5.30 p.m., on Friday, the 24th ult., Mr. E. M. CHAPMAN in the chair.

The minutes of the previous meeting were read, and on the proposal of Mr. UPSHER-SMITH, seconded by Mr. FINNEMORE, were unanimously passed and confirmed.

Mr. Garsed's amendment to Rule V., that "at the commencement of each session the officers of the Association and six other members shall be elected to form an Executive Committee; of the six other members two shall be Major students and four Minor students," was read. This amendment was seconded by Mr. DEANE. Mr. UPSHER-SMITH opposed it, proposing that the rule should stand unaltered; he was seconded by Mr. FINNEMORE. On putting to the meeting eighteen voted for the amendment to Rule V. and ten against it. Mr. Garsed's motion was thus lost, there not being the two-thirds majority required to carry it.

The CHAIRMAN then called on Mr. Garsed to open the debate, "Is a Compulsory Curriculum Desirable in the Interests of Pharmacy?" Mr. GARSED spoke in the affirmative, urging, among other things, that the establishment of a compulsory curriculum would reduce the number of failures to pass the qualifying examination.

Mr. FINNEMORE opposed, speaking for the same length of time as Mr. Garsed—a quarter of an hour.

Messrs. Pollard, Upsher-Smith, Woolcock, Collinette, Hellyer, Lawson, Allen, Heslop, and Deane also spoke, being limited to five minutes each.

Mr. FINNEMORE and Mr. GARSED having replied, the CHAIRMAN put Mr. Finnemore's motion to the vote of the meeting: "Considering the present state of pharmacy, it is the opinion of this meeting of the School of Pharmacy Students' Association that a compulsory curriculum is undesirable." Eight voted in favour.

Mr. Garsed's motion was then voted on; twenty voted for it, and eight against. The resolution, that "in the opinion of this meeting of the School of Pharmacy Students' Association it is highly desirable, in the interests of pharmacy, to establish a compulsory curriculum of at least one year's duration," was accordingly declared carried.

A most successful meeting then terminated. There were thirty-two members present.

PROCEEDINGS UNDER THE PHARMACY ACT, 1868.

THE SALE OF POISONOUS FUMIGATORS.

Pharmaceutical Society v. Jacob Wrench and Sons, Limited.

On Thursday, November 30, three summonses taken out by the Pharmaceutical Society under Section 17 of the Pharmacy Act, 1868, against the respondents, Jacob Wrench and Sons, Limited, Seedsmen, of 39, King William Street, E.C., came before the Lord Mayor at the Mansion House. The first summons charged that the respondents had sold to Mr. Moon a certain poison, to wit, a poisonous vegetable alkaloid called nicotine, being a poison within the meaning of Schedule A, Part I., of the Pharmacy Act, contained in a bottle which was not distinctly labelled with the name of the article, the word "Poison," and the name and address of the sellers. The second summons was for selling the poison to Mr. Moon, he being unknown to the respondents, and not having been introduced to them by some person known to them. The third summons was for having sold the poison without having made an entry of the name of the purchaser in a book prescribed to be kept by the Act for that purpose.

Mr. Vaughan Williams appeared as counsel for the Society; Mr. Horace Avory appeared as counsel for the respondents.

It was agreed that the three summonses should be taken together.

Mr. Vaughan Williams, in opening the case, said that the Act by Section 15 constituted the Pharmaceutical Society the proper authorities to take the proceedings. These proceedings were taken under the 17th Section, and it was open to other persons besides the Society to proceed in the matter, but the Society considered it was their duty, when they found a proper case, to take proceedings under that Section. The 17th Section provided in the most explicit terms that the name of the seller should appear, for obvious reasons, so as to attach responsibility in the sale of such a dangerous article. It also provided that the word "Poison" should be affixed to the bottle. It would be found from the bottle in question that the word "Poison" was not so attached. It would also be seen that the label used was an extremely dangerous one, owing to the mild and ambiguous phraseology which described its contents. The article was called the "X. L.—All Vaporising Fumigator," and it purported to be a composition which was to be vaporised in greenhouses for the destruction of animal life on greenhouse plants. He would call before the Court Dr. Stevenson, who would say that he had analysed the bottle in question, and that it contained no less than 37 per cent. of nicotine. He would also say that nicotine was an extremely dangerous poison, and that one drop of it would kill a rabbit in two and a half minutes.

Mr. Horace Avory said the sole question was whether the composition in question was a poison within the meaning of the Act.

Mr. Vaughan Williams said it would be found that Part I. of Schedule A included "strychnine and all poisonous vegetable alkaloids and their salts" as being articles as to which it was necessary to make an entry in a book at the time of the sale. He gathered that the whole question would be whether this was a poisonous vegetable alkaloid.

Mr. Horace Avory said he would admit that the bottle produced by the prosecutors was sold to Mr. Moon on the 7th of November by the defendant company in the condition in which it now appeared, except for the label, which had been added, "7/11/99. H. Moon. Wrench and Co., Limited."

The Clerk: Do you also admit that the other formalities required by the Act were not observed?

Mr. Horace Avory: Certainly.

Mr. Vaughan Williams said the bottle contained a label stating that it contained sufficient compound for 20,000 cubic feet; that it was prepared in bond from duty free tobacco by special permission of her Majesty's Customs, and went on to say: "As this bottle contains the pure nicotine of tobacco in a highly-concen-

trated form it is advised when the bottle is not in use to be kept in a secure place." It further went on to say that it could be obtained from all seedsmen, etc. "Tobacco is generally considered to have some poisonous properties," and that it ought to be kept out of reach of children, and added: "But the proprietor wishes it to be understood that it contains no other injurious ingredient whatever." Then came directions for using it.

Dr. Thomas Stevenson, a Doctor of Medicine, Fellow of the Royal College of Physicians, F.I.C., Lecturer on Forensic Medicine at Guy's Hospital, and Scientific Analyst to the Home Office, was then called, and deposed to having received the bottle in question from Mr. Moon on the 7th of November. He had analysed it, and found that it contained a solution of nicotine and camphor in diluted alcohol. It contained 37·3 per cent. of alkaloid nicotine, 34·5 per cent. of camphor, 15·1 per cent. of alcohol, and the balance was water. There was a slight trace of colouring matter. Nicotine was a highly poisonous vegetable alkaloid. He had experimented on a rabbit with the composition, and found that a small drop killed a rabbit in two and a half minutes. The quantity contained in the bottle produced was sufficient to kill thousands of people if swallowed. The alcohol and water were added to dissolve it, and the camphor would be, no doubt, to give a strong smell.

Cross-examined by Mr. Horace Avory: Alcohol was not in the Schedule of poisons. Alcohol was a poison if enough were taken of it. A quarter of a pound of pure alcohol was sufficient to kill a man. Tobacco contained nicotine.

Is it suggested by the Pharmaceutical Society that all tobacco must be labelled as a poison now when it is sold?—I do not understand that to be so.

Mr. Vaughan Williams: That is not suggested.

Cross-examination resumed: Every cigar contained a certain amount of nicotine, but people were not in the habit of swallowing cigars. They only swallowed a small proportion of the nicotine from the cigar. A small proportion of the poison was taken into the system every time a cigar was smoked. A thousand cigars would contain an appreciable quantity of nicotine. As he understood, any preparation of a poisonous vegetable alkaloid was a poison.

Mr. Vaughan Williams said the word "preparation" was used in the Schedule.

Mr. Horace Avory: No one would think of calling tobacco a preparation of nicotine, would they?—This is a preparation of nicotine, in my opinion; tobacco is not. Every person who sold tobacco sold a substance containing nicotine.

Then he sells some nicotine?—A sort of nicotine that can be extracted from the tobacco.

Do you say the distinction is that nicotine is an extract from the tobacco, and is not, in fact, contained in every piece of tobacco?—It is not contained as nicotine. It has to be extracted to get the nicotine. It is naturally combined in tobacco with other substances.

The Lord Mayor: Do I understand you to say that a very small proportion of what is contained in that bottle would be fatal to life?—Yes, possibly three or four drops.

Mr. Vaughan Williams: I suppose it is according to the resisting power of the subject?—Yes.

Mr. Horace Avory said that this was such a technical question that he proposed to call one or two scientific witnesses on the point, and then he would be better able to understand what the legal position was.

The Lord Mayor: I do not know whether you heard the answer Dr. Stevenson gave to the question I put?

Mr. Horace Avory: I did, my lord.

Mr. George Whiffen, F.I.C., was then called by Mr. Avory. He said he was the manufacturer of the preparation in question. He considered it did not come under the restrictions of the Act. It was a preparation of nicotine, which nicotine was manufactured from tobacco, which was generally not recognised as a poisonous material. In Part I. of Schedule A some of the poisons, with their preparations, were scheduled, but with regard to the poisonous vegetable alkaloids their preparations were not scheduled. This had been proved to be a preparation of nicotine. As to the poisonous vegetable alkaloids, it was their salts which were scheduled, as well as the vegetable alkaloids themselves. All tobacco contained an appreciable quantity of nicotine, in some cases as much as 7 per cent.

Cross-examined by Mr. Vaughan Williams: He agreed that nicotine was an alkaloid.

A vegetable alkaloid?—It is prepared from a vegetable substance. Being prepared from a vegetable substance, it was a vegetable alkaloid. He had no experience as to its poisonous properties. He might know it in a technical sense, but had no experience of it. He knew it from the text-books. The other substances, the camphor and the alcohol, were added afterwards in the manufacture of the preparation. He did not agree that the salt of an alkaloid would be a preparation of it.

Supposing a preparation to be something which is prepared from something else, cannot you prepare a salt or an alkaloid from it?—You can prepare a salt, but that salt will be a compound of the acid and the base.

Mr. Ernest John Parry, Bachelor of Science of the London University and F.I.C., was then called. He had examined and analysed the preparation in question. He did not analyse the same bottle as Dr. Stevenson analysed, but a similar one, and found it contained 35.5 per cent. of nicotine.

Looking to the question of the Schedule of the Poisons Act of 1868, do you say that this is a poisonous vegetable alkaloid, or that it is a preparation?

Mr. Vaughan Williams submitted that this was a question for the Court to decide. The witness could only say, as a scientific man, what it was as a substance.

The Lord Mayor said the witness had better answer the question.

The Witness said it was a preparation containing 35½ per cent. of nicotine, not pure nicotine.

Cross-examined by Mr. Vaughan Williams: He did not say whether the nicotine had been added to the other contents or whether they had been added to the nicotine, but, whichever way it was, it was a compound of nicotine and the other things mentioned. Of course, it was very poisonous. Nicotine was a poisonous vegetable alkaloid. He agreed with the analysis of Dr. Stevenson.

Mr. Horace Avory said the case was obviously of considerable general importance, and apart from its merits, because it seemed to be quite clear from the evidence of the two last witnesses that the question which his Lordship would have to decide was whether the Schedule to the Act included all preparations of nicotine, and it must be obvious to everyone looking at the Schedule that the Legislature had made a distinction between certain of the poisons which were named in Part I. As to some of them, arsenic, aconite, and ergot of rye, not only the poisons themselves, but all their preparations were included in the Schedule. As to the others, their preparations were not included, and, therefore, it was of the utmost importance that the Act should not be extended to a thing which, if it was in fact, as it was alleged to be, a preparation of one of the other poisons named in the Schedule. He was prepared to admit after the evidence, and he thought it was beyond controversy, that nicotine itself was a poisonous vegetable alkaloid. Therefore, it might be that if a person sold pure nicotine, he would come within the terms of the Act, but the evidence before the Court clearly showed that what had been sold was not the poisonous vegetable alkaloid itself, pure nicotine, but a preparation of it, and therefore it was not included in the Schedule. The practical importance of this question was obviously this, that if the present prosecution were well founded, it would be difficult to see why every sale of tobacco did not come within this Act, because it was admitted that every cigar contained a certain amount of

nicotine. The mere act of smoking, as Dr. Stevenson admitted, led to the smoker swallowing a certain amount of nicotine; therefore, every man who sold a cigar sold a certain quantity of nicotine, but if you were to condemn the mere sale of everything that contained nicotine, then the sale of tobacco would come under the Act. He submitted that there was no difference in law and in fact between a man who sold nicotine and a man who sold nicotine mixed with other things, as in this case. The present case was not one in which there ought to be any straining of the Act of Parliament to meet a public mischief, because this was not the sale of anything which was intended to be swallowed by anyone. It was as plain as a pike-staff that it was only intended to be used as a vaporiser. It was not like those cases which had been before the Courts in recent years where the things sold were cures for coughs or soothing syrups for children, and were found to contain some of the poisons mentioned in the Act, and which had been condemned on that very account, especially when it was borne in mind that those very cases turned upon the words: "Opium, and all preparations of opium," and that it had been held that these soothing syrups and cough mixtures contained preparations of opium, and were within the mischief of the Act. Those were cases where things were sold to be swallowed, and where it was admitted that by taking an excessive quantity inconvenience might be suffered. Here the label was distinct. It said: "This is intended only for fumigating purposes," and there was no more danger of a person getting hold of this and drinking it than there was of a child getting hold of his father's cigar-box and swallowing half a dozen of them. He would ask his Lordship to decide the important question of law first, before he said anything about the merits of the case. He would ask the Court to come to the conclusion, upon the evidence of Dr. Stevenson himself as well as the other witnesses, that this was a preparation of nicotine, and not nicotine itself within the meaning of the Schedule.

The Lord Mayor said he was quite satisfied that this was a poison within the meaning of the Schedule.

Mr. Horace Avory said, as it was an important question and would affect other cases, he would ask his Lordship to state a case for the High Court on the question of law.

The Lord Mayor: Certainly.

Mr. Horace Avory said he did not know whether it would be right to adjudge a penalty now or not.

The Clerk said a penalty must be imposed before a case could be stated.

Mr. Horace Avory said, in that event, he would ask his Lordship to impose a purely nominal penalty. The respondents were a wholesale firm of seed merchants, and in the course of their business they did allow some small retail purchases to be made, which took place in the shape of seeds and garden requisites. They themselves were absolutely ignorant that they were committing any breach of the law, and it had never occurred to anybody before that by selling a substance like this for fumigating greenhouses they were liable to the restrictions imposed by the Act. Numbers of these things had been sold for years, and no warning had been sent by anybody in authority. Up to now the Pharmaceutical Society had never interfered with the sale of these things; therefore, it was a purely inadvertent breach of the Act. There was also the fact that the label gave distinct notice that it was only intended for fumigating, and that it was not to be left within the reach of children.

The Lord Mayor said, on the evidence of Dr. Stevenson, it appeared to be one of the most deadly poisons.

Mr. Vaughan Williams called attention to the fact that the defendants' label said that it was somewhat poisonous.

Mr. Horace Avory said it should be borne in mind that all persons who dealt in seeds and garden requisites were not chemists, and the people who were selling this article did not know anything about its dangerous properties.

The Lord Mayor said on the first summons he should impose a penalty of £5 and £10 10s. costs, on the other two summonses there would be a nominal penalty of 10s. in each case, and a case would be stated. He hoped that in the meantime the sale of this compound would be stopped. He would very strongly urge that upon the proprietors of the compound.

Mr. Horace Avory said so far as his clients were concerned they had already discontinued the sale.

The Lord Mayor said he did not want to prejudice or prejudge the matter, but he should strongly recommend that they should endeavour to collect all outstanding bottles in the hands of the trade. When it was stated by Dr. Stevenson that three or four drops were sufficient to destroy life it would be seen that it was a very serious matter.

ILLEGAL SALE OF LAUDANUM.

Pharmaceutical Society v. *Hare.*

An action was brought by the Pharmaceutical Society of Great Britain, at the Goole County Court on Monday last, before His Honour Judge Raikes, against Herbert Hare, grocer, Old Goole, to recover two penalties of £5 each, for having sold, or kept open shop for the retailing, dispensing, or compounding of poison, to wit, a preparation of opium called laudanum, contrary to the provisions of the Pharmacy Act, 1868, 31 and 32 Vict., cap. 121, Sec. 15.

The Society was represented by Mr. T. R. Grey, barrister-at-law.

Defendant did not appear, but was represented by Mr. J. Burniston, solicitor, who stated at the outset that he was not going to defend the case. He was simply there to arrange as to how the penalties should be paid if the Society pressed the case. He had only been instructed a few moments ago, and he was assured by his client that he did not know he was doing wrong—he had been selling for some time—and he very much regretted it.

Mr. Grey said the Society most certainly pressed the case, for, as Mr. Burniston said, the defendant had been in the habit of selling that drug. One thing for which the Society was appointed under the Act was to prevent the illegal or unlawful sale of any of the poisons mentioned in the schedule by unqualified persons. In the present case the defendant had been written to four times, but he had not replied to any of the communications. He had been asked to admit, in a letter dated November 16 last, that the stuff which he sold was laudanum, so as to save them from making the journey from London. To that letter there had been no answer. They had brought an analyst from Doncaster, and all their witnesses were present, and he submitted that defendant, who, through his solicitor had admitted the offences, was liable for the two penalties with costs under the Act.

Mr. Burniston acknowledged that his client was liable for payment of costs, and enquired what time the Society would allow for payment of the whole.

His Honour: I am afraid from what Mr. Burniston says that the defendant has been in the habit of selling this drug for a considerable time. It only goes to show that a man in a responsible position should know the law. I give judgment for the plaintiffs for the full amount, with costs.

Mr. Burniston again asked for time on behalf of his client.

Mr. Grey said he would just like to point out that the defendant was also liable to penalties under Section 17, because the bottles were not marked poison, and defendant's name and address did not appear.

Mr. Burniston suggested £1 per month.

Mr. Grey: The payment of a penalty by instalments causes this Act to have little effect. I submit, under the circumstances, that we ought to have a certain sum down and the remainder at so much per month.

His Honour: I think if he pays £5 down and the remainder in instalments of £1 per month, that would meet the case.

Mr. Grey concurred, and the Judge made the order accordingly.

LETTERS TO THE EDITOR.

The Company Pharmacy Problem.

Sir,—Will you permit me, through the medium of the Journal, to raise a rallying call to our craft, and especially to those who are halting over this company regulation scheme? We are pushed into a fog over this matter, and the clear issue has become obscured, so that we know not exactly where we are; we are troubled; some of our leaders have lost their heads; we are divided, torn by factions, under the influence of conflicting interests. Selfishness blocks our progress, and if we are not careful we shall be stranded and wrecked. What are we to do then? Approach the powers that be, without hesitation or halting. Stand up as men—men who are in earnest, honest and firm—let us prove that we have no desire to injure others; but do not mean to be injured ourselves. We ask no favours, but we do ask for justice and right, not for selfish ends, but for their own sake. Bounce, insolence, or double-dealing will not avail—they will only damage the cause. If an individual infringes a patent or pirates a trade mark, he is liable to prosecution, and punishable by law, and we hold that the titles—chemist, chemist and druggist, and pharmaceutical chemist, etc., are ours, and that by legal enactment. They are our letters patent, and indicate to the public that we are qualified to do the work for which we have been educated and examined. We know that piracy is both illegal and criminal, and when the pirate or his crew is caught, they are dealt with severely and justly punished. Now, just for a moment, suppose that when these men were caught and placedo their trial, they were to whimper in court and raise the question, hat having been in the business so many years, and in virtue of having accumulated very large vested interests in it, they ought to be left alone, and allowed to pursue their calling, or to be placed under such conditions and regulations as shall enable them still to carry on their business without sacrifice or loss. What would any just Government say or do under such circumstances? Would they yield? We trow not. Would they condone such acts of piracy; if they did, what would an indignant public opinion have to say in the matter? Now, gentlemen of the craft, here is our position to day. Companies limited and bogus companies have been poaching and pirating upon our legally acquired professional rights for years: has not the time come when this system of piracy should be scotched? We appear to have amongst us (and unfortunately in our Council chamber) timid, weak-kneed men who are halting and afraid. Do not, however, forget that we have still among them, and amongst ourselves, men of real grit and good backbone. They may be in minority at present. Never mind that—we want them. Let us rally around them unitedly with all our force and voice, and ask them to pilot us through these troubled waters. They have been ready and trusty guides in the past, and they will not in the present crisis betray us, or say us nay. Our motto must be union, we don't want uniformity or absolute unanimity, but we do want agreement as to broad principles. If we would present a clean sheet to our rulers we must have such agreement; then, and not till then, shall we be able to prevent the pirates from boarding our craft or splitting us upon a rock. It is simple nonsense (rhetorical nonsense) to talk about what ought to have been done twenty years ago: such wisdom after the event is valueless. Mistakes were then made which do not reflect credit upon the chemists of that time (doubtless at that time); but, be it remembered, at this date, mistakes are being committed now which do not reflect any credit upon those who make them, and that after their knowledge and enlightenment. We have now to do with facts as they are, to provide against injustice and wrong-doing. If the Government is approached in a fair and enlightened manner we may be confident that we shall have justice done, and that our cause will be better placed for future consideration. Don't let us forget that if this Companies Bill comes to the fore again that it is not as to a Pharmacy Act, but as to a Companies Prohibition Act that we shall be called upon to watch it. If we cannot get justice done by that, then we must oppose this particular clause tooth and nail, and strive to get it dropped out of the Bill altogether. We shall be none the worse off in spite of croakers to the contrary.

Rotherfield, December 4, 1899. G. G. Hornsby.

Sir,—I should like to make it clear that, when speaking at the Wolverhampton meeting, reported in last week's Journal, I was not arguing that a man should be made a director because he had advanced money to a company; but was replying to the assertion that an unqualified director in a company might exercise control over the qualified director. I was suggesting that even in a private firm any man who had advanced money to a chemist's business might, in like manner, seek to influence the policy of the business, or in some way control the management, and would often have it in his power to do so; so that, provided there were a qualified director at the head of affairs, a limited company might be as safe as regards its management as some private concerns. I should also like to point out that I said "previous attempts at legislation had failed because even a little opposition had been raised to them by the trade," not that they had failed because of the littleness of the opposition raised to them. Is it not possible for the trade to carry the legitimate drug companies with them, by providing that no company shall practise pharmacy, or at least sell poisons, or call themselves chemists, unless at least the managing director of the company is a registered chemist. Year by year as the chemist's business becomes extensive in its character, the tendency is more and more to convert a private business into a limited company, and cases may very conceivably arise in which it may be a great hardship for the title of chemist to be lost to a business, where for legitimate reasons it has been turned into a limited company by a qualified chemist who retains the principal direction of it. In voting on this question in various centres over the kingdom, or in trying to influence members of Parliament, chemists may do well to keep such possibilities in mind, even though present interests seem to suggest another course, always supposing the Legislature is ready to back up those interests by depriving legitimate drug companies—managed by a qualified directorate—of their right to call themselves chemists, or to carry on business at all.

Wolverhampton, December 2, 1899. Thos. Reade.

Sir,—I have pleasure in enclosing herewith copy of a conjoint letter addressed by the Chemists of Linlithgow County to the Council of the Pharmaceutical Society.

Alexander Spencer,
Linlithgow, December 2, 1899. *Local Secretary for Linlithgow*

[Enclosure.]

November 30, 1899.

To the Council of the
Pharmaceutical Society of Great Britain,
17, Bloomsbury Square,
London, W.C.

Gentlemen,—We the undersigned Chemists of the County of Linlithgow, are of opinion that in the public interest any clause inserted in the Companies Bill should have for its object:—

The protection of Chemists' Titles and the making it illegal for companies of unregistered persons to keep open shop for selling poisons as in the case of individuals.

We therefore urge the Pharmaceutical Society to take immediate steps with the object of having a clause inserted in the Companies Bill which will place every member of a company upon the same footing, as to responsibility, as is expected from a qualified chemist, and the acts of a company treated as the acts of an individual, or until the 1868 Pharmacy Act has been amended in the above direction.

We are, dear Sirs,
Yours respectfully,
Signed by A. Tweedie, Bo'ness.
,, John Freeland, Bathgate.
,, James Chapman, Kirkliston.
,, Francis Rae, South Queensferry.
,, Annie T. W. Spence, Linlithgow.
,, Alexander Spence, Linlithgow.
,, David Reid, Bathgate.
,, Findlay Stuart, Broxburn.
,, David Lister, South Queensferry.
,, C. M. Spence, Linlithgow.
,, Thomas Lumsden, Linlithgow.
,, Edward Spence, Linlithgow.

Sir,—In the Frain case on the 20th ult. their specific was described as warranted to cure want of ambition; I think it is a pity that some chemists did not try it, for the body is lamentably lacking in that virtue. Of course, there is no distinction to be made between an examined and qualified physician and pharmacist; if it is proper to protect the one it is equally so to the other. The misfortune is that the decision of the House of Lords is final, however wrong or foolish it may be. I have lately written to the

Lord Chancellor on the subject, pointing out to him the absurdity of Lord Selborne's judgment. (1) If it is illegal for one to do a thing, it must be more so for a number to do it. (2) Before the 1868 Act anyone could be a chemist; how do we know it was not the intention of the Legislature they should not do so now? I pointed out to him that the Act was passed to prevent them from doing it, and that it is absurd to talk of intentions in point of law, they do not count anything; to be legal they must be in black and white. (3) This does not apply to companies, because companies cannot be examined. Again I pointed out that if they cannot comply with the law they ought not to be allowed to break it, and it is absurd to say companies cannot be examined, when the whole British Army is examined every month. But at whose door does the treatment of the thing lie? The chemist himself. When the Society was formed how few joined it again in the opportunities of 1852 and 1868, and how few joined on passing their examinations. No, sir, an opportunity once lost is very difficult to recover; tho fools who opposed the Society in 1867 forming a united society are responsible for the present state of affairs, and now they blame the Society, and many chemists have not clean hands. Before the decision that assistants must be qualified, how few employed them, and a great many have no end of shops without a qualified man in any of them; and then, also what did they sell? I am sure that if the majority outside do not come in quickly, the game will be lost; but if the majority would join and put their shoulders to the wheel, the situation might be carried. I have done my best for chemists, and am very glad I am not in practice now. I ended my career by founding the Kensington Chemists' Association, which by amalgamation became the "Western Chemists," and I established that, for I induced one hundred gentlemen to become members. These local associations are of the greatest importance, and members ought to interview members of Parliament and enlighten them. Look at the rot magistrates, coroners, and other legal functionaries talk; if chemists did not know their business better, the undertakers would be busier. As to the legal status of companies, how long did it take to find out that none but qualified men could sell poisons, and that patent medicines were a mockery, delusion, and snare, and that any containing poisons could only be sold by registered men? Companies are not for the protection or good of the public, what they want is a respectable qualified chemist in their own immediate neighbourhood. Why not strike if you cannot get your rights?

Reading, December 5, 1899. HENRY LONG.

What is the Principle of the Pharmacy Act.

Sir,—You say of my letter, "He makes assertions which cannot be sustained by facts." I assert (1) that our Society contended that the principle of the Pharmacy Act was "qualified ownership"; (2) that the House of Lords declared that it contained no such principle, and that the object and policy of the Act did not require that it should; and (3) that at present it is settled law that "qualified ownership" is not the principle of the Act. Here are the facts in brief:—(1). Mr. Benjamin said for us to the House of Lords, "Nobody shall have an open shop for the sale of poisons except a duly registered chemist. That is our interpretation of the 1st Section, and we say that it includes corporations. The Act says the proprietor must be qualified." (2). Lord Selborne said: "It was not thought necessarily inconsistent with the object and the policy of the Act that the principals, the proprietors of the business, the persons to whom those actually selling the drugs would be responsible, should be unqualified." Lord Blackburn said: "If there had been anything in the Act, or in the nature of things, which made it reasonable that it should be provided that all the profits to be derived from vending poisons or poisonous drugs should be shared amongst those who are pharmaceutical chemists, and that nobody else should intermeddle with that trade; if there was anything of that sort in order to carry out that object, it would be necessary to say that 'person' includes corporation, and not a natural person only. But that object is certainly not avowed on the face of the Act." (3). Any decision of the Court of ultimate appeal is settled law on the question at issue. The facts cited will enable your readers to judge what foundation there is for my assertions. I hope no one will take my statements for more than they are worth. It may be necessary to proceed by way of reversing the settled law by fresh legislation. I suggest that procedure founded on settled law is practicable and sufficient for the one great purpose we are all anxious to secure. Whatever procedure may ultimately be adopted, I sincerely hope we will all fall into line, and work unitedly for the common good.

December 4, 1899. OBSERVER (11/48).

The Society's Examinations.

Sir,—As a student, and one with a little knowledge of the London University examinations, I feel it my duty to say something about "Educationalist's" remarks in last week's Journal. It is recognised that the pharmaceutical examinations are less thorough than those of a university, and there is more "shotting" at the Minor than at examinations conducted by a university; but this depends on the class of men who come into our little "craft." Certainly I agree that two days (it is really less than two days) is insufficient for the Minor; there should be three days' written papers, one day's practical, and one day's oral examination. But "Educationalist" chiefly attacks the Major, and in this I think he is unfair. He attacks it at its weakest point—physics; now depth in physics means depth in mathematics, and as long as our preliminary standard is so low, this cannot be altered. I see no reason why pharmacists should be very mathematical; pharmaceutical physics should be only experimental, and this I think is the case. The experimental part of the physics at the Intermediate examination for science is not more difficult than the Major, but there is a practical examination, which proves a stumbling block to many candidates. Rather than go deep into physics, I should suggest physiology and bacteriology instead; those are subjects which chemists are often only too ignorant about. The botany in the Major is rather in advance of the Intermediate—at least as regards the syllabus. But I understand that the marking is easy in the Major, and I should like "Educationalist" to prove that the practical examination in chemistry in the Final B.Sc. is superior to the Major. And I think the theoretical chemistry of the Major does not lag far behind. At any rate I know men who have relied solely on the training at the "Square" for the chemistry at the Final examination, and have been successful. The statement that "the papers are not up to the standard of the London Matriculation or Senior Cambridge Local" is, in my opinion, a gross exaggeration.

December 4, 1899. SQUARER (11/45).

Sir,—It is pleasant to learn that a gentleman who is so intimate with examination affairs as Mr. J. Laidlaw Ewing, Edinburgh, is voicing what many will hail as a much-needed reform in the direction indicated. It will be infinitely better for the candidates when it has been arranged that they get credit for the subjects in which they have really passed. They will derive much encouragement to persevere with their studies, and so come out well versed in the various subjects. The change would also add enormously to the popularity of the Pharmaceutical Society, and the two-thirds of outsiders would rapidly disappear. In law and medicine the method now hinted at by Mr. Ewing was forced upon the several examining bodies because of the increased high standard of examinations. Why then should not the Pharmaceutical Society follow suit? Their standard has been run up in recent years, but consideration for the candidate has not been apparent. The sooner the change indicated by Mr. Ewing is made, the better it will be for all concerned.

December 2, 1899. A COUNTRY MEMBER (11/31).

Liquor Krameriæ Concentratus.

Sir,—The new preparation of rhatany in the last Pharmacopœia does not seem to be a success. A sample now before me which has been kept cool and away from a strong light has deposited a thick coating over the bottom of the bottle and become perceptibly paler. It contrasts very unfavourably with a little of the old tincture in the bottle on the shop shelves. Is the weaker spirit employed—20 per cent. alcohol instead of proof spirit—the cause of this? Why is it so difficult to obtain a permanent galenical combining rich red colour with marked astringency? Red sanders is unexceptionable, but the astringency is very small. Kino gelatinises. The old tincture of rhatany was not always satisfactory when used as an ingredient of tooth tinctures. Red gum is admirable when freshly made, but not for long; the astringent and colouring principles soon settle to the bottom in flakes or masses of insoluble matter. A compound liquor of logwood I have had in stock some time has proved no exception to the rule. It would be interesting to know the reason of this.

Dover, December 4, 1899. J. F. BROWN.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

KICKXIA AFRICANA.

The seeds of this plant were noticed as a substitute for strophanthus in a former number of the Journal (*P.J.* [3], **17**, 903), but the plant at that time, 1887, was not supposed or known to yield indiarubber. But in 1895, specimens of an indiarubber plant sent from Lagos to Kew were identified as *Kickxia africana* (*Kew Bull.*, 1895, p. 243; 1896, p. 76), and figures of flowers and fruit were given. Recently, however, better materials have been received from Lagos, and these show that the specimens previously received did not belong to one plant, but to two nearly allied species, one of which yields excellent indiarubber, and the other does not, the evaporated juice of the latter yielding a sticky substance more nearly approaching gutta-percha than indiarubber. At a recent meeting of the Linnean Society Dr. Stapf, of the Kew Herbarium, exhibited and described specimens of these two plants, and showed that they must be placed in a new genus, which he named *Fantumia*, after one of the native names of the rubber. The one yielding indiarubber he has named *Fantumia clastica*, This, when in fruit, is recognised by its short stout pod, and when in flower by its petals being ovate and shorter than the tube of the corolla, and when in leaf alone by minute oblong depressions at the base of the lateral veins on the under surface of the leaf. The other plant, which does not yield indiarubber, he has named *Fantumia africana* (this being the old *Kickxia africana*). It is distinguished by its flowers having petals of a linear lanceolate shape, three or more times longer than the tube of the corolla, a long narrow angular pod, and leaves without the minute oblong depressions on their under surface. There are other characters distinguishing them, and the genus *Fantumia* from the genus *Kickxia*, which latter will now be confined to the Asiatic species. A full account of these characters will, we understand, shortly be published by the Kew authorities. A specimen of the pod and seeds of the genuine rubber plant, *Fantumia elastica*, are in the Museum of the Society.

CHEMICAL SUBSTANCES IN PLANTS.

M. P. van Romburgh records the occurrence of the following substances in the vegetable kingdom. Acetone appears to be a substance widely distributed, and was detected in *Hevea brasiliensis*, *Manihot glaziovii* and *utilissima*, *Phaseolus lunatus*, and many other plants. Methyl salicate is apparently a substance of wide distribution in the vegetable kingdom, and is recorded in many plants, and in many organs of those plants. The presence of hydrocyanic acid was determined in *Hevea brasiliensis*, *Manihot glaziovii*, the leaves of *Indigofera galigoides*, and *Phaseolus lunatus*, and, in smaller quantities, in the leaves of many other plants.—*Ann. Jard. Bot. Buitenzorg*, **16**, 1899, p. 1.

ASTERIONELLA A CAUSE OF FOULNESS IN DRINKING WATER.

G. C. Whipple and D. D. Jackson have made a study of the life history and properties of *Asterionella formosa*, a diatom which is a frequent cause of foulness in the supply of drinking water to American cities, giving it an odour varying from fishy to geranium-like, caused by the formation of an oil having a strong analogy to the essential oils. During periods of stagnation the diatoms form spores at the bottom of the reservoirs, and they increase with very great rapidity when these spores germinate; this growth taking place chiefly during the spring and autumn. The growth of the diatom is greatly favoured by light; and the best mode of preventing its increase appears to be to store the water in the dark.—*Journ. N. England Waterworks Assoc.*, 1899.

INFLUENCE OF ELECTRICITY ON PLANTS.

H. Euler gives the result of experiments on the influence of electricity on the growth of plants, chiefly *Elodea canadensis*. He finds that the electrical processes in the atmosphere can have only a slight effect on the amount of dissolved gases in water free from bacteria. Atmospheric electricity can, therefore, have no direct action on the growth of water plants, or of the parts of plants immersed in water.—*Proc. Swedish Acad. of Sciences*, 1899, p. 609.

FORMATION OF PROTEIDS IN THE DARK.

From observations made on the germination of wheat, J. Goldberg states that proteid substances are formed in considerable quantities in the embryo. Since this phenomenon takes place at the close of the period of germination, it is clear that the formation of proteids does not take place at the expense of the decomposition of proteid substances which have passed from the endosperm by osmose.—*Bonnier's Rev. Gén. de Botanique*, **11**, p. 337.

OYSTERS AND DISEASE.

In a report on oysters and disease ('Lancashire Sea Fisheries Memoir,' i., 1899), Herdman and Boyce state that although they have never detected the *Bacillus typhosus* in any oysters obtained from the sea or from the markets, yet in experimentally infected oysters the organism could be recovered from the body of the oyster up to the tenth day, pointing to the possibility of the transmission of enteric fever by oysters. The colon bacillus was frequently found in shell-fish as sold in towns, but not in mollusca living in pure sea-water, the inference being that the presence of the colon bacillus indicates sewage pollution. The *Bacillus enteritidis sporogenes* of Klein was frequently detected in various shell-fish.

GREEN OYSTERS.

In the same paper the vexed question of "greening" in oysters is discussed. There seem to be several distinct kinds of greenness. Some of these, such as the green Marennes oysters and those of some rivers on the Essex coast, are healthy whilst others, such as some Falmouth and American oysters, are not in a healthy state. In the Marennes oysters the greenness is dependent upon the presence of a special pigment (marennin), which seems to be associated with a certain amount of iron. As regards the green Falmouth and American oysters, the greenness seems to be due to the presence of an abnormal amount of copper—nearly four times as much as in the normal oysters. The presence of copper could be detected readily by treating sections of the green oysters with potassium ferrocyanide and dilute hydrochloric acid which gave a red, with ammonium sulphide which gave a black, and ammonia a blue. Pure hæmatoxylin is also a most delicate test for copper, with which it gives a purple. The memoir is illustrated with eight admirable plates.

CHANGES IN OIL OF BERGAMOT.

E. Charabot finds that during the process of ripening, the essential oil of the fruits of *Citrus bergamia* undergoes a marked change, losing free linalool and bergaptene, but increasing in terpinic constituents, and in linalyl acetate. Thus he finds the green fruits give an oil containing 13·9 per cent. of free linalool, and 26·6 per cent. combined as esters; while that from the ripe fruit contained but 5·9 per cent. of free linalool with 29·6 per cent. as esters. The total linalool in oil from the unripe fruit being 40·5 per cent., that in the ripe fruit 35·5 per cent. Although the amount of the terpenes increases during ripening, the relative proportion of their constituents, limonene and dipentene, remain the same.—*Comptes rend.*, **129**, 728.

WHAT IS THE COMPANY PHARMACY PROBLEM?

BY JOHN HUMPHREY.

In reading the various reports and letters dealing with the company pharmacy problem, one cannot help being struck with the manifest ignorance of the subject betrayed on every hand. It has come to be regarded as an article of faith by registered chemists that all their troubles are due to competition by companies of unregistered individuals; it is not surprising, therefore, to find the impression prevailing widely that abolition of such companies would inaugurate a virtual pharmaceutical millennium. To suggest that such an impression is ill-founded may appear heretical; on the other hand, to foster it is nothing short of encouraging belief in an unreality. For, to any unprejudiced observer, nothing is more obvious than the fact that, if the House of Lords' decision in the case of the London and Provincial Supply Association were reversed to-morrow, the average chemist and druggist's position would not be bettered in the least degree. Evasion of the provisions of the Pharmacy Act would remain as easy then as now, and competition might be expected to increase, rather than otherwise.

DISLOYALTY THE CHIEF MISCHIEF.

Paradoxical as the foregoing statement may appear, it is nevertheless true. For the chief mischief at the root of chemists' troubles is not the tendency of capitalists to invest their surplus funds in concerns which, by their success, inflict serious injury upon registered chemists, but the open disloyalty manifested by the action of those registered persons who run branch pharmacies without duly qualified persons in charge and those others who sell their qualification to the highest bidder, without due consideration of the possible injurious effects of their most injudicious procedure upon the professional position of the pharmaceutical body. To put the matter briefly, so long as holders of the statutory pharmaceutical qualification persist in general disregard of the value of that qualification by avoiding the employment of qualified managers or by selling themselves to capitalists who find the lack of that qualification a hindrance to the development of their business projects, so long must those suffer who practise pharmacy in a legitimate manner. Probably, in a greater or less degree, that will be as long as pharmacy is practised in the fashion now prevalent, since it is inconceivable that the evil can ever be entirely rooted out whilst the trading element so far outbalances the professional side of pharmacy. At the same time, the position is far from being a hopeless one, though the remedy for the existing mischief has been vainly sought for nearly twenty years, and the specialists are not yet agreed as to what it should be. It must be recognised at the outset, however, that the statutory qualification is the common property of the whole body of registered persons, and that its value depends upon the manner in which it is cared for.

WHAT THE PROBLEM REALLY IS.

But before applying any treatment, it is always desirable to form an accurate diagnosis; prior to the adoption of resolutions and the drafting of remedial clauses, it would be as well to devote some little consideration to the nature and exact bearing of the company pharmacy problem. Nominally, that problem was first stated in 1881, when the House of Lords decided that a limited company, though a "person" for other legal purposes, is not a "person" within the meaning of the first fifteen sections of the Pharmacy Act of 1868; in reality, the difficulty originated when that measure was added to the Statute book, and it will remain so long as the professional practice of pharmacy continues closely allied with trade, as it is at present. If the leading spirits in pharmacy had it in their power to secure the passing of an ideal Pharmacy Bill, without risk of any modification after leaving their hands, it would still be possible for unregistered persons to reap profit from the practice of pharmacy, if only they could secure the co-operation of persons duly qualified under the Act. And at how cheap a rate such co-operation can be secured it is unnecessary to state here. The existence of black sheep in the ranks of pharmacy is too painfully obvious when we consider that hundreds of pseudo-pharmacies are carried on at a profit by their aid.

HOW EVASION IS POSSIBLE.

Even if companies carrying on the business of a chemist and druggist were abolished, any unregistered individual could continue to do as they do now, if he had command of the necessary capital. The only difference would be that whereas companies are at present outside the scope of the Pharmacy Act, the unregistered individual would simply evade its provisions. All that he would require to do, after stocking his pharmacy, would be to buy up a registered chemist, whom he would place in apparently absolute charge—exhibiting his name outside the place of business, printing it on all the labels, etc., and entering it in the ratepayers' book. The registered individual would then appear, to all intents and purposes, as the proprietor of the business, and the real proprietor could defy detection so long as he paid the dummy proprietor's price. In all probability, there are pharmacies run on such lines to-day, but it is impossible to secure satisfactory evidence on the point; the actual parties to the bargain are not at all likely to give their case away. The requirements of the law may apparently be fulfilled in such a hypothetical case, everything else in connection with the business may be done in a perfectly satisfactory manner, the public interests may not suffer in the least, and the fact that the nominal proprietor only shares the profits concerns no one but the parties to the bargain. True, the registered person is undoubtedly guilty of infamous conduct in a professional respect, but evidence of that is not forthcoming, and the law is helpless in the matter.

THE ESSENTIAL THING TO AIM AT.

On the face of it, such an arrangement might be regarded as differing only in degree from the case of any chemist and druggist who commences business with borrowed capital. The dummy proprietor's share of the profits would be less, but so would his share of the worries incident to the conduct of the business. The responsibility of one, so far as the public was concerned, would be as great as that of the other, and, even if the facts of the illegal arrangement were ever disclosed, it is doubtful if anyone would impute serious blame to the impecunious chemist, except the more orthodox members of his own profession. He might be pitied because of his lack of means, but if his business relations with the public had been beyond reproach, his justification would probably be held to be complete. Moreover, at the worst, he could not be punished, for he could not be proved guilty of any offence, the only person infringing the Statute being the unqualified proprietor. It may be suggested that it is inadvisable to go into detail to show how easily the Pharmacy Act can be evaded, but in response to that it is only necessary to observe that the truth is better faced than shirked, and that if instances of such a nature do occur nobody seems to be a penny the worse. The fact of the matter is that the manner in which a business is financed is of no consequence whatever to anyone but the individuals directly concerned, and it is difficult to see how the public value of a registered chemist's services can vary, whether the capital invested in the business he conducts is provided by himself, by his wife, by his friends, or by outside capitalists—individuals or companies. And that brings us to the main point. What is the essential thing to be aimed at in any satisfactory solution of what is termed the company pharmacy problem? Is it regulation of the manner in which the business of a chemist and druggist is financed, or is it not rather the protection of professional qualification and regulation of the dispensing and sale of poisons?

THE ABOLITION OF COMPANY TRADING INSUFFICIENT.

The abolition of company trading, whether it be possible or not, is not an end in itself. For, as has already been shown, the cause of the mischief would still remain if every company carrying on business as a chemist and druggist were compelled to wind up

to-morrow. The object to be aimed at must strike at the root of the evil, and yet its accomplishment must not be opposed to public policy. It is unreasonable to ask registered chemists to cut themselves off from all the benefits of the Companies Acts, as must be done if company trading in pharmacy is to be prohibited absolutely. And it is the more unreasonable, inasmuch as the vast bulk of the business conducted by chemists and druggists is not pharmacy proper. The most that can be demanded, in reason, is that no company shall be permitted to exploit the professional qualification, or to undertake professional duties for which its members are individually unfitted. The assumption and use of titles based on the possession of a pharmaceutical qualification must be rigidly restricted to the individuals who have been duly educated, examined, and registered as fit and proper persons to perform the professional duties which that qualification is evidence of fitness to perform. A company or other corporate body cannot be educated or examined; it cannot, therefore, be registered, and must not, on any consideration, be permitted, as an association, to assume or use titles which rightly appertain to individual chemists only. That is even more necessary in the public interest than for the sake of registered chemists, since the public is undoubtedly afforded a considerable measure of protection by a proper significance of professional titles being preserved.

The Medical Profession as an Example.

The position of the medical profession affords an admirable instance of that fact. For, although medical titles are well protected, medical practice is absolutely unrestricted, except to the slight extent covered by the Apothecaries Act. It should be patent to everybody, therefore, that the public enjoys an enormous advantage from the restriction of medical titles to duly qualified persons. The medical art has progressed by leaps and bounds, though any quack has been, and is, at liberty to practise; the public, therefore, has benefited in spite of the fact that medical practice is free to anyone, and the present exceptional position of the medical profession must, in great measure, be attributed to the protection of titles. Moreover, if medical men who sell medicines, etc., to their patients would only sever entirely their connection with trade, the position of the profession would be still further improved. In proportion as the supply of medicines has been dropped by medical men, the restriction of titles has sufficed to protect their practice, and that tendency will be more marked as time goes on. The same would be true of pharmacy if similar conditions prevailed to an equal extent; unfortunately, however, there is no immediate prospect of such a position being attained. But what is not within immediate reach is not necessarily unattainable. Registered chemists, therefore, must be of good heart and refuse to go back a single step, as would be the case were they to acquiesce in the surrender of their professional titles to unqualified persons, or to corporate bodies of any kind.

Pharmaceutical Practice.

As regards pharmaceutical practice, the law already protects that to the extent that only individuals registered under the Pharmacy Acts can lawfully dispense and sell scheduled poisons. What is required beyond that is that unqualified persons—whether individuals or companies—shall not be permitted to exploit the services of registered individuals to an unreasonable extent. How that is to be provided for is far from clear, but it may be suggested that one way in which the desired end might be secured would be to insist that every place where the dispensing and sale of poisons is conducted shall be virtually controlled by a registered individual responsible to the public for the conduct of the business carried on there. In other words, the business of every pharmacy should be *bonâ-fide* conducted by a person registered under the Pharmacy Acts, the name of that person being conspicuously painted or affixed outside the premises and printed on all labels, etc., used in the pharmacy. If not actually the proprietor of the business, he should be so virtually, in relation to the public, though the nature of the financial arrangements involved need not be considered. So far as responsibility to the public is concerned, he alone ought to be regarded as the proprietor, and if he chooses to act as cover to any unqualified person, or association of unqualified persons, that might be regarded as a matter of concern to himself alone.

No Surrender of Principle Involved.

Objection may be taken to the foregoing suggestion as involving a certain amount of surrender of principle; but does it really? If every pharmacy were personally conducted by a duly qualified individual who, to all appearances, was the proprietor of the concern, how would either public or pharmaceutical interests suffer? It is safe to say: Not at all. Moreover, the capitalists who now finance so many pseudo-pharmacies would not be compelled to seek other outlets for their capital; yet some hundreds of registered chemists would virtually be placed in business on their own account, without anything being done that would increase the existing competition. The company pharmacy problem would thus be solved. Public interests would be properly cared for, registered chemists as a whole would benefit by the practical elimination of their chief unqualified competitors, and, whilst their professional position as pharmacists would be fully protected, there would be no bar to legitimate trade developments such as would be involved in an absolute prohibition of company pharmacy.

How Shall the Law be Modified?

How the law shall be modified so as to effect such a result as has been indicated remains to be considered, but it should not be difficult to deal with the matter usefully, yet very briefly, in a Companies Bill, though it could only be fully and satisfactorily dealt with in a Pharmacy Bill. For example, if it should be decided to rest content with securing something short of the actual abolition of company trading in pharmacy, whilst rejecting the principle of qualified directorship and seeking to secure something better, the principle of virtual qualified ownership might be maintained by adopting some such clause as the following, which might have a fair prospect of being accepted by the Government for insertion in a Companies Bill:—

> No company or other corporate body may carry on the business of a chemist and druggist unless such business is *bonâ-fide* conducted, in every place where it is carried on, by a person registered under the Pharmacy Acts, the name of that person being conspicuously painted or affixed outside the place where he is conducting the business, and printed in legible characters in all labels, bills of parcels, invoices, receipts, and other documents or publications issued from or referring to such place of business; but, subject to this provision, anything which would be an offence under the Pharmacy Acts, if committed by an individual, shall be an offence if committed by a company or other corporate body.

The proposed clause is based on that drafted by the Lord Chancellor or his advisers and published as Clause 2 of the Companies Bill, 1899; such additions as have been made follow the lines of the Companies Acts rather than the Pharmacy Acts.

Qualified Directors Not Sufficient.

Nothing is said in the clause about the appointment of qualified directors, for it is difficult to see how any board of directors can efficiently control the conduct of a pharmaceutical business unless the existing law with respect to the responsibility of directors is altered to a much greater extent than is at present conceivable. A qualified managing director holding a preponderance of shares and actually conducting the business would be more to the point, but the idea should not be to make companies beyond reproach as persons carrying on the business of a chemist and druggist; what is requisite is that the steps taken should be such as are most likely to conduce to the protection of the public safety. Nothing can prove so effective in that direction as making the qualified individual in charge of each pharmacy as absolutely responsible as a proprietor, whether he is actually the proprietor or not, and that can be effected by some such clause as the foregoing. It will be observed that the clause covers the trade aspect of the matter more particularly; the professional side would be more satisfactorily dealt with

in a clause affecting other professions also. Thus, to take as a basis Clause 3 of the Companies Bill, 1899, it might be enacted that:—

It shall be unlawful for a company or other corporate body to carry on the profession or business of a physician, surgeon, medical practitioner, dentist, pharmaceutical chemist, or midwife, or to use any description implying qualification under the Pharmacy Acts; and if any company or other corporate body contravenes this enactment it shall be liable, on summary conviction, to a fine not exceeding five pounds for every day during which the contravention happens.

Chemists and druggists can well afford to support the inclusion of pharmaceutical chemists in this second clause; such inclusion would probably mean little or nothing for the moment, even if the clause became law. Pharmaceutical chemists, however, may fairly be considered to hold a more purely professional qualification than chemists and druggists, and it does not seem unreasonable to include them, although the Government declines to admit chemists and druggists on the same footing as other professional men. For the present it would be difficult to say how the practice of a pharmaceutical chemist differs from that of a chemist and druggist; but in the future the pharmaceutical chemist qualification may come to mean something more definite than it does now, and if, then, all persons registered under the Pharmacy Acts should be—as is not unlikely—pharmaceutical chemists, much benefit will accrue from the exercise of a little foresight at the present moment.

THE OCCURRENCE OF SODIUM SULPHATE IN NATURE.*

BY HERBERT HYMANS.

Sodium sulphate occurs in nature in various forms and combinations, and in such widely divergent regions as Arizona, Peru, Spain, India, and the Caucasus, in many cases only as crusts or in small quantities, but occasionally in beds or layers of considerable thickness, and of such quality and surroundings as to render them of interest and value from a commercial point of view.

Let us first rapidly survey the minerals in which sodium sulphate occurs, and we can then enter more fully into the properties, occurrence, and composition of the commercially important varieties, and more especially of thènardite, of which I have been enabled to obtain from a large deposit in Spain some interesting details and specimens, through the kindness of Mr. P. S. Boult, who recently had his attention drawn to the property.

The following are the more important minerals containing sodium sulphate. The chemical formulæ are those given by Dana ('System of Mineralogy'), but it must not be assumed that they represent in every case the actual chemical composition of the substance as found native, in which state, of course, there is always present a percentage of impurity, varying with origin and surroundings:—

Thènardite, Na_2SO_4.
Mirabilite, Na_2SO_4, $10H_2O$.
Glauberite, Na_2SO_4, $CaSO_4$.
Hanksite, $4NaSO_4$, Na_2CO_3.
Sulphohalite, $3Na_2SO_4$, $2NaCl$.
Blödite, $Na_2Mg(SO_4)$, $4H_2O$.
Apthitalite, $(NaK)_2SO_4$.
Lecontite, $(Na, NH_4, K)_2SO_4$, $2H_2O$.
Mendozite, $NaAl(SO_4)_2$, $12H_2O$.
Kronkite, $Na_2Cu(SO_4)_2$, $2H_2O$.
Ferronatronite, $Na_2Fe(SO_4)_3$, $3H_2O$.
Caracolite, $Pb(OH)Cl$, Na_2SO_4.

It would be unnecessary to enter into descriptions of all the above, some of which occur in isolated spots and in small quantities. The first three, however—thènardite, mirabilite, and glauberite—occurring in considerable quantities and presenting the sulphate in a pure, or at any rate, easily available form, may be worth fuller details.

Mirabilite, Na_2SO_4, $10H_2O$, derives its name from the term which Glauber, the discoverer of sodium sulphate, gave to that salt—viz., "Sal Mirabile." It occurs in many parts as efflorescences or crusts on rocks. In large beds it is to be found in the Ebro Valley, in Spain, where it is described as occurring in glassy layers from two feet up to several yards in thickness. According to Lunge, this deposit is quite free from iron, and very suitable for glass-making, but most of the English consumers have now given up its use, owing to its variable quality. There are also beds of mirabilite at Aussee in Hungary: Guipuzcoa in New Castile, Spain: near the hot springs at Carlsbad: in Tarapacà, Chili: St. Rambert, France. The following is an analysis quoted by Lunge ('Acids and Alkalies,' ii., 29), of the St. Rambert bed:—

Na_2O,	20·0	per cent.
SO_3,	26·0	,, ,,
H_2O,	53·0	,, ,,
MgO,	0·7	,, ,,
HCl,	trace	
	99·7	,,

Lunge also describes lakes containing in solution very pure sodium sulphate in the Russian Caucasus, and computes the total amount of sulphate at about 260,000 tons. Small deposits of a partially-hydrated sulphate, containing about 20 per cent. of water, occur at the base of Vesuvius, and in other volcanic districts, such as Hawaii.

The great Salt Lake, Utah, U.S.A., holds in solution sodium sulphate of medium purity. The following is a description from Dana's 'System of Mineralogy':—

"The sulphate is present in solution in the lakes, and in winter, when the temperature falls to a certain point, the precipitation begins and the salt accumulates, so that it is gathered from the bottom and thrown up on the shores. Under favourable circumstances, the shores get covered to the extent of several feet in thickness with crystallised mirabilite. It must be gathered as soon as formed, as if the water rise above the critical temperature the whole of the deposit is taken into solution again. This change is often very rapid, the whole deposit within reach of the waves disappearing in the course of a single day."

Glauberite is a combination of anhydrous sodium and calcium sulphates. The derivation of the name is obvious. The chief occurrences are as follows:—Ocana, New Castile, Spain; Aussee, Austria; and several places in Bavaria and Germany; the salt mine of Vic, France; and at Varengeville, near Nancy. The following is a typical analysis:—

Na_2SO_4,	50·50	per cent.
$CaSO_4$,	48·78	,, ,,
Clay, etc.,	0·40	,, ,,
	99·68	,, ,,

It also occurs with thènardite at Rio Verde Valley, Arizonà, and Tarapacà, Chili.

Thènardite, Na_2SO_4, occurs in large rhombic crystals agglomerated into masses, and is usually colourless, or of a whitish translucence, though it occasionally presents a faint bluish tint, the cause of which has not with certainty been explained. When taken from the beds the surface is clear; but on exposure to the air becomes dull and opaque, through the absorption of water. Thènardite, although generally found abundantly in the places where it occurs, is not so widely distributed as either mirabilite or glauberite. It is found, mixed with sodium carbonate, in several beds or "lakes" in the alkali plains of North America, and also at Tarapacà, in Chili. Silliman (*American Journ. Science*, 22, 204) describes an outcrop in Verde Valley, Arizonà, of which he says:—"The deposit crops out boldly in the face of the bank of the river, and seems to extend along a distance of 800 to 1,000 feet. It occurs in a white, chalky-looking formation, and the surface opening is about 10 feet wide. The ranchers of the district carry off cart-loads for use, in place of salt, for their cattle. No systematic openings of the deposit have been made, but it seems to be practically inex-

haustible." An analysis by Dunham of a sample from the above bed gave the following results:—

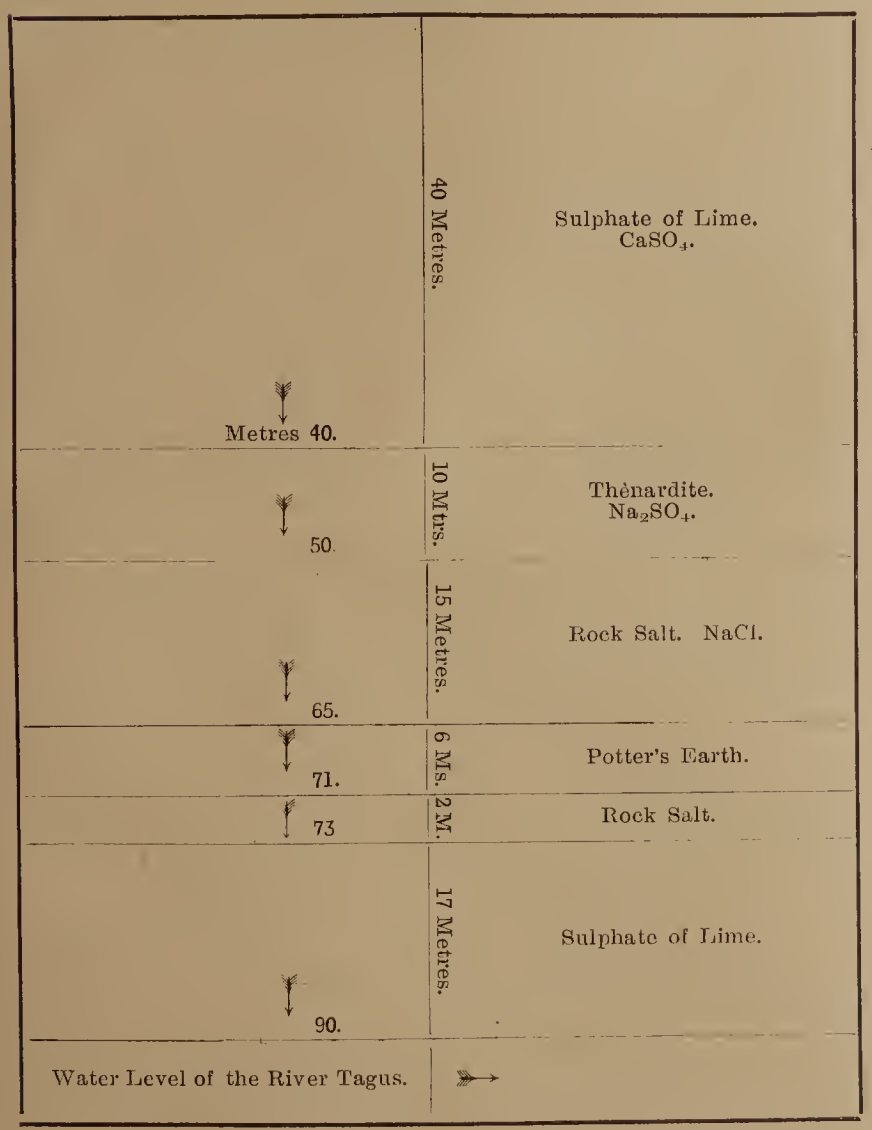
Na_2O,	43·02	per	cent.
SO_3,	56·36	,,	,,
CaO,	0·12	,,	,,
MgO,	0·02	,,	,,
Cl,	0·10	,,	,,
Insol.	0·38	,,	
	100·00		

We will now turn our attention to the large deposit of thènardite in Spain, from which I have been able to obtain the interesting specimens before us.

This deposit, although its existence has been known for some time, has only recently been measured and surveyed. It is situated in the salt mines of Castellar, at Villa Rubia de Santiago, Toledo, Spain. The thènardite had been noticed in the old salt workings, which date back many years, but was lost to view in consequence of a falling in of the galleries, and has recently been rediscovered by a further subsidence.

The deposit, which is about 10 metres in thickness, exists next to the rock salt. The arrangement of the strata will be clearly seen in the accompanying vertical section of the mine.

GEOLOGICAL SECTION OF SALT MINES OF CASTELLAR.



The beds of rock salt are of extraordinary purity, and when ground produce an excellent crystal salt. The deposit is 17 metres thick, more than 2 kilometres long, and of an average width of 500 metres. That is to say, the quantity would be more than fifteen million cubic metres.

From a cañon in the mine issues a stream of mineral water, impregnated with sulphate of soda by its passage through the deposit. This stream flows into the river Tagus, which is near by, and is of sufficient strength and volume to entirely depopulate the river of fish for some distance below that point.

The following is an analysis of the mineral water by the Spanish chemist, D. Fausto Garagaza:—

	Grammes per litre.
Sulphate of Soda	106·7000
,, ,, Magnesia	0·6336
,, ,, Calcium	0·6759
Silica	0·0154
Chloride of Sodium	0·2211
Oxide of Iron and Alumina	0·1619
Total	108·4079

The sulphate of soda contained in this water is obtained by conducting into a reservoir, where the heat of the sun evaporates the liquid, and almost chemically-pure sulphate crystallises out. This is at present consumed by a soap factory at Aranjuez.

The thènardite deposit, as mentioned before, is 10 metres in thickness, and there has actually been measured of it more than two million tons, and it is believed that at least double that quantity remains unmeasured.

The following is an analysis by Garagaza:—

Sulphate of Soda	97·049
,, ,, Calcium	0·699
,, ,, Magnesia	0·566
Chloride of Sodium	0·147
Oxide of Iron and Alumina	0·211
Silica (soluble)	0·014
Insoluble matter and loss	1·314

An analysis recently made of another sample from the deposit showed over 99 per cent. of sulphate.

It is proposed to utilise this immense deposit of practically-pure sulphate of soda in the manufacture of carbonate and caustic soda, which should prove commercially very profitable, as coal, wood, and carbonate of lime are all plentiful in the district. The quality of the sulphate is also excellent for glass-making.

This deposit of thènardite will be the first in Europe to be turned to commercial advantage in the manufacture of chemical products.

AMBROISE PARÉ AND HIS TIMES.*

BY J. GRANT ANDREW, M.B., C.M.

Assistant-Surgeon to the Victoria Infirmary, Glasgow.

The following sketch of the great French surgeon Paré is based on material derived from the classical monograph of Malgaigne and the admirable biographical study of Mr. Stephen Paget. Paré was born in 1510 and died in 1590. So that his life was practically co-extensive with the century. The potentates who ruled the destinies of Europe in his days included, in the order of time, Maximilian, Charles V., and Philip of Spain, over the Empire; Henry VIII., Edward VI., Mary, and Elizabeth, in England; and Louis XII., François I., Henry II., François II., Charles IX., Henri III., and Henri IV., in France; and Paré was Surgeon-in-Ordinary to four of these French kings. Among the more notable of Paré's contemporaries were Luther and Erasmus, Calvin and Knox, Shakespeare and Rabelias, Raphael and Titian, Montaigne, Paracelsus, Servetus, Sylvius, and Vesalius, and his long lifetime touched at opposite points of its course the Battle of Spurs and the battles of Ivry, Flodden Field and the Armada. During the Dark Ages the ban of the Church on the dissection of the human body had arrested pathological research and development in surgery, with the result that the great mediæval surgeons can be counted on one hand. The rediscovery of the literature of the ancients, which partly caused and partly followed the Renascence and the revolt against prescriptive authority, imparted new life to the study of

* Abstract of an Address delivered before the Glasgow Chemists'and Druggists' Assistants' Association on December 1, 1899.

surgery. Paracelsus, with all his charlatanry, was a beneficent iconoclast, and Paré, on the experimental side, was the great pioneer of saner methods of operative surgery and regimen. Paré was born at Bourg-Hersent, in Maine, his father being, according to one account, "coffretier," or maker of wooden chests; according to another, valet-de-chambre and barber to the Seigneur de Laval. Ambroise had a sister, Catherine, who married Gaspard Martin, a master barber-surgeon of Paris. His education was irregular and elementary. He says, quaintly:—"I desire not to arrogate to myself that I have read Galen either in Greek or Latin, for it did not please God to be so gracious to my youth that it should be instructed in the one tongue or the other."

PARÉ'S AMBITION AND ENERGY.

An opportunity which Ambroise had of "assisting" an eminent surgeon from Paris, who came to the village to perform an operation, fired him to try his fortune in Paris, and since his brother-in-law was a barber-surgeon there Paré set himself to learn surgery. There is no record of the circumstances of his student-life beyond the fact that, while still unqualified, he was lucky enough to get an appointment at the Hotel Dieu as house surgeon, where he continued three years, accumulating a vast store of data for future use, one of his teachers being the great anatomist, Sylvius. After leaving the hospital Paré did not settle down to spend his life in a barber-surgeon's shop for a practice to grow up slowly. He had too much ambition and energy for that. It was a stormy age of frequent wars, and Paré resolved to live a double life—with the army in times of war, at Paris in the intervals of peace. Accordingly we find him present at every campaign until 1569, when he ceased to wander, and lived quietly, but industriously, at home, one of the most familiar and best-beloved citizens of Paris. He died about Christmas, 1590. Just after Henri IV. had raised the siege of Paris, which, in respect of the frightful suffering which it caused, has been compared to the siege of Jerusalem by the Romans. We know nothing of the manner of Paré's death.

THE HORRORS OF WAR.

War has always had its horrors, but in this scientific age it is difficult to conceive of the monstrous inhumanities rife in Paré's times. We owe his description of these, and of the humaner methods of treatment which he introduced, to the mere accident that he was attacked in his old age by a preposterous Dean of the Faculty of Medicine, who asserted that Paré's use of the ligature after an amputation was vastly inferior to the old-established use of the cautery. "The book was an idiotic appeal to authority and tradition; the very thing that Paracelsus would have loved to burn. But it has an everlasting merit, inasmuch as it drew from Paré his 'Apologie et Traicte contenant les Voyages faicts en divers Lieulx.' This work, which is remarkable for rich humour, pungent wit, and shrewd observation of the facts of disease, and of men and affairs, gives an account of Paré's campaigning experiences, and of the lessons he drew from them, and casts many instructive sidelights on the manner and customs of medical and surgical practice in the sixteenth century. The thesis of his defence being the superiority of ligaturing and soothing treatment for hæmorrhage and gunshot wounds, etc., to the orthodox methods of the actual cautery and boiling oil. He, naturally, gives much attention to the miseries of the wounded under the prevailing system. One passage will serve as a sample of his quality:—"The soldiers within the castle, seeing our men come on them with great fury, did all they could to defend themselves, and killed and wounded many of our soldiers with pikes, arquebuses, and stones, whereby the surgeons had all their work cut out for them. . . . I had read in John de Vigo . . . that wounds made by firearms partake of venenosity, by reason of the powder, and for their cure he bids you cauterise them with oil of elders, scalding hot, mixed with a little treacle; and, to make no mistake, before I would use the said oil, knowing this was to bring great pain to the patient, I asked first, before I applied it, what the other surgeons did for the first dressing, which was to put the said oil, boiling well, into the wounds, with tents and setons; wherefore, I took courage to do as they did. At last, my oil ran short, and I was forced instead thereof to apply a digestive made of the yolks of eggs, oil of roses, and turpentine. In the night I could not sleep in quiet, fearing some default in not cauterising, that I should find the wounded to whom I had not used the said oil dead from the poison of their wounds, which made me rise very early to visit them, where, beyond my expectation, I found that those to whom I had applied my digestive medicament had but little pain, and their wounds without inflammation or swelling, having rested fairly all night; the others to whom the boiling oil was used I found feverish, with great pain and swelling about the edges of their wounds. Then I resolved never more to burn thus cruelly poor men with gunshot wounds." Paré then relates how he paid court to a surgeon of Turin to discover his secret and sovereign balm for gunshot wounds. He succeeded, and was much gratified to find the recipe, which was to boil in oil of lilies young whelps just born and earthworms prepared with Venetian turpentine, "was like that which I had obtained by chance."

SIXTEENTH CENTURY DRUGGING.

One of the cures upon which Paré dwells with venial pride will have a peculiar interest for pharmacists as an example of the sixteenth-century drugging. By the command of the King, Paré attended M. d'Auret, a Flemish nobleman, who was almost moribund with a suppurating gunshot wound in the thigh. Paré very naïvely remarks that when he saw that the patient was so ill he was very sorry that he had come, for his own reputation. In consultation with the staff of physicians and surgeons who had been treating d'Auret for seven months, Paré prescribed a course of treatment which is only partly indicated in the following extracts:—"For the bedsore . . . a fresh soft bed, with clean shirt and sheets. For the swelling and coldness of the limb hot bricks, sprinkled with a decoction of nerval herbs in wine and vinegar, and to the feet an earthenware bottle filled with the decoction. The thigh and the whole of the leg to be fomented with a decoction made of sage, rosemary, thyme, lavender, flowers of chamomile and melitat, red roses boiled in white wine, with a drying powder made of oak-ashes and a little vinegar and half-a-handful of salt. For the bedsore a large plaster made of the desiccative red ointment and of Ung. Committissae equal parts. . . And for the strengthening of the heart a refrigerant of oil of water-lilies, ointment of roses, and a little saffron dissolved in rose-vinegar and treacle, spread on a piece of red cloth. For the syncope . . . good nourishment full of juices, as raw eggs, plums stewed in wine and vinegar, broth of the meat of the great (stock) pot, the white meat of fowls, partridges' wings minced small, and other roast meats easy to digest, as veal, kid, pigeons, partridges, thrushes, and the like, with sauce of orange, verjuice, sorrel, sharp pomegranates; or he may have them boiled with good herbs, as lettuce, purslane, chicory, buglass, marigold, and the like. At night he can take barley-water, with juice of sorrel and of water-lilies, of each two ounces, with four or five grains of opium, and the four cold seeds crushed, of each half an ounce. . . . For the great pain in his head his hair must be cut and his head rubbed with rose vinegar just warm . . . also a forehead cloth of oil of roses and water-lilies and poppies, and a little opium and rose-vinegar, with a little camphor, all wrapped in a handkerchief, to be held some time to his nose. . . . And we must make artificial rain, pouring water from some high place into a cauldron, that he may hear the sound of it, by which means sleep shall be provoked in him. . . . For the knee, ointment of mallows and oil of lilies, and a little *eau-de-vie* and a wrapping of black wool with the grease left in it." It is evident from this example that Paré possessed one of the chief secrets of success in medical practice—he was a master of minutiæ; but while, probably, some of the details were introduced for the sake of their dramatic or moral effect, Paré did not omit the essentials, which were the opening of the abscess and the administration

of opium, along with careful dieting. This use of opium in an age which esteemed powdered unicorn's horn a panacea and crushed mummy "the sovereign'st thing on earth for an inward bruise" is significant of Paré's bias towards more rational modes of treatment. The last book that Paré wrote was in denunciation of the craze for mummy. "Ambroise will have none of it, 'flesh of decomposed, cadaverous, dead bodies.' He has never seen it do anything but give the patient a pain inside and make him sick. The ancient Jews, Egyptians, and Chaldees never dreamed of embalming their dead to be eaten by Christians. . . . It smells so bad that fishermen use it for bait. . . . Nobody is sure what it really is. Some people believe that mummy is made and manufactured in our own France, and that they take the bodies, by night, off the gallows, eviscerate them, dry them in an oven, dip them in pitch, and sell them for good, true mummy, saying they bought them of Portuguese merchants, who brought them from Egypt." He then tells the story of a friend of his who visited a storehouse of mummies, owned by a Jew, at Alexandria. Asked if the bodies had been brought from the sepulchres of the ancients, "The Jew fell a-laughing and mocked at this . . . saying that it was not four years since he had prepared all these bodies himself, thirty or forty, and they were the bodies of slaves and such-like people. He did not care whence they came, nor what they died of, nor whether they were young or old, male or female, provided he got them, and nobody could tell who they were once they were embalmed, and he marvelled greatly that the Christians were so greedy to eat the bodies of the dead."

Paré as a Writer.

Considering the activity and vicissitude of his life, Paré was a prolific writer. His writings, according to the custom of his time, range over a wide variety of subjects in anatomy, surgery, medicine, obstetrics, State medicine, pathology, pharmacy, natural history, and demonology. Many of his treatises brought him into violent conflict with the Faculty of Medicine, which controlled the whole profession at that time. The interests of the three leading branches of applied medicine were represented by (1) the corporation of barber-surgeons, which had worked its way up from the position of a craft to a quasi-professional footing; (2) the confraternity of surgeons; and (3) the Faculty of Medicine, which stood for the physician proper. These institutions were perpetually engaged in a sort of triangular duel. Paré began his career as a member of the corporation of barber-surgeons. He underwent two examinations, but it is not quite clear whether they were two separate examinations or whether Paré failed the first time he went up. When Paré became distinguished by his skill and his Court appointment, he naturally wished for a better professional status, and he sought to enter the confraternity of surgeons; and they were so eager to have him that they plunged into a labyrinth of irregularities, and, although they made a pretence of ploughing him, he was admitted soon after, and it was understood that the examination was merely formal. His enemies of the Faculty never allowed him to forget that he had been smuggled into the fold; but the great grievance which that body had against him was that he wrote his books in the vernacular, and even when he got some of them turned into Latin they were not propiated, but Paré held his own against them, and sometimes outflanked all their forces.

Paré's Limitations.

While Paré's works contain much sound doctrine on the subjects with which they deal, they also reveal the limitations of the man, which, of course, reflect the limitations of his age. "He had no knowledge of the circulation of the blood, or of the absorbent system, no anæsthetics, no antiseptics, no bacteriology; his understanding of the nervous system was not in advance of his times, and he had neither microscope, nor stethoscope, nor thermometer." Paré believed that the stars influenced the course of disease, that the plague came of itself by the Divine will apart from Nature, as a punishment for the sins of the people, although he endeavoured to trace its natural causation, that maggots in wounds and many other living things were generated spontaneously. He believed in the devil, evil spirits, sorcery, and witchcraft, and in the power of saints to cure disease. He had a firm faith in the royal touch for the king's evil. As an offset to these superstitions, we find that "some of his operations and methods were curiously modern. He understood and practised what we now call massage, he had a good way of producing local anæsthesia, he was opposed to immoderate bleeding, he knew the value of rest and of silence for his patients."

His Private Character.

In his private character Paré presents many engaging aspects. He was sociable, peace-loving, humane, and the friend of the poor. In some respects he was very like his illustrious successor, John Hunter, whose maxim "Why think? Why not try experiment?" was the keynote of Paré's method. "They both of them began life in the country, they saw something of war, and wrote on gunshot wounds. They spent the money lavishly when it came, they were great lovers of animals and their ways. . . . They loved the collecting of specimens, dissecting them, demonstrating them. . . . But there are two points of special likeness between them—first, the constant appeal to experience; next, the love of questioning, comparing notes, getting to know the results obtained by other men. Paré rashly predicted that the surgical advances of his times had left little for posterity to improve upon, and now his own "methods are antiquated, his theories all wrong, his books are the forgotten treasures of a few great libraries. Our methods, our explanations, will also be superseded; our books, many of them, will not even be treasured. He has kept his hold for three centuries by force of character, and that alone."

THE PHARMACEUTICAL EXAMINATIONS IN GERMANY.

The system of pharmaceutical examination and instruction was entirely rearranged after the foundation of the German Empire. The regulations now in force were issued in 1875 by the "Bundesrath," and have authority throughout the whole empire.

A young man, desiring to enter upon a pharmaceutical career must have the certificate of a "Gymnasium" or "Realgymnasium," which is obtainable by passing the "Untersekunda," and entitling him to serve only one year in the army (Einjaehrig-Freiwilligen-Zeugniss). Those who have passed the corresponding examination in a "Realschule," where Latin is not an obligatory subject of instruction, are bound to undergo a special examination in that language. The term of apprenticeship is three years, but it is shortened to two years for students who have passed the matriculation examination of a university (Abiturientenexamen).

The practical and scientific instruction of an apprentice is the duty of his master. In the larger cities like Berlin, apprentices, besides the instruction given by their masters, have the opportunity of systematical instruction by special teachers, and those who are deficient in their knowledge can have recourse to the schools of pharmacy (Pharmazieschulen), which are carried on by some pharmacists in Thuringia and Alsace-Lorraine. In several districts pharmacists have established private examinations of their apprentices in order to ascertain in what respect they are deficient.

Having passed the three years of apprenticeship, the next step is to pass the first examination for assistantship (Gehülfenprüfung). The board of examiners for the "Gehülfenprüfung" is composed of one medical officer (commonly the medical councillor to the president of the province, "Regierungsbezirk," the Regierungsrath, and Medizinalrath) and two pharmacists, one of whom must own or conduct a pharmacy. The members of the board are appointed by the authorities charged with the control of the pharmacies of the district—*i.e.*, in Prussia and Bavaria by the "Regierungspraesident," in Saxony by the "Kreishauptmann," etc. There are seventy-one boards for the assistants' examination in the Empire, in Prussia

one in each "Regierungsbezirk." The examinations are held four times a year.

The assistants' examination is divided into three parts, the written, the practical, and the oral examination.

In the written part the candidate must elaborate three themes—one belonging to pharmaceutical chemistry, one to botany or pharmacognosy, and one to physics. A collection of such themes is published by the Prussian Ministry.

In the practical part of the examination the candidate is required to read, to dispense, and to tax three prescriptions, to make a galenical or chemical preparation, and to test two chemical preparations as to their purity.

In the oral part the candidate must classify several fresh or dried plants and some raw drugs and chemical preparations, explain their derivation, their adulterations, etc., translate a pharmaceutical text from Latin into German, and answer questions about the principles of botany, chemistry, physics, and legislature.

Having passed this examination and obtained the position of qualified assistant (Apothekergehülfe) a period of three years must be spent in practical work in a pharmacy. Half of that period may be passed in a foreign country, and military service must also be got through.

At the end of the three years the assistant is entitled to attend a university, where he passes one and a half year, and his education is concluded by the qualifying examination (pharmazeutische Staatsprüfung), for which candidates present themselves before the special examining boards connected with every university, and with some technical high schools, academies, etc. There are such examining boards in the universities of Berlin, Bonn, Breslau, Erlangen, Freiburg, Giessen, Goettingen, Greifswald, Halle, Heidelberg, Jena, Kiel, Koenigsberg, Leipzig, Marburg, München, Rostock, Strassburg, Tübingen, Wuerzberg, in the academy of Muenster, and in the technical high schools of Brunswick, Darmstadt, Karlsruhe, and Stuttgart.

The members of these boards, comprising a professor of chemistry, a professor of physics, a professor of botany, and two pharmacists (or one pharmacist and a professor of pharmaceutical chemistry) are appointed annually by the central authorities of those federated States, which have a university—*i.e.*, the ministries of Prussia, Bavaria, Saxony, Wuertemberg, Baden, Hesse, Mecklenburg-Schwerin, Brunswick, Alsace-Lorraine, and the joint ministries of the Saxon duchies. The examinations are held twice a year, and they are subdivided into five parts: preliminary examination, pharmaceutical technic, chemical analysis, pharmaceutical sciences, and final examination.

The preliminary part consists in three themes, taken from inorganic chemistry, organic chemistry, and botany or pharmacognosy.

In the technical part the candidate must make two galenical and two chemical pharmaceutical preparations.

In the analytical part he must test a natural or artifical mixture by qualitative and (partly) quantitative analysis and a poisoned or adulterated organic or inorganic substance (food or medicine). All this work is done with doors locked.

The examination in pharmaceutical sciences is an oral one. The candidate must demonstrate at least ten fresh or dried officinal plants, or such plants as are easily confounded with them, at least ten raw drugs, referring to their derivation, adulterations, and pharmaceutical application, and some raw materials or chemical preparations as to their adulterations, ingredients, manufacture, etc.

The final examination, which is oral and in public, is a comprehensive one.

The qualifying document is given by the State ministries above mentioned.

The average number of pharmacists qualified each year is about 600. The number of failures is not published.

As already quoted in this Journal (October 21, 1899), it is now intended to raise the educational standard by requiring the student to take the "Prima," and by prolonging and enlarging the scientific courses.

THE ORIGIN OF THE WORD "PHYSICIAN."

At the meeting of the General Medical Council, on Saturday, December 2, Mr. Brudenell Carter read the following extract, bearing on the origin of the word "physician," from a letter written by Dr. Murray, the editor of the Oxford Dictionary:—

Dr. Murray said: "The word was taken by us from Norman French in the thirteenth century in the form *fisicien* and in its present sense of practiser of the healing art, medicus; the only sense which it had in contemporary French. It has never had any other sense in English, though one or two writers have expressed a desire to abolish this and to convert the word back to the sense of Latin *physicus*, Greek φυσικός, student of nature, naturalist, natural philosopher. Hume did this, but only as an etymological fancy. In French it has been different; *médecin* has successfully ousted *physicien*, and the latter in modern French since the sixteenth century has meant physicist. If you will turn to Du Cange's Lexicon of Mediæval Latin you will find that the regular mediæval Latin sense of *physica* is medicine, and *physicus* equals *medicus*. But in classical Latin and as late as the Latin lexicons come down—*i.e.*, to the fifth century or so, *physica* in Latin literature meant natural science and *physicus* a physicist. What you have to do, then, is to show how Latin *physicus* and *physica* passed between the fourth or fifth and, say, the eighth or ninth centuries, during the very midnight of the Middle Ages, from the ancient to the mediæval and modern sense. This is an inquiry that lies far away behind the scope of an English or even a French dictionary; it is part of the general history of the Latin language during the period of the break-up of the Roman empire and civilisation, for which perhaps no materials exist, and all that can be said is that the change took place and was a very natural and intelligible one. I have little doubt that even in the third century the common peasant of Italy or Gaul thought a *physicus* must know something about the influence of stars and planets and mysterious influentias or influenzas generally and about the position of bones and virtues of herbs, the only practical use of *physica* to him, and so thinking the *physicien* a *medicus* called the *medicus* a *physicus*. Does not the ignorant nineteenth-century Englishman call a drug-seller a chemist for the same reason, and does not the drug-seller find it profitable to call himself a chemist, which he is much less than a baker or a whisky maker is? Well, when the Roman civilisation perished all the literary class (as a class) perished and the peasant survived, and his Latin became the language of the modern world. He did not call in a *medicus* to use his *medicina* to cure his bad *crures* or his aching *caput*, but got a *physicus* with his *physica* (*fisicus* and *fisica* he wrote them when he could write) to attend to his *gampas* (pins or hockey-sticks) or his *testa* (shell or cocoa-nut). The substitution of *physicus* for *medicus* is then only part of the great revolution; but it lies a long way anterior to English and to the Englishmen of the thirteenth century who accepted *physicien* or *fisicien* as quite the fashionable courtly learned title for their own leche or leech. Of course, modern etymologists, going back to the original Latin and Greek sense, are apt to think the words ought to have the original sense, which is to undo history, and pull down the Tower, St. Paul's, and Westminster, to say nothing of Cannon-street Station, in order to restore Roman London. (They do so at Athens and Rome.)"

FUMIGATION FOR PHTHISIS.—Evaporate 20 to 30 drops of the following mixture on a hot plate in the patient's room:—Formaldehyde (40 per cent.), 60; creosote, 15; turpentine oil, 37·5; menthol, 1.—*Wien Klin. Rund.*, **13**, 467, after *Pharm. Centralh.*

PHARMACEUTICAL SOCIETY.

EVENING MEETING.

The second evening meeting of the session in London was held in the Pharmaceutical Society's house, 17, Bloomsbury Square, W.C., on Tuesday, December 12. The PRESIDENT—Mr. William Martindale—took the chair at eight o'clock, and introduced Professor J. Millar Thomson, F.R.S., one of the Society's examiners, who proceeded to deliver an interesting lecture on

Some Relations of Water to Other Substances.

Professor Thomson commenced by dividing the subject matter he proposed to consider in his lecture into the four following heads:—(1) The relation of water when combined as a whole with other substances; (2) Its relation to other substances as a solvent; (3) Its relation to the crystalline form of salts deposited from solution; and (4) Its relation to the colour and composition of certain substances.

Considering the combination of water with substances, Prof. Thomson showed the controlling effect of temperature upon such combinations, more especially when water unites with bases, as in the case of copper oxide; at the ordinary temperature the blue hydrated oxide $CuO \cdot H_2O$ being formed, but if the temperature be raised to the boiling point of water— viz., 100° C., no combination between the base and the water takes place, and the anhydrous black oxide CuO is alone obtained. The similar union of water with salts was touched upon; the heat of combination between anhydrous calcium chloride and water to form the hydrated salt $CaCl_2 \cdot 6H_2O$ being experimentally demonstrated.

Passing to the relations of water to substances as a solvent, attention was first given to the very varied rates at which, and amounts in which, substances dissolved in water; this point being illustrated experimentally and also by means of diagrams indicating the rates of the solubility of different salts, and also certain exceptions and peculiarities to the regular rules of solubility which may be seen in common salt, calcium sulphate, and Glauber's salt.

Professor Thomson then dealt with the question of hot and cold saturated solutions, illustrating the deposit or crystallisation of various salts during the cooling, that is, the passing of a solution from the hot to the cold point of saturation, and indicated some of the various crystalline forms in which the salts were obtained during the process. The effect of the temperature at which the salt is deposited controlling the crystalline form and the amount of water attached to the salt was also dealt with.

After considering the principal questions relating to what may be termed ordinary solution, Professor Thomson pointed out that many salts showing peculiarities in their mode of solution also show abnormalities in their methods of deposition, this giving rise to the so-called states of supersaturation. Flasks containing supersaturated solutions of sodium sulphate and sodium acetate prepared at their temperatures of maximum solubility, tightly stoppered with a cork or with cotton wool and allowed to cool, did not deposit the excess of salt on regaining the ordinary temperature. On being opened, however, the large excess of salt retained by them is suddenly discharged, the whole contents of the flasks becoming solid. The question of the circumstances causing this sudden crystallisation was discussed, Professor Thomson showing experiments proving that it is not due to mere shaking, but to the entrance of minute particles which start the crystallisation. He finally demonstrated that the active nuclei must be either a particle of the same salt as that in solution or of a salt isomorphous with it and of similar chemical structure. The application of these phenomena to the separation of dissimilar salts was also shown, and an account was given of experiments dealing with the action of one or other of the component salts as active nuclei on supersaturated solutions of compound salts.

In connection with the relation of water to crystalline form, it was shown that the amount of water attached to salts varied if these salts were deposited or crystallised at different temperatures, the quantity of water generally diminishing as the temperature rises. This is to be seen in salts such as magnesium or iron sulphates, which on deposition from their solutions at the ordinary temperature give a general composition of $MSO_4 \cdot {}_7H_2O$, but at higher temperatures crystallise with $6H_2O$, or even $5H_2O$. The same is seen on heating copper sulphate to 100° C., when the whole crystalline structure is destroyed and a certain fixed quantity of water passes off from it. Professor Thomson then explained the term "water of crystallisation," and alluded to the various systems of crystals into which each variety of crystal might be classified.

Attention was next drawn to the peculiarly hydrated salts investigated by the late Professor Guthrie and called by him "Cryohydrates," which are definite aggregations of the salt with water, only formed temperatures much below the usual ones at which salts crystallise. Passing to the relation of water to the colour of certain substances, the various changes of colour with change of composition were shown by the properties of various cobalt salts. Thus cobalt chloride or bromide, in their full state of hydration, as $CoCl_2 6H_2O$, red in colour, but on heating became blue, due to the formation of the dihydrate $CoCl_2 2H_2O$. Similar changes were exhibited with cobalt iodide, which shows these changes almost in a more marked manner, dehydrating from $CoI_2 6H_2O$ into the $CoI_2 \cdot 4H_2O$, $CoI_2 \cdot 2H_2O$, and the anhydrous salt CoI_2 as the temperature rises, and exhibiting for each of these states of hydration the various colours of pink, green, yellow, and, finally, black. Pictures were shown painted with these various salts, which, in the fully hydrated condition, give the idea of a sepia sketch, but which on heating change colour, giving the various tints of a spring landscape.

These changes of colour with change of hydration may also be seen with solutions of the salts, as dehydration takes place between the salt molecules and the molecules of water at the various temperatures showing a temporary dissociation, which is accompanied with a change in colour as long as the solution remains at that particular temperature. On cooling they return to the original colour.

The lecture, which was fully illustrated by experiments, was listened to with close attention throughout.

The PRESIDENT said Professor Thomson had given a very interesting lecture, and performed some beautiful experiments, and he was sure that all present were thankful to him for a very pleasant hour. There was, however, one interesting change with regard to water that had not been referred to by the lecturer—namely, the crystallisation of water into snow that had taken place in the atmosphere that day. But he supposed that was an experiment which would be difficult to perform in that room. He asked all present to show their appreciation of the lecture by according a hearty vote of thanks to the lecturer.

This was done by acclamation, and Professor THOMSON replied.

The PRESIDENT then announced that the next evening meeting would be held on February 13, 1900.

The usual pharmaceutical refreshments were provided in the Examination Hall.

BENEVOLENT FUND GENERAL MEETING.

ELECTION OF ANNUITANTS.

A general meeting of the members of the Pharmaceutical Society and of subscribers and donors to the Benevolent Fund was held at Bloomsbury Square, on Tuesday, December 12, for the election of four annuitants on the Benevolent Fund.

Scrutineers were appointed, and, Mr. E. N. BUTT having been elected as Chairman, they proceeded to examine the voting papers.

The general meeting then adjourned until the scrutiny had been completed.

At the adjourned meeting, Mr. WILLIAM MARTINDALE, President in the chair, the Scrutineers presented the following report:—

SCRUTINEERSS' REPORT.

We, the undersigned Scrutineers appointed at the thirty-fifth election of annuitants on the Benevolent Fund of the Pharmaceutical Society of Great Britain, do hereby certify that we have examined the voting papers committed to us, and report the following results:—

Bosley, Emily Jane	6,407
Troke, Charles	6,322
Stangroom, Frederick	5,995
Burrows, Hampden C.	4,282
Holt, Richard Wylde	3,773
Partridge, Thomas S.	897

4,089 voting papers were received, of which number 96 were informal (59 unsigned, representing 189 votes, and 37 incorrectly filled up, representing 130 votes). 7,045 voting papers were issued.

EDWARD N. BUTT, Chairman.

F. Bascombe.	W. B. Nelson.	John T. Wallis.
G. S. Taylor.	F. A. Upsher Smith	W. Pickard.
J. W. Bowen.	J. H. Shacklock.	A. J. Bullen Cooper.
R. Fisher Young.	Harry Wilson.	D. R. Jacks.
E. W. Lucas.	I. Bourdas.	A. J. Wing.
W. Fred Gulliver.	W. Prior Robinson	H. Bate.
Herbert Cracknell.	Henry Wiggins.	

The PRESIDENT then declared the following duly elected annuitants:—

Bosley, Emily Jane.	Stangroom, Frederick.
Troke, Charles.	Burrows, Hampden C.

The PRESIDENT proposed a vote of thanks to the Scrutineers for their services, which was seconded and carried unanimously, and was acknowledged by Mr. E. N. Butt.

Donations to the Library and Museum.

At a meeting of the Library, Museum, School and House Committee, on Wednesday, December 13, the Librarian and Curator presented the following reports of donations:—

TO THE LIBRARY (LONDON).

Royal Institution of Great Britain:—Proceedings, No. 92; List of Members, 1899.

Philosophical Society of Glasgow:—Proceedings, 1898-99, vol. 30.

Royal Medical and Chirurgical Society:—Medico-Chirurgical Transactions, vol. 82.

University College, London:—Calendar, 1899.

University College, Nottingham:—Calendar, 1899.

Mr. M. Carteighe:—Men and Women of the Time, 1895.

Mr. H. Wippell Gadd, Exeter:—Synopsis of the British Pharmacopœia, 1898, 4th edition.

Mr. C. W. Peach, London:—Thomson's London Dispensatory, 1811.

Mr. G. J. Seabury, New York:—Shall Pharmacists become Tradesmen? 1899.

Professor Remington, Philadelphia:—United States Dispensatory, 18th edition, 1899.

Mr. R. T. Baker, Technological Museum, Sydney:—On three new species of Eucalyptus.

Mr. H. G. Smith, Sydney:—On the Crystalline Camphor of Eucalyptus Oil, etc.

Proprietors of Chemist and Druggist:—The Chemist and Druggist, 1899: The Chemists' and Druggists' Diary for 1900.

Kaiserliche Akademie der Wissenschaften in Wien:—Sitzungsberichte, 107 Band, 4.—10. Heft.

Kaiserliche Leopoldinisch-Carolinische Deutsche Akademie der Naturforscher:—Nova Acta, Bd. 71, 74.

TO THE LIBRARY (EDINBURGH).

Mr. A. K. Baxter, Leith:—Priestley on Air, 2 vols., 1790.

Mr. H. Wippell Gadd, Exeter:—Synopsis of the British Pharmacopœia, 1898, 4th edition.

TO THE MUSEUM (LONDON).

Messrs. S. Figgis and Co., London:—Specimen of Suez senna.

Messrs. Jenkin and Phillips, London:—Specimen of Colombian red bark.

Commendatore Thos. Hanbury, F.L.S., Ventimiglia:—Specimens of the fruits of *Diospyros kaki*, *D. virginiana*, *Pyrus sorbus*, *Cydonia sinensis*, and *Ficus* species.

Mr. H. Collier, London:—Ingredients of a Chinese prescription for broken limbs.

TO THE HERBARIUM (LONDON).

Mr. R. J. Mellor, Hemel Hempstead:—Specimen of *Rubus fruticosus* in flower on December 2.

CHEMICAL SOCIETY.

At a meeting, held on Thursday, December 7, Dr. THORPE, LL.D., F.R.S., President of the Society, took the chair, and several new fellows were elected, including Mr. Dudderidge and Mr. E. M. Chapman, Salters' Research Fellow in the laboratories of the Pharmaceutical Society. At the conclusion of the formal business, the Chairman called for a paper by H. J. H. Fenton, M.A., F.R.S., and H. O. Jones, B.A., B.Sc., on the

OXIDATION OF CERTAIN ORGANIC ACIDS IN PRESENCE OF IRON.

This now well-known reaction, the oxidation of organic oxygenated compounds, brought about by means of iron in presence of hydrogen peroxide, has furnished the authors with material for many previous communications during the last two years. The extreme interest and value of the results obtained by investigating the carbohydrates and other compounds in a similar manner has induced the authors to extend their researches to the organic acids, with a view of describing completely the products obtained in the case of all of the important acids. This paper forms the first contribution on the subject. Among the acids already more or less completely investigated are glycollic, lactic, tartronic, glyceric, malic, mucic, pyromucic, picric, acetylene dicarboxylic, acetone dicarboxylic, and benzoic acids. Details will be found in the complete paper to be published in the Journal of the Chemical Society, but it may be mentioned that the action is more vigorous in some cases than in others. With glycollic acid the reaction is so vigorous that the mixture must be carefully cooled during the process. The product is glyoxylic acid. Lactic acid yields a product, pyruvic acid, that is so easily oxidised that special care has to be taken, not only to cool the mixture, but also to add the reagent gradually. An interesting point came under notice in the oxidation of tartronic acid. The mesoxalic acid formed had a melting point of 172° C., contrary to published statements that the melting point is 160° C. Glyceric acid, perfectly pure and freed from traces of glycerin, gave an almost quantitative yield. The oxidation of malic acid affords material for a separate communication. Mucic and saccharic acids have been investigated, but not completely. Pyromucic acid gives a beautiful transient violet coloration, when oxidised. With picric acid a green colour is obtained. The product obtained by the oxidation of acetone dicarboxylic acid strikes a purplish colour with ferric salts, and gives a precipitate with phenyl-hydrazine. There are some acids oxidised as easily without iron as with it. Of those benzoic acid is an example.

Mr. Fenton was then asked to read the next paper, on

OXALACETIC ACID.

When malic acid is subjected to the foregoing treatment it tends to yield carbon dioxide and pyruvic acid with the greatest ease. When, however, sulphuric acid is present and the liquid product is extracted with ether, a substance is obtained that proves, on analysis, to be oxalacetic acid. It strikes a red colour with ferric salts, and is scarcely altered by dilute acids. The yield is 22 per cent. It is slowly soluble in water—though it cannot be described as sparingly soluble—and easily soluble in alcohol. Its slow solubility in ether renders its extraction a tedious process; even the thirty-fifth extraction with ether was found to leave some oxalacetic acid behind. When dried in a vacuum and analysed its formula was found to be $C_4H_4O_5$. On titration this acid acts as a dibasic acid. Contrary to statements made in text-books this substance is quite stable and easily obtained. Water, however, has some action upon it, altering its eutralising power.

Next followed a communication by A. W. Crossley, M.Sc., Ph.D., and H. R. Le Sueur, B.Sc., dealing with "The Determination of the Constitution of Fatty acids, Part II." Ethylisopropyl

acetic acid was the subject of the paper. Its reactions were given, and from these the constitution was reasoned out.

Then a paper was given by R. H. Adie, M.A., B.Sc., and K. C. Browning on the

Reactions Between Sulphuric Acid and Potassium Ferrocyanide.

When strong, pure sulphuric acid is poured on crystals of potassium ferrocyanide they dissolve, but no gas is evolved, even above 200° C. The change brought about may be represented by the equation:—

$$K_4FeC_6N_6 + 4H_2SO_4 = 4KHSO_4 + H_4FeC_6N_6.$$

The presence of water gives very different results, varying with the amount of water present.

When the proportion of water reaches two molecules for every molecule of sulphuric acid present, all the carbon is converted into carbon monoxide. Thus:—

$$K_4FeC_6N_6 + 8H_2SO_4,2H_2O = 4KHSO_4 + FeSO_4 + 3(NH_4)_2SO_4 + 6CO + Aq.$$

The hydrolysis appears to be due to the sulphuric acid rather than to water. As the mixture is diluted the yield of carbon monoxide diminishes in quantity, none being formed when $10H_2SO_4$ $4H_2O$ is the proportion and strength of acid per molecule of potassium ferrocyanide. In this case Everett's salt and hydrocyanic acid are produced. The Everett's salt is formed as a result of the action of potassium sulphate on hydroferrocyanic acid. When this acid is treated with water it yields prussic acid and ferrous cyanide:—

$$\overbrace{H_4FeC_6N_6}$$

$$4HCN{\cdot}Fe(CN)_2 + Aq = 4HCN + Fe(CN)_2 + Aq.$$

It is a most interesting point that air assists the decomposition of potassium ferrocyanide, reducing the time necessary for the completion of the reaction with sulphuric acid from ten hours down to two. Now this explains in a plausible way the instructions given to students in manuals of chemistry to place in the retort fragments of pumice, brick, or porous tile. It has generally been stated that such additions are necessary in order to prevent bumping, but the authors point out that no doubt the air imprisoned in the pumice, etc., is of service in hastening the process.

The discussion was joined in by Messrs Travers and Groves, Professor Ramsay, and the Chairman. The last-named mentioned that some time ago, when preparing large quantities of carbon monoxide by this method, he never got the theoretical yield. He drew the authors' attention to an old paper published by Dittmar, in which it is shown that the strongest sulphuric acid obtainable contains a certain amount of water, the strongest containing one molecule of water to twelve molecules of sulphuric acid.

When Mr. Adie had replied to the various points raised, he followed on with a paper on the

Sulphates of Bismuth.

Several sulphates of bismuth have been described, but the different workers are at variance as to their constitution. There is the normal sulphate $Bi_2(SO_4)_3$, besides two others having the formulæ $BiH(SO_4)_2{\cdot}3H_2O$ and $Bi_2O_3{\cdot}2SO_3{\cdot}2H_2O$, and a mixture of these two obtained by dissolving bismuth oxide in moderately concentrated sulphuric acid. On attempting to prepare definite sulphates by using strong sulphuric acid, $H_2SO_4{\cdot}2H_2O$, the authors found on analysis that the product gave widely varying results, the yield of oxide being 44—59 per cent. They were on the point of abandoning the investigation when it occurred to them that better results might possibly be obtained by starting at the other end with dilute acid. This was done, and with acid having the strength represented by the formula $H_2SO_4{\cdot}12H_2O$, crystals were obtained of the constitution, $5Bi_2O_3{\cdot}11SO_3{\cdot}17H_2O$. When the number of water molecules was lowered to five, $Bi_2O_3{\cdot}4SO_3{\cdot}74H_2O$ was obtained, and three molecules of water gave $BiH(SO_4)_2{\cdot}3H_2O$. The last-named product decomposes at 173° C. with production of the normal sulphate. Crystallisation with strong acid takes place in two stages, the first crop sinking at 240—280° C., and the other at 130° C. down to the air temperature. These two crops were collected separately, when the first proved to be $BiH(SO_4)_2$, corresponding to 57 per cent. of bismuth oxide. The crystals formed below 170° C. had the constitution $Bi_2O_3{\cdot}5SO_3{\cdot}10H_2O$, corresponding to 44 per cent. of oxide. This is a new sulphate of bismuth. Evidently the temperature employed is of importance, as well as the strength of acid. The question of time may also affect the result. The conclusion is that below 170° C. bismuth oxide dissolves in strong sulphuric acid forming $Bi_2O_3{\cdot}5SO_3{\cdot}10H_2O$; with a rise in temperature sulphuric acid and water split off, an acid sulphate separating out. Prolonged heating gives the normal sulphate.

INCOMPATIBILITY AND SOME OF ITS LESSONS.*

BY WALTER G. SMITH, M.D.

Ex-President Royal College of Physicians, Ireland; Physician to his Excellency the Lord Lieutenant; King's Professor of Materia Medica and Pharmacy, School of Physic, T.C.D.

Part II.—General. (*Continued.*)

Heterogeneous Systems,

i.e., either a precipitate formed or a gas liberated.

Sometimes an intentional incompatibility is committed, *e.g.*, all effervescing draughts: seidlitz powders; sodii phosph. efferv., B.P.; sodii sulph. efferv., B.P.; sodii citro-tart. efferv., B.P.; lotio nigra.

Some incompatibilities are trivial and comparatively unimportant, *e.g.*, vegetable astringents (tannic and gallic acids) with iron salts; lead salts and opiate solutions (meconate of lead); ferric chloride and tincture of opium (ferric meconate).

In very dilute solution, *e.g.*, of $HgCl_2$, it is obvious that precipitations may not occur which would happen in stronger solutions.

Of the more important changes which should, as a rule, be avoided, we will notice:

(1) *Action of halogens upon Liq. ammoniæ.*

The reaction between the halogens and the fixed alkalies has been already referred to.

With ammonia the case is different.

(*a*) Free Cl or Br liberates nitrogen gas, and the effervescent solution is colourless:

$$4NH_3 + Br_3 = 3NH_4Br + N.$$

(*b*) A more important reaction occurs with iodine.

When Liq. ammoniæ (or Lin.. camph. ammoniatum) is added to Tinct. iodi (or liquor iodi) the colour of the iodine is discharged, and a black precipitate forms, the so-called iodide of nitrogen.

This is a most unstable substance, and when dry very explosive. Dangerous accidents have occurred through ignorance or carelessness in dealing with it, after collection on a filter. The black precipitate is an iodine derivative of ammonia, and its formula is usually given as NHI_2 or NI_3. But according to Chattaway and Orton, the true formula is $N_2H_3I_3(NH_3, NI_3)$, and they have obtained it in well-defined copper-coloured crystals.

The theory of its formation is:

$$2NH_4OH + I_2 = NH_4I + H_2O + NH_4OI \text{ (hypo-iodite)}$$
$$3NH_4OI = NH_3 + 3H_2O + N_2H_3I_3.$$

Iodide of nitrogen is also liable to be formed when alcoholic solution of iodine is left in contact with white precipitate.

*Reprinted, by permission, from the *Practitioner*. Continued from page 554.

Iodide of nitrogen is analogous in composition to silver fulminate, NAg_3 or $NHAg_2$, but not to fulminate of mercury, $C_2Hg(NO_2)N$, which is a derivative from the nitro-acid, $C_2H_2(NO_2)N$.

(2) *Liberation of an acid gas* (CO_2 or H_2S).

Carbonates are decomposed by :

(*a*) Free acids, except HCN and H_2S.

Examples of such stupid combination are :—Ac. sulphuric dil. with mist. cretæ ; nitromuriatic acid with aromatic spirit of ammonia ; oxymel, or syrup of squill (acetic acid), with carbonates, bicarbonates, spir. ammoniæ aromat.*

(*b*) Acid salts, *e.g.*, cream of tartar, $KH\bar{T}$.

If grey powder (hyd. *c.* cretâ) be rubbed up with conf. sulphuris ($KH\bar{T}$), the pasty mass slowly swells and becomes frothy :—

$$CaCO_3 + 2KH\bar{T} = Ca\bar{T} + K_2\bar{T} + H_2O + CO_2.$$

(*c*) Basic salts, *e.g.*, Bism. subnitras.

This slowly decomposes alkaline bicarbonates, especially if gently warmed.

Soda bicarb	.....	ʒij.
Bism. alb	.....	ʒij.
Sp. ammon. aro...	.....	ʒij.
Sp. chlorof	.....	ʒi.
Aquæ	..... ad	ʒviij.
M.		

After the bottle had been put aside for an hour it burst.

$$BiONO_3 + 2NaHCO_3 = Bi_2O_2CO_3 + 2NaNO_3 + H_2O + CO_2.$$

Bismuth carbonate should be substituted for the nitrate.

If bismuth subnitrate be added to chalk mixture, CO_2 will be slowly evolved.

(*d*) Double citrates, *e.g.*, scale preparations of iron, viz., ferri et amm. citr. ; ferri et quin. citr.

The following prescription could not be dispensed without some effervescence :—

Pot. bicarb	.....	ʒij.
Pot. iodidi	.....	ʒi.
Ferri ammon. citr	.....	ʒij.
Aquæ aurantii	..... ad	ʒiii.
M.		

Sulphides, *e.g.*, CaS, are decomposed by acids, and H_2S liberated.

Potassium chlorate reacts with strong HCl, and Cl gas is set free.

With H_2SO_4, Cl_2O_4 is liberated.

(3) *Liberation of an insoluble acid.*

Free benzoic and salicylic acids are sparingly soluble. Add a mineral acid, *e.g.*, Infus. rosæ acidum, to solution of ammonium benzoate or sodium salicylate, and note the abundant crystalline precipitate.

Neither acetic nor boric acid will cause precipitation.

Some glucosides, *e.g.*, glycyrrhizin, are precipitated from their solutions, viz., ext. glycyrrh. liq., by mineral acids, and an unsightly brown mass produced.

(4) *Mercurials.*

The following points should be noted :—

(i.) Mercurous compounds are more unstable than mercuric compounds, *e.g.*, green iodide of mercury, Hg_2I_2, which has been rejected from the B.P. owing to its instability.

(ii.) Mercuric (per) compounds sometimes assume allotropic forms, *e.g.* :

Mercuric oxide, HgO, red (red precipitate) and yellow forms (both official).

Mercuric iodide, HgI_2 (red and yellow forms).

(iii.) Mercuric compounds readily form double salts, *e.g.*, Donovan's solution (Liq. arsen. et hydr. iod.).

Lister's zinco-mercuric cyanide, $HgCy_2, 4ZnCy_2$;

Mayer's reagent, $HgI_2, 2KI$; Sal. alembroth, $HgCl_2, 2NH_4Cl$.

* Several official preparations contain free acid, viz., acetum scillæ ; infusum rosæ acidum ; liq. ferri acetatis; syr. calcis lactophosph.; syr. ferri phosph. ; syr. ferri phosph. *c.* quin. et strychn. ; syr. limonis ; syr. scillæ.

(iv.) All mercurous (sub) compounds are insoluble.

Both oxides of mercury are insoluble, and an intentional incompatibility is exemplified in Lotio hydrarg. flava, and Lot. hydrarg. nigra formed by action of lime water on the chlorides :—

$$HgCl_2 + Ca(OH)_2 = HgO + CaCl_2 + H_2O.$$
$$Hg_2Cl_2 + Ca(OH)_2 = Hg_2O + CaCl_2 + H_2O.$$

Potash and soda and their carbonates react similarly to lime water.

R. Hydrarg. perchlor.	.....	gr. i.
Liq. Fowler	.....	ʒiss.
Potass. iodidi	.....	ʒi.
Liq. peptici	.....	ʒij.
Infus. Cinch.	..... ad	ʒviii.
M.		

About as bad a prescription as could be devised.

To prescribe corrosive sublimate with arsenic, use Liq. arsen. hydrochlor.

A solution of $HgCl_2$ in glycerin is not precipitated by Liq. potassæ in the cold.

Ammonia behaves quite differently.

With corrosive sublimate it forms "white precipitate" (hydrarg. ammon., B.P.).

$$HgCl_2 + 2NH_3 = NH_4Cl + NH_2HgCl.$$

With calomel, "black precipitate" is formed (not official).

$$Hg_2Cl_2 + 2NH_3 = NH_4Cl + NH_2Hg_2Cl.$$

Borax added to $HgCl_2$ precipitates red oxychloride of mercury.

Calomel is converted into mercuric salt by HCN, and turns black from liberation of metallic mercury :—

$$Hg_2Cl_2 + 2HCN = Hg(CN)_2 + 2HCl + Hg.$$

Calomel is decomposed and blackened by bromide of potassium in presence of a trace of moisture.

$$Hg_2Cl_2 + 4KBr = (HgBr_2, 2KBr) + 2KCl + Hg.$$

This is a dangerous incompatibility, and these two salts should never be prescribed together, for a poisonous mercuric salt is formed.

The following prescription was written for a child (result to child not stated) :—

Potass. brom.	.....	gr. x.
Calomel	.....	gr. iii.
M. Mitte tales iii.		

(*Ph. J.*, Feb. 24, 1894.)

Calomel is decomposed by pure iodide of potassium and blackened, and yellow mercurous iodide is also formed.

Tincture of iodine acts upon calomel in a somewhat complex fashion, with precipitation of red iodide of mercury.

$$Hg_2Cl_2 + 4KI = (HgI_2 2KI) + 2KCl + Hg.$$
$$Hg_2Cl_2 + I_2 = HgCl_2 + HgI_2.$$
$$HgCl_2 + I_2 = HgICl + ICl.$$—(*Ph. J.*, Feb. 24, 1894.)

This is a dangerous and objectionable reaction.

The following prescription was ordered to be painted on a glandular swelling on the neck :—

Tinct. iodi. ʒi. ; calomel gr. xx. M.

Calomel and iodoform left in contact turn scarlet from formation of HgI_2. The reaction possibly is :—

$$CHI_3 + Hg_2Cl_2 = CHCl_2I + HgI_2 + Hg.$$

Corrosive sublimate is, in one sense, incompatible with KI, and mixed in molecular equivalents, red iodide of mercury is precipitated (B.P. process).

But excess or KI quickly forms the colourless solution of double iodide ($HgI_2 2KI$), so that the favourite combination of, say, 1 gr. $HgCl_2$ in ʒvi. of solution of KI (5-10 grains to ʒi.) is quite legitimate and therapeutically efficient.

℞	Pulv. calcii sulphidi	.... gr. xv.	
	Liq. hydr. bichlor.	..... ʒvi.	
	Pot. iodidi	..... gr. xl.	
	Pot. bicarb.	..... ʒiiss.	
	Aq. chlorof.	.....ad ʒviii.	
	M.		

No ingenuity can render this prescription presentable.

(To be continued.)

PHARMACEUTICAL JOURNAL.

Publishing and Advertising Office: 5, SERLE STREET, W.C

LONDON: SATURDAY, DECEMBER, 16 1899.

THE PHARMACY ACT, 1868, AND "COMPANY PHARMACY."

The use of plain English, free from ambiguity, as recommended by Mr. Glyn-Jones, in connection with the subject of "company pharmacy," is, at the present time, very obviously a pressing necessity. In regard, also, to the general matter of pharmacy law, there is an equal want of definite ideas and of suitable application of abstract principles. Judging from what has recently been said and written in this connection, the inference may be drawn that very few persons, even among the speakers and writers on the subject, have a sufficiently correct appreciation of what pharmacy law means, what is its object, what the extent of its operation, or what is the principle upon which it is based. Taking, for instance, as the Statute of most general importance, the Pharmacy Act, 1868, to which attention has recently been directed by the Companies Bill introduced into the House of Lords last Session, its intention, purport and effect, are very generally misunderstood. Instead of being, as many suppose, a measure creating a trade monopoly, in favour of a class of persons, it is altogether a public measure: its one object is the safety of the public, and every one of its provisions is directed to the attainment of that one object. The Act does not even relate, as its title would indicate, to pharmacy or to the practice of that art; neither does it relate to the trade in drugs or to the materials employed for medicinal purposes; but only to a certain limited number of those drugs and their preparations which are used for medicinal purposes chiefly, together with a few other articles of a dangerous nature that are used for various economic or technical purposes. Those drugs, preparations, chemicals, etc., to which the Act relates, are specified, in a schedule to the Act, as being poisons within the meaning and for the purposes of the Act. All the provisions of the Act relate to those articles, to the conditions under which they may be lawfully sold or supplied in the form of medicine, to the persons by whom they may be sold or supplied, either by retail or as medicine, and to the penalties incurred by disregard of the regulations laid down in those respects. The drugs, chemicals and preparations to which the Pharmacy Act relates do not amount to more than one-tenth part of those constituting the official materia medica of the British Pharmacopœia. Consequently the Act affects only a very small part of the practice of pharmacy, and as regulating the practice of that art it is from the point of view of the pharmacist only a miserably emasculate measure. Even in regard to trade transactions it is but partially effective as a poisons Act, inasmuch as it applies only to a comparatively small number of the poisonous articles employed in medicine.

The persons to whom the provisions of the Pharmacy Act relate are primarily medical practitioners and "persons known as chemists and druggists," both of whom have, in the exercise of their respective occupations, to deal with the articles included in the schedule of poisons Medical practitioners are referred to in the Act only as being specially exempted from its operation; presumably on the assumption that by their professional education and training they will have acquired a knowledge of the nature and use of the scheduled articles, as well as of the precautions to be observed with them on account of their poisonous properties. A further reason for the exemption of medical practitioners is the circumstance that, as the present representatives of the old apothecaries, they claim to be entitled to practice pharmacy as apothecaries were, in addition to their practise of medicine. Chemists and druggists—defined in the Act as persons "keeping open shop for the compounding of the prescriptions of duly qualified medical practitioners"—are the persons recognised by the Act as being authorised to keep open shop for retailing, dispensing, or compounding the articles included in the schedule of poisons. The exercise of their business in that respect is made subject to the condition that they shall be registered as the Act requires. The Act also provides that the necessary preliminary to registration as a chemist and druggist within the meaning of the Act is the passing of an examination for the purpose of obtaining a certificate of competent skill and knowledge for conducting the business of a chemist and druggist in retailing, dispensing, or compounding of poison, and becoming entitled to be registered as, and entitled to use the title of, a chemist and druggist. The Act relates also to persons who are not thus legally qualified: in regard to them it provides that it shall be unlawful for "any person" to sell poisons or to keep open shop for retailing, dispensing, or compounding poisons, or to use the title of chemist and druggist, in connection with that business, unless such person is a chemist and druggist, is registered under the Act and conforms to such regulations as to the keeping, dispensing, and selling of poisons as may from time to time be prescribed by the Pharmaceutical Society with the consent of the Privy Council.

The privileges appertaining to the statutory qualification of the Pharmacy Act, 1868, are like the qualification itself, and the acts to which it relates altogether of an individual nature. Some of the most important of those privileges are necessarily consequences of the qualification, and their conservation is a condition as necessary for the safety of the public as it is in the interest of registered chemists and druggists. In regard to selling, for instance,

no person can lawfully sell any of the articles included in the poison schedule unless he or she—whether master or servant—is a registered chemist and druggist. If the registered keeper of a shop delegates to an assistant the sale of poisons, that assistant must either be a registered chemist and druggist himself or the sale must be carried out under the immediate personal supervision of the keeper of the shop, or of a registered person acting on his behalf as well as in virtue of his own qualification. The qualification that entitles a person to sell poisons also entitles that person to keep open shop for retailing, dispensing, or compounding poisons, also to use or exhibit the title of chemist and druggist in connection with that business. As Lord SELBORNE stated in his judgment, keeping open shop extends to "something more" than performance of the several acts of selling, etc., for which qualification is required, that is to say, the direction and general management of the shop, as well as the control of sales of poison and of the arrangements for dispensing and compounding: these constitute the particular function of the keeper of a shop, and the exhibition of the statutory title points out that he is a legally qualified person. On that account qualification of the keeper of a shop for those purposes is obviously necessary for the Act to be effectual. In the case of a sale of a poison in the first part of the schedule, the keeper of a shop (according to Section xvii.) is the seller, the person responsible for the proper conduct of the sale and the person to whom the purchaser must be known. That section of the Act contemplates the possibility of such a sale being made by "any apprentice" or by a "servant" not necessarily qualified; therefore the person on whose behalf such a sale is made—the keeper of the shop and the master of the apprentice or servant—is obviously the person required by the Act to be a registered chemist and druggist, *i.e.*, the qualified owner of the shop, and there is every reason that Section i. should have the same interpretation. The cogency of the argument that the Act requires qualified ownership is even stronger in regard to the case of dispensing or compounding medicine, for the performance of which the keeper of an open shop is alone responsible, and must, in the nature of things, be especially trusted by the public in that case. In that respect the privilege of registered persons to use the title of chemist and druggist in connection with their business is the only means of distinguishing persons certified to possess the competent practical knowledge of their business necessary for securing the object of the Act. The exclusive right of legally qualified persons to use that title requires no support by argument: that is a necessity—both to prevent the public being misled and in justice to the possessors of the privilege.

Much of the difficulty experienced by the Courts in regard to the question whether the provisions of the Act should apply to a corporate body as well as to individuals has arisen from insufficient consideration of the fact that the object of the Act can be secured only by conserving individual privileges conferred by qualification; that, in fact, proprietary qualification is as essential to the principle of the Act as individual qualification. The absurdity of the argument that a company may do anything that an individual may not do, would not otherwise have remained so long unperceived, nor would judges have been misled by the equally fallacious doctrine that for the purposes of the Pharmacy Act, a qualified servant is as good as a qualified master. A further misleading influence has been exercised by the prominence given to the sale of poisons as a trade transaction, and the consequent mistaken inference that the Pharmacy Act created a trade monopoly. That mistaken view of the matter has been sedulously cultivated by persons interested in company drug stores, until many have been induced to believe that the entire business of a chemist and druggist is subject to the restrictive operation of the Act; thus popular prejudice has been unreasonably excited against its provisions and against legally qualified chemists. These misleading influences must be counteracted by proper explanation of the circumstances to members of Parliament throughout the country, and especial care should be taken to point out that the company drug store, whatever its attractions, is not a suitable place either for the sale of poisons or for the careful and proper dispensing of medicine, because it cannot in the nature of things be directed and controlled by a legally qualified proprietor in the manner declared by the Pharmacy Act to be expedient for the safety of the public.

WHOLESALE PRESCRIBING.

THE *British Medical Journal* of last week has, under this heading, an article on the subject of wholesale prescriptions, in which the practice of prescribing active drugs in the form of proprietary articles is spoken of as a very undesirable one. It is admitted that many of the articles referred to are well and carefully prepared, their composition is known, and it may be added that there is sometimes considerable convenience in the use of them by country practitioners. But the disadvantage attending the general use of such articles is that it cannot well be confined to medical practitioners. These ready-made forms of administration soon become familiar to patients, and are recommended to their friends, with the possible consequence of eliminating demand for the services of the medical man and the pharmacist, even more completely than the lending of prescriptions may do. In the case of such medicinal agents as antipyrine, sulphonal trional, and thyroid gland preparations, there is, moreover, considerable risk attending the amateur medication that is too frequently practised. Our contemporary offers a decided warning against the promotion of a system which tends to substitute for the skilled physician and pharmacist the local grocer who is the distributing agent of wholesale manufacturers. Continuing, the assertion is made that there is no rational check to the sale of these preparations containing medicinal agents as dangerous as any of those included in the poison schedule, and they are used in many instances and recommended to friends "without the slightest thought of the harm they may do." As a consequence, our contemporary adds, "the art of writing a thoughtful and appropriate prescription is lost, and the medical man falls a victim to the wiles of the wholesale medical vendor," a result somewhat similar to that which has been brought home to the chemist and druggist by promoting the sale of so-called "patent medicines."

ANNOTATIONS.

The Death of Mr. E. C. C. Stanford will come as a great shock to his many friends in the world of pharmacy. He had been ailing for some time past, but it was not generally known that he was seriously ill until a few days ago. Mr. Stanford always took a great interest in pharmaceutical matters. He was a student in the Pharmaceutical Society's School, where he won medals for all subjects in 1857, and subsequently he acted as a demonstrator under Professor Redwood. His Major examination certificate was number 480, and he became a life member of the Pharmaceutical Society, his membership dating from 1860. He was also a founder of the British Pharmaceutical Conference, of which body he was President at the Edinburgh meeting in 1892, a Fellow of the Institute of Chemistry and of the Chemical Society, and a Justice of the Peace for the County of Dumbarton. Quite recently, Mr. Stanford had promised to contribute a paper for an evening meeting in Edinburgh, on a new automatic infuser, of which he was to get a working specimen made for exhibition at the meeting. He was very original and ingenious in devising processes and apparatus,and always had some new idea in hand. He was a typical example of a pharmacist applying his chemical knowledge on a large scale outside the line of ordinary pharmaceutical practice. His lecture on the "Economic Uses of Seaweed" before the Society of Arts, in November, 1862, for which the silver medal of that Society was awarded, attracted the attention of the Duke of Argyll, and led to his taking (*P.J.* [2], **4**, 375) up his residence in Scotland in 1863. He had a wide knowledge of the west coast of Scotland and the Hebrides, which he frequently visited in connection with his work on the manufacture of iodine and other products of marine algæ, a collection of which exists in the London Museum of the Society as an evidence of his industry. He had collected many notes on the substances used by the natives of those districts as dyes, and also as medical remedies. He also paid considerable attention to the utilisation of sewage, and tried to introduce the use of seaweed char for that purpose (*P.J.* [3], **3**, 410). He subsequently patented a process for the preparation of algin from seaweeds, for various technical as well as medicinal purposes, the alginate of iron being one of the most tasteless salts of that metal. Mr. Stanford read two papers at the Belfast Conference last year, and may be said to have investigated everything that promised to yield iodine. One of his latest researches was on the iodo-compounds of the thyroid gland, of which he brought out a preparation claimed to contain the full iodine content of the gland in the combination naturally occurring in it, and free from any risk of pathological contamination. He was a Liberal in politics, and took a very active part in public affairs in the county and district of Dumbarton, in which Glenwood, his private residence on the Clyde, a little below Glasgow, is situated. He was a most genial individual, a delightful *raconteur*, and highly popular with all classes. Though not a Scotchman, his enthusiasm and admiration for everything that was Scotch could not be excelled by any native.

The Company Pharmacy Problem is defined in an article published this week (see p. 578 *et seq.*), wherein it is attributed to the action of two classes of registered persons, rather than to the development of joint-stock trading. The abolition of company trading in pharmacy is not held to be sufficient, even if it be necessary, and the remedy suggested is naturally directed at what is held to be the actual cause of chemists' troubles. It consists in placing duly qualified persons in what would be practically the same position as proprietors, in all pharmacies not actually personally conducted by qualified proprietors. That remedy—if applied all round, as it ought to be—would affect registered chemists who own branch shops, as well as corporate bodies, and a Pharmacy Bill is, therefore, the most fitting place in which to introduce the matter. But at present it is a Companies Bill, and not a Pharmacy Bill, that looms large before us; accordingly, the proposition is made that an attempt might be made to deal with corporate bodies, to the extent suggested, in a Companies Bill. What is proposed is much more than qualified managership; the idea is that, in every pharmacy—not personally conducted by a qualified proprietor—there should be a registered individual who, in all his business relations with the public, should occupy exactly the same position as a proprietor. To illustrate that point by familiar examples, he would virtually be in the position of a ship's master whilst his vessel is at sea, or of the lessee and licence-holder of a house of public refreshment. Though actually a paid servant, he would—in relation to the public—appear as the proprietor of the business, and be liable in that respect under all Statutes which affected the individual proprietors of pharmacies. There is little question that this ought to be the law in any case; professional qualification cannot be deputed to unqualified individuals, any more than it can be acquired by corporate bodies. Whilst, therefore, pharmacy law reform is in the air, the article here referred to is a useful contribution to the subject of which it treats, and merits serious consideration.

The Qualified Director Remedy for the company pharmacy evil has been promptly resorted to by Mr. Jesse Boot, presumably as a means of further postponing the day of reckoning which seems likely to arrive when the public fully realises what it risks when it trusts associations of unqualified persons to supply it with medicines. To most chemists, the readiness with which the remedy has been applied may cause suspicion with regard to its effectiveness as a check upon the development of company pharmacy, and judging from statements in the report of the Inspector-General in Companies Liquidation for the year ending December 31 last, the utility of directors may be questioned, for he deliberately states that directors are frequently mere puppets in the hands of the promoters who stand behind them. "Careless and neglectful of duty they may be, and impecunious they often are, but they rarely act with fraudulent intention." Attempts to make directors liable in cases where fraud exists, therefore, may often be futile. Unless it can be proved that a fraudulent promoter has acted in conjunction with another person, he cannot be indicted for conspiracy,since he cannot conspire by himself, and carelessness or neglect of duty on the part of the directors does not bring them within the grip of the law. But if directors are mere puppets in the hands of fraudulent promoters, they are probably none the less so in the hands of other promoters and, even if all companies carrying on the business of a chemist and druggist were compelled to have boards of qualified directors, it is difficult to see how those directors are to exercise any effective control over, or indeed to be of any use in, the conduct of the business.

Free Trade in Poisons does not commend itself to laymen, as a rule, and the opinions expressed by the *Globe*, in commenting on the case against a Goole grocer (see *ante*, p. 574) who had illegally sold laudanum, are welcome as showing that the Pharmaceutical Society is occasionally regarded as something more than a mere trade union. The defendant in the case referred to not only sold laudanum without being legally qualified to do so; he also omitted to label the preparation "poison," or with his name and address. It was perhaps natural that he should infringe the provisions of Section 17 of the Pharmacy Act, inasmuch as to label the preparation properly would have been to acknowledge that he was breaking the law, whilst also providing evidence against himself. The *Globe*, however, regards it as nothing

less than a crime that deadly poisons should be vended in such a reckless manner, and claims that the Pharmaceutical Society has earned public gratitude by taking legal action in the matter. The suggestion is made, by the way, that it hardly suffices to inflict fines in such cases. "When this perilous trade is carried on with full knowledge of its illegality and of its danger, the vendor should have his conscience refreshed by a substantial term of imprisonment." Unfortunately, however, such punishment is not provided for by the Pharmacy Act, even in the case of repeated offences. In conclusion, the *Globe* suggests that all drugs capable of destroying human life should be included in the poison schedule, and that it should be an offence punishable with imprisonment to sell any poison without so labelling it as to give warning of its deadly nature.

THE SALE OF ABORTIFACIENTS is properly regarded as a noxious kind of business, and chemists who may at any time be tempted to make money quickly by resorting to such traffic will do well to note carefully what has happened in the "Madame Frain" case (see *ante*, p. 534c). One of the most striking points about the trial was Mr. Justice Darling's statement that if a woman takes a medicine, believing it to be noxious, with intent to procure abortion, she is guilty of an attempt to commit that crime, although the medicine is absolutely harmless. On the other hand, it was held that a person supplying a woman with something which he knows to be innocuous, but which she believes to be capable of procuring abortion, is not guilty of inciting her to commit that crime, but in such a case an indictment for obtaining money by false pretences might be preferred against the vendors. More important still, however, was Mr. Justice Darling's statement that the crime of which the defendants were convicted was rendered possible because newspapers accepted advertisements of the illegal business, and that, those responsible for the production of such newspapers might possibly if charged, be found guilty of inciting to crime. Books and handbills recommending certain proprietary preparations as remedies for somewhat vaguely-defined complaints might, conceivably, be held to come under the latter ruling, and chemists are warned to have nothing to do with "literature" of the type referred to. It is hardly worth while to sell a box of pills or a bottle of mixture at an infinitesimal profit, at the risk of appearing in the dock charged with a serious criminal offence, and, above all, a chemist's reputation ought to be too high to permit him to stoop to make money by such questionable methods.

THE BENEVOLENT FUND ELECTION was held on Tuesday, December 12, when four annuitants were duly elected on the Fund. The candidate whose name comes first on the list (see p. 585) had applied once before. She is the widow of a member of the Pharmaceutical Society and a subscriber to the Benevolent Fund, who was unable to leave any adequate provision for her support. The second on the list has been a member of the Society for a quarter of a century and a subscriber to the Fund up to the present time. He was formerly Divisional Secretary for East Finsbury, and is now in feeble health and very poor circumstances. The name of the third successful candidate was before the subscribers for the second time. He also had formerly subscribed to the Fund, has suffered from ill-health, and is unable to do anything towards his own support. The fourth on the list has attained the great age of eighty-two, is suffering from senile paralysis, and has no friends or relatives able to assist him. He receives a small amount as sick pay from a benefit society. Each of those four cases was a thoroughly deserving one, and it must be a source of great satisfaction to the subscribers to the Fund that it has been in their power to help four individuals who are evidently so little able to help themselves now, though they have done what they could in that direction in the past —three by subscribing to the Benevolent Fund and one to a benefit society. But the cases of the two unsuccessful candidates are equally deserving, one having subscribed to the Benevolent Fund for twenty-five years and the other occasionally. It is to be hoped that both may secure election on the Fund at no distant date. The fact may be noted, by the way, that nearly three thousand voting papers were not returned, so that there appears to have been a considerable margin left for canvassers to work upon.

THE SPECTACLE MAKERS' COMPANY'S EXAMINATIONS, which have been conducted under the auspices of the Spectacle Makers' Company at the Northampton Institute, Clerkenwell, for the purpose of awarding optical diplomas for qualifying candidates have just concluded. In all, 117 candidates presented themselves for examination, and of these 96 were examined, and 21 postponed their examination. Candidates to the number of 67 were examined in written visual optics, 40 took the *viva voce*, and 79 the practical portion of the examination. Of those who submitted themselves to the test 28 described themselves as opticians, 6 as optical and photographic dealers, 3 as scientific and surgical instrument makers and opticians, 43 as watchmakers, and 16 as chemists and opticians.

THE POISONOUS FUMIGATOR CASE is not to be carried further, we understand, the respondents having decided not to proceed with the appeal. A full report of the case appeared in last week's Journal, and it is unnecessary to refer to it further, except to point out how emphatically the Lord Mayor spoke in regard to the dangerous nature of such preparations as that in question. The fumigator was shown by Dr. Stevenson to contain no less than thirty-seven per cent. of nicotine, and there is no question of that being a poisonous vegetable alkaloid within the meaning of Part I. of Schedule A of the Pharmacy Act, 1868. Nevertheless, the preparation was sold without being labelled with the name of the article, the word "Poison," or the name and address of the sellers. The decision in the case, therefore, can only be described as an eminently proper one.

TARTARIC ACID AS A SUBSTITUTE FOR SALTPETRE, in curing the meat of pigs, has proved an unmitigated failure in a certain country district. According to Mr. A. J. Giles, Secretary of the Federation of Grocers' Associations, the assistant at a co-operative store a short time ago served several village customers with tartaric acid instead of saltpetre for curing the meat of the pigs they killed. Very speedily the outcry came, as the mistake was only discovered when the cure had been done. To still the complaints the store took over the tartared bacon and washed it, in the hope of drying it and selling it to customers. It will be an interesting thing, says Mr. Giles, to know the result of the experiment, also under what head the transaction in tartared pig will appear in the quarterly statement of accounts, which is supposed to be prepared when the dividend is declared to the delighted meeting of members. It would, further, be interesting to know the extent of the loss incurred by the difference in price between the tartaric acid and saltpetre, as well as whether the co-operative society has a special drug department, and dispenses medicines for its members.

THE EFFECTS OF STRAMONIUM SMOKE have proved more far-reaching than was anticipated by a lady who had been in the habit of burning the drug in her bedroom, as a remedy for asthma. She rented a furnished house at Dawlish, and has been sued at Newton Abbot County Court, for damage done to the carpets, bedding, etc., by the smoke. A local chemist gave evidence for the plaintiff, and in the result, the defendant was mulcted to the amount of eighteen pounds and costs.

PHARMACEUTICAL SOCIETY OF IRELAND.

MEETING OF THE COUNCIL.

The monthly meeting of the Council of this Society was held on Wednesday, the 6th inst., at 67, Lower Mount Street, Dublin.

The Vice-President (Mr. Beggs) took the chair, and mentioned that he had been requested to do so by the President, who was unfortunately ill and unable to attend.

The other members of the Council who attended were Messrs. Grindley, Bernard, Ryan, Dr. Walsh, Kelly, Michie, P. L. White (Sligo), Wells, and J. E. Connor (Newry). Mr. Sidney H. Vaughan, President of the Pharmaceutical Society of Queensland, was also present.

The Vice-President said he was sure they all joined in a hearty greeting to their friend, Mr. Vaughan. They all felt that it was both a pleasure and an advantage to have him among them. They heard his address at the evening meeting, but he had something more of importance to say to them.

A conference with Mr. Vaughan then took place in committee.

Correspondence.

A letter was received from the Attorney-General of the Isle of Man enclosing a copy of the Pharmacy Act which had just been passed by the Legislature of that island, containing a provision that the licence of the Pharmaceutical Society of Ireland shall be recognised there.

A letter from the District Inspector of the Royal Irish Constabulary at Athlone stated that Mr. William Doyle, registered druggist of that town, had been fined 20s. and costs for a breach of Section 17 of the Irish Pharmacy Amendment Act.

Mr. Wells said this was the first prosecution under the section mentioned. It was altogether a police prosecution and was for not having a qualified manager in a branch shop kept open for the sale of poisons. There were several other summonses against the defendant, but they were all withdrawn by the police.

A letter was received from Mr. Frederick N. Binks thanking the Council for having appointed him Professor of Theoretical Chemistry.

The Vice-President: I am sure we have got a very good man in Mr. Binks.

A letter was read from the Principal Medical Officer to the Army in Ireland asking to be furnished with the names of any pharmaceutical chemists who would be willing to undertake temporarily the duties of compounder of medicines in one of the military hospitals of Dublin.

Mr. Wells: Anyone who wishes to undertake this can apply to Mr. Ferrall.

Pharmacists as Public Analysts.

The next business was an adjourned discussion on a motion made at the last meeting by Professor Tichborne as to the institution of a degree to meet the requirements of the Local Government Board as regards public analysts.

As Professor Tichborne was absent in London attending a meeting of the General Medical Council, the discussion was postponed to the next meeting.

Donations.

Donations were received from the Agent-General for Queensland of a copy of his 'Guide to Queensland,' from the British Pharmaceutical Conference of a copy of the 'Year-Book for 1899,' from Mr. John Wishart of copies of the 'Botanists' Vade Mecum' and of 'Schedules for Plant Description,' and from Mr. H. Wippell Gadd, M.P.S.G.B., of a copy of the new edition of his British Pharmacopœia Synopsis.

On the motion of Mr. Wells, seconded by Mr. Grindley, thanks were voted to the donors.

Election of Examiners.

On the motion of Dr. Walsh, seconded by Mr. White, Mr. Brown and Dr. Tweedy were re-elected to conduct the Society's Preliminary Examination.

On the motion of Mr. Grindley, seconded by Mr. Connor, Mr. J. Smith was re-elected to conduct the Botany and Materia Medica Division of the License Examination.

On the motion of Mr. Wells, seconded by Mr. Kelly, Mr. J. Guiler and Dr. McKinney were re-elected to conduct the Registered Druggists Examinations in Dublin and Belfast.

On the motion of Mr. Wells, seconded by Mr. Grindley, Mr. W. V. Johnston was re-elected to conduct the Examination for Assistants to Pharmaceutical Chemists.

On the motion of Mr. Grindley, seconded by Mr. Wells, the following were elected members of the Society:—Mr. W. J. Burke, Cashel; Mr. J. T. Chamberlain, Dublin; and Mr. J. Hewton, Ballinasloe.

Mr. F. W. Warren, of Navan, was nominated for membership.

Other business having been disposed of, the Council adjourned.

EVENING MEETING.

At Dublin on Monday, December 11, the usual fortnightly evening meeting of the Society for the discussion of scientific and practical subjects, was held at 67, Lower Mount Street, Mr. W. F. Wells, ex-president, in the chair. The meeting was specially interesting on account of its being the occasion for Mr. P. Kelly, M.C.P.S.I., to deliver a lantern lecture on

The Development of Plant Life From Seed to Fruit.

Mr. Kelly said he purposed making his remarks so simple as might stimulate non-students to take up the study of botany, which had many advantages over other scientific pursuits, in that it was a most fascinating one, and required only a knife and a lens to furnish material from the roadside sufficient to reward the student with an abundance of enjoyment. Mr. Kelly started by drawing an analogy between plant life and animal life. The chief constituents were the same in both. He instanced a cell of yeast, and showed that it was built up of carbon, hydrogen, nitrogen, and oxygen. The origin of life was the task of the philosopher. Some said life was spontaneously generated, while others held that life could only be given from life. Dr. Bastein, M.A., and Fellow of the Royal Society, the highest title that a scientific man could get, tried to prove that life could be spontaneously created. He got a flask and immersed some hay in fluid, sealed the bottle, and boiled it, so that no animalculæ could exist in it, and in course of time he discovered myriads of bacteria had developed, thus proving to his own satisfaction that life was not necessary to get life. Tyndall and Huxley next went to work in the matter, and took up the experiments on the same lines. Tyndall, who was a clear-headed man, saw some of Bastein's errors, and as the result of his searches was bound to confess that life must be got by life. Much had been said for and against Darwin's theory of evolution. Darwin, however, did not deny that things must be created. His theory was a modification of that which already existed. Take pigeons of different types. The original pigeon was the rock dove, and although many classes of pigeons existed, such as fantails, pouters, etc., if these were allowed to remain unattended to they would revert to their original state and become rock doves again. So it was with regard to plants. The theory of natural selection in plant life was carried out by man. If certain plants were to be cultivated specially the seeds were retained and the pollen from other flowers kept away. The same thing obtained in the poultry yard—the weaklings were destroyed and the strong fowl looked after. The herdsman likewise attended to his cattle. It was, as Herbert Spencer remarked, "the survival of the fittest." The brain of a gorilla of twenty stone weighed only twenty-six ounces, whereas

the brain of a human being weighed from forty-eight to seventy-six ounces. Humorous reference was made to the prevailing habit of ladies cycling, and Mr. Kelly said that, like the gorilla, whose brain decreased in weight through not using it, so would the ladies lose the organ of speech if they went on cycling, for while doing so they could not talk very well. Proceeding to the direct subject of his lecture, the speaker showed a lime-light view illustrating the development of plant-life generally. The seed in its embryonic state, barley growing, and a mangrove forest were flashed on the screen, together with transverse sections of roots and stems of plants. He also explained how it was possible to ascertain the age of a tree by counting the rings formed in the wood. The peculiar leaves of the "Pitcher Plant" formed an interesting series of views, and the power of this plant to absorb flies was shown by means of a number of views; a fine section of a rhododrendron was exhibited and its various peculiarities described. Vegetation and fructification formed the second part of the lecture, and Linnæus was quoted as one of the first of the 17th century botanists to make the assertion that there were male and female plants. The carriage of pollen by insects was next described, and some beautiful specimens of the thistle defended from beetles by ants were compared by Mr. Kelly to Ladysmith, with the Boers coming down on the defenders and retiring discomfited. The ants were, said the speaker, amid laughter, like the poor chemist, who got up at all hours of the night and spent his energy in doing good for other people, with very little thanks for his trouble. Cross sections of the fruit of belladonna and digitalis were shown. Cross fertilisation by insects came in for a share of attention, and in connection the lecturer related a laughable story as illustrating the doctrine of natural selection. Ferns and their propagation formed the third and concluding portion of the lecture, which lasted over an hour, and was delivered throughout extempore and without notes, and in a catchy and interesting style. A vote of thanks having been accorded, on the motion of Mr. O'CONNOR, the proceedings closed.

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of the Dewsbury and District Chemists' Association was held on Monday, December 11, Mr. A. FOSTER presiding. A letter was read from the Bradford and District Chemists' Association, directing attention to a resolution passed at a recent meeting (see *ante*, p. 456*a*), and asking the Dewsbury Association to pass a similar resolution. It was explained that the Dewsbury Association had already passed a resolution on the matter, and it was thought there was no need to take further action at present.

A communication was also read from the Council of the Federation of Local Pharmaceutical Associations, directing attention to the fact that at the last meeting of the Pharmaceutical Council there was a wide divergence of opinion between members of the Council on

THE QUESTION OF COMPANY PHARMACY

in connection with a clause to be submitted for embodiment in a Companies Bill. It was of the greatest and most urgent importance that the Council should be informed before next month of the opinion upon this subject, which vitally affected the general interests of chemists. The letter also asked for the views of members of the Dewsbury Association on this question. In the course of a discussion it was mentioned that the meeting of the Association had been put off in the expectation that the policy of the Pharmaceutical Society would be announced at the meeting of the Pharmaceutical Council last week, and some surprise was expressed that this course was not taken.

CHEMISTS' DEFENCE FUND.

Reference was next made to the Chemists' Defence Fund. A letter having been received from Mr. Glyn-Jones stating that five hundred shares required to be taken up. When these had been taken up, the company would be floated. Several members present agreed to apply for shares.

Mr. G. WALKER, Dewsbury, introduced the question of the

CAMWAL RECONSTRUCTION SCHEME.

A letter that was read stated:—"As you are aware, the existing Association can supply only chemists (who are shareholders) and hospitals. It is proposed that C.A.M.W.A.L., Limited, shall supply chemists, hospitals, public institutions, hotels, etc., trade with which is not prejudicial to the retail trade of chemists. In other words, the retail syphon trade in C.A.M.W.A.L. waters will be thoroughly protected to the chemists, as no wine merchant, grocer, or other such retailer can be supplied. In the reconstruction the directors hope to get a Stock Exchange quotation for the shares." In the discussion that took place it was stated that a question had been asked the Secretary of the Association whether those who were shareholders, and not chemists, would be supplied, and the reply was that they would be bound to supply all who were shareholders. It was held that this meant that any wine merchant, grocer, or other retailer who was a shareholder would be supplied, and the opinion was expressed that this was another case where chemists had built up a trade, as they had done with patent medicines, and then had it snatched out of their hands. It was eventually decided to put the matter on the agenda for the next meeting.

CAMBRIDGE PHARMACEUTICAL ASSOCIATION.

At a meeting held in the large theatre at the University New Museum, Cambridge, on Friday, December 8, Mr. Alderman DECK, the President of the Cambridge Pharmaceutical Association, presiding, Dr. E. Lloyd Jones, of Downing College, delivered an interesting and profitable lecture on

Sewer Air

before the Cambridge Pharmaceutical Association. The lecturer pointed out that sanitary science was only in its childhood, and that a great deal had still to be done to improve the unhealthy places that some of our forefathers had left us. He gave a technical analysis of sewer air, pointing out that it was the organic bodies in sewer air that were hurtful, which caused disease, and sometimes death. For instance, cases were known in which typhoid fever had been communicated by sewer air, the sewer air containing a microbe which must have come out of sewage contaminated by the excreta of a typhoid patient. Dr. Jones gave several instances of diseases that had come under his treatment which he had found to be directly attributable to escapes of sewer air into living and sleeping rooms, pointing out how frequently puerperal fever was caused by bad drainage. He also emphasised the fact that the offensiveness or non-offensiveness of sewer air is no criterion of its hurtfulness. An epidemic at Middlesboro' had shown that pneumonia could follow exposure to sewer air, and sore throats, diphtheria, scarlet fever, typhoid fever, anæmia, headache, loss of appetite, and even peritonitis (*e.g.*, epidemic at Wandsworth) might be due to it. It was not advisable to have sewer air escaping at the level of the street. The great moral drawn by Dr. Jones, after he had shown numerous diagrams of faulty drainage, was that private persons should look after their drains and sewers themselves, and not rely on the local authority.

A cordial vote of thanks was passed to the lecturer on the motion of Mr. A. S. CAMPKIN, J.P., seconded by Mr. STURTON.

BOURNEMOUTH AND DISTRICT PHARMACEUTICAL ASSOCIATION.

The members of this Association dined together at the Granville Hotel, Bournemouth, on Friday, December 8, when Mr. J. A. Toone, President of the Association, occupied the chair, and among others present were Mr. S. R. Atkins, J.P., of Salisbury,

member of the Pharmaceutical Society's Council, who was the guest of the evening; Mr. J. Humphrey, London; Messrs. F. E. Bilson, Hon. Sec.; G. E. Bridge, W. Jones, J. H. Morris, W. Bland Botham, J. H. Williams, E. Worth, Lawrence, J. T. Hall, C. F. R. Pars, F. Rye, Taylor, Rose, Aitken, W. R. Atkins, Spinney, etc.

The Chairman, at the conclusion of an excellent dinner, followed by the usual loyal toast, gave the toast of

The Pharmaceutical Society of Great Britain,

He said he had no sympathy with the attacks so often made on it, first, because the Society was not a body of gentlemen who met now and again in Bloomsbury Square, but consisted of chemists all over the kingdom, and they could change or remove the Executive if they did not think they acted wisely. Another reason was that he was convinced that the Society had done excellent work in the past, and that if pharmacists occupied a better position now it was due to the labours of the gentlemen who from time to time represented them on the Council. No doubt they had much to complain of, but it seemed to him that the House of Lords in 1881 deliberately kicked the bottom out of the Pharmacy Act of 1868, and was the body whom they ought to blame most for the decision that a company was not a person within the meaning of the Act, which, therefore, did not apply to a company. A company composed of seven unqualified men might proceed to do what one man could not. Some individual, thinking it would be a good thing to do, took unto himself six other persons more wicked than himself—or, at any rate, not qualified—and formed a company, put over his door that he was a chemist, and perhaps he did not know the difference between strychnine and sulphate of magnesia. This, he argued, was a great hardship on the individual pharmacist who had trained himself and worked for his position. In asking Mr. Atkins to respond to the toast, the Chairman alluded to his happy apprenticeship many years ago to the guest of the evening, and spoke warmly of Mr. Atkins' high qualities and the value of his experience and work on the Council.

Mr. S. R. Atkins, in response, thanked the Chairman for his personal references, and with regard to the Council of the Society, his answer to particularly silly remarks he sometimes heard about it as to what good it was doing for pharmacy was, "What good have you ever done the Society?" and there he left the matter. He spoke strongly in favour of extending full confidence to the Council, which, from his own experience, was a body of men filled with the desire to advance the interests of pharmacists, and of great ability as a whole, and then went on to allude to the anxiety which the position of pharmacy was causing to all concerned in it. They had much to complain of, but the principal topic of the moment was that of company trading, which overshadowed everything else. In what he said, he desired that his remarks should be understood as in no way representing the Council, but as his own views only. At the present moment the Council was not united. It was anxiously deliberating, and would have to do so again and again. Possibly some consensus of opinion might be reached by and bye, but they had not reached it yet. The point was that they, as a Society, might fine an individual unqualified trader for selling scheduled poisons, but that such unqualified person might absolutely contract himself out of the Act by forming himself into a company. He could do that by the unhappy decision of the House of Lords, and he did it. It was now necessary for them to assert again the principles of the Pharmacy Acts—that of individual qualification, individual education, examination, and registration. It was necessary, however, to be frank, and to admit that there were companies and companies. With some they could have no possible contention, and he could not conceive why they could not be brought into line and comply with the law as he should desire the law to exist; that the directors should be man for man qualified; and that the capital of such companies should be kept strictly within that qualification. Companies other than those he desired to see abolished. He felt so strongly entrenched in that position that he was not disposed to stir an inch till he was driven by stress of circumstances, or stress of decisions at law, to do so. What he would do would be to go to the department charged with that particular question and represent to its chief—the Lord Chancellor, or the President of the Privy Council, or the President of the Board of Trade, as the case might be—and state the case frankly and fearlessly, and ask for legislation or consideration. If he were told by that authority that it was too late, that vested interests had grown up so enormously strong that they could not be dealt with, and that such contentious matter could not be launched in the House of Commons without fear of defeat, what would he do next? He would report the result to the Council and ask for fresh powers. If the Council felt unable to come to a decision on a matter of such enormous weight, he would advocate an appeal to the community at large and place the result of the appeal before the authorities, though it might not embody all they desired or felt they had a right to claim. The next line of defence they could take up was that of a qualified directorate. Personally, he did not attach that weight to it that some did, as he looked forward with the greatest apprehension to the development of the co-operative principle, to the syndicate principle, to the combination of capital, in a calling like theirs. He feared that their position would be most gravely imperilled. For something like 200 years the great unpaid work of the community had been done by the great middle class. If that class were destroyed as employers and became merely employés, if they were all to become servants of corporations, companies, and syndicates, their ability to serve the community would go, and the effect on the country itself would be a bad one. He took high ground deliberately in saying that it would be disastrous to the nation. There were scattered all over the country men of education, of character, and of reading, who, with moderate means, were conducting the work of pharmacy on the highest principles, and the abolition of that class would be a serious blow to the country and to pharmacy itself. That took him to the third line, which was to simply leave matters alone and let them drift. But the drifting policy was too late in his opinion. The country was roused to such a state of anxiety and expectation that rendered it imperative that something should be done. He had been amazed at the mass of correspondence that had been sent in and all pointing, with one or two exceptions, to general support of the first position he had shadowed forth. He did not expect there would be absolute agreement, but he would be glad to hear the views of the chemists present representing a town that stood high in the pharmaceutical world.

Mr. W. Jones was then called upon to propose a resolution dealing with

The Company Pharmacy Problem.

It was in the following terms:—

That it should be unlawful for a company to take, use, or exhibit the title of pharmaceutical chemist, or of chemist and druggist, or any other title indicating registration under the Pharmacy Acts, and in all other respects a company should be subject to the provisions of those Pharmacy Acts in the same manner as individuals.

He said it was necessary, not only in fairness to the pharmacist who accepted certain restrictions and conditions, and was granted certain privileges, but for the public good, as the Pharmacy Act entrusted to them the sale and dispensing of poisons. It was for the public good that the pharmacist should be highly trained and highly efficient, and he feared they were bound to go backwards in the near future, if it became no longer worth the while of young men to go in for pharmacy. The medical profession was interested in this struggle, and, he thought, would have something to

say about it. He blamed the Council for not taking the matter up long ago.

Mr. MORRIS seconded the resolution, and described the average chemist as an apathetic beggar. It was largely owing to his apathy that the present troubles had arisen. If they could get the companies abolished it would be a glorious day for pharmacy, but he was afraid they were hoping for too much. The idea of the Pharmacy Acts was qualified ownership, and the idea of qualified managership was absurd and dangerous as a cloak and cover for capital.

Mr. G. E. BRIDGE said he was one of those House of Lords' entities—a limited liability company. He had taken to himself, as a speaker had said, six others and formed himself into a company. His reasons for doing this were partly that he had two excellent servants and was anxious to make them partners, and he considered a joint-stock company the ideal and only condition for partnership. Another reason was that he had a mixed business. He was qualified as a pharmacist himself and gave way to no one in his interest in a love of pharmacy, but he was making a man not qualified for pharmacy, but qualified for mechanical, surgical, and orthopædic work one of his directors. He was dead against capitalists coming in and destroying the trade under false pretences, and that might be met by having a qualified director who had a substantial interest in the firm. The chance of securing more than that had, he feared, been lost years ago. He moved as an amendment that limited liability companies should be legal under such a restriction as he had suggested with respect to a qualified and substantial director.

Mr. BOTHAM seconded this for the sake of argument, but the original proposition met with general approval in the brief discussion that followed.

Mr. HUMPHREY, who was invited by the Chairman to speak, said it was necessary to consider the subject under two aspects—the professional and the trade. With regard to the professional qualification, chemists could not afford to surrender anything. In particular, pharmaceutical titles must be absolutely restricted to individuals who held the qualifications which alone entitled them to use them. No company, whether consisting of qualified or unqualified persons, must be allowed to use those titles, though the qualified individuals constituting any company would, of course, continue to use their titles as at present. With regard to the trade aspect of the company-pharmacy problem, he must remind them that probably nine-tenths of the average chemist and druggist's business had nothing to do with what was protected by the Pharmacy Acts, viz., the dispensing and sale of poisons. How could they expect to protect the rest? It could not be done, and the question of where the capital invested in the business came from was of no consequence to anyone but the parties directly concerned. Whether it was provided by the individual, or borrowed, or furnished by a joint-stock company, did not affect the matter. The point was that the individual in every pharmacy who was responsible to the public for the conduct of the business, especially as regards dispensing and the sale of poisons, must be a duly qualified individual, independent of any control by unqualified persons.

After further discussion, the amendment was put and defeated, whilst Mr. Jones's resolution was carried, only two members voting against it.

The other toasts were "The Local Association," proposed by Mr. W. R. ATKINS and responded to by Mr. BILSON; "The Guests," by Mr. BRIDGE and responded to by Mr. S. R. ATKINS; and "The Chairman," by Mr. S. R. ATKINS. The proceedings were enlivened by several excellent musical items, a violin solo in particular being exceptionally well rendered.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.

A meeting was held at the Liverpool School of Pharmacy, on Thursday evening, the 7th instant. Mr. PROSPER H. MARSDEN, presiding. Two new members were duly elected, viz., Messrs. J. A. Mercer and John Hodgson. Certain votes belonging to the Society, arising from contributions to the Benevolent Fund, were unanimously given to the two local candidates.

A series of

PHARMACEUTICAL NOTES

was then contributed by Mr. T. S. WOKES, Ph.Ch., consisting of difficulties in and peculiarities of certain prescriptions, which had passed through his hands of late.

No. 1. Liberation of iodine took place in the following mixture owing to the action of the ferric chloride on the alkaline iodide—an action there was no means of preventing.

℞ Potass. iodidi ..... ʒiss.
Liq. ferri perchlor. ..... ʒii.
Liq. arsenici hydroch. ..... ʒi.
Sp. chloroformi ..... ʒii.
Aquæ .....ad ʒvi.
Ft. mistura.

This was not taken by the patient, as the doctor on being communicated with countermanded it.

No. 2. A mixture peculiar from the large amount of resinous tincture it contained, but which resulted in a good emulsion on the addition of mucilage.

℞ Tinct. benzoini comp..... mʒ20.
Ox mellis scillæ ..... ʒi.
Vini ipecacuanhæ,
Syrupi tolutani .....aa mʒ80.
Aquæ .....ad ʒviii.
Misce fiat mistura.

No. 3. The peculiarity in this was the large dose of bromide and tincture of henbane, but as only one dose daily at bedtime was ordered, the object of the prescriber was evident.

℞ Potassii bromidi ..... ʒi.
Tincturæ belladonnæ..... ..... mʒ80.
Tincturæ hyoscyami ..... ʒi.
Aquæ camphoræ.....ad ʒviii.
M. ft. mist. Sd. ʒi. horâ somni.

No. 4. This gargle appeared to require mucilage to suspend the myrrh resin, but the amount of glycerin contained proved to be sufficient for the purpose.

℞ Potassæ chloratis ..... ʒi,
Tincturæ catechu ..... ʒiv.
Tincturæ myrrhæ ..... ʒiii.
Glycerini..... ʒi.
Aquæ .....ad ʒvi.
Misce fiat gargarisma.

No. 5. Here the doctor evidently did not mean what he had written.

℞ Suppos. acid. boric, aa gr. xv. Mitte vi. more dictu ut.

What he did want was a pessary containing 15 grains of boric acid, so six of 60 grain size were sent.

No. 6. Rather an out of the way lotion was ordered as follows:—

℞ Amygd. amar. ..... mx
Aquæ rorismarini ..... ʒvi.
Contunde et tere simul dein cola et adde
Hydrarg. perchlor ..... gr. xvi.
Spirit. vini rect. .... ʒii.
Fiat lotio.

The almonds were made into an emulsion which was strained, and the other ingredients added.

No. 7. A pessary of compound tincture of benzoin and cacao butter went very well when made by cold compression.

℞ Tinct. benzoini co..... mx.
Olei theobromæ .....ad gr.lx. (60).

When made by heat the result was not nearly so good.

No. 8.—In this mixture, effervescence was noticed, and as the mucilage was made fresh, this could not be due to any acidity of the gum. The author concluded it was probably due to some reaction between the sodium bicarbonate and the codeine.

R	Sodii bicarbonatis	gr. 80.
	Tinct. cotonis (*sic!*)	m80.
	Tinct. chlorof. comp.	ʒiv.
	Codeinæ	gr. i.
	Mucilaginis	ʒi.
	Aquæ cinnamomi	ad ʒviii.

Fiat mistura.

In conclusion, Mr. Wokes drew attention to some samples of suppositories" made by compression, and also to "linted suppositories," each of which had a tuft of lint, about three inches long, attached to it. These were intended to be used in certain rectal operations, and were made by the process of dipping and subsequent rolling on a slab.

The President said that material had been provided by Mr. Wokes for both thought and discussion. Mixture No. 1 was one he frequently had dispensed at the Liverpool Royal Infirmary, though he had drawn the prescriber's attention to the incompatability. Unfortunately, the knowledge of the chemistry of prescribing among latter-day medical men was very far from accurate—in fact, it could hardly be otherwise, when the demands made upon students by the important subject pharmacy were taken into account. It was presumed that about three months' practice and lectures would supply all the knowledge the student stood in need of! Such incompatibles as salicylate of sodium and hydrobromic acid, sulphate of iron and Fowler's solution, and a mixture of potassium iodide, solution of perchloride of mercury, solution of strychnine, and solution of peroxide of hydrogen were samples of what he had had ordered of late by qualified medical men. Papers like this of Mr. Wokes deserved every praise, they were practical and of great utility to students.

In proposing a vote of thanks to Mr. Wokes for his work, Mr. H. Wyatt, jun., remarked that No. 2 mixture had been through his hands frequently, and he had always used the yolk of an egg to emulsify the tincture of benzoin, making a note on the prescription to that effect. In No. 4 and similar gargles, containing tincture of myrrh, if an equivalent amount of good moist picked gum myrrh be used, rubbing it down to a smooth paste with water, and gradually forming an emulsion to which the spirit necessary and the other tinctures are added last and in small quantities at a time with frequent shaking—a very satisfactory result will be obtained without the use of mucilage.

The effervescence in No. 8, if Mr. Wokes had not proved it to be due to liberated CO_2, would be most likely caused by the expulsion of the excess of air dissolved in the water (in making the bicarbonate go into solution) by the amount of chloroform contained in the tincture. In making chloroform water the same effect is produced if tap water be used, or distilled water which has stood some time and has been exposed to the air. The chloroform suddenly saturating the water drives out the dissolved air with a considerable amount of force. At any rate, in the mixture No. 8, the codeine could not be accused of any action on the bicarbonate whatever the tincture of coto or the other ingredients had to do with it.

Mr. Wyatt next gave a lecture on

Arms and Ammunition.

After briefly sketching the history of firearms down to the introduction of the percussion cap, the lecturer went on to consider the causes of the adoption of rifling in small arms, then the change of shape in bullets to the conical form, after this the advent of the breech-loaders with their necessarily elaborate cartridges, and finally enlarged upon the tendency to reduce the calibre of military rifles to a still smaller one than that in use in the British army at the present time. The high velocity, coupled with flat projectory of the Lee-Metford bullet, was explained as being due chiefly to the use of such a powerful explosive as cordite, of which the manufacture and composition as well as action was dwelt upon. The service rifles of other nations were described, including the Mauser, Lebel, and Mannlicher, and specimens of various types of ammunition ranging from the Snider-Enfield Boxer cartridge and Remington solid drawn case used by the Egyptians under Arabi Pasha, to the latest Mannlicher and Lee-Metford cartridge, with hard-cased bullets and smokeless powder. An outline of the chemistry of explosives brought the lecture to a close, and a vote of thanks was accorded the lecturer.

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of the above Association was held on Wednesday, December 6, at the Hotel Metropole, Newcastle-on-Tyne, Mr. C. Ridley, the President, in the chair. Mr. W. Buckley, North Shields, read a paper on

The Extension of the Poisons Schedule.

He said there has been of late years a growing conviction in the minds of the public, as in those of pharmacists, that an extension of Part 2 of the Schedule was most desirable in the interests of the public safety. Scarcely a week passes without some coroner or jury making strong recommendations to this effect, and since the recommendations of the Pharmaceutical Society for the keeping and selling of poisons have become law, the present is an opportune time for approaching the Privy Council with respect to certain additions to the existing list. Mr. Buckley very clearly described the various legislative enactments in the poison question down to the present time. He showed how the Government appeared to view the question of still further increasing the list of poisons as savouring too much of a monopoly for the registered chemists, but showed that whilst chemists, by their training and qualification, were competent to distribute these articles, it was not a matter of £ s. d. for them, as in many instances, which occur daily, do chemists refuse to sell poisons to persons they think unsuitable, or to those who will not conform to the regulations, but also sell lesser quantities than those asked for. These circumstances go a long way to prove that chemists have the safety of the public more in their minds than any pecuniary advantage. Even if all poisonous substances were scheduled, chemists would gain very little by it, for without exaggeration there is no branch of business which demands so much self-sacrifice as that which relates to the sale of poisons by chemists, the same being more of a necessary evil than a source of gain. In conclusion, Mr. Buckley hoped that the Pharmaceutical Council would be able to draft a list of substances which would meet with the approval of the Privy Council.

A good discussion followed, everyone present expressing his views, and ultimately the following resolution was carried unanimously:—

"That in the opinion of this meeting it is desirable, in the interests of public safety, that carbolic acid, strong mineral acids, butter of antimony, acetate of lead, sulphates of copper and zinc, oxalates, and strong solution of ammonia be added to Part 2 of the Poisons Schedule."

A vote of thanks was warmly accorded to Mr. Buckley for the excellent way in which he had handled the subject.

EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION.

The opening meeting of the session was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Wednesday, December 6, 1899, at 11 a.m., Mr. David McLaren, President, in the chair.

Messrs. Charles Stewart and James B. McLaren, Kirkcaldy; W. J. McNab, Gorebridge; and D. W. Nicholson, Leith, were elected members.

Mr. HENRY, Hon. Secretary, reported that replies had been received from Lord Salisbury, the Lord Chancellor, the Duke of Devonshire, Mr. A. J. Balfour, and the Lord Advocate acknowledging receipt of the resolutions passed by the Association in June last.

With regard to the Federation of Associations' five proposals anent company pharmacy, as a reply was asked before the 30th ult., the Committee met and unanimously agreed to reply that the Association saw no reason to depart from the resolutions adopted in June and published in the journals at the time. A copy of the resolution was forwarded to the Federation.

The meeting unanimously approved of the action of the Committee.

The CHAIRMAN then said he had intended giving an address, but owing to illness he had found it impossible to carry out his intention. He had thought of speaking about

PHARMACY IN SCOTLAND DURING THE LAST FIFTY YEARS.

In 1849 there were 49 open drug shops in Edinburgh, and in 1860 these had increased to 53. But he would reserve a fuller statement till another meeting of the Association. In regard to the present situation, one feature was the extreme difficulty experienced in getting apprentices. He had noticed the other day that a certain editor had compared the chemist and druggist to the publican and the grocer. He could not assume that remark to be intended as derogatory to the trade at large, and, therefore, the editor must have been thinking of the fact that these trades are very profitable, and he hoped that meant that pharmacy was going to be more profitable in the future than it had been in the past. As to the question of unqualified men carrying on the business he thought the less they said about it the better. While they were entitled to object to their titles being used by such persons, he thought they should not say too much, for they would only advertise them. He had to ask the indulgence of the meeting, because he did not feel well enough to speak at length.

Mr. LUNAN, in moving a vote of thanks, expressed sympathy with the chairman, and said they would look with interest for the full address at a subsequent meeting. He quite agreed that the only matter they could contend for in regard to company pharmacy was the protection of the qualification. They had nothing to do with the capital by which the business was carried on. He thought they should go forward unitedly to protect the title. On other matters chemists generally did not seem to have made up their minds.

Mr. BOA, in seconding the vote, said he agreed with Mr. Lunan. He also thought it was good advice to say as little as possible about the stores. He could not profess to be up in all the recent proposals as to legislation, but thought they should seek to protect the qualification and the titles.

Mr. NESBIT agreed with Messrs. Lunan and Boa. They should not allow any company or store to assume the title of chemist and druggist or similar titles.

Mr. GLASS said he did not think they could in the present connection demand more successfully than the restriction of titles to persons holding them by examination. He could not agree with the statement that the qualification of the employee became in any sense the qualification of the employer. They might as well say the qualification of a certificated teacher conferred a qualification on a School Board, or that the qualification of a physician conferred qualification on those corporate bodies who employ doctors. They should seek to protect the titles and steer clear of the intricacies which lay in anything beyond that.

Mr. HENRY agreed with previous speakers. They were, as a body, at variance yet on other matters, and he had been astounded by some of the resolutions even yet being passed by some associations. Evidently, a great deal had yet to be thought out. No doubt those who differed were equally sincere, but he thought tact and prudence suggested that they should agree as to protection of titles in the meantime, and allow the discussion on other matters to continue. It was said that if you shake a barrel of apples the good ones will come to the top, and that would doubtless happen with the suggestions now abroad. They should concentrate on titles, and leave the other matters over.

Mr. MCLAREN acknowledged the vote of thanks.

It was resolved to hold a dinner about the end of January, and the President, Vice-President, and Secretary were appointed to carry out the arrangements.

The meeting then closed.

BRITISH PHARMACEUTICAL CONFERENCE.

A meeting of the Formulary Committee was held at 17, Bloomsbury Square, London, on Wednesday, December 6, 1899. Present: Messrs. Martindale, Bird, Martin, Ransom, Wilson, Symes, and Naylor. On retiring from the chairmanship, Mr. Martindale was warmly thanked for his valuable services during the last thirteen years. Mr. Martin was unanimously elected to succeed him. Mr. Naylor was reappointed Secretary to the Committee. It was agreed to invite Mr. Peter Boa, of Edinburgh, and Mr. H. Wilson, of Southampton, to fill the places vacated by Mr. Maben (resigned) and Mr. Greenish (deceased). The Secretary was instructed to convey to Mr. Maben the thanks of the members for the able assistance he has rendered the Committee from its formation. So as to make the future editions of the Formulary as widely useful as possible, it was agreed to include, as far as convenient, formulæ for all preparations which are generally prescribed by physicians for pharmacists to dispense. With a view to accomplishing this, suggestion from members of the Conference and from pharmacists in all parts of the kingdom will be welcomed by the Chairman, Mr. N. H. Martin, Ravenswood, Low Fell, Gateshead-on-Tyne; or by the Hon. Secretary, Mr. W. A. H. Naylor, 38, Southwark Street, London, S.E.

LEGAL INTELLIGENCE.

HIGH COURT OF JUSTICE—CHANCERY DIVISION.

THE SACCHARIN PATENT.

On Saturday, December 9, Mr. Justice North gave judgment in the action of the Saccharin Corporation, Limited, *v.* the Chemicals and Drugs Corporation, Limited. He said it was an action originally to restrain the infringement of eighteen patents, subsequently reduced to twelve, for the production of ortho-sulpho-benzinamine, commonly called saccharin, or of the ingredients used in its manufacture. The defendants denied infringement, disputed the validity of each of the twelve patents on all the grounds commonly set up in patent actions, and also alleged anticipation. Before the action came on for trial, however, the battle-field was very much reduced by arrangement between the parties; one patent only—Monnet's, of 1894—had been discussed, and even as to that, all the grounds of defence were abandoned except one. The defendants admitted the importation and sale in England of saccharin made by a firm in Dresden according to the invention claimed in the patent in question, and dropped all the objections to the validity of the patent, except one, viz., that the invention described was not of sufficient ingenuity or merit to form the subject matter of a patent, having regard to the state of common knowledge at the time. The patent was described to be for improvements in the manufacture of toluene-sulpho-chlorides, the object being to obtain ortho-toluene-sulpho-chloride, which by a subsequent process was converted into saccharin. Previous to the

patent, this was obtained by treating toluene-with sulphonic acid, or rather with a salt of that acid, and then treating it with phosphorus chloride, the result being at least two kinds of toluene - sulpho - chloride, ortho and para, of which the former only was useful. There was some evidence of there being a third kind, termed meta, but any knowledge of it seemed very limited, and some chemists even disputed its existence, The result of the old methods was that only about half of the mass treated was converted into toluene and sulpho-chloride, and only about half of that was the ortho variety, so that the total useful product was only about 25 per cent. of the ingredients used. By the patent now in question it was claimed that by keeping the temperature of the mass between 0° and 5° C., and using a large excess of acid, the whole of the toluene was converted into sulpho-chloride, of which over 60 per cent. was of the useful kind. His Lordship then referred briefly to the published papers, particularly one by Claesen and Wallin, which were put forward as showing the state of knowledge at the time of the patent, pointing out that none of them contained any direction for keeping the temperature as low as 0° to 5° C., and after quoting certain passages from the evidence of Professor Dewar, Dr. Liebmann, and Dr. Passmore on the one side, and of Professor Frankland and Dr. Hehner on the other, he said he came to the conclusion that the invention was of sufficient importance and utility to form the subject matter of a patent. He must, therefore, grant an injunction to restrain the infringement, with costs, and the plaintiffs were entitled to an account of profits.

HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION.

On Thursday, December 7, the members of this Association dined at the Old Cock Hotel, Halifax.

After the repast and the usual loyal toasts, Mr. W. C. Hebden gave "The Town and Trade of Halifax." He said they were blessed with a large number of different trades, and he could say with confidence that every one of them was at present in a most flourishing condition. They had reason to be proud of the town's co-operation, for its Corporation was in the front rank of municipal boroughs for its enterprise, its health management, and its finances. He recalled that it was just about thirty-one years since the Halifax Chemists' Association was formed, and of those then connected with it, Mr. Brierley and himself were the only two present that evening. During its career the Association had been a useful and powerful organisation.

Mr. Cobb, in responding, agreed with Mr. Hebden that Halifax held its own with regard to improvements and the amount of business which was transacted. The drug trade, along with the others, was doing well.

Mr. S. N. Pickard, of Bradford, gave the toast of "The Halifax and District Chemists' Association," and spoke in high praise of its members' business aptitude. He urged upon them to support the Pharmaceutical Society to the best of their power. In the near future they would have to fight for their just rights, and they must be united.

Mr. Brierley, in reply, characterised the Association as a factor for good, which smoothed off the corners of competition.

Mr. Comyns gave "The Visiting Friends," and this was responded to by Mr. Cousins, of Dewsbury, and Mr. Silson, of Bradford.

Mr. F. D. Crossley, of Manchester, proposed "The Pharmaceutical Society," and Mr. C. Fielding responded.

Mr. Gibson gave "The Newly-Elected Officers," on whose behalf Mr. Wilkinson replied.

Finally, "The Past Officers" fell to Mr. W. S. Thompson, to which Mr. Hebden and Mr. Cobb briefly replied.

The enjoyment of the evening was greatly augmented by a number of vocal and instrumental solos, which were all rendered very creditably.

LETTERS TO THE EDITOR.

Ammonia Soap.

The usual text-books on chemistry are so reticent respecting this that I make no apology for pointing out that if four ounces (by weight) of oleic acid be shaken up in a wide-mouthed, stoppered bottle with two and a half fluid ounces of solution of ammonia perceptible evolution of heat follows, and a firm jelly is formed, closely resembling in physical characters sapo mollis B.P. It is readily soluble in 90 per cent. of alcohol, but the solution becomes turbid on dilution with water, apparently because the traces of ammonium stearate and margarate present are less soluble in aqueous than in alcoholic liquids.

Dover, December 4, 1899. J. F. Brown.

Bitter Appel.

In the short African section of my report of progress, for 1899, of the projected Indian and Colonial Addendum to the British Pharmacopœia, printed on page 655 of your last issue, the words *Monœcia monodelphia*, from page 276 of the *South African Medical Journal* for April of this year, doubtless should be *Citrullus vulgaris* Schrad. (= *Citrullus amarus*, Schrad.) of Pappe's 'Floræ Capensis Medicæ.' For the writer of the article in the above Cape Town journal is referring to the Dutch "bitter appel," and Mr. Holmes, after turning up the reference to "bitter appel" in Pappe, pointed out to me when I called at 17, Bloomsbury Square, yesterday, that the words *Monœcia monadelphia* occur within a line or so of the words *Citrullus amarus*, and suggested that the writer in the *South African Medical Journal*, or his amanuensis, had probably also referred to Pappe, and inadvertently had copied the class name instead of the other. Dr. Hewat in proposing the recognition, for South Africa, of the "bitter appel, or wild water-melon," adds: "the pulp of which is a drastic purgative, like that of colocynth, for which it might well be substituted in this country."

Watford, December 12, 1899. John Attfield.

The Company Pharmacy Problem.

I have read with great interest the articles and letters which have lately appeared in the *Pharmaceutical Journal* on "company pharmacy." In your issue of the 9th inst., Mr. Thomas Reade raises the question of the qualification of the managing director only, and suggests that it is "possible for the trade to carry the legitimate drug companies with them, by providing that no company shall practise pharmacy or at least sell poisons, or call themselves chemists unless at least the managing director or the company is a registered man." This, sir, at first sight seems plausible; will Mr. Reade explain why a chemist who wishes to enter a partnership with an unregistered man must needs do so only by means of limited liability company machinery? Under his proposed alteration of the law it will be legal for a company to do what it would be illegal for an individual to do—a registered chemist cannot take into partnership an unregistered man. Why then should a chemist legally be able to take into partnership six unregistered men!

Rochdale, December 11, 1899. Edward Thomas.

What is the Principle of the Pharmacy Act?

If an answer be sought to the question why it was "impossible to infer" that a larger construction should not be put upon the word "person," there is no escape from the conclusion "because qualified ownership is not an essential principle of the Pharma Act." In last week's Annotations, it is stated that this settled law "is founded upon error," and that the Lord Chancellor has clearly perceived that it cannot be relied upon as a foundation The Lord

Chancellor says: "He thought that the learned judges who came to the conclusion that that was the true construction of the Statute were perfectly right." Taking this statement and Clause 2 of the Companies Bill, how is it possible to avoid the conclusion that the Lord Chancellor founds on settled law in seeking a remedy for a legislative defect?

December 12, 1899. "OBSERVER" (13/23).

The Society's Examination.

"Squarer's" opinion, expressed last week in answer to my letter, would be a good deal more valuable if he would previously get an accurate grasp of what he is writing about. First, there is no reference to the practical portion of the Major in my letter; in fact, I believe that the standard is a good one. Secondly, he says depth of physics cannot be entertained as long as our preliminary standard is so low. If he will refer to my letter, he will find that it is now we are entering upon a new era in preliminary education that I recommend a somewhat higher standard than the questions to which I took exception, and I defy "Squarer" to prove that these questions are up to the standard of the two examinations I mention. Let him note—I do not state that the Major papers are not up to this standard. This is a "gross" inaccuracy on his own part. Thirdly, "Squarer" takes it upon himself to compare the Major with the Inter. B.Sc., London. It must be borne in mind that this examination is a compulsory Intermediate, whereas the Major is an honorary Final, two entirely different things altogether, and he admits that the Major standard in botany is somewhat lower than the Inter. Science. Why should it be? This bears out what I was commenting upon. Lastly, our medical friends would very soon strongly object to our adding physiology on to the syllabus. Zoology might be added with advantage, and the subject botany converted into biology.

December 12, 1899. "EDUCATIONALIST" (13/12).

The Reconstitution of Camwal.

The success that the Chemists' Aërated Waters Association has achieved is, I think, entirely due to the fact that the shares are held by the chemists themselves, and being so protected they have taken an interest in it. I see that the company in future intends supplying hotels. I think this is a great mistake, from a chemist's point of view. Why, every public house in a town can call itself an hotel. I hope the chemists will keep the concern in their own hands, and if the hotels want the waters supplied by the Association let them obtain them through the chemists.

December 11, 1899. A SHAREHOLDER (12/44).

Senna—a Suggestion.

This important drug, which has held its own since the time of Alfred the Great, has from time to time received the attention of chemists. No satisfactory results have, however, followed their attempts to isolate its cathartic principle, which does not seem to reside in an alkaloid, but is of a volatile nature, as has been demonstrated. Senna has always been a favourite in my practice. I made a palatable black draught, using tartrate of potass. in place of sulphate of magnesia, covering the taste by extract of liquorice. The purgative quality of senna is materially increased by the addition of sp. ammon. arom. Accidentally this was added to the ingredients in the percolator, instead of to the percolate—the result was an unexpected success. There seems to be an affinity between the active principle of the drug and ammonia. The idea now suggested is, Would it be possible by digesting senna with solution of ammonia and then distilling *in vacuo* that the two volatile principles might come over together? The ammonia could easily be neutralised, and the remaining portion might contain the veritable substance sought for; but, having no apparatus now, experimenting is not possible, nor do I know a pharmacist willing to undertake the trial.

Kew, December 13, 1899. R. GOODWIN MUMBRAY.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.*

Nipple Lotion (A. F.—36/26).—It appears to contain borax and zinc sulphate, dissolved in rose water. The solution is extremely dilute.

Calcium Phosphate in Bread (H. B. R.—37/1).—It is probably as good a plan as any. Mix the phosphate with the salt (say 1 part to 2) added to the flour when making the bread.

Photographic Lamp (T. R. A.—37/3).—If you find the light too powerful, you might try a bulb of obscured glass, or coat the clear bulb with transparent red varnish.

Prescription (P. W.—36/31).—It cannot be dispensed satisfactorily without adding powdered gum acacia, and you are therefore, quite justified in making the addition.

Medicine Licence.—(J. E. J.—37/6).—You must take out a licence if you make or sell medicines requiring the Government stamp.

Spirit Licences.—(J. E. J.—37/6).—Apply for information regarding your first and second questions to the local supervisor, through whom the permission of the Board of Inland Revenue must be obtained if necessary.

Small Sterilising Apparatus (G. L.—37/2).—You do not say for what purpose you require the apparatus, but you will probably get what you require from C. Baker, 244, High Holborn, London, W.C., or from any maker of chemical apparatus.

Tinct. Lithantracis (H. W. M.—36/24).—A correspondent kindly informs us that this is a preparation used at the Manchester Skin Hospital, and prepared, he thinks, by Messrs. Midgeley and Co., St. Ann's Square, Manchester.

Partnership (W. P. C. A.—36/32). — One respectable lawyer ought to suffice; his fee will depend upon the work he has to do. Apply at the local stamp office for information regarding the cost of stamping the agreement.

Books on Mineralogy (J. W.—36/22).—Collins' 'Systematic and Descriptive Mineralogy,' Nicol's 'Elements of Mineralogy,' Ramsay's 'Rudiments of Mineralogy,' and Bauerman's 'Descriptive Mineralogy' and 'System of Mineralogy' are among the books most likely to be useful to you.

Polishes (J. J. B. W.—36/25).—The best brush polish is prepared by dissolving pale orange shellac (6 to 8 ounces to the pint) in methylated spirit or wood naphtha, or a mixture of the two. Ordinary resin and benzoin are sometimes added, but they tend to make the coating brittle. French polish is a similar preparation, containing a small proportion of oxalic acid, say one or two drachms to the pint. For the method of application, see the reply to G. O. P. in the *P.J.* for November 25 last, page 520.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

MALIC ACID IN HIPPOPHÆ RHAMNOIDES.

H. Erdmann has ascertained that the yellow berries of the sea buckthorn contain a large amount of malic acid, together with mannite. The orange-yellow juice of the berries when neutralised with chalk gives a slightly coloured liquor when filtered, most of the coloured constituent remaining mixed with the excess of chalk. On heating the clear liquor to boiling an abundant deposit of white granular crystals separates, consisting of calcium malate, having a composition represented by the formula $C_4H_4O_5Ca + 1\frac{1}{2}\,Aq$. The rotary power of an ammonium salt of the acid was found to be $-2°\ 94'$, showing that the acid is identical with that of service berries (*Pyrus aucuparia*). Examination of the syrupy mother liquor from calcium malate led to the conclusion that the crystals deposited after some time consisted essentially of a calcium compound of mannite.—*Berichte*, **32**, 3,351.

PHARMACY OF MUIRA-PUAMA.

This drug stands in high repute in Brazil as an aphrodisiac. Cæsar and Loretz recommend the following pharmaceutical preparations for use:—*Fluid Extract of Muira-puama.* — Muira-puama wood in coarse powder, 100; alcohol (90 per cent.), 20; glycerin, 10, are mixed and allowed to macerate for two hours, and then percolated with dilute spirit to complete exhaustion; about 400–500 parts of dilute alcohol are required. Dose 2 to 3 Gm., twice or three times daily. To prepare *wine of muira-puama* (1–10), take of muira-puama wood, 100; alcohol (90 per cent.), 25; distilled water, 25; sherry, 950. Macerate for ten days, press, and filter. Dose, 20 to 30 Gm., twice or thrice daily. The fluid extract is the best form for use.—*Pharm. Cent.*, **40**, 611.

PHARMACY OF COLLOIDAL SILVER.

In septicæmia, colloidal silver may be given in the form of pills composed of colloidal silver, 50 centigrammes; milk sugar, 5 Gm.; glycerin and water of each *q.s.* to mass. Divide into fifty pills. Two to be taken for a dose, twice or three times a day before meals. In mixture form it may be dispensed as follows:—Colloidal silver, half to 2 Gm.; distilled water, 50 to 200 Gm.; fresh white of egg and glycerin, of each 0·5 to 2 Gm. A teaspoonful to be taken in a glass of water three times daily, from 15 to 30 minutes before meals. Pills, 3 Mm. in diameter, each containing 5 centigrammes of colloidal silver and 25 Mgm. of milk sugar, are employed in surgical practice for introduction into the cavities of fistulas, and into deep lesions of various organs. In endometritis, Klein has employed it in the form of rods, containing 20 centigrammes of colloidal silver, massed with milk sugar, gum arabic, and glycerin.—*Nouv. Rem.*, **15**, 472, after *Klin. therap. Woch.*

BENZOYL PEROXIDE AS A DISINFECTANT.

The disinfecting value of this body which is obtained—by the interaction of benzoyl chloride, hydrogen peroxide, and sodium hydrate—as a white powder, sparingly soluble in alcohol, glycerin and fatty oils, and but slightly soluble in water, has been experimented with by Carl Frey and L. Vanino, who have investigated its bactericidal power, obtaining the following results with pure cultures of the respective bacteria:—Diphtheria bacillus, killed in fifteen minutes; *Streptococcus* in one and a half hours; *B. coli communis* in fifty minutes; *B. pyocyaneus* in fifteen minutes. *B. prodigiosus* in one hour. *B. proteus mirabilis* in twenty minutes.—*Pharm. Centralh.*, **40**, 209.

OIL OF TROPÆOLUM MAJUS.

A. W. Hoffmann has recorded that on distillation, the garden "nasturtium" yields a volatile oil, consisting solely of benzyl cyanide, and free from any mustard-like odour, although the fresh plant, both by taste and odour, indicates the presence of mustard oil. J. Gadamer explains this as being due to the conversion of the glucoside, glyco-tropæolin, into a cyanide by the action of heat and water. He finds that when the fresh juice is extracted with ether, the ethereal extract gives with alcoholic ammonia, rosettes of crystals of benzyl-thio-urea, melting at 162° C. The glucoside glyco-tropæolin is isolated by precipitating a neutral aqueous extract of nasturtium seeds with silver nitrate solution. The precipitate thus obtained gives with ammonia a crystalline compound, the composition of which is given as $C_6H_5{\cdot}CH_2{\cdot}NCS{\cdot}Ag_2SO_4{\cdot}2NH_3$. It is analogous to the body furnished by sinigrin.—*Pharm. Cent.*, **40**, 281.

POISONING BY BRYONY.

A. S. Auger records a case in which several horses were killed by eating *Bryonia dioica*. The chief symptom was a very marked stiffness, with a gait resembling that in laminitis, but without throbbing of the plantar artery. All recovered under the influence of diuretics, together with mustard and embrocation to the loins, but after the elimination of the poison, the animals showed signs of weakness for some days.—*Vet. Record*, **12**, 254.

BACTERIAL TREATMENT OF SEWAGE.

A second report on the bacterial treatment of crude sewage has been issued by the London County Council. The chemical portion of the report, which is by Professor Clowes, concludes that the bacterial process presents the following advantages: (*a*) It requires no chemicals; (*b*) it produces no offensive sludge, but only a deposit of sand or vegetable tissue free from odour; (*c*) it removes the whole of the suspended matter, instead of only about 80 per cent. thereof; (*d*) it effects the removal of 51·3 per cent. of the dissolved oxidisable and putrescible matter, as compared with the removal of 17 per cent. only as effected by the present chemical treatment; (*e*) the resultant liquid is entirely free from objectionable smell, does not become foul when kept, and maintains the life of fish. The bacteriological portion of the report, by Dr. Houston, includes investigations on the number of bacteria present, and the percentage of liquefying forms, also of the bacteria met with, such as the *B. coli communis* and *B. enteritidi sporogenes*, with a description of several species. The report is illustrated with a number of diagrams and photo-micrographs.

STERILISATION OF WATER BY OZONE.

A number of experimental details on the sterilisation of water for drinking purposes by means of ozone are given by Weyl in a recent communication (*Centr. f. Bak.* xxvi., p. 16). Water from the Spree was pumped through a chamber filled with stones by which the suspended matter was strained off. By means of another centrifugal pump the water was pumped into a second cylindrical chamber, 4·5 metres in height and filled with large stones, through which the water trickled and so became finely divided, meeting the stream of ozonised air introduced below. The ozonised water collected in the lower part of this chamber and thence passed to the reservoir. The plant was capable of treating 3·5 to 4 cubic metres of water per hour (800 gallons). The experiments showed that for a good water 1 Gm. of ozone per cubic metre (220 gallons) was sufficient, but for a bad water 2 Gm. were required for sterilisation, the cost being about one-third of a penny per gramme of ozone. The whole of the machinery was driven by electricity.

THE ASSAY OF THE LIQUID EXTRACT OF IPECACUANHA.

BY H. J. HENDERSON.

Since the publication of the new British Pharmacopœia the process adopted therein for the assay of the liquid ext. of ipecacuanha has been subjected to much adverse criticism. The process would work easily if a certain volume could be taken, and after precipitating with solution of subacetate of lead, a certain volume of the filtrate could be taken which might represent an aliquot part of the original volume. There are many difficulties to be overcome before this can be accomplished, but the solution of the problem lies in this direction. There is one point upon which everyone seems to agree, and that is, that too large a quantity is taken for the assay; 5 C.c. appears to be the most suitable quantity. Wright and Farr were of the opinion that one or two C.c. were ample in the hands of an expert, and so firmly were they convinced of this that they used 5 C.c. in their process.

There appears to be but little difference between the process of Wright and Farr and the No. 3 process of Naylor and Bryant, which was abandoned because it formed such intractable emulsions. The process of Wright and Farr is open to this objection, which is a serious one, and they appear to be fully alive to the fact, for in their paper, read before the British Pharmaceutical Conference last year, they stated that a process has yet to be devised which will work rapidly—an opinion which coincides with my own. With the substitution of an alkaloid standard depending upon titration alone, I do not agree; neither do I consider that the end reaction is so very sharp or precise, and until it has been proved that cephaeline and emetine occur in different samples of Rio ipecacuanha in unchanging proportions, I shall trust to a gravimetric method. Wilson in his paper (*P.J.* [4], **7**, 3) stated that titration appeared to be useless as a means of determining the alkaloids of ipecacuanha.

Wilson's process was the first alternative method for the assay of the liquid extract published, after the appearance of the B.P., 1898. It consisted in the removal of colouring matter, and other substances soluble in ether-chloroform, by first shaking the extract, from which the spirit had been removed, with that solvent in acid solution, the alkaloids being afterwards removed by shaking out in alkaline solution with ether-chloroform. Wright and Farr appear to have misunderstood Wilson's remarks in one place. He does not state that his ether-chloroform washings require any treatment with acidulated water. He entirely overlooks the fact that these washings contain any alkaloid at all. That they do contain alkaloid is an undoubted fact, as pointed out by Wright and Farr, whose experiments on this point are confirmed by my own.

It is probably the presence of the fatty bodies that determines the solution of the alkaloid, as pointed out by Dragendorff in his book on plant analysis as far back as 1884. What Wilson did say was that if the ether-chloroform solution of the alkaloids was treated with acidulated water the ether-chloroform left no residue on evaporation, which would hardly be the case if he was referring to the ether-chloroform washings. He thus indirectly implies that nothing is present in the ether-chloroform but alkaloids. I have never been able to confirm this statement; in fact, my own experience has satisfied me that directly the opposite is the case. It does not follow that because no more colouring matter and substances other than alkaloids are dissolved when shaken with ether-chloroform in acid solution that no more will be dissolved when the same solution is shaken with the same solvent after adding excess of ammonia. Ammonia is a powerful solvent of organic matter, and in the case under discussion a quantity of the ammonia gas is absorbed by the ether-chloroform, and thus enables the latter to dissolve a considerable quantity of matter other than alkaloids. Moss has, however, stated (*P.J.* [4], **7**, 347) that Wilson's process yielded a purer residue than the B.P. method. It is difficult to see how this conclusion was arrived at; if by the volumetric method, then the results obtained by Wilson are against this statement made by Moss. Wilson simply claimed that his process yielded a residue as rich in alkaloid as the B.P. process—1 Gm. of B.P. residue = 36·1 C.c. N/10 acid, 1 Gm. Wilson's residue = 35·75 C.c. N/10 acid, and these are Wilson's own figures. For my own part I do not consider that the residue of the alternative process is as pure as that yielded by the B.P. process, for the following reasons:—1. The colour of the alkaloidal solution is a deep orange, many degrees darker than the corresponding chloroformic solution of the B.P. process. 2. It is less soluble in acids, and yields a darker solution. 3. I have never been able to confirm his volumetric results.

A characteristic feature of Wilson's process is the formation of the most intractable emulsions that I have ever had the misfortune to deal with, many have refused to separate even after standing many days, and were not to be beguiled by warming. Owing to this property the process in my hands has not been so speedy as the B.P. method, and, after giving it a prolonged trial, I abandoned it.

The process No. 4 of Naylor and Bryant is also open to the objection that it forms emulsions, but these are not nearly so intractable, much of the resinous matter having been removed before the ammonia is added. In the majority of instances, however, these emulsions separate very well if the contents of the separator be warmed, but require to stand some considerable time to clear, the lower layer of chloroform having an opaque appearance. It is a general method of assay, and calls for no particular comment, as it introduces nothing novel. Curiously, in the table of comparative results published by the authors (see 'Year-Book of Pharmacy,' 1899, 346), 20 C.c. of the liquid extract, when assayed by the B.P. process, yielded 0·402 Gm. of alkaloid, which contained 0·0646 Gm. of impurity, whilst 20 C.c. assayed by Wilson's process yielded only 0·400 Gm., and contained 0·07465 of impurity. These figures do not confirm Wilson's results. I feel convinced that the liquid extract used by Wilson in his experiments was singularly free from resinous matter.

In the *P.J.* for November 25, 1899, F. H. Alcock publishes a method which, owing to its recent appearance, has not been subjected to an extended trial. I have been able, however, to compare it with the B.P. method, using 5 C.c. in each case. The official method yielded 0·1540 Gm., and Alcock's yielded 0·1560 Gm. The process is very rapid, and if the chloroformic solution of the alkaloids be washed with a little ammoniated water the resulting solution compares favourably with the corresponding solution of the B.P. in colour. Alcock has designed a very neat and rapid process, it emulsifies but little, and yields a residue which corresponds very closely in weight to the residue yielded by the B.P. method. Most workers are agreed that the latter method is very tedious. F. C. J. Bird, however, appears to differ very considerably from the majority in his experiences, as he is reported to have said at the B.P.C. that with the help of a Bunsen's filter pump, and with a little ingenuity, it could be completed in a quarter of an hour. It is much to be regretted that Mr. Bird did not enter more into detail. Mr. Jones made some very weighty remarks at the British Pharmaceutical Conference (see 'Year-Book,' 1899, 351), which deserve the closest attention from anyone interested in this subject.

Although I have never met with a sample of liquid extract of ipecacuanha having an alkaline reaction, yet it is easy to see how such a thing could be possible, and if the liquid extract should contain alkaloids in a free state one would wash the lead precipitate a long time before they were removed, as the spirit in which they were soluble has been dissipated. After adding the solution of subacetate of lead the magma should be subjected to a

careful trituration, as after the removal of the spirit in the preliminary step a considerable quantity of resin and other bodies insoluble in an aqueous menstruum are precipitated. These conglomerate, and mechanically carry down alkaloid, which, being imprisoned, is very difficult to wash out. The official method of assay requires extreme care and a considerable amount of time for its exact performance, and a filter pump is indispensable in washing the lead precipitate. This once done, the process works cleanly and well, yielding a residue which I believe to be purer than that yielded by any other method; certainly more of the extract is ordered to be taken for the assay than is necessary, but a slip of this kind is hardly a serious one, and, speaking generally, the process is far from being so bad as it has been said to be.

MACERATION TINCTURES.*

BY THOMAS DUNLOP.

As is well-known, the B.P. of 1898 reverted to the process of maceration in the manufacture of some of the tinctures. The change has been brought into prominence by an occasional question in the Journal as to whether the finished tincture is to be made up to a definite volume or not. This inquiry may have been prompted by uncertainty arising from the fact that the process is not uniformly conducted, although the instructions given in each case are very definite.

The absence of uniformity of operation has, through increase of volume, weakened several of the tinctures, so that, although the modern tendency is towards standardisation or percentage strength, there has been a marked backward move in this class of tinctures.

Of the thirty tinctures made by mixture or maceration, twelve are directed to be made to the volume of one pint. In the other eighteen one pint of menstruum is directed to be taken, and nothing is said about finished product, no allowance being made either for increase or diminution of volume. In tinctures of asafetida, guaiacum ammoniatum and myrrh we have examples of allowance. In compound tincture of cardamoms and tincture of squill we have examples of no allowance. Allowance is made in tincture of kino with two ounces of drug to the pint, whilst no allowance is made in tincture of catechu with four ounces of drug to the pint. Of the thirty tinctures only one is new, and of the remaining twenty-nine only three were formerly of indefinite volume. One of the freaks of the Pharmacopœia is seen in acetum and tinc. scillæ. In the 1885 Pharmacopœia the former was of indefinite and the latter of definite volume. In the 1898 Pharmacopœia it is the other way about, and yet squill is a drug, every four ounces of which adds fully one ounce to the volume of either of these preparations. In the following table I give the results obtained in making a pint of the respective tinctures, the amount of drugs ordered in each being likely to affect the product either in loss or gain:—

Tincture.	Vol. of Product.		Weight of drugs.		Weight of expressed marc.		Weight of marc spontaneously dried.		Loss of weight in drying.		Weight of Sol. matter.	
	oz.	drs.	oz.	grs.	oz.	grs.	oz.	grs.	oz.	grs.	oz.	grs.
(*a*) Calumb.	18	6	2		2½	30	1¾		¾	30	¼	
Cardam. Co.	20	7	3	55	1¾	30	1¼		½	30	1¾	55
Catechu	21	1	5		2¼	45	1½		¾	45	3½	
(*b*) Gent. Co.	19	2½	3½		3	40	2¼	20	¾	20	½	90
(*c*) Scillæ	21		4*c*		2¾		1*c*		1¼		3	
(*d*) Sennæ Co.	19	2½	7		5¾	90	4¾	90	1		2¼	90

(*a*) Product, plus loss of weight in drying, leaves a deficit of half-an-ounce.
(*b*) Product, plus loss of weight in drying, equals volume taken.
(*c*) Even dried equals moisture free.
(*d*) Product plus loss of weight in drying exceeds volume taken.

* Read at an evening meeting of the Pharmaceutical Society in Edinburgh, December 20, 1899.

As might be expected, the products of tinctures of calumba and gentian co. fall short of the menstrua taken, the amount of soluble matter in the drugs being small and the marcs being incompressible, which was demonstrated in the fact that the expressed marcs were heavier than the original weights of the drugs. On the other hand, compound tincture of cardamoms and the tinctures of catechu and squill being made from drugs containing a large amount of soluble matter, and the marcs yielding readily to pressure, the products are in excess of the menstrua taken. Such being the case, to be accurate it will now be necessary to indicate the strength of tinctures yielding an excess as 1 to x instead of 1 in x as formerly. Compound tincture of senna occupies an intermediate place; a fair proportion of the ingredients used is soluble, but the marc being bulky and absorbent the product falls short of the menstruum taken.

The plea put forward for not "making up" has been that that which is in the marc after expression is the same strength as what has been expressed, the deduction being that to authorise "making up" would tend to foster careless manipulation. I think no practical pharmacist would be blind to the fact that the time required for thorough expression is of less value than the tincture that would be lost through slipshod workmanship. My results were easily got by using an ordinary screw press and in making a pint quantity. With larger quantities and more powerful expression the figures would be increased.

The process thoroughly exhausts the drugs. I found the marc in each case, after expressing and drying, inert, so that what was lost in drying was spirit, the whole of the activity being in the strained and expressed portions. I think, however, the process would be improved by conducting it uniformly (except in the case of tinct. pruni. virg.) on the lines of the percolation process that was official in the 1885 Pharmacopœia, viz.—macerate in three-fourths of the menstruum for the specified time, strain, wash out with three ounces of menstruum, express and "make up" to one pint. This would also prove a source of economy in the manufacture of some of the tinctures of definite volume where at present there is waste through the marc not being expressed. The recovery of residual tincture spirit may be resorted to on the manufacturing scale, but if the Pharmacopœia is to be for pharmacists, then each process should be complete in itself. This suggested modification of the process cannot be looked upon as included in the "details and minor variations" that "are left to the judgment of the pharmacist," as it is distinctly stated that "the solid ingredients are to be placed in the whole of the menstruum"; but it is an adaptation of a *modus operandi* that is at present officially recognised in the manufacture of other galenicals—*e.g.*, extracts of liquorice and opium and syrup of senna.

In advocating definiteness of volume I would direct attention to the fact that the average weight of moisture in the expressed marcs reported on is three-quarters of an ounce, so that where the deficit is not counterbalanced by soluble matter the loss must be due to evaporation, and that "making up" would be quite justifiable. The increased strength of most of the tinctures must also be borne in mind as specially warranting it, whilst it would bring all the tinctures into line, as was the case in the 1885 Pharmacopœia.

As it is, the progress (?) of the age has brought us back to where we were fifty years ago, from which we see that in pharmacy as in other things there is fashion.

Since the foregoing notes were made I have seen Lucas's table, and I am at a loss to know how he accounts for the deficits in the cases of tr. card. co., tr. catechu and tr. scillæ. To have only 0·6 of a difference between tr. pruni virg., which is made from four ounces of a bark with an uncondensed menstruum, and tr. catechu, which is made from four ounces of an almost entirely soluble extract with a condensed menstruum, indicates a discrepancy somewhere.

I have compiled this series of notes to satisfy myself as to what extent the tinctures were affected by the altered process. In submitting them to-night it has been in the hope that they might alike afford material for criticism, and at the same time elicit the experience and opinions of others, sufficient time having elapsed since the publication of the Pharmacopœia for pharmacists to have something to say on the subject.

AN INCOMPATIBLE STRYCHNINE MIXTURE.*

BY THOMAS DUNLOP.

Recently I had the following prescription to dispense:—

℞ Liq. Sod. Arsen.
Liq. Strych. aa ʒss.

A few minutes after the liquors were mixed I observed that the inside of the bottle was covered with a granular deposit. As shaking did not detach this, I set it aside for an hour. At the end of that time there was a loose deposit in the bottom of the bottle and a scum on the surface of the liquid. As the latter prevented decantation, I filtered the liquid, when the precipitate was then seen to be crystalline. I allowed the filter to dry and the bottle to drain, and then washed out the bottle with three successive two drachms of methylated spirit, passing the washings through the filter. This dissolved the precipitate, which, on evaporation of the spirit, was recovered in crystalline form. It weighed fully half a grain.

On examination it was found to be strychnine, which was confirmed by its solubility in various media, by its taste, and by the reaction with K_2CrO_4; only a trace of arsenate and chloride being indicated, these being adherent from the liquid in which it had been precipitated. Having found what the precipitate was, the question arose, What caused it? Squire gave no clue—"incompatibles" being absent from both sod. arsen. and strych. hydro-chlor.; but on reading the B.P. characters and tests of sodii arsenas I found that it "yields an alkaline solution." As I had not observed this incompatibility with 1885 liq. strych. it occurred to me that the excess of acid in that solution would have been sufficient to neutralise the alkalinity of the arsenical solution, and that is so. Experiment proved that it required two and a-half minims of diluted hydrochloric acid to each ounce of the liq. sod. arsen. to produce a faintly acid solution, and this was compatible with liq. strych. hydrochlor., 1898.

This observation suggests an amendment of the formula for making liq. sod. arsen. Meantime, its incompatibility with hydrochloride of strychnine should be noted by dispensers, as otherwise the loss in alkaloid (equals, in this case, fully 28 per cent.) is very serious, and in a coloured mixture it might escape notice, and thus become highly dangerous.

This inquiry also throws some light on Mr. Kidd's note on the dispensing of syr. fer. iod. *c.* liq. sod. arsen. (*P.J.*, [4] **7**, 629.) The opalescence caused in that mixture is *wholly* due to the *alkalinity* of the arsenical solution. When the mixture is made with a neutral or faintly acid solution, there is neither opalescence nor discoloration.

In the "Students' Column" of the *P.J.*, Sept. 30, page 324, under sodii arsenas, in describing the quantitative test, it is stated that "The necessity for adding acetic acid is really due to the fact that, although the official sodium arsenate is acid in constitution . . . it yields an alkaline solution. It is *supposed* that a partial hydrolysis of the salt occurs in aqueous solution with formation of sodium dihydrogen arsenate and sodium hydroxide." *My supposition* previous to that was that the hydroxide was the result of the hydration of some sodium oxide—which may be a variable quantity—present in the salt, and this seems the more probable, because different samples when treated with mercuric chloride test solution do not precipitate in the same degree.

* Read at an evening meeting of the Pharmaceutical Society, in Edinburgh, December 20, 1899.

LIQUOR BISMUTHI.*

BY R. C. COWLEY AND J. P. CATFORD.

This liquor was first included in the pharmacopœial preparations in 1867, and since then each time the Pharmacopœia has been revised the formula has been altered; still it remains unsatisfactory.

The B.P. of 1867 ordered it to be made from metallic bismuth by solution in nitric acid, adding solution of ammonia to this until the precipitate produced is redissolved, then diluting it to the required volume. It contained bismuth ammonium, citrate, and ammonium nitrate.

In the 1885 Pharmacopœia the precipitated bismuth citrate was washed free from nitrate and dried. A definite proportion of this salt could be dissolved in solution of ammonia, and diluted to volume when required. This method possessed many advantages, but these were negatived by the difficulty in dissolving many samples of the salt, and the solution invariably contained more ammonia than would be required to dissolve a freshly precipitated bismuth citrate.

To remedy this defect McEwen published a formula, in which the bismuth oxynitrate is dissolved in nitric acid, and citric acid is added to the solution. This is divided into two equal portions; ammonia is added to one-half, until the precipitate formed is redissolved, and water is added to make the volume equivalent to the volume of the finished article; the other half is now added, which causes a precipitation of bismuth citrate. The precipitate is washed, dissolved in the necessary volume of ammonia, and finally diluted to the required volume. The chief objection to this process is the loss of bismuth experienced, which MacEwen states to be about 3 per cent., and which he allows for by using an additional quantity of bismuth oxynitrate. As a matter of fact, the loss is much greater if ammonia is added to the first half until the liquid just becomes clear, but by using sufficient solution of ammonia to neutralise the whole of the free nitric acid, and, in fact, this quantity, plus sufficient to combine with half the nitric radical in the original oxynitrate of bismuth, the proportion of loss is considerably diminished; any further addition, however, causes solution of the bismuth citrate. The compilers of the 1898 Pharmacopœia, taking into consideration the shortcomings of the 1885 formula, have ordered the preparation of a bismuth citrate, which is dissolved while still moist in solution of ammonia, and let down to the required volume.

On the face of it, this appears quite simple, but often in practice it is most difficult to wash the precipitate free from nitric acid, and when so washed it does not completely dissolve in solution of ammonia. For this reason pharmacists still employ MacEwen's process, or the bismuth citrate as ordered in the 1885 Pharmacopœia. From a considerable number of experiments we have determined that the best proportions are as follows—(*a*) Sufficient of the citric radical to combine with all the bismuth; (*b*) sufficient of a fixed alkali to combine with all the free nitric acid, plus the nitric radical in the bismuth oxynitrate. As previously remarked, this does not apply where ammonia is used.

Comparing this with the pharmacopœial formula, it will be seen that, curiously enough, the latter orders sufficient citric radical to combine with the bismuth, provided the potassium citrate is 100 per cent. pure. The purity of this salt, as given in the B.P., is 98 per cent., but actually, in commerce, the salt is often much less pure. One sample we examined was just under 94 per cent. pure. The total amount of alkali is also insufficient to neutralise the nitric acid. Thus we have the conditions to produce an admixture of basic bismuth nitrate with the bismuth citrate, which will require at least a week's washing to wash it free from nitric acid, or, in other words, to wash out the nitric radical from the basic bismuth nitrate. The washed precipitate will, of course, be incompletely dissolved by ammonia.

* Read before the Liverpool Chemists' Association, on December 14, 1899.

To enter into the rationale of the process, which consists of two steps, we will first consider the conditions under which the bismuth citrate is formed.

If we take 4-milligramme molecules of bismuth oxynitrate—*i.e.*, 0·305 × 4 = 1·2 gramme—and dissolve this in 10 Mgm. molecules of nitric acid—*i.e.*, 2 C.c. of equal parts of nitric acid, sp. gr. 1·42, and water, which is equivalent to a 8 N solution—the simple addition of 4 Mgm. molecules of citric acid—*i.e.*, 0·84 gramme—will at once cause a precipitation of bismuth citrate, without the addition of any alkali; because, although the citric acid is a weaker acid, yet it exceeds the uncombined nitric acid by 4 to 2, and in basicity by 12 to 2; the affinity is influenced by the relative quantity of the reagents used, and by the relative solubility of the resulting compounds.

Next, if we take 3 Mgm. molecules of bismuth oxynitrate—*i.e.*, 0·915 gramme—and dissolve them in a similar quantity of nitric acid to the first, and add 3 Mgm. molecules of citric acid, there is no precipitation until 6 out of the 13 nitric acid molecules are neutralised*—*i.e.*, 10 of the added, plus 3 in combination with the bismuth, or until the citric acid is present in excess of the free nitric acid. This may be shown as follows:—

$$3Bi3NO_3 + 4HNO_3 + 3H_3C_6H_5O_7 + 6KOH =$$
$$6KNO_3 + 2Bi3NO_3 + HNO_3 + 2H_3C_6H_5O_7 + 6H_2O + BiC_6H_5O_7.$$

Bismuth citrate will then continue to precipitate until the added nitric acid is fixed by the alkali. At the point when the tenth molecule of the total nitric acid is fixed, one milligramme molecule of bismuth nitrate still remains in solution, and two more molecules of alkali will suffice to precipitate it in the form of citrate. Thus the final reaction is attained before exact neutrality is reached.

We have previously stated that an equivalent amount of ammonia cannot be used owing to the bismuth going into solution long before the point of neutrality is reached, but if it should be used the quantity required for 70 grammes of bismuth oxynitrate is 160 C.c. of a 10 per cent. solution, or 183 C.c. of 5 N ammonia.

In MacEwen's formula 50 per cent. more nitric acid is employed than in the 1898 B.P. formula. This is not at all necessary; in fact, with the increased proportion of nitric acid the amount of bismuth left in solution is much greater than when the smaller amount of acid is used.

If we convert the B.P. proportions of bismuth oxynitrate and nitric acid into molecular proportions we shall have a working formula, viz.:—

Bismuth Oxynitrate (3·05 × 23)	=	70·15 grammes.
Nitric Acid, sp.gr., 1·42	=	50·0 cubic centimetres = 100 C.c. of 8 N·HNO_3.
Citric Acid		50 grammes.

The equivalent quantity of potassium or sodium carbonate or hydrate, if made into a 5 N solution, will be 206 C.c.

(A pound tin of commercial caustic soda (90 per cent.) will make two litres of 5 N sodium hydrate.)

The equivalent of sodium bicarbonate is 86·5 grammes. Two-thirds of it may be mixed with the citric acid before adding it to the bismuth solution, the two being dissolved in hot water.

The alkaline hydrate need not be adjusted to any definite strength, a fairly concentrated solution may be made, and compared as to neutralising power with the diluted nitric acid (equal parts of strong nitric acid, sp. gr. 1·42, and water), a known volume of which—say 100 minims—with a suitable indicator, when neutralised, will show the volume of alkaline solution for 100 C.c. of acid; to this must be added the alkali required to fix the nitric radical in the bismuth oxynitrate, which will be as 23 to 80 of the free acid.

After precipitating the bismuth citrate by the strong alkali, the thick cream should be diluted with *hot* water to the volume of the liquor it is about to produce; this is well cooled before transferring it to the filter. It will then be in a granular compact state holding comparatively little fluid, the filtrate will be bright, and will not deposit, as it would if filtered while warm. Another advantage is that it does not require much more water to free it from nitrates beyond that necessary to displace the original liquid. The whole of the filtrate should contain not more than 1 per cent. of the bismuth used.

By having regard to the principles involved, equally successful results can be obtained by using the hydrate, carbonate, or bicarbonate of any fixed alkali. It is only necessary to know their real strength in comparison with the nitric acid used, as we have previously stated, and to use sufficient to decompose all the oxynitrate, but not so much as to render the liquid alkaline, or it would affect the bismuth citrate. To guard against this a slight excess of citric acid above the calculated quantity (48·3 grammes for 1 litre) should be used.

The second step is to dissolve the citrate in solution of ammonia. An interesting point in the formation of the ammonio-citrate is that it does not require twice the number of ammonia molecules to dissolve the bismuth citrate, even allowing for slight alkaline reaction required by the Pharmacopœia. 60 C.c. of 10 per cent. liquor ammonia is all that is necessary—*i.e.*, 3 molecules to 2 molecules of the bismuth salt. The ammonia should be diluted with four volumes of water, and poured on the contents of the filter. The Pharmacopœia allows for a loss of 6·5 per cent. of bismuth oxynitrate, but by the above process the loss is practically 1 per cent., so that the final liquid will bear dilution to 1,050 C.c. instead of to 1 litre, as the B.P. states.

The percentage of loss calculated as oxynitrate in the filtrate is as follows:—

MacEwen's process, using 120 gramme molecules to 23 gramme molecules of $BiONO_3$; 101 gramme molecules of NH_3 will make a clear solution with half; if no more be added, an enormous loss of bismuth will result, even as much as 15 per cent. In practice, doubtless an excess of ammonia is used; 126 gramme molecules will precipitate the maximum proportion leaving in solution 6·3 per cent.

B.P. proportion of acid, 80 to 23 (sp.gr. of liquor, 1·070), loss 5·6 per cent.

Ditto using NaOH	loss 1·06	,,
Ditto ,, $NaHCO_3$ (sp.gr. 1·080)	loss 0·72	,,
Ditto ,, $KHCO_3$	loss 1·06	,,

These determinations were all made as sulphide, therefore they are comparative only; lower results would be obtained if weighed as oxide.

The best working formula to prepare a litre of liquor bismuthi is as follows:—

Bismuth. Oxynitrate, 70·0 Gm.
Acid. Nitric (s.g. 1·42).
Aq. Destill. aa 50·0 C.c.
Acid. Citric, 50·0 Gm.
} Bicarbonate Potash, 103·0 Gm.; or, Soda, 86·5 Gm.
{ Or, Solution of *Sub*carbonate; or, Hydrate, *q.s.* equivalent to 128·0 C.c. of the diluted Nitric Acid.

The bicarbonates may be weighed as pure, being fairly constant in purity, but subcarbonates or hydrates, being variable in strength, are best made into solution, 10 to 20 per cent. (soda crystals 30 per cent.), and titrated with the diluted acid. If 128 minims of the diluted nitric acid are neutralised by **x** minims of the alkali solution, then x C.c. of the alkali solution are required. If liq. ammoniæ is to be used, deduct 1-10th or titrate with 115 minims of the acid instead of 128 minims; or if a burette is used, 11·5 C.c. instead of 12·8 C.c. Dissolve the bismuth in the diluted nitric acid by gently warming, add the citric acid dissolved in a little water (and if a carbonate is used two-thirds of it may be mixed with the citric acid); lastly, add gradually the alkali solution, stirring well; dilute with hot water to about a litre, cool, filter, wash free from nitrate. Pour on to the citrate 60 C.c. of liq. ammon. (10 per cent.) diluted to 200·0 C.c. with water; return filtrate (ammoniacal) until all the bismuth citrate is taken up; then dilute to a litre or to the required gravity 1·07.

B

* The solution remains clear until 5 milligramme molecules are added.

A NEW AMERICAN DISPENSATORY.

THE DISPENSATORY OF THE UNITED STATES OF AMERICA. By Dr. G. WOOD, and Dr. F. BACHE. Eighteenth Edition, by H. C. WOOD, M.D., LL.D., JOSEPH P. REMINGTON, Ph.M., F.C.S., and SAMUEL P. SADTLER, Ph.D., F.C.S. Pp. 1999. Price 36s. Philadelphia, U.S.A.: J. P. Lippincott Company.

The 'Dispensatory of the United States,' which was first published in 1833, and has now reached its eighteenth edition, is a heavy and bulky volume of just upon 2,000 pages. Its object has been, as may be learnt from the preface to the first edition, to present an account of medicinal substances in the state in which they are brought into the shops, and to teach the modes in which they are prepared for use.

That the work should have passed through seventeen editions in the course of less that seventy years is sufficient evidence that it has in the past supplied a want that has been felt, and fulfilled the object set forth in the preface.

It may at once be stated that the perusal of the volume leaves no room for doubt that the eighteenth edition will be fully equal in every respect to its predecessors, and that the 'Dispensatory' will remain a necessary adjunct to every pharmaceutical library.

The work is divided into two parts; the first deals with all the drugs and galenical preparations of the United States and British pharmacopœias, whilst the second contains the National Formulary of Unofficial Preparations, and a large number of unofficial drugs and preparations. Elaborate and useful tables complete the work. The mushroom growth of synthetic remedies during the past few years has necessitated a large increase in the second part, upwards of two hundred additional drugs and medicines having been described. The Pharmacopœia of the United States has long been recognised as a most useful volume, and when it is understood that the British Pharmacopœia of 1898, with its new drugs and preparations, receives an equal share of notice and comment, the value of the Dispensatory to the English pharmaoist as well as to the American must be freely admitted.

The chemistry of the volume, for which, presumably, Professor Sadtler is responsible, is in every respect equal to the traditions of the Dispensatory. The descriptions of the various substances, their tests, properties, impurities, etc., have been revised, and in each case a complete and often elaborate treatise is the result.

The pharmacy, which may probably be attributed to Professor Remington, apparently lags a little behind the chemistry, at least if one is correct in including drug assays in that section. Considering the importance that the valuation of drugs by assay has attained during the past few years, the absence of assay processes for many potent or important drugs must be regarded as a defect. On the other hand the English pharmacist will find many useful comments on the preparations of the British Pharmacopœia.

The materia medica appears to be the least satisfactory part of the work, and that is probably due to two causes; in the first place the work is essentially a compilation, and therefore much information that is either difficult of access, or has not been published, finds no place in the Dispensatory; in the second place a pharmacognosist has not found a place on the editorial staff. With some notable exceptions, as, for instance, coca leaves, cinchona bark, ipecacuanha root, etc., the descriptions of the drugs and their commercial varieties are often either deficient or antiquated.

A considerable part of the volume is occupied by accounts of the medical properties and uses of the various drugs and preparations; these are given at great length, but it must be left for one who is well acquainted with that subject to express an opinion as to the value of this section. As a work of reference, the Dispensatory will doubtless continue to be as necessary to the English pharmacist as hitherto.

THE PRESIDENT AND THE COMPANIES BILL.

The President of the Pharmaceutical Society has furnished us for publication with the following copy of correspondence he has recently had with the President of the Board of Trade:—

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN,
17, Bloomsbury Square, London, W.C.,
December 14th, 1899

TO THE RIGHT HONOURABLE C. T. RITCHIE, M.P.,
President of the Board of Trade.

SIR,—I am led to understand that it is proposed to introduce into Parliament next Session a Companies Bill similar to that passed through the House of Lords last Session, and I presume, therefore, that you will shortly be considering the provisions of that measure.

This Society—as representing chemists and druggists throughout Great Britain—is deeply interested in the amendment of the Companies Acts, and a statement from my predecessor* in the presidency of this Society was, in January, 1895, presented to your Department directing attention to the evasion of the provisions of the Pharmacy Acts by the formation of companies, and pointing out that this was prejudicial alike to the interests of the public and to the statutory rights of chemists and druggists.

The statement is printed on page 157 of the report of the Departmental Committee whioh in November, 1894, was appointed by the Rt. Hon. James Bryce, M.P., to inquire into the working of the Companies Acts.

The statement above alluded to was not only published in the Blue Book, but was also mentioned in the report of the Committee itself as offering cogent evidence of the facility with which the Companies Acts could be misused. It was, however, felt by the authorities at that time that the specific amendment of the law which this Sooiety advocated did not come within the scope of the Departmental inquiry.

The Draft Companies Bill which the Departmental Committee had under its consideration, and which is also printed in the Blue Book, was eventually, as you will no doubt remember, introduced by Earl Dudley into the House of Lords in 1896, when Lord Herschell gave notice of an amendment prohibiting the use of professional titles by companies.

This amendment was not considered, as the Bill was—on the second reading—referred to a Select Committee, whioh reported at the end of that Session that it had not completed its labours.

The Bill was re-introduced the following Session (1897), with the same result.

During the Parliamentary Session of 1898 this Society promoted a Bill which subsequently passed as the Pharmacy Act, 1898. This Bill, which was of a non-contentious nature, passed through all its stages in the House of Commons without amendment, and reached the Committee stage of the House of Lords also without amendment. At this point, however, the Lord Chancellor and the late Lord Herschell being of opinion that the use of the machinery of the Companies Acts for evading the Pharmacy Acts should be stopped, attempted to effect the necessary alteration in the law by an amendment of the Bill then before them.

The Lord Chancellor directed attention to the fact that the Pharmacy Acts did not cover the case of drug stores carried on by companies or corporations; and he suggested that the scope of the Bill should be extended so as to deal with these. The Courts had decided, he added, that the word "person" in the Pharmacy Acts meant a natural person, and not a corporation, and the common-sense view of the question required that companies should be treated just in the same way as individuals.

Lord Herschell supported this contention, and quoted a case which had been brought under his notice, in which a man and his

---

Michael Carteighc.

family formed themselves into a company, with the object of carrying on the business of a chemist and druggist while avoiding the statutory obligation.

An amendment to the Pharmacy Bill was consequently placed on the notice paper by the Lord Chancellor, but he was induced to postpone dealing with the matter until the following Session.

In withdrawing his amendment and moving the third reading of the Pharmacy Bill, his Lordship is reported to have said:—

> "Undoubtedly the state of the law as disclosed in the inquiry before the Standing Committee is extremely unsatisfactory, and it appears under the circumstances that some amendment of the law is required."

He further said that he had received a number of complaints in respect of these companies, which are practically medical companies; that the question was a very important and serious one; and that he adhered to the opinions expressed by him and Lord Herschell at the Committee stage of the Bill.

The Lord Chancellor, in pursuance of the intention he had conveyed at the third reading of the Pharmacy Act (1898), introduced last Session a Pharmacy Bill, and also a Companies (Medical Profession) Bill, a copy of each of which is in the Appendix hereto; but neither of these was proceeded with.

Meanwhile, the Companies Bill was again introduced, and, for the last time, referred to the Select Committee, which reported on May 18, 1899—the day before the House rose for the Whitsun recess.

The Committee's report disclosed the fact that the substance of the Lord Chancellor's Pharmacy Bill and his Medical Professions Bill had been incorporated in the Companies Bill, and figured as clauses 2 and 3 of that measure. A copy of the two clauses are in the Appendix hereto.

These additional clauses were adopted by the House of Lords, and the third reading of the Bill was passed on August 3, 1899, when the Lord Chancellor referred to the subject in the following terms:—

> "My Lords,—there are one or two observations which, I think, it is desirable I should make to your lordships. There were some clauses introduced in the Bill in Committee having relation to questions which, I think, are very interesting to the medical and pharmaceutical professions. I have received a very large number of communications upon the subject, and I am fully alive to the necessity of guarding very carefully the language by which the intentions of the measure, as manifested by the amended form of the Bill, should be carried out. I am still very strongly convinced that a company ought not to be permitted to do what a private person is prohibited from doing, and that the public must be protected against practising of that sort. It is impossible to resist the propriety of subjecting these companies who are at present carrying on business as chemists and druggists to restrictions such as are proposed in the Bill. I daresay your lordships will remember that cases have been decided—in my opinion, rightly decided—that the language which calls upon a person to qualify in any of the professions does not in turn apply to companies; and that the word "person" in the Acts which form the code upon that subject must be construed as meaning a natural person and not a company. The idea of an ideal personage such as a company practising and undergoing an examination is absurd, and cannot cohere with the language of the Statute. In my view, the learned judges who came to the conclusion that that was the true construction of the Statute were perfectly right, and that decision left the law that a company could be formed to do the very thing which an individual is not permitted to do without examination as to qualifications. I think I may say that the Committee to whom this matter was referred was unanimously of opinion that the formation of companies to practise any profession and who intended really to take advantage of the company machinery to do that which an individual without qualification may not do, should be stopped. As I have said, I have received a large bulk of correspondence on the subject, and in some of the communications which have been sent to me it is suggested that this is an effort to prevent proper enterprise, and so forth. As a matter of fact, I think the writers were not familiar with the state of the law. It is true to say that although a company can do it, and that at present a company cannot be prosecuted for doing it, and a company cannot undergo an examination to enable them to do it, yet if an individual dispenses without qualification you can catch him and prosecute. And it was in view of that state of the law on the subject that the Committee to which this matter was referred came to their conclusion. I must say that I quite agree that if this matter is to come forward, as it probably will in another session, it is desirable that we should guard very carefully the language used, so as not to interfere with any proper vested interest; but, on the other hand, that we should not allow the public generally to be exposed to the dangers of the practising of unqualified persons as dispensers. What I said on a former occasion, that the Committee were practically unanimous, appears to have given rise to controversy. I say so still. It is true there were certain divisions on matters of detail during the investigations, which lasted three years—some members of the Committee went one way and some the other—but they were not important questions. What I said before, and what I adhere to now, was that on the main lines of the Bill, the important matters under the Bill, the measure as now presented, represents the practically unanimous decision of the Committee. I think, my Lords, that it is a subject of congratulation that on such a subject practical unanimity has been attained. At this period of the Session I think it is, perhaps, not worth while that I should go through the whole clauses of the Bill. I have said all that is necessary on the report of amendments to the Bill. I can only add that I believe the Bill will be a very great improvement on the state of the law as it exists at present, and that it will in a great measure check the creation of fraudulent companies, which, I think, is the proper thing to do, and not to enact a penal code against persons engaged in the conduct of such enterprises."

[The Earl of Kimberley and the Earl of Dudley expressed approval of the Lord Chancellor's views, and the Bill was read a third time.]

From the repeated expressions of opinion by the Lord Chancellor that it is necessary, in the interests of the public, to deal with the question of company trading in so far as it relates to medicine and pharmacy, and having regard to the insertion at the last moment of Clauses 2 and 3 in the Companies Bill of last Session, I feel justified in again approaching your Department on the subject. I venture to urge—

> **That inasmuch as a limited liability company could not be examined and registered in accordance with the provisions of the Pharmacy Acts, it should be unlawful for any such company to assume or use any title implying registration under those Acts; and that it is not desirable in the public interest, that any person not registered under the Pharmacy Acts should be permitted to exercise any control over the retailing, dispensing, or compounding of poisons.**

I may add that this represents generally the views of the persons who are entitled to practise pharmacy in Great Britain, and is the essence of the point to which I desire to direct your special attention.

I shall be obliged if you will grant me an interview in order that I may reply to any inquiries you may think it desirable to make after having read the above statement.

C

I regret to have had to address you at such great length, but thought that you would prefer to have the history of the present position clearly brought under your notice before seeing me.

I have the honour to be, Sir,
Yours faithfully,
(Signed) WM. MARTINDALE, President.

APPENDIX.

BILLS INTRODUCED INTO THE HOUSE OF LORDS BY THE LORD CHANCELLOR ON MARCH 24TH, 1899:—

A BILL INTITULED
AN ACT TO AMEND THE PHARMACY ACT, 1868.

Be it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

(1) APPLICATION OF PHARMACY ACT TO COMPANY.—31 and 32 Vict., c. 121.—A company may carry on the business and use the description of a pharmaceutical chemist or chemist and druggist if and so long only as the business is *bonâ fide* conducted by a manager or assistant being a duly registered pharmaceutical chemist or chemist and druggist, as the case may require, but, subject to this provision, anything which would be an offence under Section fifteen of the Pharmacy Act, 1868, if committed by an individual, shall be an offence if committed by a company.

(2) SHORT TITLE.—This Act may be cited as the Pharmacy Act, 1899.

COMPANIES (MEDICAL PROFESSION) BILL, 1899.
A BILL INTITULED
AN ACT TO PROHIBIT THE PROFESSION OR BUSINESS OF A PHYSICIAN, SURGEON, DENTIST, OR MIDWIFE BEING CARRIED ON BY A COMPANY.

Be it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

(1) COMPANIES NOT TO ACT AS DOCTORS, ETC.—It shall be unlawful for a company under the Companies Acts, 1862 to 1898, to carry on the profession or business of a physician, surgeon, dentist, or midwife, and if any company contravenes this enactment it shall be liable on summary conviction to a fine not exceeding five pounds for every day during which the contravention happens.

(2) SHORT TITLE.—This Act may be cited as the Companies (Medical Profession) Act, 1899.

CLAUSES INSERTED IN THE COMPANIES BILL, 1899,
BY THE SELECT COMMITTEE OF THE HOUSE OF LORDS:—

(2) No company may carry on the business and use the description of a pharmaceutical chemist or chemist and druggist unless such business is *bonâ fide* conducted by a manager or assistant, being a duly registered pharmaceutical chemist or chemist and druggist, as the case may require, and unless the name of the person so qualified is conspicuously posted in the shop or other place in which the business is carried on, but, subject to this provision, anything which would be an offence under Section fifteen of the Pharmacy Act, 1868, if committed by an individual, shall be an offence if committed by a company.

(3) It shall be unlawful for a company to carry on the profession or business of a physician, surgeon, dentist, or midwife, and if any company contravenes this enactment it shall be liable, on summary conviction, to a fine not exceeding five pounds for every day during which the contravention happens.

(COPY OF REPLY.)

BOARD OF TRADE,
Whitehall Gardens, S.W.
16th December, 1899.

SIR,—I am desired by Mr. Ritchie to state that he has received your letter of the 14th inst., with its enclosures, expressing the views of the Pharmaceutical Society of Great Britain that a provision should be inserted in the Companies Bill rendering it unlawful for a limited liability company to assume a title implying registration under the Pharmacy Acts, or for a person not registered under those Acts to exercise any control over the retailing, dispensing, or compounding of poisons.

I am to state in reply that the views of your Society will receive Mr. Ritchie's careful consideration, and that he will bear in mind your willingness to reply at a personal interview to any inquiries he may desire to make on the subject.

I am, Sir,
Yours faithfully,
(Signed) GARNHAM ROPER.

WM. MARTINDALE, Esq.

PHARMACEUTICAL SOCIETY.

EVENING MEETING IN EDINBURGH.

The second Evening Meeting of the session was held in the Society's House, 36, York Place, Edinburgh, on Wednesday, December 20, Mr. PETER BOA (Chairman of Executive) in the chair.

The CHAIRMAN referred to the loss which the Society had sustained in Scotland by the death of Mr. Stanford, of Dalmuir. Most of them would remember him as President of the Conference when it met at Edinburgh in 1892. He moved that they should record their regret at having lost so active a member of the Society, and that a letter of sympathy should be sent to Mrs. Stanford. That having been agreed to,

Mr. THOMAS DUNLOP was then called upon to read a paper on

AN INCOMPATIBLE STRYCHNINE MIXTURE,

which is printed at page 604.

Mr. LUNAN said he had tried mixing solutions of strychnine hydrochloride and sodium arsenate, and got the same result, though his precipitate differed a little from Mr. Dunlop's. He thought the Journal note was correct as to the cause of the alkalinity of sodium arsenate solution. The salt was crystallised from an alkaline solution, and alkalinity might be due to traces of alkali. Such a salt as sodium phosphate behaved in a similar way. No doubt the mixture was incompatible.

Mr. DOTT said the main lesson of the paper was to point out the rashness of doctors in prescribing such mixtures without thinking of the possible consequences. There could be no reason for prescribing those two solutions together, and no care seemed to be taken to ensure the solubility of any compound that might be formed. Commercial sodium arsenate generally contained a trace of carbonate, and he attributed the precipitation to that. He did not think the explanation of the alkalinity given in the *Pharmaceutical Journal* was correct. It was not probable that the salt would decompose in solution as suggested. It should be quite possible to get a pure salt and a neutral solution.

Dr. COULL said this note was interesting, both to dispensers and manufacturers. He thought the sodium arsenate was at fault, and that carbonate when present was due to the process of manufacture. He questioned the statement in the Students' Columns as to the alkalinity being due to disassociation of the sodium arsenate in solution.

Mr. SIMPSON said he was inclined to think the Journal explanation was based on Ostwald's theory of ions, and was the true explanation of the alkalinity. If the alkalinity were due to sodium oxide it could be removed by washing with alcohol, in which sodium arsenate is insoluble.

Mr. J. Rutherford Hill said he had received a note from Mr. Duncan, in which he said the difficulty with Mr. Dunlop's mixture was due to hydrolysis of sodium arsenate into sodium dihydrogen arsenate, and sodium hydroxide, and not to sodium oxide as an impurity. The same happened with other salts, such as phosphates, borates, and acetates, which gave alkaline solutions. Even alcohol-washed salts, which would be free of any accidental sodium oxide, gave similar results. Mr. Hill said these strychnine mixtures were constantly cropping up, and Mr. Dott had indicated the *fons et origo* of the difficulty, in his allusion to the ignorance or carelessness of prescribers. One point against the suggestion that the precipitate was due to carbonate in the arsenate was that Mr. Dunlop found the precipitate to be free alkaloid.

The Chairman said the discussion revealed difference of opinion. Some of the experts should take up and settle the point which the paper and discussion left open—namely, the cause of the precipitate.

Mr. Dunlop, in replying, said this mixture emphasised the danger attending the practice, now so common, of ordering highly-concentrated medicines to be taken in small doses. The old-fashioned method of tablespoonful doses was much safer.

Mr. Dunlop next read a paper on

Maceration Tinctures,

which is printed at page 603.

Mr. Henry said his results with an ordinary screw press were slightly under those of Mr. Dunlop. There had been a discussion in the journals as to whether infusions should be made up to a definite volume, and Dr. Attfield had settled the point in a letter giving a negative answer. He thought that reply would apply also to tinctures. A question of some importance was whether the expressed liquid was of the same strength as that which remained in the marc, and whether the last ounce expressed was of the same strength as the first portion. If that were not so there would be discrepancies in proportion to the pressure employed.

Dr. Coull said there was no doubt that the Pharmacopœia intended that the tinctures should not be made up. Dr. Symes had investigated this matter, and the present plan brought the British Pharmacopœia into line with the Continental pharmacopœias. As to Mr. Dunlop's yield, especially in the cases of catechu and squills, he agreed with Lucas.

Mr. Guyer said he agreed that the Pharmacopœia directions were quite distinct. But there was often variation in the tincture, due to the quantity of moisture. Take, for instance, tincture of orange. It contained a lot of water, especially if the fruit were peeled immediately before making. But if the peel were got from a jam-maker, with an interval of a day or two in transit, the percentage of water would be much less, and the tincture consequently stronger. As to the yield of tincture, he rather agreed with Mr. Dunlop. In the case of cardamoms he had got even higher results.

Mr. Glass said there was always a shortage, due to evaporation, and that varied according to the conditions of filtration as to time and exposure. It was proper that the shortage should be made up. He thought the paper a very practical one, and favoured the idea of a definite volume.

Mr. McDiarmid said Mr. Umney had said he got twenty-one and a half ounces of tincture in making a pint quantity. He wondered if anyone else had ever got such a yield. Personally he had never got anything like the quantities Mr. Dunlop had got.

Mr. Hill said there was a growing tendency to allow the making of all tinctures to pass into the hands of wholesale makers. That was to be deprecated, for it deprived the public of a proper legal guarantee as to the making of pharmaceutical preparations. He suggested that cane sugar might well replace raisins in tinctures of cardamoms and senna, and then they could be much better prepared by the percolation process. By macerating with one half of the menstruum, and then with the other half, pressing and making up a uniform result would be most easily and certainly attained.

The Chairman said the present official method had been adopted to secure greater uniformity, and he thought it did. He could not see how the tincture expressed could differ from what remained in the marc if care were taken. The present process, he thought, was about as good as they could get. In the case of some, such as orange and lemon, they could not get exact uniformity. One point omitted by the Pharmacopœia was that it did not mention an approximate yield. He protested against omitting raisins. It was part of the art of pharmacy to retain the flavour, just as they did with liquors used as beverages for titillating the palate.

Mr. Dunlop replied, and on the motion of the Chairman was awarded a cordial vote of thanks for his interesting communications. Owing to the lateness of the hour the description of additions to the Museum was delayed till next meeting.

THE STUDENTS' COLUMNS.

EXPLANATORY NOTES ON THE B.P. 1898.*

Tinctures—The Process of Maceration.—At the end of the period of maceration the fluid is decanted and the marc expressed. The united liquors so obtained coustitute the finished tincture and dilution to a uniform fixed volume is not directed as in the maceration process of the 1885 B.P. At first sight this omission may not appear to lead to uniformity in the products, but a little consideration will show that whereas the 1885 process produced a *uniform volume* of tincture of *variable potency*, the new process leads to a *variable volume* of tincture of *uniform potency*. Thus, if one macerates for seven days, say 4 ounces of a given drug in 20 fluid ounces of alcohol, agitating frequently, we may reasonably assume that at the end of the period of maceration all the soluble constituents of the drug will have been dissolved and distributed uniformly by diffusion throughout the bulk of the menstruum. Both the supernatant fluid and that imbibed by the tissues of the drug will have attained a condition of equilibrium so far as the distribution of the extractable constituents of the drug are concerned. Neglecting the minor sources of loss, let us suppose that by decantation and expression in an ordinary small screw press, 18 fluid ounces of tincture are obtained from the 20 fluid ounces of alcohol with which we started. Then it follows that we have left behind in the pressed marc 2 fluid ounces of tincture representing a tenth part of the soluble constituents of the 4 ounces of drug. Operating now on larger quantities of the same materials—say twenty times the quantity—and employing the more powerful pressure obtainable by means of a hydraulic press, it would be found that a large proportionate volume of tincture could be obtained. We may assume for the purpose of argument that owing to the more efficient press available and the smaller proportionate loss from other sources in working on large quantities, 19 fluid ounces of tincture would be obtained from each 20 fluid ounces of alcohol, thus leaving only $\frac{1}{20}$th part of the extractable constituents behind. For the reasons already given the strength of the finished tinctures would be the same in both cases, although a larger proportionate quantity would be obtained in working larger quantities. If now the method of dilution to a definite volume according to the 1885 Pharmacopœia were carried out, we should have to add in the first case two fluid ounces of alcohol to every 18 fluid ounces of tincture, and in the second case only one to nineteen, leading thus to a variation in the

* Note.—The series of articles should be read in conjunction with the series referring to the 1885 B.P., and published in the *P.J.* during 1897-8.

strength of the finished tincture corresponding to the dilution necessary to bring the fluids to a constant volume.

The Process of Percolation—The powdered drug is to be uniformly moistened with sufficient of the menstruum to convert it into a damp powder. It is then allowed to stand for twenty-four hours in order that the tissues may swell before the percolator is packed. If the dry drug be packed in the percolator it often happens that the swelling which occurs when the fluid is poured on is so considerable that the contents of the percolator become too tightly wedged and the passage of fluid is rendered impossible. The preliminary soaking also enables the menstruum to permeate the cells, rendering the brittle dry tissue more pliable, and, therefore, more easily packed uniformly in the percolator. At the same time the cell contents are brought into a plastic condition, so that the soluble constituents are more readily extracted by the subsequent percolation with more of the menstruum. The proper packing of the percolator is an operation which can only be learnt by experience. The main points to observe are (1) that the material be uniformly distributed, so as to avoid the formation of channels; (2) that the tightness of the packing should be varied for each material so that, working on a few pints of tincture, a rapid succession of drops, but not a continuous stream, of percolate should be obtained when the menstruum is poured on. Of course with larger quantities a proportionately larger flow is permissible. Then, to quote the officail directions, "pour over, at intervals, further portions of the menstruum, always maintaining a layer of liquid above the materials." The last point is important, because if the liquid be allowed to drain away below the surface of the materials air spaces will be formed in the upper part, so that the succeeding portion of menstruum added will immediately run into and fill up these without passing slowly through the overlying material. If the process be carried out efficiently the last fraction of percolate will be almost, and in most cases quite colourless. The efficiency of percolation as a means of exhausting a drug depends upon the fact that the solid material is being continually acted upon by fresh solvent, which displaces the fluid partially or entirely saturated by contact with the drug. At the end of the process the marc is left saturated by almost pure menstruum, the soluble constituents having been removed by the fluid which has been previously added and displaced. When, therefore, the marc is pressed to recover the imbibed menstruum, the portion of fluid which is still unavoidably left in represents, not an appreciable fractional part of the soluble constituents as in the maceration process, but in most cases a negligible proportion, owing to the fact that these constituents have been dissolved by the percolate which has been displaced by the later portions of menstruum poured on.

Notwithstanding this advantage, the process of simple maceration is still used for preparing many tinctures. The reasons for this may be broadly classified under three headings:—

1. In the case of bulky drugs, like hop, the available quantity of menstruum is insufficient for the accomplishment of the process of percolation.

2. Certain drugs yield a powder which is physically unfit for percolation. Thus calumba and squill powder when moistened form tough and slimy masses which, unless the powder is very coarse, almost entirely prevent the passage of fluid through them Many resins and gum resins partly dissolve in alcohol, and yield an insoluble residue of a sticky tenacious nature which effectually occludes the percolator tube.

3. In other cases the increased labour involved by percolation is not justified by the improved exhaustion effected. Thus, if the solid ingredients of a tincture are of small commercial value and at the same time not potent, as in the case of tincture of gentian, or are used in small proportion, as in tincture of cantharides and compound tincture of lavender, then the proportionate part of extractable materials left in the marc by the maceration is not considered of sufficient value or importance to compensate for the extra time and trouble required for the percolation process. The process of percolation now described in the Pharmacopœia is given in greater detail than in the 1885 B.P. In the latter the drug to be percolated was directed to be previously macerated in three-fourths of the alcohol, leaving only one-fourth for the displacement of the previously added alcohol. This was in most cases insufficient for the purpose, so that the marc was not by any means exhausted.

FLORAL CALENDAR FOR DECEMBER.

Amaryllidaceæ.—*Eucharis amazonica.* Fl.

Araliaceæ.—*Hedera helix* (*P.J.* [3], **12,** p. 537).

Begoniaceæ.—*Begonia* species.

Berberidaceæ.—*Berberis darwinii.* Fl.

Calycanthaceæ.—*Chimonanthus fragrans.* Fl.

Caprifoliaceæ.—*Lonicera standishii.* Fl.

Compositæ or **Asteraceæ.**—*Pctasites fragrans* (*P.J.* [3], *Taraxacum officinale, Bellis perennis, Chrysanthemum* (single). Fl. *Matricaria inodora* (*P.J.* [3], **10,** p. 501).

Cornaceæ.—*Viburnum tinus.*

Cruciferæ or **Brassicaceæ.** — *Alyssum maritimum.* Fl. *Capsella bursa-pastoris* (*P.J.* [3], **15,** p. 503).

Ericaceæ.—*Arbutus unedo.* Fl. *Erica* species. Fl.

Euphorbiaceæ.—*Euphorbia peplus. Poinsettia pulcherrima.* Fl. (*P.J.* [3], **8,** p. 501).

Geraniaceæ.—*Pelargonium* species. Fl.

Graminaceæ.—*Poa annua.*

Hamamelidaceæ.—*Hamamelis virginica.* B.G. (*P.J.* [3], **11,** p. 509).

Ilicaceæ.—*Ilex aquifolium* (fruit) (*P.J.* [3], **8,** p. 501; [3], **12.** p. 537; **17,** p. 509).

Iridaceæ.—*Iris histrio.* Fl. *Iris stylosa.* Fl. *Schizostylis coccinea.* Fl.

Labiatæ.—*Lamium album, L. purpurcum.*

Leguminosæ or **Fabaceæ.**—*Ulex europæus. Acacia* species, B. G.

Liliaceæ.—*Ruscus aculeatus* (fruit).

Loranthaceæ.—*Viscum album* (fruit). (*P.J.* [3], **9,** p. 525, 528; **10,** p. 501.)

Magnoliaceæ.—*Illicium anisatum.* (*P.J.* [3], **7,** p. 609.) *Drimys winteri.*

Monimiaceæ.—*Peumus boldus.* B.G. (*P.J.* [3], **7,** p. 609.)

Oleaceæ.—*Olea fragrans.* B.G. *Jasminum nudiflorum.* Fl.

Orchidaceæ.—*Dendrobium nobile,* etc. Fl.

Primulaceæ.—*Primula obconica.* Fl.

Ranunculaceæ.—*Anemone japonica. Helleborus niger.* (*P.J.* [3], **7,** p. 610; **11,** p. 509.)

Rutaceæ.—*Citrus aurantium.* (*P.J.* [3], **17,** p. 509.)

Scrophulariaceæ.—*Veronica buxbaumii. Linaria cymbalaria.* (*P.J.* [3], **12,** p. 522.)

Solanaceæ.—*Solanum jasminoides.* Fl.

Thymelæaceæ.—*Daphne mezercum* (var. autumnale). (*P.J.* [3], **7,** p. 610.)

Verbenaceæ.—*Caryopteris mastacanthus.* Fl.

Violaceæ.—*Viola odorata. Viola tricolor.* Fl.

Correction.—The result of the calculation given near the end of the paragraph on "Sodii hypophosphis," at page 534, should be 0·4808 instead of 4·808.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, DECEMBER 23, 1899.

THE LATEST STEP IN ADVANCE.

It is just about twelve months since the subject now chiefly agitating the minds of registered chemists came prominently to the front once more, and the year's record has been one of almost continual discussion of that subject. The numerous arguments advanced and suggestions offered have been duly placed before the readers of the *Pharmaceutical Journal*, and if any registered chemist has not yet considered what the remedy for the existing state of affairs should be, or how that remedy is to be applied, it must be because he is in too prosperous a condition to trouble his mind about such a trifling matter as the company pharmacy problem. At any rate, he can hardly be connected with the Pharmaceutical Society or any of the numerous local pharmaceutical associations which have so recently indicated their views on the subject through the medium of the Federation of Local Pharmaceutical Associations. The opinions of the registered chemists of Great Britain, as voiced by their representative organisations, are—generally speaking—that none but individuals registered under the Pharmacy Acts should be permitted to assume or use the titles protected by those Acts, or to retail, dispense, or compound poisons. The vast majority of registered chemists are in favour of an attempt being made to enforce those views by legislative action; others vary in the degree of faint-heartedness with which they are afflicted, and suggest compromise of one kind or another. They would insist upon every company which carries on the business of a chemist and druggist having a board of directors with a pharmaceutical qualification, or one or more directors so qualified, or a legally qualified manager for each place where the business is carried on. But all are united in the opinion that it is essential in the public interest that every place where poisons are dispensed and sold should be properly controlled by a duly qualified individual.

The latest association to consider the all-absorbing question is the Western Chemists' Association of London, the members of which will doubtless be much better known to their brethren in the provinces a few months hence—after the British Pharmaceutical Conference meets in London. The discussion at the meeting on Wednesday last was opened by Mr. Walter Hills, the immediate past-President of the Pharmaceutical Society. He presented his case in a fair and temperate manner, but it is evident from the report of his remarks (see p. 618), that he is far from taking up an unduly optimistic position. Mr. Hills seems to fear that the *casus omissus* revealed by the decision of the House of Lords in the case of the London and Provincial Supply Association cannot be entirely remedied, and that it is hopeless to look for such amendment of the Pharmacy Acts as would satisfy registered chemists as a class. The prohibition of all company trading in pharmacy is held to be the best and strongest position to take up, but there is apparently little hope in Mr. Hills' mind of any such position being tenable. In that case, he contends, it would be undesirable to oppose any and every proposal recognising the principle of limited liability. The Western Chemists' Association apparently supports him in that contention, having adopted a resolution providing that should the Council of the Pharmaceutical Society become convinced that to restrain all companies from keeping open shop for the retailing, dispensing, or compounding of poisons is not feasible, legislation would be desirable to make it unlawful for companies to assume or use titles implying registration under the Pharmacy Acts, and, further, to provide that all such open shops should be under the sole control of persons registered under the Pharmacy Act, 1868.

At present, however, the Council is far from being convinced that companies cannot be restrained from retailing, dispensing, or compounding poisons. Indeed, as is indicated by the letter recently sent by the President of the Pharmaceutical Society to the President of the Board of Trade (see p. 606), the Council is fufly prepared to insist that—inasmuch as a limited liability company cannot be examined and registered in accordance with the provisions of the Pharmacy Acts—it should be unlawful for any such company to assume or use any title implying registration under those Acts, or for any person not registered under the Pharmacy Acts to be permitted to exercise any control over the retailing, dispensing, or compounding of poisons. The interpretation of the word "control" will naturally vary according to the views held on the subject by the interpreters. But, in the public interest, it must be a real control if it is to be effective. As was pointed out in last week's Journal, in every pharmacy which is not personally conducted by a qualified proprietor, the public interest requires that there should be a registered individual in full charge, and occupying virtually the same position as a proprietor in all his relations as a pharmacist with the public. He should not be controlled or interfered with in the exercise of his professional functions by any unqualified person or persons, and the simplest way of insuring that is to provide that associations of unqualified persons shall not be permitted to do what the separate units constituting the associations are unable to do. But other ways may present themselves to the official mind, and, for the present, we must wait until Mr. Ritchie has given the careful consideration he promises to the Society's views.

ANNOTATIONS.

THE SCHOOL OF PHARMACY will be closed for the Christmas recess from 5 p.m. on Wednesday, December 20, until 9 a.m. on Monday, January 8. The Library and Museum in London will be closed entirely on Christmas Day and December 26, and will also shut at 5 p.m. each day afterwards up to and including New Year's Day. The usual vacation arrangements have been made with respect to the rest of the Society's premises—that is to say, the office will be closed on December 25 and 26, and the House in Edinburgh will not be open on December 25 or January 1. As the January examinations commence in Edinburgh on the 26th inst., and in London on the 27th, the official vacation cannot be regarded as an unduly long one.

SPEAKING OF EXAMINATIONS, it may be of interest to readers of this Journal to learn that no less than 422 persons have entered for the January qualifying examination; 324 have decided to submit themselves to the London Board, whilst the remaining 98 find it more convenient to go to Edinburgh. One might quite reasonably assume that the pharmaceutical outlook is not without some degree of attractiveness, in spite of corporate and municipal trading in medicinal substances, and dispensing by unregistered persons; otherwise so large a number of young men would scarcely be found cheerfully paying fees and hazarding fate on a mid-winter examination. There is, perhaps, the alternative deduction that fear of a coming ten-guinea fee is a more potent factor in augmenting the number of candidates than any real or fancied allurement in pharmacy.

INTENDING CANDIDATES for the "First" examination are reminded that the next examination takes place on Tuesday, January 9, and that entries must be complete on or before Tuesday next, December 26—that is to say, on Boxing Day. At such a time postal delays are not infrequent, and in order to obviate the unpleasantness of being too late, would-be candidates are earnestly requested to send in their applications at once. It is always risky to wait until the last moment before proceeding to comply with the regulations, but in the case of the January "First" examination the risk is enormously increased by the interposition of the holiday season.

EARLY CLOSING of the Library and Museum in London has been decided upon by the Library, Museum, School and House Committee, and in future—until further notice—both departments will close at 6 p.m. every week-night except Saturday, instead of 7 p.m., which was the hour experimentally fixed in January last. It is understood, however, that there will be no alteration in the arrangement whereby the Library is available for use on evening meeting nights until 8 p.m. The action of the Committee is said to be based upon the well-tested fact that the members and students of the Society do not use the Library or Museum in the evening. It would appear that the habits of the modern students differ from those of his predecessor of fifty years ago, and that evening study in the Society's house forms no part of the programme of the pharmaceutical aspirant of to-day, who devotes the mornings of every day to lectures, the afternoons to laboratory practice, and the evenings to—well, non-pharmaceutical pursuits.

PROFESSOR JOSEPH P. REMINGTON asks us to inform our readers that, in the disastrous fire which occurred on November 29, at Messrs. Lippincott's, the plates of Remington's 'Practice of Pharmacy' were saved without injury. A few of the plates of the 'United States Dispensatory' were destroyed. The new issue of the 'Practice of Pharmacy' will be out in a few weeks, and the 'United States Dispensatory' as soon as possible, the paper having been ordered for both books while the fire was still burning.

THE READY METHOD IN PRESCRIBING—*i.e.*, the compressed tablet system of medication—is not viewed with such disfavour by the *Medical Press* as by other organs of the medical profession. A correspondent of that journal has written to direct attention to the injury done to the public and to the medical profession generally by the growing practice of prescribing tablet preparations and proprietary medicines. He thinks medical men have been cleverly hoodwinked by the manufacturers of such articles, and that they have unwisely allowed themselves to drift away from prescribing the well-tried drugs of the B.P. Wherever the fashionable physician goes he is sure to find tablets containing antipyrine, caffeine, sulphonal, thyroid, etc., being taken by patients with as little hesitation as they take their meals. But, though the British Pharmacopœia has been compiled for the benefit of medical men, and they are required to study materia medica and pharmacy, chemists who have studied for years, with the object of compounding medicines, are insulted by prescriptions being sent to them for ready-made mixtures and pocket bottles of tablets, which might just as easily be supplied by a grocer. The remedy suggested by the writer of the letter is a closer study of the British Pharmacopœia and avoidance of the tablet system of medication.

COMMENTING ON THE LETTER, however, the editor of the *Medical Press* remarks that the observer of the progress of events for the past few years must have seen very clearly that the days of universal prescription-writing, and the profits arising therefrom, are numbered. Moreover, it is thought that, generally speaking, the trustworthiness of the infinite variety of coated pills and compressed medicines which are now at the disposal of the public and the medical practitioner, cannot be questioned. In addition, those preparations are said to afford facilities for the administration in minute doses of active alkaloids which the medical practitioner hesitates to order in a prescription—*i.e.*, a prescription of the old-fashioned type. Whilst recognising, therefore, that special cases require special combinations of drugs, which the skilled physician can prescribe and the skilled pharmacist compound, the editor of the *Medical Press* is of opinion that such occasions are now exceptional. In conclusion, he says "the dispensing practitioner and the chemist must see that it has become necessary, and will be increasingly more so, to accommodate their practice to the new system, and no longer place their sole dependence on the one-and-sixpenny mixture or the shilling box of pills. We can see, of course, how disadvantageous it must be to make every patient his own prescriber and dispenser, but to a great extent this has been already done, and it will be quite futile to raise a trade cry against it."

THE QUESTION OF PROPRIETARY *v.* OFFICIAL PREPARATIONS has also vexed the soul of a correspondent of the *Lancet*, who directs attention to the real or supposed dangers of the frequency with which proprietary preparations are prescribed in lieu of the equivalents of the British Pharmacopœia. Apparently he is identical with the individual who has written to the *Medical Press*, for he also says that wherever the fashionable physician goes he finds such preparations are taken by patients with as little hesitation as they take their meals, and he, again, considers that ruinous to the interests of the medical man, the dispensing chemist, and the patient. It is, of course, possible, says the *Lancet*, to argue that the interests of the medical man and the dispensing chemist suffer from the frequency with which the laity attempt to treat slight ailments, without skilled assistance; but the natural tendency of every man to attempt to be his own medical adviser commonly entails subsequent prolonged medical attendance owing to an initial error of diagnosis. "In other words, it might be argued, from interested motives, that proprietary preparations are blessings in disguise—a contention which we should deem unworthy of any professional man. It is perfectly true that many of the advertised preparations cannot in ignorance be used with impunity, and it is the duty of every practitioner to speak with no uncertain voice of

the possible dangers of self-medication. On the other hand, it is probable that the growth of the use of such proprietary preparations by medical men was in the past fostered by the difficulty of remembering the pharmacopœial doses—a difficulty which was evaded by employing proprietary articles." A more absurd reason it would be difficult to give, but probably that is only the *Lancet's* little joke, though our usually sage contemporary appears serious enough when suggesting that careful consideration of the current British Pharmacopœia will show that the suggested hindrance to the employment of official preparations has to a large extent been removed, and that pharmacopœial drugs can now be prescribed with as much facility as proprietary articles.

It is More to the Point that the *Lancet* thinks it scarcely concerns the prescriber whether the average dispensing chemist can compete with the wholesale manufacturer in rendering the results of his labour equally attractive in appearance. "It can undoubtedly be done by a skilfully trained pharmaceutist ; it is for him to determine what profit accrues from the trouble involved. So far as the benefit of the patient is concerned it appears to be the duty of the prescriber to order the remedy demanded by the nature of the complaint, and to indicate the form in which it is to be dispensed ; and, provided that the drugs supplied by the chemist are of the pharmacopœial standard of purity, the prescriber should be perfectly indifferent as to whether the actual preparation sent to his patient is proprietary or official. A prescription which indicates the name of a maker is necessarily an advertisement." With those concluding sentences the majority of pharmacists will doubtless agree, and there is no reason to doubt that they are prepared, at all times, to supply exactly what the prescriber orders. If the prescriber always does his best for the patient, altogether irrespective of the source of what he orders in his prescriptions, the conscientious pharmacist will have but little ground for complaint, and is not likely to complain.

Unqualified Dispensers must be a necessity of the medical man's professional existence if the *Medical Press* is right in stating that the whole fabric of medical practice is based on the employment of unqualified dispensers, and that any modification of existing arrangements would entail what would almost amount to a dislocation. That remarkable statement appears in a note referring to the action of the General Medical Council in deciding not to take any action in regard to the employment of unqualified dispensers by medical practitioners. The question is described as one of far-reaching importance, though the reluctance of the Council to intervene, unless constrained thereto, is thought to be quite comprehensible. But is it in reality? Public opinion may not, as yet, be sufficiently alive to the drawbacks of the present system, to insist on a change, but it is hardly correct to speak of "the bogey of accidental poisoning, trotted out by pharmaceutical agitators for trade purposes," and to say that it has not had the desired effect, nor should it be assumed too readily that medical practitioners are not likely to be molested in respect of their unqualified dispensers for some time to come.

The Subject of Wholesale Prescriptions is again referred to in last week's *British Medical Journal*, where two letters on the subject appear—the first signed by ten leading West End dispensing chemists, and the second by the Secretary of the Chemists' Assistants' Union. In both concurrence is expressed with the view taken by the editor of the *British Medical Journal*, in his comments on wholesale prescriptions (see *ante*, p. 590), and the hope is expressed by the West End chemists that the medical profession will raise its voice against a system of medication detrimental to the interests of the public and of the medical faculty generally.

Sir Richard Thorne Thorne, whose death has occurred quite suddenly, was the principal medical officer of the Local Government Board. According to the *Times*, he was born in 1841, received his medical education at St. Bartholomew's Hospital, and obtained the membership of the Royal College of Surgeons in 1863. In 1866 he became M.B. of the London University, taking a double first class, and for a short time he held some hospital appointments in London ; but about 1870 he accepted office in the Medical Department of the Privy Council, which was afterwards transferred to the Local Government Board. In that capacity he continued for many years to discharge the routine work of the office, in the way of inspections and reports, until 1885, when his mastery of the French language led to his selection as a delegate of the British Government at a first International Sanitary Conference, which was held at Rome, and was followed by others at Venice, Dresden, and Paris. At those conferences Sir Richard took from the first a leading part, and was mainly instrumental in convincing the representatives of other Governments of the futility of quarantine and of the facility with which, notwithstanding the presence of infectious disease, commerce might be liberated from vexatious restrictions which had previously hampered it. He was appointed her Majesty's Plenipotentiary for signing the Sanitary Convention of Dresden in 1893 and that of Paris in 1894. Sir Richard early received the distinction of C.B., and that of K.C.B. was conferred upon him in 1897, soon after he had succeeded the late Sir George Buchanan as the head of his department. He was a Crown member of the General Medical Council, a Fellow of the Royal Society and of the Royal College of Physicians, LL.D. of Edinburgh, Doctor of Science of the Royal University of Ireland, and held numerous foreign distinctions.

Camphorated Oil appears to be the favourite article for public analysts to direct their attention to at the present moment, cases in different parts of the country being reported every week. The reason for that is not far to seek, camphorated oil being a preparation which retailers have been accustomed to make from a number of differing formulæ, no official standard being generally recognised. In the British Pharmacopœia, 1898, however, the term "camphorated oil" is applied as a synonym to linimentum camphoræ, and advantage has been taken of that fact to prosecute retailers all over the country. Without going into the question of the lack of authority of the B.P. as a general standard, it may be pointed out that, even when the preparation is made in accordance with the official instructions—*i.e.*, by dissolving one ounce of camphor in flowers, in four fluid ounces of olive oil—it is necessary to adopt certain precautions if the strength of the preparation is to be maintained at what it is presumably intended to be. Thus, heating should be avoided when preparing the liniment, unless special arrangements are adopted to prevent the volatilisation of camphor during the operation. Again, when finished, the preparation should not be kept in partially-filled bottles exposed to temperatures much above the normal, or loss by volatilisation may occur. In fact, like all other galenical preparations, camphorated oil must be skilfully made and carefully preserved, the pharmacist requiring to bring his scientific knowledge and technical training to bear in dealing with even the most minute details of every operation. Therein should lie the difference between the skilled pharmacist and the mere retailer of medicines.

Influenza and Imperial Fever are both epidemic in Australia, according to a Melbourne correspondent, who thinks it is about a toss-up which prevails most. "Long ere this reaches you," he writes, "you will have had full accounts by cable of the dispatch of our comparatively small, but significant, contingent of "Soldiers of the Queen" to assist the Motherland in her South African troubles. And, if the offer be accepted by the Defence Department of Victoria, Messrs. Felton, Grimwade, and Co., of Melbourne, will have contributed their mite towards the campaign by supplying, free of charge, the medical equipment with all drugs and surgical dressings necessary for our boys in any eventuality that may befall them."

NOTICES OF BOOKS AND OTHER PUBLICATIONS.

'FORMULAIRE DE MEDICAMENTS NOUVEAUX POUR 1900,' par H. Bocquillon-Limousin. (Paris: J. B. Baillière et fils, 19, Rue Hautefeuille. Pp. 324. Price 3 francs.)—This useful little summary of the newer remedies, and particularly of those introduced during the past twelve months, is as well up to date as usual. Among the remedies to which space is devoted are acoïne, amylene-chloral, anesine, anytyne, asterol, bronispine, cosaprine, cresamine, dionine, echtol, eunol, guilol, iodipin, melarine, phenegol, pipizoac, quino-chloral, siroline, sugarine, tannocol, tenaline, vasothion, etc. As usual, the monographs contain the names, synonyms, composition, therapeutics, doses, etc., of the substances described.

'INDIGESTION,' by Thomas Dutton, M.D. (London: Henry Kimpton. Pp. 212. Price 3s.).—The fact that Dr. Dutton's work is now in its fifth edition should alone suffice to prove that it has been found useful as a book of reference. It appeals to the general public more than to professional readers, and was originally published with the idea of so educating the public with regard to medical matters that the advice of quacks would be less sought, and the use of nostrums less resorted to. The book appears to have fulfilled its purpose to some extent, and those who require information regarding the causes, symptoms, and treatment of indigestion will find it concisely stated by Dr. Dutton.

'THE PERFECT NEGATIVE,' by Rev. F. C. Lambert, M.A (London: Hazell, Watson, and Viney, Limited. Pp. 136. Price 1s.).—In this book we have a series of chapters on after-treatment of the negative—the part of the photographer's work which is apt to prove most tedious and unsatisfactory to the amateur. The author explains when a plate is fixed, how it should be washed and dried, and the precautions to be adopted when intensifying, reducing, re-developing, etc. In fact, he appears to leave but little unexplained that the beginner in photography is likely to require to know.

'THE PHOTO-MINIATURE' FOR OCTOBER. (London: Dawbarn and Ward, Limited. Pp. 50. Price 6d.).—The subject of the present number of this dainty little monthy is platinotype processes. The properties of platinum prints are described at length, the various methods of producing them are explained, illustrations are given to emphasise what is stated in the letterpress, and the subject of platinotype printing generally is fully dealt with.

THE 'CHEMISTS AND DRUGGISTS' DIARY, 1900' (London: Offices of the *Chemist and Druggist*. Pp. 530. Price 3s. 6d.).—The thirty-second year of publication finds this diary as bulky as ever, and containing the usual mass of solid information buried among advertisements. It is an excellent trade guide, the merits of which are marred to a considerable extent by the manner in which it is produced. But, though a nominal price is placed upon the book, it is virtually given away gratis, and those who receive it have, therefore, but little reason to find fault with it.

THE 'BRITISH JOURNAL PHOTOGRAPHIC ALMANAC, 1900.' (London: Henry Greenwood and Co., 24, Wellington Street, Strand. Pp. 1516. Price 1s. net.).—The principal contents of the present issue of this wonderful almanac include an article on 'Stereoscopic Photography,' by the Editor; about ninety contributions on practical subjects by prominent photographers; a series of pithy 'Practical Notes and Suggestions of the Year'; an 'Epitome of Progress during 1899,' giving a *résumé* of the latest important discoveries and advances; miscellaneous information, many illustrations, and the completest collection of photographic formulæ and recipes ever gathered together in one volume. In its many hundreds of pages will be found a mass of information of use to all photographers, professional and amateur.

'CARR'S CYLINDER REGISTER BOOK,' by J. R. Carr, M.P.S. 52, Nevill Street, Southport, is intended to show at a glance th quantity of gas in stock. The pages are ruled in columns, so that the kind of gas, size and number of cylinder, quantity of gas, and other particulars can readily be recorded.

PYE'S 'SURGICAL HANDICRAFT,' revised and edited by Bertram M. H. Rogers, B.A., M.D., B.Ch. (Bristol: John Wright and Co. Pp. 550. Price 10s. 6d.).—This is a well-known manual of surgical manipulations, minor surgery, and other matters connected with the work of house surgeons and surgical dressers. Eight years have elapsed since the publication of the third edition, and in preparing this—the fourth—considerable alterations and additions have been rendered necessary in order to make the work properly representative of modern ideas and methods. In addition to the various sections on the arrest of hæmorrhage, fractures and dislocations, emergencies, anæsthetics, treatment of the teeth, etc., there are chapters on X rays and the taking of skiagrams; the making of poultices, fomentations, etc., surgical case-taking, and urine-testing. The book is illustrated freely, the wood cuts exceeding two hundred and sixty in number, and a formulary is embodied in an appendix. The formulæ given comprise those for the chief lotions, ointments, liniments, suppositories, hypodermic injections, enemata, sprays, etc., used in surgical practice. Every care seems to have been taken to render the manual of the greatest possible value as a handy work of reference.

THE STATE BOARD OF HEALTH, MASSACHUSETTS, sends its thirtieth annual report (1898-99), a bulky, well-bound volume of nearly nine hundred pages. In addition to a general report, the book treats of water supply and sewage, food and drug inspection, the production and use of antitoxin, diphtheria cultures, examinations for tuberculosis and malaria, etc., etc. The samples of drugs examined during the year numbered 10,638; of those, 2,687 proved to be impure, showing the percentage of adulteration to be 25·3. One sample of "acidum sulphurosum" proved to be a weak sulphuric acid, three samples of alcohol were below the required standard, two of aloe purificata were poor, and three of strong solution of ammonia were below strength. Thirteen out of seventeen samples of distilled water were unsatisfactory, as also were three of bismuth subcarbonate, five of chlorinated lime, thirteen of capsicum, one of chloroform, eighteen of liquorice extract, thirteen of ferri et quininæ citras, twelve of lemon juice, twenty-five of olive oil, six of powdered opium, twenty-seven of tincture of iodine, and fifty-four of tincture of opium.

'BULLETIN DES SCIENCES PHARMACOLOGIQUES.' (Paris: 18, rue du Val de Grâce. Annual subscription, 14 francs.).—This is a new monthly publication, intended to deal with scientific and professional matters. The first number contains sixty-four pages, forty of which are devoted to original articles, reviews, abstracts, and reports of meetings of scientific societies. The remaining twenty-four include articles and notes on applied pharmacology—the use of creosote in tuberculosis, aseptic and antiseptic surgery, the sterilisation of pharmaceutical solutions, etc. The contents of the number (November, 1899) are such as should prove extremely attractive to scientific pharmacists.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of this association was held at the Exchange Rooms, Birmingham, on the 13th inst., Mr. F. Spear presiding. Mr. John Barclay, B.Sc. (Lond.), F.C.S., read the following

Laboratory Notes.

1. *Small Jaborandi Leaves as an Adulterant of Coca Leaves*:—A sample parcel of coca leaves recently obtained from a London broker was found to consist of from 40 to 50 per cent. of small jaborandi leaves mixed with Bolivian coca, The bulk of the adulterant leaves had the following characters:—From $\frac{5}{8}$ths to $1\frac{1}{2}$ inch in length, from $\frac{3}{8}$ths to 1 inch broad, margin entire revolute, unequal at the base without petiole, oval oblong in shape. A smaller proportion of lanceolate leaves with short petioles, but in other respects similar, was also present, but the characters of the two varieties corresponded generally with those described by Holmes (see *P.J.* [4], **1**, 520), as belonging to *Pilocarpus microphyllus* and *Pilocarpus spicatus* respectively. Both varieties may readily be distinguished from coca leaves, the apex of which is quite different, and which possess the well-known curved line from base to apex at each side of the midrib. It is noticeable that the 1885 Pharmacopœia speaks of coca leaves as being blunt and emarginate, while the 1898 edition mentions the prolongation of the midrib into a horny apiculus. It need hardly be said that the latter description is the correct one.

On extracting the powdered jaborandi leaves with suitable solvents, an alkaloidal residue was obtained, which yielded a crystalline nitrate, and this gave, on the addition of strong sulphuric acid with bichromate of potassium, an emerald green colour, thus answering the official test for pilocarpine.

This adulteration of coca leaves is one which might be missed by the casual observer, but cannot but be regarded as being a highly dangerous one.

2. *The Aqueous Tincture of Opium of Commerce*:—Some uncertainty as to the alkaloidal strength of this tincture appears to exist, and it was therefore thought desirable to endeavour to clear up the matter by obtaining samples from various sources. This was done, and seven samples purchased from leading wholesale houses gave the results shown in the appended table:—

Table Showing Results of Examination of Commercial Samples of "Aqueous Tincture" of Opium.

	1.	2.	3.	4.	5.	6.	7.
Specific Gravity	0·986	0·9855	0·989	0·998	0·968	0·983	0·976
Extractive	3·10	3·22	4·28	5·09	3·48	2·54	4·24
Alcohol by volume	20·71	21·19	21·19	17·17	38·04	22·18	32·98
Morphine	0·681	0·778	0·700	0·967	0·781	0·381	0·739
Comparative colour	17	14	17	19	20·5	19	23

Extractive, alcohol and morphine are given in parts per cent. by volume.

It will be seen that the specific gravity of the samples ranges from 0·976 up to 0·998. The amount of extractive is in one case only 2·54 per cent., while in another it is 5·09. There is also a notable variation in alcoholic strength, one sample containing 38·04 of alcohol by volume, another less than half that, viz., 17·17. The most important point, however, is the percentage of morphine present. This was found to vary considerably, being in one case as low as 0·38, in another as high as 0·97. The majority of the samples, however, approximated to the strength of the B.P. tincture of opium (0·75 per cent.), and it seems desirable that this percentage should be the recognised standard for the tincture. A mixture of three parts of water with one part of 90 per cent. alcohol would appear to be the menstruum most commonly made use of, and the one to be recommended.

3. *Notes on the loss of strength during sixty days of the official Ethyl Nitrite Preparations.*—In view of the well-known fact of the very marked loss of ethyl nitrite which takes place in the spirit of nitrous ether of the British Pharmacopœia when kept in bottles constantly used for dispensing, it was thought desirable to endeavour to obtain some definite knowledge as to the extent of the said loss.

In December of last year four 20 oz. stoppered bottles filled respectively with:—

(*a*) Solution of ethyl nitritis.
(*b*) Spirit of nitrous ether with 10 grammes of bicarbonate of soda.
(*c*) Spirit of nitrous ether.
(*d*) Spirit of nitrous ether.

were taken for the purpose of experiment. On the day in question bottle *d* was placed in a cool, dark cellar, for future reference, whilst on that and on each successive day for sixty days five cubic centimetres of liquid were removed from each of the bottles, *a*, *b*, and *c*, and the strength ascertained by the official process in a nitrometer. During the whole of the sixty days the bottles were kept on the laboratory shelves, and the conditions of temperature, etc., may be regarded as being fairly similar to those under which dispensing bottles would be kept. The results obtained were tabulated, and the accompanying table shows the condition of the solutions on every tenth day. It will be noted that the proportions of ethyl nitrite present in the samples is given in terms of volumes of nitric oxide gas yielded by 100 C.c. of the liquids, which in each case were at the commencement of the experiment well above the strength required by the British Pharmacopœia.

Table Showing Percentage of Nitric Oxide Gas Yielded by Samples every Tenth Day.

	a	*b*	*c*
Dec. 14th, 1st day	929·2	789·8	789·8
,, 24th, 10th ,,	862·3	743·2	721·9
Jan. 3rd, 20th ,,	859·18	702·6	658·3
,, 13th, 30th ,,	843·9	656·3	597·9
,, 23rd, 40th ,,	814·2	619·6	541·2
Feb. 2nd, 50th ,,	804·0	563·0	498·1
,, 12th, 60th ,,	796·0	475·3	416·6

The sample *d* originally of the same strength as *b* and *c*, was found at the end of sixty days' storage in a cool, dark cellar to have a strength corresponding to a yield of 730 centimetres per cent. of nitric oxide gas. It will thus be seen:—

(1) That the liq. ethyl. nitrite of the Pharmacopœia does not suffer any serious diminution of strength during a considerable period, even when in daily use for dispensing purposes.

(2) That the spt. ether nit. of the Pharmacopœia will, under similar circumstances, in sixty days fall from a strength above the maximum requirement down to a point below the minimum.

(3) That keeping the official spirit over a small quantity of alkaline carbonate slightly retards its loss of strength.

(4) That the spt. ether nit. of the Pharmacopœia, when kept in full bottles in a cool, dark place, suffers very little diminution in strength during a considerable period.

The lesson to be drawn from these experiments that under no circumstances should a shop bottle used for dispensing purposes be allowed to contain a quantity of spirit of nitre more than sufficient for use during a period of two months.

In conclusion, Mr. Barclay expressed his indebtedness to his assistants, Messrs. Mann and Barnes, for assistance given him in preparing the paper.

After the reading of the paper, an interesting discussion took place in which the Chairman, Messrs. Selby, Bell, Jessop, and others took part.

LIVERPOOL CHEMISTS' ASSOCIATION.

At a meeting of this Association held at the Royal Institution, Liverpool, on Thursday evening the 14th inst., and presided over by Mr. A. S. BUCK, only a sparse attendance of members put in an appearance, probably owing to the inclement state of the weather and the proximity to the Christmas holidays. After the usual routine business had been transacted, an important paper was read by Messrs. Cowley and Catford on:—

THE ESSENTIAL CONDITIONS FOR ENSURING THE PERFECT, RAPID, AND ECONOMICAL PREPARATION OF LIQUOR BISMUTHI.

The paper is printed in full at page 604.

In the discussion following the reading of the paper, the PRESIDENT referred to the small number of members present, which he hoped would not be considered as uncomplimentary to the authors of the paper, who had contributed in no small degree to the better comprehension and the removal of many difficulties attending the preparation of liquor bismuthi by the process of the present Pharmacopœia.

A hearty vote of thanks to Messrs. Cowley and Catford was proposed by Mr. JOHN SMITH, who had found the prolonged washing of the citrate in the B.P. process very tedious, and who was glad of the very practical suggestion that hot solutions threw down the citrate in granular form and considerably shortened the time required for the elimination of nitrates. He certainly looked upon the poor attendance as scant courtesy to the authors for the time and trouble they had expended in the preparation of this very valuable contribution.

In seconding the vote of thanks, Mr. PROSPER H. MARSDEN said that the specimens of the product of Messrs. Cowley and Catford's improved process were very fine, both as regards clearness, freedom from ammoniacal odour, and from colour, and were superior to most of the liquors found in commerce. The point that the loss of bismuth was reduced should also be remembered.

On being put to the meeting, the vote was passed with a warmth and unanimity which should console the authors for the paucity in the attendance.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

The fourth meeting of the session was held in the Lecture Theatre, at 17, Bloomsbury Square, at 5.30 p.m., on December 8, Mr. H. FINNEMORE in the chair. The minutes of the last meeting were read and confirmed. The CHAIRMAN announced that, as a result of the collection made on behalf of Colonel Gildea's Fund, the sum of £9 7s. 6d. had been forwarded, and a receipt for that amount had been received. There being no business to transact, he called upon Mr. C. W. B. Heslop to read his paper, entitled

INSECTS IN GENERAL,

With Notes on those mentioned in the Pharmacopœia. Mr. HESLOP first dealt with the different forms which insects assume before, reaching maturity, and then explained the general structure of an "imago" or perfect insect, and concluded with descriptions and historical notes on the insects mentioned in the Pharmacopœia. The CHAIRMAN thanked Mr. Heslop for his interesting paper, and mentioned the part insects play in the fertilisation of certain flowers. He invited members to put questions. Messrs. HARRIS and POLLARD responded, and were answered by Mr. HESLOP. Mr. BRIGHAM moved a vote of thanks to the Chairman. Thirty-five members signed the attendance book. The next meeting will be held on Friday, January 12, 1900. Notices will be issued to members in due course.

WESTERN CHEMISTS' ASSOCIATION (OF LONDON).

A meeting of this Association was held at the Westbourne Restaurant, Paddington, W., on Wednesday, December 20, the PRESIDENT (Mr. J. F. Harrington) in the chair. After the usual preliminary business, the PRESIDENT proceeded to deliver the

Inaugural Address.

He said: There is a very important question before us all, which is to be the subject of discussion to-night, and perhaps you will allow me to refer to that subject in this short address. It is, how are we likely to be affected by the Companies Acts Amendment Bill that is to be introduced into Parliament next year? This is a very important matter, and I think we may succeed in obtaining a clause inserted in this Bill that would be of some advantage to ourselves, but, on the other hand, it is quite possible that a clause may be inserted which, instead of being an advantage, might be the last straw to break the chemist's back. We must bear in mind that this Bill is not a Pharmacy Bill, but, as far as I understand it, is a Bill

TO CORRECT SOME OF THE ABUSES

that have crept up under cover of the Limited Liabilities Act, and there is only a very small portion of it that will refer directly to us. We can only hope, therefore, to obtain any redress of our grievances, or any direct advantages, by clearly showing that the public are not so well served by company pharmacy, and that there is a great danger in allowing a company of unqualified men to sell and dispense poisons. We have every right to demand an alteration in the existing state of affairs, and, first, it would be greatly to the interest and safety of the public that no company should be allowed to use our titles, as by their use—fixing over their doors and on their labels—they induce the public to believe they are entering the pharmacy of a pharmaceutical chemist, or chemist and druggist. If it is impossible for a company to present itself for examination, so it should be impossible for it to use any title implying qualification. I believe you will all agree on this point, that it is desirable to protect our titles. I believe, also, you will agree with me that it is desirable that no company should be allowed to sell or dispense poisons, and that although they have been doing it for the last twenty years or more it is not to the advantage of the public. It would be wasting your time to repeat here all the arguments that have been used. It is sufficient to say that we are compelled to pass a very severe examination before we can go into business and hand these poisons to the public; and yet, if we fail to pass, there is nothing to prevent us making use of the Limited Liabilities Act, and, protected by it, can keep open shop without any qualifications whatever.

THE BEST AND ONLY WAY

to prevent such a thing as this is to put a stop to all company pharmacy, and I think we should use every effort to attain this end by placing our case very plainly before those members of the Government who are likely to have charge of this Companies Bill, but at the same time I am very strongly of opinion that if we are told quite plainly that there is no hope of obtaining all we are asking for, that we should be prepared with some second line of attack. I remember well the fate of our poor suggestions, and while in those suggestions there was nothing we asked for but was reasonable and just, still at the same time I think if we had asked for something less we should have stood a good chance of obtaining some attention that would have led on to substantial advantages. If we can only, through the means of this Companies Bill, obtain even a small measure of success, it will always be open to us at a later period to try what we can do with a new Pharmacy Bill. But what seems to me to be a very great mistake would be to do as some gentlemen have advocated—to nail our colours to the mast, and say we will have all this or nothing.

That it should be illegal for all companies to sell or dispense all scheduled poisons, and that those who are now doing so must stop that part of their business; I say that very desirable as this end is, and not only desirable, but in the name of justice it is right and should be so. Still, if we cannot attain all this, I do not think it good policy to turn on those who refuse it and say we decline to discuss the matter further, and that we decline to accept anything less. That is the position I take. I think we may have, when this Companies Bill is introduced,

A Chance that Will Never Occur Again,

and I am very anxious we should not throw that chance away. I am very much afraid that if we take up the no-surrender position that we shall be quietly put on one side, or the Lord Chancellor's clause be inserted in the form it now is; or, perhaps, what is more likely, we shall be left out altogether. I am afraid I have trespassed somewhat on Mr. Hills' ground, and I hope he will pardon me, but as your Chairman I felt I could not take part in the discussion after it is started, and yet I felt I should like to say a few words on this very important subject, for, as I have said here before, I feel it is the duty of every chemist to speak out boldly and express his opinion on the best course to pursue. There are several other matters I should like to have spoken to you about, but I must put them off for some future occasion.

Mr. Walter Hills was next called upon by the President to open a discussion on the subject of

Limited Companies and the Practice of Pharmacy.

Mr. Hills said: Soon after the November meeting of the Pharmaceutical Council your President asked me if I would open a discussion at a meeting of the Western Chemists' Association on the subject which is now occupying our serious attention—namely, limited companies in their relation to the practice of pharmacy. In acceding to his request, I take the opportunity of saying how pleased I am to meet my fellow members of this Association, and to have an opportunity of discussing this important matter with them. As it was thought desirable, for practical purposes, to offer for your consideration a resolution on which a vote might be taken, I have framed one which I hope may meet with your approval, and, at the same time, one which, whilst offering some practical suggestions for future course of action, should not hamper the Council in its efforts to protect the best interests of all registered persons.

Definitions.

In order to condense my remarks as much as possible, I may say that when I speak of companies I mean limited companies; and when I speak of protection or restriction of practice, I mean that amount of protection or restriction which is indicated by the words: "Keeping open shop for the retailing, dispensing, or compounding of poisons." I am aware that the second clause in the Companies Acts Amendment Bill, 1899, says that, "No company may carry on the business of a pharmaceutical chemist, etc.," except under certain conditions. Whilst I am entirely in favour of this wider definition, I am doubtful if it would, unless interpreted, cover more of practice than is defined in the Pharmacy Act, 1868, and probably more is not intended.

Some Past History.

Before I pass to the terms of my resolution, may I ask you to consider with me for a few minutes the history of the past in so far as it affects the question under discussion; also some of the present conditions wholly or partly arising therefrom. You will remember that before 1868 the practice of pharmacy in this country was unrestricted, though certain titles implying qualification had been restricted to registered persons since 1852. In the year 1868, Parliament, in its anxiety for the safety of the public, passed an Act which, whilst protecting the above and other titles, made it unlawful for any but registered persons to sell or keep open shop for retailing, dispensing, or compounding poisons. Now, I wish to point out that under the 1868 Act persons entitled to keep open shop were not only those who were at that time, or who should become, registered as pharmaceutical chemists, but also those who should pass the examination "provided under the Pharmacy Act, 1852, for the purposes of a qualification to be registered as an assistant under that Act." I mention this because I think if the original ideas underlying the 1852 Act had been made compulsory in 1868, there would have been less subsequent trouble. It must always be borne in mind that Parliament has expressed its opinion that the person who, at the age of twenty-one, has passed what is known as the Minor Examination is competent to keep open shop on his own account; in this respect, therefore, he is on the same level with the pharmaceutical chemist.

A "Casus Omissus" and its Effects.

I think we shall agree that when the 1868 Act was passed the case of limited companies keeping open shop was not contemplated; in fact, it was a *casus omissus*. We shall also probably agree that the idea which our representatives had in their minds at that time was, broadly, that the proprietor of each open shop should be qualified. I say *each*, for though branch shops were not in any way prohibited, it could hardly have been contemplated that qualified proprietors should be permitted to keep an unlimited number of such shops—a tendency very remarkable at the present time. It was also generally believed that the qualified owner, being responsible for the conduct of the business, was also responsible for each sale of a poison, and might himself be the judge as to how far it was necessary to employ qualified assistants to do the physical acts of sale or compounding. We now pass to the important case of the Pharmaceutical Society *v.* the London and Provincial Supply Association. It will be remembered that though the Society was successful in this case in the Court of Queen's Bench, judgment was given against its contention by all the Lords Justices in the Court of Appeal, and by all the Law Lords in the House of Lords. I do not propose to refer to the several judgments, but I wish to point out that more than one of these eminent authorities gave it as his opinion that whilst there was no inherent legal difficulty in making a company liable, it was not necessary for the general purpose of the Act to make it cover a company—as in the case before them, the sale of poison having been made by a registered person, the safety of the public did not in their opinion appear to have been endangered. For instance, Lord Justice Bramwell said that he "would not refuse to include corporations under the term persons if it were clear that without doing so the mischief aimed at could not be prevented. But that was not so here." A few years after this judgment, in 1890, a case involving other considerations was taken to the Court of Queen's Bench, when Mr. Justice Hawkins stated that the law requires that every sale of poison must be made by a qualified person or under the actual personal supervision of a qualified person. In this case, moreover, leave to appeal was refused. Under these judgments, therefore, the public appears to be protected so far as the actual physical sale is concerned, always assuming that when the law is not observed a reasonably easy method of proving its infraction is attainable. Nevertheless, it is contended by us, and I think rightly so, that sufficient provision for the public safety is not thereby secured in accordance with the 1868 Act, unless the "keeping open shop" is also restricted to qualified persons.

A Judgment of Expediency.

There has been, however, considerable difficulty in bringing this important point before the public on the lines we have thought desirable. I am bound to admit that in my opinion the judgment of the House of Lords was one largely of expediency; and, if this opinion is in any way correct, the difficulty experienced by the Council in getting the Pharmacy Act amended in the desired direc-

tion is accounted for. Various attempts, however, have been made, and recent events have led some of us to hope that an amendment of the law to prevent company trading was possible. It is unnecessary to take up your time by referring in detail to what has recently transpired. I have only to remind you of the apparently sympathetic remarks of the Lord Chancellor in the House of Lords, both in 1898 and in the present year. It is also an important advantage that, largely owing to the unwearying efforts of Mr. Carteighe and others, the position of companies with reference to the practice of pharmacy has been considered of sufficient public importance to be dealt with in a Companies Acts Amendment Bill. In spite, however, of these encouraging factors, the clause that has actually been drafted, and already approved by the House of Lords, is one with which we cannot be satisfied; and as the Bill will probably be introduced into Parliament next session it is necessary that we should be prepared with a policy on which there may be some general agreement amongst registered persons. The Council of the Pharmaceutical Society has anxiously considered the question as it now presents itself, and I need hardly say that, though there is an apparent difference of opinion as to the best method of dealing with it, there is in each member of that Council an earnest desire to obtain every possible advantage for those they represent.

The Position of the Lord Chancellor.

Personally I have long been of opinion that Parliament would not attach much importance to the financial aspect of the question, though I must admit that I was so much impressed last year with the remarks of the Lord Chancellor, to which I have already alluded, that I thought it possible the Government would not be unwilling to support us in getting the law amended in the desired direction. I have always maintained that to get the law so amended two factors were necessary—one being the support of the Government, and the other the general support of our own body. When, however, I see the Lord Chancellor's clause, knowing that our wishes have been fully laid before him, I am again doubtful if the prohibition of company trading is a practical object to aim at. The difficulty of dealing with the subject has always been somewhat increased by the existence in the 1868 Act of the so-called "Widows' Clause," and at the present time a further difficulty arises from the fact that not only have companies, more or less of a bogus nature, been formed to keep open shop, but also many of our own members have found it convenient and advantageous to make use of the limited liability principle. Many, probably all, of the latter, being entirely controlled, except financially, by registered persons, are not the least source of mischief to the public; but still they have to be reckoned with in framing a policy which would command general acceptance.

The Suggestion of Prohibition.

Many suggestions have recently been offered by individuals, and many resolutions have been passed by local Associations; but they do not by any means agree in essential particulars, and many of them do not appear to be very hopeful that Parliament will prohibit company trading. I myself scarcely ever hear anyone sanguine of such a result. The prohibition of *all* company trading, which I may call the first line of defence, is undoubtedly the best and strongest, not only from the logical but also from the pharmaceutically popular point of view, and is one which even now may be urged upon the Government, if the Council, or a majority of the Council, with any special knowledge they may possess or obtain, consider such a policy one that will receive a considerate attention by the Government. But I am of opinion that if this line is now adopted it will be necessary, in order to be thoroughly logical, to insist that *no* limited company, although constituted largely of registered persons, should be permitted to "keep open shop." I can certainly conceive a company consisting at its inception entirely of registered individuals, though there must be a minimum of seven persons; but what, I ask, will happen when one of the seven dies? Will the trustee for the widow, though unqualified, be allowed to form one of the company? Moreover, to be strictly logical, no single share, whether ordinary, preference or debenture, should be held by an unregistered person. Still, for the general good, possibly the companies already in existence would be ready to "unlimit" themselves. I need hardly say that I am firmly opposed to any suggestion prohibiting the future formation of companies, whilst allowing those already in existence to continue indefinitely.

The Restriction of Titles.

If, however, our first line of defence is not tenable, are we to oppose any and every proposal recognising the limited principle in pharmacy? I hope not, for two reasons—(1) Because I believe the Government to be in earnest and intend to legislate on the subject, and (2) because, as matters are getting every year more unsatisfactory, we ought at the present juncture to endeavour to get some improvement in the law. We ought then, in my opinion, to insist on the restriction of titles to registered persons. If we do this we shall probably succeed, because it is a strong position to adopt, and one which will, I think, recommend itself to the majority of members of Parliament. Here, however, we may possibly find some opposition, not only from the one-man company, but also from some of our own members who are trading as companies. These would, however, for the general good, perhaps not press their opposition, as they could always use titles in connection with their own names. Some of our friends advise us to restrict our efforts to the protection of titles, but I am persuaded that if the general question is dealt with by Parliament, the trading aspect will be considered the more important one, and will consequently not be permitted to remain in its present position.

The Question of Practice.

Now, however, I come to the most difficult part of the whole question—that of "keeping open shop." I maintain that we have a strong case if we approach the Government and point out that the clause, as drafted in the present Bill, does not in the public interest sufficiently provide for one of the essential principles of the Pharmacy Act, because it does not insist on the qualification in a company of a responsible person, not only to do the physical act of sale, but also to control the open shop, and thus it does not supply in any way the safeguard represented by a qualified ownership. *Inter alia*, it might be pointed out that under the clause as drafted an assistant qualified the previous day and liable to dismissal at a day's notice might be stated to be in full control of a shop owned and managed entirely by unregistered persons forming the company—a condition surely not compatible with the public interest. Many proposals having for their object the provision for this *bonâ-fide* control have been made. I do not propose to tie myself to any particular one this evening. If we could agree to the principle of recognition of company trading, I should be inclined to take the advice of some eminent legal authority on company law, and ask him, with all the facts before him, to frame for our consideration a clause which, with the least amount of probable opposition in Parliament, would make control something of a reality, and so bring companies as nearly as possible into line with qualified individual proprietors. Such a clause should not interfere with the conduct of a company business under the complete control of qualified persons, but should make it practically impossible for a bogus company to keep open shop. Probably we all agree that if companies are allowed to keep open shop, the provision in Clause 2, making "anything which would be an offence under Section 15 of the Pharmacy Act, 1868, if committed by an individual, also an offence if committed by a company," is a desirable one, and one of urgent necessity in carrying out the law. As regards Clause 3 of the Companies Bill, dealing with other professions, I think it very unlikely that it will pass in its present form, as it seems to propose preventing companies doing what an individual is entitled to do. It must also be admitted that though our titles should be equally protected with those of medical practitioners and dentists, their

practice is more uniformly professional than that of pharmacy is, or indeed is likely to be, unless pharmacists have the exclusive right of dispensing medicines.

Points Covered by the Resolution.

The resolution, then, gentlemen, that I have the pleasure to ask your acceptance is the following :—

That, in view of the probable introduction of the Companies Acts Amendment Bill into Parliament next Session, this Association is of opinion that, should the Pharmaceutical Council be convinced that to restrain *all* companies from keeping open shop for the retailing, dispensing or compounding of poisons, is not feasible, legislation on the following lines would be desirable :—

1. To make it unlawful for companies to assume or use titles implying registration under the Pharmacy Acts.
2. To provide that all such open shops should be under the ole control of persons registered under the Pharmacy Act, 1868.

In placing my resolution before you I wish to emphasise these points, which it covers : —

(1) That in adopting the first line of defence, *all* company trading should be prohibited, and

(2) That, if this be found to be impracticable, efforts should be made in the direction of

(*a*) Protection of titles to qualified individuals, and

(*b*) *Bonâ-fide control* of all open shops owned by companies.

Mr. H. Cracknell said it was very difficult to say anything upon the question that had not already been dealt with. He considered it was the duty of the Association not to hamper the hands of the Pharmaceutical Council in any way, and the resolution gave the Council so wide ground for action that he had pleasure in seconding it.

Mr. R. H. Parker recognised the great importance of the question before the meeting, and that it was one presenting great difficulties in its solution. As regards legislature chemists stood in quite a different light now than they did thirty years ago. Then the generous British public would readily grant monopolies, but now there was no chance of that ; the Government would only grant measures framed solely in the interests and for the protection of the public ; still he thought that in respect to the company trading question certain measures would be granted. So far as pharmacy pure and simple was concerned, he was of opinion that chemists were in no danger, because they would always stand individually upon their merits, independently of legislation. The difficulties of the situation lay mostly in the fact that the alteration in the law that chemists want, namely, the stopping of company trading and the limitation of titles to individual qualified persons, would interfere with existing interests, not only outside but also within their own ranks ; for there were companies and companies, and it would be difficult to frame a clause to stop bogus companies without stopping concerns which might fairly claim to be legitimate companies. While advocating the regulation of companies trading as chemists and druggists by means of registration which should ensure that every shop was under the control of a qualified person, he thought it would be unwise to throw overboard the question of qualified ownership because they might lose something they already possess, namely, the fact that at present no unqualified person can open a shop without forming a company. He was of opinion that for the safety of the public qualified ownership was a much more desirable thing than qualified managership, but however much he might be inclined to that view, he thought the wisest course to pursue would be to endeavour to bring limited companies within the pale of the law by insisting that there should be at least one qualified director for each shop owned by a company, and that each qualified director should be told off, so to speak, to one particular shop, which should be under his sole control. With regard to titles, he thought that no name should be used in connection with the business of a chemist except that of a living qualified person. That would interfere with existing arrangements, but it was the only logical position to take up.

Mr. W. Warren was strongly in favour of the individual pharmacist. He could not agree with any regulation of companies because he felt that by so doing it would simply make them thoroughly respectable, and would tend largely to do away with the feeling of distrust which at present exists among medical men with regard to companies.

Mr. Andrews, while of opinion that chemists might fairly claim to have companies prevented from carrying on business as chemists and druggists, did not believe that it was practicable. They might try to prevent little bogus companies from starting as "Store chemists," and he thought an effort should be made in that direction. Still, he was inclined to support Mr. Parker in his contention that every shop should be registered and under the control of a qualified manager. He thought, however, that this registration should not be left to the Pharmaceutical Society, but that it should be carried out by the Government,

Mr. J. C. Hyslop, said it had been stated that the Pharmacy Act of 1868 was passed solely for the safety of the public. That was not quite the case, for there was a balance on the side of the chemists, namely, their recognition by Parliament as the only persons qualified to carry on the business of pharmacists. Chemists had for too long held a hesitating, sentimental, jellyfish kind of position, and he thought it was high time, now that they had a just cause of complaint, to go to the Government and ask for their rights, and to say "That's our position ; that's where we mean to stay." Mr. Hyslop then went on to say that there are three words frequently used in connection with the subject before the meeting which he thought they ought to avoid, viz., Profession, Protection, and Competition, and gave his reasons for thinking so.

Mr. W. S. Glyn-Jones, referring to the remarks made by Mr. Hyslop, said that whatever they might justly consider their rights as pharmacists, the Government only recognised them as a body of men qualified to keep open shop for the dispensing and compounding of poisons, and for the sale of poisons. It was an anomaly, but it was the position at the present time that any person, however unqualified, might dispense medicines, and so long as those containing poison were handed over the counter by a qualified person, the law was fulfilled. Under such circumstances, therefore, all that could reasonably be asked of the Government now was that companies shall be placed under the same conditions as individuals. In one sense it was true that the law expects the owner of a shop to be qualified, but only in so far as he keeps open shop for the sale, etc., of poisons. The ideals, with regard to the practice of pharmacy, of those who founded the Pharmaceutical Society, were not recognised by the Government ; it simply recognised pharmacists as persons qualified to hand poisons to the public. Nothing could be done to remedy that state of things without the help of the Government ; a private Bill would have absolutely no chance of passing. He did think that sometimes it was not right, as Mr. Hyslop advocated, to go for the greater. He thought that an opportunity was lost at the beginning of the year by asking too much. At the present time they could not do better than try to bring companies into line. Personally he would prefer that the words "should the Pharmaceutical Council be convinced that to restrain all companies from keeping open shop for the retailing, dispensing or compounding of poisons is not feasible," in the resolution proposed by Mr. Hills, were struck out, because he did not think that the resolution would be as useful to the Council as it would have been if it had stated whether that meeting held the view that it was feasible to prevent companies from carrying on the business of chemists and druggists. He had a very grave doubt whether that meeting would pass a resolution that it was feasible to go to the Government to ask for the stopping of all companies keeping open shop for the sale of poison. The question then would be what kind of companies they were prepared to allow. If

they admitted that a company may under certain conditions keep open shop, then the regulation of companies would naturally follow. He did not think that the Government would attempt to deal with the question as to how pharmacy is financed, but he maintained that a director of a company kept open shop, and he held that anyone keeping open shop should be qualified, and he would ask the Government to make it legal that where a company keeps a number of shops it should be subject to the same conditions as individuals. He was very much opposed to the qualified managership solution, because they had already in the Pharmacy Act, 1868, a clause that makes it imperative not only that there should be one qualified man in each shop where poisons are sold, but that there should be in every shop as many as needs be. The only difficulty was that, because it is the assistant who is liable, the Pharmaceutical Society sometimes finds it impossible to enforce the law. What was really needed was a short Act to make the employer liable. He was of opinion that effective regulation of companies would do a great deal of good.

Mr. GAUBERT asked if it was not a fact that the Pharmaceutical Society was contemplating introducing a Pharmacy Bill of its own, and if so, would not any action taken in regard to the Companies Bill bind the hands of the Council afterwards?

Mr. KNIGHT then referred to the lost opportunities of dealing with the question, and was of opinion that in the old days the Council should not have considered existing companies, but have gone in for individual proprietorship.

Mr. HILLS, in reply, said that he had been very anxious in framing his resolution not to hamper the members of the Council. They had the best means of knowing what it was possible to obtain, and he thought it must be left to them as to what was best for registered persons. He thought those present would gather from the general tone of his remarks that he was quite in accord with the views of Mr. Parker, Mr. Andrews, and Mr. Glyn-Jones. He thought it was not feasible to restrain companies from keeping open shop, but, at the same time, he thought that it was the best line to take at present because they had already before them a clause which none of them liked, but which would be brought into the House of Commons next year. Mr. Warren had expressed the opinion that the Government should be prevented from bringing in a clause to regulate the practice of pharmacy as at present carried on by companies. He (Mr. Hills) thought it possible that chemists might make things so unpleasant for the Government that it would drop the whole matter in respect to pharmacy. He knew that certain people were of opinion that it would be better to drop the "accursed thing," and that the Pharmacy Act of 1868 should be done away with, but he did not hold that view. The public was protected up to a certain point by that Act; that was to say it had already been decided by Mr. Justice Hawkins that the sale of poisons must be in the hands of qualified persons. The public would not throw away that protection. There was much to be said for the regulation of each shop where poison is sold, but they were not discussing the question that night. Mr. Hyslop had spoken in his usual effective way, and had taken very high ground, but he thought it was untenable. One speaker had stated that their titles were not in jeopardy, but he believed they were in danger. The same speaker had also expressed a fear that if they dealt with the matter now it might interfere with the freedom of the Pharmaceutical Council in any future action. The Council was always wanting a new Act, but to get any new Pharmacy Bill passed it must have the support of the Government, and hitherto it had not succeeded in obtaining that support What the Government would consider in any matter affecting pharmacists would be, "What is for the public safety, and what interferes as little as possible with existing interests?" In any future measures they would have to consider those two points.

The motion was then put to the meeting and carried, a number of members refraining from voting.

ANSWERS TO QUERIES.

Special Notice.—*Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.*

Dry Soap (T. E. J.—37/5).—If you mean a washing powder or "soap extract," that is made from dried powdered yellow soap, 3; dried washing soda, 1. Mix.

Dyspepsia Mixture (E. P. D.—12/17).—Your formula would be improved by the addition of five grains of American scale pepsin to each dose.

Lin. Ammoniæ (W. B. D.—12/37).—The almond oil in the present formula is intended to make the liniment more fluid than formerly. It should be a thick creamy preparation, and will be liable to become less fluid if exposed to temperatures below the normal.

Patenting a Medicine (J. G.—37/10).—(1) Apply to the Comptroller, Patent Office, Chancery Lane, London, E.C.; (2) The cost depends upon the circumstances of the case; (3) By patenting the preparation, registering its name as a trade mark, or selling it under your own name.

"Russia Leather" Perfume (J. D.—37/4).—Extract of rose, 10 fl. oz.; extract of violet, 10 fl. oz.; extract of jasmin 10 fl. oz.; extract of musk, ½ fl. oz.; extract of orris, 10 fl. oz.; oil of neroli, 30 minims; oil of bergamot, 1 drm.; oil of amber (rectified), 1 drm.; oil of birch (oleum rusci), 1 drm.; vanillin, 30 grains; coumarin 30 grains; cinnamein, 1 drm.; oil of bitter orange, 20 minims.

Carnation Sachet Powder (J. D.—37/4).—Finely powdered orris root, 4 oz.; caryophyllin, 10 minims; synthetic oil of jasmin (Schimmel), 4 minims; oil of bitter almonds, 1 minim; oil of Niobé, 5 minims; heliotropin, 5 grains; oil of Neroli, 10 minims; oil of bitter orange, 5 minims; musk, 1 grain. Rub all the perfumes down intimately with a little of the powdered orris, then add the rest of the basis.

Lin. Potass. Iodid. c. Sapone., Tichborne (F. G.—37/7).—This is Professor Tichborne's formula; the liniment is made with a potassium oleate basis (soft soap) instead of the official curd soap (sodium oleo-stearate). It forms a clear transparent jelly when cold. The formula is:—Oleate of potassium, 1½ oz.; potassium iodide, 1½ oz.; oil of lemon, 1 drm.; glycerin, 1 fl. oz.; distilled water, 10 fl. oz. Dissolve the potassium oleate in 7 fl. oz. of water on the water bath. Dissolve the potassium iodide and the glycerin in the remaining 3 fl. oz. of water; mix, and when nearly cold add the oil of lemon. The potassium oleate is made by saponifying oleic acid with solution of caustic potash. The amount of alkali for the sample of acid used being first determined by titrating a little, in alcoholic solution, with standard soda solution.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

PHARMACY OF COLLOIDAL MERCURY.

Oscar Werber gives the following recipes for preparations of this form of mercury:—COLLOIDAL MERCURY OINTMENT.—Colloidal mercury, 10; distilled water, 10; prepared lard, 60; white wax, 15; ether, 1·5; benzoated ether, 3·5. Since by continued rubbing colloidal mercury is readily converted into the globular form, the mercury is previously dissolved in the water; the fat and wax are melted together and then mixed with the solution until the ointment shows a uniform dark grey colour; finally the ether and benzoated ether are added. The fine division of the mercury can be noted by the microscope or by the naked eye. The ointment should be kept in a cool place, protected from light. To prevent oxidation it may be filled into gelatin capsules, each containing 2 grammes. EMPLASTRUM HYDRARGYRI COLLOIDALIS is a 15 per cent. colloidal mercury caoutchouc plaster, spread on close white linen; it is of dark grey colour and keeps well. COLLOIDAL MERCURY PILLS (1).—Colloidal mercury, 0·3 Gm. to 1·0 Gm.; kaolin and glycerin, of each, enough to make thirty pills; sprinkle with French chalk. (2) Colloidal mercury ointment, 3 to 6 Gm.; kaolin, enough to make thirty pills; sprinkle with French chalk. This second form keeps soft for a long time; the pills disintegrate in water in less than a minute. A solution of colloidal mercury (1·2 parts to 1,000 of distilled water) and a powder of colloidal mercury for dusting purposes are also used. All these preparations should be preserved in orange glass bottles.—*Pharm. Central.*, **40**, 609.

EUPHORBONE.

A. Orlow extracts this body from euphorbium with petroleum ether. He attributes to it the formula $C_{15}H_{24}O$. It melts at 114°-115° C. By crystallisation from ice-cold alcohol crystals are obtained, which melt at 91° C. Those obtained from petroleum ether melt at 67° C.; by re-crystallisation of those from alcohol the melting point is raised to 114° C. The crystals retain one molecule of alcohol. Heated with water, the sparingly soluble euphorbone yields a substance giving a dark colour with ferric chloride, which is not destroyed by hydrochloric acid; but in an alcoholic solution the colour obtained is discharged. Dried chlorine reacts with euphorbone in chloroformic solution, yielding an amorphous chloro-compound, which yields up chlorine on fusing with alkali. By heating with iodine an amorphous body is obtained, from which the iodine can be recovered by treatment with silver oxide; the residue, however, is not euphorbone. By treatment of the alcoholic or chloroformic solution of euphorbone with a chloroformic solution of bromine, an orange-coloured precipitate is obtained, which is only with difficulty soluble in absolute alcohol. The formula is $C_{15}H_2H_{21}Br_3O$. By heating with alcoholic potash, this bromo-euphorbone is not changed, but it is decomposed by strong nitric acid. The iodine compound does not resemble this. After treating euphorbone with fuming nitric acid, the addition of water throws down a nitrogen containing acid, which is yellow, and dissolves in alkali to a red colour. By treatment with zinc dust in acetic acid and alcohol a water soluble body is formed, very similar to an amide.—*Chem. Zeit. Rep.*, **23**, 174.

OXIDISING ENZYMES.

Woods (*Centr. f. Bak.*, 2 Abt., v., p. 745), draws attention to the fact that chlorophyll by oxidation becomes decolorised and converted into a yellowish pigment, and suggests that oxidising enzymes, which are widely distributed in plants, might take part in the autumnal destruction of chlorophyll, and in the variegation and spotting of leaves. His experiments lead to the conclusion that two groups of oxidising enzymes—oxidases and peroxidases—are normally present in small quantities in the higher plants. Under certain conditions, not well understood, these enzymes either become more active or are produced in larger quantities, causing variegations and various "diseases"; for example, the 'mosaic disease' of tobacco. If the epidermis of a leaf showing yellow spots be carefully removed, and the cells moistened with a 2 per cent. alcoholic solution of guaiac resin, the yellowish cells become intensely blue, while the surrounding healthy cells are much less deeply coloured. Portions of leaves may be ground up with sand and extracted with distilled water and fresh guaiac resin solution in absolute alcohol added. Those enzymes which give a direct reaction with guaiac resin are termed oxidases. Those which require the addition of peroxide of hydrogen are termed peroxidases. Care must be taken that the guaiac resin is fresh and good, the solution should be freshly prepared, and oxidsing agents, such as chlorine and nitrous acid must, of course, be absent from the solution to be tested. These enzymes retain their activity for a long time in the dry state. In aqueous solution the oxidases are destroyed by a temperature of 65°—70° C., acting for five minutes, the peroxidases by five minutes' exposure to 80°—85°C.

ASCENT OF SAP.

H. W. Chamberlain discusses the phenomena connected with the ascending sap, as shown by a long series of experiments performed on a great variety of plants. Among the more important results are the following. After decapitation an efflux of water takes place in some plants but not in others. Root-pressure is stronger in herbaceous than in woody plants. The period of the year has but little influence on the root-pressure when the plant is in active growth. In respect to a daily periodicity, the plants examined could be arranged under three groups: in the first there was no trace of any daily periodicity in the flow of sap; in the second a daily periodicity was manifested, but the times for the maxima and minima were uncertain; in the third group the periodicity was regular and permanent. Variations in temperature have no marked influence on the root-pressure. The ascent of sap is greatly promoted by moistening the leaves, while saturation of the soil acts prejudicially. The larger and more strongly developed the roots, the stronger is the root-pressure.—*Bot. Centralblatt*, **79**, 1899, p. 31; from *Bull. Lab. Bot. Univ. Genève.*

PEREZOL A NEW INDICATOR.

Under the name of perezol, Duyk suggests the use of pipitzahoic acid, derived from *Perezia adnata*, a common Mexican plant. The acid occurs in the rhizomes of the plant, from which it is easily extracted by toluene or benzene. From those solvents it is deposited, on evaporation, in orange yellow crystals, which are purified by recrystallisation. The yield is about 5 per cent. As an indicator a 0·5 per cent. alcoholic solution is recommended. This is extremely delicate towards alkalis, both fixed and volatile, giving a mauve rose tint with the slightest trace of free alkali; the action is very sharp, even in extreme dilution. Thus, distilled water boiled in a glass vessel, will give a distinct reaction, from the trace of alkali dissolved from the glass. In ordinary drinking water, the alkaline-earthy carbonates present give a marked reaction; so does saliva. Alkaloids react with perezol with great delicacy, rendering it valuable for the titration of those bodies by the alkalimetric method. Perezol, sensitised by the addition of the faintest trace of alkali, is immediately decolorised by free acids; carbonic acid, and organic acids, react in this way like the mineral acids. Boric acid, however, acts as a base towards the indicator, except in the presence of glycerin, when it has an acid reaction. Borates, acetates, carbonates, and bicarbonates have an alkaline reaction; ammoniacal salts are neutral towards it.—*Annales de Chim. Analyt.*, **4**, 372.

THE B.P. PREPARATIONS OF IPECACUANHA.

BY R. GLODE GUYER.

Recently, when a stock of liquid extract of ipecacuanha was re-assayed, its strength was found to be only 1·528, whereas its original strength about two months previously was 2·08 per cent. In consequence of this very pronounced reduction in the strength of the total alkaloid in the liquid extract, an examination of the wine, prepared from the same liquid extract about a fortnight before, was also estimated, and was found to contain only 0·0250 per cent. (second estimation 0·0248), against the 0·10 per cent. of the B.P.

In order to have some confirmatory evidence, a small stock of liquid extract, prepared from Carthagena root, standardised to contain 2·1 per cent. of total alkaloid, was assayed; and it had also depreciated to the extent of 5 per cent., its alkaloid value only being 1·525 per cent. This result, as will be seen, is exactly parallel to the case of the liquid extract prepared from the Rio root. In consequence of these examinations, three samples of the wine were collected from three of the best retail pharmacies in London, each of whom are known to keep a competent laboratory chemist.

Their examination proved most interesting. In each case there was a marked decrease in strength from the official standard:—(*a*) 0·0788 per cent.; (*b*) 0·0384 per cent.; (*c*) 0·0348 per cent.

A further set of samples of ipecacuanha wine was collected from three of the leading manufacturing pharmacists. These had a distinctly better value than those purchased from the retail pharmacies, as the following results will show:—(*a*) 0·0882 per cent.; (*b*) 0·1022 per cent.; (*c*) 0·077 per cent.

Even here there was only one sample which could be classified as being up to the B.P. standard.

A sample of liquid extract, collected from a provincial wholesale house, was examined and came up to the B.P. requirements of alkaloids, yielding 2·018 per cent. of total alkaloids.

Reference here might be made to Naylor and Bryant's Paper, 'Y.B.Ph.' 1899, p. 347, where it will be noticed that they examined three trade samples, where neither of the samples came up to the B.P. standard.

It is of interest to note that there was a marked physical difference between the wines sold by the retail pharmacist and the wholesale. The former were all brilliant, and of a lighter colour compared with the latter, which were opaque and dull, and in one case decidedly muddy. Apparently, the wine as sold by the retail pharmacist was carefully filtered so as to be brilliant, whilst the wholesale manufacturer evidently has simply mixed the required proportion of the liquid extract with the wine without subsequent filtration. In the case of the samples from stock, which led to this investigation, they also were filtered. Whether the process of filtration has any depreciatory effect upon these galenicals or not I have not been able as yet to confirm, the above idea being purely a deduction from observation; or whether the depreciation is the result of age also remains to be solved. Possibly that may be the cause.

Judging from personal experience, the stocks of a wholesale firm are, as a rule, of a very recent date compared with those kept by a retail pharmacist. If the percentage of the total alkaloids varies with the age, then one would, as a rule, expect the samples collected from a retail business to be weaker in alkaloids than those sent out by wholesale firms.

A well-known London firm, whose sample proved deficient in alkaloids, was written to, and they had their stocks examined, and found that they had depreciated in alkaloidal value on keeping. It is only at the request of others who have experienced a similar decrease in the strength of these important preparations, that these notes are published, with the hope that they may put our fellow-craftsmen on their guard, and that perhaps others, who have more leisure and opportunity, may be led to examine their stocks and to make further investigations.

PRACTICAL NOTES AND FORMULÆ.

Teething Syrup.

Citric acid, 50 centigrammes; cocaine hydrochloride, 10 centigrammes; simple syrup, 10 Gm.; syrup of saffron, 10 Gm.; tincture of vanilla, 10 drops. A little to be rubbed on the gums for painful dentition.—*Bull. de Pharm. de Brux.*, **43**, 279, after *Odontologie.*

"Glacier" Ointment.

This ointment, sold as a remedy for the inflammation of the skin known to Alpine climbers as "snowburn," is composed, according to Lorenz, of equal parts zinc oxide, starch, lanoline and cold cream.—*Pharm. Central.*, **40**, 267, *Südd Apoth. Ztg.*

Fluid Extract of Convallaria Majalis.

Morguliss takes exception to the preparation of this extract from the root, as recommended in the U.S.P., since that portion of the plant contains but very little glucoside. He advocates the following method:—100 parts of freshly gathered flowers, at once dried between 30—35° C. and finely powdered, are moistened with 35 parts 95 per cent. alcohol and 5 parts water and allowed to stand for a time. The moistened mass is now allowed to macerate in a percolator with another 40 parts of the same menstruum for two days. Then 85 parts are allowed to percolate through and set aside, using more menstruum, if necessary. The drug is then exhausted by further percolation with 500 parts of alcohol, 95 per cent. This last alcoholic percolate is then mixed with 5 parts glycerin and the alcohol evaporated off. The residue is evaporated, at a temperature of not over 50° C., to 10 parts, mixed with the reserve, and made up to 100 parts with alcohol, 70 per cent. Wobbe, on the other hand, recommends in preference the following method: 100 parts of dried flowers are moistened with a mixture of glycerin, 10, water, 15, alcohol (90 per cent.), 25, and then exhausted in a percolator with a mixture of equal parts of alcohol and water. The first 80 parts are reserved, the remainder is evaporated to a thin extract; this is dissolved in water, 40 parts, filtered and evaporated to 20 parts; this, mixed with the 80 parts of reserve, gives 100 parts.—*Oesterr. Zeits. für Pharm.*, **53**, 369 after *Farmazeft.*

Sealing Wax Insoluble in Spirit.

For sealing bottles and flasks containing alcoholic fluids a sealing wax prepared according to the following recipe is recommended:—Carnauba wax, 1, hard paraffin, 1, are melted together; then, with constant stirring and heating, a mixture of red lead, 5, whiting, 2, is mixed in till a thick fluid is formed.—*Pharm. Central.*, **40**, 245.

For Colouring Gold Green.

The following solutions are employed:—(1) Potassium nitrate, 12; iron sulphate, 4; zinc sulphate, 2; alum, 2; water, 20. (2) Potassium nitrate, 3; ammonium chloride, 12; verdigris, 9; iron sulphate, 3; water, 30. Solution No. 1 gives a pure green tint; No. 2 gives more of a reddish opalescent colour. To deepen the red add to this 1 to 2 parts of copper sulphate in solution. To colour the object it may be immersed completely in the solution or painted with a brush and then warmed till it becomes dark, then while hot, it is immersed in acetic acid and rubbed till clean.—*Pharm. Centr.*, **40**, 364, after *Journ. der Goldschmeidek.*

Plaster Paper

T. Koller suggests that cigarette paper painted with the following solution be used as a substitute for court plaster:—Salicylic acid, 1; gum arabic, 45; water, 55; glycerin, 2-3.—*Pharm. Centralh.*, **40**, 576.

LABORATORY NOTES.

BY E. W. LUCAS.

Filtering under Pressure (Fig. 1).—Much time is saved in the course of analysis by keeping a vacuum filter always ready. The ordinary apparatus, however, cannot be used for very small quantities, as it entails too much loss of material. The apparatus figured is intended for filtering into small test tubes direct, thus avoiding transference of the filtrate.

(A) is an ordinary wide-mouthed bottle of the capacity of about 8 ounces. It is provided with a rubber stopper (B) perforated with two holes. Through one of these is inserted a tube (C), bent at right angles, which is connected to the filter pump. Through the second hole is passed the stem of a funnel (D).

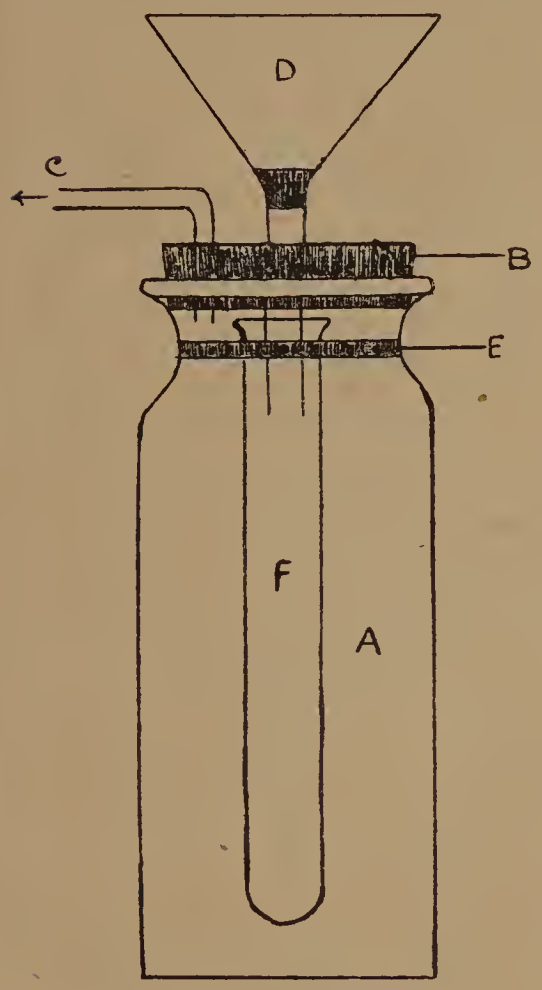

Fig. 1.—Filtering Apparatus.

A very shallow cork (E) is previously pushed well down the neck of the bottle. It is perforated with a hole large enough to take the test-tube (F), which should hang loosely by its lip.

The filter paper having been damped and pressed closely to the funnel, the liquid is poured in and the pump set going. At the close of the operation the rubber stopper is loosened, and the test-tube containing the filtrate removed by the finger.

Filtering Material.—When dealing with very small quantities the author prefers to use a conical plug of bath brick. It may be made to fit perfectly by winding with a few strands of silky asbestos. This will, of course, stand any pressure, and is very readily washed.

Pressure Gauge.—A simple pressure gauge is improvised by connecting the tube C with a T piece, the upright limb of which dips into mercury, the other end being connected to the filter pump. It is rarely necessary to use a vacuum of more than six inches, but if required the bottle may be blocked up so as to increase the length of the mercurial column.

Heating Ether Flasks in Fat Determinations (Fig. 2).—An ordinary 2-lb. paint can, with push-down lid, is chosen, and a hole cut in the centre of the lid about 2 in diameter. Round this is soldered a flange 1 in. deep (A). Two pieces of metal piping are also soldered to the side of the can, half an inch from bottom and top respectively.

The flask should fit comfortably within the can, as shown by the dotted line. The cork, which must fit tightly into the flange, is perforated so as to take the neck of the flask—the exact diameter being found with callipers—and sliced in half (B).

To fit up, the neck of the flask is placed inside the flange, the two halves of the cork adjusted as indicated in the sketch (C), and pushed home. On pressing down the lid the joint is made practically steam tight.

When making a determination, the flask is partially filled with ether or other volatile solvent, and connected to the reflux condenser, the *lower* pipe of the can being connected by composition

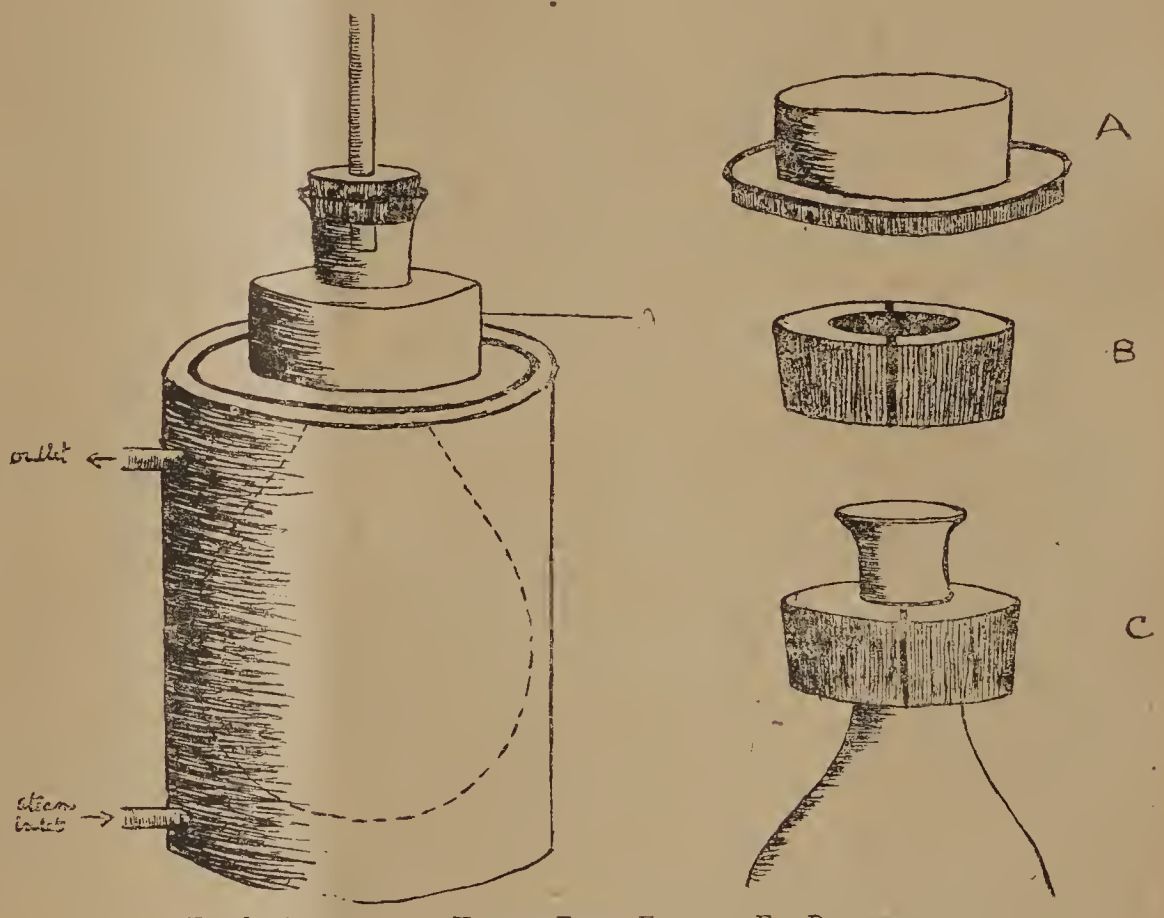

Fig. 2.—Apparatus for Heating Ether Flasks in Fat Determinations.

piping to a small boiler placed at some distance to avoid danger of fire in case of leakage. If the can is filled with hot water, the steam, having to blow through before escaping by the upper pipe, is generated under slight pressure, and keeps the water boiling, so that distillation proceeds rapidly.

The apparatus is easily disconnected by levering up the lid and removing the two halves of the cork when the flask is set free. Its chief advantage lies in its simplicity, small cost, and the almost complete freedom it provides from risk by fire.

A can provided with only one side hole, for the escape of steam, makes an exceedingly useful water bath, as the neck is held rigidly in an upright position, so that boiling may proceed vigorously without danger of fracture from bumping.

Paraform for Warts.—Meuse recommends paraform in the treatment of warts, and also papular syphilides. It is said to be specially useful in palmar psoriasis. Its action extends deeply into the skin. It is applied in the form of a collodion composed of paraform, 8; collodion, 27, to be painted on the surface thrice daily.—*Dermatol. Centralblatt*, through *B. M. J. Epit.*, **2** [99], 80.

CHEMICAL SOCIETY.

A meeting was held on Thursday, December 21, the President Dr. THORPE, LL.D., F.R.S., in the chair. The SECRETARY read a copy of a letter of congratulation that was recently sent to Dr. Emil Fischer on the completion of the twenty-fifth year of his doctorate. The reply was also read, wherein Dr. Fischer thanked the Society for the compliment, and paid a graceful tribute to the Chemical Society as the oldest in the world, and a model to all the rest.

The CHAIRMAN then asked Dr. Perkin, LL.D., F.R.S., to read a communication concerning

The Refractive and Magnetic Rotatory Power of Some Aromatic Hydrocarbons.

This paper occupied the greater part of the evening, and dealt with the following aromatic compounds, among others :—Benzene, toluene, xylene, ethyl benzene, and propyl benzene. Most of these hydrocarbons were obtained in the purest possible condition from their pure sulphonic acid salts. Where this was not done the method of fractional distillation was resorted to. The number of workers in this field of research appears to be limited, but previous work, especially that of Gladstone and the author, has shown that there is as a rule a correspondence between the magnetic rotation and the refractive power of substances. The author has found in the case of mixtures that abnormal values are often obtained for which he cannot at present give an explanation. An improved instrument for ascertaining these values has been devised by Dr. Perkin, and by means of lantern slides and the apparatus he explained the various working parts.

The CHAIRMAN said that the paper recalled an investigation, carried out some years ago by the late Mr. Roger and himself, into the determination of the viscosity of mixtures of substances whose viscosity was known. If, as seems likely, there be a common underlying cause which affects the various physical constants of bodies, then the consideration of the results obtained in the determination of one set of constants should bear comparison with other constants of the same body. The viscosity numbers obtained were often higher or lower than theory required. As Dr. Perkin's work has been attended with similar results, it would be of interest if he would investigate the same mixtures of substances as were used in the viscosity experiments and ascertain whether abnormal results were also obtainable in determining their refractive and magnetic rotatory power, and Dr. Thorpe pointed out the necessity for studying all the same physical constants from the same point of view. Thus, Dr. Perkin took equal volumes of liquids in making the mixtures for his experiments. It would probably be better to take equimolecular proportions.

Dr. GLADSTONE spoke at some length, In the course of his remarks he made the statement that benzene resembles water in being an utterly abnormal liquid. This apparently paradoxical remark is explained by the fact that in these liquids the molecular aggregation at one temperature is different from that at other temperatures.

After the author had replied, the CHAIRMAN called for a paper, by H. Jackson, B.A., on the

Condensation of Glycollic Aldehyde, and the Formation of α- and β-Acrose.

This investigation, which was carried out in the Cambridge laboratories where Mr. Jackson is a Demonstrator, was an outcome of the work done by Mr. Fenton on the carbohydrates. The paper drew forth remarks from Mr. Fenton and Dr. Groves.

ANALYTICAL NOTES.

QUANTITATIVE DETERMINATION OF SANTONIN.—For the determination of santonin in santonica, J. Katz recommends the following method :—10 Gm. of the finely powdered flower heads are extracted in a Soxhlet for two hours with ether 0·720, and the ether distilled off. The residue amounts to about 2 Gm. of a dark green, resinous extract. This is heated under a reflux condenser for from 15 to 30 minutes, with a solution of 5 Gm. crystallised barium hydrate in 100 C.c. of water. It is allowed to cool and saturated, without previous filtration, with carbonic acid gas, till the liquid reddens litmus paper. Without delay, the precipitated barium carbonate is filtered off, and twice washed with about 20 C.c. of water. A faint yellow liquid is obtained, which is evaporated to 20 C.c. on the water bath, then 10 C.c. of hydrochloric acid (containing 12·5 per cent. HCl) is added, and the mixture allowed to stand for two minutes, not longer, on the water bath, and after cooling is run into a separator, the residue in the basin is dissolved in 20 C.c. of chloroform, and transferred to the separator, the whole mixture being thoroughly shaken up. After separation, the chloroform layer is run through a filter previously moistened with the same solvent; the shaking out is twice repeated, each time employing 20 C.c. of chloroform. The mixed chloroformic solution is distilled and the residue heated for ten minutes under a reflux condenser with 50 C.c. of 15 per cent. alcohol. The hot solution is now filtered into a tared flask, filter and flask being twice washed with 10 C.c. of 15 per cent. alcohol. The mouth of the flask is now covered with a watch glass and allowed to stand for 24 hours in the cold. The flask with contents is weighed, and the contents filtered through a tared filter of 9 Cm. diameter, any turbidity of the filtrate, due to minute particles of resin, being disregarded ; the flask and filter are washed with 10 C.c. of alcohol, 15 per cent., the filter is then dried in the flask and the two weighed together when dry, to determine the weight of the santonin ; a correction of 0·006 Gm. of santonin is added for each 10 Gm. of filtrate obtained. For the titration of the santonin, the solution in 15 per cent. alcohol is evaporated; the residue dissolved in absolute alcohol, and, after the addition of 3 drops of phenol-phthalein 1/10N KOH solution is added till a pink colour, permanent for ten minutes is attained ; 20 C.c. of 1/10N KOH is added and the solution boiled, 50 C.c. cold water is now added, whereby the red colour is intensified; the solution then titrated back with 1/10N HCl; the number of C.c. of 1/10 KHO used up from the original 20 C.c. employed, multiplied by 0 0246, gives the weight of santonin. A blank experiment with the same flask with identical reagents should be made, without any santonin, to determine the amount of alkalinity derived from the glass of the flask under these conditions, and the necessary correction made on the above results. In the determination of the tincture of santonica, the extraction with ether is unnecessary. From 50 to 100 C.c. of the tincture is evaporated and treated direct with the the baryta as previously described. In toxicological experiments the acidified mass is extracted with chloroform and then treated with baryta and the process followed as above.—*Archiv der Pharm.*, **237**, 245.

REACTION FOR SALOPHENE.—Goldmann states that on heating salophene with a 2 per cent. solution of NaOH a blue colour is produced, due to the action of atmospheric oxygen. A layer of fluid vaseline on the solution prevents the reaction.—*Berichte der Deuts. Pharm. Ges.*, 1899, 112.

DETERMINATION OF ALDEHYDE IN ETHER.—Hermann Blaser recommends for the detection of small traces of aldehyde, the use of a solution of fuchsine 1 : 100,000, which has been bleached by exposure to sunlight, in preference to the solution bleached by sulphurous acid.—*Pharm. Centralh.*, **40**, 607.

A SCIENCE CRIPPLED BY WORDS.*

BY WALTER BRYAN, A.M., M.D.

Instructor at the Brooklyn College of Pharmacy.

No one will question the great advances in all the natural sciences which have been made within the last two decades—advances caused by a demand on the part of the public for greater conveniences of life and for more exact knowledge of things, and resulting in a great wave of investigation and analysis. The consequences of the stimulus given to scientific investigation by the interest of the whole people in each new line of discovery, and the practical applications and possibilities of such discoveries in each department of natural science have been to cause each ambitious investigator to work under high pressure to outshine his predecessor, and to specialise his work down to the most minute detail, and to make it of as much practical benefit as possible. Our knowledge of botanical science has advanced hand in hand with the sciences, and an immense mass of details, all important, since each exemplifies some general law (a great man once said, "There are no little things"), has been accumulated. Each detail, receiving its special defining name, has been properly classified and distributed for reference.

In their great zeal for scientific accuracy original workers in botany have so frequently gone outside of the English language for special words signifying newly-discovered or re-observed technical details, that a work on botany of the present day bristles with adopted foreign words, principally Greek and Latin in derivation, to such an extent that a student to read such a work must be familiar with at least three languages.

Botanical technical words fall naturally into two groups—those which identify plants, and those which describe them. Thus we find on page 257 of the U.S. Pharmacopœia, 1890, the official description of spearmint as derived from *Mentha viridis*, natural order *Labiatae*; these are placed in the first group and called words of identification. Following them is a description in part as follows: "Leaves about 5 Cm. long, subsessile, lance-ovate, acute, serrate, etc." The words subsessile, lance-ovate, etc., I should call words of description, or descriptive words. Now, whereas the descriptive words in many sciences—notably that of chemistry—have been accumulated in accordance with a definite plan of word-building which enables them to be easily memorised, there is no such system in botanical descriptive wording. Furthermore, these descriptive words used in botany far out-number proportionately those of any other science, and year by year they still accumulate, and the older words are used with new and confusing meanings. Some words, like "sperm," vary in meaning according to the idea of the particular authority in botany who defines in the preface to his book the particular meaning of the word as used by him.

Little confusion results from this lack of method in the use of old words and the choice of new ones among professional botanists, though many find it difficult to keep in mind their entire botanical vocabulary for immediate use. But the effect upon the student plunged from the clean, clear, descriptive words of chemistry into the maze of botanical description is at first to amaze, then to stupefy, and finally to demoralise the forces of mind; memory, staggering under unreasonable burden, balks and refuses further tasks.

I believe that the limit of capacity to remember isolated words is reached long before the limit of remembering facts or cohering sequences of facts. It is conceded that memory for isolated words is more highly developed in youth, and grows gradually weaker as we reach maturity, although the faculty of remembering facts or logical sequences of facts progressively becomes stronger till old age begins.

The average vocabulary of the well-educated man is estimated at from 3,000 to 5,000 words; the average student can hardly claim more than three-quarters of this figure. Gray, in his 'Manual of Botany,' gives a glossary of more than seven hundred botanical descriptive words which require special technical definition.

In one text-book of botany I counted on 24 pages of text (out of a total of 123 pages devoted to morphology) 155 botanical descriptive terms, few of them related to each other, most of them requiring a special effort of the memory to recall them, unassisted by any association of the word beyond a translation from Latin or Greek.

In Gray's 'Structural Botany' there is a glossary at the end of the book containing over two thousand words, with a definition for each.

These words are the terror of students of botany—not merely in colleges of pharmacy, but everywhere. It takes from five to ten years to learn these botanical terms completely. My experience of several years as a teacher of botany to boys, young men, and adults, has given me positive evidence of the extreme difficulty experienced by students in learning to define and remember these foreign words. If this maze of foreign terms were indispensable we would suffer in silence, or attempt a remedy through a congress of English-speaking peoples, who might lay down a systematic method of forming such words.

In these days of trusts, of liquid air, and a hundred other time and labour-saving devices, it seems wrong in precept to devote a great deal of time and labour to studying out the meanings of so many difficult words unless we can get practical results from such study. If we can find other simple English words to express the exact meanings of the difficult foreign ones, and thus save time and labour to all who study plants, is it not our duty to take that step?

The subject of botany—the study of plants—is curious, interesting, fascinating; plant life-processes have a certain definite similarity to our own; their reproductive actions especially imply their possession of intelligence, but the study of the meanings of thousands of words borrowed from Greek and Latin terrifies and repels the searcher for knowledge. The most widely-used text-books of botany of the present day contain many hundreds—some contain thousands—of these words, environing the subject like frowning fortresses, each of which requires to be taken by assault; and the average student wearies of the unending task before he has carried one-tenth of them. This overburdening of a science and crippling of its usefulness I believe to be an evil. I think that all educated men—pharmacists and students of pharmacy in particular—are interested in it, and I believe that there is a remedy for it

It is possible to make the study of botany easy by substituting for the difficult Greek and Latin descriptive words their English equivalents, and thus simplify by doing the exact opposite of the work done by scientific word-experts when they translated our familiar English words into strange and unfamiliar Latin and Greek. We will be obliged to do this unless we are satisfied to exclude from botany all who have not studied the classics.

As if the descriptive words in botany were not in themselves sufficiently difficult, the authorities have caused most of them to be pronounced with the emphasis placed upon some unimportant syllable. Thus: "Pentamerous" arises from the Greek root "pent," meaning five; and "mer," measure; together signifying five-parted. Manifestly, to express the meaning of the word clearly, it should be pronounced penta-merous; but it is pronounced pen-tam-erous, as though "tam" or "am" were the important syllable. This false system of pronouncing words, not only in botany, but in many other sciences, is certainly misleading.

The remedy proposed is to cut out most of the foreign technical words in botany, using English words in their place, and to pronounce all remaining foreign words in botany with all the emphasis placed so as to separate the component word-roots, as in epi-gynous, penta-merous, etc., etc. By means of such a method botany could be taught and learned without loss of accuracy of description, and with an immense gain in comprehension on the part of the student.

B

* Read before the Kings County Pharmaceutical Society, and reprinted from the *Pharmaceutical Era*.

The prime object of a word is to communicate an idea. To be of value to a practical man words must approximate to certain tests:

1. They must be simple.
2. They must be easily remembered.
3. They must express one fact.
4. They must be, so far as possible, in the homc language.

Most of our botanical terms are complicated, they are hard to remember, and they are as far as possible in a foreign language, and they have been multiplied without regard to the capacity of the human memory. I deny that these foreign descriptive words are in themselves of any use to the student of botany. I affirm that they do great harm by annoying, worrying, and discouraging all those who love plants and desire to study them, and those students whose life-work will be to dispense the curative substances derived from them.

The plea has been advanced in defence of this profuse application of the dead languages in botanical description that they, remaining stable, furnish an unchangeable universal technical language, and thus facilitate international intercourse.

It is time that Latin and Greek furnish a changeless technical language for plant *identification*, but the terms of *description* are not universal; many of them are embodied by the Germans, among others, in their home language, in the form of compound words, without any loss of scientific accuracy.

Let me read some technical words taken from the U.S. Phara copœia, with their English equivalents:—

Acute—sharp.
Acuminate—sharper (or sharpest).
Annulate—ringed.
Attenuate—thinned.
Awn—bristle.
Bilabiate—two-lipped.
Calyx—cup.
Clavately—clawed.
Conchoidal—shell-like.
Contorted—twisted.
Cordate—heart-shaped.
Coriaceous—leathery.
Crenate—scalloped.
Crenulate—finely-scalloped.
Digitate—finger-cleft.
Emarginate—notched.
Filiform—thread-like.
Floret—flowerlet.
Foliaceous—leaf-like.
Fusiform—spindle-shaped.
Glabrous—smooth.
Glaucous—downy.
Indehiscent—non-splitting.
Inflorescence—flower-cluster.
Involucre—spiral.
Laminate—layered.
Ligneous—woody.
Lyrate—lyre-like.
Mucronate—hard-tipped.
Peduncled—stalked.
Pedicel—stalklet.
Pentangular—five-angled.
Pericarp—fruit-rind.
Mesocarp—fruit-rind.
Pinnately—feather-like.
Pinnatifid—feather-cleft.
Pubescent—hairy.
Quadrangular—four-angled.
Rhachis—mid-stalk.
Reniform—kidney-shaped.
Reticular—netted.
Rhizome—substem.
Rugose—wrinkled.
Serrate—saw-toothed.
Sessile—sitting.
Sphero-tetrahedral—four surfaced spheroid.
Trifoliate—three-leaved.
Truncate—flat.
Undulate—wavy.
Etc., etc.

To these could be added a list of a thousand dispensable words from any standard text-book or from the Dispensatory.

There are, of course, many technical terms which are so useful that it is wise to retain them in their present form. Prefixes like that in sub-class and post-fixes (suffixes), like oid in ovoid, are too useful and convenient to discard. Careful discrimination by associated minds would seem to be required in carrying out the scheme of substitution outlined above, and which I am convinced would effectively and permanently augment the general knowledge of botany and the public interest in it.

If the Pharmacopœia can be called the druggist's Bible, we may similarly term the Dispensatory his Dictionary. In the Dispensatory are accurate botanical descriptions of the characters of plants, parts of which may be used as drugs. These descriptions, which are so complete as to include the means of botanically identifying a plant by its flower, fruit, seed, etc., are made up principally of these foreign descriptive terms, a glossary or unabridged dictionary being indispensable, since half of these terms have no meaning to the average pharmacist.

It seems not desirable to insist that a student be familiar with all of these terms unless we give him four full years in college on the subject of botany alone.

Nevertheless each department in a college is expected to teach its students to read standard works intelligently; and I think that this requirement is fulfilled so far as a college teaching, a course consisting of several branches, can fulfil it by teaching our students the principal botanical descriptive words, and indicating the means of finding the technical definitions of those less frequently used. That a student must learn every botanical technical word in the Pharmacopœia is a point beyond argument. That a student shall learn within the time of his college course every technical botanical term is, at the present average of human understanding, an impossibility.

There is no question of the difficulty of learning botany. Every student of the subject has experienced it. I have heard it spoken of a thousand times, and in every instance the student has told me that the facts were easily grasped, but that the immense mass of strange words placed a ban upon the memory which is unheard of in any other science.

Within the last two years there has been adopted in a metropolitan college (with a class of 600 students) a new text-book of botany, which has omitted some of the hardest technical words, with a distinct gain of grasp of the subject on the part of the students, and with a gratifying absence of that fear and hatred of the subject which has been in the past a matter of open comment.

I am not a caterer to popularity, but I do believe that when a science dealing with Nature's laws and methods arouses persistent and dogged dislike and hatred in the minds of successive generations of students, there is something radically wrong, and this wrong is not with the plants that the Almighty made, but perhaps with the labels man has placed upon them, in such myriads as to hide the plants themselves.

That there exists at the present time the beginning of a reaction against word-slavery is manifest in scientific text-books on biology published within the last two or three years. There appears to be a tendency to cut out all biological terms invented at random and to start afresh on a systematic basis, so that the biological, technical words might so far as possible branch from a few original word-roots. Another tendency appears to be to cut down the amount of time devoted in the preparatory schools and colleges to the classics, and to increase correspondingly the work in the sciences. Can we, in view of this, require from our students a classical vocabulary in the guise of botanical nomenclature?

Gentlemen, let us be in line with the times. Let us have the courage to cast off the dead wood of foreign burdensome words. Let us turn the searchlight of common-sense upon every botanical term that hides a truth behind a foreign compound word.

What the future will bring forth no man knows. What discoveries may be made when once the great public mind grasps universally the truths of the plant world, now hidden behind these black-word shadows, is beyond our ken. Let us do our part to make as clear as can be made the facts about the plants that give us food, that make oxygen for us, and that cure us of our sicknesses. Let us remove from our text-books, our Dispensatories, and our Pharmacopœia foreign words, and let us tell the plain truths we know in plain English.

If it were possible to reach the committee in charge of formulating the next Pharmacopœia, and convince it of the desirability of substituting English words for foreign ones wherever possible, the step would, I believe, attract a tidal wave of reaction against the unnecessary use of foreign words, not only in botany but in other sciences as well.

I beg to present this summary:—

(1) That the modern discovery of an immense mass of botanical details has caused the accumulation in our language of an inordinate number of botanical descriptive words.

(2) That these descriptive words are taken practically at random from the Greek and Latin languages.

(3) That the inordinate number of these words and their strangeness in our language severely overtax the average memory, obscure the subject, and constitute a serious obstacle to the successful study of botany.

(4) That most of these words can be discarded and English words

substituted without loss of accuracy in description, and with a gain of the time spent in describing and memorising these words.

(5) That botany, thus divested of its chief difficulty, can be more readily assimilated and practically applied by the student and pharmacist.

(6) That the first step towards a remedy for this excessive use of foreign words lies in the substitution of English descriptive words for the foreign botanical terms in the U.S. Pharmacopœia.

MEDICINE AND PHARMACY IN CENTRAL CHINA.

One of the most interesting and instructive books of travel that has appeared for some time past is 'The Yangtze Valley and Beyond,' by Mrs. J. F. Bishop (Isabella L. Bird), F.R.G.S., dedicated by permission to the Marquess of Salisbury, and published by Mr. Jno. Murray, of Albemarle Street. The authoress, who is the widow of John Bishop, M.D., is intimately acquainted with many forms of philanthropic work at home and abroad, and especially with medical missions. So far back as 1892 she was elected the first lady Fellow of the Royal Geographical Society, and she is the only lady who has had the honour of reading a paper before that Society. Her account of the Hangchow Medical Mission hospitals and the dispensaries attached to them will be of interest to our readers. Those beneficent institutions have been the means of producing much goodwill towards foreigners, and over 14,000 new patients, afflicted with all manner of torments, are annually treated there. The services of Dr. Main and his coadjutor, Dr. Kimber, are in request among officials, from the highest to the lowest. Mandarins of high rank, attended by their servants, are treated in the paying wards, and occasionally leave donations of 100 dollars, in addition to their payments. Officials of every rank in the Chekiang province send to the British doctors for advice and medicines.

The men's and women's hospitals are of the latest and most approved European type. They are abreast of our own hospitals in lighting, ventilation, general arrangement and organisation, and the facility of obtaining the celebrated Ningpo varnish, really a lacquer, which slowly sets, with a very hard surface, reflecting much light and bearing a weekly rub with kerosine oil, greatly aids the sanitation. The purity of walls, floors, and bedding is so great as to make one long for a speck of comfortable dirt! The men's hospital buildings consist of four roomy and handsome general wards, eleven private paying wards, accommodating from one to three patients each; a range of rooms for the ward assistants, who are practically male nurses; students' rooms, rooms for three qualified assistants, a lecture-room, with an anatomical (in lieu of the unattainable human) subject, which cost a thousand dollars; a reception-room for mandarins, the principal's private room and medical library, a fine consulting-room and operating theatre, bathrooms, a room for patients' clothing, done up in numbered bundles, after it has been washed; wardrobes for the clothing lent them while in hospital, a cashier's office, a large bottle-room, extensive storage, and an office for out-patients. Adjoining is a fine lofty room, where any non-patient passers-by, who are either tired or curious, can rest or smoke, amusing themselves with the transactions of the other half of the hall, which is a large and attractive "drug store," fitted up in conventional English style, where not only medicines but medical requisites of all kinds can be procured by non-patients and foreigners. It has been remarked in the official consular reports that missionaries unconsciously help British trade by introducing articles for their own use which commend themselves to the Chinese; and this drug store has created a demand for such British manufactures as condensed milk, meat extracts, rubber tubing, soap, and the like; condensed milk having "caught on" so firmly that several of the Chinese shops are now keeping it for sale.

The women's hospital has head and junior nurses and a dispenser, and is equally efficient and admirable. There are risks and difficulties, however, in the treatment of out-patients, as Chinese medicines are administered bulkily, a pint or a quart at a time, and patients do not understand our concentrated and powerful doses. Hence, dangerous and grotesque mistakes are continually made, such as the following:—

Patient: "Doctor, when I took the medicine you gave me yesterday it made me very sick; it has given me diarrhœa and a severe pain in the stomach; my fingers and toes also feel very numb."

Dr. Malcolm (looking at the bottle): "Why, you have already almost finished the eight-days' medicine (arsenic) that I gave you yesterday. The wonder is that you are alive at all."

Patient No. 2 enters: "Where is the old boss of this shop? I want some foreign devil medicine to cure malaria."

Doctor: "Allow me to tell you I am not a devil. You had better go home, and when you can come and ask respectfully for medicine we will give it you."

Patient No. 3 enters, holding out her hands, and asking the doctor to find out her disease by "comparing her pulses." D.: "Tell me what is the matter with you?"—P.: "My bones and muscles are sore all over." D.: "What was the cause of your trouble?"—P.: "It was brought on by a fit of anger." D.: "How long have you had it?"—P.: "From the time the heavens were opened and the earth was split" (*i.e.*, a very long time).

The arms and shoulders of this woman were covered with pieces of green plaster, given her by the Chinese doctors. She proposed to throw these away, and "to publish the doctor's name abroad" if he cured her. So she received medicine, with very full directions about taking it; these were not enough. She asked a string of questions, such as if she must heat it before taking it, if she must keep the bottle tightly corked, if she must take it along with anything else, and, lastly—P.: "Shall I abstain from eating anything?" D.: "No." P. (greatly disappointed): "What! Shall I not forbid my mouth anything at all?" D. (jokingly): "Yes. Do not talk too much, do not revile your neighbours, do not smoke opium, do not scatter lies." The doctor, getting worried, reiterates the directions, tells her not to ask any more questions, and shows her out; but she returns in a few minutes, and asks if the medicine is to be swallowed or rubbed on the outside!

When describing Chinese Hangchow mention is made of the signboards of the various trades. The shape and the different colours of the letters and face of the signs indicate different trades. The designing is a very important matter, as it may affect the luck of the shop. The name of the shopkeeper comes first, but in the case of a firm a word of good omen is substituted for the names, with a character signifying union. In both cases the characters are followed by words of good omen, suggesting wealth, prosperity, and increase. An old signboard is a valuable piece of property, and if the business is sold fetches a high price, like the goodwill of a long-established business at home. An old established druggist's sign has sold for as much as 3,000 taels (about £450).

The writer of the book contrasts the business methods of our rivals with those of our own, and not to our advantage. She remarks that if Englishmen were to give to the learning of the Chinese language and of Chinese requirements and methods of business a little of the time which is lavished on sport and other amusements, there might possibly be less occasion for the complaint that large fortunes are no longer to be made in Chinese trade.

From ignorance of the language, and reliance on that limited and abominable vocabulary known as "pidgun," the British merchant must be more absolutely dependent on his Chinese compradore than he would care to be at home on his confidential clerk. Even in the British banks it seems impossible to cash a cheque without calling in the aid of a sleek, supercilious-looking, richly-dressed Chinese, who looks as if he knew the business of the bank and was capable of running it. It is different at the Yokohama Specie Bank, in which the alert Japanese clerks manage their own affairs and speak Chinese.

BRITISH PHARMACEUTICAL CONFERENCE.

Research List.

The following subjects are suggested for investigation. The Executive Committee hopes that members will undertake to work at some of those questions, or others that may occur to them. New subjects have been added to the list to replace those worked out. The Committee will be glad to receive questions that may have presented themselves as desirable for investigation.

Plant Analysis.

(1) CASCARA SAGRADA.—What is the nature of the various resins contained in this bark? (See 'Year-Book of Pharmacy,' 1893, p. 131, from 'Comptes Rendus,' cvx., pp. 286-288.)

(2) CIMICIFUGA RACEMOSA (*Actæa racemosa*).—Further information is needed on the chemical nature of the constituent or constituents to which the rhizome of this plant owes its activity. (See 'Year-Book of Pharmacy,' 1885, p. 149.)

(3) EUPHORBIA PILULIFERA.—Required, a report on the chemistry of this drug.

(4) ASTRINGENT DRUGS AND PREPARATIONS. — The various methods employed for the estimation of tannin in these give very discrepant results. Required, a thorough research into the comparative merits of these processes.

(5) MEZEREON BARK.—What is the chemical nature of the *acrid principle* of this bark?

(6) ARNICA.—What is the active principle, and what are the relative proportions of it in the root and flower?

(7) CHAMOMILE.—Research on the *bitter principle* contained in the flowers of *Anthemis nobilis*. (See 'Bulletin de la Société Chemique de Paris' [2], xli., p. 483.)

(8) CASTOR OIL.—A research, having for its object the isolation of the purgative principle, either from the oil or the seed.

(9) TARAXACUM.—Little that is definite appears to be known regarding the active principles of taraxacum root. A research is required to clear up the point. To what constituents are the cholagogue and diuretic properties due?

(10) FUCUS VESICULOSUS.—The medicinal virtues have been attributed solely to the presence of iodine and bromine. It is not improbable that it may also contain some organic constituent of importance. A complete chemical investigation is required.

(11) LOBELIA INFLATA.—Further investigation of the active principles of this drug is required.

(12) DAMIANA is reported to contain a bitter substance, resins and volatile oil. The liquid extract of the leaves being now extensively used, a thorough systematic examination of this drug is desirable.

(13) PROXIMATE ANALYSES of the following drugs are needed:—*Cereus grandiflorus*, *Citrullus colocynthis*, and *Cassia fistula*.

(14) PAPAVER RHŒAS.—An examination of the red colouring matter of the petals is required.

(15) SENNA FRUITS.—A comparison of the constituents of the leaves and the fruits would be of interest.

(16) ASH.—What are the percentages of ash that should be found in the following drugs in powder:—Anise, fennel, cinnamon, cassia, coriander, cubebs (fruit and fruitstalks respectively), gentian, liquorice, guaiacum resin, jalap, myrrh, nux vomica, black pepper, mustard (black and white respectively), squill, senna (*Cassia angustifolia*, *C. acutifolia*, and *C. obovata* respectively), rhubarb root (*R. rhaponticum*, *R. palmatum*, and *R. officinale* respectively?

(17) SALIX NIGRA.—In what respect do the constituents of this species vary from those of other willows?

Chemistry.

(18) GLYCERIN.—Required, a good method of estimating this substance, applicable, if possible, to pharmaceutical preparations.

(19) QUININE.—Results obtained in the titration of this alkaloid suggest the possibility that it is di-basic, and not mono-basic. (See 'Year-Book of Pharmacy,' 1894, p. 351; 1898, p. 424.) Further work is needed to clear up the point.

Materia Medica and Pharmacy.

(20) STANDARDISATION.—It is suggested that the Pharmacopœia preparations of aconite, stramonium, strophanthus, Calabar bean and colchicum should be standardised. Processes of assay are required.

(21) ALEXANDRIAN AND EAST INDIAN SENNAS.—The two sennas of the British Pharmacopœia are permitted to be used indifferently. Do preparations of the leaves of the two varieties of senna differ? If so, to what extent?

(22) EXTRACTION OF DRUGS BY PRESSURE.—This mode of extraction (see Dr. Symes's suggestions in the 'Year-Book of Pharmacy,' 1888, p. 356) is likely to produce good results with a number of drugs. Required, a series of experiments in this direction, showing the effect of the process on the quality and yield of extracts as compared with the corresponding products obtained by the ordinary modes of xtraction.

(23) STANDARDISED PREPARATIONS.—Report on commercial specimens of official standardised preparations.

(24) EFFECT OF CULTIVATION, SOIL, CLIMATE, AND TIME OF COLLECTION ON MEDICINAL PLANTS.—Compare the proportions of active constituents of indigenous plants grown in different districts, and the effect upon these constituents by time of collection.

(25) CAPSULES.—The quality and quantity of medicines in capsules. (See 'Year-Book of Pharmacy,' 1875, p. 285.)

(27) MISPRONUNCIATION OF LATIN PHARMACOPŒIA NAMES IS COMMON.—It is suggested that a short prosody be compiled for purposes of reference.

(28) STANDARDISED TINCTURES.—Is it possible to standardise any of the pharmacopœial tinctures which owe their activity to the presence of one or more resins?

(29) COMPRESSED DRUGS AND COATED PILLS.—Required, a report on the strength and quality of the compressed drugs and coated pills of commerce.

(30) KINOS.—A comparison of the characters of the official and other commercial kinos, including the Cochin, Malabar, and Eucalyptus varieties, is much needed.

(31) ERGOT.—The determination of the proportion of alkaloid extracted from ergot by the official processes for the various preparations.

(32) SYRUP OF GLUCOSE.—A series of experiments is required to show whether the official syrup of glucose is a satisfactory pill excipient as regards its composition and official application.

(33) TEREBENE.—To what extent do commercial samples of terebene correspond with the characters and tests of the 1898 Pharmacopœia?

(34) CANNABIS INDICA.—A preparation which can be relied upon containing the active principle of the drug is still a desideratum.

(35) LIQUID EXTRACT OF COCA.—What percentages of cocaine and ecgonine are present in the official liquid extract?

(36) PODOPHYLLUM RESIN.—Much of the podophyllin in the market is of foreign manufacture, and does not answer the requirements of the official resin. An examination of commercial specimens would be of value.

(37) FOXGLOVE LEAVES.—These are directed to be gathered from plants of the second year's growth. The radical leaves of the first year's growth have been stated to be efficacious. A comparison of the constituents of each variety would be of interest.

(38) PLASTERS.—What advantages have plasters (such as belladonna, etc.), prepared with a basis containing rubber, over those made with a resinous or lead plaster basis only, and would the formulæ of the official plasters be improved by the addition of rubber as one of the ingredients,

THE STUDENTS' COLUMNS.

EXPLANATORY NOTES ON THE B.P. 1898.*

Sodii Nitris.—The conversion of nitrate of sodium into nitrite by loss of oxygen can be effected by heat alone, but the change is facilitated by the employment of reducing agents. Lead constitutes a useful reducing agent because it forms an oxide which easily separates from the fused layer of nitrite. Lead as an impurity may be detected by the formation of a precipitate of lead sulphate when dilute sulphuric acid is added to a solution of the suspected salt. The determination of actual $NaNO_2$ in the commercial salt is effected by the measurement of the nitric oxide in the manner described under Spiritus Ætheris Nitrosi. 68·58 Gm. (one mol. wt.) of sodium nitrite will yield 22·32 litres of nitric oxide measured 0° C. and 760 Mm. pressure.

$$\therefore \text{ 1 Gm. pure } NaNO_2 \text{ will evolve } \frac{22{\cdot}32 \times 1{,}000}{68{\cdot}58} \text{ C.c. of nitric oxide}$$

$$= \frac{22{\cdot}32 \times 1{,}000 \times (273 + 15{\cdot}5)}{68{\cdot}58 \times 273} \text{ C.c. at } 15{\cdot}5^\circ \text{ C.}$$

$$= 343{\cdot}9 \text{ C.c.}$$

Standardised Tinctures.—These include—

Tincture of Belladonna and *Tincture of Nux Vomica*, obtained by dilution with alcohol of the previously prepared and standardised liquid extracts.

Tincture of Opium.—The opium is effectually disintegrated by trituration and maceration with hot water, a volume of 90 per cent. alcohol equal to that of the water being subsequently added. This is found to be the most effectual way of exhausting the opium, and does not involve the necessity of previously drying and powdering the drug. A portion of the resulting liquor is evaporated to remove the alcohol, and the residue assayed in a similar manner to that directed under opium, an explanation of which will be found in the Students' Columns.

Compound Tincture of Camphor and *Ammoniated Tincture of Opium* are prepared from the foregoing sample of tincture, so as to avoid the necessity of individually assaying them. The strength of all three remains practically the same as in the 1885 Pharmacopœia.

Tincture of Jalap.—This will be slightly stronger than average specimens of the unstandardised 1885 tincture.

Tinctures of Cinchona (simple and compound).—An explanation of the assay process will be found in the Students' Columns under Extractum Cinchonæ Liquidum.

Unguenta.—These formulæ have been subjected to a very thorough revision, and the proportion of active medicament to fatty vehicle very much simplified. At the same time the fatty vehicles have been altered in many cases on the lines suggested in the article dealing with the 1885 B.P. ointments in the Students' Page, *P. J.*, April 9, 1898. By classifying the ointments according to the fatty vehicle it will be found, broadly speaking, that those medicaments which are intended to have a local or surface action are compounded with paraffins, while those which are intended to be absorbed are combined with lard or other animal or vegetable fat. The formulæ omitted comprise :—

Unguentum calaminæ
Unguentum elemi
Unguentum potassæ sulphuratæ
Unguentum sabinæ
Unguentum simplex
Unguentum terebinthinæ

The new formulæ are :—

Unguentum aquæ rosæ
Unguentum capsici
Unguentum cocainæ
Unguentum hydrargyri oleati
Unguentum hydrargyri oxidi flavi
Unguentum paraffini

The ointments containing alkaloids are now made on the uniform plan of solution in oleic acid and combination of this alkaloidal oleate with lard. This is done in order to effect the uniform distribution of the alkaloids. Nitrate of mercury ointment has been subjected to some alterations in the details of the process which have not given universal satisfaction. With regard to the action of nitric acid and mercuric nitrate on oil, refer to the articles dealing with oleic acid and the fixed oils already given in the Students' Columns. The chief alterations in strength will be found in

Unguentum acidi salicylici
Unguentum olei eucalypti
Unguentum hydrargyri nitratis dilutum
Unguentum staphisagriæ
Unguentum sulphuris

Vina.—The wines of aloes, opium and rhubarb are now omitted from the Pharmacopœia. They had fallen in disuse probably because of the impossibility of masking the taste of such nauseous drugs by the use of sherry as a menstruum. The student should refer to the remarks already made on these preparations (*P. J.*, April 9, 1898, p. 354). A test has been introduced for detecting salicylic acid in orange wine and sherry. It is sometimes used for preserving inferior qualities of wine, but the necessary proportion is so small that the ferric chloride reaction is not sufficiently distinct in presence of the colouring matter when the reagent is applied to the wine itself. In order to separate the salicylic acid advantage is taken of the fact that it is volatile in steam. When the wine is distilled, the first portion of distillate is rejected, since this contains the bulk of the alcohol of the wine. The remainder of the distillate containing the greater part of the salicylic acid will still probably be too dilute to give a distinct reaction with ferric chloride. Concentration by evaporation is inadmissible because the salicylic acid will volatilise as well. From its aqueous solution, however, the salicylic acid may be extracted by agitation with ether owing to its much greater solubility in this solvent. After separation the ethereal layer may be evaporated (since salicylic acid does not volatilise at temperatures below the boiling point of ether and in the absence of aqueous vapour), and the residue tested by ferric chloride. This evaporation is best conducted in a white porcelain dish, so that the colour, if any, which is produced on the addition of the reagent shows up distinctly by contrast with the white porcelain. The reason for rejecting the first portion of the distillate, which will contain most of the alcohol of the wine, is that the separation of salicylic acid by ether from dilute alcohol is much less complete than from water only. Hence this alcoholic fraction is collected separately and the remaining portion of the distillate used for the test. Ipecacuanha wine will be much more uniform in strength than the 1885 preparation, since it is now made by dilution of the standardised liquid extract. Quinine wine is now made with the soluble hydrochloride in place of the sulphate of quinine, which needed some citric acid to dissolve it.

Zinci Acetas.—The behaviour of solutions of this salt when treated with sulphuretted hydrogen should be carefully noted, as it sometimes leads the student astray in qualitative analysis. When the gas is passed through the solution a white precipitate of zinc sulphide is obtained. This is because the zinc sulphide is insoluble in acetic acid, although readily soluble in, and hence not precipitated in the presence of, dilute mineral acids. By the action of sulphuretted acid on a neutral metallic salt free acid is always formed in proportion to the sulphide precipitated. Owing to the

* NOTE.—The series of articles should be read in conjunction with the series referring to the 1885 B.P. and published in the *P.J.* during 1897-8.

insolubility of zinc sulphide in acetic acid the formation of the precipitate is possible in the case of zinc acetate—

$$\begin{matrix} Zn & 2C_2H_3O_2 \\ | & \\ S & H_2 \end{matrix}$$

With the other common salts of zinc, the formation of zinc sulphide under these conditions does not occur, owing to its solubility in the acid which would be set free as a consequence of the reaction. Thus with the sulphate and chloride—

$$\begin{matrix} Zn & SO_4 \\ | & \\ S & H_2 \end{matrix} \qquad \text{and} \qquad \begin{matrix} Z & Cl_2 \\ | & \\ S & H_2 \end{matrix}$$

In the ordinary course of analysis hydrochloric acid is added before sulphuretted hydrogen is passed through the solution.

Zinci Oxidum.—The solubility of zinc oxide and hydroxide in excess of ammonia is used to detect metallic zinc, particles of which may be present through imperfect combustion of the metal in preparing the oxide by this method. The presence of these metallic particles is particularly objectionable in zinc oxide which is used, either in the form of dusting powder or ointment as an application to abrased surfaces. The solubility of zinc hydroxide in excess of ammonia is due to the formation of a soluble double salt; the reaction is also utilised in analysis to separate zinc from the iron group, the hydroxides of which do not form any soluble double salts with ammonia.

Zinci Sulphocarbolas.—The formation, reactions and relationships of phenol sulphonic acids have been dealt with in the article on sodium sulphocarbolate (q. v.). The sodium and zinc salts both give a violet colour with ferric chloride, but are easily distinguished by the behaviour of their solutions towards ammonium hydrosulphide.

Zinci Valerianus.—This salt is subject to gross sophistication, often consisting of other zinc salts powdered and mixed with sufficient valerianic acid to communicate the characteristic odour. Although the Pharmacopœia refers to the salt as zinc iso-valerianate it can hardly contemplate insisting upon the use of a chemically pure salt. This would be most difficult to obtain because the commercial amylic alcohol from which it is derived always contains more or less isomeric or homologous alcohols. When the amylic alcohol is distilled with oxidising agent the distillate will contain all the acids corresponding to these alcohols. Hence the purity of the acids depends upon the purity of the amylic alcohol employed. If this be first shaken with strong brine the lower homologues methyl, ethyl, and propyl alcohol are dissolved by the brine, while the amyl alcohols separate as an oily layer. This oily layer is then fractionally distilled, and the fraction coming over above 125° C. will consist chiefly of iso-primary amyl alcohol

$$\begin{matrix} CH_3 \\ \diagdown \\ \quad CH - CH_2 - CH_2OH \\ \diagup \\ CH_3 \end{matrix}$$

. When this is oxidised it yields the corresponding acid

$$\begin{matrix} & & CH_3 \\ & \diagup & \\ CH - CH_2 - COOH \\ & \diagdown & \\ & & CH_3 \end{matrix}$$

. The percentage of ash is a good criterion of quality. For one molecular weight of zinc valerianate $[Zn(C_5H_9O_2)_2 = 265{\cdot}53]$ yields one of zinc oxide $[ZnO = 80{\cdot}79]$.

$$\therefore \text{ 1 gramme will yield } \frac{80{\cdot}79}{265{\cdot}53} \text{ grammes ZnO.}$$

$$= 0{\cdot}3043 \text{ or } 30{\cdot}43 \text{ per cent.}$$

The lower homologues such as zinc acetate and butyrate will be found to give a higher percentage of ash, and a simlar result would be shown by a sample adulterated with zinc oxide or sulphate. A lower ash would only be shown by the higher homologues of zinc valerianate, or a sample containing an undue proportion of water The formula for the anhydrous salt is given in the Pharmacopœia, but zinc valerianate crystallises from water with one molecule of water. A salt of this formula, $Zn(C_5H_9O_2)_2,H_2O$, will yield 28·51 per cent. oxide: hence probably the official allowance of 26–30 per cent. of ash. The moistening with nitric acid is done to facilitate the combustion of the last traces of carbon. When distilled with sulphuric acid the distillate will contain the acids corresponding to the zinc salts present. Butyric acid is the next lower homologue of valerianic acid, and if any zinc butyrate be present the acid will produce a precipitate in copper sulphate solution owing to the insolubility of copper butyrate.

INSTRUCTION IN DISPENSING.

One of the most serious arguments advanced by pharmacists in their attack upon the practice of allowing medical men to dispense their own medicines is the utter inadequacy of the instruction provided by our medical schools in that department. Some half-dozen attendances in the dispensary is usually all that is demanded of the student, and as the dispenser in chief has his hands full of other work it can easily be imagined that the future practitioner escapes with a modicum of practical teaching. Even a diligent student, under the most favourable circumstances, cannot be expected to obtain much insight into the practical details of pharmacy, nor do we see how it can be otherwise. To allow every tyro to educate his hand by assisting in the dispensing department of public institutions would be to court disaster.

There is really only one way to learn dispensing other than by putting in time with a retail chemist, and that is in the surgery of the busy practitioner, but this unexceptionable way opportunity was virtually wiped out of existence by the General Medical Council when the abolition of the old-fashioned apprenticeship was decreed. It is still open to the senior student, it is true, in his last year, to avail himself of this opportunity; but the fact remains that but an infinitesimal proportion of the general body of students do avail themselves thercof, and as a rule the newly-qualified man has to learn it as best he may on commencing practice. It seems to be forgotten that dispensing is an indispensable department of the practice of medicine, even though the practitioner may not take up a class of practice in which dispensing is admissible. A practical knowledge of pharmacy is a necessary step to writing good workable prescriptions, and the decay in the standard of prescription-writing which characterises the present generation of medical men is directly attributable to their want of instruction in this department.

The result is seen in the ever-increasing disposition to have recourse to ready-made preparations of which the manufacturing chemist is yearly becoming more profuse. In France, where dispensing has always been more or less tabooed, the empire of the specialty is absolute, and prescribing proper is a lost art. We are not concerned to deny that dispensing "pays," but that fact—if fact it be—is rather another argument in support of the contention that better provision should be made for teaching it. What with doctors who have never learned to dispense, and unqualified dispensers who have had no practical training in their duties, it is something to be thankful for that accidents are so rare, and disaster so infrequent. Room ought to be made in the curriculum for the subject, and we would appeal to the members of the General Medical Council to see that the subject receives the attention it deserves.—*Medical Press.*

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, DECEMBER 30, 1899.

PHARMACISTS AS TRADERS.

THE recurrence of cases under the Sale of Food and Drugs Acts, in which the defendants are charged with supplying medicinal preparations not in accordance with the British Pharmacopœia standards, brings prominently forward the question of what the position of registered chemists should be with regard to those standards. The defence usually raised in the cases referred to is (1) that the British Pharmacopœia is not a legal standard under the Sale of Food and Drugs Acts; (2) that the preparation was made strictly in accordance wtth the official formula, but has deteriorated on keeping; (3) that it has been sold in the same condition as that in which it was purchased; (4) that the Pharmacopœia includes no proper standard for the preparation in question; (5) that the purchaser has not been prejudiced by the sale of the preparation. Any of those points may be raised in defence and, if skilfully argued, may result in the case being dismissed. But, from the strictly pharmaceutical point of view, it is a question for serious consideration whether—in the event of any medicinal preparation sold by a registered chemist being really deficient in strength or quality—the defendant would not act more wisely to plead guilty and promise to do his utmost to avoid getting into similar trouble in the future.

There is not the least doubt that the British Pharmacopœia ought to be regarded by everyone engaged in the practice of pharmacy in this country as the official standard for all drugs and preparations referred to therein, when those drugs and preparations are intended for medicinal use by human beings. It is quite true that the Pharmacopœia is not a legal standard under the Sale of Food and Drugs Acts, and that it is only a standard under the Pharmacy Act, 1868, in so far as concerns the compounding of official medicines. But pharmacists, as professional men, should be the first to recognise the desirability of having all medicinal articles in accordance with "one uniform standard and guide," so that medicines may be dispensed consistently in whatever part of the British Empire the prescriptions may be presented. They should, therefore, make it an article of faith to consider the British Pharmacopœia as the invariable standard for all drugs and preparations used for medicinal purposes and referred to in the book. It is safe to assume that the great majority of registered chemists are of that opinion, and that they take every care to guard against any departure from that standard. But accidents may occur, even in the best regulated establishments, and, if ever a chemist should occupy the unfortunate position of a defendant in a case under the Sale of Food and Drugs Acts, it will be as well that he should meet the difficulty in a proper professional spirit, rather than as a mere trader.

In the first place that line of conduct requires the abandonment of any idea of pleading that the Pharmacopœia is not a proper standard; it is morally so, if not legally, and the pharmacist, as a professional man, simply cannot afford to have it thought that he ever supplies drugs and preparations for medicinal purposes, other than in strict accordance with the Pharmacopœia. Neither can he, with justice to his professional reputation, urge in extenuation of an offence that a preparation was originally made in strict accordance with the official formula, but has since deteriorated. The idea of such a thing being possible should be scouted by anyone who has the least respect for his professional status and technical skill. It should be impossible in the ordinary course for any pharmacist to use or sell an inferior medicinal preparation; if deterioration cannot be prevented, the preparation should promptly be taken out of stock, and replaced by something more satisfactory. Similarly, it is difficult to see how any conscientious pharmacist can plead before a magistrate that defective medicinal articles supplied by him—and for which there are official standards—were purchased from a wholesale house and sold in the condition in which they were received. Even though the exigencies of business should compel the retail chemist to purchase ready-made what he ought to prepare himself, it is none the less incumbent upon him to sell all medicinal articles with a personal guarantee. If he must buy certain preparations which he ought to make, as a professional man he is confronted with the obvious duty of testing what he purchases before handing it over to the consumer. There is no escape from that position for a self-respecting individual, and a due acceptance of it will save registered chemists much trouble besides going far towards securing for them that recognition which many of them are—somewhat unreasonably—inclined to claim as an inherent right. Public recognition is the reward of work done or services rendered in the public interest, and it implies something more than merely passing a qualifying examination and securing registration as a chemist and druggist.

With regard to the fourth and fifth grounds of defence, it may not be unreasonable for registered chemists to urge them if the facts thoroughly justify such a course. Some public analysts are apt to read into the British Pharmacopœia more than is to be found in that work; they suggest standards of strength, and attempt to persuade magistrates that those standards are reasonable ones before they have secured official recognition. In such instances, it is necessary that the interests of pharmacists as a class should be stoutly defended, and that the public analysts concerned should be made to understand that they are not the

persons authorised to fix standards. Their duty is to test articles alleged to be other than in accordance with recognised standards, and to report thereon without adding unjustifiable comments. Anything beyond that should be left to the proper and legally-constituted authorities. The question of prejudice is chiefly a medical one, so far as drugs and medicinal preparations are concerned, and it is probably in but few cases that the defence of lack of prejudice should be raised by a pharmacist. The Pharmacopœia monograph may be wrong, or its sense may be strained, and a report of a well-argued case may afford the pharmacist the only remedy he can secure. But unless the plea that the purchaser has not been prejudiced is thoroughly justified, it should not be advanced. Indeed, to end by repeating a statement made at the beginning of this article, it is a question for serious consideration whether a pharmacist should ever defend a case under the Sale of Food and Drugs Acts when an article he has supplied for medicinal purposes is not in accordance with the British Pharmacopœia.

THE PRESIDENT AND THE COMPANIES BILL.

THE PRESIDENT'S assault on the Board of Trade, which was published in last week's issue (see p. 606), may have escaped notice owing to the holiday season, and it may, therefore, not be inappropriate to refer chemists and druggists to the full text of the carefully prepared statement which has been forwarded to the President of the Board of Trade. Briefly summarised, the letter urges the following considerations :—(*a*) That the Department formerly deemed the representations of the Society to be outside the scope of the investigation with which the Companies Committee was charged; (*b*) that since that decision was given, the LORD CHANCELLOR and the late Lord HERSCHELL have clearly expressed the opinion that the condition of the law which permits a company to do what an individual without personal qualification cannot legally do, is not compatible with the safety of the public, and that amendment is imperative ; (*c*) that the LORD CHANCELLOR has given practical support to his opinion that the amendment should be effected through the medium of a Companies Bill, by inserting a clause dealing with the subject in last year's Bill; (*d*) that as the subject of Company Legislation will shortly be again engaging the attention of the Department, the views of chemists and druggists should receive further careful consideration; (*e*) that those views embodied two principles, viz., the prohibition of the use by companies of the personal titles mentioned in the Pharmacy Act, 1868, and the undesirability, from a public point of view, that an unregistered person should be permitted to exercise any control over the retailing, dispensing, or compounding of poisons. The action of the PRESIDENT should commend itself to all registered chemists, and it should also disabuse the minds of any pessimistic spirits who may have been disposed to think that the Council never did and never would give any outward sign of vitality in the matter of company trading.

ANNOTATIONS.

THE END OF THE YEAR 1899 finds British pharmacy in a vastly superior position to that which it occupied twelve months earlier, although the chief problem which has attracted attention during the year yet remains as far off solution as ever. The adoption of poison regulations in January marked an important step in advance, and was indicative of a strong desire on the part of the Pharmaceutical Society to neglect no precaution which may place the dispensing and sale of scheduled poisons beyond the risk of accident. It is safe to say that, so far as concerned registered chemists generally, the public interests were already sufficiently safeguarded; but, by the adoption of formal regulations, advertisement of that fact was secured. No inconvenience appears to have been caused to any chemist by the carrying out of those regulations, and the forebodings to which utterance was given by several prophets of evil seem to have been based upon the assumed reality of purely visionary difficulties. To sum up the effects of adopting the regulations, the Pharmaceutical Society did its duty, the Government has been favourably impressed and its assistance bespoken for further pharmaceutical reforms, whilst the medical profession and the public have had a striking practical illustration of what pharmacists are prepared to do for the general welfare. Last, but not least, the practice of pharmacy has been shown publicly to have attained to something more than a mere trade in drugs and sundries, and the position of pharmacists as professional men has been advantageously affected in due proportion.

THE THOROUGH PHARMACEUTICAL INCORPORATION which was rendered practicable by the Pharmacy Act, 1898, has not yet been brought about, but there has been a wonderful stirring of the dry bones during the year just ending, more perfect organisation in pharmacy having been recognised as a neccssity of the times. Greater interest than usual was taken in the Council election last May and the work of the Council has probably been more closely scrutinised, month by month, than at any former period. The leaven of organisation has spread throughout the length and breadth of the land, many more local pharmaceutical associations being now in existence than of old, whilst towns and districts where no associations exist have found a means of expression in the Federation of Local Pharmaceutical Associations. That body has given sufficient reason for its existence in a variety of ways, but chiefly by securing the simultaneous discussion of serious matters in all important pharmaceutical centres throughout Great Britain. The latest of its exploits was to evoke expressions of opinion regarding the company pharmacy problom from the registered chemists of more than seventy important towns and districts. The opinions so collated, having been published in the Journal and submitted to the Council of the Pharmaceutical Society, may be expected to exert no slight influence on the course of events—so far, at least, as that can be influenced from the pharmaceutical side.

THE ALL-ENGROSSING TOPIC OF THE YEAR has naturally been that same company pharmacy problem. A profusion of ways and means for its solution have been suggested and considered, but as at the outset of the present agitation, so now—events wait on the position which the Government may take up in the matter. Strict justice demands that the use of any title indicating qualification under the Pharmacy Acts should be restricted to individuals who can be examined and registered in accordance with those Acts; also, generally, that no association of unqualified persons should be permitted to do what is forbidden by the law to those persons individually. Expediency, however, as voiced by several leading pharmacists, suggests that whilst all pharmaceutical titles must certainly be protected, it may be found desirable to agree to some compromise with regard to keeping open

shop for the dispensing and sale of scheduled poisons. The actual sale of those poisons, they point out, is already fully restricted to duly qualified individuals, and the Legislature may be expected to consider that sufficient for the protection of the public without interfering with the keeping of open shop for selling poisons by joint-stock companies. In that case, they urge, it may be found extremely difficult, if not impossible, to stem the tide of trade development, as illustrated by the spread of company trading and particularly by the growth of company pharmacy. Opinion is thus divided within the pharmaceutical camp, and what the end will be it is impossible to foretell or even to surmise at the present moment.

The B.P. Preparations of Ipecacuanha are the subject of observations by Mr. R. G. Guyer (see p. 622), who furnishes some startling figures. There may be a slight loss of alkaloid in the deposit which forms when liquid extract of ipecacuanha B.P. is first prepared, but that should be allowed for, and can hardly be so serious as that shown by the author, namely, a loss of 26·5 per cent. of the total alkaloid in two months. That it is possible to prepare a liquid extract which shall remain fairly constant in alkaloidal strength is evident from the fact that the B.P. preparation obtained from a wholesale firm eighteen months ago is still bright, and contains the full amount of alkaloid. In that sample, the total alkaloid amounted to 2·1 per cent. As the author does not state the method adopted in the analysis it is presumed that the inaccurate method described in the Pharmacopœia was employed. It is necessary to be certain of the analytical work. That this suggestion is not unnecessary is apparent from papers frequently published, which show the want of careful manipulation in alkaloidal determinations. It is true that emetine and cephaeline, as has been shown in Paul and Cownley's papers on the chemistry of ipecacuanha, are very prone to alteration when exposed to light or heated in alcoholic solution—for the latter reason the B.P. process is faulty—but that is more a molecular change than a decomposition likely to affect gravimetric determination.

The War in South Africa has become of direct interest to pharmacists, as such, by reason of the War Office authorities having been compelled to advertise for compounders of medicines to serve at the front. As the *Morning Herald* puts it, "Should a chemist and druggist, or a dispenser of three years' experience, who is over 21 and under 35 years of age, be of a patriotic and not money-grabbing disposition, here is a chance for him. The War Office will give a salary of 3s. 6d. per day, a free passage to the Transvaal, kit, rations, and quarters, and at the end a gratuity of three months' pay for his services in the military hospitals as a compounder of pills, potions, and powders for the sick and wounded Tommies, and the equally afflicted Boer prisoners. The patriotic chemist will, as will be seen, not become rich beyond the dreams of avarice, but he will have a pleasant sea-trip, see a bit of the world possibly have a fairly exciting time, and do a good service to his country." Whether patriotism will so far overcome self-interest as to induce properly qualified pharmacists to apply for the position offered is more than doubtful, as the views expressed by Mr. J. B. Guyer (see p. 640) are likely to be entertained generally in pharmaceutical circles. It will be observed (see p. 634) that there is a marked contrast in the two qualifications which the authorities propose to recognise, and it can hardly be regarded as a compliment that the alternative to having passed the qualifying examination of the Pharmaceutical Society is of such a distinctly inferior type.

Dispensing Extraordinary has resulted in the death of two patients at the Crumpsall Workhouse Hospital (see page 634), solution of strychnine having been dispensed in mistake for spirit of nitrous ether. According to the evidence of the chief dispenser, solution of strychnine had, by some unknown means, got into the spirit of nitrous ether bottle, but the Manchester City Coroner, who presided at the inquest subsequently held, is reported to have said that the evidence before the jury made it extremely difficult to fix the responsibility for the mistake that had been made. It lay between three persons—the chief dispenser and his two assistants. They all denied having made any mistake, but two lives had been lost owing to the lack of systematic arrangements in the dispensary. It has been held, the Coroner pointed out, that a dispenser who mixes poisonous medicine by mistake is guilty of criminal negligence, and the jury was therefore advised to consider the case carefully before liability was fixed on anyone. There was no doubt that death was caused by strychnine poisoning, or that the mistake arose from putting solution of strychnine into the spirit of nitrous ether bottle. The question the jury had to decide if possible was who made the mistake. After consultation in private the jury returned a verdict that the deceased men met their deaths through misadventure, by strychnine poisoning, and that in consequence of the lax system which prevailed in the dispensary it was impossible to fix the blame upon any individual. It is satisfactory to learn that the matter has since been brought before the Manchester Board of Guardians for further consideration.

So-Called "Temperance" Drinks were at one time supposed to be free from alcohol, but, in view of the evidence of a public analyst, Professor A. Wynter Blyth, before Sir Herbert Maxwell's Committee on Preservatives and Colouring Matters in Food, old-fashioned teetotal notions seem to need modification. Professor Wynter Blyth stated that he had found salicylic acid in certain "fizzy" drinks, used apparently to arrest alcoholic fermentation, or, as he explained, so that the "temperance" beverage might be almost free from alcohol. According to the *Daily Telegraph*, "the inference would appear to be that such drinks are 'cups that inebriate,' if only they have time to develop their power," and, it may be added, if substances that check fermentation are not added to the liquids. Another witness, Mr. Richard Bannister, late Deputy Principal of the Inland Revenue Branch of the Government Laboratory, also stated that salicylic acid was chiefly used in British wines and other liquids in which there was not sufficient alcohol to make them clear and bright. Sulphurous acid in one form or another was said to be used in beer to give and preserve its character—to make it of a nice bright colour.

Mr. Jesse Boot as an exponent of the just (?) claims of the assistants employed in the drug stores conducted by the company which he represents is decidedly amusing. The registered chemists of Nottingham have been at considerable trouble and expense to provide for their assistants and apprentices, at University College, a course of study suitable for the requirements of candidates for the Minor examination. For good and sufficient reason, no one is admitted to those classes unless he is an associate of the local Pharmaceutical Association and in the employment of a legally qualified chemist. Mr. Boot, however, objects to those conditions, and has written to the local newspapers to complain of the restriction which excludes the employees of his company from sharing the benefits of the classes. He writes about the "injustice" which excludes those employees from "pharmaceutical study specially designed for chemists," conveniently ignoring the fact that he and his unqualified partners and assistants are not chemists. In reply, Mr. Eberlin, hon. secretary to the local association, has pointed out that Mr. Boot has his remedy for the matter he complains of entirely in his own hands, namely, "to qualify himself as a chemist." And, though the remedy suggested in such brief terms would probably not prove entirely effective, we are cordially at one with Mr. Eberlin in defending the restriction of privileges to those who are properly entitled to them.

ENGLISH NEWS.

ARMY DISPENSERS WANTED.—A notice has been posted at the War Office, intimating that compounders of medicine are urgently required for service in South Africa. The conditions of enlistment will be as follow: (1) For one year unless the war lasts longer than one year, in which case they can be detained until the war is over. If, however, the war is over in less than one year they may either be discharged at once or remain until they have completed their year's service at their option. (2) Pay 3*s.* 6*d. per diem*, free rations, kit and passage to and from South Africa, and a gratuity at the end of the campaign of two months' pay. (3) Age, 21 to 35 years; height, 5 ft. 3 in. and upwards; chest measurement, 33 in. and upwards; weight 115 lb. and upwards. (4) Qualifications.—A certificate of Minor examination of Pharmaceutical Society of Great Britain; in default thereof a certificate that the candidate has been practically employed in the dispensing of medicines for three years and that he has performed his duties in a satisfactory manner. (5) Each candidate when attested to be sent direct to the Depôt Royal Army Medical Corps at Aldershot to be clothed and put under training in drill and discipline until embarkation. (6) Married men who enlist under these conditions will be treated as men married with leave for whom no accommodation is available at quarters. (7) In addition to the gratuity specified in paragraph 2 they will receive any general gratuity that may be granted to the troops at the conclusion of the campaign. (8) Men who are desirous of joining the Royal Army Medical Corps under the above conditions should apply either personally or by letter to the recruiting staff officers, London, W.C., Liverpool, Manchester, Birmingham, or Edinburgh.

SHEFFIELD PHARMACEUTICAL SOCIETY.—On December 20 Mr. J. W. J. Turner lectured before the members of the Sheffield Pharmaceutical and Chemical Society on "Fruits, Rare and Interesting." Mr. George Squire, the President of the Society, occupied the chair. Mr. Turner explained that his object in giving the lecture was to draw attention to many fruits that are not met with in commerce. He said that one reason why people in England did not get so many succulent fruits was probably because they would not stand the transit. Consequently they were only met with in English hot-houses. The lecturer showed about forty lantern slides, mostly illustrative of foreign fruits, and explained their external structure and their uses. The fruits in their natural state were generally small, but they were improved by cultivation, grafting and pruning. Mr. Turner also exhibited a number of dry fruits with edible seed. The lecture proved very interesting, and Mr. Turner was warmly thanked at the close.

LONDON COLLEGE OF PHARMACY.—We are requested to announce that the College Dinner and Distribution of Prizes will be held at the Holborn Restaurant, on January 22, when Mr. T. Skewes-Cox, M.P., J.P., will preside. Students and friends wishing to attend are requested to communicate with the Principal as early as possible.

DEFICIENT CAMPHORATED OIL.—At Hinckley Petty Sessions, on Thursday, December 21, William Pridmore, chemist and druggist, Hinckley, was summoned for selling camphorated oil deficient by 2 per cent. of camphor, and otherwise below the standard, cotton-seed oil having been substituted for olive oil. For the defence it was stated that the oil used was purchased as pure, and the absence of 2 per cent. of camphor was due by evaporation.—Thomas Pratt, grocer, Hinckley, was also summoned for a similar offence.—Supt. Shillcock stated that he took the sample, and had the same analysed, when it was found to be diluted with mineral oil. He had taken samples before from defendant's premises, but had previously had no cause of complaint. The Bench dismissed both cases on payment of costs, remarking that the magistrates were bound to protect the public.

THE SALE OF POTASH WATER.—At Swindon Petty Sessions on Thursday, December 21, the adjourned cases against William Evans, described as a chemist, of Market Street, New Swindon, and Joseph Henry Green, chemist and druggist, Wood Street, Swindon—for selling potash water not of the nature and quality demanded—were resumed. Mr. H. Bevir prosecuted on behalf of the Wilts County Council, and reminded the Bench that the cases had been adjourned to enable Dr. Bernard Dyer and Mr. Stoddart (Bristol city analyst) to make a joint examination of the water (see *ante*, p. 534*c*). Dr. Dyer said he had examined the sample with Mr. Stoddart, and they agreed that it was practically destitute of potash, but contained soda in the proportion of five grains to the pint. Mr. Henderson (Bristol), for the defence, suggested that in view of the divergency of opinion on the part of the analysts, as disclosed at the last hearing, the magistrates ought not to convict. The Bench, however, was unanimous in convicting, and imposed fines of 1s. and costs.—The Chemists' Aërated and Mineral Waters Association, Limited, of Gifford Street, Caledonian Road, London, was summoned at the same Court under the Merchandise Marks Act for applying a false trade description to a syphon of aërated water supplied to William Evans, of Swindon.—It was stated for the prosecution that the label on each syphon represented that the water contained five grains of bicarbonate of potash to each pint.—Mr. Henderson, for the defence, said that by some inadvertence a potash water label had been placed on a bottle of soda water. There was no object in wilfully adopting that course, as the prices of the two waters were almost the same.—The Chairman said the Bench found in this case that soda water was sold in place of potash water, and on that finding it could not convict.—The Clerk: In other words that no false trade description was applied to these goods.—The Chairman, in answer to Mr. Bevir, said the Bench would state a case if it was thought desirable to take the matter elsewhere.—There was a second summons against the company for applying a false trade description to a syphon supplied to Joseph Henry Green.—Dr. Dyer said the sample examined was practically destitute of bicarbonate of potash, but contained 2 grains per pint of bicarbonate of soda.—Mr. Groom, for the defence, suggested that the deficiency arose through insufficient mixing in the tank.—The Bench imposed a fine of 10s. and costs.

FATAL DISPENSING MISTAKE.—On Wednesday, December 20, the inquest was concluded upon two inmates of Crumpsall Workhouse Hospital, named John Smith and William Wharton, whose deaths were caused by the administration of strychnine as medicine in mistake for nitrous ether (see *ante*, p. 610*c*). It appeared that eight other patients had shown symptoms of poisoning on the same occasion, but the results had not proved fatal.—A large number of witnesses were called, including two nurses who administered the medicine, and others who spoke to the disposition of the various medicine bottles in the dispensary, in the selection of one of which it was stated the mistake had been made.—One of the assistant dispensers deposed that there was nothing to tell who had dispensed the bottles of medicine in question.—The jury returned a verdict of "Death from misadventure from strychnine poisoning, but that in consequence of the lax system which obtained in the dispensary, they were unable to fix the blame on any individual."—The Foreman added the recommendation of the jury that the poisons should be kept in differently shaped bottles, and that the initials of the dispenser who last filled them should be shown on the bottles.—The Master of the Workhouse, Major Ballantine, promised that those recommendations should be carried out.——

At the fortnightly meeting of the Manchester Board of Guardians, on Wednesday, Alexander Currie, assistant dispenser at Crumpsall Workhouse, resigned his position, having been acccpted as a dispenser at the seat of war in South Africa. He statcd that his resignation must not be construed as an admission of any kind in connection with the late disaster in the workhouse infirmary, which was deplored by no one more deeply than himself, no matter wherein lies the blame. He asked to be as liberally dealt with as possible as regarded pay, but Currie having been paid up to the day he left, the Board considered this a full discharge of their responsibility. Referring to the recent poisoning cases at Crumpsall Workhouse, the Chairman (Mr. Geo. Rooke), expressed his great regret at the occurrence.

Camwal Annual Meeting.—At the annual meeting of shareholders, held on Tuesday, December 19, at Anderton's Hotel, Fleet Street, E.C., the directors' report and the balance sheet (see *ante*, p. 588*b*) were unanimously adopted, the dividend proposed being agreed to. With regard to the annual sum of £50 which it has been usual to vote to the directors, who have then presented it to the Pharmaccutical Benevolent Fund, it was stated that the directors would this year be content with their usual fees without addition. They had come to that decision because many of their employees were Reservists, some of whom had been called out, and as the directors were keeping their situations open, and were assisting their wives during their absence, they might want a large sum for that purpose. The meeting thoroughly agreed with that decision. On the proposition of Mr. Nicholls, the retiring directors, Messrs. H. Davenport and A. Gould, were re-elected, as were also the auditors.—The meeting then resolved itself into an extraordinary general meeting, to consider the reconstruction scheme, and after some discussion, it was decided to wind up the old company and to form a new company to be known as "Camwal, Limited." An extraordinary general meeting of the company to confirm this decision is announced to take place at Anderton's Hotel on Tuesday, January 9, at 3 o'clock.

British Optical Association.—At the last council meeting of this Association, the names of thirty-one gentlcmen were passed for membership, including five chemists, viz.:—Thomas Mackenzie Inverness; R. H. Groves, Blandford; W. C. Gowans, Brechin; J. H. Nicholson, Oswestry; Daniel Evans, Ruabon. We are requested to state that the address of the offices and headquarters of this Association in future will be Piceadilly Mansions, 17, Shaftesbury Avenue, London, W.

Obituary.

Cheetham.—On December 22, The Right Rev. Henry Cheetham, D.D., formerly Bishop of Sierra Leone, died at his residence at Bournemouth, aged 72 years. The son of a Nottingham manufacturer, he was brought up to pharmacy, and was for some years an assistant with the late Mr. Thomas Harvey, of 13, Briggate, Leeds. He showed great interest in church work, and was Superintendent of the St. George's Sunday Schools, ultimately deciding to enter St. Bees College, and was ordained in due course. After holding the vicarage of Quarndon, Derbyshire, for twelve years, he was appointed Bishop of Sierra Leone, and held this position from 1870 to 1881.

Copney.—On Friday, December 22, suddenly, William Copney, of Lavender Hill, Pharmaceutical Chemist. Aged 79. Mr. Copney was a student in the School of Pharmacy in 1848 and gained the first prize for Materia Medica (lectures) in that year; the late R. W. Giles taking thc corresponding prize for laboratory work in the samc subject. In 1850 he carried off the first prize for Chemistry and Pharmacy, and passed the Major Examination—a natural result, perhaps, after a thrce years' curriculum and painstaking work. They did not hurry things in those days, and no one was called upon to compress the honest work of three years into a period of as many months. For many years subsequent to his school career, the Society had no more loyal supporter or active partisan than William Copney, and his warm interest in its work was manifest almost to the closc of his life. Not very long ago he presented to the Society a drawing taken from Blackley's well-known painting of "Faraday at the Royal Institution," and in the early days of the Museum he was a frequent contributor of interesting specimens. For some time he was Secretary of the Museum of the Royal College of Physicians, a position which naturally led him to interest himself rather deeply in materia medica collections. Mr. Copney was a man of considerable culture, artistic instinct and wide reading, and was never so happy as when engaged in reading, writing, or conversing on his favourite subject of meteorology. In the earlier numbers of the *P. J.* may be found several papers on thc subject from his pen, and he claimed to be the originator of the graphic method of recording barometric and thermometric readings now universally adopted in the daily press. To the knowledge of pharmaceutical science he contributed the following papers, which are published in the *P. J.*:—"Formation and Growth of Crystals"; "Nitrate of Silver and Tannic Acid in Pills"; "Test for Carbonate and Iodate of Potash in Iodide of Potassium"; "Chemical Tests for Strychnine"; and "Iodide of Antimony." Mr. Copney met with very evil fortune some ten years ago, and was compelled to have recourse to the Benevolent Fund. He was elected an Annuitant in 1889, and it should be a source of some gratification to subscribers to the Fund to know that they have been instrumental in rendering the poor gentleman's latter years less hard and less burdensome than they would otherwise have been.

Griffits.—On December 12, John Alonza Griffits, Chemist and Druggist, Torrington. Aged 57. Mr. Griffits had been connected with the Pharmaceutical Society for many years as an associate, and latterly as a member.

Mount.—On December 16, William Mount, Pharmaceutieal Chemist, Canterbury. Aged 78. Mr. Mount, who had been a member of the Pharmaceutical Society since 1853, was, until a few years ago, one of Canterbury's best known and most active citizens, and was three times Mayor of the city. Mr. Mount was a talented musician, and for twenty-one years held the band-mastership of the Royal East Kent Mounted Rifles. He was a noted amateur rose grower, and was also a keen lover of sport; one of his hobbies being the breeding of setters, which he carried on with considerable success. He was a Justice of the Peace, and up to November, 1898, was an Alderman of the city, having been raised to the Aldermanic Bench in 1886.

Pumphrey.—On December 19, at Bournemouth, Arthur Pumphrey, Pharmaceutical Chemist, late of Weston-super-Mare. Aged 37. Mr. Pumphrey had been a member of the Pharmaceutical Society since 1885.

Thompson.—On Dccember 24, Andrew Thompson, Pharmaceutical Chemist, Carlisle. Aged 75. Mr. Thompson had been a member of the Pharmaceutical Society since 1846, and was for many years the local secretary, always supporting the aims and views of the Society and furthering the interests and welfare of his fellow craftsmen. He was a native of Carlisle, and was one of the oldest and best known tradesmen of the city. He took a keen interest in the municipal affairs of the city, and until a short time ago was a very regular attendant at the meetings of the Town Council, of which he was a member as Councillor or as Alderman from 1871, and also at the meetings of the Health Committee. He was also a member of the Burial Board. He was a member of the Carlisle Subscription Bowling Club, and on one occasion won the championship pair of bowls. His death occurred suddenly during the night from failure of the heart's action. It is interesting to note that Mr. William Martindale, President of the Pharmaceutical Society. worked for three years in Mr. Thompson's pharmacy.

SCOTTISH NEWS.

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION.—The weekly meeting of this Association was held on December 22, Mr. J. P. Gilmour, President, in the chair. Mr. M. Meldrum, Ph.C., read a paper on "Reproduction in Plants." Beginning with schizoporous forms, the author went on to describe in general terms the leading laws and modes of asexual and sexual propagation among Cryptogams and Phanerogams, more particularly in relation to the facts of the alternation of generations in the Thallophyta and Pteridophyta, and to the homologies in the sexual members of Cryptogams and Phanerogams which go to prove their community of descent from a single archaic type. Having glanced at the problem of the origin of sex, the essayist gave an outline of some of the more striking and elaborate mechanisms for securing self- or cross-fertilisation in flowers, with an account of the essential steps in the process of pollination. In conclusion, he spoke of the immense importance of the datum of evolution in this as every other study of organic nature. The Chairman complimented Mr. Meldrum warmly upon the virtues of expression and compression which his paper had displayed. The history of the discovery of reproductive processes in animals and plants was a striking proof of the power of positive knowledge in dispelling illusion or imposture. It seemed but yesterday that the belief in heterogenesis held the field, and now as regards all the living forms known to us, it was quite discredited. The genetic affinities of the great sub-kingdoms and classes of the plant world were being worked out with conclusive results, and as a case in point he might quote the discovery by two Japanese biologists of the presence in certain Gymnosperms of a motile male gamete, a fact which linked that group with the Cryptogams. Mr. B. Cockburn, Ph.C., in the course of an instructive sketch of the process of the fertilisation of the ovum, mentioned the latest discovery as to the destination of the second generative nucleus. As they were aware, the pollen-tube contained two generative nuclei. One of these fused with the nucleus of the oosphere to form the zygate, but hitherto they had had no information about the fate of the other generative nucleus. It was now ascertained that it moved through the embryo-sac and, without previous division, fused with the pro-nucleus to form the secondary nucleus. The meeting closed with a vote of thanks to Mr. Meldrum.

ANNUAL SOCIAL.—The employees of Messrs. Raimes, Clark and Co., Edinburgh, held their annual social in Trafalgar Hall, Henderson Street, Leith, on Friday, December 15. Mr. Clark presided, and Messrs. Davies and Cunningham officiated as croupiers. After an excellent tea, an interesting programme of vocal and instrumental music was carried through, those contributing being Misses Amos, Barnetson, Clark, and Montgomery, Mrs. Donaldson, and Messrs. J. H. Davies, A. Donaldson, Gibb, and Jamieson. Misses Davies and Hill proved efficient accompanists. The programme included a cinematograph entertainment. An assembly followed, Mr. Hutton acting as M.C., and dancing was kept up to an early hour the following morning.

AERATED WATERS IN HOSPITALS.—The Hospitals Committee of the Glasgow Corporation has recommended acceptance of the offer by the Volcanic Aeration Company, 203, Great College Street, Camden Town, London, to fit up the necessary apparatus for the manufacture of aerated waters at the hospital, the amount, including expenses, superintending, fitting up, etc., £54 8s. 6d.; as also for the supply of 500 syphons and 50 cases to be marked "Belvedere Hospital,"—cost £49 11s. 8d.

IRISH NEWS.

QUACKERY IN EDUCATION AND MEDICINE.—Professor Leebody recently told the Irish Intermediate Commissioners, apropos their education system, "that a patient suffering from a malady of a particular kind was greatly benefited by a particular sort of medicine; but when the patient recovered, in spite of the beneficial results in the first instance, if the medicine was still continued, evil instead of good results would follow." Succinctly put. But the patent medicine vendor's bribed medium, after being cured by seven boxes or bottles, always continues to imbibe the virulent concoction.

POISONING BY SULPHURIC ACID AND LAUDANUM.—An inquest was held regarding the death of Mary Jane Lyons, aged thirty, at Toomebridge. It appears deceased went to Randalstown, and, feeling very cold on her return, took some vitriol in water to heat her up, some time after taking a small quantity of laudanum. Subsequently the woman was taken ill, and died a few days later. Sulphuric and laudanum! Why such an incompatible combination? Antidotic drugs, mutually destructive in their medicinal effects. The one stimulating liveliness, the other inducing lethargy. The only prescription it recalls is that administered by the Oracle on the "Quaker City," mentioned by Mark Twain:—"Four tablespoonfuls of laudanum to put the patient to sleep, and a mustard plaster, about the size of a saddle, applied to the spine of the back to wake him up again." The sequence is important.

CIRCUMSTANCES ALTER CASES.—This applies especially to medical cases, for doctors' fees are regulated by many standards and influenced by many contingencies. Dr. George Gibson, Donaghadee, sued William Milliken, Royal Avenue, Belfast, to recover £3 3s. for professional attendance. The doctor proved account. In cross-examination he admitted having refused to give any explanation as to his charge. Three years ago he had charged defendant 2s. 6d. a visit, it not being a consultative visit in the ordinary sense, and also because he did not know defendant's exact position. His present charge was 10s. 6d. a visit. His fees varied according to patients. Servants and fishermen he charged half-a-crown; to people in the plaintiff's position half-a-guinea. After some further questioning his Honour gave a decree for the full amount.

DENTAL NOTES.

FOR CASES OF SEVERE HÆMORRHAGE following extraction W. H. Dolamore advocates, in the *Journal of the British Dental Association*, the passing of sutures from the gum on one side of the tooth socket through that on the opposite side, and tying them together as tightly as possible. The clot is retained, the thread possibly hastening its formation; the stitches are left in for a few days. In cases where there is much laceration of the gum, and the alveolus is broken or removed during the extraction of the tooth, it is possible, with the stitches, to draw together the edges of the wound and so lessen its size considerably. He recommends the use of a curved needle, which should be rather strong, for the gum is dense, and the needle is apt to strike against the opposite alveolar wall. Horsehair answers well for the sutures; it should be strong and used in long pieces. Two or three stitches suffice, each being passed through the gum on one side, then through that on the other, and separately tied.

IN TAKING PLASTER IMPRESSIONS let the patient thoroughly rinse out the mouth with a little milk immediately before the tray is inserted, and there will be no need to use vaseline or glycerin.

FOREIGN NEWS.

The Nutritive Value of Sugar.—As a result of a series of experiments made by Leitenstorfer in the German Army, it appears that sugar is eminently suited to replace alcohol or wine. It affords, indeed, the same stimulation as alcohol, without, however, any of the latter's inconveniences. It has the advantage of being a muscular aliment of the first order, at the same time warding off fatigue. During the manœuvres the men who were fed upon sugar felt its benefit. They were more healthy and vigorous than before the administration of it. When marching, hunger and thirst were assuaged by a large piece of sugar. It has therefore been decided that sugar shall form part of the alimentation of the German troops in future.

Yolk of Egg as an Ointment Excipient.—M. le Docteur P. Unna, of Hamburg, advocates the use of a mixture of yolk of egg and almond oil in the proportion of two to three (2 : 3) prepared as one would make "mayonnaise." It constitutes an excellent ointment, into which may be easily incorporated 10 per cent. of the majority of medicaments used in dermatotherapy (sulphur-ichthyol, tar, starch, limewater, goulard, etc.). Such a pomade, on rapidly drying upon the skin, forms a very adhesive protective layer. It is specially useful in eczema, acne, and itch. To preserve it from decomposing, 1 per cent. of balsam of Peru should be added.

The Progress of Alcoholism in Paris.—Docteur Jacquet has just communicated to the Medical Society the results of an inquiry on which he has been engaged, into the progress of alcoholism in Paris. Dr. Jacquet's observations bore more particularly on the patients treated in the hospitals at Paris. Out of 4,744 cases personally investigated by the eminent physician 1,405, or 29·61 per cent., were found to be persons who habitually drank to excess, and whose malady, if not directly ascribable to alcohol, had been greatly aggravated by the abuse of stimulants. Moreover, Dr. Jacquet is convinced that the percentage given ought in reality to be higher. The patients are disposed to conceal their excesses—a fact especially noticeable in the case of women who, even when confirmed topers, stoutly maintain that they are models of sobriety. A striking feature of the situation is that the proportion of drunkards greatly augments when only the more serious cases treated in the hospitals are considered. Calculated on this basis the percentage of inebriates rises to 46. The perhaps unparalleled facilities for obtaining drink that exist in Paris, and the practice, rapidly becoming universal, of taking apéritifs, or appetisers, before meals, are considered by Dr. Jacquet to be among the principal causes of the alarming growth of the drink habit. Women—in particular those of the lower classes—are especially influenced to join the ever-increasing army of tipplers by the fact that the temptation to indulge in stimulants meets them at every turn. A great number of small tradesmen, especially greengrocers and coal-merchants, add to their income by selling intoxicants. Servants and others can thus obtain drink without frequenting the bars or wine-shops they would be ashamed to enter. Then, yet another class—who cannot well be styled small tradesmen—the pharmaciens, come in for condemnation, for they, too, are alleged to be capital offenders.

Pharmaciens are Accused of having taken advantage of the vogue acquired by certain much-advertised strengthening wines or "quinquinas" to push the sale of similar products of their own manufacture. Dr. Jacquet affirms that pharmaciens often persuade their customers to take one of those concoctions, which are merely strongly alcoholised wines sweetened and with an admixture of kola, in the place of prescriptions ordered by a doctor. This is a somewhat exaggerated assertion; doctors are greater sinners in prescribing various tonic wines as vehicles for their potions. But the craze for appetisers is more deadly still. It has spread to all classes of society, while the drinks swallowed under this pretext—absinthe, vermouth, and the various "bitters"—are the most pernicious forms of alcohol in existence. The increase in the consumption of absinthe—the most deleterious of all these filthy poisons—among the working classes is appalling. Many workmen have now reached the pitch of drinking absinthe with their meals, as well as taking it when they get up in the morning, and before lunch and dinner. Dr. Jacquet is of opinion—and rightly so, too—that the habitual taking of absinthe is responsible for much of the morbid irritability displayed by Frenchmen at the present day. There is, however, no possibility of getting into a Frenchman's mind the fact that his favourite "dram" is inferior to, and more injurious than, the much-ridiculed "Whisky des Anglais," or that the French as a nation are far and away ahead of all others as consumers of alcohol. But there are none so blind as those who will not see. Statistics fail to convince them.

Discovery of an Anti-Anæmia Serum at the Pasteur Institute.—One of the greatest discoveries of modern science has just been made at the Pasteur Institute. When the last details have been settled, science will have reached the point of abolishing most of the defects of old age, and, consequently, of prolonging life. Professor Metchnikoff, director of one of the sections of the Institute, is now engaged in seeking the accurate doses of a lymph, or rather, a series of lymphs, each of which will rejuvenate a particular organ of the human body. Professor Metchnikoff, like most men of science, is very modest, and has an antipathy to premature publicity. His explanations show, however, that he has already succeeded in solving the main problem. To begin with, Professor Metchnikoff's experiments show that the explanation of senile atrophy hitherto obtaining is erroneous. The theory was that certain blood cells devoured others when the vital functions began to weaken. The organic poisons thrown off energetically in youth were believed to remain in the system in old age, or at least to be less energetically ejected, and to poison the finer cells, while without action upon those of the conjunctive tissues. The noble cells died and became the prey of the others or plebeian cells, thus bringing about the atrophy of the organ where the metamorphosis took place. This explanation is erroneous. Professor Metchnikoff has discovered and proved conclusively that the noble cells are not dead in organs atrophied by senility, and, moreover, that they may be multiplied. By assisting them in their struggle with the plebeian cells they will continue to live as actively as in youth. Theoretically, the organism will cease to grow old, and in practice life will be prolonged.

The Discovery was Made in the following way:—Among Professor Metchnikoff's pupils is Monsieur Bordet, who last year published in the "Annales de l'Institut Pasteur" the results of a curious experiment he had made. Monsieur Bordet had injected the blood of a rabbit into a guinea-pig. Some-time later he injected the blood of this guinea-pig into a rabbit. The rabbit died. Professor Metchnikoff sought the causes of this phenomenon, and soon became convinced that the blood of the guinea-pig injected into a rabbit, or other vertebrate animal, elaborates a poison that weakens the red globules of the blood and makes them the prey of the phagocytes. Under the microscope one can see how the white globules devour the red and digest them. If one places the non-transparent, ordinary blood of a rabbit in a test tube, and add afterwards some of a guinea-pig's blood, before long the rabbit's blood becomes transparent, taking the colour of Bordeaux wine. Starting from the fact that the poison elaborated in the guinea-pig is fatal in large doses, Professor Metchnikoff argued that its action in small doses must be stimulating. Thereon is based the action of all medicines like strychnine, arsenic and so forth. Professor Metchnikoff, therefore began to inject into rabbits feeble solutions of previously injected guinea-pig's blood. The cubic-millimetre of blood in the rabbits thus treated contained before the injections 3,000,000 red globules. In three or four days that number increased to 8,000,000. A sovereign remedy against

anæmia had thus been discovered, and Professor Metchnikoff's theory concerning the red globules had been confirmed. His entire section at the Pasteur Institute is now working to find the specific serums for each particular organ. If the blood-serum act on the red globules, the liver serum must produce similar effects on the cells of the liver that of the brain on the brain, and so on. Experiments have demonstrated this. The specific kidney serum was found some few days ago, and Professor Metchnikoff is now determining the exact dose for medical purposes. The discovery has passed the period of mere laboratory experiments. The celebrated Dr. Vida is now at work on human serums. It is remarkable that so many of these discoveries are due almost to accident. It will be remembered that Dr. Roux's great discovery regarding diphtheria was worked on for four years in France and Germany, and was finally completed through a fact that had no relation whatever with the malady in question. When acquainted with the discovery Dr. Polaillon, of the Académie de Médicine, was inclined to be sceptical. "We must see, we must see," he said. "After all, however, it is not impossible," he added. "Organic creatures ought to live ten times as long as it takes them to reach maturity.' Elephants, according to Dr. Polaillon, are full grown in thirty years, and live three hundred years, and there are many other examples. Man, on the same principle, should live two hundred and fifty years, but he comes to a premature end owing to the conditions of life. Two and a-half centuries would be rather a long extension of the allotted span, but there is no reason why human life should not be materially prolonged by scientific discoveries. Horses, which by the same rule ought to live thirty years are, he added in reply to an objection, in the same condition as man.

ACADEMIE DES SCIENCES.—The annual meeting of the Academy of Sciences has been held at Paris, under the presidency of Monsieur van Tieghem, assisted by Monsieur Maurice Lévy Vice-President. In opening the proceedings, the President gave a *résumé* of the recent progress of science, and sketched the life and work of the members and correspondents of the Academy who had died during the year, viz.:—Messieurs Friedel, Naudin, Frankland, London; Bunsen, Heidelberg; Richards, London; Wiedemann, Leipsig; Marsh, Newhaven; Flower, London; and Ringenbach, Olten. Monsieur Marcel Bertrand, in place of his father, who was slightly indisposed, read a historic sketch of the life and labours of the astronomer, Félix Tisseraud, a former member of the Académie des Sciences.

MERCURIAL MASSAGE FOR RHEUMATISM.—A German doctor has devised a plan for massaging rheumatic joints. He takes the patient's hand and puts it into a deep glass receptacle which is two-thirds full of quicksilver. The mercury exerts an equal pressure on every portion of the fingers, and the pressure increases rapidly as the fingers sink further into it. The hand is alternately plunged and raised about twenty or thirty times at each treatment, and after a second visit there is a marked diminution of the swelling.

AN ACID-RESISTING PAINT.—A German paint for giving to wood great resistance to acids and steam under pressure, consists of two parts by weight of gypsum and one part of asbestos, stirred together with ox blood into a thick liquid. The paint is supplied evenly to wood perfectly dry. After a few hours another coat—with the addition of linseed-oil varnish—is given, and the work is dried by exposure for several days in the open air, or more quickly, over a wood fire. The paint is then steamed slowly, then dried for a considerable time. The coating adheres firmly, is cheap, harmless, odourless and tasteless, and therefore does not affect liquids in vessels covered with it.

AUSTRALASIAN NEWS.

(From Our Melbourne Correspondent.)

INTERCOLONIAL RECIPROCITY.—Notwithstanding a considerable amount of discussion at meetings of the various pharmacy boards and societies on the question of intercolonial reciprocity, recently revived by a circular letter from the Registrar of the West Australian Board, we seem to be hastening very slowly towards the much-desired consummation, the general feeling in the smaller colonies being apparently that some definite scheme should be formulated and submitted from the larger centres before they commit themselves to any decision. And with the failure of the negotiations entered into some two years ago in view, neither New South Wales nor Victoria seems inclined to take the initiative. Discussing a letter from the Pharmacy Board of Queensland, suggesting that a conference should be convened to discuss the subject, the New South Wales Board recently replied to the effect that while it was not adverse to equitable reciprocity, the idea originated in Victoria, whence should come the initiative. The Victorian Board, on the other hand, recognising that the Board of New South Wales was definitely invited, if not appealed to, by the Westralian circular to open the campaign, has been diffident about taking the lead; and at its last meeting resolved that a letter be sent to the N.S.W. Board, asking what course it proposed to adopt, as, until some expression of opinion had been given, the Victorian Board was unable to proceed further.

THE POSITION OF THE VICTORIAN BOARD.—There is unquestionably but little doubt that, had the Victorian Board been a shade more generous in meeting the claims of New South Wales as regards the recognition of those who were locally qualified on the grounds of a three years' apprenticeship, without examination, reciprocity might have been accomplished two years ago, and the *Australian Journal of Pharmacy*, in an editorial on the subject, strikes a note of warning in reference to further negotiations on this point. "One point becomes more strongly impressed upon us as time rolls on—namely, that existing rights must be recognised if reciprocity is to become a fact, and however unpalatable may seem the pill to those colonies who hold the opinion that the educational status of their men is superior to those who seek to stand upon equal terms with them, it is self-evident that the pill must grow larger with delay." Briefly put, the *A.J.P.* scheme for reciprocity is:—As regards registered men, the recognition of all colonial registers—deficiency of term of apprenticeship or of educational value of certificates, as compared with that of Victoria, to be met by a term of practice in business. The other colonies to put themselves in line with Victoria in obtaining amendments of their respective Acts, whereby intercolonial apprenticeship shall be recognised. And, as regards the future, all written examinations to be from papers set and valued by the same examiners (to be intercolonially appointed), the examinations to be held simultaneously. Were the two foremost colonies—New South Wales and Victoria—to agree to some such platform as this, their combined gravity would naturally attract the smaller ones, and reciprocity be speedily achieved. Well, we are hoping for the best.

THE VICTORIAN POISONS ACT AMENDMENT BILL was introduced into the Legislative Assembly and read a first time on September 6, but has not since been heard of. After it had apparently bade adieu to the Legislative Council, it was again recommitted on August 29, and after an animated discussion, a prominent part in which was taken by the Hon. F. S. Grimwade (Messrs. Felton, Grimwade, and Co.), Sub-section 3, Clause 4, was struck out. It provided that "no patent or proprietary medicine consisting of or containing any poison should be sold unless the bottle, etc., con-

taining the medicine bore, conspicuously printed or stamped thereon, the English name or names of the poison or poisons of which the medicine consisted, or which it contained, and the amount present." In opposing this sub-section Mr. Grimwade urged that it would put restrictions on trade which had never existed before, and which did not exist in any other English-speaking community. Victoria would be put under a great disadvantage if the provision were passed, and the other colonies had no such restrictions. It was not at all likely that the proprietors of these medicines would state what quantity of poisons they contained, or what the constituents of their medicines were. Several minor amendments, such as the addition of the words "within the meaning of the principal Act" after the word "poison" in several of the clauses, were also adopted; but, as it now stands, the Bill falls very far short of pharmaceutical ideals, and will prove a very unsatisfactory measure unless considerably modified in its passage through the Legislative Assembly.

Certification of Public Analysts.—Another gratifying illustration has been afforded of the important position in the Victorian educational system filled by the Melbourne College of Pharmacy. Some time ago, at the request of the Department of Public Health, facilities were provided at the College for a course of study for intending candidates for the certificate of public analyst, and the first examination—the first of the kind ever held in the colonies—was conducted recently by three of our leading specialists—Mr. C. R. Blackett, F.C.S., the Government analyst; Mr. Sidney Plowman, F.R.C.S., F.I.C., etc., and Mr. Wm. Sutherland, M.A.

Popular Scientific Lectures in New South Wales.—The first of the series of scientific popular lectures arranged by the Council of the Registered Pharmacists' Society of New South Wales was given by Mr. J. H. Maiden, F.L.S., Government botanist, and director of the Botanic Gardens, Sydney, on September 13, when, under the title of "A Botanist on Mt. Kosciusko," the lecturer, with the aid of photographs and limelight views, gave a vivid and interesting description of the scenery and plant life of our Australian Alps. The following well-known scientists have also promised to give their services gratuitously in filling up the programme—viz., Professor A. Liversidge, M.A., LL.D., F.R.S., Professor of Chemistry at the Sydney University; Professor T. P. Anderson Stuart, M.D., Dean of the Faculty of Medicine, Sydney University; W. H. Hamlet, Esq., F.I.C., F.C.S., Government Analyst and President of the Royal Society of New South Wales; T. Cooksley, Esq., Ch.C., B.Sc., F.I.C., Assistant Government Analyst, Sydney.

The Registered Pharmacists' Society of New South Wales continues to peg away at the Government in connection with the Friendly Society business; but the latest reply from the Crown Solicitor's office is somewhat discouraging. It is to the effect that a Dispensary "having been registered as a Friendly Society under Part III. of the Friendly Societies Act, 37 Vic., No. 4" the Registrar's certificate, "under the decisions of the English courts in similar cases, is, and must be deemed to be, conclusive as to the purposes for which the Society was established, and the Registrar having considered the rules and given his certificate, the Society cannot for the purposes named be deemed to be illegal. Under such circumstances, I cannot advise the Government to interfere. If the Pharmacists' Society consider that their privileges are interfered with, they should seek advice from their own solicitors as to what steps they can take to remedy their supposed grievances." Of course, the Registered Pharmacists' Society are not content to abide by this legal *ipse dixit*, and are now taking steps to bring the subject immediately under the notice of the Legislature.

LETTERS TO THE EDITOR.

Pharmacists and the War.

I have this day come across the following paragraph from one of the Service papers:—

> A circular has been issued by the Royal Army Medical Corps, stating that compounders of medicines are urgently required for service in South Africa; the conditions of enlistment are for a year or until the end of the war; the pay 3s. 6d. a day, free rations, kit, and passage, and a gratuity of two months' pay. There are also conditions as to age and physique. Application should be made to the recruiting staff officers at London, Liverpool, Manchester, Birmingham, or Edinburgh.

For myself personally, I feel utterly indignant at this; it amounts almost to an insult to the Pharmaceutical Council and to the pharmaceutical body at large. Why did not the authorities write to the Council stating their requirements, so that they might have selected as Army pharmacists properly qualified men, who should have received good pay and, for the time they were serving in the Army, have had local rank as lieutenants? What would society say if they advertised for nurses and took them from the old women of Mrs. Gamp's style? What an outcry there would have been! What are compounders of medicine? There is no such class of men recognised. Will they then accept the broken-down drift, and the ever-plucked men, who have given up study through want of brain power, and are therefore useless? In the old past days of the Crimea, a few dispensers were sent out, and were paid in the Crimea 7s. 6d. a day and allowances; afterwards, in India, 12s. 6d. a day. A regulation uniform was recognised. In the Crimea they had local rank as ensign, and in India as lieutenant. The old rank of ensign has long been done away with. I hope no one will come forward to accept the position offered, not from want of patriotism, but because I look on this offer as an insult to the whole body of pharmacists. What a splendid lot of young fellows—efficient, and a real help in every way to the Army—could have been enlisted, if the authorities had approached the Council.

Torquay, December 21, 1899. James B. Guyer.

The Reconstitution of Camwal.

A correspondent of the Journal has expressed the fear (see *ante*, p. 600) that the reconstitution of "Camwal," so as to enable the company to supply hotels, public institutions, etc., will interfere with the business of retail chemists, and deprive them of that privilege for which the company was organised. It may interest your correspondent to know that the retailing of the company's waters is not restricted to chemists in this part of the West Riding of Yorkshire; and that they are freely sold by pernicious stores, grocers, greengrocers, and fishmongers at absurdly low prices. It is to be hoped that the new company will be run on P.A.T.A. or other secure lines, so as to prevent outsiders from defeating the object for which "Camwal" originated.

Halifax, December 21, 1899. Clement Fielding.

Liquor Bismuthi.—Corrections.

We submit the following corrigenda to the otherwise correct report of our paper on liquor bismuthi (see *ante*, p. 604). The second paragraph (p. 604) should read, "adding *citric acid and* solution of ammonia, etc." In the second paragraph on p. 605, read, "0·305 × 4 = 1·22 gramme—dissolve in 10 Mgm. molecules of 5 N nitric acid, *i.e.*, 2 C.c." The following sentence as to 8 N solution should be omitted; it belonged to a subsequent paragraph at bottom of column.

Liverpool, December 26, 1899. R. C. Cowley.
J. P. Catford.

Dispensing Bromoform.

Will any readers oblige by giving their experience in the dispensing of bromoform prescribed for whooping cough?

December 26, 1899. W. R. K. (37/14).

The Plymouth Chemists' Ball.

The annual Ball, originally fixed for Friday, January 12, 1900, in connection with the Plymouth, Devonport, Stonehouse and District Association, has been postponed *sine die* on account of the Transvaal War. This being a military centre it was considered inadvisable to hold the Ball just now.

Stonehouse, Devon, December 22, 1899. F. MAITLAND, *Hon. Sec., Ball Committee.*

Carbon Dioxide in Vats.

In the *Pharmaceutical Journal* for December 23 is a report of the death of William Robb, who died owing to poisoning by carbonic acid issuing from a vat in Messrs. M'Connell's Brewery, and the jury, in returning their verdict, considered there was neglect on the part of Messrs. M'Connell in not taking proper precautions to ascertain the presence of gas in the vessel. It takes, as is well known, a long time to empty vats and other vessels of the carbonic acid gas which is generated in them, but however large their size, they can in a very short time be freed from it by a simple and very inexpensive process, thus:—Mix in the proportion of one pint of liquor ammon. fort. to twenty gallons of water, and with a watering-pot, having a large and finely perforated distributing rose, sprinkle the vat with this mixture; immediately carbonate of ammonia is formed and falls to the bottom like snow, and the sprinkling is continued until no more of the carbonate is formed. Water, through a hose, is now turned on, and the solution drawn off. In an hour the whole process is ended, and by sending down a light it will be seen that there is no danger to anyone descending into the vat to clean it.

North Kensington, W., December 26, 1899. PERCY WELLS.

The Society's Examinations.

It was my privilege to be present at the opening meeting of the North British Branch of the Society in Edinburgh, on November 29 last. Mr. Boa, in his address upon that occasion, made some important statements upon the present position of pharmacy, and, speaking with the authority of an examiner, he advocated the division of the Minor Examination. I can vouch for it, that this opinion was received with great satisfaction by most, if not by all, who were present. Furthermore, Mr. J. Laidlaw Ewing, who surely can speak from knowledge, and Mr. Gilmour—the mover and seconder of a vote of thanks—both went further, and advocated not only division, but also the still more important proposition of making the conditions of examination such that no candidate on re-offering himself for examination would be required to undergo examination a second time in the subject or subjects in which he had previously shown fitness. Now I think it will be admitted that, within certain limits, this is a most important question, and one deserving careful consideration. Now, what are the facts? In the *Pharmaceutical Journal*, we are told in the "Annotations," which are always very readable, that Mr. Boa discoursed pleasantly on (amongst other things) the question of dividing the Minor Examination. With this bare statement, a question which affects the future of our calling quite as much as company-trading, and which at present rests hardly upon hundreds of prospective chemists, is pushed aside. In the second place, only one reader of the Journal has thought it worth his while to record his opinion upon the subject. The thanks of all aspiring graduates in pharmacy are due to "A Country Member" for his letter, published in the Journal of date December 9. It states the case succinctly. But where are our "Town Members" and our "Student-Associates" plodding over their books? Have they no opinion worth expressing upon the matter? Surely I am not mistaken when I say that this question of allowing subjects already passed to stand to a candidate's credit is a deeply and widely felt necessity. It is because I have found it to be so that I (for very shame that no one else has done so) take up the thread woven by "A Country Member"; and whilst weaving my little bit to the web, I would plead with those who have deep and true feelings on the question to make their feelings and opinions known, for only thus can our Council have guidance in its work.

Edinburgh, December 26, 1899. JAMES LENNOX.

Proposed School of Pharmacy Drill and Rifle Corps.

I wish, with permission, to suggest the formation of a School of Pharmacy Drill and Rifle Corps? In the present state of public affairs such a step needs no lengthy arguments to support it. No doubt every student would feel a lively satisfaction in doing his best to become "an efficient defender of his country." Will those who are willing to form such a corps communicate their intention to me, together with any views they may have on the subject? It is necessary first to know at least approximately how many would wish to join the movement. Possibly old "Squaremen" in and around London who have not the time to spare for volunteering would like to join. Inquiries could then be made as to the possibility of the corps becoming affiliated to one of the Middlesex Volunteer Corps. If this could be managed it would give the use of drill hall, rifle ranges, rifles, etc. It is obvious that those who are not permanently settled in London cannot well join the Volunteers for the three years' service. Besides, it probably would require more time than a student could well spare. I propose that Saturday evenings be devoted to drill, etc. Range practice could be readily obtained after Easter on Saturday afternoons. If it is found impossible to become temporarily attached to existing Volunteer corps, then steps might be taken to secure the services of a skilled drill instructor. As the Middlesex County Council is now raising additional Volunteer companies, there is every prospect of an early application on our part receiving favourable consideration.

West End, St. Ives, Hunts, December 27, 1899. F. A. UPSHER-SMITH.

ANSWERS TO QUERIES.

Preliminary Examination (C. R. P.—37/13).—The certificate will be insufficient after August next.

Baking Powder (H. G. M.—36/27).—Yes, the amount of carbonic acid gas in the second powder will be about the same as that in the first, for although it contains more sodium bicarbonate, the whole of that salt is not used up, since the proportion of tartaric acid is not sufficient to neutralise it entirely, as you will find by working out the equivalents. You should reduce the amount of the bicarbonate somewhat, so as to have a slighter excess Alum is most objectionable as an ingredient, and its prohibition is well deserved.

Active Principle of Celery (G. A. B.—37/9).—Probably the volatile oil of celery fruits would be the best thing for you to use. You might combine that in pilular form with the green extract of the fresh green tops, or of the seeds, extracted with dilute alcohol (50 per cent.). The etiolated petioles which we eat probably owe their very slight diuretic property to the trace of volatile oil which they contain. That part of the plant probably contains less of the "active principle" than any other. We believe a liquid extract of celery is made in America, where they make liquid extracts of almost everything. The formula for compound elixir of celery which is prescribed in the States is: Celery fruits, 384 grains; catnip herb, 640 grains; German chamomile, 384 grains; alcohol, (49 per cent.), *q.s.*, simple elixir to make 1 pint. Percolate the drugs to obtain 4 fluid ounces of percolate; then add the elixir and filter. Dose, 1 fluid drachm.

POLITICAL GOSSIP.

Carbolic Acid.—Sir Matthew Ridley, the Home Secretary, replying to Sir John Leng on Friday night, June 23, made the following statement: "I am aware that a considerable number of deaths yearly are due to carbolic acid poisoning, and that it has frequently been suggested that the sale of carbolic acid should be placed under restrictions, such as apply to poisons named in the Schedule to the Pharmacy Act of 1868. Some years ago the Pharmaceutical Society did apply for the insertion of carbolic acid in that Schedule, but it was considered that the gain to the public would not be commensurate with the inconvenience arising from the restrictions, and the application has not recently been renewed. I believe that the Irish Government has scheduled carbolic acid, but that was done under an Irish Act, and without consulting the Privy Council in this country. I understand that the objections to scheduling the poison in England have now been lessened by the fact that regulations for the keeping, dispensing, and selling of poisons within the meaning of the Act of 1868 have now been prescribed, and that the Privy Council is prepared to consider whether carbolic acid can advantageously be dealt with in some way; but it cannot take any step except upon a resolution of the Pharmaceutical Society."

Generally Speaking, the Home Secretary's Statement is satisfactory, inasmuch as it indicates a willingness on the part of the Privy Council, which no doubt was the source of the Minister's inspiration, to sanction the use of existing machinery in putting an end to an anomaly that has assumed the dimensions of a scandal. There is, moreover, an element of gratification in the fact that the answer to Sir J. Leng's well-worded question contains no hint of Ministerial action on the lines of the Poisonous Substances Bill which made its meteoric appearance last Session. But notwithstanding these good points, the words of Sir M. W. Ridley on Friday convey an impression—and it is not altogether unnatural in a Departmental reply—that the Council of the Pharmaceutical Society has been somewhat lax in the performance of its statutory duties. The implied impeachment is delicately veiled in the reference to the recently-adopted Poison Regulations. Practically the pharmaceutical authorities are told that in the absence of the Regulations contemplated by Section I. of the Pharmacy Act, all resolutions under Section II. of the same Act could only be of academic value; and that whilst the Society persisted in putting Section II. before Section I. it was only engaged in the ineffective operation of putting the cart before the horse. There was, unfortunately, something in this charge, but now that the relations between animal and vehicle have been properly adjusted any mistaken tactics and shortcomings of the past may be left for the historian.

A Second Indictment is contained in the assertion that the Council has not recently renewed its application to have carbolic acid placed among the poisons, and that no action can be taken until the Society puts in motion the provisions of the Statute relating to the scheduling of poisons. This is distinctly misleading to the public and not quite fair to the Society. The Privy Council has still two resolutions before it affirming that carbolic acid ought to be a poison within the meaning of the Act, and although they were passed in the pre-regulation or "topsy-turvy" days, they have never been the subject of official repudiation. The Privy Council could, if it had deemed expedient, have given effect to either of those resolutions immediately after Mr. Walter Hills had completed his "good day's work" in carrying the Poison Regulations. But no such action was taken, and one was perfectly justified in assuming that the former well-known attitude of the Government in respect to restricting the sale of the substance in question would be maintained. The position being now distinctly clearer, the Government and the public need be under no misapprehension that the Pharmaceutical Society will fail in its duty. As we read it, the answer to Sir John Leng's question is a definite invitation to the Council of the Society to send to the Privy Council another resolution in slightly different terms to those already forwarded—a resolution which, whilst embracing the more dangerous forms of carbolic acid, shall not interfere with the free distribution of innocuous preparations that have obtained a certain amount of popularity on account of their real or fancied antiseptic value. We understand that a Committee of the Council has already met to grapple with the question.

The Food and Drugs Bill has not yet been reached, and Mr. Balfour has informed the House that it will not be taken till some time in July. Petitions for amendment of the Bill have reached Parliament from Glasgow, Tenbury, and other places whose geographical position is not so generally known. There are also ten pages of amendments now on the notice paper, hence there is good ground for supposing that the Bill will occupy a considerable portion of Parliamentary time when it is considered. The opposition is not confined to the Liberal members, for General Laurie (Pembroke) and Mr. Bartley (Islington, N.) are among the non-contents; the former desiring to restrict the operation of the provisions establishing the invoice as a warranty, and the latter being deeply interested in the margarine clauses.

The Lords' Bills Relating to the Company Question still stand where they did, and the Session is sufficiently advanced to warrant the belief that they are to be shelved. Mr. Swift MacNeill's outburst last week in the House of Commons has apparently not penetrated the Upper Chamber. The President of the Board of Trade, in an address to a gathering of City merchants at the Mansion House on Wednesday, followed Mr. MacNeill's lead by publicly denouncing the supineness of the Lords in reference to the Companies Bill. The right honourable gentleman stated that if he could have his way next Session he would bring the Bill into the Commons first. Mr. Crombie (Kincardine) is also amongst the anxious ones. He will ask Mr. Balfour on Friday, June 30, whether he expects to pass the Companies Bill this Session.

SCOTTISH NEWS.

Edinburgh Chemists', Assistants', and Apprentices' Association.—The second botanical excursion took place on Friday, June 16, to Royston, going by train from Waverley Station at 8.20 p.m. to Granton and walking along the shore, where many interesting maritime plants were found. There was a good attendance, and the party was conducted by the President, Mr. Fraser McDiarmid. The return journey was by train from Craigleith at 10.42 p.m. It was felt that if chemists had shorter hours and could start an hour earlier, much better work could have been done, as darkness came on far too soon for the plant-hunters — The second summer meeting was held in the Pharmaceutical Society's House, 36, York Place, on Wednesday, June 21, Mr. David Harley, Vice-President, in the chair. The plants collected by members were named and described by Mr. Rutherford Hill. After the demonstration the Association elected Mr. James Lennox, 139, Princes Street, to the vacant office of Secretary. The meeting then closed.

Mr. Robert Tocher, pharmaceutical chemist, Maybole, N.B., and Walter Stavert, chemist and druggist, Selkirk, have passed at the June examination of the Worshipful Company of Spectacle Makers in London. There were 140 candidates, of whom twenty-three were registered chemists.

Edinburgh Pharmacists and the Lord Chancellor's Proposals.—Taking advantage of the Parliamentary vacancies in South and East Edinburgh, a joint meeting of registered chemists having votes, convened by Messrs. James Paton and Claude F. Henry, the respective divisional secretaries, was held in the Pharmaceutical Society's House, 36, York Place, on a recent date. Mr. J. Laidlaw Ewing was called to the chair, and after a free interchange of opinion it was agreed to send to each of the four candidates a memorandum pointing out that Clause 2 of the Companies Acts Amendment Bill proposes to confer the titles of "pharmaceutical chemist" and "chemist and druggist" on others than those who have passed the examinations provided for by the Pharmacy Acts, 1852 and 1868, which confer and protect those personal titles for the safety of the public. Those titles, it was urged, imply a personal qualification on the part of those using them; and the general use of such personal titles by parties not possessing, and incapable of acquiring, the qualification implied therein would destroy the statutory significance of the said titles and prove misleading to the public. Registered chemists, therefore, objected to the passing of the Bill with that clause. In reply to a request for favourable consideration of this memorandum, both the candidates for South Edinburgh agreed to oppose the objectionable clause. Major-General A. G. Wauchope said he fully realised the importance of the question raised, both to the

chemists and to the general public, and he would do anything in his power to prevent the sale and dispensing of drugs by any but fully competent and qualified men. If elected, he would oppose Clause 2 of the Companies Acts Amendment Bill, so that chemists might have time for fuller consideration of the matter. Mr. Arthur Dewar, advocate (who proved to be the successful candidate), said that if elected he would oppose Clause 2 of the Companies Acts Amendment Bill, so that chemists might have further time to consider the matter. The candidates for East Edinburgh also replied, Mr. Harry G. Younger saying that he quite agreed with what the pharmacists wished, and would, if elected, oppose the passing of this clause. Councillor George McCrae, the successful candidate, said if elected he would oppose the clause so that chemists might have time for fuller consideration. It was found necessary in each case to explain the matter carefully to the candidates, and it was felt to be expedient to limit the matter to the withdrawal of the Lord Chancellor's proposals in the meantime, without attempting to discuss or bind candidates to any details of any further proposals.

The Glasgow Apothecaries' Company.—A social meeting of the employés of this Company was held on Monday last at the Cobden Hotel, Glasgow, and Mr. John Arnot presided over a large and representative gathering. The occasion was the presentation of a handsome testimonial to Messrs. Bain and Wilson, who have left the service of the firm to take over the business at Hawick conducted by Mr. Thomas Maben, Ph.C. The gifts were handed over by the Chairman with a few happy words, and the recipients thanked their fellow-workers for the kindness shown them. A varied musical programme was provided and a most enjoyable evening spent.

ENGLISH NEWS.

The Students of the Imperial College of Chemistry, under the guidance of the principal, Mr. Frederick Davis, visited Brin's Oxygen Works on Friday, June 23. The party was received by Mr. K. S. Murray, the Secretary, the methods employed by this company being explained in detail by the chief engineer. Air is passed over barium oxide heated by coke fires to a temperature of 1400° F.; the barium oxide retains the oxygen, becoming converted into barium dioxide; the nitrogen is permitted to escape whilst the barium dioxide is still further heated, parting with the oxygen previously absorbed from the air and is conveyed into gasometers. The testing of the cylinders in which the gas is sent out proved of great interest. Each cylinder is filled with water and subjected to a pressure of a ton and a half, and whilst in this condition is sounded by hammers. Dr. Hampson, who was introduced by the Secretary, then prepared some liquid air, and whilst the liquid boiled at a temperature of 191° C. introduced mercury, which immediately became a solid block; this block was handed to the students. Similarly, a common pliable French nail was immersed in the liquid air and upon removal from the fluid was snapped by a sharp blow. A solid piece of brass was then placed in the liquid air and was afterwards transferred to a vessel of water, causing the water to become a solid block of ice. Several further experiments were carried out, after which Mr. Frederick Davis thanked Dr. Hampson on behalf of the students.

Saturday by the Sea.—The seventh annual outing of the employés of Messrs, C. R. Harker, Stagg, and Morgan was held at Southend-on-Sea on Saturday last. Mr. S. R. Collis occupied the chair, and in a few appropriate words gave the "Health and Continued Prosperity of the Firm," and referred to the absence, through death and illness, of a few of the old faces that he was accustomed to see at the annual gathering. Mr. Rowland Stagg, jun., responded, and was desired to convey the thanks of all present to the firm. The afternoon and evening were spent in excursions on sea and land, and all left by a late train for London, having had a most enjoyable day.

Literary Intelligence.—The following books will shortly appear:—'A Text-Book of Physics,' by Professor Andrew Gray, F.R.S., Professor of Physics in the University College of North Wales. To be issued in three parts. Part I. will be on Dynamics, Properties of Matter. 'A Handbook on Chemistry and Physics,' for students preparing for the first examination of the Conjoint Board, under the joint authorship of Messrs. Corbin and Stewart. 'Notes on Folkestone,' by Dr. Larking. 'The Pathologists' Handbook,' a manual for the post-mortem room, by Dr. T. N. Kelynack, Demonstrator in Morbid Anatomy at Owens College, Manchester. 'Medical Electricity,' for the use of students and practitioners, by Dr. W. S. Hedley, Physician in Charge of the Electro-Therapeutic Department of the London Hospital. The above books will be published by Messrs. J. and A. Churchill.

Midland Chemists' Assistants' Association.—A Committee meeting of this Association was held in the Exchange Rooms, Birmingham, on Wednesday, June 21, when the following were elected officers for the coming session: President, Mr. W. F. Cox; Vice-Presidents, Messrs. F. A. Spear and F. Foster; Treasurer, Mr. A. Billington; Secretaries, Messrs. W. Holland (finance) and A. H. Bell (literary).

Messrs. C. J. Hewlett and Son's Annual Outing for the staff was held on Saturday, June 24, when over fifty of the senior members left London by train for Portsmouth. The morning was spent in visiting the dockyard, training ships, etc., and dinner served at the Hyde Park Hotel, Southsea. The chair was taken by Mr. E. J. Millard, and the toast of "Success to the Firm," proposed by Mr. T. B. Fickling, senior town representative, was received with enthusiasm. In reply, Mr. Millard referred to the number of those present who had been connected with the firm for over twenty years as a proof of the excellent relations existing between employers and employed. In the afternoon the majority proceeded by steamboat to Cowes, the return to London from Portsmouth taking place at 7.15 p m. The weather throughout was perfect, and, thanks to the liberality of the firm, a most enjoyable day resulted.

Poisoning by Ammonia.—On Saturday, June 24, an inquest was held at the Coroner's Court, Holloway, with respect to the death of an organ-builder named William Hunt, of 41, Maryton Street, Holloway, who went into his kitchen for a drink of some kind. He found a bottle with a publican's label upon it, and, thinking he had found whisky, took a draught. Unfortunately, the bottle contained ammonia, for cleaning cloth, and in a few hours Hunt was dead.—A verdict of "Death by misadventure" was returned.

The Wellcome Club and Institute.—At Dartford on Saturday last Mr. Henry S. Wellcome formally inaugurated an excellently-appointed club and institute for the benefit of the eight hundred odd employés of Messrs. Burroughs, Wellcome and Co., of Dartford and Snow Hill, London. For the purposes of the new club and institute Mr. Wellcome has acquired the old Manor House formerly known as Acacia Hall, with a large adjacent flour mill and other buildings, together with extensive grounds in a picturesque part of the valley of the River Darent. The Manor House has been transformed into a most comfortable club for members of the professional staff, the mill into a capital club house for the female employées, and a building called the Tower House has been conveniently arranged as a club and institute for male employés not included in the professional staff. Many visitors from London were present at the festivities held in connection with the opening ceremony. On arriving at Dartford they witnessed from the railway platform, which overlooks the firm's works and laboratories, some well-executed fire-alarm drill on the part of Messrs. Burroughs and Wellcome's fire brigade. Proceeding afterwards to the parish church, they took part in a brief inauguration service conducted by the vicar, the Rev. P. E. Smith. The formal opening of the club and institute then took place, after which came a luncheon in a marquee erected in the club grounds, the company numbering about 1300. Mr. Wellcome, in proposing "The Employés," remarked that it had always been the policy of the firm to consider the welfare of everyone associated with them, and the result was that they had won not only the hand-work but the heart-work of those who served them. After luncheon the whole company assembled on the recreation ground, where they had the pleasure of witnessing a prettily-designed "May Queen" procession, followed by a Maypole dance, athletic sports, tea in the marquee, a musical bicycle ride, aquatic sports, and tugs of war. The prizes won in the sports were subsequently presented by Mrs. A. Chune Fletcher, and the festivities wound up with a firework display and an illumination of the grounds.

Poisoning by Laudanum.—At an inquest held on June 14, concerning the death of Wilfrid, aged four weeks, son of Septimus Drinkhall, labourer, Culcheth, the jury returned a verdict of death from misadventure. Evidence was given that Mrs. Drinkhall sent her daughter Florence, aged eight, for some cordial to Mr. Worden, beerhouse keeper, grocer, and vendor of "patent" medicines, but by mistake she asked for and was supplied with laudanum. The bottle was not labelled "poison," nor did Worden ask for what the drug was intended. Mrs. Drinkhall gave the child the laudanum, death resulting fourteen hours later. —Coroner Brighouse said it was monstrous that because people got a 5s. licence to sell "patent" medicines the Legislature should allow them to sell unlabelled bottles containing nobody knew what. Practically the death was due to Worden, and there would be a miscarriage of justice if he was not prosecuted by the Pharmaceutical Society.

Earth Currents and Electric Traction.—Several views have been put forward as to the cause of the earth's magnetism, and Professor Rücker recently discussed them in a lecture delivered at the Royal Institution. By some physicists it is held that it is due to the existence of electric currents far down beneath the earth's surface, while others contend that there is a magnetisable substance within the earth. By means of an instrument devised by Mr. Henry Wilde, it is possible to produce much experimental evidence in favour of the latter theory, by reproducing the known magnetic condition of the earth on a geographical globe specially arranged for the purpose. While withholding complete adherence to this theory, Professor Rücker considered that there was much to be said for it, and that it was not physically impossible. One difficulty lies in the determination of the nature of the magnetisable substance. It is not magnetite, and perhaps it is not iron. All things considered, terrestrial magnetism may be classed as one of the most backward of sciences. The magnetic currents that are found near the surface of the earth next received attention. It is difficult to say whether islands and mountains that possess magnetism possess that property as a result of induction or whether they are permanently magnetised. The investigations recently made in the atoll Funafuti show that at a depth of about a thousand feet the matter obtained by boring is magnetic. It is believed that the magnetic property is not due to induction in this case but to the volcanic origin of the reef. Speaking of artificial electric currents, the lecturer drew attention to the danger which they threaten to magnetic observatories. Two American observatories, one at Toronto the other at Washington, have suffered severely from electric railways, so much so that the former has been ruined and another set up in its stead at a distance of about eight miles from the railway, while the Washington authorities contemplate a similar move. It remains to be seen whether industrial improvements of an electrical character can be combined with properly equipped laboratories for making magnetic observations. It is true that the difficulties experienced in America were largely due to the unscientific way in which the lines were laid down. At the present time the engineers connected with electric enterprises are doing all they can to prevent leakage by avoiding the old custom of putting currents to earth and by insulating the return wires. The next two years will be an anxious time for all connected with observatories, since it is important to preserve the continuity of observations which have been made regularly, *e g.*, at Kew during the past forty years. Improvements are constantly being made; thus at Charlottenburg the engines are provided with accumulators. Continuous currents are the most dangerous in respect of their effect on observatories. Professor Rücker concluded by discussing the possibility of currents flowing from air to earth and *vice versâ*.

The Purity of Drugs.—Physicians may prescribe, but, after all, the worth of the remedies they order is determined by the activity of the drugs that are put into the bottle. We are happy to believe that with the average respectable chemist their patients are safe, but a slight consideration of the matter from the point of view of probability must convince the most confiding customer that now and then he does not get what he pays for. Nay, more, in the rare instances in which local authorities have troubled to test pharmaceutical products a fair proportion of convictions have followed under the Sale of Food and Drugs Acts; indeed, a more strenuous application of those salutary measures is much to be desired in the interests of the public. What can be more desirable, for instance, than the systematic supervision of the purity of drugs used as medicines? Yet in the vast majority of cases no samples are taken by the sanitary boards of our local authorities. Perhaps the new districts created by Mr. Balfour in the metropolis will find time to look into this important matter, and set an example to the provinces. In America, the Massachusetts Board of Health analysed 1380 samples of drugs in the year 1896, and found 156, or 11·3 per cent., impure. The percentage of similar adulterations during the four years preceding was 11 per cent. Among the drugs implicated were spirits of nitre, rhubarb, and vinum ipecacuanha. Clearly the matter is worthy of a little more attention on this side of the Atlantic.—*Medical Press.*

Ferruginous Eggs.—It may truly be said that there is scarcely any branch in which medicine has not advanced within the last twenty years, but in no one branch has more improvement been shown than in the compounding and putting together of drugs. No more is the unwilling patient to swallow large doses of nauseating medicine, for sugar-coated pills, capsules, and wafers have come into use, and the patients can now take the most vile-tasting medicines without discomfort. According to a Transatlantic contemporary, an ingenious person has come forward with a still more ingenious plan which opens up to pharmacy unbounded possibilities of going still further ahead. On account of the difficulty of assimilating iron as a medicine, a French chemist has sought to introduce it in a digestible way by what he terms ferruginous eggs. Hens can digest iron easily while rendering it back through the albumen of their eggs in a form which is easily digested by the weaker stomachs of mankind. A salt of iron is given to the hens with grains of wheat. A dozen of these medicated grains of wheat a day make the hens, after three or four days, lay eggs which are very rich in iron already digested. The chemist in question is said to be experimenting further with other drugs, and it is not without the bounds of possibility that we shall shortly be able to take our medicines in the form of eggs.—*Grocers' Review.*

Grocers and the Pharmacopœia.—The Bradford and District Grocers' and Provision Dealers' Association has issued to all members of the trade a copy of the following circular:—We beg to call your attention to several recent prosecutions under the Food and Drugs Act, for selling articles that are included in the British Pharmacopœia and that are not of the nature and strength required by law. We therefore advise you that if you have any of the articles named below, or others that are included in the B.P., to at once satisfy yourself that these are of the nature and strength required. If you have purchased from a firm of any reputation you will have no difficulty in making arrangements to exchange the goods. But it is of importance that you look into this matter. Hoping you will understand the motive in which this advice is sent to you, we are, sir or madam, yours obediently (for the Committee), H. Horsman, Secretary.

Milk of sulphur.	Chlorodyne.
Liquorice powder.	Fellows' syrup of hypophosphites and others.
Camphorated oil.	Parrish's food.
Tincture of rhubarb.	Winslow's syrup.
Seidlitz powders.	Perry Davis's pain killer.
Sal volatile.	Oxalic acid.
Gregory powder.	Salts of lemon.
Sweet spirits of nitre.	Ground ginger.
Arsenical soaps.	Pepper.
Kaye's essence of linseed.	

—*Grocers' Review.*

Thomas W. Bartlett and Alexandra B. Creak, Physicians and Surgeons, Erith.

ITEMS OF INTEREST.

Dammar Resin.—Dammar is obtained from *Dammara alba*, *Hopea splendida*, *Hopea micrantha*, and *Engelhardtia spicata*—trees indigenous to the Moluccas. The resin occurs in irregular, colourless, or light yellow transparent lumps with a dull surface and scaly fracture; it softens when warmed in the hand, is quite pliable at 75° C., melts to a viscous liquid at 100° C., and is perfectly fluid at 150° C. It is completely soluble in fatty and ethereal oils, in benzene and in chloroform; partially soluble in alcohol and in ether. A. Zucker states that its constituents are dammaryllic acid 80 per cent., resins 19 per cent., and gum about 1 per cent. The resin is secreted in tears from large knotty formations growing near the roots or on the lower part of the tree trunk. Dammar varnish is noted for its clearness, but is much less hard and lasting than copal varnish; it is, however, indispensable for oil paintings. The so-called Australian dammar is Kauri copal; this is derived from the Kauri pine of New Zealand. The dammar trees never grow in numbers together, but in widely scattered groups, giving a very peculiar appearance to the landscape. Some of the trees are 30 mètres high, and have a diameter of 4 to 5 mètres. The resin is at first milky and changes later to a yellow amber colour. All the branches of the tree are full of resin, which drops and collects at the foot in large masses. The size of these masses depends greatly on the weather during the season of excretion. These large pieces are getting scarcer every year, as the Chinese, who monopolise the trade, break up the impure lumps which rank as second quality into small chips, which appear more transparent and are then suitable for being mixed off with the first quality with little fear of detection. This adulteration has now been checked by the Chamber of Commerce, at Batavia, but, on account of depreciation in prices, 28 per cent. of dust is still allowed to be mixed off with the bulk.—*Pharm. Ztg.*, **44**, 6.

Decorating Glass and Distinguishing False Diamonds by Means of Aluminium.—According to a discovery by C. Margot, aluminium seems to be destined to play an important part in the decorative arts. Margot found that, with a pencil of aluminium, distinct writing can be traced on smooth surfaces of materials containing silicic acid, such as glass, porcelain, etc., and that the letters adhere so firmly to the respective materials that even continued rubbing with moist substances will not remove them. If the characters are treated with strong hydrochloric acid or caustic potash, the metal disappears gradually, but leaves on the surface distinct traces as if etched. Hence the soft metal must actually combine more or less with the hard, siliceous substance. An indispensable condition for the production of distinct characters or designs is a most thorough cleaning of the surface, and the removal of even the slightest trace of grease, by polishing with chalk, as even the thinnest layer of grease would prevent the metal pencil from marking properly. Shortly before writing the material is breathed upon, whereby an easier touch of the pencil is effected. The metallic characters and designs may be given such a lustre by treatment with the burnisher and oil that it is not possible to distinguish them from inlaid silver. Magnesium, cadmium, and zinc also possess this writing capacity for glass and similar materials, but the ease with which they oxidise renders them too perishable and without permanent gloss. This property of the above-mentioned metals to act upon substances containing silicic acid may be practically utilised for distinguishing genuine diamonds from the imitation article. The latter, as regards fire, cannot sometimes be distinguished from genuine ones, although they are but paste, as a rule. But they are characterised as such, beyond a doubt, by aluminium, magnesium, cadmium, and zinc pencils.—*Scient. Amer.*, **80**, 135, after *Deutscher Uhrmacher Kalender.*

A New Coating, which is said to successfully protect posts and other timber surrounded by earth from rotting, is prepared, according to the *Baugewerkszeitung*, from resin, 50 parts; finely-crushed chalk, 40 parts; fine white sharp sand, 500 parts; linseed oil, 4 parts; native red cupric oxide, 1 part; and sulphuric acid, 1 part. First heat the resin, the chalk, the sand, and the linseed oil in an iron kettle, then add the oxide and the sulphuric acid, with caution, mix everything carefully, and paint the wood with the hot mass, using a strong brush. If the mixture is not liquid enough, it is diluted with a little linseed oil. When the coating is dry, it forms an extremely hard varnish, which allows no moisture to enter. —*Scient. Amer.*, **86**. 135.

Heliotropin.—Molten heliotropin forming a brown fluid is useless to the perfumer; the crystals, therefore, should be kept in a cool and dark place during the summer months. A temperature of 30° C. having a deleterious effect on its perfume, heliotropin should not be bought in large quantities during the hot season. Consumers residing in hot climates should, upon the receipt of heliotropin, dissolve it at once in alcohol and keep this solution in a cool and dark place, in order to preserve the flavour unimpaired. So-called amorphous heliotropin, consisting of a mixture of heliotropin and some vanillin with the inodorous and inert anisic acid, seems to have been withdrawn from the market.—*Schimmel's Bericht.*

Bixa Orellana as an Anti-Emetic.—A decoction of the leaves of the annatto plant is used in Paramaribo as an anti-emetic. J. S. Gurie has isolated a glucosidal bitter principle from them which is readily soluble in alcohol and chloroform, but only slightly so in water.—*Pharm. Zeit.*, **44**, 108, after *Nederl. Tijdschr. voor Pharm.*

Orthoform for Dog Sickness.—The only drug which has given any good results in the treatment of the prevailing epidemic among dogs is stated by F. Hobday to be orthoform. This is given in doses ranging from 2 to 15 grains every four or six hours. It should be given either as a powder or rubbed down with glycerin, olive oil, or mucilage. The symptoms of the affection which is now prevalent resemble those produced by an irritant poison, persistent vomiting being most marked.—*Vet. Record*, **11**, 598.

Blindness Caused by Ginger.—A. G. Thompson some time ago recorded a case of toxic amblyopia caused by ginger. H. Woods, in the *Ophthalmic Review*, has recently fully described six more. Although the ginger was taken in the form of an alcoholic essence, the toxic effect cannot be attributed to the alcohol alone. —*Quart. Med. Journ.*, **7**, 267.

Cod-liver Oil and Digestion.—Wirshillo finds that the ingestion of cod-liver oil has an unfavourable influence on healthy digestion; it diminishes the amount of hydrochloric acid and of pepsin, the latter being more affected at the beginning of the process of digestion; and that the secretion of the gastric glands is weakened, but that they remain longer active than when oil is not present.—*Internat. Med. Journ.*, **8**, 285, after *Vratch.*

Theobromine Solution.—Trisodic phosphate acts as a solvent on theobromine, the alkaloid dissolving to the extent of 1:50 in aqueous solutions of that salt. The solution thus obtained has the advantage over diuretine of not irritating the mucous membrane. Brissemort recommends the following formula for its administration. Theobromine, 1 Gm.; trisodic phosphate, 4·5 Gm. Dried egg albumin, 0·5 Gm.; distilled water to 80 Gm. To be taken twice to four times daily in a little warm milk.—*J. de Pharm. d'Anvers*, **55**, 146.

Products Obtained by the Chemical Treatment of Cellulose.—PARCHMENT PAPER.—Unsized paper is immersed in sulphuric acid of 50° B. and the excess of acid removed by washing. PARCHMENT PAPER SUBSTITUTE (Pergamyn).—Cellulose sulphite is milled for a long time and made up into paper. CELLULITH.—On continued milling of cellulose sulphite an amorphous product is obtained, which evaporates to a dry horny substance. VULCAN FIBRE.—Unsized paper is immersed in a solution of zinc chloride and several layers united together by mechanical pressure. CELLULOID.—Nitrated paper is pulped with water, the mass mixed with camphor and pressed out into sheets. Soaked in alcohol the sheets become pliable at 125° C., so that they may be moulded into any form. PEGAMOID—Is composed of paper or tissue dressed with a coating of celluloid mixed with castor oil. Pegamoid paper thus dressed on both sides resembles animal parchment. Ink-marks can be washed off, but not print. Pegamoid paper is very serviceable for wallpapers and showcards exposed to the influence of the weather. Cotton tissues dressed with pegamoid substance are stamped out into imitation pressed art leather. CELLULOSE SILK is nitrated cellulose spun into threads from a liquid solution and denitrated. VISCOSE is cellulose sulphocarbonate dissolved in water. VISCOID is the amorphous cellulose obtained from vicose.—*Pharm. Central.*, **40**, 159, after *Ztsch. f. angew. Chem.*

PRACTICAL PHOTOGRAPHIC NOTES.

Whilst Bromide Paper has come to stay and will probably always find adherents, there is a good future for a printing-out paper which shall, with or without toning, give a black image. Such a paper ought not to be difficult to prepare. At the present time most of the printing-out papers may be considered to depend upon the action of light upon the chloride and an organic salt, generally the citrate or tartrate of silver with free silver nitrate. The method of making the emulsion is to form the chloride and organic salt by double decomposition, and in consequence of the free silver nitrate it is impossible to wash the emulsion to free it from the inert nitrates of ammonia, etc., which are formed. To these and to the free silver nitrate is due the difficulty of keeping the paper. The former, being hygroscopic, is liable to attract moisture, in the presence of which the silver nitrate combines with the gelatin and the fibre of the paper to form coloured compounds without the action of light.

For Warm Tones, as already stated, longer exposures must be given, and for cool to warm sepias the exposure must be five or six times that for black, and the developer should be—

Concentrated developer as above	250 C.c.
A.C. solution	25 to 32 C c.
Water	to 1000 C.c.

The A. C. solution is—

Ammonium Bromide	50 Gm.
Ammonium Carbonate	50 Gm.
Distilled Water	to 1000 C.c.

For warm brown to red tones the exposure should be increased from six to eight times, and the developer is—

Concentrated	125 C.c.
A.C. solution	31 C.c.
Water	to 1000 C.c.

For red chalk tones the exposure is increased eight or ten times, and the developer is—

Concentrated	50 C.c.
A.C. solution	25 C c.
Water	to 1000 C.c.

Of all the tones the most pleasing are the sepias, and there are very few subjects which they are not suitable for.

Professor Valenta, of Vienna, points out that many of the amines may be used for making toning baths for silver papers, and that the best is *m*-phenylendiamine, which has the formula $C_6H_4 < \begin{matrix} NH_2\ (1) \\ NH_2\ (3) \end{matrix}$ and is made from *m*-dinitrobenzol by reduction with tin and hydrochloric acid. The hydrochlorate forms small white crystals, easily soluble in water with an acid reaction. This salt very quickly reduces gold salts, but platinum salts by no means so readily, and he suggests the following formula :—

Potassium Chloroplatinite solution, 1 per cent.	5 to 10 C.c.
M-phenylendiamine solution, 1 per cent.	5 to 10 C.c.
Water	100 C.c.

The prints should be washed for a short time and then immersed in the above bath, in which they assume very quickly an intense platinum black tone, with pure whites, and then fixed in a 10 per cent. solution of hypo.

If Blue-Black Tones are wanted, the prints should be first toned for a short time in the following gold bath :—

Borax	10 Gm.
Sodium Acetate (fused)	10 Gm.
Gold Chloride	0·5 Gm.
Water	1000 C.c.

and then thoroughly washed and immersed in the platinum bath; if the prints are not thoroughly well washed between the gold and platinum baths, the gold is reduced all over the whites of the print.

Pyrogallic Acid Solution.—At a recent meeting of the Photographic Club an interesting piece of evidence was given of the keeping qualities of pyrogallic acid solution when properly compounded and stored in well-closed bottles. A bottle was brought from the Club dark room bearing the inscription that the solution it contained was mixed in 1887 by the following formula :—

Pyrogallic Acid	1 oz.
Sulphite of Soda	3 oz.
Boiled Water	to make 10 oz.

made acid with meta bisulphite of soda. It was further recorded that the solution was tested against a freshly-mixed solution made by the same formula, and it was found not to have deteriorated and the remainder rebottled, a smaller bottle being used. The solution remains almost colourless.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

June 29, 1899.

Business, as might have been expected, has been decidedly restricted during the past week, while the changes in values which have taken place are comparatively quite unimportant. Ipecacuanha maintains its price in spite of the late arrival, which turns out to be only 50 bales, it being asserted that further supplies cannot be expected before October. Price of Cocaine has so far not been advanced. Quicksilver is stated to be very firm, it being believed that a further advance in price is not unlikely. Acid Citric has been advanced in price by the makers, who are apparently not anxious to book orders, even at the advance. Opium is dearer, and the more especially as regards price in Smyrna. Morphia and Codeia very firm. Acid Carbolic is also firm. Oil of Lemon is dearer. Cod-liver Oil and Glycerin quiet; same may be said of Sulphate of Ammonia. Permanganate of Potash partly maintains the improvement which was lately reported. Quinine and Sulphonal remain practically *in statu quo*. The following are actual prices for articles of principal interest :—

Acetanilide—Dull and weak at 10½d. to 1s. per lb., according to quantity and make.

Acid Carbolic.—Refined is in good demand at very firm prices, say 6⅝d. to 6¾d. per lb. for the 35°-36° Ice Crystal in large bulk, other qualities and packing being quoted at proportionate prices. An advance in value is considered not improbable. Crude steady at 2s. 1½d. per gallon for the 60° F., and 2s. 8d. per gallon for the 75° F. Liquid, 95 to 98 per cent., of pale straw colour, 1s. 2d. to 1s. 3d. per gallon, according to quantity, in 40-gallon casks.

Acid Citric.—Makers' price has been advanced to 1s. 8d. per lb. There are, however, sellers from second hand at 1s. 7½d. per lb. for crystals, in 5-cwt casks.

Acid Tartaric.—Foreign is rather dearer at 1s. 0¼d. per lb., c i.f., English being still quoted 1s. 1d. per lb.

Ammonia Compounds.—Bromide, 2s. 2d. per lb. Carbonate, 3d. to 4d. per lb., according to packing and make. Muriate, chemically pure, 30s. to 32s. 6d. per cwt.; commercial, free from metals, 25s. 6d. to 27s. 6d. Iodide, 14s. 6d. per lb. Sal Ammoniac : Sublimed firsts, 35s.; seconds, 33s. per cwt.; crushed for batteries, 2s. per cwt. more. Sulphate quiet; grey prompt, 24 per cent., London, £12 7s. 6d. per ton; Hull, prompt, £12 6s. 3d.; Leith, prompt, £12 6s. 3d. to £12 7s. 6d.; Beckton, prompt, £12 7s. 6d.; July-Dec., £12 3s. 9d.; Beckton terms, £12 2s. 6d. to £12 3s. 9d. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb., according to quantity.

Antimony.—Regulus, £39 to £40 per ton; crude Japan (Black Sulphide), £24 10s.

Antipyrine and Phenazone—Are steady at unchanged values.

Arsenic.—The market is quiet but steady, quotations being,

nominally, white or yellow lump 33s. per cwt., powder 20s. per cwt.

BISMUTH AND SALTS—Unchanged at 5s. per lb. for the commercial quality of the metal, 5s. 8d. per lb. for the carbonate, and 5s. 1d. per lb. for the subnitrate.

BLEACHING POWDER (CHLORIDE OF LIME).—English is still quoted £6 per ton.

BORACIC ACID—Steady at unchanged prices, viz., 25s. per cwt. for crystals, and 27s. per cwt. for powder.

BORAX—Is quiet but steady at 16s. per cwt. for crystals, and 16s. 6d. for powder.

BROMINE AND BROMIDES.—Bromine is quoted 2s. 2d. per lb. in case lots (60 lbs.). Potassii Bromid., 1s. 10½d. per lb. Sodii Bromid., 2s. 1½d. per lb. Ammon. Bromid., 2s. 2d. per lb.

CAMPHOR.—Market is quiet, but steady at unchanged price, both for crude and for the refined article.

CASTOR OIL—Firmer. Belgian first pressing, spot, £25 10s.; second pressing, £23 10s. per ton ex-wharf. Hull manufactured, £23 15s. to £24 per ton, in barrels; 2⅞d. to 3⅛d. per lb. in cases, for prompt delivery, ex-wharf, London. London pressed, 24s. 6d. per cwt. in barrels; French, 23s. 6d. to 25s. 6d. per cwt.

CLOVES.—Privately the market for Zanzibar exhibits a steadier tone, but business is on a small scale at 3⅛d. to 3$\frac{5}{32}$d. for Oct.-Dec. delivery. At auction 9 cases picked Penang were bought in, no Zanzibar being offered.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 8½d. per gallon; pure, 1s. 3d. per lb. Benzole, 50 per cent, prompt 7½d., July-Dec. 8d.; 90 per cent., prompt 6¾d., July-Dec. 7¼d. per gallon. Creosote, 3¼d. to 3⅜d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 3d. Solvent Naphtha, 95 per cent. at 160° C., 1s. 4d.; 90 per cent. at 160° C, 1s.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene, A, 3¼d.; B, 2½d. per unit. Pitch, 32s. 6d. per ton, f.o.b. Tar, crude or refined, 14s. per barrel, 2½d. per gallon.

COCAINE.—Makers are very firm. They have, however, so far made no alteration in their prices, which remain at 11s. 3d. to 11s. 9d. per oz., according to quantity and brand, for the Hydrochlorate in 25-oz. tins.

CODEIA.—This article is in very good demand, price remaining very firm at 12s. 3d. to 12s. 9d. per oz., according to quantity.

COD LIVER OIL.—Market is fairly steady at 56s. to 58s. per barrel, f.o.b., according to brand, for new non-congealing Norwegian oil, in 25-gallon tin-lined barrels. It is thought that when the autumn demand sets in, which will be the case shortly, we may very likely see an improvement in values.

CREAM OF TARTAR—Firm at 73s. to 74s. per cwt. for first white crystals on the spot, and 75s. to 77s., according to percentage, for powder.

GALLS.—Business in all kinds continues very slow. China are quoted 59s. to 60s. per cwt. for usual shape. Smyrna neglected, although in very moderate supply. Persian: Blues in little request; Greens more enquired for, but prices asked check business; Whites are firm at about late rates.

GINGER.—930 packages Cochin offered met slow demand rather easier rates ruling. About 200 packages found buyers; native cut medium and bold at 45s. 6d. to 49s. 6d., small and medium 27s. 6d. to 28s., washed rough medium and small at 22s. Of Jamaica 596 packages offered and 257 sold; good bright plump at 73s. to 75s., fair to good medium 61s. to 66s., ordinary to good ordinary 51s. to 58s. 6d., common 49s. to 50s. 6d.

GLYCERIN.—Crude is steady at about £30 per ton for the quality most suitable for refining purposes, while refined is quiet at about late prices, viz., 48s. 6d. to 50s. per cwt. for English, and 52s. 6d. to 57s. 6d. per cwt., according to brand, for German, best white double-distilled, chemically pure, 1260° quality, in 56-lb. tins (2 or 4 tins in a case).

IODINE AND IODIDES—Are in fair demand at steady prices, viz., 7½d. per oz. for commercial Iodine, 12s. per lb. for Iodine resublimed, 10s. 6d. per lb. for Potassii Iodid., 11s. 10d. per lb. for Sodii Iodid., 14s. 6d. per lb. for Ammon. Iodid., and 13s. 10d. per lb. for Iodoform, cryst., pulv., or precip.

IPECACUANHA.—Late arrival of Rio proves to have been only about 50 bales, while it is stated that no further arrivals can be expected before October. Price is firm, holders asking 17s. per lb. for Rio and 12s. 6d. per lb. for Carthagena.

LYCOPODIUM—Is firm at 1s. 5d. to 1s. 6d. per lb. for sifted, according to quantity.

MENTHOL—Is rather firmer at 7s. to 7s. 3d. per lb., according to quantity, for best white dry crystals in 5 lb. tins (12 tins in a case).

MERCURIALS—Are very firm at 2s. 10d. per lb. for Calomel, and 2s. 6d. per lb. for Corrosive Sublimate; other Quicksilver preparations being also unaltered in price.

MORPHIA—Is firm at 4s. 6d. per oz. for the Hydrochlorate Salt in powder (crystals 2d. per oz. more). Makers are exceedingly busy, and will not book fresh orders at all, except for delivery, at earliest, end of August to beginning of September, so great is the demand for delivery in execution of existing contracts.

NITRATE OF SODA.—Refined is quoted £8 5s. per ton, while the ordinary commercial article can be obtained at £7 17s. 6d.

NUTMEGS—Very slow of sale. Of 22 cases Penang, only 2 cases sold at 1s. 1½d. per lb. for 107's. 3 packages West Indian sold at 10d. per lb. for limed 106's.

OILS (FIXED) AND SPIRITS.—Linseed, steady; pipes, spot, London, £20 to £20 5s. per ton; barrels, £20 7s. 6d.; July-August, £20; September-December, £19. Hull, spot, naked, £19 10s.; July-August, £19; September-December and January-April, £17 10s. Rape, firm; ordinary brown spot, £22; July-August and September-December, £22 5s.; refined spot, £23 10s.; Ravison spot, naked, £18; July-August, £18 5s.; September-December, £18 10s. per ton. Cotton, quiet. London crude spot £15, July-August £15 5s., refined spot £16 10s to £17 5s., according to make, etc.; Hull refined spot naked £15 2s. 6d., July-Aug. £15 5s., Nov.-April £14 2s. 6d., crude spot £14 2s. 6d., July-Aug. £14 5s., Nov.-April £13. Olive: Mogador £30 to £31, Spanish £30 to £32. Coconut: Ceylon spot £25 10s. to £25 15s. landed, June-July and July-Aug. £23 15s, Aug-Oct. £23 10s., c.i.f. Cochin spot £28 10s. landed, Aug.-Oct. £25 15s., c.i.f. Palm: Lagos spot £24. Lubricating Oil: Pale American spot, 5s. 6d. to 7s. 6d. per gallon; black, 5s. to 6s.; pale Russian, 5s. 9d. to 8s.; black, 5s. to 5s. 9d. Turpentine, firm and dearer; American spot and June, 31s. 7½d.; July, 29s. 9d.; August, 28s. 6d. to 28s. 7½d.; Sept.-Dec., 28s. 6d.; Jan.-April, 1900, 29s. 3d. per cwt. Petroleum, firm; Russian spot and Sept. Dec., 5¼d. per gallon; American spot, 5⅛d. to 5⅜d.; Sept.-Dec., 5⅜d.; Water White spot and Sept.-Dec., 6⅞d. Petroleum Spirit: American, 9d.; deodorised, 9d. to 9¼d. per gallon.

OIL OF LEMON—Is dearer, 3s. 9d. to 4s per lb. being now the price of finest quality.

OPIUM.—The market for this article is somewhat firmer, prices being nominally 9s. 3d. to 11s. per lb. for good to fine soft shipping, and 8s. 3d. to 8s. 9d. for seconds. Good to fine Druggists', 8s. to 8s. 3d.; seconds and manufacturing, 7s. 3d. to 7s. 9d. Persian is very firm at 11s. 3d. to 11s. 9d. for good to fine, and 10s. 6d. to 11s. for seconds. In Smyrna prices rule distinctly higher than London parity, while there are very conflicting reports as to the new crop, the estimates of which vary from 6000 to 10,000 cases. It is probable that, as is often the case, the actual result of the new crop will be somewhere near about in the middle between the higher and lower figures.

OXALIC ACID.—3d. to 3⅛d. per lb. nett, free London.

PARAFFIN WAX.—Crude is still quoted 1⅞d. to 2d. per lb., and refined 2¼d. to 3d.

PHENACETIN.—Makers continue to press sales. Quotations for a really reliable article are 3s. 6d. to 3s. 9d. per lb., according to quantity. Bayer's article in original 1-lb. bottles is still quoted 6s. 6d. per lb., and Riedel's 5s. 6d. per lb.

PITCH.—8s. to 8s. 6d.

POTASH COMPOUNDS—Are unchanged, present quotations being: Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, crystals, 3¾d.; powder, 3⅞d. per lb., spot, London. Iodide, 10s. 6d. per lb. Permanganate: Makers' prices vary from 52s. 6d. to 60s. per cwt., according to brand, for small crystals in 1-cwt. kegs, large crystals being quoted 5s. per cwt. more money. Prussiate: Yellow, Beckton, 7⅞d. Other English makes, 8d. to 8⅛d. per lb.; red, 1s. 1d. to 1s. 2d. per lb.

QUICKSILVER—Is very firm at £8 5s. per bottle from the importer, and 6d. per bottle less from second hand.

QUININE.—Market is rather firmer to-day, the article still, however, maintaining its anomalous position. Makers of the German brands, which are chiefly in demand, maintain their price of 1s. 6d. per oz. for the Sulphate, for 1000-oz lots in 100-oz. tins, while second-hand quotes for the same brands 1s. 4¾d. per oz. for August delivery, and 1s. 5d. per oz. for October delivery. There are, however, rather buyers than sellers at these lower prices.

ROSIN.—Quiet. Strained on spot is quoted 4s. 3d. to 4s. 4½d.

per cwt., ex wharf, landed terms, and 3s. 11d. per cwt., c.i.f., for Sept.-Nov. and Nov.-Dec. shipment, per sailing vessel.

Saffron.—Very high prices are asked up to 44s. for best Valencia.

Seedlac—Quiet, and 75 bags fine pale Kurrachee in auction were all bought in at 63s. to 65s.

Shellac.—Market remains quiet, demand on spot being somewhat slow. For arrival, however, rather higher prices are asked, viz., 65s. 6d. per cwt., c.i.f., for TN Orange for Oct.-Dec. steamer shipment. In the speculative market 67s. 6d. per cwt. is quoted for TN for August delivery. In auction there was good competition for the reduced supplies catalogued, and the whole found buyers, Second Orange, chiefly without reserve, at fully previous rates to 1s. advance, fair TN selling on a basis of 66s. to 67s.; the few cases cakey Garnet brought steady rates. Button easier. A total of 378 cases offered and sold:—311 cases Second Orange sold, fair bright reddish free at 66s., good bright flimsy at 66s., good bright cakey to blocky at 65s., fair bright curly matted at 64s. to 65s., strong curly liver free at 63s. to 64s. 14 cases Garnet offered and sold, fair strong cakey at 60s. 53 cases Button offered and sold, good pale at 76s., fair pale resinous at 73s. to 74s., fair cakey firsts at 70 to 71s., cakey seconds at 65s.

Soda Compounds.—Bromide, 2s. 1½d. per lb. Crystals, 52s. 6d. per ton in bags and 55s. per ton in barrels ex-ship Thames. Ash, £5 to £5 15s. per ton, according to percentage, package and make. Bicarbonate, £7 12s. 6d. to £8 per ton; ditto, fully bicarbonated, 19s. 6d to 20s. 6d. per cwt. Bichromate, 2¾d. per lb. Caustic, white, 70 per cent., £7 10s.; 60 per cent., £6 10s. per ton. Hyposulphite (Antichlor.), 6s. 6d. to 8s. 6d. per cwt. Iodide, 11s. 10d. per lb. Nitrate: Commercial, £7 17s. 6d.; refined, £8 5s. per ton.

Spices (Various)—Black Pepper: 816 bags Malabar sold in auction at 5d. to 5¼d., also 5 bags Ceylon at 5¼d. White Pepper all bought in, Singapore at 8¾d. and Penang at 8¼d. Capsicums: 5 robbins Bombay bought in at 23s 6d. Cassia Lignea: 210 packages all bought in, good old false packed at 50s., new at 40s. to 45s. Cassia Vera: 120 bags bought in, coarse Padang quill at 31s. Cinnamon Chips: Of 161 bags Ceylon 140 sold, ordinary to good at 2⅞d. to 4¾d., and bark at 2½d. to 2⅞d. Mace, dull: Of 15 cases Penang only 1 case sold, fair pale, part wormy, at 1s. 5d.; 6 cases West Indian sold, fine pale at 1s. 10d., good at 1s. 7d. to 1s. 8d., broken pickings at 1s. 2d. Pimento, easier: Of 332 bags about 120 sold, middling to fair at 3⅜d. and fine small at 3¾d.

Sulphate of Copper—Is quoted £24 15s. to £27 per ton on the spot, according to make, etc.

Sulphonal.—The two principal makers are firm at 17s. per lb. for both crystals and powder; there are, however, still offers from second hand at a lower price. Whether there is really a third maker supplying the article is a question as to which opinions differ.

Sticklac—Neglected. In auction 20 cases Siam, rather small, bought in at 46s.

Tar.—Stockholm 26s. 6d., Archangel 20s.

Turmeric—Is quiet but steady, quotations being: Bengal, 18s. 6d. per cwt., with small sales of dark fracture at 19s.; Madras, good to fine bright, 25s. to 27s. 6d.; Cochin finger, 17s. 6d.; split bulbs, 9s. to 9s. 6d.; China fair finger, 18s. per cwt.

Liverpool Market Report.

June 28, 1899.

The market has been rather busier as regards transactions in Canaryseed, Ginger, Beeswax, and Castor Oil. Better prices are obtainable now for Castor Oil and Canaryseed, whilst lower rates rule for Spirits of Turpentine. A fair inquiry, with limited business passing, exists in the chemical trade. Sulphate of Ammonia a turn dearer.

Ammonia Sulphate.—£12 10s. to £12 12s. 6d. per ton.

Beeswax.—35 sacks of Chilian sold for £7 5s. to £7 10s. per cwt.

Borax—Is very firm; £16 to £16 10s. per ton.

Canaryseed.—The demand for Turkish has been and continues good, with a steady upward movement in price; 100 bags fair quality Turkish sold at 32s. per 464 lbs., 100 bags at 32s. 6d., 280 bags at 32s. 6d. to 32s. 9d., and 400 bags at 33s. 6d. per 464 lbs.

Carnauba Wax.—A fair demand exists for grey, and 31 bags sold for 42s. per cwt. *Ginger*: 160 bags of Sierra Leone found buyers ex-quay at 18s. per cwt.; 50 bags of Cochin, ex-store, sold for 23s. per cwt. *Linseed* is quiet, with a slight lowering of price. River Plate "to arrive" and on the spot is 36s. 6d. per 416 lbs., and Calcutta July 38s.; 200 tons Calcutta May-June shipment sold for 37s. 6d.

Oils (Fixed) and Spirits.—*Castor Oils* are very steady, with fair inquiry. 100 cases of Calcutta sold for 2⅛d. por lb., and 250 cases at 2⅞d. per lb. Sales of French 1st pressure at 2¾d. and 2nd pressure at 2⅝d. are reported. Madras is 2¾d. per lb. *Olive Oil* is strong in tone, with only a small amount offering. Candia at £31 10s. per tun, and Malaga at £32 per tun on the spot. For shipment, Malaga is put at £32 5s., and Seville at £31 to £32 per tun, cost and freight. *Linseed Oil* of Liverpool make, packed in export casks, is again dearer, 22s. 3d. to 22s. 6d. being asked. *Cottonseed Oil* is firm but quiet at 17s. to 17s. 6d. per cwt. *Spirits of Turpentine*, owing to arrivals, have dropped to 35s. per cwt.

Manchester Chemical Report.

June 28, 1899.

So far as this district is concerned, there is little new to report in regard to heavy chemicals, in which the business continues steady. Ammonia Alkali, 58 per cent., is very firm at convention rates. Miscellaneous chemicals are lower in some cases. Chlorates of Potash and Soda, even at the recent reduced rates, are the turn easier, the former being quoted 3½d., and Soda 3¾d. Salt Cake is easier at 27s. 6d. to 28s. 6d. per ton in bulk on rails. Glycerin continues in a position of great uncertainty, and there is still great competition for orders amongst producers in this district. A fairly current quotation appears to be about £42 for tins and cases, on rails or *f.o.b.* White Powdered Arsenic is firm and unchanged at £19 5s. to £19 10s. per ton, ex-ship Garston. Sulphate of Copper is lower, and £26 is taken for best brands, delivered Manchester. Brown Acetate is very irregular, but the tendency is upwards, and contracts are being put through at £5 to £5 2s. 6d., both Welsh and American, delivery over the next six months. Acetate of Soda is firm at £12 15s. per ton, *c.i.f.* Yellow Prussiate of Potash has recovered somewhat at 8¼d. in quantity. Coal Tar products are somewhat dull, except Creosote and Tar Oils, which are in request. Pitch is firm, but Anthracene is stagnant.

Newcastle Chemical Report.

June 28, 1899.

Business in heavy goods continues active. Shipping orders are passing hands with more freedom, mostly, however, for the Upper Baltic ports. Bleaching Powder and Soda Crystals are in rather more demand. Quotations, however, go unchanged, and are as follow:—Bleaching Powder, £5 7s. 6d. to £5 12s. 6d. Soda Crystals, 45s. to 47s. 6d. Caustic Soda: 70 per cent., £7 to £7 5s. Soda Ash: 52 per cent., £4 5s. Alkali: 52 per cent., £5 5s. Sulphur, £4 15s. to £5 per ton.

TERMS OF SUBSCRIPTIONS.

The Pharmaceutical Journal circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United Statos, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1. 0s. 0d.

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to Street Brothers. Cheques should be crossed "London Joint Stock Bank."

Publications Received.

A Manual of Pharmaceutical Testing for the Man of Business and His Assistants. By Barnard S. Proctor, F.I.C. second edition. Pp. viii.+192. Price 2s. 6d. net. London: The *Chemist and Druggist*, 42, Cannon Street, E.C. 1899. From the Publishers.

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m on Thursdays.

OFFERED.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Superfine Oil Lemon, 10 lbs. Copper, 22s. 6d.; sample pound, 3s.—Moss, Chemist, Chorley.

36 Munyon's, 22s. 6d.; 4 ounces Quin. Sulph. Pur. 5s. 6d., 16 ounces £1, 50 ounces £3; Bismuth Scarb., 5s. 3d. per lb., 4 lbs. £1; Iodoform, Precip. or Crystal, 12s. 6d. per lb.; Saffron, 2s. 6d. per ounce, 4 ounces 9s. Carriage paid.—Eastman, Forest Lane, Stratford.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Camwal Shares Wanted. State number and lowest price.—Lawrence, Chemist, Rhyl.

Daisies, 7s. doz.; Erasmic Soap. Quantity and price.—Eastman, Forest Lane, Stratford.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc, have been received from Messrs. Abram, Alcock, Beaton, Bell, Bennett, Boor, Bowie, Brewer, Browning, Cox, Cruickshank, Davis, Elborne, Ellal, Gair, Harrie, Hewlett, Kirkby, Loosmore, McLaren, Mumbray, Ough, Peck, Sandy, Simmons, Stewart, Summers, Ward,

Obituary.

Butler.—On June 17, Samuel Butler, Chemist and Druggist, of 18, Ashgrove Road, Redland. Aged 90. Mr. Butler was formerly in business in Old Market Street, Bristol, but retired some twenty or thirty years ago. He took a personal interest in the work and ministry of the late Mr. George Müller at the Orphan Houses, Ashley Down, being associated with the movement from its inception sixty years ago, and for many years his name appeared amongst those who annually audited the accounts of the Orphan houses. Mr. Butler, who originally belonged to the Society of Friends, devoted much of his income to the Orphanage work.

Harvie.—On June 17, at his residence, Kilinn Cottage, George Harvie, Chemist and Druggist, Princes Street, Helensburgh, N.B. Aged 62. Mr. Harvie became a member of the Pharmaceutical Society in 1870, and had acted as Local Secretary for Helensburgh from 1878 till the time of his death. For some years he had been in failing health from weak action of the heart. He leaves a widow, and is succeeded in the business by his son, Henry Taylor Harvie, who qualified in January last.

Crofts.—On June 25, John Lawrence Crofts, Chemist and Druggist, Halifax. Aged 28.

Hargreaves.—On June 27, Mark Hargreaves, Chemist and Druggist, Preston.

Advertisements.

(Received too late for Classification).

NEWPORT (Salop).—Wanted immediately, an APPRENTICE or TURNOVER. A young man with 18 months' experience would be treated with as an Improver. Apply, with full particulars, to G. L. DOUTHWAITE, Chemist, Newport, Shropshire.

DISPENSER requires engagement with a medical man or institution, or LOCUM TENENS. Town or country. Hall certificate. Apply, Miss B. CORY, 56, Homefield Rd., Chiswick.

QUALIFIED ASSISTANT seeks permanency as SENIOR or MANAGER. Out-door. London or suburbs. West-end experience. Excellent references. Age 24½. DAVIES, 5, Rokeby Cres., Brockley, S.E.

DISENGAGED. 40. Hall. LOCUM or permanency in London or country. Experienced prescriber. Had hospital and private experience. Extractor. SPES, 70, Venner Rd., Sydenham.

POLITICAL GOSSIP.

Courteous Ambiguity characterised Mr. Balfour's response to the question put to him by Mr. J. W. Crombie as to the expectations of the Government in respect to legislation on the "Companies" question this Session. The first Lord of the Treasury evidently had no expectations whatever on the subject, and following the sound precept immortalised by Hosea Bigelow, he declined to predict without absolute knowledge. Though, like a good statesman, he replied nicely but said nothing, he managed to convey pretty conclusively to those in the habit of estimating the purport of parliamentary utterances that neither Mr. Beggs' Amendment Bill nor the House of Lords' proposals on the same subject will receive further attention this Session. Mr. Beggs' remedy for bogus company promotion is postponed for the present, whilst the Lords' Bills for restoring commercial morality and, incidentally, ensuring the salvation of Medicine and Pharmacy are still motionless—mere lines of standing print upon the official order book. Mr. Crombie would probably have something to say about Limited Companies if the matter came before the House, for he is a Director of J. and J. Crombie, Limited, and has had the advantage of some administrative training at the Board of Trade, where he acted as private secretary to Mr. Bryce during that gentleman's Presidency.

Exit the Shops (Early Closing) Bill.—Sir John Lubbock after so long a struggle against adverse circumstances, has again had to yield to the inevitable, and to drop his Bill for another year. Nor has he been fortunate enough to secure the ear of the House for his motion relative to the excessively long hours in shops. Mr. Steadman (Stepney) is also a reformer of shops, and some little time ago introduced a measure of his own to minimise what has been referred to as "white slavery." The Bill, which bore the name of the Shop Hours Act (1892) Amendment Bill, has now been abandoned. Thus of the attempts made this Session to obtain parliamentary authority to restrict shop hours have all proved abortive. It is true that Sir Charles Dilke still keeps his Shops Bill on the paper, but it is only a matter of a few days before it will follow its kindred to that bourne from which no Bill returns. It may be of interest, as indicating the present condition of business, to state that there are still 98 Bills on the Order Book, and 23 of these are "starred," that is to say, belong to the Government programme.

The Lord President of the Council was solemnly admonished on Tuesday by the Lord Chancellor not to meddle with the Jury Law of these realms. The incident arose out of an amendment to the London Government Bill, which stood in the name of an absent Peer, and which proposed that members of the new Municipal Councils should be exempt from Jury Service. His Grace of Devonshire moved the amendment on behalf of the absentee, and there was every possibility that the Peers assembled would have accepted it without much difficulty. Lord Halsbury, however, allowed no time for the expression of views; he conceived it to be his duty to save the House from legal sacrilege and he performed his duty well. He protested that the amendment would alter the general jury law of the country, and ought not to be adopted without the gravest consideration. The Peers trembled and the Lord President accepted the rebuke, and withdrew the obnoxious motion. The episode is referred to in this column, as it may be useful for chemists and druggists who pine for exemption from jury service to know the attitude of the Lord Chancellor in respect to applications for relief from such service.

Sir John Leng is apparently acquiring a politico-pharmaceutical qualification. Having been instrumental in wringing from the Government a hope-inspiring answer on the subject of the retailing of carbolic acid, Sir John has now been led to turn his attention to the Medicine Stamp Duty. On Monday next he will ask the Chancellor of the Exchequer if he can state the amount of revenue derived from the sale of medicine stamps in Scotland for the years ending March 31, 1898 and 1899 respectively. When the information has been obtained and handed over to the instigator of the question, will the Chancellor be asked to abolish the Stamp Duties in so far as they apply to Scotland? After all, there seems to be a distinct advantage in having questions bearing on pharmaceutical matters asked in Parliament, and we should not be sorry to see the question paper more frequently ornamented with such items. It would be an outward and visible sign of that political vitality within the pharmaceutical body, which we have continually advocated and endeavoured to promote.

East St. Pancras has been added to the parliamentary vacancies by the resignation of its member—Mr. R. G. Webster, LL.B., of the Inner Temple. The Unionist majority at the last election was only 289; hence a close contest may be expected. The polling is to take place on July 11, and between this and the critical day there should be ample opportunity for chemists in the Division to co-operate with a view to educating the candidates who seek their votes on the present position of pharmacy and its qualified practitioners.

THE PURITY OF FOOD AND DRUGS.

Lime Water.—At Lambeth Police-court, on June 22, E. F. Munday, chemist and druggist, Camberwell Green, was fined 40s. and 12s. 6d. costs, for selling lime water which the public analyst certified to be only 50½ per cent. of the strength required by the B.P. The defence was that the deficiency in strength arose through a mistake made by the wholesale house.

Milk of Sulphur.—Percy Murray was summoned at Bridlington Police-court, on June 24, for selling, in the shop of Messrs. J. Hardwick and Sons, milk of sulphur adulterated with 54·72 per cent. of calcium sulphate. For the defence it was urged that Murray was not liable, as the sample was endorsed as having been bought from John Hardwick. The Chairman said the Bench would convict, as it was a very serious adulteration. Defendant would be fined £5 and costs.

Almond Oil.—At Birmingham Police-court on June 23, Frank Henry Prosser, pharmaceutical chemist, 114, Spring Hill, was summoned and fined £1 and costs for selling almond oil containing 50 per cent. of peach-kernel oil. The defendant stated that he bought the oil as pure, but admitted that he had not tested it as he had perfect confidence in the wholesale house.—A similar fine was imposed upon Arthur Tyler, drysalter, for a like offence, he also pleading that the oil was sold in the same condition as received. One of the magistrates remarked that it would be a wise thing on the part of chemists to examine what they were buying and selling.

Camphorated Oil.—At Burnley on Wednesday, June 28, Charles Edward Dodsley, chemist and druggist, of Manchester Road, was summoned for selling adulterated camphorated oil. Mr. Wheatley, who prosecuted, said that analysis showed the oil to be deficient in camphor to the extent of 8 per cent. by weight. Any diminution in camphor meant a gain to the seller. Mr. Steele, for the defendant, admitted the analysis, but did not plead guilty. He urged that complete saturation had not taken place, but there had been no fraudulent intent. A fine of 10s. and costs was inflicted.

ENGLISH NEWS.

Johnson's Saccharum Co., Ltd.—On July 1 Mr. Justice North sanctioned an alteration in the memorandum of association of this Company for the purpose of enabling it to manufacture isinglass, finings, etc., in addition to glucose, dextrine, saccharine, and saccharine materials, to which it is at present confined. It was stated by Mr. Hamilton, who appeared for the Company, that the principal customers were brewers, distillers, and pharmaceutical chemists, who also used the other substances it was desired to deal in, and which were supplied by their foreign competitors. His lordship thought the name of the Company ought to be altered, subject to which the order would be made. Mr. Hamilton suggested that the name should be Johnson's Saccharum and Chemical Manufacturing Co., and his lordship said that would be satisfactory.

Death by Chloroform.—At Leeds, on June 23, an inquest was held with respect to the death of a page boy, aged seventeen years, who had been employed by Dr. F. B. Musgrave, first as surgery boy and afterwards as assistant dispenser. He was found dead in bed, with a bottle, which had contained chloroform, by his side, and a piece of cotton-wool covering his face. Evidence was given to the effect that the boy had suffered from neuralgia and toothache, and it was supposed that he had used the chloroform to alleviate pain. Death was attributed to mechanical suffocation, and the jury returned a verdict of death by misadventure.

Morphine Poisoning. On Tuesday, June 27, an inquest was held at Walsall concerning the death of a child aged one year and ten months, son of Mr. G. M. Tolley, ironmaster, Bescot. It appeared from the evidence that the little one had climbed from his chair on to the dresser and had swallowed the contents of a bottle containing an ear lotion. Medical assistance was obtained immediately, but was unavailing, death resulting from morphine poisoning. The lotion had been supplied by a doctor at Bilston and was said to contain two grains of morphine. The bottle was not labelled "Poison." Dr. Sydenham pointed out to the jury that though it would be necessary to label the bottle "Poison" in the case of sale by a chemist, it was optional with the medical profession. The jury returned a verdict of "Accidentally poisoned," but strongly recommended that it should be compulsory for doctors to label as poison all bottles which contain poison.

Employes' Outing.—The employés of Messrs. Stone and Son, chemists, of 166, Fore Street, Exeter, held their annual outing, in North Cornwall. The party journeyed to Camelford by train, travelling in a saloon carriage, kindly placed at their disposal by the London and South Western Railway Company. Arriving at Camelford the party proeeeded to Tintagel by brake. Dinner was served at the Wycliffe Hotel, the chair being occupied by Mr. E. F. Stone. "Success to the firm" having been drunk, the party continued their drive to Boscastle. Tea was provided at the Wellington Arms Hotel, after which the party drove back to Camelford to catch the train for home, which was reached after ten o'clock. The weather was all that could be desired, and a very enjoyable day was spent.

Outing and Presentation.—On Saturday last the annual outing of the employés of Messrs. Evans, Gadd and Co., of Exeter and Bristol, took place, the party numbering about eighty. The Exeter staff (exclusive of the female staff, who held an outing elsewhere) left Queen Street Station at 7.45, and the Bristol staff Temple Mead at 6 15, both meeting at Bournemouth, where, on arrival, the excursionists were entertained to a capital lunch at the Hotel Mont Dore, after which the majority of the party had a trip to Swanage by the steamer "Empress." The remainder of the party spent their time in visiting places of interest in and around the town, particularly Branksome Park Lakes and Chine, Alum Chine, over the Cliffs to Boscombe Pier, and through the Chine. The pleasure-seekers subsequently returned to the Hotel Mont Dore, where an excellent dinner awaited them. Alderman Gadd occupied the chair, and Mr. W. J. Wippell the vice-chair. After dinner and the usual toasts, Mr J. Taylor asked Mr. Boorne (manager of the Bristol branch) to accept for Miss Gadd and himself a standard lamp from the Exeter employés, and a silver lamp from the Bristol employés, on the occasion of their marriage. He hoped the lamp would serve to illuminate their home, brighten their leisure, and reflect the good feelings which prompted them in making the presentations. He understood that Mrs. Beck, on behalf of the bottling and finishing department of the Exeter factory, had presented Miss Gadd and Mr. Boorne with a cucumber knife, and there was also an address from the employés. Mr. H. Wippell Gadd acknowledged the gifts on behalf of his sister, and Mr. Boorne, who was enthusiastically received, also thanked the company for their kind presents to Miss Gadd and himself. Mr. Boorne then proposed "The Host," who having responded, the party separated. The homeward journeys were soon afterwards commenced, the destinations being reached after a glorious day's outing.

Overdose of Laudanum at Ashton-on-Mersey.—On Friday, June 30, Mr. Yates, coroner, held an inquest touching the death of Fanny Dean (49), dressmaker, of 9, Elm Grove. It was stated that deceased was of intemperate habits, and took laudanum to check sleeplessness. A verdict of "Death from misadventure by taking an overdose of laudanum" was returned.

Poisoning by Ammonia.—On Saturday, July 1, an inquest was held concerning the death of John Higginbottom (61), a weaver, of 47, Droylsden Road, Audenshaw. From the evidence it appeared that he had not for some time been able to follow his employment owing to failing eyesight, and on June 29 he had taken ammonia in mistake for turpentine, which he had been in the habit of taking for worms. A doctor was called in but the same evening the man died. The jury found that deceased had taken ammonia by mstake, and returned a verdict of "Death by misadventure."

Valentine Meat Juice Company v. Valentine Extract Company, Limited.—Mr. Justice Stirling in the Chancery Division on Thursday resumed the hearing of this action by which the plaintiffs asked for an injunction to restrain the defendants from carrying on business as manufacturers and vendors of extract of meat or meat juice under any name of which Valentine formed part. Mr. Upjohn, Q.C., for the defendants, urged that the defendant C. R. Valentine had a perfect right to sell the goodwill of his name to the defendant Company, which was an honest undertaking. The defendant and the other gentlemen connected with the Company had done nothing but what an honest commercial man might do without infringing the highest sense of commercial honour. He asked that no injunction should be granted. Mr. J. Fletcher Moulton, Q.C., replied on the whole case for the plaintiffs on Saturday and Wednesday. He said the plaintiffs were well known throughout the world for their meat juice, and when they found that someone else came into the trade with a form of globule of extract of meat and used Valentine as part of their name it was natural that the plaintiffs should feel injured. He submitted that it had been proved in evidence that the meat juice of the plaintiffs was frequently asked for as Valentine and if the defendants were permitted to continue to use their present title confusion to the public would arise and the plaintiffs would be damaged. There were letters put in which showed considerable confusion, and a traveller of the defendants had stated that everyone he had called on thought the firms were one and the same. Mr. Justice Stirling reserved judgment.

Exeter School of Pharmacy.—T.R.H. the Duke and Duchess of York on Wednesday last visited Exeter to open the new Diamond Jubilee Wing of the Exeter Technical and University Extension College at the Albert Memorial Museum, attached to which is a School of Pharmacy in which students are specially trained for the Pharmaceutical Society's examinations by Mr. Alan H. Ware, under the direction of Mr. A. W. Clayden, the principal of the College, who, on Saturday last, was presented by the students and friends of the College, to the number of about ninety, with a silk M.A. gown in case and a framed illuminated address recording this fact, and the names of the subscribers, and that it was in connection with the opening of the Diamond Jubilee Wing by their Royal Highnesses. The Royal visitors were received by the Mayor and Corporation and presented with an address prior to the opening of the wing. Mr. Clayden gave an outline of the work of the College, and after the opening ceremony Their Royal Highnesses were entertained at luncheon by Sir Stafford and Lady Northcote, after which the Royal visitors inspected the Devon and Exeter Hospital, where they received purses and attended other civic functions, the city being *en fête* for the occasion. Their Royal Highnesses were the guests of Lord and Lady Clifford, of Chudleigh, during their visit to Devonshire, and fulfilled several county engagements.

Royal Institution.—At a general monthly meeting of the members of the Royal Institution, held on the 3rd inst., Sir James Crichton-Browne, treasurer and vice-president, in the chair, Lord Kinnaird, Mr. A. F. Lindimann, and the Hon. W. J. Ward were elected members. The special thanks of the meeting were returned to Mr. Henry Vaughan for his donation of £20, and to Sir Henry Thompson, Bart., for his donation of £25 to the fund for the promotion of experimental research at low temperatures. The cordial thanks of the members were returned to the Masters and Wardens of the Merchant Taylors' Company; to the Lord Mayor and Lady Mayoress; to Dr. and Mrs. Mond; to Dr. and Mrs. Dewar; to Professor William Odling and to the Teachers of Natural Science at Oxford, for their hospitality to the members and guests of the Royal Institution during the recent centenary celebrations. The managers reported that they had received gratifying assurances from their guests that the centenary celebrations, as a whole, were highly appreciated and considered not unworthy of the past history of the Royal Institution, and of good augury for that new century of scientific work to which it has now to apply itself. It is satisfactory to be able to report that the centenary celebrations have not affected the pecuniary resources of the Royal Institution, as all expenses in connection therewith have been defrayed by private contributions. A balance remaining over of the sums contributed, amounting to £87, has been paid over to the fund for the promotion of experimental research.

'A Jubilee Souvenir' is the title of a volume composed of some two-hundred pages, giving an account of the work of Mr. G. S. V. Wills and the Westminster College of Chemistry and Pharmacy. The book has been written to gratify the wish expressed by many of the students who have passed through the College, for the history of the Principal, and the story of the College; therefore copies of the book are being sent to all old students. The narrative has been issued at this particular time because four events of deep interest to Mr. Wills and his friends occur within the twelve-months—his jubilee birthday; his silver wedding day; the coming of age of his only son; and the twenty-fifth year of the establishment of the Westminster College. In conjunction with the publication referred to, Mr. Wills issues his Minor Prospectus for 1899, in connection with the Westminster College, the old partnership of Messrs. Wills and Wootton having been dissolved on and from June 30 last.

Poisoning by Carbolic Acid.—On Monday, June 26, an inquest was held at Low Prudhoe, respecting the death of Ellen Brown, 74, a widow, and also of her great-grand-child, aged 2½, both having died the previous day from the effects of poison. It appeared from the evidence that the old lady was ill with English cholera, and some disinfectant, carbolic acid, had been used in the room, and the bottle placed on the floor under one corner of the bed. Her mind being somewhat deranged she got out of the bed, and seeing the bottle, poured some of the carbolic acid into a cup and swallowed part of the contents. Soon afterwards she was found to be very ill, and while being attended to the child found the cup and drank the remainder of the poison, death resulting in both cases. The jury returned a verdict to the effect that Ellen Brown died from carbolic acid poisoning, having taken the same in mistake for medicine which had been prescribed for her. And in the case of the child that he died from carbolic acid poisoning, having drunk the same in mistake for milk.

SCOTTISH NEWS.

Presentation to Mr. David Storrar, Kirkcaldy.—On Friday, June 30, an influential company of ladies and gentlemen assembled in the Swan Memorial Hall, Kirkcaldy, to do honour to Colonel Storrar, member of the Pharmaceutical Council. Mr. M. B. Nairn, of Dysart House, presided, and Mr. Lewis Grant, Chairman of the School Board, made the presentation, which consisted of an illuminated address, a silver salver, and a purse of 300 sovereigns. The address bore the inscription: "Presented to David Storrar, Esq., together with a silver salver and a purse of sovereigns, in recognition of the many and valuable public services rendered by him to the community through many years, and especially of his work as Secretary to the Committee of Science and Art Classes, from 1880 to 1898." Mr. Grant said if there was a man in their community who might be said to approach—and in some respects to far excel—the old Athenian ideal of citizenship, of self-abnegation, and self-sacrifice in the interest of his fellow-men, it was the citizen whom they were now met to honour and whom they all delighted to honour. Their guest was a many-sided man, an enthusiast in art, and himself an artist of no mean attaintments. He was Lieut.-Colonel of the local Artillery Volunteer Corps, and a member of the School Board, and had also acted as a Town Councillor, Harbour Commissioner, Water Commissioner, Governor of Philip's Trust, and a member of the Burgh Trust and the Parochial Board, and for eighteen years he had rendered invaluable service as secretary for the science and art classes which were now taken over by the School Board. His many friends had ventured to honour themselves by presenting him with these tangible tokens of their high sense of obligation to him for all his labours of love. The subscribers included many former students of the science and art classes in distant parts of the earth, and he had to express the hope of all the subscribers that he would be spared for many years to continue his useful public work. As an evidence of his repute in his own line as a chemist, it was enough to say that he was one of the two Scottish representatives on the Council of the Pharmaceutical Society of Great Britain. Colonel Storrar, who was loudly applauded, expressed his high appreciation of their great kindness. He was born in Kirkcaldy and had lived his life in it and given a little help to its progress, the extent of which he described in a most interesting speech, and concluded by saying he hoped their kindness to him would be an incentive to the young men present to take part in public work when they saw that such work was appreciated by their fellow-townsmen. A complimentary dinner followed in the George Hotel, when Rev. John Campbell, B.D., presided and proposed the toast of the evening in a very humorous speech, in which he said there was a perpetual resort to Mr. Storrar's backshop by all ranks and conditions of people, and if Colonel Storrar were to write "The Chronicles of the Backshop" they would have a revelation as to the extent to which he had influenced the private and public life of the community. Mr. Storrar suitably replied, and among other toasts were "The Friends of our Guest" proposed by Mr. D. Wilson (Perth) and replied to by Messrs. H. Storrar and J. Laidlaw Ewing, the latter representing the Pharmaceutical Society.

Laudanum Poisoning in Glasgow.—On Saturday night, July 1, John Robertson (40), shoemaker, 93, Cumming Drive, Glasgow, was admitted to Victoria Infirmary suffering from an overdose of laudanum, and recovered after treatment. He was found lying unconscious by his wife with an empty four-ounce phial beside him. He had been depressed for some time, and was in the habit of taking laudanum to induce sleep.

Mr. John MacIntyre, chemist and druggist, North Berwick, has been elected Provost of that town.

Aberdeen Pharmaceutical Association.—This Association held its annual excursion on Tuesday, June 27, the party, which numbered about thirty, leaving the Joint Station, Aberdeen, in a saloon carriage provided by the Caledonian Railway, and proceeded to Fordoun. At Fordoun Station they were met by Mr. Bertie, chemist, Auchenblae, who from his knowledge of the district was quite an acquisition to the company. From Fordoun the party drove in carriages through the beautiful village of Auchenblae. At Drumtochty the party dismounted, and by the kindness of Mr. Gemmell, the proprietor, were allowed within the chapel and grounds, where numerous photographs were taken of the beautiful surroundings. The drive was afterwards continued through hedges of rhododendrons, by the loch of Glensaugh to Clatterin' Brigs, where lunch was partaken of and numerous games were engaged in. After a stay of fully two hours, the company drove to Fettercairn, and afterwards proceeded to Laurencekirk, where an excellent dinner was served by mine host of the Gardenston Arms. The return journey to Aberdeen was made with the train that arrives there at 9.5 p.m. The weather was all that could be desired.

Presentation to Mr. Thomas Maben, Hawick, on the evening of Thursday, June 29, at a meeting held in the hall of the Evangelical Union Church, Hawick, for which he has acted as secretary since 1888, and which position he now resigned in consequence of his removal to Glasgow. The presentation was made by Mr. Edward Wilson, of Beechhurst, who said Mr. Maben had been one of the strong ones among them for a quarter of a century, and his personality had been deeply marked on much in that church and town. With great energy of purpose he combined an immense power of working, which he was always ready to give heartily in the interests of all good work. He then handed to Mr Maben a three-quarter plate English lever watch, bearing the following inscription: "Presented to Mr. Thomas Maben, by the E. U. Congregational Church, in recognition of the many valuable services rendered during a long period of years, June 1899." He also handed to Mrs. Maben a handsome silver-mounted brush and comb, suitably inscribed. Mr. Maben acknowledged the gifts, which he said they would be proud to show to their friends as an evidence of how they were regarded by the people among whom they had spent nearly twenty happy years.

FRENCH NEWS.

Petty Vengeance.—Dr. Augagneur, professor of the Faculty of Medicine of Lyons, has just been the unfortunate victim of the over-zealous patriots of Lyons. It appears that the learned professor offended the students who cheered and acclaimed Marchand, by calling them a set of rabid imbeciles. For this outspokenness and assumed lack of patriotism the Council of the University of Lyons has childishly retaliated by suspending Dr. Augagneur's "Cours" for a period of one year. Truly a tyrannical and vindictive procedure and one quite incompatible with that boasted *liberté*, *égalité*, and *fraternité* the national motto, which one hears so much about and sees plastered upon every edifice in the country.

Vitriol Dramas.—It is only in France that when the course of true love ceases to run smooth, women seek vengeance in throwing vitriol upon the lovers who have offended them. Of late there seems to be quite an epidemic of this abhorrent practice, and some legislation is sorely needed to regulate the sale of this dangerous fluid. Last week Marie Legagneur and Gaston Marchand, two young sweethearts and employés at a printing establishment in the Cours des Petites-Ecuries at Paris had a quarrel. It appears that Marie announced to her young Romeo that, due to his attentions, she was in an unenviable condition. Learning this fact the youth ceased all relationship with the girl, and in fact shunned her completely. Stung by such cowardly treatment the girl awaited Gaston at the corner of the Rue d'Enghien and threw full in his face a bowl of vitriol, disfiguring him fearfully. He was at once taken to the nearest pharmacy, but his state was so dreadful that an ambulance had to be telephoned for to bear him off to the Hospital Lariboissiére. His eyesight is completely destroyed.—— On Sunday night, as Monsieur Louis Moisan was returning to his home, 6, Rue de Wattignies, a woman accosted him and threw over his head and neck the contents of a milk-jug of vitriol, burning him frightfully on the right cheek and neck, and destroying his right eye. His condition was considered so grave as to demand his retention at the Hospital Saint-Antoine. His aggressor, Marie Eléanor Cojeau, was at once placed under arrest and conducted to the police depôt, where, in reply to questions, asserted that she had committed the act because she was jealous of him, and yet intended to "warm" his other side when the opportunity shall present itself.

Interesting "Find" in a Parisian Pharmacy.—As stocktaking and a general cleaning out was being prosecuted at the Pharmacie Swann, Paris, a rather interesting box was found carefully packed away in the magasin. It appears to have belonged to a former assistant, who had charge of the Pharmacie in Mr. Swann's absence during the Commune in 1871. The assistant died soon after, but the box had remained intact where it had been stowed until the other day. When opened and its contents removed, carefully wrapped and labelled packets were found. In one were Prussian bullets in various conditions found, some whole, others flattened. Then in another, a portion of a Prussian shell weighing about 800 grammes, found in the Jardin du Luxembourg. In still another was a portion of the Column Vendôme, wrecked during the Commune. Others contained flowers taken from the statue of General Clement Thomas, who was shot during the siege; pieces of the Porte Saint Denis, and chips of marble from statues mutilated in the Place de la Concorde, and many other trophies and souvenirs too numerous to mention, but all bearing testimony to the troublous times which reigned in the gay capital after the war.

At the Sorbonne.—The University Council met on June 27, under the presidency of Monsieur Gréard. Having acknowledged the receipt of sundry expeditions from foreign Universities the work of the Council was proceeded with. Monsieur Gréard nominated Monsieur Michel as master of Conferences of Mineralogy to the Faculty of Sciences, and Messieurs Lévy-Bruhl and Lafaye as directors d'études de la Faculté des Lettres. He also communicated the decision of the Faculty of Medicine to delegate Monsieur le professeur Fournier to the Medical Conference of Brussels in September next. The Council then pronounced upon one of the students the penalty of exclusion from all Faculties and Schools of Higher Education, public and free, during twelve months, for having sold books belonging to the Library of the Faculty to which he belonged. Authority to continue the free course of lectures by Monsieur Courtant upon pharmaceutical legislation was also granted, and a favourable reception was accorded to the proposition to found an institution granting the certificate "d'études françaises" to male and female students of foreign nationality.

A Pharmacy Besieged.—A pharmacien at Raincy has just had a singular adventure. It appears that his little girl, whilst playing outside the pharmacy with some neighbours' children, was ill-treated and fled indoors, still followed by one little boy. Noticing blood-stains upon the child's face, the father, moved to anger more than was necessary, seized the boy and took him into the pharmacy, and there wrote upon his forehead in large characters with a caustic point the word "Brigand." Recognising the absurdity of his action, he essayed to remove the stains, but the youngster struggled and bellowed, and finally made good his escape. The news was soon wafted round the quarter, and the neighbours, indignant at the act, repaired *en masse* to the Pharmacy. Hearing them coming the pharmacien quickly closed and went upstairs to the window, from which he fired several revolver shots in order to attract the attention of the police. This he succeeded in doing, several arrests were made, but the demonstrators were soon liberated.

Concours.—A Concours is to be held on December 11, 1899, before the mixed Faculty of Medicine and Pharmacy of the University of Lyons, for the chairs of Pathology, Clinical Surgery, and Obstetrical Clinique to the Preparatory School of Medicine and Pharmacy of Dijon.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. A. E. Bolshaw, M.P.S., chemist and druggist, 37, White Rock, Hastings, has placed in his handsome newly-fitted pharmacy an artistic late design "American Soda Fountain," and is now able to supply his patrons with fruit-juice beverages in the latest up-to-date American style.

Mr. L. A. Cocker, M.P.S., pharmaceutical chemist, 68, Mostyn Street, Llanduduo, intimates that he has erected a splendidly-equipped photographic dark room for the use of visitors, and keeps a very large assortment of photographic goods, and that all dry plates, films, papers, etc., are guaranteed to be quite fresh.

Messrs. Oxen and Co., Limited (D. H. Oxen, M.P.S., managing director), of Newcastle-under-Lyne and Stoke-upon-Trent, have recently purchased the branch business of Mr. W. Hartle, chemist and druggist, 99, Broad Street, Hanley.

Mr. Josiah Austin, F.S.A., M.P.S., Nechells, Birmingham, is the author and publisher of an illustrated booklet entitled "Beautiful Italy" and numerous other pamphlets on health, travel, etc. These pamphlets are "dedicated to the working classes, who, whilst not being able to visit the world's wonders are ever ready to read and learn from the pen of those who desire their welfare." The booklet referred to includes interesting descriptions of Milan, the Lakes, Veniec, Florence, Naples, Pompeii, Vesuvius, Rome, Genoa, Pisa, etc.

Mr. James Taylor, head of the drug department of Messrs. Evans, Gadd and Co., Exeter, was the recipient on Friday last of a handsome marble clock and Japanese vases, together with a framed photographic group of the principals and employés of the firm. A silver plate on the clock bore the inscription: "Presented to Mr. James Taylor as a slight token of esteem and a memento of fifty years' faithful service for the firm of Messrs. Evans, Gadd and Co., from his sincere friends, Henry Gadd and W. J. Wippell, Exeter, July 1, 1889." Mr. Taylor was also presented with a framed illuminated address by his fellow emloyés.

Bro. W. R. Cook, Pharmaceutical Chemist, Faringdon, has had the honour of Provincial Grand Pursuivant conferred upon him at the Provincial Grand Lodge held at the Royal Military College, Sandhurst, on the 1st instant, by the Right Worshipful the Provincial Grand Master, Lord Wantage, V.C., K.C.B.

Mr. I. Weston Aplin, chemist and druggist, Chislehurst (from P. W. Squire, Oxford Street, London), is reported to have acquired the business recently established by Messrs. Coleberd and Co., Ltd., in High Street, Exeter, and intends to carry on a "high-class pharmacy on the latest modern cash principles," and to supply "Imperial quality at democratic prices."

Dr. S. B. Schryver, of the Wellcome Chemical Research Laboratories, has been awarded a Research Medal by the Council of University College, London, as one of the former pupils of the College who has most distinguished himself in research. Dr. Schryver received the medal at the official presentation of prizes at the College, on Friday, June 23.

Mr. Owen Jones, chemist and druggist, Penmaenmawr, has succeeded to the business of his brother-in-law, Mr. J. W. Ellis, chemist and druggist, Abergele, North Wales.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

July 6, 1899.

As might have been expected, business has been somewhat restricted during the past week; at the same time a fair number of transactions have taken place since the turn of the half-year. There are no changes in value of any special importance to report, excepting a rise in price of Quicksilver, which, it is said, may very likely be followed by a further advance before very long. Mercurials are so far unchanged. Quinine very dull at nominally unchanged values. Iodides and Bromides without change. Bismuth and Salts very firm and in good demand, it being hinted that the long anticipated advance in price to something like the old figure may possibly now not be much longer postponed. Glycerine, Cod Liver Oil, and Glycerine are very dull. Opium and Morphia dearer. Codeia very firm. Castor Oil firmer. Sulphate of Ammonia rather easier. Linseed Oil and Rape Oil very firm. The following are particulars as to prices ruling for some articles of chief interest:—

ACETANILIDE—Continues dull and weak at 11d. to 1s. per lb., according to quantity and make.

ACID CARBOLIC—Is in good demand, quotations for the best makes being 6¾d. per lb. for the 35°-36° C. ice crystal in large drums and overcasks; 7¼d. to 7½d. for the 39°-40° C. ice crystal, and 8¼d. to 8½d. for the 39°-40° C. in detached crystals, this being now the B.P. quality. Crude 60° F. 2s. 1½d.; 75° F. 2s. 8d. per gallon. Liquid of pale straw colour 95-98 per cent. at 1s. 2d. to 1s. 3d. per gallon in 40 gallon casks.

ACID CITRIC.—Makers of the best brands still quote 1s. 8d. per lb. for Crystals in 5 cwt. casks. They can hardly be considered as being free sellers at the price. Second-hand offers at 1s. 7½d. per lb. It is stated that with a continuance of warm weather there is prospect of even higher prices ruling, both Juice and Citrate of Lime being very firm.

ACID OXALIC.—No change in price to report.

ACID TARTARIC—Firm at unchanged price.

AMMONIA COMPOUNDS—Are without change with the exception of sulphate, which is a shade easier.

ANTIPYRINE and **PHENAZONE**—Are unchanged.

BLEACHING POWDER (CHLORIDE OF LIME)—Unchanged at £6 per ton for English.

BORAX AND BORACIC ACID—Are unchanged.

BROMIDES AND BROMINE—In good demand, prices remaining as given last week.

BISMUTH.—Price both of the Metal and of the Salts remains unchanged; there are, however, rumours that the long-expected advance to something like the old figure of 7s. 6d. per lb. for the metal may possibly take place ere long.

CAMPHOR.—Crude remains nominally unchanged at 135s. per cwt. c.i.f. for Japan, and 127s. 6d. for China, while the price of refined has been reduced 1d. per lb. by the English makers, prices now being for ton lots, 1s. 7d. per lb. for Bells and Flowers, and 1s. 8d. to 1s. 10½d. per lb. for Tablets, according to size. The German refiners also reduced their price.

CASTOR OIL—Remains firm. Belgian first pressing, spot, £25 10s. per ton; second pressing £23 per ton ex wharf. Hull manufactured, guaranteed cold drawn, fine Pharmaceutical oil £28 5s. per ton in barrels, 3$\frac{5}{16}$d. per lb. in cases; pure firsts £25 15s.; seconds £24 5s. per ton in barrels; firsts 3$\frac{1}{16}$d. per lb. in cases, seconds 2$\frac{7}{8}$d. per lb. for prompt or forward delivery ex wharf London. London first pressing 24s. 6d. per cwt., second pressing 23s. 6d. per cwt. Medicinal in cases 3½d. per lb.; French 25s. 6d. per cwt.; spot, 23s. 6d. f.o.b. Marseilles; second pressing, spot, 24s. per cwt.

CLOVES.—Privately the market for Zanzibar is firm at rather higher rates. Sales include July-Sept. at 3$\frac{3}{16}$d. and Oct.-Dec. at 3$\frac{9}{32}$d. to 3$\frac{5}{16}$d. No Zanzibar offered in auction. 27 cases Penang were bought in, ordinary picked at 7d. to 7½d., unpicked at 6d.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. per gallon; pure, 1s. 3d. per lb. Benzole: Dearer, 50 per cent., 8½d.; 90 per cent, 8d. per gallon. Crude Naphtha: 30 per cent. at 120°C., 3½d. per gallon. Solvent Naphtha: 95 per cent. at 160°C., 1s. 4d. per gallon; 90 per cent. at 160°C., 1s. 1d.; 90 per cent. at 190°C., 1s. 2d. per gallon. Creosote: 3½d. per gallon. Anthracene: A. 3½d. per unit; B. 2¾d. Tar, Crude and Refined: 13s. 6d. per barrel; 2¼d. per gallon. Pitch, 32s. per ton, f.o.b.

COCAINE—Makers so far make no change in their price, which remains at 11s. 6d. to 11s. 9d. per oz., according to quantity and brand, for the hydrochlorate in 25-oz. tins.

CODEIA—Is in good demand, and very firm at 12s. 6d. to 12s. 9d. per oz. for the pure, and 1s. per oz. less for the salts.

CODLIVER OIL—Is quiet, with no alteration in price to report.

CREAM OF TARTAR—Quiet, but steady at unchanged quotations.

ESSENTIAL OILS—Remain very quiet. In Peppermint H.G. Hotchkiss is firm, and rather dearer at 5s. 3d. per lb. Japanese dementholised is also quoted rather higher at 7s. 3d. per lb. Star Aniseed unchanged at 5s. 7½d. per lb.

GALLS.—China continue slow of sale at 59s. per cwt. for usual shape. Persian are in good demand, and firm at 62s. 6d. to 65s. per cwt. for blues, 56s. to 57s. 6d. for green, and 52s. 6d. to 53s. per cwt. for white. Smyrna remain dull, although the supply is very restricted.

GINGER.—Fair supplies offered, but demand slow and somewhat lower rates ruled. Of 1,082 bags and 233 cases Cochin, about 200 packages sold; good bold cut and scraped, much limed, at 75s.; fair bold, some medium ditto, at 69s. 6d. to 70s.; fair medium ditto at 45s. 6d.; cut ends at 23s. 6d.; washed rough bought in at 23s. to 25s. 1,097 packages Jamaica offered, of which 813 sold; fair to good bright at 64s. to 70s.; fair to good medium 59s. to 63s.; ordinary to good ordinary 51s. to 56s. common to good common 47s. to 50s. 6d.

GLYCERINE.—Crude continues firm, while the refined article remains dull and weak at nominally unchanged prices.

IODIDES AND IODINE—Are steady at unchanged prices.

MENTHOL.—Best dry white crystals are quoted 7s. 3d. per lb., but with the renewal of demand we shall probably see a better price for this article.

MERCURIALS.—Makers so far made no alteration in their prices, which remain therefore as given last week.

MORPHIA.—Makers advanced their price to 4s. 10d. per oz. for the Hydrochlorate Powder (crystals 2d. per oz. more), and in view of the firmness of the crude Drug it looks as if the advance will be maintained, for the present at any rate, especially in view of the fact that makers appear to be unable to cope with the pressure of orders against existing contracts, and are therefore practically unable to book fresh contracts except for later delivery.

NITRATE OF SODA—Is quoted £7 17s. 6d. per ton for the ordinary commercial article, and £8 2s. 6d. per ton for refined on the spot.

OILS FIXED and **SPIRITS**.—Linseed and Rape oils are very firm. Cotton quiet. Petroleum and petroleum spirit rather firmer; otherwise there are no changes of importance to record.

OIL OF SWEET ORANGE.—Best makes are now quoted 8s. to 8s. 6d. per lb.

OPIUM—Has been in good demand, and prices are firm to somewhat dearer for both druggists' and manufacturing kinds. Soft shipping is firm, but no business has been reported. Persian has been in active demand, and is now held for full prices, say 11s. 9d. to 12s. per lb. for fine, no medium being available.

PHENACETIN—Very quiet at nominally unchanged price.

POTASH COMPOUNDS—Are quiet and without change.

QUICKSILVER.—Yesterday the importers raised price 2s. 6d. per bottle, to £8 7s. 6d., secondhand meantime not offering. It is believed in some quarters that a further advance is not improbable.

QUININE.—The market remains very quiet. Makers' price for the best German brands of sulphate remains unaltered, while in the speculative market there is nothing doing, prices being nominally unchanged at 1s. 4d. per oz. for spot, 1s. 4¾d. for August, and 1s. 5¼d. for October delivery.

SHELLAC—Remains very quiet, there being practically no business passing in the article, while prices are nominally without change.

SODA COMPOUNDS—Are practically without change.

SPICES (various).—Black Pepper: 130 bags Tillicherry bought in at 5⅜d., no Singapore offered. White Peppper: 150 bags Singapore and 85 bags Penang all bought in. Capsicums firm: of 77 bales Bombay 31 sold at 29s. to 33s. for fair to good bright. Mace dull: of 31 cases Penang 5 sold, finc bold red, little pale, wormy, and slightly mouldy, at 2s.; broken red at 1s. 2d.; 12 packages West Indian sold, fair to good red at 1s. 6d. to 1s. 7d., broken pickings at 1s. 1d. Nutmegs flat: 33 packages West Indian sold, 64's at 2s.; 84's, slightly mouldy, at 1s. 3d.; 76's at 1s. 6d. to 1s. 7d.; 101's and 102's at 1s. to 1s. 1d.; 111's at 1s.; 118's, slightly mouldy, at 9½d.; 128's at 9d. to 9½d.; 148's at 6½d. Pimento: 488 bags offered and 187 sold, ordinary to fair at 3d. to 3⅜d.

SULPHONAL.—The quantity offering below 17s. per lb., whioh is the makers' price for both crystals and powder, appears now to be reduced to quite limited dimensions.

TURMERIC—Has been very quiet, with only restricted business at about previous rates.

To-day's drug auctions passed off quietly, and without special incident. Rio Ipecacuanha showed a decline. The following are the particulars as far as it has been possible to give same up to time of going to press:—

ALOES.—Good hard bright Cape was held for 26s. per cwt., softer, duller, and rather drossy selling at 24s, down to 20s. 6d. per cwt. for two barrels sweepings.

ASAFETIDA.—Of 10 cases, fine drop realised 77s. 6d. per cwt., rather stoney 65s. to 67s. 6d., and black heavy 40s.

BALSAM PERU.—4 cases of good quality were taken out at 8s. 6d. per lb.

BALSAM TOLU.—4 cases were held for 1s. 4d. per lb.

BUCHU LEAVES.—2 bales oblongs were taken out at 4d. per lb.

CARDAMOMS.—Medium to fair Ceylon sold at 1s. 9d. to 2s. 6d. per lb. 1 case seeds sold at 2s. 5d. per lb.

CASTOR OIL.—33 cases Calcutta were all bought in at 3¾d. per lb. for firsts and 3¼d. per lb. for seconds.

CASCARILLA BARK.—7 bales and 15 barrels bought in at 50s. per cwt. for good bold; siftings selling at 35s.

CINCHONA BARK.—13 bales Carthagena were bought in at 4d. per lb. 8 serons catalogued as Peruvian sold at 8½d. per lb.

COCCULUS INDICUS.—23 bags of good quality realised 10s. per cwt.

COLOMBO ROOT.—7 bags fair washed were held for 40s. per cwt., 35 bags medium ditto part selling at 20s., while good sorts realised 16s. 6d. per cwt.

CANELLA ALBA.—10 bales good realised 35s. per cwt.

CUTTLE FISH BONE.—For 85 mats good white sorts there was no bid, same were taken out at 5d. per lb.

DRAGON'S BLOOD.—7 cases fine picked part sold at the very high price of £22 per cwt., balance being bought in; fair bright lump realised £9 to £10; rather better quality, £12 per cwt.; inferior bricky selling at £6 to £7.

ERGOT OF RYE.—10 cases good sound Spanish taken out at 1s. 9d. per lb.

ESSENTIAL OILS.—40 cases Eucalyptus of fair commercial quality were held for 9d. per lb.

GAMBOGE.—17 cases were taken out at £9 for bright pipe; part rather damp.

GUM BENZOIN.—Good seconds Sumatra sold at £9 10s. to £9 15s., fair ditto at £9 per cwt. 2 cases good Siam at £18 per cwt.

GUM GUAIACUM.—1 bale good lump sold cheaply.

GUM KINO.—2 tins, African, sold at 2s. 6d. per lb.

GUM MYRRH.—13 bales and 3 cases part sold at 40s. per cwt. for fair, three cases inferior blocky selling at 12s. per cwt.

HONEY.—157 packages Jamaica part sold at 21s. to 22s. per cwt. for set white; another lot of 69 barrels part sold at 22s. 6d. to 23s. per cwt.; 23 cases good liquid Californian taken out at 34s. per cwt.

IPECACUANHA.—Eleven bales Rio part sold at 14s. 6d. to 15s. per lb. for ICSD and ICCD which shows a decline in valuc. Ten bags finc Cathagena were held for 13s. per lb., a bid of 11s. 6d. being refuscd. Other eight bales not so good in quality realised 11s. 9d. per lb.

JALAP.—Fair heavy tubers were bought in at 7d. per lb. for rather small, and 7½d. per lb. for fairly bold.

LIQUORICE ROOT.—16 bales fine peeled bought in at 65s. per cwt.

MUSK.—6 tins Tonquin of inferior quality, offered without reserve, sold at 17s. to 30s. per oz.

NUX VOMICA.—99 bags small Madras were bought in at 9s. per cwt.

ORRIS ROOT.—86 packages East Indian sold cheaply at 5s. per cwt.

QUASSIA WOOD.—20 tons Jamaica, bought in, at £4 15s. per ton.

QUININE.—2,000 oz. Brunswick Sulphate in 100 oz. tins held for 1s. 4d. per oz., 1,500 Jobst for 1s. 3d. per oz.; 2,000 ozs. Pelletier's guaranteed B.P. test, 1898, for 1s. 4d. per oz.; 1,000 ozs. Howard's in 1-oz. vials for 1s. 8d., 750 ozs. ditto in 25-oz. tins for 1s. 6d. per oz.

RHUBARB.—Fair to good flat Canton was taken out at 1s. to 1s. 3d. per lb.; round, 1s. 1d.; good bold round Shensi sold at 2s. 6d. per lb.; fair flat ditto, at 1s. 6d.

SANDALWOOD CHIPS.—173 bags of good quality were bought in at 22s. per cwt.

SARSAPARILLA.—8 bales Guayaquil sold at 10d., 1s., and 1s. 1d per lb. for 3, 2, and 1 CCD respectively. 5 bales Jamaica, part sold at 1s. 6d. per lb. 6 serons Honduras were taken out at 1s. 4d. to 1s. 5d. per lb. 22 bales Lima, somewhat chippy, at 11d per lb., a bill of 10½d. per lb. being refused. 9 bales good Lima held for 11d. per lb.

SCAMMONY ROOT.—271 bags sold, without reserve, at 17s. 6d. to 18s. per cwt.

SENNA.—11 packages Alexandria sold at 7½d. to 7¾d. 4 bales Tinnivelly were bought in at 7d. per lb. for the sound, and 6d. for I.C.S.D.

STAR ANISEEDS.—2 bales, quality of which left much to be desired, were bought in at 60s. per cwt.

TAMARINDS.—Fair Antigua bought in at 11s. per cwt., very medium East Indian being held for 6s. 6d. per cwt.

TONQUIN BEANS.—2 casks fair Angostura were taken out at 3s. per lb.

WAX.—16 blocks fair African were bought in at £6 10s. per cwt.; 16 cases East Indian held for £7 2s. 6d.; white Calcutta part sold at £5 17s. 6d. to £5 12s. 6d.; fair Jamaica bought in at £7 7s. 6d. 12 bags Cuban part sold at £6 5s., balance being taken out at £6 15s. 4 cases very medium Zanzibar fetched only £5 15s. per cwt; fair Madagascar bought in at £6 10s.

Newcastle-on-Tyne Chemical Market.

JULY 4, 1899.

Shipping orders for heavy goods for the Baltic and Channel ports have been more in circulation during the last few days. Bleaching Powder and Soda Crystals are still being well booked ahead at quoted prices. In fact, the existing better all-round trade is keeping general makes on the move, so that stocks do not materially increase. Quotations keep as follow:—Bleaching Powder, £5 7s. 6d. to £5 12s. 6d. Soda Crystals, 45s. to 47s. 6d. Caustic Soda, 70 per cent., £7 to £7 5s. Soda Ash, 52 per cent., £4 5s. to £4 10s. Alkali, 52 per cent., £5 5s. to £5 7s. 6d. Sulphur, £4 17s. 6d. to £5 per ton.

Manchester Chemical Report.

JULY 5, 1899.

The stock-taking now progressing in various works interferes with the usual volume of business, and buyers are only buying from hand to mouth. Notwithstanding this, prices of Alkalies are firm, caused no doubt by the continued demand for export account. Caustic Soda and Bleaching Powder are in request, and Soda Crystals continue somewhat scarce. Glycerin is unchanged at £42 per ton, tins and cases, chemically pure on rails. Brown Acetate is firmer, and the range is now £5 2s. 6d. to £5 7s. 6d. for prompt delivery. Sulphate of Copper is about 10s. per ton lower on the week. Pitch is higher, and for prompt 28s. 6d. is being paid, while makers are looking forward to higher prices for next season's delivery. Naphthas remain firm. Green Copperas, Lancashire. make, is unchanged at late rates. Acetate of Soda dull at £13 10s. to £13 15s. per ton. Both Glauber and Epsom Salts are firm at 35s. and 55s. respectively. Yellow Prussiate is firm at 8¼d. to 8½d according to quantity. Alum dull.

Liverpool Market Report.

July 5, 1899.

With the exception of a considerable fall in the price of Spirits of Turpentine prices are practically those of last week. Slight improvements are to be noted in the quotations for Quillaya Bark and Cream of Tartar. The demand in the chemical trade is better, and a good amount of business has been done in Caustic Soda.

Ammonia Salts.—*Carbonate:* 3¼d. per lb. *Sal ammoniac:* 33s. to 35s. per cwt. *Sulphate* quieter: £12 7s. 6d. to £12 10s. per ton.

Canaryseed.—Turkish seed has been in good demand. 300 bags sold for 33s. 6d. per 464 lbs. early in the week, then 80 bags for 34s. 6d., and now there is nothing of good average quality to be had under 35s. per 464 lbs.

Ginger.—102 bags of *Monrovian* sold privately in transit, terms not mentioned.

Linseed.—The market is firm and the amount offering is practically *nil*. Some attention is directed to North American seed which has in consequence risen in price to 36s. 9d. per 424 lbs. No business has been concluded in Calcutta or River Plate seed.

Oils (Fixed) and Spirits.—*Castor* is selling steadily almost at last week's rates: Calcutta at 2⅞d. per lb. French, 2$\frac{11}{16}$d. to 2¾d., and Madras at 2¾d. In the early part of the week 150 cases of Calcutta sold for 2$\frac{13}{16}$d. to 2⅞d. "to arrive," and latterly French has sold at 2$\frac{9}{16}$d. for second pressure, ex-quay, and 2⅝d. from store. *Olive:* There has been more doing of late, Candia and Levant oils being in good demand at full rates. Candia is quoted at £31 10s. per tun, and Malaga at £32. *Linseed* is firmly held for 22s. to 22s. 6d. per cwt. in export casks. *Cottonseed* is steady with quiet trade passing at 17s. to 17s. 6d. per cwt., for Liverpool refined in export barrels. *Spirits of Turpentine*: Quotations have experienced a considerable fall, and are now fairly steady at 33s. 6d. per cwt. spot delivery, 32s. 6d. delivery before end of week, and 32s. during the month.

Potash Salts.—*Bichromate* 3¼d. per lb. *Chlorate* scarce, 3½d. to 3¾d. per lb. *Cream of Tartar* is firmer, and higher prices are asked, viz., 75s. to 80s. per cwt. for "finest white." *Pearlashes* are very quiet at 32s. per cwt. *Potashes* 23s. per cwt. *Saltpetre* firm, 22s. 6d. per cwt.

Quillaya Bark.—3 to 4 tons of Chilian sold at £12 5s. per ton ex store. Prices have since gone up.

Soda Salts.—*Bicarbonate*, £6 5s. to £5 15s. per ton. *Borax* is very firm at 16s. to 17s. per cwt. *Caustic*, 76 to 77 per cent., £7 15s. per ton; 70 per cent. £7; a very firm market. *Crystals*, £3 per ton. *Hyposulphite* is firm at £6 15s. to £6 per ton. *Nitrate* is easier, and the trade doing is quiet at 7s. 9d. to 8s. per cwt.

TRADE NOTES.

New Sponge Case and Show Stand.—Messrs. Baughan and Co., shopfitters, etc., Walthamstow, London, are introducing a new hexagon sponge case and show stand in mahogany and crown glass, which forms a handsome centre case, and can be made in any size. It is well made and well finished, and an ornament to any shop. The base is 34½ inches high, and 24 inches in diameter, total height with stand, 64½ inches. The case has six separate cages, thus enabling six sizes of sponges to be shown; each door is hinged at bottom, and tips forward with a tinned wire cage attached, at bottom of which a ticket clip is fixed, so that price ticket can be put in each cage if desired. The upper part consists of three circular plate glass shelves, with rounded and polished edges 10, 12, and 14 inches diameter, which can be altered to any height, and are supported on a handsome fancy brass pillar, thus with the top of case and shelves a handsome show of other goods can be shown. Price, polished bright or black, £8 15s. If in plate glass, 9s. 6d. extra.

Extension of Premises.—Holloway's Wine Co., Ltd., 61, New Oxford Street, W.C., intimates that it has secured large cellarage, adjoining its present bottling cellars, under the new building being completed by Mr. Carmichael in New Oxford Street, also two large additional offices on the ground floor which will be connected with the present offices and packing warehouses. This extension will add considerably to the firm's facilities for bottling. The company also directs attention to its latest speciality St. Holloway's Quinquinna at 1s. 6d. and 2s. 9d. per bottle retail, less 33⅓ per cent., which is said to be rapidly gaining favour. Doctor's samples and a sampling vase for counter use are supplied with the Quinquinna.

Photographic Price List.—Messrs. F. Darton and Co., Clerkenwell Optical Works, 142, St. John Street, E.C., submit a copy of their trade price list of cameras, etc. It is profusely illustrated, and contains descriptions of several good lines. The "Exceptioual" hand cameras, at prices from a guiuea upwards, appear to be fitted with all the latest improvements, and in finish equal to much more expensive oues. Dealers in photographic goods should apply for a copy of this list.

"Twenty-one Years in Fleet Street" is the title of a booklet issued by Smith's Advertising Agency, 132, Fleet Street, E.C., being a retrospect by Mr. Thomas Smith, founder of the firm. An interesting account is given of the growth of the advertising business from June 10, 1878, when literally the writer had not a stick in an office to call his own, or a single clerk—not even an office boy—to the present time. The staff now numbers forty-three.

The "Plymouth" Lime Juice Cordial.—Mr. James Maurice, chemist and druggist, 34, Bedford Street, Plymouth, submits a sample of his "Plymouth" lime juice cordial. It is a preparation entirely free from alcohol, made from the purest West Indian limes. However hot the weather may be at the time of the forthcoming Conference at Plymouth, visitors will be able to satisfy their driest thirst with a perfectly pure and wholesome beverage, for mixed with either plain or aërated water, the cordial forms a most palatable and refreshing drink, free from the musty flavour which is so frequently associated with lime juice. Locally it has a great sale, the price being 1s. per bottle, or three bottles for 2s. 6d. The London agents are Messrs. Barclay & Sons, Ltd., 95 Farringdon Street, E.C.

Messrs. A. H. Cox and Company, St. Martin's Place, Brighton, have just issued their July, 1899, priced catalogue of tasteless pills. A few new formulæ have been added, and the prices of many of the pills have been reduced, notably antipyrin, pepsin, and papain. The firm also issue a list of "Packed" Pills suitable for chemist's own name and address.

Births, Marriages, and Deaths.

BIRTH.

Ough.—On June 30, at Curzon Terrace, Sparkenhoe Street, Leicester, the wife of Lewis Ough, F.C.S., pharmaceutical chemist of a daughter.

MARRIAGE.

Boorne—Gadd.—On July 5, at Southernbay Congregational Church, Exeter, by the Rev. H. Arnold Thomas (Bristol, Chairuan of the Congregational Union), assisted by the Rev. Herbert Arnold, Mr. Herbert E. Boorne (manager of the Bristol establishment of Messrs. Evans, Gadd, and Co., wholesale chemists and druggists, of Exeter and Bristol), son of the late Mr. Charles Boorne, of Clifton, to Miss E. Rose Gadd, second daughter of Alderman Henry Gadd, J.P., of St. David's Hill, Exeter (Messrs. Evans, Gadd and Co.).

DEATHS.

Moon.—On June 17, Henry Moon, Chemist and Druggist, Brighton. Aged 50.

Dodd.—On June 24, William Henry Dodd, Chemist and Druggist, Fulham. Aged 47.

Goddard.—On June 25, Enoch William Goddard, Chemist and Druggist, Nottingham. Aged 45.

Watts.—On June 26, Walter Watts, Chemist and Druggist, Lower Clapton.

Garforth.—On June 27, John Garforth, Chemist and Druggist, Sheffield, Aged 66.

Clark.—On July 3, Robinson Unwin Clark, chemist and druggist, Jarrow-on-Tyne. Mr. Clark, who was a member of the Pharmaceutical Society, had been unable to attend to his business for about a fortnight, and had been away to recuperate, but returned home on Monday last and died from heart affection.

What Offers. Squire's (9th Edition) Thorpe's 'Metals and Non-Metals'; Balfour's 'First Botany'; Lindley's 'School Botany'; Everett's 'Physics'; Attfield (4th Edition); Proctor's 'Pharmacy,' 'Art of Dispensing'; Elborne's 'Pharmacy and Materia Medica'; Remsen's 'Organic.'—65, Barnsbury Road, London, N.

Automatic Sight-testing Company's ½-doz. 2s. 6d. spectacles and 22 2s. 6d. folders for 1s. 6d. each.—Finch, 11, Manor Park Parade, Lewisham, London, S.E.

Three Dozen Stoppered Winchesters, gold labelled; two specie jars; 5-gr. pill machine; revolving pill coater; several proprietaries and patents; large iron mortar; all very cheap.—Plattin, Fakenham, Norfolk.

Pharmaceutical Journal, from February, 1898, to present date, 2s.—Chemicus, 88, Sussex Road, Holloway.

36 Daisies, 24s.; 72, 46s. 6d.; 36 Munyon's, 22s. 6d.—Eastman, Forest Lane, Stratford.

Cannot Repeat. Sponge Bags, best check (Maw's sizes) 2, 5s., 3, 6s.; 4, 8s. 6d.; 5, 9s. 6d.; 6, 10s. 6d. doz. Bathing Caps, circular, best check, 5s. 6d. Eye Shades, celluloid lined green, rights, lefts, 2s. Enema Syringes, I.R. bottle, bone pipes, best English, red, green, black, 1 oz., 1s.; 2 oz., 1s. 3d.; 3 oz., 1s. 6d.; 4 oz., 1s. 9d. each. 10s. lots post free. Cash returned if sold.—Warnes, Chemist, 333, Gray's Inn, Rd., W.C.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Camwal Shares Wanted. State number and lowest price.—Lawrence, Chemist, Rhyl.

Partnerships Dissolved.

(From the London Gazette.)

W. J. Sprott and W. B. Smith, Physicians and Surgeons, Beeston Notts, so far as regards W. R. Smith.

Lewis Mackenzie and Stephen Henry Fisher, Surgeons and Medical Practitioners, Tiverton, Devon.

Hugh Wallace and R. A. Wallace, Chemical Manufacturers, 5, Fenchurch Street, E.C.

Geo. S. V. Wills and Henry Wootton, Tutors, Westminster College of Pharmacy, Trinity Square, Boro', S.E. Debts will be received and paid by G. S. V. Wills.

Receiving Order in Bankruptcy.

(From the London Gazette.)

William Payne, Mineral Water Manufacturer, St. Anne's-on-the-Sea, Lancs.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Allen, Attwood, Balkwill, Bostock, Bonn, Bullock, Burroughs, Cruickshank, Davis, Edwards, Fleming, Gall, Giles, Glass, Hall, Hardy, Hill, Jones, Kenway, Lenfestey, Lovis, McVitæ, Morton, Ough, Rogers, Rowell, Sandy, Stiles, Watson, Westley, Wilson, Wolstenholme.

POLITICAL GOSSIP.

The Lord Chancellor is to be placed on trial in the House of Commons by an Irish barrister, who, some seven years back, was instrumental in securing the downfall of the Unionist Ministry. The hon. gentleman in question is Mr. Swift MacNeill, who represents, among other things, Donegal and Anti-vivisection, and boasts of a remote connection with the famous Dean Swift. He is one of Her Majesty's Counsel learned in the law, who considers that Lord Halsbury's judicial patronage is not judiciously bestowed, and he, therefore, proposes to air his convictions by moving that the recent action of the high officer impeached is calculated to degrade the dignity of the judicial office and to bring the administration of justice into contempt. It is not the first time that the breath of calumny has been directed at the present occupant of the Woolsack, but we have little doubt that the Chancellor will come out of the ordeal without much damage, for he has been described as a somewhat "rugged" person, whose nature is allied to the toughness of the eminent Major Joseph Bagstock. It will be remembered that it was Mr. MacNeill who made the recent indignant protest against the "shelving" methods adopted by the House of Lords in regard to the Companies Bill. He evidently regards the Lord Chancellor as the prime obstacle to reform in Company law, and perhaps he may not be very far wrong.

Virtue is its own reward, or should be according to Mr. Hazell, one of the members for Leicester, for that gentleman has notified that he will move to reduce the salary of the Lord President of the Privy Council by £2,000. As this amount represents the whole of the salary of the Lord President, it would appear that his services to Education are not ranked very high by Mr. Hazell and those who act with him. Another Minister whose action has endangered his salary is Mr. Long—the President of the Board of Agriculture. He, together with Mr. Chaplin, of the Local Government Board, are to be rewarded for the worry they have experienced over the Food and Drugs Bill by motions in the names of Mr. Strachey and Mr. Channing (both ardent opponents of the Bill) for reductions of £100. Fortunately for Ministers there is so much talk over general Parliamentary business that the Estimates usually have to be rushed through Committee without adequate discussion.

Food and Drugs Legislation is likely to be postponed for another Session, to judge by the recent utterances of some prominent members and the action of others. It is stated that Mr. Long, the Minister in charge of the Government Bill, has appointed a committee to consider and report upon the question of the use of colouring matter and preservatives in food products. The committee is to include Sir H. E. Maxwell, Dr. T. E. Thorpe, Dr. Bulstrode, and Dr. Tunnicliffe. The Bill will therefore have to be thrown over, for it is well known that in regard to the use of preservative substances there is an amount of conflicting expert evidence that will occupy the discriminating faculties of the committee a considerable time. Meanwhile everything works towards making the abandonment of the Bill easy. Mr. Hedderwick (Wick Burgs) has considerately put upon the paper a question inviting Mr. Long to state whether he has promised the above-mentioned Committee; whilst Mr. Provand (Glasgow) has another notice delicately insinuating that as the Food and Drugs Bill is highly contentious in character, and is strongly opposed by manufacturers and traders, it might be wise to consent to its withdrawal. Sir J. Leng is also among the enquirers. The result of these Scotch manœuvres will be made public as we go to press. Mr. Balfour will at the same time make a further statement as to the Bills to be passed this Session, and it is expected that he will give the *coup de grace* to Mr. Long's measure. The amendments to the Bill, it may be mentioned, have swelled into twelve pages of folio.

The Companies Amendment Bill, to which we referred last week as standing in the name of Mr. Faithful Begg, has now been dropped. The other Bills in the House of Lords on the same subject stand where they did, and there is no sign of their progress. Having regard to the fact that the Session is almost at an end, all hope of relief from the "Company" incubus this year must be abandoned.

The Shop Girl found favour with the Lords on Tuesday, when the Seats for Shop Assistants (England and Ireland) Bill passed its second reading in triumphant disregard of the words of wisdom uttered by Lord Shand and the Marquis of Salisbury, backed up by the sturdy "whip," circulated amongst the noble Lords by the Council of the Liberty and Property Defence League. Means must now be found to include Scotland within the operation of the Bill, and Lord Ribblesdale has already notified an amendment to effect that object.

Medical Research does not yet recommend itself to the Government. Replying to Sir C. Cameron, who suggested the appointment of a Royal Commission to devise means of combating the increase of cancerous diseases, Mr. T. W. Russell, in the absence of Mr. Chaplin, stated that the Local Government Board has from time to time caused scientific inquiries to be made into the causes of cancer, but that in the present state of knowledge he is advised that the appointment of a Commission would serve no useful purpose. Perhaps Chicago may find the remedy in fulfilment of recent rumour.

According to the Chancellor of the Exchequer, the arrangements for the conversion of the Imperial Institute into a branch of the London University are almost complete. Replying to Mr. Hogan, the Australian colonist, who sits for Mid-Tipperary, Sir Michael Hicks Beach informed the House that the Treasury, the Institute, and the Commissioners had come to an arrangement which is mutually satisfactory; and that after the ratification by the Senate of the University, the terms of the agreement would be embodied in a Treasury minute and presented to Parliament. It is to be hoped that the satisfaction said to exist among the contracting parties may communicate itself to the general public when the whole scheme is made known.

THE PURITY OF FOOD AND DRUGS.

Camphorated Oil.—At the Durham County Police Court on Wednesday, July 5, Messrs. John Bell and Sons, Ltd., drysalters, Liverpool, were charged with having given a false warranty with regard to camphorated oil.—Mr. B. Scott Elder, chief inspector of food and drugs under the Durham County Council, prosecuted, and Mr. T. Jennings, of Bishop Auckland, appeared for the defendants. —Mr. Scott Elder gave evidence as to purchasing several bottles of camphorated oil from the shop of a Mrs. Fisherwick at Langley Moor, near Durham, who had written to the defendants' firm for a written warranty as to the pureness of the article before selling any of the oil, and they had forwarded the warranty certifying the oil to be pure. The oil, upon being submitted to analysis, was found not to be compounded with olive oil as required by the B.P. which costs from 5s. to 7s. 6d. per gallon, but with rape and mineral oil, which could be purchased at 1s. 6d. a gallon.—Mr. Jennings raised a technical objection that since the oil was purchased the firm had been converted into a limited company, and also that the analysis was obtained after the summons was taken out.—The defendants' warehouseman was called to prove that the defendants purchased what was guaranteed to them as olive oil for the purpose of making camphorated oil.—The magistrates overruled Mr. Jennings' objections, and convicted the defendants, inflicting the full penalty of £20 and costs.—William Whittle Mellor, of the general stores, Leatherhead, was summoned by the County Council for selling camphorated oil which was 20 per cent. deficient in camphor.—Mr. Downs, of Dorking, appeared for the defendant, and Mr. Washington watched the case on behalf of the wholesale dealers.—There was no dispute as to the facts. Inspector Martin stated that he went to the defendant's shop and bought three twopenny bottles of camphorated oil, which purported to be prepared in accordance with the British Pharmacopœia. On being analysed it was found to contain 16·6 per cent. only of camphor, instead of 20 per cent., as required by the Pharmacopœia.—Mr. Downs produced a letter from the wholesale firm, stating that they now only supplied the oil in accordance with the formula stated, and that defendant ordered on that letter, paying a higher price than he had paid before. The Chairman stated that the magistrates were satisfied that the defendant was perfectly innocent of any fraudulent intention. Still the public must be protected, and he would be fined 2s. 6d., the costs being remitted. He would be able to recover from the wholesale firm.

What to Buy is the title of a sub-heading in an article in *Food and Sanitation* on "Practical Lessons Derived from 14,000 Samples Taken for Analysis under the 'Sale of Food and Drugs Act,'" by J. R. Kaye, M.D., Medical Officer of Health, West Riding, Yorkshire. Referring to drugs the writer remarks that this is a wide branch of the work, bristling with difficulties; but much good can be done by sampling those drugs of definite composition which are much used by the public, and much liable to sophistication. He then goes on to say that it is of no use purchasing such drugs as "Life and Health Elixir," "Castor Oil Pills," and any other such remedies, which may consist of practically anything, but recommends a list of drugs which may be usefully purchased by inspectors for analysis, and gives the amount to be asked for in each case as follows:—Almond oil, 4 oz.; oil of eucalyptus, 2 oz.; olive oil, 4 oz.; camphorated oil, 4 oz; antimonial powder, 1 oz.; Gregory's powder, 2 oz.; milk sugar, 3 oz.; milk of sulphur, 2 oz.; saffron, ¾-oz.; precipitated chalk, 4 oz.; jalap, 2 oz.; fluid magnesia, ½-pint; benzoic acid lozenges, 2 oz.; tincture of iodine, 2 oz.; lemon juice, 4 oz.; mercury ointment, 2 oz.; compound mercury powder, 4 oz.; sulphur ointment, 4 oz.; zinc ointment, 4 oz.; sweet spirit of nitre, 3 oz.; spirit of sal volatile, 4 oz.; paregoric, 2 oz. Chemists and druggists will do well to make a note of the above quantities, as they may thus be saved trouble. Dr. Kaye points out that if the articles which are supplied do not conform to the requirements of the B.P., a conviction would be obtainable under Section 6 of the Food and Drugs Act, 1875, also that according to the Pharmacy Act of 1868, Section 15, any person who shall compound any medicine of the B.P., except according to the formularies of the said B.P., is liable to a penalty. The author omits to point out that, in so far as the provisions of the Pharmacy Act, 1868, relate to the compounding of medicines according to the formularies of the British Pharmacopœia, the interpretation that has been put upon the word "person," as not including a company, makes the administration of that part of the Act extremely difficult, if not impossible, in the case of drug stores or shops carried on by companies. The Food and Drugs Act alone provides a remedy for the sale of improperly prepared medicines of the British Pharmacopœia, on giving proof of their not being of the nature of the article demanded.

With Regard to Medicines Compounded according to special prescriptions, Dr. Kaye states that those may be purchased for analysis if proper care is exercised. He advises inspectors to have three facsimile copies of the prescription it is intended to have made up—one to be handed to the chemist who compounds the prescription, a second for the guidance of the analyst, and the third to be kept by the inspector. If the certificate shows any variation, proceedings may be taken under Section 7 of the Sale of Food and Drugs Act. The writer points out that proceedings under that Section would be effective even though the purchaser got more for his money than he demanded, there being nothing about prejudice in the Section, as the offence is supplying what is not in accordance with the demand.

Paregoric Tablets, put up in penny packets, marked "Confectionery, sold as herbal sweets," and retailed by confectioners, have been examined by the public analyst for Kensington. Regarding a sample of the tablets as a drug, it was found that it had been correctly described, and was accordingly reported as genuine, although had the sample been purchased and submitted for analysis as "sweets," and if the attention of the purchaser had not been drawn to the fact that it contained "paregoric," it would have been certified as adulterated, the presence of any appreciable quantity of morphine in an article sold as food unquestionably constituting adulteration within the meaning of the Acts. The sample in question was found to be composed of sweetstuff into which paregoric had been introduced, but the sample was too small to admit of the determination of the percentage of morphine present, it being only possible to prove the presence of the alkaloid, In his report, the analyst remarks that the danger attending the unrestricted sale of a preparation of such a nature is too obvious to need comment.—*British Food Journal*, **1**, 20.

The Enamel of Cooking Utensils has been the subject of investigation by M. L. Barthe in consequence of a case of poisoning at Bordeaux which resulted in the death of one person and the serious illness of several others. The poisoning, however, appeared to have been due to a ptomaine. He found little information on the subject in echnical works, but according to a paper by A. Granger, the enamels consist of complex silicates, or borates, in combination with potash, soda, lime, or oxide of lead. Binoxide of tin is employed to make the enamel opaque, also arsenious anhydride, phosphate of lime, and high proportions of alumina. An analysis by O. Emmerling of an enamel intended for domestic utensils showed that it contained 52.51 per cent. of oxide of lead and 3·74 per cent. of arsenic acid. M. Barthe personally examined the enamels from four saucepans which he found to be similar in composition, and to consist of silica, tin, and alumina, with small proportions of zinc, lime, and potash, and traces of iron and cobalt. A trace of manganese was found in one case. Lead, boric oxide, and arsenic were entirely absent. These enamels were fusible with great difficulty; but, according to the *British Food Journal*, there is no doubt that many others are used which are easily fusible and which contain oxide of lead and other dangerous ingredients. Dr. G. Ambühl, official analyst for the canton of St. Gall, Switzerland, states in a recent report that a preparation used by a local enameller contained 35 per cent. of oxide of lead, and it is thought that similar facts would be revealed if the matter were looked into in this country.

The Toxic Effects of Boric Acid are described by Dr. J. J. Evans in the *British Medical Journal*. In treating a case of cystitis increasing doses of 10 to 20 grains of boric acid three times a day were prescribed. After about three weeks of this treatment an erythematous rash spreads over the patient's neck, face, and head, followed by some subcutaneous œdema, and a fine scaly dermatitis. The salivary glands became enlarged, and eventually the hair on the face and head fell out, so that in about a fortnight the man was perfectly bald. The drug was discontinued, but six weeks elapsed before there was any reappearance of hair on the face or head. In numerous other cases of cystitis and urethritis extending over a period of five years, Dr. Evans has observed similar effects following the administration of boric acid—that is, an erythema followed by a fine scaly exfoliation. Immediate discontinuance of the drug prevented development of the more severe symptoms, but in one case in which it was inadvertently continued the hair fell out to a slight extent, and there was marked exfoliation of the skin, especially of the hands, with onychia and splitting of the nails. Dr. Evans concludes that the symptoms were entirely due to the action of boric acid on the skin and appendages.

A Novel Meat-Preservative has been examined by A. C. Chapman. It was a colourless antiseptic solution having a mixed odour of sulphurous and benzoic acids. A qualitative analysis revealed the presence of aluminium sulphate, sodium chloride, sodium nitrate, sulphurous acid, chloral hydrate, benzoic acid, and a small quantity of iodine, apparently existing as hydriodic acid. The alum was evidently intended to exert its astringent effect upon the fibre of the meat, whilst the remaining constituents, with the exception, perhaps, of the chloral, were used for their well-known preservative and antiseptic properties. The chloral and the benzoic acid would doubtless be volatilised during the process of cooking, which probably suggested the use of benzoic instead of the more active salicylic acid.—*British Food Journal*, **1**, 35.

ENGLISH NEWS.

Charing Cross Hospital Medical School.—In the absence of Lord James of Hereford, Sir Robert Finlay, M.P., the Solicitor-General, distributed the prizes and certificates awarded during the summer session, 1898, and the winter session, 1898-99, to the students at this school, on Wednesday, July 5. The Dean, Dr. Montague Murray, having read his report on the past year's work, the Solicitor-General congratulated the prize winners on the success which had attended their efforts, and referred to the presence of Professor Virchow and Lord Lister at the Huxley lecture instituted to commemmorate the connection of the late Professor Huxley with this medical school. Every student of medicine might well feel proud of the fact that he had chosen, without exception, the most unselfish profession in the world. There was no class of men who did their work more nobly and conscientiously than the medical men and surgeons of Europe. He impressed upon the students the importance, when they started practice, of keeping themselves in touch, not only with the improvements of Science, but with the great masterpieces of literature in which some phase or other of human nature was always to be found. A vote of thanks to Sir R. Finlay, proposed by Sir Joseph Fayrer, concluded the proceedings.

Cricket.—In a match played at West Green on Saturday, July 8, between the Allenbury's C.C. and Balland's C.C., the former team scored 101 runs, and the latter, playing one man short, 50.

Society of Chemical Industry.—The annual meeting of the Society of Chemical Industry was opened on Wednesday, July 12, at Newcastle-on-Tyne. Mr. George Beilby, of Edinburgh, president of the society, was in the chair. At the Durham College of Science, where the delegates were welcomed to the city by the mayor, Professor C. F. Chandler, M.D., of New York, was elected president for the ensuing year. Professor Chandler had written to the retiring president accepting the office, and regarding it as an evidence of the good feeling existing between the two branches of the Anglo-Saxon race on opposite shores of the Atlantic. The council's report, which was adopted, according to the *Times*, stated that the number of members on the register was 3,312, compared with 3,185 at the last annual meeting. The president (Mr. Beilby) in the course of his address dealt with the rapid exhaustion of British coalfields and the serious increase of smoke pollution. The remedies were broadly divided into two classes—first, improved appliances for the combustion of raw coal and distribution of the air supply in furnaces, and secondly, the transformation of the raw coal into smokeless fuel by preliminary treatment. The effects of the natural development of certain industries on the markets for by-products were next considered. It was pointed out that if any considerable part of the 137 million tons of coal which is at present burned in the raw condition were to be converted into gas, coke, and ammonia, an altogether new condition of things would arise which would need to be foreseen and provided for. A careful study of the whole subject had led to the conclusion that the natural outlet for the coke and pitch would be found in the manufacture of fuel briquettes, and the president advocated the turning of the very best technical skill to the perfecting of this manufacture. He believed that with skill and enterprise it would be possible to make briquettes exactly suited for every purpose from boiler firing to domestic cooking. As a means of bringing all of the different interests which are concerned in this matter into line, it was suggested that the society might arrange for the holding of a conference on the subject of fuel and smoke, at which the leading technical societies as well as the actual industries concerned should be fully represented.

Newcastle-on-Tyne and District Chemists' Association.—The third annual excursion in connection with this Association will take place on Thursday, July 20, to Morpeth. The train leaves Newcastle at 1.30 p.m., arriving at Morpeth at 2.20 p.m. The party will visit Morpeth Castle, Morpeth Parish Church, and then on through the fields to Newminster Abbey, where tea will be provided at 4.30 prompt. After tea, Mitford will be visited. These arrangements are, of course, liable to slight variation. The cost of single tickets is 4s. each, double, 7s. 6d. As this is the only outing the Association has in the year, the committee hope that all members and friends (ladies specially invited) will be able to be present. Those members who reside at Blyth, Bedlington, etc., may book direct to Morpeth themselves, and in that case the cost of the tea, 2s. each, will only be charged. Those intending to be present should notify the Secretary, Mr. F. Gilderdale, 19, Groat Market, Newcastle-on-Tyne, on or before Monday, the 17th inst., so that the necessary arrangements may be made.

Swallowing Medicine Bottles.—A coroner's inquest was held at Bath, on Tuesday, July 11, on the body of a fruiterer, named Thomas Watson, aged 53, in whose stomach were found over twenty small bottles, containing mercury, all securely stoppered with gutta-percha. They weighed over a pound, and the perforation of the stomach had set up peritonitis, which caused death. The jury found that the deceased swallowed the bottles while in a state of dementia, believing that they were medicine.

The Owens College, Manchester.—We are requested to announce that the Introductory Address at the opening of the Winter Session of the Department of Medicine, will be delivered in the Physiological Theatre, on Monday, October 2 next, at 4 p.m., by Sir J. Crichton Browne, LL.D., M.D., F.R.S.

Prussic Acid Poisoning.—An inquest was held at Manchester on July 6 with respect to the death of Izod Richards (36), a surgeon practising at 47, Churnell Street, Rochdale Road. Evidence was given to the effect that deceased went into his surgery on the previous evening, telling his wife that he would follow her upstairs to bed in a few minutes. Shortly afterwards she heard a loud noise, and upon going downstairs found her husband sitting upon a chair in an unconscious condition. On the desk was a small measure containing yellowish, milky fluid. Death occurred shortly afterwards, and was attributed to cardiac failure, the result of an overdose of prussic acid. A verdict of "Accidental death" was returned.

FRENCH NEWS.

To Combat Disease.—A committee, which includes Messrs. Audiffret, Aynard, and d'Arenberg (Deputies), and Monsieur Siegfried (Senator), has been formed to organise a public subscription in aid of scientific research, with a view to the discovery of new methods of treatment for infectious and contagious diseases. That the need is pressing will be seen when it is stated that France loses every year by these diseases two hundred and forty thousand victims, nearly double the number of lives lost in the Franco-Prussian war of 1870. Out of this terrible total tuberculosis is responsible for 100,000 deaths; typhoid fever and other contagious diseases, such as small-pox, measles, scarlatina, whooping-cough, diphtheria, and puerperal fever for 64,000, without speaking of the ravages caused at long intervals by cholera and plague. The task of the scientists is to discover how to cope with these deadly enemies to health; but lack of the sinews of war seriously handicaps them, and although 125,000 fr. has been derived from the funds of the Pari-Mutuel (a Society under Governmental control, having to do with the regulation of racecourse betting), and 75,000 fr. has been subscribed by the public, much more money is needed to accomplish the important work in view. It is to be hoped the noble efforts of the Committee will meet with the success they merit, and that in consequence the ravages of infectious diseases will be considerably lessened.

Suicide of a Medical Student.—Monsieur M. Renard, medical student, living at 219, Boulevard Raspal, Paris, committed suicide on Sunday evening by throwing himself out of his bedroom window on the fifth floor into the courtyard. Death was instantaneous. No cause is assigned for the act, though the deceased youth had for some time past been in a low-spirited condition.

The Turkish Students in Paris, who are assisted by the Ottoman Government, have taken advantage of the presence in Paris on holiday of General Ahmed Djelaled-din Pasha, Aidé-de-Camp-General to the Sultan, to wait upon him with an address of gratitude, which they asked him to transmit to the Sultan. The General, in thanking them for their visit, commended them on their loyalty, and counselled them to profit by the admirable scientific institutions placed at their disposal in France.

The "Presse" announces that Mr. Carrington, an English publisher in the Rue Montmartre, lately issued a volume entitled 'L'histoire de la Flagellation,' from a medical, scientific, and historical point of view. Following a denunciation of this book by the English Society (National Vigilance Association), the French authorities have found that the engravings in question are of an obscene nature, and Mr. Carrington was this week summoned before the Ninth Correctional Tribunal. Our contemporary in a later account of the trial puts the result as a fine of 1,000 fr. exclusive of expenses.

A Peculiar Request.—A certain Monsieur Guichard, shocked at the steady growth of intemperance in France, would like that doctors should prescribe for their patients the least quantity possible of alcohol or alcoholic preparations necessary for their well being. And, with every good intention, he has addressed a request to the Pharmaceutical Society, proposing that alcohol be replaced by some other medium (not suggesting "which") in the preparation of the Codex tinctures, etc. The Society, in replying courteously to this request, admitted that many abused the use of some of the alcoholic preparations, but thought that it rested rather with the medical fraternity to abstain from indiscriminately prescribing such wines and medicaments as lent themselves to abuse when they judged that such were not indispensable, and added that the Codex could only indicate the means whereby the medicaments

could be prepared in the most active form possible, and if a substance could only yield its active principles to an alcoholic menstruum, it was necessary that that menstruum should be employed. Had Monsieur Guichard studied his point a bit more closely, he would have first turned his attention to the cafés rather than the pharmacies. The public as a rule have such a variety of quack wines to choose from that they have recourse to these before consulting either doctor or pharmacien, and then their object is not to gratify any tendency to intemperance, but rather to find a medicament as agreeable to their palate as possible. Hence, though Monsieur Guichard's object be a very praiseworthy one, he pursues it from the wrong end. True, medicated wines and elixirs are used and abused, but not to such an alarming extent as to call for such interference.

Treatment of Carbuncles, etc.—A treatment now very much in vogue in France for carbuncles and dermal suppurations, impetigo, acne, etc., and one advised by Dr. Brocq, the eminent Parisian skin specialist, consists in the use of fresh beer-yeast in doses of two or three teaspoonfuls before meals. When the fresh yeast is unobtainable, the baker's solid variety may be employed. The above-mentioned authority has witnessed marvellous results from the use of this simple remedy. The illustrious, but departed, Saint-German invariably prescribed the application of "pâte de pain d'épice" (a sort of ginger-bread paste) with equally good results. A Parisian pharmacist has now put up a specialty which he calls "Extrait de Levure de Biére," or extract of beer yeast.

SCOTTISH NEWS.

Chemists' Apprentices Outing.—On Wednesday, July 5, all the apprentices in the various drug businesses in Dumfermline enjoyed a day together in the country. Leaving town in one of Mr. Goodall's brakes, the party drove to Aberdour. After a delay of an hour or two, they proceeded per steamer to Leith, and after spending an hour or two there and in Edinburgh, they returned to Aberdour, and reached Dumfermline at about 11 p.m. The weather was all that could be desired.

IRISH NEWS.

Pharmaceutical Society of Ireland.—The following have passed the preliminary examination:—Messrs. E. J. Burke, E. E. W. Young (equal), Miss Mary M. Stanton, Messrs. A. Williams, R. H. Lowe, Matthew Murphy, T. Stack, W. Harnett, A. Bennett (J. Campbell, Miss Sarah E. Dimond equal). Eight candidates were rejected.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. P. S. Campkin has been awarded the Dental Prize for second year's (1898) students at Guy's Hospital Medical School.

Mr. C. G. Yates, chemist and druggist, Brighton, intimates that he has removed from 21, Upper Hamilton Road to 9, Upper Hamilton Road, and requests that all communications be sent to the new address.

Miss Rennie has been appointed dispenser at the Royal County and City of Perth Infirmary. Miss Rennie was trained at the General Hospital, Birmingham. She also studied with F. Alcock, F.I.C., Temple Chambers, Birmingham.

Mr. George Coull, B.Sc., chemist to Messrs. Raimes, Clark and Co., Edinburgh, is, we understand, among those who are to receive the degree of Doctor of Science at the Edinburgh University Graduation Ceremonial on July 29.

Dr. John Coates, M.B.C.M., son of Mr. Joseph Coates, one of Messrs. Raimes, Clark and Co.'s representatives, is to graduate as Doctor of Medicine at the same time.

Messrs. Hickman and Metcalf, wholesale and retail chemists, Newbury, have taken into partnership Mr. Stanley Hickman from July 1 last. The name of the firm is to remain unaltered.

Mr. R. G. Gourlay, chemist and druggist, has recently opened a shop at 65, High Street, Rushden.

TRADE NOTES.

Vasogen Preparations.—Mr. E. J. Reid, 11, Dunedin House, Basinghall-street, E.C., submits samples of several vasogen compounds, manufactured by the Vasogenfabrik Pearson and Co., Hamburg, for which he is now the British agent, having taken over the agency from Messrs. Burgoyne, Burbidges and Co. Vasogen is a vehicle which is said to possess the property of penetrating the pores of the skin more quickly than any other substance, and at the same time to be an admirable solvent, holding in clear solution iodine, iodoform, creosote, guaiacol, etc. The samples submitted include:—Liquid Vasogen Compounds—Camphor-Chloroform, part. aeq.; Creosote, 20 per cent.: Ichthyol, 10 per cent.; Iodine, 6 per cent. and 10 per cent.; Iodoform, 3 per cent.; Guaiacol, 20 per cent.; Beta-Naphthol, 10 per cent.; Menthol, 2 per cent.; Sulphur, 3 per cent.; Tar, 25 per cent; a Vasogen Ointment Base; Mercury Vasogen Ointment, 33⅓ and 50 per cent; and Vasogen Capsules, including Creosote Capsules, 20 per cent.; Iodine Capsules, 6 per cent.; and Mercury Vasogen Soft Capsules, 50 per cent. and 33⅓ per cent.

Photographic Printing and Enlargements, etc.—Messrs. John Done and Co., Lewisham Works, New Barnet, send their price list for various kinds of photographic printing, collodion enamelling, developing, intensifying and reducing, mounting, spotting and hot rolling, retouching, copying, enlargements, lantern slides, etc. A specialty of this firm is the fact that single copies are prepared at the same rate as per dozen. Trade discounts are allowed, and carriage is paid one way to country clients, goods to London clients being collected and delivered free by the firm's own messengers.

Extension of Premises.—Messrs. Taylor, Taylor, and Hobson, scientific instrument makers, Stoughton Street Works, Leicester, intimate that their business having overgrown the capacity of the Slate Street Works, they have erected a new factory and office buildings, to be known as "Stoughton Street Works, Leicester." These buildings, equipped with every modern convenience, will, it is expected, enable the firm to improve its products and to execute orders with greater despatch. After June 15 the address will be as above.

Sandron's Assimilable Iron Tonic.—Messrs. Sandrons, Limited, 34, Devonshire Street, Portland Place, London, ask us to state that in order to facilitate the prescribing of their Assimilable Iron Tonic they have decided to make use of the term "Liquor Ferri Assim. (Sandrons)," in accordance with the advice given to them by several of the leading London medical men who are prescribing the preparation. It is now obtainable in 12 and 18 oz. bottles, unstamped for dispensing, and also, as before, specially labelled and stamped for retail, from the proprietors, at the above address, or from the wholesale houses.

Bath Tablets.—Messrs. Wright, Layman, and Umney, Limited, of Southwark, have lately introduced a series of perfumed tablets for bath and toilet use. They are supplied in vegetable ivory topped tubes with various perfumes. Customers can have their name and address printed on if three dozen tubes are ordered. The tablets readily dissolve in water, and form a very pleasing addition to the bath.

Hand-Made Show Cards.—Messrs. Evans, Lescher, and Webb, 60, Bartholomew Close, E.C., are making a special offer to chemists with the idea of enabling them to make effective displays of Hawley's counter adjuncts. The firm is prepared to get up show cards with whatever wording a chemist may choose, free of cost. These cards are got up in attractive style—12 in. by 7 in.—black letters with red capitals. As they have to be entirely written by hand, the firm stipulates that not less than six dozen of that article be taken for which a show card is required.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

July 13, 1899.

As might have been expected at this time of the year, business has been somewhat quiet during the past week, while the changes in values which have taken place have not been very important. Quicksilver remains very firm; a further advance in price is still expected, although so far it has not taken place. Ipecacuanha is somewhat firmer. Glycerin and Codliver Oil very quiet. Opium firm, especially Persian. Morphia very firm, particularly for immediate delivery. Codeia is also very firm. Bromides and Iodides steady at unchanged prices. Bismuth and Salts unchanged. Mercurials are also unchanged. Quinine quiet, and somewhat weaker, the future course of the article appearing still quite undecided. Acid Citric very firm. Acid Tartaric and Cream of Tartar firm. Acid Carbolic dearer. Santonine has also been advanced in price. Phenacetin and Acetanilide quiet and weak. Antipyrine and Phenazone unchanged. Sulphonal fairly steady. Borax and Acid Boracic quiet, but steady. Sulphate of Ammonia easier. The following are prices actually ruling for some articles of chief interest:—

ACETANILIDE—Weak at 11d. to 1s. per lb. according to quantity.

ACID BORACIC—Unchanged at 25s. per cwt. for crystals and 27s. per cwt. for powder.

ACID CARBOLIC.—Market is very firm at ½d. per lb. advance, say 7d. to 7¼d. per lb. for the 35-36° ice crystal in large drums and over casks, the other qualities and packing being quoted at proportionately advanced prices. Crude, 60° F. 2s. 1d. per gallon; 75° F. 2s. 8d. per gallon. Liquid, 95 to 98 per cent. of pale straw colour, 1s. 2d. to 1s. 3d. per gallon in 40 gallon casks.

AMMONIA COMPOUNDS.—Bromide: 2s. 2d. per lb. Carbonate: 3d. to 4d. per lb., according to packing and make. Muriate, chemically pure, small crystals, 30s. to 32s. 6d. per cwt.; commercial, free from metals, 25s. to 27s. 6d. per cwt. Iodide, 13s. 10d. per lb. Sal Ammoniac: Sublimed firsts 35s., seconds 33s. per cwt.; crushed for batteries, 2s. per cwt. more respectively. Sulphate dull, gray prompt, 24 per cent. London, £12 3s. 9d. per ton; Hull prompt, £12 2s. 6d.; Leith prompt, £12 2s. 6d. to £12 3s. 9d.; Beckton nominal. Beckton terms prompt, £12 2s. 6d. Sulphocyanide, 1s. per lb.

ANTIMONY.—Regulus £39 to £40 per ton, Crude Japan (Black Sulphide) £24 to £24 10s. per ton.

ANTIPYRINE and **PHENAZONE**—Remain quiet, at steady prices.

ASHES.—Pots, 24s.; pearls, 32s.

BISMUTH.—So far, there has been no change in price of either the metal or the salts.

BLEACHING POWDER (CHLORIDE OF LIME)—Steady, but unchanged, at £6 per ton for English.

BORAX—Quiet and unchanged, crystals being still quoted 16s. per cwt., and powder 16s. 6d. to 16s. 9d.

BROMIDES AND BROMINE—Are unchanged at 1s. 10½d. per lb. for potasii bromid, other salts being quoted in proportion.

CAMPHOR—Without change either for the crude or for the refined article.

CASTOR OIL—Easier, Belgian first pressing spot £25, second pressing spot £23 per ton, ex wharf. Hull manufactured guaranteed cold drawn pure pharmaceutical, £28 per ton in barrels, 3¼d. per lb. in cases; pure firsts, £25 10s. per ton; seconds, £24, in barrels; first, 3d. per lb.; seconds, 2⅞d. per lb., in cases, ex wharf London for prompt delivery. London first pressing spot 24s. per cwt., second pressing 23s. per cwt. Medicinal in cases, 3¼d. per lb.; French first pressing 25s. per cwt spot; 23s. to 23s. 6d., f.o.b. Marseilles; second pressing, spot, 24s. per cwt.

CITRIC ACID—Is very firm at 1s. 8d. per lb. for crystals in 5 cwt. casks from the makers, and 1s. 7½d. to 1s. 7¾d. for best makes from second-hand.

CLOVES.—Privately, the market for Zanzibar is very quiet, with sellers for July-August delivery at 3 3/16d., and Oct.-Dec. at 3 7/32. Nothing offered in auction.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 1½d. per gallon; pure, 1s. 3d. per lb. Benzole: Firm, 50 per cent. being quoted for prompt delivery, 8¼d. to 8¾d. per gallon, 90 per cent. 7½d. to 8d. Creosote: 3½d. per gallon. Crude Naphtha: 30 per cent. at 120°C., 3d. per gallon. Solvent Naphtha, 95 per cent. at 160°C., 1s. 5d. per gallon; 90 per cent. at 160°C., 1s. 1½d.; 90 per cent. at 190°C., 1s. 2½d. per gallon. Anthracene: A. 3½d. per unit; B. 2¾d. Pitch: 32s. 6d. per ton f.o.b. Tar: Refined and Crude, 13s. per barrel, 2¼d. per gallon.

COCAINE—Is still unchanged at 11s. 6d. to 11s. 9d. per oz., according to quantity and brand, for the Hydochlorate in 25 oz. tins.

CODEIA—Is very firm at 12s. 6d. to 12s. 9d. per oz. for the pure, and 1s. per oz. less for the salts.

COD LIVER OIL.—Market remains exceedingly quiet, at 56s. to 57s. 6d. per barrel f.o.b. for best new non-congealing Norwegian in tin-lined barrels of 25 gallons.

CREAM OF TARTAR—Is firm at 75s. per cwt. for first white crystals on the spot, and 77s. to 78s. per cwt., according to percentage, for powder.

FISH OILS.—The quantity offered at auction to-day met with a good demand, and fair prices were obtained. St. Vincent Whale: 47 tuns practically all sold, single compass and stroke £14 5s. to £15 10s., double compass and stroke £13 15s. to £15, single compass and nick £14 to £14 15s., nick £13 5s. to £14 5s., stroke £13 to £13 10s., double stroke £12 10s. to £13 5s., dark £12 10s., black £9 5s. per tun. Newfoundland Whale: 8 tuns nearly all sold, double compass and stroke £14 15s. to £15, single compass and stroke £13 15s. to £14, stroke £12, double stroke £10 15s. to £12 per tun. Pale Seal: Of 20 tuns 10 sold at £18. Salmon Oil (in drum): 16 tuns sold at £15. Herring: 20 barrels sold at £12 15s. per ton. Sardine: 20 barrels sold, single compass and nick £15 15s. to £16.

GALLS—Remain quiet. China are firmly held at 59s. per cwt., on the spot, landed, and same price c.i.f. to arrive, for usual shape, while plum shaped are scarce, with little offering. Persian steady, the supplies, especially of green and white, tending to run short, quotations being, blues, 62s. 6d. to 65s. per cwt.; green, 56s. to 57s. 6d., and white, 52s. 6d. to 53s. 6d. per cwt.

GINGER.—Supplies of Cochin were not large, but demand continues slow and only small sales resulted. Of 607 packages offered, 165 sold; bold and medium, roughly cut and scraped, little limed, at 48s. 6d.; fair medium cut and scraped at 45s.; fair washed rough at 23s.; small brown rough, part shrivelled, at 17s. 6d. to 18s. Jamaica in fair demand at steady rates. 667 barrels and 4 half-barrels offered, and about half sold; good bright at 66s. 6d.; ordinary to good ordinary at 52s. 6d. to 58s.; and common to good common at 48s. to 51s.

GLYCERIN—Is very quiet for refined, at 50s. per cwt. for English, and 52s. 6d. to 57s. 6d. per cwt., according to brand, for German, for best white double-distilled chemically pure 1260° quality in tins and cases (2 or 4 by 56-lb. tins in a case), carboys being proportionately cheaper. Crude is firm at about £30 per ton for the quality best suited for refining purposes.

IODIDES and **IODINE**—Are without change at 7½d. per oz. for commercial Iodine and 10s. 6d. per lb. for Potassii Iodid, the other salts being quoted at proportionate unchanged prices.

IPECACUANHA—Market is somewhat firmer, sales having been made at 11s. 6d. per lb. for Carthagena and 15s. to 15s. 6d. per lb. for good Rio. The future course of the market depends now upon the demand and on the question of the possibility of any further arrivals between this and October.

MENTHOL—Is steady at 7s. 3d. to 7s. 6d. per lb. for best dry white crystals in 5lb. tins, 12 tins in a case.

MERCURIALS.—Makers so far made no change in their prices, which remain at 2s. 10d. per lb. for Calomel and 2s. 6d. per lb. for Corrosive Sublimate.

MORPHIA—Continues very firm, especially for prompt delivery, at 4s. 10d. to 5s. per oz. for the hydrochlorate in powder (2d. per oz. more for crystals), while in view of the active demand for prompt delivery, it looks as if the price will be fully maintained, for the present at least.

OILS FIXED and **SPIRITS.**—Linseed easier. London, spot, pipes, £20 10s. to £20 15s. per ton; barrels, £20 17s. 6d., spot: August, £20 10s.; September-December, £19 7s. 6d.; January-April, £19.

Hull easier, spot, naked, £19 7s. 6d. August, £19 2s. 6d.; September-December and January-April (£17 15s. per ton. Rape firm; ordinary brown, spot, £22; August and September-December, £22 5s.; refined, spot, £23 10s.; Ravison, naked, spot, £18; September-December, £18 2s. 6d. Cotton very firm at 2s. 6d. to 5s. per ton advance. London crude, spot, £15 2s. 6d. to £15 5s.; August, £15 7s. 6d. Refined spot, £16 10s. to £17 10s. per ton, according to make. Hull, refined, naked, spot and August, £15 2s. 6d.; November-April £14 2s. 6d. Crude, spot and August, £14 2s. 6d.; November-April, £13. Olive: Mogador, £30 to £31; Spanish, £30 to £32. Coconut quiet. Ceylon, spot, £25 per ton landed; afloat, £23 10s., c.i.f.; July-September and September-November, £23 2s. 6d., c.i.f. Cochin: Spot, £28 to £28 10s. landed; August-October, £25 10s. to £25 15s. per ton, c.i.f. Palm: Lagos, spot, £24. Lubricating Oil: Pale American spot, 5s. 6d. to 7s. per gallon; black, 5s. to 5s. 9d.; pale Russian, 5s. 9d. to 8s.; black, 5s. to 5s. 6d. Turpentine remains firm, and especially for forward delivery. American spot is quoted 30s. 9d. per cwt.; July, 30s. 7½d.; August and September-December, 30s. 3d. to 30s. 4½d.; January-April, 31s. to 31s. 3d. Petroleum: Strong at ⅛d. per gallon advance for American, quotations being: American spot, 6d.; September-December, 6d. to 6⅛d. per gallon; Russian spot and September-December, 5⅛d.; water white spot, 7¼d.; September-December, 7⅜d. per gallon. Petroleum Spirit: American, 9½d.; deodorized, 9¼d. to 9½d. per gallon.

OPIUM—Has been in moderate demand, full prices having been paid for druggists' and manufacturing kinds, while for soft shipping there has been but little inquiry. Persian firm, with a higher tendency, 11s. 9d. to 12s. being asked for good to fine, but only retail sales have been effected.

OXALIC ACID—Is still quoted 3d. to 3¼d. per lb. nett, free delivered London.

PARAFFINE WAX.—Crude, 1⅞d. to 2d. per lb.; refined, 2¼d. to 3d. per lb.

PHENACETIN—Weak at 3s. 4½d. to 3s. 9d. per lb., according to quality and make for both crystals and powder., Bayer's make being quoted 6s. 6d. per lb. and Riedel's 5s. 6d. per lb. in original 1-lb. bottles.

PITCH.—8s. to 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt.; Bichromate, 3½d. per lb.; Bromide, 1s. 10½d. per lb.; Chlorate crystals 3¾d., powder 3⅞d. per lb., spot, London; Iodide, 10s. 6d. per lb. Permanganate somewhat irregular, quotations varying according to quantity and make from 52s. 6d. to 60s. per cwt. for small crystals, and 5s. per cwt. more for large crystals in 1 cwt. kegs. Prussiate: Yellow Beckton, 7¾d.; other English makes, 8d. to 8½d. per lb.; red, 1s. 1d. per lb.

QUICKSILVER.—Unchanged, at £8 7s. 6d. per bottle from first hand. Second hand not offering.

QUININE.—Market remains quiet, with sales from second hand of Sulphate, B. and S., and/or Brunswick, in 100oz. tins and for 1,000oz. lots, at 1s. 3½d. per oz. on spot and 1s. 3¾d. for August delivery, while makers of these brands maintain their price of 1s. 6d. per oz. for similar quantity and packing.

ROSIN.—Strained spot 4s. 3d. per cwt. ex wharf, 4s. per cwt. c.i.f. for October-December and December-February shipment per sailing vessel.

SANTONINE.—In consequence of the reported failure of the crop of semen cinæ in Turkestan, makers of refined santonine advanced price on Monday to 6s. per lb. (2-cwt. lots being subject to a certain reduction). If the news proves correct, we may very likely see a further decided advance on present price, which is still an extremely low one compared with the figure which ruled not so very many years ago.

SHELLAC.—Market remains very quiet, with but little business passing privately. The speculative market is somewhat steadier, with buyers of TN Orange for August delivery at 66s. per cwt., and sellers at 6d. per cwt. more money. The small supplies at auction met a fair demand. Second Orange sold rather irregularly, free descriptions at steady to rather easier prices, but out of condition lac brought full rates; the value of standard TN is now 65s. to 66s. Garnet and Button neglected. A total of 341 cases offered and 228 cases sold. Fine Orange: 18 cases offered and sold, without reserve, fine lemony Octagon B at 85s. to 86s. Second Orange: Of 256 cases 210 sold, a small portion without reserve; dull palish flat free at 65s. to 66s.; fair flat reddish free at 64s. to 65s.; good bright red strong matted at 65s.; ditto cakey at 64s. to 65s. Garnet: 10 cases good curly cakey AC, and 25 cases OCC part hard block all bought in. Button: 32 cases offered and bought in. Since the auction a small quantity of Second Orange found buyers at a slight improvement in price.

SODA COMPOUNDS.—Crystals, barrels 55s. per ton, bags 52s. 6d., ex ship Thames. Ash, £5 to £5 10s. per ton according to strength, quantity, and packing. Bicarbonate, fully bicarbonated, 19s. 6d. to 21s. per cwt.; commercial, 97 per cent., £7 to £8 per ton. Bichromate 2¾d. per lb. White, 70 per cent., £7 10s. per ton; 60 per cent., £6 10s. Hyposulphite (antichlor) 6s. to 8s. per cwt., according to make, quantity, and packing. Iodide 11s. 10d. per lb. Nitrate, commercial, spot, £7 17s. 6d. per ton; refined, £8 2s. 6d.

SPICES (various).—Black Pepper: 20 bags Singapore bought in at 5¾d.; of 122 bags Tellicherry 12 sold at 5¼d.; 150 bags heavy Trang bought in at 5⅝d.; of 382 bags Penang a few bags sold at 4⅝d. to 4¾d. White Pepper: All bought in, Singapore at 8½d. to 9½d., Siam at 8½d., and Penang at 8d. Chillies: Zanzibar bought in at 38s., and African at 45s. Cinnamon Chips: About 600 bags, all bought in from 3½d. to 7d. Cassia Lignea: Of 429 cases only 20 sold, ordinary new selected at 40s., the remainder bought in, including fine old at 50s. Nutmegs: Without demand: 24 cases Penang all bought in; no West Indian offered. Mace dull: 6 cases Penang bought in, fair red at 1s. 6d.; also 6 cases West Indian, fair pale at 1s. 9d. Pimento in rather better demand and steady; of 528 bags 210 sold at 3d. to 3¾d.

STAR ANISEED OIL—Is firmer, a fair business having been done at 5s. 9d. per lb., closing with buyers thereat, but no sellers.

SUGAR OF MILK—Is firm at 60s. to 62s. 6d. per cwt. for finest American brands in powder.

SULPHATE OF COPPER—Is quiet but firm at £24 15s. to £26 10s. per ton, according to brand, and for spot delivery.

SULPHONAL.—Second-hand offers have practically ceased, while the two chief makers maintain their price of 17s. per lb. for both crystals and powder (with 6d. per lb. reduction for 10 lb. lots in bulk).

TAR.—Stockholm, 26s. 6d.; Archangel, 18s. 6d.

TURMERIC.—In auctions no sales were effected, while privately transactions have been small at about previous rates, quotations being: Bengal, 18s. 6d. per cwt. for good fair, 27s. 6d. for good bright Madras fingers, 17s. 6d. to 18s. for Cochin fingers, and 9s. to 9s. 6d. per cwt. for Cochin split bulbs.

Bank rate was to-day advanced to 3½ per cent., it having previously for some considerable time stood at 3 per cent.

Manchester Chemical Report.

JULY 12, 1899.

The Board of Trade Returns published at the end of last week bear testimony to the continued improvement manifested in the chemical trade. Although the imports of chemicals, dye-stuffs, and tanning substances show a decrease of 10.2 per cent., it is more than compensated for by the exports of chemicals and chemical and medicinal preparations, which are returned at £772,680, or an advance of 13.9 per cent. on the corresponding period of June last year. Chemicals and chemical preparations show an increase, the export of alkali being 314,645 cwt., or an increase of 12.9 per cent., and bleaching materials of 112,607 cwt., or 3.3 per cent. It is still more satisfactory to note that the value of alkali was £89,082, or an increase of 18 per cent., although bleach shows a small decrease. The exports of alkali to the United States continues to decrease, but bleaching materials are well maintained. In this district the volume of business is fairly satisfactory, and in heavy chemicals there is no particular change in prices to report. In miscellaneous chemicals, however, there are one or two changes of a downward character. Notwithstanding the high price of the metal, sulphate of copper continues to decline, and to-day business has been done as low as £24 12s. 6d. delivered Manchester. The price of best brands, however, ranges from £25 to £25 10s. per ton. Brown Acetate is lower, and ranges from £4 17s. 6d. to £5 2s. 6d. for prompt delivery. Arsenic is offered at a trifle under last week's rates. On the other hand Yellow Prussiate is firm, as also Epsom and Glauber Salts. Other chemicals are unchanged. The direct oil trade continues active, and six large steamers are on passage or loading at Batoum or Philadelphia for Manchester.

Newcastle-on-Tyne Chemical Report.

July 12, 1899.

Business in Chemicals keeps in a fair way. Shipments are still good to the Baltic, Channel ports, and Mediterranean. Prices, however, do not vary much. Bleaching Powder, however, is a shade more stiffly quoted. Prices are: Bleaching Powder, £5 7s. 6d. to £5 12s. 6d. Soda Crystals, 45s. to 47s. 6d. Caustic Soda, 70 per cent., £7 to £7 5s. Soda Ash, 52 per cent., £4 5s. to £4 10s. Alkali, 52 per cent., £4 5s. to £4 10s. Sulphur, £4 5s. to £5 per ton.

Liverpool Market Report.

July 13, 1899.

A considerable amount of Turkish Canaryseed has changed hands during the week at full rates and prices have gone up. Chilian produce has obtained a good share of attention, Honey, refined Spermaceti, and Quillaya Bark having sold well, though Nitrate of Soda closes slack and at a reduction. In Oils Candia and Levant Olive Oils have advanced in price for shipment, and Spirits of Turpentine are lower but steady.

AMMONIA SALTS.—Sulphate is weaker, £12 5s. per ton.

BEESWAX.—10 bales of Gambier went for £6 15s. per cwt.

CANARYSEED.—Good sales of Turkish—some 1,500 bags in all—have been effected at 35s. to 35s. 6d. per 464 lbs. The closing rate is 36s. and very firm.

COPPERAS—Enjoys good inquiry at 37s. per ton for Welsh, and 40s. per ton for Lancashire.

COPPER SULPHATE—Is dull at £24 15s. per ton.

CREAM OF TARTAR—Continues firm at 75s. to 80s. per cwt., but no sales have been reported.

GINGER.—Fifty bags of old crop Sierra Leone sold from store for 18s. 9d. per cwt., and 25 bags of Cochin, also from store, at 23s.

HONEY.—50 barrels pile 2 Chilian made 19s. 6d. per cwt.

LINSEED.—No sales are reported and the only quotation not nominal is that for North American—viz., 36s. 9d. per 424 lbs.

NITRATE CHILE—Is dull, and the trade doing very quiet at 7s. 6d. to 7s. 9d per cwt.

OILS (FIXED) AND SPIRITS.—Castor is not selling very briskly, business having been confined mostly to Calcutta and small amounts of French, Calcutta "good seconds," 2⅞d. per lb,, and 132 cases have been sold; French 1st pressure, 2 11/16d. to 2¾d. per lb.; 2nd pressure, 2⅝d. ex store, 2 9/16d. ex quay; Madras, 2¾d. per lb. Olive has advanced in price for shipment for Candia and Levant 20s. to 30s. per tun. The supply here is becoming smaller, and Candia has risen to £31 10s. and £32s per tun for spot delivery, and Malaga to £32. Linseed is in limited supply, held firmly for 22s. to 22s. 6d. per cwt. for Liverpool makes in export casks. Cottonseed.—Liverpool refined is selling steadily at 17s. to 17s. 6d. per cwt. Spirits of Turpentine are easier at 33s. per cwt.

QUILLAYA BARK.—10 tons of Chilian went for £12 15s. per ton. Holders now ask £13 to £13 10s. per ton.

SPERMACETI.—36 cases of refined Chilian sold on price terms after the auction.

EXTRACTS FROM CONSULAR REPORTS.

The Introduction of Aniline Dyes into Damascus is responsible for a great reduction in the quantity of indigo imported from India, the demand now being considerably less than half what it was a few years ago. Indigo was used for dyeing cotton cloth for the clothing of the lower classes, and though it is by far the best and most durable dye for the purpose, preference is given to the aniline dyes, cheapness being the great desideratum of the Oriental purchaser. Indeed, as Consul Richards remarks, cheapness is the first and last requirement of the Syrian markets, quality is nothing. This is alleged to be the reason why German and Austrian manufacturers have obtained their present footing in the country, especially in the case of ironmongery and tools of all sorts. A good article of fair price will not as a rule sell, whereas an inferior one will so long as it is cheap.

A New Sulphite Factory, calculated to produce on a large scale, Consul-General Dundas states in his report on the trade and commerce of Norway for the year 1898, is expected shortly to commence working near Christiania.

The Liquorice Trade of Damascus is on the decline. The export last year was small, though not, perhaps, below the average of recent years. At one time liquorice held the position of one of the chief articles of export from the country, but for some years past it has ceased to hold that position, because the plant found in Anatolia, according to Consul Richards, is far more plentiful and of a better quality. The bulk of the liquorice exported from Damascus goes to the United States and the rest to Egypt.

The Phylloxera, instead of being cursed, as it usually is wherever it makes an appearance, is blessed, at any rate by some of the agriculturists in Algeria. Some twelve or fifteen years ago almost the whole of the vegetables consumed in Oran were imported from Spain, and a large fleet of small vessels (feluccas) was engaged in the trade. Then the phylloxera broke out in the south of Spain, and in order, it was said, to protect the Algerian vineyards from the scourge, a law was passed forbidding the entry of any fruit or vegetables into Algeria from either Spain or any other country. The consequence was that for some two years all fruit and vegetables were at an exorbitant price. This stimulated the colonists, particularly those in the neighbourhood of towns, to set to work digging wells and searching for water, many finding it where previously it had been considered impossible. The result is that vegetables and fruit are now as cheap in Algeria as in Spain, and, notwithstanding the fact that the interdiction was raised some six years ago, the trade has never attempted to revive, the province of Oran, at least, being now able each year to ship large and increasing quantities of early vegetables and fruit. Hence what was at one time considered a great hardship has in the end proved to be a great benefit to the province and to the colony generally.

The Method of Preparing Indigo in Hupei (China) is somewhat primitive. It is sown towards the end of June and gathered about the middle of September, the plants being either pulled up by the roots or cut down with sickles and tied up into small bundles. A number of wooden tubs of uniform size (3ft. 6in. high and 11ft. 9in. in circumference) with a hole in the side about fourteen inches from the bottom, closed up with a wooden stopper, are filled a little more than half full with clear water; and about forty or fifty bundles of indigo are immersed in each tub and soaked for twenty-four hours. As soon as white spots begin to appear on the leaves, the plants are taken out and strained off into the tub again. Stone lime, dissolved, is added and the whole stirred about with a kind of wooden rake, until it is a mass of foam. It is left to stand for from six to ten hours, and the stopper is then removed and the water allowed to run out. The indigo is next put into large baskets to strain off the rest of the water. This indigo is not exported but used locally for dyeing foreign piece goods, the damaged ones more especially.

Although the Native Exports and re-exports of opium from Ichang (China) fell off in 1898 from the record figure of 10,450 piculs, value £306,464, in 1897 to 7,696 piculs, value £219,903, other branches of the drug trade continue to prosper. In native medicines the exports exceeded the record of 1897 by some £500, being £102,591, against £102,081, while rhubarb, which is one of the most valuable exports, brought in a revenue exceeding that of the previous year by no less than £8,894, the total export being 9,647 piculs, value £27,563, as against 6,534 piculs, value £18,669. White wax did not do quite so well, the export being 10,048 piculs, value £123,447, compared with 10,291 piculs, value £126,432 in 1897. Musk also shows a decrease of considerably over £6,000, the quantity exported in 1897 being 52,288 Chinese ounces, value £70,029, and only 47,440 Chinese ounces, value £63,536 last year.

The Manufacture of Ginseng, which takes place at Songdo (Corea), a royal city about sixty miles from Söul, according to the report of Mr. J. N. Jordan, is now largely financed by Chinese and Japanese, and it is probable that this, the only Corean industry of any importance, with the exception of the tillage of the soil, will soon pass entirely into the hands of strangers.

Obituary.

Tompsett.—On July 4, Walter Hartnup Tompsett, Chemist and Druggist, late of Paddock Wood, Kent. Aged 34.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Cannot Repeat. Sponge Bags, best check (Maw's sizes), No. 2, 5s.; 3, 6s.; 4, 8s. 6d.; 5, 9s. 6d.; 6, 10s. 6d. doz. Bathing Caps, circular, best check, 5s. 6d. Eye Shades, celluloid lined green, rights, lefts, 2s. Enema Syringes, I.R. bottle, bone pipes, best English, red, green, black, 1 oz., 1s.; 2 oz., 1s. 3d.; 3 oz. 1s. 6d.; 4 oz., 1s. 9d. each. 10s. lots post free. Cash returned if sold.—Warnes, Chemist, 333, Gray's Inn Rd., W.C.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Erasmic Soap.—Peplow's Swandown Powder. White. 2s. 6d.—Eastman, Forest Lane, Stratford.

Advertisements.

(Received too late for Classification.)

ASSISTANT WANTED.—About 24, unqualified. Salary, £45. In-doors. References, &c., and photo (if convenient) to BLUNT, Chemist, Shrewsbury.

WANTED immediately, an ASSISTANT as Junior (in-door), permanency, commencing salary £40. State age, height, and full particulars of experience, with address for references, to J. BAILY & Co., Chemists, Margate.

WANTED at once, Qualified ASSISTANT, out-door, about 22, as dispenser in high-class dispensing business. Apply personally if possible to W. H. BATE, 44, Harrington Rd., South Kensington, S.W.

FOR Immediate Disposal.—A good class Family BUSINESS unopposed; situated in good class northern suburb. Returns, £1,200 per annum. *Net profit* over £400. Rent, £70 per annum. Lease about 26 years. Price £1,000, or first reasonable offer accepted. Particulars only at interview, and only those who really mean business need apply. This is one of the finest chances that one will meet with. Apply "ALPHA," c/o Evans, Lescher, & Webb, Bartholomew Close, London, E.C.

Publications Received.

THE MATRICULATION DIRECTORY, No. xxvi. June 1899, with articles on the special subjects for January and June 1900, also including the University Correspondence College Calendar for 1898-9. Pp. 64 + 140. Price 1s. net. Cambridge: University Correspondence College Press. London: 32, Red Lion Square, W.C. From the Publishers.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Abram, Baron, Bennett, Bowen, Butcher, Dhargalkér, Done. Ellul, England, Ferrall, Fox, Grandison, Gregson, Hall, Hardy, Hobson, Kilmer, Kirkby, Mair, Melling, Rennie, Roper, Ross, Routley, Sandrons, Taylor, Tocher, Wain, Wallace, Yates.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

Partnerships Dissolved.

(From the London Gazette.)

Sydney Maskell and Thomas M. Paul (trading as Paul Maskell and Co.), Photographers, 156, Islington, Liverpool. Debts will be received and paid by Thomas M. Paul.

A. R. Jennens, R. W. Jennens and W. H. Wilkins (trading as Jennens Bros. and Co.), Glass Bottle Manufacturers and Druggists' Sundriesman, 60, Summer Row, Birmingham.

Arthur E. Ekins and Ernest H. Fisher, Pharmaceutical Chemists, Market Place and Victoria Street, St. Albans. Debts will be received and paid by Ernest H. Fisher.

Thomas W. Colbeck and Chas. E. Murphy, General Medical Practitioners, Dover, so far as regards Thomas W. Colbeck.

Receiving Order in Bankruptcy.

(From the London Gazette.)

David M. Wilson, Physician and Surgeon, Rowley House, 1 Angel Bridge Villas, Upper Edmonton.

POLITICAL GOSSIP.

What Happened to Dr. Lamont formed the subject of debate in the House on Friday, 14th, when the Scotch Estimates were taken, and in the course of the evening a very edifying revelation was given of local administrative methods in North Britain. It appears that the Doctor, who was medical officer of South Uist, carried out his duties so intelligently and energetically that he made himself obnoxious to some of the local magnates, pretty much in the same way as Tom Thurnall did at Aberalva in Kingsley's delightful story, "Two Years Ago." Dr. Lamont's particular misfortune was to incur the enmity of the Procurator-Fiscal of the Island, and in the result that official apparently utilised his position to give effect to private feeling; for the unfortunate Doctor was dismissed, and subjected to the ignominy of arrest and trial on charges which were referred to in Parliament as trumpery and malicious. Sir C. Cameron started the protest against the action of the responsible officials, and, after a very lame defence by the Lord Advocate, the case was taken up briskly by a number of prominent members. Some of the remarks may not be unworthy of reproduction here, as showing that the action of the Sheriffs in certain Pharmacy Act prosecutions in Scotland is not an isolated instance of public functions being made to coincide with personal antipathies. Sir Walter Foster said the case made him suspicious of the methods by which the law was carried out in Scotland, whilst Admiral Field solemnly gave thanks that there were no such administrators in England. Mr. Asquith and Dr. Farquharson joined in the denunciation, and even Mr. Cross, of Camlachie, referred to the action of the officials as outrageous and scandalous. Dr. Clark went so far as to say that the Procurator Fiscal had apparently aided and abetted a local conspiracy to ruin a man who was trying to do his duty, and suggested that his salary ought not to be voted. Mr. Balfour, in closing the debate, regretted that as the law stood the Government had no power to protect its medical officers, but hinted that as the Procurator Fiscal would be censured, and the effect of the debate would be to show those concerned in the case the sense of the House in respect to their action, some good might accrue. The unpleasant incident may thus bring about wholesome results, for scandals cannot thrive on publicity. We might incidentally express the hope that the Pharmaceutical Society may have the support of the honourable gentlemen mentioned in this paragraph if ever it should be necessary to protest against the methods of the Sheriffs in dealing with Pharmacy Act infringements.

The Food Preservatives Committee has been appointed, as reported last week, but the Food and Drugs Bill has not been withdrawn. On the contrary, the Government is proceeding very briskly with it, despite the high temperature and the numerous calls on Parliamentary time. Mr. Balfour on Monday included the Bill in the list of measures to be passed this Session, and the Minister in charge has given evidence of a stiffening back in respect to the numerous suggestions from the anti-margarine party that the country does not want the legislation proposed. On Monday the first batch of objectors were heard. Mr. Strachey moved the shelving of the Bill because it was only "indifferently honest," and did not go far enough, inasmuch as it did not prohibit the colouring of margarine. Sir J. Leng opposed the Government because they had been forced into their present position in regard to the Bill by an insane hostility to a wholesome nutritious article, to wit, margarine, and by the organised agitation of interested parties. Mr. Lough wanted the Bill withdrawn on the ground of the administrative confusion its clauses introduced, and criticised the provisions as to warranty. "Why," said the honourable gentleman, "the Bill makes an invoice a warranty, but actually does not define what an invoice is." He went on to say that it was ridiculous that a firm should be bound by an invoice written by the worst paid clerk in a commercial establishment. Sir C. Cameron then discharged his thunder, and stigmatised the Bill as a blank cheque to the Government in regard to Orders in Council, which would hit retailers and let wholesale dealers go free. But none of these arguments (and some of them are hardly consistent with each other) prevailed, and the motion for rejection was negatived.

Attempts to Improve the Bill by inserting new clauses to carry into effect the ideas of Sir C. Cameron as to the liability of an employer for the acts of his servant, and also as to the equalisation of liability in regard to wholesale and retail dealers, were also rudely rejected by large majorities. This is not to be wondered at, for there appears to be nothing in the contention that the "big rogues," as Sir J. Leng calls the wholesalers, will be furnished by the Bill with an immunity from liability. If the wholesale dealer is fraudulent the retailer has his remedy under the Act of 1875, and can proceed under his warranty; hence it is difficult to see what further check to dishonest dealing is needed. It is true that there have been complaints that the 1875 Act is a trifle imperfect in regard to prosecuting the wholesale wrong-doer, but it must not be overlooked that under the Bill now being proceeded with the retail dealer who makes a successful defence on the ground of his invoice or warranty furnishes *primâ facie* evidence of fraud on the part of his invoice giver, who might then be hit at common law.

The Board of Reference, beloved of the analyst, and recommended by the Select Committee, has also gone by the board. Mr. Long, on behalf of the Government, urged the rejection of the idea because it would have the effect of transferring the responsibility of a Government Department to an irresponsible committee of experts, and the House did as it was urged, 84 voting for Sir C Cameron's clause and 194 against. The Pharmaceutical Society was to have one nominee on the Board, but it has never manifested any very keen interest in being amongst the experts, and will probably not regret the vote above alluded to. So far as the consideration of the amended Bill has gone up to the present, the debate has been simply a repetition of the proceedings which took place in Committee, and one may pretty safely say that by the time the drug clauses are reached the opposition will have fizzled out.

THE PURITY OF FOOD AND DRUGS.

D. L. Anti-Rheumatic Bread is the name given to a bread recently introduced, according to the *British Baker*, by the firm of Messrs. John Law and Co., Limited, Glasgow. This bread is described as being a boon to bakers and rival to chemists, and is said to be the outcome of careful experiments carried out by a practical baker and an eminent medical practitioner. It is similar in appearance and taste to Sweet Milk Bread, and is said to contain active ingredients which have a powerful effect in curing rheumatism, being eaten as a substitute for, and in the same quantity as ordinary bread, that is to say it should be used regularly if benefit is to be derived. The bread will keep moist for a week, but is best when from one to three days old. It is being put on the market in an attractive form, each loaf being wrapped in a sheet of pure tinfoil.

A Concentrated Essence of Vinic Plants is, in the opinion of a French engineer, the best of all methods for producing an exquisite wine. According to the prospectus issued by this ingenious person, two of his tablets, costing 2 francs 50 centimes each, are sufficient to yield 110 litres of a liquor containing all the qualities of natural wine, from which it is indistinguishable. Not only does the compound possess a most agreeable flavour and a delicate aroma, but it is also said to be unrivalled as a refresher of the slightly damaged wines that are usually used diluted. The tablets are converted into wine by the simple process of boiling in a little water, the decoction, when sufficiently cooked, being further diluted and sweetened to taste. *Food and Sanitation*, **10**, 310.

Adulterated Coffee.—Dr. T. Zammitt, Director of the Analytical Laboratory, Malta, reporting on several samples of raw coffee sent in by the Inspectors of Nuisances, states that the berries were dark and greenish, and soiled the hands, and were found to be coated with a mixture of finely-powdered plumbago and lead chromate. Hundreds of bags of coffee of this quality, chiefly imported from Trieste, were seized and destroyed. Subsequently another quality of coloured coffee was detected. The berries were yellowish, and, to the untrained eye, did not differ from the best coffee berries. Lead chromate proved to be the adulterant, as in the previous case. The percentage of this colouring matter differed in the different samples; in one batch not more than 0·0525 Gm. of chromate per 100 Gm. of berries was isolated, but in a number of samples the berries were dotted all over with the bright yellow lead salt.

Of 370 samples of coffee taken from different shops not less than 261 were found coloured with lead chromate. The object of coating the berries with the chromate is to give to a very inferior article the appearance of that of a better kind. Samples of ground coffee were almost invariably found adulterated with roasted leguminous seeds.—*British Food Journal*, **1**, 46.

Public Analysts' Reports.—During the quarter ending December 31, 1898, the public analyst for the County of Durham, Mr. W. F. K. Stock, examined 242 samples of food and drugs, of which he certified 208 to be genuine, 11 doubtful, and 23 adulterated, the percentage of adulteration being equal to 9·5. Four samples of drugs out of sixteen failed to satisfy the requirements of the B.P.; two, out of five, samples of ground cassia contained an excess of mineral matter to the extent of 4·68 and 10 per cent. respectively; and one sample, out of five, of ground ginger contained 30 per cent. of exhausted ginger. Mr. C. A. Seyler, public analyst for the county of Glamorgan, analysed 243 samples—twenty-three or 9·46 per cent. being adulterated, or excluding butters containing under 0·5 per cent. boric acid, 12, or 4·94 per cent. Of three samples of olive oil, one was a mixture containing 40 per cent. of cotton-seed oil; of nine samples of ground ginger three were very poor; one sample of sweet spirit of nitre was deficient in nitrous ether to the extent of 83 per cent. of the minimum quantity, and was also deficient in alcoholic strength; one sample of compound tincture of cinchona was not equal to the 1885 standard, either in spirit or alkaloidal strength, and in his report Mr. Seyler remarks that as the new Pharmacopœia fixes a definite limit for alkaloidal strength, judging by samples recently examined there must be a great improvement in this article if it is to conform to that standard. The report of Mr. A. E. Ekius, pharmaceutical chemist and public analyst for the County of Hereford, shows that forty-four samples of food and drugs were submitted for analysis, and that the vendors of five (the total) adulterated samples were all prosecuted and fined. Mr. T. Fairley, public analyst for the City of Leeds, examined 353 samples during the year 1898, which number, as he points out, is equivalent to one for every 1,180 of the population of Leeds.

Milk of Sulphur.—John Rees, chemist and druggist, Church Road, Newport, was summmoned at the borough police-court on Friday, July 14, for selling milk of sulphur containing 48·5 per cent. of calcium sulphate.—Mr. F. Lewis, for the defence, held that the case came under the first exception to Section 6 of the Food and Drugs Act, which exempted articles where ingredients were required for production or preservation, and not to fraudulently conceal inferiority of the goods. He further pointed out that there were two articles sold really as milk of sulphur, produced by the same treatment, with the exception that in one instance sulphuric acid was used, and in the other hydrochloric acid, the latter being known as precipitate of sulphur. In the latter case the required sulphurous deposit was obtained, but it was impregnated with calcium sulphate or lime. According to Atkins's 'Treatise on Chemistry,' the proportion of calcium sulphate was sometimes two-thirds of the whole. — William Johnson, the chemist's assistant, held that calcium sulphate was not injurious to health, but Dr. Howard Jones, medical officer of health to the borough, disagreed, saying that it was insoluble in the stomach, and stated that prosecutions had been instituted where 37 per cent. had been present in the article.—Though not unanimous, the Bench imposed a fine of 5s.

Camphorated Oil.—At Smethwick Police-court, Jane Brown, 10, Brasshouse Lane, was summoned for selling on April 28, camphorated oil deficient in proper camphor to the extent of 64 per cent., and containing 80 per cent. of mineral oil. It was pointed out that the defendant could recover from the wholesale dealer the amount of any fine and costs which the Bench might impose. For the defence it was stated that defendant only purchased a dozen bottles of the oil at 8d., and sold them again at 1d. each. A fine of twenty-five shillings, including costs, was inflicted.

Arsenic and Copper in Enamelling Materials.—Specimens of kryolite and of fluor-spar, intended to be used in the enamelling of cooking pans, have been examined by Dr. Van Hamel Roos, of Amsterdam. He reports finding a considerable amount of arsenic in the kryolite, and of copper in the fluor-spar. The German firm which was supplying these substances to certain Dutch enamellers was at once warned to stop the sale, and the facts were made public. Dr. Van Hamel Roos mentions that some time ago he found lead in a specimen of kryolite intended for enamelling, and explains that the presence of these dangerous substances is due to the fact that the minerals in question are associated in the crushing process with minerals containing arsenic, copper, and lead. The great danger attending the use of these poisonous materials for enamelling cooking utensils is too obvious to need comment.—*British Food Journal*, **1**, 69,

Peanut "Butter," according to a recent report, is now being manufactured in Indiana, and is being sold at 15 cents per pound. The shells are first removed, then the nuts are hand-picked, roasted in a rotary oven, and ground into meal. The oil in the grains gives the meal the appearance and consistency of putty as it leaves the mill except that it is of an orange colour. Water is added, but no other ingredient is said to be used. It is put up in tins of various sizes from 1 lb. up to 100 lb. and sealed.

Sulphurous Acid as a Preservative.—Referring to the use of sulphurous acid and its compounds for preserving meat and meat preparations, Dr. Bernhard Fischer, director of the Municipal Laboratory of Breslau, in his annual report remarks that the maximum amount of sulphur dioxide to be allowed is fixed at 0·1 per cent., and that this limit was laid down in 1894 upon medical authority. The researches of Kionka demonstrated that sulphurous acid is not to be regarded as an innocuous substance for food preservation, inasmuch as it acts as a blood poison. Relatively small quantities may be injurious to the human organism, in that it induces bleeding from the capillaries. Dr. Jakobi laid it down that the amount of sulphurous acid must not be allowed to exceed 0·06 per cent., which corresponds to an addition of 1·2 Gm. of crystallised sodium sulphite to one pound of meat.—*British Food Journal*, **1**, 94.

Camphorated Oil.—At the Kensington Petty Sessions, on Tuesday, July 18, William R. Hoare, chemist and druggist, 90, King Street, Hammersmith, London, W., was summoned by the Vestry for selling camphorated oil which was not of the nature demanded, by reason of it being not less than 20 per cent. deficient in camphor. The defendant explained that in the winter time he was careful to see that the camphor was properly dissolved in the oil by means of heat, but in the summer time the camphor was placed in the oil, and allowed to dissolve without the application of heat. In the oil in question it was evident that the camphor had not had time to dissolve properly. There had evidently been slight carelessness on the part of his assistant. Mr. W. Bird (magistrate): It is absolutely necessary for chemists and druggists to be very careful in serving such preparations, and to make up the preparations strictly in accordance with the British Pharmacopœia. This case, however, does not appear to be of a very serious nature, because camphorated oil is used externally, and a little less or a little more camphor in the oil would not do much harm. It is clear, however, that the preparation should be made as prescribed by the British Pharmacopœia, and this the defendant has not done: for such neglect he must be fined 40s., including costs.——John Foster, chemist and druggist, 107, King Street, Hammersmith, was summoned by the Vestry for selling camphorated oil which was not less than 75 per cent. deficient in camphor, and for preparing it with hydrocarbon (mineral) oil instead of olive oil. The defendant admitted the offence, but stated that for all practical purposes he had always found the mineral oil in question satisfactory, and in the case of camphorated oil, the hydrocarbon oil took up as much camphor as olive oil. Mr. Bird: The British Pharmacopœia says that you must use olive oil, but you used paraffin. This is a very bad case. You must be fined £5, including costs.——Percy Wilfred Purdie, chemist and druggist (trading as Feltwell and Co.), 27, Glenthorne Road, Hammersmith, was summoned at the Kensington Petty Sessions, on Tuesday, July 18, for selling camphorated oil which was not less than 13·5 per cent. deficient in camphor. The defendant stated that on the Saturday before the Inspector called at his shop they ran short of camphorated oil, and he advised his assistant to make a fresh supply. The assistant, while preparing the article, was called away to attend to a customer, and forgot the oil for a short time. He could only account for the deficiency by the fact of the oil becoming over-heated.—Mr. Bird: This is not such a serious case, but you must be fined 20s., including costs.

ENGLISH NEWS.

Burnley and District Chemists' Association.—At a Committee Meeting held on Tuesday, July 11, it was decided to have a Picnic, confined to chemists and their wives or lady friends, on Tuesday, August 1. The proposed programme is as follows:—The party will board the train to Skipton, which leaves Barrack at 1.10; Bank Top, 1.12; Nelson, 1.22; Colne, 1.40, arriving at Skipton at 2.5. Then by char-à-banc to Embsay, Bolton Abbey, Barden Tower, Burnsall, where a stay of two hours will be made for tea, etc., then on to Grassington, Linton, Cracoe and Skipton in time to catch the 8.30 train, arriving at Bank Top at 9.34. The inclusive charges will be 7s. 6d. The Hon. Sec., Mr. J. Brown, 7, Manchester Road, Burnley, will be glad to hear from those intending to join the party not later then Saturday, July 22, in order to make positive arrangements.

The London College of Chemistry, Pharmacy, and Botany, 323, Clapham Road, London, S.W., has been established by Mr. Henry Wootton, B.Sc. (Lond.), formerly in partnership with Mr. G. S. V. Wills, of the Westminster College of Chemistry. In arranging and fitting the college Mr. Wootton has especially considered the health and comfort of students, a noticeable feature throughout all departments is that there is abundance of light and air, and plenty of room. The college stands on over a third of an acre of ground, and all sanitary arrangements are new and of the most modern type. The chemical laboratories occupy the whole of the ground floor, and will accommodate sixty-five students without any crowding. Each bench is fitted with gas and water, the sinks draining into large half-round earthenware troughs. There are large fume cupboards, with glazed sides and lift-up fronts, ventilating directly into flues. The balances are placed near windows in a pleasant room built out into the garden. In this room are hung dried specimens of scheduled plants and plant models. The pharmaceutical laboratory is a convenient room, well ventilated, and fitted with all modern requirements. A special room is set apart for performances by students of distillations, nitrometer determinations, etc. The lecture room, on the first floor, is lighted by five large windows, and will comfortably seat sixty-five students, each student having a numbered desk. The walls are hung with a complete set of botanical diagrams, and the materia medica specimens are arranged on shelves in numbered specimen bottles. The microscopes are placed in a good light, and the physical apparatus is available for inspection and use of students. All the departments are separate and distinct, and are lighted throughout by electricity. A special feature of the London College is the botanic garden; a quarter of an acre of ground has been set apart for the cultivation of medicinal and herbaceous plants. The students have access to the garden at all times during college hours.

Hydrochloric Acid.—Herbert White, aged one year and seven months, whose parents live at 8, back 21, Ford Street, Hockley, died in the General Hospital, Birmingham, on Thursday, July 13, from the effects of drinking hydrochloric acid. It was stated that the child, when alone, obtained possession of the bottle containing the poison and drank a small quantity.

British Pharmaceutical Conference.—The following papers have been added to the list of those to be read at the Plymouth meeting:—25. "A New Condenser," by E. W. Lucas; 26. "Notes on (1) Liq. Ferri Perchlor. Fort., P.B., (2) Detannated Wine, and (3) Miscible Liquid Extract of Ipecacuanha," by F. C. J. Bird; 27. "Suggested Standards of Purity for Food and Drugs," by C. G. Moor and C. H. Cribb; 28. "The Salient Features of the Flora of Devonshire," by G. C. Druce, M.A., F.L.S.; 29. "Notes on Hydrogen Peroxide," by C. T. Tyrer; 30. A Paper by Mr. Tyrer.

Meeting of Local Secretaries at Plymouth.—Mr. Freeman W. Hunt, Local Secretary of the Pharmaceutical Society for Plymouth, writes to announce that a meeting of local secretaries of the Society will be held in the Assembly Rooms, Plymouth, on Wednesday next, at 9 a.m., and he hopes that as many as possible will make it convenient to attend.

FRENCH NEWS.

Novel Departure.—From time to time much comment has been indulged in by the medical journals, and dissatisfaction freely expressed, in consequence of the meagre pittance allowed by the authorities to the doctors who have to attend to patients under the Poor Law regulations, the medical fraternity considering the fees out of all proportion to the time and trouble they are called upon and expected to expend in connection with such cases. These fees are regulated according to the nature of the complaint for which the doctor's services are demanded. Weary of agitating, the doctors of Constantin have hit upon a novel idea for professional men, and have decided, one and all, to "strike work" unless the powers that be decide to revise the scale of fees and make it worth their while to continue to hold an office which must assuredly needs be filled. Some few weeks ago the pharmaciens aired their grievance and threatened to do likewise unless they were fairly dealt with; and fearing lest the threat should be carried out, the authorities "climbed down." It is to be hoped they may do likewise in this instance, otherwise they may incur responsibilities *vis-à-vis* the public in general, which they may have difficulty in ridding themselves of. Clearly the doctors have a good case, and considering it is public and not private money that the authorities deal out for this purpose it is hard to imagine their reasons for such closefistedness.

Vol-au-Chloroforme.—What is known as the "Vol-au-Chloroforme" or "robbery with chloroform" has just been successfully practised on a lady travelling between Bordeaux and Paris. When an employé at the Gare d'Orleans was engaged cleaning out the carriages of a train, he came upon a well-dressed lady passenger fast asleep. When with some difficulty the lady was awakened; she seemed as though she had been in a trance, but quickly revived when she discovered that a small leathern bag she carried in her hand when she left home, had vanished, and with it a sum of 70,000 fr. She at once proceeded to the special commissaire of the station, and informed him that after passing Limoges the night before, while the train was in motion, a man in uniform, whom she took to be an employé of the company, entered the carriage and demanded her ticket. At the same time he advanced a small bottle towards her, and from that moment she remembered nothing more. Inquiries were at once made by telegraph, but the only reply received was that Madame G——'s bag had been found empty on the line near Orleans, and a broken phial, which carried a pharmacist's poison label, and which may possibly have contained chloroform, was discovered a few kilometres further up the line. In view of the name being upon the label, it is hoped that this may serve as a clue in ultimately securing the perpetrator of this most audacious robbery.

Fire in a Chemical Works.—On Friday night a fire broke out in the oil-cake and chemical works situated in the Route d'Aix, at Calencelle, in the commune of Marseille. The whole of the material being of an inflammable nature was completely devoured by the flames, notwithstanding the efforts of the fire brigades to overcome them. The amount of damage done is considerable, and, unfortunately, the buildings being completely razed to the ground, a great number of workmen will for some long time be thrown out of employment. An inquiry has been instituted as to the cause of the outbreak, but no light has up to the present been thrown on to the affair.

Madame Bianchini Pardoned.—The 14th July this year will be notable by the numerous pardons granted by the President of the Republic to those who have, in one way or another, transgressed the laws of the country—truly a fitting manner to celebrate the National Fête-day. Amongst those who have thus profited is Madame Bianchini, the "Mrs. Maybrick" of France, an account of whose attempt to poison her husband by atropine appeared in these columns a few months ago. Thanks to the unremitting efforts of her eminent advocate, Maitre Henri Robert, her ultimate pardon has been obtained. Only a month ago her sentence of five years' "solitary confinement" was commuted to five years' imprisonment.

IRISH NEWS.

Pharmaceutical Society of Ireland.—At the last Pharmaceutical Assistants' Examination Mr. F. C. Large passed. One candidate was rejected. At the Registered Druggist Examination Messrs. S. J. Cairns, T. J. Carroll, and J. Maxwell have passed. Two candidates were rejected. At the Pharmaceutical License Examination Messrs. T. W. Corcoran, J. Hewton, J. J. C. Culbert, H. Burns, McDonald, M. Dempsey, D. N. Stewart, and S. W. Curham passed. Fifteen candidates were rejected.

Expert Evidence.—At the Belfast Assizes, before Baron Pallcs, evidence was given in a case of coining. A jeweller, being asked if a certain bottle contained nitric acid, undid the cork, applied the liquid to his finger and tongue, and pronounced it to be nitric. This was part of the expert evidence upon which the prisoner was convicted.

Merchandise Marks Acts.—A further number of cases coming under this Act have been recently decided in reference to false trade descriptions as applied to mineral waters. The inspector of the Belfast Bottling Exchange has prosecuted right and left throughout the province and city. Fines were inflicted in every instance. In one case the defendant argued that the label sufficiently safeguarded the purchaser, but under the Act it was held that the embossed name on the bottle amounted to a "forged trade mark."

TRADE NOTES.

A New Sprinkler.—Mr. Morten Dodge, chemist and druggist 139, Strangeways, Manchester, has just patented a new sprinkler which he considers to be an improvement on the old kinds for perfumes, etc., having great advantages over the metal top variety by preventing any possibility of leakage, being more easily fixed without breakage, and moreover, it can be sold at a small cost. The idea, as will be seen from the illustration, is simply a glass plug fixed in a bored cork. Those shown are exact sizes of corks. In order to fix the sprinkler, the cork is inserted flush with the top of bottle, and the glass plug is then put in. Price 4s. 9d. per gross in two sizes (any size to order).

MORTEN DODGE'S PATENT SPRINKLER.

Hunyadi Janos Wrapping Paper.—Andreas Saxlehner Budapest (Hungary), and Trafalgar Buildings, Charing Cross London, W.C., intimates that his firm is prepared to supply to all chemists who apply for it, quantities of wrapping paper with medical press notices of Hunyadi Jáno's waters, and the name of the chemist to whom the paper is supplied printed thereon. The specimen submitted is of good white paper, attractively printed in red and black.

Valsolum Purum Liquidum.—William Poppelreuter, 54, Portland Street, Manchester, and 19, St. Dunstan's Hill, London, E.C., submits samples of valsolum purum liquidum. This is described as a new introduction of importance in therapeutics, as it will enable chemists to prepare their own solutions of many medicaments, such as iodine, creosote, guaiacol, ichthyol, etc., in any strength required, according to the prescriptions of medical men, or many of the ready-made valsol solutions can be easily reduced in strength with the new plain liquid valsol when required.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. Lionel Laurance, announces that he will be holding a class in Manchester, on August 14, for Practical Visual Optics, which will last one week.

Mr. J. C. Brewer, who has been Dispenser at the Birmingham General Hospital for a period of twenty years, is resigning his position at that institution to represent Messrs. Cuxson, Gerrard and Co., of Oldbury, Manufacturers of Surgical Dressings and Appliances.

ITEMS OF INTEREST.

The Purification of Volatile Fluids Without Distillation.—Gawalowski recommends the following methods for purifying various volatile liquids: *Petroleum Ether* is treated with zinc and sulphuric acid with agitation, and then filtered; neutralised with soda or calcium carbonate, again filtered, shaken out with cupric ammonio-sulphate solution, and once more filtered. Petroleum ether thus purified is free from odour, and volatile without residue. *Solution of Ammonia.*—Crude ammonia is shaken with animal charcoal and filtered. Sufficient crystalline barium hydrate to combine with any sulphuric acid present is added, and the liquid is again filtered. If lime, alumina, or iron are present, they are precipitated by means of a little crystallised ammonium phosphate, and filtered out. *Alcohol.*—Crude spirit is first mixed with calcium permanganate and as much sulphuric acid as is necessary to combine with the lime. After standing for several days, when the pink colour has disappeared and a brown precipitate has formed, the solution is filtered, shaken with freshly precipitated copper phosphate, and again filtered. After four to six weeks the alcohol is ready for use.—*Pharm. Centralh.*, **40**, 134, after *Oest. Chem. Ztg.*

Active Constituents of Male Fern.—Bochm, of Leipsic (*Sudd. Apoth. Zeit.*) finds that the anthelmintic value of the oleo-resin of male fern depends on the presence of aspidin as well as of filicic acid. Out of eleven preparations examined, six contained from 2 to 3 per cent. of aspidin, while filicic acid was absent, four contained filicic acid and no aspidin, and one small quantities of both. The author concludes that an oleo-resin rich in aspidin is preferable to one containing filicic acid.—*Therap. Gaz.*, **23**, 179.

Solution of Mercuric Benzoate.—Desesquelle and Bretonneau do not find that mercuric benzoate is soluble, as generally stated, in solutions of alkaline chlorides or iodides, but state that it may be readily dissolved by the aid of neutral ammonium benzoate. For hypodermic injections they employ mercuric benzoate, 60 centigrammes, ammonium benzoate, 3 Gms., distilled water to 60 Gms. This solution does not occasion pain, is less toxic than mercuric chloride solution, and does not precipitate albuminoids.—*Journ. de Pharm. d'Anvers*, **55**, 188.

To Abort a Cold.—Max Nassauer asserts that an incipient cold in the head may be checked if the nose is thoroughly rinsed out with a weak solution of potassium permanganate, which seems to have a specific action upon the germs causing coryza. It checks colds in the first hour or so. He keeps a strong solution of potassium permanganate at hand, about as much as can be taken up on the tip of a small knife to half a litre of water. A few drops of this strong solution are added to warm water until it is coloured a pale pink. After blowing the nose vigorously, both nostrils are well rinsed out with this weak solution, the fluid being allowed to run out through the other nostril and through the mouth. Each nostril is then wiped out with cotton on the finger. A small plug of cotton is then pushed well up into each nostril and the nostrils filled with the weak solution with the head held back, the cotton being allowed to soak it up. The plug is left undisturbed for about an hour, when it can be expelled by blowing the nose. Even an established cold is favourably influenced by this treatment, but it is most effective when the sneezing, tickling, and increased secretion announce the onset of the cold.—*Practitioner*, **42**, 635.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

JULY 20, 1899.

As might be expected at the time of the year, and with the prevailing hot weather, business in the Drug and Chemical Trade during the past week has been anything but brisk, while we can hardly look for any improvement until the holiday season is over, and cooler weather again sets in. The only important change in price to record is a further advance in the price of Santonine. Opium is steady, Persian being specially firm. Morphia is also firm, particularly for early delivery. Codeia is also firm, and in good demand. Quicksilver is steady. Mercurials unchanged. Acid Citric firm. Acid Tartaric and Cream of Tartar steady. Quinine has been somewhat unsettled, but appears to have steadied again; what, however, is in store for the article in the future appears to be a puzzle to the best informed. The following are some of the prices actually ruling for articles of principal interest:—

ACETANILIDE—Is weak at unchanged prices.

ACID BORACIC.—Crystals, 25s. per cwt.; powder, 27s.

ACID CARBOLIC—Very firm at late advance, price now being 7d. to 7½d. for the 35-36° C. ice crystal.

ACID CITRIC—As might be expected, the hot weather now ruling, has had the tendency to stiffen the price, which is still 1s. 8d. per lb. from the makers, for crystals in 5 cwt. casks.

ACID, TARTARIC—Steady; prices being nominally unchanged.

AMMONIA COMPOUNDS—Are without change at prices quoted in our last number.

BORAX.—Crystals, 16s.; powder, 16s. 9d.

BROMINE AND BROMIDES.—No change in price to report.

CLOVES.—Privately Zanzibar quiet, but steady, with sellers for Aug.-Oct. delivery at 3 3/16d., and Oct.-Dec. delivery at 3 5/32d. No Zanzibar offered at auction. Of 6 cases Ceylon 3 sold, fair bright picked at 5½d.

COAL TAR DISTILLATION PRODUCTS—Are without special change.

COCAINE—Makers continue firm at 11s. 6d. to 11s. 9d. per oz. for the Hydrochlorate in 25 oz. tins, stating that they must shortly advance price; from second hand there is still a little offering at something below above figures.

CODEIA—Is in good demand at 12s. 6d. to 12s. 9d. per oz. according to quantity

COD LIVER OIL—Extremely quiet, price being nominally unchanged at 56s. per barrel, f.o.b., for best new non-freezing Norwegian oil, in 25 gallon tin-lined barrels.

CREAM OF TARTAR—Steady, without change in price.

GINGER.—Moderate supplies of Cochin met slow demand, and of 687 bags and 129 cases, only 2 single cases sold, good bold cut little limed, at 75s.; medium and bold brown, cut and scraped, at 71s.; the remainder bought in; good bold cut at 75s. to 80s.; medium and small ditto at 42s. 6d., and small at 27s.; also bright brown cuttings at 17s., and washed rough at 23s. to 24s. Jamaica, also in moderate supply, went off slowly at rather easier rates. Of 520 packages 256 sold, fair to good bright at 66s. to 69s., but chiefly ordinary to middling at 53s. to 60s.; good common at 48s. to 51s. 6d.

GLYCERINE.—Crude is fairly firm. Refined quiet and weak at 48s. to 50s. per cent. for English, and 50s. to 57s. 6d. for German, according to quantity and brand, for best white double distilled, chemically pure, 1260 quality in tins and cases.

IODINE AND IODIDES—Are without change from last week.

MENTHOL—Rather firmer at 7s. 3d. to 7s. 6d. per lb. for best dry white crystals in 60lb. cases (5lb. tins.)

MERCURIALS.—So far makers made no alteration in their prices, which remain at 2s. 10d. per lb. for calomel, and 2s. 6d. per lb. for corrosive sublimate.

MORPHIA—Is firm at 4s. 10d. to 5s. per oz., according to packing, for the hydrochlorate powder.

OILS (FIXED) AND SPIRITS. There being, comparatively speaking, so little business passing in these articles, and prices being nominally about the same as last week, we refrain from quoting, referring our readers to our last week's issue.

OPIUM—Steady for both druggists and manufacturing kinds. In soft shipping kinds there is not much doing. Persian is in good demand, with a tendency to further advance.

PHENACETIN—Weak at nominally unchanged price.

POTASH COMPOUNDS.—No alterations of any importance to record in the articles usually quoted under this heading.

QUICKSILVER.—Firm at £8 7s. 6d. in bottle from the importer.

QUININE.—Makers' price remains at 1s. 6d. per oz. for the best German brands of sulphate in 100 oz. tins and for 1,000 oz. lots, there being, however, sellers of these brands from second hand at fully 2d. per oz. below makers' price. The future of the article remains somewhat of a puzzle. Certainly those who have bought at 1s. 4d. per oz. should not think of selling except at a profit.

SANTONINE.—Makers again advanced price on Saturday to 7s. 6d. per lb. for smaller quantities; lowest for 2 cwt. lots being 6s. 3d. per lb. It is stated that a further advance may possibly be necessary owing to short supply of the article.

SODA COMPOUNDS—Ar practically without change from last week.

SPICES (various).—Black Pepper: 24 bags Ceylon sold at 5⅛d. to 5⅜d., no Singapore offered. White Pepper: Singapore all bought in, good to fine at 9d. to 11d. Chillies: Of 278 packages Japan only 10 sold, fair bright at 35s. Cassia Lignea: 70 bales Broken bought in at 32s. Cinnamon: 3 bales offered and 1 bale sold, firsts at 9d. Nutmegs neglected: 27 cases Penang mostly bought in, 66's at 2s. 2d. and 81's at 1s. 8d. to 1s. 9d.; 3 casks West India sold, 90's at 1s. 7d. Pimento easier: Of 537 bags 116 sold, middling to fair at 3⅛d. to 3¼d.

SULPHONAL.—Makers still quote 17s. per lb. for both crystals and powder. There is now very little indeed offering from second hand.

To-day's drug sales passed off quietly, a considerable number of the lots offered being bought in. The following are particulars of prices realised or required by holders:—

ACONITE ROOT.—10 bags good Japan bought in at 28s. per cwt.

ALOES.—5 cases very soft Zanzibar sold at 35s. per cwt. 54 kegs soft Socotrine were taken out at 75s. per cwt. 26 boxes capey Curaçoa realised 16s. per cwt. 19 cases Cape all bought in at 26s. per cwt. for fair hard bright quality.

AMBERGRIS.—1 tin of quite low quality taken out at 10s.

ANTIMONY.—40 cases crude Japan (Black Sulphide) were taken out at £24 per ton.

ASAFETIDA.—14 cases brown sandy block sold without reserve at 29s. per cwt., down to 21s. for very inferior.

ARECA NUTS.—23 bags good sound, bold, bought in at 30s. per cwt.

BALSAM COPAIBÆ.—5 casks pale Maranham taken out at 1s. 6d. per lb. 10 cases, part sold at 1s. 5d., per lb.

BALSAM PERU.—8 cases were bought in at 8s. per lb.

BALSAM TOLU.—4 cases sold at 1s. 4d. per lb.

BIRD LIME.—1 case genuine Japanese fetched 1s. 9d. per lb.

BUCHU LEAVES.—2 bales, 1 round 1 oblong, taken out at 5d. per lb. Medium rounds part sold at 4¼d. to 5d. per lb.

CAMPHOR OIL.—20 cases black Japan taken out at 25s. per cwt.

CARDAMOMS.—Really fine, bold Ceylon Mysores sold at 3s. 4d. to 3s. 6d. per lb., one case being taken out at 3s. 7d., lower grades selling at 3s., down to 1s. 3d., according to size, shape, and colour. 3 cases spurious, catalogued as wild China, sold without reserve at 3d. per lb. Fair seeds fetched 2s. per lb.

CASTOR OIL.—5 cases Calcutta taken out at 4d. per lb.

CHIRETTA.—6 bales were bought in at 3½d. per lb.

CINCHONA BARK.—1 bale crown bark sold at 4d. per lb. 36 bales flat Calisaya sold at 7d. to 8½d. per lb.

CIVET.—5 horns, quality of which left much to be desired, part sold at 10s. per oz.

COLOCYNTH.—8 casks fair Turkey were bought in, a bid of 1s. 2d. per lb. being declined. This shows a considerable advance

in value of this article, which sold not long since in public sale at 11½d.

COLOMBO ROOT.—7 bags fair washed were taken out at 42s. per cwt.

CUBEBS.—14 bags, dusty, stalky, and inferior, sold without reserve at 20s. 6d. per cwt.

CUTTLE FISH BONE.—75 mats fair sorts, part sold at 3d. per lb. 4 bags small at 2d. 3 cases really fine bold bought in at 1s. per lb.

DRAGON'S BLOOD.—4 cases of medium quality were bought in at £10 to £12 per cwt., while for another lot of 8 cases £12 10s. per cwt. was bid and declined for good fair, and £9 and £10 for less desirable quality.

EGG ALBUMEN.—16 cases fair pale, were taken out at 1s. 9d. per lb.

ERGOT OF RYE.—14 bags Russian sold without reserve at 1s. to 1s. 1d. per lb. Good Spanish was bought in at 1s. 6d. per lb.

ESSENTIAL OILS.—Two cases Cassia Oil stated to contain 81 per cent. cinnamon aldehyde, sold without reserve at 4s. 1d. per lb. 3 cases Oil Neroli Bigarade were taken out at 2s. 8d. per oz. 1 case Dodge and Olcott's Oil Wintergreen bought in at 5s. 6d. per lb. ; 1 case Dodge and Olcott's Bay Oil at 10s. 6d. per lb., 2 cases Dodge and Olcott's Sassafras Oil at 1s. 6d. per lb. 10 cases dementholized Japan Peppermint, taken out at 3s. 6d. per lb. 1 case Michigan Peppermint at 3s. 1d. per lb. 1 case Clove Oil at 2s. 4d. per lb. 1 case Cedar Wood Oil at 11½d. per lb. 5 cases Nutmeg Oil at 2¼d. per oz. 10 cases Cajeputa at 3s. 6d. per bottle (of 20 oz. net). 5 cases fair commercial Eucalyptus at 1s. 3d. per lb.

FŒNUGREC SEEDS.—6 bags realised 6s. per cwt.

GAMBOGE.—11 cases fair pipe bought in at £9 per cwt.

GUAZA (CANNABIS INDIC.).—77 robbins part sold at 4d. for good tops, which shows a decided decline in price ; part dusty and stalky only realised 3d. to 3¼d. per lb.

GUM ARABIC.—2 cases picked gum sold without reserve at £6 2s. 6d. per cwt. 7 cases fair grey part sold at £6 10s.

GUM BENJAMIN.—Fair Palembang was held for 48s. per cwt. Good seconds Sumatra were bought in at £9 to £10, down to £7 for lower quality. 3 cases medium to fair Siam at £15.

GUM GUAIACUM.—2 cases good block bought in at 1s. 8d. per lb.

GUM KINO.—2 cases genuine Cochin bought in at 3s. 6d. per lb. This shows a decidedly lower value as against price hitherto ruling.

HONEY.—Medium Jamaica realised 19s. to 20s. per cwt., 5 casks of rather better quality being held for 21s. ; 1 cask and 2 barrels good liquid sold at 20s ; 5 crates, each containing 6 by 14 lb. tins Canadian, sold at 22s. 6d. per cwt. ; 20 cases white set Californian bought in at 38s. per cwt.

INSECT POWDER.—35 kegs, quality of part of which was somewhat doubtful, were taken out at 7d. to 10d. per lb.

IPECACUANHA.—13 packages were all bought in at 12s. per lb. for Carthagena, and 16s. per lb. for Rio ; later on holders met the market, selling fair Rio at 15s. and Carthagena at 11s., which shows a weaker market for the article.

KAMALA.—1 case of inferior quality taken out at 5d. per lb.

KOLA NUTS.—5 bags, medium to fair quality, sold at 4d. per lb., 5 bags good bold being bought in at 5½d.

LICORICE ROOT.—8 bales thin decorticated were taken out at 40s. per cwt.

LIME JUICE.—7 puncheons sold at 1s. 6d. per gallon.

MENTHOL.—2 cases good dry white crystals, Kobayashi brand, bought in at 7s. 3d. per lb.

MUSK.—4 caddies Tonquin were bought in at 37s. 6d. to 62s. 6d. per oz., according to quality.

MUSK SEED.—1 bag East Indian sold at 1s. 3d. per lb.

QUINCE SEEDS.— 4 bags good African were bought in at 1s. 6d. per lb.

RHUBARB.—Of 51 cases practically nothing was sold, medium to fair flat Shensi was bought in at 1s. 4d. to 1s. 6d. per lb. ; round at 1s. 3d. to 1s. 6d.

SARSAPARILLA.—Medium Lima Jamaica more or less chumpy sold at 6d. to 6½d. per lb. 3 bales fair native Jamaica fetched 10d. per lb., really good Jamaica selling at 1s. 4d. to 1s. 7d. per lb. 6 serons Honduras taken out at 1s. 5d. per lb.

SOY.—20 casks of good quality bought in at 1s. 6d. per gallon.

STAR ANISEEDS.—2 bales bought in at 45s. per cwt.

TONQUIN BEANS.—7 cases bought in at 2s. 5d. per lb. 1 cask of better quality of Angosturas at 3s. 3d.

TURMERIC.—34 bags Madras, part sold at 19s. per cwt. ; 20 bags China at 18s. per cwt.

SENNA.—3 bales, fair bold Tinnevelly, bought in at 6d. per lb. which is about value as market stands at present. 3 bales ditto, good bold green, were held for 7d. per lb. Low broken and yellow leaf sold at 1¼d. to 2¾d.

WAX was again rather easier, medium Jamaica selling at £6 15s. per cwt. ; rather better quality at £7 2s. 6d. ; yellow Calcutta, of doubtful quality, taken out at £5 10s. ; fair Zanzibar at £6 ; fair Madagascar at £6 10s. ; somewhat lower quality realising £5 10s. 6 bags ceresine wax sold without reserve at 30s. per cwt. 50 cases Japan bought in at 30s. 6d. per cwt.

WOOD OIL.—7 barrels China bought in at 35s. per cwt.

Newcastle-on-Tyne Chemical Report.

JULY 19, 1899.

This market continues to find more shipping orders passing from all directions. Bleaching Powder is a special feature at the moment, and as the article is scarce, prices from the various and special markets are more stiffly quoted. More inquiries are in circulation for Soda Crystals and Caustic Soda, but prices are not disturbed. Quotations are : Bleaching Powder £5 10s. to £5 12s. 6d. Soda Crystals, 45s. to 47s. 6d. Caustic Soda, 70 per cent., £7 to £7 5s. Soda Ash, 52 per cent., £4 5s. to £4 10s. Alkali, 52 per cent., £5 5s. to £5 10s. Sulphur, £4 15s. to £5 per ton.

Manchester Chemical Report.

JULY 18, 1899.

Strange as it may seem, the cricket match between England and the Australians greatly affected the attendance on 'Change to-day, and such was the interest felt that even two of Her Majesty's Judges adjourned their courts at an early hour in order that they themselves, counsel, jurymen, and the public might have an opportunity of witnessing the unique match at Old Trafford. Under the circumstances there was not the usual turn over, although in the manufacturing centres the volume of business in heavy chemicals is regarded as satisfactory. Prices remain unchanged, and in miscellaneous articles tin salts are somewhat higher. The arrivals of Brown Acetate are fairly larger, and as low as £4 15s. is reported for Welsh and American, in quantity. Sulphate of Copper is also somewhat lower at £24 12s. 6d. to £25 per ton, best brands, Manchester. In some respects, coal tar products are firmer, especially Pitch and Creosote. Chlorate of Potash tends upwards. Foreign White Sugar of Lead is dull at £22 to £22 10s., c.i.f., but Acetate of Soda is firm at £13 10s. per ton. Arsenic is easier at £19 to £19 5s. Yellow Prussiate is unchanged at 8d. to 8½d. for best Lancashire make. The local oil trade is brisk. Salt Cake is lower and irregular at 21s. to 25s. per ton, in bulk, on rails, and this causes an easier feeling in Glauber's Salts.

Liverpool Market Report.

JULY 13, 1899.

AMMONIA SALTS.—Carbonate firm, 3¼d. per lb. Salammoniac, 33s. to 35s. per cwt.

BEESWAX.—25 packages Conakry made £6 2s. 6d. per cwt.

CANARYSEED.—300 bags Turkish sold at 35s. 6d. to 36s. 6d. per 464 lbs., 100 bags at 36s., 500 bags at 36s. 6d., and latterly 1,120 bags at 37s. 6d. to 38s. Prices are very firm now, holders wanting 39s.

CHILLIES.—14 bags fair Sierra Leone went for 42s. 6d. per cwt. ex store.

COPPER SULPHATE—Quiet at £24 15s. per ton.

COPPERAS.—37s. to 40s. per ton; very firm.

GINGER.—156 bags Sierra Leone changed hands at 18s. per cwt. ex quay.

LINSEED.—Forward business in Calcutta is at a standstill owing to high prices wanted by holders. River Plate ex quay is offered at 37s. per 416 lbs., but there are no buyers. American is firmer, 36s. 9d. per 424 lbs. being asked.

OILS (FIXED) AND SPIRITS.—Castor is steady with slow demand. Calcutta offers at 2⅞d. per lb. ; French 1st pressure at 2¾d. ; 2nd pressure 2$\frac{9}{16}$d. ; second sulpher 2⅝d. ex quay ; Madras 2¾d. per lb. Olive is in improved inquiry, but amount of business done is not large. Candia £31 10s. to £32 per tun ; Spanish £32 to

£32 10s. Linseed is unaltered, with a steady market at 21s. 9d. to 22s 6d. per cent. Cottonseed is firm at 17s. to 17s. 6d. per cwt. Spirits of Turpentine are dull, and there are sellers at 32s. 6d. per cwt.

POTASH SALTS.—Bichromate 3¼d. per lb; Chlorate 3½d. to 3¾d. per lb; Cream of Tartar is firm at 75s. to 80s. per cwt., but transactions are few. Pearlash 32s. per cwt.; Potashes 22s. 9d. per cwt.; Prussiate is very firm at 8d. to 8½d. per lb.

QUILLAYA BARK.—Sales have been made of Chilian at £13 5s. per ton, and £13 10s. is now wanted.

SODA SALTS.—Bicarbonate £6 5s. to £6 15s. per ton; Borax 16s. to 17s. per cwt.; Caustic, scarce and firm, 76 per cent. to 77 per cent., £7 15s. per ton; Crystals £3; Nitrate 7s. 6d. to 7s. 9d. per cwt.

STARCH MOUNTANTS.

BY "ERUDIO."

Starch as an adhesive for photographs of all descriptions cannot be too well recommended, being at once extremely clean drying, easy to make, and at the same time free from the impurities that prevail in many made-up mixtures. It is not soluble in cold water but hot water forms it into a mucilage of almost any consistency required, a small quantity of best white starch being mixed up in cold water to the thickness of cream, and after adding boiling water, stirred till thick enough, or boiled in a saucepan until it thickens. Used in this form there is nothing to beat it. If this preparation is allowed to stand, the result is that in a short time fermentation soon starts, and we get a lot of water out; and even in this state it is hardly fit to use for any delicate work owing to this decomposing matter giving off acetic acid, ammonia, and sundry other unwelcome constitutents. In fact, the starch loses a great deal of its adhesive qualities when in this form.

To stop and retard this decomposition is one of the chief aims, and to do it efficiently would probably be the right road to obtain a suitable starch mountant. The preservatives that are usually recommended being salicyclic acid and also alum and several other chemicals, they certainly act in their way, but may, to a great extent, be looked upon as necessary evils.

If some best white starch is obtained, and a quantity made up in the usual way of fairly thick consistency, glycerin and a small quantity of rectified spirit will be found to be about the best preservative one can use, both with regard to the length of time the starch solution will keep and also from the absence of any ill effects to the picture, it being really a neutral solution. In fact, the starch will keep good for an indefinite length of time. One or two drops of some essential oil may be added to scent the mixture. The spirit may to some extent be found to evaporate, but a small quantity should be added from time to time. In adding the glycerin it must be done when the starch is hot, and well mixed, which may be done with an egg whisk, or shaking up in a bottle, the spirit being afterwards added, shaken well, and then corked up till cool, when it will then be found in an excellent condition for use. The best glycerin should be used.

There are many pastes that will not stand an acid or alkaline test, otherwise they may have everything to recommend them; but for a delicate subject like a photograph the most assiduous care must be taken in choosing a mountant free from any substance that tends to keep the paste and spoil the photograph, and a penny book of test papers will quickly set at rest any question of this sort one way or the other.

Two excellent preparations, for use other than mounting photographs, are dextrine, or British gum, which makes a distinctly acid preparation; and also a solution of cold starch, added to a strong solution of potash. This forms an excellent stickfast, but at the same time, being so strongly alkaline, it is not fit to mount photographs with.—*Photographic News.*

PHOTOGRAPHIC NOTES.

Transferring Photographic Films.—To remove gelatin films from celluloid, or other transparent support, W. Jennings dips the film for about half a minute in a 10 per cent. solution of alum and water, then lays it on a plate of glass, and at the upper corners proceeds to roll back the gelatin film gently with the fingers. It readily separates from the support, and in this rolled-up condition it is washed in running water for about five minutes, to take out the wrinkles and eliminate the alum. Then place a clean plate in a tray containing a 10 per cent. solution of glycerin and water. Next take the separated film and spread it out (printing side up on the glass plate in the tray), then lift up the plate and place the film on the plate, under slowly running water. This will drive out the bubbles. Use the finger or the tip of the tongue for a squeegee. The film will dry perfectly flat and free from grain. When dry it may be intensified, reduced, or retouched, as usual. This is an excellent way to save film negatives having joints in the celluloid, and there is no trouble in transferring fifty 4 by 5 films in an hour. Positive pictures can just as well be transferred from this supporting film on to other things than plates of glass as one's fancy may choose.—*Scientific American.*

Toning Gelatino-Chloride Papers.—We frequently hear conflicting experiences of the behaviour of toning baths other than sulpho-cyanide, which are from time to time recommended for gelatino-chloride prints. The discrepancy arises generally from the fact that a toning bath which will give good results with one brand of paper will not necessarily suit all. The sulpho-cyanide bath seems to suit all kinds, but the results are characteristic and not always desirable. In papers of the kind it is essential that, in addition to silver chloride, there should be an organic salt of silver, but there is a wide choice of the organic salts which are available. Those most commonly employed are the citrate, the tartrate, and the acetate. Free silver nitrate may also be present, and variations in the method of preparation and in the conditions under which the emulsion is formed are also factors which affect the result.

It is not surprising that the use of the generic term—gelatino chloride—for sensitive surfaces of such widely different nature as it is possible to produce, consisting of emulsified silver chloride as a part, should lead to difficultics. In the present state of our knowledge of the action of light, which is hardly rudimentary—we do not even know of what the reduced image consists—and our almost as fragmentary knowledge of how the toning bath acts, the only course that seems open to the practical photographer is to experiment with various samples of paper and various toning baths until he obtains the result he requires, or as near it as possible, and then to stick to the same brand of paper and the same method of treatment. In publishing experiences which relate to a commercial article, the particular article referred to is rarely mentioned, owing, probably, in most cases to the fear that an advertisement or a "puff" might be suspected, and, as a rule, this is wisdom, and leads to no difficulty. Gelatino-chloride paper, however, as we have pointed out, is not of a specific nature, and a well-meaning hint, which might be a valuable one to many, is liable to pass unheeded on account of the impossibility of identifying the actual material to which it applies unless the maker's name is given.

Simple Method of Preparing Potassium Chloroplatinite.—The following simple method for preparing this salt, much used in photography, is due to Vèzes. Platinic chloride is added to water in considerable excess, so that a portion of the salt is left undissolved, even on boiling, for every 100 parts of platinic chloride employed, about 37 parts of neutral potassium oxalate are added, and the mixture heated to boiling, CO_2 is evolved, the platinic salt is reduced to the platinous state, the solution assumes a bright red colour, and the undissolved platinic chloride is taken into solution. On evaporating and crystallising the chloroplatinite separates out: in this way 80 per cent. of the theoretical yield may be obtained, while the rest may be precipitated from the mother liquor by the addition of alcohol.—*Sci. Amer.*, **80**, 325, after *Bull. Soc. Chim.*

SODIUM SULPHATE FOR PHENOL BURNS.—B. Weiss suggests that washing with a solution of sodium sulphate should be employed in the treatment of accidental cases of phenol burning. He finds that this application is more effectual than that of alkaline solutions, as generally recommended in text-books, the resulting sulpho-carbolate formed being quite devoid of caustic action, whereas the combination of phenols with alkalis still retain irritant properties. Pain and burning sensation is at once relieved by washing the parts with an 8 per cent. solution of sodium sulphate, followed by the application of compresses saturated with the same solution.—*Nouv. Rem.* **15**, 215.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Holloway's Wines, half face value.—Balchin, Gosport.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. EDWARD PECK, East Dereham,

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements.

(Received too late for Classification.)

WANTED JUNIOR for August and September; outdoors; time for study. Suitable for one entering for October examination. Must be an accurate dispenser. London experience preferred. Apply, either personally, between 3 and 8 p.m. on Friday, or on Monday, or by letter in first instance. C. E. TURNER, 20, Bury St., Bloomsbury.

SOUTH WALES.—In Bankruptcy, *re* G. H. J. Cullwick.—The Official Receiver in Bankruptcy has instructed the undermentioned to sell by Private Sale the Stock-in-Trade and Shop Fittings; no reasonable offer will be refused, an early clearance being desirable. For particulars and to view, apply to BOWLING BROTHERS, Auctioneers, Pembroke Dock.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Andrews, Burns, Clarke, Cowley, Cruickshank, Cumber, Dazell, Ferrall, Gould, Hardy, Jameson, Kent, Loosmore, Lovis, Mackie, Masters, Naylor, Parker, Payne, Schaefer, Shepherdson, Stewart, Taylor, Thompson, Watson, Wheeler, Woods, Wootton, Young, Zimmer.

Marriage.

Gould—Harman.—On July 16, at Argyle Chapel, Bath, by the Rev. J. Turner-Smith, Sydney Hartforth Gould, M.P.S., fifth son of Henry Collins Gould, of Woodside, S. Godstone, to Isabel, youngest daughter of Stephen Harman, of Bexhill-on-Sea.

Obituary.

Wilson.—On July 5, Robert Morris Wilson, Chemist and Druggist, Nefyn, Carnarvonshire. Aged 65.

Donaldson.—On July 7, William Donaldson, Chemist and Druggist, Brora, Sutherlandshire. Aged 51. Mr. Donaldson had been a member of the Pharmaceutical Society since 1892.

Youngman.—On July 11, Edward Youngman, Pharmaceutical Chemist, Bury St. Edmunds. Aged 71. Mr. Youngman had been a member of the Pharmaceutical Society since 1853.

Pellow.—On July 15, James C. Pellow, Chemist and Druggist, Bude, Cornwall.

Calendar for the Week.

Sunday, July 23. 8th after Trinity. Sun rises 4.12; sets 8 0.

Monday, July 24. Sun rises 4.13; sets 7.59.

BRITISH PHARMACEUTICAL CONFERENCE, Assembly Rooms, Royal Hotel, Plymouth, at 6 p.m.—Meeting of the Executive Committee, followed at 8 p.m. by a Reception by the President of the Conference.

Tuesday, July 25. Sun rises 4.15; sets 7.58.

BRITISH PHARMACEUTICAL CONFERENCE at 10 a.m.—Opening of the Sessions of Conference at the Law Courts, Plymouth, by the Mayor (Alderman J. Pethick, J.P.), followed, at 4.30 p.m., by an excursion from Plymouth along the Cornish Coast to Looe.

Wednesday, July 26. Sun rises 4.17; sets 7.56.

BRITISH PHARMACEUTICAL CONFERENCE at 10 a.m. and 2 p.m.—Sessions of Conference at the Law Courts, Plymouth, followed, at 8 p.m., by a Ladies' Drawing-room Concert and a Smoking Concert, at the Assembly Rooms, Plymouth.

PHARMACEUTICAL SOCIETY.—Meeting of Local Secretaries at the Assembly Rooms, Plymouth, at 9.30 a.m.

Thursday, July 27. Sun rises 4.18; sets 7.55.

BRITISH PHARMACEUTICAL CONFERENCE at 9.30 a.m.—Excursion from Plymouth to Mount Edgcumbe Park and Gardens and up the River Tamar.

Friday, July 28. Sun rises 4.19; sets 7.53.

BRITISH PHARMACEUTICAL CONFERENCE.—Visit to the Dockyards. Garden party given by the Mayor of Plymouth, at "Down House," Yelverton.

Saturday, July 29. ☾ 0.43 A. Sun rises 4.21; sets 7.52.

WHOLESALE CHEMISTS' AND DRUGGISTS' CRICKET CHAMPIONSHIP.—Davy Hills' *v.* Hewlett's, at Brockley.

Partnerships Dissolved.

(From the London Gazette.)

M. Baines and Eustace W. P. Baines, Physicians, 11, Cranley Place, South Kensington.

C. E. Wilkinson and E. H. Flower, Chemists and Druggists, Hemel Hempstead.

Publication Received.

THE QUARTERLY THERAPEUTIC REVIEW. A record of all the published new remedies, special applications and preparations of medicines and of new formulæ. Vol. XVII., No. 66, July, 1899. London: Baiss Brothers and Stevenson, Jewry Street, E.C. From the Publishers.

complete skeletons; hog was especially prominent, but cave lion and rhinocerous were present, also associated with teeth and bones of man.

Man and hyæna both appear to have been residents. The hyæna left proof of his active presence in the form of gnawed bones; man afforded evidence of his occupation in the presence of charcoal and a nodule of flint.

The remains of fifteen or sixteen human beings of both sexes and very various ages were found. Sufficient of the bones were recovered to practically represent every principal portion of the human skeleton. The race was a short one, averaging under five feet. The tibiæ were exceptionally flattened or platyenemic. No skull could be obtained intact, but the form can be definitely stated as orthocephalic. The teeth were exceptionally good, in many cases much worn, but with no trace of decay. Associated with the human remains were those of some five-and-twenty species of animals—rhinoceros, lion, hyæna, fox, badger, bison, urus, red deer, roe deer, hog, goat, etc.

The human remains are the most perfect and complete in this country that have yet yielded information as to the physical characteristics of the men who lived as neighbours with the mammoth, rhinocerous, and cave-lion. Dates, eras, or geologic periods are dangerous handling. Suffice it to say that the bone caves and fissures around Plymouth demand a fluctuation of the level of land of some hundred and twenty feet during their infilling. One which was a den lies by the present sea level; others, filled with apparently fluviatile deposits, lie some hundred feet above; everything points to a lengthened period, the nearest date in which would be vastly remote from our own time. The northern mammoth and man endured each other's society; the latter had already armed himself with flint, either to attack therewith his neighbours or to defend himself therefrom. The land was a sportsman's paradise, and probably a palæolithic man's purgatory. We talk of the stress of modern life: nerves would be more excusable if, back at the fore end of the ages, we were planted down to play hide-and-seek with Machairodus and pick bones with the cave hyæna. Beyond joke or quip there must have been good stuff in the human race that has lived to discuss its own survival from the horrors of pre-historic nightmare.

FINANCIAL STATEMENT FOR THE YEAR ENDING JUNE 30, 1899.

The Hon. Treasurer in Account with the British Pharmaceutical Conference.

1898.	*Dr.*	£ s. d.	£ s. d.

July, 1899. Examined and found correct.

THE STUDENTS' COLUMNS.

EXPLANATORY NOTES ON THE B.P. 1898.

Pix Carbonis præparata.—By fractional distillation coal tar may be separated into five fractions, which are distinguished as follows, the figures representing the average proportions of each:—

1. Ammoniacal water	5	per cent.
2. Light oils	3	,, ,,
3. Carbolic and creosote oils	20	,, ,,
4. Anthracene oils	12	,, ,,
5. Pitch	60	,, ,,

The commercial coal tar by gently heating in an open dish will lose the greater portion of the ammoniacal water and the prepared coal tar so produced is used in medicine on account of its strong antiseptic and parasiticide properties. These properties are due to phenol and its homologues, various hydrocarbons, such as naphthalene, basic bodies of the pyridine and acridine class, and sulphur compounds such as thiophene. When prepared coal tar is digested in tincture of quillaia, made with 90 per cent. alcohol (*vide* Liquor Picis Carbonis B.P.), most of the constituents of fractions 2, 3 and 4 are dissolved, and the greater part of the pitch is left as a black insoluble residue. The filtrate constitutes liquor picis carbonis. This is used chiefly in the form of a lotion diluted with water. On dilution the greater part of the hydrocarbons and the higher phenols are precipitated but remain emulsified, forming a milky fluid owing to the presence of the saponin derived from the quillaia bark.

Plumbi Acetas.—When lead acetate is dissolved in water it is dissociated slightly into an oxysalt and free acetic acid. This oxysalt is the cause of the turbidity mentioned in the official characters and test, while the acetic acid produces a slight reddening with blue litmus paper. Acetic acid added to the faintly turbid solution counteracts the dissociating effect of the water, and converts the oxysalt into normal lead acetate. In applying the hydrochloric acid test for silver, remember the sparing solubility of lead chloride in water. Hence a precipitate of lead chloride may be obtained if the acid be added to a strong solution of lead acetate. Lead chloride may, however, be easily distinguished from silver chloride by its solubility on boiling with more water, in which silver chloride remains insoluble. The quantitative test with sulphuric acid requires that the salt shall be practically pure.

$$\underbrace{Pb(C_2H_3O_2)_2 3H_2O}_{376.15} + \underbrace{H_2SO_4}_{97.34} = PbSO_4 + 2HC_2H_3O_2 + 4H_2O$$

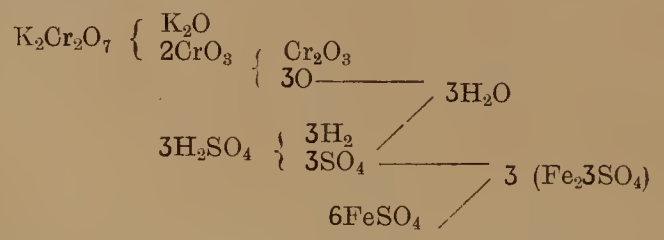
Since 1 litre of N/10 H_2SO_4 solution contains $\frac{97.34}{20}$ Gms. of H_2SO_4 it will be equivalent to $\frac{376.15}{20} = 18.8075$ Gm. of lead acetate.

Each C.c. therefore indicates .0188075 Gm. and 53.1 C.c. are capable of precipitating .0188075 × 53.1 = .998 Gm. of lead acetate.

Potassii Birchromas.—The volumetric test with ferrous sulphate requires the bichromate to be practically pure. It depends upon the conversion of ferrous into ferric sulphate which gives no blue colour with potassium ferricyanide.

$$\left.\begin{array}{c} K_2Cr_2O_7 \\ + \\ 6(FeSO_4,7H_2O) \\ + \\ 7H_2SO_4 \end{array}\right\} = \left\{\begin{array}{c} K_2SO_4 \\ + \\ Cr_2 3SO_4 \\ + \\ 3(Fe_2 3SO_4) \\ + \\ 49H_2O \end{array}\right.$$

The reaction and quantitative relationship between potassium bichromate and ferrous salts are best remembered by the aid of the following diagram:—



The diagram shows that one molecule of bichromate is capable of yielding three available atoms of oxygen for oxidising purposes, the K_2O and Cr_2O_3 forming (in presence of free acid which must be added in order that the reaction may be carried out) the corresponding salts—K_2SO_4 and $Cr_2 3SO_4$ with sulphuric acid, or 2KCl and Cr_2Cl_6 with hydrochloric acid. Note also that the free acid is necessary, not only to form salts with the bases, but to enable the ferrous to form the ferric salt, which contains, relatively to the ferrous, a larger proportion of acidulous radicle. According to the diagram and equation one molecule of bichromate ($K_2Cr_2O_7$ = 292 3) is capable of converting six molecules of ferrous sulphate ($6FeSO_4,7H_2O = 6 \times 276.10 = 1656.60$) into ferric sulphate. From this it follows that 1 Gm. of potassium bichromate is capable of oxidising 1656 60 ÷ 292.30 = 5.667 Gms. of crystallised ferrous sulphate under the conditions described.

Potassii Iodidum.—The Pharmacopœia now gives a minimum and maximum figure for the quantity of N/10 silver nitrate solution required for the complete precipitation of 1 gramme of the salt.

$$\underbrace{KI}_{164.73} + \underbrace{AgNO_3}_{168.69} = AgI + KNO_3$$

16·473 grammes of pure potassium iodide require, therefore, 1 litre of N/10 solution of silver nitrate.

$$\therefore \text{ 1 gramme KI} = \frac{1{,}000}{16.473} = 60.70 \text{ C.c. N/10 } AgNO_3.$$

60·70 is the mean of 59·5 and 61·9. If titration of the salt yields results outside the Pharmacopœia limits, it indicates on the one hand presence of more than traces of chlorides and bromides which require more silver nitrate for complete precipitation than an equal weight of iodide, owing to their lower molecular weights. If the volume of silver nitrate falls below the minimum value given, then presence of more than traces of impurities have no action on silver nitrate are indicated.

Potassii Permanganas.—When strongly heated the salt is decomposed, yielding oxygen, manganese dioxide and potassium oxide. The latter with water forms potassium hydroxide.

$$K_2Mn_2O_8 = K_2O + 2MnO_2 + O_3$$

The volumetric test is based upon the oxidation of oxalic acid to carbon dioxide and water

$$\underbrace{K_2Mn_2O_8}_{313.74} + 5\underbrace{(H_2C_2O_4,2H_2O)}_{5 \times 125.1} + 3H_2SO_4 = K_2SO_4 + 2MnSO_4 + 10CO_2 + 18H_2O$$

The oxalic acid solution referred to in the official test as containing 62·58 grammes of oxalic acid per litre is probably meant to be the normal solution, which contains 62·55 grammes per litre, *i.e.*, $\frac{1}{2}(H_2C_2O_4,2H_2O)$, the molecular weight of oxalic acid according to the table of atomic weights given in the B.P. appendix being 125·1. Assuming this to be so it will be seen from the equation that 313·74 grammes of potassium permanganate will require for decolorisation 10 litres of normal oxalic acid solution.

$$\therefore \text{ 1 Gm. } K_2Mn_2O_8 \text{ will require } \frac{10{,}000}{313.74} \text{ C.c.} = 31.87 \text{ C.c.}$$

The potassium permanganate is by this test only required to be 97·9 per cent. pure.

POLITICAL GOSSIP.

Poor Law Analysts.—In reply to a question by Mr. Macaleese (N. Monaghan) on Monday, respecting the qualifications required by the Irish Local Government Board for the appointment of analytical chemists to the Irish Poor-law Unions, Mr. Gerald Balfour stated that for persons other than Public Analysts under the Food and Drugs Act the Board required educational attainments equal to those possessed by such of the Fellows or Associates of the Institute of Chemistry as had obtained the certificate granted by that body in therapeutics, pharmacology, and microscopy. It would seem that the Department does not regard the mere pharmaceutical chemist as being competent to conduct the official analysis of drugs, but there is some lingering doubt on the point. What is meant by "educational attainments" equal to the diploma of the Institute, and who is to be the impartial judge of the equality? Perhaps, being interpreted, the reply of Mr. G. Balfour signifies that if the Board cannot get a F.I.C. they will make shift with the services of the lowly licensee under the Pharmacy Act.

Trade Marks certainly require a statute to themselves, and every effort towards the simplification and codification of the law relating to these essential aids to the development of trade will bespeak the interest of the whole commercial community. The Trade Marks Bill of Mr. Fletcher Moulton (Launceston), which was introduced into Parliament on the 21st inst., will therefore be closely scrutinised by a large number of electors. Of course, there is no intention of proceeding with the Bill this year, and it is simply submitted as a sample of what Mr. Moulton, backed by his friends, Messrs. Butcher, Kearley, and Provand, can do when they set to work seriously to devise remedies for our faulty Patents, Designs, and Trade Marks Acts. The chief features of the new proposal are (1) the appointment of a legal and commercial assessor for the guidance of the Board of Trade; (2) provision for registering a geographical name if it has, or is capable of having, a meaning totally distinct from its geographical signification; (3), registration of a combination of colours as part of the mark; (4) disclaimer of exclusive right to non-essential portion of any registerable mark; (5) provision for continuing application for registration through the legal representatives of deceased applicants; (6) power to assign one of a series of registered marks; and (7) power to erase a mark of which public use is not made within a period of two years.

Sir Mancherjee Bhownaggree will move this week for portions of the annual report of the Indian Section of the Imperial Institute embodying the more important details of the working of that section, and the results obtained in the scientific investigations of natural products from India carried on at the Imperial Institute. Is the representative for Bethnal Green and India cultivating an uneasy suspicion that the Empire is not getting its money's-worth out of the Institute's researches?

Lady Shop Assistants may even now get their seats this Session. The Lords have formally intimated to the Lower House that they have passed a Bill entitled "Seats for Shop Assistants Bill," which was formerly restricted to England and Ireland, but now embraces the whole of the United Kingdom. But unless the Government is prepared to elevate the measure to the dignity of official rank it is difficult to see how the Lords' amendments can be considered. From the confident assurance with which Mr. Balfour on Monday told Mr. Channing that the Bill would pass before the end of the Session it may be assumed that the ministerial "star" will be placed against its name. Sir Blundell Maple will not be over-pleased with his party.

Alarms and Excursions in the House of Lords on the subject of the Companies Bill continue to vex the soul of unwary journalists who are unacquainted with the Lord Chancellor's little ways. Last week Mr. Balfour told his colleagues in the Commons that the Bill would not be taken this Session, and most people jumped to the conclusion that it would therefore be withdrawn from the list of Bills in progress in the other Chamber. As a matter of fact, even as Mr. Balfour was speaking the Lord Chancellor was engaged in pushing the defunct measure (for it is quite dead) through the Committee stage, and dissolving the Select Committee, which had for so long been deliberating on the virtues and the evils of unlimited opportunities for company promotion. In the course of his remarks his Lordship took occasion to eulogise the Select Committee in unmeasured terms. There never was such a perfect Committee, according to its Chairman; its legal elements, its business elements, and its general knowledge of the world constituted it in very truth a *Select* Committee in the very best sense of the adjective. The three years' labour of the Committee having resulted in a practically unanimous report on a subject of so much importance to the mercantile community, it could not be said, still according to the Chairman, that the time had been wasted. On this point, however, there may be some diversity of opinion, but it is not of much advantage to discuss that now. What may be questioned is whether the Committee were really unanimous in deciding that while it is contrary to public policy that a company should be a doctor, it is in accord with equity that a company should masquerade as a chemist. There is no evidence that this particular phase of the Bill was ever discussed by the Committee, hence the promised detailed explanation of the Lord Chancellor on Friday, when the third reading is due, should be interesting, though it may not be satisfying to the pharmaceutical mind.

The Principle upon which the Committee has based its work—namely, prevention rather than cure, is one with which we have no quarrel. To stop *ab initio* the formation of improper concerns is infinitely more statesmanlike and just than to devise pains and penalties for the punishment of those engaged in undesirable or doubtful practices. But why should the principle be allowed to operate unequally—why, in fact, that should midwives be within the argument and chemists outside? Is the Legislature disposed to paraphrase Hosea Biglow and say that "equity's a sort of thing that doesn't suit a chemist"? The official statement on Friday may contain an answer to these speculations. It may be remarked that the Pharmacy and Medical Bills have neither been advanced nor withdrawn up to the time of going to press.

The Food and Drugs Bill has passed through Committee and been read a third time. Most strenuous opposition was exhibited at every step, but the Government has carried its point and the Bill. The chief alteration to be noted is the omission of the words in clause 19 which provided that an invoice should be deemed to be a warranty without the addition of specific words of guarantee. The promotion of an invoice to the rank of a warranty was the act of the Standing Committee, so that the Bill now goes back to its original form, and the invoice will continue to be nothing more than a fancy description of goods purchased, unless indeed, the Lords think fit to support the contention of the Grand Committee. Mr. Heywood Johnstone (Horsham) was the prime instigator of the omission, and his work was facilitated by the open-minded attitude of the Minister in charge, Mr. Long, who pointed out that whilst he left the matter in the hands of the House, he was advised that to give an invoice the force of a warranty would be fraught with very great danger from the point of view of the successful detection and prosecution of the defendant. This may be good advice, but one cannot help feeling that a very valuable check upon a possibly fraudulent wholesale dealer has been removed from the Bill. It might have been better, as Mr. Bryce suggested, to so modify the clause that words importing quality or description on an invoice would be deemed to impart the force of a warranty.

On the motion of Mr. Long, an addition was made to the effect that Scotland should be included in the provisions of the Bill. This is particularly hard on some of the Scotch members who have been most conspicuous in their hostility. Sir C. Cameron, for instance, crystallised his opinion in a very scathing denunciation. The measure, he said, would only benefit one class of Her Majesty's subjects, and that class was the lawyers; it would also render still more complicated the confusion already existing in the adulteration laws. Furthermore, the Government had successfully resisted all attempts to protect the public against fraud by getting at the wholesale adulterator, and in this connection the honourable baronet had a number of supporters who acted as chorus. Before the third reading was agreed to Sir Charles's words had taken effect, for Mr. Long intimated that ere the Bill reached Committee in the Lords the Government might be able to find words which would clear up any doubts as to the legitimate use that ought to be made of an invoice.

THE PURITY OF FOOD AND DRUGS.

Copper in Peas.—Mr. Fairley, public analyst for the City of Leeds, in his annual report states that the whole of six samples of preserved peas contained copper in small quantity, but a prosecution in one case was dismissed on the ground that these peas are "a perishable article." Mr. Fairley admits that they are perishable after the tin is opened, though not so as to affect in the slightest degree the presence or absence of copper, or its amount. He goes on to show that there are divergent opinions amongst magistrates as to the necessity for opening the tins of such articles before dividing them for analysis. One magistrate ruled that three tins may be regarded as one sample, and that the division into three parts, according to the Act, may be simply carried out by allotting one tin to each recipient, while another magistrate ruled that the tins must be opened before the division of the contents of one or more tins among the recipients. Mr. Fairley points out that so long as the goods remain in a sound sealed tin they are not perishable in any ordinary sense, and that it would be well if a reliable opinion could be obtained as to the proper mode of division of tinned goods, and of the proportion of copper, if any, which ought to be permitted in them. In his own experience he has observed copper-poisoning where the metal was present in minute quantity in drinking-water, and he is of opinion that wherever copper is used for preserving the green colour of preserved vegetables it ought to be declared, so that the buyer may know of the presence of copper.—*British Food Journal*, **1**, 49.

Factitious Sulphate of Copper.—The consulting chemist to the Bath and West and Southern Counties Society, Dr. J. A. Voelcker, has examined a sample of a material sold as "vitriol for wheat dressing." He reports that though made up to look like sulphate of copper (bluestone or blue vitriol), and the purchaser believing it to be and buying it as such, it was found in reality to be nothing but the far cheaper and ineffectual material sulphate of iron (green vitriol), coloured with Prussian blue so as to make it look like sulphate of copper. He states, further, that there is reason to believe that there has for some time past been a great deal of defrauding practised upon the farmer in this respect. As Dr. Voelcker points out, if farmers do not make use of the facilities in regard to chemical examination which are so readily placed at their disposal by the Council of the various Agricultural Societies it can hardly be wondered at that they will from time to time be imposed upon.—*British Food Journal*, **1**, 50.

Seidlitz Powder.—Roger Upton, of Devonshire Road, Chiswick, was summoned at Brentford on Friday, July 21, for having sold a seidlitz powder deficient in tartaric acid to the extent of 68.8 per cent., and a blue powder deficient in sodium bicarbonate to the extent of 15 per cent.—The summons was amended by altering the name to Harriet Upton, she being the owner of the shop.—The defence was that the powders were sold as they were received from the wholesale dealers.—Mr. Tyler, the inspector under the Act, said he must ask for a conviction in order that he might be able to take proceedings against the wholesale dealer.—A fine of £5 and costs was imposed.

The Composition of Sausages.—The question as to what kind of preparation can be regarded as a genuine sausage has been under the consideration of the Directors of the British Analytical Control, and they are of opinion that the unacknowledged admixture of bread or farina, in any quantity, constitutes adulteration. The term "sausage" without any qualifying designation, is held to mean a preparation consisting of meat and spice only; therefore sausages which consist merely of bread and fat, coloured with a ferruginous earth or an aniline dye, or of a mixture of bread and fat with a small amount of meat, are considered to be fraudulent adulterations.—*British Food Journal*, **1**, 130.

Gregory's Powder.—At Lambeth Police-court on July 13, a fine of £2 19s., including costs, was inflicted upon G. R. Turner, described as a chemist of Camberwell Road (the name G. R. Turner does not appear on the Register of Chemists and Druggists for 1899.—Ed., *P.J.*), for selling Gregory's Powder, which was certified by Dr. F. Teed to contain 66·7 per cent., of magnesium carbonate.

Food and Drug Analysis in the City.—Dr. W. Sedgwick Saunders, the medical officer of health and public analyst for the City of London, in his annual report to the Corporation states amongst other things that his district comprises an area of 672 acres divided into 113 parishes. The night population was 29,121 and the day population 334,050. Two hundred and thirty analyses were made during the year of butter, cocoa, cream, drugs, lard, malt liquor, margarine, milk, mustard, pepper, spirits, suet, sugar, tapioca, tea, vinegar, and water. Nine prosecutions were ordered, and fines inflicted.

Vinegar.—James Pass was charged at Marlborough Street Police-court, W., last week with selling vinegar containing 50 per cent. of added water. Defendant was fined £3 and costs.——In the case of Mr. Morrell, 37, Carnaby Street, the charge was that the vinegar contained sulphuric acid.—Dr. Edmunds gave evidence to the effect that he had examined a sample of vinegar purchased from the defendant, and found it to contain sulphuric acid. This was not an ingredient of vinegar, but was added in place of acetic acid, and was injurious to health.—Mr. B. E. R. Newlands and Mr. Lee Taylor, public analyst for Hackney, both gave evidence on behalf of the defendant to the effect that there was no free sulphuric acid in the sample.—The case was adjourned for six weeks in order to send a sample of the vinegar to Somerset House.

Camphorated Oil.—Thomas Butler, drysalter, Hook Road, Surbiton, was charged, at Kingston-on-Thames Police-court, on July 13, with selling camphorated oil deficient in camphor to the extent of 40 per cent. For the defence it was stated that the oil was sold in exactly the same condition as received from the wholesale house.—The case was dismissed.—A summons had also been taken out against the firm who supplied the oil—Messrs. Bell, Sons and Co., Ltd., Liverpool—and a fine of £5, and 13s. 6d. costs, was imposed.

Adulteration of Flour.—According to a recent report, the Secretary of the State Board of Agriculture (Maine, U.S.A.), during the past year issued a circular notice for the information of the public, cautioning them against an adulterant termed "mineraline," which the manufacturers claimed was being extensively used in high and medium grade flour, also in bread and feed-meal. Chemical analysis is said to have proved "mineraline" to be ground soapstone. The manufacturers, in urging its adoption and sale, claimed that when mixed with flour, the latter became whiter, and that by this adulteration an increased profit to the retailer was assured.

Food and Drug Inspectors on Wheels.—The Surrey County Council at its meeting on Tuesday, July 25, according to the *Daily Telegraph*, sanctioned an expenditure of £67 4s. in purchasing bicycles for the county inspectors under the Foods and Drugs and the Weights and Measures Acts.

ENGLISH NEWS.

Leeds College of Pharmacy.—On Saturday last the district of East Keswick, which is one of the richest, botanically, in England, was visited by the students of this college. Many specimens of the rarer British flora were discovered, and though the weather was unpropitious, a most enjoyable afternoon was spent.

Carbolic Acid for Ginger Beer.—On Tuesday, July 18, Mary Alice Sutcliffe, aged fifteen, the daughter of John Sutcliffe, of Rodick Street, Woolton, went into the parlour for some ginger-beer, the bottles being kept under the sofa. By mistake she picked up a bottle containing carbolic acid, and drank a quantity. She immediately threw the bottle down, and screamed. Constable Rutter and Inspector Adamson were quickly on the scene, and Dr. Pethick was sent for, who used a stomach pump, with the result that it is expected that the girl will recover. There was no label on the bottle to denote its contents. This case, although fortunately it had not a fatal termination, adds another link to the long chain of evidence showing the necessity for some kind of regulations with regard to the sale and distribution of carbolic acid, and nothing will answer the purpose so well as its being scheduled under the Pharmacy Act of 1868.

Cricket.—At a match between "Allenbury's" C.C. and "Davy Hill's" C.C., played on Saturday last at Wadham Lodge, the former scored 62 runs, against the latter's 142 for eight declared.

Sheffield College of Pharmacy.—The students of this college, accompanied by the Principal (Mr. J. W. J. Turner) and Dr. R. B. Greaves, went for a botanical ramble through the Loxley Valley on Tuesday afternoon, July 25. A large number of specimens were collected and described. A halt was made when the Bradfield reservoir was reached. The return journey was made at 6 p.m. The outing proved most instructive.

Newcastle-on-Tyne and District Chemists' Association.—The annual excursion took place on Thursday, July 20, to Morpeth. The party, which numbered over 30, reached Morpeth at 2.20, and was met at the station by the President, Mr. F. E. Schofield, who conducted them to the Castle, where, through the kindness of County Councillor Nicholson, the Castle itself, gardens and grounds, were inspected, and greatly admired. The old Church of St. Mary on the Kirk Hill was visited, and its history and items of interest pointed out by Mr. J. R. Hardy. Newminster Abbey was afterwards explored, and after a substantial tea had been partaken of, the party returned to Morpeth in time to catch the three minutes past eight train to Newcastle. Arrangements had been made to visit Mitford, but on account of the unfavourable state of the weather, had to be cancelled.

Professor Dewar Threatened.—Charles Bomberger, 54, an instrument maker, of Swiss nationality, living at 42, King's Cross Road, was charged on Tuesday, July 25, on a warrant before Mr. Denman, at Marlborough Street Police-court, with using threats towards Professor James Dewar, of the Royal Institution, Albemarle Street, whereby that gentleman went in fear of his life or some bodily injury. Professor Dewar said that on June 5 he received one of the two letters now produced, written in German, and last week the second one arrived. In consequence of the contents of the letters he went in fear of the writer of them. He had never seen or heard of the prisoner before. Having consulted a gentleman of high authority in mental diseases he was advised to proceed against the prisoner, who appeared to be a danger to the community. The letters having been read, the prisoner was asked if he wished to make any statement, and in reply said, "I have only to say that the persons who persecute me told me that it was Mr. Dewar, and I wrote the letters only to ask him about it. If he is offended I am very sorry." Bomberger was remanded to Holloway for a week, and by the magistrate's direction he will receive special medical attention.

Inland Revenue Prosecution.—At Retford, on Monday, July 24, George Eyre, of Leicester, was summoned by the Inland Revenue authorities for selling medicine without a stamp, and also for not having a licence. Mr. Hawkins, from Somerset House, represented the authorities. For the prosecution, it was argued that under Section 2 of George III., chap. 150, it was required that all packages, boxes, etc., containing drugs kept ready for sale should have a 1½d. stamp affixed. The defendant was seen selling pills to be used for the cure of indigestion, gout, and other disorders affecting the human body. Mr. A. J. Heatley, officer of Inland Revenue, said he was in the Retford Market Place, and saw the defendant speaking to a crowd of people about boxes of pills, which he was offering for sale. He stood at a stall, and recommended the pills as being good for indigestion, dropsy, gout, and several other ailments. He went on to say that neither the Revenue officers nor the police could touch him for selling, but if he printed any of the letters which he exhibited attached to a sheet as testimonials, then he would be liable to a penalty of £20, and would have to put a stamp upon every box of pills he sold. There was no Revenue stamp on the boxes sold to witness, or on those sold to other persons.—The defendant gave evidence, and stated that four years ago he had a recipe given him for making pills and other articles, and he asked the Inland Revenue authorities at Leicester what it was necessary for him to do to enable him to sell his pills at the markets. He was told that he could not advertise them by any public notice, or print any testimonials respecting them, or he would be liable to the Inland Revenue, but if he did neither of these things, and took out a pedlar's licence, he could sell wherever he liked.—The Bench fined the defendant £1, including costs.

Boots', a Book, and a Coroner.—On Wednesday, July 19, the Coroner of Derby (Mr. John Close) held an inquiry respecting the death of Edith Freeborough, aged fourteen months, daughter of George Wm. Freeborough, 59, Macklin Street. Ruth Freeborough, the mother, stated that the deceased had been suffering from measles. Witness had given her certain "Children's cooling powders" and a pill by a patent medicine vendor which contained aconite. Witness administered the pill on Monday afternoon, and the child afterwards seemed to be very much easier in her breathing, but about eight o'clock she was taken suddenly worse. Witness then sent for Dr. Vaudrey, but the child expired before he arrived. No doctor had previously attended the deceased, and witness did not think it necessary until deceased was taken worse. — The following dialogue is reported to have then occurred:—The Coroner (holding up a pamphlet): Where did you get this book from?—Witness: From Boots'.—The Coroner: Have you read it?—Witness: I think I have.—The Coroner: Why did you not send for a doctor to see the deceased?—Witness: I did not think she was ill enough to send for a doctor.—The Coroner: What led you to that opinion?—Witness: She took her food pretty well all day, and appeared to be going on quite well.—The Coroner: Was it in consequence of what you read in this book that you did not send for a doctor?—Witness: I could scarcely answer that question. I thought that what I was giving her was quite right.—The Coroner: Was it in consequence of reading a clause at the commencement of this book you did not send for a doctor?—Witness: Yes; I thought I was doing quite right.—The Coroner then read a clause out of the book previously mentioned, and which stated that "mothers may rest satisfied that no doctors have any means or remedies superior to this, here recommended, and that if anything will save the child's life this will do so."—The Coroner: Was the book wrapped up with the medicine, or was it sent separately?—Witness: No, sir, I think my little boy brought it to me.—Dr. Vaudrey, Friar Gate, stated that he was called to see the deceased on Monday evening. She was quite dead on his arrival, the cause of death being measles. Witness did not think that medicine containing aconite ought to be sold to people who were going to administer it themselves. As most people were aware, aconite was a very dangerous poison, and he was of opinion that it ought only to be administered by a skilled medical man. It was certainly doubtful whether the pill which the mother had given the child contained any aconite at all, but this would only be ascertained by means of analysis.—The Coroner: Do you think the powder or pills had anything to do with the cause of death?—Witness: None whatever.—The Coroner, in summing up, endorsed the remarks made by Dr. Vaudrey, and added that he had been given very little time to examine the book referred to, but would do so, and take such steps as were deemed necessary.—The jury returned a verdict in accordance with the medical testimony, and added as a rider that they quite concurred with the observations of the Coroner.

Proposed Presentation to Mr. J. C. Brewer.—We are requested to announce that a proposal is on foot amongst the "Lady Dispensers," who have been pupils at the Birmingham General Hospital, to make a presentation to Mr. J. C. Brewer on the occasion of his resignation (see last week's issue, page 74d). All former pupils of Mr. Brewer who are in favour of a presentation to him are asked to communicate their views to Miss R. Kathleen Spencer, Cadarga, Knowle, Birmingham.

IRISH NEWS.

Mr. Robt. F. Blake, F.I.C., Demonstrator of Chemistry, Queen's College, Belfast, has been appointed analyst to the Banbridge Board of Guardians at a salary of £10 per annum.

The Monaghan Guardians have been informed by the L. G. B., that Mr. R. H. Lennon Wilson, whom they appointed as analyst, is not eligible as he is not a Fellow of the Institute of Chemistry, and has no certificate of the Institute in therapeutics, pharmacology, or microscopy. It was mentioned that the Pharmaceutical Society was sending a deputation to the L. G. B. regarding the subject of qualification, and the Guardians postponed further action pending the Conference.

The Secrets and Mysteries of Science are not all divulged or cleared up yet. There is opportunity for original research to solve the as yet unexplained fatal action of chloroform in certain isolated cases. In the Royal Hospital, Belfast, a young man of 18 years of age, who was certified as a perfectly fit subject for chloroform prior to undergoing an operation, succumbed to the administration of the drug. The jury returned a verdict of chloroform poisoning, due care and attention being exercised by the surgeons.

SCOTTISH NEWS.

Mr. Henry Fraser, Ph.C., Aberdeen, has just completed his third professional examination with Double Honours for the degree of M.B. ChB. at Aberdeen University. Mr. Fraser's career as a student of pharmacy and medicine has been of exceptional brilliancy. During his apprenticeship he attended the Evening Science and Art Classes at Gordon's College and secured first-class certificate in Advanced Organic Chemistry (Theoretical and Practical), Advanced Inorganic Chemistry (Theoretical and Practical), and Advanced Botany—being Queen's Prizeman in Botany and Organic Chemistry. He passod the Minor in April, 1895, and after three months at Bloomsbury Square he passed the Major and obtained the Pharmaceutical Society's Silver Medal. In October of the same year he was appointed teacher to the Aberdeen School of Pharmacy and also commenced the study of medicine at the University. His record there has been one long series of prize taking:—First Prizeman in Osteology, Twice Prizeman in Anatomy, First Prizeman in Botany, Double Medallist in Physiology, First Prizeman in Materia Medica (Senior), Medallist in Practice of Medicine, Medallist in Pathology, First Medallist in Forensic Medicine, Fife-Jameson Gold Medallist in Anatomy, Keith Gold Medallist in Systematic and Clinical Surgery. In his second year he was first in Bursary List—obtaining a three years' Bursary. He has Double Honours in First, Sccond and Third Professional Examinations. He was class assistant in materia medica and physiology and prosector in anatomy. He takes a great interest in student affairs, being Vice-President of the Students' Representative Council and President of the University Medical Society.

TRADE NOTES.

Thompson's Food Warmer and Heater. — Charles Thompson, 159, Stratford Road, Sparkbrook, Birmingham, proprietor of Thompson's atmospheric gas jet for soldering, sealing, etc., sends specimens of his food warmer and water heater, with kettle and saucepan, some of the advantages of which are, that the heater will fit on any ordinary gas bracket; that a pint of hot water can be obtained in less than five minutes without interfering with the ordinary light in a bed or other room; that food can be kept warm at any desired temperature; that the kettle may be used as a bronchitis kettle; that it may be used as a water bath by placing an evaporating basin either on the kettle or saucepan, according to the size required; and that the adjustable ring forms a useful support for holding a lady's curling iron. The price of this ingenious and extremely useful contrivance is 2s. 6d., nickel plated, with one kettle or saucepan, postage 3d. extra. Kettles and saucepans may be had, price 9d. each, to fit the adjustable ring.

"Newbery's Catalogue."—Messrs. F. Newbery and Sons, 1 and 3, King Edward Street, Newgate Street, E.C., send a copy of the nineteenth annual issue of their catalogue of druggists' sundries, medicines, perfumery, mineral waters, etc. It contains extracts from the Medicine Act, remarks on the medicine duty, lists of medicated wines, etc., regulations affecting sales of "poisons," and eight hundred illustrations. Several changes in the proprietary goods' section have been made, and the druggists' sundries and photographic sections have also been considerably extended. Great care appears to have been taken to exclude obsolete articles, and the typographical arrangement, comprehensive indexes, etc., facilitate ready reference to any part of the work. Messrs. F. Newbery and Sons also send a copy of a tastefully printed pamphlet setting forth the advantage of Messrs. W. R. Warner and Co.'s specialties, which is being distributed to members of the medical profession throughout the United Kingdom. Amongst the most recent of this firm's novelties are Carlsbad Water Centiforms, which afford a ready method of producing a draught similar to that of the natural springs, and Nervitone Tablets, a nerve tonic and stimulant. Messrs. Newbery have also recently placed on the market an effervescent saline which they style the "Niagara Health Salt." The tins retail at 4d., and it is supplied to the trade on terms yielding a good profit.

"Practical" Poison Bottle.—We have received samples of a "Practical" Poison bottle which has been designed to meet the requirements of the recent poison regulations. The shape differs from any other previously introduced; it is a combination of the flat and octagon. The front is made as rough as possible with prominent ribs at the edges so as to make it distinguishable to the touch, and the back is smooth to take the label. It is made in sizes from half ounce to twenty ounce capacity in dark blue or actinic green glass. Stocks are held by Messrs. Maw, Son, and Thompson, Evans, Lescher and Webb, and Evans, Sons, and Co., of Liverpool, from whom prices and further particulars may be obtained.

Flyodoomo Gum in collapsible tubes is the most recent form in which Mr. John H. Smith, pharmaceutical chemist, of Newark-on-Trent, supplies his useful article for destroying flies. The *modus operandi* is to suspend a piece of string from some convenient object, and pass the mouth of the tube along it, thus leaving a small quantity of the gum which can be made to cover the surface by passing a piece of stiff paper to and fro.

Conversion of Business.—Messrs. Hearon, Squire, and Francis, 38, Southwark Street, London, S.E., announce that they have decided to convert their business into a private limited liability company as from June 30 last. As the step taken is entirely of a private nature, no shares will be offered to the public or the trade. The directors who will all take an active part in the management, will be Messrs. G. Bult Francis (chairman), and W. H. Francis (the late partners), together with Messrs. W. A. H. Naylor, R. J. Reynolds, T. B. Ridgwell, W. J. Rogerson, and R. Sharrah. Each of these latter gentlemen is widely known in the trade, and all have for many years been intimately associated with the success and traditions of the house.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. J. Milner, M.P.S., Chemist and Druggist has commenced in business at 85, Woolwich Road, Greenwich.

Mr. F. J. Evans, M.P.S., Chemist and Druggist, has opened the East End Pharmacy, St. Anne's-on-the-Sea, Messrs. Ayrton and Saunders, of Liverpool, supplying him with the entire fittings.

Mixer for Compound Powders.—The following simple piece of apparatus has been devised by T. Garraud, and is stated to afford a mixer for powders, in which the admixture is more intimate and more rapidly obtained, than by rubbing down in a mortar; and which also has the further great advantage of not being accompanied by any loss, or making the least dust. A much flattened spheroidal box is fitted with a tight lid of similar shape, so that the vertical section of the vessel forms an ellipse. A convenient size is that having a diameter of 7 by 4.5 centimetres. Inside this, three glass marbles having a diameter of 10 to 15 M.m. are placed. After introducing the ingredients the whole is shaken round with a rotary movement. In two minutes a perfectly homogeneous mixture will be obtained. In addition to being more efficacious than the mortar, the box greatly adds to the comfort of the dispenser when irritating powders, such as salicylic acid, podophyllin or naphthol have to be dispensed.—*Bullet. de la Soc. de Pharm. de Bordeaux*, **39**, 112.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

July 27, 1899.

As might have been expected at the time of the year, business has been excessively quiet during the past few days, and it cannot be expected that we shall see any renewed activity in the Drug and Chemical trades until after the holidays. The chief incident of the week has been a set-back in makers' price of Quinine, which must have proved a serious disappointment to speculators in the article. Opium is quiet, but fairly firm, at late rates. Morphia remains firm and very scarce for immediate delivery. Codeia is also very firm. Cod Liver Oil and Glycerine dull and weak. Cocaine very firm, with a rise in value confidently predicted. Quicksilver and Mercurials firm, there being no price from second hand for the former article, which looks as if a further advance in price was not improbable. Sulphonal steady. Acetanilide and Phenacetin dull and weak. Camphor very quiet both for crude and for refined. Shellac dull. Rape Oil firm. Turpentine dearer, especially for distant delivery. Sulphate of Ammonia quiet. Iodides and Bromides steady at unchanged prices. Bismuth and Salts unaltered. Citric and Tartaric Acid and Cream of Tartar steady at firm prices. Acid Carbolic in good demand. Santonine maintains its advanced price. Borax and Acid Boracic quiet. The following are actual quotations for some articles of chief interest:—

ACETANILIDE—Continues weak and slow of sale at 11d. to 1s. per lb. according to quantity and packing.

ACID BORACIC—Quiet, but fairly steady at 27s. per cwt. for powder, and 25s. per cwt. for crystals.

ACID CARBOLIC—Very steady at 7d. to 7¼d. per lb. for 35-36° C. ice crystal in 2½cwt. drums and over casks, 7½d.-7¾d. per lb. for 39-40° ice crystals, and 8½d. to 8¾d. per lb. for the B.P. quality, 39-40° C., in detached crystals. Crude, 60° F. 2s. per gallon; 75° F. 2s. 6d. per gallon. Liquid, 95-98 per cent. of pale straw colour, 1s. 2d. to 1s. 3d. per gallon, in 40 gallon casks.

ACID CITRIC—Is quiet, but firm at 1s. 7d. to 1s. 7½d. per lb. for crystals in 5-cwt. casks.

ACID TARTARIC—Quiet but steady at 1s. 1d. per lb. for English on the spot, and 1s. 0¼d. per lb. c.i.f. for foreign.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb.; Carbonate, 3d. to 4d. per lb., according to make, etc. Muriate Commercial, free from metals, 25s.to 27s. 6d. per cwt.; chemically pure small crystals, 30s. to 32s. 6d. Sal Ammoniac: Firsts, 35s.; seconds, 33s. per cwt.; crushed for batteries, 37s. and 35s. per cwt. respectively. Sulphate quiet but steady. Gray, prompt, 24 per cent., London, £12 2s. 6d.; Hull, prompt, £12; Leith, prompt, £12 1s. 3d. to £12 2s. 6d.; Beckton, nominal; Beckton, terms, prompt, £12. Sulphocyanide, 1s. to 1s. 1d. per lb., according to quantity.

ANTIMONY.—Regulus is quoted £39 to £40 per ton, and Crude Japan (Black Sulphide) £24 to £24 10s. per ton.

ANTIPYRINE and **PHENAZONE**—Steady, at unchanged prices.

ASHES.—Pots, 23s. 9d.; pearls, 32s.

ATROPINE—Firm, in consequence of scarcity and dearness of suitable raw material, makers' prices being 17s. 10d. per oz. for the pure and 15s. 6d. per oz. for the Sulphate B.P.

BISMUTH—Is unchanged, both for the salts and for the metal.

BLEACHING POWDER (CHLORIDE OF LIME)—Unchanged at £6 per ton for English.

BORAX—Very quiet at 16s. per cwt. for crystals, and 16s. 6d. per cwt. for powder.

BROMINE AND BROMIDES—Are in good demand at 1s. 10½d. per lb. for Potassii bromid, 2s. 1½d. per lb. for Sodii bromid, and 2s. 2d. per lb. for Ammon bromid. Bromine, 2s. 1d. to 2s. 2d. per lb. according to quantity.

CAMPHOR.—The market for crude continues extremely quiet, with little or no demand, buyers' ideas being about 120s. c.f. and i. The quotation from China to-day comes 128s. to 129s. c.f. and i. according to importer. Refined is quiet and without change, English makers still quoting 1s. 7½d. per lb. for Bell's and Flowers in half-ton lots.

CASTOR OIL—Quiet. Belgian first pressing spot £25, second pressing spot £23 per ton, ex wharf. Hull manufactured guaranteed cold drawn pure pharmaceutical £27 15s. per ton in barrels, 3¼d. per lb. in cases. Pure firsts £25 5s., seconds £23 15s. per ton in barrels, first 3d. per lb. in cases, seconds 2 13/16d. prompt delivery, ex wharf London. London first pressing spot 24s. per cwt., second pressing 23s. per cwt.; medicinal in cases 3¼d. per lb. French first pressing 25s. per cwt. spot, 23s. to 23s. 6d. f.o.b. Marseilles, second pressing 24s. per cwt.

CLOVES—Privately, the market for Zanzibar is very quiet, but prices steady, with buyers Oct.-Dec. and Jan.-March deliveries at 3 7-32d, and sellers at 3¼d.. No Zanzibar or Penang were offered in auction.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 2d. per gallon; pure, 1s. per lb. Benzole: Firm, 50 per cent. prompt, 10d. per gallon; August-December, 10½d.; 90 per cent. prompt, 8½d. to 9d.; October-December, 9d. Creosote: 3½d. per gallon. Crude Naphtha: 30 per cent. at 120°C., 3d. per gallon. Solvent Naphtha: 95 per cent. at 160°C., 1s. 5d. per gallon; 90 per cent at 160°C., 1s. 2d.; 90 per cent. at 190°C., 1s. 3d. per gallon. Anthracene: A., 3½d. per unit; B., 2½d. per unit. Pitch: 35s. per ton, f.o.b. Tar: Crude and refined, 13s. per barrel; 2¼d. per gallon.

COCAINE.—Makers are very firm at 11s. 6d. to 11s. 9d. per oz. for the Hydrochlorate in 25-oz. tins; they will, however, only book orders after same have been first submitted to headquarters.

CODEIA—Is very firm, and in good demand at 12s. 6d. to 12s. 9d. per oz., according to quantity.

COD LIVER OIL.—Market is very quiet at about 56s. to 57s. 6d. per barrel, f.o.b., according to brand, for best new non-congealing Norwegian oil in 25 gallon tin-lined barrels.

CREAM OF TARTAR—Steady at 75s. per cwt. for first white crystals on the spot, and 77s. to 78s. per cwt., according to percentage for powder.

GINGER—The smaller supply of Cochin in auction went off slowly at about steady prices. Of 256 bags and 206 cases offered, 162 packages sold. Calicut rough in case, bold and medium brown hard at 26s. to 28s. 6d., fair bright cuttings sold, chiefly without reserve, at 16s. to 16s. 6d., the remainder bought in, including good medium and bold cut little limed at 80s. Jamaica in reduced supply, met a fair demand at steady rates, 398 barrels and 2 half-barrels offered, and mostly sold, fine bright at 75s., ordinary middling to middling 53s. to 60s. 6d., common to good common at 47s. to 52s., Rhatoon at 45s.

GLYCERIN.—Crude is steady at about £30 per ton for quality most suitable for refining purposes. Refined is very quiet at 48s. to 50s. per cwt. for English, and 52s. 6d. to 57s. 6d. per cwt. according to brand, for best German, double distilled, chemically pure white, 1260° quality, in 56 lb. tins, 2 or 4 tins in a case; carboys being proportionately cheaper.

IODINE AND IODIDES—Makers' present prices are Potasii iodid. 10s. 6d. per lb., sodii iodid. 11s. 10d. per lb., ammon. iodid. 14s. 6d. per lb., iodine resublimed 12s. per lb., iodoform crystals, powder or precipitated 13s. 10d. per lb. Price of commercial iodine also remains unchanged at 7½d. per oz.

MERCURIALS—Are firm and unchanged at 2s. 10d. per lb. for Calomel and 2s. 6d. per lb for Corrosive Sublimate.

MORPHIA.—Makers are still unable to book fresh orders for prompt delivery, while for delivery after beginning of September 4s. 9d. to 5s. per oz., according to quantity, is asked for the Hydrochlorate powder, crystals costing 2d. per oz. more money.

OILS (FIXED) AND SPIRITS.—Linseed quiet. Spot London pipes, £20 to £20 2s. 6d. per ton; barrels, £20 7s. 6d.; August, £20 5s.; September, £19 2s. 6d.; January-April, £18 15s. Hull spot, naked, £19 7s. 6d.; August, £19 5s.; September-December, £17 15s.; January-April, £17 10s. Rape firm. Ordinary brown spot, August and September-December, £22; refined spot, £23 5s. Ravison dearer, spot, naked, £18 to £18 5s.; September-December, £18 10s. Cotton very firm. London crude spot and August, £16 10s.; refined spot, £17 15s. to £19, according to make. Hull, naked, refined spot, and August, £15 15s.; September-October, £15 7s. 6d.; November-April, £14 5s. Crude spot and August, £14 15s.; November-April, £13 5s. Olive: Mogador, £30 to

£31; Spanish, £30 to £32 per ton. Palm: Lagos spot, £24 per ton. Cocoanut: Ceylon spot, £25 per ton landed; afloat, £23 5s. c.i.f. July-September and September-November, £23 2s. 6d. Cochin: Spot landed, £28; August-October, £25 15s. c.i.f. Lubricating oil: Pale American spot, 5s. 6d. to 7s.; dark, 5s. to 5s. 9d. per gallon; dark Russian, 5s. to 5s. 6d.; pale, 5s. 9d. to 8s. Turpentine dearer. American spot, 31s. to 31s. 6d. per cwt.; August, 31s. to 31s. 3d.; September-December, 31s. 6d. to 31s. 9d.; January-April, 32s. 3d. to 32s. 6d. per cwt. Petroleum steady. Russian spot, and September-October, 5⅛d. to 5¼d. per gallon. American spot and September-December, 6¼d.; water white spot and September-December, 7½d. Petroleum spirit: American, 9d.; deodorized, 9¼d. to 9½d. per gallon.

OPIUM—A quieter tone has prevailed and, with less demand for manufacturing and druggists' kinds, only a limited business has been put through at about previous prices. Soft shipping is without alteration. Persian remains firm, although quieter, with small sales at 11s. 9d. to 12s.

OXALIC ACID—Is still quoted 3d. to 3¼d. per lb. nett, free delivered London.

PARAFFINE WAX.—Crude, 1⅞d. to 2d. per lb.; refined, 2¼d. to 3½d. per lb.

PHENACETIN—Weak, at 3s. 4½d. to 3s. 9d. per lb., according to quantity, for both crystals and powder. Bayer's make in original 1lb. bottles is quoted 6s. 6d. per lb. and Riedel's 5s. 6d. per lb.

PITCH—8s. to 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt.; Bichromate, 3½d. per lb.; Bromide, 1s. 10½d. per lb.; Chlorate crystals, 3¾d., powder, 3⅞d. per lb., spot, London; Iodide, 10s. 6d. per lb.; Permanganate, 52s. 6d. to 60s. per cwt., according to make and quantity, for small crystals in 1 cwt. kegs, large crystals costing 5s. per cwt. more. Prussiate: Yellow Beckton, 7¾d.; other English makes, 8d. to 8½d. per lb.; red, 1s. to 1s. 1d. per lb.

QUICKSILVER—Firm, at £8 7s. 6d. per bottle from the importer; second-hand not offering.

QUININE.—Contrary to expectation the makers on Monday reduced their price 2d. per oz., the favourite German brands of Sulphate being now quoted 1s. 4d. per oz. for 1,000oz. lots in 100oz. cases, while same are obtainable from second-hand at 1½d. per oz. less money. Messrs. Howards and Sons' price is now 1s. 5d. per oz. for the sulphate in bulk, and 1s. 7d. per oz. in vials for 1,000 lots, in limited quantities and for prompt delivery only.

ROSIN.—Strained spot 4s. 4½d. per cwt. landed, and 4s. 1½d. per cwt. c.i.f. for December-February shipment per sailing vessel.

SANTONINE—Is firm at the late advance, 7s. 6d. per lb. being now the price in smaller quantities.

SEEDLAC—Quiet. 10 cases fine bright Madras in auction were bought in at 10s. 5d. per cwt.

SHELLAC.—Market remains exceedingly quiet, with almost entire absence of demand. Privately, however, a few sales have taken place. For arrival TN October-December steamer there are buyers at 63s. 6d., being steadier, but importers do not offer this position; near at hand quoted 61s. 6d. c.f. and i. For August delivery the nearest value is 64s. 6d., and no business is reported. At auction to-day small supplies were catalogued, which met a slow demand, and only a small proportion found buyers, Second Orange at a further decline of 6d. to 1s., making Standard TN now 64s. 6d. Garnet neglected. Button chiefly bought in, only odd lots sold at about previous rates. A total of 538 cases offered and 124 cases sold. Second Orange: Of 161 cases 112 sold, fair curly red at 64s., ordinary red cakey at 62s. to 63s., flat free liver at 61s., dark ditto at 59s.; the remainder bought in, including good bright diamond SG and SR at 80s. Garnet: 172 cases offered and bought in, chiefly good curly cakey AC at 66s., also weak thin, nondescript mark, at 56s. Button: Of 205 cases 12 sold, cakey 2's at 66s., weak circle 2's at 61s., ditto 3rds at 57s., common resinous circle 4's at 36s.; the remainder bought in, including so-called pure, stamped, 1st at 85s. to 90s., 2nd at 75s., circle 2's at 67s. 6d. to 70s., and dark tongue at 70s.

SODA COMPOUNDS.—Crystals: Barrels, 55s. per ton; bags, 52s. 6d., ex-ship Thames. Ash, £5 to £5 10s. per ton, according to strength, etc. Bicarbonate, commercial, £7 10s. to £8 10s. per ton; fully bicarbonated, 19s. 6d. to 22s. 6d. per cent. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic White, 70 per cent., £7 10s.; 60 per cent., £6 10s. per ton. Hyposuphite (Antichlor), 6s. to 8s. 6d. per cwt., according to make, quantity, and packing. Iodide, 11s. 10d. per lb. Nitrate, commercial, spot, £7 15s.; refined £8 per ton.

SPICES (various).—Black Pepper: Of 202 bags Telicherry only 6 bags sold at 5⅝d.; no Singapore offered. White Pepper: Only 88 bags Penang offered and bought in. Capsicums: 21 bags Bombay sold at 29s., also 9 bales Natal at 80s. to 95s. 6d. Mace steady: 11 cases and 10 half-cases Penang offered and 10 cases sold, fine pale at 2s. 5d., fair at 1s. 7d., broken at 1s. 5d.; 3 cases Ceylon also sold, fair, pale, part mouldy and wormy, at 1s. 7d. to 1s. 8d. Pimento in fair supply met slow demand, and of 645 bags only 115 bags sold, ordinary to good at 3d. to 3¼d. Nutmegs quiet but steady: of 36 cases Penang offered only 7 cases sold, 65's at 2s. 3d., and 79's at 1s. 8d. to 1s. 9d. 3 cases damaged Ceylon also sold at 5d. to 6d.

STAR ANISEED OIL—Remains quiet, but fairly firm on spot, Business has been done at 6s. 1d. per lb., holders, however, now ask 6s. 2d., while for arrival the quotation is 6s. 1d. to 6s. 2d. per lb. c.i.f. for Aug.-Sept. steamer shipment.

SULPHATE OF COPPER—Quiet, but steady, £24 10s. to £26 5s., according to make, for spot delivery.

SULPHONAL—Makers maintain their price of 17s. per lb. for both crystals and powder (10 lb. lots 6d. per lb. less), while there appears to be comparatively little still available from second hand.

TAR.—Stockholm, 26s. 6d.; Archangel, 18s. 6d.

TURMERIC—Quiet, and in slow demand at auction, and 196 packages offered were all bought in, comprising fair bright Madras finger at 25s. Cochin split bulbs, ordinary rough to fair bright at 8s. to 9s., and Japan dark finger and bulbs at 10s.

Newcastle-on-Tyne Chemical Market.

JULY, 25, 1899.

The chemical business of this district is rather the turn better all round. Bleaching Powder is still in good request, with Soda Crystals following suit. Inquiries for Caustic Soda are on a larger scale. Sulphur is somewhat scarce. Quotations: Bleaching Powder, £5 10s. to £5 12s. 6d. Soda Crystals, 45s. to 47s. 6d. Caustic Soda, 70 per cent., £7 to £7 5s. Soda Ash, 52 per cent., £4 5s. to £4 7s. 6d. Alkali, 52 per cent., £5 to £5 5s. Sulphur, £5 per ton.

Manchester Chemical Report.

JULY 26, 1899.

An upward movement has at last set in in heavy chemicals, and an advance of 7s. 6d. per ton has been made in Caustic Soda, which now ranges from £7 17s. 6d. to £8 2s. 6d. for 77 per cent.; £7 12s. 6d. to £7 17s. 6d. for 74 per cent.; £7 5s. to £7 10s. 70 per cent.; and £6 5s. to £6 10s. 60 per cent. on rails at works. Bleaching Powder is also higher, and is quoted £4 5s. to £4 10s. per ton, softwood casks, on rails. Ammonia Alkali, 58 per cent., Soda Crystals and Bicarbonate of Soda are unchanged, but firm. Sulphate of Ammonia continues quiet, although most Lancashire makers are fully sold for some time to come. Brown Acetate of Lime is a trifle firmer at £4 17s. 6d. to £5 2s. 6d. for Welsh and American, delivered Manchester. Glycerin is in better request, and the figure of £42 per ton, for chemically pure, tins and cases on rails or f.o.b., is quoted. White Sugar of Lead is dull at £22 10s. per ton, c.i.f. With the better turn of affairs in the Transvaal, Yellow Prussiate has an upward tendency at 8d. to 8½d. for best Lancashire make. Coal Tar products are without material change, although Carbolic Acid maintains the recent advance well, and Naphthas are scarce. Glauber Salts firm at 32s. 6d. to 35s., and Epsoms 55s. per ton, in bags, on rails. Sulphate of Copper is fairly steady at £24 12s. 6d. to £25 per ton, according to brand, delivered Manchester

Liverpool Market Report.

JULY 26, 1899.

Though prices are only slightly changed from last week, good business has been done in Canaryseed at full rates which have risen a shade since. A fair amount of attention has been attracted by sales of Chilian Honey and Quillaya Bark, and also by sales of Arabic sorts, for which there is an improved inquiry. Oils generally are unchanged since last week, but there is a steady demand at firmer prices for Olive. The Chemical market here has been dull, with limited business done, but better inquiry.

AMMONIA SALTS.—Sulphate is dull at £12 2s. 6d. per ton.

BEESWAX.—36 packages of Sierra Leone sold for £6 2s. 6d. per cwt.

BLEACHING POWDER—Is steady at £5 per ton.

BORAX—Continues very firm, £16 to £16 10s. per ton.

CANARY SEED.—100 bags of Turkish went for 38s. 6d. per 464 lbs., and smaller sales subsequently at 39s. 6d. Price at close is firm at 39s. to 39s. 6d.

CASTOR SEED.—Brazilian has been selling ex quay at 9s 6d. per cwt.

GUM.—Arabic sorts 10 serons changed hands at 65s. per cwt.. The market is steadier in tone with improved inquiry.

HONEY.—About 200 barrels of Chilian sold at prices varying from 19s. 3d. to 19s. 6d. per cwt.

LINSEED—Is very dull both on the spot and to arrive, with no desire evidenced either by sellers or buyers for business. American seed is easier and is quoted at 35s. 9d. per 424 lbs. c.i.f. for July-August shipment.

NITRATE CHILI.—Amount of trade doing is only retail, but the price remains steady at 7s. 6d. to 7s. 9d. per cwt.

OILS (FIXED) AND SPIRITS.—Castor oils are steady and unchanged for all varieties, with fair sales of Calcutta "good seconds," of which 100 cases sold, ex store, at 2⅞d. per lb. and 50 cases, ex quay, at the same rate. French, 1st pressure, sells at 2¾d. per lb; second pressure, 2$\frac{9}{16}$d.; and 2nd sulphur, at 2⅝d. Madras, 2¾d. per lb. Olive is in reduced stock here, and, though sales are not extensive, prices have a tendency upwards. Malaga, for shipment, is quoted at £31 10s. per tun. Linseed of Liverpool pressure is quiet, with sellers asking 21s. 9d. to 22s. 6d. per cwt. Cotton Seed is quietly selling at 17s. to 17s. 6d. per cwt. Spirits of Turpentine are offering at 32s. 6d. per cwt., but business is in small amount.

PEARLASHES—Are slow of sale at the easier rate of 30s. to 31s. per cwt.

POTASHES—Are lower in price, 21s. 6d. to 21s. 9d. per cwt.

QUILLAYA BARK.—Chilian has sold at £13 5s. per ton; but £13s. 7s. 6d. to £13 10s. is now asked.

TARTAR.—75s. to 80s. per cwt., with little business and smaller inquiry.

Partnerships Dissolved.

(From the London Gazette.)

W. G. Harvey and W. F. Peak, Scientific Instrument Makers, 56, Charing Cross Road, W.C. Debts will be received and paid by W. G. Harvey.

C. E. Peckover and C. F. Haines, Surgeon-Dentists, Worthing.

Receiving Order in Bankruptcy.

(From the London Gazette.)

David Moseley, Mineral Water Manufacturer, Short Cross, Halesowen.

New Reaction for Bile Pigments in Uaine.—Twenty C.c. of urine is shaken up in a separator with 5 C.c. of chloroform for three minutes. After allowing the mixture to stand for half an hour the chloroforn emulsion is drawn off. To it are added an equal volume of absolute alcohol and 2 C.c. of solution of para-diazo-nitraniline. The mixture is well shaken, when, if the least trace of biliverdin or bilirubin be present, a red colour will be developed, and the red coloured chloroform will separate out. The chloroform separated with this normal-urine test from normal urine will be only faintly yellow. The para-diazo-nitraniline reagent is prepared by dissolving para-nitraniline, 5 Gm., in water, 25 C.c., and sulphuric acid, 6 C.c., shaking until complete solution is effected. Water, 100 C.c., is then added, and also another 3 Gm. of para-nitraniline in water, 25 C.c. The whole is then diluted to 500 C.c. with more water. In the dark, this solution keeps well.—*Schweiz. Woch.*, **37**, 237.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. EDWARD PECK, East Dereham.

Cannot Repeat. Sponge Bags, best check (Maw's sizes), No. 2, 5s.; 3, 6s.; 4, 8s. 6d.; 5, 9s. 6d.; 6, 10s. 6d. doz. Bathing Caps, circular, best check, 5s. 6d. Eye Shades, celluloid lined green, rights, lefts, 2s. Enema Syringes, I.R. bottle, bone pipes, best English, red, green, black, 1 oz., 1s.; 2 oz., 1s. 3d.; 3 oz. 1s. 6d.; 4 oz., 1s. 9d. each. 10s. lots post free. Cash returned if sold.—Warnes, Chemist, 333, Gray's Inn Rd., W.C.

Moulds—Suppository, Pessary, Bougie, Capsule; Maw's patterns, some new. Particulars free. Warnes, Chemist, 333, Gray's Inn Road, W.C.

Capital Clock, suitable chemist's shop; perfect order. Robbins, 118, Fenchurch St., London.

Homœopathic Medicines.—Watson and Wate's three guinea case; complete, new. Offers to HOMŒOPATH, 5, Serle Street, W.C.

Holloway's Wines, half face value.—Balchin, Gosport.

Bismuth Scarb., 5/3 lb., 4 lb. £1; Iodoform Precip., 13/- lb.; Crystal, 12/6; Cocain. Hydroch., 10/6 oz.; 36 Munyon's, 22/6; 36 Daisies, 24/-. Offers wanted for 16 doz. Tetlow's Gossamer and 20 doz. Swandown. Eastman, Forest Lane, Stratford.

Complete Set of Fixtures, in mahogany, comprising 2 4-ft. nests; 1 8-ft. nest drawers, glass labels and glass handles, 120 drawers in all, with contents; 2 8-ft. mahogany-top counters; dispensing screen, fitted with glass case; 2 1½-ft. mirrors, 4½-ft. high, framed in mahogany; mahogany cornice, faced shelving, pilasters, and side-counter; 2 bottle-lockers; 2 counter-stands; 6 counter-drawers; soda-water stand, with carved mahogany front; 3 large carboys, cut-glass stoppers; 2 specie-jars, and other sundry effects: the whole in excellent condition; any reasonable offer accepted. can be seen any time. W., c/o E. Owers, 104, West End Lane, W. Hampstead (Metropolitan Railway).

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash. —P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements.

(Received too late for Classification.)

Obituary.

Petty.—On July 10, Thomas Petty, Chemist and Druggist, Deddington, Oxon. Aged 76.

Callaway.—On July 11, George Frederic Callaway, Pharmaceutical Chemist, Seven Sisters Road, London, N. Aged 38.

Richardson.—On July 21, William Henry Richardson, Pharmaceutical Chemist, Dudley. Aged 44.

Marriages.

Knott—Gregory.—On the 19th inst., at St. Matthew's Church, Bolton, by the Rev. E. S. Richardson, Vicar, Mr. Herbert Knott, of Knott Brothers, chemists, Bolton, to Miss Edith Mather Gregory, of Bolton.

Dickson—Flattely.—At St. Saviour's Church, St. George's Square, S.W., on the 22nd inst., by the Rev. R. Reid, John Dickson, Pharmaceutical Chemist, to Gertrude, younger daughter of J. C. Flattely, Esq., 3, Cambridge Terrace, S.W.

POLITICAL GOSSIP.

The Chancellor's Promised Manifesto and declaration of faith in regard to the Companies Bill bear a strong resemblance to the "Amen" of Macbeth, inasmuch as there appears to be difficulties in the way of delivery. At any rate, the looked-for pronouncement had not reached his Lordship's lips at the time of going to press. By deferring his speech from Friday, July 28, to the following Monday, then to the next day, and finally till Thursday, the interest centred in the Bill has very cleverly been maintained long after the fate of the measure has ceased to be a matter for speculation. The procedure to be adopted when the President of the House of Lords finally resolves to take the final stage of this Bill will probably be an imitation of that sometimes adopted in the Lower House in similar cases. A brief statement is made by the Minister in charge, and remarks on the more important details follow by those interested in the subject, the order for the third reading is then read and the Bill discharged, that is to say, withdrawn. But there is, of course, the possibility of their Lordships going through the farce of passing the Bill, and solemnly reporting to the Commons that they have done so; for it is a point of etiquette with the two branches of the Legislature to politely ignore each other's business programme. In any case, it is expected that references will be made by the Lord Chancellor to the Pharmacy and the Medical Bills introduced by him, and still on the list of "Bills in progress," though they have never made any.

Great Expectations need not be entertained by pharmacists in respect to what the Lord Chancellor will be willing to do for them. It has become more than ever apparent this session that the pharmaceutical calling must rely entirely upon itself, and must be prepared to work out its own salvation. Next session may possibly be the last of the present ministry, and this circumstance might be turned to account, if between now and November chemists and druggists could agree to a definite line of action. The value of whatever Lord Halsbury may say will lie in revealing the particular path along which it may be most expedient to travel. Nothing more need be looked for. The political straw will not always indicate an ideal hurry, but the pharmaceutical organisation should make itself ready to utilise any wind with a favourable point in it.

The Food and Drugs Bill proceeds apace in the House of Lords, where a good deal of very foolish talk has been indulged in respecting some of its provisions. Evidently the noble Lords are unacquainted with the subtleties of margarine, and failed to see why its adulteration with more than 10 per cent. of butter fat should be prohibited. Viscount Cross could not explain it, hence the puzzled peers left the problem alone. A new clause relating to taking of samples of food was added, and then Viscount Cross proceeded to Clause 19, which dealt with the question of warranty. The following clause was inserted:—"Every person who in respect of an article of food or drug sold by him as principal or agent gives to the purchaser a false warranty in writing shall be liable on summary conviction for the first offence to a fine not exceeding £20, for a second offence to a fine not exceeding £50, and for any subsequent offence to a fine not exceeding £100, unless he proves to the satisfaction of the Court that when he gave the warranty he had reason to believe that the statements or descriptions contained therein were true." This is a very poor fulfilment of Mr. Long's promise to devise a reasonable measure of protection for the retailer, and it is not surprising to find the grocers up in arms on the invoice question. A petition for amendment of Clause 19 was presented to the House by a trade association of Bristol, but it does not appear to have borne much fruit whilst lying on the table. The Bill as amended in Committee is now awaiting further consideration prior to third reading, after which it will have to go to the Commons again in order that the Lords' amendments may be agreed to—or otherwise.

Ben Nevis Observatory is still in a poor way financially, and Mr. Buchanan has failed to impress the Government with the necessity for allocating a special grant of £1,000 to enable the work of observation to be carried on for another two years. It appears that the Meteorological Council receives £15,300 a year of public money, and a strong effort was made last year to bring Government pressure to bear on the Council with a view to having a sufficient grant awarded to Ben Nevis. Mr. Hanbury has now informed the Scotch members that the pressure was duly exerted, but that apparently no good effect has resulted. The North British representatives are proportionately wrathful, and their expressions of opinion in the House had to be cut short by the cry of "Order" from the Chair. It is represented that the Royal Society does not believe in the particular form of work done at the observatory in question.

The Home of the London University will henceforth be South Kensington, the Imperial Institute having agreed to surrender a portion of the Institute buildings under terms made public in a Treasury minute dated July 13, and reproduced in the *Times*. The consideration to be given for the assignment appears to be the payment of a mortgage of £40,000 on the Institute building and a further sum of £15,000 in respect of Institute debts. For this sum the University will acquire the eastern and central portion of the main block, and a portion of the upper floor of the inner block, as well as the temporary structure now standing in the south-eastern court; an amount of accommodation which is said to be much in excess of that furnished by the Burlington House premises. It is intended to make use of the new buildings of the Royal College of Science for the purpose of holding the practical examinations of the University in Chemistry and Physics. The University will thus stand to the Institute as landlord to tenant, with the important difference that the tenant is to pay no rent.

At the moment of going to Press we learn that the Companies Bill, introduced by the Earl of Dudley, was read a third time in the House of Lords, on Thursday.

THE PURITY OF FOOD AND DRUGS.

A Mercurial Metal-Polishing Powder has been examined by Dr. Van Hamel Roos, of Amsterdam, who, according to the *British Food Journal*, states that the powder is of a reddish colour, and contains mercury in considerable amount. When used for polishing metal, it leaves a brilliant layer of mercury upon the metal. Our contemporary in pointing out the dangerous character of the powder referred to remarks that the daily use of forks and spoons covered with a thin layer of mercury is the more dangerous because immediate and violent poisonous effects are not likely to be produced except under special circumstances; the injurious effects are likely to be gradual, but none the less sure, if comparatively slow.

Alum in Baking-Powder.—Dr. Hope, Medical Officer of Health, in submitting a list of the prosecutions under the Sale of Food and Drugs Act at a meeting of the Health Committee of the Corporation of Liverpool, recently referred to the fact that a very much-used article—baking-powder—had been held not to come within the scope of the Act on account of its being neither a food nor a drug, and consequently, in the present state of the law, no proceedings could be taken in respect to baking-powder preparations, many of which were likely to be prejudicial to health. One preparation had been found to contain 30 per cent. of alum.—*British Food Journal*, **1**, 135.

Antiseptics in Food.—During the three years ending March, 1899, Dr. Alfred Hill, public analyst for the City of Birmingham, examined 2,300 samples of food for preservatives. In 460 instances, or 20 per cent., boric acid, formic aldehyde or salicylic acid was detected. This, in his opinion, showed that the use of preservatives in food had risen to very large dimensions, and required serious consideration by all interested in the health of the community. Boric acid was found in 35 per cent. of 882 samples of butter and margarine, and in 15 of 24 samples of bacon, sausage, and other animal foods. For preservative purposes a mixture of boric acid and borax was generally used. In a paper read before the Society of Medical Officers of Health, Dr. Hill deals with the subject of antiseptics in food, and suggests that there is at command a means of food preservation which is available for every kind of food, and is open to none of the objections that attach to the material antiseptics; he meant refrigeration. This method possessed several advantages. It is more effective than any other; it adds nothing and takes away nothing, not even water, in no material sense altering the quality of the article treated. It also causes no change of appearance or taste, leaving the meat or other substance substantially in its original condition, neither rendering it less nutritious nor less digestible.—*British Food Journal*, **1**, 142.

Camphorated Oil.—At the County Petty Sessions, on Monday, July 24, Allan Treadaway, described as a vendor of drugs, Ashford, was summoned for selling camphorated oil which was deficient in camphor to the extent of 76 per cent., and had been compounded with mineral oil instead of olive oil.—The defendant stated that he purchased the oil as being in accordance with the B.P. from a firm at Battersea.—Fined 2s. and 10s. 6d. costs.

Camphorated Oil.—Richard Smith, shopkeeper, Swadlincote, was summoned at Swadlincote Petty Sessions by Capt. Sandys, inspector, for selling camphorated oil which was not prepared in accordance with the British Pharmacopœia. Defendant's wife said that the bottles of oil were sold as they were received at the shop.—Captain Sandys said that the small retailers were somewhat harshly dealt with, as it was the wholesale dealers who made the money out of adulterated articles.—The Chairman said that the Bench were unanimously of opinion that the defendant had no intention to defraud, and as the costs were 20s. 6d. defendant would be fined 6d. only.——Wm. Hart, shopkeeper, of Woodville, was also summoned for selling adulterated camphorated oil, and was fined 1s. 6d and 10s. 6d. costs.

Seidlitz Powders.—James Lord, drysalter, Wootton Bassett, was summoned at New Swindon Petty Sessions on Thursday, July 20, for selling seidlitz powders which were not of the nature, substance, and quality demanded. Defendant pleaded that the powders were sold in exactly the same conditions as he received them from Messrs. J. Bell, Sons, and Co., of Liverpool. Fined 1s. and 10s. 6d. costs.--A summons issued against Messrs. Bell, Sons, and Co., for applying a false trade description to the seidlitz powders supplied to Mr. Lord, was adjourned so that it might be re-issued against the individual members of the firm and not against the company.

Heavy Magnesia.—Arthur Mitchell Carr, chemist, of Gresley, was summoned, at Swadlincote Petty Sessions, for selling 4oz. of magnesia to the prejudice of the purchaser in that it consisted entirely of magnesium carbonate.—Defendant pleaded not guilty. Mr. Timms defended.—Captain Sandys said that magnesium carbonate would cost 3s., and the heavy magnesia 10s.—A witness stated that he asked for heavy magnesia distinctly, and no remark was made.—Defendant, examined, stated that he had been in business over forty years. There were two substances in the trade known as heavy magnesia. He supplied a special substance known to the trade as heavy magnesia, and unless specially asked, he would supply that article. There were two prices, but the medicinal properties were exactly the same.—Captain Sandys held that there were not two heavy magnesias in the new British Pharmacopœia as the defendant had stated.—The case was adjourned while the defendant went for a copy of the book, and on his return with it Mr. Timms admitted, after reading the Pharmacopœia, that he must plead guilty.—The Bench considered that defendant had not wilfully defrauded, and reduced the fine and costs to 10s. 6d., refusing the analyst's fees.

Public Analysts' Reports.—*Birmingham.*—The annual report of Dr. Alfred Hill, public analyst for Birmingham, shows that a total of 1,146 samples of food and drugs were examined during 1898, which is equivalent to one sample for every 445 of the population. The average of the five years, 1892-96, was one per 458 persons. The number of adulterated samples in the year under notice was 203. These consisted of, milk, 91; butter, 88; coffee, 8; self-raising flour, 5; Scotch whisky, 1; sherry, 1; ale, 1; gin, 1; compound tincture of benzoin, 3; tincture of iodine, 1; borax, 3. There were also 22 cases under the Margarine Act. Boric acid was present in 16 samples of milk, in quantities varying from 3 to 130 grains per gallon. Formic aldehyde was detected in 32 samples of milk. The adulterated sample of ale contained 105 grains per gallon of chlorides, expressed as common salt. The 3 adulterated samples of borax contained sodium bicarbonate in the percentages of 35, 35, and 25 respectively. The adulterated samples of tincture of benzoin were each deficient in solid ingredients to the extent of 16, 23, and 65 per cent. respectively; the latter sample also contained 20 per cent. of water and 25 per cent. of glycerin. The condemned sample of tincture of iodine contained 17 per cent. in excess of the proper amount. The 5 samples of self-raising flour were adulterated with 8 to 40 per cent. of maize flour. The total amount paid in fines was £269 18s. 6d., of which £101 6s. was under the Margarine Act. The average fine inflicted under the Sale of Food and Drugs Act was £2 8s. 11d., and under the Margarine Act £5 12s. 7d. The legal costs paid by the vendors amounted to £49 1s.——*Cheshire.*—During the March quarter of the present year the Cheshire County Council's Chief Inspector under the Food and Drugs Act submitted to the public analyst a total of 258 samples, consisting of 66 butters, 89 milks, 23 spirits, 13 condensed milks, 11 coffees, 3 peppers, 2 cheese, 2 arrowroot, 2 iodine liniments, 1 camphor liniment, and one tincture of rhubarb. Of these 13 were reported by the public analyst as adulterated, namely, 3 butters, 7 milks, 1 coffee, 1 spirit, and 1 iodine liniment. The liniment was certified to be deficient in iodine to the extent of 70 per cent. This, it was pointed out, was no doubt due to some error on the part of the dispenser in serving the sample, for it was not iodine liniment, but tincture of iodine.——*Dudley.*—Mr. T. C. Brown, Inspector under the Food and Drugs Act to the Borough of Dudley, in his report for the year ending March 31, 1899, states that several of the popular nostrums sold by small shopkeepers were submitted to the public analyst, but none were found to contain poison or anything particularly injurious. One sample of camphorated oil was certified as being deficient in camphor to the extent of 8 per cent. He also states that it is believed that the sale of paregoric in Dudley by other than properly qualified chemists has ceased. Several of the samples of drugs were taken from the shops of chemists, and were all found to be in accordance with the requirements of the new B.P.—*British Food Journal*, **1**, 179.

ENGLISH NEWS.

Presentation to Mr. H. Wootton, B.Sc.—On Monday, July 31, at the Swan Hotel, Clapham, Mr. Wootton, B.Sc., formerly of Westminster College, was the recipient of a handsome present in the form of a polariscope and an illuminated address from his former pupils as a small token in recognition of the esteem in which he is held by them. Mr. Fred Ashford occupied the chair, and in the course of his remarks alluded to the good work Mr. Wootton had done, and to his kindness and consideration as a teacher, and expressed a hope that he would have health and be long spared to continue his useful work. Mr. Roberts, in making the presentation, read extracts from several letters of subscribers who were out of London and unable to attend, all of whom testified to Mr. Wootton's kindness. Mr. Wootton, in reply, thanked the students for their valuable and useful present, and assured them how glad he was to hear of the success of old students from time to time. They had had success in the past, and he would do his best in the future to achieve even greater success. During the evening songs were given by the students and the clever imitations of Dan Leno and Joe Elvin by Mr. George Drayton (an old student) were greatly appreciated. After the usual toasts had been honoured, the pleasant evening concluded with the singing of the National Anthem.

Laudanum Poisoning in Manchester.—During the past week, writes our Manchester correspondent, two inquests have been held on persons who have died from laudanum poisoning. One of the victims was named "Laudanum Lily" by her associates, and for five years she had been accustomed to take laudanum in place of food. She sent, in the usual way on Monday, a one and a half ounce bottle to a chemist, who was so accustomed to seeing it that he filled it and asked no questions. In fact, sometimes she sent it twice a day. The Manchester Deputy Coroner remarked on the frequency of the cases of laudanum poisoning which came before him, and said that if it had been whisky they would have had interference from half a dozen societies to put it down. In reply to a juror, the Coroner said that opium was not scheduled under the Poisons Act (*sic*), and, although chemists put a label "Poison" on the bottle, it was more for the protection of the people themselves than their own. Dr. Melland, surgeon at the Manchester Infirmary, said that the woman died from exhaustion. No doubt her past life had much to do with it. In reply to the Coroner, witness said they dealt with a great many cases of laudanum poisoning. They had had three cases in three days, and they appeared to be on the increase. The facilities for obtaining it were very great. A verdict of accidental poisoning was returned.

Medicated Wine.—The action of Coleman and Co. *v.* Brown and Co. came before Mr. Justice North on Wednesday last, on a motion by the plaintiffs for an injunction to restrain the defendants from using the name of "Vincalis" in connection with medicated or other wine, on the ground that it so closely resembled the name of the plaintiffs' wine, "Wincanis," as to be calculated to deceive intending purchasers of the plaintiffs' wine. It appeared from the evidence filed in support of the motion that plaintiffs' article consisted of port wine and Liebig's Extract of Meat and Malt Extract, and that it was specially recommended for invalids. The defendants' wine, which had recently come on the market, it was contended, being pronounced Vincarlis, and also being recommended for invalids, would be calculated to deceive customers of the plaintiffs' wine. The defendants contended that their wine was a pure wine, and had been specially recommended for sacramental purposes by the Archbishop of Nottingham. His Lordship refused to grant the injunction, holding that there was no intention to deceive on the part of the defendants. Mr. Macnaghten, Q.C., and Mr. Austen-Cartmell appeared for the plaintiffs; Mr. H. Terrell, Q.C., represented the defendants.

British Pharmaceutical Conference.—Owing to the fact that the authors of several papers read at the Plymouth meeting last week did not return their corrected proofs in time, it was found impossible to make some of the corrections in last week's issue of the Journal. Several errors have also crept into the report of the discussions on the papers read. Thus, at page 122, column 2, line 47, for "1·2" read "1·6," and at line 52, for "Bunsen filter pump" read "Buchner's filter"; at page 124, column 1, line 51, for "order" read "odour," and at col. 2, lines 26 and 28, for "colour" read "odour"; at page 127, col. 2, line 9, for "would" read "might," and at line 10, for "grammes" read "milligrammes." Any other errors that may be deteced by readers should be promptly notified, in order that they may be corrected in the official report, to be included in the 'Year-Book of Pharmacy.'

FRENCH NEWS.

Savants Meet.—On Thursday evening, July 27, the Society of Hypnology and Psychology held its annual séance in the Salons of the Restaurant Lapérouse, Quai des Grands-Augustins, after which a banquet was served and presided over by Monsieur le Doctor Jules Voisin of the Saltpêtrière Hospital. Among the guests present were Dr. Berillon, general secretary of the Society, Dr. Paul Richer, member of the Académie de Médicine; Dr. Dauriac, professor at the Sorbonne; Monsieur Molcot, Advocate-General of the Court of Cassation; Drs. Paul Maguin, Baradue, Apostoli, and Dr. Bilhaut, Surgeon of the International Hospital. At dessert many short speeches were indulged in, dealing chiefly in eulogising past and departed members of the Society. Then M. Jules Voisin drank to the prosperity of the Society. Other toasts were drunk to the memory of the precursors and masters of hypnotism, viz., Charcot, Dumont-pallier, Durand, De Gros, Liebeault, etc. It was decided to open a subscription list for the erection of a monument in honour of Dumont-pallier; and after fixing the date of the National Congress of Hypnotism for August 12, this assembly of "savants" dispersed, having spent a very enjoyable evening.

The Beer Tax.—About the beginning of the year, pharmaciens were loud in their protestations against the infliction of an Octroi tax which had been some time before imposed upon alcohol, and which later on had been proved to be outside the jurisdiction of the authorities, resulting in the enforced "remboursement" by the "Ville de Paris" of the surtax which had been levied. As an offset, it would appear, the powers that be, ever tenacious in piling on the agony, have decided to recoup in some manner, for a few months ago the people of Paris who drink beer were surprised to find that table beer had "gone up" in price; it had been sold at 20 c. the litre, and had increased to 25 c. and 30 c. The Paris brewers contended that the increase arose from the steps taken by the Chamber by the Budget of 1890, which, while not increasing the tax nominally, had extended the powers of investigation of the agents of indirect taxation, had increased the work of the officers on night duty and prevented the clandestine manufacture of beer. A petition was got up and shortly received 300,000 signatures. It was addressed to the Municipal Council, and asked for such a reduction in the Octroi duties as would correct the increased cost resulting from the measures taken by Parliament. The Municipal Council saw the point, but were doubtful how best to deal with it. The precautions taken with the cheap beer meant as much cost per litre as with the more expensive beer, and in reducing the charges on all sorts of beer it was clear that the necessary reduction was not going to be effected on the table beer, while it would mean an appreciable loss on the local Budget. The real way out of the difficulty was to reduce the local tax on small beer. But the question was how to distinguish it at the fortifications from beers of higher gravity. Another way was proposed in order to get out of the difficulty—to let the brewers off the payment of the Octroi duty on the condition of a commuted payment. The Municipal Council agreed to the latter course, which has been adopted, but is only to exist for six months, while further measures are taken to deal with the question in such a way that the man who drinks cheap beer has not to pay the same taxation per litre as he who drinks the more expensive qualities.

Mysterious Poisoning Case.—La France also has her artists in poisoning, for, says the *Matin*, a mysterious case of poisoning is being investigated by the judicial authorities of Paris. About a year ago, M. Fernand Couderc, the representative of a large brandy house, married Mdlle. Rocz, the daughter of a wholesale hatter. The young couple, who lived in a handsome flat in the *chic* quarter of the Boulevard Hausseman, had an income of something like 20,000 f. (£800) a year, and they expected a considerable legacy from the grandmother, an old lady living at Asnières, in the outskirts of Paris. It was known that the old lady meant to leave a considerable income to a little girl of whom she was very fond, Marie Saintenoy, whose mother, née Rocz, had contracted a second marriage with a police sergeant named Blanc. The Blancs had no direct relations with the Couderes, but Marie often told her parents that Madame Coudere used to meet her as she was leaving school, caress her, and make her little presents. When Marie left school on Friday evening in company with two or three other little girls, a fashionably dressed lady, wearing a thick white veil, approached her and said: "Don't you know me?" "Why, you are my cousin," replied the child, and the lady, after distributing sweets to the little girls, said to Marie "You are rather pale, my dear; take this capsule, and it will give you strength." Marie obeyed, went home, and whilst relating what had occurred, was seized with violent pains. A doctor was called in and administered an emetic, but it was too late, for Marie died a few minutes later. Her stepfather at once proceeded to the police station and accused Madame Coudere of having poisoned Marie, to obtain her expected legacy. An investigation was begun, and Madame Couderc arrested on suspicion. An autopsy is to be made upon the child's body at once.

Franco-American Trade Convention.—On the subject of the Franco-American Commercial Convention of July 24, the *Temps* publishes further information communicated by the Minister of Foreign Affairs. It is to be observed that the liberty of action of the two Governments in the matter of Customs tariffs is not restricted for any given length of time. France simply pledges herself to grant the United States the benefit of her minimum tariff, whatever it may be, with certain specified exceptions, and the United States accords France, besides the most favoured nation's treatment for the products enumerated, the reductions on the general tariff which are enumerated. Either of the contracting parties may bring this arrangement to an end by giving twelve months' notice. Hitherto pharmaceutical products of American origin have been burdened with an absurdly heavy tax, and much trouble and annoyance given to pharmaciens in consequence, inasmuch as it was not too clearly defined upon the tariff what was meant by "American product." For instance, if upon the label of a specialty which was in reality English there appeared "Houses in New York and Paris," that sufficed to make the "all-knowing" Customs officer come to the conclusion that it must be American, "because he saw New York on the label." The result was a fine for false declaration of origin. Explanation was useless; he knew better. But now a better order of things may be expected. In so far as pharmacy is concerned, the following articles figure in the new list for reduction. Perfumery (alcoholic), 10 per cent.; dyes, 20 per cent.; glycerin,

10 per cent.; olive oil, 15 per cent.; colours and varnishes, 10 per cent.; potash, 10 per cent.; drugs, 10 per cent.; perfumery (non-alcoholic), 10 per cent.; soaps, 10 per cent.; soda (and products derived from it), 10 per cent.; cements, 10 per cent.; bottles, 15 per cent.; flasks, and other glass receptacles, 5 per cent.; and mineral waters, 20 per cent.

The Dangers of Cosmetics.—Monsieur Roussel, doctor to the "Hotel-Dieu de Saint-Etienne" has just made known another cause of intoxication, viz., the employment by nurses and mothers of a cosmetic with a lead base for the cure of cracked nipples. It appears that recently in the Departement of the Loire many children have been brought to the above doctor for treatment, suffering invariably from colic and constipation. He noticed that many of the mothers and nurses suffered from cracked nipples, and upon enquiry learned that they had treated themselves upon the advice of their intelligent (?) neighbours with a quack heal-all, sold in their neighbourhood at a low price by an old hag who posed as a public benefactor. It was a pale yellow, limpid liquid with an acetic odour, and was ordered to be painted upon the cracks with a camel-hair brush, and covered with a leaden cap somewhat resembling a "Wandsworth nipple shield." When suckling the child this was supposed to be removed and the nipple wiped previously to feeding the child; but apparently the mothers forewent this necessary precaution, especially at night when sleepy, with the result that the child imbibed a portion of the cosmetic. Monsieur Duchet, pharmacien en chef at the Hotel Dieu, analysed the cosmetic, and stated its composition to be acetate of lead and dextrine, containing 12 grammes 990 centigrammes of neutral acetate of lead per litre, corresponding to 7 grammes 211 centigrammes of metallic lead. Hence the mystery was solved. The youngsters were suffering from saturnine colic, with attendant constipation, and, being treated for such, were speedily brought back to health. But for the fortunate observation by the doctor of the cracked nipples, it might have been otherwise, as many of the other signs of lead intoxication, one for instance the "Burton" line on gums and teeth, are absent in the new-born child.

IRISH NEWS.

Pharmaceutical Society of Ireland.—The monthly meeting of the Council was convened for Wednesday, the 2nd inst., at 67, Lower Mount Street, Dublin, at three o'clock, but did not take place in consequence of a sufficient number of members not attending to form a quorum. A resolution passed by the Council at a former meeting directed that the President should adjourn at a quarter-past three o'clock if a quorum were not present then. On this occasion the Vice-President, Mr. George Beggs, waited until within a minute or two of four o'clock. The following gentlemen attended:—The Vice-President, and Messrs. Michie, Brittan (Drogheda), Wells, Simpson, and Dr. Walsh. The President, Mr. Downes, was absent through having met with a severe accident whilst alighting from a tramcar. The members present requested the Registrar to convey to Mr. Downes their regret at what had befallen him.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. W. Miles Bramley, Chemist and Druggist, M.P.S., has opened the Regent Pharmacy, at 77, Rookery Road, Handsworth, Birmingham. All communications should now be sent to that address.

Mr. R. J. Downes, President of the Pharmaceutical Society of Ireland, particulars of whose narrow escape from a violent death were reported in our last week's issue, is progressing favourably, and his fractured arm is healing satisfactorily.

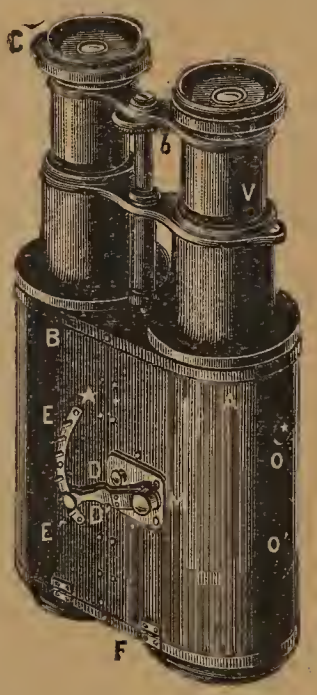
Professor Tichborne asks us to state that he was amongst those delegates who were unable to attend the Conference at Plymouth. He would not like to appear discourteous to his friend the President or to the Conference, but his letter to the Hon. Secretaries must have miscarried.

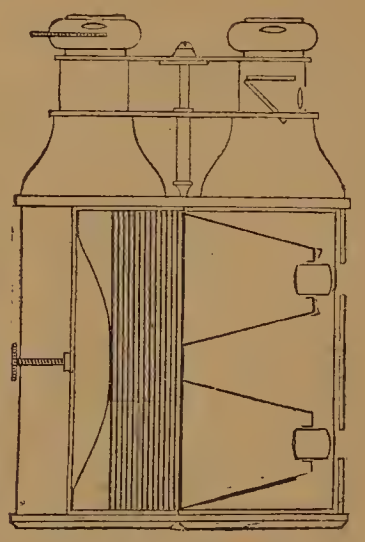
SCOTTISH NEWS.

Presentation to Mr. and Mrs. T. Maben.—On Friday, July 14, at Marlfield House, Hawick, Mr. T. Maben was presented with an illuminated address by the members of, and the teachers under, the Burgh of Hawick School Board, of which he was until lately chairman. Mr. Mark Currie made the presentation, and accompanying the address was a handsome gold albert with appendage, an aneroid barometer with carved walnut case, and a diamond and sapphire bracelet for Mrs. Maben. The barometer bears the following inscription:—"Presented to Mr. and Mrs. Maben, with diamond and sapphire bracelet, by the teaching staff and members of the Burgh of Hawick School Board with their best wishes—July 14, 1899."

TRADE NOTES.

A New Stereoscopic Binocular Camera.—Messrs. W. Watson and Sons, 313, High Holborn, London, have recently introduced an ingenious instrument for taking stereoscopic photographs of people and objects without fear of detection. As will be seen from the illustration, this camera resembles in appearance and size an ordinary binocular glass, and when taking a picture it is applied to the eyes in a precisely similar manner. It differs, however, from any other camera, in that it in no way betrays its purpose, *the picture being taken from the side* and not from the end of the apparatus. Thus it is possible to approach quite nearly to any object that it is desired to photograph, without being detected.





SECTIONAL VIEW,
SHOWING POSITION OF PLATES.

The camera is fitted with a pair of lenses, by means of which the stereoscopic images are taken. A shutter is fitted, giving varying degrees of exposure, and the plates (12 in number) are contained in a magazine in one of the tubular bodies of the camera. The changing of the plates is perfectly simple and effective; the back is opened at F and a bag pulled out, into which the exposed plate is dropped and then replaced in the back of the magazine. When the whole of the plates have been exposed and changed there remains an aluminium sheet which keeps the magazine light-tight, thus enabling it to be withdrawn in daylight, and another magazine inserted. An exposure indicator, by means of which the number of pictures taken may be recorded, is provided. The sectional view given above shows very clearly the construction of the camera. The view-finder is placed in the left tube in exactly the same plane as the lenses. Fitted with rapid rectilinear lenses and with sling case complete, the price of the camera is £10.

Boxes of Assorted Corks.—Messrs. Ayrton and Saunders, Liverpool, submit a sample box of corks, such as they are supplying to chemists post free for 2s. 6d. The idea is that the chemist can keep the sample box by him, so that when ordering he may know exactly what corks to specify. The box, which is divided into ten compartments, contains from 2½ to 3 gross of corks of various sizes; thus apart from the advantage of having samples handy, the purchaser gets fair value for his half-crown.

ITEMS OF INTEREST.

Detection of Bacillus Coli Communis and Typhoid Bacillus in Drinking Water.—Peptone bouillon about 150 Gm. are mixed with carbolic acid, 1 Gm., and made up to 1 litre with the water to be tested. The flask is placed in the incubator for 12 to 30 hours. Test tubes filled with a mixture of bouillon, 100; carbolic acid, 1; peptone, 5; water, 900, are inoculated, then ordinary bouillon, and finally gelatin (if necessary, with the addition of potassium iodide). B. coli communis is distinguished from typhoid bacillus by its behaviour with milk sugar bouillon, in which it sets up fermentation; with litmus tincture, with which it gives a red colour; and with milk, with which it causes coagulation. The typhoid bacillus gives none of these reactions.—*Pharm. Centr.*, **40**, 144.

Caution on the Use of Orthoform.—Asam Murnau calls attention to nine cases met with in his practice which leads him to suggest that the presumed innocuousness of orthoform may not be entirely relied on. In the instances referred to a kind of necrosis, similar to that caused by phenol, resulted from the local application of the remedy. In nearly all these cases the tissues were badly nourished, which may have been a predisposing cause of the unfavourable action.— *Med. Chron.* (3), **1**, 135, *after Munch Med. Woch.*

Pipitzahoac is the name given in Mexico to the root of *Peregia adnata*, which grows in abundance near Salvateria. It is aperient in action; from it Rio de la Loca has isolated pipitzahoinic acid, which is considered to be the active principle. Mylius states that the acid also acts like a quinone, and Wild gives it the formula $C_{30}H_{20}O_6$. The dose of the powdered root is 4 Gm. in four gelatin capsules taken simultaneously, or 1 Gm. of the acid in ten pills. It is used in haemorrhoidal affections as a substitute for jalap.—*Pharm. Post*, **33**, 251.

Lute for Chloroform Bottles.—Allain recommends the use of bichromate gelatin as a lute for the stoppers of chloroform bottles. Gelatin, 100; distilled water, 300; glycerin, 10, are dissolved together. To every two parts by weight of this solution, one part of 10 per cent. potassium bichromate solution is added, both solutions being warm. The mixture is kept at 55°-60° C. during use.—*Journ. de Pharm.* [3,] **9**, 571.

Cupric Sulphate to Destroy Charlock.—A solution of 2 lbs. of copper sulphate in 10 gallons of water, applied to the growing crops by means of a strawsonizer, in the proportion of 25 to 50 gallons per acre, is said to be an effective poison for charlock, but not to damage cereal or leguminous crops. The solution should be applied during dry weather, and at an early period of the growth. —*Cape Agric. Journ.*, **14**, 482, after *Mark Lane Express.*

Beryllium-Sodium-Fluoride, $BeFl_2NaFl$, is a whitish powder readily soluble in water, which has lately attracted notice as being the source of the production of beryllium by the electrolytic method of Lebeau.—*Merck's Report*, 1898, 41.

An Impudent Fraud is described by a correspondent of the *Morning Post*, who states that, during his absence from London, a boy who professed to come from some drug establishment in the neighbourhood, called at his house with a bottle of medicine done up in white paper and addressed to him, with "7s. 4½d. to pay" written on the parcel. He asked the servant for payment, which was refused, as no bill was brought with the parcel, and her master was not at home. The boy deposited the bottle, and after a short interval returned, saying the bill was at the shop and when the order was given instructions had been left that the parcel was to be paid for on delivery. The servant, however, refused to pay without the production of the bill. The boy went away and returned the third time with a receipted bill from the drug establishment for 7s. 4½d., and the money was duly paid. The whole thing, however, proved to be a fraud. The boy had originally made a purchase amounting to 4d. at the drug store and been given a receipted bill, which he altered to 7s. 4½d. Then with a bottle of tonic, which he had in all probability purloined from somewhere, as the label was written in a professional hand, he called at the correspondent's house and succeeded in imposing upon the servant.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

August 3, 1899.

Business in the drug and chemical trade has been restricted during the past few days, and with the near approach of Bank Holiday we shall now probably see slack times until after the commencement of September. The principal incident of the week has been an advance in the price of Salicine, while Quinine has also somewhat improved in tone. Opium is very quiet, while Morphia and Codeia remain firm. Same may also be said of Quicksilver and Mercurials. Iodides and Bromides remain steady. Camphor is in a somewhat anomalous position as regards the crude. Cocaine firm. Linseed Oil dearer. Sulphate of Ammonia slightly easier. Borax and Acid Boracic, Acid Citric, and Tartaric and Cream of Tartar steady and unchanged. Turpentine again dearer. Acid Carbolic in good demand. The following are the prices of some articles of principal interest:—

ACETANILIDE.—Weak at 11d. to 1s. 2d. per lb., according to quantity, etc.

ACID BORACIC—Is unchanged at 25s. per cwt. for crystals, and 27s. per cwt. for powder.

ACID CARBOLIC.—Very steady, partly no doubt in consequence of the hot weather. Quotations are: 35-36° Ice Crystal in 2½ cwt. drums and overcasks, 7¼d. per lb.; other qualities and packing in proportion. Crude: 60°F., 2s. 1d.; 75°F., 2s. 7d. per gallon. Liquid: 95 to 98 per cent. of pale straw colour, 1s. 2d. to 1s. 5d. per gallon, according to quantity, filled in 40-gallon casks.

ACID CITRIC—Has, in common with most other articles, been somewhat quiet, in spite of the hot weather, the article being obtainable at 1s. 7d. to 1s. 7½d. per lb., according to make, for crystals in 5-cwt. casks.

ACID TARTARIC—Steady at 1s. 1d. per lb. delivered for English, and 1s. 0¼d. to 1s. 0½d. per lb. c.i.f. for Foreign.

AMMONIA COMPOUNDS—Are steady, and without appreciable alteration in value, with the exception of Sulphate, which is rather easier, quotations being nominally:—Gray prompt, 24 per cent. London, £12 1s. 3d. to £12 2s. 6d. per ton; Hull prompt, £12; Leith prompt, £12 1s. 3d.; Beckton, August, £12 1s. 3d.; Beckton terms, prompt, £12; September, £12; October-March, £11 5s.

ANTIPYRINE and **PHENAZONE**—Are quiet and without change in value.

ANTIMONY—Regulus is quoted £39 to £40 per ton, and Japan crude (Black Oxide) 24s. 6d. per cwt.

ATROPHINE—Is very firm at 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d. per oz. for the pure alkaloid.

BISMUTH.—Makers quote Metal pure 7s. per lb. Carbonate B.P., 5s. 8d. per lb., Subnitrate B.P. 5s. 1d. per lb., Citrate 5s. 5d. per lb., Oxide B.P. 7s. 7d. per lb., and the Salicylate B.P. 5s. 9d. per lb. The price of the Commercial quality of the metal remains unchanged at 5s. per lb.

BLEACHING POWDER (CHLORIDE OF LIME)—Quiet at £6 per ton for English make.

BORAX—Quiet but steady at 16s. per cwt. for crystals, and 16s. 9d. per cwt. for powder.

BROMIDES AND BROMINE.—There is no change to report. Prices remain the same as those quoted in our last week's issue.

CAMPHOR.—Crude is very firm, prices quoted by holders being: China, 122s. 6d. per cwt. on the spot, and 136s. per cwt. c.i.f. for arrival; Japan, 130s. spot, and 135s. per cwt. c.i.f. for arrival. For refined English makers maintain their price of 1s. 7d. per lb. for Bells and Flowers in ton lots, in spite of a reduction to 1s. 6¾d. per lb. on part of the Hamburg refiners.

CASTOR OIL—Quiet. Belgian, first pressing, spot, £25 10s., second pressing £23 per ton, ex wharf. Hull manufactured, guaranteed cold drawn, Pharmaceutical quality, £27 10s. per tun in

barrels, 3¼d. per lb. in cases. Pure firsts £25 per tun, seconds £23 10s. in barrels; firsts 2 15/16d., seconds 2 13/16d. per lb., in cases for prompt delivery, ex wharf, London.

CLOVES.—Privately the market for Zanzibar is quiet but firm, business comprising August-October delivery at 3 1-32d., and October-December at same figure. At auction 79 bales Zanzibar offered and 11 bales sold at 3d.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 3d. per gallon; pure, 1s. per lb. Benzole: Firm, 50 per cent. prompt, 10d.; August-December, 10½d. per gallon; 90 per cent. prompt, 8½d. to 9d.; October-December, 9d. Creosote: 3½d. per gallon. Crude Naphtha: 30 per cent. at 120°C., 3½d. per gallon. Solvent Naphtha: 95 per cent. at 160°C., 1s. 6d. per gallon; 90 per cent. at 160°C., 1s. 2d.; 90 per cent. at 190°C., 1s. 3d. per gallon. Anthracene: A. 3½d.; B. 2½d. per unit. Pitch: 35s. per ton f.o.b. Tar: Crude and Refined, 13s. per barrel; 2d. per gallon.

COCAINE.—The market is very firm at 11s. 6d. to 12s. 3d., according to brand and quantity, for the Hydrochlorate in 25 oz. tins, these being makers' prices, while secondhand holders do not appear very desirous of selling at anything below above figures. Crude remains very firm, and in quite limited supply.

COD LIVER OIL.—Market continues extremely quiet, at nominal prices of 56s. to 57s. 6d. per barrel, f.o.b., according to brand for new, non-congealing Norwegian oil, in tin-lined barrels of 25 gallons.

CODEIA—Continues extremely firm at 12s. 6d. to 12s. 9d. per oz. for the pure, and 1s. per oz. less for the salts.

ESSENTIAL OILS.—Business has been quite inactive—is, in fact, at a standstill for most of the above. Star aniseed oil is quoted 6s. 1½d. per lb. in warehouse on the spot, and 6s. 2d. per lb. c.i.f. for August-September steamer shipment.

GALLS—Have remained quiet and, in the absence of demand, few sales have occurred in any description, but sellers remain firm. Persian blues quoted 62s. 6d. to 65s., green 55s. to 57s. 6d., and white 50s. to 52s. 6d.

GINGER.—Large supplies of Cochin met a slow demand. Of nearly 1,700 packages only 290 sold; good, bright medium, and bold cut and scraped at 50s. to 50s. 6d.; medium native cut and scraped, little limed, at 43s.; small ditto. at 27s. 6d. to 28s.; ends at 22s. to 23s.; Calicut rough at 20s. to 23s. Jamaica, in moderate supply, realised rather higher prices. Of 415 packages, 332 sold, fine bright at 76s.; fair to good at 66s. to 71s. 6d.; low middling to middling at 55s. to 64s. 6d.; common to good common at 48s. to 54s.; Rhatoon, 45s. to 47s.

GLYCERIN.—In spite of the firmness of the crude article, the quality of which best suitable for refining purposes is quoted as high as £32 to £33 per ton, the refined article remains exceedingly dull and weak at 48s. to 50s. per cwt. for English, and 52s. 6d. to 60s. per cwt., according to brand, for German, best white, double-distilled, chemically pure 1,260° quality in tins and cases. It is stated that at present figures the English refiners, if they are not actually losing money, are at least making no profit.

IODIDES AND IODINE—Quiet at the prices quoted last week. The commercial quality of Iodine is also unchanged at 7½d. per oz.

IPECACUANHA.—There has been an unexpected arrival this week of about 20 bales Rio, which has so far, however, had no effect on the market, which remains steady at 15s. to 15s. 6d. per lb. for Rio; there is, however, no business reported. A few bales of Carthagena have, it is said, changed hands at 11s. 6d. to 12s. 3d. per lb.

LITHIA SALTS—Are in good demand at 11s. to 11s. 3d. per lb. for the Carbonate, the other salts being quoted in proportion according to quantity.

MERCURIALS—Are unchanged at 3s. 3d. per lb. for White Precipitate, 2s. 6d. per lb. for Corrosive Sublimate, 2s. 10d. per lb. for Calomel, 3s. 2d. per lb. for Red Oxide, 3s. 3d. per lb. for Yellow Oxide, 2s. 3d. per lb. for White Sulphate, and 2s. 2d. per lb. for Sulphuret with sulphur.

MORPHIA—Very firm, especially for early delivery, at 4s. 10d. to 5s. per oz., according to quantity, etc., for the Hydrochlorate Powder.

OILS (FIXED) AND SPIRITS.—Linseed—The market is firmer, especially for forward delivery. London, spot, pipes, £20 to £20 2s. 6d. per ton; barrels, £20 5s. to £20 7s. 6d.; September-December, £19 7s. 6d. to £19 10s.; January-April, £19. Hull, spot, naked, £19 10s.; September-December, £18; January-April, £17 15s. Rape steady; ordinary brown spot, £21 17s. 6d. to £22; September-December, £22; refined, spot, £23 5s. Ravison, naked, spot, and September-December, £18 10s. Cotton firm; London crude, spot, £17 5s.; August, £17 10s.; refined, spot, £18 15s. to £20, according to makes. Hull, naked, refined, spot, August and September-October, £16; November-April, £14 5s.; crude, spot, and August, £15; November-April, £13 5s. per ton. Olive: Mogador, £30 to £32; Spanish, £32. Cocoanut firm; Ceylon, spot, £25 per ton in warehouse; July-September and September-November, £23 to £23 5s., c.i.f.; Cochin, spot, £28 10s., landed; August-October, £25 15s., c.i.f. Palm: Lagos, spot, £24 per ton. Lubricating Oil: Pale American, spot, 5s. 6d. to 7s. per gallon; black, 5s. to 5s. 9d.; Russian, black, 5s. to 5s. 6d.; pale, 5s. 9d. to 8s. per gallon. Turpentine: Market very strong and again dearer, owing to short supplies in America. Quotations are: American, spot, 32s. 9d. to 33s. per cwt.; September-December, 33s. to 33s. 3d.; January-April, 34s. to 34s. 3d.. Petroleum quiet; Russian, spot, 5⅛d. to 5¼d.; September-December, 5⅛d. to 5¼d. per gallon; American, spot and September-December, 6¼d.; water white, spot, and September-December, 7½d. Petroleum spirit: American, 9d.; deodorised, 9¼d. to 9½d. per gallon.

OPIUM—There is no change to report, the business which has taken place having been only of a retail character. Persian is firmly held at 11s. 9d. to 12s. for fine. Demand for same has, however, also become slow.

OXALIC ACID—Is unchanged at 3d. to 3¼d. per lb. nett free delivered London.

PERMANGANATE OF POTASH.—There appears to be some uncertainty as to the exact position of this article, the agents of the make most in favour quoting 60s. per cwt. for small crystals and 65s. per cwt. for large crystals in 1-cwt. kegs. There are, however, offers in the market of inferior makes as low as 50s. per cwt. It is said that the late low prices actually showed makers a loss.

PHENACETIN—Continues dull and weak at 3s. 6d. to 3s. 9d. per lb. for crystals and for powder in quantity.

POTASH COMPOUNDS—Are quiet, but fairly steady at nominally same prices as were quoted last week.

QUICKSILVER—Is only quoted from first hand. Importers' price is £8 7s. 6d. per bottle of about 76lbs. net. The fact that second-hand does not offer points to the probability of a further advance in price before very long.

QUININE.—Makers of best German brands still quote 1s. 4d. per oz. for the Sulphate in 100-oz. tins and for 1,000-oz. lots, while the speculative market is rather firmer at 1s. 2¼d. per oz. for B. and S. and/or Brunswick on spot, and 1s. 2½d. per oz. for October delivery. The landings during July were 96,992 oz., and the deliveries 70,176 oz., making the stock on July 31, 2,743,216 oz. against 1,697,056 in 1898. The exports of Java bark for July were 940,000 Amsterdam lb., against 1,172,000 Amsterdam lb. last year, making a total for the seven months of 6,030,800 Amsterdam lb., against 6,089,000 Amsterdam lb. in 1898.

SALICINE.—In consequence of bad yield of the new crop of Willow Bark, in combination with scarcity and dearness of same, makers advance price of this article 2s. per lb. to 12s. 6d. per lb. for smaller quantity, and even at this advanced price they do not appear to be very anxious to book any large orders.

SANTONINE.—It is reported that a further advance in price may possibly take place; meantime, price remains firm at 7s. 3d. to 7s. 6d. per lb. for small lots.

SHELLAC—Is somewhat quiet on the spot, with only small sales at fairly steady rates; the market for "Futures" remains, however, firm. For August delivery 200 cases TN have been sold at 65s. per cwt. in warehouse, while for arrival, near position, there are buyers of TN at 62s. 6d. per cwt. c.i.f., and October-December steamer at 64s. per cwt. c.i.f.

SODA COMPOUNDS—Are practically without change from last week. We therefore refrain from quoting, referring our readers to last week's issue.

SPICES (Various).—Black Pepper: 95 bags Tellicherry sold at 5⅛d. to 5¼d.; 340 bags Singapore bought in. White Pepper: Nothing offered. Chillies: 22 bags Natal sold, fair bright at 41s., good red at 37s. 6d., pickings at 23s.; 66 packages Japan bought in, good bright at 36s. to 38s. Cassia Vera: 120 cases bought in, fair Padang quill at 30s. Cinnamon dull: 143 packages Ceylon bought in, chips at 3¼d. and bark at 1½d. to 2½d. Mace quiet: of 26 cases Penang 4 sold, fair broken at 1s. 3d. to 1s. 4d.; 20 packages West Indian sold, fair to good red at 1s. 6d. to 1s. 9d. Nutmegs quiet: of 35 cases Penang only 2 cases sold, 150's partly shrivelled at 8d.; 69 packages West Indian sold, 64's at 2s. 1d., 73's at 1s. 8d., 85's at 1s. 4d., 97's at 1s. 1d. to 1s. 3d., 106's at 11½d. to 11d. Pimento neglected: of 807 bags only 72 sold at 3d. to 3¼d.

SULPHATE OF COPPER—Is rather weaker at £24 to £25 10s., according to make, etc., and for prompt delivery.

SULPHONAL—Remains *in statu quo*. The two principal makers maintain their price of 17s. per lb. for both crystals and powder. There are, however, sellers at below these figures, and the question as to whence the apparently almost unlimited supplies of second-hand (?) Sulphonal are drawn remains a puzzle to most people.

TURMERIC—Has remained very quiet, and no sales of importance have been made, but prices are unchanged; Bengal at 18s. 6d., Madras fair to good bright finger at 25s. to 27s. 6d., Cochin finger 17s. 6d. to 18s., ditto split bulbs at 9s., and China finger at 18s.

Newcastle-on-Tyne Chemical Report.

August 2, 1899.

Fair chemical business is still passing on this market. Shipping orders are plentiful for the Baltic and Mediterranean directions, but as stocks of some makers are running down owing to the warm weather interruptions, a slight scarcity is experienced in Soda Crystals, Bleaching Powder, and Caustic Soda. Prices generally are unaltered, but firmly quoted as follows:—Soda Crystals, 45s. to 47s. 6d.; Bleaching Powder, £5 10s. to £5 12s. 6d.; Caustic Soda, 70 per cent., £7 5s.; Soda Ash, 52 per cent., £4 5s. to £4 10s.; Alkali, 52 per cent., £5 to £5 5s.; Sulphur, £5 per ton.

Manchester Chemical Report.

August 2, 1899.

The excellent reports which have appeared for some time past of the chemical trade are now receiving extra confirmation from the centres of production at Widnes and St. Helens, while in the Manchester district manufacturers are fully booked with orders for some time to come. Last week's advance in Caustic Soda has been well maintained, and there is every possibility of another advance in this article in the near future. Ammonia Alkali 58 per cent. is scarce, and if anything higher for prompt delivery; but in Soda Ash and Soda Crystals there is no quotable change. Salt Cake for prompt is quoted 22s. to 23s. in bulk on rails, and forward 25s. to 27s. 6d. per ton is about the figure. Bleaching Powder remains firm at the advance. Chlorate of Potash and Soda are steady at 3¾d. to 4d. respectively. White Powdered Arsenic is the turn easier at £19 per ton, ex ship, Garston. Aniline Oil is dull at 4½d., and Salt at 4d. Brown Acetate of Lime is about half-a-crown per ton lower, but in Sulphate of Copper there is no change. Benzols are fairly firm, but Naphthas are somewhat lower both for solvent wood (white colourless) and miscible, but there is very little offering. Tin Crystals are dearer at 9¼d. per lb., but Foreign White Sugar of Lead is lower at £22 per ton, c.i.f. Acetate of Soda firmer at £12 15s. per ton on rails. Carbonate of Ammonia is easier, but Muriate is in more enquiry. Yellow Prussiate continues steady, and Lancashire make is unchanged at 8d. to 8½d., according to quantity.

Liverpool Market Report.

August 2, 1899.

Trade has been dull during the week due to the proximity of the holiday season, and several regular articles of commerce have not even sold to a sufficient extent to enable one to base anything more than a nominal quotation. This is particularly so with Linseed and Canary Seed. In Oils slight advances may be observed in Cotton Seed Oil and Spirits of Turpentine, whilst Olive Oils of all kinds close very firm and at higher rates. Attention is worth directing to the prices obtained for Beeswax, Chilian Quillaya Bark, and a consignment of Scammony Root. Chemicals are still quiet with only unimportant alterations in price.

AMMONIA SALTS.—Carbonate is firm at 3¼d. per lb.; Sal ammoniac firm at 33s. and 35s. per cwt.; Sulphate without alteration, £12 2s. 6d. per ton.

BEESWAX.—14 packages of Sierra Leone sold at £6 per cwt.; 15 sacks of Chilian made from £6 17s. 6d. to £7 12s. 6d. per cwt. 23 bales of Gambia were also disposed of privately.

BLEACHING POWDER—Is steady but quiet at £5 per ton.

CANARYSEED.—Turkish is easier, and is quoted at 38s. to 39s. per 464 lbs., but there have been no sales reported.

CARNAUBA WAX.—Inquiry has been better, and private transcations of a satisfactory nature have been concluded.

COPPERAS—Is very firm at 37s. to 40s. per ton.

COPPER SULPHATE—Is quiet at £24 15s. per ton.

OILS (FIXED) AND SPIRITS.—Castor Oils are in moderate demand at the following steady prices:—Calcutta, 2⅞d. per lb.; French, 1st pressure, 2¾d.; 2nd pressure, 2$\frac{9}{16}$d.; 2nd quality Sulphur, 2⅝d.; Madras, 2¾d. per lb. Olive Oil of all sorts is in reduced quantity here and prices rule very firm. Candia and Levant Oils are £31 10s. to £32 per tun. Spanish Oils for shipment are quoted at £32 to £32 10s. per tun. Linsced Oil of Liverpool make is quiet but steady at 21s. 9d. to 22s. 6d. per cwt. Cotton-seed Oil: Liverpool refined has advanced slightly, and is firmly held for 17s. 6d. to 17s. 9d. per cwt. Spirits of Turpentine: Early in the week lots were offered at 31s. 9d. per cwt. in a vessel near at hand, since that the price has risen to 32s. 9d., and the article is very strong at present.

POTASH SALTS.—Bichromate 3¼d. per lb.; Chlorate 3½d. to 3¾d. per lb.; Cream of Tartar, 75s. to 80s. per cwt.; Prussiate, 8d. to 8½d. per lb. Pearlashes declined to 30s. per cwt. Potashes down to 21s. 3d. and 21s. 6d. per cwt. Saltpetre 22s. per cwt. 100 tons of Calcutta under 5 per cent. sold privately at firm rates.

QUILLAYA BARK.—Chilian sold at £13 7s. 6d. per ton, about 5 tons in all. Holders ask £13 10s. to £13 15s.

SCAMMONY ROOT.—13 bales sold, ex quay, at 21s. per cwt.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax, £16 to £16 10s. per ton. Caustic firm at recent advance, viz., 76 to 77 per cent., £8 5s. per ton; 70 per cent., £7 10s. per ton. Crystals, £3 per ton. Nitrate selling in small amount at 7s. 6d. to 7s. 9d. per cwt.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. EDWARD PECK, East Dereham.

Cannot Repeat. Sponge Bags, best check (Maw's sizes), No. 2, 5s.; 3, 6s.; 4, 8s. 6d.; 5, 9s. 6d.; 6, 10s. 6d. doz. Bathing Caps, circular, best check, 5s. 6d. Eye Shades, celluloid lined green, rights, lefts, 2s. Enema Syringes, I.R. bottle, bone pipes, best English, red, green, black, 1 oz., 1s.; 2 oz., 1s. 3d.; 3 oz. 1s. 6d.; 4 oz., 1s. 9d. each. 10s. lots post free. Cash returned if sold.—Warnes, Chemist, 333, Gray's Inn Rd., W.C.

Glass Bottles.—2½ gross ½-oz. actinic green round-shouldered vials, stoppered, 9s. 6d.; 1 gross ½-oz. ball-shaped stoppered perfumes, 12s.; 8 gross 4-oz. blue wide-mouth direct squares, 6s.; 7 gross 2-dr. homœopathic vials, spouted, 2s. 6d.; 16-gross 2-oz. white fancy perfumes, 6s.; 23 gross 3-dr. heavy round-shouldered vials, 3s.; 6 gross 1-oz. Lubins, 5s.; 3 gross 6-oz. white flint Lubins, 16s. 6d.; 3 gross 8-oz. blue-tinted Corbyns, 8s. gross. Samples sent for stamps 6d. Apply, Hearns (Limited), Lea Bridge, Clapton, London, N.E.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

(Received too late for Classification.)

REQUIRED, position as MANAGER or SENIOR in a first-class Pharmacy. Outdoors. Major Qualification. 7 years with Messrs. Giles, Schacht & Co. Apply, SMITH, 42, Carisbrooke Rd., Walton, Liverpool.

Obituary.

Hinde.—On July 25, Albert Henry Hinde, Chemist and Druggist, Lowestoft, aged 37. Mr. Hinde had been for some years connected with the Pharmaceutical Society as an associate, and latterly as a member. His death occurred under extremely sad circumstances. It appears that shortly before 11 o'clock in the evening he complained of the intense heat, and left his house to go for a bathe. As he did not return a search was made, and his body was discovered on the North Beach, where it had evidently been left by the receding tide. Deceased could not swim, and whether he was seized with cramp or got beyond his depth is not known.

Malcolm.—On July 27, Alexander Malcolm, Chemist and Druggist, Dundee. Aged 63.

POLITICAL GOSSIP.

The Tail End of a dreary and somewhat unprofitable Session has been rendered quite sensational by the remarks which the Lord Chancellor is reported to have uttered on the passing of the Companies Bill through the House of Lords on Thursday, the 3rd instant. Those remarks are given *in extenso*, and fully commented upon elsewhere in this issue, and will doubtless afford material for reflection as well as possible misinterpretation during the autumn. The Bill was sent to the Commons as per ordinary routine, and that House duly sent a respectful message to the Peers asking for a copy of the proceedings of the Select Committee together with minutes of the evidence; so that all things might be accomplished as ordained by official procedure. But there the incident closes. All persons concerned are now invited to fix their hopes upon next Session, which is expected—like most Sessions—to be an exceptionally favourable one for dealing seriously with the company question. Has not Mr. Ritchie practically pledged himself to bring in a Bill, and are not several of his supporters as well as some opponents anxious to have the subject discussed? Sir A. Rollit (S. Islington) is so earnest in this connection that he has taken time by the forelock by giving notice that he will move next Session that reform of the law relating to joint-stock companies is urgently needed in the interests of commerce. He will suggest that legislation based upon the draft Bill which was printed with the Board of Trade Report in 1895 ought not to be longer delayed.

An Interesting Return was presented to the House on Tuesday, and ordered to be printed. It consists of particulars and statistics of all joint-stock companies formed since January 1, 1898, and December 31 of the same year, and will include the names, objects, and business address of the companies, together with amount of nominal capital, number of shareholders, distribution of shares, and the number as well as the total amount of calls thereon. A distinction is drawn between those concerns which still exist and those which have been, or are in process of being, wound up; and the companies still in operation are labelled with their paid-up capital. Mr. Ritchie was the prime instigator of this return, and it would appear that he is determined to have a few useful compilations of this kind as material for next Session's onslaught on commercial irregularities.

Briskness is a not unusual characteristic at the end of a session, hence it will surprise no one that Parliament has done more work during the past three weeks than in any previous period of its sitting. The Food and Drugs Bill having emerged from Committee of the House of Lords, speedily passed its third reading, and was sent on Thursday with amendments to the Commons for consideration. The following day it appeared on the Commons Notice Paper, and on Bank Holiday the Lords Amendments were agreed to without discussion and again returned to the Upper House, where the Bill now awaits Royal Assent.

The Chief Merit of the new Act lies in the powers given to the Local Government Board and the Board of Agriculture to put the Act of 1875 into operation in cases where local authorities may be lax or are animated by frugal ideas. It is the duty of every local body entrusted with the execution of the laws relating to the sale of foods or drugs to appoint a public analyst, and to direct their officers to take samples from time to time for analysis. If there should be default in this direction, the Government Department concerned may now send its own officer to take samples and secure obedience to the law. But what is more, the expenses incurred by the official and the Department in such a case will have to be paid by the defaulting local authority—a distinct incentive to walk in the path of duty; for most localities would be able to manage local offences of this kind cheaper than a Government officer could do it for them. Thus there is every reason to suppose that the most noticeable effect of the new Act will be manifested in an increased local activity. and it is highly probable that chemists and druggists will be favoured with more frequent visits by the local officer who is charged with the duty of watching the public interest so far as the purity of drugs is concerned. There is, happily, no reason for conscientious pharmacists to dread such visits. Another point of interest in the Act is the provision which gives the Local Government Board power to frame regulations respecting the standard of qualification for public analysts. Now Mr. Long has already hinted at the ideal qualification, and we alluded to it some little time back, but there is one consideration which might be urged before the head of the Department concerned, and that is that, in the interest of chemists and druggists, analysts who are called upon to deal with samples of medicinal substances or preparations should have had some sort of a pharmaceutical training. The Act defines "food," but does not attempt to answer the question, "What is a drug?"; it also specifically includes flavouring matters and condiments, though what standard of purity is to apply in such cases is left an open question. It is proposed to reprint the principal clauses of the new Act in the next issue of the Journal.

Telegraphic Addresses must not be unduly abbreviated, says Mr. Hanbury, unless one pays the prescribed fee and revels in the possession of an officially registered address. Replying to Mr. Trevelyan (Elland) on Friday, 4th inst., Mr. Hanbury stated that the Post Office authorities had to insist upon a full address for all telegrams in order that delivery might be effected by the Department without difficulty or delay, and without reference to local directories. There is always a risk of insufficiently addressed telegrams taking up a lot of time and thereby hindering the delivery of full-worded wires. Mr. Brown may be a well-known chemist in Blanktown, but Mr. Hanbury thinks it is unfair to address a wire "Brown, chemist, Blanktown," and burden the receiving office with searching for the local list of chemists to determine the exact address to which the messenger is to be despatched. The moral is, pay an extra halfpenny or so, and the Post Office will bless you and deliver your wires with promptitude. Incidentally it was stated in the course of the reply to Mr. Trevelyan that the Post Office does not encourage the registration of telegraphic addresses and is not prepared to reduce the registration fee.

THE PURITY OF FOOD AND DRUGS.

Copper in Peas.—At the Tottenham Police-court on Thursday, August 3, Messrs. Tyler and Brasher, grocers and provision dealers, Essex Road, Islington, were summoned for selling peas which to their knowledge were coloured with copper sulphate so as to render them injurious to health; also for selling peas which were not of the nature, substance, and quality demanded, being adulterated with copper sulphate to the extent of 2·5 grains to the pound.—Edward Bevan, Middlesex County Analyst, gave evidence to the effect that he found five times as much copper in the peas as was required to preserve them. He was of opinion that peas so coloured were injurious to health, as copper salts were well known to be poison.—For the defence it was urged that the second summons must fail, as anyone who purchased peas in tins must be aware that he was purchasing an article which had gone through a process of preservation. With regard to the first summons, it must be proved that the defendants not only knew that the peas contained a foreign substance, but that they contained it in such quantity as to make them injurious. The defendants pleaded that they were not aware of this. They were obliged to stock tinned peas and bought what they considered to be the best brand.—It was suggested from the Bench that the defendants might have opened a tin and had the peas analysed. The magistrates held that the peas were coloured in such a manner as to be injurious to health, and that the defendants did not use reasonable diligence to ascertain the fact.—A fine of £1 and costs was imposed with respect to the first summons, while the second was withdrawn. Two other cases were heard for similar offences, the defendant in one case being fined 5s. and costs, and the other 10s. and costs.

Copper in Peas.—William Elliff, grocer, Yarmouth, was summoned at the County Petty Sessions for selling preserved peas containing copper sulphate to the extent of half-a-grain of copper to the tin.—The magistrates said that as it had been decided that copper was injurious to health, they had no option but to convict. Though defendant had not himself put the copper in the peas, still he was the person responsible under the Act.—Fined 1s., and 9s. 6d. costs.

Copper in Peas.—At Staines on Monday, July 31, Messrs. Budgen and Co. (Ltd.), grocers, were summoned for selling bottled

green peas which had been mixed or coloured with copper equal to 2·4 grains of copper sulphate per pound. There were two informations relating to one purchase, proceedings being taken under Sections 3 and 6 of the Act.—The analyst having given evidence as to finding copper in the peas, and that in his opinion it was in sufficient amount to be injurious to health, Dr. C. D. Morris was called by the prosecution, and stated that he considered 2·4 grains of copper sulphate per pound would be injurious to health. He had personal knowledge of poisoning by pickles, having had a case of the kind last year.—The defendants pleaded that they bought and sold the peas believing them to be perfectly safe.—The Bench decided that there must be a conviction. The magistrates had no doubt that the defendants sold the peas precisely as they bought them from the wholesale house, and were under the impression that the bottle did not contain enough copper to be injurious to health. But the evidence showed that it was injurious to health, and that evidence had not been refuted.—The prosecutors having intimated that they would be satisfied with a penalty in respect of one information, a fine of £1 and costs, including the county analyst's fee and a guinea for Dr. Morris, was imposed. Notice of appeal was given.

The Food Preservative Danger.—Referring to the fact that for some time past the dangers of the use of antiseptics in the preservation of food have been increasingly apparent, and that boric acid, salicylic acid, and many other chemicals of a more or less potent nature have been discovered in food-stuffs of various kinds, and have in several instances formed the subject of prosecutions, the *Medical Press* remarks that it can hardly be said that the judicial attitude with regard to this form of adulteration has been yet clearly and authoritatively defined. The scientific knowledge of the agency of bacteria in putrefaction is of recent growth, and the subsequent practical applications of the newly-born science have, in many instances, introduced into the ethical life of the community problems that await a satisfactory solution. So far as the addition of chemical preservatives is concerned the greatest offenders have hitherto been the milk and the butter man. As a general rule the drug chosen for their purpose is comparatively harmless, but a report comes from New York of the use of a deadly poison, arsenic. The fact was brought to light by the poisoning, in Brooklyn, of nine persons, two of whom are not expected to live. The occurrence was traced to milk, an analysis of which revealed the presence of arsenic. As the outcome of further investigation the dairyman confessed that he used the poison systematically in order to keep the milk sweet. Medical men generally, observes our contemporary, will do well to bear in mind the fact that some cases of obscure illness may be due to food preservatives. If the milk man is going to embark in a wholesale round of chemical experimentation, the community will find a fresh terror added to their daily life.

Camphorated Oil.—At the Barnsley West Riding Police-court, on Wednesday, August 2, Christopher John Yardley, grocer, draper, and general dealer, Roystone, was charged with selling camphorated oil which did not comply with the requirements of the British Pharmacopœia.—Inspector Bundy said he went to defendant's shop and purchased a bottle of camphorated oil, a portion of which he caused to be analysed. A certificate had been received which stated that the sample only contained 11·3 per cent. of camphor, or only about one-half of the necessary amount.—Mr. J. Raley, for the defence, said the oil was purchased in 1897, before it was a standard drug. Defendant was a grocer, draper, and general dealer, and not a chemist or druggist, and therefore did not thoroughly understand the matter.—The Chairman said it was not a case which warranted a severe penalty, and defendant would only be fined 10s. and costs.

IRISH NEWS.

Re The Ulster Medical Hall (Davidson and Hardy, Belfast).—We desire to tender our sincere apology to Messrs. Davidson and Hardy for the insertion of a groundless paragraph regarding their business in our issue of May 6, under the head "Irish News." We find that same was wholly incorrect, and we deeply regret that any such statement should have appeared in our Journal.

ENGLISH NEWS.

The Royal Botanic Society is again to be asked, at the annual meeting of the Society to be held in the Gardens this week, to establish classes for the study of botany, to be open to all students, and to erect a large floral hall to serve as a winter garden wherein exhibitions, flower shows, receptions, and musical promenades can be held in all seasons and in any weather. Notice of the necessary resolutions has been given by Mr. J. S. Rubinstein.

Tiemann's Ionone Patent.—In the High Court of Justice, Chancery Division, before Mr. Justice Cozens-Hardy, on August 3, the case *re* Tiemann's Patent (8,736 of 1893) came on for hearing. This was a petition by Messrs. Franz Fritzsche and Company for revocation of a patent granted to Johann Carl W. F. Tiemann, of Berlin, for the manufacture of new chemical substances suitable for perfumery, confectionery and the like—in other words, "artificial violet." Mr. Moulton, Q.C., Mr. Astbury, Q.C., and Mr. Colefax were for the petitioners; and Mr. Cripps, Q.C., Mr. T. Terrell, Q.C., Mr. A. J. Walter and Mr. J. A. S. Bucknill for the respondents, Messrs. De Laira and Company. At the conclusion of the arguments and evidence, Mr. Justice Cozens-Hardy said the proceedings were regulated by Section 26 of the Patents Act, 1883, under which the petitioner must deliver with the petition particulars of the objections on which he meant to rely, and no evidence could, except by leave of the Court or Judge, be admitted in proof of any objection of which particulars were not so delivered. There was a remarkable provision that the respondent was entitled to begin and to give evidence in support of the patent. This provision, which was very unusual, seemed to his Lordship to be highly inconvenient, for the patentee could scarcely be expected to know the full case against him until the petitioner's evidence had been given, and in the present case the most important evidence in support of the patent was given in reply. His Lordship said he doubted whether the case would have occupied so much of the public time if the petitioners had in the first instance put forward their case attacking the patent and left the respondents to meet that evidence as they best could. The patent was for two chemical products, the existence of which was discovered by Dr. Tiemann, called respectively pseudo-ionone and ionone, the former being of no value except as a material from which the second, ionone, could be obtained. Ionone itself was a very valuable article, having a beautiful violet odour, and the invention was undoubtedly useful. The question was whether, having regard to the particulars of objection, the patent was wholly bad. No question of infringement was or could be raised on a petition of this nature. After going through the specification, which described the patented process in chemical and highly technical language, and stating the effect of the objection, his Lordship said that a chemical patent was addressed to skilled chemists. It was not good unless the directions given, if fairly followed by a competent chemist, produced the promised result. He must not be left in the dark and forced to make fresh experiments to discover what was the real invention. The patentee must honestly disclose everything necessary for the easy and certain procurement of the commodity for which the patent was granted. The patent must be interpreted according to the state of chemical knowledge at its date, and not according to the state of chemical knowledge when the validity of the patent was litigated. His Lordship then dealt with the evidence, and concluded by saying that under the circumstances, believing as he did that Dr. Tiemann had made a valuable discovery which he had honestly disclosed in his specification, his Lordship was not prepared to hold that the patent was void by reason of any insufficiency of description in the specification. It was unnecessary to go in detail through the various items of the particulars of objection, and sufficient to say that none of them had been established. The petition must, therefore, be dismissed with costs. Costs were given upon the higher scale.

SCOTTISH NEWS.

Glasgow School of Pharmacy.—The Kinninmont Gold Medal has this year been awarded to Henry Rodwell. This is now the third year in succession that this honour has been gained by a student of this school, of which Mr. John Lothian is the Principal.

FRENCH NEWS.

To Bleach the Negro—Another Use for Electricity.—It is known throughout the world of science, says *La Science Française*, that electricity can exert a characteristic action on the tissues and liquids of the organism. What is the exact nature of this action? What is its exact mechanism? Is it exclusively mechanical or exclusively chemical; or is it alternately mechanical and chemical? Does it act by electrolysis or by vibratory massage? Over all these delicate question hangs still a pall of mystery. But this does not prevent physiologists and therapeutists from making common use of electricity in all its forms, and in particular by the method of electropuncture, by which they sometimes obtain results both curious and encouraging. The method is used, not only for destroying undesirable growths of hair, eradicating birthmarks, warts, etc., but also with success for erasing tattoo-marks that had been supposed to be indelible. Electricity, therefore, modifies the tissue and liquids of the living body when it traverses them, either by provoking certain chemical reactions or certain changes of state, or by suspending or disturbing the nutrition of the blood vessels and nerves. These facts are, perhaps, not easily explained, but they are undeniable, and although the laws that govern them remain hidden in obscurity, they none the less manifest themselves by visible and tangible effects, one of the most common of which is decoloration. It is extremely rare that in the cases noted above of the surgical uses of electricity, it does not leave a scar so distinct that it alters the colour of the skin, on which appears a white spot of considerable size. It is probable that it exerts a peculiar selective action on the colouring matter or pigment of the epidermis. . . . The epidermis consists of three distinct layers of cells, one above the other. In the deepest layer, the so-called "mucous layer of Malpighi" is found the colouring matter to which the skin owes its hue, and which is known as "pigment." The pigment exists in all races in the form of brown granulations, mingled with the cells of the "mucous layer." The only difference in this regard between a negro and a white man is that in the negro these granulations are more numerous and larger. If we could, by any process whatever, destroy or disorganise these pigmentary infiltrations, which are, as it were, natural tattoo-marks, the skin would present in the spots so treated, even if it were the skin of a negro, the characteristics of an Albino's skin, whose peculiarity is that it lacks pigment altogether. Now it is neither impossible nor improbable even that electricity acts on the pigment. We have a right to suppose that it does, since it always leaves behind it light-coloured scars. Hence, if you wish to bleach a Kaffir or a Zulu, a Yolof or an Abyssinian, instead of ruining yourself by buying soap and rice powder, set to work to depigmentize him electrically.

A Disagreeable Fact.—In the Middle Ages the Germans had the reputation of being the hardest drinkers in Europe, and next to them came their Teutonic cousins the English and the Dutch. Nowadays the French, or, at least, the Parisians, have the ill-repute of being greater victims to alcoholism than either the English, Dutch, or Germans. Such is, indeed, the testimony of the recent report of a great Paris hospital. Out of 1,000 patients examined, 70 in the 100 amongst the men, and 31 in the 100 amongst the women were hopeless "alcoholists." The whole of the 1,000 lived in Paris. One of the number, the keeper of a Paris wineshop, gave the following autobiographical account of his normal life each day:—"At 6.30 a.m. I rise. At 7 a.m. I take my coffee and brandy. About 9 a.m. I take three or four glasses of white wine, and, perhaps, eat a little therewith. Between 9 and 'déjeuner' I usually take three or four 'apéritives'—(bitter, vermouth, or absinthe). For my second breakfast I have one litre of white wine, and then coffee and rum. During the afternoon I take various 'consommations.' Between 5 and 8 p.m. I take some more 'apéritives,' on an average about three or four. At 8 o'clock I have my dinner, or supper, with which I drink one litre of red wine. Between that and bed-time I consume a few glasses of brandy or liqueur." The customers of this unwearied "tippler," so far as they can afford it, follow his terrible example, says the report. When Parisians begin to realise the foregoing, we may, perhaps, hope to see at least the "whisky flask" left out of the hideous cartoons wherewith they invariably depict the average Englishman. But they are usually blind to their own shortcomings, poor creatures.

An Ignorant Drysalter.—Mademoiselle Marie Marino, a pretty little dressmaker, living in the Rue St. Denis, visited a "marchand de couleur" in the same street, in search of "something to kill bugs." This omniscient individual gave her a mixture of hydrochloric acid and sulphydrate of ammonia, ordering her to well shake the bottle and paint it around the haunts infested with these summer trippers. On reaching home she shook the bottle, with the result that the cork blew up to the ceiling and the liquid splattered all over her, fearfully burning her face and neck and destroying her eyesight. She was immediately taken off to the hospital, where she now lies in a precarious state. There is no lack of pharmaciens in that quarter, yet chandlers are permitted to indiscriminately deal out acids, etc., in wholesale quantities, whereas the pharmacien is not permitted to do so without a prescription. Queer anomaly that!

Aphthous Fever.—The outbreak of aphthous fever which had for so long visited the Côte-d'Or of France, and which a few weeks ago seemed to have been thoroughly stamped out, has re-appeared with even greater intensity than before, and now affects an area of more than thirty kilometres around Dijon. The authorities are bestirring themselves in the matter, and hope this time to effectually overcome it.

Inauguration of the International Hospital.—Wednesday morning witnessed the solemn inauguration of the International Hospital installed by Dr. Bilhaut, 180, Rue de Vangirard. An enormous and distinguished gathering of the interested spectators was present for the ceremonial, which was presided over by Doctor Chassaing, Deputé of the Seine. Monsieur le Docteur Le Fort was delegated to represent the Minister of Public Instruction, who was unable to be present at this important function.

Medical Congress.—The Congrès de Medicine terminated last week by a visit to the Pasteur Institute, where Dr. Calmette demonstrated in the presence of his confrères the anti-toxic action of the anti-venomous serum of which he is the inventor. Having before him three rabbits, Dr. Calmette injected in the vein of an ear of one, a cubic centimetre of venin. The rabbit which had received the injection of serum remained unaffected, whereas the second died twenty-two minutes after, and the third, into which the anti-venomous serum had been injected five minutes after inoculation by the venin, also remained in apparently its ordinary state of health. These experiments greatly interested the Congressionists, who also expressed their admiration of the installation of Dr. Calmette's laboratory.

A Thesis.—The last thesis sustained before the Faculty of Medicine of Paris evoked much favourable comment, equally on account of its originality as for its matter. Its title was "Laughter and Exhilarants," and was delivered by Dr. J. M. Raulin, of the University of Paris, former externe of the Paris hospitals, and student of the "Ecole Nationale du Louvre." This highly praiseworthy thesis has been retained for the "Concours des Medailles."

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. Harry Oldham, of Hyde, late with Messrs. Woolley, Sons and Co., of Manchester, has taken over the business of Mr. A. Shaw, at 413, West Derby Road, Tue Brook, Liverpool.

Mr. Henry Doyle Brice, M.P.S., pharmaceutical chemist, has been successful in gaining the Bird medal and prize, value £14, in connection with Westminster Hospital, also a certificate for materia medica and pharmacology, and a certificate for midwifery.

Mr. J. Jones is retiring from the old-established pharmacy, Castle Square, Carnarvon, and is succeeded by Mr. W. H. Parry from Messrs. De Castro and Co., Belgravia, London.

TRADE NOTES.

The I. and I. Food.—The Infant and Invalid Food Company, Ltd., Cereal Buildings, 54, City Road, London, E.C., submit a sample of the I. and I. food. This food is put up in 6d. packets, and 1s., 2s., 2s. 6d., and 4s. tins, attractively labelled, and giving full directions as to its preparation, etc. The proprietors claim for the food that it is superior to the richest milk in nutritive elements, while being in all cases perfectly digestible. An analysis of the food is stated to have yielded the following result:—

Moisture	8·03
Oil and Fat	3·55
Albuminoids	13·19
Digestible Carbohydrates	72·03
Fibre	1·00
Mineral Matter (Ash)	2·20
	100·0

In addition to its value as an infant food, the food is recommended for nursing mothers for increasing and enriching the supply of milk.

Liquid Food.—Carnos, Limited, Wragby Street, Great Grimsby, send a specimen bottle of "Carnos," which is claimed to be the most nutritious of all food extracts. In appearance, colour, and flavour it resembles the richest beef gravy, and may be used as beef tea, soup, or as a nutritious summer drink; it is also used for making and improving gravies. It is put up in bottles ranging from 1 oz. to 16 ozs. in size, at prices from 4d. to 3s. 6d. each. Carnos Invalid Extract is a special preparation in 2 oz. bottles at 1s. each. Two-ounce pocket flasks of Carnos, fitted with screw stopper and metal cup, are also supplied at 1s. 6d. each, being intended for the use of cyclists and tourists.

Chinosol as a Disinfectant.—The Chinosol Hygienic Company, 36, St. Mary-at-Hill, London, E.C., has recently published a useful pamphlet on chinosol and its use in inodorous disinfection and general sanitation in technical industries, agriculture, horticulture, etc., and for domestic, hygienic, and toilet purposes. It is a popular treatise based on collected facts, and demonstrating the importance of chinosol as a disinfectant and deodorant, written by B. Kühn, the Company's manager, to whom application should be made for further particulars.

ITEMS OF INTEREST.

Accelerated Extinction of Mercury.—Boudouresques recommends the following process for the preparations of unofficial mercurial ointment. To a mixture of vaseline, 30, lanolin, 15, and barium sulphate, 100--mercury, 3,000, are added in portions, each being mixed in for three to four minutes. In this way the whole process of extinction may be accomplished in about half an hour.—*Pharm. Post*, **32**, 180.

Distinction between Winter and Summer Felled Wood.—The section of the tree-trunk to be examined is moistened with a weak solution of iodine. If bluish-violet streaks appear, due to the presence of starch in the wood, it indicates that the wood has been felled in winter.—*Pharm. Centralh.*, **40**, 129.

Sensitive Litmus Paper.—Wobbe has found that a test paper of extreme sensitiveness may be prepared as follows:—Best Swedish filter paper and letter paper, freed from acid by Dieterich's method and dried, is the paper used. Best litmus, 100 Gm., are powdered and extracted with boiling alcohol (90 per cent.) in a flask attached to a reflux condenser, in three successive lots of 500, 250, and 250 Gms. respectively for half an hour each time. The alcoholic extracts are removed, and the residue covered with distilled water, 1,000 Gms., and macerated for 24 hours with occasional stirring. The extract is filtered and the filtrate divided into two portions. One portion is mixed with dilute phosphoric acid, until distinctly red, the other portion is again halved, one portion being mixed with diluted phosphoric acid until just red, and then diluted with the other portion. The solutions thus prepared are filtered through cotton wool after having stood for a day. The prepared paper is saturated with these solutions and dried after Dieterich's method.—*Schweiz. Woch. f. Chem. und Pharm.*, **37**, 125.

POISONING CASES.

Ammonia.—On Saturday, August 5, an inquest was held at Ilkeston, touching the death of a two days old infant, the son of John Beardmore, engine driver, of Rutland Street, Ilkeston. The evidence showed that on the previous Friday the midwife asked for some castor oil to give to the child, and the mother, who was in bed, said the bottle was on the dressing table. The midwife picked up a bottle labelled "Spirits of Sal Volatile," and without observing the label, put the bottle to the child's mouth. The mother noticing that it was the wrong bottle, screamed out. The midwife dropped the bottle, but the child had already taken some of the contents, and after several hours of suffering, died of acute inflammation of the gullet and throat, caused by ammonia poisoning. Verdict, "Accidentally poisoned."

Carbolic Acid.—At Chatham, on Wednesday, August 2, Arthur Steady, aged 17 months, the child of parents residing at Chatham Hill, was discovered lying unconscious in a field near by its parents' home, suffering from carbolic acid poisoning. A bottle containing the poisonous fluid was found beside him, and it is presumed that the little fellow carried it from indoors and drank of the contents. The sufferer was conveyed to St. Bartholomew's Hospital, where he died two hours after admission.

Morphine.—At the Police Buildings, South Shields, on Friday, August 4, an inquest was held on the body of Gladys Jane Samuel, aged seven months, who died at No. 73, Marine Approach, from the effects of morphine. The evidence of the mother, Elizabeth Samuel, was to the effect that on the recommendation of a medical man she occasionally administered glycerin enules to the child. On the previous Tuesday the child needed one of the enules, but witness, being unable to find the box, her sister told her where there was a box containing morphine suppositories, and, thinking that they might answer the same purpose, she administered one to the child. She never read the label on the box, and as the child was a good sleeper she did not think that anything was wrong until her mother said that she thought something was wrong with the baby. A doctor was subsequently sent for, and everything was done to restore the child but without avail. Medical evidence having been given, a verdict to the effect that the child had been accidentally poisoned with morphine was returned.

Strychnine.—A singular case of poisoning has occurred at Altrincham. Two little girls, aged four and two years respectively, the daughters of a local tailor named Ray, found a parcel of what they thought were sweets in their father's coat pocket, and they devoured them with relish. They proved, however, to be tabloids containing quinine, iron, and one sixty-fourth of a grain of strychnine each. The younger of the two girls died at the hospital the same evening (Sunday). At the inquest, Dr. Gore stated that he supplied the tabloids for the "convenience" of Mr. Ray, and they were perfectly harmless if taken as he directed. He thought it was unnecessary to label the box containing them "Poison." A verdict of "death from misadventure" was returned.

Marriages.

Buckingham-Booth.—On July 31, at the Primitive Methodist Church, Sparkhill, Mr. Harry Buckingham, Witton Pharmacy, Aston, Birmingham, to Miss Helena Louise Booth, eldest daughter of the late W. J. Booth, of Dudley.

Medley-Reeder.—On July 31, at St. Andrew's Church, Ashton-on-Ribble, Preston, by the Rev. E. T. Millard, Vicar of Woodplumpton, Fred Medley, M.P.S., Sheffield, to Grace, third daughter of Mr. Samuel Reeder, Lea Road, Preston.

Obituary.

Gantlett.—On August 2, Henry Gantlett, Chemist and Druggist, Marlborough. Aged 40.

Hewlins.—On August 6, Edward Hewlins, Pharmaceutical Chemist, Leatherhead. Aged 77. Mr. Hewlins had been a member of the Pharmaceutical Society since 1853.

Honman.—On August 6, Alfred Taylor Honman, Chemist and Druggist, Harrow. Aged 40.

EXTRACTS FROM CONSULAR REPORTS.

The Olives in the Saffi district (Morocco) for the last three or four years have been damaged by locusts, but this season, according to Vice-Consul Hunot, they show a fairly good crop, and it is expected that there will be some oil for exportation. Vice-Consul Johnston (Mogador) also reports an improvement in the production of almonds, gums, etc. He states that judging from the large arrivals of these articles from the interior it is to be gathered that production is increasing, or rather returning, to its normal standard of ten years ago.

The Imports of Drugs from Great Britain into Belgium during 1898 were valued at £120,360; chemical products, £313,680; resin, bitumen, £1,381,600; soap, £23,800; dyes and colours, including indigo, £180,200; tobacco, £9,520; plants and flowers, £22,800; vegetable oils, £178,000; yeast, £120; alcoholic liquids, £3,840; hops, £46,640. With regard to hops, there was the considerable increase of £44,160 over the previous year, dyes and colours, not including indigo, the import value of which was £24,080, also increased by £60,920, and resin, bitumen by £296,480. On the other hand, the value of chemical products imported decreased by £217,160; drugs, by £48,520; vegetable oils, by £57,080; while yeast fell off to the extent of £109,080.

The Liquorice Trade of Vilayet of Aleppo (Turkey) is reported to be in the hands of two companies, that of MacAndrews and Forbes, of Smyrna (British), and the Stamford Manufacturing Company (American), whose headquarters are at Alexandretta. Almost the entire amount exported is absorbed by the United States of America, the quantity exported last year being 4,662 tons, with a value of £32,535 in excess of that shipped in 1897.

The Import of Chemical Products into Genoa (Italy) during 1898 was nearly the same as the previous year, Great Britain, Germany, and American being the largest suppliers. Of 434 tons of acids, France sent 176 tons; Great Britain, 66 tons; Germany, 47 tons; Austria, 75 tons; and 70 tons from other countries. Out of a total of 4,359 tons of potash and caustic soda Belgium supplied 4,004 tons, and Great Britain 355 tons. Of oxides Great Britain sent 437 tons and Germany 79 tons. Out of 5,160 tons of carbonates, 2,769 tons were from Great Britain, 228 tons from Germany, 616 tons from France, 1,328 tons from Belgium, and 219 tons from other countries. The import of chlorides amounted to 5,788 tons, Great Britain sending 1,771 tons; Germany, 1,608 tons; France, 2,194 tons; and other countries 215 tons. Of the 13,598 tons of sulphates, Great Britain was to the fore with 11,219 tons; Germany, 417 tons; Belgium, 43 tons; France, 7 tons; and other countries, 1912 tons. There were 2,160 tons of paraffin (parafina solida) imported, 609 tons from Great Britain, 9 tons from Germany, and 1,552 tons from America and Canada. In gums and resins, 669 tons went from Great Britain, 449 tons from France, 353 tons from Russia, and 7,358 tons from North America. Of 21,593 tons of dye-stuffs imported, France sent 577 tons; Spain, 575 tons; Turkey, 5,144 tons; Asiatic-British possessions, 890 tons; Great Britain, 427 tons; South America, 2,817 tons, and North America, 11,163 tons.

Sodium Sulphate and Chemicals imported at Spezia (Italy) in 1898, amounted to 306 tons, value £798, and included nearly 285 tons of sodium sulphate from France, the total showing an increase of 100 tons on the previous year. These figures, however, do not represent the actual quantity of chemical products received at Spezia, as chemists draw the greater part of their supplies from Italian wholesale firms and from the agents of British and foreign houses having depôts at Genoa, Milan, etc.

The Necessity for Irroration of the growing vines in the province of Lecce (Italy), Consul Cocoto reports, has not been so urgent during 1898 as in previous years, peronospera not being as troublesome as formerly, and where it did appear it was in a very mild form, consequently a considerable remainder of sulphate of copper existed in the province on the termination of the vintage. This was a doubly fortunate occurrence for the landowners, who had a certain stock on hand at the beginning of the year when the rise in the price of copper took place, as they were only compelled to purchase the balance necessary at the enhanced prices which now rule in this article.

Upon the Success or Failure of the olive harvest the commercial prosperity of Taranto (Italy) depends, and any falling-off in this industry makes itself strongly felt in statistics dealing with the general commercial conditions for the year. This is especially the case as regards the export trade, the quantities of olive oil exported in an average year to Russia forming a considerable proportion of the outgoing commerce. In 1897 out of a total of 1,300 tons of olive oil shipped at Taranto, over 1,100 tons went to Russia, whereas in 1898, owing to the complete failure of the olive crop, only 311 tons of oil were exported altogether, Malta taking 74 tons as compared with 80 tons for the previous year. According to Vice-Consul Thesiger, new markets were found for the inferior oil (which is extracted from the olive grounds by means of sulphuric acid) in Turkey, Egypt, and Tripoli. This quality of oil is much used in the manufacture of soap, and it is worthy of note that the demand, as well as the supply, seems to be gradually falling off. The demand, because chemistry has brought into use other and cheaper equivalents, and the supply because, with the now almost general introduction of hydraulic presses in the place of the old hand-worked machine, so little oil is left in the grounds that the process of extracting it is fast becoming unprofitable.

The Introduction of Machinery also affects very considerably the general characteristics of the olive oil produced. Under the old system three or more distinct qualities of oil were produced, the olives being passed and repassed several times through the presses, each time producing an oil of lesser quality. When no more oil could be extracted in this way, the "sansa," or grounds, were treated with sulphuric acid to produce the inferior oil used in soap making. The introduction of the hydraulic press, however, does away with these distinctive grades, a larger quantity of oil is produced, but the quality, taken as a whole, deteriorates, and the higher class of oil can only be obtained by repeated filtration. But the oil produced in this way, although excellent in colour and appearance, after continual straining, loses much of its flavour, and lacks the fruity taste which distinguished the best oil produced by the old method of extraction.

A New Industry in the Taranto district of Italy, Vice-Consul Thesiger reports, has been established by the opening of a liquorice manufactory capable of turning out 600 to 700 kilos. of stick liquorice per diem. The roots from which the juice is extracted are brought from Calabria and the Basilicata, where the plants are said to grow abundantly.

The Use of Yellow Phosphorus in the manufacture of lucifer matches is to be prohibited in Switzerland from April 1, 1900, while the importation of yellow phosphorus matches ceased on June 1 of the present year, as well as its importation in any form, except for scientific or special purposes, with the permission of the proper authorities. The exportation or sale of yellow phosphorus matches in the country will be illegal after January 1, 1901.

The Method of Cultivating Oysters employed at Spezia is described in an interesting report by Vice-Consul Towsey. The first attempts to cultivate oysters there were made in 1887, and after a few years the industry developed so rapidly that the production rose from about 150,000 oysters in 1891 to more than 6,000,000 in 1898. The method practised is the same as at Taranto, with several modifications rendered necessary by the difference of situation, temperature, etc. This method consists of suspending twigs of lentiscus in the months of May, June and July, in 12 or 13 metres of water, on the inner side of the "diga" or breakwater, across the gulf, which is about 4 kiloms. from the town. These twigs serve as "collectors" for the embryos, and are kept suspended there one or two months. When the twigs are sufficiently laden with young oysters they are removed to the "sciaje" or enclosures, where the twigs are cut into short pieces inserted crosswise into the strands of ropes of esparto grass and again suspended in water varying from 2·80 to 7·20 metres deep. The oysters are kept there for twelve or fifteen months, and when developed and fattened enough they are taken to the depôts closer in shore. Here they are separated from the mussels and sea dates clinging to them and the twigs, scraped, sorted, and packed in baskets (with their mouths upwards to retain water), and despatched by rail to Genoa, Turin, Milan, and other Italian markets. Those kept for local consumption and for re-sorting are placed in baskets of iron wire and kept hanging in shallower water.

THE VALUE OF OPIUM imported into Chefoo (China) during 1898 was £47,587, as against £30,141 in 1897. As Consul Hopkins remarks, a steady decline in the import of Indian Opium has become so customary in recent years that a sudden jump in the value of the drug of over £17,000 is a noteworthy feature. The only explanation to be obtained is an alleged bad crop in Szechuan. The quantities of Indian opium imported during the years 1896, 1897, and 1898 were 424, 380, and 591 cwts. respectively. At Kiukiang the imports of foreign opium last year continued their downward course, the decline for the past six years averaging about 203 piculs per year, the total decline being 1,220 piculs. The actual fall which has taken place during that period is shown by a comparison of the figures for 1893, and those for 1898, the former being 3,268, and the latter 2,240 piculs. That the drug is being replaced on the Chinese market by the native article is beyond all doubt, but unfortunately no statistics are forthcoming to substantiate this.

THE IMPORTS OF MEDICINES to Barcelona during last year amounted to 145 tons, value £30,104, as against 143 tons, value £23,936 the previous year. Of drugs 2,840 tons, value £90,880 were imported, compared with 1,975 tons, value £72,426 in 1897. In chemical products there was a decrease in the amount imported, viz., from 20,918 tons, value £244,043 in 1897, to 17,102 tons, value £243,532 last year. Perfumery also dropped from 52 tons, value £13,879, to 39 tons, value £10,335, while dye extracts fell off from 1,824 tons, value £63,833 to 1,226 tons value £42,910. A new item in the list of imports for 1898 is 94 tons of vegetable oil, valued at £2,448.

THE PRODUCTION AND SALE OF TOBACCO in Italy is a Government monopoly, with the result that the plant is grown only under certain restrictions and with the constant surveillance of the Government department to which the monopoly is attached. The enormous increase of late years in the use of the cigarette has rendered it necessary for the monoply to provide a tobacco of delicate quality, and with this end in view experiments have been made in the province of Lecce to cultivate the form of the tobacco plant grown mostly in Turkey. One of the principal conditions of success in the growing of this delicate quality of tobacco is that the land be exclusively manured with ovine matter, and on landowners it was specially enjoined that none but sheep dung should be used by them in the cultivation of the "Oriental" tobacco plants confided to them by the department. The result of last year's crop, according to Consul Cocoto, was disappointing; cigarettes made from the leaves proved defective, the tobacco was not aromatic, and would not keep in some cases. This was attributed to insufficient manuring or the total absence of manuring, whilst in the case of other parcels the smell was altogether offensive, which was attributed to the use of ordinary farm manure and not the special manure indicated by the department. Matters are reported to have been brought to a head by the department announcing that unless landowners fulfil the conditions imposed on them when accepting the cultivation of the plant for account of the Government, it will become necessary to discontinue the cultivation of Oriental tobaccos in the province.

Newcastle-on-Tyne Chemical Report.

AUGUST 9, 1899.

This market continues very steady. Caustic Soda keeps advancing in price, a further rise of 10s. per ton having to be noted for home and oversea districts. Bleaching Powder keeps scarce and is firmly quoted. Current prices are: Bleaching Powder, £5 10s. to £5 15s. Soda Crystals, 45s. to 47s. 6d. Caustic Soda, 70 per cent., £8. Soda Ash, 52 per cent., £4 5s. Alkali, 52 per cent., £5 5s. to £5 10s. Sulphur, £5 per ton.

SPECIAL ANNOUNCEMENT.

The Students' Number of the *Pharmaceutical Journal* will be published on September 9, and the Editor will be glad to receive any information regarding special courses of instruction for pharmaceutical students from the Principals or Secretaries of Schools and Colleges in the United Kingdom.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

AUGUST 10, 1899.

As might have been expected, business has been quiet during past week, matter of chief interest having been two successive advances in makers' prices for cocaine hydrochlorate, while it is rumoured that a further advance is not improbable. Otherwise markets have been inactive. Quicksilver is very firm, and an advance in importer's price is confidently looked for, which will no doubt mean also an advance in makers' prices for mercurials. Bismuth unchanged, sulphate of ammonia firm with an advancing tendency. Turpentine dearer, opium quiet, morphia steady, codeia firm. Acid carbolic is also firmer. In cod-liver oil the turn appears to have come at last. Glycerin very quiet. Camphor unchanged. Iodides and bromides very steady. Acid citric rather weaker, partly due, no doubt, to the fact that purchasers have now covered their requirements for the present summer. Acid boracic and borax quiet but steady. Acid tartaric and cream of tartar firm. The following are the ruling quotations for some articles of interest:—

ACETANILIDE—Continues dull and weak at nominally 11d. per lb. for 5 cwt. lots.

ACID BORACIC.—Quotations are unchanged at 25s. per cwt. for crystals, and 27s. per cwt. for powder.

ACID CARBOLIC.—Refined acid is firm at unchanged price, value being, if anything, slightly higher. Crude steady at 2s. and 2s. 6d. per gallon for 60°F. and 75°F. respectively. Liquid 95-98 per cent. of pale straw colour decidedly dearer at 1s. 4d. to 1s. 5d. per gallon in 40-gallon casks.

ACID CITRIC.—Makers still quote 1s. 7d. per lb. for crystals in 5 cwt. casks, but it is possible to buy from second-hand at somewhat below above figure.

ACID TARTARIC—Steady. English spot, 1s. 1d. per lb.; foreign 1s. 0¼d. per lb. c.i.f.

AMMONIA COMPOUNDS.—Quiet and unchanged, with the exception of Sulphate, which is strong and advancing, quotations being:—Gray, prompt, 24 per cent., London, £12 5s. to £12 7s. 6d. per ton; Hull, £12 5s. to £12 7s. 6d.; Beckton, terms prompt, £12 5s. per ton; Leith, prompt, £12 5s. to £12 7s. 6d.; Beckton, September, £12 10s., October-March, £12.

ANTIMONY—Unchanged, at £39 to £40 per ton for Regulus and £24 to £24 10s. for the crude Japan (Black Sulphide).

BISMUTH—Is without change in price, either for the metal or the salts.

BORAX—Quiet at 16s. per cwt. for crystals, and 16s. 6d. per cwt. for powder.

BROMIDES and **BROMINE**—Are unchanged in price, but demand for Bromides is so brisk that manufacturers find it difficult to keep pace with buyers' requirements as to early delivery.

CAMPHOR—Is without change, either for the refined article or for the crude. For the former English makers still quote 1s. 7d. per lb. for Bell's and Flower's in one ton lots.

CASTOR OIL—Is quiet, with not much business passing in the article, quotations being nominally unchanged.

CLOVES.—Privately Zanzibar are firm, with sales of January-March delivery at 3 3/32d. to 3⅛d.; there are buyers at 3 1/16d. for October-December delivery, and on spot sales have been made at 3 1/16d. No public sales of spices have been held this week.

COAL TAR DISTILLATION PRODUCTS—Are practically without change at prices quoted last week, there being little or no business passing in the articles usually quoted under this heading.

COCAINE.—The long-expected rise in price has taken place at last, makers of the brands most in favour now asking 13s. per oz. for the Hydrochlorate for 100 oz. lots in 25 oz. tins. Second-hand holders are also stiff in their price, and it is believed that a further advance is not improbable.

COD LIVER OIL—Is somewhat firmer at about 60s. to 62s. 6d. per barrel for best new non-congealing Norwegian oil in tin-lined barrels of 25 gallons.

CODEINE—Is very firm at 12s. 6d. to 12s. 9d. for the pure, and 1s. per oz. less for the Muriate, Phosphate, and Sulphate salts.

COPPER SULPHATE—Weak and lower at £24 to £25 10s. per ton on the spot.

COLOCYNTH—Very scarce, and high prices are named, there being practically nothing offering on the market.

CREAM OF TARTAR—Is firm at 76s. per cwt. for first white crystals, and 78s. per cwt. for powder.

ERGOT OF RYE—Is somewhat firmer, 1s. 6d. per lb. being asked for sound.

GLYCERIN—Very quiet at nominally unchanged price for refined, crude remaining firm.

IODIDES and **IODINE.**—Prices are firm but unchanged.

IPECACUANHA—Is nominally unchanged in price, no business having been reported in the article during the week.

JALAP—A shade firmer at 6¾d. to 7d. per lb. for fair heavy tubers.

LITHIA—Is very firm at 10s. 8d. per lb. for the Carbonate, 6s. 5½d. per lb. for the Citrate Crystals, and 6s. 11½d. per lb. for the Citrate Powder in 2 cwt. lots, smaller quantities being quoted higher in proportion. An advance in price is considered not improbable.

MERCURIALS—Are so far unchanged at 2s. 10d. per lb. for calomel and 2s. 6d. per lb. for corrosive sublimate. An advance in price of quicksilver is, however, considered imminent, and this will almost certainly mean an advance in price of mercurial preparations.

NITRATE OF SODA.—Commercial is quoted £7 15s., and refined £8 per ton on the spot.

MORPHINE—Is very firm, especially for early delivery, prices being nominally unaltered at 4s. 10d. to 5s. for the Hydrochlorate powder and 2d. per oz. more for crystals. The future of the market remains somewhat of a puzzle, even to those best capable of judging.

OILS (FIXED) AND SPIRITS.—Linseed closes firm, with an upward tendency. London, spot, pipes, £20 5s. to £20 7s. 6d. per ton; barrels, £20 12s. 6d.: September-December, £19 15s.; January-April, £19 5s. Hull, spot, naked, £19 15s.; September-December, £18 2s. 6d.; January-April, £17 17s. 6d. per ton. Rape quiet but steady; ordinary brown spot and September-December, £22; Refined, spot, £23 5s. Ravison, naked, spot, and September-December, £18 10s. Cotton firm; London crude, spot, £17 5s. to £17 7s. 6d.; August, £17 10s.; Refined, spot, £18 to £20 per ton, according to make. Hull, naked, refined, spot and August, £16 2s. 6d.; September-October, £16 5s.; November-April, £14 5s.; crude, spot, £15 5s.; November-April, £13 2s. 6d. Cocoanut firm at nominally unchanged prices. Palm: Lagos, spot, £24 10s. Olive: Mogador, £30 to £31; Spanish, £30 to £32 per ton. Lubricating Oil quiet and unchanged. Turpentine steady at the advances for spot, and rather quieter for forward delivery. Present quotations are: American, spot and September-December, 36s. per cwt.; January-April, 36s. 7½d. to 36s. 9d. Petroleum dull at about ⅛d. per gallon decline at 5⅛d. for Russian spot and September-December, and 6¼d. for American spot and September-December; water white, spot and September-December, 7½d. per gallon; deodorised, 9d. to 9½d. per gallon.

OPIUM—Market is very quiet, with practically no business passing. Prices are nominally unchanged. There have been some moderate arrivals of new crop opium in London, but buyers hold off. Crops' estimate varies from between 6,000 and 7,000 cases.

OXALIC ACID—Unchanged at 3d. to 3⅛d. per lb. for prompt delivery free London.

PHENACETINE.—Market remains weak, and pressure to sell on part of the makers or their agents continues. Price is nominally unchanged at 3s. 6d. to 3s. 9d. per lb. for both crystals and powder.

POTASH COMPOUNDS—Are quiet at unchanged prices, with exception that Potasii Bromid is in active demand for prompt delivery, while Permanganate is also somewhat firmer, it being stated that the low prices which formerly ruled for this latter article are not remunerative to the manufacturers.

QUICKSILVER.—There is no second-hand price, while the importer requires all orders to be first submitted to him, which two facts combined appear to point to the extreme probability of an advance in price in the near future. Price remains meantime nominally unchanged at £8 7s. 6d. per bottle.

QUININE.—There is no business of any importance to report in this article. Makers' price remains unchanged at 1s. 4d. per oz. for the favourite German brands (B. & S. or Brunswick) in 100oz. tins and for 1,000oz. lots, while from second-hand there same brands are obtainable at 1s. 2½d. per oz. on the spot and 1s. 3d. per oz. for December delivery.

SALICINE.—The late advance in makers' price to 12s. 6d. per lb. is fully maintained.

SANTONINE.—No further advance has so far taken place in the price, which remains at 7s. 3d. to 7s. 6d. per lb. for smaller quantity.

SHELLAC.—The market remains quiet, and business in all positions is unimportant, but prices are steady; Second Orange on the spot quoted 64s. basis fair TN, October-December steamer nominally 64s. c.f. and i., and August delivery 65s.

SODA COMPOUNDS.—There are no changes to report in value of articles usually quoted under this heading.

SULPHONAL.—While the price of the two chief and only two officially known makers remains firm and unchanged at 17s. per lb. for both crystals and powder, there are still sellers of apparently unlimited quantity at 15s. per lb. and even below, the puzzle remains as to whence the supply comes.

Manchester Chemical Report.

August 9, 1899.

It is not too much to say that at the present time there is quite a "boom" in heavy chemicals. A week or so ago we had to record an advance of 10s. per ton in Caustic Soda, and this has been followed by a further similar advance, as also 10s. per ton in Bleaching Powder. White Caustic Soda 77-78 per cent. is now quoted £8 12s. 6d. per ton, on rails, and Bleach £4 12s. 6d. to £4 15s. per ton, softwood casks at works. These prices will not affect the rates quoted for certain foreign markets, although it is some consolation to know that British makers are getting a little advantage over Continental competitors. Salt Cake continues irregular. In miscellaneous chemicals we can scarcely say the same state of things exists. Sulphate of Copper is rather lower, ranging from £24 10s. to £25 per ton, best brands, delivered Manchester. Brown Acetate is unchanged. Arsenic is lower at £18 15s. to £19 per ton, ex-ship, Garston. Acetate of Soda firm at £13 10s. to £13 15s. per ton. The continued controversy over Transvaal affairs is adversely affecting Yellow Prussiate, which is easier at 8d. to 8¼d. for best Lancashire make. Sulphate of Ammonia is rather lower locally. The Board of Trade returns are scarcely so favourable as they have been for some months past, although the export trade remains very steady. The imports of chemicals, dyestuffs and tanning substances total up to £418,269, a decrease of 4·7 per cent. The exports of chemical and medicinal preparations amount to £637,031, a slight decrease of 0·2 per cent. In quantities Alkali amounts to 269,989 cwts. (decrease, 4·4 per cent.), and value £75,293 (increase, 0·2 per cent.). Bleaching materials, 81,380 cwts. (decrease, 10·8 per cent.), and value £19,968 (decrease, 21·2 per cent.). These decreases are entirely connected with exports to the United States of America, other countries continuing to take their full quantities.

Liverpool Market Report.

August 9, 1899.

AMMONIA SALTS.—Carbonate firm, 3¼d. per lb. Sal ammoniac firm, 33s. to 35s. per cwt. Sulphate quiet, £12 2s. 6d.

CANARY SEED—Is in better inquiry, at firmer prices for Turkish, at 38s. to 39s. per 464 lbs.

COPPERAS—37s. to 40s. per ton.

COPPER SULPHATE—£24 12s. 6d. per ton.

GUM.—12 serons of Arabic sorts sold at 65s. per cwt.

LINSEED.—Business forward has been better. 50 tons Calcutta, July, sold at 38s. 6d. per 416 lbs. 100 tons of River Plate sold at 35s. 6d. per 416 lbs. spot.

OILS (FIXED) AND SPIRITS.—Castor is generally steady, with fair inquiry. Holders ask for Calcutta 2⅞d. per lb.; French, 2¾d.; 2nd pressure, 2$\frac{9}{16}$d.; Madras, 2¾d. per lb. Olive has developed a much firmer tone and both spot and shipment lots have advanced. Malaga for shipment is £33 per tun. Levant and Candia, £31 10s. to £32 10s. per ton. Linseed is quiet at 21s. 6d. to 22s. per cwt. Cottonseed is firm at 18s. to 18s. 6d. per cwt. Spirits of Turpentine has taken a very firm turn and is now quoted at 35s. per cwt.

POTASH SALTS.—Ashes Pot.; 21s. to 21s. 3d. per cwt. Pearl: 30s. per cwt. Bichromate: 3¼d. per lb. Chlorate: 3½d. to 3¾d. per lb. Cream of Tartar steady, but quiet, at 75s. to 80s. per cwt. Prussiate, 8d. to 8½d. per lb.

SODA SALTS.—Caustic, 76 to 77 per cent., £8 5s. per ton; 70 per cent., £7 10s. per ton. Crystals, £3 per ton. Nitrate quietly steady at 7s. 6d. to 7s. 9d. per cwt.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns, some new. Particulars free. WARNES, Chemist, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. EDWARD FECK, East Dereham.

Cannot Repeat. Sponge Bags, best check (Maw's sizes), No. 2, 5s.; 3, 6s.; 4, 8s. 6d.; 5, 9s. 6d.; 6, 10s. 6d. doz. Bathing Caps, circular, best check, 5s. 6d. Eye Shades, celluloid lined green, rights, lefts, 2s. Enema Syringes, I.R. bottle, bone pipes, best English, red, green, black, 1 oz., 1s.; 2 oz., 1s. 3d.; 3 oz. 1s. 6d.; 4 oz., 1s. 9d. each. 10s. lots post free. Cash returned if sold.—WARNES, Chemist, 333, Gray's Inn Rd., W.C.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—HUGHES, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. ROWSELL, 9, Derwent Grove, East Dulwich, London, S.E.

Partnerships Dissolved.

(From the London Gazette.)

Richard Atkins and George Atkins, Druggists, etc., 118, Falcon Road, Clapham Junction, London, S.W. The business will be carried on by Richard Atkins under the same style.

W. Symmonds, junr., and Victor C. Yeulett (trading as Yewlett and Co.), Photographers, 188, Norwood Road, Lower Norwood, S.E. Debts will be received and paid by Victor C. Yeulett.

James Glen, John Glen, John Steele, A. N. Steele, and J. C. Glen, (practising as Glen and Steele), General Medical Practitioners, South Bank and Grange Town, Yorks. Debts will be received and paid by Joseph Bevan, Stockton-on-Tees, Debt Collector.

Francis Fielding and John J. Jepson, Photographers, Mincing Lane, Blackburn. Debts will be received and paid by John Jepson, who will continue the business.

C. N. Layman, Chas. Umney, Herbert C. Wright, Ernest B. Layman, John C. Umney, Fredk. N. Layman, Ernest A. Umney (trading as Wright, Layman, and Umney, Southwark Street, London, S.E.), Manufacturing Chemists and Soap Manufacturers. Dissolved by mutual consent as on and after January, 1899, the business was converted into a company.

Receiving Order in Bankruptcy.

(From the London Gazette.)

William Henry Pearson, 114, North Road, St. Helens, Dispenser and Bookkeeper.

Advertisements.

(Received too late for Classification.)

QUALIFIED, 22; tall. Abstainer. State particulars, MONTANA, 1, Melville Rd., Maidstone.

MANAGEMENT, Branch. Locum or permanency. Qualified. Disengaged 13th inst. DAVIS, 5, Myddleton Rd., Bowes Park, N.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

Publications Received.

ESSENTIALS OF PHARMACY FOR MINOR STUDENTS, by W. A. KNIGHT, Ph. C. Edited by HENRY WOOTTON, B.Sc. (Lond.). Pp. viii. + 189. Price 4s. net. London: London College of Chemistry and Pharmacy, 323, Clapham Road, S.W., 1899. From the Principal.

FOREIGN NEWS.

Professor Bunsen died at Heidelberg, on Wednesday, in his eighty-eighth year. He was born at Göttingen in 1811, his father being professor of literature in the University of Göttingen. After taking his degree in 1831, and spending a few years in study at Paris, Berlin, and Vienna, Bunsen succeeded Wöhler as teacher of chemistry at the Polytechnic Institute of Cassel in 1836, whence in 1838 he was appointed to Marburg as assistant professor of the same science, attaining to the chair thereof in 1841. Ten years later he was called to Breslau, and in 1852 to Heidelberg. In conjunction with Professor Kirchhoff, of Berlin, Bunsen may be said to have founded the science of stellar chemistry, and his numerous discoveries soon procured for him a world-wide reputation. The Bunsen battery and gas burner are two of the best known of his practical applications of science. Foreign honours poured in upon him; in 1858 he was elected a foreign member of the Royal Society, and in 1883 he was appointed one of the eight foreign associates of the Paris Academy of Sciences.

Pharmacy in England.—Such is the title of an article written by Monsieur Pegurier, a pharmacien, of Nice, in a trade organ, called *La Pharmacie*. Of late, Monsieur Pegurier has given much of his time to criticising pharmacy in almost all the European States, but if his criticisms of the art in other countries be no more correct than those relative to England, he had better either renew operations with the balance and mortar, or make quite sure of the subject he handles, before writing so boldly about it. In a former article under the same heading he divides pharmacists in England into three classes:—1. The pharmaceutical chemist corresponding to the French pharmacien de 1ere classe. 2. The chemist and druggist corresponding to the pharmacien de 2me classe. 3. The store chemist, whom he fervently thanks his lucky stars has no counterpart as yet in "La belle France," but who exists in England to counteract the rapacity of qualified chemists and to supply the British public with cheap and nasty stuff got up to replace well-known articles of higher prices, etc., etc. So far so good. His idea of an English pharmacy is a "bazaar" where almost anything in daily use can be obtained. He certainly gives his British *confrère* credit for being a conscientious and hard-working individual, but rather prone to neglect the scientific side of his profession for the commercial side; however he presumes that this is accounted for by the presence of Mr. No. 3, the store chemist, whose absurdly keen competition precludes all idea of wasting time in scientific research, this legitimate branch of the profession being thus entirely relegated to the "analytical chemist." In consequence he concludes that scientifically and intellectually the pharmacien Français is much superior to his British *confrère*. His articles deal chiefly with pharmacy as practised in and around London. Remarking that the English chemist lacks nothing as a keen business man, ever catering to the wants of his clients, he adds, "It sometimes happens that, attached to, but separated by a partition from the pharmacy, the chemist controls a post-office, and is thus distributor of stamps and money-orders as well as of pills and potions." But (and here comes the rub), whilst this may be the exception in and around London, it is very common in the provinces, the provincial chemist going even one better, and having in addition an annexe "where hosiery and sundry other non-pharmaceutical products are sold" (presumably by Mrs. Chemist or her daughters). One feels tempted to cry out:—

> "Oh! would some power the giftie gie us,
> To see ourselves as ithers see us."

In his Second Article he comments upon the new toxicological regulations which the Pharmaceutical Society of Great Britain has recently adopted, and agrees with the recommendation of the Society to adopt a special bottle for medicaments destined for external use. (In France one gets lotions and liniments more often than not, in white glass b ttles, at French pharmacies.) He then criticises the action of the Privy Council (not without just reason), and declares his inability to reconcile the feigned regard of that body for the public welfare with its stubbornness to accede to the chemist's proposals to schedule certain toxic substances. He next goes on to say that suicides and deaths by misadventure, due to the facility with which poisons are obtainable, are by no means rare in England, and appends the following comparative lists of the Registrar-General for the years 1895 and 1896:

By Accident:—

	1895.	1896.	Total.
Opium, laudanum, morphine, etc...	103	89	192
Chloroform, chloral	78	71	149
Mineral acids.....	17	21	38
Carbolic acid.....	34	34	68
Prussic acids and cyanides	3	6	9
Oxalic acid and oxalates	3	2	5
Mercury and mercurials	4	4	8
Arsenic.....	3	4	7
Strychnine	3	6	9
Divers	350	382	732
Total	598	619	1217

By Suicide:—

	1895.	1896.	Total.
Opium, laudanum, morphine, etc...	68	56	124
Chloroform, chloral	5	14	19
Mineral acids	38	40	78
Carbolic acid	224	163	387
Prussic acid and cyanides.....	60	47	107
Oxalic acid and oxalates	46	24	70
Mercury and mercurials	1	3	4
Arsenic	4	5	9
Strychnine	31	24	55
Divers	103	96	199
Total	580	472	1,052

Truly an eye-opener, which assuredly calls for serious attention from one quarter or another. But whilst deploring the laxity of the regulations and its attendant alarming results he is happy in the knowledge (?) that a better state of affairs reigns in his own country. But, he had better first cast out the beam from his own eye before plucking out the mote of his *confrères* across the channel. He can get as much poison as he likes at the drysalters or "marchands de couleur," and yet the "Ecole Supérieure de Pharmacie" does not demand that a qualified chemist shall adorn their "boutiques" to retail ten centimes' worth of muriatic acid, etc. True, affairs in that respect are in a deplorable state in England, but they are precious little better in France. It is no more the fault of the qualified chemist in England than it is of his French *confrère* in France, and the one would be equally as glad as the other to ensure a better state of things if either or both were but allowed a free hand in the matter of proper legislation. Now that the moment is fast approaching for the revision of the Codex and the discussion upon the laws relative to the exercise of pharmacy, one ticklish point which French pharmaciens desire a little light thrown upon is the clause concerning the storage of poisons within the pharmacy, which must be in a cupboard, apart and locked. But, who must have the key? Clearly, he who has most to do with this cupboard is the dispenser. This stringency somewhat touches the *amour propre* of the French pharmacien, who imagines that since the public have no access to this cupboard, the law is intended to check his own actions as though he were not fully cognisant of the depth of his responsibility. It is nevertheless a wise precaution, for the most careful person is liable to error, and the routine of unlocking a cupboard is more calculated to ensure immunity from accidents than is the indiscriminate intermingling of toxic with non-toxic substances such as one sees in some disorderly pharmacies.

Petroleum Hair Wash Accident.—A death, as the result of using a petroleum hair wash is reported from Marseilles. Madame Auquier, thirty-seven years old, residing on the Boulevard de la Corderie, had been using such a wash on her head when she incautiously approached a flame, and the spirit evaporating from the wash caught fire. The unfortunate lady had her clothes also set on fire, and, although assistance was speedily on the spot, she was so badly burned before help could be rendered that death ensued.

Medical Congress, 1900.—The French Government has sent an invitation to the United States Government to take part in the proposed International Medical Congress in 1900. The invitation will be accepted.

Paris Water.—The Paris water authorities issue a note of warning to consumers. They point out that in spite of the excessive heat which has been experienced, they have had no difficulty in maintaining the supply of drinking water at its usual quantity. But during the last few days the consumption has been increasing

in a larger degree than can be accounted for by the increased thirst of the Parisian population, and consumers are therefore asked not to use the drinking water for ordinary watering, but to restrict its use to domestic purposes. The request seems reasonable. A London water company would cut down the supply and make sure of it. It is to be hoped that the Parisian authorities will not be driven to the extreme measure of turning on the Seine water.

ENGLISH NEWS.

Royal Botanic Society.—The annual meeting of the Fellows of the Royal Botanic Society was held in the Museum at the Society's Gardens, Regent's Park, on Thursday, August 10, Mr. C. Brinsley Marley presiding. The Duke of Teck was re-elected President, Mr. G. J. Marjoribanks Treasurer, and Dr. St. George Mivart, F.R.S., Mr. W. Sowerby, Dr. R. C. A. Prior, Mr. H. Graham, M.P., Sir J. Blundell Maple, M.P., Mr. G. R. Ryder, Lord John Joicey-Cecil, and Mr. W. Wallace were elected upon the Council. The sixtieth annual report, which was adopted, showed a decided improvement in the condition of the Society. The number of new Fellows and members joining during 1898 was 108, and since the beginning of this year 165 had already been elected. This number was much above the average. The total number of Fellows and members was 2,102. The balance-sheet to the end of 1898 showed a liability of £20,670 16s. 10d., which was more than covered by the amount of plant and buildings belonging to the Society as a going concern. The report went on to say that, while increasing the refreshment-room accommodation the Council had sanctioned the establishment of a club within the Society, which had proved a source of increased strength to the Society, and had added greatly to the attractions of the Gardens. The number of members of the club was now 560, including 220 ladies. The attendance at the Gardens during the past twelve months reached 86,090, compared with 67,212 during the previous year.—The Chairman said the Gardens were much more popular than they had been, but he would be very sorry to see their scientific character lost in that of amusement. The Society was struggling on with too small an annual income; in fact, he did not think that the Gardens could be kept up as they should be with the present low rate of subscriptions.—Mr. Rubinstein complained that the financial statement had not been submitted to the Fellows according to the by-law, the figures in the reports did not tally, that there was a disinclination on the part of the Society to thank those who had served them, and that the Council had not taken the Fellows into their confidence in the matter of the club. He also brought forward two resolutions, which he had persistently moved at the annual meetings for several years past. The first was in favour of establishing classes for the study of botany, but the Chairman pointed out that the Society had no funds for such a purpose, and, moreover, it was impossible to teach botany in London, as many of the commoner plants would not grow in London. The resolution failed to find a seconder, and was therefore lost. The second motion recommended the establishment of a floral hall, wherein receptions and musical promenades could be held in the winter, but this was also defeated.—A vote of thanks to the Chairman terminated the proceedings.

To Prepare Quick-Printing Paper, float the paper for five minutes on a solution of mercuric chloride, prepared by diluting 6 drachms of a saturated solution with 1 pint of water. When dry, float in a darkened room in a silver solution, 40 grains to ounce. The exposure required is about five seconds in sunlight, or a minute in dull weather, until a faint image is produced, then develop with: Sulphate of iron, ½ ounce; water, 1 pint; glacial acetic acid, 1 drachm. Wash and fix with hypo. In place of the iron developer, very dilute metol, or para-amidophenol, may be used with good effect. These prints need no toning and are quite pleasing in colour. Another process, long forgotten, gives most beautiful results: Take syrup of iodide of iron and distilled water, each 2 drachms; tincture of iodine, 10 drops. Mix and brush over one side of well-glazed paper, and, after a few minutes, dry with blotting-pad and then wash with nitrate of silver, 1 drachm; distilled water, 1 ounce; and dry in dark. Expose in a printing frame, when a latent image is formed, after which all that is required to develop is a wash in pure water and preservation for a short time in the dark, varying with the degree of exposure. The exposure induces an action which is carried on in the dark. After the image is completely evolved, the free silver is eliminated by fixing in hypo.—*Amer. Journ. Photog.*

POISONING CASES.

Potassium Permanganate.—A fatal case of poisoning by crystals of potassium permanganate is reported in the *Lancet* by Dr. Charles R. Box. A married woman, aged forty-seven years, of very intemperate habits, after drinking heavily, took a "handful" of crystals of potassium permanganate and, putting them into a teacupful of beer, drank the mixture. She was immediately taken to the casualty department of St. Thomas's Hospital. On the way she was said to have vomited. When first seen at the hospital she was pale, conscious, but unable to speak. Her lips, chin, fingers, and the front of the right forearm were stained dark-brown. The tongue was much swollen and almost black in colour. The skin was dry; the pulse moderately rapid, and of fair tension. After a few minutes she struggled into a sitting posture, and her breathing became accompanied by slight stridor. Preparations were immediately made for tracheotomy, but before anything could be done she fell back pulseless, and the respiration stopped. By the stethoscope the heart could still be heard beating faintly and very slowly, although no pulse was perceptible at the wrist. Artificial respiration induced one or two respiratory movements, but beyond that was of no avail. The heart sounds ceased altogether a few moments later. Death occurred thirty-five minutes after taking the poison.

Belladonna.—On Thursday, August 10, an inquest was held at Birkenhead with respect to the death of Mary Ann Sarah Dagnall, 37, the wife of a ferry employee. From the evidence it appeared that deceased had been ill for some time, and was taking medicine and using a lotion for outward application, and on the previous Sunday took a dose of the lotion in mistake for the medicine. Dr. H. L. Pearson stated that death was due to belladonna poisoning. A verdict of "death by misadventure" was returned.

THE PURITY OF FOOD AND DRUGS.

Vinegar.—On Thursday, August 10, at Marlborough Street Police-court, W., William Morrell, 37, Carnaby Street, Regent Street, was charged with selling vinegar adulterated to the extent of one part of sulphuric acid in each 910 parts of vinegar; Matilda Kelly, 31, Broad Street, Golden Square, was also summoned for selling vinegar containing one part of sulphuric acid in each 500 parts of vinegar, and Fanny Finstein, 6, Portland Street, Soho, with respect to vinegar adulterated to the extent of one part of sulphuric acid in 580 parts of vinegar. The summonses were before the Court several weeks ago, but were adjourned in order that samples might be sent to Somerset House for analysis. The result of the Somerset House analyses was now stated to confirm those made for the prosecution. Morrell and Kelly were each fined £2, with £3 2s. costs, and Finstein, who is a widow in a small way of business, 10s., with one guinea costs.

Spirit of Nitre.—At Barnsley Police-court on August 2 Jeremiah Woffinden, shopkeeper, Penistone, was summoned for selling sweet nitre, not of the nature, quality, and substance demanded by the purchaser, it not being in accordance with the requirements of the Pharmacopœia. Fined 10s. and costs.

Camphorated Oil.—Charles W. Austen, of Weybridge, was summoned at Chertsey Police-court on Wednesday, August 9, for selling camphorated oil deficient in camphor to the extent of 30 per cent. The defence was that the full quantity of camphor was in the oil but had not dissolved properly. Fined 5s.

Invoice as Guarantee.—On August 4, the adjourned hearing took place at Birmingham of a summons against Samuel Allen, grocer, 17, Tower Street, Birmingham, for selling butter containing 112 grains per pound of boric acid. The case had been adjourned in order to allow the defendant an opportunity of converting an invoice which he had received into a warranty. The butter was supplied by a local merchant who had stamped upon the invoice "Guaranteed pure butter." There was no signature to it, and the magistrates held that as it stood it was useless. For the defendant it was now stated that the firm which supplied the butter did not repudiate the invoice, but admitted that

the stamp put upon it was that of the firm. It was also proved that the stamp was upon the invoice when it was received. One of the magistrates remarked that the guarantee appeared to have been put on by way of a stamp, but they could not accept such evidence in general cases. There must be satisfactory proof of the guarantee. They believed the defendant had done his best to get a pure article and had acted in good faith, therefore they accepted the invoice as a guarantee, and dismissed the case.

Seidlitz Powders.—On Thursday, August 10, several cases against wholesale dealers were heard at the Brentford Police-court, arising out of a case reported in the 'Journal' for July 29, p. 112D, in which Harriet Upton, a shopkeeper, of Devonshire Road, Chiswick, was fined £5 for selling seidlitz powders deficient in tartaric acid and sodium bicarbonate.—Messrs. Edward Cocks, of Clapham Junction, were summoned for having supplied Mrs. Upton with packets of powders bearing false labels and not prepared according to the British Pharmacopœia. Mr. C. Robinson represented Mrs. Upton, and Mr. G. W. Lay defended. Mr. Walter Tyler, the inspector of Foods and Drugs, conducted the prosecution.—Mrs. Upton said she purchased some seidlitz powders from a traveller named Watson. She sold them to the public in exactly the same condition as she had received them.—James Watson, of Shepherd's Bush, said Mrs. Upton said she was out of Seidlitz powders, and asked if he had any. He left her some, but did not receive any money.—Mr. Tyler pointed out that on the label the words "British Pharmacopœia" were wilfully mis-spelt.—Mr. Lay: You must summon the printer for mis-spelling. Proceeding, Mr. Lay said the summons was for selling the powders on July 4 last, whereas the sale took place nine months ago. He submitted that on that ground alone the proceedings must fail, as Mr. Tyler had been too late in taking out the summonses.—Mr. Tyler said he could not take the summonses out before the proceedings against Mrs. Upton had been concluded. The matter was an important one for little traders.—The magistrates dismissed the case.——Mr. Bienes, of the "Drug and Sundries Company," was similarly summoned, but one of the witnesses for the prosecution stated that he sold the powders to Mrs. Upton on his own account, and had nothing whatever to do with the present defendant. The magistrates dismissed the case, and allowed one guinea as costs.

TRADE NOTES.

Tannoform.—E. Merck, Darmstadt, and 16, Jewry Street, London, E.C., submits specimens of tannoform and of tannoform dusting powder. Tannoform has lately been introduced as a specific in the treatment of hyperidrosis and bromidrosis. Being a condensation product of tannin and formaldehyde, it possesses not only the healing and astringent properties of tannin, but the highly antiseptic and disinfecting properties of formaldehyde. Compared with tannin and salicylic acid it is said to be more efficacious, and has the further advantage of not causing the skin to shrivel. Tannoform is highly recommended for the treatment of foot-sores and other similar diseases. Its use, however, is not limited to external application, it is also of very great importance as an intestinal astringent. It is said to be insoluble in the gastric juice; not to impair the digestion. On reaching the intestines tannoform is split into its component parts, and begins to act only when it has actually reached the diseased organs. Clinical experiments are stated to have shown that tannoform is a most valuable therapeutic agent, and possesses all the qualities required in an intestinal astringent. Tannoform is supplied as an ointment as well as in form of soft and dry soap. Full particulars as to its properties and uses are published in *Merck's Digest*, No. 4.

Tabloid Cascara Sagrada.—Messrs. Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C., submit specimens of new "Tabloid" preparations of cascara sagrada. In the past it has been the custom of the firm to supply tabloids of cascara sagrada containing 2 grains of dry extract, but as the susceptibility of patients to the action of the drug varies somewhat, they are now prepared containing 1 and 3 grains of dry extract. By the issue of these different strengths it is hoped that the administration of cascara sagrada extract on a definitely regulated plan will be simplified. It is suggested that one of the 3 gr. strength may be taken once, twice, or even thrice daily for habitual constipation until the habit of regular action of the bowels is established, when the dose should be gradually reduced to one of 1 gr. strength taken once daily. It is then usually possible to do without a laxative after a short period. These "Tabloid" products are supplied both plain and sugar-coated in bottles containing 25 or 100 in each.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. J. Scriven Turner, M.P.S., F.C.S., has recently been appointed one of the Gas Examiners to the London County Council.

Mr. P. E. F. Perrédès, M.P.S., pharmaceutical chemist, has been successful in passing, in the first division, the University of London, 1899, Intermediate Examination in Science.

Mr. Evelyn William Pollard, M.P.S., chemist and druggist, of Ryde, was one of the successful candidates, in the second division, at the recent Intermediate Examination in Science of the London University.

Mr. George Senter, M.P.S., pharmaceutical chemist, has been successful in gaining honours certificates in the University of London, 1899, Intermediate Science and Preliminary Scientific Examination, in Chemistry and in Experimental Physics.

Mr. Thomas E. Wallis, M.P.S., pharmaceutical chemist, junior demonstrator in the Pharmaceutical Society's Chemical Laboratory, has passed, in the first division, the University of London, 1899, Intermediate Examination in Science.

Mr. Harold Wilson, M.P.S., pharmaceutical chemist, formerly demonstrator of pharmacy in the Pharmaceutical Society's School of Pharmacy, and now of University College Hospital, has passed, in the first division, the University of London, 1899, Intermediate Examination in Science.

Mr. William A. Knight, M.P.S., pharmaceutical chemist teacher of materia medica, pharmacy, and dispensing at the London College of Chemistry, etc., recently opened by Mr. H. Wootton, was one of the successful candidates in the first division at the July Intermediate Examination in Science of the University of London.

Mr. Edward C. Spurge, M.PS., pharmaceutical chemist, passed, in the first division, the recent University of London Intermediate Examination in Science.

Mr. H. Troughton, M.P.S., of Lancaster, has refitted his shop, which is now extremely handsome and striking. All the alterations have been carried out by Messrs. Ayrton and Saunders, Liverpool.

A Home-Made Stereo Shutter.—Take a piece of soft wood ½-in. thick, and make two holes in it to fit the lens tubes. Now take a strip of ¼-in. wood (part of a cigar box lid will do) about twice the length of the first, and cut two square holes in the centre to correspond with the former. Take two strips of thin zinc, brass, or even tin, and fasten along top and bottom of the back, bending over the edges to form a clip to hold the front which slides to and fro across the lenses. Insert a small screw in either end of the front to stop it from slipping right through, and your shutter is complete. By pushing it straight across with the finger, I calculate it will give one-tenth of a second, and, by carrying some lantern slide binding and sticking equal pieces across the openings, the slits may be made any width, and very quick exposures made; also time exposures are very easily made. The shutter may be finished off according to taste or skill.—A. H. Harrington in *Photo News*.

PHARMACY IN SOUTH AFRICA.

BUSINESS IN SOUTH AFRICA generally is at a low ebb owing to the pending crisis in the Transvaal, several of the wholesale firms finding orders coming in very slowly. A regular exodus is constantly taking place from Johannesburg, business men sending their wives and families over the Border for safety. Up to now these measures are merely precautionary, as it is felt that the Boers will assuredly "climb down," and the much-needed Franchise be conceded before the "Maxims" take the place of the "ultimata." Opinions as to the likelihood of war or not are equally divided among colonials, but the proverbial stubbornness of the Boer has to be reckoned with, and it is a case of "we shall see what we *shall* see."

MR. H. T. DOBLE, pharmaceutical chemist, of King William's Town, Cape Colony, has opened a new pharmacy in Oxford Street, East London, next to the new Town Hall. The business will be under the management of Mr. E. A. Hodge, formerly with Messrs. Breeze and Co., of Devonport and Plymouth, and a member of the Plymouth and District Chemists' Association.

CAPE CHEMISTS AND THE PHARMACY ACT.—The chemists of Cape Colony are greatly concerned anent the Bill now before the Cape Parliament for "The Repealing of certain Sections of 'The Medical and Pharmacy Act, 1891,' and to make other provisions in lieu thereof, and to make further provisions with regard to the Colonial Medical Council and Colonial Pharmacy Board. The Sections which are of immediate interest to chemists would, if made law, seriously hamper the business of a pharmacist. They are Nos. 8, 9, and 16, in the Bill, and set forth that:—

> 8. "Every shop shall be conducted under the *constant* and *personal* supervision of some registered chemist and druggist."
>
> 9. "No person shall be entitled to medically treat any person by reason that he is a person licensed as an apothecary, or chemist and druggist under the provisions of the said Act."
>
> 16. "From and after a date to be proclaimed by the Governor, which shall not be less than six months after publication in the 'Gazette' of his intention to proclaim such date, every patent or proprietary medicine intended for human use, and containing any poison mentioned in the Third Schedule of the Act, shall bear upon the bottle, case, or other package immediately containing such medicine, a true and exact statement setting forth the nature and quantity of each such poison contained in such medicine, and any person selling, or keeping for sale, any such medicine not so labelled, shall be liable, on conviction, to a penalty not exceeding Fifty Pounds, and in default of payment, to six months' imprisonment with or without hard labour; provided that it shall be lawful for the Governor, after giving six months' notice in the 'Gazette' of his intention so to do, to declare any article mentioned in such notice to be a poison within the meaning of the said Schedule."

AN ABLE LEADING ARTICLE appeared in the *South African News*, of July 10, in which the writer pointed out that, in the interests of the public, the literal enforcement of the above Clauses would be absurd and cause a great amount of annoyance and inconvenience, inasmuch that the chemist could not even give an antidote to a poison or render first aid in case of accident, as he would be "medically treating" within the Act. A simple draught for headache, and the thousand and one small ailments to which humanity are prone could not be supplied except the individual presented a prescription from a doctor, and doctor's fees in the Colony are not at all low. It was out of the question to expect the public to pay a doctor's fee every time it catches a cold or eats too much for its dinner. Recent cases were quoted where the prompt action of a chemist in Cape Town had saved human life in prussic acid and iodine poisoning, also in burning by carbolic acid. Were this Bill passed, the chemist would be liable to imprisonment for so doing; and the public would also be the sufferers. The Clause dealing with the declaration of the contents and amount of poison in all patent medicines was also mentioned at some length. It was not likely that every manufacturer would disclose the recipe of his preparation. The effect of the Clause would be to put the public to the trouble of sending for its patent medicines direct to the makers, and thus depriving colonial chemists of a certain amount of business and revenue. Other newspapers of Cape Colony had leading articles on the subject, considering that the Bill conferred privileges on the medical profession at the expense of the chemist.

AT A MEETING OF THE CAPE PHARMACEUTICAL SOCIETY, held in Cape Town, under the presidency of Mr. James Jones, it was decided to submit a resolution to the Government before the second reading of the Bill on the 26th, that the Sections 8, 9, and 16 be either eliminated or amended, the last-named section to be worded as in the English Act, without the same restriction of sale. This resolution was supported by the chemists of East London, King William's Town, Queenstown, and Border Towns in the Eastern Province.

DENTAL NOTES.

"DODGES" is the title of an excellent paper read at the annual meeting of the Midland Counties Branch of the British Dental Association by Mr. Frederick Rose, and printed in the official journal of that body. Mr. Rose describes some devices which he has found useful in overcoming some of the many difficulties that are met with in practice, and they are briefly summarised here.

To overcome suction when taking impressions with composition, and so obviate the chances of the impression being in any way distorted, it is a good plan to pass a thread of waxed silk across the centre of composition just before insertion. This can be withdrawn when the composition has hardened, and the inlet of air will cause the impression to drop.

BEFORE taking an impression with composition a much sharper one can be obtained by chilling the tray under the tap and warming the compo. over the spirit lamp just before insertion.

WHEN the capacity of a patient's mouth is out of proportion to the opening of the lips, and difficulty is experienced in inserting a sufficiently large tray, the trouble can mostly be overcome by first inserting the tray on one side, so dragging the cheek back, insert a visiting card at opposite side and the tray will glide into place. The card acts as a shield to the lips and greatly facilitates the ingress of the tray.

IN taking the model of dovetail spaces, fill up the space with soft compo. modelling to shape, then take the impression with these in position. They are left behind when the tray is withdrawn, and so can be removed and placed in position in impression. This is a good plan when modelling a mouth where there are loose teeth; the blocks steady them.

IN those cases where a patient wanting a denture does not wish to be seen without teeth, the difficulty can be got over by taking a specimen model of the natural teeth as they stand, select a set of "minerals" of exact size, shade, and shape, then extract the back teeth and stumps that are to be removed, and leave the gums to settle for a few weeks. Then take an impression, and make trial plates to get bite, etc. Saw off the front teeth on model, having previously carefully trimmed away any drags in front so as to get the exact position of the labial surface of the natural teeth, then cut out the plaster model like it would have been if you had taken the impression after extracting the teeth; cut it freely away from the labial wall of the sockets, so insuring a good fit of the artificial teeth to the gum. The front teeth are then extracted, and the plate inserted at the same visit.

IT is a good plan as a means of obtaining suction in new cases to well dry the palate with a fine cloth, and freely cover the palate of denture with glycerin, put into place, using pressure.

WHEN a young patient has one or two teeth much elongated with Rigg's disease extract them, and use to fix on a metal plate instead of mineral teeth. The teeth must be sound. Use a pin for a tube-tooth cemented into a hole drilled through the base, but not to penetrate the enamel. Use osteo for setting.

A HINT for those who use slab-bites: Get an old slab, cut off the portions that have retained the models in place, and rough the surface with knife cuts. Put in water for a minute or two and wipe dry, then put a dab of plaster on each side, not to run into one another, and lay the models already greased into them, moulding the plaster up in the usual way. It will be found that this completely prevents the opening that always takes place with the new slab-bite.

When casting a model in sand that has small interspaces where one or two teeth have come out, and the standing teeth are long, it is a good plan to bend a bit of thin wire like a hairpin, only shorter, and place it across the interspaces sufficiently loose to remain in the sand when removing the plaster cast. It prevents the blocks of sand between the teeth from breaking out.

When an upper wisdom which is fully erupted is biting on to the gum over an uprising lower (or vice versâ) and extraction is required, extract the fully erupted tooth, not the one which is causing the pain. It is simpler and effects the same end.

In the case of a fractured central incisor where the nerve is exposed and the patient's condition will not admit of the use of an anæsthetic nor can stand the shock of an operation without it, pass a small piece of rubber down over the stump and tie with silk in usual way, then apply arsenical paste to pulp, and over it lay a small pledget of wool steeped in mastic varnish. Gently drawing the free portion of rubber down over the stump, tie it in a bunch and so make a bag of it, cutting the surplus rubber close off. Allow the dressing to remain long enough to devitalise the pulp.

Inlays of vulcanised white rubber have been invented by Dr. Scheuer, Dentist, Teplitz. He claims that inlays of vulcanised white rubber are easier to work and cheaper. To fill a side cavity, clean it and work it out to a cone shape, brush it over with vaseline, fill up the cavity with modelling wax kneaded between the fingers, being careful to fill up all defects; syringe the wax filling with cold water, spray a little ethyl chloride to harden, and remove the filling from the tooth by means of a pin roughened at the end; imbed the wax model in plaster underneath the lid of the flask, and leave bottom end of the model standing out of the plaster in order to get the wax out by means of boiling water; now pack the white rubber into the mould (a piece of wire may be inserted to aid the connection with the cement fastening) and vulcanise; undercut the edges of tooth cavity a little, and insert the rubber inlay by means of soft cement. After the cement has thoroughly set, finish off and polish with the usual instruments.

A verdict of £3 10s. for a set of teeth was obtained by Henry Hodgkinson, dentist, Darwen. The defendant said the teeth did not fit. She admitted that she only had them in two minutes, and would never have them in again. His Honour said it was still the plaintiff's obligation to make the teeth fit if they did not do so, and defendant must give him every chance of doing it. Two minutes is hardly sufficient length of time in which to try in a new set of teeth. A good deal of patience is often required on both sides before the desired end is attained.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

August 17.

Contrary to expectation business in Drugs and Chemicals, and more particularly in Chemicals, has been more active than could have been hoped at actual season of the year. This has been perhaps chiefly in consequence of the anticipated rises in makers' prices of various articles having at last become an accomplished fact. The changes include a further tangible advance in prices of Cocaine and Santonin, while the price of Physostiquinine (Eresine) and of Pilocarpine has also been advanced. Codeine remains firm, the same may also be said of Morphine, especially for prompt delivery. Quinine remains a puzzle. Acid, Citric. Tartaric, and Cream of Tartar are quiet and unchanged. Acid Carbolic firm. Bromides and Iodides unchanged. Quicksilver and Mercurials very firm. Linseed Oil and Rape Oil dearer, and very firm. Bismuth and Salts without change. The following are prices actually ruling for articles of chief interest:—

ACETANILIDE—Is dull and weak at 11d. to 1s. 2d. per lb., according to quantity.

ACID CARBOLIC.—Firm at 7¼d. per lb. for the 35-36°C. ice crystal in large drums and overcasks, other qualities and packing being quoted in proportion. Crude, 60°F., 2s. 1d. per gallon; 75°F., 2s. 7d. per gallon. Liquid, 95 to 97 per cent. of pale straw colour, 1s. 3d. to 1s. 4d. per gallon in 40-gallon casks.

ACID CITRIC—Quiet, at 1s. 6d. to 1s. 7d. per lb., according to quantity and make, for crystals in 5-cwt. casks.

ACID BORACIC—Steady at late quotations.

ACID TARTARIC—Quiet and without change.

AMMONIA COMPOUNDS—Are practically without change, business being, as might be expected for the time of the year, restricted to actual immediate requirements. Sulphate is perhaps a shade dearer, Gray 24 per cent., London prompt, being quoted £12 7s. 6d. to £12 10s. per ton; Hull, £12 5s.; Leith, prompt, £12 7s. 6d. to £12 10s.; Beckton, September, £12; Oct.-March, £12 10s.; Beckton terms, prompt, £12 5s. per ton.

ARSENIC—Steady, but without change, at £31 10s. per ton for white and yellow lump, and £19 10s. per ton for powder.

BORAX—Quiet and unchanged.

BROMIDES—Firm at late quotations.

CAMPHOR—Is firm, but somewhat quiet, for refined, while the prices asked for crude from the other side would appear to point to the probability of an advance in refiners' quotations.

CLOVES.—Privately Zanzibar dull, with weaker tendency in prices. Spot and near quoted at 3 1-16d. October-December delivery at 3⅛d. and January-March 3 3-16d. No Zanzibar offered at auction; 31 cases picked Penang bought in, fair to good bright at 6¾d. to 7½d.

COAL TAR DISTILLATION PRODUCTS. — Toluol commercial 1s. 3d. per gallon, pure 1s. per lb. Benzole quiet, 50 per cent. prompt, 10d.; August - December, 10½d. per gallon; 90 per cent. prompt, 8d.; October - December, 9d. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120°C., 3d. per gallon. Solvent Naphtha, 95 per cent. at 160°C. 1s. 6d. per gallon; 90 per cent. at 160°C., 1s. 2d. per gallon; 90 per cent. at 190°C., 1s. 3d. per gallon. Anthracene A, 3½d. per unit; B, 2½d. per unit. Pitch, 35s. per ton f.o.b. Tar, crude and refined, 13s. per barrel, 2¼d. per gallon.

COCAINE—Has been further advanced to 14s. 4d. per oz. for the Hydrochlorate in 25 oz. tins, and for 100 oz. lots, price being very firm at this figure. Our readers will recollect that this advance has been repeatedly predicted in these columns as more than probable.

COD LIVER OIL.—Market remains very quiet. Quotations show, however, a slight improvement, same being now about 60s. to 62s. 6d. per barrel for best new non-freezing Norwegian oil in tin-lined barrels of 25 gallons.

CODEINE—Firm at 12s. 6d. to 12s. 9d. per oz.

COPPER SULPHATE.—£24 to £25 5s. per ton, according to make, for spot delivery.

CREAM OF TARTAR—Is quiet, and practically without change in price.

ESERINE (PHYSOSTIGMINE).—Makers advanced prices to 2s. 3d. per gramme for the Sulphate and Salicylate, the other salts, as also the pure alkaloid, being also dearer in proportion.

CINGER.—Cochin again in large supply met extremely slow demand: 1,313 packages offered, of which only 30 cases and 7 robbins sold, good medium and bold limed cut and scraped at 59s., small ditto at 27s. 6d., fair but dusty cuttings at 16s. Calicut rough bought in at 24s., and fair washed rough at 23s. to 24s. Jamaica, in smaller supply, met a fair demand, but owing to firmness of holders only a small quantity sold at full to rather dearer rates: Of 338 packages 90 sold, fine bright at 79s., fair to good bright at 66s. to 72s., low middling to middling 57s. to 65s., common to good common 50s. to 54s., low Rhatoon 46s. to 48s.

GLYCERIN.—The makers of the refined article appear to have at last ceased to press sales à tout prix, and in view of the continued firmness of price of crude it looks very much as if we shall shortly see better prices for pure glycerine, which is, however, still quoted at about 50s. per cwt. for English, and 52s. 6d. to 60s. per cwt., according to brand, for German, best white, double distilled, chemically pure, 1260° quality in tins and cases.

IODIDES—Steady and unchanged.

MERCURIALS—Are firm and unchanged.

MORPHINE—Still firm, especially for prompt delivery, at 4s. 9d. to 5s. per oz., according to quantity, for the hydrochlorate powder.

OILS (FIXED) AND SPIRITS.—Linseed dearer and very firm London, spot, pipes, £21 5s. per ton; barrels, £21 10s.; September-December, £20 10s. to £20 15s.; January-April, £20 2s. 6d.; Hull, spot, naked, £20; September-December, £19; January-April, £18 7s. 6d. Rape strong, ordinary brown spot, £22 10s., buyers; September-December, £22 15s. to £23; refined spot, £23 15s. to £24. Ravison, naked, spot, £19 10s.; September-December, £20. Cotton easier. London crude, spot, £17 2s. 6d.; August, £17 5s. Refined, spot, £18 to £19 10s., according to make. Hull, naked, refined, spot, £16; August £16 2s. 6d.; September-October, 16; November-April, £14; crude, spot, £15; November-April, £13. Olive quiet and unchanged. Palm Lagos, spot, £24 10s. Cocoa-nut firm, at the shade dearer prices. Lubricating oil steady and unchanged. Turpentine, in consequence of pressure to sell, is rather easier at 36s. 3d. per cwt. for American; spot, 36s. 3d. to 36s. 4½d., for September-December, and 37s. per cwt. for January-April. Petroleum firm at 5¼d. per gallon spot, and September-December for Russian, and 6¼d. for American; Water white, 7½d. per gallon. Petroleum Spirit, American, 9d.; deodorised, 9½d. per gallon.

OPIUM—Quiet and practically without change.

PHENACETINE.—It would almost seem as if the makers had grown tired of competing one against the other, and thereby reducing price to a starvation level. It is, however, still possible to buy at 3s. 6d. to 3s. 9d. per lb. for both crystals and powder. Bayer's make in original 1lb. bottles is still quoted 6s. 1d. per lb., and Riedel's 5s 5d. per lb.

PILOCARPINE.—Price has been advanced to 1s. 6d. per gramme for the hydrochlorate and nitrate, 1 oz. lots being quoted 30s. 6d. per oz.

PERMANGANATE OF POTASH.—Quotations remain irregular, and vary from 50s. to 60s. per cwt. for small crystals (large crystals 5s. per cwt. more) in 1 cwt. kegs according to make and quantity.

POTASH COMPOUNDS—Are practically without change at about the quotations quoted end of July.

QUICKSILVER—Firm, at £8 7s. 6d. per bottle from the importer, while second-hand still refrains from offering.

QUININE—Nominally unchanged, makers' price for favourite German brands of Sulphate being still 1s. 4d. per oz. for 1,000oz. lots in 100oz. tins.

ROSIN—Dull and easier at 4s. 1½d. per cwt. for strained on spot, and same price ex-ship for September-December and January-March shipment per sailing vessel.

SANTONIN.—The consequences of the drought and the therefrom resulting short crop of semen cinæ in Turkestan have been further emphasised by advance in makers' prices of Santonine to 9s. 6d. per lb., it being stated that a further advance in price may still yet become necessary.

SHELLAC.—Market remains very quiet at nominally unchanged prices; holders are, however, rather firmer in their views, which tends to check business.

SODA COMPOUNDS—Are without change at the quotations last given, with the exception that caustic is quoted higher at £8 10s. per ton for white 70 per cent., and £7 10s. per ton for 60 per cent.

SPICES (VARIOUS).—Black Pepper firm; 64 bags Tellicherry sold at 5¼d.; no Singapore offered. White Pepper steady; only 54 bags Singapore offered and bought in, good to fine, at 9½d. to 10d. Capsicums steady; of 52 bales Bombay 18 sold, fair cherry pods at 30s. 6d. to 33s. Cassia Buds: 50 bags wild bought in at 26s. Cinnamon Chips: 269 packages Ceylon offered, and only 24 sold, fair quillings at 4½d.; chips and quillings at 3⅞d. Nutmegs quiet; 72 cases mostly bought in, 79's at 1s. 9d., 90's at 1s. 7d., 105's at 1s. 2d.; 109's at 1s. 1d., and 164's at 8d. Mace dull; 26 cases Penang bought in; fine pale at 2s. 4d., fair at 1s. 7d. to 1s. 8d.. and broken at 1s. 5d.; 54 cases West Indian offered and mostly sold at rather easier prices, good pale at 1s. 7d. to 1s. 8d., fair to good red 1s. 5d. to 1s.6d., pickings and broken 1s. 3d. to 1s. 4d. Pimento quiet but steady; 822 bags offered and 360 sold, ordinary to fair, at 3d. to 3⅛d., with a few bags at 3 5/16d.

SULPHONAL.—The price of the two recognised makers remains at 17s. per lb. for both crystals and powder. An outside maker, whose mode of doing business has hardly tended to increase his popularity with respectable buyers, is stated to be offering, to a certain extent *sub rosâ*, to supply the article in 28lb. lots at 14s. per lb. Buyers will, however, do well not to allow themselves to be tempted to lay in a stock of the article, while they will also perhaps be acting in their own interest if they confine their purchases to one of the two generally recognised brands—viz., Bayer's or Riedel's.

To-day's drug auctions appear to have passed off quietly and as might have been expected, without any very striking incident, in spite of the long interval which has elapsed since last sale. A not inconsiderable portion of the lots offered were bought in. The following are the particulars as far as it has been possible to give same up to time of going to press:—

ALOES.—Five cases East Indian bought in at 40s. per cwt. Nine boxes Curaçoa sold at 17s. per cwt. subject to owner's approval, another lot of Capey ditto selling at 17s. 6d. Twenty-two cases Cape sold at 24s per cwt. for fair down to 21s. for inferior, hard, and rather drossy. Ten kegs Socotrine sold at 5s. per cwt.

ANISEEDS.—Forty bags fair Russian were taken out at 20s. per cwt.

ANTIMONY.—50 cases Japan crude all sold at £23 15s. to £24 per ton.

ARGOL.—Eight bags Cape, part held for 46s., per cwt., a bid of 42s. being declined, balance of not so good quality being taken out at this latter figure.

ASAFETIDA.—Of 134 cases a few sold at 38s. to 61s. according to quality, the greater portion being, however, bought in. Of other 172 cases which were offered some of the better lots sold at 75s. per cwt. down to 37s.

BALSAM COPAIBAE.—10 cases fair filtered bought in at 1s. 5d. per lb.; 3 casks good Maranham part sold previously, remainder held for 1s. 8d. per lb.

BALSAM PERU.—5 cases of good quality bought in at 8s. per lb.

BALSAM TOLU.—Of 8 cases, an offer of 1s. 2d. per lb. was to be submitted for 4 cases, remaining 4 cases being taken out at 1s. 6d. per lb.

BIRD LIME.—2 cases genuine Japanese were taken out at 2s. 4d. per lb.

BUCHU LEAVES.—1 bale fair quality rounds realised 4½d. per lb.

CALUMBA ROOT.—32 bags fair washed bought in at 30s. per cwt.

CAMPHOR.—Two casks German refined in Bells sold, subject to owner's approval, at 1s. 5¾d. per lb.

CARDAMOMS.—Medium to fair Ceylon Mysores sold at 2s. 1d. to 2s. 6d. per lb., up to 3s. 10d. per lb. for really fine; lower quality realised 1s. 5d. to 1s. 8d. per lb.; good seed sold at 2s. 4d. to 2s. 5d. per lb.

CASCARA SAGRADA.—40 bales good new bark were held for 30s. per cwt.

CASTOR OIL.—Thirty-three cases seconds Calcutta bought in at 3⅛d. per lb.

CINCHONA BARK.—Four bales Carthagena bought in at 5d. per lb.

CIVET.—10 horns sold readily at 10s. per oz, which appeared cheap in view of the quality of same.

COCA LEAVES.—12 cases Ceylon realised 8d. to 9d. per lb., a comparatively high figure having regard to the quality. 57 bales medium Huanoco were taken out at 1s. 2d. per lb.

COCOA BUTTER.—1 case guaranteed genuine was held for 1s. 7d. per lb.

CUBEBS.—33 bags of fair to good quality were bought in at 25s. per cwt.

CUMMIN SEEDS.—Sixteen bags bought in at 21s. per cwt.

CUTTLE FISH BONE.—3 cases good, bold white were taken out at 8d. per lb.

DILL SEED.—33 bags of good quality were taken out at 15s. per cwt.

DRAGON'S BLOOD.—38 cases fair drop, part woody and part dust, were taken out at £5 per cwt., while 2 cases fine quality realised the high price of £21 per cwt., fair medium quality being held for £10 to £11 10s per cwt., dark seedy block taken out at £16 per cwt.

ERGOT OF RYE.—Eight bags sound Russian realised 1s. 7d. per lb.

ESSENTIAL OILS.—Two cases Orange were held for 7s. 6d. per lb., 5 coppers commercial Bergamot for 4s. 9d. per lb., 5 cases Battaglini's Lemon for 4s. per lb., 5 cases Nutmeg for 2¼d. per oz.,

1 case Clove for 2s. 3d. per lb., 2 cases Star Aniseed for 6s. 6d. per lb., 2 cases West Indian Oil of Limes sold at 3s. 6d. per lb., 2 cases good, genuine Oil Cajaputa at 2s. 11d. per bottle, other 25 cases being taken out at 3s. 6d. per bottle; 9 cases Rhisdonia Oil Eucalyptus bought in at 1s. 9d. per lb., 6 cases Pasquales Cedar Oil Lemon at 4s. per lb., 2 cases Pasquales Oil Orange Rose at 8s. 6d. per lb.

GAMBOGE.—Eight cases part sold at £6 15s. per cwt. for good pickings, balance being bought in at £7 10s. to £9 per cwt.

GUAZA (Herba Cannabis Indica).—35 Robbins were bought in at 3½d. to 4d. per lb. for medium to fair tops, and 3d. per lb. for dark and somewhat stalky.

GUM AMMONIACUM.—7 cases common gum, part blocky, were taken out at 21s. per cwt.

GUM ARABIC.—5 cases grain were bought in at £6 12s. 6d. per cwt. and 10 serons Turkey sorts at 85s. per cwt.

GUM BENJAMIN.—A few lots, offered without reserve, sold at 75s. to 100s. per cwt. for inferior to low seconds Sumatra; medium Siam was held for £14 to £16 per cwt., and downwards for lower quality.

GUM KINO.—3 cases good Cochin bought in at 3s. per lb.

GUM MYRRH.—Nineteen cases common and siftings were taken out at 25s. to 45s. per cwt., thirty packages of better quality being bought in at partly nominal prices, say 65s. to 90s. per cwt.

HONEY.—17 barrels good Jamaica part set, part liquid, sold at 20s. 6d. to 21s. per cwt. 15 cases dark set West Indian sold at 18s. 6d. per cwt., subject to holder's confirmation. 30 cases white Californian were all bought in at 40s. per cwt.

INSECT FLOWERS.—Five bales of open flowers were taken out at 65s. per cwt.

IPECACUANHA.—2 bales picked Carthagena were taken out at 12s. per lb. Of 31 bales Rio only 1 bale 1CCD sold at 14s. 6d. per lb., balance being taken out at 15s. to 15s. 3d. per lb.

JALAP.—20 bales fair heavy taken out at 7d. per lb.

KAMALA.—11 cases of good to fine quality were all bought in.

KOLA NUTS.—10 bags good washed were bought in at 3½d. per lb.

LAVENDER FLOWERS.—40 bags offered without reserve only realised 3s. 6d. per cwt., sale being, however, subject to owner's confirmation.

MUSK.—3 caddies good Tonquin bought in at 65s. per oz.; 1 caddy low ditto at 21s. per oz.

NUX VOMICA.—178 bags were bought in at 7s. 6d. per cwt.

ORRIS ROOT.—15 bags only fair Florentine bought in at 40s. per cwt.; low Verona at 17s. per cwt.

ORANGE PEEL.—Fifteen packages were practically all bought in, nominally at 7d. per lb.

OTTO OF ROSES.—4 vases sold, subject to holder's confirmation, at 14s. per oz. English.

RHUBARB.—Without reserve 4 cases round Canton sold cheaply at 9¾d. per lb., 21 cases small rough round high dried only realising 4¾d. to 5d. per lb.; for 3 cases flat 10d. per lb. was accepted, and for 7 cases sound half showing fair fracture 1s. per lb., subject to owner's approval, good round Shensi being held for 2s. 6d. per lb., an offer of 2s. 1d. for 4 cases trimming root being submitted to holders.

ROSE OIL.—2 pots were bought in at 6d. per oz.

SANDALWOOD LOGS.—57 bundles of fine quality were taken out at £55 per ton.

SARSAPARILLA.—Twelve bales Jamaica sold at 1s. 6d. per lb. for sound, 1s. 5d. per lb. for 1 C C D, and 1s. 3d. per lb for 2 C S D. One case yellow native sold at 10d. per lb. for 1 C C D. Six serons fair Honduras bought in, an offer of 1s. 4d. per lb. not being entertained. Nine bales Lima sold at 10d. to 10½d. per lb.

SENNA.—1 bale fair Tinnevelly was taken out at 6d. per lb., while 58 bales ditto practically all sold at 2¼d. up to 7d. per lb., according to quality, colour, condition, etc.

STAVESACRE SEED.—Sixteen bags were taken out at 35s. per cwt.

TONQUIN BEANS.—5 cases fair frosted Paras, part sold at 2s. 5d. per lb., 3 casks medium Angosturas being held for 3s. per lb.

TURMERIC.—Sixty bags fair finger Madras were taken out at 25s. per cwt.

VANILLOES.—3 tins and 5 parcels New Zealand part sold at 4s. 9d. per lb. for part 4 × 5½, part 4 × 6, part 3½ × 4½, slightly mouldy.

WAX.—30 cases Japan taken out at 34s. per cwt.; 128 packages Zanzibar, part sold at £6 2s. 6d. per cwt., subject to approval; 29 cases Calcutta bought in nominally at £7 per cwt.

Newcastle-on-Tyne Chemical Report.

August 16, 1899.

This market keeps well on the steady side, with prices fully maintained. If anything, some articles have a hardening tendency owing to the want of stocks at the local works. Caustic Soda in fact has been further advanced by 10s. per ton, making the price 20s. dearer than a month ago. Quotations are:—Bleaching Powder, £5 10s. to £5 15s.; Soda Crystals, 45s. to 47s. 6d.; Caustic Soda, 70 per cent., £8 to £8 10s.; Alkali, 52 per cent., £5 to £5 5s.; Soda Ash, 52 per cent., £4 5s. to £4 10s.; Sulphur, £4 15s. to £5 per ton.

Manchester Chemical Report.

August 16, 1899.

There is sustained activity in the demand for heavy chemicals In the Manchester district calico printers and dyers are very busy and this alone absorbs a large production. Caustic Soda and Bleaching Powder are unchanged on the week, but stocks of 58 per cent. Ammonia Alkali are reported considerably reduced, and higher figures are talked of. Soda Crystals are rather higher. Brown Acetate of Lime is steady at £4 12s. 6d. to £4 17s. 6d. per ton, Welsh and American, Manchester. Glycerin is recovering the old position, and local makers are again asking £46 per ton for chemically pure, tins and cases, f.o.b. or rails. Caustic and Carbonate Potash scarce and dearer. Sulphate of Copper is dull at £24 to £24 10s. per ton, according to brand, delivered Manchester. White Powdered Arsenic is easier at £18 15s. per ton, ex-ship Garston. Salt Cake is variable. Lime Salts are firmer, but Lead Salts are quiet.

Liverpool Market Report.

August 16, 1899.

Most articles of regular consumption continue practically at the same figures as before the holiday. In Oils: Linseed, Cottonseed and Olive have advanced a shade, whilst Spirits of Turpentine have jumped up considerably. Miscellaneous sales include Chilian Honey for which there is a good demand, dried Kola Nuts at relatively low rates and Gum Arabic sorts at improved figures. Drysalteries are unchanged, but several heavy chemicals are firmer, notably Sulphate of Ammonia and Borax, whilst a weakening is showing itself in Sulphate of Copper.

AMMONIA SALTS.—Carbonate is firm at 3¼d. per lb. Sal Ammoniac firm, 33s. and 35s. per cwt. Sulphate, £12 7s. 6d. per ton.

CANARYSEED.—The demand for Turkish is improving and the price obtainable rules at or about 38s. per 464 lbs.

COPPERAS—Is very steady at 37s. to 40s. per ton.

COPPER SULPHATE.—This, in consequence of slowness of demand, has dropped to £24 per ton.

GUM.—Arabic "sorts" have been selling at 71s. to 74s. per cwt., and the market closes firm.

HONEY.—50 barrels of Chilian sold at 20s. 6d. per cwt. for Pile 2, and 19s. 6d. for Pile 3. Latterly 150 barrels of Pile 2 changed hands at 20s. 6d.

KOLA NUTS.—29 bags of dried went for 1d. per lb., and 12 bags ditto at 1½d.

LINSEED—Is firmer for all kinds in all positions. 500 tons of River Plate sold at 36s. 3d. per 416 lbs.

OILS (FIXED) AND SPIRITS.—Castor Oils have been selling well from the quay, and the prices now obtainable at Calcutta "good seconds" store, 2⅞d. per lb. French 1st pressure, 2 11/16d. to 2¾d.; 2nd pressure, 2 9/16d.; and second sulphur, 2 15/16d. Madras held for 2¾d. per lb. Olive is very steady with small amounts in stock and little offering. Candia is £32 per tun, and Levant £31 10s. to £32. Linseed: Liverpool pressed oil is very firm at the advanced price of 22s. to 22s. 6d. per cwt. Cottonseed is held steadily for 18s. to 18s. 6d. per cwt. for Liverpool refined oil in export barrels. Spirits of turpentine have rapidly risen to 37s. 9d. per cwt., at which price they remain steady with good inquiry.

POTASH SALTS.—Bichromate, 3¼d. per lb. Cream of tartar is steady but slow of sale at 75s. to 80s. per cwt. Chlorate is quiet, 3½d. to 3¾d. per lb. Pearlashes are nominal at 30s. per cwt. Potashes, 21s. to 21s. 3d. per cwt. Prussiate, 8¼d. to 8½d. per lb. Saltpetre, 22s. per cwt.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax, £16 to £16 10s. per ton. Caustic, 76 to 77 per cent., £8 5s., per ton; 70 per cent., £7 10s. Crystals, £3 per ton. Hyposulphite, £5 15s. to £6 per ton. Nitrate, 7s. 6d. to 7s. 9d. per cwt.

Advertisements.

(Received too late for Classification.)

QUALIFIED; 27; good-class experience; desires situation in London for early in September. Outdoors preferred.—RADIX, 5, Serle St., W.C.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

SPECIAL ANNOUNCEMENT.

The Students' Number of the *Pharmaceutical Journal* will be published on September 9, and the Editor will be glad to receive any information regarding special courses of instruction for pharmaceutical students from the Principals or Secretaries of Schools and Colleges in the United Kingdom.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns, some new. Particulars free. WARNES, Chemist, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. EDWARD PECK, East Dereham.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—HUGHES, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Camwal Shares. State lowest price.—BRAYSHAY, 32, North Frederick Street, Dublin.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. ROWSELL, 9, Derwent Grove, East Dulwich, London, S.E.

Obituary.

Wood.—On May 23, Edward Wood, Pharmaceutical Chemist Wallington; formerly of Brighton. Aged 68. Mr. Wood had been a member of the Pharmaceutical Society since 1852.

Bates.—On August 3, Edward Bates, Chemist and Druggist, Kennington. Aged 42.

Ewing.—On August 6, James Ewing, Chemist and Druggist, Edinburgh. Aged 52.

Harry.—On August 7, Samuel Rhys Harry, Chemist and Druggist, late Sloane Square, London, S.W. Aged 36.

Summers.—On August 9, James Richard Summers, Pharmaceutical Chemist and Dentist, of Norton Folgate, Bishopsgate, E.C. Aged 79. Mr. Summers had been a member of the Pharmaceutical Society since 1853.

Owen.—On August 14, John Owen, Chemist and Druggist, Christchurch. Aged 81.

ENGLISH NEWS.

Alleged Frauds Upon Wholesale Druggists.—Geo. Hammond, 54, described as a traveller, having no fixed abode, and a licence-holder under the Prevention of Crimes Act, was charged, on remand, at Clerkenwell, with attempting to obtain, by means of false pretences, on the 9th inst., 4oz. quinine, 1lb. of menthol, and other drugs, to the value of £1 6s., from Messrs. Hodgkinson, Clark, and Ward, manufacturing chemists, of Whitecross Street, St. Luke's; he was further charged with obtaining, by means of false pretences, a quantity of quinine and peppermint, value £2 8s. 1d., from Walter Goss, the property of Geo. Francis and others, manufacturing chemists, of Southwark. There were stated to be other similar charges against the prisoner. When arrested on the premises of the first prosecutors, where he was recognised as a "wanted" man, and was detained, he had upon him a set of rubber type and sheets of notepaper. With this material, it was said, he produced bogus orders from retail chemists or from medical men, and presented them to wholesale firms, thus securing quantities of valuable drugs, which he in turn disposed of to other chemists as a traveller. It was stated that the prisoner had undergone a term of imprisonment for similar practices in the past. Mr. Horace Smith committed him for trial at the Central Criminal Court.

A Prescribing Chemist.—At Islington, Mr. Walter Schroder held an inquest respecting the death of James Richard Dwyer, aged 17 months, the son of a wood carver, of 14, Herrick Road, Finsbury Park. According to the evidence of the child's mother, the boy, who had previously had intermittent attacks of diarrhœa, was taken by her on Thursday last to Mr. E. G. Robinson, chemist, 165, Blackstock Road, who gave her a powder for the child. He told her to give him also a little lime-water mixed with his milk. Subsequently, the child getting worse, she again went to Mr. Robinson, when he said possibly the boy "had a touch of bronchitis." He supplied her with medicine. The deceased suddenly expired on Monday. Dr. Mitchell, of Blackstock Road, who was called in after death and had made an autopsy, ascribed death to rupture of the stomach whilst the child was suffering from inflammation of the stomach and bowels, from which it had, he said, been ailing at least a week before he was called in. Mr. Robinson said he had no particular recollection of this case. He prescribed for so many. The mixture produced bore his label. It was right for bronchitis. Dr. Mitchell, being informed of its ingredients, said he did not think it would do the child any harm. The Coroner (to Mr. Robinson): Do you prescribe to all who come?—Witness: Yes. In what position? As a chemist, do you think you have any right to do so?—According to law, I suppose I have no right, but people have confidence in me. The Coroner: I do not wish to say anything unkind, but I think this is a misplaced confidence. Persons are in the habit of assuming that you have a medical knowledge which you have not. Mr. Robinson: What are poor people to do if they cannot afford to pay medical men?—The Coroner: I am not here to argue the question. I simply tell you the law. If people are too poor to pay for medical attendance the law provides that they shall receive it gratuitously. The jury returned a verdict in accordance with the medical evidence.

Chemists' Licences.—At the Newton Abbot (Devon) Annual Licensing Sessions on Tuesday last Mr. William Bennett, chemist, applied to have a licence to sell medicated wines off the premises in Queen Street, Newton Abbot, he giving up the licence he formerly held in Wolborough Street. The application was granted. Mr. Albert Christie, chemist, of Courtenay Street, Newton Abbot, also applied for a medicated wine licence, which was granted.

Poisoning Cases in the Manchester District.—The Manchester Deputy Coroner has held an inquest on the body of Samuel Ward, 52 years of age, of 14, Barlow Road, Levenshulme. Deceased had suffered from sleeplessness for some years past, and used to take a 30-grain dose of chloral, mixed with water, every night or every other night, according to how he slept. On Thursday he was found lying dead in bed. His medical man said he had repeatedly warned deceased not to take more thas 10-grain doses at a time, and allow several hours to elapse after each dose. Death, in his opinion, had caused paralysis of the heart, brought about by the habitual and excessive use of chloral hydrate. A verdict of "Death from misadventure" was returned.—The Cheshire Coroner held an inquest at Altrincham on Monday touching the death of a young man of 20, named Frederick Charles Wild, son of a Manchester cotton merchant. In a fit of passion consequent on a quarrel with his father, he went to the dark room where his brother kept his photographic chemicals and drank from 4 to 6 drachms of nitric acid, from the effects of which he never recovered. A verdict of "Suicide during temporary insanity" was returned.

Partnerships Dissolved.

(From the London Gazette.)

Andrew Spearing and Martin James Richardson, General Medical Practitioners, Shaw and New Hey, Lancashire, as regards Andrew Spearing.

Karl Hebbeler and Heinrich Leins, carrying on businesss as Chemists and Druggists, at 149, Houndsditch, London, under the style of M. Buchner and at 55, Fore Street, London, under the style of Schacht, Warner and Co., as regards Karl Hebbeler.

William Sykes and Martin James Richardson, General and Medical Practitioners, Gosport and Alverstoke, Hants.

Receiving Order in Bankruptcy.

(From the London Gazette.)

Wright, Kershaw, Mineral Water Manufacturer, Union Brewery, Pimlico Street, West Hartlepool.

Birth.

Lander.—On Sunday, August 20, at the Medical Hall Canterbury, the wife of Arthur Lander, Ph.C., F.S.M.C., of a son.

Marriages.

Hurst—Lewis.—On August 16, at Heneage Street Baptist Church, Birmingham, by the Rev. Geo. West, James Vernon Hurst, export manager, Southall Brothers and Barclay, Limited, to Emily Alice Lewis, of Havelock Road, Saltley, Birmingham.

Pearson—Peyton.—On August 9 at St. James's, Piccadilly, by the Rev. F. W. Parkes, M.A., George Edward Pearson (of Messrs. Burroughs, Wellcome and Co.) to Clorinda Teresa Peyton, only child of James Peyton, London.

Death.

Field.—On August 16, at East End Farm, Flitwick, Mary Elizabeth, wife of William Field, Chemist, Church Street, Wolverton, Bucks, formerly of Rotherfield, Tunbridge Wells.

Manchester Chemical Report.

August 23, 1899.

The chemical trade generally is enjoying a period of prosperity at the present time such as it has not been favoured with for some three or four years past. The works in the centres of the north continue very busy. Ammonia Alkali, 58 per cent., as indicated last week, is higher, and may be quoted £4 2s. 6d. to £4 7s. 6d. per ton, bags, on rails. Quotations for Caustic Soda are as follow:—77-78 per cent., £9 5s. to £9 12s. 6d.; 74 per cent., £8 15s. to £9; 70 per cent., £8; and 60 per cent., £7. Bleaching Powder unchanged. Salt Cake is rising, and is quoted 24s. to 25s., in bulk, on rails. A few miscellaneous chemicals show weakness. Sulphate of Copper is £24 to £24 10s. per ton, according to brand, delivered Manchester. Acetate of Lead is quiet, and Acetate of Soda ranges from £12 15s. to £13 5s. per ton, c.i.f. White Powdered Arsenic tends lower, at £18 10s. to £18 15s. per ton, ex ship Garston. Yellow Prussiate lower, at 7⅝d. to 7¾d. On the other hand, prices of Carbolic Acid are well maintained. Brown Acetate of Lime is steady at £4 15s. to £4 17s. 6d. per ton, Welsh and American, Manchester. Glauber Salts have advanced to 35s., and Epsoms, £3 per ton, bags, on rails, Manchester.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

AUGUST 24, 1899.

As might have been expected, business has been exceedingly quiet during the past few days, while there are no changes of any importance to record in the values of any of the articles of special interest in the drug and chemical trades. Quicksilver is tending upwards, but so far the advance has been small, and can hardly be considered as being official, in that the importer declines to sell. Everything, however, points to the probability of a distinct advance in the official price in the near future. This will undoubtedly mean also then an advance in makers' prices for Mercurials, Santonine, Pilocarpine, and Eserine (Physostigmine) are firm at the late advance. Quinine remains dull and neglected, and the German Sulphate is obtainable from second-hand at fully 2d. per oz. below the price which the makers themselves quote. Acid Citric, Acid Tartaric, and Cream of Tartar are quiet, but fairly steady. The following are particulars of prices quoted for some articles of chief interest:—

ACETANILIDE—Continues weak at 11d. to 1s. 2d. per lb., according to quantity, brand, and putting up.

ACID BORACIC.—Crystals are still quoted 25s. per cwt., and powder 27s. per cwt.

ACID CARBOLIC.—Market is firm at 7d. per lb. for the 35-36° C. ice crystal in large drums and overcasks, 7½d. per lb. for the 39-40° C. ice crystal, and 8½d. per lb. for the 39-40° C. detached crystals, which is now the quality prescribed by the B.P. Crude 60° F., 2s. per gallon; 70° F., 2s. 6d. per gallon. Liquid 95-98 per cent., of pale straw colour, 1s. 4d. per gallon in 40-gallon casks.

ACID CITRIC—Continues very quiet at 1s. 6½d. to 1s. 7d. per lb. for crystals in 5-cwt. barrels.

ACID OXALIC.—Very quiet at 3⅛d. to 3¼d. per lb. nett, delivered free London.

ACID SALICYLIC.—There is a rumour that makers intend to advance the price of this preparation.

ACID TARTARIC.—Quiet at 1s. 1d. per lb. for English on the spot, and 1s. 0¼d. per lb. c.i.f. for foreign.

ANTIMONY.—Regulus is steady at £39 to £40 per ton. Crude Japan (black sulphide) firm at £24 10s. per ton.

ATROPINE—Is firm at 15s. 6d. per ounce for the Sulphate B.P., and 17s. 10d. per oz. for the pure Alkaloid.

BISMUTH SALTS are steady at 5s. 1d. per lb. for the Subnitrate, the other Salts being also unchanged in price. The commercial quality of the Metal is also still quoted at 5s. per lb., and the Refined at 6s. 6d. per lb.

AMMONIA COMPOUNDS.—Bromide 2s. 2d. per lb., Carbonate 3d. to 4d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 30s. to 32s. 6d. per cwt.; commercial, free from metals, 25s. to 27s. 6d. Sal Ammoniac: Firsts, 35s.; seconds, 33s. per cwt.; ditto, crushed for batteries, firsts, 37s.; seconds, 35s. per cwt. Sulphate dull; gray, prompt, 24 per cent., London, £12 7s. 6d. to £12 10s. per ton; Hull, £12 5s.; Leith, prompt, £12 7s. 6d. to £12 8s. 9d.; Beckton, September, £12 10s.; October-March, £12; Beckton terms, prompt, £12 5s. per ton. Sulphocyanide, 1s. to 1s. 1d. per lb.

ANTIPYRINE AND PHENAZONE.—Prices are steady, and without change, both for Dr. Knorr's article and for its cheaper commercial equivalent.

ASHES.—Pots, 22s. 9d.; Pearls, 32s.

BLEACHING POWDER (CHLORIDE OF LIME).—Quotation remains unchanged at £6 10s. per ton for English.

BORAX—Quiet, at 16s. per cwt. for crystals, and 16s. 6d. to 16s. 9d. per cwt. for powder.

BROMIDES—Are very firm at 1s. 10½d. per lb. for Potassii Bromid. 2s. 2d. per lb. for Ammonii Bromid., and 2s. 1½d. for Sodii Bromide. Price of Bromine is also unchanged at 2s. 2d. per lb. in cases of 60lb.

CAMPHOR.—The market for crude remains extremely quiet at nominally unchanged prices. Near shipment Japan is, however, offering at a rather lower figure—viz., 127s. 6d. per cwt. c.i.f. Refined is unchanged at 1s. 7d. per lb. for English Bells and Flowers in one ton lots.

CLOVES.—Privately continued dulness prevails for Zanzibar, but prices are steady, with buyers October-December delivery at 3 1/16d. and January-March at 3 3-32d. At auction 20 bales Zanzibar offered were bought in, good at 3⅝d. No Penang offered.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 2d. per gallon; pure, 2s. 4d.; Benzole 50 per cent. 10d. per gal., 90 per cent. 8d. Creosote 3½d. per gallon. Crude Naphtha 30 per cent. at 120° C 3¾d. per gallon. Solvent Naphtha 95 per cent. at 160° C 1s. 4½d. per gallon, 90 per cent. at 160° C 1s. 3d., 90 per cent. at 190° C 1s. 3d. per gallon. Anthracene: A, 4d. per unit; B, 3d. per unit. Pitch, 36s. per ton f.o.b. Tar, refined, 14s. 6d. per barrel, 2½d. per gallon; crude, 13s. 6d. per barrel, 2¼d. per gallon.

COCAINE.—Makers of the best brands are firm at 14s. 4d. per oz. for the Hydrochlorate in 25-oz. tins and for 100-oz. lots, while second-hand offers slightly below makers' prices. Inferior makes of this article are being hawked round, and are offering almost

COD LIVER OIL.—Best new Norwegian Oil is still quoted 58s. to 60s. per barrel, in tin-lined barrels of 25 gallons.

CODEINE—Remains very firm at 12s. 6d. to 12s. 9d. per oz. according to quantity for the pure, the Muriate, Sulphate, and Phosphate Salts being quoted 1s. per oz. less money.

COPPER SULPHATE—Quiet but fairly steady at £23 17s. 6d. to £25 10s. per ton on the spot, according to make, quantity, etc.

CREAM OF TARTAR.—First White Crystals are quoted 76s. per cwt. on the spot; Powder, 78s. per cwt.

ESERINE (PHYSOSTIGMINE)—Remains firm at the lately advanced price of 2s. 3d. per gramme for the Sulphate and Salicylate.

ESSENTIAL OILS—Are quite inactive. HGH Oil of Peppermint is quoted nominally 5s. 6d. per lb., but there are sellers at somewhat below this figure.

GALLS.—Business in all descriptions is very small, but holders are generally firm. China quoted 59s. for usual shape. In Persian retail sales have occurred in Blues at previous rates, and Whites have been dealt in to a moderate extent at full prices; Blues quoted 62s. 6d. to 65s.; Greens, 56s. to 57s. 6d.; and Whites, 50s. to 52s. 6d. Smyrna sell slowly, including Blues at 57s. 6d.

GINGER.—Cochin, in moderate supply, realised about previous rates. Of 228 bags and 186 cases offered, about 140 packages sold, fair bold, some medium cut and scraped, 70s. to 71s.; fair small ditto at 28s.; brown rough, 19s. 6d.; tips and cuttings, 16s.; ordinary washed rough, 21s. to 21s. 6d. Jamaica being firmly held, fetched rather better prices for the small lots sold. Of 162 barrels, 24 found buyers, low middling to middling at 56s. to 61s. 6d.; common to good common, 48s. 6d. to 54s.

GLYCERIN.—Refined is fairly steady at nominally unchanged price. Crude keeps firm.

IODIDES—Steady at 10s. 6d. per lb. for Potasii Iodid.; 13s. 10d. per lb. for Ammon. Iodid.; 11s. 10d. per lb. for Sodii Iodid.; and 13s. 10d. per lb. for Iodoform Cryst. Powder; and Precipitated Iodine resublimed is quoted 12s. per lb., and the commercial quality 7½d. per oz.

MENTHOL—Is quiet, but steady, at nominally 7s. 3d. to 7s. 6d. per lb., according to quantity and brand, for good white Crystals in 5 lb. tins and cases of 12 tins each.

MERCURIALS—Are very firm, but so far without change, at 2s. 10d. per lb. for calomel and 2s. 6d. per lb. for corrosive sublimate.

MORPHINE.—Market is quiet, but steady, the Hydrochlorate Powder being still quoted 4s. 9d. to 5s. per oz. according to quantity, price of the Crystals being 2d. per oz. more.

NITRATE OF SODA—Is quoted £8 per ton for refined on the spot, and £7 15s. per ton for the commercial article.

OILS (FIXED) AND SPIRITS.—Linseed steady. London spot pipes are quoted £21 to £21 5s. per ton, barrels £21 7s. 6d. to £21 10s., September-December £20 12s. 6d., January-April

£20 2s. 6d. Hull spot naked, £20 10s.; September-December, £19 2s. 6d.; January-April, £18 12s. 6d. Rape firm. Ordinary brown spot and September-December, £23 5s.; refined spot, £24 15s. Ravison naked spot and September-December, £20. Cotton quiet. London crude spot, £16 15s.; August, £17. Refined spot, £18 to £19 10s., according to make, etc. Hull naked refined spot, £16; September-October, £15 17s. 6d.; November-April, £14 2s. 6d.; crude spot, £15; November-April, £13 per ton. Olive firm. Mogador, £33; Spanish, £32 10s.; Palm Lagos spot, £25 15s. Coconut Ceylon spot, £25 per ton, landed terms; July-September and September-November, £23 5s. c.i.f. Cochin spot, £29 landed; August-October, £26 c.i.f.; and October-December, £25 17 6d. c.i.f. Castor Oil firmer. Belgian first pressing spot, £25 10s.; second pressing, £23 per ton, ex wharf. Hull-manufactured, guaranteed pure cold drawn Pharmaceutical quality, £28 per ton in barrels; $3\frac{5}{16}$d. per lb. in cases. Pure firsts, £25 10s.; seconds, £24 per ton in barrels; firsts, 3d. per lb.; seconds, $2\frac{7}{8}$d. per lb. in cases for prompt delivery, ex wharf, London. Lubricating Oil: Pale American spot, 5s. 9d. to 7s. per gallon; black, 5s. 6d. to 6s.; pale Russian, 6s. to 8s.; black, 5s. 6d. to 6s. Turpentine opened flat in consequence of pressure to sell, and prices fell away 9d. to 1s. 3d. per cwt., according to position; later on, however, a steadier tone prevailed, and there was a recovery all round of about 3d. per cwt. from the lowest figures touched. Quotations close as follow:—American spot, 34s. $1\frac{1}{2}$d. to 34s. 3d. per cwt.; September-December, 34s. 3d.; January-April, 34s. $10\frac{1}{2}$d. per cwt. Petroleum steady at $5\frac{1}{8}$d. per gallon for Russian spot and September-December, and $6\frac{1}{8}$d. to $6\frac{1}{4}$d. for American in same positions. Water white spot and September-December, $7\frac{1}{4}$d. to $7\frac{1}{2}$d. per gallon. Petroleum Spirit: American, 9d. per gallon; deodorized, $9\frac{1}{4}$d. to $9\frac{1}{2}$d. per gallon.

OPIUM.—Prices are nominally unchanged, but business in the article is practically at a standstill for the moment.

PARAFFIN WAX.—Quiet, at $2\frac{1}{8}$d. to $2\frac{3}{8}$d. per lb. for Crude, and $2\frac{3}{4}$d. to $3\frac{3}{4}$d. per lb. for Refined.

PHENACETINE—Continues weak at 3s. $4\frac{1}{2}$d. to 3s. 6d. per lb. for quantity, both for the crystals and powder. Inferior makes of this article are being offered, even below above figures, but it is somewhat a case of caveat amptor.

PERMANGANATE OF POTASH—Is in fair demand, prices remaining, however, somewhat irregular, and varying from 50s. to 60s. per cwt., according to quantity and make for small Crystals in 1 cwt. kegs, the large Crystals being quoted 5s. per cwt. higher.

PILOCARPINE.—The makers are firm at the advanced price of 30s. 6d. per oz. for the Hydrochlorate and Nitrate Salts (with a reduction for larger quantity), and it would appear as if the cheaper offers of outside makes had also ceased.

PITCH.—8s. to 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate 32s. 6d. to 35s. per cwt., Bichromate $3\frac{1}{2}$d. per lb., Bromide 1s. $10\frac{1}{2}$d. per lb., Chlorate Crystals $3\frac{3}{4}$d., powder 4d. per lb., spot, London; Iodide 10s. 6d. per lb., Permanganate 52s. 6d. to 60s. per cwt. in 1-cwt. kegs for small crystals, and 5s. per cwt. more for large crystals; Prussiate, yellow, Beckton, $7\frac{3}{4}$d. per lb.; other English makes 8d. to $8\frac{1}{4}$d. per lb., red 1s. to 1s. 2d. per lb.

QUICKSILVER.—It is stated that the importer declines to sell. The article is, however, obtainable, nevertheless, at £8 9s. 6d. to £8 10s. per bottle.

QUININE—Remains quite inactive. In the speculative market price for best brands of German Sulphate (B & S and/or Brunswick) are quoted 1s. 2d. to 1s. $2\frac{1}{2}$d. per lb. according to delivery for 1,000 oz. lots in 100 oz. tins, while makers' price for these brands remains unchanged at 1s. 4d. per oz.

ROSIN.—Dull. Strained spot, 4s. to 4s. $1\frac{1}{2}$d. per cwt., and to arrive 4s. $1\frac{1}{2}$d., ex-ship for September-November and January-March shipment per sailing vessel.

SHELLAC—Remains very quiet, and the demand slow in all positions, with only small sales on the spot, including TN Orange on a basis of 64s. cash terms. For arrival TN October-December steamer quoted nominally 64s. to 65s. c.f. and i.

SODA COMPOUNDS.—Crystals, barrels, 55s.; bags, 52s. 6d. per ton, ex-ship Thames. Ash, £5 to £5 10s. per ton, according to percentage, etc. Bicarbonate, commercial, £7 10s. to £8 10s. per ton; ditto fully bicarbonated, 19s. 6d. to 22s. 6d per cwt. Bichromate, $2\frac{3}{4}$d. per lb. Bromide, 2s. $1\frac{1}{2}$d. per lb. Caustic white, 70 per cent., £8 10s.; 60 per cent., £7 10s. per ton. Hyposulphite (Antichlor), 6s. to 8s. per cwt., according to make, quantity, and packing. Iodide, 11s. 10d. per lb. Nitrate, commercial, £7 15s.; refined, £8 per ton.

SODA CRYSTALS—Unchanged at 55s. per ton for barrels, and 52s. 6d. per ton for bags, ex-ship Thames.

SODA SALICYLATE.—The rumour of a possible advance in makers' price of Acid Salicylic also applies to the Soda.

SPICES (Various).—Black Pepper firm: Penang bought in at $5\frac{1}{4}$d. and Tellicherry at $5\frac{5}{8}$d.; no Singapore offered. White Pepper quiet but firm: Singapore bought in at $8\frac{3}{4}$d. and Penang at $8\frac{1}{2}$d. Capsicums: 20 bales Bombay sold, fair cherry pods at 29s. 6d., long stalky at 26s. to 27s. 6d.: 2 bales Natal bought in at 90s. Cassia Lignea: 100 cases China bought in, old import at 51s.: 13 bales Saigon also bought in, coarse quills at 55s. Cinnamon: 306 bags Ceylon offered, of which 56 sold, broken quill 9d., quillings 6d., featherings 6d.: chips and bark bought in at $5\frac{1}{2}$d. Mace: 4 cases Penang sold, good bright part wormy at 1s. 7d.: 12 packages West Indian sold, fair to good pale at 1s. 7d. to 1s. 9d., fair red 1s. 5d. to 1s. 6d. Nutmegs quiet: 5 cases Penang bought in, 64's at 2s. 4d.: 37 packages West Indian sold, 98's at 1s. 1d., 100's at 1s., 116's at $11\frac{1}{2}$d., 138's at $6\frac{1}{2}$d. Pimento quiet but steady: of 289 bags only 46 sold, fair to good at $3\frac{1}{8}$d. to 3 3-16d.

SULPHONAL—Unchanged, at 17s. per lb. from the maker, a little (some of it of doubtful quality) being obtainable from second-hand for rather less money.

TURMERIC—Remains quiet, and business is of an unimportant character, but prices are steady. Bengal quoted 18s. 6d., Madras fair to fine bright finger at 25s. to 30s., and Cochin split bulb sellers at 8s. 6d.

Newcastle-on-Tyne Chemical Report.

August 23, 1899.

Shipments of heavy goods to the Baltic and Mediterranean ports still keep this market fairly busy, particularly for Caustic Soda and Bleaching Powder. Both articles are somewhat scarce through smallness of stocks; prices firmly quoted. Rather more doing in Soda Crystals. Bleaching Powder, £5 10s. to £5 15s. Caustic Soda, 70 per cent., £8 to £8 10s. Soda Crystals, 45s. to 47s. 6d. Alkali, 52 per cent., £5 to £5 5s. Soda Ash, 52 per cent., £4 5s. to £4 10s. Sulphur, £4 17s. 6d. to £5 per ton.

Liverpool Market Report.

August 23, 1899.

Quotations still continue steady and the business done during the week has been of a substantial character. Considerably higher rates may be looked for in Olive Oils, which close very firm, particularly for Candia and Levant. Good sales of Chilian Honey have been effected at full prices, and Canaryseed has attracted more attention, having risen somewhat in price. In Chemicals, Caustic Soda, Borax and Ammonia Sulphate are still dear, whilst Sulphate of Copper for spring shipment is in more demand.

AMMONIA SULPHATE—Is scarce and dearer, £12 7s. 6d. to £12 10s. per ton.

BEESWAX.—42 blocks of Sierra Leone made £6 per cwt., and 9 bales of Gambia were disposed of privately.

BORAX—Is firm, £16 to £16 10s. per ton.

CANARYSEED—Is in better demand, fine quality Turkish has sold in small amounts at 39s. 6d. per 464 lbs. The price now is 38s. 6d. to 39s. 6d., according to quality.

COPPER SULPHATE.—Spot price, £23 10s. per ton; forward spring, £22 10s.

HONEY.—60 barrels, Pile 1, Chilian, sold for 24s. per cwt. Californian is very firmly held.

OILS (FIXED) AND SPIRITS.—Castor is in good demand; Calcutta is a shade higher, $2\frac{15}{16}$d. per lb.; French 1st pressure $2\frac{3}{4}$d.; 2nd pressure $2\frac{9}{16}$d; 2nd sulphur $2\frac{5}{16}$d. Madras $2\frac{3}{4}$d. per lb. Olive is very firm, with fair inquiry. In consequence of the poor reports as to crops in Candia the price has risen to £32 10s. and £33 per tun for Candia and Levant oil, and small sales have been made at the higher figure. Linseed Oil is very firmly held at 22s. 3d. to 22s. 6d. per cwt. Cottonseed Oil is steady at 18s. to 18s. 6d. per cwt. Spirits of Turpentine are now easier at 37s. per cwt.

POTASH SALTS.—Cream of Tartar is selling moderately at 75s. to 80s. per cwt. Saltpetre 22s. per cwt. Potashes 21s. to 21s. 3d. per cwt. Pearlashes 30s. per cwt.

SODA SALTS.—Bicarbonate £6 5s. to £6 15s. per ton. Caustic Soda, 76 to 77 per cent., £8 15s. per ton. Nitrate 7s. 6d. to 7s. 9d. per cwt.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns, some new. Particulars free. WARNES, Chemist, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. EDWARD FECK, East Dereham.

Half-plate Set, consisting of field camera (all movements), Swift roller-blind shutter, Ross's portable symmetrical lens, 8 by 5, three double slides, tripod case, and straps; new last summer. Cost £8 16s., price £6 10s.—GATWARD, Yeovil.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—HUGHES, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Mahogany Pill Machine, gr. 3, Maw, Fig. 92. Suppository Mould, 1 doz., gr. 15, Maw, Fig. 48. Year-book of Pharmacy, 7 vols., bound, 1874-1880. Phillipps' Pharmacopœia, 1851. "Analyst," unbound, Vol. 22, 1897, Jan. to July, 1898. Gray's Supplement to Pharmacopœia, 1847, no index from "F." "Underwood's Celsus," 2 vols., interlineal translation. "Pharmaceutical Journal," unbound: Vol. 14, 1883-84; Vol. 15, 1884-85; June, 1882, with index, Vol. 12; January to June, 1883; July 4, 1885, to January 2, 1886; January to June, 1889.—MALLETT, 19, Caernarvon Road, Norwich.

WANTED.

Good Vanilla Pods; also Daisy Powders. Lowest price.—EASTMAN, Forest Lane, Stratford, E.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. ROWSELL, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements.

(Received too late for Classification.)

FOR immediate disposal, a good, reliable, Chemist's BUSINESS, with Gilbey's Agency attached, in rapidly-increasing suburb of Liverpool. Returns last year, nearly £700, and are increasing. Very little opposition; good opening for dentistry. Low rental. Shop well fitted and stocked; good range of specialities. Price, about £500.—Apply B., c/o Woodburn & Holme, 5, Fenwick Street, Liverpool.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

SPECIAL ANNOUNCEMENT.

The Students' Number of the *Pharmaceutical Journal* will be published on September 9, and the Editor will be glad to receive any information regarding special courses of instruction for pharmaceutical students from the Principals or Secretaries of Schools and Colleges in the United Kingdom.

ENGLISH NEWS.

Camwal Outing.—On Saturday, August 26, the employees of the Bristol Branch of Camwal had their annual outing at Clevendon, for which place the party left Bristol in two four-horse brakes, a capital journey being made in fine weather. An excellent repast was provided at Wickenden's Restaurant by the manager, Mr. R. R. Groome, and after the repast the usual loyal toasts were drunk. Responding to the toast of "The Firm," Mr. Howe, of the Camwal office staff, said that according to a journal he had before him he noticed the Camwal train was passing under the bridge of success, and he hoped soon to see it had passed under the bridge of prosperity. Songs were rendered by Mr. Coomber Brookman and Miss Perrin (lady baritone singer) and others. After a very pleasant day Bristol was reached at 11 o'clock.

The Newcastle Infirmary Fund.—According to the *Newcastle Daily Chronicle*, amongst a number of circulars sent out by Mr. Riley Lord, the Chairman of the Queen's Commemoration New Infirmary Fund Committee, for financial assistance to obtain the full £100,000 as required under the terms of the late Mr. John Hall's will, before his £100,000 can be paid over, was one to Mr. J. C. Eno, of Wood Hall, Dulwich, S.E., formerly chemist and druggist in the Groat Market, Newcastle. Mr. Eno replied to the circular by asking what sum would be required to make up the £100,000, and he was informed that the amount needed would be £8,500. On Saturday morning, August 19, a cheque for that sum was received by Mr. Riley Lord and Mr. Sutton from Mr. Eno. Mr. Eno was a student at Newcastle Infirmary, and whilst at that institution wrote his name on the glass of one of the windows, and on receipt of the good news on Saturday, a mark was placed round the pane, so that it may be preserved as a memento of the generous donor.

The Size of Post-cards.—Mr. Henniker Heaton, M.P., has received an unofficial communication stating that his request that the postal authorities should permit the enlargement of the present restricted size of the inland post-cards has been granted and that the change will take effect on November 1. On the same date the issue of the small official inland post-card will be discontinued, and two kinds of official post-cards, of the same size as the foreign post-cards, will be issued by the Post Office. One of these will be white and the other buff in colour. It is understood that Messrs. De La Rue and Co., the contractors, have in a liberal spirit made very considerable concessions, which will result in a large saving to the Post Office. Mr. Hanbury, M.P., the Secretary to the Treasury, conducted the negotiations. The sale of the inland post-cards at their face value has not yet been conceded.

The Lists of Jurymen.—On and after September 1, for twenty-one days, the lists of persons liable to serve as jurymen in England and Wales will be exhibited on the doors of the churches and chapels and other public places of worship over the country. These lists are open to public inspection. Persons of 60 years of age and upwards are exempt from serving, as also are judges, magistrates, officers of the army and navy, members of the legal and medical professions, and pharmaceutical chemists. Unless objection is made to the overseers of the various parishes during September by persons who are exempt and whose names appear on the lists, their names will be returned to the Clerks of the Peace, and they will be liable to serve on special and common juries for the ensuing year. During the last week of September, the Justices will hold a petty sessions to correct the lists and to allow the notices of objection to the overseers.

Counterfeit Stamps on Scales.—At Worship Street Police Court, on August 28, Charles Toombes, 62, scale-maker, of Camden Street, Bethnal Green, who had been arrested on a warrant charging him with counterfeiting and using a die or stamp for stamping weighing instruments contrary to the Weights and Measures Act, 1878 and 1889, and Morris Shapnitzki, a butcher, of Wentworth Street, Spitalfields, appeared to a summons charging them with knowingly selling a certain weighing instrument bearing a counterfeit of the stamp used for stamping weighing instruments. —Mr. Andrews prosecuted for the London County Council, and Mr. Cox, an inspector under the Act, stated in evidence, that about March, 1898, it came to his knowledge, when making inspections of weights and measures in the district of Spitalfields, that certain scales and weights bore a counterfeited stamp. Acting on information, he called on Shapnitzki, who offered scales at 4s. and 4s. 6d. each stamped, or 6d. less unstamped. An arrangement which was come to led subsequently to the witness seeing Toombes in company of Shapnitzki, and to both of the accused arranging for the sale and stamping of scales. He also called at Toombes' place, and Toombes allowed him to see him stamp one of the machines with a die which had been used on the other machines. This die was produced and was found to be one of old use—bearing a crown, V.R., and the figures "388."—Mr. Andrews said this was a die allotted by the Board of Trade to the Dorking division of the county of Surrey. He called an inspector of that division, who said the number "388" was still in use, but the other form of the stamp had been altered since 1890. He had no doubt the die was one that had been in use prior to 1890. A question by Mr. Denyer, second clerk, elicited the reply that old dies were supposed to be broken up, but obviously the one in question had escaped official cognizance, how or in what manner was not known.—Mr. Corser thought that the evidence did not show guilty knowledge on the part of Shapnitzki, and he dismissed the summons against him. Toombes, who only pleaded that he had not counterfeited the die, but knew he had no right to apply it, was ordered to pay a fine of £10 and £5 5s. costs, or a month in default. Toombes was removed to prison, and the scales and die were forfeited.

A Surgeon Accidentally Poisoned.—An inquest has been held at the London and North-Western Railway Company's Hotel, Crewe, touching the death of Arthur Lucas Morgan, surgeon, of Swansea. He arrived at the hotel on August 18, and on the next day was found in his room breathing heavily. Mr. Lawrence was summoned, and found him suffering from opium poisoning, from which he died two hours later. It was stated that the deceased had been overworked and looked ill when seen by his friends last week. A verdict of "Poisoned by misadventure" was returned.

POISONING CASES.

Prussic Acid.—At Newport (I. of W.), on Thursday, August 24 an inquest was held with respect to the death of Robert Gibson Smith, 43, described as "proprietor of the well-known corner chemist's shop facing St. James's Square" (the name of Robert Gibson Smith does not appear on the Register of Chemists and Druggists for 1899.—Ed. *P.J.*), who was found earlier in the day suffering from prussic acid poisoning. Evidence was given by Dr. Dabbs, J.P., to the effect that deceased had complained that "his business worried him, through the position in which he was, not having passed his examination and obtained the proper certificate." A verdict of "Suicide whilst temporarily insane" was returned.

Opium.—The *Times* reports that on Wednesday, August 30, Mr. Wynne E. Baxter, the East London coroner, held an inquiry at the Bromley Sick Asylum into the circumstances attending the death of Elizabeth Bailey, aged forty-nine years, the wife of a dock labourer, who had died in that institution from the effects of opium poisoning.—John Bailey, the husband, stated that eighteen years ago his wife met with an injury, and ever since had been in the habit of taking opium pills.—The Coroner: How much opium did she take?—Witness: Well, I reckon it has cost me between £200 and £300.—The Coroner: What did she buy?—Witness: About threepennyworth every day.—A nurse, who attended to the woman on her admission to the infirmary, said she was in a drowsy, dreamy condition. In her pocket the witness found the box containing the piece of opium produced. The woman told her that she had been in the habit of taking the drug for thirteen years.—Dr. Donald Bruce said that the cause of death was exhaustion and weakness consequent on continual opium taking.—The Coroner observed that the box produced was not labelled, although opium was a scheduled poison. There was no actual proof as to where it was purchased, but whoever supplied the woman with the drug had broken the law. Taking opium to excess was ten times worse than taking too much alcohol. In this case it would be wrong to describe it as a natural death; it was the act of a person of unsound mind, and it would be ridiculous to say otherwise.—The jury expressed their concurrence with the Coroner's remarks, and returned a verdict of "Suicide whilst temporary insane." They requested the Coroner to draw the attention of the proper authorities to the apparent sale of opium without the necessary precautions under the Pharmacy Act having been carried out.

FRENCH NEWS.

The Antiseptic Influence of Light.—The purifying action of the solar rays, according to Marechale, is such that the spores of charbon (anthrax), one of the most redoubtable of known bacilli, are influenced to such a degree as to be rapidly rendered incapable of germinating. The bacteriæ, if not wholly destroyed by the light, are nevertheless sufficiently injured that the *ferments* or *toxines* which they secrete are greatly modified in their specific virulence. Frankland and Koch have each shown that the virulence of the tuberculosis and cholera bacilli is speedily nullified by the antiseptic action of solar rays. "This assertion," adds Monsieur Lacassague," should allay any fears respecting the homicidal *rôle* which phthisic individuals play in glazing the pavements of the streets with their expectorations; the sun happily steps in and becomes the vigilant guardian of the public health, destroying the virus where it would be difficult for the best organised body of hygienic police to effectually neutralise." There is much truth in the old Italian adage which says "*Dove non va il sole, va il medico*" (where the sun goes not, the doctor visits). Microbes, like all evil-doers, are the sons of shade and darkness.

Pure Water for Paris.—A preliminary analysis has just been made of the water filtered by the new basins of Ivry, which were inaugurated a few days ago. A cubic centimetre of the water under examination revealed an average of 269 bacteriæ, whereas the average of the best drinking water with which Paris has hitherto been regaled has been between 1,200 and 1,500 bacteriæ per cubic centimetre. The latter figures are insignificant when one compares them with the average number of bacteriæ contained in a cubic centimetre of unfiltered Seine water, which amounts to 50,000. This fact makes one shudder to think of the millions of microbes which were contained in a single glassful of this water, which from time to time in dry seasons the City of Paris beneficently "turned on" to wet citizens' parched whistles with before the construction of the filtering basins of Saint Maur and Ivry. Now they can take their fill without fear of being swamped with typhoid and diphtheria bacteriæ at every mouthful.

The Röntgen Rays have been tried to see whether they have any influence on the growth of plants. Sachs has found that the blue, violet, and ultra-violet rays of the solar spectrum incite the tendency of plants to curve towards the sun, in other words, "heliotropic curvature," whereas the red, yellow, and green rays appear to be inactive. Herr Schober took young oak plants, and submitted them to the Röntgen rays for an hour, but found no alteration in their curvature. After exposure to ordinary daylight for the same length of time, however, a notable increase of curvature was seen. An account of his experiments was given to the German Botanical Society; but obviously his experiment was not so satisfactory as it would have been with a longer exposure of the plants to the X-rays.

Herren Wiedemann and Schmidt have found that the vapours of alkaline metals are fluorescent in the sunlight. As the atmosphere of the sun coutains the vapours of these metals, the discovery is important in solar physics and the interpretation of the solar-spectrum.

Kidnapped from a Paris Hospital.—A day or two ago a girl waited outside one of the Paris hospitals the hour when the public were admitted to visit their friends. She had a baby eleven months old in her arms, her little brother, whose mother was a patient in the institution. A woman, up to the present unknown, who had seated herself beside the girl, entered into conversation with her, and offered to take charge of the baby whilst the girl went to visit her mother. This was agreed to. But when the sister came back the woman had disappeared with the baby. After waiting for some time in vain, the girl informed the police, and an investigation was at once set on foot. That same night the police on duty in the Rue de Charenton found a baby fast asleep lying in a doorway, and took it to the police depôt, whence it was conveyed to the *Enfants Assistés*. The friends of the missing baby were advised of the discovery and came to inspect the child, which, to their joy, they found to be the lost one.

Fire at a Stearin Works.—On Sunday afternoon a big fire broke out at half-past two at the works of the "Stearinerie Française le Phenix," 106, Rue du Laudry, plaine St. Denis, in the environs of Paris. The fire originated in the saponifying department of the works, and is supposed to have been caused by the escape of gas from the fittings in course of repairs. The fire spread with alarming rapidity, and threatened at one time to envelop the adjoining structure, which contained a quantity of explosive material. Happily the fire brigades from St. Denis, Paris, and Aubervilliers were quickly on the spot, and succeeded in preventing the fire from extending to the annexe. After three hours' hard work the flames were finally overcome, but not before considerable damage had been wrought. The loss is enormous, but the premises are said to be fully insured. Two of the firemeu, Sergeant Debonue and Fireman Harbilleau, of the St. Ouen brigade, were seriously injured, and after receiving first aid from a distant pharmacien were conveyed to their respective abodes. Of late St. Denis, which is a sort of French Widnes or St. Helens, has been the scene of no small number of like mishaps.

Supply of Anti-Plague Serum in Paris.—It appears that the demands for Anti-Plague Serum at the Laboratory of the Pasteur Institute have been coming in during the past week to such au extent that some little fear was entertained as to the possibility of meeting them all. Dr. Metchnikoff, however, gives the assurauce that the supply is ample at present for Portugal, Spain, Italy, and Turkey, and all demands hitherto received can be met without drawing on the reserve, which is kept in view of the necessity for its use arising at any moment in Paris and the proviuces. As a matter of fact, the Pastcur Iustitute has for four years past been preparing the serum, although the regular authorisation to prepare it only appeared a few days ago in the *Journal Officiel*. The first expeditions of anti-plague serum were to Réunion, and during the past few days a supply has been sent to Portugal. The Anti-Rabique Serum was the first to be prepared, and may be said to be universally known. Then came the Anti-Tetanique Serum, of which the consumption is somewhat large, especially so since cycling has become such a craze, for many are the "spills" resulting in superficial grazing of hands, legs, noses, etc., too trivial apparently to pay much attention to, but which often enough, by virtue of their exposed condition, offer au excellent ground for the germs of tetanus carried by the dust, etc., to develop upon. The third is the Anti-Diphtherique Serum, which has already been instrumental in saving thousands of young lives from the clutches of that dreadful infantile malady, croup. The fourth and last is the Anti-Pesteux, or Anti-Plague Serum, the consumption of which bids fair to be the highest of all. But one serum which is greatly needed in France at the present moment for a disease which is peculiar to the French, and whose effects may yet be appalling unless a remedy be quickly discovered, is au "Anti-Anti-Semitique Serum." If the besieged patriots of the illustrious "Fort Chabrol," the headquarters of the "Anti-Jewish" journal, had but had a few injections of such a panacea, typhoid fever, the result of their being besieged in such an insanitary abode, would not be laying them low as it is now doing. No! this Anti-Jewish fever greatly needs a counteracting serum.

IRISH NEWS.

"**Laudanum Poisoning**, acting upon a weak heart," was the cause of death found by the jury in the case of a woman named Margaret Sinclair, Belfast. Her husband, a seaman, witnessed that she had taken laudanum once before, necessitating medical treatment.—William Hall, a lodger, held a policy of insurance on her life. The latter called in a woman, who stated that on her entering Hall took two bottles, labelled "laudanum," from a drawer and flung them through the open window, whereupon she told him they should have been kept for the doctor. There was no evidence of suicide, nor did the jury state by whom the poison was administered.—Dr. Calwell considered that further restrictions should be placed upon the sale of laudanum by its inclusion in Part 1 of the Schedule, and the "absolute necessity" of doing so was endorsed by the jury.

Sir Charles Cameron has writteu to the Kilkeel Board of Guardians, who revoked his appointment, that his services would still be available gratis as an analyst of water, liquor, etc. The Board have, however, advertised for an analyst at £10 a year.

Mr. J. A. Stewart, M.P.S.I., Ava Buildings Pharmacy, Ormeau Road, Belfast, is extending his business to new premises on the Dublin Road.

AUSTRALASIAN NEWS.

(From Our Melbourne Correspondent.)

The Lapsed Poisons Amendment Act of last Session has again made its appearance in the Victorian Parliament, this time in the Upper House, where it was introduced on July 5, and read a second time on July 11. With the exception that cyanide of potassium is expressly withdrawn from the exemption previously provided for photographic materials, and for mining purposes unless sold in quantities of not less than 56 lbs., the measure is almost identical with that of last year. Fortunately Victorian pharmacists have in the Hon. F. S. Grimwade (of Felton, Grimwade and Co.), a representative in the House both able and willing to champion the amendments which are considered necessary to lick the Bill into workable shape; and while reserving his full strength for the committee stage, Mr. Grimwade in a very exhaustive speech on the second reading, showed conclusively that in its present form the Bill fell very far short of what it was intended to secure—the safety of the public.

As they Stand in the Bill at present, the exemptions (Clause 4) read as follow:—"(*a*) Patent or proprietary medicines; (*b*) photographic materials (others than cyanide of potassium) for the purpose of photography; or (*c*) cyanide of potassium to be used for mining purposes, if sold in quantities of not less than 56 lbs.; or (*d*) medicines dispensed by registered veterinary surgeons for animals under their treatment; or (*e*) poisoned seed for the destruction of vermin (within the meaning of the Vermin Destruction Act, 1890); or (*f*) packets of poisonous mixture for the destruction of vermin other than vermin mentioned in paragraph (*e*); or (*g*) fly-poison papers; or (*h*) poisons by wholesale dealers in the ordinary course of wholesale dealing where an order in writing signed by the purchaser has been given for the supply of the same."

Subject to the Provision contained in Sub-section 2 of the clause, which requires that certain precautions shall be adopted, and that a record of the sales shall be kept, these poisons may be sold by any person. The sub-section referred to reads:—"Every sale of any materials or articles mentioned in this section, and which consist of or contain any poison, shall at the time of sale and before delivery be entered by the person who sells the same, or by any employé, assistant, or apprentice of such person, in a book, together with the date of sale, the quantity and nature of materials, or articles sold, and the name and place of abode of the purchaser; and no such materials or articles consisting of or containing any poison shall be sold or delivered unless the bottle or other vessel, wrapper, or cover, box, or case immediately containing such materials or articles bears the word "Poison" printed conspicuously thereon, together with the name and address of the seller thereof."

Referring specially to the paragraph (*f*), exempting packets of poisonous mixtures for the destruction of vermin, Mr. Grimwade drew attention to the large number of deaths resulting from the unlicensed sale of poisons, such as Vermin Killer and Rough on Rats, and maintaining that these articles should only be sold by chemists—although he felt inclined to go the length of making it absolutely illegal to sell them because of their dangerous nature. He intimated his intention of proposing an amendment which would remove these poisons from the list of exemptions, and among others one that would enable regulations to be framed for the safe custody as well as the sale of cyanide of potassium, which is at present allowed to lie about the mines using it very much as if it were as harmless as a bag of sugar.

Mr. Grimwade, illustrating his arguments by reference to the admirable provisions of the *Code Napoleon*, forcibly pointed out that one of the greatest dangers that confront all English communities is the licence with which various articles called patent or proprietary medicines are sold. "Of all the civilised countries of the world," said Mr. Grimwade, "England and her colonial dependencies and the United States of America are the only countries where people are allowed to flood the market with these alleged remedies, some of which may be good, but many of which are worthless, and for which, by stupendous advertising, a demand is created. If the Government had gone further, and appointed a Commission to investigate and deal with the sale of patent medicines, they would have done a good thing, and I should have supported them, because I think that one of the greatest evils of the present day is the extent to which the sale of patent medicines is advertised." Coming from the source they did, Mr. Grimwade's criticisms evidently impressed upon the House the deep importance of the questions at issue, and strong hopes are entertained that many of the amendments desired by the Pharmacy Board will be effected before the measure makes its appearance in the Legislative Assembly.

In the Matter of the proposed Victorian Pharmaceutical Conference, referred to in my last, the Committee report having secured the services on the General Committee of such prominent gentlemen as Messrs. F. S. Grimwade, Tompsitt, H. Francis, F. Cheshire, A. J. Owen, R. P. Francis, Church, Witt, Rankin, Woolnough, and Drs. Plowman, Cole, and P. Ward Farmer, Messrs. Shillinglaw and Turner have undertaken to act as joint honorary secretaries, and Mr. Witt has been appointed chairman. A subcommittee, consisting of Messrs. Cheshire, Woolnough, and Rankin, has been appointed to prepare a list of preparations to be submitted to the General Committee; and a letter embodying the objects of the Conference is being forwarded to all registered chemists in the colony.

The Australasian Association for the Advancement of Science, which held its last meeting in Sydney at the beginning of 1898, will hold its next session in Melbourne in January next. The meetings will be held at the University under the presidency of R. L. J. Ellery, Esq., C.M.G., F.R.S., F.R.A.S., commencing on Tuesday, January 9, and will be continued throughout the following week. The work of the session is divided between ten sections, as follows:—Section A, astronomy, mathematics and physics; section B, chemistry; section C, geology and mineralogy; section D, biology; section E, geography; section F, ethnology and anthropology; section G, economic science and agriculture; section H, engineering and architecture; section I, sanitary science and hygiene; section J, mental science and education. In addition to the meetings of the sections, arrangements are in progress for evening lectures and entertainments, and for excursions to places of interest. Mr. A. W. Craig, M.A., and Mr. D. McAlpine, members of the teaching staff of the College of Pharmacy, have been appointed secretaries to sections B and G respectively, and will be glad to receive the offer of contributions of papers on any subject of pharmaceutical or general scientific interest from any part of the world.

The Contest for the two vacancies on the Pharmacy Board of New South Wales has resulted in the re-election of Mr. J. C. Hallam (226 votes), and the election of Mr. C. A. Marshall (205 votes); their opponents, Messrs. H. A. Rose and G. S. C. Wells scoring respectively 153 and 133 votes. The voting at this election reveals a very regretable amount of apathy, as out of 680 voting papers issued only 386—a little more than half—were returned, and owing to careless filling up 28 of these were declared informal. The vacancy on the Council of the Pharmaceutical Society of New South Wales, caused by the retirement of Mr. Willows, has been filled by the election of Mr. W. G. Bladon.

The Pharmaceutical Society of South Australia held its annual meeting on July 11, when a very gratifying report was presented. Instead of four students, as in 1895, there are now thirty-one attending the classes. The balance-sheet showed the following figures:—Receipts: Subscriptions, 1898-9, £124 14s. 6d.; University fees, etc., £231 12s. 6d. Disbursements: University fees, £102 2s. 1d.; Board fees, £62 9s. 6d.; journals, printing, and sundries, £59 14s. 4d. After providing for all liabilities, a credit balance is shown o £170 18s. 4d.

The Poll recently taken in New Zealand to determine where the headquarters of the Pharmacy Board should be located resulted in favour of Wellington, for which 127 votes were cast as against 120 for Christchurch. Mr. George Mee, the Wellington member of the Board, is on his way to England for a few months' trip.

At Auckland, last month, several members of a company carrying on business under the name of the African, Pacific, and

Indian Hagey Company, for cure of drunkenness and smoking, were sued by one Harrison for £2,000 damages for alleged breach of contract. The plaintiff, it was represented, had been induced to put £2,000 into the company and exploit Tasmania with the "cure." An agreement had been entered into; but the plaintiff had reserved to himself the right to call his money back again if the business in Tasmania was not satisfactory. Before he left for Tasmania he asked for a supply of the remedies and instructions for their use. He was told they would follow him. He got them in Sydney, and after reading the instructions his ardour cooled somewhat as regards the success of the drink cure. Doubts having arisen in his mind, he returned to Auckland, and demanded his £2,000 worth of stock, as he was not satisfied. The partners told him he was premature, and he was persuaded to try business in Tasmania. The Tasmanians, however, were not at all eager after the Hagey cure, and after a month's stay he returned to Auckland, not having had a single patient. After evidence had been taken, the jury returned a verdict for the amount claimed, with costs on the highest scale.

TRADE NOTES.

Microscopic Stains.—Messrs. Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C., have recently introduced a series of microscopic stains in the form of soloids, comprising gentian violet, methylene blue, eosine, Bismarck brown, and fuchsine. The tendency of solutions of the aniline dyes to decompose has always been a source of trouble in microscopic work, but the introduction of these stains enables such solutions to be prepared in small quantities when required. The method of preparation is as follows:—A saturated watery solution of fuchsine, methylene blue, gentian violet, or Bismarck brown, is obtained by powdering one soloid, adding 7 C.c. (two drachms) of distilled water, and then shaking well. Five to ten per cent. dilutions with distilled water of these saturated solutions may then be used for ordinary staining purposes. Thus one drachm of saturated solution made up to two drachms with distilled water gives 1 in 17, or a 6 per cent. solution. A saturated alcoholic solution of methylene blue, gentian violet, or Bismarck brown may be obtained by treating in the same way one of the soloids with a similar quantity of absolute alcohol instead of distilled water. A saturated alcoholic solution of fuchsine is obtained by treating two soloid preparations with 3·5 C.c. (one drachm) of absolute alcohol. To obtain a solution of eosine suitable for general staining one of the soloids should be dissolved in 12·25 C.c. (three drachms) of 50 per cent. absolute alcohol in distilled water. This gives approximately a 0·5 per cent. solution. The soloids are put up in tubes of six, containing one grain each.

Messrs. Burroughs, Wellcome and Co. also submit a specimen tube of holocaine hydrochloride tabloids, gr. 1/50, which have been introduced for use in ophthalmic surgery. The tabloid preparation has been introduced to do away with the objection that solutions of holocaine quickly undergo decomposition and rapidly deteriorate in therapeutic value. They are issued in tubes containing twenty-five.

Thermometers, etc.—Messrs. F. Darton and Co., 142, St. John Street, London, E.C., send a specimen copy of their trade price list of thermometers, and intimate that they will be pleased to forward a copy of the list, post free, to any of our readers. Messrs. Darton also send particulars of "The Luminous Lamp," an ingenious contrivance for use in the bedroom, smoke room, or anywhere where a light may be required instantaneously for a short time. The lamp, when charged, will light, by a simple pressure of the finger, about 3,000 times, and can be recharged in one minute. It is said never to get out of order, and to last a lifetime. The price of the lamp complete, with bottle of charging salts, is 10s. 6d.

Cocaine for the Stings of Bees and Wasps.—A correspondent to *Nature* states that the local application of cocaine solution is an effectual remedy for the stings of bees and wasps; not only does it relieve the pain, but it appears to act as a direct antidote to the poison.

THE PURITY OF FOOD AND DRUGS.

Almond and Camphorated Oils.—In his quarterly report the Birmingham analyst (Dr. Alfred Hill) states that three samples of almond oil out of twenty examined were certified to be adulterated. One contained 75 per cent.. another 50 per cent., and the third 100 per cent. of peach kernel oil. In the first two cases a fine of £1 and 8s. costs was inflicted, and in the other the prosecution was withdrawn owing to a technical error in the wording of the certificate. Thirteen of nineteen samples of camphorated oil received were prepared with olive oil, and contained about the right proportion of camphor; another contained 10 per cent. too little camphor. Two samples were prepared with a cheaper vegetable oil, but were not deficient in camphor. Three samples were made from mineral oil, one of them containing a very small quantity of camphor. The sale of common lubricating oil, scented with camphor oil is, Dr. Hill states, a cruel fraud, as the medicinal properties of such a preparation are very slight. One fine of £5 and four of £3 were inflicted.

Camphorated Oil.—On Saturday, August 19, at Bedford Division Petty Sessions, Edward Gaunt, of Turvey, was summoned for selling camphorated oil which was not of the substance and quality demanded, being deficient in camphor to the extent of 15 per cent. The county analyst having certified that the sample consisted of 82·2 per cent. of olive oil and 17·8 per cent. of camphor; whereas according to the British Pharmacopœia, it should have contained at least 21 per cent. of camphor. Mr. Clare, who defended, argued that camphorated oil was not a drug. The inspector did not ask for oil containing any particular proportion of camphor, and he urged that this part of the certificate was *ultra vires*. Probably, he continued, the oil was originally up to the standard, for at the bottom of each of the twelve penny bottles purchased there would be more camphor than oil in the sediment which remained. The defendant, he might mention, was the manager of the Turvey branch of the Bedford Co-operative Society, and as a matter of fact the bottles in question were sent there by accident. It was intended that they should be recalled on account of a mistake in the composition. Defendant was fined £1 and costs.

Seidlitz Powders.—On Wednesday, August 23, at Leicester Police-court, Albert Davenport, grocer, of Great Wigston, was charged with selling seidlitz powders, of which the acid portion in the white paper instead of consisting solely of tartaric acid, contained 12 per cent. of alum, which, as an ingredient, the county analyst considered injurious.—Defendant said he thought the powders were genuine.—A fine of £2 7s. 6d., including costs, was imposed.

Self-Rising Flour.—Before the Manchester Stipendiary Magistrates recently, Annie Moffit, grocer and provision dealer, Tamworth Street, Stretford, was charged with selling 1 lb. of self-rising flour which was alleged to contain ingredients injurious to health, Dr. Bell, of Liverpool, having certified that the flour contained 170 grains of alum, 140 grains of bicarbonate of soda, and 65½ grains of salt per pound of wheat flour. To his certificate Dr. Bell added the following:—"No change had taken place in the constitution of the sample that would interfere with the analysis. Alum is an astringent drug, of which the maximum dose is 10 grains. In food it is injurious to health, whether mixed with bicarbonate of soda or not. The quantity present in this sample is excessively large, and its use in self-rising flour is quite unnecessary, and very unusual."—Dr. Campbell Bell was present at the hearing of the case, and stated that he had personally made the analysis, and believed it to be correct.—Mr. Chorlton, for the defendant, said a portion of the same sample had been analysed by Mr. William Thompson, who was prepared to state on oath that there was no alum in the flour at all.—As there appeared to be a serious conflict of evidence, the magistrates ordered that a portion of the sample be forwarded to Somerset House for analysis, and adjourned the case pending the arrival of the certificate from the Somerset House authorities.—On Thursday, August 10, the solicitors engaged in the case again attended the court, and Mr. Yates (the stipendiary) said that the certificate from Somerset House had arrived, and it showed that the self-rising flour in question was free from alum.—Mr. Chorlton, for the defendant, contended that the case ought to be withdrawn, and costs allowed to his client, but it was eventually decided to adjourn the matter to September 7.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

AUGUST 31, 1899.

Business has been quiet during the past few days, while there are few changes to record. Quinine has had another slump, while Quicksilver is dearer, and as a consequence, an advance in makers' prices for mercurials has taken place. Linseed Oil and Rape Oil are dearer; Rosin is also quoted higher. Otherwise, there are practically no alterations to report in value of articles usually noticed in these columns.

The following are the prices ruling for some articles of chief interest:—

ACETANILIDE—Continues dull and weak at 11d. to 1s. 2d. per lb., according to quantity, etc.

ACID BORACIC—Steady, and without alteration in price.

ACID CARBOLIC.—Market is quiet, but firm, at 7d. to 7¼d. per lb., according to make, quantity, and packing, for the 35-36°C. ice crystal, other qualities being also unchanged at proportionate prices. Crude, 60°F., 2s. per gallon; 75°F., 2s. 6d. per gallon. Liquid, 95-98 per cent. of pale straw colour, 1s. 3d. to 1s. 4d. per gallon in 40-gallon casks.

ACID CITRIC—Quiet and slow of sale at 1s. 6d. to 1s. 7d. per lb., according to make, for crystals in 5 cwt. casks.

ACID OXALIC—Steady at unchanged rates.

ACID TARTARIC—Unchanged.

AMMONIA COMPOUNDS.—There are no changes of any importance from the prices given last week.

BLEACHING POWDER—Is quoted 10s. dearer at £6 10s. per ton for English.

BORAX—Quiet and unchanged.

BROMIDES AND BROMINE—In fair demand at unchanged prices.

CAMPHOR—Has been very quiet, and there is no change to report either in Crude or in the Refined article.

CLOVES.—Privately Zanzibar quiet but steady; small sales comprising Oct.-Dec. delivery at 3 5-32d., and Jan.-March at 3 3/16d. No Zanzibar or Penang were offered in auction.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 1s. 2d. per gallon; pure, 2s. Benzole, 50 per cent., 9½d. per gallon; 90 per cent., 8d. per gallon. Creosote, 3¼d. per gallon. Crude Naphtha, 30 per cent., at 160° C., 3¾d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 5d. per gallon; 90 per cent. at 160° C., 1s. 2d.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene, 4d. per unit; B., 2¾d. Pitch, 35s. per ton f.o.b. Tar, crude or refined, 13s. per barrel; 2¼d. per gallon.

CODEINE—Is very firm at 12s. 6d. to 12s. 9d. per oz. for the pure, and 1s. per oz. less for the salts.

COD LIVER OIL.—There has been practically no business doing in the article during the past few days.

CREAM OF TARTAR—Quiet.

ERGOT OF RYE—Is extremely scarce, and very high prices are asked, up to 2s. to 2s. 6d. per lb. for sound Russian, and 2s. 6d. to 3s. per lb. for Spanish, for the comparatively small lots which are offering in this market. It would appear possible that even higher prices may rule for this article in the not too distant future, before any reduction in value can take place.

ESSENTIAL OILS—Have been extremely quiet, with very little business passing, while there are no changes in value of any particular importance to record.

GALLS.—The demand for all descriptions shows no improvement, but prices are generally steady. China nominal in the absence of business; usual shape quoted 59s. Persian Blues and Greens have met with a moderate inquiry, but few sales have resulted, holders remaining firm. The reports of the new crop are favourable; Blues quoted 62s. 6d. to 65s., Greens 56s. to 57s. 6d., and Whites 50s. to 52s. 6d. Smyrna and Morea are in slow demand, with few sales passing.

GINGER.—Cochin, in moderate supply, found slow demand. 709 bags rough offered and 179 sold; Calicut rough, good bold bright, some medium slightly mouldy at 26s., washed medium and small bright plump at 22s., small and shrivelled part mouldy at 19s., fair cuttings at 15s. 6d. Of 64 cases cut kinds 16 cases sold, fair medium cut and scraped 50s., small ditto but mouldy at 26s. Small supplies of Jamaica sold steadily, fair to good at 65s. to 69s., good common to middling 54s. to 60s.

GLYCERIN.—Refined is quiet and unchanged in spite of the continued firmness of the Crude article.

IODIDES AND IODINE—Steady and without change.

MERCURIALS.—In consequence of the advance in price of Quicksilver makers of mercurials advanced their price on Saturday 1d. per lb. to 2s. 11d. per lb. for Calomel, and 2s. 7d. per lb. for Corrosive Sublimate.

MORPHINE—Continues firm and scarce for prompt delivery, at 4s. 9d. to 5s. per oz., according to quantity, for the Hydrochlorate powder, the Crystal salt costing 2d. per oz. more money.

OILS (FIXED) AND SPIRITS.—Linseed very firm. London spot pipes, £21 10s.; barrels, £21 12s. 6d.; September-December, £21 5s. to £21 7s. 6d.; January-April, £20 10s. to £20 12s. 6d. Hull, spot naked, £20 12s. 6d.; September, £19 15s.; January-April, £19 5s. Rape firm; ordinary brown spot and September-December, £23 5s. Refined spot, £24 15s. Ravison naked spot and September-December, £20. Cotton quiet. London crude spot and September-October, £16 10s. Refined spot, £17 15s. to £19 10s., according to make. Hull naked refined spot, £15 17s. 6d. September-October, £15 15s.; November-April, £14 10s. Crude spot, £14 17s. 6d.; November-April, £13 5s. Castor oil dearer. Belgian, first pressing spot, £26; second pressing spot, £23 10s. per ton, ex wharf. Hull manufactured, guaranteed cold drawn pure Pharmaceutical quality, £28 per ton in barrels, 3 5/16d. per lb. in cases. Pure firsts, £25 10s.; seconds, £24 per ton in barrels; firsts, 3d. per lb. in cases; seconds, 2⅞d. per lb. in cases for prompt delivery, ex wharf, London. Turpentine: Market opened depressed and weak, 32s. 9d. per cwt. being accepted for spot and September-December; prices, however, speedily recovered, but in absence of buyers the recovery was hardly maintained at the close, quotations being—American spot, 33s. 1½d. to 33s. 3d. per cwt.; September-December, 33s. 4½d.; January-April, 34s. 3d. The other articles usually quoted under this heading remain quiet and practically without change in price.

OPIUM.—Market in London remains quiet at nominally unchanged to slightly firmer prices. In Smyrna, towards the end of last week, 100 cases were sold to the Dutch Government at 8s. 9d. per lb, and early this week further 100 cases are reported to have changed hands at 2d. per lb. advance for manufacturing kinds.

PHENACETINE—Continues weak at 3s. 6d. to 3s. 9d. per lb., according to quantity and packing, for both crystals and powder.

POTASH COMPOUNDS—Are quiet and without any particular alterations in values.

QUICKSILVER.—The importer late last week advanced his price, which is now £8 12s. 6d. per bottle; while second-hand quotes £8 12s. A further advance is considered not improbable.

QUININE.—Makers last week reduced price to 1s. 2d. per oz. for the favourite German brands, B & S. and Brunswick, while price of Howard's Sulphate has also been reduced to 1s. 5d. per oz. for vials in 1,000 oz. lots. In the speculative market a few thousand ounces have changed hands at 1s. 0½d. per lb. for best German Sulphate on the spot, and 1s. 0¾d. to 1s. 1d. per oz. for December delivery, the market closing with a rather steadier tone.

ROSIN—Dearer at 4s. 6d. per cwt. for strained on the spot, and 4s. 1½d. to 4s. 2d. per cwt., ex-ship terms for September-October and November-January shipment per sailing vessel.

SEEDLAC—Slow of sale, and 43 bags Kurrachee in auction were all bought in.

SHELLAC.—There has been a fair inquiry on the spot, resulting in sale of about 300 cases at steady rates, including TN Orange, on a basis of 64s. for fair, short prompt. The Future market continues neglected; quotations are, therefore, uncertain. The Calcutta market remains firm. These auctions to-day produced small supplies of Second Orange, which met a fair demand at about steady previous sales' rates, standard TN value 64s. Garnet quiet, and all bought in. Button was offered chiefly in small lots, and partly sold at fairly steady prices. A total of 497 cases was offered and 228 cases sold. Second Orange: Of 358 cases 183 sold, strong flat bright reddish at 64s., fair curly at 64s., middling to fair reddish

livery at 63s. to 64s. Garnet: 42 cases offered and bought in, pale ruby flat weakish at 64s., and blocky Rangoon. Button: Of 97 cases, 45 sold, fair firsts at 72s. 6d., blocky to fair seconds at 64s. 6d. to 67s. 6d., ditto thirds at 60s. to 62s. 6d., blocky chips at 60s.

SODA COMPOUNDS—Remain quiet and without any special changes in values.

SPICES (VARIOUS).—Black Pepper: 23 bags Singapore sold at 5½d. and 15 bags Aleppy at 5⅜d. Penang bought in at 5¼d. White Pepper firm; 52 bags Singapore bought in at 10d. to 10½d. Chillies steady; 102 bags Natal sold, fair to good bright at 36s. to 40s. 6d., ordinary dull, part perished, at 28s. 6d. to 31s. Capsicums dull; 151 bales Bombay bought in; fair bright cherry pods at 30s. to 32s. Mace: 40 packages West Indian sold, fair to good pale at 1s. 7d. to 1s. 9d., ordinary to fair red at 1s. 4d. to 1s. 6d., broken at 1s. 3d. Nutmegs: 133 packages West Indian sold, 70's, 1s. 9d. to 1s. 10d.; 80's to 85's, 1s. 5d. to 1s. 6d.; 92's, at 1s. 3d., 101's to 114's, 11½d. to 1s. 1d.; 134's, 8½d. Pimento quiet, but firm; of 305 bags, only 55 sold, fair at 3¼d.

STICKLAC—Remains quiet. In auction 66 cases offered and bought in, fair Saigon at 45s., and unsifted Siam, part small and woody, also at 45s.

SULPHATE COPPER—Is slightly easier in tone, quotations being nominally £23 17s. 6d. to £25 per ton, according to make, etc.

SULPHONAL—Remains practically unchanged, there being still offers at prices below maker's figure of 17s. per lb. for crystals or powder.

TURMERIC.—In auction nothing was offered, and privately but little business is passing, demand being slow for all descriptions; while prices show no quotable change at 18s. 6d. per cwt. for Bengal, 25s. to 27s. 6d. per cwt. for fair to good bright Madras Finger, and 8s. 6d. per cwt. for Cochin split bulbs.

To-day's drug auctions passed off very quietly, a large proportion of the lots offered failing to find a buyer. There were no changes in value of any special importance.

ACONITE ROOT.—10 bags good Japan root were bought in at 28s. per cwt.

ALOES.—Eight cases fine East Indian in monkey skins were taken out at 70s. per cwt. Eighteen cases fair, bright, hard Cape part sold at 25s. 6d. to 26s. per cwt., while two cases low, soft, and drossy were taken out at 18s. per cwt.

ANNATTO SEED.—For one bag an offer of 1d. per lb. was to be submitted.

ARECA NUTS.—Ten bags of good sold cheaply at 21s. per cwt.

ARGOL.—2 bags Cape bought in at 37s. per cwt.

ASHPALTUM.—Eighty-six cases Syrian were bought in at 31s. 6d. per cwt.

BALSAM PERU.—Five cases good quality, but rather dark in colour, taken out at 8s. per lb.

BALSAM TOLU.—Four cases bought in at 1s. 3d. per lb.

BUCHU LEAVES.—Eight bales part sold at 6¼d. per lb. for good green leaves.

CAMPHOR OIL.—280 cases dark Japan were taken out at 35s. per cwt.

CARDAMOMS.—Of 59 cases Ceylon part sold at 2s. 6d. for fair quality; while fine bold were held for 3s. 2d. to 3s. 6d. per lb., a bid of 3s. 1d. being declined. Lower qualities were bought in at 2s. 2d. down to 1s. 6d. per lb.; other 54 cases sold freely at 1s. 5d. up to 2s. 7d. per lb. for low to fair medium. Other 72 cases part sold, realising up to 3s. per lb. for fine bold. Other 94 cases sold at 3s. 1d. for fine bold oblong Ceylon Mysores. Seeds sold at 2s. 1d. to 2s. 4d. per lb.

CASTOR OIL.—20 cases fair Calcutta were taken out at 3¾d. per lb.

CINCHONA BARK.—20 serons Crown bark sold at 7d. to 11d. per lb. for sound, and 6d. per lb. for damaged.

CIVET.—5 horns all bought in at 10s. per oz.

COCCULUS INDICUS.—85 bags fair quality were taken out at 9s. per cwt.

COLOCYNTH.—6 cases good pale Turkey taken out at 1s. 6d. per lb. Rather less would, however, probably have been accepted, while for other 20 cases 1s. 7d. per lb. was the price required.

COLOMBO ROOT.—7 bags of fair quality were taken out at 40s. per cwt.; 58 bags dark sorts all sold at 13s. 6d. per cwt.

CROTON SEEDS.—12 bags of rather dull appearance were held for 60s. per cwt.

CUS CUS ROOT.—Eight bales, very sandy, were bought in at 25s. per cwt.

DRAGON'S BLOOD.—Nine packages drop, rather woody, were taken out at 90s. per cwt.

ERGOT OF RYE.—8 bags good sound Spanish was bought in at 2s. 6d. per lb. For another lot of 9 bags an even higher price was mentioned, the article being apparently very scarce.

ESSENTIAL OILS.—15 cases Ceylon Citronelle were bought in at 1s. per lb. Five cases China Star Aniseed at 6s. 3d. per lb. Two cases West Indian Oil of Orange at 10s. per lb. Three cases Neroli Bigarade at 2s. 6d. per oz.

FŒNUGREEK SEEDS.—125 bags yellow taken out at 6s. 6d. per cwt.

GENTIAN ROOT.—Thirty-four bags of cut root taken out at 15s. per cwt., while for 20 bales good whole root 14s. 6d. per cwt. was price required.

GUM AMMONIACUM.—One case of good fair quality bought in at 30s. per cwt.

GUM ARABIC.—4 cases picked gum were taken out at £6 10s. per cwt. 36 bales Turkey sorts at 47s. 6d. to 75s. 5 cases grains at £6 12s. 6d. per cwt.

GUM BENZOIN.—75 cases were all bought in at 47s. 6d. to 60s. per cwt. for medium to fair Palembang, and £8 15s. for medium to fair seconds Sumatra.

GUM CHICLE.—Five bales of fair quality were sold at 8¼d. per lb.

GUM GALBANUM.—15 packages bought in at 9d. to 1s. 3d. per lb.

GUM GUAIACUM.—19 packages part sold at 10d. to 1s. 2d. per lb. for fair, 1 case being bought in at 2s. per lb.

GUM KINO.—3 cases were bought in at 3s. 6d. per lb. for fair Cochin, 1 case good black selling cheaply at 2s. per lb.

GUM MASTIC.—Nineteen cases, all bought in at 1s. 7d. to 1s. 9d. per lb.

GUM MYRRH.—Of 7 cases 1 case pale, rather soft, sold at 35s. per cwt., while 4 bales dark realized 25s. per cwt. Good sorts were bought in at 65s., and siftings at 40s. per cwt.

GUM THUS.—5 casks were bought in at 12s. per cwt.

GUAZA.—29 Robbins fair tops were bought in at 3¾d. per lb.

HONEY.—2 casks liquid West Indian sold at 20s. 6d. per cwt. 10 barrels Chilian bought in at 28s. per cwt. 20 cases fair Californian at 40s. per cwt.

ICELAND MOSS.—Two bales of fair quality fetched 4s. per cwt.

IPECACUANHA.—14 packages Rio part sold at 14s. 6d. per lb., while 16s. was the price for 4 bales picked, a bid of 15s. 3d. being refused. 2 cases Carthagena bought in at 11s. per lb. Other 16 bags ditto were also held for the same figure.

KOLA NUTS.—5 bags were taken out at 4d. per lb., 1 bag dark inferior selling at 1¾d. per lb.

LIME JUICE.—1 puncheon from New York sold at 1s. per gallon.

LIQUORICE ROOT.—71 bales cut root bought in, only 11s. per cwt. being offered, which was declined.

MENTHOL.—Six cases good Japan crystals were taken out at 7s. 3d. per lb.

MUSK—4 caddies Tonquin were bought in.

NUX VOMICA.—79 bags bought in at 6s. up to 7s. 6d. per cwt. for good small bright.

ORANGE BLOSSOMS.—20 cases, catalogued as Italian dried blossom bitter orange were bought in at 1s. 6d. per lb.

ORANGE PEEL.—Four cases were bought in at 6½d. per lb., while eight cases dark offered without reserve only realised 1½d. to 3¾d. per lb.

RHATANIA ROOT.—99 bales were all taken out at 4d. to 4½d. per lb.

RHUBARB.—16 cases flat high dried were taken out at 10d. per lb.

ROSE FLOWERS.—10 bales brown, from Jedda, were taken out at 20s. per cwt.

SARSAPARILLA.—12 bales Lima sold at 7d. to 7¼d. down to 6d. for country damaged. Other 7 packages ditto realised up to 7½d. per lb., while for 4 bales of same 8½d. per lb. was bid and refused. For other 7 bales ditto 1s. 1d. per lb. was price required. Eight bales Jamaica sold at 1s. 5d. per lb. Eight serons Honduras were taken out at 1s. 3d. to 1s. 5d. per lb.

SENNA.—119 packages Alexandria were chiefly bought in at 4½d. to 8d. per lb., according to quality and condition. 1 bale Alexandria pods, which was catalogued, had been disposed of previous to the auctions. 114 bales Tinnivelly sold freely at 2¼d. up to 4½d. per lb., according to quality, condition, etc. Other 146 bales also sold readily up to 5½d. per lb. for fair green leaf.

SCAMMONY ROOT.—309 bales were bought in at 18s. to 21s. per cwt.

SQUILLS.—10 bags sold at 1¼d. per lb.

STROPHANTHUS SEED.—Two bags rather dark Kombé bought in at 3s. per lb.

TAMARINDS.—40 barrels West Indian part sold at 9s. 1d. per cwt., balance being bought in at 9s. 6d.

TONQUIN BEANS.—3 cases fair Paras were taken out at 2s. 5d. per lb. 1 cask fair Angosturas bought in at 3s. 6d. per lb.

WAX.—Fair Jamaica sold at £6 15s. per cwt., which shows rather lower value. Fair Madagascar bought in at £6 10s., a bid of £6 being declined, while lower quality sold at £5 10s. to £5 15s. per cwt.

YELLOW BERRIES.—29 bags of fair quality bought in at 20s. per cwt.

Liverpool Market Report.

August 30, 1899.

The firm prices ruling of late for Linseed, Canaryseed, and Olive Oil still continue, but reduced quotations are now given for Spirits of Turpentine. Good sales of Chilian Honey and Sierra Leone Beeswax are reported, together with fair business in Castor Oil, both spot and forward. A fair inquiry is experienced for Caustic Soda and Bleaching Powder, which are both firm, as is also Borax.

AMMONIA SALTS.—Carbonate is firm at 3¼d. to 3½d. per lb. Sal Ammoniac is still at £33 to £35 per ton. Sulphate is scarce here at £12 10s. per ton.

BEESWAX.—12 blocks of Sierra Leone went at £6 per cwt.

CANARY SEED.—There is a shade more inquiry for Turkish, and 240 bags have sold at 39s. 3d. to 39s. 6d. per 464 lbs. Holders ask 40s. for fine samples.

COPPERAS.—37s. per ton Welsh, 39s. Lancashire.

COPPER SULPHATE—Is quiet on the spot at £23 10s. per ton, with a good inquiry for forward parcels.

HONEY.—150 barrels of Pile 3 Chilian have been sold at firmer rates privately.

LIME, CHLORIDE OF (BLEACHING POWDER)—Is firm at £4 15s. to £5 per ton.

LINSEED—Continues very strong, with little business done, except in River Plate seed, of which 400 tons of August shipment sold at 37s. per 416 lbs. early in the week, and subsequently 250 or more tons changed hands at 37s. 6d. The price now asked is 38s. 9d.

OIL (FIXED) AND SPIRITS.—Castor Oils are passing out of stock fairly well at the steady rates of last week, viz.:—Calcutta, 2 15/16d. per lb.; French, 1st pressure, 2¾d. per lb., 2nd pressure, 2 9/16d., and 2nd Sulphur at 2⅝d.; Madras, 2¾d.; French, 1st pressure to arrive, has been selling at £22 15s. to £24 per ton, f.o.b., at Marseilles. Olive Oils are all firmly held. Levant at £32 10s. to £33 per tun, and to £34 for other oils. Linseed Oil of Liverpool pressure has become very strong in tone and has advanced to 22s. 9d. and 23s. per cwt. Cottonseed Oil: Liverpool refined oil is steady and selling satisfactorily at 18s. to 18s. 6d. per cwt. Spirits of Turpentine are again easier and can now be had here at 35s. per cwt.

POTASH SALTS.—Bichromate, 3¼d. per lb.; Chlorate is quiet at 3½d. to 3¾d. per lb.; Cream of Tartar is in moderate demand at 75s. to 80s. per cwt.; Pearlashes are dead at 30s. per cwt.; Potashes are nominal at 21s. to 21s. 3d. per cwt.; Prussiate is very firm at 8d. to 8½d. per lb.; Saltpetre, 21s. 9d. per cwt.

SODA SALTS.—Bicarbonate, £6 6s. to £6 15s. per ton; Borax, £16 to £16 10s. per ton; Caustic, 76 per cent. to 77 per cent., £8 15s. per ton; 70 per cent., £8. Nitrate is steady with only a small trade, at 7s. 6d. to 7s. 9d. per cwt.

Newcastle-on-Tyne Chemical Report.

August 30, 1899.

Activity in heavy chemicals still continues on this market. Bleaching powder for general sanitary purposes is in brisk demand. Stocks are small, and prices quoted are firmly made. Caustic Soda is pretty much in the same position. The higher strengths have been further advanced in price by 10s. per ton. Soda crystals move freely; prices, however, are unchanged. Other goods very steady in tone. Quotations are:—Bleaching Powder, £5 10s. to £5 15s. Caustic Soda, 70 per cent., £8 to £8 10s.; 77 per cent., £8 15s. to £9. Soda Crystals, 45s. to 47s. 6d. Soda Ash, 52 per cent., £4 5s. to £4 10s. Alkali, £5 to £5 5s. Sulphur, £4 17s. 6d. to £5 per ton.

Manchester Chemical Report.

August 30, 1899.

There is little change to report in the position of heavy chemicals, which continue in good consumptive demand. Caustic Soda is very firm at late rates; and Soda Crystals, owing to the hot weather, are scarce. Glycerin is firm at £50 per ton, chemically pure on rails or f.o.b., and £44 naked. It is evident that supply and demand is once more asserting itself in this direction, notwithstanding the break-up in the combine of English makers. The advance in Bleaching Powder is well maintained, Chlorate of Potash is firm, and Soda is bringing rather better prices than last month. Naphthas have recovered a little, and Benzols are very firm. Yellow Prussiate is dull and somewhat lower prices are in vogue owing to the Transvaal troubles. Coal Tar products are rather dull generally. Acetate of Lime is very steady, but without change in price. Acetate of Soda is firm and in short supply. Aniline Oil and Salt are in better request.

Marriages.

Ridley—Chapman.—On August 29, at St. Stephen's Church, by the Rev. Canon Nicholson, assisted by the Rev. W. W. Loudon, Charles Ridley, chemist and druggist, son of the late Thomas Ridley, to Margaret (Morsie), daughter of the late Hedley Chapman, J.P.

Coward—Kingston.—On August 29, at St. Margaret's, Lidlington, Bedfordshire, by the Rev. F. Veasey, M.A., vicar of the parish, Miles Coward, chemist and druggist, Devizes, to Helen, younger daughter of the late Chas. Kingston, "Hillside," Lidlington.

Deaths.

Garrad.—On August 16, Charles Garrad, Chemist and Druggist, Leamington. Aged 68.

Allanson.—On August 20, William Allanson, Chemist and Druggist, Wishaw, N.B. Aged 58.

Townley.—On August 20, Thomas Townley, Chemist and Druggist, Taporley. Aged 70. Mr. Townley was a member of the Pharmaceutical Society.

Heden.—On August 26, Joseph Henry Heden, Chemist and Druggist, Leamington. Aged 26.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. Herbert Bennett Billington, chemist and druggist, 103, Sheffield Road, Barnsley, at the recent Borough Brewster Sessions, was granted a licence to sell wines to be consumed off the premises.

Professer Lopper, Dublin, has been appointed analyst to the Castleblayney Board, at a remuneration of 10s. 6d. per sample.

The Ballymoney Guardians, after much correspondence with and opposition to the Local Government Board, have selected Mr. R. F. Blake, F.I.C., as analyst, at a salary of £10 per annum.

Publications Received.

Die Aetherischen Oele. Von E. Gildemeister und Fr. Hoffmann. Bearbeitet im auftrage der firma Schimmel and Co., in Leipzig. Mit vier karten und zahlreichen abbildungen. Pp. iv. + 919. Berlin: Verlag von Julius Springer. 1899. From Messrs. Schimmel and Co.

Asthma: Recent Developments in its Treatment. By Ernest Kingscote, M.B., C.M., L.R.C.S. Edin. Pp. xii. + 184, with coloured frontispiece and illustrations. Price 5s. net. London: Henry J. Glaisher, 57, Wigmore Street, Cavendish Square, W. 1899. From the Publisher.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—WARNES, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—EDWARD PECK, East Dereham.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—HUGHES, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Cork Presser and a bandage-roller; good make.—BARBOUR, Swanage.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. ROWSELL, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements.

(Received too late for Classification.)

PHARMACEUTICAL Chemist; 24; Square medallist, with good business experience, seeks MANAGERSHIP or Senior in a good-class business. Highest references.—BUSINESS, 5, Serle Street, W.C.

Partnerships Dissolved.

(From the London Gazette.)

Benj. Hepworth and John Fehbenbach (trading as B. Hepworth and Co.), Chemical Manufacturers, 24, Coventry Street, Kidderminster. Debts will be received and paid by Benj. Hepworth.

W. Wigglesworth and E. J. E. Coop, Physicians and Surgeons, 57, Darnley Road, Hackney, and 75, Cazenove Road, Stamford Hill, N. Debts will be received and paid by E. J. E. Coop, who will continue the business.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

Alfred T. Maguire (lately carrying on business as Maguire's Drug Co.), Artificial Teeth Manufacturer, 65, Bow Road, E., lately at 61, West Ham Lane, and formerly at 3 and 4, High Street, Ponders End, as A. Wilson.

Henry S. Planck, Dentist, 446, Fulham Road, S.W., and lately at 23, High Street, Kingston-on-Thames.

Robert S. Barcham, Veterinary Surgeon, North Walsham, Norfolk.

George Pearson, unregistered Medical Practitioner, 4, Cromwell Terrace, Halifax.

ENGLISH NEWS.

Hydrogen has been Solidified by Professor Dewar, according to an exceedingly brief note in the *Chemical News*, which gives no particulars beyond the statement that the solidified hydrogen forms a glassy transparent mass. It is just seven months since Professor Dewar explained to a greatly-interested audience how he had reduced hydrogen to the liquid form, and it was not until two months ago that he was able to exhibit liquid hydrogen in public. The real temperature of the liquid was then stated to be 21° on the absolute scale, equivalent to 252° below zero Centigrade.

The Medical Schools, like the School of Pharmacy, will be opened, for the winter session, on Monday, October 2. At Bloomsbury Square, as already announced, the introductory sessional address is to be delivered by Professor D. J. Leech, of Owens College, Manchester. At the Middlesex Hospital, the introductory address will be delivered by Mr. John Murray; at St. George's Hospital, by Dr. Howship Dickinson, consulting physician to the hospital; at University College the session will be opened by Dr. G. F. Blacker, assistant obstetric physician to the hospital; at St. Mary's Hospital the address will be given by Mr. H. G. Plimmer; and at Charing Cross Hospital Dr. Mitchell Bruce will address the students. At Guy's Hospital the term begins on October 2, when the first meeting of the session of the Physical Society will be held at 8, in the new physiological theatre, Sir Samuel Wilks presiding. After the meeting a conversazione will be held in the new laboratories and class-rooms. At St. Bartholomew's Hospital there will be no formal opening, but the old students' dinner will be held in the great hall of the hospital, Dr. T. Lauder Brunton presiding. The session at King's College will begin on October 2, and the old students' dinner will be held in the evening. At the London Hospital the annual dinner will be held in the college library, when Dr. Herman will take the chair. At Westminster Hospital the opening will be celebrated by a dinner at the Holborn Restaurant, Mr. Thomas Bond in the chair. At the London School of Medicine for Women the introductory address will be given by the dean, Mrs. Garrett Anderson, M.D., after which the prizes for the past year will be distributed. The winter session of the London School of Tropical Medicine will open on October 2, when the new school will be formally opened to students. At St. Thomas's Hospital the Session will open on October 3, when the prizes will be distributed by Professor Clifford Allbutt. In the country, work begins on or about the same day as in London. Thus, the winter session at Mason College, Birmingham, will begin on October 2, when Sir William Gairdner will deliver the introductory address. At University College of South Wales and Monmouthshire, Cardiff, the address will be given on October 6 by Professor A. W. Hughes. At Yorkshire College, Leeds, the address will be given on October 2, and the prizes distributed by Dr. Byrom Bramwell. The session at University College, Liverpool, will begin on October 3, with an address by the Rev. S. A. Thompson-Yates, who will afterwards distribute the prizes. The introductory lecture at Queen's College, Manchester, will be given on October 2 by Sir J. Crichton Browne. At University of Durham College of Medicine, Newcastle-on-Tyne, the session begins on October 2, when a conversazione will be held. At University College, Bristol, and University College, Sheffield, the session will also begin on October 2.

Manchester College of Pharmacy.—On Saturday last the students of this college with Mr. Charles Turner passed a most enjoyable afternoon at the farm at Hayfield, where they not unfrequently resort. Science was for the time being discarded and recreation was the order of the day. Mr. Hirst made all the arrangements and very kindly paid all expenses. A cordial vote of thanks was proposed to him by Mr. Turner, seconded by Mr. Mitchell, and carried unanimously. The weather, which had been threatening, was almost all that could be desired, though at that altitude the barometer read 28·5 inches.

Chemical Trade Developments.—According to the *Liverpool Post*, the town of Middlewich, which has long suffered severely from trade depression, chiefly owing to the stoppage of the Cheshire Alkali Works, is about to be the scene of an important development in the chemical industry, which will probably find employment for some hundreds of hands. A large piece of land has been purchased at Cledford Bridge, Middlewich, by the present electrolytic company, with which Messrs. Pilkington, St. Helens, are closely identified. A subsidiary company has been formed for the manufacture of chemicals by the new electrical process. The news has been received with great rejoicing in Middlewich. Another works is also expected to be built in the same neighbourhood.

Cruelty to a Mare.—According to a report in the *Midland Evening News*, at Dudley Police-court, on Monday, September 4, Thomas Salt, Castle Foot, Dudley, was charged with cruelty to a mare, and Charles Goldstraw, chemist and druggist, Castle Foot, Dudley, was charged with permitting it to be worked.—Evidence was given to the effect that the mare was attached to a gig containing the defendants while it was suffering from several wounds underneath the saddle.—Both the defendants admitted that the animal had suffered from a bad back, and it was turned out to graze for a time. They, however, had not seen the condition of the mare on the day in question, as they had nothing to do with the harnessing of it.—Goldstraw was fined 10s. and costs, and Salt 10s. and costs.

Coroner and Chemists' Prescriptions.—On Friday, September 1, an inquest was held at Trowbridge before Mr. F. T. Sylvester respecting the death of May Mizen, 75, wife of a carpenter. According to a newspaper report, evidence was given to the effect that deceased refused to see a doctor, but consented to have a bottle of medicine from the chemist.—Mr. Dyer, pharmaceutical chemist, was called, and asked why he, in common with other chemists, prescribed for people.—Witness: Because we could not live if we did not.—Dr. Pearse said the medicine supplied by Mr. Dyer could not do any harm, even if an overdose was taken.—The Coroner pointed out that, under the Medical Act, none but a qualified person could prescribe for people. There was nothing to stop a chemist from selling patent medicines, but when he prescribed for anyone he exceeded what the law allowed him to do. He knew it was generally done, and it was a great pity it was not put an end to. The Coroner also stated that the husband had failed to do his duty by not calling in a doctor.—Verdict: "Death from natural causes."

Secret Commissions.—Replying to a letter in the *Times* of September 2 from Sir Edward Fry, headed "Secret Commissions and the Medical Profession" (see p. 255), Dr. J. Roberts Thomson, President of the British Medical Council, emphatically denies the statement that "The Council of the British Medical Association has sought to hamper rather than to help the London Chamber of Commerce in its effort after honesty," and quotes from the report of the Council submitted to the general meeting of the Association at Portsmouth this year, as follows:—

> In consequence of charges made in a report of the London Chamber of Commerce against members of the medical profession, the following resolution was passed:—"Resolved that the attention of the Council has been called to grave general accusations impugning the probity of the medical profession in the matter of receiving secret commissions, and the Council calls upon the London Chamber of Commerce to substantiate such accusations, in order that the Council may be in a position, should such practices exist, emphatically to condemn them as a grave breach of professional good conduct, and inconsistent with membership of the British Medical Association."

Dr. Thomson goes on to express the opinion that Sir Edward Fry's description of the Association's action is the reverse of the actual position, and a gross travesty of the facts.—The Vice-President of the British Medical Association, Dr. Robert Saundby, also states explicitly that "the acceptance of any payment or consideration from a tradesman for recommending his wares is repudiated by the medical profession as a most dishonourable transaction," but he is of opinion that it would be better for the medical profession if the General Medical Council would take more notice of the conduct of members than it does.—Dr. Nelson C. Dobson, Emeritus Professor of Surgeory and Consulting Surgeon of the Bristol General Hospital, while not denying that individual members of the medical profession, owing to poverty, may be tempted to accept secret commissions, states that "such practices would be condemned in the strongest possible way by all that is best in the profession, and anyone known to be guilty of such practices would be ostracised, socially and professionally." Dr. Dobson also states that during a large practice of thirty years he has never received any secret or other commission, nor has the smallest suggestion or hint of the kind ever been made to him.—As a chemist of twenty-five years' extensive experience among both medical men and chemists, Mr. John D. Marshall states that he has never given a bribe, never offered one, and has never known one to be accepted.

THE METRIC SYSTEM.—At the meeting of the Associated Chambers of Commerce, on Wednesday, five resolutions on the subject of the metric system appeared on the agenda, from Birmingham, London, Bristol, and Leicester Chambers, but with the acquiescence of the delegates, only one motion, covering the entire question, was proposed. This was: "That the Association, reaffirming its frequently expressed opinion that the metric system of weights and measures should be made compulsory in the United Kingdom, strongly urges her Majesty's Government to use it in all Government departments, and to strictly enforce the existing provisions in the Educational Code with regard to the teaching of, and examinations in, the subject in elementary schools, and that representations to this effect be made to the Government."—This was moved by Mr. Walsh (Birmingham) and seconded by Mr. A. Lee (Bristol).—Mr. Stiebel said one of the most serious obstacles to British trade in foreign countries was the antiquated system of weights and measures.—Mr. G. Evans, D.L. (Llanelly), held that it would be impossible to have a practical system taught in schools unless the Educational Boards would supply the material for a practical education on the subject.—Mr. Miller (Edinburgh) suggested that a rider should be added to the effect that each Chamber and trade organisation should be asked to use their influence with the School Boards within their district to have the system properly taught as now authorised in the code. The suggestion was agreed to, and the resolution as amended was adopted.

IRISH NEWS.

PHARMACEUTICAL SOCIETY OF IRELAND.—Applications for the October Preliminary Examination must be lodged with the Registrar, 67, Lower Mount Street, Dublin, *not later than 11 o'clock on the morning* of Tuesday, the 19th inst.

SOME CASES OF FRUSTRATED SUICIDE seldom occur without bringing before the mind's eye the picture of Mr. Mantalini struggling with theatrical futility to terminate existence with a small bottle and a teaspoon, the while lamenting that the "apothecary had not mixed the prussic acid strong enough." An incident which happened a few weeks ago in Belfast can hardly be placed in the same category, although the bizarre effects lent to it by "punishing" two bottles of laudanum under the evening sky in the presence of witnesses might suggest points of resemblance to the bloodless French duel. The gentleman's further endeavour, however, to supplement the dose with a third bottle of the opiate, which was wrested from him by his wife, was conclusive proof to the magistrate of a "most deliberate attempt" at suicide, but considering that prisoner had been drinking and was otherwise exemplary, his Worship took a merciful view of the aberration.

THIS RECALLS AN ALMOST SIMILAR CASE in which the hero purchased four single pennyworths of the "tincture of opium" (as a learned writer in *Harmsworth's Magazine* puts it). Having addressed a solemn farewell to the unfeeling world, he consumed the collection. Like Clive, however, he found out that he could not choose his hour, and awakened with such knife-cutting pains that for a flicker of time he was horrified to think he was in "another place." More tragical was the instance which occurred in Ireland twenty years ago. A gentleman, whose business affairs had not prospered, took an abnormal dose of strychnine, and had the determination to walk out for a few minutes, that the poison might be quickly distributed through the blood. A person who inserted a steel blade between the teeth, to open his mouth, asserted that the agonised energy of the jaw was such that the knife was snapped in pieces, and a portion of the steel was even ground to powder.

"A PRESCRIPTION procured from a gentleman who was not a medical man" was evidence given at a recent inquest in Belfast. It is satisfactory to know that he was not a pharmacist, though the instance, which occurred in a provincial town during the week, is proof that the latter is sometimes useful. A woman rushed into the Medical Hall with a baby which had got a match in its nostril. She had been to four doctors, but they were out of town. As the case seemed urgent, the young gentleman reached for a bottle of veratrine. The child sneezed thrice and, hey presto! half an inch of match, and the baby was saved.

ALONG WITH THE ABOVE if it is remembered that the scrimmages in Derry brought the usual assortment of injured to the chemist's shop, the dispenser may be excused if he sings:

By the law of the land
The Chemist can't demand
A fee if he should prescribe.
The scalp wound in a riot
He must genially tie it,
And take naught—for that's a bribe.

SURELY THE LEGISLATURE might in all fairness dower the pharmacist with some supplementary privileges, in view of the fact that he is so often resorted to in temporary ailments, and especially as he is being driven out of the market by those, who, though untitled, yet contrive by elusory anomalies to prescribe for all diseases by paying the Medicine Stamp Tax, which should be abolished so far as chemists are concerned.

SCOTTISH NEWS.

LAUDANUM POISONING CASE.—An elderly man was found unconscious in Pollokshields on Thursday last, 31st ult., with an empty half-ounce laudanum bottle in his pocket. As he was evidently suffering from the effects of an overdose of laudanum, the police surgeon, Dr. Chalmers, ordered his removal to the Royal Infirmary.

SUSPECTED POISONING CASE.—A girl, aged 16, named Beattie, was tried at the Glasgow Circuit Court last week, charged with attempting to poison a child, 17 months old, with laudanum. The baby was found in the cradle, and alongside it a note from the girl to her mistress saying she had given it a dose.—Jane Stevenson, in the employment of Dr. Ferguson, Dumbarton Road, stated that she had sold laudanum to the girl on the day in question.—The prisoner, who gave evidence for herself, said she had given the laudanum to the child to stop it crying, but ran away out of fright when she saw what happened, leaving the note by way of explanation.—The jury acquitted the girl of intent to poison, and Lord Young, after discharging the prisoner, remarked to the jury—"Gentlemen, you can return to the body of the court; we will have another jury."

BLAMING THE NARCOTICS.—At the Glasgow Central Police-court last week, a clergyman named Palmer was convicted of obtaining goods on false pretences.—Dr. Stevenson said the accused had been in the habit of taking narcotics in such enormous doses that he believed he would really act automatically, and do things without knowing what he was doing or saying. He took 130 drops of chlorodyne several times a day, enough to kill an ordinary man, and had taken these doses for years for a painful internal disease.—Palmer was sent to prison for seven days.

AN ADDITION TO THE CLYDESDALE FLORA has just been made by Mr. T. S. Barrie, of the West of Scotland College of Pharmacy, the plant, which is very rare in Scotland, being *Linaria repens*. Professor Bower of Glasgow University, writing to Mr. Barrie, asks him to send a notice of the discovery to Professor Scott Elliot, in order that the plant may be included in the list being prepared for the British Association Glasgow meeting in 1901.

FOREIGN NEWS.

ICED CHLOROFORM has been used as an anæsthetic with good results at the Julius Hospital, Wurtzburg, by Professor Shorburg. It is said to act more quickly, and to be less dangerous or nauseating than ordinary chloroform.

COLOUR PHOTOGRAPHY.—Judging by the number of brands of colouring media on sale at the vendors of photographic materials, one might conclude that "colouring" was in vogue. A list of formulæ, etc., by which excellent results have been obtained in all classes of photography is here given. It is not necessary to be a born artist to paint by this method, neither is it necessary to lay

out more than a few pence to purchase the necessary materials, which consist of five or six camel-hair pencils and four bottles of solution. Three colours suffice for this class of work, blue, yellow, and red, and in addition a bottle of colourless adhesive liquid. The blue is prepared by dissolving 25 centigrammes (or about 4 grains) of methylene blue in 30 grammes (or ʒi.) of distilled water. The yellow by dissolving 50 centigrammes (or about 8 grains) of picric acid in 30 grammes (ʒi.) distilled water. The red by dissolving 25 centigrammes of eosine in 30 grammes distilled water. The colourless adhesive liquid is prepared by dissolving in 100 grammes of distilled water a quarter of the albumin of an ordinary-sized egg, beaten to froth and passed through muslin, and finally 2 grammes of liquor ammonia added. The colours ready, one large and a few small finely pointed camel-hair pencils and a few sheets of good blotting paper complete the outfit. As for the *modus operandi*, it is simplicity itself. The surface and back of the print should be first washed with a large brush charged with the colourless adhesive solution. If, however, the print be mounted, simply wash the surface only, but, if unmounted, the back also, the better to ensure evenness during the colouring process. After this preliminary washing, the print is allowed to thoroughly imbibe the albuminous solution, but if the paper be a gelatin or enamelled one, two or three layers of the liquid are indispensable, allowing the previous one to dry before another is applied. Heat may be employed to hasten the drying process, the albumin coagulating thereby being of no importance. Then a few drops of the blue liquid are mixed in a saucer with a little of the colourless solution, and the mixture passed upon the whole recto surface of the print. This slightly azures and accentuates the white parts of the image. If there be already blue colours in the subject, a solution, richer in blue, is passed upon those regions until the desired tint is obtained. If a colour when applied be deemed too pronounced, it may easily be modified by pressing a little blotting paper upon the surface whilst the colouring is still wet. The strength of the colours, by the way, should be in the proportion of one drop of colour to twenty drops of albuminous solution. In portraits, the flesh colour solution is obtained by mixing one drop of yellow solution, two drops of red, and a few of the adhesive solution. The colour of the cheeks and lips may be heightened by the discreet application of the red solution. For landscapes the sombre green colour for trees and grass is obtained by mixing the blue and yellow; and a mixture of red and yellow in the sky portion gives the illusion of a sunset. In heightening the colours, always allow each layer to dry before applying another, preceding each layer of the colouring medium by a layer of colourless adhesive solution.

Project of an International Pharmacopœia.—At the sitting of the Belgian Royal Academy on April 29 last, a Commission was nominated to study the proposition relative to the elaboration of an International Pharmacopœia. The result of the Commission has just been reported, thus:—The governments of different countries publish an official Pharmacopœia indicating the modes of preparation and preservation of various medicaments, and it is in conformity to such principles that medical prescriptions are written and dispensed. The national character of these pharmaceutical codes restrain their action to the limit of the country wherein they are formulated, and as the same drug may be treated differently in different countries, it follows that the same prescription differs somewhat according to the country in which it may be dispensed. With simple and harmless drugs this is of but slight importance, but in the case of strong and dangerous substances, the harm which might occur is apparent. The necessity for some sort of *entente* between the various governments is more evident in view of the numerous new preparations which are ever and anon cropping up, and a mode of preparation which shall be general for all countries and which will ensure a uniformity of dose of the active constituent contained therein, is a consummation devoutly to be wished. The first question which presents itself, however, is, "Are the differences which exist in the various pharmacopœias between a preparation formulated in identical terms of sufficient importance to constitute a danger?" This is the principal point which the various governments will have to decide, for no action in the matter need be expected unless they be convinced of the utility of the step. Take, for instance, *Tincture of Iodine*, the percentage in Belgium is 8; in England, 2·5; in France, 8·33; Holland, 8; Switzerland, 10; Italy, 8·33; Germany and Russia, 10; or, *Tincture of Digitalis*, the percentage in Belgium is 20; in England, 12·5; France, 20; Holland, 10; Switzerland, Italy, and Germany, 10. Two principal facts are noted upon the tableau of Monsieur le Professeur Herlant:—(1) The difference, sometimes considerable, between the activity of a medicament known under the same denomination, but prepared in Brussels, Paris, Berlin, London, or elsewhere, to wit, the preceding tinctures, by way of example. (2) To total absence of any mention of some active medicaments in certain pharmacopœias, whilst they have prominence in others These two facts are certainly conducive to danger. A patient who is accustomed to have recourse to tincture of digitalis in certain grave crises of heart trouble, prepared according to the Belgian Pharmacopœia, is afforded little or no relief when the English, Dutch, Swiss, Italian, or German tincture is employed. The prescription which had hitherto assured the calm and relief so much needed, seems to fail, or its activity is at least reduced by half.

The Absence of Certain Popular Medicaments from a Pharmacopœia presents no less an inconvenience. Thus the gouty individual who is accustomed to tincture of colchicum prepared according to the Belgian Pharmacopœia will not find any mention of the same tincture in the Italian Pharmacopœia. In view, therefore, of the extent to which the peoples of different countries travel nowadays, the majority of such being generally fortified with a few pet prescriptions, in which they place unbounded reliance in the hour of need, one must conclude from the foregoing invitations that the preparation in a foreign country of a prescription formulated, for example, in Belgium, exposes the patient to danger by virtue of the disparity in the activity of the medicaments of neighbouring states. One point which the Commission has not lost sight of is the fact that certain preparations exist in some pharmacopœias which are old standing and well-known household remedies, and to which old prescribers will ever adhere. It is not such, however, that the Commission desire to revolutionise, nor does it aspire to the remodelling of all pharmacopœias upon the same basis. More particularly do its efforts apply to the innumerable new remedies now being daily foisted upon the profession, and in addition the whole of such existing medicaments as may be denominated "dangerous." It is for these that the Commission considers that necessity for international intervention exists. If but an *entente* between the various governments were realised, respecting what may be termed "new and heroic" medicaments, to formulate a mode of preparation which shall be uniform for all countries, and a small booklet, or a series of fly-leaves issued for gumming into the existent pharmacopœias, the Commission will feel that at least something considerable will have been accomplished, and the thin end of the wedge inserted. Having gained this precedent, the way will be paved for future amelioration as necessity may require.

Feminine Vengeance.—Incompatibility of temper recently brought about the mutual decision of a provincial pharmacien and his wife to break up their happy (?) home, and go their respective ways. The husband came to Paris, and the wife returned to her parents. Whether a warm reception under the parental roof, or an inward conviction of having been the instigator of the little bickerings, set her reflecting in her loneliness, history sayeth not; it however happened that she wrote her husband imploring him to "bury the hatchet" and recommence life with her (presumably under more auspicious conditions). Failing to receive any response to her entreaties, and suspicious lest he may have found a more congenial partner, she vowed to avenge herself, employing a means to which, unfortunately, too many French women have recourse when the tide of their love affairs is on the ebb. Armed with a bottle of vitriol (most probably purchased from one of those privileged vendors of dangerous substances, the drysalter), Madame C——l set out in search of her husband, and met him, eventually, on the Boulevard des Invalides. Her greeting was somewhat tragic, for crying "The hour for vengeance has arrived," she dashed the contents of the phial in his face, burning him fearfully. Passers-by conducted him to a neighbouring pharmacie, where he received every attention in the shape of first aid, whilst others seized and held his murderous better-half until the gentlemen in blue arrived. The unfortunate man, whose eyesight, happily, is not destroyed, was conveyed to hospital, and Madame C——l to the "cellule de police," where she will, no doubt, have ample time to reflect upon the horror of her deed ere justice metes out to her the sentence she rightly merits.

TRADE NOTES.

MEDICATED TOILET ROLL. — Messrs. Marlborough, Gould and Co., 52, Old Bailey, London, E.C., submit a specimen roll of the "Vade Mecum Medicated Toilet Paper," sold at 6d.; wholesale, 4s. per dozen. This roll is guaranteed to contain the best medicaments for hemorrhoids and to be a perfect antiseptic paper. It is especially recommended for invalids.

SOUTHALL'S STUDENTS' REQUISITES.—Messrs. Southall Bros. and Barclay, Limited, Lower Priory, Birmingham, send a copy of their most recent catalogue of pharmaceutical students' requisites. The materia medica collections have been brought up to date, and several useful additions have been made. We understand that Mr. John Barclay is busy with a new edition of Southall's 'Materia Medica,' which will probably be published in the course of two or three months.

BENZOSOL.—The Farbwerke vorm. Meister Lucius and Bruning, of 46, St. Mary Axe, requests us to state that, through a printer's error, the word "Benzosol" has appeared as "Denzosol" in their advertisement in the Journal, and has caused them a lot of correspondence. Benzosol is the firm's preparation, and there is no such article as Denzosol on the market.

X-RAY APPARATUS.—A visit to Messrs. Harry W. Cox, Limited, 10, 11, and 28, Cursitor Street, Chancery Lane, W.C., the well-known manufacturers of X-Ray Coils and Apparatus, is full of interest to those who have taken up radiography. Here the latest improvements in the new Electrolytic Interruptor can be seen, the results obtained being really wonderful. With the aid of the Fluorescent Screen the pelvis in a human subject can be seen distinctly. We understand that among this firm's best customers are a number of chemists, and as Messrs. Cox are the actual makers of all the apparatus, we have no hesitation in recommending the firm to those of our readers who think of taking up this new branch of business. The firm publishes a very complete catalogue which contains much useful information. A copy will be sent post free, to chemists, on mentioning this Journal.

MR. R. M. CROSSDALE, chemist and druggist, has commenced business at 340, Manchester Street, Oldham, the entire fittings of the pharmacy being supplied by Messrs. Ayrton and Saunders, Liverpool.

THE PURITY OF FOOD AND DRUGS.

CAMPHORATED OIL.—Edmund Jackson, Burton-in-Lonsdale, was fined 10s. and costs £1 13s. 7d., for selling camphorated oil which contained 13 per cent. of camphor, instead of 21 per cent.—The defendant said he sold it just as he bought it, and he had returned all his stock to the wholesale dealer.

SPIRIT OF NITRE.—At Ingleton Police-court, on Friday, September 1, Joseph Thornton, manager of the Ingleton Co-operative Society, was fined 20s. and costs £1 14s. 1d., for selling sweet spirit of nitre containing an excess of 1·12 of water, and only a trace of nitrous ether, instead of $1\frac{3}{4}$ per cent.

LIME WATER.—At the North London Police-court, on Wednesday, August 16, Alfred Croft, trading as the Graham Drug Stores, 211, St. Paul's Road, Highbury (the name Alfred Croft does not appear on the Register of Chemists and Druggists for the year 1899.—Ed. *P.J.*), was summoned for selling lime-water which was certified to be 14·5 per cent. deficient in strength.—The defendant pleaded that he had not in any way wilfully deteriorated the lime-water, and that he sold it as he got it.—Mr. Cluer said that was probably correct, the percentage was very small, and the case to his mind was not so important as the vestry appeared to imagine. It was a trivial case, and justice would be met by the defendant paying costs—2s. for the summons and 10s. 6d. for the analysis.

COPPER IN PEAS.—A few weeks ago a firm of grocers was fined for selling bottled peas coloured with copper sulphate (see *ante*, p. 168*a*), and as a sequel to that case Messrs. Petty, Wood and Co., wholesale grocers, 41 to 57, Southwark Bridge Road, S.E., were summoned at the Spelthorne Sessions on Monday, August 21, for having wilfully given to Messrs. Budgen and Co., Limited, tho firm implicated, a label which falsely described the article of food sold by them.—A letter from the defendant company was read, however, asking for an adjournment of the case, and this request was granted.

MILK OF SULPHUR.—At the East Riding Police-court, Hull, on Wednesday, August 30, George Kirk, chemist and druggist, Hallgate, Cottingham, appeared in answer to an adjourned summons charging him with selling milk of sulphur adulterated with 19 per cent. of calcium sulphate.—Mr. Rollit, who represented the defendant, explained that the case was adjourned in order that a sample of milk of sulphur might be sent up to Somerset House for analysis. This had been done, and the authorities certified there was practically no adulteration.—The Bench dismissed the case.

SEIDLITZ POWDERS.—Richard Parsons, of Shepshed, described as a chemist (the name, Richard Parsons, does not appear on the Register of Chemists and Druggist, 1899.—Ed. *P. J.*), was summoned at the Loughborough Petty Sessions for selling seidlitz powders not of the nature, substance, and quality demanded.—Deputy Chief Constable Smith, inspector under the Foods and Drugs Act, stated that he bought a dozen seidlitz powders from defendant for 11d. The analysis showed that the powders were not composed in accordance with the British Pharmacopœia.—Mr. H. J. Deane, for defendant, pleaded guilty, but said he sold the powders in perfect good faith, selling them exactly as he received them from the makers. The boxes were stamped "genuine," and he asked the Bench to believe that defendant fully thought that the powders were genuine. The wholesale dealers had admitted that the fault was theirs, and were prepared to accept the whole responsibility.—Wm. Stevenson, druggist, Shepshed, was summoned for a precisely similar offence.—The evidence was the same, except that 8d. was paid for the dozen powders, and Mr. Deane offered the same explanation. These powders, he said, came from the same wholesale house as in the other case, showing that defendants were not at fault.—The Bench believed the defendants did not intend to deceive the public by supplying inferior goods. A fine of £1, and half a guinea, the analyst's fee, was ordered to be paid by each defendant.

SPIRIT OF NITRE.—At the Barnsley West Riding Police-court, on Wednesday, August 16, Miriam Tomlinson, shopkeeper, of Darfield, was summoned for having sold spirit of nitre which was not in accordance with the British Pharmacopœia.—Mr. Wardell, of the West Riding County Council, prosecuted, and Mr. Hodgson, barrister, Manchester, defended.—Mr. Wardell said evidently the case was of importance to the wholesale trade, as counsel appeared to defend. So far as he was concerned his duty was in the interests of the public, and they had only to see that the article when it reached the public was of the proper strength. In this case there was no allegation of adulteration, and though he admitted evaporation might have taken place, a conviction must follow, because the article sold to the public was not of such a strength as demanded. Evaporation was provided for, but in the sample in question there was a deficiency of three-sevenths per cent. below the minimum allowed by the B.P.—Alfred Henry Allen, County Analyst, gave evidence to the effect that he had analysed the sample in question. It contained, nitrous ether, 0·98 per cent.; alcohol and legitimate water, 99·02 per cent. Mr. Allen added that the sample only contained four-sevenths of real nitrous ether, which was the most active and characteristic constituent of sweet spirit of nitre, required by the British Pharmacopœia to be present in proportion of not less than $1\frac{3}{4}$ per cent., even after the preparation had been kept for some time and the vessel containing it had been occasionally opened. For the defence Mr. Hodgson submitted that the Act did not apply in a case where admittedly there had been no fraud on the public, as the result was due to causes beyond control.—Evidence was given by Adolphus J. Coates, chemist, employed by Messrs. Parkinson and Son, wholesale druggists, to the effect that the preparation was of full strength when sent out by the firm.—The Bench was satisfied the spirit was not of the quality demanded, and a fine of 10s. and costs was imposed.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

September 7, 1899.

Business has been decidedly quiet during the past few days, partly, no doubt, owing to the fact that many people are still away from town. There has, however, been a firm undertone as to prices, while there are no changes in value of any especial importance to record. Quinine has had a further relapse as regards the speculative market, and things look now very unpromising for those unfortunates who rushed in to buy at almost, if not actually, the highest figure which the article touched not so very long since. Opium is rather better, same applies to Morphine. There has also been an advance in price of refined Glycerin. Quicksilver is very firm, as also are Mercurials, Acetanilide, and Phenacetine weak. Sulphonal remains in a doubtful position. Cod Liver Oil is very dull. Acid Carbolic firm. Menthol rather better. Acid Citric dull. Tartaric and Cream of Tartar quiet and unchanged. Borax and Acid Boracic steady. The following are prices actually ruling for some articles of chief interest:—

ACELANILIDE.—Weak at 10¾d. per lb. for 2-cwt. lots.

ACID BORACIC.—Unchanged at 25s. per cwt. for crystals and 27s. per cwt. for powder.

ACID CARBOLIC.—Prices are decidedly firm at 7d. per lb. for best make of 35-36° C. ice crystal in 2½ cwt. drums, and overcasks 7½d. for 39-40° C. ice crystal, and 8½d. per lb. for 39-40° C. detached crystals (which is now the kind demanded by the requirements of the B.P.). Crude 60° F., 2s. per gallon; 75° F., 2s. 6d. per gallon. Liquid 95-98 per cent. of pale straw colour, 1s. 3d. to 1s. 4d. per gallon in 40-gallon casks.

ACID CITRIC—Continues quiet and dull at 1s. 6d. to 1s. 7d. per lb. for crystals in 5 cwt. casks.

ACID OXALIC—Is still quoted 3d. to 3¼d. per lb. nett, delivered free London.

ACID TARTARIC—Steady at 1s. 1d. per lb. for English and 1s. 0¼d. per lb., c.i.f., for foreign.

AMMONIA COMPOUNDS.—Bromide very firm at 2s. 2d. per lb. Carbonate unchanged at 3d. to 4d. per lb., according to packing, quantity, and make. Muriate, commercial, free from metals, 25s. to 27s. 6d. per cwt; chemically pure small crystals, 30s. to 32s. 6d. per cwt. Iodide, 13s. 7d. per lb. Sal Ammoniac: Firsts, 35s. per cwt.; seconds, 33s., crushed for batteries costing 2s. per cwt. more money. Sulphate dull and lower; gray, prompt, 24 per cent.; London, £12 2s. 6d. per ton; Hull, £12 2s. 6d.; Leith, prompt, £12 2s. 6d.; Beckton, September, £12 3s. 9d. to £12 5s.; October-March, £11 17s. 6d.; Beckton, terms prompt, £12 2s. 6d. Sulphocyanide, 1s. to 1s. 1d. per lb., according to quantity, etc.

ANTIMONY.—Regulus, £39 10s. to £40 per ton. Crude Japan (Black Sulphide), £23 to £23 10s. per ton.

ANTIPYRINE AND PHENAZONE—Are in good demand at unchanged price, both as regards Dr. Knorr's article and its cheaper chemical equivalent.

ATROPINE—Is firm at makers' prices, which are 15s. 6d. per oz. for the Sulphate, B.P., and 17s. 10d. per oz. for the pure alkaloid.

ASHES.—Pots, 22s. 9d.; Pearls, 32s.

BELLADONNA ROOT.—Price of really good root is 42s. 6d. to 45s. per cwt., inferior quality being quoted 37s. 6d. to 40s.

BISMUTH SALTS—Are unchanged at 5s. 1d. per lb. for the Subnitrate, the commercial quality of the metal being also unchanged at 5s. per lb.

BLEACHING POWDER (CHLORIDE OF LIME)—Steady at £6 10s. per ton for English make.

BORAX—Quiet, but steady at 16s. per cwt. for cystals and 16s. 6d. for powder.

BROMIDES—Are in good demand at unchanged rates—viz., 1s. 10½d. per lb. for Potassii Bromid., 2s. 1½d. per lb. for Sodii Bromid., and 2s. 2d. per lb. for Ammon. Bromid. Bromine, 2s. 2d. per lb. in cases of 60lb.

CAMPHOR.—Market for crude is firm, while high prices are asked from the East. There is no change in price of the refined article, English makers still quoting 1s. 7d. per lb. for Bells and Flowers for ton lots.

CLOVES.—Privately Zanzibar are rather dearer but quiet, business comprising October-December delivery at 3¼d. and January-March at 3 5/16d. At auction of 53 cases Penang 13 sold, fair bright picked but little damp, at 7d.; 40 bales Zanzibar were bought in at 3¼d. to 3⅜d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 90 per cent., 1s. 2d. per gallon; pure, 2s. Benzole firmer and dearer, quotations, being 50 per cent., spot, 11d. per gallon; 90 per cent., 8½d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent., at 120° C., 4d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 5½d. per gallon; 90 per cent. at 160° C., 1s. 2d.; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene, A., 4d. per unit; B., 2¾d. per unit. Pitch, 35s. 6d. per ton, f.o.b. Tar, crude and refined, 14s. 3d. per barrel; 3d. per gallon.

CODEINE—Is in good demand at unchanged price, viz., 12s. 6d. to 12s. 9d. per oz., according to quantity, for the pure, and 1s. per oz. less for the salts.

COD LIVER OIL—Remains very dull at nominally 60s. per barrel for best Newfoundland oil in tin-lined barrels of 25 gallons each.

CREAM OF TARTAR.—First white crystals are quoted 75s. to 76s. per cwt. on the spot; powder, 78s. per cwt.

ESERINE (PHYSOSTIGMINE)—Is firm at 2s. 3d. per gramme for the Sulphate and Salicylate Salts.

EXTRACT FILICIS MARIS (OIL OF MALE FERN).—Price has been advanced to 4s. 6d.-5s. per lb., according to quantity; while in view of the rise in cost of Ether, a further advance in price of this article is considered probable.

ESSENTIAL OILS—Continue quite inactive, and there has been practically no business passing. H. G. Hotchkiss American Oil of Peppermint is quoted 5s. 3d. to 5s. 6d. per lb., and Wayne County 3s. 6d. to 3s. 9d. for fair to good.

GALLS—Have been quiet. In China no transactions are reported, but prices are steady at 59s., usual shape. Persian have been dealt in to a small extent at previous rates; blues, of which the present stock principally consists, are firmly held and quoted 62s. 6d. to 65s.; greens, 55s. to 57s. 6d.; and whites at 50s. to 52s. 6d. Smyrna quiet and unchanged.

GINGER.—Cochin in large supply but slow demand. Of 221 cases cut kinds 65 cases sold, fair medium, little bold and rough, and part limed, at 49s.; small and tips ditto at 26s. Calicut rough, medium and small bright, little wormy, at 23s. Jamaica, in small supply, was firmly held, and nearly all bought in. Of 155 barrels 14 sold, good common to middling, at 52s. 6d. to 60s. 29 bags St. Lucia sold at 49s. to 50s.

GLYCERIN.—The market for refined has taken a decided turn for the better. A moderate advance in price has taken place, and a further rise is confidently anticipated. Present quotations are for English best white double distilled chemically pure 1,260° quality in tins of 56lb., two (or four) in a case, 54s. per cwt., and for German 55s. to 62s. 6d., according to make, etc. Crude remains very firm at £31 to £32 per ton for the quality most suitable for refining purposes.

IODIDES—Unchanged, at 10s. 6d. per lb. for Potassii Iodid., 13s. 10d. per lb. for Ammon. Iodid., 11s. 10d. per lb. for Sodii Iodid., 12s. per lb. for Iodine resublimed, and 13s. 10d per lb. for Iodoform crystals, powder, or precipitated. Commercial Iodine is also unchanged, at 7½d. per oz.

MENTHOL—Has an upward tendency, 7s. 6d. to 7s. 9d. per lb. being now asked for fine white dry crystals in 5-lb. tins (12 tins in a case).

MERCURIALS—Continue very firm at the late advance to 2s. 11d. per lb. for Calomel, and 2s. 7d. per lb. for Corrosive Sublimate.

MORPHINE.—is firm at nominaly unchanged rates, say 4s. 10d. to 5s., according to quantity, for the Hydrochlorate Powder, and 2d. per oz. more for crystals.

OILS (FIXED) AND SPIRITS.—Linseed, spot, pipes. London, are quoted £21 5s. per ton; barrels, £21 10s.; October-December, £20 15s. to £20 17s. 6d.; January-April, £20 10s.; Hull, spot, naked, £20 15s.; October-December, £19 10s.; January-April,

£19; May-August, £19 5s. Rape steady; ordinary brown spot and October-December, £23. Refined, spot, £24 10s.; Ravison, naked, spot, £20; October-December, £20 5s. per ton. Cotton firm. London crude, spot, £16 per ton; November-April, £14 15s. to £15; Refined, spot, £17 15s. to £19 10s., according to make. Hull, naked, refined, spot, £16; November-April, £14 15s.; crude, spot, £14 17s. 6d.; November-April, £13 12s. 6d. per ton. Olive higher, quotations being: Mogador, £33; Spanish, £33 to £33 10s. Cocoanut: Ceylon, spot, landed, £25 per ton; August-October, £23 5s. c.i.f.; Cochin, spot, £28 15s. to £29 per ton landed terms; August-October, £26; December-February, £25 15s. per ton c.i.f. Lagos, firm and rather higher at £26 per ton. Castor Oil dearer. Belgian, first pressing, spot, £26; second pressing, spot, £23 10s. per ton, ex. wharf. Hull manufactured: Guaranteed Cold Drawn Pure Pharmaceutical, £29 5s. per ton in barrels; 3⅜d. per lb. in cases. Pure firsts, £26 15s.; seconds, £25 5s. per ton in barrels; firsts, 3⅛d. per lb. in cases; seconds, 3d., ex wharf, London. Lubricating Oil: Pale American, spot, 5s. 9d. to 7s. 3d.; black, 5s. 6d. to 6s.; Russian black, 5s. to 5s. 6d.; pale, 6s. to 8s. 6d. Turpentine: Quiet; American spot, 33s. to 33s. 1½d. per cwt.; October-December, 33s. 3d.; January-April, 33s. 10½d. Petroleum: Strong; American has again advanced ⅛d. Russian importers have temporarily withdrawn from the market; spot quoted second hands, 5¼d. to 5½d., and to end of March; American spot, 6½d. to 6⅝d., and to end of March; Water White quoted 7¾d. to 7⅞d. Petroleum Spirit: American, 8d. to 8½d. per gallon; deodorised, 9d. to 9½d.

OPIUM.—The improvement in the demand previously noted has been maintained for most descriptions, and business of fair extent has resulted. Holders continue very firm, and higher prices are now required. Persian is quiet, with only small sales; sellers are firm at 12s. for finest and 10s. to 11s. for medium quality.

PARAFFIN WAX.—Crude: 2½d. to 2¾d. per lb. Refined, 3d. to 3¾d.

PHENACETIN.—Still very weak, the agent for one maker endeavouring to press sales at 3s. 3d. per lb. Buyers of the article have, however, become very cautious, both as to buying quantity and also as to the quality of what they buy.

PILOCARPINE.—Makers are very firm at the lately advanced price of 30s. 6d. per oz. for the Nitrate and Hydrochlorate Salts.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide firm and in good demand at 1s. 10½d. per lb. Chlorate crystals, 3¾d. per lb.; powder, 4d. per lb., free London for spot delivery. Iodide, 10s. 6d. per lb. Permanganate, 52s. 6d. per cwt. in 1-cwt. kegs for small crystals,, and 57s. 6d. per cwt. for large crystals. Prussiate, yellow, Beckton make, 7¾d. to 8d. per lb. Other English makes, 8½d. per lb.; red, 1s. to 1s. 2d. per lb.

QUICKSILVER.—Very firm at £8 12s. 6d. per bottle from the importer, and 1s. per bottle less from second hand. A further advance in price is still spoken of as not beingimprobable.

QUININE—Has had another set-back, with a good business passing at the decline. About 80,000 ozs. B&S and/or Brunswick have changed hands, comprising spot at 1s. ¼d. to 1s., the bulk at 1s., and at the close one transaction at 11⅞d., and December delivery at 1s. ¼d. to 1s. ½d., closing at the lowest. The makers of these brands still quote 1s. 2d. per oz., but are for the moment practically quite out of the running. Prospects hardly look very bright for those rash speculators who paid 1s. 10d. per oz. not so very long since.

ROSIN.—Firm and dearer, strained spot being quoted 4s. 6d. per cwt., while for shipment, September-October and December-February, by sailing vessel, 4s. 1½d. to 4s. 2d. per cwt., ex-ship terms, is asked.

SANTONINE—Continues very firm at the late advance to 9s. 6d. per lb., there being still a little obtainable from second hand at rather less money.

SHELLAC.—There is still very little demand on the spot, and only retail sales have been effected, at about previous rates, including Second Orange on basis of 64s. per cwt. for fair TN. In "Futures" the market continues very inactive.

SODA COMPOUNDS.—Crystals are quiet but steady at 55s. per ton, ex ship Thames for barrels, and 52s. 6d. per ton for bags. Ash, £5 5s. to £6 per ton, according to percentage, etc. Bicarbonate Commercial, £7 10s. to £8 10s. per ton, the fully bicarbonated quality being quoted 20s. to 22s. 6d. per cwt. Bichromate, 2¾d. per lb. Bromide firm and in good demand at 2s. 1½d. per lb. Caustic, white 70 per cent., £8 10s. per ton, 60 per cent. £6 10s. Hyposulphite (Antichlor.), 6s. to 8s. 6d. per cwt. according to make, packing, and quantity. Iodide 11s. 10d. per lb. Nitrate, £8 per ton for spot delivery.

SPICES (VARIOUS).—Black Pepper dearer; 105 bags Singapore sold at 5½d. to 6d.; 240 bags Aleppy bought in, 5⅝d.; 5 bags Ceylon sold at 5¾d. White Pepper firm; Singapore bought in at 8¾d. to 10d.; of Penang 26 bags sold at 8 7/16d. to 8⅞d. Chillies quiet; 20 bags Japan sold, good bright, at 36s. Capsicums quiet; 10 bales Bombay sold, fair cherry pods, at 26s. Cassia Lignea dull; 325 cases China bought in, fine old, at 50s.; 425 bales broken bought in at 37s. 6d. to 38s. Cinnamon Chips: Only 40 packages sold, stout quillings, at 6d.; ordinary chips and bark at 2½d. to 3d. Mace firm; 33 cases Penang sold, good, bold pale, little wormy, at 2s. 5d.; fair reddish but broken and little wormy at 1s. 5d.; 13 packages West Indian sold at 1s. 4d. to 1s. 8d. Nutmegs steady at previous values. Pimento dearer; 221 bags sold at 3¼d. to 3⅜d.

SULPHATE OF COPPER.—Spot, £23 15s. to £24 10s. per ton.

SULPHONAL.—The two official makers' price remains at 17s. per lb. for both crystals and powder. There are, however, offers in the market at a lower figure, whether of other make does not transpire.

TURMERIC.—Business continues to be only of moderate extent, but prices are somewhat higher—viz., 19s. per cwt. for Bengal; ditto, with dark fracture, 20s. Cochin split bulbs, 8s. 6d. to 8s. 9d. Madras fair to good bright finger, 25s. to 27s. 6d. per cwt.

TAR.—Stockholm, 25s. 6d. to 26s.; Archangel, 18s. to 18s. 6d.

THYMOL—Is rather firmer at 7s. per lb. It is thought probable that this article will be dearer.

Liverpool Market Report.

SEPTEMBER 6, 1899.

During the week a good amount of Beeswax has changed hands at full rates. The same remark applies to Honey, particularly Chilian, which, together with fine Canadian has been bringing very good prices. In Seeds not much business has been transacted as regards Linseed, but Turkish Canary has sold well at high rates. Castor Oil has advanced a shade for most varieties, and the demand continues good; other oils are but slightly changed. Heavy chemicals have only been in fair to moderate demand, but prices have been firm and there is a forward prospect of better prices in Alkali, Caustic Soda, and Bleaching Powder.

AMMONIA SALTS. — Sulphate is easier at £12 7s. 6d. per ton.

BEESWAX. — Good amounts of Gambia—about 21 bales—changed hands at late rates; 21 packages of Sierra Leone at £6 2s. 6d. per cwt.; 60 sacks of Chilian at £6 12s. 6d. to £7; and 2½ tons of Benguela at £6 per cwt.

BLEACHING POWDER—Is scarce, and easily brings £5 per ton.

CANARY SEED.—The demand is fair and prices firm. 60 bags of fair average Turkish made 39s. 6d. to 40s. per 464 lbs., and poor quality, 38s. 6d. Towards the close of the week a further 100 bags of fair Turkish sold at 39s. 6d.

HONEY.—There is a continued good inquiry for Chilian, of which 125 barrels sold for 19s. per cwt. 78 cases of choice Canadian changed hands at 46s. per cwt. Californian is held for very full prices.

LINSEED.—With the exception of the sale of 60 bags of Turkish at 45s. per 416 lb., there is no business to report, the market being bare of supplies, and what little there is in hand is very firmly held.

OILS (FIXED) AND SPIRITS.—Castor Oils have been sellingto a considerable amount, and there is a shade better price obtainable Calcutta, "good seconds," bring 3d. per lb; French 1st pressure, 2¾d. to 2⅞d. per lb.; 2nd pressure, French or Belgian, 2⅝ per lb.; Madras, 2¾d. 30 tons of 2nd pressure French, sold second-hand, to arrive October-December, at £23 15s. per ton f.o.b. Marseilles, but quotation is now advanced to £25 per ton. Olive Oils are in limited compass, and sales are therefore restricted. For shipment Malaga is at £33 10s. per tun, cost and freight. Candia and Levant are £32 10s. to £34 per ton. Linseed Oil of Liverpool make is firm at 23s. per cwt., but business done is small. Cotton-Seed Oil is still quoted at 18s. to 18s. 6d. per cwt., and is steady in tone. Spirits of Turpentine are in fair to moderate demand at 35s. per cwt. Potash Salts.—Chlorate is in better demand at 3½d. to 3¾d. per lb. Soda Salts.—Caustic is improved 76 per cent. to 77 per cent. £8 17s. 6d.; 70 per cent., £8 per ton. Crystals, £3 per ton.

Manchester Chemical Report.

September 6, 1899.

The accounts from the principal centres of the chemical industry continue good. There is great scarcity in some departments owing to the prevalent hot weather, but generally orders are executed with fair promptitude. Miscellaneous Chemicals are rather dull. Current quotations for 77-78 per cent. White Caustic Soda are £9 5s. to £9 12s. 6d.; 70 per cent., £8 to £8 5s.; and 60 per cent., £7 to £7 5s., on rails, at works. Bleaching Powder has been in request at late rates, and Ammonia Alkali, 58 per cent., is scarce, and selling at full prices. Sulphate of Copper is dull at £23 15s. to £24 10s. per ton, according to brand, delivered Manchester. White Powdered Arsenic easier at £18 10s. to £18 15s. per ton, *ex* ship, Garston. Yellow Prussiate is a shade firmer at 7¾d. to 8d. for best Lancashire. Acetate of Soda shows some improvement at £13 10s. to £13 15s. Acetates of Lime are dull but unchanged at £4 15s. to £5 per ton, Welsh and American, rails, and c.i.f. Manchester. Coal Tar Products are without material change for local makes. Pitch is perhaps a shade better at 31s. to 32s. per ton, f.a.s. Manchester Ship Canal, and fair quantities are being shipped in spite of the hot weather. Green Copperas firm at late rates for Lancashire make.

Birth.

Prince.—On Friday, September 1, at the Pharmacy, Connah's Quay, the wife of J. Prince, M.P.S., of a son.

Marriages.

Prior—Robinson.—On August 31, at Bunyan Meeting, Bedford, by the Rev. John Brown, D.D., James Siddall Prior, Pharmaceutical Chemist, of 19, High Street, Stanford, elder son of Samuel Oldfield Prior, of Oldfield Lodge, Melton Mowbray, to Gertrude Helen, only daughter of W. J. Robinson, Belmont, De Parys Avenue, Bedford.

Clarke—Hodgkinson.—On September 5, at Christ Church, Coventry, by the Rev. F. M. Brodie, B.A., Arthur Bertram Clarke, M.P.S., of Coventry, to Millicent Annie, youngest daughter of the late G. Hodgkinson, of Coventry.

Deaths.

Spargo.—On August 22, James Alfred Spargo, Chemist and Druggist, Lowestoft. Aged 79.

Williams.—On August 28, William Williams, Chemist and Druggist, Liverpool. Aged 78.

Ashby.—On August 29, Charles Edward Ashby, Chemist and Druggist, Chelsea. Aged 81.

Ransom.—On August 29, George Edward Ransom, Chemist and Druggist, Kirmington. Aged 55.

Ritchie.—On August 29, Thomas Ritchie, Chemist and Druggist, Manchester. Aged 71. Mr. Ritchie, who had been a member of the Pharmaceutical Society since 1892, was born near Aberdeen, where he was apprenticed to Mr. Alexander Kemp, subsequently going to Limerick (Ireland), where he stayed several years. He then went to Manchester to Messrs. Wright and Barnaby, finally joining the staff of Messrs. Standing, Son and Co., with whom he served for some twenty years.

Goodchild.—On August 31, Robert Stratford Goodchild, Chemist and Druggist, Walthamstow. Aged 84.

Venables.—On September 2, George Venables, Chemist and Druggist, lately living at 2, Malvern Terrace, Barnsbury. Aged 49. Deceased had been in the habit of taking narcotics to induce sleep, and on Thursday, August 31, took an overdose of opium, from the effects of which he never recovered. A verdict of "Death from misadventure," was returned by a coroner's jury.

Newcastle-on-Tyne Chemical Report.

September 5, 1899.

Heavy chemicals still form a fairly brisk feature on this market. Baltic and Mediterranean shipments keep bulky. Bleaching Powder for general sanitary purposes is still eagerly sought after, and as the article is scarce through reduced stocks, holders have advanced the price 10s. per ton. Caustic Soda moves freely, and Soda Crystals go somewhat better. Quotations are:—Bleaching powder, according to markets, £5 10s. to £6. Caustic Soda, 70 per cent., £8 to £8 10s.; 77 per cent., £9. Soda Crystals, 45s. to 47s. 6d. Soda Ash, 52 per cent., £4 5s. to £4 10s. Alkali, 52 per cent., £5 to £5 5s. Sulphur, £4 17s. 6d. to £5 per ton.

Partnerships Dissolved.

(From the London Gazette.)

F. M. Williams and Basil T. Makins (trading as Walter Graham and Co.), Oil and Seed Crushers, Greenwich and West Drayton. The business will be carried on under the same style by F. M Williams.

Caroline Emilie Goode and Amelia T. Wiginton, proprietors of a Surgical Home at Welback, Shorncliffe Road, Folkestone. Debts will be received and paid by Caroline Emilie Goode.

Henry Phillips and W. W. Scales, Veterinary Surgeons, Ipswich. Debts will be received and paid by Henry Phillips.

Receiving Order in Bankruptcy.

(From the London Gazette.)

Geo. B. Simpson, Surgeon, Rosedale Abbey, Yorkshire.

PHOTOGRAPHIC NOTE.

Kachin Developer.—This new developer is stated to give good black negatives free from any blue tints, but with marked contrasts, gradation or softness, at will, with the entire absence of stains on the hands. It is stated to be generally preferable to pyro. The following stock solutions are found to give good results:—(A) Kachin, 120 grains; sodium sulphite, 1,200 grains; water to make 10 ounces. (B) Sodium hydrate, 80 grains; water, 10 ounces. (C) Sodium carbonate, 1 ounce; water to make 4 ounces. (D) Sodium sulphite, 1,200 grains; water to make 10 ounces. For use with correctly exposed plates where a fair amount of contrast is required, such as landscapes, take solution A, 160 minims; solution B, 30 minims; water to make 1 ounce. For a portrait, in which less contrast is required, take solution A, 80 minims; Solution B, 30 minims; solution D, 80 minims; water to make 1 ounce. For under-exposed plates use solution A, 80 minims; solution B, 60 minims; solution D, 80 minims; water to make 1 ounce. If sodium carbonate is preferred, 20 minims of solution D may be substituted for each 30 minims of solution B. In cases of slight over-exposure, all that is necessary is the addition of a little more of solution A, and slight increase of the amount of B. or C. Kachin will permit of solution of hyposulphite being added to it in such proportion that development and fixation may take place simultaneously. This renders it particularly useful in the treatment of over-exposed plates. For correct exposures the following is the best formula for the hypo stock solution:—(E) Sodium hyposulphite, 1 ounce; water, 2 ounces. The working solution for simultaneous development and fixation is, solution A, 160 minims; solution B, 240 minims; solution E, 25 minims; water to make 1 ounce. In a correctly exposed plate fixation will have taken place as soon as development is complete. In over-exposed plates the proportion of B may be reduced to one-half, and when development has proceeded some time the amount of hypo may be increased, but at the commencement it should not exceed the proportion above stated.—*Photography.*

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—WARNES, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—EDWARD PECK, East Dereham.

Materia Medica Specimen-case, 186 drawers, each labelled with botanical name, natural order, habitat of the specimen. Suitable for public school, with specimens.—BRADDOCK & BAGSHAW, Oldham.

Overstocked Bismuth Sub-Carb., 5s. 3d. lb., 2 lb. 10s.; Iodoform Precip., 13s.; Crystal, 12s. 6d. lb. Offers wanted for 6 lb Crystal. Morph. Hydroch., 5s. oz.; Cocain Hydroch., 12s. oz.—EASTMAN, Forest Lane, Stratford.

No. 2 Frena, cost £8 9s., new this year, hardly been used; Tylar's No. 2 Zenith casket of lenses, cost £4; ½-plate camera, tripod, 3 slides, case; 7.5 in. Cooke lens, nearly new, cost £5 10s.; offers wanted.—J. E. ALLENBY, Chemist, Helmsley.

Chemists' Fixtures for sale, cheap, good condition, immediately; no reasonable offer refused. Nest of 94 drawers, with shelves above; window enclosure, 2 and 3 gal. carboys (pear-shaped); counter (mahogany top), with glass cases in front; large show case; wall cases.—E. HIGHTON, Chemist, Blackburn.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—HUGHES, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Small set Dental forceps.—MAYSON, 4, Crystal Rd., South Shore, Blackpool.

Good Vanilla Pods, Daisies, 6s. 6d.; Tetlow's Swandown Powder.—EASTMAN, Forest Lane, Stratford.

Old Electric Lamps and Scrap Platinum for prompt cash. —P. ROWSELL, 9, Derwent Grove, East Dulwich, London, S.E.

Several Chemical Balances wanted—preferably second-hand—of good make.—Particulars and lowest prices to ASSAYER, 2, Brunswick Pl., Leeds.

Green's Botany, Part 2; Scott's Botany (Flowerless Plants); Bower's Practical Botany for Beginners; recent editions.—DAVIS, 90, Cotham Brow, Bristol.

Advertisements.

(Received too late for Classification.)

LONDON, S.W.—ASSISTANT wanted; could attend lectures twice a week.—Apply personally, or full particulars and photo, to F. H. GLEW, 156, Clapham Rd.

AS CHEMIST or ANALYST; experienced in Manufacturing, Medical and Commercial Analysis, Microscopy and Photography.—CHEMIST, 13, Benbow Rd., Hammersmith.

TERMS OF SUBSCRIPTIONS.

The PHARMACEUTICAL JOURNAL circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."

Publications Received.

KING'S COLLEGE HOSPITAL REPORTS. Edited by Nestor Tirard, M.D., F.R.C.P., W. Watson Cheyne, F.R.C.S., F.R.S., John Phillips, M.A., M.D., F.R.C.P., and W. D. Halliburton, M.D., F.R.S. Vol. v. (October 1, 1897—September 30, 1898). Pp. xxiv. + 270. Price 7s. 6d. London: Adlard and Son, Bartholomew Close, E.C. From the Publishers.

ORTHOPÆDIC SURGERY: A TEXT-BOOK OF THE PATHOLOGY AND TREATMENT OF DEFORMITIES. By J. JACKSON CLARKE, M.B., Lond., F.R.C.S., pp. xx. + 454, with 309 illustrations. Price 21s. London. Cassell and Company, Limited, 1899. From the Publishers.

FIRST ANNUAL REPORT ON THE SOILS OF DORSET, to which is appended analysis and notes on four soils in Berks, Hants, Oxon. By DOUGLAS A. GILCHRIST, B.Sc., and C. M. LUXMOORE, D.Sc., F.I.C. Supplement VIII. to the Journal of Reading College. Pp. 40. Reading: Dorset County Council, August, 1899. From the Authors.

PHARMACY IN BRITISH GUIANA.

We are indebted to Mr. G. H. Hawtayne, C.M.G., Administrator-General of British Guiana, and a corresponding member of the Pharmaceutical Society, for particulars of the proposed chemists and druggist's examination, to be held at Demerara.

Proposed Syllabus for Chemist's and Druggist's Examination.

Poisons.—Candidates will be required to enumerate the poisons contained in the schedule of the Pharmacy Act and Poison Act of 1899, in pursuance of the provisions contained therein. They must describe minutely the conditions required upon the sale of poisons by retail and to write the proper entry upon the sale of a scheduled poison when forming an ingredient in a medicine dispensed.

Materia Medica.—The candidate is required to recognise specimens of any crude drug mentioned in the British Pharmacopœia and to describe their characteristics so far as may be necessary to detect adulterations or substitutions, and also to name their chief active ingredient, and also the official preparations into which they enter.

Practical Dispensing.—To weigh, measure, and compound medicines, write the directions in concise language, in a neat and distinct hand, finish and properly direct each package.

Prescriptions.—To read autograph prescriptions, translate them into English, and render a literal as well as an appropriate translation of the directions for use. To detect errors, discover unusual doses, and have a general knowledge of posology. To calculate percentages and other quantities occurring in prescriptions, also to render in good Latin ordinary prescriptions written in English.

Pharmacy.—To possess a general knowledge of the following branches, viz. :—Evaporation, operations requiring the use of heat, water, steam, and sand baths ; distillation, ordinary, fractional and destructive, and the character and object of each; filtration, clarification, precipitation, elutriation, levigation, and rectification. The principles involved in the dispensing of medicines, particularly with reference to the best methods for forming pill-masses, the preparation and nature of emulsions, the most suitable emulsifying agents, and the best means of suspending insoluble bodies or substances in liquids. The candidate will be required to show a practical knowledge of the processes by which the official preparations belonging to the following classes are made, viz. :—Confections, decoctions, dilute acids, extracts, glycerins, infusions, juices, liniments, lotions, mixtures, ointments, pill-masses, plasters, powders, solutions, spirits, suppositories, syrups, vinegars, waters, wines. A knowledge of the active ingredients in official preparations containing the following, viz. :—Aconite, antimony, arsenic, belladonna, calabar bean, cantharides, chloral hydrate, chloroform, caustic potash and soda, colchicum, digitalis, elaterium, ergot, iodine, iodoform, ipecacuanha, lead, mercury, nucis vomica, opium, phosphorus, scammony, stramonium, squills.

Chemistry and Physics, Elementary Knowledge of.—(*a*) The law of gravitation, the balance, specific gravity, atmospheric pressure, the barometer, air-pump, the syphon, temperature, thermometer, the law of gaseous diffusion. (*b*) Characteristics of chemical action, elements and compounds, the law of chemical combination by weight and volume, atomic weight and molecular weight, chemical formulæ and nomenclature, distinction between metals and non-metals. (*c*) General characters of the non-metals. The chief methods of preparation of the following non-metallic elements and compounds: hydrogen, oxygen, chlorine, nitrogen, bromine, iodine, and their compounds with hydrogen and oxygen, ammonia, oxides of nitrogen, nitric acid, sulphur, sulphurous, and sulphuric anhydride and acid, phosphorus, the usual impurities in those of the above-named substances that are included in the British Pharmacopœia. (*d*) The general characters and classification of the metals and methods of forming oxides and salts, the sources, the usual method of extracting, and the chief properties of the undermentioned metals. The principal modes of preparation, properties and adulterations of such of their compounds as are described in the British Pharmacopœia, viz. :—Potassium, sodium, ammonium, lithium, barium, calcium, magnesium, lime, aluminium, iron, chromine, manganese, arsenic, antimony, tin, copper, bismuth, lead, silver, mercury, gold, and platinum. (*e*) Carbon, its oxides, cyanogen, hydrocyanic acid, cyanide of potash, ferrocyanide and ferricyanide of potash, oxalic acid, the methods of preparing alcohol, acetic acid, spirit of nitrous ether, chloral hydrate, nitrate of amyl, chloroform, iodoform, ether, the principal properties and reactions of these compounds.

Practical.—Specific gravity of liquids and solids, and be familiar with the use of thermometer and hydrometer. To recognise by chemical tests the more important non-metallic elements and compounds. To recognise those of the B.P. by their physical properties and characteristics. To identify by chemical tests tartaric acid, citric acid, starch, quinine, morphine, and strychnine. To be familiar with the use of balance, and have a practical knowledge of the British and Metric system of weights and measures.

Conditions of Entry.—Men or women who have attained the respective age of twenty or eighteen years may enter for this examination under the following conditions :—(1) That he or she has been engaged as an apprentice or assistant for a period of two years ; (2) That he or she produce a certificate of birth ; (3) That he or she pay a fee of seven [? pounds.—Ed. *P.J.*] and send in his or her application to the Secretary [? of the Board of Examiners.—Ed. *P.J.*] fifteen days before the date of examination.

ENGLISH NEWS.

At the Drug Sales this week five cases (each containing 10 × 10 lb. bottles) of potassium iodide, prepared in Japan, and guaranteed to answer to the tests of the Japanese Pharmacopœia, were offered. The crystals were of good colour and dry, and so far as appearance goes, seemed to be of excellent quality. Under the name of "Japan Wood Oil," a large quantity (415 cases) of a drying oil, having some of the properties of linseed oil, was offered by one broker, and a similar oil, from Hong Kong, to the extent of about five cwt., by another. This oil was described some years ago in this Journal [3], **15**, 636-7., by the late R. H. Davies, who investigated its properties. It is one of the most drying oils known and is largely used in China and Japan for paints and varnishes. From New Guinea a new variety of turmeric has been offered for the first time, somewhat inferior in appearance, but interesting as showing that the products of that country are already being exploited. Calumba root, which has for some time been scarce, was offered of poor quality, one lot being adulterated with a similar root with a more woody centre, and another presenting pieces cut longitudinally in slices—a very unusual form of the drug. Peruvian rhatany of good quality is again obtainable. Matico leaves appeared in two forms, in one of which the leaves are very broad, 3 to 4 inches, and apparently derived from an undescribed species growing in the United States of Columbia, but possibly extending to Peru, since the package came from Pimentel. Some small "bitter almonds" from Bombay are apparently the kernels of a species of *Prunus*, since fragments of the shell are smooth and hard like those of plums and apricots.

Westminster College of Chemistry and Pharmacy.—On Thursday evening, September 8, an interesting gathering took place in connection with this college at the Holborn Restaurant to celebrate several events, viz., the principal, Mr. G. S. V. Wills' jubilee ; the silver wedding of Mr. and Mrs. Wills; the coming of age of their son, Mr. H. S. Wills ; the completion of twenty-five years' work at the college ; and the dissolution of partnership between Mr. Wills and Mr. H. Wootton. A large number of guests, amongst whom were many past and present students of the college, were present, Mr. J. Kinsey Jones, Mayor of Llanidloes, presiding at a sumptuous dinner served in the Royal Venetian Chamber. After dinner and the usual toasts, the college prizes were distributed to successful students by the chairman. The party then adjourned to the King's Hall, where a conversazione was held, and during the evening a presentation, on behalf of the past and present, students, was made to Mr. Wills, consisting of an address accompanied by a cheque for £100.

Botanical Excursion.—On Thursday, September 7, the botanical students attending Middlesbrough High School classes, had an excursion to Hilton-in-Cleveland. The party, under the guidance of Mr. E. C. Bennison, Ph.C., drove to Middleton and walked viâ "Weary Bank" to Hilton, where tea was provided by Mr. W. J. Clarke, of Stockton. The outing was thoroughly enjoyed, and the following plants were collected :—*Conium maculatum*, *Tamus communis*, *Scabiosa arvensis*, *Senecio jacobæa*, *Lythrum salicaria*, *Potentilla tormentilla*, *Barbarea vulgaris*, *Centranthus ruber*, *Lactuca muralis*, *Lathyrus pratensis*, *Eupatorium cannabinum*, *Rumex crispus*, *Scrophularia nodosa*, *Erysimum cheiranthoides*, *Erigeron canadense*, *Anthemis arvensis*, *Hypericum perforatum*, *Convolvulus arvensis*, *Reseda lutea*, *Spiræa ulmaria*, *Dipsacus sylvestris*. *Tanacetum valgare*, *Geranium robertianum*, etc.

VISIT TO BOTANIC GARDENS.—On Saturday last, the students of the Leeds College of Pharmacy paid a visit to the Royal Botanic Gardens at Old Trafford. An inspection was made of all the plants of pharmaceutical interest, and the mechanisms of *Drosera*, *Dionica*, *Sarracenia*, and other carnivorous plants were explained. Tea was partaken of in the Grand Pavilion, after which the students remained to a concert which was being held, returning to Leeds by a late train.

PRESENTATION TO A MANCHESTER CHEMIST.—Mr. Chas. Swinn, Ph.C., of Moss Side, Manchester, has been presented with a solid silver tea and coffee service on the occasion of his silver wedding by his numerous friends, who hold him in high esteem.

DEFICIENT WEIGHTS.—At Nelson, near Burnley, on Saturday, September 9, Foggitt's Drug Stores, Limited, 3, Scotland Road, Nelson, were summoned for having for trade purposes an unjust weight and an unstamped measure. The registered offices are at 13, Neville Street, Southport, and the managing director is Mr. John Blackett Foggitt, pharmaceutical chemist.—Inspector Green stated that on August 23 he visited the shop in Scotland Road and found behind a partition six weights and a pair of scales, whilst two weights were actually in use. All the weights were deficient, but not to a great extent, the deficiency ranging from a drachm and a-half down to a few grains. The weights had been very much neglected, whilst in the shop he examined three measures, and found two were not stamped. He made a purchase, and was served with a measure not stamped.—The manager of the stores explained that he only went to Nelson about last Christmas, and thought the weights had been examined just prior to that. The measure was one which they kept for photographic chemicals.—The Bench after warning defendant not to neglect his weights and measures in future, fined him 5s. and costs for the first case and 2s. 6d. and costs in the second.

CANCEROUS MEAT.—Mr. Archibald Hodder, M.R.C.V.S., of Liverpool, writes to the *Daily Chronicle* to say that the everyday practice of his profession has brought him into close contact with the farmers and cattle of Herefordshire, Northamptonshire, Warwickshire, and Norfolk, and although he has found the British farmer second to none as an agriculturist, his knowledge of pathology and such pathological lesions as neoplasms cannot be said to be very extensive. The majority of farmers are said to be as likely to refer to any tumour on a beast as a cancer, as to call it anything else. For instance, in cases of actinomycosis in cattle, the disease is characterised by a tumefied condition of the jawbones, cheeks, and tongue. Many farmers would term those cases cancer of the tongue. Again, farmers have been heard to refer to fibrous tumours as cancer; in fact, wens, cysts, bursal enlargements, and all kinds of tumours and abnormal swellings are apt to be classified under the common name of cancer by persons unacquainted with their true nature. Then, again, it is not easy to diagnose the existence of carcinomata, apart from a microscopical examination of the affected part. For those reasons it is difficult to accept the statement that cancer is far more common amongst cattle than tuberculosis. And even did such a state of things exist, the danger of eating the meat of affected animals would probably be small, since, owing to the unsaleable appearance of diseased meat, such things as tumours are usually removed by the butcher before the carcase is offered for sale.

WIRELESS TELEGRAPHY.—The installation of wireless telegraphy, according to the *Times*, will be the most interesting scientific accomplishment at the Dover meeting of the British Association. The arrangements have been made under the personal supervision of Mr. Marconi and Professor Fleming, the latter of whom has charge of this section, as Mr. Marconi left England on September 12 for America. It is hinted that one of the objects of his voyage across the Atlantic is to consider the question of the possibility of obtaining wireless communication between America and this country. Some exceedingly interesting preliminary tests were made by Professor Fleming at the Dover Town Hall on Monday, and conducted by Mr. Kemp, who was in charge of the instruments, the tests being productive of the most successful results. The height of the pole on the Town Hall has been increased 36ft., the sprit to which the wire is now connected being 140ft. from the ground. The automatic records made on Monday by the receiving instrument were absolutely perfect as specimens of telegraphic work. A very interesting feature of the demonstrations during the meeting of the French and British Associations at Boulogne and Dover will be the exchange of wireless telegraphic communications across the English Channel. In this respect another important result has been achieved. Until the present trials it was believed that these cross-Channel communications would have to be retransmitted through the South Foreland, but direct communication has now been obtained between Boulogne and Dover, which is another scientific triumph for the new telegraphy, especially when the curvature of the earth is taken into consideration. At the south Foreland the top of the pole is about 550ft. above sea-level. In the valley at Dover it is only about 150ft. above the level of the sea, and yet with all this difference it has now been proved that the results which can be obtained are equally efficient. Such are the possibilities of wireless telegraphy that i would appear that a new development might at any time occur which would place the curvature of the earth to a great extent out of the question and permit infinitely greater distances to be traversed.

THE SOCIETY'S LONDON MUSEUM.—We are requested by the Curator to state that the Materia Medica Museum will not be ready for purposes of study until Monday, September 18, by which date it is hoped that the painting and alterations will be completed. The electric light has been installed in the part of the Museum chiefly used by students, and a new system of labelling the specimens has been adopted.

THE "PATENT MEDICINE" LICENCES issued during the year ending March 31, 1899, numbered 33,992, of which 31,323 were issued in England and Wales, and 2,669 in Scotland. The net receipt of duty derived from the licences was £8,500. The total number of licences issued in 1897 was 32,473, and in 1898 it was 33,130. A steady increase in the number of shops where proprietary medicines are sold continues therefore to be manifested.

LAUDANUM POISONING.—An inquest was held at the Town Hall, Castle Road, Scarborough, on Tuesday, September 12, with respect to the death of Mark Kinner, 43, fried fish dealer, of 55, Sandringham Street, who died the previous day from the effects of laudanum poisoning. Evidence was given to the effect that deceased had been depressed on account of losing his situation and that he had bought three ounces of laudanum at the Hull Drug Stores, stating that he was going to take about 10 drops of it for diarrhœa. He, however, took the whole of the three ounces, death resulting. A letter to his wife was read, and the jury came to the conclusion that deceased committed suicide while temporarily insane.

THE FORTY-FOURTH ANNUAL EXHIBITION of the Royal Photographic Society, which will be held at the Gallery of the Royal Society of Painters in Water Colours, 5A, Pall Mall East, is now in course of preparation, and will be opened to the public on Monday, September 25, for a period of seven weeks. On Saturday, September 23, there will be a private view for members, exhibitors, and their friends, and in the evening there will be a conversazione, when the President the Earl of Crawford, K.T., will receive the members and the other guests of the Society. The following have been elected the judges:—Pictorial Section: Harold Baker, Colonel J. Gale, A. Horsley Hinton, B. W. Leader, R.A., W. L. Wyllie, A.R.A. Technical and Scientific Section: Captain W. de W. Abney, C.B., F.R.S., T. Bolas, F.I.C., F.C.S., Chapman Jones, F.I.C., F.C.S.

THE SALE OF POISONS.—An inquest was held at Smethwick on Monday, September 11, by Mr. A. A. Betham (deputy coroner), concerning the death of Ann Foxall (55), widow, who resided in High Park Road. On Saturday, September 9, she purchased a packet of vermin-killer from Mr. Betts, chemist, Grove Lane, and about an hour later died. She told her son that she had taken poison.—The jury returned a verdict of "Suicide whilst of unsound mind," and recommended Mr. Betts in future to require an introducer with every person who asked for poison whose name he did not know.

MR. CHARLES U. IND, chemist and druggist, of Margate, has for the second time in the present year secured first place in the prize list of St. Thomas's Hospital, London, and has just been awarded the First College Prize, £15, in Midwifery and Practical Surgery.

Fire at a Wholesale Druggist's.—On Monday evening, September 11, a slight fire occurred in the wool-room in the premises of Messrs. Southall, Barclay, and Co., manufacturing chemists, Dalton Street, Birmingham. The alarm was given to the Central Fire Station, and the brigade, with the manual engine and fire-escape, under Mr. Teviotdale, attended, but a few buckets of water extinguished the flames. The origin of the fire is unknown, and the damage is slight.

SCOTTISH NEWS.

Edinburgh District Chemists' Golf Club.—The fourth competition this season for the "Gibson Handicap Medal" took place last week at the Braids, with the following result: Mr. C. F. Henry, (116—25 = 91), 1; Mr. W. C. Baker (97—5 = 92), 2; Mr. J. G. Robb (121—25 = 96), 3; Mr. James Stott (93 + 4 = 97), 4.

The Prize Competition on the Edinburgh Autumn holiday (September 18) will be held at Leven, when the "Gibson Handicap Medal," the Hon. President's, and club prizes will be played for. The train will leave Waverley Station at 8.53 a.m.

Aerated Water Legal Crusade.—Lord Stormonth Darling granted interim interdict in the Court of Session on Wednesday, at the instance of Reid Brothers, chemists, Falkirk, against James Sinclair, Bathgate, to prevent Sinclair filling bottles bearing Reid Brothers' name. His lordship said there seemed to be an epidemic of aërated water trade disputes.

Suicide at Port Glasgow.—Edward O'Brien, aged 35, belonging to Whiteinch, was on Wednesday morning found unconscious in the Birkmyne Park, Port Glasgow. Dr. Millar was early in attendance, but O'Brien only survived a few minutes. In one of the deceased's pockets was found a carbolic acid bottle, and it was evident from the condition of his mouth that he had taken a quantity of the poison.

A Game of Bowls was played on Bellahouston Green, Glasgow, on September 12, between a Wholesale and a Retail rink. The players were Messrs. J. Walker, D. C. Houston, H. Thomson, and J. Cairncross (skip) for the *Wholesale*, and Messrs. R. H. Gordon, D. Moir, M. Wallace, and Thos. Adam (skip) for *Retail*. At the 8th end, game stood Retail 13, Wholesale 2, at 20th end 17 all, finishing at 21st end Wholesale 19, Retail 17.

IRISH NEWS.

Pharmaceutical Society of Ireland.—Applications for the October Examinations must be lodged with the Registrar before eleven o'clock on the mornings of the dates mentioned:—Pharmaceutical Assistants' Examination, Monday, 25th inst.; Registered Druggist Examination, Tuesday, 26th inst.; Pharmaceutical License Examination, Wednesday, 27th inst.

Carbolic Acid Poisoning.—An inquest was held at Newry on Saturday, September 9, concerning the death of Laurence M'Shane, who was poisoned on the 6th inst. by drinking carbolic acid in mistake for whisky.—According to the evidence, deceased offered to see a man named Edward Nugent, who was under the influence of drink, safely home. On the way M'Shane took a "slug" out of a bottle that Nugent had with him, under the impression that it contained whisky. He became ill, and lay down on the road. In the meantime Nugent went into a neighbour's house, and offered the bottle to the occupier, Arthur Lenagh, who also drank of the contents and was taken ill. M'Shane was found and carried into Lenagh's house, where he died, while Lenagh still lies in a precarious state.—The jury found that the occurrence was purely through misadventure. The man Nugent was arrested, and admitted to bail so as to be present at the inquest.

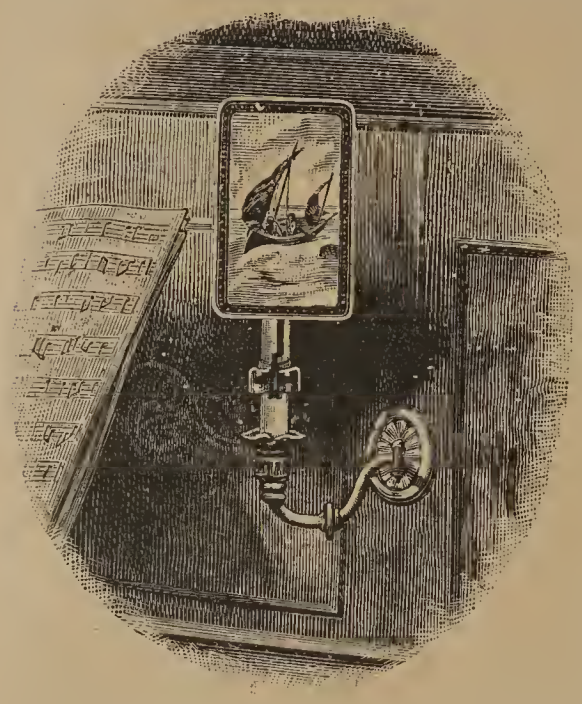
THE FREE SALE OF CARBOLIC ACID.

Chemist's Assistant Fined.—Mr. T. E. Sampson, the Liverpool city coronor, held an inquest on Thursday, September 7, respecting the death of Theresa Proctor, aged 17, who lived with her husband at 62, Hampton Street.—Robert Proctor, husband of the deceased, stated that they had been married only four weeks. He was an army reserve man, and had spoken of being called out in case of a Boer war, and the deceased said, laughingly, "If you go I shall poison myself." They had some little disagreement over money matters on the previous Friday, and witness used some sharp words to her. On the Wednesday following witness went out in the morning. His dinner was not ready when he returned, and he again spoke sharply to her. She made no reply, but prepared the dinner, afterwards going upstairs. A few minutes later he was startled by hearing cries of "Bob, Bob, Bob! I am dying." Rushing upstairs, witness found her lying on the floor with a bottle of carbolic acid by her side. He at once administered an emetic, and, calling a constable, had her removed by ambulance to the Southern Hospital.—It was ascertained that the carbolic acid was obtained in the afternoon in Windsor Street, and William Simpson, the chemist's assistant, was called as a witness. He did not appear, however, and Mr. Sampson told the jury that he had received a letter from him, excusing his attendance on the ground that he was alone in the shop. The excuse was a good one, and might have been accepted in other circumstances; still, if it were allowed, it might create a precedent. He had probably nothing further to state, but he would be fined 20s. for the disobedience.—The jury brought in a verdict of "Suicide whilst temporarily insane," and recommended that some restriction should be put upon the sale of carbolic acid.—Mr. Sampson said he heartily endorsed the verdict. The unrestricted sale of carbolic acid was a point which his brother coroners had frequently reprehended. It could be obtained as easily as milk, and was a favourite poison in cases of suicide.

Other Carbolic Acid Cases.—An inquest was held on Wednesday, September 6, on the body of Mr. Ernest Renshaw, the well-known lawn tennis player, who died at Waltham St. Lawrence, Berks.—Jane Elizabeth Dow, servant with the Renshaw family, stated that early on the previous Saturday morning she found deceased on the couch in the drawing-room. She spoke to him, but as he did not answer she called assistance. About half-past seven she went into the lavatory, and noticed that the bottle of carbolic acid, always kept in an adjoining closet, had been removed from its usual place to the basin. The cork was out, and there were one or two spots on the basin. The candlestick from his bedroom was in the lavatory, and the candle was burning. Deceased had not been very well during the last few days, but she did not know what was the matter with him; there appeared nothing serious.—Mr. G. G. Bothwell, M.B., *locum tenens* for Dr. Young, of Twyford, said he made a post-mortem examination, and found well-marked traces of carbolic acid in the stomach. This was the cause of death. The other organs were healthy, but congested, due, he thought, to the action of the carbolic acid. The deceased might have had a severe attack of vomiting, and being afterwards anxious for something to drink, taken the carbolic acid inadvertently.—The jury, after considering their verdict, came to the conclusion that deceased died from the effects of carbolic acid, but whether taken intentionally or not the evidence did not show.——The same day, September 6, at Leek, a man named Thomas Hammond, labourer, mixed a quantity of carbolic acid with some cabbage vinegar in a preserve jar, and drank it. He lingered for about six hours in great agony. He was fifty-two years of age, and had been drinking heavily.——The next day, Thursday, September 7, a gentleman, named Mr. Henry Hayes, of 45, Whingarth Avenue, Victoria, Scarborough, was sitting on the Spa at Scarborough, when he was noticed to be ill. Shortly after, a bottle, which had contained carbolic acid, was found empty by his side. Mr. Hayes died just after the attention of the attendant was called to him.——Mr. R. F. Haslewood (coroner) held an inquiry at Bridgnorth on Monday evening last touching the death of Ann Lawley, 52, the wife of a rabbit catcher.—It appears that the deceased was in the habit of drinking vinegar, and on the Saturday evening called to a neighbour, "Polly, come here. I have drunk some of this stuff (referring to a bottle of carbolic acid on the table), I thought it was vinegar." She died shortly afterwards.—The jury returned a verdict of "Death from carbolic poisoning."

TRADE NOTES.

PHOTOGRAPH CANDLE SHADE.—Messrs. W. Butcher and Son, Blackheath, S.E., submit a sample pair of their new candle shade screens, a "Primus" specialty, which they are just putting on the market. This should find a ready demand amongst amateur photographers, as they can mount their own photographs in the frames for the screens, and thereby turn them into useful ornaments. The frames can be fitted to any candle, and are made for holding paper prints, which are simply slipped in at the back and held by turning over projecting pieces. Platinotype prints are found to give the most satisfactory effects, but thin bromide paper and even silver paper may be used and produce beautiful transparent effects. No previous mounting is necessary, but the prints should be made rather darker than usual to give the most satisfactory result with transmitted light. They are made in two sizes—¼-plate or 4 by 3 inches; ½-plate or 6 by 4 inches (horizontal and vertical). Prices per pair, 1s. 6d. and 2s. respectively. Messrs. Butcher and Son also send a specimen copy of the sixth editiou of their "Primus" Lanternist's Pocket Book. It is a handy little book, being admirably adapted for its purpose. That it is appreciated by lanternists is evident from the fact that about 10,000 copies are distributed every lantern season. The firm will be pleased to supply copies free on receipt of two stamps for postage.



CHINOSOL has been awarded a prize medal at the Southampton Sanitary Congress.

THE PURITY OF FOOD AND DRUGS.

SPIRIT OF NITRE.—Herbert Hall, grocer, Cranfield, was summoned at Ampthill Police-court, on Thursday, August 31, for selling sweet spirit of nitre not of the nature, quality, and substance demanded by the purchaser.—Mr. W. E. Bottrill, solicitor, Nottingham, for the defence, stated that the article in question was made by Boots, Limited, about the end of February last, and was bought by defendant from Boots' shop in St. Mary's, Bedford, on May 3. Mr. Hall was not a chemist, and not understanding its volatile nature, had let the sun get at the spirit, so that the quality of the article deteriorated. Defendant's total sale of spirit of nitre was only about 5s. worth a year. Mr. Bottrill pointed out that the defendant was not accused of fraudulently tampering with the spirit of nitre, and asked the Bench to allow the withdrawal of the summons on payment of the costs, which amounted to about a guinea. This was agreed to, and the summons was withdrawn.——A similar case was heard at Woburn Petty Sessions on Friday, September 1, the defendant being Philip Arthur Parkins, grocer, of Evershott, who had sold six ounces of sweet spirit of nitre deficient in nitrous ether to the extent of 60 per cent.—The Chairman said that according to the report of the analyst the case was a bad one.—The defendant, however, put in a note from Mr. Philip Stoneham Canning, chemist and druggist, of Leighton Buzzard, stating that the spirit of nitre, as supplied to defendant, was "B.P., 1898," such as the inspector would require. Defendant admitted that the nitre had deteriorated by evaporation, caused by the heat, but stated that it could not be kept intact, even in capsuled bottles.—The Inspector, while admitting that the spirit would evaporate unless great care was taken, pointed out that evaporation might be allowed to go on until the nitre became absolutely useless. The case had simply been brought before the magistrates as a caution, therefore he was willing to withdraw the summons on defendant paying the costs, 19s. 6d.—Defendant paid the costs, and the charge was struck out.

SPIRIT OF NITRE.—At Settle County Petty Sessions on Tuesday, August 29, Robert Kitchen, grocer, Long Preston, was charged with selling sweet spirit of nitre deficient in nitrous ether, and containing an excess of water to the extent of 3·25 per cent.—Defendant pleaded that he had only recently taken over the business, and took the nitre along with the other goods in stock.—Fined £1 10s.

SELF-RAISING FLOUR.—On Thursday, September 7, the adjourned case against Annie Moffitt, grocer and provision dealer, of Tamworth Street, Old Trafford, for selling self-raising flour alleged to contain ingredients injurious to health (see *ante*, p. 226*d*) was resumed before the Manchester Stipendiary magistrate, Mr. Yates, Q.C., and others. Briefly, the case for the prosecution was that defendant had sold self-raising flour which, according to the analysis of one of the county analysts, contained 170 grains of alum to the pound. A portion of the same sample was analysed by Mr. William Thomson, of Manchester, who certified that it contained no alum, and this was supported by the Somerset House analysts. Application was then made to the magistrates for permission to send the residue of the sample in the possession of the county analyst to Somerset House for analysis. It was urged that in dividing the flour in the first instance the alum, being heaviest, had not been thoroughly distributed, and had all got into the sample analysed by the county analyst, while the sample sent to Somerset House was quite free. This application was refused, and Mr. Chapman, on behalf of the prosecution, now stated that in view of the Somerset House certificate he should not proceed further with the summons; he had, however, evidence in corroboration of the certificate of the county analyst.—Mr. Chorlton, for the defendant, stated that she was prepared to prove that no alum whatever had been put in the flour in question, and had in Court every person who had had anything to do with it from beginning to end. He thought it was a case in which the defendant was entitled to an absolute acquittal. The defendant had been put to great expense, and he asked for reasonable costs on her behalf.—Mr. Yates (the Stipendiary magistrate) in announcing the decision of the Bench, said that the Somerset House certificate clearly showed that a mistake had been made by the county analyst. Samples sent for analysis by the county analyst were not bound to be analysed by himself, but might be done by his assistants, under supervision, and he thought that this fact was the probable cause of the mischief, as it was impossible to give that supervision necessary to prevent a mistake being made. The summons would be dismissed, and the defendant allowed ten guineas costs.—The county analyst wished to make a personal explanation, but was not permitted to do so, as the magistrates could only take evidence on oath.

CAMPHORATED OIL.—At Wednesbury, on Tuesday, September 12, before the Stipendiary Magistrate, Messrs. Raybould. Whitehouse and Co., wholesale druggists, of Dudley, were summoned for supplying with camphorated oil a false label, describing it as "genuine B.P."—meaning that it was prepared according to the British Pharmacopœia. There was a further summons for giving a false warranty. Mr. R. A. Wilcock (Wolverhampton), who prosecuted, explained that the proceedings were taken in consequence of camphorated oil having been purchased from one Benjamin Burns, of Camp Street, Wednesbury, and which on analysis proved to contain 12 per cent. of mineral oil, and 68·76 per cent. of arachis oil, instead of olive oil, as prescribed by the British Pharmacopœa.—Evidence was given showing that the bottle from which the oil was sold was labelled "Warranted Genuine B.P."—The defence was that the oil purchased was represented to be olive oil, and receipted accounts were produced, showing purchases by the firm of olive oil.—Mr. Raybould was sworn, and stated that he himself prepared the drugs, and no adulterants were used by him. He was unable to account for the presence of the other oils, as he used what was sold to him as olive oil.—A fine of 40s. and costs was imposed in each of the two cases, the fines and costs amounting to £8 8s. 6d.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

SEPTEMBER 14, 1899.

Business has again been somewhat quiet, but with the close of the holidays and the advent of cooler weather more activity is confidently looked for in business generally. The only changes of any importance during the week have been a further slump in the speculative price of Sulphate of Quinine, an advance in price of Morphine, and a very tangible advance in makers' prices for Cocaine. Otherwise there are no alterations in values of any importance to notice. Iodides appear to be somewhat unsettled, in consequence of the appearance of 5 cases, each 100lbs., of Potassii Iodid., of Japan manufacture, in to-day's public sales, as this may mean that the Iodine Convention may take retaliatory steps by reducing the price. Prenacetine and Acetanilide remain very weak, while Sulphonal remains in the same dubious position. Opium is harder—in fact, slightly dearer. Codeine in good demand and very firm. Glycerin steadv. Cod liver oil dull and weak. Acid Carbolic firm. Bromides steady, at unchanged prices. The following are prices ruling for some articles of principal interest:—

ACETANILIDE—Continues weak in consequence of continued pressure to sell on part of the maker's agents here, quotations being 10½d. to 1s. 2d. per lb., according to quantity, etc.

ACID BORACIC—Is unchanged at prices given last week.

ACID CARBOLIC—Continues firm at 7d. per lb. for best make of 35-36° C. ice crystal in large bulk packing, other qualities being quoted in proportion. Crude 60° F., 2s. per gallon; 75° F., 2s. 6d. per gallon. Liquid 95 to 98 per cent. of pale straw colour, 1s. 3d. to 1s. 4d. per gallon, in 40 gallon casks; ditto., 30 per cent. dark in colour, 10d. to 11d. per gallon.

ACID CITRIC—Dull and weak at 1s. 5½d. to 1s. 6½d. per lb., according to quantity and make for crystals in 5-cwt. casks.

ACID OXALIC—Is without change from last week.

ACID TARTARIC.—English is still quoted 1s. 1d. per lb., and foreign 1s. 0½d. per lb. c.i.f.

ANTIMONY.—The Regulus is unchanged at £39 10s. to £40 per ton, while the crude Japan (Black Sulphide) is rather dull at £23 10s. to £24.

AMMONIA COMPOUNDS.—Bromide firm at 2s. 2d. per lb. Carbonate 3d. to 4d. per lb., according to packing, etc. Muriate, chemically pure, small crystals, 30s. to 32s. 6d. per cwt.; ditto commercial, free from metals, 27s. 6d. per cwt. Iodide, 13s. 7d. per lb. Sal Ammoniac, firsts, 35s. per cwt.; seconds, 33s.; ditto, crushed for batteries, firsts, 37s.; seconds, 35s. per cwt. Sulphate dull and rather lower. Gray, prompt, 24 per cent., London, £12 per ton; Hull, £12; Leith, prompt, £12; Beckton, October-March, £11 15s.; Beckton terms, prompt, £12. Sulphocyanide, 1s. to 1s. 2d. per lb.

ANTIPYRINE and **PHENAZONE**—Continue in fair demand at unchanged prices.

BLEACHING POWDER (CHLORINATED LIME)—Quiet, at £6 10s. per ton for English.

BORAX—Is steady at unchanged quotations.

BROMIDES—Are unchanged from last week.

CHINCHONA BARK.—For these periodical auctions on Tuesday catalogues were more numerous, but supplies were again small, amounting to 1904 packages of all descriptions, which included 729 packages damaged, against 1736 packages last sale. There was little animation at the sales, but the bulk were disposed of, in many instances at much lower prices than the last London auctions, the average unit obtained being 1⅛d., or equal to the last Dutch sale. Ceylon: 129 bales and 17 bags offered and sold, according to analysis, Succirubra, natural stem chips and shavings, fair at 2¾d. to 3¼d., ditto mixed stem and branch at 2¼d. to 2½d.; Officinalis, stem chips at 3d.; Ledger, stem chips and shavings, at 4½d. and 6¾d. East Indian: 471 bales offered and 381 sold; Red, natural chips and shavings, fair at 3¼d. to 3¾d., fair root 3¼d., fair quill at 3½d.; Officinalis, renewed chips and shavings, fair to good at 3⅛d. to 4⅝d., branch at 2½d. to 3¾d., fair broken quill at 3½d.; hybrid, fair quill at 4¼d. Java: 148 bales offered and sold; good stem chips 5¼d., common dusty ¾d. to 1¾d. South American: 346 bales Bolivian cultivated Calisaya quills offered and 210 bales sold at 6¼d. to 7¼d.; 14 bales Red bought in. Cuprea: 50 bales offered and bought in at 2¼d. 729 packages damaged Bark also offered and sold, for account of whom it may concern, comprising 159 packages Columbian, 129 packages Pitayo, 127 packages Cuprea, and 314 bags mixed Bark, with all faults.

CLOVES.—Privately Zanzibar quiet, quotations being October-December delivery 3 1/16d., and January-March at 3¼d. At Auction no Zanzibar offered; 118 cases picked Penang were all bought in; fair to good bright at 8d. to 1s. 1d.

COCAINE.—The further advance in makers' prices, which had been predicted in these columns, was announced on Friday last, present quotations being:—For the Hydrochlorate, in 25oz. tins, for 200oz. lots, 17s. 7d. per oz.; for 100oz. lots, 17s. 9d. per oz.; and for less than 100oz., 18s. per oz.; it being even stated that the possibility of a further advance is not absolutely out of the question. Cause of the advance is stated to be the continued scarcity and dearness of the raw material, combined with the fact that price of the article had previously been unduly depressed. There are sellers from second hand at 9d. to 1s. per oz. below makers' present quotations.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 2d. per gallon; pure, 2s. Benzole has quieted down 50 per cent., being quoted prompt and September-December delivery 10½d. to 11d. per gallon; 90 per cent. prompt, 8d., September-December 8½d. per gallon. Crude naphtha, 30 per cent. at 120° C., 3¾d. per gallon. Solvent naphtha, 95 per cent. at 160° C., 1s. 5d. per gallon; 90 per cent. at 160° C., 1s. 2d. per gallon. Anthracene: A, 4d. per unit; B, 3d. Pitch, 35s. per ton, f.o.b. Tar, refined, 14s. 3d. per barrel, 3d. per gallon; crude, 14s. per barrel, 2¾d. per gallon.

COD LIVER OIL—Remains very quiet at 57s. 6d. to 62s. 6d. per barrel of 25 gallons for best new Norwegian oil, in tin-lined barrels.

CODEINE—Continues very firm and in good demand at 12s. 6d. to 12s. 9d. per oz., according to quantity for the pure, and 1s. per oz. less for the salts.

CREAM OF TARTAR—Steady at 74s. 6d. to 75s. per cwt. on the spot for first white crystals and 77s. per cwt, for powder.

GALLS.—The market is steady, but quiet. China on the spot quoted 59s., usual shape, and for arrival 58s., with plum shaped at 61s. to 62s. c. f. and i. Persian Blues have been selling in retail lots at 62s. 6d., but Greens are dull, with sellers firm. Conflicting reports come to hand of the new crop, which, however, point to scarcity. Other descriptions neglected.

GINGER.—The good supply of Cochin met a moderate demand at rather easier rates; of 111 cases, cut kinds, 62 cases sold, fair small same medium at 27s. to 29s., small and tips at 25s.; of 1,607 bags, washed rough, 462 bags sold, fair bright medium and small part wormy at 23s. to 23s. 6d., small shrivelled at 18s. 6d. to 19s., fair cuttings at 16s. Jamaica, in small supply, met slow demand, and nearly all bought in, but holders were firm; 122 barrels offered and 5 sold, middling to good, at 60s. to 66s.

GLYCERIN.—Crude remains firm, the refined article being also steady at the lately advanced quotations to 54s. per cwt. for English and 55s. to 62s. 6d. for German best white double-distilled chemically pure 1260° quality in tins and cases.

IODIDES—Are unchanged, although the offer of some Potassii Iodide of Japan manufacture in public sale to-day has made buyers rather chary, they fearing that the continuation of these imports may lead to a reduction in price on part of the Convention.

MERCURIALS are firm at the late advance to 2s. 11d. per lb. for Calomel, and 2s. 7d. per lb. for Corrosive Sublimate.

MORPHINE—Is firm at higher prices, some of the makers having advanced their price to 4s. 11d. per lb. for the Hydrochlorate powder, the crystal salt being quoted 5s. 1d. per oz.

OILS (FIXED) AND SPIRITS.—Linseed firm. London spot pipes £21 5s. per ton, barrels £21 10s. October-December £20 17s. 6d., January-April £20 10s. Hull spot naked, £21 5s.; October-December, £19 17s. 6d.; January-April and May-August, £19s. 5s. Rape steady; ordinary brown spot and October-December, £23; refined spot, £24 10s.. Ravison naked spot and October-

December, £19 5s Cotton steady. London crude spot, £16 to £16 5s.; November-April, £14 15s. Refined spot, £17 15s. to £19 10s., according to make. Hull naked, refined spot, £16 2s. 6d. November-April, £14 17s. 6d; crude spot, £15; November-April, £13 15s. Olive Mogador, £33; Spanish, £33 to £33 10s. per ton. Coconut firm; Ceylon spot, £25 per ton, landed terms; October-December, £23 to £23 5s. c.i.f. Cochin spot, £29 10s., landed; August-September, £26 5s.; October-December, £26 c.i.f. Palm again higher, Lagos being quoted £26 per ton on the spot. Lubricating oil: pale American spot is quoted 5s. 9d. to 7s. 3d.; black, 5s. 6d. to 6s.; Russian black, 5s. to 5s. 6d.; pale, 6s. to 8s. 6d. Turpentine, after opening strong, subsequently became quieter, holders showing, however, increased firmness at the close, quotations being, American spot, 34s. 6d. per cwt.; October-December, 34s. 9d.; January-April, 35s. 4½d. to 35s. 6d. Petroleum firm and again dearer at 5 7/16d. to 5½ per gallon for Russian spot, and for delivery up to end of March. American spot and to end of March, 6⅝d. to 6¾d; water white, 7⅛d. to 8d. per gallon. Petroleum spirit: American, 8d. to 8½d. per gallon; deodorised, 9d. to 9½d.

OPIUM.—The market remains firm, with a continued demand for rich manufacturing kinds, resulting in a fair business at full rates, but many parcels have since been withdrawn. In Soft Shipping descriptions few sales have occurred. Persian has met a good inquiry, but little actual business is reported.

PHENACETINE.—This article appears to be going from bad to worse. The agents for some makers quote 3s. 2d. per lb. While there are also sellers of good makes from second hands at or below this figure, buyers will do well to be careful as to the quality of the article offered at these cheap prices.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate: Crystals, 3¾d.; powder, 3⅞d. per lb., spot London. Iodide, 10s. 6d. per lb. Permanganate, 52s. 6d. and 57s. 6d. per cwt., for small and large crystals respectively in 1-cwt. kegs. Prussiate yellow: Beckton, 7¾d.; other English makes, 8d. per lb.; red, 1s. to 1s. 2d. per lb.

QUICKSILVER—Is unchanged at £8 12s. 6d. from the importer, and 1s. per bottle less from second hand.

QUININE.—The lower prices realised for Bark at Tuesday's London Bark sales have tended to further depress the market for Quinine, and it is now possible to buy the favouite brands of German Sulphate below 1s. per oz. in the speculative market. The makers of these brands have, however, so far made no alteration in their nominal price of 1s. 2d. per oz.

SODA COMPOUNDS.—Crystals are dearer, at 60s. per ton, ex ship London in barrels, and 57s. 6d. per ton in bags. Ash, £5 5s. to £6 5s. per ton, according to percentage, etc. Bicarbonate, commercial, £7 10s. to £8 10s. per ton, and 22s. 6d. to 25s. per cwt. for the fully bicarbonated quality. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic, white, 70 per cent., again rather dearer at £8 15s. per ton, the 60 per cent. costing £1 per ton less money. Hyposulphite (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make, etc. Iodide, 11s. 10d. per lb. Nitrate, £8 per ton on the spot.

SPICES (VARIOUS).—Black Pepper: 10 bags Tellicherry bought in at 6d., and 210 bags Penang at 5½d.; no Singapore offered. White Pepper: 24 bags Singapore partly sold, fine at 9¾d.; of 159 bags Penang 50 sold; good fair white limed at 8½d. Chillies: 70 bags Zanzibar bought in at 38s. to 40s. Capsicums: Of 95 bales Bombay 55 sold; dull red long at 22s. to 22s. 6d.; good bright cherry pods bought in at 29s. Cassia Vera: 12 bales bought in at 26s. Cinnamon: 78 bags chips and quillings bought in at 3d. to 4d. Mace: 35 cases West Indian sold, fair pale at 1s. 7d. to 1s. 8d.; ordinary to fair red at 1s. 4d. to 1s. 6d.; ordinary to good pickings 1s. 1d. to 1s. 3d. Nutmegs: 24 cases Penang bought in, 80's at 1s. 9d., 158's, part shrivelled, at 8d.; 135 packages West Indian sold; 66's at 1s. 11d.; 90's at 1s. 3d. to 1s. 4d.; 95's at 1s. 2d. to 1s. 3d.; 102's to 112's at 1s. 1d. to 10d.; 148's at 7½d. Pimento: Firmly held, of 368 bags only 40 bags sold at full rates; fair at 3¼d. to 3⅜d.

SULPHONAL.—While the two recognised makers of the article still quote 17s. per lb. for both crystals and powders, there are still offers quasi from second hand at 14s. per lb., and even cheaper. It would thus appear that either there are other makers of the article or else that the supply from second hand is inexhaustible. Intending buyers will be able to draw their own conclusions.

TURMERIC—Remains firm, and in fair demand. Bengal is quoted 21s., but no actual business is reported. About 200 bags Madras have been sold, mixed bulby to fine bright finger at 27s. to 30s. Cochin finger is offering at 20s.; split bulbs sold at 8s. 9d. to 9s. 6d., according to quality and quantity. China finger quoted 20s.

THURSDAY'S DRUG SALES.

To-day's Drug Auctions passed off very quietly, a large number of the lots offered being bought in. There are no changes in values of any importance to record.

ACONITE ROOT.—Ten bags good Japan were again taken out at 28s. per cwt.

ALOES.—130 gourds Curaçoa all sold at 30s. per cwt. for livery and 21s. per cwt. for fair ditto. Another lot of 20 boxes realised 22s. to 23s. per cwt. 55 cases Cape practically all bought in at 26s. per cwt. for good bright hard, a few lots of inferior drossy selling at 19s. 6d. to 20s. Other 27 cases part sold at 23s. 6d. for fair bright.

ASSAFOETIDA.—90 cases consisting of common sandy black stuff offered without reserve sold at 13s. to 15s. per cwt.

BALSAM COPAIBÆ.—Five casks pale were bought in at 1s. 6½d. per lb.

BALSAM PERU.—5 cases good blank were bought in at 7s. 9d. per lb.

BALSAM TOLU.—10 cases were taken out at 1s. 4d. per lb.

BITTER ALMONDS.—13 bags offered as such, but which were really apricot kernels, were bought in at 50s. per cwt.

CANELLA ALBA.—Six bales of good quality sold readily at 35s. per cwt.

CANTHARIDES.—4 casks Russian were bought in at 2s. per lb.

CARDAMOMS.—5 cases Ceylon Mysores sold at 1s. 5d. per lb. for inferior, up to 2s. 2d. to 2s. 9d. per lb. for fair to good; 37 cases all bought in up to 3s. 2d. per lb., seeds being taken out at 2s. 4d. per lb.

CASTOR OIL.—40 cases fair Calcutta firsts were taken out at 4¼d. per lb.

CINCHONA BARK.—10 packages crown and grey were bought in, 10d. per lb. being price required.

COCCULUS INDICUS.—65 bags were taken out at 9s. per cwt.

COD LIVER OIL.—69 casks not very clear Norwegian oil part sold, without reserve, at 49s. to 50s. per barrel.

COLOCYNTH.—10 cases good Turkey were bought in at 1s. 9d. per lb. 1s. 8d. per lb. would, however, have been accepted.

CALUMBA ROOT.—50 bags washed pickings were taken out at 21s. per cwt.

CROTON SEEDS.—3 robbins bought in at 65s. per cwt.

CUMMIN SEED.—17 packages new crop Morocco taken out at 30s. per cwt.

DILL SEED.—33 bags were bought in at 12s. per cwt.

DRAGON'S BLOOD.—5 cases of only fair quality were bought in at £11 per cwt., 8 cases good bright, part rather sandy, selling at £12 12s. 6d. to £12 15s. per cwt., down to £5 15s. for low inferior quality. 2 cases reeds bought in at £12 per cwt. 38 cases of inferior quality were bought in at 85s. per cwt.

EGG ALBUMIN.—12 cases were bought in at 1s. 7d. to 1s. 9d. per lb.

ELATERIUM.—1 tin English offered without reserve sold at 10d. per oz.

ERGOT OF RYE.—Good sound Russian was held for 2s. per lb., ditto, but weevily, for 1s. 9d. per lb.

ESSENTIAL OILS.—2 packages West Indian lime oil of good quality sold at 3s. per lb., another case being bought in at 3s. 6d. per lb. 1 bottle Bourbon Geranium Oil bought in at 1s. per oz., 5 cases Cinnamon at 2d. per oz., 7 cases Pimento at 9s. per lb. (a bid of 7s. per lb. being declined), 25 cases good Cajeputa at 3s. 3d. per bottle, other 50 cases being bought in at 2s. 9d. 3 cases D. & O.'s Oil Winter Green taken out at 6s. per lb., 10 cases Wayne County Oil of Peppermint at 4s. 6d. per lb. 1 case Oil of Fennel sold without reserve at 11d. per lb. Fair commercial Oil of Eucalyptus was held for 11d. to 1s. per lb.

GAMBOGE.—10 cases, offered without reserve, sold at £8 2s. 6d. to £8 5s. for fair pipe, medium ditto only realising £6 15s. per cwt.

GUAZA (HERBA CANNABIS INDICA).—76 robbins all bought in at 4d. per lb for good tops.

GUM AMMONIACUM.—26 cases, all bought in at 20s. to 35s. per cwt., according to quality.

GUM ARABIC.—5 cases grain taken out at £6 12s. 6d. per cwt. 10 serons fair Turkey sorts at 80s.

GUM BENZOIN.—45 cases Sumatra were bought in at £5 10s. to £8 5s. per cwt., according to quality, 51 cases inferior Siam at £9, 11 cases medium ditto at £12 per cwt., 10 cases good quality ditto at £18 per cwt.

GUM EUPHORBIUM.—12 serons fair pale sold without reserve at 11s. 3d. to 11s. 6d. per cwt.

GUM GUAIACUM.—29 cases bought in at 2s. for good quality, 1s. 6d. being declined for same.

GUM KINO.—2 cases rosy Cochin were taken out at 3s. per lb., 3 cases rough at 2s. per lb.

GUM MASTIC.—2 cases were bought in at 1s. 6d. per lb.

GUM MYRRH.—4 barrels dark bought in at 55s. per cwt; another lot of 8 casks and 9 bales at 80s. to 100s. for fair to good pale sorts.

GUM SANDRAC.—17 casks bought in at 52s. 6d. per cwt.

HONEY.—74 packages Jamaica chiefly bought in at 22s. per cwt., a few lots selling at 21s. 6d. to 22s. 6d. 45 barrels ditto part sold at 20s. to 23s. 6d. per cwt. 31 cases good West Indian all sold at 22s. to 24s. 20 cases Honolulu realised 25s. per cwt.

IODIDE OF POTASSIUM.—5 cases each containing ten 10-lb. bottles of Japanese manufacture all sold at 9s. 4d. per lb.

IPECACUANHA—Fair to good Rio was bought in at 15s. per lb., and picked at 16s. 1 bale Carthagena sold at 9s. 9d. per lb.; another lot of 4 bags Carthagena all sold at 9s. 9d. per lb. for 1 C.C.D. down to 9s. per lb. for 2 C.C.D.

JALAP.—12 bales fair small heavy tubes were bought in at 7d. per lb.

JAPAN WOOD OIL.—415 cases were taken out at nominally 30s. per cwt.

KAMALA.—Two cases of dark colour offered without reserve sold at 2¾d. per lb.; eleven cases of fair quality held for 6½d. per lb.

LIME JUICE.—2 packages West Indian bought in at 1s. 6d. per gallon.

MATICO LEAVES.—8 bales fair green bought in at 3½d. per lb.

NUX VOMICA.—34 bags bold Cochin part sold at 9s. 6d. per cwt.

ORANGE PEEL.—The lots offered were chiefly bought in, demand being very slow.

ORRIS ROOT.—5 bags Verona fetched 20s. per cwt.

RHATANIA ROOT.—30 bales of fair to good quality were taken out at 4d. to 5d. per lb.

RHUBARB.—25 chests all bought in at 1s. for fair round Canton and 1s. to 1s. 4d. per lb. for fair to good flat ditto. 72 cases part sold at 1s. 4d. to 1s. 6d. per lb. for fair round Shensi, flat ditto being bought in at 1s. 10d. Flat high dried was held for 9½d. to 11d. per lb., round ditto for 10d. per lb.

SARSAPARILLA.—10 bales rough Lima sold at 10d., 7 bales good ditto being held for 1s. 1d. per lb., Jamaica for 1s. to 1s. 2d. per lb. for red, and 10d. per lb. for yellow; other 5 packages part sold at 1s. 1d.; 6 serons fine Honduras were bought in at 1s. 6d. per lb.

SENNA.—128 bales Tinnevelly practically all sold at 2½d. to 6¾d. per lb., according to quality and condition. Other 71 packages also sold readily at about same prices. 19 bales Alexandria realised 2¼d. to 3¾d. for small leaf, down to 2d. for siftings.

SQUILLS.—5 bags sold at 1¼d. per lb.

TAMARINDS.—Fourteen barrels Barbadoes bought in at 10s. per cwt., a bid of 9s. 6d. being declined. Other eight barrels and three kegs sold at 8s. 6d. to 9s. per cwt.

TONQUIN BEANS.—2 barrels foxy Paras were bought in.

VANILLOES.—24 tins Seychelles part sold at 24s. 6d. to 27s. 6d. per lb., and 10s. 6d. per lb. for mouldy.

WAX.—1 package of 141bs. only, Madagascar, sold at 90s. per cwt. Fair Jamaica was bought in at £6 12s. 6d. to £6 17s. 6d. per cwt. 11 cases Italian at £6s 15s. 1 case fair Zanzibar fetched £6 5s.

Newcastle-on-Tyne Chemical Report.

September 13, 1899.

The Tyne-side Chemical Market is still very firm all round. The scarcity of Bleaching Powder is felt owing to stocks having run completely down, and those who hold the article are demanding more money. Caustic Soda and Soda Ash are the turn dearer. Quotations are: Bleaching Powder, £6 to £6 10s.; Soda Crystals, 45s. to 47s. 6d.; Caustic Soda, 70 per cent., £8 to £8 10s.; 77 per cent., £9 to £9 10s.; Soda Ash, 52 per cent., £4 10s. to £4 15s.; Alkali, 52 per cent., £5 5s.; Sulphur, £5.

Manchester Chemical Report.

September 13, 1899.

There is a rather quieter demand for heavy chemicals, but the Board of Trade returns of exports show a fairly satisfactory state of affairs. The imports of chemicals, dye stuffs, and tanning substances show an increase of 15·5 per cent., amounting to £435,478, as against £377,046 corresponding period last year. In the same way, chemicals, and chemical and medicinal preparations show an increase of 14·2 per cent., being £699,437, as against £612,241. Alkali shows an increase in quantity of 15·1, and in value of 10·5 per cent., and in Bleaching materials of 35·2 in quantity, and 23·7 in value respectively. The decline in exports to the States would now appear to have touched "bottom," Alkali showing a slight increase of 2,089 cwts., and Bleaching materials a more substantial one of 20,657 cwts. In miscellaneous chemicals in this district there is a rather better feeling. Brown Acetate appears to be in greater consumptive demand, and may be quoted half-a-crown better. Arsenic is about 5s. to 10s. per ton higher, and is quoted £18 15s. to £19 per ton, ex ship "Garston." Sulphate of Copper has taken a turn for the better, and there are buyers at £23 15s., while sellers are asking £24 to £25, according to brand delivered Manchester. Acetate of Soda varies from £13 10s. to £14. Yellow Prussiate continues to be affected by the state of affairs in the Transvaal, and is easier. Should war break out a big reduction may be looked for in this article. Chlorate of Potash unchanged, bu firm.

Liverpool Market Report.

September 13, 1899.

The general tone of the market continues steady, and, if anything, making for higher rates. Good sales of Honey, both Peruvian and Chilian, have been made at full prices, and an increased inquiry for Arabic Gum exists. Both Carnauba and Beeswaxes have been selling fairly at satisfactory figures. In Oils, higher rates will be noted in Castor, chiefly in Calcutta "seconds" and French 1st pressure, and in Olive, which has increased to at least 10s. or 20s. per tun. Chemicals have been quiet, but prices are unaltered.

AMMONIA SALTS.—Carbonate is steady at 3¼d. to 3½d. per lb. Sal ammoniac, 33s. and 35s. per cent. Sulphate is firm at £12 7s. 6d. per ton.

BEESWAX.—Ten sacks of Chilian went at £6 15s. to £7 2s. 6d. per cwt.

CANARY SEED.—A good demand exists for Turkish at 39s. 6d. to 40s. per 464 lbs.

CARNAUBA WAX.—50 bags of yellow "fair ordinary" made 65s. per cwt. Small sales of grey have been effected at 43s. 6d. per cwt.

COPPERAS—Is very firm at 37s. and 40s. per ton.

COPPER SULPHATE—Is in better inquiry and firmer, £24 per ton.

GUM ARABIC.—The demand for "sorts" is better, and 20 serons have found buyers at 62s. 6d. per cwt.

HONEY.—100 barrels of Peruvian sold for 18s. 9d. to 19s. 6d. per cwt., and 150 barrels of Pile 2 Chilian for 21s. 6d.

LINSEED.—Small quantities of Calcutta, to arrive October-December, sold at 42s. 6d. per 416 lbs. There has been no business in River Plate transacted, and a little North American has been disposed of at 41s. 6d. to 42s. per 424 lbs.

OILS (FIXED) AND SPIRITS.—Castor is improved in demand and is very steady at the following fuller rates: Calcutta, 3d. per lb.; French, 1st pressure, 2⅞d. (15 tons sold earlier in the week for 2¾d. to 2 13/16d. per lb.); 2nd pressure, French and Belgian, 2⅝d. per lb.; 2nd Sulphur, French, 2½d. per lb. Olive Oils are only offering in small amount at 10s. to 20s. per tun advance on last week's prices. Linseed is very firm at 23s. per cwt. for Liverpool makes in export casks. Cottonseed is steady for Liverpool refined oil at 18s. to 18s. 6d. per cwt. Spirits of Turpentine are now steady at 35s. per cwt., after dropping early last week to 34s. 9d.

POTASH SALTS.—Bichromate, 3¼d. to 3⅜d. per lb.; Chlorate, 3⅜d. to 3¾d. Cream of Tartar steady at 75s. to 80s. per cwt. Pearlashes, 30s. per cwt.; Potashes, 21s. to 21s. 3d. per cwt.; Saltpetre, 21s. 9d. per cwt.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton; Borax, £16 to £16 10s. per ton. Caustic is very firm, 76 to 77 per cent., £8 17s. 6d. per ton; 70 per cent., £8. Crystals, £3 per ton. Nitrate is in fair demand at 7s. 6d. to 7s. 9d. per cwt.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—EDWARD PECK, East Dereham.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—HUGHES, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Greenish's Materia Medica, Squire's Companion; latest. Lowest price.—PINCHBECK, 8, St. James's St.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. ROWSELL, 9, Derwent Grove, East Dulwich, London, S.E.

Books on Photography.—Woodbury, Abney, Erasmic Soap, 4d.—WEST, Chemist, Barrow, Lincs.

"Pharm. Journ. and Trans."—Odd volumes and a lot of numbers to complete a set. *Must be cheap.*—GENTIAN, 5, Serle St., London, W.C.

Advertisements.

(Received too late for Classification.)

EVENINGS; three weekly; with Doctor; qualified.—CHEMIST, 1, Willesden Lane, Kilburn.

Marriages.

Holoran—Allison.—On September 11, at St. John's Church, Lowestoft, by the Rev. E. J. M. Davies, of St. Philip's, Norwich, Frank G. Holoran, chemist and druggist, Norwich, to Emmie, youngest daughter of the late John Allison, of Retford.

Goodman—Partridge.—On August 23, at St. Lawrence's Church, Lindridge, by the Rev. R. C. Bolton, vicar of Staunton Long, assisted by the Rev. Harry Clifford, vicar of Lindridge, Frederick W. Goodman, M.P.S., of Eccleshall, Staffordshire, son of the late Thomas Goodman, of Newport Pagnell, Bucks, to Gertrude, daughter of the late C. J. Partridge, of Miles Hope, Tenbury, Worcestershire.

Deaths.

Rowlands.—On September 4, Richard David Rowlands, Chemist and Druggist, Manchester. Aged 60.

Waterall.—On September 7, George Edwards Waterall, Pharmaceutical Chemist, Nottingham. Aged 68. Mr. Waterall had been a member of the Pharmaceutical Society since 1853.

Thompson.—On September 10, John Thompson, Wholesale Druggist, Liverpool. Aged 65.

Whittaker.—On September 11, William Whittaker, Chemist and Druggist, Runcorn. Aged 81.

Partnerships Dissolved.

(From the London Gazette.)

Thomas Hudson and Philip Johnson, Surgeons and General Medical Practitioners, Ingatestone, Essex. Debts will be received and paid by Thomas Hodson.

Annie Stuart and Harriet Thomas, Proprietors of the Medical and Surgical Institute of Trained Nurses, 173, High Street, Oxford Road, Manchester. Debts will be received and paid by Harriet Thomas, who will continue the business.

George Herbert Lewis and J. M. Jones, Mineral Water Manufacturers, etc., South Quay, Worcester. Debts will be paid by George Herbert Lewis, who will continue the business in partnership with Charles L. Smith, under the style of Lewis and Smith.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

Thomas Welch, Wholesale Drysalter, 15, Hill Street, Smethwick, formerly at 252, Halford Lane, Smethwick.

David Patterson, Wine and Spirit Merchant (lately trading as a Chemist), Middle Street, Consett.

Publications Received.

ON THE CINNAMOMUMS OF NEW SOUTH WALES; with a special research on the oil of *C. Oliveri*, Bail. By R. T. BAKER, F.L.S., Curator, Technological Museum, Sydney. Reprinted from the "Proceedings of the Linnean Society of New South Wales." From the Author.

PHARMACEUTISCHE PRAPARATE, DER FARBWERKE VORM. MEISTER LUCIUS AND BRUNING IN HŒCHST-AM-MAIN. Pp. 77. Frankfurt, a.M. Druck von August Osterrieth, 1899. From the Publishers.

THE GROWTH OF MONOPOLY IN ENGLISH INDUSTRY. By HENRY W. MACROSTY. Pp. 15. Price 1d. London: The Fabian Society, 276, Strand, W.C. September, 1899. From the Publishers.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

The annual general meeting of the members of this Society was held in the new rooms, Rutland Institute, Sheffield, on Wednesday evening, and was very well attended. The chair was occupied by the President (Mr. GEORGE SQUIRE), and among others present were Messrs. G. T. W. Newsholme, J. Austen, W. Ward, J. F. Eardley (members of the Council); J. B. Pater (Hon. Sec.), H. Antcliffe, J. W. J. Turner, C. F. Carr, E. C. Exell, F. W. Whitworth, G. H. Meadley, R. Douglas, A. Exell, and T. Cocking.

The Council, in its annual report, had pleasure in being able to announce an increase in the membership of the society, there being now 49 members and 20 associates. The last session was opened by an address by Mr. J. Rymer Young at the Masonic Hall. At the general meetings during the session papers were read by Mr. G. Squire (President) on "Company Pharmacy," and Mr. G. Ellinor on "Patent Medicine Stamp Licence"; and Mr. J. Preston opened a discussion on "The Division of the Minor Examination." There had also been held a smoking concert, a chemists' ball, and a public lecture by Mr. W. L. Howie, of London. A series of interesting papers were being arranged for the coming session. The Council were pleased to announce that they had now made arrangements with the Sheffield University College for a three years' course of instruction for the students of the Sheffield School of Pharmacy. All the classes were being conducted at the College. In consequence of those arrangements the rooms in New Surrey Street had been vacated. The materia medica specimens and the Society's microscopes had been presented to the Univesity College, but arrangements had been made to enable members and associates to continue to have the use of the same. The remaining effects of the Society had been sold. The accounts were very satisfactory, and showed the Society to be in a flourishing condition. The credit balance had increased considerably during the year, and now stood at £8 10s.

The President, in proposing the adoption of the report, said it was the most favourable they had had for some years. The profits on the School of Pharmacy last year amounted to over £4, and he hoped the interest shown by the members would be continued, and that they would have better meetings this year.

Mr. Antcliffe seconded the motion, which was supported by Mr. Ward, and carried.

Six members of the Council retired, and five of them—Messrs. J. Austen, H. E. Ibbitt, G. T. W. Newsholme, S. T. Rhoden, and G. Squire—were re-elected; Mr. C. F. Carr took the place of the other retiring member (Mr. G. Owen); other members of Council are Messrs. J. F. Eardley, A. R. Fox, C. O. Morrison, J. B. Pater, J. Preston, and W. Ward.

It was announced that the annual dinner will be held on October 19, and that Professor Hicks, the Principal of the University College, has consented to give the inaugural address to the students

A meeting of the Council, for the purpose of appointing the officers for the ensuing year, will be held next week.

ENGLISH NEWS.

'A RECORD CRUISE TO NORWAY,' on the S.Y. "Ceylon," is the title of an illustrated booklet published by the Polytechnic, 309, Regent Street, W. Apart from a realistic description of one of the Polytechnic's co-operative and educational holiday tours, the booklet is specially interesting to pharmacists, inasmuch as it has been written by a gentleman connected with the drug trade, Mr. R. C. Wren, of the firm of Messrs. Potter and Clarke, London, and also contains an article by Mr. H. A. Potter, of that firm.

FIRE.—The City Mills, High Street, Stratford, the property of Messrs. Howards and Sons, manufacturing chemists, were the scene of a disastrous fire late on Saturday night, the 16th inst. The cooperage, a building 50ft. square, burst into flames at half-past ten o'clock, and the fire rapidly spread to the stock in the open yard. The West Ham firemen were unable to cope with the mischief, and the men of the Metropolitan Brigade went to their assistance, but in the result the cooperage was entirely destroyed and other serious mischief caused.

THE FREE SALE OF CARBOLIC ACID.—In addition to the six cases of carbolic acid poisoning reported last week, particulars of five other cases are recorded this week at page 304c.

CAUSE OF THE CORONER'S ILLNESS.—Coroner A. Braxton Hicks, who was prevented from holding an inquest last week through indisposition, on resuming duty at Battersea, on Wednesday, the 13th inst., said he wished to offer advice to the public—never to use medicine which they had kept for any length of time. His illness had been caused by taking a dose of stale linctus, in which the morphine had undergone changes.

CHEMICAL LABORATORY FOR MIDDLEWICH.—Mr. F. Bettley Cooke, honorary secretary for the Victoria Technical Schools, Middlewich, has received a communication from Dr. Ludwig Mond expressing his willingness to defray the cost of providing and fitting up a chemical laboratory in connection with that institution. Dr. Mond had already given a substantial sum to the building fund of the schools. The County Council promises lectures, and a number of students are ready to join the classes.

THE EXCUSE OF THE CHEMIST, immortalised by Charles Dickens, that he had left his shop in charge of the errand boy, whose prevailing impression was that Epsom salts meant oxalic acid, has been imitated at High Wycombe. It is stated that one of the witnesses in a case of larceny tried before the High Wycombe Borough Justices on Saturday last was a chemist in the town, who, before he gave evidence, expressed the hope that he would be dealt with quickly, as he had left his shop in charge of a small boy, and he feared that in his absence someone might be poisoned.

MANCHESTER PHARMACEUTICAL ASSOCIATION.—The Council of this Association has decided to hold a dinner on the occasion of the opening meeting of the coming Session on Wednesday, October 11, 1899, at the Mosley Hotel, Manchester. It is hoped that the members of the Association and other members of the craft will join in making this a successful gathering of the chemists of the district.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.—The annual meeting of this Association was held on Tuesday, September 19, at the County Restaurant. The following officers for the coming year were elected:—President, Mr. H. G. Rogerson; Vice-Presidents, Mr. Silson and Mr. Waddington; Treasurer, Mr. Hanson; Secretary, Mr. Mitchell; Council, Messrs. Rimmington, Dunn, Mackay, Wilcock, Moulson, and Pickard.

CRICKET.—On Saturday, September 16, a match was played at Wadham Lodge, between Evans, Lescher and Webb C.C. and "Allenburys" C.C., the scoring being, for the former team: Bradford 2, Kirby 13, Rogerson 3, Young 4, Shiefflwbotham (run out) 0, Nixon 0, Osborne (run out) 7, Raffield 1, Woollard 0, Payne 8, Rose (not out) 9, extras 2; total 49. For "Allenburys": F. C. Hanbury 18, E. A. Collins 11, W. Little 2, J. Norden 15, W. Walton 1, J. Evans (not out) 10, extras 2; total (for 5 wickets) 59. Messrs. S. G. R. Coles, B. Hazel, J. F. Graves, S. Roach, and J. A. Taylor did not bat.

MR. WILLIAM EDGE WHITTAKER, chemist and druggist, whose death, at the age of 81 years, was announced in last week's Journal, was one of Runcorn's oldest and most respected townsmen. In his early days he served an apprenticeship with Mr. Peter Ward, chemist, of that town, and subsequently started in business for himself as a chemist and druggist in High Street, in the premises now occupied by Mr. J. H. Weston, chemist and druggist. Here he made a competency which enabled him to retire into private life. He, however, continued to take an active interest in the affairs of the town, having held numerous public offices from the year 1857 onwards. He was an ardent Volunteer, and a member of the Weaver Trust.

SCOTTISH NEWS.

BOTANICAL EXCURSION.—After the usual fortnightly visit to the Botanic Gardens last Saturday, the students of the West of Scotland College of Pharmacy went out Hyndland way with Mr. Barrie, and a large number of plants were collected.

EDINBURGH DISTRICT CHEMIST'S GOLF CLUB.—The annual autumn holiday prize competition was held at Leven, on Monday, in delightful weather. Ten members competed for a very handsome first prize, presented by Mr. Geo. D. MacKay, the Hon. President, and two other prizes presented by the Club. The Gibson Handicap Medal was also played for. The following were the prize winners:—1. Hon. President's Prize and Gibson Medal, Mr. T. Miller, 106—10 = 96. 2. Mr. A. W. Wilson (scratch), 99. 3. Mr. H. D. Alexander (scratch), 101, and Mr. W. C. Baker, 106—5 = 101 (a tie). Mr. Claude F. Henry had the lowest aggregate score for three competitions during the year, and is therefore the winner of the Gibson Medal and gold charm. After dinner in the Caledonian Hotel, where the prizes were presented by the Captain, the members engaged in friendly matches, while Mr. Wilson and Mr. Scott played off the final tie in the hole and hole tournament. The result was a victory for Mr. Wilson.

IRISH NEWS.

MR. S. D. O'CONNOR, Dublin, has been appointed analyst by the Omagh Guardians at £10 per annum.

MR. ROBERT BARKLIE has been elected by the Newry Union to the position of analyst, at a salary of £15. Sir Chas. Cameron and Mr. R. F. Blake were candidates for the appointment.

THE ROYAL DUBLIN SOCIETY, having proposed an Irish Solar Eclipse Expedition for next year, a committee has been formed, of which Sir Charles Cameron and Professor Tichborne are members.

MR. J. W. W. AGNEW, M.P.S.I., Clifton Street Medical Hall, has sold his branch pharmacy on the Old Park Road, including "the goodwill, stock, etc.," to Mr. Robert Andrew, L.P.S.I., late manager to Messrs. Alex Boyd and Co., Limited, The Pharmacy, Lisburn.

IS WHISKY A MEDICINE?—Properly speaking, it ought to be considered such. The Cookstown Guardians, at any rate, have refused to interfere with the doctor's discretion as to its administration. Absolute control in its prescription could only be guaranteed to medical men by having it included in the 1st Schedule.

SCHOOLS REOPEN.—At the Pharmaceutical Schools of Botany, Materia Medica, and Chemistry, 67, Lower Mount Street, Dublin, the new session begins next month. The Botany and Materia Medica School will reopen on Tuesday evening, October 3, and the Chemistry School on Wednesday evening, October 4.

CARBOLIC ACID FOR WHISKY.—Arthur Lenagh, the farmer who drank a quantity of carbolic acid out of a bottle handed him in mistake for whisky by a neighbour, named Nugent, as reported last week, has since died at his residence, Rathcarberry, county Armagh. This makes the second victim of the blunder, a farmer, named Lawrence McShame, who also partook of the contents of the bottle, having expired a few hours after the occurrence. Nugent was arrested, but is now out on bail, as the affair was a pure misadventure. He had two bottles in his pocket at the time, one containing whisky and the other the poison.

FOREIGN NEWS.

THE CITY OF PARIS, which recently opened at Berck-sur-Mer a hospital for children of the poor containing 750 beds, and which is erecting on an elevation at Angicourt, in the Oise, a consumption hospital, has just opened a sanatorium at Hendaye intended for the children of the working classes and for young Parisian employés. This last-mentioned building is situate at three kilometres from Hendaye, by the sea, at the foot of the two great rocks known as the Jumeaux, which guard the mouth of the Bidassoa, in a sort of basin, where the salubrious air of the open sea reaches the inhabitants, who are sheltered, however, from various winds. Monsieur Belonet has constructed eight blocks of buildings, four for boys and four for girls, who will be classified further according to age, and it is intended that the education of the young folk shall not be entirely neglected during their stay. The playgrounds are open to the sea. The sanatorium comprises a lazaret of twenty-six beds, where the little invalids are received and kept under medical observation for a time, and an infirmary of seventeen beds, while there are 200 beds available for the convalescents.

DREYFUS'S HEALTH.—Dr. Pozzi, the eminent physician, of 10, Place Vendôme, Paris, who saw Dreyfus daily at Rennes, says he cannot possibly live more than a few months. His condition is hopeless. Milk is the only form of nourishment his stomach can take, and during the whole of the trial he never took more than two quarts a day. The *Figaro* says it is the only point upon which the Government is likely to intervene in the case. Considering the strain which his system has been called upon to undergo it is not at all strange that he has become a wreck, irrespective of the malady from which he suffers, which latter his recent hardships have only tended to accentuate and hasten the crisis.

HORRIBLE CRIME.—The body of a man found lying in the street at Monthauban, the upper half in a sack soaked with blood, and the hands tied across the chest with a boot-lace, has been recognised as that of a pharmacien of Montech, named Veruhes, aged sixty-nine years of age. Robbery is supposed to have been the motive of the crime. The perpetrator or perpetrators of this horrible outrage are still at large.

THE FRENCH ASSOCIATION—TRIBUTE TO JENNER.—The twenty-eighth session of the Congress of the French Association for the Advancement of Science was opened on Thursday, the 14th inst., at Boulogne-sur-Mer, under the presidency of Dr. Brouardel, doyen of the Faculty of Medicine. Monsieur Aigre, Mayor of Boulogne, in welcoming the members, recalled various important dates in the history of the town. It was there that Cæsar and his lieutenants embarked in their galleys to go to the conquest of Great Britain, and the subsoil of each of their houses was the burial place of a trierarch of the *Classis Britannica*. Godefroy de Bouillon and Sainte-Ide, his mother, who personified the melancholy and sombre poetry of the Middle Ages, were born there. Boulogne had fêted Francis I. on his return from the Field of the Cloth of Gold, and Louis XIV. after the peace of Nimegna; and it was under its walls that Napoleon, while fitting out a second *Classis Britannica*, made the first distribution of the Cross of the Legion of Honour. To the list of celebrated visits made to the town the Mayor, in conclusion, added that of Thursday, made by "Science, the great power of the century, the power whose splendour illumines and dazzles everything and everybody." Dr. Brouardel thanked the townspeople of Boulogne, through their Mayor, for the welcome accorded to the Congress. Every scientific conquest (he continued) assured to the whole of the human race a larger part of material well-being, and, what was still better, it enlarged the field of their intellectual domain, it prepared for the future other discoveries, of which the coming generations would reap the benefit, as they had profited by those of their predecessors. Coming to the discussion of special science he placed hygiene in the front rank. Foremost among other names stood that of Jenner, who discovered vaccine, not as the result of a happy accident, but after observations which lasted several years. But if the date when Jenner inserted several drops of cow-pox into the arm of young James Phipps was one of the greatest of science, they might say that it was only from Pasteur that the present hygiene dated. Referring to the advance made by hygienic science and its success in the treatment of disease, Dr.

Brouardel took typhoid fever as an example. If they compared the statistics of the Minister of the Interior for two periods, 1886-90 and 1891-96, they would see that for the whole of France the mortality caused by this scourge had fallen from five to three per 10,000 inhabitants. What was the cause of this progress? In the first place the improvements effected by a certain number of municipalities in the supply of drinking water, and the fact that it was beginning to be realised by everyone that it was dangerous to drink foul water. The campaign which the hygienic commission, aided by the Press, had carried on for fifteen years, had not, therefore, been without result. They proposed now to shift the struggle to another field of battle. The new enemy, which killed in France 150,000 persons annually, was tuberculosis. Here were the proportions for Europe. If they took England as being affected on the basis of 1, Germany was on the basis of 2, France 3, and Russia 4. It was a Frenchman, one of the learned professors of Val-de-Grâce, Villemin, who in 1885 showed the contagious nature of tuberculosis, and fixed its laws. By an observance of hygienic laws tuberculosis might often be prevented. They knew that it was curable, they knew the laws of its development. France came last on the birth-list of nations. Her population did not increase; she scarcely remained stationary. Her annual mortality was greater than that of the surrounding nations. They might at least assure the life of those who were born. If they could, they must.

Pharmacien and Cycling Mishap.—It will not surprise those who are accustomed to the ways of the Parisian bicyclist to know that a day or two ago a gentleman crossing the Boulevard Sebastopol was knocked down by a bicycle and so seriously injured that, after receiving a temporary bandaging up at a pharmacy near at hand, he had to be taken to a hospital. The only redeeming feature about the accident in some people's minds will be the fact that the bicyclist himself (a chemist's assistant) had an arm broken. Once upon a time the Parisian Jehu was the terror of all pedestrians, particularly those who were not very nimble on their pins. To-day he has been taught better manners, and does not run over you as a matter of course. But he seems to have handed over his erstwhile prerogative to a percentage of bicyclists, who, if they do not frighten the pedestrians by their wild career, scare the life out of them by the awful bellow of their foghorns. It would be foolish, of course, to pretend that all bicyclists and auto-motor drivers are tarred with the same brush. There are plenty of them who recognise the right of foot passengers to cross the road. But there are others who do not, and the result of their wanton negligence is invariably pain and inconvenience to their poor victim, and no end of fee-less bother to the pharmacien who is called upon to render his best services, not that the latter is inhuman enough to decline to act the good Samaritan, but his pharmacy is made the dumping-ground for all sorts and conditions of accidents, whereas such should be conveyed to "posts-de-secour, hospitals, and surgeries," which are more abundant and better suited to such cases than are the "too convenient" pharmacies.

Claude Bernard.—A monograph of the illustrious French physiologist, which has just been issued, forms one of the "Masters of Medicine" series, and commences with the following dedication by Sir Michael Foster:—"To the Physiologists of France, both to those who had the happiness to know Claude Bernard in the flesh and to those who, like myself, never saw his face, this little sketch is dedicated in the hope that as he has been to me a father in our common science, so I may be allowed to look upon them as brethren." Bernard, the only son of a small peasant proprietor, was born in 1813 at the village of St. Julien, near to Villefranche-sur-Saône, in which town he received his early education under the Jesuits. As a youth he served in a druggist's shop in Lyons, dabbling with literature while dispensing medicines. With a drama in his pocket and a letter of introduction to Saint-Marc Girardin, he came to Paris in 1834, but the great critic recommended the young man to study medicine, and to make the Muses a secondary consideration. Bernard followed this advice, and five years later was selected to be assistant to Magendie, then the leading physiologist in France. The author devotes considerable space to the condition of physiological science at the time, and then reviews Bernard's studies and discoveries, chief of which were the action of the pancreatic juice and of glycogen, and the physiological action of sugar, especially with regard to the liver. "The discovery of glycogen was Bernard's greatest achievement; next in importance to this, and, indeed, hardly less important than it, was his discovery of the vaso-motor system"—a term, it may be explained, applied to nerves which govern the motions of the blood-vessels. With regard to Bernard's experiments Sir M. Foster states that the marvellous improvements in the treatment of diseases at the close of the present century "had their origin in Bernard's initial experiment on a living animal." Many other of Bernard's discoveries are discussed by the author, who also gives some account of Bernard's numerous works. In later years honours fell thick on the great physiologist. Louis Napoleon invited him to Court, and in 1868 he became one of the "Immortals." Up to the time of his death in 1878 he was "simply worshipped" by his pupils of all countries. Among his intimate friends were Renan, Paul Bert, and Berthelot, the chemist. He also watched with appreciation the great researches made by Pasteur. All Paris mourned his loss, and many orations were made at his public funeral in the draped cathedral of Nôtre-Dame.

Vitriol Outrage upon Englishmen.—An outrageous attack upon Englishmen—which had no connection with the Dreyfus case—was committed upon five passengers who visited Boulogne on the 12th inst., on the s.s. "Conqueror." Four men, employed at the Grosvenor Hotel, London, in company with a Ramsgate resident, named Parsons, had just left the Criterion Restaurant on the Quai Gambetta, where they had dined, when a woman of the working class rushed at them, and having emptied the contents of a can of vitriol over the whole of them ran off at a high speed. She was pursued by gendarmes and overtaken, but she violently resisted capture. Thomas Oliffe, of London, sustained the worst injuries, his face and neck being terribly burned. The five men were treated at the pharmacy of Mr. Parsons, English chemist, at Boulogne, and then returned to England.

Notification of Plague.—According to the *Apotheker Zeitung*, an order has been issued, applicable to the whole of Germany, including bubonic plague among notifiable diseases.

POISONING CASES.

Chlorodyne.—Eliza Atwood, a married woman, 27 years of age, residing with her parents at No. 29, Crown Street, Landport, was admitted to the Landport Hospital on Tuesday, September 19, suffering from the effects of chlorodyne poisoning. It appears she formerly lived at Eastney with her husband, but for some time past has been staying with her parents in Crown Street, in consequence of being in a depressed and run-down condition. She slept with a younger sister, and on going to call the two early the father found her lying on the bed unconscious and breathing heavily. Her sister was not in the room, but on calling her it was found that in consequence of her sister's moaning and groaning a great deal during the night she had gone downstairs and had slept on the sofa. She had no idea that her sister had taken poison, and probably the drug was taken after she had left the room. A doctor was at once summoned, and he promptly administered an emetic, and ordered Mrs. Atwood to be removed to the hospital. She had never threatened to take her life, but had not been in the habit of taking chlorodyne. A labelled wrapper was found in the bedroom which had evidently contained the chlorodyne, and a blue bottle, labelled "Timothy White and Co., Portsmouth, Chlorodyne, Poison," was subsequently found over the garden wall.

Carbolic Acid still keeps up its reputation of being the handiest and most popular poison with those persons who, for the moment, are desirous of escaping from the sorrows and trials of life. This week's newspapers record another crop of suicides and attempted suicides by means of carbolic acid.—At Ashton-under-Lyne, on Monday, Samuel Hall, a collier, aged 62, of Charles Street, before going to work in the morning told his wife he would not be here very long. He returned from his work at 5.30, and soon after his wife saw him raise a bottle of carbolic acid to his lips and drink the contents. He died, despite medical efforts to restore respiration, an hour later.——The day following, Tuesday, the 19th inst., a woman of 60, named Mrs. Brownhill, wife of Mr. Reuben Brownhill, market gardener, Sale, Cheshire, committed suicide by taking a dose of carbolic acid. An emetic was promptly administered, but she died almost immediately.——On the previous Wednesday, William Capon, 82, of private means, of 19, North Denes Road, Yarmouth, died from the effects of carbolic acid poisoning. An

inquest was held on Friday, the 15th inst., and from the evidence of the deceased's wife it appeared that he had been a great sufferer with a very painful bladder disease and severe attacks of general eczema. On Wednesday afternoon he went into a pantry and took a dose of carbolic acid, and although Dr. Moxon did all he could for the deceased, he died three hours later. His sufferings were terrible at times, and it was thought he took the acid to put an end to his pain.—Dr. Moxon stated that deceased probably took nearly four ounces of the acid at a gulp. An ounce of the acid would have been sufficient to cause death. He thought deceased's action was poison, but it was not a poison scheduled under the Pharmacy Act, and intentional. The doctor pointed out that the acid was a fatal anyone was allowed to sell it. So far as the bottle in question was concerned, every protection was taken in armouring the cork with metallic points, but he had seen this poison kept in a ginger-beer bottle. Mrs. Capon said she had put an ordinary cork in a bottle if the armoured cork got broken.—The jury found that deceased died from poisoning by carbolic acid during temporary insanity.—— At Wheatley on Thursday, September 14, Mr. F. E. Nicholson, District Coroner, held an inquiry at the Board School concerning the death of Caroline Warden, 30, wife of Stephen Warden, grocer's assistant, who died early the same morning from carbolic acid poisoning.—Mr. Warden, the husband, 45, Stanhope Street, Wheatley, said that on Wednesday night he and his wife went to bed at 10.50, and deceased then appeared as usual. At two o'clock he awoke, and saw his wife standing at the foot of the bed, with a cup in her hand. Immediately afterwards she fell on to the bed side and collapsed. He gave her some castor oil, which made her vomit, and he also called in several neighbours and a doctor. The doctor used the stomach-pump, but deceased expired twenty minutes after his arrival.—The doctor said that the cup contained carbolic acid, and there was a bottle of the liquid in the house. Deceased was in a consumption, and had been very much depressed.—A verdict of "Suicide whilst temporarily insane" was returned.—— A case of attempted suicide by means of carbolic acid is also recorded. On Saturday night a young man named John Holmes, residing at 3, Law-street, Hoole, returned home shortly after eight o'clock the worse for drink, and sent his son for 3d. worth of carbolic acid, telling him he wanted it for the purpose of killing bugs. The lad went to a chemist's shop, and was followed by his father. The chemist informed the lad that he did not sell less quantities of carbolic acid than 6d. worth made up in a bottle. The lad met his father and told him this, and the father gave another 3d. and sent him back for a 6d. bottle. The father got the bottle from the boy, went home, and proceeding to the backyard started to drink it. His wife seeing the bottle in his hand suspected that he meant to poison himself, and told her next-door neighbour, who knocked the bottle out of his hand before he had time to drink all the contents. Police-sergeant Farnworth received information shortly after, and taking with him a bottle of salad oil he hurried to Holmes' residence and poured the lot over Holmes' throat, and this according to the doctor, saved the man's life. Drs. Williams and Butt were called in, the stomach pump was applied. and everything possible was done for the man, who was in a state of collapse. At one time he was thought to be dead, as his pulse was not perceptible, and it was not until midnight that he showed any signs of recovery. On Tuesday last he was somewhat better, but it was thought that he would not be well enough to be brought before the magistrates for several days.

A CHEMIST'S APPRENTICE AND CHLOROFORM.—On Monday, September 18, at the Birkenhead Police Court, Albert William Jenks, an apprentice to Mr. Fore, chemist and druggist, of Market Square, was charged with attempting to commit suicide. It appears that on Sunday he went to his room and did not appear for tea or supper. Mr. Fore called him shortly after ten at night, and receiving no answer sent for the police. Detective-inspector Parker arrived, burst open the bedroom door, and discovered the prisoner in bed asleep. Under the bed was found a 2-pound bottle of chloroform, of which there was a pungent smell in the room. The bottle had been taken from the shop, and a quantity of the liquid was missing. Prisoner was unconscious, but recovered under the detective's treatment, and was subsequently conveyed to the Borough Hospital, where he thoroughly recovered without the aid of an emetic. The house surgeon was of the opinion that Jenks had merely inhaled the chloroform.—The young man told the Court he had been suffering from neuralgia, and must have become unconscious through inhaling the narcotic. He never intended to commit suicide, and he locked his door because it was customary to do so.—Mr. Fore stated that the prisoner had no friends, but he would look after him in the future. Upon this undertaking Jenks was discharged.

LAUDANUM AND OXALIC ACID mixed were the means by which Bennett Phillips, who up to a few years ago was well known in Oldham as a waterproof manufacturer, tried to kill himself last week, and as a result was brought before the Oldham magistrates on Saturday, the 16th inst., on a charge of attempted suicide.—Evidence given by Police-constable Godbold showed that the prisoner, who had a large business in Derby, and has since had a tobacco shop in Loughborough, came to Oldham on Thursday with the intention of becoming reconciled to his wife, from whom he had been separated four years. In this he did not succeed, and on Friday Godbold found him lying on the ground near his wife's shop in Manchester Street, suffering from the effects of poisoning by laudanum and oxalic acid. Three bottles which had contained the poisons were found in his pockets, and it was evident that he had had a large dose. Godbold administered an emetic, and this having taken effect removed his charge to the Infirmary.—It was stated there was a possibility of the prisoner being taken care of by friends, and the Bench decided to remand him to Strangeways for a week "to enable him to collect his thoughts a little," as the Chairman (Mr. G. B. Taylor) remarked.

THE PURITY OF FOOD AND DRUGS.

SEIDLITZ POWDERS.—Charles Callis, drysalter, Melton, was fined £1 at Melton Mowbray County Petty Sessions for selling seidlitz powders which were not composed of the proper ingredients.—Defendant pleaded that he bought the powders as genuine, and had sold them as such.

SPIRIT OF NITRE.—On Tuesday, August 29, at Swadlincote Petty Sessions, Lucy Staley, grocer, Church Gresley, was summoned for selling four ounces of sweet spirit of nitre utterly devoid of nitrous ether. Captain Sandys, the inspector, recommended retailers to insist upon receiving a warranty when purchasing from wholesale dealers.—Defendant was fined £1.

OLIVE OIL.—At Ashford (Kent), on Tuesday, September 12, William James Friar, grocer, Molash, was charged with selling olive oil, not of the nature, quality, and substance demanded by the purchaser, it being certified to be entirely devoid of olive oil, and to consist wholly of mineral oil.—For the defence, it was stated that the defendant did not keep olive oil in stock, and that the constable who made the purchase was understood to ask for "one flask of oil," which was supplied, and invoiced as such.—The magistrates were of opinion that there was a slight doubt as to what was asked for, and dismissed the case.

COPPER IN VEGETABLES.—Referring to the prosecutions instituted against vendors of preserved vegetables coloured by copper sulphate, the *British Food Journal* states that, while they have served to direct public attention to this most injurious and dangerous form of adulteration, they have had but slight effect in checking the sale of the preparations referred to. Enormous quantities of tinned and bottled peas, beans, and spinach which have been "greened" by treatment with copper salts are placed upon the market, and command a ready sale. This fact might lead to the erroneous supposition that no great harm is done by the sale of products adulterated in this way; but, remarks our contemporary, because a number of cases of violent copper-poisoning are not reported by the Press, it is not to be supposed that there is an absence of injury. Small doses of copper salts induce a variety of gastric and intestinal troubles which are liable to be put down to all sorts of causes other than the true one. The continued use of coppered vegetables must also in many cases lead to permanent injury; and it is, in fact, the slow and insidious character of "small-dose" metal-poisoning which constitutes its greatest danger. The public cannot be too strongly warned against the consumption of tinned and bottled vegetables which are offered for sale without a sufficient guarantee that they are free from compounds of copper.

Copper in Peas.—At the Spelthorne Petty Sessions, held at Staines, on Tuesday, September 12, Messrs. Petty, Wood and Co., wholesale grocers, of 41 to 57, Southwark Bridge Road, were summoned, under the 27th section of the Food and Drugs Act, for having unlawfully given to Messrs. Budgen and Co., Limited, grocers, of Staines, a label with a certain article of food, green peas, which was sold by Messrs. Budgen and Co., the said label falsely describing such article of food.—Mr. Blanchard Wontner defended. Some few weeks ago proceedings were instituted in the same Court against Messrs. Budgen for selling preserved peas which were coloured with copper sulphate to the extent of 2·4 grains per pound (see *ante*, p. 168*a*). The firm was convicted, and notice of appeal was given. The present proceedings were taken against Messrs. Petty, Wood, and Co. in consequence of the conviction of the Staines firm.—Mr. Wontner urged that proceedings had been taken under the wrong Section, and asked the Magistrates not to convict.—Inspector Tyler, who conducted the case for the prosecution, contended that the Section under which proceedings had been taken was the only Section which gave the County authority power to proceed against Messrs. Petty, Wood, and Co. If a conviction were not obtained in such a case, the real offenders would get off scot free, inasmuch as the goods in question were sealed goods, and were sold by Messrs. Budgen in exactly the same condition as received from the present defendant Company.—The Chairman (Mr. John Ashby) said that the Bench had very carefully considered the legal points, and the majority of them had come to the conclusion that the proceedings had been taken under the wrong Section, and that the case must, therefore, be dismissed.—Inspector Tyler asked the Magistrates to state a case.—The Clerk (Mr. A. Engall) said that there was no question of law involved.—The Chairman suggested that it was for the County Council to apply to a superior Court for a mandamus compelling the Magistrates to hear the case under this particular Section. He hoped that they would do so and be successful.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. T. B. Bamford, chemist and druggist, has opened the Talbot Pharmacy, Station Street, Port Talbot, South Wales, the fittings being supplied by Messrs. Ayrton and Saunders, of Liverpool.

Mr. C. E. Sage, M.P.S., 8, Fisher Street, Red Lion Square, London, W.C., who was poisoned the first week in August, when at work on a post-mortem examination, asks us to announce that he has not yet recovered his health, consequently the doctor will not allow him to return to his business, which, in the meantime, has been brought almost to a standstill.

Messrs. Fletcher, Fletcher and Co., manufacturing chemists, Holloway, London, N., have decided to register their firm as a private limited liability company. This step is only a formal one, and will not entail any change in the conduct of the business, and there will be no share capital offered for subscription.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

Joseph Gibbs and Sydney Gibbs (trading as Gibbs and Son), Chemists and Druggists, Terminus Road, Eastbourne. Debts will be received and paid by Sydney Gibbs, who will continue the business under the same style.

Peter Leigh and Sarah Hutchinson (trading as Leigh and Co.), Patent Medicine Vendors, etc., 9, School Road, Sale, and 131, Northenden Road, Sale Moor, Chester.

Ernest H. Aves, Chemist and Druggist, Low Moor Road, East Kirkby, Notts.

Henry Seagrave, Photographic Artist, etc., 64, Powis Street, Woolwich, 28, Plumstead Road, Plumstead, and 21, Pier Road, Erith.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

September 21, 1899.

Business has been somewhat quiet during the past few days, while the alterations in price have not been important. Quinine, after a further slump, has taken a slight turn in an upward direction, and it would look as if a further improvement was not impossible. It is a noteworthy fact that the article as momentarily stands is at just exactly the half of about the highest price touched during the late excitement. Opium is very firm, and slightly dearer. Morphine very firm. Codeine dearer. Glycerin is also somewhat dearer. Sulphate of Ammonia slightly lower. Camphor steady, as also are Bromides, while as regards Iodine and Iodides buyers are somewhat doubtful as to the future of the market in view of the threatened Japan competition. Pilocarpine very firm. Acid Citric quiet and dull. Quicksilver and Mercurials firm. Menthol tending upwards. Bismuth Salts unchanged. Cod liver oil quiet. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE—Continues very weak, sales being pressed almost *à tout prix* down to 9½d. per lb. for larger quantity.

ACID BORACIC—Unchanged, at 25s. per cwt. for crystals and 27s. per cwt. for powder.

ACID CARBOLIC—Firm at 7d. per lb. for best make of 35-36°C. ice crystal in large bulk packing; 7½d. per lb. for 39-40°C. ice crystal, and 8½d. per lb. for the B.P. quality (39-40°C.) in detached crystals. Crude rather dearer at 2s. 1d. per gallon for the 60°F., and 2s. 7½d. per gallon for the 75°F.; liquid 95-98 per cent. of pale straw colour, 1s. 6d. to 1s. 4d. per gallon in 40-gallon casks; ditto dark, in colour, 10d. to 11d. per gallon.

ACID CITRIC—Dull and weak at 1s. 5½d. to 1s. 6d. per lb. for crystals in 5 cwt. casks.

ACID OXALIC—Is still quoted 3d. to 3¼d. per lb. nett, delivered free, London.

ACID TARTARIC.—Unchanged at 1s. 1d. per lb. for English on the spot, and 1s. 0¼d. per lb. c.i.f. for foreign.

AMMONIA COMPOUNDS.—Bromide steady and unchanged at 2s. 2d. per lb.; Carbonate, 3d. to 4d. per lb., according to make, quantity, and packing. Muriate, commercial, free from metals, 27s. 6d. per cwt.; ditto, chemically pure, small crystals, 30s. to 32s. 6d. per cwt. Iodide, 13s. 7d. per lb. Sal Ammoniac: First, 35s. per cwt.; seconds, 33s.; ditto crushed for batteries, 2s. per cwt. more. Sulphate steady at rather lower quotations—viz., gray, prompt, 24s. per cent., London, £11 17s. 6d. per ton; Hull, £11 15s.; Leith, prompt, £11 15s. to £11 16s. 3d.; Beckton, October-March, £11 12s. 6d.; Beckton, terms prompt, £11 12s. 6d. Sulphocyanide, 1s. to 1s. 2d. per lb., according to quantity, etc.

ASHES.—Pots 22s. 9d., Pearls 32s.

ANTIMONY.—Regulus is steady and unchanged at £39 to £40 per ton, and Crude Japan (black Sulphide), £24 to £24 10s. per ton.

ANTIPYRINE and **PHENAZONE**—Continue in fair demand at steady, unchanged prices.

ATROPINE—Remains firm at 15s. 6d. per oz. for the Sulphate B.P. and 17s. 10d. per oz. for the pure Alkaloid.

BISMUTH—Unchanged, at 5s. per lb. for the commercial quality of the metal, 5s. 1d. per lb. for the subnitrate, and 5s. 8d. per lb. for the subcarbonate.

BLEACHING POWDER (CHLORINATED LIME).—Steady at the late advance to £6 10s. for English makes.

BORAX—Steady and unchanged at 16s. per cwt. for crystals and 16s. 6d. per cwt. for powder.

BROMIDES—Are firm at unchanged, prices being:—Potassii Bromid. 1s. 10½d. per lb., Sodii Bromid. 2s. 1½d. per lb., Ammon.

Bromide 2s. 2d. per lb., Bromine 2s. 2d. to 2s. 3d. per lb., according to quantity, in 60lb. cases.

CAMPHOR.—Crude is unchanged at nominally very high prices, there being, however, practically no business passing. Refined is firm at English makers' prices of 1s. 8d. per lb. for Bells and Flowers, tablets being quoted in proportion, according to size.

CASCARA SAGRADA.—Old bark has been sold this week at 30s. per cwt.; while new bark is offering at 5s. per cwt. less money. This is rather a disappointment to holders, who have been keeping their bark back in anticipation of high prices.

CLOVES.—Privately Zanzibar continue very quiet, at barely steady prices. Small sales made include January-March delivery at 3 5/16d. At auction no Zanzibar were offered. Of 64 cases picked Penang only 8 cases sold, fair bright at 6¾d.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 2d. per gallon; pure, 2s. Benzole: 50 per cent., 10d. to 10½d. per gallon; 90 per cent., 8½d. to 9d. Creosote: 3½d. per gallon. Crude Naphtha: 30 per cent. at 120°C., 4d. per gallon; solvent naphtha, 95 per cent. at 160°C., 1s. 5d. per gallon; 90 per cent. at 160°C., 1s. 2d.; 90 per cent. at 190°C., 1s. 1d. per gallon. Anthracene: A., 4d. per unit; B., 3d. per unit. Pitch: 35s. per ton f.o.b. Tar: Refined, 14s. 6d. per barrel; 3d. per gallon; crude, 13s. per barrel; 2½d. per gallon.

COCAINE.—Makers are very firm at the advanced price of 18s. for the Hydrochlorate, it being more than hinted that a further advance of several shillings per oz. has been practically decided upon. From second-hand it is possible to buy in limited quantity at 17s. per lb.

CODEINE—Has been advanced to 12s. 11d. per oz. for large contracts and 13s. 4d. per oz. for smaller quantity. There is a good demand and market closes very firm.

COD LIVER OIL—Remains very quiet, price being nominally 58s. to 62s. 6d. per barrel, according to brand, for best new, non-congealing Norwegian oil in tin-lined barrels of 25 gallons.

CREAM OF TARTAR.—Quiet at 74s. 6d. for first white crystals on the spot, and 77s. per cwt. for powder.

ESERINE (PHYSOSTIGMINE)—Continues firm at the advance to 2s. 3d. per gramme for the Sulphate and Salicylate Salts.

ESSENTIAL OILS—Continue exceedingly quiet, the business passing having been practically nil, while prices remain nominally unchanged.

GALLS.—The market is steady, and unchanged. No business in China is reported. Usual shape on the spot quoted 59s., and for arrival 58s., with plum shaped at 62s. c.f. and i. Persian Blues have met a fair inquiry, with sales at full values, and small sales of Greens at 57s. 6d. No White offering; supply exhausted. Smyrna are in little request, but there is little to be had.

GINGER.—The small supplies of Cochin were mostly bought in; of 221 cases and 378 bags offered only 78 packages sold, native cut, fine bold, scraped, at 77s.; small and medium ditto at 32s.; Calicut, rough, small, and shrivelled at 21s.; small shrivelled pickings at 15s. 6d.; washed, rough, fair, bought in at 25s. Jamaica in slow demand, the 79 barrels offered being all bought in.

GLYCERIN.—Crude continues very high in price, in comparison with prices ruling for the refined article, the quality most suitable for refining purposes being quoted £36 to £39 per ton, against £26 to £27, the price ruling not so very long ago. Refined should on this basis, in order to pay the producers even the most moderate profit, be much dearer than present quotations, which are 52s. 6d. to 55s. for English and 54s. to 62s. 6d. for German best white double-distilled, chemically pure, 1,260° quality in tins and cases.

IODIDES—Continue rather unsettled, prices being, however, unchanged, but if the Japanese competition continues and becomes in any way important, it may lead to a reduction in price of Iodine and Iodine preparations on part of the syndicate which now governs the prices of same. Quotations are: Crude Iodine, 7½d. per oz.; Iodine Resublimed, 12s. per lb.; Potassii Iodid., 10s. 6d. per lb.; Sodii Iodid., 11s. 10d. per lb.; Ammon. Iodid., 13s. 10d. per lb.; Iodoform Crystals, Powder, and/or Precipitated, 13s. 10d. per lb.

IPECACUANAHA—Has been quiet this week at nominally 15s. per lb. for Rio and 10s. per lb. for Carthagena.

LITHIA SALTS—Are in good demand at 11s. to 11s. 3d. per lb. for the Carbonate and 7s. to 7s. 6d. per lb. for the Citrate.

MERCURIALS—Are firm at the late advance to 2s. 7d. per lb. for corrosive sublimate and 2s. 11d. per lb. for calomel.

MENTHOL—Is tending upwards. There are buyers of good brands at 7s. 9d. per lb, with but few sellers thereat.

MORPHINE—Is very firm at late advance to 5s. per oz. for the Hydrochlorate Powder in large quantity, the Crystals being quoted 2d. per oz. more. Demand is good, while the rising tendency of the raw drug points to the probability of even higher prices in the near future.

OILS (FIXED) AND SPIRITS.—Linseed dearer: London spot pipes £22, barrels £22 7s. 6d. Rape firm: ordinary brown on spot £23, October-December £23, refined spot £24 5s. Ravison dearer, naked spot £19 15s. Cotton firm: London crude spot £16 10s., November-April £15 5s., refined spot £17 15s. to £19, Hull naked refined spot £16 2s. 6d., crude spot £15. Olive firm: Mogador £33, Spanish £33 to £33 10s. Cocoanut firm: Ceylon on the spot £25, October-December and January-March £23 5s., c.i.f., Cochin spot £29 10s., August-September £26 5s., January-March £26 c.i.f. Palm unchanged: Lagos on the spot quoted £26. Castor Oil firm: Belgian first pressing spot £26 10s., second pressing spot £24, ex wharf; Hull manufactured, guaranteed cold drawn, pure, pharmaceutical, £29 5s. per ton in barrels, 3⅜d. per lb. in cases; pure firsts £26 15s., seconds £25 15s. per ton in barrels, firsts 3⅛d. per lb. in cases, seconds 3d., ex wharf, London. Lubricating Oil: Pale American, spot, 6s. 6d. to 8s.; black, 6s. 3d. to 7s. Russian, black, 5s. 6d.; pale, 7s. to 8s. 6d. Turpentine irregular, closing firm at a slight decline on the day: American spot 36s. 6d., October-December 36s. 6d. to 36s. 10½d., January-April 37s. 4½d. to 37s. 6d. Petroleum firm: Russian spot and to end March 5½d. to 5⅝d. per gallon, American spot and to end March 6⅜d. to 6¾d. Water white 7⅞d. to 8d. per gallon. Petroleum spirit dearer: American 9½d., deodorised 10d. per gallon.

OPIUM.—A good demand continues to prevail for manufacturing and druggists descriptions, and a fair business has been done at full rates, but higher prices are now required. In "soft shipping" only retail sales have occurred at previous rates. Persian has been dealt in to a fair extent at full to rather dearer prices.

PARAFFIN WAX.—Crude 2½d. to 3d. per lb., refined 3d. to 3¾d.

PHENACETINE—Continues weak, with pressure to sell the makes less in favour, which have even been offered as low as 3s. 2d. per lb. Buyers will do well to see that they get a really good article, even if they have to pay rather more money. At present low figure the article should be worth stocking to a moderate extent.

PERMANGANATE OF POTASH.—While some makers have advanced their price others of less repute are still pressing sales at about the late low figure, consequently buyers are confronted with the anomaly of quotations, varying from 50s. to 62s. 6d. per cwt. for small crystals in 1-cwt. kegs (large crystals costing 5s. per cwt. more money). Provided price be reasonable, buyers will find that in the long run it pays them best to only handle reliable makes of this, and, in fact, of any other article.

PILOCARPINE.—Very firm at 30s. per oz. for the Nitrate and Hydrochlorate Salt, it being reported that Jaborandi Leaves showing anything like a fair yield of Pilocarpine are exceedingly scarce and dear.

PITCH.—8s. to 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, 3¾d. and 4d. per lb. respectively for crystals and powder for London spot delivery. Iodide, 10s. 6d. per lb. Permanganate unsettled, quotations verying from 50s. to 60s. per cwt., according to make, for small crystals in the cwt. kegs, and 5s. per cwt. more for large crystals. Prussiate, yellow, Beckton, 7¾d. per lb.; other English makes, 8d. per lb.; red, 1s. to 1s. 2d. per lb., according to quantity, packing, etc.

QUICKSILVER—Firm, at £8 12s. 6d. per bottle from the importer and 6d. per bottle less from second-hand.

QUININE.—After drifting down to 10½d. per oz. sellers for B. & S. and/or Brunswick in the speculative market, things have taken a slight turn for the better, and a considerable business has been done up to 11d. per oz. for December delivery. Taking all the facts of the case into consideration, buyers can hardly do much harm by securing a fair stock at 11d., not forgetting that a few months ago there were eager buyers at more than double this figure. Makers' prices are nominally unchanged, but, of course, they are for the moment quite out of the running.

ROSIN—Steady, at 4s. 6d. per cwt. for strained, ex wharf, on the spot, and 4s. 1½d. to 4s. 2d. per cwt. for September-October and November-December shipment per sailing vessel.

SALICINE—Firm, at the late advance to 12s. 6d. per lb.

SANTONIN—Is firm at late advance to 9s. 6d. per lb. There are, however, still sellers from second-hand at somewhat below this figure.

SHELLAC—Remains very quiet at nominally unchanged prices, there being practically no business to report.

SODA COMPOUNDS.—Crystals are steady at the late advance to 60s. per ton, ex ship Thames in barrels, and 57s. 6d. per ton in bags. Ash £5 5s. to £6 10s. per ton, according to percentage, packing, etc. Bicarbonate, commercial, £7 10s. to £8 10s. per ton; ditto fully bicarbonated 22s. 6d. to 25s. per cwt. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic, white, 70 per cent., £8 15s. per ton; 60 per cent., £7 15s. Hyposulphite (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to quantity, make, and packing. Iodide, 11s. 10d. per lb. Nitrate, commercial, £8 per ton for spot delivery.

SPICES (VARIOUS).—Black Pepper: 80 bags good fair Tellicherry bought in at 6d. White Pepper: 20 bags Singapore bought in, fine, at 10d. Cassia Lignea quiet; of 15 packages China 4 bales broken sold at 28s. 6d. to 31s. 6d.; 13 bales Saigon bought in at 30s. Cassia Vera: 60 bales coarse Padang quill bought in at 33s. Mace: 31 packages Penang chiefly bought in, fair red, part wormy, at 1s. 10d.; 10 cases West Indian sold, fair to good red, at 1s. 5d. to 1s. 8d.; broken pickings at 1s. 3d. Nutmegs: 57 packages West Indian sold, 86's at 1s. 5d. to 1s. 6d.; 99's at 11½d. to 1s.; 110's to 112's at 10d. to 1s.; 118's at 11d.; 146's at 7½d.; wormy and broken at 3d. to 3½d. Pimento firm; of 305 bags offered 195 bags sold, fair to good at 3⅜d. to 3½d.

SULPHATE OF COPPER.—Quiet at £23 12s. 6d. to £24 10s. per ton, according to quantity, picking, and make.

SULPHONAL—Unchanged, as far as makers' price is concerned, at 17s. per lb. for both crystals and powder, while quasi, from second-hand, it is possible to buy at 14s. 6d. per lb.

TAR.—Stockholm 25s. 6d. to 26s., Archangel 18s. to 18s. 6d.

TURMERIC—Continues firm, and higher prices are asked, but only a restricted business has been done. Bengal quoted 24s.; Madras, fine, bright finger, 30s. to 32s. 6d.; Cochin, finger, 22s. 6d.; ditto, split bulbs, 10s.

Liverpool Market Report.

September 20, 1899.

AMMONIA SALTS.—Carbonate is very scarce at 3¼d. to 3½d. per lb. Sal ammoniac, 33s. to 35s. per cwt. Sulphate is dull at £12 2s. 6d. per ton.

CANARYSEED.—Turkish selling at 39s. 6d. to 40s. per 464 lbs.

CHILLIES.—Fine Sierra Leone fruit sold at 60s. per cwt.

COPPER SULPHATE.—Is dearer and closing very firm at £24 10s. per ton.

COPPERAS.—Is firm at 40s. and 37s. 6d. per ton.

GUM.—Arabic sorts have sold at 62s. 6d., 65s. and 70s. per cwt.

LINSEED.—Continues very firm, North American has been sold at 40s. 9d. per 424 lbs. for October-November shipment.

OILS (FIXED) AND SPIRITS.—Castor Oil is selling well with steady inquiry: Calcutta at 3d. per lb., French, 1st pressure, at 2⅞d. per lb., 2nd pressure, French and Belgium, at 2⅝d. Olive Oil is only offering in small amount at very full prices, inquiry is good. Linseed Oil of Liverpool make continues firm at 23s. to 23s. 6d. per cwt. Cottonseed Oil: Liverpool refined is steady at 18s. to 18s. 6d. per cwt. Spirits of Turpentine is dearer and now brings 37s. per cwt.

POTASH SALTS.—Bichromate, 3¼d. to 3½d. per lb.; Chlorate, 3½d. to 3¾d. per lb. Cream of Tartar is in limited demand at recent rates. Prussiate is firm at 8¼d. to 8½d. per lb. Saltpetre, 21s. 9d. per cwt.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton; Borax, £16 to £16 10s.; Caustic, 76 to 77 per cent., £9 5s. to £9 7s. 6d.; 70 per cent., £8 10s. per ton; Crystals, £3 2s. 6d. to £3 5s. per ton; Nitrate, 7s. 6d. to 7s. 9d. per cwt.

Newcastle-on-Tyne Chemical Report.

September 20, 1899.

Good steady business is still experienced on this market at the advanced prices. Bleaching Powder keeps in demand, and as stocks are low quotations forward are firmly made. Soda Crystals for home markets are a better movement. Soda Ash and Caustic Soda are well sought after. Quotations are:—Bleaching Powder, £6 to £6 10s. per ton; Soda Crystals, 45s. to 47s. 6d.; Soda Ash, 52 per cent., £5; Alkali, 52 per cent., £5 5s.; Caustic Soda, 70 per cent., £8 10s.; Sulphur £4 15s. to £5.

Manchester Chemical Report.

September 20, 1899.

It is rarely that the upward trend of the movement in heavy chemicals has been so well maintained. Prices of principal articles may be quoted as follow:—White Caustic Soda, 77 to 78 per cent., £9 15s. to £10; 74 per cent., £9 5s. to £9 10s.; 70 per cent., £8 10s. to £8 15s.; 60 per cent., £7 10s. to £7 15s. Soda Ash, 48 per cent., £4 2s. 6d. to £5. Ammonia Alkali, 58 per cent., £4 2s. 6d. Soda Crystals, £3 per ton, bags, and £3 7s. 6d. per ton, casks, and Bleaching Powder, £5 5s. per ton, soft wood casks, all on rails at works. Crude Glycerin is rather higher. Chlorates of Potash and Soda are firmer, but unchanged in price. Sulphate of Copper has advanced about 10s. per ton on the week—£24 10s. to £25 per ton, best brands, delivered Manchester. Brown Acetate of Lime is steady at £4 17s. 6d. to £5 per ton, Welsh and American, delivered Manchester. White Sugar of Lead dull at £21 10s. to £21 15s. per ton, c.i.f., and Nitrate of Lead, £22. White Powdered Arsenic is rather higher at £18 15s. to £19 per ton, ex ship, Garston. Green Copperas in fair request for Lancashire make at unchanged prices. Yellow Prussiate is scarce at 8d. to 8¼d. per lb., Lancashire make. Tin Salts firm at the advanced prices.

TERMS OF SUBSCRIPTIONS.

The Pharmaceutical Journal circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and the average number of copies circulated weekly exceeds seven thousand.

The annual subscription, commencing at any time and including postage, to any address throughout the world is

£1 0s. 0d.

For the convenience of subscribers the following table of amounts payable in foreign currencies for one year's subscription is given:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway	Kr. 18.20	Greece	Dr. 29.00
Sweden and Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions, which are payable in advance, and Advertisements should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to Street Brothers. Cheques should be crossed "London Joint Stock Bank."

Magnesium Flashlights.—A possibly useful addition to the data governing the composition of these mixtures may be found in a paper recently read before the Paris Academy of Sciences by M. H. le Chatelier, who finds a greater certainty of combustion in mixtures of the nitrate of ammonia class by making a special crystal from a solution containing potassium chlorate and ammonium nitrate. By modifying the temperature of the solution and the proportions of the ingredients, he was able to produce a crystal of definite and constant proportions; it contained 5 per cent. of the chlorate.—*Brit. Journ. Photo.*

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Splendid New English Honey, 12-lbs. for 7/- cash.—Brampton, Sudbury, Suffolk.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—EDWARD PECK, East Dereham.

Skeleton, half, disarticulated, in very good condition: Dental Chair, good condition, wood in metal cylinder, rotates, elevates, inclines, ball and socket head-rest. — C. W., Bank Buildings, Ventnor.

50,000 Choicest Microscopical Objects, bargains. Catalogue free. New and second-hand Microscopes, Cabinets, Mounting Materials, etc. Microscopes and collections purchased.—Richard Suter, 10, Highweek Rd., South Tottenham, Middlesex.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—HUGHES, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Daisies; 7/-. Good Vanilla Pods. Tetlow's Swandown Powder.—Eastman, Forest Lane, Stratford.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. ROWSELL, 9, Derwent Grove, East Dulwich, London, S.E.

Books. Crabbe's "Synonyms," Faraday's "Chemical Manipulation," Mohr and Redwood's "Practical Pharmacy," C. and D. Diary, 1898. State lowest price. Student, 5, Serle St., London, W.C.

Latest Editions: Greenish's "Materia Medica," Squire's "Companion," C. and D. "Art of dispensing," Lucas's "Pharmacy," Southall's "Materia Medica." State lowest prices and condition to Ashkanazy, Dartford.

Marriages.

Brawn—Hewitt.—On Thursday, September 14, at St. Mary's Church, Stone, by the Rev. Canon Murray, Harry S. Brawn, chemist and druggist, of Bedford, to Lilian Agnes Hewitt, niece of Mr. J. J. Hewitt, of Stone Court, Greenhithe, Kent.

Hope—Fairer.—On the 9th ult., at St. Mary's Parish Church, Windermere, by the Rev. Canon Crewdson, M.A. (Vicar), Richard Hope, M.P.S., pharmaceutical chemist (formerly of Westhoughton), to Margaret Fairer (formerly of Kirkby Stephen). No cards. Home address, Sunnyside, Kendal.

Watts—Hardwick.—On the 14th inst., at Christ Church, Attercliffe, by the Rev. A. Payling, Herbert Watts, M.P.S., of Darnall, to Sarah Ann, the youngest daughter of the late Thomas Hardwick, of Attercliffe.

Henderson—Carver.—On September 9, at the Parish Church, Lowestoft, by the Rev. Canon Lawrence, Henry John Henderson, Ph.C., only son of Captain H. J. Henderson, Harbour Master, Lowestoft, to Lois Carver, only daughter of Henry Charles Carver, of Lowestoft.

Deaths.

Shove.—On August 26, Bertha Shove, Pharmaceutical Chemist, Lewisham. Miss Shove had been a member of the Pharmaceutical Society since 1892. She was for some time engaged on some minor investigations in the Pharmaceutical Society's Chemical Research Laboratory.

Lewington.—On September 10, Alexander Belamy Lewington, Chemist and Druggist, Cleveland Street, London, W. Aged 64. Mr. Lewington had been a member of the Pharmaceutical Society since 1873.

Devereux.—On September 11, Frederic Edward Devereux, Chemist and Druggist, late of Walthamstow. Aged 56.

Lester.—On September 11, Theodore Christopher Lester, Chemist and Druggist, Hull. Aged 77.

Rayner.—On September 11, William Rayner, Pharmaceutical Chemist, Sheerness. Aged 66.

Publications Received.

CONSUMPTION CHART AND CASE PAPERS. Bristol: J. Wright and Co., 1899. From the Publishers.

KING'S COLLEGE HOSPITAL REPORTS. Edited by Nestor Tirard, M.D., F.R.C.P., W. Watson Cheyne, F.R.C.S., F.R.S., John Phillips, M.A., M.D., F.R.C.P., W. D. Halliburton, M.D., F.R.S. Vol. iv. (Oct. 1, 1896—September 30, 1897), pp. xxii. + 358. Price 7s. 6d. London: Adlard and Son. 1898. From the Publishers.

THE ROYAL PHOTOGRAPHIC SOCIETY'S EXHIBITION.

The forty-fourth Annual Exhibition of the Royal Photographic Society is now open to the public at the Gallery of the Royal Society of Painters in Water Colours, 5A, Pall Mall East, and will remain open daily until Saturday, November 11. The Exhibition will also be open on Monday, Wednesday, and Saturday evenings. There will be a lantern lecture on each evening. The private view of the Exhibition, which was held on the afternoon of Saturday last, was well attended by members and friends, and the soirée, which marks the commencement of the Society's winter season of work, as well as the opening of the Exhibition, was quite as largely attended as usual. In the absence of the President of the Society, the Earl of Crawford, K.T., F.R.S., who was prevented from attending by illness, the members and guests were received by the officers and most of the Council.

The general aspect of the Exhibition is decidedly pleasing. The pictures and their frames are characterised by the same sombreness of tone which the work of the past few years has rendered us familiar with, but the hangings of the gallery have been somewhat altered. The covering of the walls is of a lighter tone and brighter colour than before, and the dark draperies which divided the walls into sections have not been used. As to the merit of the works shown generally, but one opinion has been expressed: The Exhibition is distinctly in advance of any of its predecessors. We understand that this year the Society departed from its usual system of appointing a large committee, which included the judges, to select the pictures, and entrusted this duty entirely to the small committee who have the arranging of the frames on the wall. This departure has been the subject of a considerable amount of acrimonious writing in the photographic press, but the Exhibition itself bears testimony to the wisdom of the change. The most exacting critic could find hardly a weak spot. Glancing through the list of exhibitors, one cannot help noticing the large number of unfamiliar names; but, considering the general high standard of the work, this is a sign of promise. On the other hand, we do not miss many of the regular contributors. Mr. H. P. Robinson once more sends a work to the scene of his ancient triumphs, and although the list of his contemporaries who are exhibiting at this year's show is not a long one, there are as many as one might expect to find.

The judges of the pictorial work—Mr. Harold Baker, Col. J. Gale, and Messrs. A. Horsley Hinton, B. W. Leader, R.A., and W. L. Wyllie, A.R.A.—awarded eight medals, and the fact that they have been able to place the distinguishing mark of conspicuous merit upon so unusually large a number of pictures is a confirmation of general opinion of the Exhibition.

Comparing this year's Exhibition with those of, say, the last three years, one is first struck with the distinct decline of the "fuzzygraph." The extreme out-of-focus method of treatment is hardly represented at this year's show. The few examples that there are, which have more than the most moderate amount of diffusion of focus, certainly show, too, a greater intelligence in restricting this style of treatment to subjects for which it is suitable. There is much less of the dreary swamp kind of picture, but perhaps this naturally follows, and altogether a greater variety in the subjects chosen. If one might venture to say what is the favourite subject for the year we should say it was sheep, but woodland scenery also comes in for a considerable share of attention. The portraits are very fine, and most of the single figure studies are quite free from the posed appearance which has been too common in photographs of the kind in the past. That class of subject which is generally termed "genre" is but barely represented, and, as an honest chronicler, we must say it is not in advance of what was shown ten or more years ago in the same gallery. The architectural pictures are perhaps not so numerous. In this branch of photography much greater perfection of technical work than that we have been accustomed to can hardly be expected, but there is certainly apparent a desire to infuse more feeling into the bare stones. As this branch of photography is quite as popular as ever it may be that the selection has been more rigid.

The decisions of the judges will probably raise an unusual amount of adverse criticism. This we strongly deprecate. The choice of the judges is entirely at the voice of the members of the Society. There is no standard in art, and all that can be asked of any board of judges is to give their collective opinion. Having given their opinion it should be respected as such.

Referring to the medalled pictures—and the limited space we can devote to this review will prevent us from noticing much else—Dudley Hoyt (of New York) will undoubtedly win golden opinions for his "Head of an Old Man." Here we have a photograph which might almost serve an optician as a specimen of lens definition, but which, nevertheless, possesses a breadth which is seldom attained under similar conditions. It is due entirely to skilful lighting, or, if any adventitious aid has been employed to subdue what was unnecessary, the means are not apparent. J. H. Gash's "Summer Shades" is good, but it is marred by a gritty sharpness which is exceedingly unpleasant. In "The Miller's Workshop" W. J. Greatbach has one of those happy little bits which seem so easy but which really are so difficult. There is not much of the miller's workshop, for a considerable portion of the picture is made up of the view through the open door. The difficulties of the subject have been very skilfully overcome. "After Rain," by Chas. F. Inston, is strikingly reminiscent of his last year's picture. The subject is almost the same, and the style of treatment the same. "In Wirksworth Church," by W. R. Bland, is noticeable for the effect of sunlight through the windows. "Sunny Pastures," by Ernest G. Boon, is not altogether a pleasing work; the general idea is good, but there is a spottiness about it which is very distressing. Much of this might be avoided. J. M. Whitehead's "Roses" is quite as commendable as a specimen of perfect technical photography as for its pictorial qualities, if not more so. However, it is a charming little picture. "A Vignette in Two Colours," by Alfred Stieglitz, is described as being a platinum print, developed locally with various solutions. The subject is the head of a female, with bare shoulders. The head is turned away, so that very little of the face appears. The hair is black, and the flesh is of its natural tint. The effect is charming.

The technical section, which includes photographs of scientific interest or illustrative of photographic methods and also apparatus, strikes us as being more representative than has been the case for the past few years; but, considering the enormous number of the applications of photography to the work of the printing press, examples of photo-mechanical processes seem strangely absent. The judges of the section, Capt. W. de W. Abney, C.B., F.R.S., and Messrs. J. Boles, F.I.C., F.C.S., and Chapman Jones, F.I.C., F.C.S., awarded three medals. One of these was awarded to J. Hort Player for a series of reproductions of engravings, lithographs, ordinary photographic prints, etc., produced by a process now fairly well known as "Playertype." The negatives are obtained by placing a piece of bromide paper with its sensitive surface in contact with the face of the print to be copied. Yellow or green light is then allowed to fall on the back of the bromide paper for a sufficient time, and it is then developed, etc., the result being a paper negative, from which the final prints are made in the usual way. This may seem an incomprehensible method, but nevertheless, the admirable results shown prove the process to be practical and valuable. W. Andrews' photographs of rainbows are interesting, and the Autotype Co.'s illustrations from the supplement to "Electric Movement in Air and Water," by Lord Armstrong, C.B., are admirable. The Kodak Company have a number of enlargements, showing the characteristic effect of enlarging through bolting cloth, which will be studied to advantage by pictorial workers, etc. We must not omit to mention the three examples of interference colour photographs by the Lippman method, the work of Harold Senior.

The apparatus exhibits are necessarily always limited in number, owing to the condition that each exhibit must be novel or show some point of novelty. Two medals have been awarded. One of these is received by J. E. Johnson and Co., of Leicester, for an engraved screen plate for half-tone work. The lines in this are 200 to the inch, and the size of the plate is 13 in. by 16 in. The exhibit includes other plates up to 22 in. by 18 in. in size, the rulings varying from 133 to 200 to the inch. It may be interesting to note that according to the prices given the four plates exhibited are valued at over £274. The second medal is given to E. Sanger Shepherd for a set of 2 in. square trichromatic light filters for natural colour photography. Other exhibitors of apparatus are Messrs. Watson and Son, Messrs. J. H. Dallmeyer, Limited, Messrs. Spratt Brothers, Messrs. G. Houghton and Sons, Messrs. Marion and Co., and Mr. Jas. Cadett.

The catalogue is adorned with twenty-four full-page half-tone reproductions of the pictures besides a large number of outline sketches in the text. It is well worth the price, sixpence, even to those who are not able to visit the Exhibition.

ENGLISH NEWS.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION (Junior Section).—A meeting of this section was held on Tuesday, September 26th. Mr. C. J. Park (member of the Pharmaceutical Council) in the chair. Mr. A. J. Rider (head master of the Devonport High School), in the course of an interesting address, advised the students to conduct their studies in a most thorough and systematic manner, and in regard to practical chemistry, it was most necessary that they should be orderly, methodical and cleanly in their work, and everything should be thoroughly examined and proved; that was one of the faults of the old alchemists, they based too much upon supposition, without at times having the least particle of proof. Pharmaceutical students, he said, are engaged in a work that does not present such advantages perhaps to their eyes as other callings, because of the limited time placed at their disposal for recreation, the bulk of which they were supposed to spend in study, but he was sure the junior members of the Association were possessed of the right professional spirit. Theirs was a work that stood very high in public estimation, and it gave him the greatest pleasure to be amongst them on the present occasion, as he saw around him several old friends whom he had the honour of instructing in chemistry many years ago. Mr. Rider then distributed the prizes to the successful students at the classes during the last sessions, as follow:—Materia medica (Teacher, Mr. Hooper, Ph.C., R.N.): 1st, J. Bryan; 2nd, W. Pickard. Chemistry (Organic and Pharmaceutical) (Teacher, Mr. H. M. Morgan, Ph.C.): 1st, W. W. Hellyer; 2nd, H. Vibert. Pharmacy (Teacher, Mr. Oswald A. Reade, F.L.S., Ph.C.): 1st, H. J. Reynolds; 2nd, J. Bryan. On the motion of Mr. Barge, seconded by Mr. Weary, Mr. Rider was heartily thanked. Mr. Park, in supporting, remarked that they had secured a capital teacher in pharmacy in Mr. H. M. Morgan, who, at great self-sacrifice of his spare time, had consented to instruct the students for the coming session. He urged all the students to avail themselves of those classes in order to show their gratitude to Mr. Morgan. Mr. Rider, in responding, said he would do everything in his power to promote the welfare of the Chemists' Association in the Three Towns. He should be glad if they would allow him to give a prize annually to the student who was most successful in practical chemistry.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.—A meeting of the Council of this Society was held on Tuesday night, for the purpose of electing officers and making arrangements for the ensuing winter session. Mr. G. Squire was re-elected President. Mr. J. B. Pater retired from the office of Hon. Secretary, and was made a Vice-President, along with Mr. J. Austen, the Secretaryship being undertaken by Mr. H. Antcliffe, Union Offices, Westbar, Sheffield. The other officers are as follow:—Treasurer, Mr. J. Preston; Hon. School Secretary, Mr. S. T. Rhoden; Council (in addition to the above officers), Messrs. J. F. Eardley, A. R. Fox, G. T. W. Newsholme, G. Owen, W. Ward, and C. O. Morrison; Auditors, Mr. J. P. Hewitt and Mr. H. E. Ibbitt; Librarian, Mr. C. F. Carr. Mr. Ibbitt has resigned his membership of the Council, and the meeting elected Mr. Antcliffe in his place. The Session will be opened with the annual dinner and inaugural address to the students by Professor Hicks on October 19, and after that it is intended to have monthly gatherings. The syllabus has not yet been fully drawn up, but there has been arranged a smoking concert on November 16; a paper by Mr. J. W. J. Turner on "Fruits, Rare and Interesting," with lantern illustrations, on December 13th; a students' night on January 10th; a paper by the President on February 14th; an open night, conducted by the members, on March 13th; and an excursion into the country in June. Tickets for the annual dinner, which will be held at the Wharncliffe Hotel, at 7.45 p.m., may be obtained from the Hon. Secretary, price 4s. 6d. each.

PUBLIC ANALYSTS AND THEIR ASSISTANTS.—An interesting case is reported in the *Daily Telegraph*, in which the public analyst's responsibilities were prominently brought forward. The report states that at Southwark, before Mr. Slade, Pantaleoni Manzi, an ice-cream merchant, of Bermondsey Street, was summoned by the St. Olave's District Board of Works for selling ice-cream containing injurious organisms.—Mr. Hawker, solicitor to the District Board of Works, appeared in support of the summons, and Mr. H. N. Philcox defended.—Thomas Ashdown, sanitary inspector, stated that he purchased some ice-cream from one of the defendant's men, who was selling it from a barrow in Maze Pond, Bermondsey. The sample was sent to Dr. Stevenson, the public analyst appointed by the District Board of Works, and a certificate had been received signed by that gentleman stating that the ice-cream contained twenty millions of microbe organisms per one cubic centimètre.—Dr. Stevenson, in the course of his evidence, said that the cream had been made from decomposed milk, or the stuff had not been properly frozen. In cross-examination he admitted that the analysis had not been made by him personally, but by his bacteriological assistant.—Mr. Philcox submitted that, after that admission, the summons must fail. The Act distinctly said that the analysis "shall be made" by the public analyst. Dr. Stevenson was the public analyst appointed by this board, and approved by the Local Government Board, and, according to the Act, the public analyst must do the work himself.—Mr. Hawker: I submit that what is done by his assistant is done by him for the purposes of the Act. It is quite impossible for a public analyst—some of whom hold many appointments—to analyse every sample themselves.—Mr. Philcox: A public analyst should not take more appointments than he is able himself to carry out.—Mr. Hawker: I believe it is almost the invariable practice for analysts to have assistance.—Mr. Philcox: But they have no power under the Act to deputise the work.—Dr. Stevenson said that after the results had been arrived at he checked them.—Mr. Philcox: But you did not go over any of the working?—Dr. Stevenson: No; but my assistant is very competent. I looked at the results and signed the certificate.—Mr. Slade: Unless the question had been asked I should have assumed that the analysis was made by Dr. Stevenson.—Mr. Philcox: That is just my point, and a deputy can only be appointed by the Vestry or Board of Works, and sanctioned by the Local Government Board.—Mr. Slade said he would have accepted the certificate without suspicion as the result of an analysis made by Dr. Stevenson himself but for the doctor's admission. He agreed with Mr. Philcox's contention, and dismissed the summons, but without costs.—Mr. Hawker: If I wish later to take the case on that point you will allow me to do so?—Mr. Slade: Certainly.

AN UNFORTUNATE MISTAKE.—An inquest was held at Ryde on Saturday, September 16, relative to the death of Mrs. Alice Reed, aged eighteen. From the evidence it appeared that Mrs. Reed was confined on August 31. She did well until the fifth day, when she was taken worse. Dr. Preston was sent for, and he ordered medicine to be sent from Mr. William Smith, chemist and druggist, Ryde. On Tuesday, September 12, Dr. Preston, who had called almost every day, found her not quite so well, and sent to Mr. Smith's for more medicine. When he called the next day, Wednesday, he was surprised to find his patient much worse. He saw a bottle of medicine on the table, and said, "What have you got there?" and on being told that it was Mrs. Reed's medicine, said, "That is not what I ordered. I am not surprised at her going back now." He wrote out another prescription, which was taken to Mr. Pollard, chemist and druggist, to be made up. Mrs. Reed took two doses of the new medicine, but got worse, and eventually died on Thursday evening, the 14th inst. Earlier in the day Dr. Preston had gone away for his holiday, and left the case in the care of his partner, Mr. Kenneth Ingleby-Mackenzie, surgeon, of Ryde, who gave a certificate attributing death to milk fever and asthenia, but the Registrar refused to act upon it.—In the course of his evidence Mr. Mackenzie stated that two medicines appeared to have been prescribed by Dr. Preston, the first for reducing fever, and the other as a tonic. In repeating the mixture, from some cause or other, which no doubt Mr. Smith would be able to explain, the fever mixture was sent instead of the tonic.—Mr. Wm. Smith, chemist and druggist, High Street, Ryde, stated that on September 5 a prescription was sent to him to be dispensed for Mrs. Reed, Cross Street, Oakfield. A boy waited in the shop and paid for it. The next order he had for Mrs. Reed, of Cross Street, was on September 11, which was "Repeat mixture." That was in Dr. Preston's writing. It was dispensed and sent to the address. On September 8 he had an order from Dr. Preston for Mrs. Reed, of Eastfield. He now thought the two Mrs. Reeds were the same person. When the order was given to him to repeat the medicine it was for Cross Street, Oakfield, and he repeated that for Mrs. Reed, Cross Street, Oakfield. Had the order been given for Mrs. Reed, Eastfield, the right medicine would have been sent.—P.S. Sharpe said Eastfield was Cross Street. Some people also called it High Street.—After further evidence Inspector Coleman said he understood that the

whole dispute was as to who made the mistake as to Cross Street and Eastfield—the dispenser or the doctor. That seemed to be the whole bone of contention.—The Coroner said the misfortune was that there were supposed to be two Mrs. Reeds. Mr. Smith having had the prescription on the 5th repeated it on the 11th, ignoring that of the 8th altogether. The mistake evidently arose from there being two names to the same street, and that not in the knowledge of Mr. Smith, so far as he could make out.—In reply to a question by a juryman, Mr. Smith said he did not know where Eastfield was. He thought it was in Simeon Street.—The jury found that death took place from milk fever, probably accelerated by the mistake in the medicine.

The Free Sale of Carbolic Acid.—Another coroner's jury has expressed the opinion that carbolic acid should be placed on the Schedule of the Pharmacy Act. See page 324*d*.

Presentation.—On Saturday, the 23rd inst., the employees of Messrs. Jewsbury and Brown, of Manchester, presented Mr. Stones (the senior partner), and Mrs. Stones with a silver rose bowl and pedestal, upon the celebration of their silver wedding. The presentation was made by Mr. Abraham Wood, who has been associated with the firm for about sixty-four years. No less than nine of those who took part in the presentation have been on the staff over a quarter of a century. Mr. John Bardsley (the manager), presided over the proceedings, which were also taken part in by Mr. Robert Bardsley and Mr. T. Hayes.

SCOTTISH NEWS.

Death from Drinking Laudanum.—The death is reported of a miner named Patrick Ferrie, aged 28, residing at Chapehall. It appears he was in the habit of drinking laudanum for cramp, and on this occasion he swallowed twopennyworth with fatal effect.

Poisoning by Carbolic Lotion.—Mr. M. D. Martin, who had for some fifteen years acted as Burgh Surveyor of Burntisland, died on Sunday last from the effects of drinking carbolic lotion.

Glasgow Chemists' and Druggists', Assistants', and Apprentices' Association.—A general meeting of this Association will take place in the Masonic Chambers, 100, West Regent Street, on Friday evening, October 6, at 9.15 o'clock, Mr. J. P. Gilmour, President, in the chair. The chief business discussed will be the Association's programme and matters touching the mutual interests of assistants. All assistants and apprentices will be cordially welcomed.

IRISH NEWS.

The Third Annual Dinner of the Pharmaceutical Society of Ireland will be held on Tuesday evening next, October 3, at the Gresham Hotel, Dublin. The President, Mr. R. J. Downes, will act as Chairman.

Candidates for the Council.—Messrs. William Jamison, associate druggist, Belfast, and P. N. White, J.P., M.P.S.I., Castle Street, Sligo, are candidates for election to the Council of the Pharmaceutical Society of Ireland, *vice* Mr. R. Spence, registered druggist, Castleblaney, who does not seek re-election. The former is proposed by Mr. W. Doig, associate druggist, seconded by Mr. W. J. Hardy, M.P.S.I., and the latter is put forward by Mr. Henry Rogers, M.P.S.I., and seconded by Mr. R. J. Downes, President P.S.I. The contest is expected to be keen.

Mr. Patrick Kelly, M.C.P.S.I., intends to propose at the annual meeting, on Monday next, of the Pharmaceutical Society o Ireland, "That it is desirable that a library on a practical basis be established, available to members, associate druggists, and students of schools of botany, materia medica and chemistry, and that books considered necessary for reference be added to the present stock and a printed catalogue of same be provided."

FOREIGN NEWS.

The British Association's Visit to Boulogne.—The following is a full account of the visit of the president and leading members of the British Association to Boulogne last week. The English *savants* and lady associates, who numbered about 400, left Dover at nine o'clock on Thursday morning, from the Admiralty Pier, on board the steamer "Empress," one of the largest and fastest of the Channel service. They were cordially received at the harbour by the President and principal members of the French Association. Under this friendly guidance the British visitors walked along the Esplanade to the Casino, where *déjeuner* was served. The route was guarded by two lines of gendarmes, but they had no difficulty in preserving order, as the only desire of the crowd of spectators was to greet their guests with ringing cheers. After breakfast the visitors were conveyed in the municipal electric tramcars to the ancient Town Hall, in the upper part of the town, where the Mayor of Boulogne and his civic colleagues formally welcomed the strangers. Sir Michael Foster, in briefly responding, said that many of his countrymen visited Boulogne, and they did so for different reasons. But he was sure none of them had ever visited it with more pleasure than those who were now enjoying its graceful hospitality. The reception over, the English scientists paid a visit to several of the sections of the French Association which were in session. In many respects its constitution resembles that of its British prototype, except that instead of ten, there are no fewer than seventeen sections, and also two sub-sections, including navigation, archæology, and medical science, which find no place in the programme of the other body.

The French Association for the Advancement of Science was founded in 1872, just after the Franco-German War. The motive animating its originators was that the disasters of the campaign were in some measure due to neglect of science, which it was accordingly determined to cultivate in a more systematic and organised fashion as one of the patriotic means of restoring the position of the country. The Association, which numbers 4,000 members, is to meet next year in Paris. After their visit to the sections, the British party returned to the Casino, where in the handsome ballroom they were entertained to a banquet provided by the local municipality. The Mayor of Boulogne presided, and the company numbered about 600. The Mayor wore for the first time the decoration of the Legion of Honour, which had that morning been conferred upon him by the President of the Republic. He first proposed the toast of "The Chief Magistrate of France and the Queen of England." The band struck up "God save the Queen," the whole assemblage, French and English, standing, and then, at the call of some of the English visitors, the "Marseillaise" was played and similarly honoured. Monsieur Bayet, the Ministerial delegate, responded in French on behalf of the President of the Republic, to whose qualities he paid an eloquent tribute. Referring to the Queen of England, he said that whenever her Majesty came to France she was received, not only with the respect due to her exalted rank, but also with the sympathy due to her person. He felt, as a director of primary education, that the work of teaching generally, even in elementary schools, was greatly helped by the good work of two such great associations as now fraternised at Boulogne. In the course of some local allusions, he remarked that all present, French and English alike, would recognise how well-deserved was the distinction which the President of the Republic had that day conferred upon the Mayor of Boulogne. Although it had been truly said that science, or, at least, the laws of science, had no country, that did not apply to men of science. Both England and France had reason to be proud of their men of science, many of the most illustrious of whom were so happily assembled together.

The Mayor of Boulogne, speaking in French, heartily welcomed the two great scientific associations, and said that he felt proud that at the dawn of the Twentieth Century the scientific representatives of France and England should honour Boulogne with their presence. Such a reunion of Anglo-Celt and Gaul for the advancement of science must tend in some measure to promote the welfare, moral and material, of all mankind. Sir Michael Foster, in response, said that one characteristic of the English people was the power they had to conceal their feelings. During the visit of the French delegates to Dover on Saturday they tried to keep up that national trait; but they failed, and their feelings got the better of them. Flat as his words might appear to be, they might be

accepted as sincerely expressing gratitude and appreciation for that memorable reception. He expressed the hope that this was not a matter merely between Dover and Boulogne, but also between the French and English peoples. It was noteworthy that Boulogne, which had twice attempted to invade England, should now be invading the world with a new idea of international reunion. It was a common saying that Britannia ruled the waves. Well, Britannia wished the waves to be smooth and quiet on Saturday and Wednesday for the crossing of the French delegation, but the waves refused. France desired the waves to be calm that day for the crossing of the British Association, and they were still, which might perhaps be regarded as a symptom that the empire of the sea had passed to France.

MONSIEUR BROUARDEL, Doyen of the Faculty of Medicine, Paris, speaking in French, said Sir Michael Foster and himself, as the Presidents of the two Associations, were now officially dying, and men who were dying were generally supposed to speak the truth. But Sir Michael had not told the whole truth, inasmuch as he had told them nothing about that section of the British Association which cultivated amiability. After paying a tribute to Lord Lister's antiseptic discoveries, which, he said, had saved thousands of lives, M. Brouardel presented to Sir Michael Foster and to the Mayor of Boulogne a commemorative medal expressly cast as souvenirs of the occasion. After the banquet the company returned by trams to the upper part of the town, where M. Brouardel unveiled a monument erected by subscription to the memory of Ducheune, a native of Boulogne, who was remarkable for his discoveries in the application of electricity to the cure of disease and especially to the restoration of paralysed nerves. Later in the afternoon the Mayor of Boulogne unveiled a *plaque* commemorative of the English poet Campbell. It is a tablet of black marble placed in front of the house in which the poet spent the last year of his life, and bears the following inscription:—

To the celebrated English poet, Thomas Campbell, LL.D., who died in this house, June 15th, 1844.

Dr. Léon Murel, who has recently published a volume in French upon the life and poetical works of James Thompson, author of the "Seasons," delivered, at the request of the Mayor, a eulogium in English of Campbell. He referred to the prominent part which Campbell had taken in founding the London University. A large proportion of the visitors returned to Dover in the evening.

IT IS ANNOUNCED that the French Medical Mission which went to Lisbon for the purpose of demonstrating the efficacy of Dr. Yersin's anti-plague serum, has been completely successful, none of the persons inoculated having succumbed.

POROUS-GLASS has been introduced into Paris. It admits air by fine holes which do not cause a draught and is quite transparent to light, so that its hygienic advantage over ordinary glass is considerable. A French doctor has also brought out a double pane by which the fresh air entering from below passes up between the two sheets of glass and out at the top into the room near the ceiling.

POISONING CASES.

STRYCHNINE.—An extraordinary case of poisoning is reported from Eastbourne. It appears that Dr. John Dick, a medical practitioner, on the 15th inst., supplied a Mrs. Greer with a bottle of medicine. She took a teaspoonful of the medicine, but became so ill after taking it that she sent a message to the doctor stating the fact. He called to see her, and was angry that it should be suggested that the medicine was the cause of the illness. To prove that it was harmless he drank twice of the contents of the bottle of medicine, and shortly afterwards went away. On arriving at his own house he fell against the street door, and on his sister opening the door, exclaimed, "My God, I believe I have been poisoned." He exhibited symptoms of strychnine poisoning, and in spite of every effort to counteract the effects of the poison he died on Sunday the 24th inst.—At the subsequent inquest, Henry Charles Browne, chemist and druggist, gave evidence to the effect that he had analysed a bottle of medicine given him by Dr. Colgate, and found that to each teaspoonful there was three-quarters of a grain of strychnine.—Dr. Henry Colgate stated that he was of opinion that deceased must have mistaken a bottle in his surgery containing a solution of strychnine for an almost identical bottle containing chloroform water. The quantity of strychnine removed from the bottle was sufficient to kill twelve persons.—The jury returned a verdict of "Death from misadventure." It was pointed out that the strychnine bottle did not bear a poison label, and was hardly distinguishable from the chloroform water bottle.

SPIRIT OF SALT.—On Friday, September 15, Ernest Ellis Heath, aged 8, of 13, Thorpe Road, East Ham, went into some new buildings which are in course of erection, and drank a quantity of spirit of salt from a bottle which he thought contained kola. He was carried as quickly as possible to the surgery of Dr. McKetterick, and for some time a fatal result was feared, but eventually the child recovered.

OPIUM.—The danger attending amateur dispensing was fatally illustrated by an inquest held at Matlock Bank on Friday, September 22, respecting the death of the infant son of Harry Dunn, of Chesterfield Road.—The evidence showed that the child had been given a home-made gripe mixture, which contained laudanum, and that when Dr. Marie Goodwin was called in it was insensible, and clearly suffering from opium poisoning. By strenuous efforts the child was partially restored, but notwithstanding the efforts of two doctors it died.—The jury returned a verdict of "Death from misadventure," and hoped it would be a warning.

MORE CARBOLIC ACID CASES.—At Liverpool, on Saturday September 23, Mr. E. A. Gibson, Deputy City Coroner, held an inquest on the body of Charles Samuel Watts (65), a ship's watchman, of Mere Lane.—Evidence was given to the effect that on the previous day he was found lying dead on the floor of his bedroom with a bottle containing a quantity of carbolic acid beside him. It was stated that he was usually of a cheerful disposition, but had lately suffered from pains, which were specially bad in the early part of the week. He had never threatened to commit suicide. It was also shown that in the early part of the day he purchased a quantity of carbolic acid, which he stated was wanted for disinfectant purposes. He was informed that it was a dangerous poison, and he answered that he had had it before, and knew perfectly well what its nature was.—The jury returned a verdict to the effect that the deceased committed suicide whilst suffering from temporary mental derangement.——The same day, at King's Heath, Birmingham, an inquest was held by Mr. E. Docker (Coroner for North Worcestershire), concerning the death of Fanny Marsh (44), the wife of Robert Marsh, jeweller's manager, of Roxbourne, Clarence Road, King's Heath. It appeared that during the last twelve months or more, deceased had been a victim to mental depression. Everything had been done for her that medical aid could advise, and she had recently returned from the seaside apparently very much better, and well on the way to recovery. On Friday, the 22nd inst., she got up at about 2.30, and went for a walk, returning about 5 o'clock, a great deal better than when she left home. A little while afterwards she asked her daughter to go downstairs to fetch her coat, but the daughter smelling carbolic acid on a handkerchief refused to leave her. In a fit of anger deceased drank a quantity of carbolic acid from a bottle she had concealed.—A chemist's assistant stated that he sold deceased two bottles of carbolic acid, which she said she wanted for a friend. Replying to a question by the foreman of the jury, witness said it was not necessary to have a witness to sign for the purchase of carbolic acid, which, though a poison, was not scheduled under the Act.—Dr. H. S. Ware stated that deceased died about 9.15, all attempts to save her being fruitless. From the results of the post-mortem examination he was of the opinion that death had resulted from corrosive poison, and from the smell he should say carbolic acid.—Dr. S. E. Johnson deposed to having attended deceased for mental depression.—The jury returned a verdict of "Suicide whilst temporarily insane." They also expressed their sense of sympathy with the husband, and added that in their opinion, which was endorsed by Dr. Johnson, carbolic acid should be scheduled along with other poisons.——A case of carbolic acid poisoning, which has greatly shocked the inhabitants of Huddersfield, occurred on Monday last. According to newspaper reports, Mr. W. Hirst, the popular honorary secretary of the Huddersfield Cricket and Athletic Club, had not been in very good health for some time, and had been in the habit of taking medicine in the early morning. On Monday he rose apparently for this purpose, but soon afterwards he was found to be suffering from severe pains in the stomach, and though Dr. John Irving and his assistant speedily attended, he died some time later. It subsequently transpired that he had drunk a quantity of carbolic acid.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

Business has been somewhat quiet during past week, partly, no doubt, owing to the close proximity of the end of the month and of the quarter. The general tone in the Drug and Chemical Trade has nevertheless been fairly good, and there appears to be a general expectation that we shall see good business doing during the coming autumn. As regards prices ruling, there are practically no changes to report, and we refer our readers to the following list of prices actually ruling for some of the articles of chief interest. Bank rate remains unchanged at 3½ per cent.

ACETANILIDE—Continues dull and weak at 9½d. to 1s. per lb., according to make and quantity.

ACID CARBOLIC.—Quiet, but very steady at 7d. to 7¼d. per lb., according to make, for the 35-36° ice crystal in large bulk packing, other qualities and packing being quoted in proportion. In Crude a large business has been done, fully 30,000 gallons having been sold, 60° F. at 2s. 1d. per gallon for delivery up to end of June next; 75° F. is quoted 2s. 6½d. to 2s. 7d. per gallon for September delivery. Liquid 95-98 per cent., of pale straw colour, 1s. 3d. per gallon; ditto, dark, 30 per cent., 9d.-10d. per gallon in 40-gallon casks.

ACID CITRIC—Quiet at 1s. 5½d. to 1s. 6½d. per lb. for Crystals in 5 cwt. casks.

ACID OXALIC—Is unchanged.

ACID TARTARIC—Quiet and unchanged.

AMMONIA COMPOUNDS—Are steady at unchanged prices, with the exception of the Sulphate, which is slightly lower and continues somewhat weak.

ASAFETIDA.—A few lots have been cleared this week at full prices, and stock now consists mainly of low qualities.

BROMIDES—Are unchanged.

CAMPHOR—There is a modcrate inquiry for Crude on the spot, and a few hundred piculs China have been sold, closing buyers at 122s. 6d. Japan quoted 132s. Refined is steady at unchanged price, viz., 1s. 7d. per lb. for English Bells and Flowers in ton lots.

CLOVES.—Privately the market for Zanzibar is quiet, but steady, the limited business including October-December delivery at 3 5-32d., and January-March at 3 3/16d. At auction 369 bales Zanzibar offered, of which 267 bales sold, chiefly without reserve, ordinary to good fair at 3d. to 3⅜d. 16 cases Penang bought in at 7½d.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 4d. per gallon; pure, 2s. Benzole: Quiet; 50 per cent., prompt, 10½d. to 11d. per gallon; September-December, 11d.; 90 per cent., prompt, 8½d. to 9d.; October, 9d. Crude Naphtha: Higher. 30 per cent. at 120°C., 5d. per gallon; solvent naphtha, 95 per cent. at 160°C., 1s. 5d. per gallon; 90 per cent. at 160°C., 1s. 3d. per gallon; 90 per cent. at 190°C., 1s. 2d. per gallon. Anthracene: A, 3¾d.; B, 2¾d. per unit. Pitch: 35s. per ton f.o.b. Tar: Crude or refined, 15s. per barrel; 3d. per gallon.

COCAINE.—Market is very firm, the second-hand being no longer free sellers, while makers' prices remain nominally 17s. 7d. per oz. for the Hydrochlorate in 200 oz. lots. They are, however, expected to again advance their price shortly.

CODEINE—Very firm at 13s. to 13s. 6d. per oz. for the pure.

COD LIVER OIL—Is dull at nominally unchanged price.

CREAM OF TARTAR.—There is no change in value to report.

GALLS.—The demand for China continues slow and no business is reported; usual shape on the spot still quoted 59s., and for arrival 57s. c. f. and i. Persian have met more inquiry, and sales of fair extent have been effected at full rates, including Blues at 62s. 6d. to 65s., and Greens at 55s. to 57s. 6d.; Whites, little offering, 52s. 6d. being the quotation. Both Smyrna and Morea meet little demand, and sales are unimportant.

GINGER.—Excessive supplies of Cochin were offered and met only moderate demand. Holders being firm, only small quantities were disposed of. Of 2,340 packages only 74 cases and 257 bags sold, good plump cut tips, heavily limed, at 24s. to 25s.; good cuttings, 17s.; mouldy ditto, 15s. 6d. Bold A cut bought in at 78s. to 78s. 6d., B at 58s. to 60s., medium and small at 40s. to 42s., and small at 33s. 6d. to 35s. Calicut, rough (in cases), fine, bold, and medium, 29s.; ditto (in bags), rather lean at 26s.; medium and small at 21s. to 22s. Jamaica in small supply. Of 22 barrels offered 7 sold, middling to good, at 62s. to 70s. Bengal firm; 87 bags fair bought in at 21s.

GLYCERIN.—Refined is firm at prices given last week, and in view of the continued firmness of the crude, a further advance in price of the refined is considered very probable.

IODIDES.—No change in prices to report.

MERCURIALS—Are firm and without change in price.

MENTHOL—Is dearer, and 8s. 3d. is now the price for good dry white crystals.

MORPHINE—Is firm at 5s. to 5s. 3d. per oz. for the hydrochlorate powder, this being the maker's price.

OILS (FIXED) AND SPIRITS.—Linseed easier. London spot pipes are quoted £21 17s. 6d. per ton; barrels, £22 to £22 2s. 6d.; November-December, £21 10s.; January-April, £21. Hull spot naked, £20 15s.; October-December, £20 2s. 6d.; January-April and May-August, £19 15s. Rape very firm. Ordinary brown spot, £23 10s.; October-December, £23 15s.; January-April, £24 10s. Refined spot, £24 15s. Ravison naked spot and October-December, £20 5s.; January-February, £20 10s. Cotton firm in London, and 12s. 6d. per ton dearer in Hull. London crude spot, £16 10s. to £16 15s.; November-April, £15 15s. per ton. Refined spot, £18 5s. to £19 10s. per ton, according to make. Hull naked refined spot, £16 10s.; November-April, £15 17s. 6d. paid, and £16 now asked. Crude spot, £15 10s.; November-April, £14 12s. 6d. paid. Olive Mogador, £33; Spanish, £33 to £33 10s. Coconut firm. Ceylon spot £25 per ton, landed terms; October-December and January-March, £23 10s. c.i.f. Cochin spot, £29 10s. landed; August-September, £26 10s.; September-November, £26 5s.; JanuaryMarch, £26 per ton c.i.f. Palm Oil: Lagos is still quoted £26 per ton on the spot. Castor Oil quiet. Belgian 1st pressing spot, £26 10s.; 2nd pressing spot, £24 per ton, ex. wharf. Hull manufactured: Guaranteed Cold Drawn Pure Pharmaceutical, £29 per ton in barrels; 3⅜d. per lb. in cases. Pure firsts, £26 10s.; seconds, £25 10s. per ton in barrels; rfists, 3⅛d. per lb. in cases; seconds, 3d., ex. wharf London. Lubricating Oil: Pale American spot, 7s. to 9s.; black, 6s. 3d. to 8s.; Russian black, 5s. 6d.; pale, 7s. to 8s. 6d. Turpentine: The market has been rampant, closing strong at a further advance for all positions. Quotations are: American spot, 37s. 9d. per cwt.; October-December, 37s. 10½d.; January-April (1900), 38s. 4½d.; July-December (1900), 31s. Petroleum Oil very firm. Russian spot quoted 5 11-16d. to 5¾d., and to end of March. American spot, 6 15-16d. to 7d., and to end of March. Water White, 8⅛d. to 8¼d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. per gallon.

OPIUM.—A fair demand has prevailed, chiefly for Salonica descriptions, both for shipping and manufacturing, and a good business has been effected at firm to rather dearer prices. Retail sales of Tokat have been made at full rates, also "druggists'" kinds at previous prices. Persian remains firm at 12s. 6d., but no business has transpired.

PHENACETIN.—Quiet, but fairly steady at the low prices ruling, say 3s. 4½d. to 3s. 6d. per lb. for reliable brands in quantity, for both crystals and powder.

POTASH COMPOUNDS—Are unchanged.

QUICKSILVER—Is unchanged at £8 12s. 6d. per bottle from first hand.

QUININE.—Makers reduced their price to 1s. 1d. per oz. for the favourite German brands (B. and S. and Brunswick) of Sulphate for 1,000-oz. lots in 100-oz. tins, while in the speculative market about 30,000oz. have changed hands at 10⅝d. spot and 10¾d. for December delivery. It is possible that the result of to-day's Bark Sales in Amsterdam, which are not known here at time of going to press, may have some decided influence on the course of the market for Quinine.

SENNA (Alexandrian).—An active demand set in at the end of last week, and good sales have been made of broken leaf and siftings at dearer prices. The former realised 4d. lb., and the latter up to 3d. lb. Fine leaf sold at 8d. lb. and now 9d. is asked. Tinnevelly: a fair demand from second hands has been experienced this week, and some sales have been made at full rates.

SHELLAC—The market remains very quiet, with only a limited business passing, including Second Orange, ex the auctions, at some improvement on the prices established there. Futures continue neglected, and prices nominal. At auction to-day supplies of good extent were catalogued. Second Orange met a fair demand, and fully two-thirds were disposed of, but at a decline of 1s. to 2s. on previous sales' rates, fair TN now being quoted 62s. Garnet was not represented, and Buttons were withdrawn above valuations. A total of 1,064 cases offered, and 479 cases sold. Second Orange: Of 738 cases, 473 cases sold, partly without reserve, fine bright part blocky at 63s., good bright curly free at 61s. to 62s., strong flat reddish at 61s., fair curly reddish at 60s., broken reddish at 59s. to 60s., flat livery slightly matted at 59s., ordinary broken flat liver at 56s. to 57s.; worked, fair to good bright shivered, at 61s. to 62s. 6d. Garnet: 8 cases blocky Rangoon bought in at 60s. Button: 318 cases offered, and 22 cases sold, fair tongue at 75s., fair thirds at 60s., ordinary dark at 44s. to 50s.

SODA COMPOUNDS.—There are no alterations to record.

SPICES (VARIOUS).—Black Pepper: Singapore bought in at 5⅝d. to 5¾d., and Penang at 5⅞d. to 5½d.; 1 bag Ceylon sold at 5¼d. White Pepper: 20 bags Singapore sold at 10½d., and 3 bags Ceylon at 8¼d. to 8¾d.; Penang bought in at 8½d. Chillies: 308 bags Japan bought in, good bright, at 43s., and fair dark red at 37s.; 25 bales Zanzibar sold, fair to good bright, at 33s. 6d. to 38s. Capsicums: 66 packages Bombay sold, fair bright cherries, at 31s., dark red ditto at 28s., fair bright long at 28s. 6d., mixed ditto 26s. Cassia Vera: 59 bags Japan bought in at 26s. Cassia Lignea: Of 349 cases China only 11 sold, without reserve, new selected, at 35s. Cinnamon: Of 213 packages 71 sold, quillings at 5¼d., cuttings at 4d., chips at 2¼d., and bark at 2⅝d. Mace: 9 cases Penang bought in, good bold pale, at 2s. 6d.; 3 cases Bombay sold, thin curly reddish, at 1s. 6d.; 65 packages West Indian sold, fair to good pale, at 1s. 7d. to 1s. 10d.; fair red at 1s. 5d. to 1s. 6d. Nutmegs dull; about 200 packages sold, 62's at 2s. 3d.; 73's at 1s. 10d.; 78's at 1s. 7d.; 81's to 88's at 1s. 5d. to 1s. 6d.; 92's at 1s. 3d. to 1s. 4d.; 97's to 112's at 11d. to 1s. 1d. Pimento: 379 bags offered and 61 sold, ordinary to fair, at 3⅜d. to 3½d., with good small at 3⅝d.

SULPHONAL.—There are still sellers from secondhand at 14s. 6d. per lb. for both powder and crystals. Makers' price remains at 17s. per lb.

THURSDAY'S DRUG SALES.

To-day's drug auctions passed off quietly, and without any very special feature, one of the matters of interest being the brisk demand for Tinnevelly senna, prices realised showing an advance of 2d. per lb. on the better qualities, and of 1d. per lb. on the lower qualities, otherwise many of the lots catalogued were bought in. The following are some of the particulars as far as it has been possible to give same up to time of going to press:—

ACONITE ROOT.—10 bags Japan sold at 28s. per cwt.

ALOES.—7 cases very dark liquid Zanzibar were bought in at 25s. per cwt. 40 kegs good Socotrine held for 75s. Of another lot of 10 kegs good ditto, 5 kegs sold at 75s. 65 cases Cape were chiefly bought in at 26s. 6d. to 27s. per cwt. for good hard bright, not quite so good quality realising 24s. 6d. and inferior soft and part drossy 21s. to 23s. per cwt. 150 boxes Curoçoa sold at 26s. 6d. down to 14s. per cwt. for low quality. 70 boxes fair dark brown livery Barbadoes bought in at 27s. down to 21s. per cwt. for inferior. 8 cases East Indian part sold at 50s. to 52s. 6d. per cwt.

AMBERGRIS.—3 tins part sold at 50s. per oz.

ANISEED.—137 bags of good Spanish were taken out at 27s. 6d. per cwt. 20 bags fair Rupssian, part sold at 20s. per cwt.

ANNATTO SEEDS.—32 bags of rather dull appearance were bought in at 2½d. to 3d. per lb.

ANTIMONY.—Crude Japan was bought in at £24 per ton.

ARECA NUTS.—84 bags, part slightly wormy, were bought in without mention of price.

ARGOL.—7 bags Cape sold at 40s. to 42s. per cwt.

ASPHALT.—78 cases Syrian were taken out at 31s. 6d. per cwt.

BALSAM COPAIBAE.—6 casks thin taken out at 1s. 6d. per lb.

BALSAM PERU.—9 cases part sold at 7s. 6d. per lb.; rest bought in at 7s. 9d.

BIRD LIME.—1 case good Japanese bought in at 1s. 9d. per lb.

BITTER ALMONDS.—13 bags (? Peach Stone Kernels) bought in at 50s. per cwt.

BUCHU LEAVES.—Fair green rounds sold at 7d. to 8d. per lb.; yellow ditto were taken out at 5d. per lb.

CARDAMOMS.—Fair Mysores sold at 3s. 1d. per lb. down to 1s. 6d. per lb. for lower qualities. Fine bold Mysores realised up to 3s. 6d. per lb.

CASTOR OIL.—30 cases good Calcutta firsts, part sold at 3⅝d. per lb., balance taken out at 3⅞d.; seconds realised 3⅛d. per lb.

CHINA SOY.—50 cases bought in at 1s. 5d. per gallon.

CINCHONA BARK.—44 serons crown bark sold at 10d. per lb. for sound down to 7d. per lb. for damaged. 15 bales flat Calisaya part sold at 5¾d. per lb. for 2CCD.

CIVET.—3 horns of good quality taken out at 10s. per oz.

COCA LEAVES.—6 bales Huanoco held for 1s. 6d. per lb.

COCCULUS INDICUS.—65 bags were bought in at 9s. per cwt.

COLOMBO ROOT.—49 bags, rough sorts, sold at 19s. 6d. to 20s. per cwt., the country damaged and second-class sea damaged realising 16s. and 11s. per cwt. respectively.

COLOCYNTH.—Of 7 cases medium Turkey apple, 2 cases had been sold previously at 1s. 6d. per lb, rest being now held for same figure.

CROTON SEEDS.—36 bags dull to rather brighter were held for 40s. to 60s. per cwt.

CUBEBS.—30 bags very dusty sold at 19s. to 19s. 6d. per cwt.

CUTTLE FISH BONE.—20 mats of good quality, but somewhat broken, sold at 3d. per lb.

DRAGON'S BLOOD.—3 cases picked fine bright were bought in at £22 per cwt.

ERGOT OF RYE.—19 bags weevily held for 2s. per lb.

ESSENTIAL OILS.—10 cases China star aniseed were taken out at 5s. 10½d. per lb., other 5 cases of fair quality being held for a higher price, nominally 6s. 4d. per lb. 3 drums citronelle bought in at 1s. 1d. per lb. 5 cases West Indian oil of limes held for 3s. 10d. per lb. 20 cases Japan dementholised oil of peppermint, Kobayashi brand, each case containing 12 × 5lb. tins, were taken out at 3s. 7½d. per lb. 5 cases H.G. Hotckiss held for 5s. 6d. per lb 2 cases Wayne County sold without reserve at 2s. 6d. per lb. 6 cases Oil Lemon, brand Pasquales Cedar, held for 4s. per lb. 1 case Ylang Ylang for 6s. per oz. 1 box Bay oil sold at 6s. 3d. per lb. 13 cases Cinnamon Leaf taken out at 3d. per oz. 17 cases Eucalyptus all bought in at 1s. to 2s. per lb.

GAMBOGE.—Good bright pipe sold at £8 15s. per cwt.; common to fair pickings at £6 12s. 6d. to £6; good ditto at £6 10s. to £6 15s.; Saigon pipe at £5 5s. 6d.

GENTIAN ROOT.—4 bags good dry cut root were held for 15s. per cwt.

GUM AMMONIACUM.—4 cases fair block taken out at 30s. per cwt.

GUAZA.—78 robbins, consisting chiefly of brownish tops, were all bought in at 4d. per lb.

GUM ARABIC.—27 bales held for 75s. per cwt. for fair Turkey sorts, and 60s. per cwt. for hard ditto. 5 cases Australian red gum were bought in at 35s. per cwt. 83 packages part sold at £6 12s. 6d. per cwt. for grains, and 80s. per cwt. for good sorts.

GUM ASAFETIDA.—38 packages were all bought in at 50s. per cwt. for pale sandy broken block and small strong and softish pinky block, and at 60s. per cwt. for heavy block with some loose almondy.

GUM BENJAMIN.—Very medium seconds Sumatra sold at £6 5s. per cwt., fair to good ditto selling at £8 5s. to £9 12s. 6d. 14 cases fair Palembang sold at 62s. 6d. per cwt.

GUM GALBANUM.—15 packages were all bought in, 1s. 1d. per lb. being the price mentioned.

GUM KINO.—3 boxes red Ceylon bought in at 3s. 6d. per lb., and 2 cases black Cochin at 3s.

GUM MASTIC.—19 cases taken out at 1s. 7d. per lb. for fair pale and 1s. 6d. per lb. for not quite so good quality.

GUM MYRRH.—7 bales pea siftings, mixed pale and dark, were held for 40s. per cwt. Other 23 cases, part sold at 18s. for fair pickings and 20s. for dark siftings. Dark sorts were taken out at 45s. per cwt.

GUM SANDRAC.—10 casks bought in at 52s. per cwt.

GUM TRAGACANTH.—Of 8 packages part had been sold previously; rest bought in at £14 15s. per cwt. for fair pale quality.

HONEY.—19 packages fair Jamaica sold at 25s. per cwt., down to 23s. for not so good quality. 70 cases Honolulu bought in at 26s. per cwt., and 5 cases Australian at 30s.

IPECACUANHA.—9 bags fair Carthagena taken out, 11s. per lb. being price required. Of 16 packages Rio, 1 bale sold at 14s. per lb., remainder taken out at 14s. 6d.

KOLA NUTS.—5 bags held for 3d. per lb.

KAMALA.—4 cases of fair quality sold without reserve at 6d. per lb.

LIME JUICE.—5 packages W.I. bought in at 1s. 6d. to 1s. 7d. per gallon; 5 hogsheads concentrated ditto at £14.

LIQUORICE ROOT.—71 bags fair natural cut were held for 15s. per cwt.; 1 bale rough decorticated taken out at 35s. per cwt.

LOOFAHS.—1 bale sold without reserve at ¼d. Of other 13 bales, part had been sold previously and part were held for ⅞d.

MORPHINE.—500 oz. of Smith's and 500 oz. of Wink's hydrochlorate in powder, packed in 100 oz. tins, sold readily at 4s. 7d. per oz. net, one tin fetching 4s. 8d. per oz.; and a single tin only 4s. 6d.

MUSK.—Of 13 tins Tonquin, 2 tins sold at 45s. per oz. for thin skin grey unsightly. Rest bought in at 65s. for thin skin blue, part browned, fairly dry.

NUTMEG PASTE.—2 cases taken out at 3d. per lb.

NUX VOMICA.—17 bags good bright bold were taken out at 8s. 6d. per cwt.

OPIUM.—2 cases Turkey were taken out, a bid of 6s. (!) per lb. not being entertained.

ORANGE PEEL.—17 packages bought in, 5d. to 8d. per lb. being price required for thin cut, and 8d. per lb. for thick cut.

OTTO OF ROSES.—3 vases bought in at 16s. per Turkish oz.

PATCHOULI LEAVES.—5 packages bought in at 3¼d. to 5d. per lb.

QUINCE SEEDS.—1 bag from the Cape, rather wormy, sold at 1s. 2d. per lb.

RHUBARB.—98 cases sold at 7¾d. to 8½d. per lb. for medium to fair high dried. 25 cases Canton were practically all bought in at 9d. to 1s. 1d. per lb., the lower price being the figure which was required for good pickings. Of other 66 cases very poor flat sold at 7¾d. to 8d. per lb., fair round being bought in at 1s. 2d. per lb. Flat Shensi was taken out at 1s. 2d. to 1s. 10d. per lb. nominally, and round ditto at 1s. 4d. per lb.

RHATANIA ROOT.—75 bales were held for 4½d. per lb.

SARSAPARILLA.—6 bales Jamaica sold at 1s. 5d. to 1s. 6d. per lb. for 1CCD. 6 bales Lima sold at 11½d. to 1s. per lb.

SOUTH AMERICAN BARK.—13 bags sold at 2½d. to 3d. per lb.

SCAMMONY ROOTS.—165 bales taken out at 18s. 6d. per cwt.

SCAMMONY.—15 cases all bought in at nominally 12s. 6d. to 22s. 6d. per lb., according to quality.

SENNA.—74 packages Alexandria part sold previously, rest being held for 6d. to 9d. per lb., according to quality, the latter figure being price required for fine green small leaf and bold green leaf; good sorts realised 4d. per lb., and old stalky ditto 2¾d. 1 bale poor Mecca pods sold at 5¼d. per lb. 54 bales Tinnevelly, all consisting of good green leaf, sold at 3½d. to 6d. per lb., according to size.

SQUILLS.—48 bags held for 2½d. to 3d. per lb.

STROPHANTHUS SEBDS.—25 bags Kombé bought in at 4s.; fluffy ditto at 3s. per lb.

TAMARINDS.—50 casks black East Indian part sold at 12s. per cwt.

TONQUIN BEANS.—2 cases low Para held for 7½d. per lb.

VANILLOES.—12 tins Seychelles part sold at 23s. per lb. for 6″ × 7″.

WAX.—Fair Zanzibar sold at £6 7s. 6d. per cwt. Fair Madagascar was bought in at £6 10s. Only medium Jamaica sold at £6 12s. 6d. 7 cases Japan sold cheaply without reserve at 28s. to 28s. 6d. per cwt.

WHITE CAMPHOR OIL.—10 cases Japan bought in at 25s. per cwt.

Manchester Chemical Report.

September 27, 1899.

There is at present no check to be noted in the upward movement in the chemical trade. Heavy chemicals are unchanged, but in one or two miscellaneous articles there are certain advances to record. Copper Sulphate ranges from £25 15s. to £26 10s. per ton, best brands, delivered Manchester. Benzols are unchanged, but Carbolic is firm at 2s. 1d. for 60's. Naphthas are showing signs of increased demand, but there is no change in price. Pitch is going fairly well at 31s. to 32s. per ton, f.a.s. Manchester. A fair amount of business is being done for next year's delivery, and prices tend higher. Yellow Prussiate is very scarce, and varies from 8¼d. to 8½d., with an upward tendency. In Oils there is a great revival on the Ship Canal, and lubricating oils are also showing a tendency for higher prices.

Liverpool Market Report.

September 27, 1899.

AMMONIA SALTS.—Carbonate scarce, 3¼d. to 3½d. per lb. Sal ammoniac is firm, 33s. and 35s. per cwt. Sulphate, £12 per ton.

BEESWAX.—64 bales of Gambia sold at £6 10s. to £6 11s. 3d. per cwt.

CANARY SEED—Is steady with more inquiry. Of Turkish, 25 bags sold for 40s. per 464 lbs., and about 600 bags at 39s. 6d.

CARNAUBA WAX.—25 bags of fair to good grey made 43s. to 45s. per cwt.

CREAM OF TARTAR—Is easier, 74s. to 80s. per cwt. Some good business has been done in Portuguese cream on private terms.

COPPERAS—Is very firm at 40s. per ton for Lancashire, and 37s. 6d. for Welsh.

COPPER SULPHATE.—Spring, £26 to £26 10s. per ton; spot, £25 12s. 6d.

LINSEED.—Calcutta is firm, to arrive, 44s. 6d. per 416 lbs.; North American to arrive is 40s. 6d. per 424 lbs.

OILS (FIXED) AND SPIRITS.—Castor oil is steady with fair business passing: Calcutta 3d. per lb., 600 cases sold at 2$\frac{15}{16}$d., and 50 cases at 3d. French, first pressure, 2⅞d. per lb.; second pressure, 2⅝d.; second sulphur, 2½d.; Madras, 2¾d. Olive oil is very strong in tone, and is offering sparingly at £34 to £35 per tun. Linseed oil of Liverpool pressure is firmly held at 23s. 3d. to 23s. 6d. per cwt. Cotton-seed oil, Liverpool refined, is steady at 18s. 3d. to 18s. 9d. per cwt. Spirits of Turpentine are in fair demand at 37s. 6d. per cwt.

QUILLAYA BARK.—Chilian has been selling at £13 5s. per ton.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. Jasper L. Hall, chemist and druggist, has purchased the old-established chemist's business at High Street, Solihull, lately carried on by Mr. Herbert Pegg, M.P.S., pharmaceutical chemist, who has retired.

Mr. A. Hunter, chemist and druggist, is shortly opening a business at No. 35, London Road, Brighton.

Mr. John Elliot, chemist and druggist, Berwick-upon-Tweed, who has entered his 85th year, and is recognised as one of the oldest practising chemists in this country, has this year celebrated his golden wedding. For over sixty years he has been established in business in the town, and during that time has built up a reputation not only in pharmacy, but as an agricultural chemist. Despite his years, Mr. Elliot gives daily attendance to his business.

Mr. J. F. Eardley, M.P.S., pharmaceutical chemist, of Glossop Road, Sheffield, who has for several years carried on a successful mineral water manufacturing business in the city, is at present erecting a new factory in Eccleshall Road. It will be lighted by electricity, and equipped with the most up-to-date machinery and appliances, and its capacity for production will be a very great increase on that of Mr. Eardley's present premises.

Marriage.

Woodruff—Peberdy.—On September 19, at St. Mark's Church, Tollington Park, London, N., by the Rev. E. Robinson Lees, Thomas Woodruff, pharmaceutical chemist, Withington, eldest son of the late Thomas Woodruff, of Stalybridge, to Ada Mary, youngest daughter of the late W. Peberdy, of Tollington Park.

Death.

Walker.—On August 26, John Walker, Chemist and Druggist, late of Conduit Street, London, W. Aged 64.

Publication Received.

Weeds and Flowers (Poems). By William Luther Longstaff, M.P.S. (author of 'Passion and Reflection'). Pp. viii. + 152, price 2s. 6d. net. London: Greening and Co., 20, Cecil Court, Charing Cross Road, W.C. From the Author.

Advertisements.

(Received too late for Classification.)

WEST END. Wanted a Qualified ASSISTANT, accustomed to first-class Dispensing business. Apply by letter, stating full particulars, to DISPENSER, 7/12, Aldersgate St., E.C.

Partnerships Dissolved.

(From the London Gazette.)

Joseph Gibbs and Sydney Gibbs (trading as Gibbs and Son), Chemists and Druggists, Terminus Road, Eastbourne. Debts will be received and paid by Sydney Gibbs, who will continue the business under the same style.

*** By a clerical slip in copying, this notice was inadvertently printed last week under the heading "Receiving Orders in Bankruptcy." The error was obviously apparent, but we desire, nevertheless, to express the most sincere regret at the unfortunate occurrence, and to apologise to Messrs. J. and S. Gibbs for any annoyance it may have caused them.—ED. *Ph. J.*

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Splendid New English Honey, 12-lbs. for 7/- cash.—Brampton, Sudbury, Suffolk.

Maisch's Materia Medica, Proctor's Pharmacy, Green's Botany, offers. Dell, 18, Clipstone Street.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Three Oculists' Trial-cases, containing 30 pairs each convex and concave spherical lenses, 18 pairs each convex and concave cylindrical, 2 prisms, double trial-frame graduated for astigmatism, black and stenopaic discs; all spherical lenses mounted in gilt and silvered rings; marked in dioptrics; second-hand but in perfect condiion; 5 guineas, cash with order each. F. Davidson, 140, Great Portland Street, London, W.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Books. Faraday's "Chemical Manipulation," Mohr and Redwood's "Practical Pharmacy." State lowest price. Student, 5, Serle St., London, W.C.

Calendar for the Week.

Sunday, Oct. 1. 18th after Trinity. Sun rises 6.2., sets 5.37.

Monday, Oct. 2. Sun rises 6.3., sets 5.35.
PHARMACEUTICAL SOCIETY, 17, Bloomsbury Square, W.C., at 3 p.m.—Re-opening of the School of Pharmacy; and Presentation of the Hanbury Medal.

Tuesday, Oct. 3. Sun rises 6.5, sets 5.33.
GRESHAM COLLEGE, Basinghall Street, E.C., at 6 p.m.—Lecture by Prof. E. Symes Thompson, on "Earth and Disease."

Wednesday, Oct. 4. ●7.14A. Sun rises 6.6, sets 5.30.
GRESHAM COLLEGE, Basinghall Street, E.C., at 6 p.m.—Prof. Thompson on "Air in Relation to Disease."
PHARMACEUTICAL SOCIETY, 17, Bloomsbury Square, W.C., at 11 a.m.—Meeting of the Council.

Thursday, Oct. 5. Sun rises, 6.8; sets, 5.28.
GRESHAM COLLEGE, Basinghall Street, E.C., at 6 p.m.—Prof. Thompson on "Water-Borne Disease."

Friday, Oct. 6. Sun rises, 6.10; sets, 5.26.
GLASGOW CHEMISTS' AND DRUGGISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—General Meeting.
GRESHAM COLLEGE, Basinghall Street, E.C., at 6 p.m.—Prof. Thompson on "Insects as Distributors of Disease."

Saturday, Oct. 7. Sun rises, 6.12; sets, 5.23.

ENGLISH NEWS.

A Radiograph of an Injected Full-Term Fœtus, which has been taken by Mr. F. H. Glew, chemist and druggist, Clapham, is a remarkable example of the valuable results that can now be obtained by the use of the Röntgen rays. The fœtus was injected by Mr. Charles Ind, of St. Thomas's Hospital, with mercury, the fluid being, introduced by means of a hypodermic needle, connected by stout rubber tubing to a funnel capable of holding two fluid ounces and elevated above the level of the needle, in a suitable holder. The radiograph was taken directly the injection was finished, so as to prevent the mercury gravitating to the lowest level. The subject was arranged on a piece of thin cardboard over a Thomas A1 plate, and the focus tube fixed over the middle of the plate, with the radiant point twenty-four inches distant. An exposure of twenty minutes was given, with a current of three Amperes through a ten-inch Apps' coil. In the radiograph the aorta, left side of the heart, kidneys and spleen are readily recognisable, and the vessels of the neck and extremities are especially clear.

The Midland Chemists' Association.—At a committee meeting of this Association, held on Wednesday, September 27, to elect a new president in place of Mr. W. F. Cox, resigned, Mr. F. A. Spear was unanimously elected.

Manchester Pharmaceutical Association.—The syllabus of this Association for the coming session is as follows:—October 11, Annual Dinner; November 8, "Local Associations and their Federation," by Mr. J. Smith, Liverpool; December 6, "The Way Plants Protect Themselves," by Prof. F. E. Weiss; January 10, "The P.A.T.A. and its Defence Fund," by Mr. W. S. Glyn-Jones; February 14, "The Outlook in Pharmacy," by Mr. J. Taylor, Bolton; March 14, "Pharmacy Notes," by Mr. J. H. Hoseason; April 11, Annual General Meeting. It is also proposed to hold a ball about the end of January. Applications for dinner tickets should be sent not later than 7th inst. to the Hon. Secretary, J. W. Walton, 427, Higher Broughton, Manchester.

Chemists' Assistants' Association (London).—The following is the programme of this Association for the half session, October to December, 1899:—October 12, Inaugural Address by the President; October 19, Musical and Social Evening at 73, Newman Street, W.; October 26, Paper, "Ethics, as Applied to the Practice of Pharmacy," by J. C. Hyslop; November 2, Annual Reunion in the Throne Room, Holborn Restaurant; November 9, Impromptu Discussion; November 16, Short Papers; November 23, Paper, "The Relation of the Wholesale to the Retail Trade," by F. Curry; November 30, Paper, by H. Hymans; December 7, Cinderella Dance at the Portman Rooms; December 14, Musical and Social Evening.

Alleged Fatal Pills.—On Saturday, September 30, Mr. G. E. Hilleary, the West Ham Coroner, held an inquiry with respect to the death of Elizabeth Alma Ward, aged thirteen years. The evidence showed that on Monday last the deceased was not very well, and took two pills, which she purchased at a general shop in the neighbourhood. The pills were known as "Carter's Head and Stomach Pills." The deceased was subsequently seized with severe diarrhœa and vomiting. She became unconscious, and died on the following day. Dr. Galley, of Ford's-market, who made the post-mortem examination, expressed the opinion that death was due to collapse following diarrhœa, which had been set up by some irritant. Mr. John Carter, of 13, Cross-street, Woolwich, a chemist, said the pills were specially manufactured for him and he retailed them. He handed a list of the ingredients of the pills to the coroner. Dr. Galley, having examined them, expressed the opinion that they were quite sufficient to set up the irritation. They might not injure an adult, but they were certainly not fit to give to young children. The jury returned a verdict of "Death from misadventure," and requested the coroner to call the attention of the Pharmaceutical Society to the manner in which these pills were sold.

Chemists' Assistants' Union.—We understand that the C.A.U. intends opening the session about the end of this month with a smoking concert at the Horse Shoe Hotel, Tottenham Court Road, London. Several well-known professional and amateur artistes have volunteered their services.

Drawback on Spirituous Preparations.—We have been favoured by Mr. Thomas Tyrer, of the Stirling Chemical Works, with a copy of a letter received by him from the Board of Inland Revenue, referring to certain modifications in the regulations applicable to the exportation on drawback of tinctures, essences, etc. It is stated that the Board has issued instructions to its officers to the effect that a uniform allowance of three per cent. for waste is to be made upon all preparations packed for exportation on and after October 1, 1899, under the regulations applicable to the exportation of tinctures or medicinal spirits, flavouring essences and perfumes, "including those preparations not at present entitled to any allowance for waste," except spirits of wine and spirits to which any ingredient is added under the regulations in the presence of the Board's officer. It is further intimated that the margin of difference for error in the statement of the strengths of the preparations as made by the exporters and that found upon examination of the samples at the Government laboratory will also be increased from two to three degrees.

The Place of Technical Education.—Sir Andrew Noble, who is associated, at the great Armstrong works, with the management of some thirty thousand highly skilled workers, has formally outlined his views on technical education at the City and Guilds Institute, in delivering the inaugural address of the new session at the Central Technical College. While Sir Andrew is impressed with the importance of technical education, he would not have it commence early in life. The age for seriously taking up professional studies is, he maintains, seventeen or eighteen. Up till then, the ordinary public school curriculum affords the most useful groundwork and the best discipline. Incidentally, Sir Andrew proclaimed himself opposed to the substitution of classical by modern languages; and in this connection he quoted Sir William Harcourt's recent pronouncement only to disagree with it. A German merchant, the great shipbuilder and gun-maker opined, would sooner receive letters in good English than bad German. From the time serious work begins at seventeen or eighteen, the matter of greatest moment is that practice should be surely based on theory. There was a greater understanding on the subject in Germany. It is worthy of note, by-the-bye, that Sir Andrew regards the marking of goods with the place of origin as a piece of unwisdom. What was intended to operate as a reproach is likely, he thinks, to serve as an advertisement. He mentioned the case of a magnificent ironclad, on whose bows was sarcastically displayed, as she entered an English harbour, the accurate legend, "Made in Germany." "And, do you know," said the lecturer, "when we require an original or a special piece of apparatus we are often compelled to go to Germany for it."

Pharmaceutical Education in Sheffield.—The newly-issued prospectus of classes of the Art and Science Department, University College, Sheffield, provides evidence of the thoroughness of the arrangements which have been made for pharmaceutical students. A three years' course of instruction for students preparing for the Minor Examination of the Pharmaceutical Society will be held in the evenings during the winter session, the course beginning on October 11 and ending about the last week in March. During the first year students attend a course of twenty lectures on Elementary Physics and Inorganic Chemistry (illustrated by experiments), and also work in the Chemical Laboratory at Practical Chemistry. The lectures are delivered on Wednesday evenings, between six and nine o'clock, and the fee for the course is £1 10s. During the second year there will be a course of twenty lectures on Inorganic and Organic Chemistry, as well as instruction in Practical Chemistry as before. The first and second year's lectures on Chemistry are given in alternate years, and it is the second course that is to be given in the session 1899-1900. The lecture hours and fees are the same as those of the first year. In Botany the first course will consist of twenty lectures, each followed by a practical class on Thursday evenings; fee, £1 10s. During the third year the programme will be as follows:—Practical Chemistry: Hour, Wednesday evenings, 6 to 9; fee, £1 10s. Botany—Second Course: Twenty lectures each, followed by a practical class; hour, Thursday evenings, lectures 6.30, laboratory 7.30 to 9.30; fee, £1 10s. Materia Medica: A course of twenty lectures on Materia Medica; hour to be settled later; fee, 10s. 6d. A class in Materia Medica will be conducted by Mr. John Austen, as formerly. It is trusted that all chemists' apprentices in Sheffield will take advantage of the opportunities afforded by these classes, and that their employers will facilitate matters as much as lies in their power.

EDUCATIONAL.—Professor J. B. Coleman, head of the chemistry department of the South-Western Polytechnic, Manresa Road, Chelsea, sends a prospectus of the evening classes held in connection with that institution. The classes for chemistry and botany appear to be suited to both "Minor" and "Major" students. We understand that last session twenty-six joined the chemistry classes and ten the botany classes, about 25 per cent. being "Major" students. The courses are specially adapted to pharmaceutical students, and are held independently of the ordinary chemistry and botany classes. ——The Secretary of the Birkbeck Literary and Scientific Institution, Bream's Buildings, Chancery Lane, E.C., also sends the calendar of that institution for the session 1899-1900. Classes are held in botany and chemistry, and other subjects, taken by pharmaceutical students. The list of the successful candidates at the University of London and other scientific examinations held during the session 1898-9 includes the names of several pharmaceutical chemists, past students in the Pharmaceutical Society's School of Pharmacy, who have continued their studies under the guidance of the teachers and professors at "The Birkbeck."

POISONING CASES.

CARBOLIC ACID.—On Thursday, September 28, the Westminster Coroner held an inquest with respect to the death of Florence Martin (54), widow of Captain Martin, of 66, St. George's Square.—Mrs. J. Kennedy, a sister-in-law, said that the deceased had committed suicide on the previous day by drinking carbolic acid. She had nursed her mother through a long illness in the recent hot weather, and this and continued anxiety about her mother had made her low-spirited. She seemed no worse on Wednesday morning.—Dr. Austen said the deceased had drunk nearly three ounces of the acid.—The jury returned a verdict of "Suicide whilst temporarily insane." —— In the course of an inquest held at Withington, on Wednesday, September 27, concerning the death of Elizabeth Crawford (31), wife of a shipping merchant of Malvern Grove, Withington, it was stated that she had not been in the best of health since April last, and had been staying at Buxton for some time, only returning home on September 25. She appeared to be much better, but about four o'clock the next afternoon she left the house, saying she was going to see her mother-in-law. She did not return, and on the mother-in-law's house being searched she was found in the front bedroom, lying on the floor. Two medical men were summoned to the house, and she was found to be suffering from carbolic acid poisoning, death taking place the same evening.—A verdict of "Suicide whilst temporary insane" was returned.

HYDROFLUORIC ACID.—An inquest was held on Saturday, September 30, on the body of Joseph Wilson Hollyer, sign-writer and glass embosser, living at Canterbury Road, New Cross, who had poisoned himself with hydrofluoric acid.—The evidence did not favour the presumption of suicide; but rather indicated that Hollyer drank the poison in a foolish display of bravado. He was well acquainted with its properties, as he had to use the acid in his trade. It appeared that Hollyer was at the bar of the Prince of Wales's Hotel, opposite Wimbledon Railway Station, with a friend. Producing an indiarubber bottle and remarking to the barmaid that it contained glycerin, he poured about a wineglassful of the contents into a tumbler. He put a lighted match into the liquid, added some water, and, holding up the tumbler, said to the barmaid, "This is as harmless as the liquor you sell." Then he tasted it, said it was too strong, and added more water.—He died from the effects of the poison a few hours later in hospital.—The jury found a verdict of "Death from misadventure." It was stated during the inquiry that this was the first recorded case of hydrofluoric acid poisoning.

ŒTHOL.—Under this name, cetylic alcohol, derived from spermaceti, has been introduced for use in dermatology. When rubbed on the skin, it becomes unctuous, but does not occasion a greasy stain, and may replace many ointment bases, but, at present, the price is too high for general use.—*Journ. Pharm. d'Anvers*, **55**, 350, after *Pharm. Central.*

FOOD AND DRUGS ACT PROSECUTIONS.

SEIDLITZ POWDERS.—A case showing the necessity for dealing direct with the manufacturer or a responsible wholesale house when purchasing drugs for retailing was heard at Market Harborough on Tuesday, September 12. Elizabeth Fox, grocer, Market Harborough, was summoned for selling seidlitz powders which did not conform with the requirements of the B.P., they being certified to contain only 9 grains of potassium tartarate instead of 120 grains, and 127 grains of sodium bicarbonate instead of 40 grains.—Defendant pleaded that she had purchased the seidlitz powders from a well-known firm, and sold them in precisely the same condition as she received them. The firm from whom she bought the powders obtained them from a London firm of high standing in the same condition as sold to the inspector. She did not challenge the analysis, but pleaded guilty to a technical offence.—The Magistrates' Clerk, after pointing out the seriousness of selling drugs which do not conform with the recognised standard, said that the law rendered the person selling the powders in question responsible, but he had no doubt that if defendant dealt with a *bonâ-fide* wholesale house, and was supplied therefrom with the powders, she could recover the amount of the penalty.—The Chairman intimated that if Mr. Simpson, the solicitor for the defence, was prepared to remove any responsibility from defendant by advising them as to the firm from whom the powders were obtained, the Bench would, if the powders came from a really respectable, responsible firm, take that into consideration. —Mr. Simpson said it was a delicate matter, for although the powders were supplied by a respectable, responsible firm, that firm got them from another firm in London, consequently he was not prepared to fix the responsibility upon the firm who actually supplied defendant with the powders.—A fine of £3, including costs, was imposed.

MAGNESIA.—John Youth, grocer, was charged at the Wootton Bassett Police-court on September 9 with selling magnesium carbonate as magnesia, and was fined 12s., including costs.——Frank Kempster was also fined the same amount for a similar offence.

CAMPHORATED OIL.—At Brierly Hill Petty Sessions, on Friday, September 15, Mrs. Morgan, who appeared for the defendant, Alexander Morgan, shopkeeper, Brettel Lane, charged with selling camphorated oil deficient in camphor to the extent of 33 per cent., and compounded with mineral oil and cotton-seed oil instead of olive oil, pleaded that she had the oil in question twelve months ago, and was not supposed to know what it contained.—The Magistrate pointed out that retailers of drugs were supposed to know of what they were composed.—It was also stated that there was a label on the bottle warranting the contents to be camphorated oil.—Defendant was fined £2, including costs.

MAGNESIA.—At Pontefract on Saturday, September 23, Walter E. Milburn, chemist and druggist, Castleford, was summoned for having sold adulterated magnesia. Defendant pleaded guilty, but stated that a mistake had been made, heavy carbonate being supplied instead of heavy magnesia. The bench accepted defendant's explanation, and inflicted a fine of the costs only—£1 11s.

SEIDLITZ POWDERS AND CAMPHORATED OIL.—On Monday, September 25, Messrs. Bell, Son, and Co., wholesale druggists, Liverpool, were summoned at New Swindon police-court for applying a false trade description to seidlitz powders supplied to James Lord, grocer, Wootton Bassett, and also to camphorated oil supplied in 1896 to Joseph Maylott, grocer, Oriel Street, New Swindon.—With regard to the first case, the analyst stated that the alkaline portion of the powders was correct, but the tartaric acid portion contained 20 per cent. of alum, whereas it should have consisted of pure tartaric acid.—Defendants pleaded that the tartaric acid in question was sold in exactly the same condition as supplied to them.—In respect to the camphorated oil, it consiste of 14 per cent. of camphor, 4 per cent. of mineral oil, and 82 per cent. of fatty oil. The analyst admitted that up to 1898 camphorated oil was not mentioned in the British Pharmacopœia.—For the defence it was stated that when the oil was sold there was no prescription for camphorated oil in the B.P. It was also stated that there had been an evaporation of camphor.—A fine of £10

was inflicted in the first case and £1 in the second, the costs to be taxed.——Mr. Maylott was also summoned for selling adulterated camphorated oil, and as the magistrates thought he had been more sinned against than sinning, he was fined 1s., the costs being remitted.

Camphorated Oil.—On Monday, September 25, at the County Petty Sessions, Jane Nicholson, grocer, Cokerton, was summoned for selling camphorated oil deficient in camphor to the extent of 54 per cent. For the defence it was stated that the oil in question was purchased with a warranty that it was of the "finest quality B.P.," from Messrs. Trowsdale, Shipley and Co., London, who obtained it from Messrs. George Wilton and Co. (Limited), Doncaster. Fined £1, including costs.——John H. Proud, grocer, Darlington, was summoned at the same Court for selling camphorated oil 60 per cent. deficient in camphor.—It was stated that the oil was manufactured last year by Messrs. Holmes and Richmond, Darlington, who on finding that it was not compounded in accordance with the B.P., 1898, requested their customers to return it. The defendant, however, had not done this, but the firm had taken the responsibility.—Fined £1, including costs.

Seidlitz Powders.—At Houghton-le-Spring Petty Sessions, on Thursday, September 21, a charge against Thomas Reay, general dealer, of selling seidlitz powders not of the nature, quality, and substance demanded by the purchaser, was adjourned for a month in order that a fresh analysis of the samples held by the defendant and the Inspector might be made.—The defendant objected to the method of dividing samples of seidlitz powders adopted by the Inspector, who had bought six packets, two packets being sent to the analyst, two sealed and left with the defendant, and two retained by the Inspector. Defendant contended that one packet only should have been divided.—The magistrates agreed with this, and adjourned the case.

Milk of Sulphur.—On Friday, September 30, Joseph Clarkson, manager of the Clayton West branch of the Scissett Co-operative Society, was charged before the Barnsley magistrates with selling milk of sulphur, which Mr. A. H. Allen, public analyst, certified to consist of sulphur 44 per. cent., hydrated calcium sulphur 56 per cent.—Mr. Bedford, president of the society, who represented defendant, said the preparation had been in stock a long time; very little of it was sold, and they did not know it was otherwise than a proper preparation.—A fine of 5s. and costs was imposed.

TRADE NOTES.

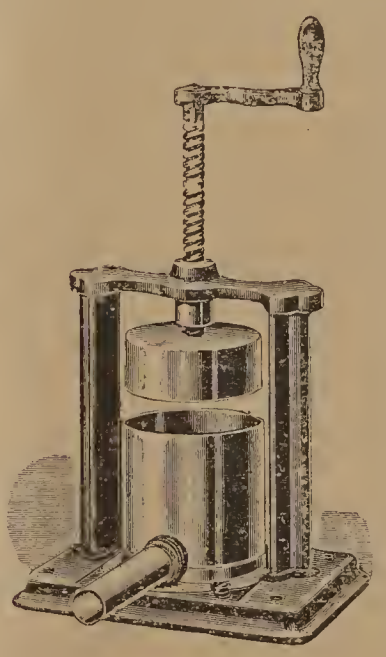
Martindale's Urine Test Case.—Mr. W. Martindale, 10, New Cavendish Street, London, W., submits a specimen of a urine test case which he has recently introduced to the medical profession. It is a compact mahogany cabinet, 6-in. × 2½-in. × 4-in., containing the apparatus and reagents requisite for the qualitative and quantitative examination of urine for albumin, glucose, and urea. It has been designed by W. Harrison Martindale, Ph.D., especially to meet the requirements of the busy medical practitioner, to carry in the bag

and conduct an analysis at the patient's bedside. For this purpose it should prove extremely useful as the processes, fully described, are simple; the calculations are readily made by reference to prepared tables; the apparatus is cheap, and above all, portable. The case contains:—Esbach's albuminometer, graduated tube for glucose determination, ureometer for urea determination, urinometer for reading off specific gravity, metal spirit lamp with brass screw top, three test tubes, test tube stand, test tube brush, four stoppered bottles of reagents fitted with patent safety stopper bands, funnel, graduated pipette, litmus papers, filter papers, cloth, calculation tables, and book of directions and charts. The nett price is 17s. 6d. Another article recently introduced by Mr. Martindale is a

neat pocket case of polished wood, to carry one dozen nitroglycerin tablets. The price of the case with its full complement of tablets is 1s. A similar portable and elegant case, to contain three amyl

nitrite capsules, is made of cream-coloured celluloid, with the words "Martindale's Amyl Nitrite Capsules" embossed in gilt letters. Filled with capsules the case is sold at 2s.

Collapsible Tubes.—Messrs. Thomas Christy and Co., 25, Lime Street, London, E.C., submit a set of samples, showing the various colours in which they can supply collapsible tubes. These colours, to which attention was directed in these columns a few months ago, are of three different types, viz., enamel colours, of an excellent quality, smooth and pleasant to the touch, and transparant and dull colours of superior quality. The tubes are artistically printed, the type, both large and small, showing up very distinctly. An illustration is given herewith of a machine introduced by the firm for filling the tubes. This machine is a very useful and compact piece of apparatus, and appears to be well adapted to the purpose for which it is intended. Chemists requiring a machine for filling their own tubes should write for particulars as to price, etc., to Messrs. Thomas Christy and Co., at the above-mentioned address.



The "Gutenberg" Temperature and Pulse Respiration Chart is published by Mr. James F. Wilkinson. The Gutenberg Works, Pendleton, Manchester, and can be used to record two, three, or four observations in the twenty-four hours, *i.e.*, as a 12, 8, or 6 hour chart. The chart is issued both singly and made up in pads.

"Primus" Lanternist's Pocket-Book.—Messrs. W. Butcher and Son, Blackheath, write to correct an error they made when writing us a few weeks ago giving particulars of their Lanternist's Pocket-Book which they distribute free (see *ante*, p. 284*d*). It was mentioned that the present edition consisted of 10,000—this should have read 5,000.

MEDICINAL CAPSULES.—The Liverpool Medicinal Capsules Company, 4, Colquitt Street, Liverpool, submits samples of flexible gelatin capsules, containing castor oil, apiol, sandal oil, quinine, Easton's, cascara, guaiacol, copaiba, Blaud pill, antisepticine, and cod liver oil. They are well made and accurately filled, and chemists will find the goods worthy of attention.

SHOP FITTINGS, ETC.—Messrs. Evans, Sons, and Co., 56, Hanover Street, Liverpool, send a copy of their illustrated catalogue of shop fittings, shop bottles, etc. The first part comprises some twenty-five large, full-page photographs, showing specimens of shop fronts and interiors erected by the firm; various departments in the shop-fitting factory; timber-laden ships, and stocks of seasoned and unseasoned timber. The latter part of the catalogue consists of illustrations and descriptions of the class of fittings usually desired by the trade, but they, of course, only represent a small portion of what the firm manufacture, new designs being introduced to meet particular requirements. The catalogue is exceedingly well printed, and so far as we know there is nothing of the sort brought out by any other firm. Liverpool being the principal timber port in the United Kingdom, the firm is able to purchase suitable wood of the highest quality on the best terms. Messrs. Evans, Sons, and Co. state that they do only first-class work, employing the best hands in the trade.

SCOTTISH NEWS.

STRATHPEFFER *v.* BAD NAUHEIM.—A correspondent writing to the *Times*, under the heading "Bad Nauheim and its British Rivals," states that for three consecutive years he has gone to Bad Nauheim for health, and has gone through four courses of its baths and heart treatment, but this year was unable to go for want of time. Hence, acting under advice, he went to Strathpeffer, one of the British substitutes to Bad Nauheim. After giving a glowing account of the Highland scenery and its invigorating air, he contrasts the two health resorts, and sums up his conclusions thus:—"For those who can spare the time, Nauheim, the natural source of the heart-healing waters, is still the best, in spite of its distance by land and sea. For those who have only a limited time at their disposal, and who prefer their own language, with British food and lodging and recreation, to what is to be found in that way in Germany, coupled with the keen health-giving air of the Highlands, and all their picturesque beauty, I would recommend Strathpeffer. . . But the authorities at Strathpeffer must set their baths in order, and make them as comfortable as those of Nauheim, and the doctors must contrive to give more individual attention to their heart patients, if they are really in earnest in their rivalry."

MR. ARTHUR MCKELLAR, M.P.S, pharmaceutical chemist, successor to the late Mr. Alexander Kinninmont, announces that his establishment at Ibrox is now open, and that former customers of Mr. Kinninmont at South Portland Street will find their requirements as carefully attended to at the new premises, the business being under his personal supervision aided by a certificated assistant.

THE PHARMACY GOLF CLUB, Edinburgh, decided the competition for possession of the "Dick" monthly challenge medal last week. The result was a win for J. P. Gibb, with J. Aikman second.

POISON FOR MEDICINE.—On Thursday, September 21, a labourer named John Stevenson, 55, of 90, Parliamentary Road, Glasgow, was admitted to the Royal Infirmary in an unconscious condition, through having swallowed a quantity of poisonous lotion in mistake. It appears that the man has been suffering from asthma, and during the early hours of the morning he rose to take some medicine which had been prescribed for his complaint, but the doctor's bottle being placed on a table beside the lotion, he drank the latter in the dark.

WEST OF SCOTLAND COLLEGE OF PHARMACY, GLASGOW.—Mr. Thomas Maben, F.C.S., one of the principals of this College, delivered the opening address, on Monday evening last. Mr. W. L. Currie presided, and introduced Mr. Maben to a Glasgow audience. Mr. Maben, having referred to the cordial welcome he had received from Glasgow pharmacists, proceeded to deal with pharmaceutical education and examination. Discussing the new Preliminary, he said pharmacists would incur grave responsibility who took apprentices who had not obtained the necessary certificate before leaving school. The question of a curriculum had he said settled itself, and students all realised that it was necessary. He threw out the suggestion that some kind of recognition by the Society of schools and colleges whose curricula were satisfactory would prove an immense value in the development of pharmaceutical education. Referring to the examinations, he spoke of the candidates whom he had often found to be utterly unprepared, and who seemed to take failure as a matter of course. This was a condition of affairs that should not be, and it was their duty to create an atmosphere where its existence would be impossible. Of the examiners, he said that it was much more gratifying to them to give a high mark than a low one, and well-prepared candidates always found them to be perfect gentlemen, while the subjective experiences of candidates ill-prepared were hardly such as fitted them to pass an opinion. He thought a division of the examination would be welcomed both by teacher and student, and he also considered that every student having paid his fee for a complete examination was entitled to be examined in every subject without being stopped midway. He knew of no examining Board in the country which refused to examine a candidate in all the subjects for which he had entered, and he thought the present system might well be altered. He concluded with a few words regarding the West of Scotland College of Pharmacy, the aim of which was to make excellent pharmacists of its students, and, thereafter, legal qualification would follow as a matter of course.

FOREIGN NEWS.

THE PROPOSED MONUMENT PELLETIER-CAVENTOU is not attracting much attention in England, despite the reference to the matter at a meeting of the Council of the Pharmaceutical Society of Great Britain, some two years ago (*vide P. J.*, October 9, 1897, p. 326). It was then announced by Mr. Walter Hills that the Secretary of the Society would be very pleased to receive and forward subscriptions, and readers may be reminded that the subscription list is still open, whilst Mr. Bremridge is doubtless as ready as formerly to transmit any amounts that may be committed to his care. It may be remarked that a representative list of subscribers is desired rather than large subscriptions.

X-RAYS AS A DEPILATORY.—People will do well to fight shy of the X-Rays as a depilatory. A lady was placed opposite a tube for twenty minutes, four days in succession, and she came to the conclusion that the result of the experiment was just nothing at all. But after a week had elapsed she found that the rays had removed not only the superfluous hair of which she desired to be rid, but the skin also.

A FRENCH PHYSICIAN mentions a curious apparent cause of left-handedness. One child in a certain family was left-handed, and the second appeared to be so at the age of one year. It was then learned that the mother always carried her children on her left arm. She was advised to change; and, held on her other arm, the infant, having its right hand free to grasp objects, became right-handed.

THE TREATMENT OF TETANUS, or lock-jaw, in animals by seropathy, or inoculation with serum, has been a great success. During the last two years Monsieur Nocard has distributed 7,000 flasks of the antitetanic serum for injection into horses, mules, bulls, goats, calves, and pigs to prevent lock-jaw after operations. Of 2,300 animals thus treated, not one suffered from lock-jaw. Of 400 beasts injected after accidental injuries, none died of lock-jaw. In fact, the serum appears to be of an absolute efficacy.

STRANGE POISONING FATALITY.—Two employees of the front railway station of Lèmorteau, on the line Montmédy to Virton, tapped a small cask which they supposed to contain brandy, and drank of its contents. Both were seen to fall dead. It was prussic acid. It is hard, however, to imagine from the report how prussic acid came to be shipped in such quantity and in a cask. The odour would scarcely be likely to have acted as a warning, and thus have deterred them from drinking, although it did not turn out to be brandy, as they anticipated, for kirsch, a common liqueur in France, has a strong cherry laurel odour.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

October 5, 1899.

Business has not been very brisk during the past few days, the uncertainty as to course of affairs in South Africa, combined with the absence of orders from that quarter, not having tended to help matters. At time of going to press it looks as if the uncertainty was over, and that war was absolutely inevitable, if not already begun. It is probable that war will have the tendency to cause an advance in price of several articles of interest to our readers, and they will perhaps do well to look to their stocks betimes, and before such probable advance has taken place. Quicksilver is very firm, as also are mercurials. An advance in price of refined Camphor is thought not improbable. Quininc is cheaper from the makers, but a shade firmer is the speculative market. Opium, Morphine, and Codeine, very firm. Glycerine decidedly dearer. Cocaine is very firm, and a further advance in maker's price is fully expected. It is reported that a corner has been brought about in Cascara Sagrada in San Francisco. Hyphophosphites have been reduced in price. Sulphate of Ammonia is weak, and lower. Acid Carbolic steady. Bank rate has been twice advanced, and now stands at five per cent. The following are prices actually ruling for some articles of principal interest:—

ACETANILIDE—Still dull and weak, with continued pressure to sell on part of makers and their agents at prices varying from 9½d. to 1s. per lb., according to make, quantity, and packing.

ACID BORACIC—Steady and unchanged at 25s. per cwt. for crystals and 27s. per cwt. for powder.

ACID CARBOLIC.—Quiet at 6¾d. to 7d. per lb., according to quantity and make, for 35-36° C., ice crystal in large bulk, 7½d. per lb. for the 39-40° C. ice crystal, and 8d. to 8¼d. per lb. for the 39-40° C. B.P. quality in detached crystals. Crude, 60° F., 2s. 1d. per gallon; 75° F., 2s. 7d. per gallon. Liquid, 95-98 per cent. of pale straw colour, 1s. 3d. to 1s. 4d. per gallon in 40-gallon casks; ditto 30 per cent. of dark-colour, 10d. to 11d. per gallon.

ACID CITRIC—Is fairly steady at 1s. 5d. to 1s. 6d. per lb., according to quantity and make, for crystals in 5cwt. casks.

ACID TARTARIC—Steady at 1s. 1d. per lb. for English on the spot, and 1s. 0¾d. per lb. c.i.f. for foreign.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, 3d. to 4d. per lb., according to make, packing, and quantity. Muriate, chemically pure, small crystals, 30s. to 32s. 6d. per cwt.; ditto, commercial, free from metals, 27s. 6d. per cwt. Iodide, 13s. 7d. per lb. Sal Ammoniac: Firsts, 35s. per cwt.; seconds, 33s.; ditto crushed for batteries, 2s. per cwt. more. Sulphate weak. Grey, prompt, 24 per cent., London, £11 8s. 9d. to £11 10s. per ton; Hull, £11 8s. 9d.; Leith, prompt, £11 7s 6d. to £11 10s.; Beckton, prompt, £11 7s. 6d.; Beckton, terms prompt, £11 5s. per ton.

ANTIMONY.—Regulus is unchanged at £39 to £40 per ton, and crude Japan (black sulphide) £24 to £24 10s. per ton, according to brand.

ANTIPYRINE AND PHENAZONE—Are steady at unchanged prices.

ASAFETIDA—Is in active demand, and good quality is very scarce. About 60 cases have been sold this week at from 40s. to 60s. per cwt., according to quality. Stock: 654 packages, against 307 packages same time last year.

ASHES.—Pots, 22s. 9d.; Pearls, 32s.

ATROPINE is firm at maker's prices of 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d. per oz. for the pure alcaloid.

BISMUTH—Unchanged at 5s. per lb. for the commercial quality of the metal; 5s. 1d. per lb. for the subnitrate; and 5s. 8d. per lb. for the subcarbonate.

BLEACHING POWDER (CHLORIDE OF LIME)—Is quiet at £6 10s. per ton for English.

BORAX—Is still quoted 16s. per cwt. for crystals, and 16s. 6d. per cwt. for powder.

BROMIDES—Firm at 1s. 10½d. for Potassii Bromid., 2s. 1½d. per lb. for Sodii Bromid., and 2s .2d. per lb. for Ammon. Bromid. Bromine, 2s. 2d. to 2s. 3d. per lb., in 60 lb. cases.

CAMPHOR.—The market for crude is decidedly firm, with a fair inquiry on the spot at dearer rates. A moderate bu iness has been done in China at 127s. 6d., and in Japan at 137s. 6d. per cwt. on the spot, with further buyers thereat. For arrival the quotations are 131s. and 135s. per cwt. respectively, c.i.f. Refined is very firm at unchanged prices, the English makers still quoting 1s. 7d. per lb. for Bells and Flowers in ton lots. It is stated, however, than an advance in makers' prices for refined camphor is not improbable.

CASCARA SAGRADA.—There is a rumour that the market has been cornered in San Francisco. To-day there are many inquiries for the article here in London, with, however, but few sellers. A few small lots have changed hands at 25s. 6d. to 27s. 6d. per cwt. for old bark. More money is, however, now asked by the few holders who are willing to sell.

CASTOR OIL—Firm. Belgian, first pressing, spot, £26 10s.; January to June, 1900, £25 10s. f.o.b.; Antwerp, second pressing, spot, £25 per ton, ex wharf. Hull manufactured guaranteed cold drawn pure pharmaceutical oil, £29 per ton in barrels; 3⅜d. per lb. in cases. Pure firsts, £26 10s.; seconds, £25 10s. per ton in barrels; Firsts, 3⅛d. per lb. in cases; seconds, 3d. per lb., ex wharf, London.

CINCHONA BARK.—At last week's Bark Sales in Amsterdam prices showed a decline of about 20 per cent., a result which had been practically already discounted in the speculative market for Quinine.

CLOVES.—Privately Zanzibar steady on spot at 3⅛d., but rather dull for delivery; October-December quoted 3 3-32d., and January-March 3 5-32d. At auction 200 bales Zanzibar sold without reserve, fair at 3⅛d.; 34 cases picked Penang bought in at 7d. to 7½d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial 1s. 3d. per gallon, pure 2s. Benzole, 50 per cent. 10½d. per gallon, 90 per cent., 9d. Creosote 3¼d. per gallon. Crude naphtha, 50 per cent. at 120° C., 4½d. per gallon. Solvent naphtha, 95 per cent. at 160° C., 1s. 5d. per gallon. 90 per cent. at 160° C., 1s. 2d. per gallon. 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene A, 3¾d. per unit; B, 2¾d. Pitch, 35s. per ton f.o.b. Tar, refined and crude, 15s. per barrel, 3d. per gallon.

COCAINE.—Market is very firm, makers' price being, however, still unchanged at 18s. per oz. In view, however, of the continued scarcity and dearness of the crude article a further advance in makers' prices for the refined article is confidently expected. From second hand there are still a few sellers at somewhat below makers' present prices.

COD LIVER OIL—Is quiet at 60s. to 62s. 6d. per barrel for best new non-congealing Norwegian oil in tin lined barrels of 25 gallons each.

CODEINE—Remains very firm at 12s. 11d. to 13s. 4d. per oz., according to quantity for the pure, and 1s. per oz. less for the sulphate, muriate, and phosphate salts.

CREAM OF TARTAR—Quiet at 74s. per cwt. for first white crystals on the spot, and 75s. per cwt. for powder.

CREOSOTE FROM BEECHWOOD TAR.—German makers advanced their prices 3d. per lb. to 2s. 6d. to 2s. 9d. per lb., according to quantity and make.

ESERINE PHYSOSTIGMINE—Makers are firm at 2s. 3d. per gramme for the Sulphate and Salicylate.

GALLS.—Market for China remains quiet, with slow demand, usual shape being quoted 59s. per cwt. on spot and 57s. for arrival. Plum shaped are rather easier, with offers at 58s. 6d. per cwt. c.i.f. Japan slow of sale, with offers, to arrive, at 56s. per cwt. c.i.f. Persian very quiet, with only small sales. Holders are, however, firm at 65s. for blues. Reports point to a short crop next season. Stock of Smyrna is nearly exhausted. Demand is, however, very slow.

GINGER.—Only 151 packages Cochin were offered at auction, and met little demand. 13 cases Calicut rough, small, and medium, slightly mouldy, sold at 25s. 6d.; the remainder bought in, small native cut at 36s.

GLYCERIN.—Market for refined has taken a decided step in an upward direction, the best white, double di tilled, chemically pure, 1260° quality, being quoted 57s. 6d. to 65s. per cwt., accord-

ing to make, for German brands in tins and cases (2 or 4 × 56 lb. tins in a case), while the same quality of English manufacture is obtainable at rather less money. Crude continues very firm at £37 to £39 per ton for the quality most suitable for refining purposes.

GUM KINO.—The deliveries have been good this month, and the late large stock has been greatly reduced. For Cochin 2s. per lb. is asked, and no less will be taken for the African kind.

HYPOPHOSPHITES.—The makers reduced their price last week 3d. per lb., present quotations being 3s. per lb. for Lime Soda and Potash Hypophosphite.

IODIDES—Somewhat unsettled in consequence of offers at prices below those fixed by the Convention, which latter are unchanged as follows:—Potassi Iodid., 10s. 6d. per lb.; Sodii Iodid., 11s. 10d. per lb.; Ammon. Iodid., 13s. 10d. per lb. Iodoform crystals, powder, and precipitated, 13s. 10d. per lb.; Iodine, commercial, 7½d. per oz.; ditto, resublimed, 12s. per lb.

IPECACUANHA.—A fair qantity of Rio has been sold since the auctions at 14s. per lb., and a few bales more could probably be obtained from same holder at that price, but another importer holds firmly for 14s. 6d. per lb. For Carthagena 11s. to 11s. 6d. per lb. is asked.

LITHIA SALTS are in good demand at 11s. to 11s. 3d. per lb. for the carbonate, and 7s. and 7s. 6d. per lb. for the crystal and powder respectively.

MERCURIALS—Are very firm at unchanged prices. Makers quote Calomel 2s. 11d. per lb. and Corrosive Sublimate 2s. 7d. per lb., the other mercurial preparations being quoted at proportionate prices.

MORPHINE.—The market is very firm at 4s. 10d. to 5s. per oz., according to quantity, for the hydrochlorate powder, and 2d. per oz. more for crystals. It is thought that we shall see higher prices for this article.

OILS (FIXED) AND SPIRITS.—Linseed strong at dearer rates. On spot, pipes, London, £22 2s. 6d. to £22 5s.; barrels, £22 10s. to £22 12s. 6d. Hull, spot, naked, £20 15s. Rape firm; ordinary brown on spot, £23 10s.; November-December, £23 10s.; January-April, £24; Refined, spot, £24 15s. to £25. Ravison, naked, spot, £20 10s.; January-February, £20 15s. to £21. Cotton dearer; London crude, spot, £17 15s.; November-April, £17 10s.; Refined, spot, £19 10s. to £20 10s. Hull, naked, refined, spot, £18; crude, spot, £16 15s. Olive firm; Mogador, £33; Spanish, £33 to £33 10s. Cocoanut firm; Ceylon, on spot, £25; October-December and January-March, £23 12s. 6d. to £23 15s. c.i.f.; Cochin, spot, £29 10s. Palm: Lagos, on the spot, quoted, £26 10s. Turpentine firm; American, spot, 37s. 3d.; November-December, 37s. 4½d.; January-April, 37s. 10½d. to 38s. Petroleum Oil quiet; Russian, spot, 5 9/16d. to 5⅝d.; American, spot, 6⅞d. to 7d.; water white, 8½d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. Lubricating Oil: pale American, spot, 7s. to 9s.; black, 6s. 3d. to 8s.

OPIUM.—The market has been very quiet, and only small sales of manufacturing and soft shipping at fully previous rates, holders being very firm. Persian kinds have been dealt in to a fair extent at 12s. to 12s. 3d. per lb. for fine quality, but holders now ask 12s. 6d. per lb.

OXALIC ACID—Is still quoted 3d. to 3¼d. per lb. nett, free delivered London.

PARAFFIN WAX—Is still quoted 2½d. to 3d. per lb. for crude, and 3d. to 3¾d. per lb. for refined.

PHENACETINE—Continues dull and weak. Prices at which some makers are pressing sales—viz., 3s. 2d. to 3s. 3d. per lb.—can hardly leave them a profit, and also hardly speaks in favour of the quality of their article, bearing in mind the old proverb of "cheap and nasty."

PILOCARPINE—Makers are firm at 30s. per oz. for the Nitrate and Hydochtorate Salts.

PITCH.—8s. to 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, powder, 4d. per lb.; crystals, 3¾d., free London for prompt delivery. Iodide, 10s. 6d. per lb. Permanganate is still quoted at widely varying prices, one maker asking 62s. 6d. per cwt. for small crystals in one cwt. kegs, while other makes are still offering at 52s. 6d. per cwt, large crystals being charged 5s. per cwt. more money. Prussiate, yellow, Beckton make, 7¾d. per lb.; other English makes, 8d. to 8½d. per lb.; red, 1s. to 1s. 2d. per lb., according to quantity.

QUICKSILVER—Is very firm at £8 12s. 6d. per bottle from the importer, and 6d. per bottle less from second hand. It is stated that an advance in price is not altogether improbable.

QUININE.—After touching 10⅛d. per oz. last week the speculative market again hardened, and there are now buyers of B. & s. or Brunswick at 11d. per oz. for December delivery, with but few sellers thereat. The makers of these brands reduced their price to 11½d. per oz. after the result of last week's Bark sales in Amsterdam became known. It would appear not unlikely that we may now see a gradual improvement in price of Quinine.

ROSIN—Firm at 4s. 6d. per cwt., ex wharf, for strained, and 4s. 1½d. to 4s. 2d. per cwt. for October-December and January-March shipment, per sailing vessel.

SANTONINE.—Early this week the price was again advanced to 11s. 3d. per lb. for 2-cwt. lots, up to 11s. 9d. per lb. for smaller lots. This advance was already foretold in these columns. From second hand there are offers at about 6d. per lb. below above figures.

SALICINE—Remains firm at the lately advanced price of 12s. 6d. per lb.

SENNA.—A few lots of very common quality. Tinnevelly in second hands have been brought out by the high prices paid last week, but the ideas of holders are quite beyond even the present high values. Stock on 1st inst.: 689 packages, against 1,388 packages last year. Alexandrian qualities are much wanted, and a fair business has been done in old leaf at 3½d. to 4d. per lb.; good half leaf at 6½d. per lb.; whilst whole leaf of good quality, which is in very small supply, is held at 9d. per lb. Reports from Egypt point to a small crop.

SHELLAC.—There is a steady, although not very active, demand prevailing on the spot, with moderate sales at previous rates, say 61s. to 62s. per cwt. for TN. Orange basis fair. The market for futures continues quiet, and without change.

SODA COMPOUNDS.—Crystals: Barrels are quoted 60s. per ton and bags 57s. 6d., ex ship Thames. Ash, £5 5s. to £7 per ton, according to percentage, etc. Bicarbonate: Commercial, £7 10s. to £8 10s. per ton; while 22s. 6d. to 25s. per cwt. is asked for the fully bicarbonated. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic: White, 70 per cent., £9 per ton; 60 per cent., £8 per ton. Hyposulphite (Antichlor.), 6s. 6d. to 8s. 6d. per cwt., according to make, quantity, and packing. Iodide, 11s. 10d. per lb. Nitrate: Ordinary, £7 13s. 9d.; refined, £7 17s. 6d. per ton.

SPICES (VARIOUS.—Black Pepper: 180 bags Penang bought in at 5½d. No Singapore offered. White Pepper: 10 bags Singapore sold, fine at 10¼d.; 52 bags fair Penang bought in at 8½d. Chillies: 20 bags Japan bought in, fair bright at 36s. Capsicums: 55 bales Bombay bought in, fair bright cherries at 35s. Cinnamon: 64 bales Ceylon sold, without reserve, fair palish, part wormy, at 1s. 6d. to 1s. 7d.; 5 cases West Indian sold, fair to good pale at 1s. 7d. to 1s. 9d., fair red 1s. 5d., broken 1s. 3d. Nutmegs: 65 cases Penang bought in, 80's at 1s. 9d., 90's at 1s. 6d., 101's at 1s. 4d., 109's at 1s. 2d.; 34 boxes Singapore bought in, 79's at 1s. 9d.; 14 packages West Indian sold, 90's at 1s. 4d., 104's at 1s., 114's at 11d. to 11½d. Pimento: Of 425 bags only 77 sold, common at 3¼d.; the remainder bought in, fair to good at 3½d. to 3¾d.

SULPHATE OF COPPER—Is firmer at £23 15s. to £25, according to quantity and make for spot delivery.

SULPHONAL.—The makers still quote 17s. per lb. for crystals and powder, while it is still possible to buy limited quantities from second hand at 14s. 6d. to 15s. per lb.

TAR.—Stockholm, 25s. 6d. to 26s.; Archangel, 18s. to 18s. 6d.

TURMERIC.—Business has been but small in all descriptions, but market remains firm at 26s. per cwt. for fair. Bengal, 32s. 6d. to 35s. for fair bulby to good bright Madras; 11s. for Cochin split bulbs, and 25s. per cwt. for China finger.

Newcastle-on-Tyne Chemical Report.

OCTOBER 4, 1899.

This Chemical Market keeps strong all round. Most of the makes of heavy goods are still scarce, particularly Bleaching Powder and Soda Crystals. Quotations are: Bleaching Powder, £6 5s. to £6 10s. Caustic Soda, 70 per cent., £8 10s. to £9. Soda Crystals, 50s. Soda Ash, 52 per cent., £4 10s. to £4 15s. Alkali, 52 per cent., £5 10s., nominal. Sulphur, £4 15s. to £5 per ton.

Manchester Chemical Report.

October 4, 1899.

There is an excellent tone prevailing, and more disposition on the part of consumers to purchase forward. The period for contracting over next year has now set in, and Bleaching Powder has been freely sold, both prompt and forward, at £5 5s. per ton, soft wood casks, on rails. Soda Crystals are unchanged, and a fair business is being done at 55s. per ton, bags, on rails, and £3 to £3 5s. casks. Green Copperas is unchanged and firm for best Lancashire make. Yellow Prussiate is scarce at 8¼d. to 8½d., and the production in this district has greatly diminished. Arsenic is rather higher at £19 per ton, ex ship, Garston. Brown Acetate has advanced to £3 5s. per ton, Welsh and American, delivered Manchester. Sulphate of Copper ranges from £26 10s. to £27 per ton, best brands, delivered Manchester. There is a good demand for Spring shipment. Carbolic Acid is firm. Almost the only articles which show any symptoms of weakness are Aniline Oil and Salt, which are quoted 4½d. and 4d., respectively. Pitch tends upwards, and as there has been an advance in the price of fuel locally, it may be followed by a corresponding movement in the manufactured material. The oil season on the Ship Canal has now set in, and three vessels have arrived, one with the largest cargo sent to this country.

Liverpool Market Report.

October 4, 1899.

Business continues steady, the chief alterations in quotations being better prices in oils. In seeds there has been but little done, Linseed being at such prices that buyers hold off, whilst Canary-seed is only in small demand. A fair amount of attention has been bestowed on Gum Arabic, of which some 20 serons are reported at good prices. In chemicals the tone is very firm for Caustic Soda, whilst Ammonia Sulphate and Copper Sulphate are easier.

AMMONIA SALTS.—Carbonate, 3¼d. to 3½d. per lb.; Sal ammoniac, 33s. to 35s. per cent.; Sulphate, £11 17s. 6d. to £12 per ton.

CANARYSEED.—Turkish is in quiet demand at 39s. to 40s. per 464 lbs., and 50 bags have been sold at 39s.

COPPERAS—Is very firm, 40s. per ton for Lancashire and 37s. 6d. for Welsh.

COPPER SULPHATE.—In consequence of an easier demand the price is now quoted at £25 7s. 6d. to £25 10s. per ton on the spot and £25 12s. 6d. to £25 15s. per ton forward.

GUM.—A better demand for "sorts" has resulted in the disposal of about 20 serons at 62s. 6d. to 75s. per cwt. according to quality.

LINSEED.—There has been no Calcutta offering either on the spot or forward. North American has sold well for shipment early in the week at 39s. 6d. to 41s. 3d. per 424 lbs., but the price has now risen to 41s. 6d. c.i.f.

OILS (FIXED) AND SPIRITS.—Castor Oil is steady and quiet with a small amount selling at 3d. per lb. for good seconds Calcutta (though 75 cases early in the week went for 2 15/16d. per lb.), 2⅝d. for French 1st pressure, 2⅝d. 2nd pressure, and 2½d. for 2nd Sulphur, Madras, 2¾d., at which price five tuns were sold. Olive Oil is extremely firm at even higher rates than last week, viz., £34 10s. to £39 per tun; Gallipoli being the dearest. Linseed Oil is firmly held for 23s. to 23s. 6d. per cwt. for Liverpool makes. Cottonseed Oil is very strong in tone at 19s. to 19s. 6d. per cwt. for Liverpool refined oil. Spirits of Turpentine, after rising to 39s. per cwt. early in the week, the price has now gone down 3d., and at present is firm at 38s. 9d. per cwt.

POTASH SALTS.—Bichromate is firm at 3¼d. to 3½d. per lb. Chlorate is steady at 3½d. to 3¾d. per lb. Cream of Tartar is unaltered both in price and demand. Pearlashes, 30s. cwt. Potashes, 21s. cwt. Prussiate is firm, 8¼d. to 8½d. per lb.

SODA SALTS.—Bicarbonate is firm, £6 5s. to £6 15s. per ton. Borax Crystals, 16s. cwt., Powder, 16s. 10d. per cwt. Caustic Soda is very firm, 76 to 77 per cent., £9 7s. 6d. per ton, 70 per cent., £8 10s. per ton. Crystals, £3 2s. 6d. to £3 5s. per ton. Hyposulphite is scarce at £6 10s. per ton. Nitrate is steady, with better demand for forward delivery, 7s. 6d. to 7s. 7½d. per cwt.

Marriages.

Brackenbury—Throop.—On September 19, at St. Laurence's Church, Bardney, by the Rev. C. E. Laing, Walter Robert Brackenbury, M.P.S., 219, Newport Road, Middlesborough, to Annie Mary Stovin, daughter of the late Chas. Stovin Throop, of Withern, Lincolnshire.

Timms—Allan.—On the 22nd ult., at 9, Irving Street, Dumfries, by the Rev. Alexander Chapman, M.A., of St. Mary's, assisted by the Rev. Duncan Cameron, B.D., George Herbert Timms, St. Loes, Amberley, Stroud, Gloucester, to Annie Birrell Carruthers, youngest daughter of William Allan, pharmaceutical chemist, Dumfries.

Deaths.

Maule.—On September 24, William Pratt Maule, Chemist and Druggist, Poplar. Aged 50.

Watson.—On September 27, Horace Watson, Chemist and Druggist, Laceby. Aged 86. Mr. Watson was a member of the Pharmaceutical Society from 1852 to 1891.

Greenish.—On September 28, Thomas Greenish, Pharmaceutical Chemist, Dorset Square, London, N.W. Aged 81. Mr. Greenish had been a member of the Pharmaceutical Society since 1847.

Bremridge.—On October 1, Anna Louise Bremridge, wife of Mr. Richard Bremridge, Secretary and Registrar of the Pharmaceutical Society, 17, Bloomsbury Square, London, W.C. Aged 60.

Partnerships Dissolved.

(From the London Gazette.)

Thomas McClure and Roger Kerr Hamilton, Physicians and Surgeons, Whittington Moor and Hasland, near Chesterfield. Debts will be received and paid by Thomas McClure,

George William Collins and Frank Collins, Surgeons, Physicians, Accouchcurs, and General Medical Practitioners, Wanstead, Essex.

Robert Thomson Forbes and Harry Graham Smith, Surgeons and Physicians, Breaston and Sandiacre, in the county of Derby. Debts will be received and paid by Robert Thomson Forbes, by whom the practice will in future be carried on under the style of Forbes and Scott.

Calendar for the Week.

Sunday, Oct. 8. 19th after Trinity. Sun rises 6.13., sets 5.21.

Monday, Oct. 9. Sun rises 6.15., sets 5.19.

Tuesday, Oct. 10. Sun rises 6.16, sets 5.17

Royal Photographic Society, 5A, Pall Mall East, London, W., at 8 p.m.—President's Annual Address; and presentation of medals awarded at the Exhibition.

Wednesday, Oct. 11. Sun rises 6.18, sets 5.15.

Manchester Pharmaceutical Association.—Annual Dinner.

Newcastle-on-Tyne and District Chemists' Association Hotel Metropole, at 8.15 p.m.—Third Annual Meeting.

Thursday, Oct. 12. ☽ 6.10M. Sun rises, 6.20; sets, 5.12.

Chemists' Assistants' Association, 73, Newman Street, London, W., at 9 p.m. Inaugural Address by the President.

Liverpool Chemists' Association, Royal Institution at 7 p.m.—General Meeting. Election of President. Paper by Mr. John Smith on "The Federation of Local Associations and the Pharmaceutical Society."

Friday, Oct. 13. Sun rises, 6.22; sets, 5.10.

Saturday, Oct. 14. Sun rises, 6.23; sets, 5.8.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. —Edward Peck, East Dereham.

What Offers? Remington's Pharmacy, (new) Art of Dispensing, Stirling's Dispensing Notes, 50 C.c. Burette, glass stopcock, ʒxii. glass stoppered Separator.—M., 388, Markhouse Road, Walthamstow.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Pharmaceutical Journal, current year. Also recent yearbooks.—Hunter, 23, Whitehead Street, Paisley.

Chemistry and Physics Books, cheap list sent.—Johnson, 155, Lea Rd., Wolverhampton.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements.

(Received too late for Classification.)

QUALIFIED ASSISTANT wanted, of good experience and address, about 22 to 25 years of age, for first-class Dispensing business at Tunbridge Wells, where 3 are employed. — Apply to Mr. R. A. ROBINSON, 195, Brompton Road, London, S.W.

LONDON, S.E.—JUNIOR (indoors) required at once, of good address and appearance, for first-class Dispensing and Retail. Apply, giving full particulars, to H. G. WILDMAN, 88, Norwood Rd., S.E.

GRANTHAM.—JOHN FILLINGHAM, Pharmaceutical Chemist, will shortly be requiring a good Junior ASSISTANT, accustomed to country business (outdoors); hours short.—Apply, with usual particulars, to the above address.

MANUFACTURING.—An exceptionally well-trained Pharmaceutical Chemist, with considerable experience in the manufacture of preparations and some knowledge of drug grinding. Must be businesslike, accurate and resourceful.—State age, experience and salary to FIDES, c/o Mather & Crowther, Limited, 10 to 12, New Bridge St., E.C.

PHARMACEUTICAL Chemist (24), Square Medallist, with good business experience, desires SENIOR or MANAGERSHIP in good-class business; good references.—BUSINESS, 5, Serle Street, W.C.

AS JUNIOR. Qualified, 22, 5 ft. 10 in., abstainer, disengaged. —A., 46, Turnham Green Terrace, Chiswick.

Publications Received.

A HANDBOOK OF PHYSICS AND CHEMISTRY. By H. E. CORBIN, B.Sc., and A. M. STEWART, B.Sc. Pp. 424, with 120 illustrations. Price 6s. 6d. London: J. and A. Churchill. 1899. From the Publishers.

MEDEDEELINGEN UIT 'SLANDS PLANTENTUIN. XXXI. Nadere Resultaten van het door Dr. W. G. BOORSMA, verrichte Onderzoek naar de Plantenstoffen van Nederlandsch-Indie. Pp. iii. + 145. Batavia: G. Kolff and Co. 1899. From the Publishers.

SHALL PHARMACISTS BECOME TRADESMEN? By George J. Seabury. Pp. 235. Price 30 cents. New York: G. J. Seabury, 59-61, Maiden Lane. 1899. From the Publisher.

THE PHYSIOLOGICAL ACTION OF THE ALKALOIDS DERIVED FROM ANHALONIUM LEWINII. By WALTER E. DIXON, M.D., B.Sc., Lond. Reprinted from the *Journal of Physiology*. From the Author.

CALENDAR OF THE BIRKBECK LITERARY AND SCIENTIFIC INSTITUTION, Bream's Buildings, Chancery Lane, London, E.C. Session 1899-1900. Pp. 184. Price 6d. London: Witherby and Co., Printers, 326, High Holborn, W.C. From the Secretary.

THE "GUTENBERG" TEMPERATURE AND PULSE RESPIRATION CHART. Manchester: James F. Wilkinson, The Gutenberg Works, Pendleton. 1899. From the Publisher.

A RADIOGRAPH OF AN INJECTED FULL-TERM FŒTUS (taken by Mr. F. H. Glew, Member of the Röntgen Society). By CHARLES IND, Musgrove Scholar in Anatomy and Physiology, St. Thomas's Hospital. (Plate xlvi.) Reprinted from the *Journal of Anatomy and Physiology*. From the Author.

NATURAL AND ARTIFICIAL METHODS OF VENTILATION. Pp. 68 + xvi. London: Robert Boyle and Son, Limited, 64, Holborn Viaduct. 1899. From the Publishers.

SUNDAY CHIMES, A NEW MAGAZINE FOR THE DAY OF REST. Pp. 56. Price 1d. No. 1, Vol. I., October 7. London: Cassell and Company, La Belle Sauvage, E.C. 1899. From the Publishers.

THE CHEMISTRY OF ESSENTIAL OILS AND ARTIFICIAL PERFUMES. By ERNEST J. PARRY, B.Sc.(Lond.), F.I.C., F.C.S. Pp. viii. + 411. (Illustrated.) Price 12s. 6d. nett. London: Scott, Greenwood and Co., Ludgate Hill, E.C. 1899. From the Publishers.

INTRODUCTION TO THE OUTLINES OF THE PRINCIPLES OF DIFFERENTIAL DIAGNOSIS, WITH CLINICAL MEMORANDA. By FRED. J. SMITH, M.A., M.D., Oxon., F.R.C.P., Lond. Pp. ix. + 353. Price 7s. 6d. nett. London: Macmillan and Co., Ltd. 1899. From the Publishers.

CALENDAR OF THE UNIVERSITY COLLEGE, BRISTOL, FOR THE SESSION 1899-1900. Pp. 286. Bristol: J. W. Arrowsmith, Printer, Quay Street. London: Whittaker and Co., 2, White Hart Street Paternoster Square. 1899. From the Secretary of the College.

ENGLISH NEWS.

Manchester Pharmaceutical Association.—The report of the annual dinner of this Association, which was held at the Mosley Hotel on Wednesday last, arrived too late for insertion in full in this week's issue. The following is a brief summary of the proceedings. There were about 100 gentlemen present, Mr. G. S. Woolley, President, in the chair. In proposing the toast of "The Pharmaceutical Society," the chairman advocated that an effort should be made to elect a representative of the Society to a seat in Parliament. Mr. G. T. W. Newsholme and Dr. C. Symes replied to the toast. The former, referring to the Benevolent Fund of the Society, stated that during the past year £2,215 was given to forty-six annuitants, and in addition a sum of £700 in casual grants. He touched upon the question of a compulsory curriculum, and referred to the position of the Council with regard to company pharmacy. Dr. Symes also mentioned the question of company pharmacy, and expressed the opinion that some means should be found whereby a person who fails to pass the qualifying examination should be prevented from forming a limited liability company to carry on the business of a chemist. Mr. J. Smith proposed "The Manchester Pharmaceutical Association and other Associations." He urged the formation of a greater number of local associations in smaller districts because he believed they could exert a great influence, especially at Parliamentary elections. Alderman Gibson responded, and advocated that local societies should unite and act together. Mr. Harry Kemp proposed "The Medical Profession," Dr. T. Harris responding. The concluding toast, "The President," was proposed by Mr. J. Rymer Young. Music and songs were rendered during the evening.

The Death is Announced of Lord Farrer, who was a member of the Select Committee of the House of Lords on the Companies Bill. He was formerly associated with the Board of Trade.

Loyalty to the Craft is not particularly manifest in the procedure of registered chemists who encourage and assist unregistered persons to sell drugs, but its absence is indicated to an extreme degree in a circular which has been sent to us by a correspondent. This document appears to have been sent out to shopkeepers by a firm of chemists, and reads as follows:—"Dear Sir or Madam,—Several shopkeepers have been fined for selling carbonate of magnesia as magnesia, and magistrates have decided that calcined should be given. We thought it desirable to caution you that what has been generally put in penny boxes is the carbonate. We are, from this date, sending out nothing but *calcined* magnesia. If you have any of our packed magnesia by you, please return it to us." As our correspondent remarks, one might smile at the sublime simplicity of the writer and his unquestioning confidence in our great unpaid, which the first paragraph evinces, and then admire his disinterested concern for "Dear Sir or Madam," and the heights of heroic resolution to which he rises in the second paragraph, if it were not that he is a chemist. If he had been an unqualified man trading as "Wholesale Druggist," nobody need have been troubled. Continuing, our correspondent says he would be very willing to support any attempt to better the position of chemists by legislation, but where is the good of it when chemists are doing this sort of thing? He firmly believes that loyalty to the calling and to one another would be a greater benefit to chemists, even under existing conditions, than would any changes likely to be obtained whilst the present attitude of mutual antagonism and disregard of common interests prevails. With this view of the matter we cordially agree.

The Jenner Institute of Preventive Medicine originated in the desire to have an establishment in London similar in character and purpose to the Pasteur Institute, Paris, and the Hygienic Institute, Berlin. It was founded in 1891, as the British Institute of Preventive Medicine, in order to study the means of preventing and curing infective diseases; to prepare any protective or curative materials found to be of value; to provide instruction in preventive medicine; and to carry out investigations in all branches of bacteriology. As pointed out by Dr. MacFadyen, the Director of the Institute, in an introductory address delivered on Monday last, no provision then existed in this country for the promotion of those objects on a scale at all commensurate with their importance, but a public appeal for funds, and the response made, showed that the idea of a national institution for the study of bacteriology met with wide approval. Work was begun in temporary premises in Bloomsbury, and ultimately transferred to the present and permanent home of the Institute at Chelsea. An event of far-reaching importance was the public announcement of Lord Iveagh's intention to devote a quarter of a million of money to the promotion of the objects for which the Institute was founded, and the new articles of association, a condition of the gift, have just been confirmed by the Court. The Jenner Memorial Committee having decided to transfer the funds in its possession to the Institute, steps were taken to perpetuate the memory of Jenner and his work by adopting the present title for the Institute. With regard to the work of the Institute, two volumes of transactions embodying work carried out in its laboratories have been published, and the anti-toxin department is engaged in preparing various therapeutic serums, notably the anti-diphtheritic serum, as well as in research in this important field of work. The primary object of the Institute is research, but facilities are afforded for post-graduate instruction in preventive medicine and bacteriology. The students attending the Institute have come from all parts of the world, and a considerable amount of original work has been done by those trained in the laboratories. Investigations are at present being made at the Institute with reference to the possible cure of typhoid fever, tuberculosis, and other diseases. The diagnosis of infectious diseases is constantly being carried out for the main parishes of London, as well as the investigation of questions affecting the public health on behalf of sanitary authorities. The chemical and state medicine laboratories will find much to do in connection with water, sewage, food, poisons, etc. A notable addition has been made to the resources of the Institute, in the Hansen Laboratory for the study of the practical application of bacteriology to industrial and technical processes, and the most important results are anticipated in the future from this branch of investigation.

Proprietary Articles Trade Association.—At a meeting of the Council of this Association, held on October 5, the report of the Executive Committee was considered and proposals submitted by the Grocery Committee were agreed to. Owing to inability to obtain the co-operation of the wholesale grocery houses, it has been decided that it would not be feasible to enforce the principle of combined stoppage of supplies in the case of grocery proprietary articles. The funds of the grocery section are to be kept distinct from those of the drug section.—The Memorandum of Association in reference to the Defence Fund was submitted and passed. The first two clauses of the Memorandum are as follow:—(1) To protect the members of the company against prosecution under any Acts of Parliament particularly affecting chemists and druggists or dealers in proprietary articles, and to defend members in any such prosecution. (2) To carry on in England and elsewhere the business of an Accident and Guarantee Insurance Company and insurance in all its branches (except life insurance), and in particular to grant or effect assurances against or upon the contingency of injury, damage, or loss by reason of accident of any description to human beings, and to grant or effect assurances against or upon the contingency of injury, damage, or loss by reason of accidents of any description to real or personal property of any kind.—Other matters discussed were the alleged insufficient profit on "Mother Seigel's Syrup," the scheme of Messrs. A. J. White, Ltd., being not approved of, and the cutting of the wholesale prices of homœopathic medicines.

Poor-Law Dispensing.—At a meeting of the Exeter Corporation of the Poor, held on Tuesday afternoon last, Mr. Governor Munro presiding, the Finance Committee reported that they had considered the application of Mr. Lemmon, dispenser, for an increase of salary, referred by the Court, and resolved to recommend that his salary be increased from £50 to £55, as from Michaelmas last. The report was adopted.

Exeter School of Pharmacy.—For the first time since the Exeter School of Pharmacy has been established in connection with the Exeter Technical and University Extension College at the Albert Memorial Museum, two students have entered for the full term course in preparation for the minor examination of the Pharmaceutical Society. The classes are being conducted by Mr. Alan H. Ware, Ph.Ch.

POISONING CASES.

Salt of Lemons.—An inquest was held at Southborough, on Monday, October 9, respecting the death of Lady Edwards (57), wife of Lieut.-General Sir James Bevan Edwards, which occurred on Saturday, the 7th inst. It transpired that early in the afternoon of Saturday, Lady Edwards had purchased four ounces of salt of lemons from Mr. Chatterton, chemist, and was subsequently found lying on Southborough Common suffering from the effects of poisoning, death occurring shortly afterwards. A *post-mortem* examination was made, and it was stated that she had consumed half-an-ounce of the salt of lemons, which was more than enough to cause death. The jury returned a verdict of suicide by poisoning, and recommended that salt of lemons should be placed on the schedule of the Pharmacy Acts.

Oxalic Acid.—In the case of Elizabeth Pitchley, the widow of a druggist's sundriesman, it was stated before Coroner Braxton Hicks, last week, that she had been afflicted with religious mania for some years, and after attending revival meetings held by American evangelists in the "Great American Tent," at Tooting, she went to stay with her sister at Wandsworth. Some beef-tea was given to her, to which she surreptitiously added oxalic acid. This mixture she consumed with a fatal result.—The Coroner, in the course of his remarks, said that the Legislature ought to place oxalic acid in Part I. of the Poison Schedule, so as to prevent it being so easily procured. There were, he said, no fewer than ten cases of oxalic poisoning in London each week—not all fatal; it was the cases of accidental poisoning it was desirable to guard against.

Carbolic Acid.—Agnes Harcourt (18), of Hulme, Manchester, a domestic servant, out of a situation, after writing a letter to her sweetheart, who had "given her up," to say that she was heart-broken, swallowed a quantity of carbolic acid. Death followed, and at the inquest held on Thursday, October 5, a verdict of suicide whilst insane was returned.——In another case which occured at Cressage, near Shrewsbury, on Monday, October 2, Henry Williams, saddler, drank from a bottle containing carbolic acid whilst in bed, and in spite of medical aid died about half an hour later.

Prussic Acid.—On Tuesday, October 3, John Greaves (56) chemist and druggist, Cardiff, died from the effects of poisoning. His relatives are of opinion that he took prussic acid in mistake for medicine prescribed for him by Dr. James.

Eye Lotion.—At Kendal on Thursday, October 5, four members of the family of a Mr. Winder were admitted to the Memorial Hospital, suffering from the effects of poisoning. It is supposed that in moving from one house to another some eye lotion became mixed with a quantity of vinegar in a bottle. At any rate, after partaking of the vinegar with some beetroot at dinner, the whole family was taken ill. Two doctors were sent for, and they found symptoms of poisoning, which they agreed was consistent with those which would be produced by the eye lotion. Every effort was made to counteract the effects of the poison, with the result that the patients are recovering.

IRISH NEWS.

Pharmaceutical Society of Ireland.—The following have passed the Preliminary Examination:—T. O'Reilly, Octavia G. Greer, F. J. Brice (D. Flynn and E. H. O'Sullivan, equal), W. J. McKinney, C. H. Fenelon, C. Agnew, T. Linehan, T. G. S. Bogue, W. P. Kennedy, Johanna M. Maher, J. Bradley, and G. F. Bredin. Nine candidates were rejected.

The Pharmaceutical Society's Annual Dinner was held on Tuesday, October 3, when Mr. R. J. Downes occupied the chair, and was supported by a large and distinguished company. In responding to the toast of the "Pharmaceutical Society of Ireland," Mr. Downes said the aim of the Council of the Society was to establish a high standard of education amongst licentiates, and for the benefit of the public. He regretted that their numbers were not increasing at such a rate as might be expected. He attributed that to the trading by unqualified persons under shelter of the Companies Acts. In that way bread was taken out of the mouths of qualified men, and there was a falling off in the numbers who were joining the Society. In combating this system of company trading by unqualified persons they had the support of many members of Parliament, and notably of Mr. Field, M.P.

The Third Session of the Evening Meetings of the Pharmaceutical Society of Ireland will be opened in a very short time. A circular on the subject has been sent to the members, and those who are desirous of discussing or contributing papers upon matters of pharmaceutical interest are asked to communicate with Mr. Henry O'Connor, M.P.S.I., the honorary secretary, at 67, Lower Mount Street, Dublin.

Typhoid Fever is at present prevalent in Dublin. Several deaths have occurred, and the malady seems on the increase.

Sir Charles Cameron, Dublin, has been appointed analyst for drugs to the Wexford Union at £10 a year.

In the Dublin Law Courts recently an amusing case was heard. It was an action brought by a Mrs. Steele, of Waterloo Road, Donnybrook, to recover damages from a Dublin perfumer and hair dyer for alleged unskilful treatment of her hair during the process of dyeing. Plaintiff affirmed that defendant turned her hair to a brick red and other colours in the process and burned it badly. Defendant denied this and pleaded that the plaintiff had previously injured her hair by the excessive use of peroxide of hydrogen, and that he treated her hair skilfully and properly. The judge seemed to enjoy the recital of the lady's grievance, and remarked that "the hair is the glory of woman and the pride of man." The case was remitted to the Recorder, and will be heard anew on the 29th inst.

One Thousand Pounds Per Annum, it was mentioned some time ago, had been offered by a Johannesburg chemist to a pharmacist in Belfast. This is given with all reserve lest another raid might be launched on the "gold-reef city." It is more like the "screw" of a big mill manager and is enough to make the mouths of assistants water. The precariousness of civic rights in the Transvaal and the risks which medical people run (Dr. Matthews being bludgeoned recently) ever since Dr. Jameson created a Boer prejudice against them, may account in some degree for the huge salary, but with the advent shortly of a more equitable rule, incomes will, perhaps, by the influx of adventurous chemists, approximate to a more normal figure.

Doctors in Some Instances are favourably impressed with the excellence of their handwriting. They cannot believe that their penmanship is not the best "Civil Service" style, but the fact is it is unnecessary trouble inditing their prescription in Latin to conceal its contents from the patient, their ordinary English writing being sufficiently cryptogammic. What could a Continental Apotheker-Verein or pharmacien make of "C———"? Yet, an Irish dispenser knew that that was to be read as indicating the name of a client.

Take the Case of a Gentleman who made a purchase in a Leinster pharmacy, desiring it to be posted to the address which he wrote out. When the chemist subsequently proceeded to rewrite it he found the caligraphy a mere jumble of saw-edged angles; so he cut it out and pasted it on the parcel, fully confident that the post-office authorities would decipher it, if anybody could. But shortly after the package of requisites was returned, address untranslateable. So it was left aside. The gentleman some days later appeared, was wroth, and desired to know why the articles had not been forwarded. He was told. "Absurd!" he retorted; "anyone could have read it." He was allowed to proceed in this strain in order that he might irretrievably commit himself, and then the parcel bearing the post-office inscription was shown him. "Is that your writing?" There was a great silence, and then the great man took up his little parcel and passed out speechless. [N.B.—He was not a doctor.]

The Local Government Board, writing to the Omagh Guardians *re* Mr. O'Connor's appointment as analyst, said:—"In view of the importance of the duties devolving on him, they required in the case of persons other than public analysts educational attainments equivalent to the F.I.C. status." A copy of the letter was forwarded to Mr. O'Connor.

In Dublin two women have been "accidentally poisoned" by mistaking some mixture for whiskey. One of them has since died, whilst the other is in a critical condition. The fact that one of the victims was stated to be a nurse renders the occurence the more extraordinary.

Marriage.—Deakin and McLachlan.—On September 18, at Drumcondra Church, by the Rev. John Connell, M.A., James Aubry Deakin, L.P.S.I., Mount Auburn, Richmond Road, to Catherine Robertson, only daughter of Donald McLachlan, Drumcondra.

Death.—Cunningham.—The death has occurred at Belfast of Mr. Benjamin Cunningham, L.P.S.I., Crossan, County Down.

SCOTTISH NEWS.

Spirit of Salt for Whisky.—A sad case of poisoning by misadventure is reported from Dollar, where a plumber named Charles Roxburgh swallowed a quantity of spirit of salt, supposing it to be whisky, and though everything possible was done to relieve him, he expired in great agony some hours afterwards.

Presentation to Mr. George Center.—Upwards of sixty past and present pupils of the Edinburgh Central School of Pharmacy held a smoking concert in the Imperial Hotel, Market Street, on Tuesday, October 3. Mr. W. B. Cowie, Principal, occupied the chair, and in the course of the evening Mr. William Cowie, one of the pupils, on behalf of the past and present students, presented a gold albert and pendant, bearing a suitable inscription, and several valuable books on chemistry and physics, to Mr. George Center, who has resigned his position as a teacher in the school to pursue his studies at University College, London, with a view to graduating in Science at the London University.

Glasgow Chemists and Druggists', Assistants', and Apprentices' Association.—The Treasurer of this Association writes to the Glasgow *Evening News* as follows:—"Some time ago a number of your readers engaged in the trade were lamenting the fact that assistants in Glasgow had no organisation of their own, whereby much might be done to ameliorate the conditions and working hours of labour, etc. I would, with your permission, inform my brethren in affliction that the above Association has been formed with this and other objects in view, and would appeal to all interested to come forward and avail themselves of the opportunity thus afforded, to mutually benefit one another socially, intellectually, and otherwise. A splendid syllabus has been prepared for the ensuing session, consisting of lectures from able men (scientific and literary), also "At Homes," and other lighter forms of amusement as a variation in the programme. The Association has secured central premises in the Masonic Chambers, 100, West Regent Street, where weekly meetings are to be held every Friday evening from 9 p.m. Assistants are therefore most cordially invited to become members at once, and so encourage the movement, which is by no means antagonistic to the interests of employers, but rather the reverse."

FOREIGN NEWS.

The First Doctor of Pharmacy of the University of Paris is M. Lacourt, whose graduation thesis dealt with the historical, chemical, and bacteriological study of the water of Versailles.

Plague Microbes Brought Back to Paris.—When Dr. Albert Calmette, Director of the Pasteur Institute at Lille, returned from fighting the plague at Oporto a day or two ago, he drove straight to the *Figaro* Office to shake hands with his brother, Monsieur Gaston Calmette, before leaving Paris for Lille. He was welcomed by several journalists who happened to be present, among them M. Emmanuel Arène, who gives a description of the scene in the *Eclair*. Dr. Calmette had left his luggage downstairs on a cab, but he carried in his hand a little tin box, fastened with two padlocks, which he put down carefully on the mantel-piece. Conversation became general. The doctor declared that all his experiments had been most successful. "So you know exactly what kind of plague you had to deal with?" asked one of the company. "Of course I do," was the startling answer, "for I have brought it back with me," and the doctor calmly took the tin box off the mantel-piece, and, somewhat to the horror of the listeners, began to open it. He took out a little glass tube, hermetically sealed, which contained something that looked very much like clear glycerine. There were millions of microbes in it, though they were not very easy to see. "You have only to dip a pin in this and prick yourself," he said, "and in ten hours you would have the plague; in five days you would be dead. But you had better take my word for it," he added, smiling, and everyone cheerfully did. Dr. Calmette has no fear for Paris. "If the plague should get here," he said, "nothing would be easier than to isolate it on its first appearance. It would be a matter of a few hours, and it would be localised in the house in which it broke out."

The French Government proposes to establish a bureau of information at the 1900 Exhibition for the convenience and comfort of English and American visitors. Monsieur Louis Herbette, member of the Superior Commission of the Exhibition, is visiting America and Canada on an official mission designed to stimulate the interest of America in the science and art and literature of France. In an interview M. Herbette said: "It is considered by France of the greatest importance to open to foreign visitors, especially Americans, who are interested in the highest intellectual pursuits, an opportunity to examine fully the establishments and institutions devoted to these varied lines of thought and endeavour. My chief purpose at the present time is to ascertain what is desired in the way of such information by prospective American visitors, and I especially desire to obtain, by correspondence, the views of Americans as to the best means of meeting their requirements. We have already established in Paris a bureau of information under the auspices of the Faculty of Medicine, which furnishes to every visitor, especially to those speaking the English language, precise information on hospitals, wards, clinics, and results secured in the scientific branches. I wish to correspond with those intending to visit France that I may present their ideas to our Government with a view to accomplishing the highest possible results."

The Scheurer-Kestner Monument.—At the top of the twelfth subscription list for a monument to the late Monsieur Scheurer-Kestner are prominent the names of Alfred Dreyfus for 500f., Mathieu Dreyfus 500f., and Monsieur Hadassard 200f.

Monsieur Jumelle, in a recent note to the Académie des Sciences, Paris, mentions a new rubber plant, found in Madagascar. It is the Piralahy, a liana common in the island, and a new species of the genus Landolphia. The Sakalaves draw from it a clear rubber containing five per cent. of resin, and suitable, apparently, for industrial purposes.

Plague in Portugal.—It is reported that several of the soldiers forming the military cordon have been attacked by plague. According to the official bulletin, five fresh cases of plague and one death occurred at Oporto on Sept. 30. Dr. Ricardo Jorge the leading medical officer, has asked to be allowed to discontinue his work in connection with the plague, both on the ground of his own state of health and of the condition of public opinion.

ARTIFICIAL COAL, a mixture of 92 to 94 per cent. of ordinary earth and 6 to 8 per cent. of chemical ingredients, is cheaper and better than coal, says Herr Montag, its German inventor. It does not develop poisonous gases, creates but little soot, and leaves no slag but a small amount of ash which resembles that of wood or cigar (*sic*). The price of the plant for producing this fuel is 18,750 francs, and patents for the invention, it is said, have been taken out in seventeen countries.

AT A RECENT MEETING of the Académie des Sciences, Paris, Monsieur Moissair, the famous chemist, announced that Professor Dewar had solidified hydrogen. "By evaporating the liquified gas he had produced a cold sufficient to freeze it. The temperature thus attained was about 267° C. below zero—that is to say, within 6 to 8 degrees of the "absolute zero" of temperature (274° C.), a theoretical temperature not yet attained in practice. We have always styled the "absolute zero" the "North Pole" of the physicist, and Professor Dewar has publicly adopted our comparison. He will not, therefore, take it amiss if we regard him as the "Nansen" of experiment, for he has certainly gone much nearer to the Pole than anybody else, and there is hope now that we may reach it."

PHARMACY IN SOUTH AFRICA.

SOUTH AFRICAN PHARMACEUTICAL ASSOCIATION (EASTERN PROVINCE).—The annual meeting of this Association was held in East London, Cape Colony, on Thursday, September 14. On account of the absence of the President, Mr. W. K. Magor (at present on a visit to the Home Country), and the Secretary, Mr. Lister, the attendance was not up to former years, letters of apology being also sent by several prominent Eastern Province chemists who could not attend. The proceedings of the meeting held at Queenstown on September 14, 1898, were read and adopted. A vote of condolence with the widow of the late Mr. Henry Tebb (Lennon, Limited), was unanimously passed, Mr. Tebb having been closely connected with South African pharmacy. The election of officers for the ensuing year resulted as follows:—President, Mr. W. K. Magor (Queenstown), re-elected; Vice-President, Mr. G. F. Dutton (East London); Executive Committee, Messrs. McJannet (East London), G. E. Cook, A. G. Doble, R. Lumsden (King William's Town), A. E. Austen (Cradock), Walsh and Willett (Port Elizabeth); Secretary, Mr. Lister (Queenstown), re-elected. New members elected were Messrs. H. E. Austin (Cradock), J. C. Jamieson, J. B. Preston and E. A. Hodge (East London). It was decided by those present that a circular letter be sent to all members and associates as to the advisability of holding a special meeting of the Association at the more general convenience, the date and place to be left to the executive committee. It has been usual to hold the annual meetings at the towns where the District Grand Lodge of Freemasons visit for their annual gatherings, but as this has not suited many who live in the up-country districts, it was considered that a more central place should be fixed upon, or one of the large towns, such as Cape Town, Port Elizabeth, East London or De Aar (Junction). The social element might be introduced to advantage on the lines of the meetings of the British Pharmaceutical Conference in England, combining business with a *soupçon* of pleasure. The question of amalgamation with the Western Province Association was discussed, but left for a future meeting. The recent Medical and Pharmacy Act Amendment Bill was successfully opposed by the Association, supporting the Cape Pharmaceutical Association, and the Bill passed the House of Assembly with the three objectionable clauses worded to meet the requests of the chemists. It was suggested that as the chemists were getting stronger in numbers that steps should be taken at an early date for drafting a Pharmacy Act pure and simple, and not bracketed with the medical profession as at present. Further business was left by mutual consent to the next meeting, to be convened before the next annual meeting, and, with a cordial vote of thank to the chairman, members once more parted on their several ways.

MASONIC.—The District Grand Lodge of South Africa (Eastern Division) met for its annual gathering this year at East London, and among the visitors pharmacy was represented by Messrs. A. E. Austen, D.D.G.M. (Cradock), G. E. Cook, P.M., B.K. 853, A. G. Doble (King William's Town), G. F. Dutton (East London). A banquet was given by members of the Buffalo Lodge in the Drill Hall, and a ball was held the following night. The electric light was used at these functions for the first time in East London, the town now being "wired" for electric tramways and lighting.

THE PURITY OF FOOD AND DRUGS.

CAMPHORATED OIL.—On Saturday, September 30, James Evans, grocer, Six Bells, was summoned at Pontypool Petty Sessions for selling camphorated oil deficient in camphor to the extent of 15 per cent. The bottle was marked as containing genuine camphorated oil.—The defence was that the oil was purchased from the wholesale dealers as a genuine article.—Fined 10s.

SPIRIT OF NITRE.—James Snowden, shopkeeper, Dinnington, was summoned at the Rotherham West Riding Police Court on Monday, September 25, for selling spirit of nitre not of the nature and quality demanded by the purchaser.—Mr. A. H. Allen, analyst, certified that the mixture contained nitrous ether, 0·87; alcohol and legitimate water, 97·84; excess of water, 1·29.—Defendant stated that he sold the spirit of nitre in question as he received it, and called Robert Bennett, chemist and druggist, Sheffield, who stated that he supplied the article to Mr. Snowden, and could vouch that there had been no adulteration. The excess of water, in his opinion, was due to evaporation.—Fined 5s., and costs.

SEIDLITZ POWDERS.—Francis Pursell, grocer, Aylesbury, was summoned at the Aylesbury Petty Sessions (Bucks) on Saturday, September 30, for selling one dozen seidlitz powders not compounded according to the B.P.—The defence was that the powders were sold as received from the wholesale firm in London.—The chairman pointed out that the printing on the box stated that they were improved powders, and were not claimed to be in accordance with the standard of the B.P.—The prosecutor said he took his stand from the fact that he asked for seidlitz powders and expected to get them.—The Bench, after some consultation, decided that they must convict, although there was no imputation against defendant.—Fined £1 1s., including costs.

Partnerships Dissolved.

(From the London Gazette.)

Edward Buxton and Henry Buxton, carrying on business as Physicians and Surgeons, at Great Crosby, in the County of Lancaster, under the style of Drs. E. and H. Buxton.

Richard Henry Reeves, Joseph Emil Maeder and Thomas Moffatt, Chemical Manufacturers, 19 and 21, Pennyfields, Poplar, E., trading under the style of the Orion Chemical Company. Debts will be received and paid by Joseph Emil Maeder.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

Herbert Sturge, Veterinary Surgeon, 2, Manston Road, Heavitree, formerly of Cowick Street, St. Thomas the Apostle, Devonshire.

John Batty Beckworth, Chemist and Druggist, 19, Moss Grove, Liverpool, formerly carrying on business at 139, Oakfield Road and 86, Everton Road, Liverpool.

James Henry Pollitt, Chemical Agent, 265, Mill Street, Bradford, Manchester.

Thomas Edward Parkin and Frederick George Fry (trading as Parkin and Fry), Photographic Material Manufacturers, 31, Sanstone Road and Etna Mills, Old Swan, Liverpool.

Daniel Macpherson Taylor, Physician and Surgeon, formerly 100, Burdett Road, Mile End, now of 1, Thanet Place, Strand, London.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

October 12, 1899.

Business, without being very active, has been somewhat better, as far as Drugs and Chemicals are concerned, during the past few days, the chief event of past week being a further advance in price of Cocaine; Quicksilver, Mercurials, refined Camphor, Quinine, and Senna are also dearer. Acid Carbolic very steady, and reported to be likely to advance in price. Opium, Morphine, Codeine firm. Sulphate of Ammonia weak. Glycerin very firm. Codliver Oil tending upwards as regards price. As the fears that war would be the ultimate result of the Transvaal question have unfortunately been realised, it now remains to be seen how prices will be affected beyond what has already taken place. It is probable that those who acted promptly on the hint given in these columns last week in the way of looking to their stocks and laying in a fair store of anything which they might require while they could still do so at a moderate price, will not have cause to regret having so done. The following are the prices actually ruling for some articles of principal interest:—

ACETANILIDE—Remains dull and weak at 9½d. to 1s. per lb., according to quantity.

ACID BORAX AND BORAX—Are quiet and unchanged prices.

ACID CARBOLIC—Firm at unchanged prices—namely, 6¾d. to 7d. per lb., according to quantity and make for 35-36° C. Ice Crystal in large bulk, 7½d. per lb. for the 39-40° C. Ice Crystal, and 8d. to 8¼d. per lb. for 39-40° C. B.P. quality in detached crystals. Crude, 60° F., 2s. 1d. per gallon; 75° F., 2s. 7d. per gallon; Liquid, 95-98 per cent. of pale straw colour, 1s. 3d. to 1s. 4d. in 40 gallon casks; ditto, 30 per cent. of dark colour, 10d. to 11d. per gallon.

ACID CITRIC—Is weak at 1s. 5d. to 1s. 6d. per lb., according to quantity and make, for crystals in 5 cwt. casks.

ACID TARTARIC—Quiet, and unchanged, at 1s. 1d. per lb. for English, and 1s. 0¼d. per lb., c.i.f., for foreign.

ALOES.—Cape have been in good demand privately, and full prices have been paid up to 26s. per cwt. for good hard bright.

AMMONIA COMPOUNDS.—Are unchanged, with the exception, that Sulphate continues weak, and is quoted at rather lower prices

BROMIDES—Are steady at unchanged prices.

CAMPHOR.—Owing to the firmness of Crude Camphor, the English makers of the refined article have raised their price 1d. per lb. to 1s. 8d. per lb. for Bells and Flowers in ton lots.

CINCHONA BARK.—Unimportant supplies were catalogued for these auctions to-day, the total amounting to only 975 packages of all descriptions, as compared with 1,904 packages at the preceding sale. A good demand prevailed, and practically the whole changed hands at an advance on the last Dutch sales, the average unit obtained being 1⅛d., being steady previous London auctions. Ceylon: 44 bales and 18 bags offered and 26 packages sold, according to analysis, Succirubra, natural stem chips at 3⅛d. to 3½d., fair Ledger ditto at 4⅝d. East Indian: 176 bales and 50 cases offered and 176 bales sold. Red, natural stem chips at 2¾d. to 3⅛d., bold, mossy, silvery Quill at 4d.; Officinalis, ordinary to fair stem chips and shavings at 2¾d. to 3¾d., branch at 1¼d. to 2⅞d.; renewed chips and shavings at 4d. to 4¼d. Ledger, natural stem chips 5⅝d., Hybrid ditto at 2d. Java: 279 bales offered and sold, ordinary to good Ledger stem chips at 3½d. to 5⅜d., good Root at 5⅛d., branch 4⅝d., twigs 1¼d. South American: 165 bales Bolivian cultivated Quills offered and sold, fair to good at 6d. to 7⅝d. Cuprea: Of 200 bales 156 sold, new import, at 1⅝d. to 1¾d. Colombian: 46 packages offered and chiefly sold, with all faults, for account of whom it may concern.

CLOVES.—Privately Zanzibar steady, but quiet, quotations being—October-December, 3⅛d., and January-March, 3 3/16d. At auction Penang in large supply, and lower prices ruled. Of 218 cases 185 sold, without reserve, good fair picked at 5⅝d. to 5¾d., dullish at 5½d. to 5⅝d. No Zanzibar offered.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 1s. 3d. per gallon. Benzole, 50 per cent. prompt, 10½d. to 11d., November-December, 11d. per gallon; 90 per cent., 9d. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent., at 120° C., 4½d. per gallon. Solvent Naphtha, 95 per cent, at 160° C., 1s. 5d. per gallon; 90 per cent., at 160° C., 1s. 3d. per gallon; 90 per cent., at 190° C., 1s. 2d. per gallon. Anthracene, A., 3¾d. per unit; B., 2¾d. Pitch, 35s. per ton, f.o.b. Tar, refined and crude, 14s. 3d. per barrel, 3d. per gallon.

COCAINE.—Makers again advanced their price 3s. per oz., quotation now being 20s. 6d. per oz. for the Hydrochlorate in 25 oz. tins for 200 oz. lots, while it is stated that in consequence of the continued scarcity of crude Cocaine, makers of the refined article are not free sellers, even at the above advanced prices.

COD LIVER OIL—Is decidedly better, quotations being now 60s. to 65s. per barrel according to brand and quantity for best non-congealing Norwegian oil in tin-lined barrels of 25 gallons each.

CODEINE.—Firm at 12s. 11d. to 13s. 6d. per oz., according to quantity, for the pure, and 1s. per oz. less for the salts.

CREAM OF TARTAR.—Firsts white crystals are still quoted 74s. per cwt., and powder 76s. to 78s., according to percentage.

GINGER.—Cochin, in large supply, found poor demand; of 1,407 packages only 171 sold: Cut kinds, bold, some medium scraped, at 76s. to 76s. 6d.; ditto, washed, at 75s.; medium, fair scraped, 52s. 6d. to 53s.; small, and ends slightly limed, at 25s.; good shrivelled pickings at 17s. to 17s. 6d.; common ditto, 15s.; Calicut, rough, fair, slightly mouldy, at 23s.; medium and small, bright, at 22s. 6d.; small at 21s. to 21s. 6d. Of Jamaica only 40 barrels offered and sold, chiefly without reserve, ordinary middling at 60s. to 61s. 6d.; common at 54s. to 56s. 6d.

GUM TRAGACANTH.—On Friday last 1,300 packages were offered by auction, and, with a strong demand, about 750 packages found buyers at, and after, the sales at an advance of 5s. to 10s. per cwt., some of the medium grades realising extreme values Stock is now small, and the selection very indifferent. Nominal values:—Firsts, £14 10s. per cwt.; seconds, £13 10s.; thirds, £11 15s.; fourths, £10 15s., and other qualities down to 50s. cwt.

IODIDES—Are unchanged in price.

MERCURIALS.—In consequence of the advance in value o Quicksilver, makers advanced their prices 1d. per lb. to 3s. per lbf for Calomel, and 2s. 8d. per lb. for Corrosive Sublimate.

MORPHINE—Is firm at the prices quoted last week, say, 5s. per oz. for the Hydrochlorate Powder.

OILS (FIXED) AND SPIRITS.—Linseed firm; on spot, pipes, London, £22 7s. 6d. to £22 10s.; barrels, £22 15s.; Nov.-Dec., £22 12s. 6d.; Jan.-April, £22 7s. 6d.; Hull, spot, naked, £20 15s.; Nov.-Dec., £20 15s.; Jan.-April, £21; May-Aug., £20 15s. Rape firm; ordinary brown on spot, £24; Nov.-Dec., £24; Jan.-April, £24; Refined, spot, £25; Ravison, naked, dearer, spot, £21 5s.; Nov.-Dec., £21 5s.; Jan.-Feb., £21 10s. Cotton steady; London, crude, spot, £17 15s.; Nov.-April, £17 10s.; refined, spot, £19 10s.-£20 10s., according to make; Hull, naked, refined, spot, £18; crude, spot, £16 15s.; Nov.-April, £16 7s. 6d. Olive firm; Mogador, £33; Spanish, £34; Levant, £33-£34. Cocoanut firm; Ceylon, on spot, £25 10s.; Nov.-Jan., £24 10s., c.i.f.; Cochin, spot, £29 10s.; Oct.-Nov. and Jan.-March, £27, c.i.f.; Mauritius, £25 10s., in hogsheads, just arrived. Palm has advanced 10s.; Lagos, spot, quoted £27 10s. Castor Oil firm; Belgian first pressing, spot, £26 10s.; Jan.-June, 1900, £25 10s., f.o.b. Antwerp; second pressing, spot, £25 per ton, ex-wharf; Hull manufactured, guaranteed cold drawn, pure pharmaceutical, £29 5s. per ton in barrels, 3⅜d. per lb. in cases; pure firsts, £26 15s.; seconds, £25 15s. per ton in barrels; firsts, 3⅛d. per lb. in cases; seconds, 3d., ex-wharf, London. Lubricating Oil: Pale American, spot, 7s. to 9s.; black, 6s. 3d. to 8s.; Russian black, 5s. 6d.; pale, 7s. to 8s. 6d. Petroleum Oil flat; Russian, spot, 5 7/16d. to 5½d.; American, spot, 6⅞d. to 7d., and to end of March; water-white, 8⅛d. to 8¼d. Turpentine firmer; American, spot, 37s. 7½d.; Nov.-Dec., 37s. 10½d.; Jan.-April, 38s. 7½d.; July-Dec., 32s. 6d. to 32s. 9d. Petroleum Spirit: American, 9¾d.; deodorised, 10d.

PHENACETINE—Is still being offered at the late low prices, say, 3s. 3d. to 3s. 6d. per lb., according to make and quantity, for both Crystals and Powder.

POTASH COMPOUNDS.—There are practically no changes in price to report.

QUICKSILVER.—Rothschild advanced his price to £8 17s. 6d. per bottle, while there are sellers from second hand at 1s. per bottle less money.

QUININE.—After some hesitation the market is again tending upwards, there being buyers in the speculative market at 11¾d. per oz. for B & S or Brunswick sulphate, while the makers of these brands. to-day advanced their prices ½d. per oz., *i.e.*, from 11½d. to 1s. per oz. for sulphate for 1,000 oz. lots in 100 oz. tins.

SCAMMONY.—There has been a fair demand for "firsts" at 30s. per lb.

SENNA.—Tinnevelly: During the week there has been a very fair demand, but there is very little offering from second hands. Arrivals are coming forward a little more freely, over 300 bales being due here at the end of the week. Alexandria: Siftings are inquired for, but stock appears to be exhausted.

SODA COMPOUNDS.—These are practically unchanged from last week.

SPICES (VARIOUS).—Black Pepper: 7 packages fair small Tellicherry sold at 5⅜d.; 100 bags Penang bought in at 5⅜d. White Pepper: 4 bags Singapore sold, fine at 9½d.; Siam bought in at 8⅝d., and Penang at same figure. Chillies: 39 bags African sold, fair to good bright red at 42s. to 45s. 6d.; ordinary dull at 38s.; 10 bags Japan sold, good bright at 34s. Capsicums: 24 bags African bought in, fair bright red at 38s. Cassia Lignea: 453 cases all bought in, fine old at 50s.; new selected at 40s. Cinnamon: Of 303 packages Ceylon only 59 bags sold, broken at 5¾d. to 8d., chips at 3⅝d. Mace: 29 packages West Indian sold, fair to good pale at 1s. 6d. to 1s. 8d.; fair red, 1s. 4d. to 1s. 5d. Nutmegs dull at about previous rates. Pimento: Of 436 bags only 98 sold, fair to good at 3⅜d. to 3½d.

THURSDAY'S DRUG SALES.

To-day's Drug Auctions passed off quietly, only a limited number of the lots catalogued finding buyers, while there are no changes of any special importance to record. Senna sold well at again higher prices. Cardamoms and Buchu Leaves also sold well. The following are some of the particulars :—

ALOES.—7 boxes fair livery Curacoa were bought in at 33s., an offer of 25s. per cwt. being declined. Good hard bright Cape sold at 23s. to 24s. 6d. per cwt. 2 cases fair Zanzibar in monkey skins sold at 50s.

ANNATTO SEEDS.—2 packages of dull appearance sold at 1d. per lb.

ANNATTO PASTE.—1 case of fair quality was taken out at 1s. 3d. per lb.

ANTIMONY.—60 cases Japan crude (black sulphide) were held for £23 10s. per ton.

BALSAM COPAIBAE.—6 casks bought in at 1s. 6d. per lb.

BALSAM PERU.—6 cases of fair quality were bought in at 7s. 9d. per lb.

BALSAM TOLU—10 cases bought in at 1s. 6d. per lb.

BUCHU LEAVES—Sold at good prices, yellowish green rounds realising 8d. per lb.

CAMPHOR.—50 cases China crude were bought in at 140s. per cwt.

CARDAMOMS.—Fine bold pale Ceylon Mysores realised 3s. 7d. to 3s. 9d. per lb., 1 case of especially fine quality fetching 4s. 3d. per lb.; 2s. 5d. to 2s. 11d. per lb. for medium, down to 1s. 8d. to 2s. per lb. for lower qualities. Malabars part sold at 1s. 9d. to 2s. per lb.; part taken out at 2s. 6d. For fair Tellicherry an offer of 2s. per lb. was refused. Good seeds sold at 2s. 5d. per lb.; medium to fair ditto at 1s. 9d. to 2s.

CASCARA SAGRADA.—2 bales damaged sold without reserve at 21s. per cwt.

CASCARILLA BARK.—12 bales thin bark of fair quality were taken out at 50s. per cwt.

CASTORUM.—2 boxes were bought in at 60s. per lb. for A quality and 52s. per lb. for B.

CHINA SOY.—20 casks, which had been catalogued, were sold prior to the auctions at 1s. 2d. per gallon.

CINCHONA BARK.—44 serons sold readily at 6¾d. to 7¾d. per lb. for Huanoco and 9¾d. to 10d. per lb. for Loxa; 20 bales Carthagena were held for 4d. per lb.; 8 bags New Granada sold at 2d. per lb., subject to owner's approval.

COCA LEAVES.—Four bales somewhat inferior Truxillo were bought in at 1s. 4d. per lb.

COCCULUS INDICUS.—65 bags bought in at 9s. 6d. per cwt.

COD LIVER OIL—For 5 barrels yellow Norwegian, there was no bid.

COLOCYNTH.—4 cases good Turkey apple were bought in at 2s. per lb. Less money would, however, probably be accepted. Another lot of 6 cases of only fair quality were taken out at 1s. 5d. per lb.

COLOMBO ROOT.—Fair sorts realised 21s. 6d. to 22s. 6d. per cwt., fine washed sold at 50s.

CROTON SEEDS.—10 bags good quality realised 48s. per cwt. 19 bags of dull appearance sold at 30s. per cwt.

CUBEBS.—31 bags were bought in at 25s. per cwt. 56 bags very dusty, sold at 20s. 6d. to 21s. per cwt.

CUTTLEFISH BONE.—5 cases of fair quality were bought in.

DRAGON'S BLOOD.—4 cases, part sold at £10 15s. for picked bright lump; 1 case fine picked was taken out at £22 per cwt.

ERGOT OF RYE.—Fair sound Russian was held for 2s. per lb. Another lot of small but sound quality was taken out at 2s. 3d. per lb.

ESSENTIAL OILS.—25 cases fair Cajeputa oil bought in at 2s. 9d. per bottle, 8 cases Lime oil at 3s. per lb., 3 drums Citronelle at 1s. 1d. per lb. 15 cases Eucalyptus sold at 1s. 5½d. per lb.

GAMBOGE.—Fair bright pipe sold at £7 17s. 6d. to £8 per cwt.; and pickings at £5 15s. to £7 5s., down to 70s. for dust, and 95s. per cwt. for chips.

GUAZA (HERBA CANNABIS INDICA).—25 robbins, part fair green tops, part brownish, were bought in at 3½d. per lb.

GUM AMMONIACUM.—22 cases bought in at 35s. for blocky, part free; at 30s. for clean blocking; and 20s. per for dark blocky.

GUM ARABIC.—4 cases fair pale grain bought in at £7 per cwt.; 14 packages part sold previously, part bought in at 35s. per cwt. for good pale sorts.

GUM ASAFŒTIDA.—41 cases, chiefly dark, but some good, were practically all bought in at 25s. to 65s. per cwt., according to quality. Of other 41 cases, part sold at 75s. per cwt. for loose almonds, down to 50s. to 55s. for pale almondy block.

GUM BENZOIN—Fair Sumatra seconds sold at £8 per cwt. Fair Palembang bought in at 60s. to 65s. per cwt. Very common ditto, at 40s.; fair free almondy Siam sold at £17 per cwt.; fine reddish block with large almonds was bought in at £14 5s,; small ditto selling at £10 10s.; and friable block at £9 down to 92s. 6d. per cwt. for lower and inferior qualities; 1 case siftings sold at 45s; 3 cases Penang sold at 72s. 6d. per cwt.

GUM MASTIC.—2 cases were bought in at 1s. 7d. and 1s. 8d. per lb.

GUM MYRRH.—1 case of fine picked gum sold at £5 10s. per cwt.; good but dusty sorts bought in at 50s. per cwt.; 5 bales fair dusty sorts sold, 49s.

GUM KINO.—2 cases genuine Cochin were bought in at 4s. per lb.; 4 tins dark blocky ditto sold cheaply at 1s. 6d. per lb.

GUM SANDRAC.—10 casks taken out, price required being 51s. per cwt.

HONEY.—Good Jamaica sold at 25s. for good pale, down to 22s. 6d., good set ditto at 25s. 6d. per cwt.; fair Honolulu realised 25s. per cwt.

IPECACUANHA.—Two bags fair Rio were bought in at 15s. per lb., and two bags Carthagena at 11s. Another lot of Carthagena offered without reserve sold at 10s. to 10s. 1d. per lb. Later on fair Rio sold at 14s., and Carthagena at 10s. 6d. per lb.

JALAP.—8 bales, consisting of small but fairly heavy tubers, were bought in at 7d. per lb. Of 37 other bags bold Tampico were bought in at 6d. per lb., and fair small Vera Cruz at 6d. to 6½d.

KOLA NUTS.—60 bags wormy nuts were taken out at 3d. per lb.

KAMALA.—6 cases very dusty were taken out at 8d. per lb.

LIME JUICE.—19 hhds. bought in at 1s. 6d. per gallon.

MATICO.—Of 4 bales part fair green, part brown, 2 bales sold at 5½d. and 6d. per lb. respectively.

MUSK.—1 caddy fair Tonquin bought in at 65s. per oz. 2 tons selling without reserve at 17s. and 25s. per oz. respectively.

NUX VOMICA.—2 bags were bought in at 7s. per cwt.

ORRIS ROOT.—13 bales fair Florentine were held for 36s. per cwt. 8 serons Mogador sold at 12s. to 13s. per cwt.

ORANGE PEEL.—Of 24 packages part sold at 5d. to 6d. per lb. for dried thin cut, and 5d. per lb. for ringlets.

OTTO OF ROSES.—4 vases were taken out at 18s. per oz.

RHUBARB.—Of 71 cases offered, medium to fair, round and flat Shensi was bought in at 1s. 3d. to 2s. per lb., trimming root at 1s. 8d.; good round Shensi bought in at 3s. 6d. per lb; fair bold, but wormy, flat Canton sold at 6d. to 7½d. per lb., according to

condition; round ditto at 6¾d. to 9d. per lb., subject to owner's approval; 2 cases fair bold flat fetched 11d. per lb.; roughish flat, high dried, sold at 9½d. per lb.

ROSE OIL.—1 pot bought in at 5d. per oz., 2 bottles settlings selling at 1d. per oz.

SANDAL WOOD.—497 bundles chips of fair quality were taken out at 25s. per cwt.

SARSAPARILLA.—Fair Lima was taken out at 1s. 4d. per lb.; 5 bales good Jamaica at 2s.; very medium native Jamaica selling at 10d. per lb.; 5 serons fair Honduras were taken out at 1s. 4d. per lb.

SENNA.—10 bales Mecca were taken out at 3d. per lb. 3 bales bold Tinnivelly at 8d. per lb. Another lot of 75 bales sold readily at a further advance of ½d. per lb.; fair green bold leaf realising up to 6d. per lb. 13 pkgs. Alexandria chiefly bought in at 6d. to 8d. per lb. 3 bales half-leaf selling at 4d.

SQUILLS.—Fair quality sold at 3d. per lb.; not quite so good at 2½d. per lb.; 11 bags, without reserve, sold at 1¾d. per lb.

STROPHANTHUS SEEDS.—9 bags bought in at 3s. per lb. for Kombé and 2s. 6d. per lb. for the fluffy kind.

TAMARINDS.—3 barrels of dark colour sold at 9s. per cwt.

TONQUIN BEANS.—1 case black Para sold at 1s. per lb., another lot of 5 cases bought in at 2s. 8d. to 3s. 6d. per lb., 1 cask Angostura at 3s. per lb.

VANILLOES.—15 cases Tahiti all bought in at 7s. 6d. per lb. for 4½ in. by 6½ in., and 8s. 6d. for 5 in. by 6 in.

WAX—Fair Jamaica sold at £6 12s. 6d. to £6 17s. 6d. per cwt. 27 bags good Mozambique bought in at £6 15s. 1 case wormy Madras, sold at £5 7s. 6d. per cwt.

Fortnightly or Monthly Drug Sales.—On Monday last, a meeting of buyers took place at the drug sale room to consider the views of those present on the above subject. After a discussion, we understand that by a bare majority it was decided to recommend that the sales should, during the year 1900, be held monthly. Subsequent resolutions, however, are said to have rather counteracted the first resolution, and it is thought that the sales will probably be practically continued as heretofore.

Newcastle-on-Tyne Chemical Report.

October 11, 1899.

A very steady business continues on this market for the principal makes of heavy goods. Soda Crystals for certain markets in the Mediterranean have been advanced 5s. per ton. Other figures are unchanged, but firm. Quotations are: Bleaching Powder, £6 5s. to £6 10s. Soda Crystals, 50s. to 55s. Caustic Soda, 70 per cent., £8 10s. Soda Ash, 52 per cent., £4 5s. to £4 10s., Alkali, 52 per cent., £5 5s. to £5 10s. Sulphur, £4 17s. 6d. to £5.

Manchester Chemical Report.

October 11, 1899.

The Board of Trade returns for the past month show that the trade in chemicals participates in the general improvement in the national industries noted for some time past. The imports of chemicals, dye stuffs, and tanning substances for the month of September show an increase of 11 per cent. as compared with the corresponding month last year, being £352,366, as against £317,426. The exports of chemical and medicinal preparations, etc., amount to £692,482, being an increase of 3 per cent. It is satisfactory to note that in heavy chemicals Alkali shows an increase in exports in quantity of 13·5 per cent., being 351,593 cwts., as against 309,733, and Bleaching Materials 35·6 per cent.—namely, 111,281 cwts., as against 82,092 cwts. The increase in Alkali value is almost the same, though Bleaching Materials do not bear the same proportion, being only 21·1 per cent. of increase. A very satisfactory feature is a slight improvement in the exports of heavy chemicals to the United States, although in other respects this country seems to be more than holding its own. During the past week the brisk demand noted for some time past continues. Contracts for both Bleach and Alkali are being made over next year, but up to the time of writing there is no change in quotations. Sulphate of Copper is firmer at £26 to £26 10s. per ton, and £25 10s., forward, is quoted. White Arsenic ranges from £19 to £19 5s. per ton, on rails, Garston. Acetate of Soda is higher at £13 15s. to £14 per ton, c.i.f., and White Sugar of Lead is quoted £22 10s., c.i.f. Nitrate of Lead, £22 per ton. Chlorate of Potash and Bichromate unchanged. Anilinc Oil and Salt unchanged. Oxalic Acid is lower at 2⅝d. to 3d. per lb. Green Copperas is easier for best Lancashire.

Liverpool Market Report.

October 12, 1899.

Quotations have sufferced very little alteration since last week, except that Castor, Olive, Linseed and Cotton-seed Oils have advanced. Among general sales will be noted Chilian and Californian Honey at very full rates. Beeswax and Carnauba Wax at late prices, together with refined Spermaceti of Chilian origin. Chemicals have been in improved demand, and prices are raised for some markets.

AMMONIA SULPHATE—Has gone down a shade, and is now quoted at £11 12s. 6d. per ton.

BEESWAX.—About 70 sacks of Chilian sold at fully recent rates.

BORAX.—£16 per ton; £16 10s. powdered.

CANARY SEED—Is quiet at 39s. per 464 lbs. for Turkish, and 50 bags have changed hands at this figure.

CARNAUBA WAX—240 bags of grey sold at 40s. 6d. to 43s. per cwt.

COPPER SULPHATE—Has been in better demand, and sales are reported at £25 5s. to £25 7s. 6d. per ton spot, and £25 10s. to £25 12s. 6d. for spring shipment.

GUM—Arabic "sorts" have been in good demand, but no transactions have been reported.

HONEY—150 barrels of Chilian changed hands at recent full prices, and 20 cases of Californian at 42s. 6d. to 46s. 6d. per cwt.

LIME, CHLORINATED—Has become dearer, and is priced at £5 5s. to £5 10s. per ton.

LINSEED.—Calcutta seed is quite idle. there being none offering and quotations being nominal. North American seed has risen from 42s. 3d. per 424 lbs. c.i.f., to 43s. 9d.. and remains firm.

OILS (FIXED) AND SPIRITS.—Castor is steady with a fair demand for all kinds. Calcutta is firm at 3⅛d. per lb. French 1st pressure, 2⅞d. per lb., two tons reported sold; 2nd pressure, 2⅝d. per lb., six tons sold; and Madras, 2¾d. per lb. Olive Oil is selling moderately at £35 per ton (Spanish oil) to £39. Linseed Oil is very firm at 23s. 3d. to 23s. 6d. per cwt. with good business passing. Cottonseed Oil is very steady at the improved price of 20s. to 20s. 6d. per cwt. Spirits of Turpentine is firm at 38s. 6d. per cwt. with a moderate demand.

POTASH SALTS.—Cream of Tartar is selling in retail amount at 74s. to 80s. per cwt. Potashes, 5 barrels, sold at 21s. 6d. per cwt. Prices are now 21s. to 21s. 3d. per cwt. Pearlashes, 30s. per cwt.

SODA SALTS.—Caustic is very firm and higher prices are expected. 76 to 77 per cent., £9 7s. 6d. per ton. Crystals, £3 5s. per ton. Nitrate is still quoted at 7s. 7½d. to 7s. 9d. per cwt., though the price in Chili is 3s. 9d. per ton dearer.

SPERMACETI.—36 cases of refined Chilian at auction brought 13¾d. to 13 13/16d. per lb.

Calendar for the Week.

Sunday, Oct. 15. 20th after Trinity. Sun rises 6.25, sets 5.6.

Monday, Oct. 16. Sun rises 6.25, sets 5.4.

Tuesday, Oct. 17. Sun rises 6.26, sets 5.2.

Royal Photographic Society, 5*a*, Pall Mall East, London, W., at 8 p.m.—Henry W. Bennett will read a paper upon "Architectural Photography."

Wednesday, Oct. 18. Sun rises 6.30, sets 4.59.

Royal Microscopical Society, 20, Hanover Square, London, W., at 8 p.m.—A Lantern Demonstration by F. Enock, subject, "British Trap-Door Spiders."

Western Chemists' Association, Wesbourne Restaurant, 1, Craven Road, London, W., at 9 p.m.—Annual Meeting; Election of Committees, etc.

Thursday, Oct. 19. ○ 10.5A. Sun rises, 6.32; sets, 4.57.

Chemists' Assistants' Association, 73, Newman Street, London, W.—Musical and Social Evening.

Sheffield Pharmaceutical and Chemical Soeiety, Wharnecliffe Hotel, at 7.45 p.m.—Annual Dinner.

Friday, Oct. 20. Sun rises, 6.33; sets

Saturday, Oct. 21. Sun rises, 6.35; sets 4.53

Deaths.

Bignold.—On September 29, Walter Bignold, Chemist and Druggist, Battersea. Aged 42.

Taylor.—On September 30, Henry William Taylor, Chemist and Druggist, Lincoln. Aged 54.

Walker.—On October 2, Henry Walker, Chemist and Druggist Swadlincote. Aged 54.

Greaves.—On October 3, John Greaves, Chemist and Druggist, Cardiff. Aged 56. Mr. Greaves was formerly an Associate, and latterly, a Member of the Pharmaceutical Society.

Fresson.—On October 4, Lewis Francis Fresson, Pharmaceutical Chemist, Stevenage, Herts, eldest son of the late Captain Francis Fresson, 60th Rifles. Aged 78. Mr. Fresson had been a member of the Pharmaceutical Society for forty-six years, having joined in 1853.

Abley.—On October 5, Edward Abley, of Hereford. Aged 94. Mr. Abley was one of the oldest and most respected citizens of Hereford, and was at one time in business in Eign Street as mist, but retired about thirty-five years ago.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Six-gallon Carboy; cut stopper. What offers?—Wright, West Ryton-on-Tyne.

Chemist's Lamp; nearly new, a bargain.—Apply, Thomas, 115, West Street, Erith.

Chemistry and Physics Books, cheap list sent.—Johnson, 155, Lea Rd., Wolverhampton.

Welsh Honey (1899) and Genuine Beeswax. What offers?—Williams, Chemist, Holyhead.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

"Squire's Companion" (Martindale), latest editions; quite new.—J. B., Westminster College, Borough, S.E.

What Offers for Quain's "Dictionary of Medicine"? Complete in 8 sections; unsoiled.—Holroyd, 75, Wellington Road, Ashton-under-Lyne.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

For Disposal—No. 1 Patent Multiple Grinder, by the Hardy Patent Pick Co., Ltd., with Powder Collector; complete as new.—Mitre Works, Cordova Road, Grove Road, Bow, E.

Books and Periodicals. All free: Squire's "Companion," 13th, 5s.; Nisbet's "Marriage and Heredity," 2 vols. (published 12s.), 6s. 6d., new; Gordon's "Electricity and Magnetism," 2 vols. (42s.), 12s. 6d., new.—Davies, 5, Myddleton Road, Bowes Park.

Two Specie Jars for Sale, splendid condition. Circumference, 46 in.; diameter, top 9 in., bottom 14 in. 1 yellow and 1 white, with coat of arms, labelled "Carb. Soda" and "Sulphur"; 2 lids for same. Cost £6 each, will take £5 for both.—Highton, Chemist, Blackburn.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Publications Received.

A Guide to Urine Testing: for Nurses and Others. By Mark Robinson, L.R.C.P., L.R.C.S. (Ed.) Pp. 48. Price 1s. Bristol: John Wright and Co. 1899. From the Publishers.

London University Guide and University Correspondence College Calender for the Year 1899-1900. Pp. xx. + 230 + 64. Price, gratis. London: The University Correspondence College Press. 1899. From the Publisher.

Advertisements.

(Received too late for Classification.)

FRANCE, South. Wanted, end of October, qualified Assistant, speaking French.—Apply, R. L., c/o S. Maw, Son & Thompson, 7 to 12, Aldersgate St., E.C.

ENGLISH NEWS.

Sheffield School of Pharmacy.—The 1899-1900 session of the School of Pharmacy conducted by the Sheffield Pharmaceutical and Chemical Society was inaugurated, and the prizes won by the students at last session's classes were distributed, at a meeting held on October 19 at the Literary and Philosophical Society's rooms, Sheffield. The Society has recently given up its own classes, and arranged for a three years' course of instruction at the Sheffield University College, and the principal of that institution (Dr. W. M. Hicks) attended to give the inaugural address to the students. There was a large attendance, and the chair was occupied by Mr. G. Squire, the President of the Society.—Mr. S. T. Rhoden, school secretary, read his report, in which he referred to the fact that the new departure of last session consisted in the holding of part of the classes at the University College and part in the Society's own rooms. This was done with a view of establishing a curriculum for this district, and, with a further view to this object, all the classes were being held at the College this year. The lecturers reported well on their classes. The attendance had been regular, and the attention given by the students very satisfactory. The results of the examinations were also satisfactory.—Mr. Squire then presented the prizes, which consisted of books, to the successful students. He said that previous to the last session the Society carried on its own classes with its own masters, but this was not found satisfactory. They had often thought of joining the classes with the University College, and, now that this had been brought about, they considered it an ideal scheme. Students could now take up their subjects from the beginning, and, as a three years' course of instruction had been arranged for, they should, after passing through that, be able to present themselves for the qualifying examination. The prizes were not awarded on the same plan this year as in previous years. Instead of an examination being held by the Society, the awards had been made on the results of the classes at the College, judged by the professors, the prizes being given to the first and second in each class. The prize-winners were as under:—Chemistry: 1, T. T. Cocking; 2, A. Yates. Botany: 1, W. Cooper; 2, A. A. Watts. Materia Medica: 1, T. Cocking; 2, Harold Williams.—Principal Hicks, of University College, Sheffield, then proceeded to deliver an address to the students, after which, on the motion of Mr. G. T. W. Newsholme, seconded by Mr. J. B. Pater, a hearty vote of thanks was accorded to him.—The annual dinner of the Society was subsequently held at the Wharncliffe Hotel.

Chemists' Assistants Union.—At a council meeting held on Wednesday night last, Mr. Ned Whineray was re-elected Chairman, the Vice-Chairmen being Mr. C. E. Pickering and Mr. W. C. Softley (Bath.) Mr. R. E. Wright was elected Secretary, and Mr. R. T. Branwall, Assistant Secretary; Mr. H. Brook Clegg was elected Treasurer. Several patrons and members were elected. The session opens with a Smoking Concert on Tuesday night next, at the Horse Shoe Hotel, Tottenham Court Road, when the chair will be occupied by Mr. W. S. Glyn-Jones, who will be supported by several well-known members of the trade, and a number of gentlemen representing allied professions. A big gathering is expected.

Burnley and District Chemists' Association.—The committee of this Association held a meeting on Tuesday, Oct. 17, Mr. J. A. Heaton being in the chair. Mr. Heaton directed attention to a letter from the Pharmaceutical Society with respect to the appointment of local secretaries, and referred to the important position local secretaries would occupy in the future. It was mentioned that Mr. B. Cowgill had been asked to act again as local secretary, but that he had refused to continue in the office. The meeting expressed itself in favour of appointing Mr. Brown, yet he too declined to stand. At the suggestion of Mr. Brown, Mr. Lowton (Nelson) moved, and Mr. Stuttard (Colne) seconded, that Mr. Heaton fill the position, and this was decided upon. The Chairman next drew attention to the meeting of the Council with respect to company trading, with the result that the following resolution was adopted:—"That this Association notice the Council intend to take action to combat the pernicious Bill now before Parliament with respect to company pharmacy, and to introduce a clause into the Bill when it is presented to Imperial Parliament, and they trust that the clause will be of such a nature as to meet with the approval and support of the Association."

The Medical Title Difficulty illustrated by the Hunter case (see last volume, p. 86) is likely to be raised anew, the Society of Apothecaries having obtained an opinion from Sir Edward Clarke to the effect that a licentiate of the Society who has obtained his diploma since 1886 is entitled to describe himself as physician or surgeon, or both, and that the judgment in Hunter *v.* Clare would not of necessity be held to be a binding authority, inasmuch as the conviction of the appellant was quashed on other grounds, so that the opinions expressed by the Court as to the rights of licentiates of the Society of Apothecaries were, under the circumstances, immaterial to the issue. From remarks which fell from the judges, the *British Medical Journal* thinks it was clear that they regarded the case as a friendly suit brought with the object of settling the question of the right to the title of physician and, if Sir Edward Clarke's opinion is to be accepted, went out of their way to make a pronouncement on this point more or less as an act of complacency. The discussion which took place at the last session of the General Medical Council made it clear that the Council would not again allow itself to be brought into the position of proceeding against a registered practitioner for making use of titles which both custom and common-sense justify him in using. It is possible that some other body or some individual might do so, and the Society of Apothecaries considers itself under an obligation to obtain a judicial decision which shall not be open to exception, to form its own opinion, and may well demand that facilities should be afforded it to attain the object in view. At any rate, observes the *British Medical Journal*, the Society has now invited the co-operation of the General Medical Council in having the issue retried in some form so that the question may be finally and formally set at rest.

The North Staffordshire Chemists' and Druggists' Association has spoken on the subject of company trading, and has passed two resolutions thereon. (*See p.* 392.) The zeal and activity of the Association in bringing so prickly a theme forward, is commendable, and the generally rational tenour of the discussion is still more a matter for commendation; but in regard to the two resolutions which were adopted as the outcome of the evening's proceedings the Association must be prepared for a little gentle chiding. Briefly stated, resolution number one urges the Council to promote such "legal action as will prohibit absolutely the practice of pharmacy by associations of unqualified persons." Now the futility of such an exhortation must be apparent to anyone who will recollect that the *ne plus ultra* of legal action in that direction was reached eighteen years ago, when the House of Lords pronounced its fiat on the subject. That pronouncement of the highest legal tribunal lies, as an effectual barrier, in the path along which the North Staffordshire chemists express a desire that the Council should travel—that statement is not the expression of a mere personal opinion, but it represents an absolute, though perhaps unpalatable, fact. Parliament alone can remedy the retrograde effect of the House of Lords' decision, and the resolution beforementioned would have been all the clearer and all the more forcible if "parliamentary" had been substituted for the word "legal." The second resolution embodies a rather graver fault, though its obvious loyalty to the Society largely disarms criticism. It is a corollary to the first resolution, and proposes to establish a fund for the purpose of legal action for defence of chemists' interests—a fighting fund to which every registered person should be invited to subscribe. Apart from the fact that to use such a fund for the promotion of the "legal action" which appears to have been contemplated, would be simply throwing money away, the very establishment and organisation of a legal defence fund would be a waste of energy, a frittering of strength, and, what is more, past experience has shown that such a proceeding would be calculated to hamper rather than to assist the successful efforts of the specially constituted means of defence which chemists have ready to their hand. There can be no necessity for making heroic efforts to collect money locally while the Pharmaceutical Society exists. If registered persons perceive the dangers which threaten them, and are earnestly desirous of doing what they can to avert disaster, let them join the Society, and, by their adhesion, the representative body will become thoroughly invested with both the moral and the financial power requisite to fight for the unabridged maintenance of the principles of the Pharmacy Acts. This text has been reiterated almost *ad nauseam*, and has furnished so many lay and official sermons in the Journal that it can scarcely be touched upon without exciting in certain journalistic quarters more or less brilliant references to the greed for guineas at Bloomsbury Square;

but for the benefit of the chemists in North Staffordshire and generally, the suggestion may be risked that if there is, in the nature of things, strong reasons for "touting for guineas," it is better the process should operate in favour of strengthening the existing fighting machinery than in the direction of creating new.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.—This Association opened the session on Wednesday, October 11, at the Exchange Rooms, with an address from the President, Mr. F. A. Spear, terminating with a musical programme. In reviewing the work of last session, he congratulated the Association on the work done, but regretted that the attendances were so small, especially seeing that such men of repute in the world of pharmacy as Messrs. J. Barclay, F. H. Alcock, J. Spilsbury, and M. Dencer Whittles had taken great pains to give interesting and valuable papers. It was discouraging to both lecturers and promoters. The previously mentioned gentlemen, also Mr. A. W. Gerrard, had kindly consented to help during this session, and he (the President) hoped that members would show more enthusiasm. There was no doubt that the pharmacist of the next generation would be a man who had worked through a pharmaceutical curriculum similar in its spirit to those which are now required for qualification in the medical and dental professions, and it behoved assistants to do all in their power to obtain knowledge, scientific, general, and pharmaceutical, that they might not in course of time feel that their acquirements were vastly inferior to those of the men who succeeded them. Needless to say, the social evenings were a great success, and highly appreciated by good audiences. In mentioning the items on the present session's programme, he drew attention to the prizes offered for the best original papers on subjects of interest to pharmacy, and hoped there would be keen competition.—The following gentlemen contributed to an enjoyable musical programme: -Messrs. White, Foster, Holland, MacGregor, and Colley.

SKERRY'S CIVIL SERVICE COLLEGE (CITY SCHOOL OF CHEMISTRY).—This popular and well-known "coaching" institution having just attained its majority, the interesting event was celebrated on Wednesday, October 11, by a banquet at the Holborn Restaurant, given by the principal and founder of the college (Mr. G. E. Skerry) to his tutors and staff, and a number of personal friends. Mr. Skerry presided, Mr. J. P. H. Bewsher, the manager, and Mr. R. W. Hines, the secretary of the college, occupying the vice-chairs, while there were present a number of representatives of the seventeen Skerry Colleges now in existence in the three kingdoms. The proceedings throughout were of a most enjoyable character, Mr. Skerry himself, and Messrs. Bewsher and Hines, upon whom, as stewards, the labour of carrying out the arrangements mainly devolved, being most assiduous in promoting the pleasure and convenience of the guests. The usual loyal and other toasts having been honoured, Mr. J. P. H. Bewsher proposed the toast of the host, and before calling upon Mr. Hines, regretted to say that they were unable to present Mr. Skerry that evening with an album which had been prepared containing the signatures of all the subscribers, and an illuminated address expressing the esteem in which Mr. Skerry was held by the whole of his staff, on account of its not having been returned from the branches. Mr. R. M. Hines then uncovered a massive silver bowl, and, as representing all the various branches of the college, requested Mr. Skerry to accept it as a slight recognition of their appreciation of his work as principal of the college and of relationship to them as their head. There was an old song which called upon the landlord to fill the flowing bowl. That bowl they would fill with domestic happiness, with prosperity, and with the very best of good wishes.—Mr. Skerry said that during the twenty-one years of the existence of the college he had often given presents, but he had never before received one. On such an occasion he failed to find words to express his appreciation of their gift. He thoroughly appreciated their kindness, and throughout the days to come he should treasure the kind words they had spoken that night. He thanked them very much, and from the bottom of his heart.

PHARMACY AS AN EMPLOYMENT FOR GIRLS is the title of a brief article, by Miss R. Kathleen Spencer, published in the *Girl's Own Paper* for October 14. The article is quite free from the inaccuracies which are usually found in similar contributions to lay periodicals, and its perusal may be recommended to parents who think of having their daughters trained as dispensers.

SUFFOCATED BY CHLOROFORM.—An enquiry was held at the Gate Hotel, Matlock, on Friday, October 13, touching the death of Mary Elizabeth Brown (24), a daughter of Mr. Edwin Brown, hydropathist, of Rutland Street.—Florric Brown, sister of the deceased, stated that her sister complained of toothache, and asked her to fetch some chloroform for it. She went to Mr. Davis, chemist, at Matlock Bridge, and bought twopennyworth. Her sister rubbed it externally, and at half past nine said she was going to sleep, and did not want to be disturbed. Witness heard nothing more until her father found her sister dead at 11 o'clock.—Dr. William Moxon said he was sent for, and tried artificial respiration without effect. He was shown the bottle the deceased had used the chloroform from, and should say 25 minims had been used out of a drachm. He attributed the death to the fact that deceased wrapped her head closely so as to exclude air, and thus secured the full strength of the chloroform. Death was caused by chloroform asphyxia.—The jury returned a verdict in accordance with the medical testimony.

DEATH OF AN OLD CHEMIST.—According to newspaper reports, Mr. Joseph Wilding Lomas, pharmaceutical chemist, was found dead at his residence, 31, Vicarage Road, Camberwell, under somewhat peculiar circumstances on Monday, October 16. Mr. Lomas, as is mentioned elsewhere, was an old member of the Pharmaceutical Society and regularly attended its public meetings. He was at one time in business at 785, Old Kent Road, and subsequently in Queen Victoria Street, E.C. There is also reason to believe that at the time of the Indian Mutiny he was a dispenser in the Army. His mode of living in Vicarage Road, Camberwell, seems to have interested his neighbours, but he never satisfied their curiosity. Apparently he was a bachelor or widower, about seventy years of age. He did his own shopping, cooked his own food, and did what cleaning was carried out in his rooms. When his death was discovered there were in his bedroom securities representing several thousand pounds, and it is understood that he had some valuable property in a deposit safe, the key of which was found on him.

A CHEMIST'S MOTOR CAR.—At Bearsted Police Court on Monday, October 16, Harry R. Beckett, chemist and druggist, Tonbridge, was summoned for non-compliance with a certain section of the Light Locomotives Act, at Barming, on September 20, by not stopping his motor vehicle when requested to do so.—The prosecutor, Mr. Herbert White, stated his case, which was to the effect that while out riding with his wife, one of his horse's shoes became loose and he called at a blacksmith's forge to have it fastened. Defendant passed at the time in his motor car, and as the horse was restive, prosecutor signalled for the car to stop, but defendant took no notice and did not stop the car until prosecutor mounted his horse and rode after him.—For the defence it was contended that no offence had been committed, because the Act simply dealt with motor cars upon the highway. Prosecutor's horse was not on the highway, and he therefore had no power to require the defendant to stop his vehicle. As a matter of fact, defendant on perceiving the signal to stop did endeavour to do so, but finding it impossible to pull up the vehicle until he had passed the horse, decided to run by silently, as, in his opinion, that was the best thing to do under the circumstances.—The Bench stopped the case while the evidence for the defence was being given and dismissed it.

SCOTTISH NEWS.

FATAL FALL.—Thomas M'Master (50), (described as a chemist), while engaged on Friday, October 13, in cleaning the window of his bedroom in his brother's house at 449, Duke Street, Glasgow, overbalanced and fell into the court, a distance of three storeys, and was instantaneously killed.

THE GLASGOW CHEMISTS' AND DRUGGISTS,' ASSISTANTS,' AND APPRENTICES' ASSOCIATION made a good start on Friday, October 13, when Mr. J. Rutherford Hill delivered the opening address; his subject being "The Position and Privileges of Pharmacy and the Pharmacist" (see page 380). Meetings will henceforth be held each Friday evening up to April 6, 1900. The programme is a comprehensive one, including in addition to musical and social entertainments, papers and lantern lectures by well-known Scottish pharmacists and medical men. The following are a few of the items in the

syllabus:—"A Trip to Switzerland," by J. Lothian; "The Assistant: his Fortunes and Future," by J. P. Gilmour; "John Ruskin: The Man and His Teaching," by Councillor Wm. Martin; "Ambrose Pare and His Times," by J. Grant Andrew; "The Hospitals of Glasgow," by Councillor J. Erskine; "Reproduction in Plants," by M. Meldrum; "The Druggist as a Civil Servant," by J. P. Taylor; "The Medicinal Plants of the Clydesdale Flora," by W. Bowie; "Stereo-Chemistry," by Geo. Coull; "The Distribution of Plants in Time and on the Earth," by T. S. Barric; and lectures and communications (subjects not specified), by T. Maben, Dr. James Devon, J. Lothian and B. Cockburn, and J. Thomson.

IRISH NEWS.

Pharmaceutical Society of Ireland.—*Pharmaceutical Asssistant Examination*: J. McC. Cherry, C.H.Waddell, and W.S. Taylor, have passed. Two candidates were rejected. *Pharmaceutical License Examination*: J. Robson, A. T. Mulhall, W. S. Taylor, H. Knight, and J. Gorry, have passed. Four candidates were rejected. *Registered Druggist Examination*: S. Hanna, F. Mannin, Margaret Perrot, F. T. Smith, and T. J. Watts, have passed. Five candidates were rejected.

Speaking Last Week at Dublin, on the occasion of the reopening for the winter session of the Meath Hospital, Dr. J. W. Moore, President of the Royal College of Physicians, said that the use of antipyretic medicines or heat reducers should never be left in unskilled hands. The employment of such remedies even by the experienced physician called for the utmost caution. The danger is incurred by interference with the production of the body heat, while the escape of heat from the system was increased. Dr. Moore regards water as the only safe antipyretic. Alcoholic stimulants were to be avoided, since a patient already suffering from the effects of a specific poison might be doubly poisoned by alcohol. A good physician should also be a good cook, as there is scarcely a disease in which diet does not play a more important part than mere medicines.

Mr. John M'Bride, who has organised a corps of Irishmen in Johannesburg to help the Boers, was formerly a Dublin chemist's assistant. His exchange of the dispensing spatula for the devouring sword will be heard with horror by peace-loving pharmacists. If it was our martial chemist who secured the contract for drugging the Vaal water with prussic acid, that might account for his pro-Boer affinities.

The Herbarium of the late Lord de Tabley, consisting of 20,000 sheets of specimens, has been presented by his sister, Lady Leighton, to the botanical department of the Dublin Museum.

"As much as would Lie on a Threepenny-bit" might be considered a fair quantity for analysis in a test examination, but under other circumstances the amount might be increased. For instance, Mr. Blake, Ballycastle analyst, wrote that the Croagh dispensary samples were "of no use," two ounces being generally required, and four ounces if alkaloids were present.

The Belfast Guardians, in considering the statement that all the apothecaries had not sent in samples to the analyst, which would prevent the Board getting half the expense on the scheduled medicine supplied, resolved to surcharge the apothecaries with any loss thus occasioned.

TRADE NOTES.

Guaiacum Resin Tabloids.—Messrs. Burroughs, Wellcome and Co. submit for examination a specimen of a 5-grain guaiacum resin tabloid which the firm has recently introduced. The properties of this therapeutic agent are well known, and its introduction as a tabloid enables the physician to prescribe it in a practically tasteless form in the treatmont of rheumatic gout, tonsilitis, etc.

Brand's Nutrient Powder.—This powder, which is prepared by Messrs. Brand and Co., Limited, Mayfair, W., from raw meat, consists of powdered muscle fibre only, from which the moisture has been removed at a temperature below the coagulation point of the muscle proteids. In the process of drying, powdering, and sifting, all the connective tissue and tendon, which constitute in popular language gristle, is rejected, and the resulting preparation is partly soluble in water and saline solution, and almost instantly and completely soluble in pepsin. It is practically tasteless, and contains all the constituents of lean meat in an unaltered condition. One ounce of the powder is equivalent in nutritive value to four ounces of fresh lean meat. This claim is based on the fact that moisture constitutes three-fourths of the weight of lean meat, hence the removal of this moisture results in the production of one-fourth of dry solids. The great dietetic importance of the preparation to invalids consists in the ease and completeness with which it can be digested, and in the fact that it can be assimilated with a minimum of effort upon the part of the digestive organs. The makers state that nothing is removed in the process of manufacture except the water of the fresh meat and the tough, stringy and indigestible portion. From this it follows that in Brand's Nutrient Powder the natural relationship of the proteids, extractives, and salts are preserved unchanged. This claim cannot be made for any other preparation of the kind on the market. The powder is supplied in screw-cap bottles, to retail at 10d. (1 ounce), 1s. 6d. (2 ounces), and 2s. 10d. (4 ounces) each.

Paper Convenience Cover.—Rolls or books of specially prepared, disinfected paper are prepared by M. Page, 473, Caledonian Road, London, N., to retail at 1s. each, the paper being perforated in sections of a convenient length to cover the seat of a w.c., and the centre of each section being cut out, leaving a tongue-piece to flap over into the pan, serving as a shield. The object of this invention is to provide an absolutely clean, disinfected seat, and that result ought to be attained if the covers are regulary used as directed by the maker.

"Norse" Toilet Paper.—Messrs. Ayrton and Saunders, 34, Hanover Street, Liverpool, send a specimen of their "Norse" Sanitary Toilet roll, which they guarantee to be absolutely pure, and in every respect a perfect toilet paper. The roll, which is impregnated with the odour of the pine (*Pinus sylvestris*), imparts a refreshing fragrance to the air, and acts both as a disinfectant and deodoriser. The regular use of this paper, it is claimed, will prevent many painful and troublesome complaints. The roll is enclosed in an attractive wrapper, space being provided for the name and address of the seller. It can be obtained wholesale only from Messrs. Ayrton and Saunders, at the above address.

FOOD AND DRUGS ACT PROSECUTIONS.

Accuracy in Dispensing.—At the West London Police-court on October 12, Mr. Rose heard an adjourned summons against William Luther Longstaff, trading as Keith Longstaff, chemist and druggist, of 84, Fulham Road, issued under the 7th Section of the Food and Drugs Act, with respect to an ingredient in a prescription prepared by Dr. Jackson, medical officer of health, and presented by the sanitary inspector to be made up. The question in dispute was as to the quantity of iodide of potassium demanded. The prescription required four drachms, but it was alleged by the public analyst that there were 36 grains in excess. The summons when first heard, was adjourned for an analysis to be made at Somerset House.—Mr. Rose, who now had the Government certificate before him, said the excess found was 23 grains instead of 36. —Mr. Ralph Swinton, analytical chemist, stated that he had analysed a sample sent by Mr. Longstaff. It contained 54 C.c. of liquid, in which there was 82·8 grains of potassium iodide. In a six fluid ounce bottle that would equal 248·4 grains, being 8·4 grains more than the prescription provided.—Mr. Rose, in giving his decision, pointed to the fact that there had been three different analyses in the case, showing that chemists would be placed in difficulties if perfect accuracy was required in making up prescriptions. The Act pointed to something injurious

to health. He found that there had not been any carelessness, or any excess in the quantity of the drug which was injurious to health. He also expressed an opinion that the 7th Section did not apply to such a case. Therefore, both on the facts and law, he decided in favour of the defendant, and dismissed the summons. He also declined to grant any costs. There was also a summons against William Fletcher Barrett, trading as Barrett's Drug Stores, with respect to an alleged excess of 24 grains of iodide of potassium in a mixture, but after the decision in the other case it was withdrawn.

MILK OF SULPHUR.—On Monday, October 9, Benjamin Dugdale, grocer, Waddington, was summoned at Bolton-by-Bowland (Yorks) Petty Sessions for selling 2oz. of milk of sulphur containing 59 per cent. of hydrated calcium sulphate.—Defendant pleaded that he sold the article in the same condition as he bought it. The wholesale people had admitted that a mistake had been made by them, and promised to pay any expense he was put to.—The inspector pointed out that the magistrates at that court had frequently advised shopkeepers to obtain warranties with their goods, but they had failed to do so.—The Chairman said it was a very serious matter that adulterated drugs should be sold to the public.—Fined £2 and costs.——David Leeming, grocer, West Bradford, was also summoned for selling milk of sulphur adulterated with 66 per cent. of hydrated calcium sulphate.—Defendant said the article in question was old stock, it had been in his possession several years.—The Chairman, in fining defendant £2 and costs, said he had no right to keep drugs in stock for years, and then sell them to the public.

SPIRIT OF NITRE.—At Bolton-by-Bowland (Yorks) Petty Sessions, on Monday, October 9, David Wright Speakman, grocer, Waddington, was charged with selling sweet spirit of nitre which was certified by the county analyst to be deficient in nitrous ether, and to contain an excess of water to the extent of 2·23 per cent.—Defendant stated that spirit of nitre deteriorated, and he could not avoid its going wrong.—The inspector did not deny that it deteriorated, but pointed out that this was allowed for by the British Pharmacopœia, and a minimum fixed; the spirit of nitre in question came below the minimum, hence its medical value was greatly reduced.—Fined £1 and costs.

CAMPHORATED OIL.—At the same court, the defendant in the spirit of nitre case referred to above, was also charged with selling camphorated oil deficient in camphor to the extent of 13 per cent., and containing 5 per cent. of mineral oil.—Fined £1 and costs.——David Leeming, grocer, West Bradford, was fined £2 and costs for selling camphorated oil 5 per cent. deficient in camphor, and adulterated with 40 per cent. of mineral oil.—Defendant said the wholesale firm from whom he obtained the oil had promised to pay all expenses.——The case against Benjamin Hargreaves, grocer, Grindleton, was described by the Chairman as disgraceful, and a fine of £3 and costs was inflicted. Defendant, who was charged with selling camphorated oil deficient in camphor to the extent of 12 per cent., and containing 88 per cent. of mineral oil, stated that he sold the oil in the same condition as he bought it from the wholesale dealers.

CAMPHORATED OIL PROSECUTIONS.—At Glasgow on Thursday, October 12, Sheriff Boyd heard three prosecutions under the Merchandise Marks Act.—Dr. Gordon admitted having sold camphorated oil which consisted of sesame oil, and which was also deficient in camphor to the extent of 41 per cent.—Mr. Neilson, who prosecuted, referred to the urgent necessity of medicines being pure, and mentioned that sesame oil cost much less than olive oil. Sheriff Boyd, in imposing a fine of £4, with £1 18s. expenses, expressed the hope that as the warning was addressed to an educated and intelligent body of men they would learn the lesson quickly.——A similar fine was inflicted on Richard Hogg, chemist and druggist, 357, Paisley Road, for having sold camphorated oil which consisted of rape oil, and was also deficient in camphor to the extent of 15 per cent.—For the defence it was stated that it was customary in the trade to have two kinds of oil, and the public in buying the cheaper article had the benefit of getting more for their money——Joseph M'Feat, M.B., was also fined £4, and £1 1s. costs, for having in his shop at 338, Scotland Street sold olive oil which contained 20 per cent. of sesame oil.

FOREIGN NEWS.

THE REUNIONS OF THE BRITISH AND FRENCH ASSOCIATIONS at Dover have been followed by a decision to establish a permanent organisation which shall maintain, develop, and utilise the good relations thus so fully initiated. According to the *Standard* it is proposed to form a General and Advisory Committee, consisting of members of the British Association, the Association Française, and of other representatives of pure and applied science, education, art, etc., with the object of promoting arrangements for an international meeting or assembly in connection with the Paris Exposition of 1900. Sectional meetings of the Committee will be held in London, Paris, New York, etc. It is stated that important French representations on the Committee has been assured, and the adjustment of the programme will be proceeded with the least possible delay. General and special lectures, with expert guidance through the various departments of the Exposition, are being arranged, both in French and English, together with excursions, etc., broadly corresponding to the features of a British Association programme.

WITH A VIEW to the reform of pharmaceutical education in Germany, it is intended by the German Government to raise the standard of pharmaceutical education. Hitherto, the young man who desires to enter upon the pharmaceutical career must, for admission as an apprentice, produce the certificate entitling to the one year's service in the army (the "Einjährig-Freiwilligen-Zeugniss"), which is obtainable by passing the lower second-class examination of a "Gymnasium" or a "Realgymnasium Untersekunda." Having been admitted and passed an apprenticeship of three years, he is admissible to the assistant's examination, and, after another period of three years passed in practical training in a pharmacy, he has the right of attending a university, where he must pass an eighteen months' course (three "Semester"). Then he can be admitted to the final examination to qualify ("Pharmaceutische Staatsprüfung"). In future no student will be admitted to apprenticeship unless he has passed the "Obersekunda," and has got his remove to the "Prima" or first-class of the "Gymnasium" or "Realgymnasium." By this elevation of the educational standard pharmacists will, in that respect, be placed on a level with officers of the army, veterinary surgeons, dental surgeons, and surveyors. The period of assistantship will be divided in two parts, one year being passed before entering the university and two years after the final examination. The university term will be prolonged from three to four "Semester" (two years) and it is also intended to increase the scientific instruction by enlarging the courses in several branches, *i.e.*, laboratory training in analysis, manufacturing of pharmaceutical products, and microscopical research. New courses too will be established for chemistry of foods and urine analysis.

THE NEGOTIATIONS between the federated German governments concerning the reform of the now existing "mixed system" of pharmaceutical privileges, transferable and not-transferable concessions, are still in progress, but it is now understood that definite regulation of that difficult matter is not soon to be expected. There is no doubt that the liquidation of the valuable properties which have come into existence under the system now prevailing is a stumbling block, not yet removable by the financial authorities. A semi-official notice announces that the question is not considered so urgent that it must be settled in a short time by legislature—a symptom that opinion is far from being agreed on that point. Meanwhile the German "Apotheker-Verein" will convoke a committee to discuss the necessary steps to be taken for carrying out the resolution passed at the Danzig meeting, that the transferable concession is the best system.

Partnerships Dissolved.

(From the London Gazette.)

Henry Ney and William Frederick Carter, Scientific Instrument Makers, Broad Arrow Court, London, E.C. Debts will be received and paid by William Frederick Carter.

Alfred Darwent and Charles Darwent (trading as A. and C. Darwent), Aërated Water Manufacturers, Swinton Bridge, near Rotherham. Debts will be received and paid by Alfred Darwent.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

October 19, 1899.

Business has not been excessively active in the Drug and Chemical markets during the past few days. There has, however, nevertheless, been a fair amount of business passing, prices of most articles remaining firm, some tending upwards, while others are again dearer. There has been considerable excitement in Quinine, which has further advanced, and is expected to go higher. Menthol is dearer. Quicksilver very firm and an advance expected. Mercurials also very firm. Camphor also expected to advance, while a further rise is also confidently expected in Cocaine. Bromides firm and in good demand. Iodides fairly steady. Acid Citric weak, as also is Sulphate of Ammonia. Opium, Morphia, and Codeia are firm. The following are prices actually ruling for some articles of principal interest.

ACETANILIDE—Continues very weak at 9½d. to 1s. per lb., according to quantity. It is reported that a fresh maker has appeared on the scene, which, in view of the pressure to sell which already existed, was hardly necessary.

ACID BORACIC—Is still quoted 25s. per cwt. for crystals, and 27s. for powder.

ACID CARBOLIC—In good demand, the prices being 6¾d. to 7d. per lb., according to quantity and make, for 35°-36° C. ice crystals in large bulk; 7¼d. per lb. for the 39-40° ice crystal, and 8¼d. for 39°-40° C. B.P. quality in detached crystals. Crude 60° F., 2s. 3d. per gallon; 75° F., 2s. 9d. per gallon. Liquid 95-98 per cent. of pale straw colour, 1s. 3d. per gallon, in 40 gallon casks; ditto, 30 per cent. of dark colour, 10d. to 11d. per gallon.

ACID CITRIC—Dull and weak at 1s. 4½d. to 1s. 5d. per lb., according to make, for crystals in 5-cwt. casks.

AMMONIA COMPOUNDS—Are practically unchanged, with the exception of sulphate, which is weak and lower; quotations are: Bromide, 2s. 2d. per lb.; carbonate, 3d. to 4d. per lb.; according to make, etc. Muriate, commercial, free from metals, 27s. 6d. per cwt.; ditto, chemically pure, small crystals, 30s. to 32s. 6d. per cwt. Iodide, 13s. 7d. per lb.; Sal ammoniac, firsts, 35s. per cwt.; seconds, 33s. per cwt.; ditto, crushed for batteries, firsts, 37s.; seconds, 35s. Sulphate, Grey, prompt, 24 per cent., London, £11 3s. 9d. per ton.; Hull, £11 1s. 3d. to £11 2s. 6d.; Leith, prompt, £11 1s. 3d. to £11 2s. 6d.; Beckton, prompt, and Nov.-Dec., £10 18s. 9d.; Beckton, terms, prompt, £10 18s. 9d. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus is still quoted £39 to £40 per ton, and Japan, crude (black sulphide), £23 10s. to £24 per ton.

ARECA NUTS.—Supply short. A small quantity has changed hands at 25s. 6d. cwt.

ARSENIC—Is quiet, but steady, higher prices being looked for in the not too distant future. Present quotations are: White powder, £19 10s. to £20 per ton; white and yellow lump, £29 10s. to £30 per ton.

ASHES.—Pots, 22s. 9d.; Pearls, 32s.

ATROPINE.—Makers are very firm at 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d. per oz. for the pure Alkaloid.

BENZOIN.—There is a strong demand for the cheaper grades of Sumatra, and a fair business has been done since last week's sales at £5 10s. cwt, below which nothing now can be found.

BISMUTH—Unchanged at 5s. per lb. for the commercial quality of the metal, the Salts being also unchanged at 5s. 8d. per lb. for the Subcarbonate and 5s. 1d. per lb. for the Subnitrate.

BLEACHING POWDER (Chloride of Lime).—English make is still quoted £6 10s.

BORAX—Unchanged; 16s. per cwt. for crystals, and 16s. 9d. for powder.

BROMIDES—Are in active demand at firm but unchanged prices.

BUCHU LEAVES.—Good green rounds are wanted; for yellow rounds 6d. has been paid.

CAMPHOR.—The market for crude is decidedly firm, with an upward tendency in values. There is a fair inquiry, and business is doing, but actual particulars have not transpired. There are buyers of China on the spot at 132s. 6d. and Japan at 137s. 6d., and for arrival at 127s. 6d. and 136s. 6d. c.f. and i. respectively. Refined continues very firm at 1s. 8d. per lb. for Flowers and Bells in ton lots, while it is considered more than possible that the English refiners will again advance their price before very long.

CASCARA SAGRADA.—There is a good demand and the lowest of the stock here is held for 25s. cwt., and from New York it is reported that price of 23s. for new bark is very steadily maintained. From the West Coast it is stated that holders are very firm; those who have bought with the purpose of controlling the market advising them to hold for a high price, hoping thus to protect themselves.

CINCHONA BARK.—It is reported that the shipments of bark from Java for the first half of the month have been 657,000 Amsterdam lbs.

CLOVES.—Privately Zanzibar quiet and barely steady. Business done for March-May delivery at 3¼d. At auction only 24 packages Zanzibar offered and sold at steady rates, fine bright small, in cases, at 4½d. to 4⅝d.; good, in bales, little stalky, at 3⅛d. 33 cases Penang offered and 18 sold, good bright picked, at 6¼d., smaller ditto, at 6d.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial 1s. 3d. per gallon. Benzole, 50 per cent., 11d. per gallon; November-December, 11d. per gallon; 90 per cent. 10d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 5d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 5d. per gallon; 90 per cent., at 160° C., 1s. 2d. per gallon, and the 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene A, 3½d. per unit; B, 2¾d. per unit. Pitch, 34s. per ton f.o.b. Tar, refined and crude, 12s. 6d. per barrel, 2d. per gallon.

COCAINE.—Market is very firm at 20s. 6d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins, from the makers, while there is very little offering from second hand below makers' price. It is stated that in consequence of the increasing scarcity and dearness of the crude a further advance in price of the refined article is not improbable.

CODEINE.—In good demand at firm prices—viz., 12s. 11d. to 13s. 6d. per oz., according to quantity, for the pure, and 1s. per oz. less for the Muriate, Phosphate, and Sulphate Salts.

COD LIVER OIL—Is quiet, but firm at 60s. to 65s., according to brand, for new, non-congealing Norwegian oil in tin-lined barrels of 25 gallons.

CREAM OF TARTAR.—First white crystals are quoted 74s. per cwt. on the spot, and powder 76s. ditto; 95 per cent., 78s. per cwt.

ESERINE (PHYSOSTIGMINE).—Prices are firm at 2s. 3d. per gramme for both the Sulphate and the Salicylate Salts.

ESSENTIAL OILS—Remain very quiet, the business passing in same having been quite unimportant.

CUTCH—Continues quiet, and sales unimportant.

GALLS.—All descriptions have remained extremely quiet, and little business has occurred. China steady at 59s. 6d. on the spot, usual shape, and 56s. c.f. and i. for arrival, with plums at 57s. 6d. c.f. and i. Persian have been dealt in to a small extent at firm prices, comprising blue at 65s. and green at 57s. 6d., also white at 52s. 6d. Smyrna remain quiet in the absence of supplies.

GAMBIER.—The market for arrival continues inactive, and in the absence of business prices are nominal. On the spot whole bales quoted 13s. to 13s. 3d.

GINGER.—Cochin offered sparingly. Washed rough rather easier, but cuttings firm. Of 629 bags, 207 sold, Calicut, rough medium and bold, rather lean, at 22s. 6d., and washed medium and small, slightly wormy, at 22s.; fair rather dull cuttings at 18s. Jamaica in little request, and of 109 barrels offered only 12 sold, ordinary at 52s. to 53s.

GLYCERIN—Continues firm, crude being again rather dearer, while price of the refined article is fully maintained at 55s. to 60s. for English, and 58s. to 67s. 6d. per cwt. for German, according to make, for the best white double distilled, chemically pure, 1260° quality, in tins and cases.

GOLDEN SEAL ROOT—Is very firm, and prices from New York come dearer at 2s. 6d. per lb., c.i.f., for autumn-dug-root.

GUM TRAGACANTH.—Although there is now very little choice of quality, a good demand continues, and about 100 packages have been sold at full rates.

IODIDES—Are fairly steady at unchanged prices.

IPECACUANHA.—Rio is firm at 14s. 3d. to 14s. 6d. per lb., as to quality, with a small business passing. For Carthagena, 10s. 3d. to 10s. 6d. per lb., as to holder.

MENTHOL—Is firmer, 8s. 3d. per lb. having been paid for Kobayashi brand in case lots (12 + 5 lb. tins in a case).

MERCURIALS—Remain very firm, in consequence of the firmness of quicksilver, calomel being quoted 3s. per lb., and corrosive sublimate 2s. 8d. per lb.; other quicksilver preparations being quoted in proportion.

MORPHINE—Is very firm at 4s. 11d. to 5s. 2d. per oz. for the Hydrochlorate powder, and 2d. per oz. more for crystals.

OILS (FIXED) AND SPIRITS.—Linseed firm; on spot, pipes, London, £22 12s. 6d.; barrels, £22 17s. 6d., November-December, £22 12s. 6d. to £22 15s.; January-April, £22 15s.; May-August, £22 10s. Hull, spot, naked, £21; November-December, £21; January-April, £21 10s.; May-August, £21 5s. Rape steady; ordinary brown, on spot, £24 5s. November-December, £24 5s.; January-April, £24 10s. Refined spot, £25 10s. Ravison naked, spot, £21 10s.; November-December, £21 10s.; January-February, £21. Cotton quiet. London crude spot, £17 10s.; November-April, £17 10s. Refined spot, £19 to £20, according to make. Hull has sharply declined; naked refined spot, £16 17s. 6d.; November-April, £16 7s. 6d.; crude spot, £15 17s .6d.; November-April, £15 7s. 6d. Olive firm; Mogador, £33; Spanish, £34; Levant, £33-£34. Cocoanut steady; Ceylon, on spot, £25 10s.; November-January and December-February, £24 10s. c.i.f.; Cochin, spot, £29 10s. to £30 in warehouse, and afloat £27 10s. c.i.f.; October-December, £26 15s. to £27; January-March, £26 10s. to £26 15s. c.i.f.; Mauritius on spot, £25 10s. in hogsheads Palm: Lagos, on spot, quoted £27 10s. Castor oil firm; Belgian, 1st pressing spot, £27; January-June, 1900, £26 10s. f.o.b.; Antwerp, 2nd pressing spot, £25 10s. per ton, ex-wharf. Hull manufactured, guaranteed cold drawn, pure Pharmaceutical, £30 per ton; in barrels, 3⅝d. per lb. in cases. Pure firsts, £27 10s.; seconds, £26 10s. per ton in barrels; firsts, 3¼d. per lb. in cases; seconds, 3⅛d., ex-wharf, London. Lubricating oil: Pale American, spot, 7s. to 9s.; black, 6s. 3d. to 8s.; Russian black, 5s. 6d.; pale, 7s. to 8s. 6d. Petroleum oil quiet; Russian spot, 5 7/16d. to 5⅝d. American spot, 6⅞d. to 7d., and to the end of March; water white, 8⅛d. to 8¼d. Turpentine steady, inactive. American spot, 38s. to 38s. 1½d.; November-December, 38s. 1½d. to 38s. 3d.; January-April, 38s. 9d. to 38s. 10½d.; July-December, 32s. 10½d. Petroleum spirit: American, 9¾d.; Deodorised, 10d.

OPIUM.—Market has been quiet, but firm at nominally unchanged prices, only retail sales having been effected. A Smyrna telegram reports that 100 cases have changed hands there at full rates. Fair to fine Persian is quoted 12s. to 12s. 9d. per lb.

OXALIC ACID—Is still quoted 3d. to 3¼d. per lb. nett, delivered free, London.

PARAFFIN WAX.—Crude, 2½d. to 3d. per lb.; refined, 3d. to 3¾d.

PHENACETINE.—The long-hoped-for turn has at last arrived, to the extent that makers now refuse to sell below 3s. 3d. per lb. for both crystals and powder.

PILOCARPINE—Is still quoted 30s. per oz. for both the Hydrochlorate and the Nitrate Salts.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt.; Bichromate, 3½d. per lb.; Bromide, 1s. 10½d. per lb.; Chlorate crystals, 3¾d.; powder, 3⅞d. per lb., spot, London; Iodide, 10s. 6d. per lb; Permanganate quotations vary according to make, from 52s. 6d. to 62s. 6d. per cwt. for small crystals in 1-cwt. kegs, large crystals being quoted 5s. per cwt. more money. Prussiate, yellow, Beckton make, 7¾d. per lb. Other English makes, 8d. to 8½d.; red, 1s. to 1s. 2d. per lb., according to quantity, etc.

PITCH.—8s. to 8s. 6d.

QUICKSILVER.—Market is very firm at £8 17s. 6d. per bottle, and even at this figure all orders have to be first submitted. It is stated that a further rise is extremely probable. There is no second-hand price.

QUININE.—This article has received a considerable amount of attention during the past few days from those interested in the same. Late on Saturday afternoon the makers of the brands which are exclusively quoted in the speculative market—viz., B. & S. and Brunswick, raised their price 1d. per oz., to 1s. 1d., and again on Monday to 1s. 2d. per oz, while at one time there were buyers from second-hand at 1s. 2¼d. per oz. for above-named brands. To-day there are not many sellers at 1s. 1½d. It looks very much as if a "bear hunt" were in progress, and it will be interesting to watch the course of the market, and especially if one has bought at about 11d.

ROSIN.—Strained spot, 4s. 6d. per cwt., ex wharf, and 4s. 2½d. to 4s. 3d. per cwt. for November-January and January-March shipment per sailing vessel.

SANTONIN.—Market is firm at late advance to 11s. 3d. to 11s. 9d. per lb., according to quantity.

SASSAFRAS BARK.—The Root is scarce both here and in New York, the nominal value here being 4¼d. per lb.

SENNA.—The demand continues for Tinnevelly leaves of all qualities, and a little business has been done this week at full prices. About 350 bales will be offered in next week's auctions. For Alexandrian there is a good inquiry, but very little of fine quality is available.

SHELLAC.—The market in all positions remains very quiet. The demand on the spot is slow, with only moderate sales at steady rates. For arrival, 200 cases TN Orange, in second hands, have been sold for October-December shipment at 60s., being cheaper. The Calcutta price is still 62s. c.f. and i.

SODA COMPOUNDS.—Crystals are still quoted 60s. per ton in barrels and 57s. 6d. per ton in bags, ex ship Thames. Ash, £5 5s. to £7 per ton, according to percentage, etc. Bicarbonate, £7 10s. to £8 10s. per ton; ditto, fully bicarbonated, 22s. 6d. to 25s. per cwt. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic: White, 70 per cent., £9 per ton; ditto, 60 per cent., £8. Hyposulphite (Antichlor.), 6s. 6d. to 8s. 6d. per cwt., according to make, etc. Iodide, 11s. 10d. per lb. Nitrate dearer at £8 per ton on the spot for refined and £7 15s. per ton for commercial.

SPICES (VARIOUS).—Black Pepper: No Singapore offered, and Penang bought in at 5¼d. White Pepper: Very small lots offered, and all bought in, fine Singapore at 11½d. and fair Siam at 8¾d. Capsicums firm; 47 bales Bombay cherries sold, fair red, 30s. 6d. to 31s. 6d. Cinnamon Chips: 420 bags sold, ordinary to fair, chips and bark, at 2⅜d. to 3⅛d.; cuttings and pieces at 5½d. to 7d. Mace quiet; only 2 cases Penang sold, without reserve, fair pale reddish, little wormy, at 1s. 6d.; 2 cases Ceylon sold, fair pale reddish, at 1s. 5d.; 14 cases Singapore bought in at 1s. 5d. Nutmegs dull; only 5 cases Penang sold, 65's at 2s. 4d; 6 packages Ceylon sold, 86's at 1s. 6d., 103's at 1s. 1d., 106's at 1s., 127's at 10½d. Pimento in slow demand; of 567 bags offered, only 176 sold, ordinary to fair, at 3¼d. to 3⅜d.; good clean, small, at 3½d.

STROPHANTHUS SEEDS.—Good green Kombé are held for 4s. lb., supply being very small, ordinary Kombé selling at 3s. 3d. lb. Brown, 1s. lb.

SULPHATE OF COPPER—After slightly receding, has again advanced, present quotations being £24 10s. to £25 10s. per ton, according to brand.

TAR.—Stockholm, 25s. 6d. to 26s.; Archangel, 18s. to 18s. 6d.

TARTARIC ACID.—English is quoted 1s. 1d. per lb. on the spot, and foreign 1s. 0¼d. per lb. c.i.f.

TURMERIC—Remains firm, although quiet, and only small sales have occurred at full rates. Bengal quoted 26s. Madras, fair to fine bright finger, 32s. 6d. to 37s. 6d. Cochin, split bulbs, 11s., and fair China finger, 26s.

Liverpool Market Report.

October 19, 1899.

A good deal of attention has been turned to Honey during the week, large sales of Chilian having been effected at satisfactory rates, whilst for Californian fine new samples have sold at higher rates, and the closing quotations are higher still. In seeds, but little has been done, as Linseed has been immovable, and Canary-seed is in poor demand. Oils generally are in a satisfactory condition. Castor Oil is firm, with fair business doing. Olive Oil, chiefly Spanish, has been selling in limited amount, whilst a further advance will be noted in the price of Spirits of Turpentine. Amongst the other articles of daily sale, Beeswax has brought good prices, Gum Arabic has been moving off well, and a parcel of dried Kola Nuts sold at a rather better figure than has been obtained of late. Chemicals are only slightly affected. Sulphate of Ammonia is weaker, Copper Sulphate is slow of sale, but other chemicals are firm, and more likely to advance, in sympathy with the higher prices for fuel, than to go down.

AMMONIA SALTS.—Carbonate is firm and scarce, 3¼d. to 3½d. per lb.

BEESWAX.—20 sacks of Chilian sold at £6 17s. 6d, £7 2s. 6d., and £7 5s. per cwt., according to quality.

BLEACHING POWDER—Is scarce at £5 5s. to £5 10s. per ton.

COPPERAS—Is exceedingly firm, Welsh at 37s. 6d. per ton, Lancashire at 40s.

COPPER SULPHATE.—£25 5s. to £25 7s. 6d. on the spot; forward (spring) £25 10s. to £25 12s. 6d. per ton.

GUM.—The demand for Arabic sorts is good, and sales have been made at 62s. 6d. per cwt. Niger Gum has sold at 50s. to 75s.

HONEY.—Chilian has been selling as follows: 170 barrels at 22s. per cwt. for Pilc 2, 20s. 6d. for Pile 3, 24s. 6d. Pile 1, and 29s. Pile X. 30 barrels of Pile 2 afterwards sold for 23s. 20 barrels of Peruvian made 25s. per cwt. Californian fine new sold early in the week at 46s. 6d., then later, 25 cases went for 47s. per cwt. Holders now want an advance on this.

KOLA NUTS.—50 bags of dried changed hands at 2d. per lb.

OILS (FIXED) AND SPIRITS.—Castor Oils, though quotations are well maintained, have not been very busy, and prices are showing a movement forward. Calcutta "good seconds," 3⅛d. per lb. French 1st pressure, 2$\frac{15}{16}$d. to 3d. per lb.; 2nd pressure, 2⅝d.; Madras, 2⅞d. per lb. Olive: Such transactions as have taken place have been almost entirely confined to Spanish, which has been sold at £35 per tun, other oils are very firm, and in small amount locally. Linseed is steady and unaltered at 23s. 6d. per cwt. in export packages. Cottonseed is still firmly held for 20s. to 20s. 6d. per cwt. for Liverpool refined, in export barrels. Spirits of Turpentine is steady at the higher rate of 39s. 6d. per cwt., with a fair amount of inquiry.

POTASH SALTS.—Bichromate firm, 3¼d. to 3½d. per lb. Chlorate quiet at 3½d. to 3¾d. per lb. Cream of Tartar is 2s. per cwt. dearer, and 1st French is now priced at 77s. to 80s. per cwt. Pearlashes are dull at 30s. per cwt. Potashes are being held for a rise at 21s. 6d. to 21s. 9d. per cwt. Saltpetre is firmly held at £21 10s. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax steady at 16s. per cwt. crystals, and 17s. powdered. Caustic is in good demand, 76 per cent. to 77 per cent., £9 7s. 6d. per ton; 70 per cent., £8 10s. per ton. Crystals steady at £3 5s. Nitrate is firm on the spot with a fair business going at 7s. 7½d. to 7s. 10½d. per cwt

Manchester Chemical Report.

October 18, 1899.

The activity in the textile industries in this district, coupled with a well-sustained demand for export, is causing the utmost firmness in heavy chemicals. Caustic Soda is very firm at £9 2s. 6d. to £9 7s. 6d. for 77 per cent., and £8 7s. 6d. to £8 12s. 6d. for seventies. Bleaching Powder is unchanged, as are also Soda Crystals and Bicarbonate of Soda. Sulphate of Copper continues brisk for Spring delivery at £25 15s. to £26 10s. per ton, best brands, delivered Manchester. Salt cake is easier at 24s. to 25s. per ton in bulk on rails. There is continuance of the upward movement in Carbolic Acid, and local makers are asking 2s. 1½d. to 2s. 2d. for sixties. Pitch is also in good demand at late rates. Brown Acetate of lime continues steady at £5s. 5s. per ton, Welsh and American, here. Alum and Sulphate of Alumina are said to be on the advance. White Powdered Arsenic £19 to £19 5s. per ton, ex ship, Garston, with higher figures for forward delivery. Yellow Prussiate continues scare and firm, but cyanide is dull on account of Transvaal affairs.

Newcastle-on-Tyne Chemical Report.

October 18, 1899.

A fair amount of business is still passing, and as the principal makes of the district are scarce, in some instances higher quotations are being made. Soda Crystals, for instance, to certain markets are 5s. per ton dearer. Quotations are:—Soda Crystals, 55s. Bleaching Powder, £6 5s. to £6 10s. Caustic Soda, 70 per cent., £8 10s. Soda Ash, £4 10s. Alkali, £5 10s. Sulphur, £4 17s. 6d. to £5 per ton.

PERSONAL AND BUSINESS NOTES.

Mr. F. M. Taubman, the sculptor, who has been commissioned to execute a bronze statue of Sir Sydney Waterlow, for erection in Waterlow Park, Highgate, is the son of Mr. Robert Taubman, of the firm of Morson and Sons, London, and is himself a registered chemist.

Mr. R. M. Williams, chemist and druggist, Abergavenny, has recently opened a new pharmacy, the fittings, etc., being supplied by Messrs. Ayrton and Saunders, Liverpool.

Marriages.

Plant—Bootiman.—On Wednesday, October 11, at St. Stephen's Church, South Shields, by the Rev. Arthur McCullagh, M.A., rector, assisted by the Rev. J. W. D. McIntosh, B.A., and the Rev. F. Peacock, M.A. (Sunderland), Walter Edward Plant, pharmaceutical chemist, youngest son of the late William Cart Plant, Doncaster, to Lucy, eldest daughter of Dr. Bootiman, M.S., Admiralty surgeon, South Shields.

Tiley—Heyeswood.—On Wednesday, October 11, at Hartford, by the Rev. E. Eddowes, vicar, Arthur Percival Tiley, chemist and druggist, Burslem, Staffordshire, to Catherine Barlow Heyeswood, of Hartford.

Deaths.

Bevan.—On Wednesday, October 11, Charles Frederick Bevan, Pharmaceutical Chemist, Harwich. Aged 78. Mr. Bevan, who was one of the few remaining old Pharmaceutical chemists, had been a member of the Pharmaceutical Society since 1847, and has served the Society as local Secretary for many years. As a youth he was articled to Dr. Clarke, of Wellingborough, afterwards turning his attention to pharmacy. He spent a few months with Mr. Provost, of Huntingdon, and five years with Messrs. Lea, Perrins, and Smith, of Cheltenham, leaving them in 1847 to take a business in the Hackney Road, London. In March, 1850, he removed to Harwich, and established the business he personally carried on until, a few years ago, he took his son, Mr. Wm. Bevan, into partnership. He took an active interest in local affairs, and has held many public offices. While serving as a member of the Town Council he was offered the position of Mayor several times, but he always declined the honour.

Seymour.—On October 3, Henry Seymour, Chemist and Druggist, Bristol. Aged 65.

Smith.—On October 5, David Smith, Chemist and Druggist, Stroud. Aged 63.

Hickin.—On October 16, Henry Hickin, Chemist and Druggist, Shrewsbury. Aged 80.

Lomas.—On October 16, Joseph Wilding Lomas, Pharmaceutical Chemist, London. Mr. Lomas had been a member of the Pharmaceutical Society since 1861.

Calendar for the Week.

Sunday, Oct. 22. 21st after Trinity. Sun rises 6.37, sets 4.51

Monday, Oct. 23. Sun rises 6.39, sets 4.49.

Tuesday, Oct. 24. Sun rises 6.40, sets 4.47.

Bradford and District Chemists' Association, County Restaurant, Bradford, at 9 p.m.—Paper on "The Legal Aspect of Pharmacy, Present and Prospective," by F. A. Wilcock.

Chemists' Assistants' Union, Horse Shoe Hotel, Tottenham Court Road, London, W.C., at 9 p.m.—First Smoker of the Season.

North-East Lancashire Chemists' Association, Blackburn.—Annual meeting; Paper by R. Lord Gifford on "Pharmacy 1868-1899"; followed by a discussion on the Companies Bill.

Royal Photographic Society, 5*a*, Pall Mall East, London, W., at 8 p.m.—Paper on the "Wellington Film," by Harry Wade.

Wednesday, Oct. 25. Sun rises 6.42, sets 4.45.

Thursday, Oct. 26. ☾ 9.40M. Sun rises, 6.44, sets, 4.43.

Chemists' Assistants' Association, 73, Newman Street, London, W., at 9 p.m.—Paper on "Ethics as Applied to the Practice of Pharmacy," by J. C. Hyslop.

Friday, Oct. 27. Sun rises, 6.46, sets, 4.41.

Glasgow Chemists' and Druggists' Assistants' and Apprentices' Association, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Paper on "The Assistant: His Fortunes and Future," by J. P. Gilmour.

School of Pharmacy Students' Association, 17, Bloomsbury Square, London, W.C., at 7 p.m.—Inaugural Address by J. Spiller. Refreshments provided. Members may take their friends.

Saturday, Oct. 28. Sun rises, 6.47, sets 4.39

Publications Received.

ON THE USES AND ABUSES OF THE PUBLIC HOSPITALS IN AUSTRALIA, TASMANIA, AND NEW ZEALAND; with thirty-two Practical Suggestions for Reform. By L. BRUCK. Pp. 72. Sydney: L. Bruck, Medical Publisher, 1899. From the Publisher.

THE PHOTO-MINIATURE: A Monthly Magazine of Photographic Information—Orthochromatic Photography. Vol. 1., No. 6. September, 1899. Price, post free, 7d. London: Dawbarn and Ward, Limited, 6, Farringdon Avenue, E.C. From the Publishers.

TRANSACTIONS OF THE JENNER INSTITUTE OF PREVENTIVE MEDICINE. Edited by ALLAN MACFADYEN, M.D. Second Series. Pp. xv. + 253. London: Macmillan and Company, Limited, 1899. From the Secretary.

THE CHEMISTRY OF THE HAIR, FACE, AND TEETH. By A. B. GRIFFITHS, Ph.D., F.R.S. (Ed.), F.C.S. Pp. viii. + 152. Price 2s. 6d., post free, 2s. 8d. London: R. Hovenden and Sons, 30-33, Berners Street, W., 1899. From the Publishers.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

Three Doz. 1/6 size Wilson's Food; 1 doz. 2/- and 1 doz. 2/6 Chapman's Cattle Oils; all in good condition. What offers?—Gartside, Chemist, Oldham.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Teck, East Dereham.

Overstocked.—Bism. Subnit., 5/3 lb., 4 lb. £1; Iodoform, Ppt., 13/- lb., Crystal, 12/- lb.; Potass. Iodid. Opt., 9/6 lb., 4 lb. 36/-; Atrop. Sulph., 2/6 ʒj., 14/- ʒ; 17 ʒ Gum Opii, 12/-.—Eastman, Forest Lane, Stratford.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Frog in Throat, Vanilla Pods.—Eastman, Forest Lane, Stratford.

Bloxam's Chemistry, 1895; Fresenius's Qualitative Analysis, 1887.—Morris, 26, S. Mount St., Aberdeen.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

(Received too late for Classification.)

LADY Pharmacist, qualified; to superintend in the packing department, handling of preparations containing poisons.—Applicants will please state age, experience, and salary required, to POISONS, "Pharm. Journal" Office, 5, Serle Street, London, W.C.

ENGLISH NEWS.

The Monument Pelletier-Caventou, to which reference was made in the Journal a fortnight ago (*ante*, p. 368), is the subject of a further communication from Mr. Walter Hills, who acknowledges the receipt of the following subscriptions to the Memorial Fund:—

Bourdas, Isaiah	£1 1 0
Reynolds, Richard	1 1 0

Other British pharmacists who may be desirous of contributing to the Fund are requested to communicate with Mr. Hills, at 17, Bloomsbury Square, London, W.C.

Lectures on Bacteriology, etc., at Exeter.—The authorities at the Albert Memorial College, Exeter, have arranged for a course of lectures on bacteriology to be delivered by Mr. C. G. Moor, M.A., F.I.C., F.C.S. (joint author of "Applied Bacteriology," "The Examination of Water," etc.), beginning on October 27, at 8 p.m. Fee, £2 2s. The lectures will be fully illustrated by lantern slides, and cultures of all important organisms will be shown. The ground covered by the lectures will be the same as for the various examinations for the diploma of public health, so far as theory is concerned. Arrangements can also be made for students who desire to undertake practical work in bacteriology, or the analysis of water, foods, etc. It is also intended to institute a systematic course of instruction, embracing all the subjects required for the diploma of public health and other examinations in sanitary science. Some of the classes are already in operation and particulars may be obtained on application. In addition to the foregoing classes, the College provides complete instruction for the examinations of the Pharmaceutical Society. For particulars see the College Time Table, which may be obtained by writing to the Secretary.

Chemists' Assistants' Association.—The first of the musical and social evenings of the session was held at 73, Newman Street, London, W., on Thursday, October 19, Mr. J. F. Harrington (member of the Pharmaceutical Council and President of the Western Chemists' Association) in the chair. There were about forty members present, and nine new members were duly proposed and seconded. An exceptionally good programme had been arranged by Mr. C. J. Strother and his colleagues. The following gentlemen taking part in the proceedings:—Mr. Victor Slin, Mr. A. Latraille, Mr. J. S. Strother, Mr. H. Hymans, Mr. T. Morley Taylor, and Mr. E. A. Marcus. Each one performed his part well, and was heartily applauded. The recitations by Mr. T. Morley Taylor were as usual highly appreciated. Mr. W. N. Ellis accompanied the songs. During the interval the President (Mr. F. W. Gamble), proposed a vote of thanks to Mr. Harrington for coming there that evening to fill the chair. Mr. Harrington briefly replied, and a very enjoyable evening terminated by the singing of "God save the Queen."

Breeze, Jackson, and Green, Limited.—Messrs. Jackson and Co., wholesale druggists and sundriesmen, and Messrs. Breeze and Co., baking and egg powder manufacturers, both Plymouth firms, announce that they have united and converted their respective businesses into a limited liability company, as from the 1st inst., and from that date will trade as Messrs. Breeze, Jackson, and Green, Limited. The share capital will be £6,000, in 6,000 shares of £1 each; of which 3,000 will be cumulative 5½ per cent. preference shares, and 3,000 ordinary shares, debentures at 4¼ per cent., £3,000. Of the ordinary shares, the vendors will take £2,000 in part payment of the purchase money, and there is offered for public subscription the balance of 1,000 ordinary and 3,000 cumulative 5½ preference shares, 10s. per share being payable on application and 10s. on allotment. Applications will also be received for sixty 4¼ per cent. debentures of £50 each, at par. The directors will be Mr. George Breeze, chemist and druggist, Mr. A. D. Breeze, wholesale druggist, and Mr. E. W. H. Green, wholesale druggist. Application for shares should be made to the Secretary, Mr. A. D. Breeze, 41, Station Road, Plymouth.

Football.—On October 21, the Metropolitan College of Pharmacy and London College of Pharmacy Football (Association) teams met at Hyde Farm, Balham. The game throughout was played in a thick fog and resulted in a win for the "Metros." by three goals to one.

Midland Pharmaceutical Association.—In consequence of the delivery of the inaugural address to this Association, by Alderman W. Gowen Cross, J.P., on "Pharmaceutical Politics," having been fixed for Thursday, November 2, Mr. Charles Thompson, local secretary of the Pharmaceutical Society, writes to say that he will be pleased to meet any member of the Pharmaceutical Society, at the Great Western Hotel, Birmingham, on Friday, November 10, instead of November 3, as previously announced.

North Staffordshire Chemical Association.—Referring to the report of a recent meeting of this Association, Mr. Weston Poole, Newcastle, writes to say that Mr. Blade's motion was not carried unanimously, as reported in last week's Journal. He says: Certainly I was the only one who did oppose it and voted against it. My reasons for doing so were:—(*a*) That everything should be done through the Council as our official representative, and as the Council had not asked for extra funds, there was no necessity for them; (*b*) that if chemists saw their danger, they should join the Society, and so present a united front, at the same time providing the necessary financial support. I am loth to occupy your valuable space by obtruding my opinions on your readers, but in justice to myself I felt I ought to let it be known that I strongly disapprove of the resolution."

Bradford and District Chemists' Association.—On Tuesday, October 24, a meeting of this Association was held at the County Restaurant, the President, Mr. H. A. Rogerson, in the chair. The preliminary business being dispatched, Mr. F. A. Wilcock read a paper on "The Legal Aspect of Pharmacy, Present and Prospective," in which he reviewed the history of pharmacy since the passing of the Pharmacy Act, 1868, referring principally to the company pharmacy problem and to the question of further regulation of the sale of poisons, advocating in the latter connection a large addition to the poison schedule. With regard to "company pharmacy," he was of opinion that it did not make for the safety of the public that unqualified persons, with or without the assistance of an irresponsible qualified assistant, should be able to usurp the titles and functions of a pharmacist, any more than they should take and use those of a doctor or lawyer. If that anomalous state of affairs was plainly put to the outside public, he thought that chemists would be able to get the question settled on a satisfactory basis. It was of no use being too modest and afraid of attacking pretended "vested interests." Chemists had right and justice on their side, and their motto ought to be "No Compromise." After a lengthy discussion, in which Messrs. Silson, Wilcock, Waddington, and the President took part, Mr. Waddington proposed, and Mr. Hanson seconded:—

> That this Association notes with pleasure the expressed intention of the Council of the Pharmaceutical Society to promote legislation having for its object the prevention of the assumption of the titles of Pharmaceutical Chemist, Chemist and Druggist, or Chemist, or Druggist, by limited liability companies, unless the individuals constituting such companies are themselves registered under the Pharmacy Act.

This was carried unanimously. The President then moved, and Mr. Silson seconded, the following proposition, which was also agreed to unanimously:—

> In the interests of the safety of the public, this Association would press upon the Council of the Pharmaceutical Society the desirability of taking steps to extend the scope of the Poison Schedule, with a view to the inclusion of a number of other dangerous substances, which will suggest themselves to the Council's judgment.

In reference to the scheme which Mr. G. T. W. Newsholme has proposed with regard to the appointment of local secretaries, Mr. Waddington proposed, Alderman Dunn seconded, and the meeting unanimously agreed to a proposition to the effect:—

> That this Association has noticed with regret that no steps have been taken by the Pharmaceutical Council to put into practice the very excellent scheme brought forward a year ago by the Vice-President, Mr. Newsholme, with regard to the appointment of local secretaries, and respectfully requests them to give it their official sanction so that the local associations may take the necessary steps for its completion.

The meeting shortly afterwards terminated.

Chemists' Assistants' Union.—On Tuesday, October 24, the first smoking concert of the season was held at the Horse Shoe Hotel, Tottenham Court-road, the chair being occupied by Mr. W. S. Glyn-Jones (member of the Pharmaceutical Council). An excellent programme of vocal and instrumental music was gone through, the ventriloquial and conjuring entertainment by Mr. Bewsher being very amusing. The comic songs by Mr. Wild, who is an excellent comedian and dancer, were highly appreciated.

Mr. Dan Jones rendered "The Wonders of the Deep" and "The Vagabond" in masterly style. The other artistes were Messrs. Graham Stead, Hollingsworth, Tidbury, Sillitoe, Taskar, Casselis, Mitchell, and Tom Taylor, Mr. Sanders acting as accompanist. Dr. Dutch, being called upon to speak, said that the pharmacist was even more necessary to the physician than the physician to the pharmacist. He thought that such preparations as tabloids, pellets, etc., should be only supplied to the trade in bulk, and dispensed only on the order of a medical man; also that chemists should support those medical men who prescribed from the B.P.—The Chairman, in the course of his remarks, said that if smoking concerts had been held by assistants twenty years ago, at the present time things would have been better for both masters and men. Mr. Whineray had said that the Union had found situations for several assistants coming up to London from the provinces. He thought the masters ought to appreciate that, as good assistants were difficult to obtain. He hoped that in the near future the certificate of membership of the C.A.U. would prove itself a sufficient guarantee that the holder was a capable man. He impressed on the members the necessity of working together, and not to leave the work to a few officers. He then read a letter from the President of the Pharmaceutical Society, saying he had an engagement elsewhere, but would attend if time permitted. He was sorry the President had not been able to come.—Mr. J. Fitzgerald, L.D.S., in proposing a vote of thanks to the Chairman, expressed himself in sympathy with the Union, and wished the members every success. The concert, which was the most successful yet held in connection with the Union, closed with the National Anthem at 11.45 p.m.

GADD'S 'SYNOPSIS OF THE B.P.'—Messrs. Baillière, Tindall, and Cox announce that they have issued a new edition (the fourth) of Mr. H. Wippell Gadd's 'Synopsis of the British Pharmacopœia.' In preparing this edition Mr. Gadd has had the assistance of Mr. C. G. Moor, M.A. (Exeter City Analyst), who has contributed some valuable analytical notes and suggested standards based on the examination of commercial samples.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.—The annual dinner of this Association will be held on Wednesday, November 8, at the Freemasons' Hall, Princess Square, Plymouth, at 7 p.m. prompt. Applications for tickets (5s. each), accompanied by remittance, must be made to the Secretary, Mr. G. Breeze, 42, Station Road, Union Street, Plymouth, not later than Saturday, November 4, or to any of the following Dinner Committee:—Messrs. F. Maitland, Jas. Cocks, Martin Johnson, J. Davy Turney, C. J. Park, A. D. Breeze, C. T. Weary, J. A. Lamble, and W. H. Woods.

BACTERIOLOGY IN LIVERPOOL.—Pharmaceutical students in Liverpool and district may be interested to know that Professor Boyce, of University College, is now conducting a class in bacteriology suitable for pharmacists, in the Thompson Yates Laboratories, on Monday evenings, at 7.45.

IRISH NEWS.

"POISONING BY NITRIC ACID, self-administered whilst temporary insane," was the jury's finding as to the cause of the death of Mr. W. J. Clarke, grocer, Newry. Deceased suffered from insomnia and nervous depression. He had been treated at different times by three doctors, and, being a total abstainer, consulted Dr. Crossle in regard to stimulants, who, however, warned deceased against their use. On the 17th inst. he procured twopennyworth of "pure nitric acid" (labelled poison) from Mr. Edgar, a druggist, which he mixed with "about a pint of whiskey" and drank. The medical evidence showed that the symptoms were such as would be produced by pure nitric acid.

OPIUM POISONING.—An inquest was held on the 18th inst. concerning the death of Mrs. Maria Wood, wife of the proprietor of the Hope Arms Hotel, Castleblayney. The deceased lady had been an invalid, customarily attended by a nurse. One night some medicine was administered which produced excitement and restlessness; the next morning deep slumber and stertorous breathing supervened. Doctors Clarke and Wilson, who were summoned, diagnosed narcotic poisoning, and applied the usual remedies, but without success. A number of bottles were found, one containing laudanum. The verdict of the jury declared the probable cause of death to be opium, but how administered there was no evidence to show.

A FURTHER POISONING FATALITY took place in Belfast. The victim, Michael Hanna, had been drinking, and, becoming "temporarily insane," swallowed some laudanum. He was taken to the Royal Hospital, where he succumbed in two days. Professor Lorraine Smith, having made a pathological examination, stated that death was due to complication following opium poisoning.

CHLOROFORM AS AN ANÆSTHETIC has been debited with another failure, a patient of Monkstown Hospital, Dublin, having died immediately after its administration.

MISS MARGARET PERROT, who has just qualified as a registered druggist, is in business with her sister as Perrot and Co., Upper Newtownards Road, Belfast.

SCOTTISH NEWS.

GLASGOW CHEMISTS' AND DRUGGISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—The second meeting of the above Association was held in the Masonic Chambers, 100, West Regent Street, on Friday evening last, John P. Gilmour, President, in the chair. Mr. John Lothian, Principal of the Glasgow School of Pharmacy, delivered a lecture on "Switzerland." There was a very large attendance of members and their friends, including a number of ladies, and the lecture, which was illustrated by seventy limelight views of Swiss scenery, was much appreciated. On the motion of Mr. Adams, a hearty vote of thanks was awarded to Mr. Lothian, who, in acknowledgment, expressed his gratification at such a bumper meeting, and trusted that the Association would go on and prosper.

FOREIGN NEWS.

A PROTEST FROM MEDICAL STUDENTS.—It has recently been stated that the house-surgeons who were coming up at the next examination at Paris objected to two of the examiners—Drs. Benjamin Auger, surgeon at the Beaujon Hospital, and Gouguenheim, of the Lariboisière Hospital. The latter was more particularly objected to. It was stated further that a petition had been sent in to the proper authorities—the Assistance Publique. As a matter of fact, although such a petition has apparently been drawn up, it does not seem to have been presented. There would be nothing astonishing about it if it were. Medical students have a way—or several ways—of protesting against authority, and the acts of the authorities. The French students are not alone in this respect; they have kindred souls across the Channel. There is seldom a year passes that the examination in question does not provide the occasion for some sort of demonstration. So far as Dr. Gouguenheim is concerned, he says that he declined to act as an examiner as soon as he knew of his appointment, on the ground that his health did not permit him to undertake the duties. As to the objection made against him by the competitors, this was ancient history, dating back fourteen years, and had already been disposed of at the time. He had then asked for an enquiry, which was held, and showed the utter groundlessness of the charge and the recklessness of those who made it. He had since been appointed examiner on two occasions for competitions much more important than that in question, and he did not know that the slightest objection had been raised against him. As to Dr. Auger, who bears a high reputation in the profession, it seems that the only objection to him is that he is cold and reserved in his attitude towards the students. Yet a number of these have subscribed to a letter in which they say:—"There is only one thing to reproach our master about—that is, that he is honest. Incomparable anatomist and surgeon, he makes use of surgery only to cure. And because he does not use the knife indiscriminately there are only two deaths in his ward, where there are a dozen in wards where the other doctors operate." The students recall the words of the doctor:—"Make a thorough examination of your patients, gentlemen; console them; give them to eat and drink, for that is the best surgeon. Do not operate excepting in a case of urgency, and you will thus reduce the mortality to its lowest."

Professor Mosso, of Turin, has made experiments in preventing smoke in long tunnels. Compressed air, carried on the locomotive tender, was allowed to escape as the train passed through the tunnel, and it blew the smoke back, purifying the atmosphere. Compressed oxygen was also allowed to enter the furnaces and promote combustion. Both methods were effective, but the former, being cheaper, is in the future to be adopted.

A Learned German, who has devoted himself to the study of physiology, anthropology, and allied sciences, makes the rather startling assertion that moustaches are becoming commoner among women in the present day than in the past. He says that in Constantinople, among the unveiled women that are to be met, one out of ten possesses an unmistakable covering of down on the upper lip. In the capital of Spain, again, the proportion of ladies with the masculine characteristic is said to be quite equal to that observable on the Golden Horn. An American medical man states that in Philadelphia fully three per cent. of the adult fair sex are similarly adorned, and probably the proportion would be still larger but that many women take the trouble to eradicate the unwelcomed growth by the application of depilatory preparations.

What the World owes to Louis Pasteur the world's great vocabulary is incompetent to express. Through his researches, and those of the students who have come after him, the light has been turned upon what has hitherto been total darkness. Doubt, uncertainty, and experiments have given way to precision and accuracy in diagnosis. As the farmer knows that the chinch bug is the cause of his withered crops, so the physician knows that the bacillus of certain diseases brings about certain symptoms. The microscope is the physician's reliance. A few drops of blood, a bit of tissue, a little perspiration brought under the eye of this magic assistant will tell him at once the cause and progress of the disease. And it is not alone the physician who benefits by this knowledge. The farmer, the vineyardist, the dairyman, the stockraiser, the cultivator of the silkworm, and the enthusiast on bees are alike indebted to the discoverer of the germ-origin of disease for invaluable aids in their business. A necessity of the near future is an improvement in microscopes and their cheapening, so that a knowledge of germs may become more widespread. Every township should have its bacteriologist and its microscopic equipment. There is no study more interesting, and none that is so important to humanity.

Pasteur once Made the Remark that the dust-brush and broom were a thousandfold more dangerous than gunpowder, and cost the world thousands of lives to one of the latter. It seems like an exaggerated statement that, while gunpowder and explosives have caused the death of thousands, the broom and dust-brush have slain millions; but this is a fact past question. Constant stirring up of dust in the house is a menace to health and a direct destroyer of life. The time will come when such a thing as a carpet will not be permitted in a civilised household, and when the floor-brush and broom will have disappeared for ever. Few people realise that they may bring in from the street on their shoes or skirts every form of disease that flesh is heir to. This is ground off into the carpet, the warmth of the apartment helps on the process of development, then the housemaid deliberately sets the germs in motion with her broom, and the air is filled with them. They settle on the furniture and ornaments, and with the dust-brush she whisks them off again on to the carpet, where they remain, possibly to propagate, certainly to live, until by the next stirring up they may float into somebody's throat or lungs. This is precisely what they have been waiting for, and is the object of their existence. Once settled in their congenial quarters, they begin their deadly work, and the system is soon overrun with their progeny; then there may be attacks of coughing, expectorating, and floating germs on the breath to scatter this same deadly enemy not only through this dwelling, but also all others from which visitors come and go.

There was at One Time an epidemic of throat trouble in a community in the South of France, and greatly were the doctors puzzled to know how the infection spread, as the only original case had been confined to the house for a long time and never mingled with his neighbours. At last someone recalled the fact that this man had been to the post-office; then someone remembered that, as he stood talking with some friends, he expectorated into the register of the heater. Down in the pipe a quantity of dust and lint had lodged, and here, in this agreeably warm bed, millions of germs were liberated, and, rising on the hot-air current, floated out into the open space in the post-office lobby. It is high time that the deadly nature of germs of this sort were proclaimed aloud through the land. Bacteriology in some simple way should be taught in every public school, and hand-in-hand with these instructions should go warnings against the broom and the dust-brush. Bare floors or matting which can be wiped clean with damp cloths are the only suitable, safe, and sanitary floor coverings. Next in order come the better grades of oilcloth. Well-fitted, matched flooring, thoroughly oiled and kept reasonably clean, makes a floor that meets all the conditions of health. Happy will the human family be when floors of this and similar kinds are the rule and not the exception.

TRADE NOTES.

Soloid Indicators for Chemical Tests.—Messrs. Burroughs' Wellcome and Co., Snow Hill Buildings, London, E.C., have recently introduced in soloid form the indicators more frequently used in conducting chemical tests and volumetric determinations. These include indigo carmine, lacmoid, methyl orange, phenolphthalein, rosolic acid, starch. By means of these soloids small amounts of a solution of any indicator, of proper quality and strength, may be quickly prepared as required.

Novelties for the Xmas Season.—Messrs. Marshalls, Limited, 27, Red Lion Square, London, W.C., are again to the front with an exceedingly pretty lot of attractive lines suitable for the Xmas season. To meet the increasing demand for their Butterfly Sachets the firm has laid down special machinery for their manufacture, and are offering the advantage thus gained to the trade by reducing the price from 4s. 6d. to 3s. 6d. per dozen large size, and from 3s. 6d. to 2s. 6d. per dozen small size, thus making it a very profitable line. Another very attractive line is their Poppyland Sachet, in beautifully shaded silk, in almost every colour of the rainbow, at 4s. 6d. per dozen. The Fairyland Sachet, made in delicately shaded crinkled silks and flowers, are very appropriately named. A number of these sachets artistically arranged make a most effective window display, and are sold at the low price of 4s. 6d. per dozen. Space will not permit of reference to all the lines that may be seen in Messrs. Marshalls' showroom, but several novelties deserve special mention as being quite a departure from the usual run of these goods. Perhaps the most appropriate for the season is the Plum Pudding Sachet, a miniature plum pudding, made in silk, and cleverly coloured to represent a rich fruity pudding, adorned with the orthodox sprig of holly (in miniature), mounted on a pretty little plate on which are various suitable greetings. Price 5s. per dozen, complete. The latest novelty of this firm, and one which is likely to "take on," is a Sachet Button. These are made in beautiful satins, exquisitely coloured with numerous designs to suit all tastes. They are made in two sizes—about the size of a sixpence and a two shilling piece—and each is a decided work of art. A great feature about them is that they are supplied with a detachable pin, which enables them to be worn as a badge for gentlemen, or can be sewn on ladies' garments like an ordinary button. They are supplied on attractive show-cards at 3s. 6d. and 2s. 6d. per dozen. There is also a very fine collection of Silk-lined Perfumery Cases, ranging from 6d. to 10s. 6d., and for chemists' convenience the firm is putting up assorted dozens. Quite a new line is that shown in the illustration, of Pot Pourri Jar. These are of beautiful translucent china, hand-painted, with charming delicate designs, unlike the usual daubs on inferior Japanese ware. They are filled with a very sweet-scented pot pourri, forming a really charming ornament. Prices vary from 6s., 9s., 12s., 15s. per dozen.

THE LANTERN SEASON.—Messrs. Perken, Son, and Rayment, 99, Hatton Garden, Holborn Viaduct, London, E.C., send a copy of their illustrated catalogue. It contains the latest prices and novelties in "Optimus" specialties, including photographic apparatus, magic lanterns, and optical instruments. Lanterns suitable for exhibitions in drawing-room and lecture hall are listed at prices ranging from 30s. (second quality 21s.) upwards. The 30s. "Optimus" Magic Lantern, made by the firm in London, and complete in outside box, which may be arranged for use as a table when displaying the lantern, appears to be very good value. It has a stout metal body, thoroughly well japanned, side and back doors, telescopic draw tube, with brass nozzle Petzval portrait combination front lens (achromatic), having rack and pinion for focal adjustment; pivoted flashing shutter and compound condensing lens, composed of two plano-convex lenses of four inches diameter. Light is obtained from a three-wick refulgent lamp, of the best London make, burning petroleum oil, each wick being two inches wide. The chimney is of Russian iron, securely joined without solder. Oxy-hydrogen gas can be fitted to the lantern at an extra cost of 16s., or in lieu of lamp 7s. 6d. A slide outfit for the above, comprising thirty-six coloured transparencies, twelve uncoloured photographic transparencies, coloured comic slipping slides, together with sliding carrier to display them in the lantern, is supplied at 30s. In addition to these the firm has a large selection of photographic transparencies, both plain and coloured, illustrating several thousand subjects. These slides are illustrative of the interesting and important features of various countries, the habits and customs of the people who inhabit them, the history—zoology, botany, geology, etc.—connected with each. Scientific subjects are also displayed, including among others anatomy and astronomy. Fairy tales and tales of adventure, comic, and in fact almost all subjects, are thus treated in pictorial form. Messrs. Perken, Son, and Rayment claim to be the makers of the only English animated photograph machine with an established reputation, £12,000 worth of machines and films having been sold with universal satisfaction. Chemists interested in the magic lantern trade should apply for the firm's catalogue of prices, etc.

FOOD AND DRUGS ACT PROSECUTIONS.

SPIRIT OF NITRE.—Eliza Noon, grocer, Nottingham Road, Ilkeston, was summoned at Ilkeston Petty Sessions on Friday, October 13, for selling sweet spirit of nitre not of the nature, quality, and substance demanded.—The analyst's certificate stated that the sample contained 86·5 parts of nitre and 13·5 parts of added water, its specific gravity being 873·5, instead of 84·2, as required by the B.P. The analyst also stated that the water could not possibly have got into the nitre by evaporation through leaving the bottle uncorked.—Defendant pleaded that she sold the nitre in the same condition as received from the wholesale dealers, but it had been in stock about eighteen months. She should take care not to sell it in future.—Fined 5s. and costs.

VINEGAR.—A case of some importance was tried at Hanley on Monday, October 16, the question at issue being, What is vinegar? Frederick Heath, grocer, Campbell-road, Stoke-on-Trent, was summoned for selling as vinegar an article which Mr. Jones, the county analyst, certified to be simply acetic acid diluted and coloured, whereas it was contended for the prosecution that vinegar ought to be the product of alcoholic and acetous fermentation.—In cross-examination, Mr. Jones, who was supported in his evidence by Mr. Otto Hehner, admitted that there was nothing in the sample analysed by him which might not be found in real vinegar.—On behalf of Messrs. Pickard and Co., manufacturing chemists, Sheffield, who supplied the extract from which the vinegar was made, and accepted all responsibility, it was urged that the extract was made from pure acetic acid of vinous origin, and was the product of alcoholic and acetous fermentation. Evidence in support of this contention was given by Mr. H. White, manager to the firm, Dr. J. Attfield and Dr. W. Hind, all of whom stated that the article sold by defendant was real vinegar, that there had been no adulteration, and that no material substance was absent.—The case was dismissed, defendant's costs, £19 17s. 6d., being allowed.

MILK OF SULPHUR.—On Wednesday, October 18, Dennis Whone, grocer, Micklethwaite, was summoned at Bingley Petty Sessions for selling milk of sulphur containing 49 per cent. of sulphur and 51 per cent. of hydrated calcium sulphate.—For the defence it was stated that the sulphur in question was bought as a pure article; the sample purchased by the inspector was the only lot sold, all the remainder had been destroyed.—The case was dismissed on payment of costs, £1 8s. 2d.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. E. M. Holmes, President of the British Pharmaceutical Conference, 1900, and Curator of the Pharmaceutical Society's Museums, has been elected an Honorary Member of the American Pharmaceutical Association.

Mr. Rowland Dixon, pharmaceutical chemist, has recently opened the Endcliffe Pharmacy, Hunter's Bar, Sheffield. The bottles, jars, and fittings have been supplied by Messrs. Ayrton and Saunders, Liverpool.

Marriages.

Ruff—Willis.—On October 19, at the Parish Church, Whitby, by the Rev. H. F. Fisher, William Ruff, M.P.S., chemist and druggist, Skinner Street, to Hannah, daughter of James Willis, master mariner, West Terrace, Whitby.

Oldham—Hargreves.—On the 25th inst., at St. James's Church, Rusholme, by the Rev. F. G. Buller, Harry Oldham, M.P.S., chemist and druggist, of The Brook, Liverpool, younger son of Joseph Oldham, Ash Mount, Gee Cross, to Annie, elder daughter of John Hargreves, of Longsight, Manchester.

Deaths.

Ernst.—On August 12, Dr. Adolphus Ernst, F.L.S., Professor of Natural History in the University, and Director of the National Museum, Caracas. Dr. Ernst had been a Corresponding Member of the Pharmaceutical Society since 1892.

Ridgley.—On October 19, Edward Barrance Ridgley, Chemist and Druggist, Ramsey. Aged 70.

Chadwick.—On October 21, George Nicholas Chadwick, Chemist and Druggist, Leeds. Aged 47.

Partnerships Dissolved.

(From the London Gazette.)

John Hurd-Wood and James Dunbar-Brunton, Surgeons, Apothecaries, and Accoucheurs, Manor House and Surrey House, Leatherhead, Surrey. Debts will be received and paid by John Hurd-Wood.

Ferdinand Sievers, Rudolph Sievers, and Albert Sievers, trading as Messrs. Sievers Brothers, Surgeon-Dentists, at Gloucester, Hereford, Stroud, and Kensington.

Henry Jones, Joseph Cort, John Rutherford, and Christopher Robert Slater (trading under the style of the Throstle Nest Soap and Chemical Company), Soap and Chemical Manufacturers, Blackburn. Debts will be received and paid by Christopher R. Slater.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

Walter W. B. Sparrow, Surgeon, carrying on business at 25, Horninglow Street, Burton-on-Trent, and at Victoria Street, Blackburn.

Raphael Charles Humfrey, Chemist and Druggist, lately carrying on business at 10, Hewlett Street, Cheltenham, afterwards at 94, Hunter's Road, Birmingham, and now residing at Tintern, Cambridge Road, King's Heath, Worcestershire.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

October, 26, 1899.

Business in Drugs and Chemicals has been fairly active during the past week; the changes in values which have taken place have, however, not been very important. Star Aniseed Oil is dearer, both for spot and to arrive, and the more especially for shipment. Quicksilver is dearer, Mercurials very firm. Refined Camphor very firm in sympathy with the crude article. Bromides firm. Iodides fairly steady. Glycerine firm. Cod-liver Oil tending upwards. Opium, Morphia, and Codeia steady. Sulphate of Ammonia weak, and again rather lower. Quinine has assumed a somewhat undecided tone, but the late advance in value is fairly well maintained. Acid Carbolic dearer and in active demand. Phenacetin is also tending higher. Acid Tartaric and Cream of Tartar steady. Acid Citric dull and weak. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE.—There is no improvement to report in this article, which is weak at 9½d. to 1s. per lb., according to quantity and make.

ACID BORACIC—Is steady and without change in price.

ACID CARBOLIC—In good inquiry, the prices being 6⅞d. to 7¼d. per lb., according to quantity and make, for 35°-36° C. ice crystal in large bulk; 7⅜d. per lb. for the 39°-40° C. ice crystal, and 8⅜d. for 39°-40° C. B.P. quality in detached crystals. Crude 60° F., 2s. 3d. per gallon; 75° F., 2s. 9d. per gallon. Liquid 95-98 per cent. of pale straw colour, 1s. 3d. per gallon in 40-gallon casks; ditto 30 per cent. of dark colour, 10d. to 11d. per gallon.

ACID CITRIC—Continues dull and weak at 1s. 4d. to 1s. 4½d. per lb., according to quantity and make, for crystals in 5 cwt. casks.

ACID OXALIC—Is steady at price quoted last week.

ACID TARTARIC—Is fairly steady at unchanged price.

AMMONIA COMPOUNDS—Are without any special changes on the prices quoted last week. The tendency is, however, in some cases in an upward direction. Sulphate flat, quotations being: Gray, prompt, 24 per cent., London, £11 per ton; Hull, £10 7s. 6d.; Leith, prompt, £10 7s. 6d.; Beckton, prompt and November-December, £10 15s.; Beckton, terms prompt, £10 15s.

BORAX—Unchanged at steady prices.

BROMIDES—Are firm and in good demand at unchanged prices.

CAMPHOR.—The market for Crude continues firm, with sales of 100 cases China on the spot at 140s. There are buyers of Japan, October-December shipment, at 137s. 6d.; importers quote 147s. 6d. per cwt. c.i.f. For Refined the Hamburg makers advanced price, but still quote slightly lower rates than their English confréres, whose price remains at 1s. 8d. per lb. for Bells and Flowers in ton lots.

CHLORATE OF POTASH.—Crystals are still quoted 3¾d. for crystals and 3⅞d. per lb. for powder, spot, London.

CLOVES.—Privately Zanzibar are rather firmer, but little business doing. Small sales comprise spot at 3½d. to 3 5-32d., and March-May delivery at 3 9-32d. At auction 20 bales Zanzibar sold, ordinary dark at 3d. No Penang offered.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon. Benzole, 50 per cent., 10½d. per gallon; November-December, 11d. per gallon; 90 per cent., 9d. per gallon. Creosote, 3⅜d. per gallon. Crude Naphtha, 30 per cent. at 120°C., 5d. per gallon; Solvent Naphtha, 95 per cent. at 160°C., 1s. 6d. per gallon; 90 per cent. at 160°C., 1s. 3d. per gallon; 90 per cent. at 190°C., 1s. 2d. per gallon. Anthracene A., 4d. per unit; B., 2¾d. per unit. Pitch, 34s. per ton f.o.b. Tar, refined and crude, 12s. 6d. per barrel; 2d. per gallon.

COCAINE.—Makers' prices remain at 20s. 6d. per oz. for the Hydrochlorate in 200-oz. lots, and they are apparently not free sellers even at this price. There is, however, still a moderate quantity offering for second hands at 9d. to 1s. per oz. below makers' price. It is asserted that in view of the continued scarcity and dearness of the crude, a further advance on part of the makers of the refined article is by no means improbable.

CODEIA—Is very firm at 12s. 11d. to 13s. 6d. per oz. for the pure.

COD LIVER OIL.—Is at last tending upwards again, best non-congealing Norwegian oil being quoted 65s. to 67s. 6d. per barrel, in tin-lined barrels of 25 gallons.

CREAM OF TARTAR.—Steady and unchanged.

GAMBIER.—The market for arrival remains quiet, without business reported, quotations being rather easier at 13s. 3d. for October-December shipment.

GINGER.—Cochin in good supply, but firmly held, and only small lots sold at rather dearer rates. Of 1,656 bags and 98 cases offered, 305 packages sold, bold, some medium, roughly cut and scraped and little lined, at 76s.; ditto, more heavily lined at 73s. 6d.; washed medium and small, slightly mouldy, 25s.; mouldy ditto, 23s. 6d. to 24s.; small and ends, mixed with shrivelled, at 21s. 6d.; small and medium rough at 24s. 6d. Jamaica in slow demand. Of 71 barrels only 4 sold, ordinary dark at 48s., good common to fair at 55s. to 66s.

GLYCERINE—Is very firm, both for crude and for refined; there is, however, no change in price to report.

GUM TRAGACANTH.—A very strong market, and although new arrivals are coming in the selection continues poor.

IODIDES—Are fairly steady at prices hitherto ruling.

MERCURIALS—Are very firm, but so far makers have not advanced prices, which remain 3s. per lb. for Calomel, and 2s. 8d. per lb. for Corrosive Sublimate.

MORPHINE.—Makers are firm at 5s. per oz. for the Hydrochlorate powder in quantity.

OILS (ESSENTIAL).—Star Aniseed has been in good demand this week, and closes rather dearer at 6s. 2d. per lb. on the spot, whilst the quotations for arrival are higher. Peppermint: H. G. H. is firmer at 5s. 6d. per lb., with stronger advices from the other side. Japanese dementholised, 3s. 9d. per lb.; 40 per cent., 5s. per lb. Cassia quiet; 80-85 per cent., 4s. 6d. per lb. Citronelle, 1s. per lb. Lemongrass quiet at 3¼d. per oz.

OILS (FIXED) AND SPIRITS.—Linseed quiet and rather easier; on spot, pipes, London quoted £23 15s. to £24; barrels, £24 to £24 5s.; Nov.-Dec., £24; Jan.-April, £23 15s. to £24; May-Aug., £23 10s.; Hull, spot, naked, £23 5s.; Nov.-Dec., £23; Jan.-April, £23; May-Aug., £22 10s. Rape steady; ordinary brown, on spot, £24; Nov.-Dec., £24; Jan.-April, £24 5s.; refined, spot, £25 10s.; Ravison, naked, spot, £21 10s.; Nov.-Dec., £21 10s.; Jan.-Feb., £22. Cotton firm; London crude, spot, £17 5s.; Nov.-April, £17 5s.; refined, spot, £19 to £20, according to make; Hull, naked, refined, spot, £17; Nov.-April, £17; crude, spot, £16; Nov.-April, £16. Olive firm: Mogador, £33 10s.; Spanish, £34 10s.; Levant, £34. Cocoanut quiet; Ceylon, on spot, £25 10s.; Oct.-Dec., £24 5s., c.i.f.; Cochin, spot, £29 10s. to £30; in warehouse near, £27 5s., c.i.f.; Oct.-Dec., £26 15s.; Jan.-March, £26 10., c.i.f.; Mauritius, on spot, £25 10s. to £26, in hogsheads. Palm: Lagos, on spot, quoted £27 10s. Castor Oil firm; Belgian, first pressing, spot, £27; Jan.-June, 1900, £26 10s.; f.o.b. Antwerp, second pressing, £25 10s. per ton, ex-wharf; Hull, manufactured, guaranteed cold-drawn pure pharmaceutical, £30 per ton in barrels, 3⅝d. per lb. in cases; pure firsts, £27 10s.; seconds, £26 10s. per ton in barrels; firsts, 3¼d. per lb. in cases; seconds, 3⅛d., ex-wharf, London. Lubricating Oil: Pale American, spot, 7s. to 9s.; black, 6s. 3d. to 8s.; Russian black, 5s. 6d.; pale, 7s. to 8s. 6d.. Petroleum Oil steady; Russian, spot, 5⅜d. to 5⅝d.; American, spot, 6⅞d. to 7d., and to end of March; water white, 8d. to 8¼d. Turpentine: A good business has been done, fully 5,000 barrels in various positions, at easier rates, the market closing steady, as follows: American, spot, 37s.; Nov.-Dec., 37s.; Jan.-April, 37s. 4½d.; July-Dec., 31s. 4½d. to 31s. 6d. Petroleum Spirit: American, 9¾d.; deodorised, 10d.

OPIUM.—The market continues firm for all kinds. For manufacturing descriptions a fair demand has prevailed, and retail sales of "Soft Shipping" have been made at full rates. Persian is firmly held, and has met a fair inquiry; but few sales of importance have transpired.

PHENACETIN.—The makers appear to be no longer eager to book orders at the low price of 3s. 3d. per lb. for crystals or powder, for quantity and bulk packing, and the general idea appears to be that we shall see higher prices ruling for this article before very long.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt.;

Bichromate, 3½d. per lb.; Bromide, 1s. 10½d. per lb.; Chlorate crystals, 3¾d.; powder, 3⅞d., spot, London; Iodide, 10s. 6d. per lb. Permanganate quotations vary according to make from 52s. 6d. to 62s. 6d. per cwt. for small crystals in 1-cwt. kegs; large crystals being quoted 5s. per cwt. more money. Prussiate, yellow, Beckton make, 7¾d. per lb.; other English makes, 8d. to 8½d.; red, 1s. to 1s. 2d. per lb., according to quantity, etc.

QUICKSILVER.—Importer again advanced his price to £9 per bottle, while it might be possible to buy from second hand at 6d. per bottle below importer's price.

QUININE—Has become somewhat quiet, with but little business passing in the speculative market, there being now sellers of B. & S. and or Brunswick brands of Sulphate for later delivery at 1s. 1¾d. per oz., while the makers still quote same at 1s. 2d. per oz. The future of the article remains somewhat of a puzzle even to those most likely to be able to form a correct and reliable opinion.

SCAMMONY.—Virgin: The entire stock of firsts has been cleared at 30s. per lb. Roots: Business done at 21s. per cwt.

SENNA.—A few small sales of Tinnevelly from second-hand this week at from 4½d. to 5d. per lb. About 200 bales are arriving at the end of the week.

SHELLAC.—A decidedly firmer tone prevails in this market. The demand on the spot continues steady, although not active, with moderate sales of Second Orange at the auction advance. For arrival no business is reported; there are first-hand sellers of TN November-January steamer at 63s. 6d., and buyers at 62s. c. f. and i. For March delivery 500 cases have been sold at 66s. to 65s. 6d., closing sellers at the lower rate.

SODA COMPOUNDS.—Crystals are still quoted 60s. per ton in barrels, and 57s. 6d. per ton in bags, ex ship Thames. Ash, £5 5s. to £7 per ton, according to percentage, etc. Bicarbonate, £7 10s. to £8 10s. per ton; ditto, fully bicarbonated, 22s. 6d. to 25s. per cwt. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic White, 70 per cent., £9 per ton; ditto, 60 per cent., £8. Hyposulphite (Antichlor.), 6s. 6d. to 8s. 6d. per cwt., according to make, etc. Iodide, 11s. 10d. per lb. Nitrate dearer at £8 2s. 6d. per ton on the spot for refined, and £7 17s. 6d. per ton for commercial.

SPICES (VARIOUS),—Black Pepper: 5 bags Ceylon sold, fair at 5⅝d.; 100 bags Penang bought in at 5¾d. White Pepper: 20 bags Ceylon sold, fair Coriander kind at 8⅝d., and 3 bags ordinary brown limed Penang at 8¼d. Chillies firm: 100 bags Japan sold, fair bright at 38s.; 16 bags African sold, good bright at 42s. to 44s. 6d.; 34 bales Zanzibar bought in at 40s. Capsicums dearer; 147 bales Bombay sold, fair red cherry pods at 34s. Cassia Buds: 10 boxes bought in at 120s. Cinnamon quiet; of 219 packages only 16 sold, without reserve, broken at 6d. to 7½d., and cuttings at 2¼d. Mace steady, but quiet; 4 cases Penang bought in good bold pale, slightly wormy, at 2s. 6d.; 5 boxes Bombay sold, small thin red at 1s. 4d., dark broken ditto at 1s. 3d.; 12 cases West Indian sold, good pale at 1s. 6d. to 1s. 7dd., fair red at 1s. 3d. to 1s. 5d., pickings at 1s. 2d. to 1s. 3d. Nutmegs lower; 36 packages Penang sold, 78's to 80's at 1s. 7½d.; 11 boxes Bombay sold, 86's at 1s. 5d., 102's at 1s. 2d., 108's at 1s.; 75 packages West Indian sold, good pale at 1s. 6d. to 1s. 7½d., fair red at to 1s. 8d., 85's at 1s. 4d. to 1s. 5d., down to 132's at 8½d. Pimento: of 915 bags, 545 sold, ordinary to fair 3⅛d. to 3 3/16d., good 3¼d. to 3⅜d.

SULPHONAL.—The two makers continue to quote 17s. per lb. for both crystals and powder, but there are still sellers of quasi from second-hand at tangibly melow makers' price.

THURSDAY'S DRUG SALES.

To-day's Drug auctions passed off with a fair amount of activity. Cardamoms and Senna sold well, prices being fully maintained, while Buchu Leaves were dearer. The following are some of the particulars:—

ALOES.—4 barrels fair gourds were bought in. 33 cases Cape practically all sold at 25s. for good hard bright down to 23s. per cwt. for inferior.

AMBERGRIS.—5 tins were all bought in, 90s. per oz. being price mentioned.

ANISEED.—30 bags fair Spanish sold at 25s. per cwt.

ANNATTO SEED.—2 bags sold at 1d. per lb.

ANTIMONY.—10 cases Japan crude (black sulphide) were bought in at £23 15s. per ton.

BALSAM PERU.—7 cases of fair quality were bought in at 7s. 6d. per lb.

BITTER ALMONDS.—4 cases Peach kernels, catalogued as above, were bought in at 40s. per cwt.

BUCHU LEAVES.—37 packages longs part sold at 9½d. per lb., balance being taken out at 10d. 3 bales brownish green sold at 10¼d. per lb.

CARDAMOMS—72 cases Ceylon Mysores chiefly sold at prices ranging from 1s. 8d. to 3s. 8d. per lb., prices realised in last sale being fully maintained. Fair seeds were bought in at 2s. 5d. per lb.

CASCARILLA BARK.—2 barrels of fair siftings were taken out at 25s. per cwt.

COLOCYNTH.—2 cases fair Turkey were bought in at 1s. 6d. per lb.

COLOMBO ROOT.—10 bags medium sorts fetched 25s. per cwt.

CUBEBS.—93 bags offered without reserve, part sold at 20s. to 20s. 6d. per cwt. for fair quality but somewhat dull and dusty, balance being taken out at 25s.

CUS CUS ROOT.—8 bales were all bought in at 17s. 6d. per cwt., for heavy, down to 12s. 6d., for inferior quality.

DILL SEED.—22 bags sold, subject to holders approval, at the low price of 8s. per cwt.

DRAGON'S BLOOD.—6 cases Zanzibar drop, which were catalogued, were sold prior to the auctions; 1 bag dust realised 30s. per cwt.; fair reeds were bought in at £12; seedy lump at same figure; part fine bright, part dullish, at £16; fair lump selling at £10 5s. per cwt. 3 cases fair lump offered without reserve sold cheaply at £6 17s. 6d. to £7 7s. 6d. per cwt.

ESSENTIAL OILS.—Of 8 cases West Indian Oil of Limes 7 cases were bought in at 2s. 9d. per lb., 1 case hand-pressed selling at 5s. 9d.. 30 cases somewhat inferior commercial quality oil Eucalyptus were bought in at 11d. per lb. 2 demijohns Bay oil sold at 7s. per lb.

GUM AMMONIACUM.—20 cases bought in at 20s. to 35s. for fair blocky with loose tears, down to dark blocky.

GUM ASAFETIDA.—144 cases offered were all bought in at 35s. to 51s. for common grey black and heavy and brown sandy block, part softish, and heavy to soft pinky and sandy block, one lot being held for 65s. per cwt.

GUM BENZOIN.—Ordinary Sumatra was bought in at £6 5s. per cwt. fair, seconds ditto at £8 to £8 10s. 14 cases Siam were all bought in at £11 to £12 per cwt. for good block and £15 per cwt. for part free, 2 cases selling at £13 and £13 7s. 6d. respectively; lower qualities at 50s. to 80s. 23 cases common Palembang, offered without reserve, sold at 20s. to 30s. per cwt.

GUM KINO.—2 cases black Cochin were taken out at 2s. 3d. per lb. 4 cases good ditto were held for 1s. 9d. per lb.

GUM MYRRH.—28 cases all sold at 26s. per cwt. for fair bright siftings, down to 13s. per cwt. for pickings.

GUM SANDRAC—17 casks were bought in at 50s. per cwt.

HONEY.—11 casks fair Jamaica sold at 22s. 6d. to 23s. per cwt. 1 cask Australian was held for 20s. per cwt., a bid of 18s. 6d. being declined.

IPECACUANHA.—5 bags fair Carthagena were bought in at 10s. 3d. per lb., 3 cases damaged selling at 9s. 6d. to 9s. 7d. 11 bags fair Rio part sold at 14s. 3d., picked ditto being held for 15s. 6d. per lb.

JALAP.—8 bales small Vera Cruz were taken out at 7d. per lb.

KOLA NUTS.—56 bags, very wormy, were taken out at 2d. per lb., 1 bag selling at this price.

MORPHINE.—1,100 oz., part Smith's and part Wink's hydrochlorate powder, in 100 oz. tins, part sold at 4s. 6d. per oz. nett.

NUX VOMICA.—80 bags, part consisting of good Cochin pickings, were bought in at 7s. per cwt.

OTTO OF ROSE.—2 vases were bought in at 15s. per oz.

QUINCE SEEDS.—2 bags, somewhat weevily, sold at 1s. 6d. per lb.

RHUBARB.—9 cases fair medium flat high dried of good colour were held for 9d. per lb. Wormy round Shensi was bought in at 1s.; sound, at 1s. 4d.; flat, ditto, at 1s. 1d. to 1s. 3d. 1 case round and flat at 9d. 2 cases flat sold, subject to approval, at 10½d. per lb.

SARSAPARILLA.—14 bales sold readily at 8d. to 9d. per lb. 13 bales Jamaica sold at 1s. 7d. per lb., down to 1s. 4d. for 2CCD. 10 serons Honduras bought in at 1s. 4d. to 1s. 5d. per lb.

SENNA.—158 packages Tinnivelly sold at about fully the prices realised at previous auctions, say 3d. to 5¾d. per lb., according to quality, colour, and condition. 2 bales Alexandrian, broken leaf, fetched 4½d. 7 cases ditto obonata leaf were bought in at 7d. per lb.

TURMERIC.—9 bags offered without reserve sold at 31s. per cwt.

VANILLINE.—745 oz. Vanilline crystals, catalogued as "manufactured by Société Anglo-Française des Parfums Perfectionnes, Limited," guaranteed 100 per cent. purity, offered without reserve, sold cheaply at 2s. to 2s. 3d. per oz., the price of the agents here for the makers being 2s. 8d. per oz.

VANILLOES.—5 tins Tahiti were bought in at 7s. 6d. to 8s. 6d. per lb. for 3 in. × 6 in., 4½ in. × 5½ in., 5 in. × 6 in., and 6 in. lengths. 11 tins Seychelles all bought in at 19s. to 20s. per lb. for 6½ in. by 7 in.

WAX.—Fair Zanzibar realised £6 5s. per cwt., 1 case medium Australian selling at £6 10s. Only fair East Indian was bought in at £6, good ditto at £7 7s. 6d. to £7 12s. 6d. Good West Indian sold at £6 15s., fair ditto at £6 10s., 2 bales South African at 5 17s. 6d., 7 bales good Honolulu fetching £7 7s. 6d. 2 casks fair Jamaica sold at £6 15s., fair Zanzibar at £6 12s. 6d. 9 cases Japan all sold at 30s. per cwt. for good squares.

Manchester Chemical Report.

October 25, 1899.

In addition to the fact that a considerable advance in the price of fuel has been reported during the past three weeks, there is the additional factor that there has been an increase in the volume of business caused by the increased orders in textile industries and for export. Caustic Soda for export has advanced about 5s. per ton, and in all departments Bleaching Powder has gone up about the same amount, being quoted £5 10s. per ton, soft wood casks, on rails. Ammonia Alkali, 58 per cent., is unchanged at £4 7s. 6d. per ton, on rails. Sulphate of Copper, owing to the decline in the metal, tends downwards, and may be quoted £25 15s. to £26 5s. per ton, best brands, delivered Manchester. Yellow Prussiate also, owing to the war in the Transvaal, has a downward tendency, and ranges from 7¼d. to 7½d. Sal Ammoniac has advanced to £40 firsts, and £38 seconds. Brown Acetate has advanced about half-a-crown per ton, Welsh and American, delivered Manchester. Alum is expected to advance. Aniline Oil 4½d., and Salt 4d. White Powdered Arsenic is easier at £19 to £19 5s. per ton, ex-ship, Garston.

Liverpool Market Report.

October 25, 1899.

Since last report, in consequence of the advance in Linseed, a correspondingly higher price is asked for Linseed oil, whilst Cottonseed oil and spirits of Turpentine are both a shade easier. Sales of Californian Honey are reported at recent full rates, as well as sales of Carnauba Wax at good figures. In seeds, Linseed has gone up very much, but Canaryseed continues steady. American Potashes are scarce, and have risen about 1s. per cwt. since last report. Higher prices are to be noted in Caustic Soda, Bleaching Powder, and Ammonium Muriate.

AMMONIUM SALTS.—Muriate, £23 10s. to £28 per ton. Sal ammoniac, 33s. to 35s. per cwt. Sulphate, £11 5s. to £11 7s. 6d. per ton.

BLEACHING POWDER—Has risen to £5 15s. per ton.

CARNAUBA WAX.—Good business has been done at 40s. 6d. to 41s. 6d. per cwt., some 200 bags having changed hands.

COPPER SULPHATE.—Though quiet, a better inquiry has been experienced of late, spot, £25 5s. per ton; Spring delivery, £25 10s. to £25 15s.

HONEY.—About 20 cases of first-rate Calfornian made 47s. per cwt.

OILS (FIXED AND SPIRITS).—Castor of all kinds has been slow of sale, though prices are well maintained. 100 cases of Calcutta shipment, September and October, sold at 3d. per lb., spot price 3 1/16d.; French, 2nd pressure, 2 tons sold for 2 5/8d. per lb.; 1st pressure, 2 15/16d. to 3d. per lb.; Madras, 2 3/8d. per lb. Olive has been only in limited consumptive demand in retail amount at £35 per tun for Spanish oil. Linseed has risen by successive advances from 23s. 6d. per cwt. to 25s. 6d., at which price it now remains very firm, with business done at this price. Cottonseed oil of Liverpool refining is now 19s. 6d. to 20s. per cwt. in export packages. Spirits of Turpentine have fallen to 38s. 3d. per cwt., but the amount of business passing is not large.

POTASH SALTS.—Potashes, 22s. 3d. to 22s. 6d. per cwt., due to the scarcity in America. Saltpetre has advanced to £21 5s. per ton, Karachi has been selling here at 17s. 9d. per cwt., ex store 5 per cent. refraction.

SEEDS.—Canaryseed of Turkish origin has sold to the extent of 400 bags, 100 of which went for 38s. per 464 lbs., and the balance on private terms. Linseed is exceedingly firm, with high rates asked limiting business. 200 tons of 4 per cent. Calcutta, October-November shipment, sold at 47s. 6d. per 416 lbs. 200 tons North American for shipment made 46s. 9d. per 424 lbs.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Caustic is dearer, 76 per cent. to 77 per cent., £9 12s. 6d.; 70 per cent., £8 15s. per ton. Nitrate is steady but slow of sale at 7s. 7½d. to 7s. 10½d. per cwt.

Publications Received.

Arithmetical Exercises in Chemistry: A series of Elementary Lessons on Chemical Calculations. By Leonard Dobbin, Ph.D., with preface by Professor Crum Brown. Third edition. Pp. viii. + 52. Edinburgh: James Thin, 54 and 55, South Bridge. 1899. From the Publisher.

Spencer's Disease: Dermatitis Multiformis Exfoliativa. By Walter Spencer, M.D. Pp. 16. London: Pewtress and Co., 28, Little Queen Street, W.C. 1899. From the Author.

Calendar for the Week.

Sunday, Oct. 29. 22nd after Trinity. Sun rises 6.49, sets 4.38.

Monday, Oct. 30. Sun rises 6.51, sets 4.36.

Tuesday, Oct. 31. Sun rises 6.53, sets 4.34.

Burnley and District Chemists' Association, Bull Hotel, Burnley, at 7.30 p.m.—General Meeting to receive Interim Report; discuss and move a resolution on Pharmaceutical Politics; confirm special resolutions, etc.

Pharmaceutical Society of Ireland, 67, Lower Mount Street, Dublin, at 8.15 p.m.—Opening of the Society's Schools, and Presentation of the Society's Silver Medal. Address by Dr. Ninian Falkiner on "The Education of the Pharmaceutical Chemist."

Wednesday, Nov. 1. Sun rises 6.55, sets 4.32.

Pharmaceutical Society of Great Britain, 17, Bloomsbury Square, W.C., at 11 a.m. Meeting of the Council.

Thursday, Nov. 2. Sun rises 6.56, sets 4.30.

Chemical Society, Burlington House, Piccadilly, London, W., at 8 p.m.—Papers on various subjects will be read by J. Lewkowitsch, F. G. Edmed, S. Ruhemann and H. E. Stapleton, B. Lean, M. O. Forster.

Chemists' Assistants' Association, Throne Room, King's Hall, Holborn Restaurant, London, W.C., at 8.15 p.m.—Annual Reunion (Smoking Concert).

Linnean Society, Burlington House, Piccadilly, London, W., at 8 p.m.—Papers by Rev. Prof. Henslow, Dr. V. G. Ridewood, Harold Wager.

Liverpool Pharmaceutical Students' Society, Kardomah Oriental Café, 46, Church Street, at 8 p.m.—Smoking Concert.

Midland Pharmaceutical Association, Great Western Hotel, Birmingham, at 8 p.m.—Inaugural meeting. Address by Alderman W. Gowen Cross, J.P. (member of the Pharmaceutical Council).

Friday, Nov. 3. ● 10.27M. Sun rises 6.58, sets 4.29.

Glasgow Chemists' and Druggists', Assistants', and Apprentices' Association, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—At Home.

Saturday, Nov. 4. Sun rises 7.0, sets 4.27.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Overstocked.—Iodoform Precip., 13s. Crystal, 12s.—Eastman, Forest Lane, Stratford E.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

Otto Roses, virgin, ounce bottle, original (gilt), 25s. Lavender Oil, Mitcham 1896, lb. original bottle, capsuled, 25s., postage free. Cash.—Warnes, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. —Edward Peck, East Dereham.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Old Druggists' Crockery-ware wanted. Blue and white Syrup Jars, Ointment Pots, Oil Vases, and other Pharmaceutical Antiquities.—John Austen, Pharmaceutical Chemist, Dore, near Sheffield.

Recent Editions of Perkin and Kipping's Organic Chemistry; Clowes and Coleman's Quantitative Analysis; Maisch's Materia Medica.—Stoneman, 3, Strand, Dawlish.

Advertisements.

(Received too late for Classification.)

JUNIOR unqualified ASSISTANT wanted at once for temporary engagement until Christmas; no Sunday duty; time for study allowed; must have had some experience.—Apply, H., 61, Sandgate Rd., Folkestone.

ENGLISH NEWS.

LEICESTER CHEMISTS' SOCIAL UNION.—A smoking concert will be held at the Grand Hotel, Granby Street, Leicester, on Thursday, November 23, at 8.45 p.m., when all chemists, their managers and assistants will be cordially welcomed. No charge will be made.

ASAFETIDA IN CHURCH.—At Hadleigh, on October 26, William Wakefield, baker, was fined £5 and £3 15s. 6d. costs for indecent behaviour in Kettlebaston Church on October 4. On that day he attended a celebration of Holy Communion, taking with him a drain disinfector or tester, which was said to contain asafetida, and when the incense came round he liberated the contents of the bottle.

CHARGE OF ADMINISTERING BENZINE.—William Barton Miller appeared before the Salford Police Justices on October 27 on an adjourned summons for feloniously administering to George Hoskins a quantity of benzine. The men are cabdrivers, and on Sunday morning, October 8, were on the stand at the Exchange Railway Station. The defendant was engaged in cleaning his lamps, and there was a bottle of benzine near him. Hoskins said he was thirsty and would go for a drink of water, when, as he alleged, Miller offered him the bottle, saying that it was whisky. Hoskins drank some of the liquid, and became so ill that Miller had to drive him home. He was attended by a doctor, and quickly recovered. Mr. Makinson, the stipendiary magistrate, in dismissing the summons, said the defendant had been guilty of a contemptible and dangerous act, and if any serious bodily harm had resulted from it he would have been committed for trial. He hoped this would be a warning to him.

DAMAGES FOR ACCIDENTAL POISONING.—At Malton County Court, on October 25, before his Honour Judge Raikes, a boy named Thomas Slack, a groom, of Norton, was awarded £5 damages against John Spanton, chemist, Norton, for suffering caused by defendant's negligence in supplying him with a noxious drug. It was alleged that plaintiff suffered from poisoning by atropine, and that it must have been supplied to him in a powder which he got at defendant's' shop, where he went for something to cure a headache.—Defendant swore that he had never had any atropine in his shop, and that what he supplied was eight grains of antifebrin.

ECCENTRIC ADVERTISING.—Oliver Charles Hayward, manufacturer of mechanical advertisements, of the Greyfriars' Works, King Street, sued Merton Dodge, chemist, of 139, Strangeways, Manchester, at Norwich County Court, on October 24, before his Honour Judge Willis, to recover £3 1s. 6d.—Mr. E. A. Kent was for plaintiff, and Mr. E. Reeve for defendant.—Plaintiff's case was that he let defendant have one of his eccentric reading advertisement machines at 10s. a month. The machine had a dial face with a large hand, which pointed in an eccentric manner to the reading painted on the circumference. The contract signed stipulated that the machine could be purchased within three months for £5 10s., with hiring money deducted. Defendant had kept the machine six months without giving notice of intention to buy it; hence the claim for £3 for hire, and 1s. 6d. for painting the reading round the dial.—The defence was that plaintiff's traveller represented the purchase price of the machine as £2, and that defendant decided to buy.—His Honour, however, was not satisfied that such was the case, and gave judgment for plaintiff for the amount claimed. He also directed defendant to return the machine at once.

FARMERS POISONED BY SHEEP WASH.—On October 11, Geo. Bowe, of Cockermouth, and John Sisson, of Loweswater, attended the fair at Cockermouth, and as they remained late they hired a trap and a man to drive them home. They left Cockermouth shortly after eleven p.m., accompanied by a man named Benjamin Thompson. Before starting Sisson had procured a bottle of Wilson's foot-rot liquid, and also a bottle of whisky. When about a mile out on the road Bowe asked Sisson for a drink, and Sisson handed him the bottle containing the sheep wash. Bowe took a sip, and handed the bottle to Thompson, who also drank from it. Sisson would also have drank from the bottle had it not been for the driver, Patrick Redmond, who, detecting a strong smell, knocked the bottle from Sisson's hand. Redmond examined the bottle, and finding it labelled "Poison," he at once turned round and drove back to Cockermouth. All three men were very drunk. Bowe and Thompson were taken to the surgery of Dr. Hutchinson, Cockermouth, and remedies were applied. Both men were in a very serious condition, and continued so until Thursday morning, when Bowe died from the effects of the poison. At the inquest evidence was given by Redmond (the driver), Sisson, and Dr. Hutchinson, and the jury returned a verdict of "Death from misadventure."

THE SACCHARIN PATENT.—The action of the Saccharin Corporation *v.* The Chemical and Drug Co., Ltd., came on for trial before Mr. Justice North in the Chancery Division, on Tuesday, October 31, with a large array of counsel and scientific witnesses on each side. Mr. Fletcher Moulton, Q.C., Mr. Cripps, Q.C., Mr. Graham, and Mr. Colfax represented the plaintiffs, and Mr. Roger Wallace, Q.C., Lord Robert Cecil, Q.C., Mr. Walter, and Mr. Laine the defendants.—In opening the case Mr. Moulton said the plaintiffs were the owners of a great many patents in connection with saccharin, but it had been decided to restrict the contest to one patent, that of Prosper

Monnet, No. 25,273, of 1894, which would very materially shorten the proceedings, and, on the other hand, the defendants admitted that they had imported and sold goods manufactured under that patent. It would be simply, therefore, a question as to the validity of this patent, which related only to one stage in the manufacture of saccharin, viz., the production of orthotoluene sulphochloride. Formerly that was made by acting on toluene sulphonic acid with phosphorus, but that was a costly and wasteful process, as it gave rise to a larger percentage of *para*-toluene sulphochloride, which was useless, than of the *ortho* salt, which alone was valuable. This patent gave a process for making the ortho sulphochloride direct from toluene, without passing through the sulphonic acid stage; it avoided the use of phosphorus, and acted on toluene with a large excess of chloro-sulphonic acid at a temperature of 0° to 5° C., whereby the whole of the toluene was converted into sulphonic chloride, the greater portion of which was of the ortho or liquid variety.—Professor Dewar, Dr. F. W. Passmore, and Dr. Liebmann were witnesses for the plaintiffs, and they having given evidence, Mr. Wallace opened the case for the defendants, but had not proceeded far when the case was adjourned. His contention would be that the patentee had only combined the information contained in a paper in the *Berichte* by Claesson and Wallin with common knowledge, and therefore the patent was invalid.

Medicated Wine.—On November 1 the appeal of the plaintiffs in the action of Coleman and Co., Limited, *v.* John Brown and Co., from the refusal of Mr. Justice North to grant an injunction restraining defendants from selling sherry under the name Vincalis or any name so similar in sound as to be calculated to lead purchasers to believe they were obtaining plaintiffs' Wincarnis, which is a mixture of wine and Liebig's Extract of Meat, was heard before the Master of the Rolls, Sir F. Jeune and Lord Justice Romer. It was admitted there was no similarity of get-up, but it was contended that as the names were so much alike chemists and others were likely to be misled.—Without calling upon counsel for the respondents, their lordships dismissed the appeal with costs.

Western Chemists' Association (of London).—The following have been elected officers of the Western Chemists' Association of London for the ensuing year:—President, Mr. J. F. Harrington; Vice-President, Mr. H. Cracknell; Treasurer, Mr. J. H. Mathews; Hon. Secretaries, Mr. W. J. I. Philp and Mr. A. G. Worsley. The ninth annual dinner of the Association will take place at the Café Royal, 68, Regent Street, W., on Wednesday, November 15, at 7 p.m. The cost of tickets will be 7s. 6d. each, exclusive of wine, and should be obtained, not later than November 13, from the hon. secretaries, Mr. W. J. I. Philip, 34, High Street, Notting Hill, W., and Mr. A. G. Worsley, 135, Ladbroke Grove, Notting Hill, W.

C.A.A. Cinderellas.—We are asked to announce that the fifth series of Cinderella dances in connection with the Chemists' Assistants' Association will be held at the Dorset Hall, Portman Rooms, Baker Street, London, W., on Thursday, December 7, this year, and on Thursdays, January 4 and March 22, 1900. The prices of the tickets will be as follows:—Double, admitting lady and gentleman to the series of dances (patrons and members), 10s. 6d., (non-members) 12s. 6d.; single, admitting gentleman to the three dances, 7s. and 8s. respectively; for one dance only, double (patrons and members), 4s. 6d., (non-members) 5s.; single (gentleman), 2s. 6d. and 3s.; single (lady), 2s. As the committee have decided to limit strictly the number of tickets issued, early application should be made to the hon. secretaries, Mr. C. Morley, 3, Bucklersbury, E.C., and Mr. H. H. Robins, 113, Ridley Road, Forest Gate, E.

Freemasonry.—At the Annual Festival and Installation Meeting of the St. Peter's Lodge of Freemasons, Market Harbro', held at the Three Swans Hotel, Market Harbro', on Friday, October 27, Bro. Samuel Cleaver was elected Worshipful Master. Mr. Cleaver is a Leicester, chemist in business in Wharf Street, and is a member of Committee of the Leicester Chemists' Social Union. It is gratifying to the trade in Leicester to know that two of its members have occupied positions as W.M.'s, namely Bros. Joseph Young and S. Cleaver.

Action for False Imprisonment Against a Chemist.—At Brompton County Court on Monday, October 30, before Judge Stonor and a jury, Miss Edith Little (18), of West Brompton, London, S.W., claimed £50 damages from Mr. Thomas F. Shephard, pharmaceutical chemist, 260a, Fulham Road, S.W., for alleged false imprisonment.—Mr. Clarke was counsel for the plaintiff, and Mr. Brandon, counsel, defended.—Miss Little stated that on September 2 last she, with a Miss Channon, went to the defendant's shop for some caustic. While being served she took up a small bottle of scent from the counter, simply to look at it. No sooner had she replaced the bottle than defendant's son told his father that she had stolen the scent. The defendant then accused her of theft and sent for a police-constable. She was charged, and locked up from Saturday night till the following Monday morning, when she was brought before the magistrate. The defendant, however, was only represented at the Court by his son, and she was remanded on bail. When the case again came before the Court on the following Wednesday there was no one to prosecute, and the case was dismissed.—Other evidence having been given for the plaintiff, Thomas Frederick B. Shephard, son of the defendant, stated that he distinctly saw the plaintiff take the bottle and put it in her pocket. When first accused she denied having taken the bottle, but as soon as a policeman was mentioned she took the scent from her pocket, saying that she did not really mean to steal it.—Mr. Thomas Frederick Shephard, the defendant, said that although he did not see the young lady put the bottle into her pocket, he saw her take it out. The reason he did not press the charge was that he imagined the theft might be the young lady's first offence, and he did not wish to injure her, and after she had been locked up from Saturday night until Monday morning he thought she was sufficiently punished.—The jury, after brief deliberation, found in favour of the plaintiff, assessing the damages at £25.—His Honour gave judgment accordingly, allowing costs.

Coroners' Juries and the Sale of Rat Poison.—The *Daily Mail* reports that on Tuesday, October 31, inquests were held by London coroners upon two girls not out of their teens who had committed suicide. Irregular employment and frequent headaches combined to render unhappy the life of Grace Rebecca Rowley, a machinist of nineteen, who lived at Globe Road, Forest Gate. Twice she had tried to destroy herself, and a third attempt made with rat-poison bought at a chandler's shop proved fatal—she had taken enough to kill a dozen people. The jury requested the coroner to write to the Home Office urging that restrictions should be imposed on the sale of such poisons. A still younger girl, Florence Eason, aged seventeen, who lived at Brabazon Street, Bromley, poisoned herself in the same way, after a quarrel with her young lover. The jury in this case expressed themselves just as strongly against the unrestricted sale of rat-poisons containing strychnine and phosphorus.

FOOTBALL.

Metropolitan.—On Saturday, October 28, at Wormholt Farm, Shepherd's Bush, the football (Association) teams of the Metropolitan College of Pharmacy and Kensington Rangers Reserves met in a friendly game, the final result being a win for the Metros by four goals to two.

Manchester.—A team of students from the Northern College of Pharmacy met a mixed team of medicos and pharmaceuticals from Owens College on Tuesday, October 31, at Longsight. A pleasant game resulted in a win for Owens, 8 goals to nil.

"Square" Football.—It would have rejoiced the hearts of old "Square" students, and especially old "Square" footballers, to have seen the exhibition given on Saturday at Shepherd's Bush by the team picked from their old school. It was the occasion of the first contest for the possession of the cup offered at the end of last session by Mr. Watson Will for competition between the leading schools of pharmacy in the metropolis, the opposing team coming from the London College of Pharmacy. The weather was all that could be desired, and much enthusiasm was displayed, owing to the presence of a fair contingent of onlookers from both schools, including the principal of the above-mentioned college, who liberally showed their appreciation of any smart pieces of work. The ball was started about three o'clock, the "Square" captain winning the toss, and for the first ten minutes the play was confined to the centre of the field, but the "Square" forwards pressing on a goal was soon registered, which was quickly followed by a second, chiefly due to the smart shooting of the forwards and the fine kicking of the

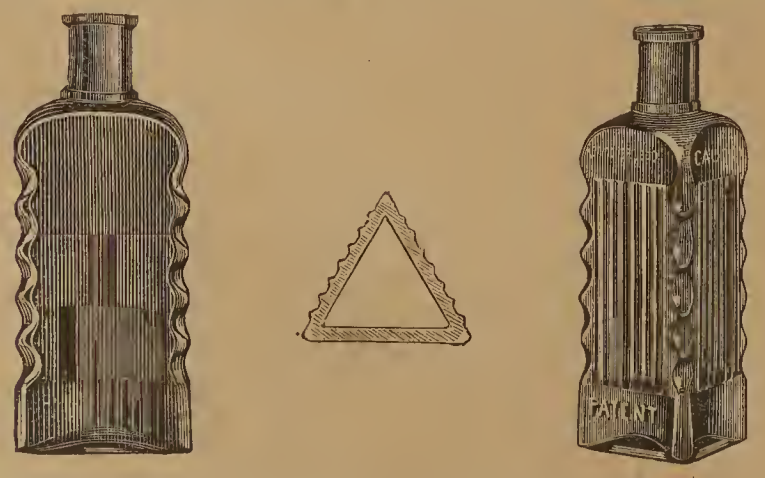
"Square" backs, which kept the ball continually in the enemy's quarters. On half-time being sounded, five goals had been registered to the "Square's" account and not one scored against. Changing over, Owen and Garsed in the front line were replaced by Fox and Jones, the two "Square" backs, and two players of whom the "Square" may well be proud, being equally proficient in any part of the field. From this point to the end of the game the ball was continually kept in our opponents' quarters, and to an onlooker the game must have appeared to be one continual succession of goal kicks and shots at goal, most of the play being in the hands of the forward line, who added three more goals to the already heavy score, making a grand "Square" total of eight goals to nil. In conclusion, it must be said that although five goals were scored in the first half they were very hardly contested, and many a close tussle ensued before the ball was finally lodged in the net; but in the second half the South Londoners seemed to lose heart, and were chiefly contented to protect as much as possible their own goal. The "Square" team was as follows:—Goal, Hirst; backs, Fox and Jones; half-backs, Collinette, Spurge, and Gray; forwards, Warren, Hills, Owen (captain), Garsed, and Godolphin.

SCOTTISH NEWS.

EXTENSION OF PREMISES.—Messrs. W. and R. Hatrick and Co., Renfield Buildings, Glasgow, after an absence of a year and a half, have now got thoroughly settled in their new premises, which stand on the site of the old building, and have been erected and fitted up in as efficient and convenient a form as their experience and business requirements suggested. Renfield Buildings is situated at the head of Renfield Street, and occupies a frontage of about 120 feet. The building consists of cellarage covering the entire area, and five storeys above, the floorage of the building being about 38,000 square feet. The ground floor comprises the offices, packing and dispatch, cart entry, and goods receiving departments. On the first floor is the working counter of the wets, dries, and patents, running from one end of the building to the other. The second floor holds the glass department, sundries, packing room, sorting room, and stocks of dries and wets departments. The bins, standards, etc., on these floors are all conveniently arranged so as to keep stocks in the best condition, and with a view to the speedy execution of orders. Each of these floors has a large fireproof room, in which the most valuable goods and special chemicals are kept. The third floor holds original packages only, but will probably be partly utilised later on for light machinery for manufacturing. The laboratory occupies the greater part of the top floor, and the apparatus, etc., for this is being transferred from the premises at Bishop Street. A hydraulic hoist runs from cellar to attic, and hot water pipes run through the whole building. The premises are lighted throughout by electricity. A complete fire extinguishing sprinkler installation has also been put in.

TRADE NOTES.

AN IMPROVED DISTINCTIVE POISON BOTTLE.—Mr. James Wilson, "Fassiefern," Holly Park, Crouch Hill, London, N., submits a specimen poison bottle which he has recently patented. The object



of the inventor has been to produce a poison bottle readily distinguishable both by sight and by touch from other bottles. In this he has succeeded, and the result is what may appropriately be termed "a safe poison bottle." It is triangular in form, having two sides corrugated and the words 'Caution" and "Not to be Taken" moulded near the shoulder; the third side is left plain for a label, and the edges are serrated in such a manner that it is impossible to grasp the bottle without noticing how it differs from other bottles. It is made in amber colour, actinic green and blue glass.

POCKET MEDICINE AND HYPODERMIC CASES.—Messrs. Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C., are introducing for the Christmas season a series of beautifully finished pocket medicine cases, made in various kinds of leather, including brown or green seal, levant morocco, crushed morocco, brown or green crocodile cow-hide, and lizard-skin; cases are also made of aluminium and silver. These, as well as the plain leather cases, will be found to make most handsome Christmas and New Year's presents for medical men. The one shown in the illustration is a

hypodermic case, made of solid silver, gilded inside, and contains a solid silver patent syringe (capacity 20 min.) with detachable finger grips, two platino-iridium needles, two glass-stoppered and capped bottles, fourteen tubes of hypodermic tabloids, one tube of mercuric potassium iodide soloids. The needles are enclosed in a separate compartment, which effectually protects them from damp and injury. Another very neat and compact hypodermic case is made of nickel-plated metal and shaped like a mussel-shell; others are made of fluted or hammered aluminium, fitted with hypodermic and ophthalmic drugs in tabloid form, camel-hair brushes, pair of minute forceps, etc. The chief feature of these metal cases is that they may be thoroughly sterilised. Various improvements have also been made in the larger class of medicine cases. An illustrated list will be sent by the firm to chemists on request.

Deaths.

Blackhall.—On October 18, W. J. Blackhall, who for the last twenty-three years has represented the firm of Messrs. Burgoyne, Burbidges and Co., wholesale and export druggists, London, in Chiua, Japan, etc. Mr. Blackhall died on board the "Sunda" homeward bound, and was buried at sea.

Bindloss.—On October 26, at Ventnor, Herbert Meynell Bindloss, chemist and druggist, Harlesden, youngest son of the late G. F. Bindloss. Aged 30.

Williams.—On October 29, William Lloyd Williams, Pharmaceutical Chemist, Dartford, Kent. Aged 38. Mr. Williams, who had been a member of the Pharmaceutical Society since 1883, was born at Nutfield, Surrey, but from an early age lived at Buckley, Flintshire, and was educated at Hawarden Grammar School. His pharmaceutical training commenced with an apprenticeship of four years' duration in Wrexham, and was continued in the Pharmaceutical Society's School, where in 1883 he obtained Certificates of Honour in Botany, Materia Medica and Chemistry. After passing the Major examination, he obtained the Society's Silver Medal. He was subsequently engaged for a year and half in original investigations in the Research Laboratory. In 1887 he entered upon a further course of study under Professor Meldola at the Finsbury Technical College, where he obtained the first prize. In 1889 he became a Fellow of the Institute of Chemistry; he was also a Fellow of the Chemical Society and a member of the Society of Chemical Industry. At one time he was President of the Chemists' Assistants' Association. His practical experience was gained in dispenserships at Malvern, Llandudno, and London, and he was also managing assistant in important dispensing businesses at Hyères (France), Bristol, Bournemouth, and London. In 1890 Mr. Williams entered the employment of Messrs. Burroughs, Wellcome and Co., London, in a minor position, and by sterling merit and ardent devotion to his duties worked himself up step by step to the important position of assistant manager of works, which position he held, with great satisfaction to the firm and credit to himself, at the time of his death.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

November 2, 1899.

While business in Drugs and Chemicals has not been very active during the past week, there has nevertheless been a moderate number of orders passing, while some of the changes in value which have taken place have not been quite unimportant. Refined Camphor has had two successive rises of a penny per lb. during the week, while the price of Crude Camphor has also advanced, having naturally been more or less the cause of the advance in price of the refined article. The position of Orris Root has also undergone a radical change, while Quicksilver and Mercurials are also again dearer. Acid Carbolic is also dearer. Phenacetin decidedly firmer. Quinine has also taken a turn for the better. Cod Liver Oil firmer and somewhat higher in price. Glycerine slightly weaker. Opium quiet. Morphine steady. Codeine firm. Acid Citric weak. Acid Tartaric and Cream of Tartar steady. In consequence of Thursday next, 9th inst., being Lord Mayor's Day, there will be no drug auctions in London next week. The following are the prices actually ruling for some articles of principal interest:—

ACETANILIDE—Continues very weak, with pressure to sell on part of makers, one agent quoting as low as 9½d. per lb.

ACID BORACIC—Steady, at 25s. per cwt. for powder, and 27s. per cwt. for crystals.

ACID CARBOLIC.—Market very active, the prices being 7d. to 7½d. per lb., according to quantity and make, for the 35°-36° C, ice crystal, in large bulk; 7⅝d. per lb. for the 39°-40° C, ice crystal, and 8⅝d. for 39°-40° C., B.P. quality, in detached crystals. Crude, 60° F, 2s. 4d. per gallon; 75° F, 2s. 10d. per gallon. Liquid, 95-98 per cent. of pale straw colour, 1s. 4d. per gallon, in 40-gallon casks; ditto, 30 per cent of dark colour, 11d. to 1s. per gallon.

ACID CITRIC—Is quiet and weak at 1s. 4d. to 1s. 4½d. per lb. for crystals in 5 cwt. casks.

ACID OXALIC—Makers still quote 3d. to 3¼d. per lb. nett, free, delivered, London.

ACID TARTARIC.—English is quoted 1s. 1d. per lb. on the spot and Foreign 1s. 0¼d. per lb., c.i.f.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, 3d. to 4d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 30s. to 32s. 6d. per cwt.; ditto, commercial, 27s. 6d. per cwt. Sal Ammoniac, firsts, 35s. per cwt.; seconds, 33s.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate dull; grey, prompt, 24 per cent., London, £10 12s. 6d. to £10 15s.; Hull, £10 12s. 6d. to £10 15s.; Leith, prompt, £10 12s. 6d. to £10 15s.; Beckton, prompt, £10 12s. 6d.; Beckton, terms, prompt, £10 11s. 3d. Sulpho-Cyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus is unchanged, at £39 to £40 per ton, while crude Japan (Black Sulphide) is dull and weak at £23 to £23 10s. per ton.

ASAFETIDA.—The market is quiet. A few cases have been sold at 65s. cwt. for darkish gum, some loose.

ASHES.—Pots, 24s. 6d.; Pearls, 30s.

BELLADONNA ROOT.—Really good quality is exceedingly scarce, and high prices, up to 45s. per cwt., are asked for the little that is to be had.

BISMUTH—Is unchanged, at 5s. per lb. for the commercial quality of the metal, 5s. 1d. per lb. for the Subnitrate, and 5s. 8d. per lb. for the Subcarbonate.

BLEACHING POWDER (CHLORIDE OF LIME)—Is still quoted £6 10s. per ton for English make.

BORAX—Unchanged, at 16s. per cwt. for crystals, and 16s. 6d. per cwt. for powder.

BROMIDES—Are very firm at 1s. 10½d. per lb. for Potassii Bromid, 2s. 2d. per lb. for Ammon Bromid, and 2s. 1½d. per lb. for Sodii Bromid, Bromine being quoted 2s. 2d. to 2s. 3d. per lb., according to quantity, in 60 lb. cases.

BUCHU LEAVES.—Short green are much wanted, but stock is exhausted. Long green are held for 9d. per lb.

CAMPHOR.—The market for Crude has shown increased firmness, and a large business has been done at dearer rates, comprising about 1,000 piculs, chiefly Japan, on the spot at 150s.; also China at 145s. and buyers, and Japan October-December shipment at 150s. c.f. and i. And there are now buyers of Japan on spot at 152s. 6d. per cwt., and of China at 147s. 6d.; but holders ask extreme rates. The English refiners have again raised their price 1d. per lb. for Bell and Flowers in ton lots, while to-day it is reported that the German refiners have also advanced their price to same figure.

CINCHONA BARK.—The exports of Java bark for October were 940,000 Amsterdam lbs., against 969,000 Amsterdam lbs. last year, making a total for the 10 months of 9,402,800 Amsterdam lbs., against 8,895,000 Amsterdam lbs. in 1898. It is reported that to-day's bark sales in Amsterdam show an advance in price of 15 to 25 per cent., which would point to the probability of an advance in makers' price for sulphate of quinine.

CLOVES.—At auction no Zanzibar were offered, and 35 cases picked Penang were bought in at 6d. to 7d. Privately, Zanzibar opened firm and dearer, but for delivery the market has since become dull and easier. Business has been restricted, comprising 800 bales, on spot, at 3 5/16d., Oct.-Dec. delivery at 3 11-32d., and Jan.-March at 3 7/16d., closing sellers Oct.-Dec. at 3 5/16d., Jan.-March at 3⅜d., and March-May at 3 13-32d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon. Benzole, 50 per cent., 10½d. per gallon; 90 per cent., 9d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120° C, 5d. per gallon. Solvent Naphtha, 95 per cent. at 160° C, 1s. 6d. per gallon; 90 per cent. at 160° C, 1s. 3d. per gallon; 90 per cent. at 190° C, 1s. 2d. per gallon. Anthracene A, 3¾d. per unit; B, 2¾d. per unit. Pitch, 34s. per ton, f.o.b. Tar, refined and crude, 12s. 6d. per barrel, 2d. per gallon.

COCAINE.—There are still a few sellers of best brands in limited quantity at 19s. 6d. per oz., makers' price being very firm at 20s. 6d. per oz. in 200 oz. lots, they still not being free sellers at this figure.

CODEINE—Is very firm at 12s. 11d. per oz. for 300 ounce lots of the pure and 1s. per oz. less for the muriate, sulphate, and phosphate salts.

COD LIVER OIL—Is decidedly firmer at 66s. to 70s. per barrel, according to brand, for best non-congealing Norwegian oil in tin-lined barrels of 25 gallons.

COLOCYNTH.—Turkey apple is in small supply, and holders are firm at 1s. 7d. to 1s. 8d. lb.

CREAM OF TARTAR.—First White Crystals are still quoted 74s. per cwt. on the spot; Powder, 76s.; ditto, 95 per cent., 77s. per cwt.

CREOSOTE FROM BEECH WOOD TAR—Is advancing in price, one agent for a firm of manufacturing chemists, who was lately hawking the article round at about 2s. 2d. per lb., now quoting 3s. 2d. per lb.

GALLS.—China remains quiet, but steady. Fair, usual shape, sold on the spot at 60s.; for arrival the nominal quotation is 57s. c. f. and i. Persian are firm, with a good demand, business of large extent in Blues having resulted at very full prices; fair sales of Greens have also been made at 57s. 6d. per cwt. Smyrna and Morea, little offering.

GINGER.—At auction the fair supplies of Cochin met a moderate demand, bold cut kinds being rather dearer, other kinds steady; out of the 666 bags and 68 cases offered, 243 packages were sold of bold and medium, roughly cut, scraped and limed, at 77s. 6d.; medium cut and scraped, 56s.; ordinary small at 33s.; washed rough, medium and small bright, rather wormy, at 25s. to 25s. 6d.; ditto, little mouldy and wormy, at 23s.; common dark shrivelled small and ends, ditto, at 18s. Bengal dull of sale. 87 bags were offered and bought in at 21s. Jamaica: Out of the small supply, consisting of 52 barrels, 30 barrels sold, good common to middling, at 56s. to 60s.

GLYCERIN.—The Market for Crude, after being very firm at £40 to £42 for the quality most suitable for refining purposes, has receded to £39 to £40 per ton, the Refined being also a shade lower

at 56s. to 58s. 6d. for English and 55s. to 65s. per cwt., according to brand, for German; for best white double-distilled, chemically pure, 1260° quality in tins and cases (2 or 4 × 56-lb. tins in a case.)

HYPOPHOSPHITES—Are unchanged, makers' prices being 3s. per lb. for the Lime, Soda, and Potash Salts.

IODIDES—Are steady at unchanged prices, say, 10s. 6d. per lb. for Potassii Iodid., 11s. 10d. per lb. for Sodii Iodid., 13s. 10d. for Ammon. Iodid., 13s. 10d per lb for Iodoform, crystals, power, or precipitated, 12s. per lb. for Resublimed Iodine, and 7½d. per oz. for Iodine Crude.

IPECACUANHA.—A small business in Rio at 14s. to 14s. 3d. per lb. Carthagena is quiet at 10s. per lb. nominally.

LICORICE ROOTS.—Supply of ordinary rough Persian is exhausted.

MENTHOL—Is firmer, and 8s. 6d. per lb. is now asked for best Japanese brands of good dry white crystals.

MERCURIALS.—In consequence of further advance in price of quicksilver, makers of mercurials again advanced their prices 1d. per lb., to 3s. 1d. per lb. for calomel and 2s. 9d. per lb. for corrosive sublimate.

MORPHINE—Remains fairly steady at 5s. to 5s. 2d. per oz. for the Hydrochlorate.

OILS (FIXED) AND SPIRITS.—Linseed values have declined fully 10s. On the spot pipes, London, quoted £23 to £23 5s.; barrels, £23 10.; November-December, £23 5s.; January-April, £22 7s. 6d. to £22 10s.; May-August, £22. Hull is also easier: Spot naked, £22; November-December, £22; January-April, £21 5s.; May-August, £21 5s. Rape quiet: Ordinary brown on spot, £23 15s. to £24; November-December, £24; January-April, £24; Refined spot, £25 5s.; Ravison naked spot, £21 5s.; November-December, £21 5s. Cotton easier: London Crude spot, £16 10s.; November-April, £16 10s.; Refined spot, £18 10s. to £19 10s., according to make; Hull Naked Refined spot, £16 5s. to £16 10s.; November-April, £16 5s.; Crude spot, £15 2s. 6d.; November-April, £15 2s. 6d. Olive firm: Mogador, £33 10s.; Spanish, £34 10s.; Levant, £34. Cocoanut steady: Ceylon on the spot, £25 10s.; October-December, £24 5s., c.i.f.; Cochin spot, £29 10s.; near, £27 5s., c.i.f.; October-December, £26 12s. 6d.; January-March, £26 10s., c.i.f.; Mauritius on spot, £25 10s. in hogsheads. Palm: Lagos on spot quoted £27. Castor Oil firm: Belgian, first pressing, spot, £27; January-June, £26 10s., f.o.b.; Antwerp, second pressing, spot, £25 10s. per ton, ex wharf; Hull manufactured, guaranteed cold drawn, pure pharmaceutical, £30 per ton in barrels, 3⅝d. per lb. in cases; Pure firsts, £27 10s.; seconds, £26 10s. per ton in barrels; firsts, 3¼d. per lb. in cases; seconds, 3⅛d., ex wharf, London. Lubricating Oil: Pale American, spot, 7s. to 9s.; black, 6s. 3d. to 8s.; Russian, black, 5s. 6d.; pale, 7s. to 8s. 6d. Petroleum Oil firm, at ⅛d. per gallon advance; Russian, spot, 5 7/16 to 5⅝d.; settlement price for Russian, 5⅜d. American spot quoted 6⅞d. to 7⅛d., and to end of March. Water white, 8d. to 8¼d. Turpentine: Market opened weak, but closed steady. American, spot, 36s. 1½d. to 36s. 3d.; November-December, 36s. 3d.; Jan.-April, 36s. 9d. to 36s. 10½d.; July-December, 31s. 7½d. Petroleum Spirit: American, 9¾d.; Deodorised, 10d.

OILS (ESSENTIAL).—Star Aniseed has quieted down a little, although prices remain firm at 6s. 4d. per lb. on the spot, arrival prices being still some pence above this. Peppermint H.G.H. steady at 5s. 4½d. to 5s. 6d. per lb. on the spot. Japan, 40 per cent. 5s. to 5s. 3d. per lb., dementholised 3s. 7½d. to 3s. 9d. per lb. Cassia firm at 3s. 10d. per lb. for 70-75 per cent., 4s. per lb. for 75-80 per cent. and 4s. 2d. per lb. for 80-85 per cent. Lemongrass, 3¼d. to 3½d. per oz. Lemon, 3s. 9d. per lb. for good. Bergamot, 7s. per lb. Orange, sweet 7s., bitter 9s., per lb.

OPIUM.—The market has been quiet, and business in all descriptions limited, including small sales of "Soft Shipping" at full prices. In Druggists no sales reported. Persian continue to be firmly held, and few sales have occurred.

ORRIS ROOT.—The supplies of the article are said to have been cornered on the other side, and the probability of very high prices ruling in the near future is freely spoken of. Price is nominal at 55s. to 60s. per cwt., according to holder, for good Florentine.

PARAFFINE WAX.—Crude is quoted 2¾d. to 3d. per lb; Refined, 3d. to 3¾d.

PHENACETIN.—Some of the makers have agreed to hold for 3s. 6d. per lb. for smaller quantities than 1 cwt., for both crystals and powders. A further advance is not improbable.

PITCH.—8s. to 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, spot, London, crystals, 3¾d.; powder, 3⅞d. Iodide, 10s. 6d. per lb. Permanganate quoted 52s. 6d. to 62s. 6d. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, Beckton make, 7⅛d.; other English makes, 7½d. to 7¾d.; red, 1s. to 1s. 2d. per lb., according to quantity, etc.

QUICKSILVER—Has again been advanced to £9 5s. per bottle from the importer, second-hand quoting 6d. to 1s. per bottle less money.

QUININE—Has been firm, although quiet, with only a restricted business at rather dearer prices for the nearer positions. The sales are about 30,000 oz. B&S and/or Brunswick, December delivery at 1s. 1⅝d. to 1s. 1¾d. and buyers, and March at 1s. 2d. per oz. Since the results of Amsterdam Bark sales became known, the market has stiffened considerably, there being buyers at 1s. 2d. per oz. on spot and at 1s. 2¼d. to 1s. 2½d. per oz. for December delivery with but few sellers. It appears probable that we shall now see a better market for the article, and very likely decidedly higher prices.

ROSIN—Firm at 4s. 6d. per cwt. for strained, ex wharf, and 4s. 3d. to 4s. 4½d. per cwt. for November-December and January-March shipment per sailing vessel.

SAFFRON—Is in good request, and prices are very firm. Valencia is quoted 42s. lb. for genuine, whilst Alicante can be had at 22s. 6d. to 24s. lb.

SENNA.—There has been a good inquiry for Tinnevelly, with a small business in qualities ranging from 4½d. per lb. to 6½d. per lb. Alexandrian leaves are scarce; 9d. is asked for whole leaf.

SHELLAC.—A steady demand prevails on the spot, with moderate sales at full rates. For arrival 100 cases TN Orange have been resold, November-January shipment at 63s., and 100 cases reported. in first hands, at 64s. c. f. and i. For delivery a few hundred cases have changed hands, comprising January delivery at 66s., and March at 66s. 6d. to 66s.

SODA COMPOUNDS.—Crystals are quoted 60s. per ton in barrels and 57s. 6d. per ton in bags. Ash, £5 5s. to £7 per ton, according to percentage, etc. Bicarbonate, landed, £7 5s. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic, white, 70 per cent., £9; 60 per cent., £1 less. Hyposulphite (Antichlor.), 6s. 6d. to 8s. 6d. per cwt., according to make, etc. Iodide, 11s. 10d. per lb. Nitrate, on the spot, refined, £8 2s. 6d.; ordinary, £7 17s. 6d.

SPICES (VARIOUS).—Black Pepper: 53 bags Singapore sold, without reserve, grayish, at 5½d. to 5⅝d. 80 bags Tellicherry bought in, good fair, at 5⅞d., and 44 bags Penang, including fine heavy, at 6½d. White Pepper: 15 bags offered and 4 sold, Singaport, small, at 8⅞d. Capsicums quiet; 5 bales Bombay offered and sold, fair bright, part dull and stalky, at 30s. Cassia Buds: 59 bags Bombay wild offered and bought in at 26s. Cinnamon quiet; 227 packages Ceylon at auction were bought in. Mace steady; 27 cases Penang offered and 9 cases sold, small pale reddish, rather wormy, at 1s. 5½d.; broken at 1s. 4d. Of 34 boxes Singapore 28 sold privately, price not reported. 23 cases Bombay wild offered and bought in, good bright, at 5d. Nutmegs quiet and in slow demand. 28 cases Penang offered and 7 cases sold, common shrivelled, 284's at 4d. to 4¼d. 34 boxes Singapore bought in, 79's at 1s. 8d. 9 cases Bombay withdrawn. Pimento in fair demand at steady rates. Of 308 bags offered 171 bags sold, ordinary to fair, at 3⅛d. to 3¼d.

SULPHATE OF COPPER—Is quoted £24 15s. to £25 per ton on the spot.

SULPHONAL.—The two known makers still quote 17s. per lb. for both crystals and powder. There are, however, still sellers from second-hand of what is believed to be a Swiss make of the article, and which is said not to be of very super-excellent quality, at 2s. to 3s. per lb. below the makers' official price.

TUMERIC—Remains firm, but business has been on a small scale. Bengal reported up to 28s., being dearer; Cochin split bulbs, small sales at 12s.; Madras finger, ordinary to good bright, quoted 32s. 6d., and China finger 26s.

VALERIAN ROOT—Is tending upwards, there being no longer sellers of good root below 27s. 6d. per cwt. c.i.f.

Newcastle-on-Tyne Chemical Report.

November 1, 1899.

A strong tone still prevails on this market. Middle-hands holding the principal makes, further advances in values are anticipated. Owing to dearer coal and other raw products in keeping, contracts for next year's produce of chemicals have to encounter higher prices. For the moment, Soda Crystals, Soda Ash, and Alkali are practically out of the market. Quotations, which are partially nominal, may be given as follows: Soda Crystals in bags, 55s.; Alkali, 52 per cent., £5 5s. to £5 10s.; Soda Ash, 52 per cent., £4 10s.; Caustic Soda, 70 per cent., £8 10s. to £8 15s.; Bleaching Powder, £6 5s. to £6 10s.; Sulphur, £4 17s. 6d. to £5 per ton.

Manchester Chemical Report.

November 1, 1899.

There is hardly a break in the continuous upward movement in heavy chemicals, and the important announcement was made to-day that Caustic Soda of all strengths had been advanced 10s. per ton. Therefore, 77-78 per cent. white will stand at £10 2s. 6d.; 74 per cent., £9 12s. 6d.; 70 per cent., £8 15s.; and 60 per cent., £7 15s. Bleaching Powder is now quoted £5 10s. per ton, on rails, soft wood casks, and £6 per ton, hardwoods, f.o.b. Liverpool. For 58 per cent. Ammonia Alkali there is an excellent demand, coupled with scarcity, and £4 7s. 6d. per ton, bags, on rails, is being freely paid. White Powdered Arsenic is rather quiet at £19 to £19 5s. per ton, ex-ship, Garston, though there are signs of improvement. Salt Cake is firm at 26s. to 27s. per ton, on rails, in bulk. Potash, Caustic, and Carbonate are scarce, but there is not the business which might have been anticipated in Chlorate, which remains at 3½d. to 3⅞d. In Coal Tar products there is little movement, although generally prices are steady. Sulphate of Ammonia is especially dull, but Pitch is fairly firm, and some shipments continue to be made for Ship Canal. Aniline Oil and Salt are unchanged and dull. Glauber Salts are firm at 32s. 6d. to 33s. per ton, bags, on rails, and Epsoms 60s. Yellow Prussiate is dull at 7½d. to 7⅝d., for Lancashire make. Brown Acetate of Lime may be quoted 5s. per ton better—£5 12s. 6d. per ton, delivered Manchester. Sulphate of Copper is dull, and, if anything, lower where sales are effected.

Liverpool Market Report.

November 2, 1899.

AMMONIUM SALTS.—Carbonate is firm at 3¼d. to 3½d. per lb. Sal ammoniac has advanced to 38s. and 40s. per cwt., and is likely to be dearer. Sulphate is quiet and a turn easier, viz., £11 per ton.

BEESWAX.—44 packages of Sierra Leone sold at £6 5s. to £6 6s. 3d. per cwt., and later five packages at £6.

CANARY SEED.—Turkish seed is fairly well inquired for, and 300 bags of good changed hands at 37s. 6d. per 464 lbs.; 465 lbs. of poor went for 36s.

COPPERAS—Is in good demand at firm rates, 37s. for Welsh and 40s. per ton for Lancashire.

COPPER SULPHATE—Is quiet at £25 per ton.

HONEY.—110 barrels of Pile X Chilian went for 29s. to 32s. per cwt.

OILS (FIXED) AND SPIRITS.—Castor is in moderate demand, and sales both spot and forward are but small though prices continue firm and unaltered; Calcutta, "good seconds," 3⅛d. per lb.; French, 1st pressure, 2$\frac{15}{16}$d. to 3d.; 2nd pressure, French and Belgian, 2⅝d.; 2nd sulphur, 2½d; Madras, 2⅞d. per lb. Olive is very firm, both on the spot and for shipment; Spanish is still quoted at £35 per tun. Linseed is steady but quiet at 25s. to 25s. 6d. per cwt. Cottonseed is held for 19s. 6d. to 20s. per cwt. in export barrels. Spirits of Turpentine are a shade cheaper, viz., 38s. per cwt., with a fair business doing.

POTASH SALTS.—Bichromate, 3½d. per lb. Chlorate, 3½d. to 3¾d. per lb. Cream of Tartar is steady at 74s. to 80s. per cwt. Pearlashes are nominal at 30s. cwt. Potashes are still scarce at 22s. 6d. to 22s. 9d. per cwt. Prussiate is cheaper, 7¾d. per lb. Saltpetre £21 15s. per ton.

SODA SALTS.—Bicarbonate continues firm at £6 5s. to £6 15s. per ton. Borax, £16 to £16 10s. per ton, has an upward tendency. Caustic 76 per cent. to 77 per cent., £9 12s. 6d. to £9 15s.; 70 per cent., £8 15s. per ton. Crystals, £3 5s. per ton. Nitrate is steady on the spot with small demand, 7s. 7½d. to 7s. 10½d. per cwt.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. A. Sidney Campkin, J.P., has again been returned without opposition for Petersfield Ward to the Cambridge Town Council.

Mr. Frederick Bird, M.P.S., chemist and druggist, Coventry, has been elected, without opposition, for the twentieth year a member of the Coventry City Council. He is also chairman of the Coventry School Board.

Calendar for the Week.

Sunday, Nov. 5. 23rd after Trinity. Sun rises 7.2, sets 4.25.

Monday, Nov. 6. Sun rises 7.4, sets 4.23.

Dewsbury and District Chemists' Association, Town Hall Dewsbury, at 8.30 p.m.—General Meeting.

Society of Chemical Industry, Burlington House, Piccadilly, London, W., at 8 p.m.—Papers will be read by Walter F. Reid and Sherard Cowper-Coles.

Tuesday, Nov. 7. Sun rises 7.6, sets 4.22.

Bradford and District Chemists' Association, County Restaurant, Bradford, at 9 p.m.—Conversation on Trade Topics.

Royal Colonial Institute, Whitehall Rooms, Hotel Metropole, London, S.W., at 8 p.m.—Lantern Lecture on "Ceylon in 1899," by John Ferguson.

Royal Photographic Society, 5A, Pall Mall East, London, W., at 8 p.m.—Lecture on "Some Mediæval Towns of Germany," by J. J. Vezey.

Wednesday, Nov. 8. Sun rises 7.7, sets 4.20.

Midland Chemists' Assistants' Association, Exchange Rooms, Stephenson Place, Birmingham, at 9 p.m.—Social evening.

Plymouth, Devonport, Stonehouse and District Chemists' Association, Freemasons' Hall, Princess Street, Plymouth, at 7 p.m.—Sixth Annual Dinner.

Thursday, Nov. 9. Sun rises 7.9, sets 4.19.

Chemists' Assistants' Association, 73, Newman Street, London, W., at 9 p.m.—Impromptu Discussion.

Friday, Nov. 10. ☽ 1.35A. Sun rises 7.11, sets 4.17.

Glasgow Chemists' and Druggists' Assistants' and Apprentices' Association, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—A Communication by T. Maben.

Saturday, Nov. 11. Sun rises 7.13, sets 4.16

Publications Received.

Pharmacopœia of the University College Hospital. Published by authority of the Medical Committee, 1899. Edited by Harold Wilson, Ph.C., Dispenser and Teacher of Pharmacy to the Hospital. Pp. 63. Price 1s. 6d. London: Jas. Truscott and Son, Suffolk Lane, Cannon Street, E.C. 1899. From the Editor.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

Cocain Hydrochlor., in not less than 4 oz. lots. What offers?—Goldsmith, 71, Park Road, Regent's Park, N.W.

Herbarium (Sale or Exchange) consisting of 174 specimens, arranged into 56 natural orders. 2 guineas.—R. W. Tildesley, Parkgate, Rotherham.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Otto Roses, virgin, ounce bottle, original (gilt), 25s. Lavender Oil, Mitcham 1896, lb. original bottle, capsuled, 25s., postage free.—Warnes, 333, Gray's Inn Road, W.C.

For Disposal.—No. 1 Patent Multiple Grinder, by the Hardy Patent Pick Co., Ltd., with Powder Collector; complete as new.—Mitre Works, Cordova Road, Grove Road, Bow, E.

Christmas Decorations. Very best special White Glass Frost, 1 lb., full weight, posted, 1s. 7d.; 2 lbs., 2s. 11d.; 7 lbs. 9s. More satisfactory full weight.—Foster, 80, Navigation Street, Birmingham.

Good Second-hand, Hand Painted Lantern Slides, to clear, 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c. Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Two "Hospital," 1 30-sec. ditto; 3 magnifying lens front, 1 30-sec. ditto; 7 good English-made clinical thermometers; mounted on standing show-card for 14s. 6d. cash, carriage paid.—Grimshaw, 16, Fairfield Rd., Edmonton.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Formula suiting good toilet speciality purchased.—W. Lewis, 15, Shelden Street, London, W.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Old Druggists' Crockery-ware wanted. Blue and white Syrup Jars, Ointment Pots, Oil Vases, and other Pharmaceutical Antiquities.—John Austen, Pharmaceutical Chemist, Dore, near Sheffield.

A Complete Set, part-set, and odd volumes of the "Pharmaceutical Journal and Transactions," also vols. of "Chemical News," "Chem. Soc. Journal," "The Analyst."—Address offers, "Gentian," "Pharm. Journal" Office, 5, Serle Street, London, W.C.

Advertisements.

(Received too late for Classification.)

JUNIOR ASSISTANT, unqualified; 21. London preferred.—JONES, 267, King's Rd., Chelsea, S.W.

ENGLISH NEWS.

Manchester Pharmaceutical Association.—At the second meeting of this Association, held on Wednesday, November 8, Mr. Harry Kemp who presided, explained that that the President, Mr. Woolley, was unfortunately absent, owing to an attack of his old enemy, influenza. The announcement was received with regret. Messrs. Middleton, Holland, Bennett, and H. Woodruff were elected members of the Association. The Secretary stated that the dance announced in the programme of the Session would take place at the Chorlton Town Hall, on January 24, 1900.

Liverpool Pharmaceutical Students' Society. — A capital smoking concert, held at the Kardomah Café, Church Street, on Thursday, November 2, inaugurated the winter session of this Society. The muster of members and their friends was very satisfactory, especially when the unpropitious state of the weather is taken into account, and the President, Mr. Prosper H. Marsden, had no difficulty in providing entertainment for the audience from the lengthy list of songs and recitations drawn up by the Secretary, Mr. Patridge, with the help of Mr. P. G. Jenner. The following artistes contributed songs:—Messrs. Atkinson, Cooke, Davies, Gilbert, Harrison, Harrod, Kennel, Nicholson, and Scott, whilst Messrs. Brown and Doran gave some capital recitations. During the evening, Messrs. Woodward and Matthew Hall officiated at the piano, giving general satisfaction both to the audience and the artistes.

Dewsbury Chemists' Association.—A meeting of the Dewsbury and District Chemists' Association was held on Monday, November 6, Mr. A. Foster presiding. The other members present were Messrs. G. Walker, G. N. Gutteridge, and R. Gledhill (Secretary), Dewsbury; Messrs. W. Stead and A. B. Barker, Heckmondwike; Messrs. C. Crooke and J. Rhodes, Mirfield; Mr. F. Broadhead, Batley; Mr. J. Day, Savile Town; Mr. J. Walker, Cleckheaton; and Mr. J. W. Cussons, Ossett. Mr. Broadhead referred to the company pharmacy problem,and some conversation took place respecting what was done at the meeting of the Pharmaceutical Council last week. It was decided, however, to leave the matter over until the future policy of the Pharmaceutical Council was made known. Arrangements were made for a special meeting to be held at the end of the month to hear a paper from Mr. Glynn-Jones on the "P.A.T.A. and Chemists' Defence Fund." It was also decided to ask all members of the association to vote in favour of Mr. Charles Troke, of Penge, being placed on the list of annuitants on the Pharmaceutical Society's Benevolent Fund.

Bradford and District Chemist's Association. At a meeting of this Association, held on Tuesday, November 7, it was decided that, whilst the Association is willing to unite with the Federation of Local Associations in any action which is calculated to assist the Pharmaceutical Council in its attempt to unite the trade, at the same time it cannot take part in any organisation of chemists which would tend to militate against the success of the scheme for local organisation proposed by Mr. Newsholme. The Federation is requested, therefore, to defer any further action in the matter until the Pharmaceutical Council has expressed its opinion on the first formulated scheme.

Western Chemists' Association of London.—The ninth annual dinner of the Association will take place at the Café Royal, 67, Regent Street, W., on Wednesday next, November 15, at 6.30 for 7 p.m. The price of tickets is 7s. 6d. each (exclusive of wine), and they may be obtained of either of the hon. secs., Mr. Herbert Cracknell, 17, Craven Road, Westbourne Terrace, W., and Mr. W. J. I. Philp, 34, High Street, Notting Hill, W., not later than the 13th inst.

School of Pharmacy Football and Cricket Club. -The annual smoking concert in connection with the above club will be held in the Crown Room, Holborn Restaurant, on Thursday, November 30. The President of the Pharmaceutical Society has kindly consented to take the chair. A committee has been formed at the "Square," consisting of Messrs. W. Owen, T. Fox, and P. B. Gray, from any of whom tickets can be obtained.

North of England School of Chemistry and Pharmacy.—The students of this school, accompanied by the principal, Mr. F. R. Dudderidge, visited the Redheugh works of the Newcastle and Gateshead Gas Co. on Wednesday, November 1. The party was conducted round the works by the manager, Mr. Hardie, who fully explained all the processes in use for the manufacture of coal gas, and its bye products. First, the charging of the retorts both by hand and machinery was seen, the latter being driven by compressed air, and the red-hot coke from the upper row of retorts conveyed directly to feed the furnaces for heating. The various stages of purification of the gas were then described, tar and ammonia being removed in the condensing pipes and scrubbing towers, carbon dioxide and sulphuretted hydrogen taken out subsequently by passing the gas through purifiers charged with lime, which alone is used at these works for this purpose. The manufacture of ammonium sulphate from the ammoniacal liquor was then seen, the crude sulphuric acid used being freed from arsenic by sulphuretted hydrogen derived from the liquor, and the excess of the latter gas converted into sulphur in the Claus kiln. A hearty vote of thanks to Mr. Hardie terminated a most interesting and instructive visit.

Royal Society.—The following is a list of those who have been recommended by the President and Council of the Royal Society for election into the Council for the year 1900 at the anniversary meeting on November 30:—President, Lord Lister, F.R.C.S., D.C.L.; Treasurer, Alfred Bray Kempe, M.A.; Secretaries, Sir Michael Foster, K.C.B., M.A., M.D., D.C.L., LL.D., Professor Arthur William Rücker, M.A., D.Sc.; Foreign Secretary, Thomas Edward Thorpe, Sc.D., LL.D. Other members of the Council.—Horace T. Brown, F.C.S., Captain Ettrick William Creak, R.N., Professor James Dewar, M.A., Professor Edwin Bailey Elliott, M.A., Hans Friedrich Gadow, Ph.D., Professor William Dobinson Halliburton, M.D., Professor William Abbott Herdman, D.Sc., Sir John Murray, K.C.B., Sir Andrew Noble, K.C.B., Professor Arnold William Reinold, M.A., George Johnstone Stoney, D.Sc., George James Symons, F.R.Met.Soc., J. J. H. Teall, M.A., Professor Joseph John Thomson, M.A., Professor Edward Burnett Tylor, D.C.L., Sir Samuel Wilks, M.D.

Chemists' Assistants' Union.—We are informed by the treasurer of the Chemists' Assistants' Union that Mr. Hugh Lloyd, of Walton-on-Naze, has generously given £3 to the funds of the Union. This amount, it will be remembered, was given to Mr. Lloyd, who was then ill (but whose name was not mentioned at the time), it being the net proceeds of a smoking concert held early in the year. We have to congratulate Mr. Lloyd on his recovery, also the C.A.U. on account of this addition to their exchequer.

Royal Institution.—A general monthly meeting of the members of the Royal Institution was held on November 6, his Grace the Duke of Northumberland, K.G., President, presiding. The following were elected members: H. H. the Thakore Saheb of Gondal, Mr. G. F. Barrett, Mr. J. B. Broun-Morison, Mr. A. H. Savage Landor, and Mr. T. C. Porter. The special thanks of the members were returned to "A Lady Member" for her donation of £100, and to Mr. George Matthey, F.R.S., for his donation of £100 to the fund for the promotion of experimental research at low temperatures. The special thanks of the members were returned to Miss Elinor Busk and Miss Frances Busk, for a portrait of Mr. George Busk, F.R.S., treasurer of the Royal Institution from 1873 to 1886.

Manchester College of Pharmacy.—On Saturday, November 4, a smoking concert was held at the Manchester College of Pharmacy. The company was composed of students and a few of their friends, no invitations having been issued. The chair was ably taken by Mr. Fisher, of Preston. The students, who were in good form, gave excellent songs, recitations, violin solos, and instrumental pieces. Miss Marley, a well-known vocalist, kindly gave her services, and delighted all by her beautiful singing. Mr. Turner made good use of the lantern, groups of past and present students were thrown on the screen, also views of different places in the neighbourhood taken while botanising on the Saturday excursions; these brought to the mind many amusing and pleasant recollections of days gone by. Mr. F. B. Hirst, who for some time has been demonstrator at the M.C.P., was presented with a very handsome marble timepiece as a

wedding present. A silver plate bore the following inscription:—"Presented to F. B. Hirst, Esq., by the Principal and Students of the M.C.P., as a token of esteem, November 4, 1899." During the interval refreshments were handed round. At the close of the evening hearty cheers were given for Mr. and Mrs. Turner, Mr. Hirst, and for those who had organised the entertainment. Mr. G. L. Scott, Ph. C., who will be remembered by past students, has again undertaken the post of demonstrator.

A BUILDING DISPUTE: COOK *v.* HINDLE.—This case arose out of the building of a house and shop by the plaintiff, a builder of Yarmouth, for Mr. W. Hindle, chemist and druggist, of Gorleston. It was tried in May before the Yarmouth County Court Judge, who gave judgment for defendant with costs.—The plaintiff appealed, and was heard by Counsel last week before Mr. Justice Ridley and Mr. Justice Darling, sitting as a Divisional Court in the Queen's Bench Division of the High Court.—Mr. Cooper, who appeared for plaintiff, said the original action was brought by plaintiff to recover balance due under a building contract, and the claim was admitted. The defendant, however, sought to set off certain sums, amounting in the aggregate to £73, and he brought the balance, £6 17s. 8d. into Court. Defendant's set-off was made up of several items, but the only one that was material was one of £54 for nine weeks' time penalties at £6 a week, and the Judge ruled in his favour. The plaintiff now appealed, and contended the judgment should be varied, and defendant should not be allowed to set off these time penalties, because part of the delay in completing the contract was the fault of the stonemason employed by defendant, which made it impossible for the plaintiff to fulfil his part of the contract, and therefore he contended the contract had been varied, and defendant could not claim for delay.—Mr. Matthews supported the ruling of the learned Judge, and eventually their lordships dismissed the appeal with costs,

FOOTBALL.—The second match in connection with the Pharmaceutical Football League took place on Saturday, November 4, at Shepherd's Bush, the opposing teams consisting of students of the London College and those of Dr. Muter's. The game was keenly contested throughout, and good all-round play was witnessed. The London College, which were beaten by the Square eleven on the previous Saturday, combined far better than on that occasion, and considering the sticky state of the ground gave a good exhibition, and eventually won by five goals to two.

IRISH NEWS.

THE DEPARTURE OF THE ROYAL IRISH RIFLES from Belfast for the scene of the war was chosen by the populace for the pronouncement of a monster *au revoir*. The duty of doing the chief honours was assigned to the Queen's College students, who flourished forth with flambeau and fancy costume in all the dazzling wildness of the improvised. It fell to the lot of two students, well-known to local chemists, to harangue the vast multitude. Mr. W. Rice, B.A., (lately Botany teacher in Templeton's Pharmaceutical Classes) referred to "broken conventions" and the necessity for establishing the Queen as suzerain *de facto.* as Her Majesty was *de jure.* Mr. Whitla, who has graduated for a considerable period at the dispensing counter, and is related to Professor Whitla, enthused the crowds by declaring, as apposite to Sir George White and the Fusiliers, that Wellington was an Irishman who had led Irish soldiers victoriously through the Peninsula, etc., and the hearers roared their delight at these historical instances of Irish genius and Irish valour.

METHYLATED SPIRITS NOT A MEDICINE "UNDER THE ACT."—When anomalies are the growth of involved statutes their *raison d'être* is valid, but that they should be adopted on principle and with due precaution marks deep intellectual acumen. The Local Government Board will not refund half the cost for methylated spirits to the Armagh Guardians, although it is admitted that some is necessary for dispensing practice and should be procured for the doctors when requisitioned, so the Guardians, in order not to appear partial and to save trouble, decided not to purchase any spirits at all.

DAMAGE TO A MINERAL WATER MACHINE.—Dr. M. R. Whitla, James Rafferty, and James Brannigan, sought to recover £50 for injury alleged to have been done to a mineral water machine, the property of the Diamond Mineral Water Company, Monaghan. The evidence showed that paraffin oil had been put in the generator, and that consequently the material was spoiled. It took ten days to make good the repairs, and orders were withdrawn. His Honour, Judge Craig, held that there was no malicious injury, and dismissed the case on the merits.

THE MEDICAL HALLS of Mr. J. W. W. Agnew, Clifton Street, and Mr. J. A. Stewart, Dublin Road, Belfast, have each received an installation of electric light.

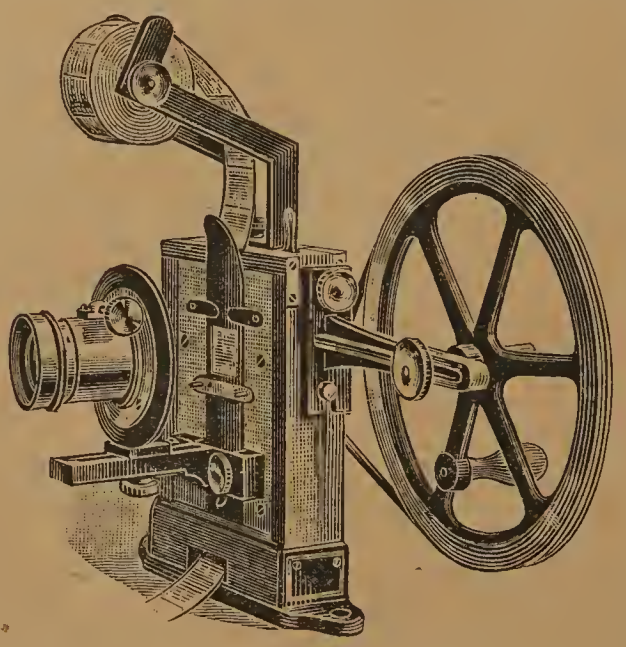
DISPENSARY DOCTORS REQUIRE PROPRIETARIES.—The Banbridge Guardians have been informed by the L.G.B. in reference to the use of patent medicines by medical officers, that the cost of articles not included in the Board's prescribed lists is not subject to recoupment out of the Local Taxation (Ireland) Account, and that the cost of patented or proprietary medicines is subject to disallowance by the auditor.

TRADE NOTES.

NOTICE OF REMOVAL.—Messrs. Francis Newbery and Sons announce their removal from King Edward Street to 27 and 28, Charterhouse Square, and 44, Charterhouse Street, E.C., where they have secured convenient premises for the transaction of their business, which has outgrown the present accommodation

LANTERN SEASON.—Mr. William Wyatt, pharmaceutical chemist, Lancaster, sends a copy of a lantern circular he is issuing in connection with his photographic department. The circular is neatly got up in pamphlet form, and contains a list and terms for hiring lantern slides, lantern and limelight apparatus etc.; also prices for developing, retouching, printing, enlarging, and mounting photographs.

CINEMATOGRAPH MECHANISM.—Messrs. W. Butcher and Son, Blackheath, send particulars of a new Cinematograph, which they are introducing for use with any ordinary lantern. This mechanism having stood the practical test of three seasons, is recommended by the firm with confidence. It is simple, reliable, well-made, and comparatively inexpensive, and is stated to give very satisfactory results. As already intimated, the machine can be used with all lanterns, either metal or wood bodies, where the base of the front does not project beyond the front tube. With metal body lanterns a base board should be provided long enough to accommodate the lantern and mechanism. The former can be fixed by means of ordinary wood screws, and the mechanism is provided with holes in the base by which it can be attached with an ordinary thumbscrew. With wood body lanterns the O.G. tube should be removed and the mechanism fixed in front to the base-board. The mechanism is the standard height to centre, viz:—5 to 5¼ inches. The cost of the mechanism (without lens) is £6 6s. complete; with front lens, 20s. extra.



FLAKE GUM.—Messrs. Potter and Clarke submit a sample of flake gum, which is claimed to be about 15 per cent. stronger than the ordinary natural gum in consequence of all impurities, having

been removed. The flake gum is intended for use in all cases in which the ordinary gum acacia can been used. It offers great advantages over the crude article, because of its freedom from all impurities, and the consequent ease with which a perfect mucilage can be prepared. In from fifteen to twenty minutes the B.P. mucilage can be made from the scales, with cold water only.

Paris Exhibition 1900.—Intending exhibitors at the forthcoming Paris Exhibition will be interested to know that Mr. C. Wilkes, 29, Ludgate Hill, Loudon, has been appointed general manager and sole agent for the British Empire (Canada excepted) for all English advertisements or publicity in the general official catalogue of the Exhibition; also for the French and English guides and other publications issued by Messrs. Lemercier and Co., official contractors to the French Government and Exhibition Board.

Beta-Eucaine *v.* Cocaine.—Messrs. A. and M. Zimmermann, 9 and 10, St. Mary-at-Hill, London, E.C., direct attention to beta-eucaine, which is claimed to be identical with cocaine in anæsthetic action, and to possess important advantages therapeutically and pharmaceutically. The chief advantage however, to which attention is directed is that in consequence of the growing scarcity of cocaine it is rapidly risiug in price, whereas beta-eucaine may be obtained at less than half the present cost of cocaine.

Xmas Mounts for Photographs.—Messrs. George Houghton and Son, 88 and 89, High Holborn, London, W.C., send a set of twelve Christmas cards for photographs, suitable for the coming season. Each mount is embossed with a pretty floral design, no two being alike. The lettering convcying the customary Christmas greetings is very pleasing, several of the cards being neatly printed in gilt, others with elegantly designed letters in

black with red initials on a white background, the dark-coloured mounts being printed in gilt and white. The mounts are in several styles and of various colours, some being of the usual folding pattern adopted for Christmas cards, others being more like the ordinary photographic mount, except as regards the floral desigu and lettering.

THE PURITY OF FOOD AND DRUGS.

Seidlitz Powders.—Dr. Bernard Dyer, analyst to the Leicestershire County Council, reported to that body at a meeting on Wednesday, November 1, that during the quarter twenty-seven samples of seidlitz powders had been submitted to him for analysis. Of these he found twenty genuine, and properly compounded in accordance with the directions of the British Pharmacopœia. Of the other seven samples two were unsatisfactory by reasons of errors in weighing, although composed of genuine ingredients, in two cases the alkaline portions of the powders were improperly compounded, and in three cases the acid portions were adulterated with alum. The Chief Constable reported that the vendors of the five adulterated samples were prosecuted and convicted, and fines and costs levied upon them to the amount of £9 13s. 6d. The vendors of the samples which contained improper quantities had been cautioned.

Camphorated Oil.—At Salisbury Police Court on Tuesday, October 24, George Williams, grocer, Shrewton, Wilts, was fined 10s. with costs, for selling as camphorated oil, a compound containing 10 per cent. of camphor only.

Lime Juice Cordial.—At Cork, on Tuesday, October 24, Joseph Haden, mineral water manufacturer, Maylor Street, was fined 10s. with costs, for refusing to supply an inspector under the Food and Drugs Act with a sample of lime-juice cordial. Defendant denied the charge, and pleaded that he could not serve the inspector at the time because the person who had charge of the keys of the store in which the lime-juice cordial was locked up, was then away.

Spirit of Nitre.—At Heanor Petty Sessions on Monday, October 23, Floreuce Gertrude Clay, grocer, carrying on business at Cromford Road, Langley Mill, was summoned for selling to the prejudice of the purchaser six ounces of sweet spirit of nitre 50 per cent. deficient in nitrous ether.—Mr. C. J. Jackson, solicitor, of Ilkeston, on behalf of defendant, admitted the sale of the article, and confessed it was for want of knowledge of such articles that the alleged error arose. Defendant had had the article in the shop for twelve months, and was not aware of the escape of the spirit, being ignorant of its nature and quality. He asked the Bench to deal leniently with his client.—The Bench imposed a fine of 1s. and £1 4s. costs, including the costs of analysis.

Camphorated Oil.—At Cwmbran Police-court, on Thursday, November 2, George Frederick Thorne was summoned for selling camphorated oil deficient in camphor to the extent of 50 per cent. Mr. Lloyd for the defence objected to the analyst's certificate on the ground that it did not set out the ingredients of the sample in order that the Bench might form an opinion upon it. He relied upon the case of Fortune *v.* Hanson. He added that the defendant had a warranty from the makers, Messrs. G. Turley and Sons, of Birmingham, who stated that no article was sent out from their establishment unless it was absolutely pure. In reply to the Chairman, Mr. Gustard, who appeared to prosecute, said a legal standard for camphorated oil was to be found in the British Pharmacopœia. The Magistrate's clerk, after reading the analyst's certificate, observed that in it the analyst did not state that he had analysed camphorated oil. He only said he analysed oil from a bottle marked "camphorated oil," and numbered "102." The case was adjourned for a month to give the justices time to consider their decision.

Copper in Peas.—Messrs. Grantham and Bryant, grocers, The Parade, Haven Green, Ealing, W., were summoned at Brentford Petty Sessions, under Section 3 of the Food and Drugs Act, for selling green peas containing 2·64 grains of copper sulphate per pound, thus being injurious to health; also under Section 6 for having sold green peas not of the nature, substance, and quality demanded by the purchaser.—The defence was that, under Section 5 of the Act, defendants had a good answer to the charge in that they had no knowledge that the article was "coloured or mixed so as to render it injurious to health."—The magistrates were of opinion, however, that "reasonable diligence," as required by the Act, had not been exercised. At the same time they felt that defendants were the victims of the wholesale people—Messrs. Petty, Wood, and Co.—and they regretted that the wholesale firm was not before them.—Fined £5 and costs.

Liquorice Powder.—Annie Conroy, herbalist, 92, Wakefield-road, was summoned at the Bradford City Police-court on Thursday, October 19, for selling compound liquorice powder below the standard quality. The Deputy Town Clerk, who prosecuted, said that an inspector purchased four penny packets of the powder from the defendant, who told him that she obtained them from a firm of chemists in the town. The powder was examined by the city analyst, and found to contain 23 per cent. of sulphur, 50 per cent. of sugar, and 26 per cent. of liquorice. One of the packets was prepared in accordance with the British Pharmacopœia.—The Stipendiary Magistrate ordered the defendant to pay the costs, which, he said, would be refunded to her by the chemists who supplied her with the powder. He also advised her to take back to them what remaining packets of it she possessed.

SACCHARIN VERSUS SUGAR.—The Society of Beetroot Manufacturers at the Hague, according to the *British Food Journal*, has called the attention of the Dutch Minister of Finance to the increased consumption of saccharin in Holland. In the Society's opinion, that will eventually have the effect of considerably reducing the receipts from duty payable on sugar. So long as saccharin was obtainable in the form of powder only, the prospect of a more general consumption was not very great, but it can now be obtained at almost any grocer's shop in tablet form, at low rates. Saccharin, the Society contends, has a great advantage over sugar, as it only pays 5 per cent. import duty *ad valorem*, whereas sugar has to pay about 200 per cent. on its value.

REPORTS OF PUBLIC ANALYSTS:—*Birmingham.*—During the quarter ending March 31 last, Dr. Alfred Hill, F.I.C., reports that 319 samples of food and drugs were examined. These consisted of 151 samples of milk, 1 of skimmed milk, 90 of butter, 26 of coffee, 12 of sugar confectionery, 10 of malt vinegar, 2 of white sugar, 2 of white pepper, 11 of compound tincture of rhubarb, 10 of sweet spirit of nitre, and 4 of margarine. 25 samples, or 8 per cent., were condemned because of the presence of preservatives, and 39 samples, or 12 per cent., were adulterated in other ways. With regard to the compound tincture of rhubarb, Dr. Hill points out that the British Pharmacopœia of 1898 orders one volume of glycerin to every ten volumes of the tincture. 8 of the 11 samples were correctly prepared, or nearly so, but the other 3 contained no glycerin, and agreed with the composition ordered by the 1885 Pharmacopœia. Of the sweet spirit of nitre, 3 of the 10 samples were deficient in 10 to 24 per cent. of the minimum amount of ethyl nitrite required to be present by the B.P. Fines to the amount of £88 6s. were inflicted, and the costs amounted to £14 10s.——*Chester.*—Mr. J. Carter Bell, F.I.C., reports that during the quarter ending June 30 this year, 219 samples were examined, consisting of 65 butters, 60 milks, 28 spirits, 7 coffees, 6 gingers, 5 arrowroots, 5 peppers, 1 oatmeal, 3 sugars, 1 cheese, 4 powdered rhubarbs, 4 tinctures of rhubarb, 5 camphor liniments, and 4 iodine liniments. Of these 4 were adulterated, viz., 2 camphor liniments, 1 iodine liniment, and 1 whisky.. The two camphor liniments were deficient in camphor to the extent of 4 and 15 per cent. ; the iodine liniment was deficient in iodine by over 7 per cent. ; the whisky contained 4 per cent. of water in excess. In regard to the four samples of powdered rhubarb submitted, they were all free from gamboge, starch and turmeric, but the analyst was not prepared to say that there was no evidence of the presence of English rhubarb in the samples. As no standards exist for powdered rhubarb, Mr. Carter Bell carried out a special investigation on the subject, and obtained from a drug grinder what was stated to be an absolutely pure sample of Chinese rhubarb for a standard of comparisou. There are many varieties of rhubarb which differ very much in percentage composition, and as the samples, microscopically and chemically, compared favourably with the pure sample, Mr. Carter Bell considered that he was bound to pass them all as genuine. A sample of ointment, said to be a most valuable remedy for curing warts, as it contained a large percentage of nitrate of silver, was examined and found to consist of—water, 11·95 ; oil, 3·45 ; sulphur, 81·80 ; oxide of iron, lime, etc., 2·80. There was not a trace of silver in the compound.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. Aubrey T. Hill has been appointed successor to the late W. Lloyd Williams, as Assistant Manager of Messrs. Burroughs, Wellcome and Co.'s works at Dartford, Kent.

Mr. Frederick J. Oliver, chemist and druggist, 43, Gabriel's Hill, and 41, Stone Street, Maidstone, has purchased the business of Messrs. T. G. Stonham and Son, 70 and 71, Bank Street, Maidstone, and has taken into partnership Mr. H. B. Turney, who has been associated with Messrs. Stonham and Son for the past eight years. The three businesses will in future be carried on at the same addresses, and under the same names as herctofore.

Mr. Thomas G. Stonham, pharmaceutical chemist, Maidstone, has retired from business, owing to failing health, and as intimated above, has disposed of his business to Mr. F. J. Oliver, who will pay all outgoings as from September 30 last.

Dr. J. Norman Collie, F.R.S., Professor of Chemistry to the Pharmaceutical Society, has been appointed External Examiner in Chemistry at Victoria University.

Dr. A. P. Luff, M.P.S., Lecturer in St. Mary's Hospital, London, has been appointed External Examiner in Forensic Medicine at Victoria University.

Mr. Lawrence Priestley, M.P.S., pharmaceutical chemist, on Wednesday, November 1, was elected at the head of the poll as one of the two representatives for the East Ward of the Newark Town Council, securiug thirty-one more votes than the other successful candidate.

Mr. S. Scruton, of the firm of Messrs. Raimes and Co., York, was the chairman at a recent meeting of the York Chamber of Commerce, when Lord Charles Beresford, M.P., delivered a lecture on "China."

Deaths.

Paddock.—On September 22, Thomas Paddock, Chemist and Druggist, Liverpool. Aged 61.

Lyon.—Ou October 24, James Lyon, Chemist and Druggist, Dalstou, London, N.E. Aged 51.

Partnerships Dissolved.

(From the London Gazette.)

Thomas Henry Black and Thomas Winslow Hamilton, carrying on business as Chemists, Spice Merchants, and Dealers in Butchers' Supplies, at 44 and 46, Gill Street, Liverpool. Debts will be received and paid by Thomas Henry Black.

Frederic Walmsley Warrick and Joseph Harrison (trading as Warrick Brothers), Merchants and Wholesale Perfumers, 7, Portpool Lane, Holborn, London. Debts will be received and paid by Frederic W. Warrick, by whom the business will in future be carried on.

Jacob Hertz aud Percy Collingwood, Commission Merchants, 38 Leadenhall Street, London, E.C. Debts will be received and paid by Jacob Hertz.

John Whittington and Willian Borrett Whittington, Dental Surgeons, 4, Central Beach, Blackpool.

James Kay, Tom Rostron Kay, and Herbert Kay (trading as James Kay and Sons), Soap Manufacturers, Nuttall Lane Soap Works, Ramsbottom. Debts will be received and paid by Tom R. Kay and Herbert Kay, who will continue to carry on the busiuess under the same style as before.

Charles Rushworth, George Bilton Wood, and Charles Henry Hope Norris (trading as W. J. Norris and Brother), Chemical Manufacturers, Calder Chemical Works, Sowerby Bridge, Yorks. Debts will be received and paid by Charles Rushworth and C. H. H. Norris, who will carry on the business under the same style as before.

John Hughes Rees, Thomas Richards, and William Williams (trading as Rees, Richards, and Williams), Aërated Water Manufacturers, Pwll, Llanelly. Debts will be received and paid by John H. Rees and Thomas Richards, who will carry on the business as Rees and Richards.

Frederick John Taylor and James Henry Burnet, Veterinary Surgeons, 8, Moseley Street, Birmingham. Debts will be received and paid by James H. Burnet.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

Charles Alfred Jones, chemist and druggist, lately carrying on business at 171 and 173, York Street, now at the Junction Pharmacy, York Street, and Marsh Lane, Leeds.

William Cornell, chemist and druggist, 8, Orwell Place, Ipswich.

Walter Storey (trading as Storey and Son), soap manufacturer, Chapel-en-le-Frith, Derby.

Bessie Stewart, homœopathist, 27, North Parade, Bradford.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

Thursday, November 9.

Business in the Drug and Chemical trade has been somewhat quiet during the past few days. There have been further advances in price of Camphor and Quicksilver. Thymol is also much dearer. Mercurials are so far unchanged. Bromides very firm. Iodides steady. Cod Liver Oil dearer. Glycerin steady. Quinine looks like going better. Opium and Morphine quiet. Codeine firm. Acid Carbolic decidedly firmer, and expected to be dearer. Higher prices are also asked for Orris Root. Acid Citric dull and weak. Tartaric and Cream of Tartar quiet, but steady. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE—Continues weak at 9¾d. to 11d. per lb., according to quantity and make.

ACID BORACIC—Is still quoted 25s. per cwt. for Crystals and 27s. for Powder.

ACID CARBOLIC.—In very active demand, the prices being for 35° to 36° C. ice crystal in large bulk, 7¼d.; the 39° to 40° C. fetching 7⅞d. per lb., and 8⅞d. for 39° to 40° C. detached crystals, B.P. quality. Crude: 60° F., 2s. 6d. per gallon; 75° F. 3s. per gallon. Liquid, 95 to 98 per cent. of pale straw colour, 1s. 3d. to 1s. 4d. per gallon in 40-gallon casks; ditto, 30 per cent. of dark colour, 11d. to 1s. a gallon.

ACID CITRIC—Quiet and somewhat weak at 1s. 3½d. to 1s. 4d. per lb. for Crystals in 5cwt. casks and for spot delivery.

ACID OXALIC—Is still quoted 3d. to 3¼d. per lb., free delivered, London.

ACID TARTARIC—Is unchanged at 1s. 1d. per lb. for English on the spot and 1s. 0¼d. per lb. c.i.f. for foreign.

ALOES.—Curacao are scarce, and prices are likely to be dearer. Socotrine: Good, in kegs, selling for export at 75s. cwt.

ALUM.—Loose lump, £5 7s. 6d. per ton; ground, in bags, £6 per ton, ex-store.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb.; Carbonate, 3d. to 4d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 32s. 6d. to 35s. per cwt.; ditto commercial, 28s. per cwt. Sal ammoniac, firsts, 40s. per cwt.; seconds, 38s.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate steady. Gray, prompt, 24 per cent., London, £10 12s. 6d.; Hull, £10 10s.; Leith, prompt, £10 10s.; Beckton, prompt, £10 11s. 3d.; Beckton terms, prompt, £10 10s. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus is quoted £39 to £40 per ton, and Japan crude (black sulphide) £23 5s. to £23 10s. per ton.

ARSENIC.—Powder, 20s. per cwt.; Lump, 34s. per cwt.

BALSAM CANADA—Has been exceedingly scarce, and price is 1s. 4½d. per lb. on the spot.

BALSAM COPAIBA—Firm at 1s. 9d. to 1s. 10d. per lb.

BALSAM TOLU.—Good quality is scarce at 1s. 5d. per lb, but inferior qualities can be had at 1s. 3d. to 1s. 4d. per lb.

BISMUTH—Is without change in price either for the Metal or for the Salts.

BLEACHING POWDER (CHLORIDE OF LIME).—English is still quoted £6 10s. per ton.

BORAX—Is unchanged at 16s. per cwt. for Crystals and 16s. 6d. for Powder.

BROMIDES—Are in good demand at firm prices.

CLOVES.—No Penang or Zanzibar were offered in auction. Privately, a moderate business doing in Zanzibar at about steady rates, compri ing January-March at 3 7/16d. to 3 13-32d., and March-May at 3 15-32d.

CAMPHOR.—The market for Crude is strong, and extravagant prices are quoted by importers. A re-sale of 200 piculs Japan, October-December shipment, has been made at 157s. 6d. c. f. and i. For the refined article makers quote Bells and Flowers 2s. per lb., tablets being charged higher in proportion and according to size.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon; pure, 2s. Benzole, 50 per cent., 11d. per gallon; 90 per cent., 10d. per gallon. Creosote, 3½d. per gallon. Crude naphtha, 30 per cent at 120° C., 5½d. per gallon; solvent naphtha, 95 per cent. at 160° C., 1s. 6d. per gallon; 90 per cent. at 160° C., 1s. 3d. per gallon; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene: A, 4¼d. per unit; B, 3d. per unit. Pitch, 34s. per ton f.o.b. Tar, refined and crude, 12s. 6d. per barrel; 2d. per gallon.

COCAINE.—There are still sellers of the Hydrochlorate from second hands at 19s. 6d. per oz., the makers quoting 20s. 6d. per oz. for 200-oz. lots in 25-oz. tins.

CODEINE—Is very firm at 12s. 11d. to 13s. 6d. per oz. for the pure and 1s. per oz. less for the salts.

COD LIVER OIL—Remains firm, the stock on the other side being apparently concentrated in the hands of a few strong holders, which augurs well for the future of the article. The agents here quote 75s. to 80s. per barrel, but without engagement, for best non-congealing Norwegian oil in 25-gallon tin-lined casks.

CREAM OF TARTAR.—First white crystals are quoted 74s. per cwt. on the spot; powder, 76s.; ditto., 95 per cent., 77s. per cwt.

GALLS.—Market continues very firm, but buyers will not take freely at prices asked. Small sales of Blues have been made at full prices.

GINGER. At auction moderate supplies of Cochin went off slowly at steady rates, good medium, cut and scraped, 56s. 6d.; small, some medium ditto, at 37s. 6d.; washed rough, small, rather wormy, at 23s.; Calicut rough bought in; fair medium at 27s. to 28s.; small and medium. rather shrivelled, at 25s. Jamaica: some sold at easier rates, good common at 51s. 6d. Privately: unassorted Calicut sold up to 29s.

GLYCERIN—Remains steady at 57s. 6d. to 58s. 6d. per cwt. for English, and 57s. 6d. to 65s. per cwt. for German, according to brand, for best white, double distilled, chemically pure 1260° quality, in tins and cases. Crude is also steady at nominally unchanged prices.

GOLDEN SEAL ROOT—Continues scarce on this side. To import the cost comes at 2s. 7d. per lb., landed.

GUM TRAGACANTH.—There has been a fair demand for the Persian kinds, and a good quantity has been sold at slightly irregular prices, in some cases being rather lower. Of Bagdad kinds stock is very small and selection poor, but the first arrivals of new are expected on the market at the end of this month, and for these a good demand is expected.

IODIDES—Are steady at unchanged prices.

IPECACUHANA.—A good business has been done this week in Rio at 14s. per lb., whilst Carthagena is held for 10s. per lb.

MENTHOL—Is firm at 8s. 6d. per lb. for best brands of dry white Crystals, and is stated to be likely to go dearer.

MERCURIALS.—Makers' prices are so far unchanged at 3s. 1d. per lb. for calomel and 2s. 9d. per lb. for corrosive sublimate. Other mercurials being quoted at corresponding figures.

MORPHINE—Quiet at 5s. per oz. for the hydrochlorate powder.

OILS (ESSENTIAL).—Star Aniseed is quiet at 6s. 4d. per lb. on the spot. Cassia firm at 4s. to 4s. 3d. per lb. as to quality. Lemongrass steady at 3¼d. to 3½d. per lb. Citronelle, 11½d. to 1s. 1d. per lb. Peppermint: H.G.H. firmer at 5s. 6d. per lb. on the spot. Japan, 40 per cent. steady at 5s. to 5s. 3d. per lb; dementholised, 3s. 7½d. to 3s. 9d. per lb. Sassafras dearer at 1s. 10d. per lb. Wintergreen dearer at 8s. per lb.

OILS (FIXED) AND SPIRITS.—Linseed flat; on the spot pipes, London, £22 5s.; in barrels, £22 10s. Hull closed steady; spot naked, £21 5s. Rape flat; ordinary brown on spot, £22 15s. to £23; Refined spot, £24 10s.; Ravison naked spot, £20 15s. to £21. Cotton dull; London Crude spot, £16; November-April, £16 2s. 6d.; Refined spot, £18 to £19, according to make. Hull Naked Refined spot, £15 15s.; Crude spot, £14 15s.. Olive steady; Mogador, £34; Spanish, £35; Levant, £34 5s. Cocoanut steady; Ceylon, on the spot, £25 10s.; October-December, £24, c.i.f.; Cochin spot £29 10s.; near, £27 10s., c.i.f.; Mauritius on spot, £25 10s. in hogsheads. Palm dull; Lagos on spot quoted £26 10s.. Castor Oil quiet; Belgian, first pressing, spot, £27; January to June, £25 10s., f.o.b.; Antwerp, second pressing, spot, £25 10s. per ton, ex wharf; Hull manufactured, guaranteed cold drawn, pure pharmaceutical oil, £30 per ton in barrels; 3⅝d. per lb. in cases; pure firsts, £27 10s.; seconds, £26 10s. per ton in barrels; firsts, 3¼d. per lb. in cases; seconds, 3⅛d. ex wharf

London. Lubricating Oil: Pale American spot 7s. to 9s.; black, 6s. 3d. to 8s.; Russian black, 5s. 6d.; pale, 7s. to 8s. 6d. Petroleum Oil firm at again dearer prices; Russian spot quoted 5¾d. to 5⅞d.; American spot, 7 1/16d. to 7⅛d.; Water white, 8⅛d. to 8⅜d. Turpentine market opened steady, but there is no activity in the demand, and prices show a slight decline; American spot, 36s.; December, 36s. 1½d.; January-April, 36s. 9d.; July-December, 31s. 9d. to 31s. 10½d. Petroleum Spirit: American, 9¾d.; Deodorised, 10d.

OPIUM.—The market has continued generally quiet, and only unimportant sales have occurred, but prices are without alteration. Persian is firmly held at 12s. to 12s. 6d. for fine quality, but no business is reported.

ORRIS ROOT—Is very firm at nominally higher prices, as much as 70s. per cwt. having been asked for really fine picked Florentine.

PHENACETINE—Is still obtainable at 6s. 1d. per lb. down to 3s. 6d. for 2-cwt. lots for both crystals and powder, while Bayer's brand is quoted 3s. 3d. and Riedel's 5s. 7d. per lb., in original 1-lb. packing.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate spot, London, crystals, 3d.; powder, 3⅛d. Iodide, 10s. 6d. per lb. Permanganate quoted 52s. 6d. to 62s. 6d. per cwt., according to make; large crystals 5s. per cwt. more. Prussiate, yellow Beckton make, 7d.; other English makes, 7½d. to 7¾d.; red, 1s. to 1s. 2d. per lb., according to quantity, etc.

QUICKSILVER.—Rothschild again advanced his price 2s. 6d. per bottle, to £9 7s. 6d., second hand quoting £9 7s. per bottle. The idea appears to prevail that a further advance in price is not improbable.

QUININE.—The makers of the favourite German brands, B.&S. and Brunswick still quote 1s. 2d. per oz. for the Sulphate in 100-oz. tins, and for 1,000-oz. lots. To-day business has been done in these brands in the speculative market at 1s. 1⅜d. per oz. for December delivery, and there were still buyers at this price, but practically no sellers.

ROSIN—Dearer, strained being quoted 4s. 9d. per cwt. on the spot and 4s. 3d. to 4s. 4½d. for Nov.-Dec. and Jan.-March shipment per sailing vessel.

SEEDLAC.—At auction 10 cases Madras offered and bought in, including good pale, but small, at 95s.

SENNA.—Tinnevelly is inquired for, and a small business has been done from second-hands, at rather over last sales' rates. The demand is principally for the cheaper grades which, however, are very scarce. For Alexandrian grades there is a good inquiry, but stock is of poor quality. Business has been done in pods at 1s. per lb.—a sharp advance.

SENEGA ROOT—Very scarce, and spot holders ask 2s. 2d. to 2s. 3d. per lb.

SERPENTARIA ROOT.—Scarce and dearer at 1s. 4½d. per lb. on the spot.

SHELLAC.—There has been a fair demand since the auctions for both TN Orange and Button, resulting in moderate sales at fully the advance established there. 200 cases worked AC Garnet have also been sold at 64s. 6d. Futures remain quiet and inactive; there are buyers of TN Orange near at hand at 61s. 6d. c.f. and i. Moderate supplies were catalogued for the auctions to-day, and a fair demand prevailed for Second Orange, but the advance required by sellers checked business, and less than half found buyers at 6d. to 1s. above last sales' rates, making fair TN now 64s. Garnet neglected. Button all bought in above valuations. A total of 707 cases offered and 214 cases sold. Second Orange: Of 447 cases 204 sold, fair bright free at 63s. to 64s.; good bright cakey at 64s.; dull palish, rather flimsy, at 63s. to 64s.; bright red broken at 63s. Garnet: Of 141 cases offered only 10 cass block G sold at 55s.; the remainder, good ruby bought in, including blocky at 60s. Button: 119 cases offered and bought in, chiefly so-called pure lac, from 72s. 6d. to 87s.

SPERMACETI.—American is dearer at 1s. 3½d. per lb.

SPICES (VARIOUS).—Black Pepper: At auction, good bold Singapore was offered and sold at 5⅞d. Some bags Penang bought in, dust, 4·90 per cent., at 5¼d. Privately there has been a good demand for Singapore on the spot; some has been sold at 5¾d. For arrival the market is firm, but quiet. White Pepper: Nothing was offered in auction beyond some cases of fine Singapore, which were bought in at 1s. Privately, it is firm in the market, but no business of importance has occurred. Chillies: At auction 185 bags Japan were offered, and only 3 bags damages sold at 37s. Cinnamon Chips, etc.: 451 bags offered and 346 bags sold without reserve, quillings at 5¼d. to 8d., featherings 4d. to 4½d., cuttings at 2⅝d. to 3d., chips and bark at 2¼d. to 2⅞d. Mace quiet but steady: 2 cases Penang sold, good pale, part wormy, at 2s. 6d., fair reddish, little mouldy, at 1s. 0d. 16 cases Bombay bought in, fair, little wormy, at 1s. 6d. 71 boxes Singapore taken out at 1s. 6d.. 21 cases Bombay wild bought in at 6d. to 5½d. for ordinary to fair bright. West Indian: 59 packages sold, good pale at 1s. 7d., fair to good pale reddish at 1s. 4d. to 1s. 6d., ordinary to fair broken at 1s. 1d. to 1s. 3d. Nutmegs continue slow of sale, and of 35 cases Penang in auction only 4 cases sold, 184's, partly shrivelled, at 5½d; the remainder bought in, including 80's at 1s. 9d. and 89's at 1s. 6d. 7 cases Bombay bought in. West Indian: 17 cases and 95 barrels, etc., sold, 56's at 6s., 66's to 67's at 2s. 2d., 71's to 74's at 1s. 7d., 77's at 1s. 6d., 82's at 1s. 5d. to 1s. 6d., 87's to 89's at 1s. 3d. to 1s. 4d., 90's at 1s. 3d., 93's at 1s. 2d., 95's to 96's at 1s. 2d., 101's to 104's at 1s., 107's to 109's at 11d. to 1s., 132's at 7½d. to 8d., 137's, slightly wormy, at 6d., defective 110's at 9d., 154's at 6½d, wormy and broken from 3d. to 5d.

SODA COMPOUNDS.—Crystals, barrels, quoted 60s.; bags, 57s. 6d. per ton. Ash, £5 5s. to £7 per ton, according to percentage, etc. Bicarbonate, landed, £7 5s.; Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic, 70 per cent. white, £10; 60 per cent., £1 less. Hyposulphite (Antichlor) 6s. 6d. to 8s. 6d. per cwt., according to make, etc. Iodide, 11s. 10d. per lb. Nitrate, on the spot, refined, £8 2s. 6d.; ordinary, £7 17s. 6d.

STROPHANTHUS SEEDS.—Green Kombé: Stock in first hands is exhausted, and second hand holders are asking 4s. to 4s. 6d. per lb. in original packages. Brown seeds are in limited supply, and are held for 1s. 2d. lb.

THYMOL.—In consequence of scarcity and dearness of the raw material (Ajowan Seed, or Wild Thyme), the price of this article has rapidly advanced. Very few of the makers are willing to sell, stating that they have no stock. Second-hand holders are offering in limited quantity at 9s. 6d. to 10s. per lb.

TURMERIC.—20 bags Cochin split bulbs offered and bought in, rather rough, at 11s. 6d. Privately prices remain very firm, but business is small. Bengal quoted 28s., Madras finger 32s. 6d. to 37s. 6d. for ordinary to good bright, and Cochin split bulbs at 12s.

SULPHATE OF COPPER—Is quoted £24 10s. to £25 10s. per ton according to brand and delivery.

SULPHONAL—Continues in an anomalous position, the makers quote 17s. per lb., while there are still sellers of both crystals and powder at 14s 6d. to 15s. per lb., according to quantity.

SULPHUR—Firm. English: Flowers, 10s. per cwt.; Roll, 7s. 6d. to 8s. per cwt. Foreign: Flowers, 6s. 9d. to 7s. per cwt.; Roll, 6s. 6d. per cwt.

VANILLA.—On Wednesday 600 tins were offered and, with good competition, practically the whole was sold. Seychelles: This kind formed the bulk of the offerings comprised of new arrivals. Prices realised were from 21s. to 30s. per lb., according to length and quality. Bourbon sold at 25s. to 27s. 6d. per lb. Tahiti bought in, but market privately is rather dearer.

Liverpool Market Report.

NOVEMBER 9, 1899.

During the week the price of Linseed has become easier, and in consequence that of Linseed Oil has come down a little. Lower prices are also to be noted for Spirits of Turpentine and Cotton-seed Oil. Improved rates are ruling for Canaryseed, Olive Oil, Potashes, and Caustic Soda and Nitrate of Soda.

AMMONIA SALTS.—Sulphate is lower and dull, £10 17s. 6d. per ton.

BEESWAX.—78 packages of Gambier sold at full prices.

CANARY SEED—Has revived both in demand and price. 36s. per 464 lbs. was offered for Turkish and refused early in the week, resulting in business being done later to the extent of 400 bags at 36s. 6d. 100 bags of Spanish made 45s.

CARNAUBA WAX.—35 bags sold at 42s. 6d. to 54s. per cwt., according to quality.

COPPER SULPHATE—Is dull at £25 per ton.

CREAM OF TARTAR.—Best white is selling slowly at 74s. to 80s. per cwt.

LINSEED—Has become quiet, with a corresponding drop in price, but buyers are not anxious for business. Calcutta seed on the spot is not offered, but forward November-December shipment is quoted at 49s. 6d. per 416 lbs. North American near at hand

46s. 6d. per 424 lbs.; forward November-December shipment, 46s.; River Plate (new crop), December-January, 43s. 6d.; January-February, 43s. 3d. per 416 lbs.

OILS (FIXED) AND SPIRITS.—Castor Oils are in very limited demand, Calcutta at 3 1/16d. to 3 1/8d. per lb.; French, 1st pressure, 2 7/8d. to 3d.; 2nd French and Belgian, 2 5/8d.; 2nd Sulphur, 2 1/2d., and Madras, 2 7/8d. Olive, owing to considerable advances in the price abroad, Spanish oil, to arrive, is now quoted at £35 per tun, cost and freight, for Malaga, and £34 per tun, cost and freight, for Seville. Linseed oils of Liverpool make are easier and slow of sale at 24s. 6d. to 25s. per cwt. Cottonseed oils are a turn in buyers' favour, at 19s. to 19s. 6d. per cwt.

SPIRITS OF TURPENTINE.—There are sellers at the lower rate of 37s. 9d. per cwt., with a fair business doing.

POTASH SALTS.—Potashes are dearer at 23s. 6d. to 23s. 9d. per cwt. Pearlashes have also risen to 32s. per cwt., but inquiry is only small.

QUILLAZA BARK.—About 20 tons of Chilian sold at £12 15s. per ton.

BORAX.—£16 to £16 10s. per ton.

SODA SALTS.—Caustic Soda is dearer, 76 to 77 per cent., £10 per ton; 70 per cent., £9 5s. Crystals, £3 5s. per ton.

NITRATE.—Is in moderate demand at higher rates, 7s. 9d. to 8s. per cwt.

Manchester Chemical Report.

November 8, 1899.

The Board of Trade returns for the past month are rather disappointing, and do not support the sanguine estimates of the chemical trade for some time past. It is not difficult to account for this, seeing that the textile and dyeing industries in this centre have been enjoying a period of activity unknown for some years. The imports of chemicals, dye stuffs, and tanning substances, emphasises this to a great extent, seeing that the value of imports is £377,409, or 20·6 of an increase over the corresponding period of last year. Turning to exports of chemicals and chemical and medicinal preparations, we find the declared value to be £708,179, or an increase of 5·1 per cent. In alkali we find the quantity to be 319,838 cwts., or 14·8 decrease, and the value £88,221, a decrease of 14·1, and bleaching materials 102,670 cwts., a decrease of 0·5, and value, £25,290, a decrease of 10·0 per cent. There is an increase of about 4,000 cwts. in Bleach to the States, so that in this respect other countries must have been consuming a smaller quantity than usual. In this market, however, there are advances to record, in addition to those mentioned in our last, and merchants have had an intimation that caution must be exercised in offering forward. Bleaching Powder is now quoted £5 15s. per ton; soft wood casks, on rails, works, and Caustic Soda has had another rise of 10s. for this year's delivery, with 5s. added for next year, thus making 70 per cent., £8 15s. and £9 per ton respectively. Sulphate of Copper is rather better, and may be quoted £25 10s. to £26 per ton, best brands, delivered Manchester. Brown Acetate of Lime ranges from £5 12s. 6d. to £5 17s. 6d. per ton, Welsh and American, delivered Manchester. Acids generally are weak, except Carbolic. Alum is very firm at late rates, and an advance is daily expected. Arsenic is a trifle firmer at £19 5s. to £19 10s. per ton, ex ship, Garston. Yellow Prussiate and Cyanide of Potassium are very dull.

Newcastle-on-Tyne Chemical Report.

November 8, 1899.

Business in Chemicals here is still very strong all round, and makers are practically sold out of most of their articles for sometime forward. Caustic Soda has experienced another advance of 10s. per ton for home and export trades. Parcels of heavy goods held by middle hands are making a shade more money. Quotations are:—Bleaching Powder, £6 5s. to £6 10s.; Caustic Soda, 70 per cent., £9 to £9 5s.; Soda Crystals, in bags, 55s.; Soda Ash, 52 per cent., £4 10s.; Alkali, 52 per cent., £5 10s.; Sulphur, £4 17s. 6d. to £5 per ton.

Calendar for the Week.

Sunday, Nov. 12. 24th after Trinity. Sun rises 7.14, sets 4.14.

Monday, Nov. 13. Sun rises 7.16, sets 4.13.

Royal Geographical Society, University of London, Burlington Gardens, W., at 8.30 p.m.—Opening address by the President, Sir Clements Markham, K.C.B.; paper by Willy Rickmer Rickmers on "Travels in Bokhara."

Tuesday, Nov. 14. Sun rises 7.18, sets 4.11.

Pharmaceutical Society of Great Britain, 17, Bloomsbury Square, London, W.C., at 8 p.m.—Evening Meeting, when papers will be read by Professor J. Reynolds Green on "The Biology of Yeast," and by Professor H. G. Greenish on "Spurious Alexandrian Senna."

Royal Photographic Society, 66, Russell Square, London, W.C. at 8 p.m.—General business meeting; Second Annual Traill-Taylor Memorial Lecture—"Teachings of the Daguerreotype," by Major-General J. Waterhouse.

Wednesday, Nov. 15. Sun rises 7.20, sets 4.10.

Royal Microscopical Society, 20, Hanover Square, London, W., at 7.30 p.m.—Exhibition of Foraminifera, by A. Earland.

Western Chemists' Association (of London), Café Royal, 68, Regent Street, London, W., at 7 p.m.—Ninth Annual Dinner.

Thursday, Nov. 16. Sun rises 7.21, sets 4.8

Chemical Society, Burlington House, Piccadilly, London, W., at 8 p.m.—Papers by W. J. Sell and F. W. Dootson; W. R. Dunstan and H. M. Reed; H. M. Dawson and P. Williams.

Chemists' Assistants' Association, 73, Newman Street, London, W., at 9 p.m.—Short Papers by Members.

Linnean Society of London, Burlington House, Piccadilly, London, W., at 8 p.m.—Papers by W. C. Wordsdell and W. T. Colman.

Midland Chemists' Assistants' Association, Exchange Rooms, Stephenson Place, Birmingham, at 9.15 p.m.—Remarks on Laboratory Chemicals, by F. H. Alcock.

Friday, Nov. 17. ○ 10.18m. Sun rises 7.23, sets 4.7.

Glasgow Chemists' and Druggists' Assistants' and Apprentices' Association, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Entertainment.

Saturday, Nov. 18. Sun rises 7.24, sets 4.5.

Leeds College of Pharmacy, 19, Springfield Place, at 7.30 p.m.—Smoking concert. Mr. W. Shaw, Ph.C., of Huddersfield, in the chair.

Publications Received.

Semi-Annual Report of Schimmel and Co. (Fritzsche Brothers). October, 1899. Pp. 75. Leipzic and New York: Schimmel and Co. From the Publishers.

Lehrbuch der Chemie für Pharmaceuten. Mit Besonderer Berücksichtigung der Vorbereitung zum Gehilfen-Examen. Von Dr. Bernard Fischer. Fourth Edition. Pp. xiv. + 649. Price 15 marks. Stuttgart: Verlag von Ferdinand Enke. 1900. From the Publisher.

Extract from Heinrich Haensel's Quarterly Report on Essential Oils and Fruit Essences. Pp. 23. October, 1899. Manchester: William Poppelreuter, 54, Portland Street; London: 19, St. Dunstan's Hill, E.C. From the Publisher.

Year-Book of Pharmacy, 1899, with the Transactions of the British Pharmaceutical Conference at the Thirty-sixth Annual Meeting, held at Plymouth, July, 1899. Pp. xiv. + 517. London: J. and A. Churchill, 7, Great Marlborough Street. 1899. From the Publishers.

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Green's Botany, Vol. I. Quite new.—Phenacetin, Westminster College, Borough, S.E.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

Herbarium (Sale or Exchange) consisting of 174 specimens, arranged into 56 natural orders, correctly named. 2 guineas.—R. W. Tildesley, Parkgate, Rotherham.

What offers for Thompson's Gelatine Pill-coating Machine Pindar's Fig B. Pill Machine, with 2 rollers; 16 vols. "Pharmaceutical Journal," with index, 1 to 15?—Hasselby, St. Leonards.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

To Clear.—Iodoform Precip. 12/6 lb., Crystal 12/- lb.; Potass. Iodid., 2 lb. 19/-. 36 Tetlow's Swandown, 9/-; Gossamer, 12/-, assorted. Offers wanted for 24 Freeman's Chlorodyne.—Eastman, Forest Lane, Stratford.

Good Second-hand, Hand Painted Lantern Slides, to clear 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Formula suiting good toilet speciality purchased.—W. Lewis, 15, Shelden Street, London, W.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Old Druggists' Crockery-ware wanted. Blue and white Syrup Jars, Ointment Pots, Oil Vases, and other Pharmaceutical Antiquities.—John Austen, Pharmaceutical Chemist, Dore, near Sheffield.

A Complete Set, part-set, and odd volumes of the "Pharmaceutical Journal and Transactions," also vols. of "Chemical News," "Chem. Soc. Journal," "The Analyst."—Address offers, "Gentian," "Pharm. Journal" Office, 5, Serle Street, London, W.C.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for.

Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C.

Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London, W.C.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Allen, Ball, Barker, Bell, Bennett, Burroughs, Butcher, Corfe, Cowap, Cowley, Cracknell, Dudderidge, Flint, Gardner, Gerrish, Gifford, Hamerton, Hasselby, Hebb, Hindle, Holt, Huntley, Johnson, Keltie, Kirkby, Kraemer, Lawson, Lescher, McCarthy, Marsden, Marshall, Michie, Middleton, Mitchell, Oliver, Pagan, Pegg, Pollitt, Poppelreuter, Sargeant, Seabury, Smith, Spurge, Tunnicliff, Turner, Twinberrow, Volans, Waterhouse, Weddell, Wellcome, White, Wilson, Wolstenholme, and Wright.

ENGLISH NEWS.

A Correspondent sends an interesting cutting from the *Peterborough Advertiser* to the effect that the borough engineer of Peterborough, failing to discover the address of Professor Wanklyn, had asked and obtained permission to retain Professor Sir *(sic)* John Attfield for the purpose of making an analysis of the town water supply. We were unaware that Dr. Attfield had received the honour of knighthood, though his services may have made such a distinction not undeserved; but perhaps our friends in the cathedral city may be in possession of information on this point, which has been withheld from some of the more intimate acquaintances of Dr. Attfield.

Royal Institution.—The annual course of Christmas lectures, specially adapted for young people, at the Royal Institution, will this year be delivered by Mr. Charles Vernon Boys, F.R.S. The subject will be "Fluids in Motion and at Rest." The lectures (which will be six in number) will commence on Thursday, December 28, at three o'clock. The remaining lectures will be delivered on December 30, and on January 2, 4, 6 and 9, 1900.

Midland Chemists' Assistants' Association.—This Association held a smoking concert in the Exchange Rooms on Wednesday evening last. Mr. J. Wakefield made an ideal Chairman, and the proceedings went merrily from beginning to end. There was a large number present, in spite of the unpropitious state of the weather, and a capital programme was provided. A collection in aid of the *Birmingham Daily Mail* Reservist Fund produced £1 7s. Messrs. Childs, Myer (sen.), Myer (jun.), Spear, Foster, Holland, and Taylor contributed songs, and Mr. Hebditch gave two recitations.

Students Visit the London Docks.—On Wednesday, November 8, the students of the Imperial College of Chemistry visited the London Docks, under the direction of their principal, Mr. Frederick Davis. The ivory floor was first visited, where many tusks were seen, some being valued individually at ninety pounds sterling. On the spice floors the students had facilities for examining every variety of cinnamon and cassia barks, cloves, mace, nutmegs, ginger, etc.; whilst the "bark floor" yielded good examples of every variety of cinchonas, including hybridised South American and Indian barks. In the essential oil department fine samples of rose, cinnamon, cassia pimento, santal, wintergreen, and other oils were inspected. On the iodine floors kegs of iodine, each bearing a distinctive mark and number, and valued at about eighty pounds sterling per keg, were seen stored in almost incredible numbers. Lastly the mercury vaults were visited, the quicksilver contained therein being the property of the Rothschilds, each bottle being valued at about twelve pounds sterling, the number varying between twenty and thirty thousands.

Plymouth Chemists' Association.—At the dinner of this Association last week, Mr. J. Davy Turney, Ph.C., recited Rudyard Kipling's poem, "The Absent Minded Beggar," after which the sum of £2 12s. 10d. was collected on behalf of the "*Daily Mail* South African Relief Fund." Songs, recitations, etc., were given by Messrs. H. J. Bailey, J. Balhatchet, J. Kinton Bond, J. Perry, and J. D. Turney Marshall.

Sheffield College of Pharmacy.—On Tuesday, October 14, the students of this College, accompanied by the principal, had a whole day botanising, the first place visited being the Sheffield Botanical Gardens, now under the control of the town trustees. The houses of Mr. Keeling, of Brownhill, received attention, followed by a visit to the conservatories at Encliffe Hall. The variety of specimens seen was instructive, among which were *vallisneua spiralis*, *trichomanes radicans*, species of carmichaelia from N.Z., Penang palm, sawaccma vanola tree ferns, Bambusa nigra, etc. Afterwards, botanical ramble was continued through Fulwood, Ringinglowe, and Eccleshall, returning at 4 p.m. after a most enjoyable day.

Valentine's Extract.—On Tuesday last, Mr. Justice Stirling, in the Chancery Division of the High Court, delivered his reserved judgment in the action brought by the Valentine Meat Juice Company, to restrain Valentine's Extract Company, Limited, from carrying on the business of manufacturers or vendors of any preparation or extract of meat, or meat juice, under any name or title of which the the word Valentine formed part. He said the plaintiff's business was started in 1871 by Mr. Valentine, who discovered a mode of making a preparation of meat juice, and on his death in 1892, the business passed into the hands of the plaintiff company, who carried on business in America. The meat juice, which was sold chiefly by chemists, was a liquid, and had always been sold in small bottles of one size and of a distinctive shape, bearing a triangular label with a trade mark. Until 1898 there was no other preparation of meat on the market connected with the name of Valentine. Towards the close of 1895 Mr. C. R. Valentine conceived the idea of putting up solid extract of meat in the form of globules, and the invention, having been patented, was sold to the defendant company. Since the commencement of the action these globules had been sold under the name of "Valtine," and it was stated that the defendants did not intend in future to use the word "Valentine." It was not unimportant to observe that the goods sold by plaintiffs and defendants were of a different nature; the plaintiffs' was a liquid and the defendants' solid; and he found, as a fact, that there was no substantial competition between the two articles. Both were prepared from meat, but they differed at least as much as one malt liquor did from another. Mr. C. R. Valentine, if honestly carrying on the business of selling meat globules in his own name, and on his own account, could not be restrained from using his own name in connection with the business; but then arose the question: Had he done something more than use his own name in such a way as to render him liable to be restrained? It appeared that in support of the application to register 'Valtine' as a trade mark Mr. C. R. Valentine had signed a declaration which contained more than one material statement which was untrue, and the only explanation given was that this statement was prepared by the patent agent and signed by Mr. Valentine without reading it. After referring to the evidence given at the trial, his Lordship said that though the case had many features of suspicion about it, he had come to the conclusion that want of good faith on the part of Mr. C. R. Valentine had not been established, and consequently the action failed and must be dismissed, but without costs.

Newcastle-on-Tyne and District Chemists' Association.—The usual monthly meeting was held on Wednesday evening, November 8, at the Hotel Metropole, Newcastle-on-Tyne, Mr. C. Ridley, the President, in the chair. An animated discussion took place on "The Question of Chemists' Titles," which was introduced by Mr. T. M. Clague, and taken part in by the President, and Messrs. Wright, Buckley, Merson, Kerse, Ellis, Whitehead, and the Secretary. The following resolution was unanimously adopted on the motion of Mr. Clague, seconded by Mr. Wright, "That this meeting expresses its conviction, that in the interests of the public, and of pharmacy, personal qualification of the responsible owner, or owners, and all persons having control of the business, is imperative. This meeting also expresses its opinion that bonâ fide pharmacists will be able to conform to the principle above laid down, without disadvantage to themselves, in such portions of their business as fall under the designation of 'Shops kept open for the retailing and compounding of medicines.'"—The next meeting will take place on Wednesday evening, December 6, when Mr. R. Buckley, North Shields, will open a discussion on "The Extension of Part II. of the Poison Schedule."

British Pharmaceutical Conference.—A meeting of the Executive Committee was held at 16, Bloomsbury Square, on Wednesday, November 8. Present: Mr. E. M. Holmes (President), in the chair, Messrs. Atkins, Bird, Peck, and White; Messrs. Warren and Cracknell (Hon. Local Secretaries), Messrs. Naylor and Ransom (Hon. General Secretaries), and Mr. Nightingale (Assistant Secretary). Letters were read from Professor Greenish and Messrs. Martin, Payne, Collier, and Turney, regretting their inability to be present. The minutes of the previous meeting were read and confirmed. On the motion of Mr. Atkins, seconded by Mr. Martindale, a resolution was passed expressing the loss that the Conference had sustained by the death of Mr. T. Greenish, and instructing the Secretary on behalf of the Executive to forward a letter of condolence to the family. On the motion of Mr. Hills, seconded by Mr. Martindale, a resolution was passed instructing the Secretary to send a similar letter to the family of the late Herr Dr. Anton von Waldcheim, formerly an honorary member of the Conference. The following members were appointed as a Sub-Committee to revise the Blue List:—The President, the Treasurer, Professor

Greenish and Messrs, Bird. White and Ransom. It was decided that the list, when revised, should be offered to the journals for publication, instead of being sent by post to each member individually. On the proposition of the Treasurer, seconded by Mr. Naylor, Mr. Siebold, F.I.C., F.C.S. was reappointed editor of the 'Year Book of Pharmacy.' Eight gentlemen, having been duly nominated, were elected to membership.

FOOTBALL.—The first Cup fixture of the Metropolitan College of Pharmacy F.C. in connection with the Inter-Pharmacy League was played against the "Pharmaceuticals" at Wormholt Farm, Shepherd's Bush, on Saturday, November 11. The game during the first part was mostly in the "Metros" half, and a number of shots were put in, but at half-time neither side had scored. After the usual interval the "Metros" with a sharp run, scored a goal, which was shortly after equalised by the "Pharmaceuticals." The game continued fairly even, both sides pressing hard at times. Finally the "Metros" secured two more goals, leaving them the winners by three goals to one.

SCOTTISH NEWS.

GLASGOW CHEMISTS' AND DRUGGISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—At a meeting of this Association on Friday, November 10, the PRESIDENT (Mr. J. P. Gilmour) occupied the chair, and Mr. T. Maben delivered a communication entitled, "A Bottle of Soda-Water." Mr. MABEN gave an interesting description of the various machines for the manufacture of aerated waters, and spoke of the great strides made in the manufacture of these waters during the past twenty years, but pointed out that all machines were practically the same in principle as those originally used. The greatly-increased consumption had necessitated the erection of large factories till now there was practically very little room left for the individual chemist to go into the manufacture. He explained how, at the price waters were now sold, it was difficult to run a small manufactory at a profit, but gave some valuable hints to those of his hearers who might get a connection with such a place, how to work it to the best advantage. At the conclusion of his lecture, Mr. Maben showed the various styles of bottles in use, and was awarded a hearty vote of thanks. Mr. Maben also referred to the address delivered by the President of the Association at a recent meeting (see *ante*, p. 461), and to the company pharmacy problem. In the latter connection he said that he hoped the effort to secure their title for themselves would soon be realised, though even then they would not be able to regulate the companies in the way they would like, much less to suppress them. It was a poor look out for them if after all their years of hardwork, trouble, and expense to call themselves chemists and druggists, they found the legal right to the name was only a fiction. He differed from Mr. Gilmour with regard to the effect the spread of secondary education would have on the future apprentice. Many of the young men who could be kept by their parents at school till they were of an age to pass the examinations were not going to remain behind the counter. They would go on to the University, so that for a long time to come they would not be troubled with too many apprentices.

IRISH NEWS.

CHEMISTS' AND DRUGGISTS' SOCIETY OF IRELAND (NORTHERN BRANCH).—A meeting of the committee of the above Society was held on Monday last in Belfast, Mr. Wm. Jamison, who was recently elected on the Council of the Pharmaceutical Society to represent the druggists, presiding. After some routine business had been transacted, the Chairman, in adverting to his recent election, urged those present to qualify for further representation. He stated that from personal observations at a recent meeting of the Council which he attended, he was perfectly satisfied that their representative would receive a most friendly welcome. He was received in a kindly manner, and nothing transpired to indicate anything but feelings of good will towards the druggists. He maintained that some recent prosecutions for infringement of the Pharmacy Act were with the object of conserving the interests of the licentiates of the Society and its members, and were taken against parties who were not qualified to fill prescriptions, they were therefore acting illegally. He did not believe that the Society would harass anyone. He hoped the druggists would endeavour by qualifying to secure full representation. Mr. Rankin supported the chairman, and said that the Council, he believed, entertained the most cordial feelings towards them. The committee afterwards adjourned.

PHARMACY ACT PROSECUTION.—At Athlone Petty Sessions on Tuesday last, 14th inst., before Captain Preston, R.M., and Mr. William Smith, J.P., a prosecution in which a good deal of interest was centred came on for hearing. Mr. William Doyle (of Messrs. W. Doyle and Co., druggists, etc., Athlone) was charged by Sergeant Connolly, local Inspector of Weights and Measures, on no fewer than six summonses, for breaches of the Pharmacy Act of 1875. The charges related to keeping open a shop which defendant did not manage and conduct for the sale of poisons without employing a qualified assistant or manager, for having in the shop an assistant or manager not qualified, not being a chemist and druggist, for selling arsenic without having made the purchaser sign the necessary entries; and the assistant was summoned for retailing and dispensing poisons—to wit, arsenic—to one George Campbell, contrary to the Pharmacy Act of 1875, not being a person properly qualified in that behalf. The offences occurred on the 11th and 13th September, and the case was adjourned for the last Court day.—The Police Sergeant said from a complaint or information made to him he visited the premises of Mr. Doyle and asked to be allowed to see the Sale of Poison Book, which it was necessary to keep. It was brought to him by the assistant, and he saw two entries made on September 11 and 13. They were not complete, inasmuch as they did not contain the signature of the purchaser or the introducer, if the purchaser had one. The assistant admitted he made the sale in the absence of Mr. Doyle. Mr. Doyle committed an offence by keeping his shop open and not personally managing or conducting the business, and by having a person managing who was not qualified; and he committed an offence by selling arsenic without complying with the regulations under the Act.—Mr. Gaynor, who appeared for the defendants, said it was the first prosecution of the kind brought in Athlone. Mr. Doyle conducted his business in a way that reflected credit on him. He had not the remotest idea he was guilty of a breach of the Pharmacy Act, but they admitted all the offences, and what he asked the Court to do was, if they pleaded guilty to one of them, the Court would ask the prosecution to withdraw the remainder. They were sorry for what they had done.—Sergeant Connolly said when issuing the summonses he got no instructions to insist upon convictions in each case, and he left it with the magistrates to direct him.—Captain Preston said they would accept a conviction in one case. It was the first prosecution brought in Athlone, and they were very merciful in proceeding on one of the sections which did not provide a heavy penalty. Fines to the amount of £75 could be imposed. They would impose a penalty of 20s., and 10s. costs.

TRADE NOTES.

MESSRS. RAIMES AND CO., wholesale druggists and manufacturing chemists, Micklegate House, York, announce that they have purchased the goodwill, stock-in-trade, plant, book debts, etc., of the firm of Messrs. Slinger and Son, York, which firm is reputed to have been one of the oldest, if not the oldest, in the kingdom, having a continued existence of over 200 years. Messrs. Raimes and Co., have secured, together with many valuable recipes, all the proprietary rights in the original "Slinger's Nutrient Suppositories," which they will continue to supply in their original form and integrity.

UMNEY'S CASCARA CHOCOLETTES.—Messrs. Wright, Layman and Umney, 48 and 50, Southwark Street, submit specimens of their Cascara Chocolettes, tablets of cascara extract, coated with chocolate. The tablets are made in two sizes, viz., two grains and four grains, have an elegant appearance, and are put up in metal screw-capped bottles. They possess many advantages over sugar coated tablets, being practically equally soluble, very pleasant to the taste, and the coating can be made so much thinner than is the case with sugar, that a four grain tablet coated with chocolate is no larger than the two grain tablet coated with sugar.

FOOD AND DRUGS ACT PROSECUTIONS.

Milk of Sulphur.—Harry Smurthwaite, grocer, Grove Street, Retford, on entering the business, took over the stock-in-trade of the previous occupier. This included some milk of sulphur, part of which was subsequently purchased by Inspector Crabtree, who had it analysed, and as a result, Mr. Smurthwaite was recently summoned at the local police-court for having sold milk of sulphur not of the nature and substance demanded. The manufacturers of the article, however, admitted responsibility, and on defendant undertaking to pay the costs of the case and to destroy the remnant of the article, the case was withdrawn.

Camphorated Oil.—Messrs. John Walton and Co., Limited, grocers, Marden, Bradley and Mere, Wilts, were charged at Warminster Petty Sessions on Thursday, November 2, with having sold camphorated oil containing 8 per cent. of camphor only. For the defence it was admitted that the article was sold as supplied by the maker, but it was contended that inasmuch as camphorated oil was a compounded drug, the summons had been issued under the wrong section, viz., Section 6.—The Bench upheld this view and dismissed the summons, but on the application of the prosecution, decided to state a case.

Spirit of Nitre.—At Wolverhampton Police-court, on Wednesday, November 8, Cornelius Charles Burnett, chemist and druggist, of 122½, Horseley Fields, Wolverhampton, was summoned for selling, on September 29, sweet spirit of nitre that was 30 per cent. deficient. There was a second summons for a similar offence committed on October 3, the drug then being 22 per cent. deficient.—Mr. R. A. Willcock, for the defence, pleaded carelessness, and contended that there was no intention to defraud. He admitted the facts.—On the first charge, defendant was fined 10s. and costs, and in the second case the summons was withdrawn on payment of costs.——At the same court, Thomas Pilbrow, described as a chemist, of 65, Bilston Road, Wolverhampton, was summoned for selling sweet nitre 60 per cent. deficient, and with selling paregoric not of the nature and substance demanded, inasmuch as it did not contain opium, one of the most important constituents.—[The name Thomas Pilbrow does not appear on the Register of Chemists and Druggists for 1899.—Ed. *P.J.*]—Inspector G. F. Allwood gave evidence as to the purchase and analysis of the articles in question, and said that in these cases an attempt had been made to sell articles which were not genuine.—Mr. E. W. T. Jones (public analyst), stated that in his opinion the sweet nitre had never been up to the proper standard. In the paregoric there was an entire absence of the tincture of opium.—Defendant admitted both charges, and said that he was not a qualified chemist.—The Stipendiary said that the case was the most fraudulent he had ever had before him, and there was no protection for the defendant in the label on the bottles. He would be fined £20 and 7s. 6d. costs in each case.—Defendant said he could not pay, and according to reports in the local newspapers, he was committed to prison for four months. Great surprise has been expressed in the neighbourhood at the sentence imposed, and it is stated that a petition is in circulation for presentation to the Home Secretary, asking for a remission of the sentence. Five hundred signatures are said to have been attached to the petition, including those of Sir Alfred Hickman, M.P., Mr. R. C. E. Plumptre, Councillors Gough-Allen, G. R. Thorne, E. White, Bull, Shepherd, F. Evans, Stevenson, Parkyn, Wilson, Steward, Hodgson, and Gibson, Dr. Scott, and others. Sir A. Hickman is reported to have consented to present the memorial to the Home Secretary.

PHOTOGRAPHIC NOTES.

Formulæ for Developers.—Most photographers who work on scientific lines will agree with the opinion expressed by one of the speakers at a recent meeting of the London and Provincial Photographic Association that, in introducing new developing agents, the makers seem to go out of their way to make the formulæ as complicated as possible. The speaker added that he had adopted ortol for his general negative work, instead of pyro, but in order to learn how to modify the ingredients of the developer so as to produce the class of negative he required, he had, first, to make an arithmetical calculation from the formula given of the quantity of the constituents to a definite amount of water that would make a negative of some kind or other, and then to rearrange the stock solutions, so that a developer containing the active principles in any proportion required might be mixed without entailing more than the simplest of calculations. He advocated the general use of 10 per cent. solutions. One would have thought in these advanced days of chemical science and commercial competition that when something new is introduced which is intended to fight its way into general use, for the credit of the chemist whose laborious experiments have brought it within our reach, and for the sake of the pockets of those who hope to repay themselves for the expense incurred and profit by their enterprise, something more than the inexact and often misleading general statements and the crude directions for its use, which are the usual accompaniment of a new developing agent, would be given. During the past few years there have been several, perhaps a dozen, of these new developers that have come under our notice, but in no case do we remember that the directions for use contained any information, or which was accompanied by a formula which would obviate the necessity for some method of procedure for the purposes of investigation, such as that referred to by the member of the London and Provincial whose remarks we have quoted. While we are on the subject of developing formulæ, we may refer to those given by plate makers. In the 'British Journal of Photography Almanac' may be found collected the formulæ for development of all the best-known brands of plates. In studying these one's impression is that a marvellous amount of ingenuity has been exercised by each maker to compound his stock solutions in a different way from anyone else. To take the pyro solution, a few, very few, adopt a 10 per cent. solution, but in the majority of cases the water to 1 oz. pyro is some odd amount—for instance, 1 oz. to 7 oz. 3 dr., 1 oz. to 7½ oz., 1 oz. to 16 oz., 1 oz. to 5½ oz., 1 oz. to 9 oz., 1 oz. to 20 oz. Sometimes even the same maker has quite different stock pyro solutions for soda and for ammonia; for instance, for ammonia pyro 1 oz. to 7 oz. 3 dr. of water; for soda pyro 1 oz. water to make 10 oz. Examples of this kind could be given almost *ad infinitum*. This want of system affects the dealer adversely in many ways. If standard solutions were generally used there is no doubt it would be the custom to buy solutions ready prepared. The photographer of to-day will do nothing for himself that he can avoid. Probably many of the extraordinary failures that beginners experience in development would not occur, or, at any rate, might be more easily explained if an account could be given of how the developer used was proportioned. Everyone who has been behind a dealer's counter has had experience of the failures the dealer is expected to account for because he happened to sell the plate. The question naturally is put: What developer did you use? When the reply is: I made it up according to the directions on the box and mixed two parts of A to one of B, or something of that kind, the thing is in a hopeless tangle at once.

Intensification of Platinotypes.—Workers in this branch of photography are often troubled by want of density in the picture, this being caused mostly by bad lighting, but also by moisture. To intensify such a picture it is treated with a solution of the following formula:—Sodium formate (10 per cent. solution), 50; platinum chloride (2 per cent. solution), 50; water, 50. The intensification proceeds slowly, and is easily controlled.—*Amat. Photograph.*, **13**, 151.

"Adurol," a New Photographic Developer.—The new developer "Adurol" is the chloro- or bromo-substitution product of the well-known and much used hydroquinone. The remarkable properties of these bodies for the development of plates has been discovered simultaneously by Hauff and Co. and Schering, who retain the manufacture in their hands, patents having been applied for in all countries. The former firm supply the chloro-substitution product, the latter, bromo-hydroquinone. Both are practically identical in their working. The chloro-substitution product is a white crystalline powder, much more easily soluble in water than hydroquinone. The following formulæ are recommended for its use:—(1) *Potash developer:* (A) Adurol, 25; sodium sulphite, 200; water, 1,500; (B) caustic potash, 100; potassium bromide, 2; water, 1,000. (2) (A) *Soda developer:* (A) Adurol, 25; sodium sulphite, 200; water, 1,500; (B) sodium carbonate, 250; potassium bromide, 2·5; water, 1,000. In the case of clear plates, the potassium bromide

may be omitted. For studio work take 30 pts. A, 20 pts. B; for landscape work, 30 A, 20 B; and for instantaneous work the same proportions, with the addition of 20 parts of water. The following concentrated developer in one solution may be employed:—Adurol, 25; sodium sulphite, 200; caustic potash, 100; potassium bromide, 2; water, 300. Take of this, for studio work, 10 parts; water, 50 parts; and for landscape and instantaneous work, 10 parts of the developer, and water 75. The picture normally appears in about 20 seconds, and is completely developed in four or five minutes. For under-exposure more of the developer should be used, and for over-exposure more potassium bromide is to be added to the fresh developer. The picture can also be forced by adding more potash solution. For developing bromide tints take A, 30; B, 20; water, 50; or concentrated developer, 10; water, 120. The potassium bromide should be used in this developer.—*Amat. Photograph.*, **13**, 151.

Publications Received.

THE DISPENSATORY OF THE UNITED STATES OF AMERICA. By Dr. GEO. B. WOOD and Dr. FRANKLIN BACHE. Eighteenth edition (illustrated), thoroughly revised and largely rewritten, by H. C. Wood, M.D., LL.D., Joseph P. Remington, Ph.M., F.C.S., and Samuel P. Sadtler, Ph.D., F.C.S. Pp. xlv. + 1999, price 36s. Philadelphia: J. B. Lippincott Company. London: 36, Southampton Street, Covent Garden. 1899. From the Publishers.

MATERIA MEDICA LABELS. Adapted for public and private collections. Compiled from the British Pharmacopœia of 1898 and other sources. Labels, nearly 500 on gummed paper. Price 12s. 6d. net, post free. London: H. K. Lewis, 136, Gower Street, W.C. 1899. From the Publisher.

A MANUAL OF SURGERY. By CHARLES STONHAM, F.R.C.S. (Eng.), in three volumes. Vol. I.—General Surgery, pp. xiii. + 343. Vol. II.—Injuries, pp. xv. + 383. Price, 7s. 6d. each. London: Macmillan and Co., Limited. 1899. From the Publishers.

ORGANIC CHEMISTRY APPENDIX. By W. H. PERKIN, Jun., Ph.D. F.R.S., and F. STANLEY KIPPING, Ph.D., D.Sc. (Lond), F.R.S Pp. 543 to 618. Price 1s. London and Edinburgh, W. and R. Chambers, Limited. 1900. From the Publishers.

Deaths.

Crompton.—On November 3, William Crompton, Chemist and Druggist, Bury. Aged 65.

Hobson.—On November 9, Charles Hobson, jun., Chemist and Druggist, Beverley, Yorks. Aged (about) 40. Mr. Hobson was the son of Charles Hobson, Chemist and Druggist, a former Mayor of Beverley.

Towerzey.—On November 10, Alexander Towerzey, Pharmaceutical Chemist, Clifton. Aged 56.

Hodsoll.—On November 11, Thomas Henry Hodsoll, Chemist and Druggist, Shepherdess Walk, London, N. Aged 72,

Evans.—On November 9, John Evans, Chemist and Druggist, Dowlais. Aged 68. Mr. Evans, who was a member of the Pharmaceutical Society for many years, was one of the best known and most widely respected tradesmen in Dowlais, having been in business there for over forty years.

LIVER EXTRACT FOR DIABETES.—Roques thus prepares extract of liver for the treatment of diabetes by the method of Gilbert and Carnot, which, in certain cases, has given very good results. Fresh ox liver, after washing with sterilised water, is cut into small pieces, with aseptic precautions, and macerated for twenty-four hours in an equal weight of glycerin. The mixture is then filtered through sterilised paper, and 0·7 per cent. sodium chloride solution is added equal to half the weight of glycerin used. The brownish or rose-coloured solution thus obtained is put up in sterilised bottles. It is given by a rectal injection in doses of 60 Gm., after first washing out the bowel with an injection of tepid water. The temperature of the liver extract should be adjusted for each patient by warming on the water bath, so as to ensure its retention:—*L'Union Pharm.*, **40**, 445.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Alderman Allwood Simpson, J.P., M.P.S., has been elected Mayor of Stalybridge. The requisition asking him to accept the office was unanimously signed by members of the Town Council, and was cordially and generally approved by the townspeople. He is a Conservative in politics, but recognition of his abilities is not confined to his own party, for in 1895 he was appointed a borough justice by the Liberal Government. Mr. Simpson was elected to the Town Council in 1886, and became an Alderman in 1893. He was born at Chelmorton, near Buxton, in 1849, and at the age of fourteen years went to Stalybridge as a chemist's apprentice in a business where he speedily rose to be manager, partner, and finally proprietor. He and his brother, Councillor Simpson, also own an extensive drapery business in the town.

Alderman John Horsley, J.P., M.P.S., has been elected Mayor of Hartlepool for the seventh time. He is a Unionist in politics and joined the Town Council in 1870. He was first appointed Mayor in 1881, holding the office until 1885. In May, 1898, on the death of the late Mayor, he was again elected, and was re-elected in November of the same year. He is a native of Hartlepool, and son of the late Mr. Matthew Horsley, shipowner. In addition to being an Alderman of the Town Council, he is an Alderman of the Durham County Council, and holds various other important public appointments, being Chairman of the Hartlepool Pilotage Commissioners, a member of the Board of Guardians, and of the North-Eastern Sea Fisheries Board, and the Tees Salmon Fishery Board.

Mr. William Albert Wren, chemist and druggist, who has been elected Mayor of Taunton, has for several years been one of the most active members of the Corporation, and has for some time acted as Chairman of the Sanitary and Hospital Committees. He is a Conservative in politics.

Partnerships Dissolved.

(From the London Gazette.)

Robert Wilfred Donoghue, Charles Boothby, and George Boothby, Analytical and Manufacturing Chemists, Church Wharf, 10, Church Row, Limehouse, London, E., trading under the style of The British Boiler Fluid and Engineers' Stores Company. Debts will be received and paid by Robert W. Donoghue and Charles Boothby, who will continue to carry on the business.

George Herbert Lewis and Charles Lovell Smith, Mineral Water Manufacturers, South Quay, Worcester.

John Thomas Browne-Mason and Thomas Arthur Goard, Dental Surgeons, 6, Southernhay, Exeter.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

William Henry Frederick Bowman, Photographer and Electrical engineer, lately carrying on business at Heaton Street, now of 3, Foster Street, Gainsborough, Lincolnshire.

Frederick Wormald, Veterinary Surgeon, 20, Liverpool Road, Birkdale, Lancaster.

Dr. Victor Jagielski, 14, Dorset Square, lately residing at 54, York Terrace, London.

CITROPHENE.—Benario reports favourably (*Wiener Med. Press*) on the antithermic action of citrophene in cases of typhoid and influenza. Puiggera has also found the remedy of use in the fever of phthisis. It is given in doses of half to one gramme, and is not followed by any unpleasant after symptoms.—*Nouv. Rem.*, **15**, 421.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

Thursday, November 16.

Business has been fairly active during past week, there being also various changes in value in an upward direction to record. Acid Carbolic is much dearer, partly no doubt owing to demand for the manufacture of Picric Acid, which is said to be the principal component part of the destructive explosive, known under the name of Lyddite. Quinine is also somewhat better. Camphor is again tending upwards, and the same may be said of Quicksilver, and, as a consequence, also of mercurials. Higher prices are asked for best brands of Cod Liver Oil. Thymol is said to be likely to further advance in value, while Sulphate of Ammonia is also dearer. Acid Citric continues dull and weak. Acid Tartaric and Cream of Tartar quiet. Ipecacuanha in better demand and rather higher, especially for the Carthagena variety. Bromides are very firm. Iodides steady. Opium quiet. Morphine fairly steady. Codeine firm. Phenacetine expected to advance. Glycerin quiet. The following are the prices actually ruling for some articles of principal interest:—

ACETANILIDE—Continues dull and weak at 9¼d. to 11d. per lb., according to quantity and make.

ACID BORACIC.—Unchanged at 25s. per cwt for crystals, and 27s. for powder.

ACID CARBOLIC —Very firm at higher prices, the prices being 8½d. for 35° to 36° C. ice crystal in large bulk; 9½d. for 39° to 40° C. and 10½d. for 39° to 40° C. detached crystals, B.P. quality. Crude, 60° F., 2s. 9d. per gallon; 75° F., 3s. 6d. per gallon. Liquid, 95 to 98 per cent. of pale straw-colour, 1s. 3d. per gallon in 40-gallon casks; ditto 30 per cent. of dark colour, 11d. to 1s. per gallon.

ACID CITRIC—Quiet and dull at 1s. 3½d. to 1s. 4d. per lb. for crystals in 5-cwt. casks.

ACID OXALIC—Is still quoted 3d. to 3¼d. per lb. nett delivered free London.

ACID TARTARIC.—Unchanged at 1s. 1d. per lb. for English on the spot, and 1s. to 1s. 0¼d. c.i.f. for foreign.

ALOES.—Cape more in demand, but the extreme prices asked for the small supply available has tended to check business.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, 3d. to 4d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 32s. 6d. to 35s. per cwt.; ditto, commercial, 28s. per cwt. Sal ammoniac: Firsts, 40s. per cwt.; Seconds, 38s.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate dearer. Gray, prompt, 24 per cent., London, £10 12s. 6d. to £10 15s.; Hull, £10 12s. 6d. to £10 15s.; Leith, prompt, £10 12s. 6d. to £10 15s.; Beckton, prompt, £10 10s.; January-March, £10 17s. 6d.; Beckton, terms prompt, £10 8s. 9d. to £10 10s. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus is still quoted £40 per ton and Crude Japan (Black Sulphide) £23 10s. to £24 per ton.

ASAFETIDA.—Some 90 cases Persian Gulf Gum of good quality, but wet with sea water, will be offered next week. The market is very quiet.

ASHES.—Pots, 25s. Pearls, 32s.

ATROPINE firm, the scarcity and dearness of Belladonna root pointing to the improbability of any alteration in price, unless it be in an upward direction. Makers' present prices are 15s. 6d. per oz. for the sulphate B.P. and 17s. 10d. per oz. for the pure alkaloid.

BELLADONNA ROOT.—Really good root is very scarce. Price is nominally 42s. 6d. to 45s. per cwt., but it is practically impossible to obtain offers.

BISMUTH—Is unchanged both for the metal and the salts.

BLEACHING POWDER (CHLORIDE OF LIME).—English still quoted £6 10s. per ton.

BORAX—Is still quoted 16s. per cwt. for crystals, and 16s. 9d. for powder.

BROMIDES—Are in good demand at firm prices, which are, however, unchanged at 1s. 10½d. per lb. for Potassii Bromid., the other sales being quoted in proportion.

CAMPHOR.—The market for Crude continues firm, and prices are again higher, but, with few sellers, little business has been done. On the spot Japan sold at 170s., China rather buyers at 162s. 6d. For arrival buyers of Japan at 165s., and China at 160s. c.f. and i. Refined is very firm at the lately advanced price of 2s. per lb. for English Bells and Flowers in ton lots, and everything would appear to point to a probable further advance in price in the near future.

CASCARA SAGRADA.—New Bark is quoted 26s. to 27s. 6d. per cwt.; while for Old Bark 30s. to 32s. 6d. per cwt. is asked.

CHAMOMILES.—Good Belgian are quoted 75s. to 80s. per cwt.

CINCHONA BARK.—The supplies at auction were larger than for some time past, amounting to 4,063 packages of all descriptions, as against 975 packages at the previous sale. Fully two-thirds of the offerings were East Indian descriptions, chiefly Crown Bark, including 406 bales from the Neilgherry districts. An active demand prevailed at the opening, but became quieter towards the close, about three-fourths finding buyers, the remainder being bought in above values. Higher prices were paid, the average advance established on the last Dutch sales being about 10 per cent., the unit averaging 1 5/16d. to 1⅜d., against 1⅛d. at the last London auctions, and 1¼d. at the sales in Holland. Ceylon: 410 bales offered and 352 bales sold, according to analysis. Succirubra, natural stem chips, ordinary to good, at 2½d. to 4⅞d.; fair shavings at 3¼d.; branch, 2½d.; root, 3½d. to 3¾d.; fair red quill, 4⅛d. Officinalis, natural stem chips, fair to good at 3¾d. to 5½d. East Indian: 2,738 bales and 4 cases offered, and 2,067 packages sold. Red, natural stem chips and shavings, ordinary to fair, at 2¾d. to 3¾d.; root, 3¼d. to 3⅝d.; quill, 2½d. to 4d.; renewed chips and shavings, 3⅛d. to 4¾d. Officinalis, stem chips and shavings, ordinary to good, at 3d. to 6⅞d.; good root at 3⅞d. to 4½d.; renewed chips and shavings, ordinary to good rich, at 2⅛d. to 8⅜d.; broken quill and chips at 2d. to 7⅝d.; stem chips, 5⅛d. to 6d. Ledger natural stem chips, fair to good, at 3⅜d. to 6⅜d.; ditto, branch, at 3¼d., and root at 3⅞d.; hybrid, natural chips, at 2¾d.; renewed ditto, 2¼d. to 3¼d. Java: Of 370 bales 321 sold. Ledger stem chips at 3¾d. to 5¾d.; root at 4⅛d. to 4½d. South American: 373 bales Bolivian cultivated Calisaya offered, and 291 bales sold. Fair quill at 7¼d. to 8⅞d.; flat at 9⅜d. Of 76 packages soft Colombian 48 sold at 1¾d. to 2d. 64 bales Cuprea and 20 bales Carthagena bought in. The following dates have been fixed for the sales next year: January 16, February 20, March 13, April 10, May 15, June 19, July 17, August 14, September 11, October 9, November 13, and December 18.

CLOVES.—At auction 100 bales Zanzibar, fair, but rather stalky, sold at 3¼d., with a few bales at 3⅜d., being rather easier. Penang quiet: 35 bales were sold out of 53 bales offered, good bright, picked, fetching 8d., small dark 5⅝d. to 5¾d. Privately, Zanzibar have remained very quiet. Small sales comprise January-March delivery at 3 5/16d., and March-May also at 3 5/16d.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 1s. 3d. per gallon, pure 2s. Benzole: 50 per cent., 10½d. per gallon; 90 per cent., 10d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 6d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 6d. per gallon; 90 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 190 C., 1s. 3d. per gallon. Anthracene A, 4½d. per unit; B, 3d. per unit. Pitch, 34s. per ton f.o.b. Tar, refined and crude, 12s. 6d. per barrel, 2d. per gallon.

COCAINE.—Makers are firm at 20s. 7d. per oz. for the Hydrochlorate in 25-oz. tins, and for 200-oz. lots; while second hand offers at 19s. to 19s. 6d. per oz., according to brand and quality.

CODEINE—Is very firm at 12s. 11d. to 13s. 6d. per oz., according to quantity, for the Pure, and 1s. per oz. less for the Salts.

CREAM OF TARTAR—Quiet at 74s. per cwt. for First White Crystals on the spot, 76s. per cwt. for powder, and 77s. per cwt. for 95 per cent. ditto.

CUTCH—Remains quiet, with only small sales at previous rates.

GALLS.—The supplies of China on the spot are practically exhausted, and extreme prices are asked; for ordinary shape there are buyers at 62s. 6d.; Japan, for arrival, still quoted 56s., c.f. and i.

There has been a continued good demand for Persian, but the firmness of sellers restricts business, and only retail sales of Blues have occurred at full prices; Blue quoted 65s. to 67s. 6d., Green 57s. 6d. to 60s., and White 52s. 6d. to 53s. 6d.

GAMBIER—Remains very quiet, and for arrival no sales have occurred; Nov.-Jan. steamer quoted nominally 13s. 9d. On the spot whole bales quoted 13s. 9d.

GINGER.—At auction moderate supplies of Cochin were firmly held, and only a small portion sold at dearer rates for all kinds. Of 799 bags and 186 cases offered, 218 bags and 50 cases sold. Good bold cut and scraped fetched 80s. medium, with little bold cut and scraped 65s. 6d. medium, some small at 61s. to 61s. 6d., small and medium at 45s., medium and small little bold native cut, much limed at 46s. 6d. small and ends slightly mouldy at 28s. to 30s. washed, rough, small, and medium, but fairly plump, part shrivelled and wormy at 26s. Calicut medium and small plump bought in at 30s.

GLYCERIN.—Crude is somewhat quiet at nominally unchanged prices. Refined is also rather quiet, quotations being nominally about the same as those given last week.

GOLDEN SEAL ROOT—Is dearer, being now worth 2s. 8d. per lb. landed.

HYPOPHOSPHITES.—Makers still quote 3s. 3d. per lb. for the lime, soda, and potash salts.

IODIDES—Are steady at unchanged prices.

IPECACUANHA.—Rio is very firm at 14s. 3d. per lb., and prices are expected to advance, as nothing is arriving. Carthagena is dearer at 10s. 9d. per lb., good sales having been made this week at 10s. 3d. to 10s. 6d. per lb.

LITHIA SALTS—Are unchanged at 10s. 8d. to 11s. per lb., according to quantity, for the carbonate, and 6s. 9d. to 7s. 6d. per lb. for the citrate crystals and powder.

MENTHOL—Is firm at 8s. 6d. per lb. for good dry white Crystals in five-case lots (12×5lb. tins in a case).

MERCURIALS—Are very firm, in sympathy with Quicksilver. The makers, however, so far made no alteration in prices, which remain 3s. 1d. per lb. for Calomel and 2s. 9d. per lb. for Corrosive Sublimate.

MORPHINE—Quiet and nominally unchanged, makers' price being still 5s. per oz. for the Hydrochlorate Powder and 2d. per oz. more

OILS (ESSENTIAL).—These are generally quiet. Star Aniseed is barely steady at 6s. 3d. per lb., but for shipment importers quote high prices. Cassia is neglected, but prices are unchanged at 4s. to 4s. 3d. per lb as to quality. Citronelle quiet, 1s. per lb. Lemon-grass firm at 3¼d. to 3½d. per oz. Sassafras is inquired for; 1s. 10d. per lb. is nominal quotation. Peppermint H.G.H. firm at 5s. 6d. to 5s. 7½d. per lb.; Japan, dementholised, 3s. 9d. to 3s. 10½d. per lb.; 40 per cent., 5s. to 5s. 3d per lb.

OILS (FIXED) AND SPIRITS.—Linseed dull earlier but firmer later, the prices now being—On the spot, pipes, London, £22; barrels, £22 5s.; December, £22 5s.; Jan.-April, £22; May-Aug., £21; Hull, spot, naked, £21 5s.; Dec., £21 5s.; Jan.-April, £20 10s. Rape easier; ordinary brown, on spot, £22 10s.; Dec., £22 10s.; Jan.-April, £22 10s.; refined, spot, £24; Ravison, naked, spot, £20; Nov.-Dec., £20. Cotton dearer; London crude, spot, £16 7s. 6d. to £16 10s.; refined, spot, £18 to £19, according to make; Hull, naked, refined, spot, £16 10s.; crude, spot, £15 5s. Olive: Mogador, £34; Spanish, £35; Levant, £34 5s. Cocoanut quiet but steady, Ceylon, on the spot, £25 10s.; Cochin, spot, £29 10s. to £30; afloat, £27 5s., c.i.f.; Mauritius, on spot, £25 10s. to £26, in hogsheads. Palm dull; Lagos, on spot, quoted £26. Castor Oil quiet; Belgian, first pressing, spot, £27; Jan.-June, £25 10s., f.o.b.; Antwerp, second pressing, spot, £25 10s. per ton, ex-wharf; Hull manufactured, guaranteed cold drawn, pure pharmaceutical oil, £29 10s. per ton, in barrels; 3 9/16d. per lb., in cases; pure firsts, £27 per ton, in barrels; firsts, 3 3/16d. per lb., in cases, ex-wharf, London; seconds, 3⅛d., ex-wharf, London. Lubricating Oil: Pale American, spot, 7s. to 9s.; black, 6s. 3d. to 8s.; Russian black, 5s. 6d.; pale, 7s. to 8s. 6d. Petroleum Oil steady; Russian, spot, quoted 5 11/16d. to 5⅞d.; Dec.-March, 5 13/16d. to 6d.; American, spot, 7d. to 7⅛d.; water white, 8⅛d. to 8⅜d. Turpentine dearer; American, spot, 37s. 9d.; December, 37s. 10½d.; Jan.-April, 38s. 3d.; July-Dec., 32s. 3d. Petroleum Spirit: American, 9¾d.; deodorised, 10d.

OPIUM.—The market remains quiet, without change, and business in both "Druggists'" and "Soft Shipping" has been of a restricted character. Persian has met more inquiry, and sales of fair extent have been made at full rates, including fine quality at 12s. to 12s. 6d. per lb.

ORRIS ROOT—Remains firm. There are, however, offers of quite limited quantity at 53s. to 55s. per cwt. c.i.f. for good Florentine.

PARAFFIN WAX.—Crude is still quoted 2¾d. to 3d. per lb. Refined, 3¼d. to 4d.

PHENACETINE—Is steady at 3s. 6d. per lb. for both Crystals and Powder. Higher prices are expected.

POTASH COMPOUNDS.—Bicarbonate, 32s. 6d. to 35s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, spot London, crystals, 3d. per lb.; powder, 3⅛d. Iodide, 10s. 6d. per lb. Permanganate quoted 52s. 6d. to 62s. 6d. per cwt., according to make; large crystals 5s. per cwt. more. Prussiate yellow: Beckton make, 7d.; other English makes, 7½d. to 7¾d.; red, 1s. to 1s. 2d. per lb, according to quantity, etc.

QUICKSILVER—Is exceedingly firm. Rothschild refuses to sell this week, and is expected to advance his price on Monday. From second hand it might be possible still to buy a few bottles at £9 10s.

QUININE.—The market for best German brands opened quiet, but showed more firmness after the Bark sales, prices closing at an advance. Only a small business has been done, barely 25,000 oz. comprising B&S and or Brunswick December delivery, at 1s. 1⅞d. to 1s. 2⅛d., and March at 1s. 2⅜d. to 1s. 2½d., closing at the best. To-day sales have been made at 1s. 2¼d. to 1s. 2⅜d. per oz. for B & S and or Brunswick for December delivery.

ROSIN.—Strained is quoted on the spot 4s. 9d. per cwt. and 4s. 4½d. per cwt. for January-March and February-April shipment per sailing vessel.

SANTONINE—Is firm at 11s. 3d. per lb. in 2 cwt. lots from the makers, and 11s. per lb. from second-hand.

SCAMMONY.—Virgin: A new parcel of Firsts have arrived, but are not yet on the market. There is no demand for Seconds, for which quotations are 19s. to 22s. per lb. Nominal value of Firsts 30s. per lb. Roots: The market has been cleared except for a small lot, which is held for 22s. per cwt.

SENNA.—There has been a good demand this week for Tinnevelly from second hands, but very little is now to be had, and buyers await next week's auctions. The market for Alexandrian continues firm. Leaf has been sold at 9d. per lb., broken leaf at 6¾d. per lb., and siftings at 3¾d. per lb. Pods, fine, are held for 1s. per lb.

SHELLAC.—Demand on the spot is slow, and only limited sales have been effected at previous prices. The market for futures is also without alteration; for March delivery, Second Orange, basis fair average TN has been done at 66s. per cwt.

SODA COMPOUNDS.—Crystals: Barrels, quoted 60s., bags 57s. 6d. Ash, £5 15s. to £7 per ton, according to percentage, etc. Bicarbonate, landed, £7 5s. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic: 70 per cent., white, £10; 60 per cent., £1 less. Hyposulphite (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make, etc. Iodide, 11s. 10d. per lb. Nitrate, on the spot, refined, £8 2s. 6d.; ordinary, £7 17s. 6d.

SPICES (VARIOUS).—Black pepper: At auction 293 bags Singapore were firmly held, and all bought in; 125 bags good Tellicherry all bought in at 6d., and 43 bags fine heavy Penang at 6d. White pepper quiet. In auction 54 bags were bought in, fine at 11d. to 11½d.; 150 bags brown limed Penang also bought in at 8⅜d. Chillies firm and dearer. In auction 90 bags Japan sold, fair to good bright at 39s. to 41s. 6d. Capsicums: At auction 1 bale Natal bought in, good bright red at 105s. Cinnamon slow of sale, and of 256 packages in auction 20 bags sold, fair quillings at 5½d., broken quill at 4d. Pimento quiet, and of 143 bags offered 25 bags sold, ordinary to good fair 3⅛d. to 3⅜d. Mace dull of sale, but fine steady. Of 19 cases Penang offered, only 4 cases were sold. Good bold pale, part wormy, at 2s. 3d. to 2s. 4d. 23 cases Singapore were bought in. Nutmegs: A small supply of 20 cases Penang sold: 108's at 1s., being easier. 6 bags wild Singapore, in shell, sold, without reserve, at 1¼d. Cassia lignea: At auction, 168 cases, season 1895-96, were sold at 43s., this being cheaper.

SULPHATE OF COPPER—Quiet at £24 10s. to £25 10s. per ton

SULPHONAL—Appears to be still offering from quasi-second-hand at 14s. to 14s. 6d. per lb. for both Crystals and Powder, the two official makers maintaining their price of 17s. per lb.

TAR.—Stockholm, 25s. 6d. to 26s. Archangel, 18s. to 18s. 6d.

THYMOL—Remains very firm, with practically the certainty of higher prices ruling in the near future. Scarcely any of the makers are able to offer; from second hand, however, limited quantities are obtainable at 9s. 6d. to 10s. per lb., according to make and holder.

TURMERIC—Continues firm for all descriptions, but only a restricted business has been done at previous rates, including Bengal at 28s., Madras finger, good bright, at 37s. 6d., and fair Cochin split bulbs at 12s.

VALERIAN ROOT—Dearer, and as much as 35s. per cwt. is asked for good root on the spot.

Liverpool Market Report.

November 16, 1899.

The chief alterations in prices will be found among oils, which have been somewhat irregular. Potashes still continue scarce, and are higher in price since last week. Good sales of Carnauba Wax have been effected at full rates, and a little business has been done in first quality Chilian Honey, and also in Chilian Quillaya Bark. Chemicals are generally firm in price, with a scarcity in Caustic Soda, one large firm having been quite cleared out.

AMMONIA SALTS.—Carbonate is quiet but firm at 3¼d. to 3½d. per lb. Sal ammoniac steady at 38s. to 40s. per cwt. Sulphate is lifeless, £10 13s. 9d. per ton.

CANARY SEED.—Turkish seed is in slow demand at 36s. 6d. to 37s. per 464 lbs.

CARNAUBA WAX.—1 ton of ordinary yellow sold at 67s. 6d. per cwt., and 100 bags of grey at 43s. to 43s. 6d. per cwt. Holders now ask 45s.

COPPER SULPHATE—Is in better demand and a shade higher, £25 to £25 10s. per ton,

COPPERAS—Is very firm, 37s. 6d. per ton.

HONEY.—Pile X Chilian has been selling at 30s. per cwt.

LINSEED—Has dropped considerably in price for arrivals and spot lots. Calcutta is not offering, but River Plate is to be had at 40s. 3d. to 40s. 9d. per 416 lbs. to arrive.

OILS (FIXED) AND SPIRITS.—Castor oils generally are dull, and a shade easier in price, demand being irregular. Calcutta, 3 3/32d. to 3 1/16d. per lb.; French, 2 13/16d. to 2 7/8d.; Madras, 2 13/16d. per lb. Olive oil continues at extreme prices; on the spot Spanish, £35 10s. to £36 10s. per tun, for shipment, £34 10s. to £35 10s. terms cost and freight. Linseed oil, owing to the sudden drop in the price of seed, quotations for Liverpool makes of oil are 23s. 6d. to 24s. per cwt. Cottonseed oil is quiet at 19s. to 19s. 6d. per cwt. Spirits of Turpentine has recovered and advanced to 39s. 6d. per cwt.; and is very firm.

POTASH SALTS.—Bichromate, 3½d. per lb. Chlorate, 3½d. to 3¾d. per lb. Cream of Tartar is steady but quiet at 74s. to 80s. per cwt. Pearlashes are slow of sale at 32s. per cwt. Potashes continue scarce at the higher rate of 24s. 6d. to 24s. 9d. per cwt. Prussiate, 7¾d. per lb.

QUILLAYA BARK.—5 tons of Chilian went at £12 15s. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax, £16 to £16 10s. per ton. Caustic is very scarce, 76 to 77 per cent., £10 per ton; 70 per cent., £9 5s. per ton. Crystals, £3 5s. per ton. Nitrate is in fair demand at 7s. 9d. to 8s. per cwt.

Newcastle-on-Tyne Chemical Report.

November, 17, 1899.

Business in the Chemical line continues very brisk. Stocks have run almost out making it difficult to readily comply with pressing orders. Caustic Soda is specially scarce. The rising prices of coal and other necessary articles in the manufacture of chemicals are causing forward quotations to be made on a higher basis. Present prices are: Bleaching Powder, according to markets, £6 5s. to £6 10s. Soda Crystals in bags, 55s. to 57s. 6d. Caustic Soda, 70 per cent., £9 5s. to £9 10s. Soda Ash, 52 per cent., £4 5s. to £4 10s. Alkali, 52 per cent., £5 5s. to £5 10s. Sulphur, £4 17s. 6d. per ton.

Manchester Chemical Report.

November 15, 1899.

There is no appearance of any lull in the heavy chemical trade but, on the other hand, there are no further advances to report. Consumers are more inclined to book forward for next year's wants, but makers will only do this at an advance of some shillings, as there is every prospect of dearer fuel and no diminution in the wages bill. Caustic Soda is firm, and 98 per cent. has been quoted £11 10s. per ton, on rails. Bleach is unchanged at £5 10s. per ton, on rails. Brown Acetate of Lime continues in steady request at £5 12s. 6d. to £5 17s. 6d. per ton, Welsh and American, Manchester. Glycerin has been a trifle easier, and local manufacturers are quoting chemically pure at £55 per ton, tins and cases; £52, naked, and crude, £30 10s. per ton, all on rails, or f.o.b. Salt Cake is unchanged and firm. Recovered Sulphur is in more request, and ranges from £4 15s. to £5 2s. 6d. per ton, according to quantity and delivery. Lead Salts are steady, with an upward tendency. Alum and Sulphate of Alumina are very firm. Yellow Prussiate is dull at 7½d. to 7⅞d. for Lancashire make. Sulphate of Copper is in more request at £25 10s. to £26 per ton, best brands, delivered Manchester. Arsenic unchanged at £19 5s. to £19 10s. per ton, ex ship Garston.

Calendar for the Week.

Sunday, Nov. 19. 25th after Trinity. Sun rises 7.26, sets 4.4.

Monday, Nov. 20. Sun rises 7.28, sets 4.3.

Dewsbury and District Chemists' Association.—Town Hall, Dewsbury, at 8.30 p.m.—W. S. Glyn-Jones on the P.A.T.A. and its Defence Fund.

Tuesday, Nov. 21. Sun rises 7.30, sets 4.2.

Bradford and District Chemists' Association, County Restaurant, Bradford, at 9 p.m.—W. S. Glyn-Jones on "The Chemists Defence Fund."

Royal Photographic Society, 66, Russell Square, London, W.C., at 8 p.m.—"Architectural Photography," by W. H. Bennett.

Wednesday, Nov. 22. Sun rises 7.31, sets 4.1.

Thursday, Nov. 23. Sun rises 7.33, sets 4.0

Chemists' Assistants' Association, 73, Newman Street, London, W., at 9 p.m.—Paper on "The Relation of the Wholesale to the Retail Trade," by F. Curry.

Leicester Chemists' Social Union, Grand Hotel, Granby Street, at 8.45 p.m.—Smoking Concert.

Midland Pharmaceutical Association, Great Western Hotel, Birmingham, at 8.45 p.m.—W. S. Glyn-Jones on the P.A.T.A. and its Defence Fund.

Friday, Nov. 24. Sun rises 7.34, sets 3.59.

Glasgow Chemists' and Druggists', Assistants', and Apprentices' Association, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Councillor Wm. Martin, on "John Ruskin: The Man and His Teaching."

Saturday, Nov. 25. ☾ 6.35m. Sun rises 7.36, sets 3.58.

ITEMS OF INTEREST.

A Fraudulent Emulsion of Cod Liver Oil and Hyposulphites.—Harst (*Nederl. Tijdsch. voor Pharm.*) states that he failed to find a trace of hypophosphites in a certain proprietary preparation sold on the Continent. It consisted of cod liver oil, 240 Gms.; powdered gum arabic, 40 Gms.; glycerin, 20 Gms.; water, 100 Gms.; essential oil of almonds, 1 drop.

A Universal Antidote.—Crouzel recommends the administration of five centigrammes of tartar emetic in hot water repeated three or four times a day at short intervals, followed by cold milk containing 5 per cent. of borax. The fat of the milk protects the mucous membrane of the stomach from the corrosive action of acids or bases. The borax combines with the mineral bases to form insoluble products. As a stimulant the author uses equal parts of strong infusion of coffee and of cinchona bark, sweetened with one gramme of Hoffmann's anodyne added.—*Zeit. Oest. für Pharm.*, **53**, 550.

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

O'Brien's check-tills, practically as good as new, 30s. each.—Chambers & Son, Dunstable.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Pharmaceutical Journal. A complete set, from 1841. First 29 volumes bound, perfect condition; remainder unbound, quite clean. Offers.—Elliott, Chemist, Gateshead.

Overstocked.—Iodoform Precip., 12s. 6d. lb.; Crystal, 12s.; Potass. Iodid., 2 lb. 19s., 4 lb., 37s.; 24 Freeman's Chlorodyne, 14s.; 2 oz. Morph. Hydroch., 10s.—Eastman, Forest Lane, Stratford.

Good Second-hand, Hand Painted Lantern Slides, to clear, 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c. Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Formula suiting toilet or other speciality.—W. Lewis, 15, Shelden St., London, W.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Old Druggists' Crockery-ware wanted. Blue and white Syrup Jars, Ointment Pots, Oil Vases, and other Pharmaceutical Antiquities.—John Austen, Pharmaceutical Chemist, Dore, near Sheffield.

Wanted, clean copies of the following Pharmaceutical Journals:—1883, Jan. 7th, Oct. 27th; 1884, Nov. 1st; 1885, March 28th, June 6th; 1887, July 9th; 1892, Jan. 16th; 1893, Jan 14th; 1895, Feb. 23rd, July 20th, 27th., Oct. 26th; 1897, Jan. 16th, May 22nd, Sept. 25th, Oct. 2nd, Dec. 25th; 1898, Jan. 1st; 1899, Jan. 7, 14, 21, 28, Feb. 4, 11, July 8th, Aug. 19th, Sept. 23rd. Full price will be paid by the Secretary, 17, Bloomsbury Sq., W.C., for unmutilated copies.

Advertisements.

(Received too late for Classification.)

STUDENT, whole or part time, 24, 9 years' experience, photography. North preferred; disengaged. — WILKINSON, 28, Finsbury Rd., Leeds.

Rectification of the Register

In Accordance with the Pharmacy Act, 1868.

Extract from Sect. X. of the Pharmacy Act, 1868.

To enable the Registrar duly to fulfil the duties imposed upon him, it shall be lawful for the Registrar to write a letter to any registered person, addressed to him according to his address on the Register, to inquire whether he has ceased to carry on business, or has changed his residence, such letter to be forwarded by post as a registered letter, according to the Post-Office regulations for the time being; and if no answer shall be returned to such letter within the period of six months from the sending of the letter, a second of similar purport shall be sent in like manner; and if no answer be given thereto within three months from the date thereof, *it shall be lawful to erase the name of such person from the Register.*

WE are requested by the Registrar appointed under the Pharmacy Acts to publish the following list of persons whose names will be erased from the Register of Chemists and Druggists, or the Register of Pharmaceutical Chemists, as the case may be, unless they communicate their addresses to the said Registrar on or before December 30 next :—

Those marked with an asterisk are Pharmaceutical Chemists.

Abbot, Joseph	125, Neville Road, Upton Park, London, E.
Alexander, Adam	68, Holburn Street, Aberdeen.
Alexander, Ernest Glover	Opposite Carlisle Hotel, Manningham, Bradford.
*Appleton, Robert	Hawthorn, near Melbourne, Victoria.
Ashford, Francis	Deptford High Street, London, S.E.
Atkinson, George John	1, Baxter Gate, Doncaster.
Baillie, Janet	Tranent, Haddingtonshire.
Baines, Joseph Charles	55, Blackman Street, Borough, London, S.E.
Banfield, Harold	26, Urswick Road, London, N.E.
Barrett, Allan Lifton	10, Brecon Road, Hay, Breconshire.
Beesley, Thomas	203, Clapham Road, London, S.W.
Beynon, Benjamin	125, High Street, Swansea.
Bland, Henry	93, Falsgrave Road, Scarborough.
Booth, William Smith	Hoyland Nether, near Barnsley, Yorks.
Botterill, Frederick William	20, High Road, Kilburn, London, N.W.
Bowden, Ambrose	13, Charles Street, St. James, London, S.W.
Bridger, Thomas	Middletown, New York.
Buck, Charles Burton	8, Lower Brook Street, Ipswich.
Burnham, Charles John, jun.	11, Axe Street, Barking.
Campbell, Alfred	13, Lordship Lane, Dulwich, London, S.E.
Casey, Edward	55, Little Lever Street, Manchester.
Chadwick, Arthur Geoffrey	10, Upper Borough Walls, Bath.
Challis, Frank	66, Lowth Road, Denmark Hill, London, S.E.
*Chapman, Joseph George	P.O., Boston, U.S.A.
Clark, John	17, Bryantwood Road, Holloway, London, N.
Clark, John Jeffrey	34, The Triangle, Bournemouth.
Cockerill, Thomas	81, North Street, Ripon.
Cocking, Frederick John	The Hawthorns, Alvingham, near Lough.
Coleman, Friend	44, Wood Vale, Lordship Lane, London, S.E.
Cookson, Joseph	115, Bridge Street, Bradford, Yorks.
Coombs, William Thomas	Brentford, Middlesex.
Cooper, Edwin	Bracebridge, Simcoe, Canada.
*Cornish, William, jun.	101, Hoddle Street, Collingwood, Melbourne, Australia.
Craig, Henry Riddell	527, W. 125th Street, New York.
Crompton, Benjamin	2, Fern Bank, Moston Lane, near Manchester.
Cross, Robert	15, Drake Street, Rochdale.
*Cule, Taliesin	Dynevor House, Pontypridd, Glamorganshire.
Dalby, Robert Eastham	21, Howick Street, Monkwearmouthshore, Sunderland.
Davies, Daniel Evan	34, Oxford Street, Mountain Ash, S. Wales.
Davies, Samuel	187, Kensington, Liverpool.
Dickinson, William	1, Queen's Gardens, Bayswater, London, W.
Dismorr, Henry	42, Windmill Street, Gravesend.
Drabble, Frederick Pearson	Clifton Lane, Rotherham.
Drummond, John Alexander	9, Corn Market, Belfast.
Duckenfield, Joseph	Winnipeg, Manitoba, Canada.
Earee, Edwin Thomas	High Street, South Croydon.
*Edwards, William	Pleasley Hill, Mansfield, Notts.
Elliott, Dyson	Trafalgar House, Tweedale Street, Rochdale. Lancs.
Elliott, George Henry	10, Ilbert Street, Plymouth.
Ellisson, Charles	Aire Street, Knottingley, Yorks.
Endall, Edward Albert	5, Southwater Road, St. Leonards.
Evans, Barrow	Curzon Street, Derby.
Evans, Thomas	22, Brunswick Street, Swansea.
Fletcher, Isaac Brackstone	Totton, near Southampton.
Fletcher, William	Todmorden.
Fowles, Frederick William	94, Edinburgh Road, Liverpool.
Franciosi, Eugène Auguste de	11, Rue d'Armaille, Paris.
Francis, George	Market Place, Romsey, Hants.
Gant, Robert Boddy	39, Artillery Place, Woolwich.
Garrett, John	22, Essex Road, Acton, London, W.
*Garrett, John Henry	8, Torrington Place, London, W.C.
Gibson, James Edward	107, London Street, Reading.
Gibson, Mary	Redcar, Yorks.
Gosden, James	Abergavenny, Mon.
*Goucher, John	21, Beaconsfield Villas, Brighton.
Grant, John	West Street, D'Urban, Natal, South Africa.
Green, Robert	23, Hare Street, Woolwich, London, S.E.
Green, Sidney Herbert	61, Trinity Square, Borough, London, S.E.
Grey, John Elston	St. Michael's Villa, Purbeck Rd., Bournemouth W.
Hamilton, John	81, Oxford Street, London, W.
Hanbury, William	84, Westgreen Road, S. Tottenham.
Hancock, Fred	1, Edward Street, Sheffield.
Hanna, George Henry	27, East Preston Street, Edinburgh.
Harper, Joshua Henry	Uitenhage, Cape Colony.
Harrison, William Dale	Perth, Western Australia.
Hart, Thomas	27, South Bridge, Airdrie.
Hayes, Frederick	Duckworth Street, Over Darwen, Lancs.
Henderson, John George	11, Promenade, Lordship Lane, East Dulwich London, S.E.
Hill, Robert Bryden	15, West Richmond Street, Edinburgh.
Hindle, John	Oulton Broad, Near Lowestoft.
Holt, John	83, Clowes Street, West Gorton, Manchester
*Hornby, Alfred	96, Chetwynd Road, London, N.W.
Howard, Henry	Colkirk, Norfolk.
Hughes, George	50, Paddington, Liverpool.
Hughes, John Edward	12, Medway Street, Westminster, London, S.W.
Hughes, William Charles	151, Hoxton Street, London, N.
James, John	35, Trinity Square, London, S.E.
Jeffrey, Elias	94, Richmond Road, Barnsbury London, N.
Jeffries, Benjamin	2, Heaton Place, Peckham Rye, London, S.E.
Jeffries, Gilbart	39, Victoria Road, Peckham, London, S.E.
Jelley, Stephen John	26, Ogle Street, Fitzroy Square, London, W.
Johnson, Frederick	142, Kingsland Road, London, N.E.
Jones, Thomas	Accra, West Coast of Africa.
*Jones, William	The White House, Lyth Hill, near Shrewsbury.
Jones, William Nathanael	62, Albion Road, Stoke Newington, London, N.
Kay, John	Corner of Workman Street and Hawkins Street, E. Los Angeles, S. California.
Kenward, Robert	63, Arundel Street, Landport.
Kerr, George Jobling	Derby Road, Huyton, Liverpool.
Kilkenny, Andrew	1, Well Street, Wellclose Square, London, E.
*King, Arthur	8, West Parade, Norwich.
Knaggs, Aaron	High Street, Loftus, Yorks.
*Lacy, Henry	4, Heslington Terrace, York.
*Lance, Henry	West Street, Durban, S. Africa.
*Leake, Thomas Whaplate	151, Uxbridge Road, London, W.
Lee, Thomas	116a, Mottram Road, Hyde, Cheshire.
Lewis, Edward Prosser	Sydney, New South Wales.
Lewis, William Spencer	Castle View, Castle Street, Kendal.
Lightfoot, John	43, Strand Street, Cape Town, South Africa.
Lindley, Henry	57, South Street, Moor, Sheffield.
Lingard, Joseph	Cheadle, Cheshire.
Lockhart, John	23, Regent Place, Shawlands, Glasgow.

THE CHEMISTS' DEFENCE FUND.

It was decided at the last Council meeting of the Proprietary Articles Trade Association that the ten retail members of the Council should be asked to provide the signatures to the memorandum of association of the newly-formed Chemists' Defence Association (Limited). The Retail Committee was called together for this purpose on November 13. It had been decided to leave the drawing up of the prospectus until this meeting, and we give below the draft prospectus which was submitted to the Committee:—

The Chemists' Defence Association (Limited) is an association having the following among its immediate objects, as quoted from a circular issued by the provisional directors:—

1.—The providing of legal advice for its members upon all matters pertaining to the business in which they are engaged.

2.—To provide legal defence for any of its members who may be prosecuted under various Trade Acts affecting them in their business.

3.—To indemnify its members against loss arising from mistakes in dispensing or retailing occurring in their places of business.

4.—To supply information to its members in reference to any new Acts of Parliament affecting their business, or any change in existing laws.

5.—To watch such legislation in the interests of its members.

The following is a copy of the rules under which the Association is governed, and will form the basis of any agreement between the Association and its members:—

1.—Any member requiring legal advice shall submit the subject in writing to the secretary of the Association, who will forward to the member the information given on the matter by the Association's solicitor.

2.—Members shall be entitled to legal defence to an amount not exceeding £10 when prosecuted under any of the following Trade Acts:—

Apothecaries Act (1815).
Dentists Act (1878).
Veterinary Surgeons Act (1881).
Sale of Food and Drugs Act (1875 and 1879).
Weights and Measures Act (1878 and 1889).
Petroleum Acts (1871 and 1879).
Explosive Acts.
Shop Hours Act (1892).
Excise Laws affecting the trade
Pharmacy Acts, subject to Rule 17,

and any others which may be added at the discretion of the directors to this list.

3.—The Association shall appoint a legal adviser and analytical chemist.

4.—That where, in the discretion of the directors, such is desirable, legal defence shall be personally conducted by the Association's solicitor, but that in cases where the directors think such a course advisable the defence shall be conducted by a local solicitor, acting in conjunction with the solicitor of the Association.

5.—That in the event of a prosecution members shall send full particulars of the alleged offence, and all documents connected therewith, to the secretary.

6.—That it shall not be compulsory on the directors to identify the Association with the defence of any particular case, but that, should they think such a course desirable in the interests of the Association, they may, in lieu of conducting such defence, hand to the member the sum actually expended on such defence, not exceeding £10.

7.—In the event of conviction the Association will not pay any fine incurred or costs of prosecution.

8.—That the directors have power to appeal against any conviction given against any particular member. That such appeal be in no way compulsory, but if undertaken such appeal shall be at the cost of the Association, who may, nevertheless, use the name of the member convicted, and the latter shall afford the Association all possible assistance in connection therewith.

9.—That members be indemnified to an amount not exceeding £500 in the event of their being liable for damages due to any mistake incurred in dispensing or retailing in any of their shops for which a subscription has been paid.

10.—That in the event of a retail member being mulcted in damages in a case in which a third party is responsible, the member be indemnified only against actual loss, not exceeding £500, after deducting the amount he may recover, or which the Association may recover for him, from such third party.

11.—That every member shall hold at least one share of £1 in the Company.

12.—That members shall be required to pay to the Company an annual subscription of £1 1s. for each shop or place of business to which the benefits of membership of the Association shall apply, but that the subscription for members who are at the same time members of the Proprietary Articles Trade Association shall be 10s. 6d. only for each shop or place of business.

13.—That subscriptions shall run for one year from date of payment, and that members whose subscriptions are more than one calendar month in arrear shall forfeit all benefits.

14.—Members will not be entitled to receive any benefit until after the expiration of three months from the date of their becoming members, and in the event of a member ceasing his subscription, he shall not be entitled to such benefits till the expiration of three months from the date of renewing his subscription.

15.—All the directors of the Association shall retire at the general meeting in each year, but shall be eligible for re-election.

16.—The directors may, without assigning any reason, refuse to admit any person or firm to membership of the Association whom they shall consider would be an undesirable member, and may, in like manner, refuse to allow any person or firm to continue a member after the expiration of any year for which such member's subscription shall have been paid.

17.—The Association will in no case defend, or assist in the defence of, any of its members against proceedings taken by the Pharmaceutical Society for the enforcement of the Pharmacy Acts, nor shall any member have any claim, for compensation, costs, or otherwise, in relation to any such proceedings.

18.—Shares in the Association shall only be held by, and issued or transferred to, registered chemists, and the directors shall have the like power of refusing to register a transfer as they have under Clause 16 hereof of refusing membership.

19.—The profits of the Association shall be applied first in the formation of a reserve fund, which shall be invested at the discretion of the directors, and may be used by them at their discretion for any of the purposes of the Association. When such reserve fund shall amount to £1,000, but not before, the directors may apply all or such part of the profits as they shall think proper to distribute in any year in payment of a dividend at a rate not exceeding 5 per cent. for the then current year on the paid-up capital of the Association, and the balance of the profits (if any) shall be credited to the members in proportion to the amount of their respective subscriptions for such year.

20.—No alteration shall be made in these Rules, except at the annual general meeting of the members of the Association, or at a special general meeting called for that purpose.

TRADE NOTES.

"Vinolia" and the Transvaal War Fund.—The Vinolia Company, Limited, Malden Crescent, London, N.W., in reply to the numerous inquiries from customers as to the means adopted to secure payment to the Transvaal War Fund of the ½d. on each tablet of Vinolia Soap sold by them from stock during the period covered by the company's offer, announce that the company will be glad to credit the ½d. on each tablet sold from stock between November 6 and December 5 if friends will advise immediately after the latter date of the quantity disposed of. If they can see their way to hand to the firm an order during the above period, however, it will help all the more to make the contribution a substantial one. Advantage is taken of this opportunity to thank the trade for the generous support extended to the company, whereby it has already been enabled to remit £1,000 to the Lord Mayor.

Davis's 'Domestic Year-Book and Calendar,' 1900.—Mr. John Davis, publisher, 24, Queen Victoria Street, London, E.C., directs attention to his 'Domestic Year-Book,' which is illustrated and compiled expressly for chemists' circulation. It is tastefully got up with high-class illustrations and interesting and useful literary matter, and possesses a number of advantages over the usual almanacs offered to chemists, which are generally compiled to suit all trades. It is larger in size and contains much more useful matter of a nature important to the chemist's customers, and calculated to improve his business. A large amount of space is reserved for the display of chemists' own announcements, while the price quoted is comparatively low, the wrapper being inclusive. Mr. Davis also directs attention to his Miniature Calendar for 1900. This is a dainty little production of very attractive appearance, and, notwithstanding the fact that the literary matter on each page may be completely covered by two penny stamps, its contents are of a most useful character. Space is reserved for the distributor's own advertisements, while the publisher's advertisements are all such as apply to articles usually sold by chemists. Only one person in each district is supplied with these publications, so that chemists who distribute an annual almanac will do well to apply for particulars at once.

Winter Printing.—Messrs. James Townsend and Son, medical label printers, Little Queen Street, Exeter, and 2 and 3, Stonecutter Street, London, E.C., are issuing a set of winter printing samples, suitable for chemists' use. These include folding boxes for bottles, lozenges, soap, etc., which may be made to order in any special sizes and of various materials. Striking and attractive handbills in assorted colours—pink, primrose, and blue—and medical labels. A set of samples will be sent to any chemist on application.

Dahl's Sterilised Pure Cream and Milk.—Messrs. Herbert Francis and Co., fruit merchants, 8, Arthur Street West, London, E.C., submit a sample of Dahl's sterilised cream. This is put up in 6 oz. and 12 oz. tins, which can be kept unopened for months ready for any emergency, the contents on opening being as sweet and wholesome as when packed. The milk is said to be obtained from the finest cows grazing on some of the richest pastures in Norway, and is absolutely pure and free from bacteria or tuberculosis. No preservatives or chemicals appear to be used, the method employed for the sterilisation being regarded by experts as quite satisfactory. Both the cream and the milk may be used for all ordinary purposes, and the cream is especially suitable for use with strawberries and fruits, and for making ice-creams and pastries. It is well spoken of by yachtsmen, and is in constant use in the Channel Squadron, and on South African Liners, where it gives general satisfaction. The tins are sold at 6½d. and 10½d. per tin.

"Clove Pink" Sachets.—Messrs. Potter and Clarke, 60, 62 and 64, Artillery Lane, London, E., have introduced a very good line of sachets for the coming season, under the name of "Clove Pink." These sachets are very pretty in appearance, exquisitely perfumed, and packed in an attractive box. The "Sweet Kiss" sachet introduced by this firm two years ago is said to have had an enormous sale, and this new packet is likely to be quite as popular. Chemists who require something to give away at Christmas time might do worse than consider the advisability of securing a few gross of "Clove Pink" sachets with their own name printed on. The printing is done free by the firm on lots of five gross and upwards.

Toilet Soaps, Perfumery, Etc.—Sharp Brothers Soap and Perfumery Co., Ltd., 18 and 19, Red Lion Square, London, W.C., the makers of Bentley's Old Musk Brown Windsor Soap, according to the original recipe, which was first made in 1796, and for the past forty years has been used by Her Majesty the Queen, now manufacture so great a variety of toilet soaps that they are putting in new mills in order to cope with their expanding trade. Their White Rose and Cucumber Soap is one of the most popular of the day, and quite merits the title of the "Queen of Soaps"; Sharp's New Buttermilk Soap and their Japanese Rose Soap are also excellent articles, and the same might be said of the seventy or eighty other soaps manufactured by the firm. These milled and superfatted toilet soaps are quoted at reasonable prices, while their quality, richness, and persistency of perfume and elegance of presentment combine to make them both satisfactory and profitable stock. In regard to perfumes, the firm has a large assortment of fancy bottles and cases for Christmas trade on view in the show-room, including the "Russian Violet" series, a lovely new perfume put up in very pretty bottles ornamented with flowers. The series, which is in the P.A.T.A. list, comprises "Brilliantine," smelling salts, tooth-powder, face-powder, soap, shaving cake, sachets, and Cologne. Sharp's Concentrated Perfumes are also put up in bulk, in ¼, ½, and 1lb. original bottles, and include over thirty varieties. Their Musk and Mitcham Lavender Perfume is a specialty that has hit the popular taste. A novelty that has been introduced for the coming season is a cheap line of Union Jack sachets in four odours. In view of the wave of patriotism that is just now affecting the country, it is extremely probable that there will be a great demand for these sachets. The price is 16s. for four dozen, including a show box. Another novelty is a series of prettily-dyed straw boats fitted with bottles of perfume. Chemists who have the opportunity will do well to visit this firm's show-room when purchasing their Christmas stock.

Harrington Brothers' Photographic Chemicals.—Messrs. Harrington Brothers, Oliver's Yard, 53A, City Road, London, E.C., manufacturers of chemicals used for research, laboratory, technical, and educational purposes, are making a specialty of photographic chemicals, bottled or packed ready for retailing. This method of packing saves loss by deliquescence or efflorescence in chemicals which would suffer by exposure if kept in bulk; another important advantage is the time saved in retailing these goods, being always ready for handing out to customers, who are therefore not delayed. The bottles are in different sizes, from 1oz. to 16oz., and the packages, up to 1lb., and can be had with plain or chemists' own labels, the prices being based on the wholesale list.

Carnigen.—Messrs. Leete and O'Connell, St. Dunstan's Buildings, St. Dunstan's Hill, London, E.C., are the sole agents for Great Britain for Carnigen, a meat powder, said to be prepared from the purest and best meat, to be entirely assimilable, and possess the highest nutritive properties. It has an agreeable taste, and is distinguished from all other preparations by the astonishing rapidity with which it dissolves. Carnigen has been used in various hospitals, and is highly recommended by medical men, not only as a nutritive for invalids, but also as a strengthening medium for weaklings, youthful or adult, it effecting a perceptible increase in weight soon after use. It is given in doses of one to two table-spoonfuls taken thrice daily, dissolved in milk, soup or water.

Wernicke Elastic Book and Show Cases.—Messrs. Thomas Turner (Leicester), Limited, 44, Holborn Viaduct, London, E.C., are the sole agents for the Wernicke system of bookcases, and, on application being made by anyone interested, will send, free of charge, a copy of a dainty booklet, which explains the many and varied uses to which the system may be adapted. The principle of the system is summed up in one word, "elasticity." It consists of a series of small compartments, with dust-proof glass doors, each ingeniously designed to interlock with another in vertical and horizontal arrangement. These, with suitable tops and bases, are the "units" of the system, and are of different depths and heights to suit all sizes of books. The field to which this system can be adapted is almost limitless; the bookcase units being suitable for use by physicians and surgeons for their instruments, etc., by chemists for showing proprietary articles and all kinds of fancy goods, and in fact for innumerable other purposes.

TABLETS.—Messrs. Wright, Layman, and Umney, Limited, Southwark Street, London, S.E., appear to be considerably extending their fields in the manufacture of tablets. We have previously commented on their bath tablets, which are effervescent, dissolve readily in water, and emit the most pleasant perfumes characteristic of the different varieties. Their sugar-coated tablets appear to be nearly perfection, and their latest departure in the way of chocolate-coated cascara tablets, referred to last week, which they are selling under the name of "Cascara chocolettes," constitutes one of the most attractive forms for taking unpleasant medicine that we have had the opportunity of examining. A perusal of the firm's complete tablet list, as well as the "packed pharmaceuticals" list, would repay any of our readers.

MUSICAL BOXES AND CLOCKS.—In view of the coming Christmas season, it may interest those readers of the Journal who may be considering what kind of a present to make to their friends to know that Messrs. Nicole Freres, Limited, 21, Ely Place, Holborn Circus, London, E.C., are prepared to send to any reader who makes application for the same a beautifully printed catalogue giving exquisite photographic reproductions of some of their musical boxes and clocks, several of which are very suitable for presents.

UNIVERSAL KNEADING AND MIXING MACHINES, ETC.—Messrs. Werner, Pfleiderer and Perkins, Limited, Engineers, 117, Queen Victoria Street, London, E.C., the well-known makers of machinery for the chemical and pharmaceutical industries, send a copy of their catalogue, which gives a short description of their productions and the uses to which they may be put. As pointed out in the preface the chemical industry, in contrast to many others, mainly owes its wonderful development to chemists themselves, but the increasing competition and greater requirements of the present day, and the necessity for careful study of economy in every operation, make it necessary for manufacturing chemists to be keener to recognise the advantages to be secured by the employment of machinery specially adapted for their purposes. Hence they will do well to obtain a copy of this firm's catalogue.

MAGGI CROSS-STAR SOUPS AND CONSOMME.—Messrs. Cosenza and Co., 95, Wigmore Street, Cavendish Square, London, W., are the sole agents for the United Kingdom and British Colonies for the Maggi Cross-Star Soups and Consommé. These products were invented on the initiative of the Société Suisse d'Utilité Publique, with a view to the improvement of rational alimentation in Switzerland, and are still made under the official patronage of the Société, the manufacture being under the constant supervision of the leading State chemists, whose efforts are directed towards improvements in the processes and the invention of new specialties. The preparations which have become exceedingly popular in the United Kingdom within the last few years include the Consommé which is a properly made and clarified clear soup solidified in gelatine capsules, which require only to be dissolved in boiling water to be ready for use. No seasoning or addition is necessary. The Cross-Star Soups, forty in number, are, both in variety and character, different to any other productions on the market. They include all the finest creams and purées of the French cuisine, and are said to be the only ready-made soups having the quality of the productions of a first-rate cook. These preparations are not only convenient in the household but are of great value in the invalid dietary. For travellers and soldiers in the field they are especially serviceable, from their portability, ease of preparation, and nourishing qualities. The War Office has recently ordered a large supply for the troops under orders for South Africa. They were largely used in the Egyptian campaign, and in the provisioning of the Jackson-Harmsworth, Borchgrevink, and all recent expeditions. It may also be mentioned that the Central British Red Cross Committee has accepted a gift of two cases (about 3,000 rations) of Maggi's Consommé, from Messrs. Cosenza and Co., for the use of the sick and wounded in South Africa.

EFFERVESCENT SALICYLIC ACID TABLOIDS.—Messrs. Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C., have recently made an addition to their list of effervescent preparations in the form of tabloids. This is effervescent salicylic acid (gr. 3) and has been introduced as a pleasant means of administering the drug. Physiologically pure salicylic acid alone is used in the production of these tabloids, which are wonderfully compact, portable and convenient, and in effervescent properties are all that could be desired.

NEW PREMISES AND CHRISTMAS NOVELTIES.—Messrs. F. Newbery and Sons, who for some twenty years past have carried on their extensive business as a proprietary medicine and druggists' sundries house, in King Edward Street, Newgate Street, E.C., have been obliged, owing to the expansion of their trade, to take more commodious premises, the front entrance of which is in Charterhouse Street, one of the side entrances being in Charterhouse Square. These premises are situated near Smithfield Meat Market, within a few minutes' walk of the old warehouses in King Edward Street, and easily accessible from all parts of London by rail, 'bus, or tram. The building, including the basement, is six stories in height, and is open to the roadway on three sides, thus affording an abundance of light and air. The interior of the building has undergone thorough reconstruction; everything being done with a view to speedy dispatch of business, the convenience of customers, and the safety of the employés. The floorage comprises some 20,000 square feet; the basement is capacious, well lighted and ventilated, and is devoted to the receiving, checking, packing, and despatching departments; the ground floor contains the town order department, showroom, the private rooms of the principals and manager, and a spacious counting house. On the first, second, and third floors, stocks of some 15,000 different varieties of patent medicines and proprietary articles, besides druggists' sundries are stored; a most ingenious system of pigeon-holes being employed for the purpose. The fourth floor is to be devoted to manufacturing purposes. Every part of the building is connected by lift and telephone, and a broad stone staircase runs from top to bottom. The building is lighted throughout by electricity, and the sanitary arrangements are excellent. It is not too much to say that Messrs. Newbery and Sons now possess one of the largest and most convenient warehouses connected with the British drug trade. Amongst the firm's novelties are the "Happy Omens" series of St. Paul's perfumes, intended as souvenirs for the coming season. This series may be had in 1s. bottles, with appropriate label, at 7s. per dozen; also put up in fancy caskets, containing three varieties of perfume, at 30s. per dozen, to retail at 3s. 6d. each. The labels and caskets each bear a representation of St. Paul's Cathedral, partly surrounded by a horseshoe with bells and slippers attached, for good luck.

X-RAYS AND THE WAR.—At a recent visit to Messrs. Harry W. Cox and Co., Ltd., the well-known manufacturers of X-Ray apparatus at 10, 11, and 28, Cursitor Street, Chancery Lane, London, E.C., a Journal representative had the opportunity of inspecting several complete X-Ray outfits which have been specially designed by Mr. Cox for the field and hospital ships in connection with the war now progressing in South Africa. The set for the Princess of Wales' Hospital Ship is one of the most complete and compact sets of apparatus yet produced. It is mounted on a specially constructed table with wheels fitted for convenience in moving the apparatus from one part of the ship to another; the coil has been specially made, and stands on the top with the tube holder in front. The drawer takes half-a-dozen tubes, screen, and extra wires, the complete outfit presenting a very neat and compact apparatus. Mr. Cox's apparatus is now too well known to need comment here, but it is interesting to know that the Government is not only providing the very best apparatus for its wounded soldiers, but that it has placed its orders in the hands of competent English manufacturers.

LIQUID MALT AND GLYCEROPHOSPHATES.—Messrs. Duncan, Flockhart and Co., Edinburgh, are making a useful new preparation, with the object of realising Dr. Robin's original idea of prescribing the glycerophosphates in conjunction with diastase and other digestive ferments. They have found it impossible to produce an honest preparation of that nature in the form of a syrup, that is to say, a satisfactory syrup strictly in accordance with the original formula. The new preparation contains only one-fourth of the proportion of the glycerophosphates in the original syrup, and the syrup made by Messrs. Duncan, Flockhart and Co. also differs somewhat from the original formula. In the liquid extract, pure caffeine is introduced in place of the kola suggested by Dr. Robin, being a therapeutical equivalent and of greater uniformity and reliability. It is an admirable preparation and should meet with great success. The liquid extract is put up in bottles for retailing at 15s. per dozen; also in 1lb. and 2lb. original bottles for dispensing purposes at 2s. per lb. The syrup prepared from the modified formula is sold in bulk only at 4s. per lb.

ENGLISH NEWS.

Prescribing Druggists are attacked by a correspondent of the *Lancet*, who has written to that journal asking "if there is any society in London which takes any notice of the following:—A chemist in this town visits people and prescribes for them, and two other chemists prescribe for their customers. Medical men are not allowed to employ unqualified assistants, but chemists do far worse." Unhappily, replies the *Lancet*, there is no society which has any power in this matter. "Anyone, however ignorant, may prescribe for, visit, and treat a patient should he find anyone fool enough to let him do so. Only the 'practitioner' must not give out or use any title implying that he is a qualified medical man."

The Izal Trade Mark.—On Thursday, November 16, the action of Newton Chambers and Co. *v.* Nicholls, was mentioned to Mr. Justice North by Mr. Schiller, who appeared for the plaintiffs. He said the action was brought to restrain infringement of the plaintiff's trade mark "Izal" by the defendant, who carried on business at Heelington, Lincolnshire, under the style of the Isolo Company. An arrangement had been made by which the motion was to be treated as the trial, and a perpetual injunction granted restraining the defendant from infringing the trade mark in question, and from using the word Isolo in connection with the sale of pills, ointment, or other medical preparations, or any word colourably differing therefrom. The plaintiffs did not ask for costs. Counsel for defendant consenting, his lordship made the order as asked.

Memory Training.—A special class for Pharmaceutical Students has been formed for the purpose of taking the Pelman course of Memory Training lessons by correspondence tuition. The fee for the course is one guinea. Those of our readers who wish to avail themselves of the opportunity, should make early application to the Secretary, 70, Berners Street, London, W.

Hot Water in Sewers.—At North London Police-court, last week, Messrs. W. J. Bush and Co., Limited, manufacturing chemists, of The Grove, Mare Street, Hackney, appeared, by Mr. George Elliott, barrister, to answer seven summonses, charging them, under the London County Council's General Powers Act, 1894, with allowing water to flow into the common sewers of a greater heat than 110° F. Mr. Blaxton appeared for the London County Council. Mr. Elliott said that the offence was admitted, and the defendant company very much regretted that there had been any infringement of the Act. The escape of hot water into the sewers had been caused by a defective attachment on a boiler. The defendants were willing to adopt any suggestion to remedy matters which might come from the London County Council, cost what it might. Mr. Blaxton said Sir Alexander Binnie, chief engineer to the London County Council, had recommended this prosecution because the sudden flow of hot water into the sewers was a danger to the health and lives of the men whose duty it was to go down into the sewers, besides which, hot water was calculated to injure the sewers themselves. Mr. Paul Taylor said he looked upon this as a serious matter, and he imposed fines of £5 on each of the seven summonses, with £10 10s. costs—£45 10s. in all.

Football.—The second Cup match of the Metropolitan College of Pharmacy in connection with the Inter-Pharmacy Football League, was played on Saturday, November 18, at Homerton Marshes, against the Westminster College. The latter College was poorly represented, and within ten minutes of the start the "Metros" secured their first goal, and on re-starting a second quickly followed. During the first half the ball was mostly in the Westminster quarter, and shot after shot was put in. At half time the "Metros" were leading by eight goals, two of which were from penalty kicks. After the interval the game still remained in the Westminster half. One or two attempts were made for the "Metros" goal, but were of no avail, the ball being returned quickly. The "Metros" still continued to increase their number of goals, and when the whistle blew six more had been added to their score, leaving them winners by fourteen goals to nil.

Chemist Freemasons and the Soldiers' Widows' and Orphans' Fund.—The *Daily Telegraph* of Friday, November 17, announced that the editor had received from the Galen Lodge, No. 2,394, per the Treasurer, Mr. M. Carteighe, the sum of 210 shillings in aid of the Fund for the relief of the widows and orphans of the soldiers killed during the present war in South Africa.

Nottingham and Notts. Chemists' Association.—The winter session of this association will be inaugurated by a smoking concert and social evening, to be held on Wednesday, November 29, at 8.30 p.m. prompt. The council of the association hope that members will endeavour to make the opening meeting a distinct success, and will cordially welcome any friends whom members may introduce.

Leeds College of Pharmacy.—On Saturday last the students attending this college held their half-yearly smoking concert. The large lecture room was decorated in the manner most compatible with present feelings, there being a profusion of flags, shields, and instruments of warfare on the walls. Mr. Bracewell opened the concert in a masterly manner by a selection on the piano, after which an excellent programme followed. During an interval refreshments were handed round and then the concert proceeded. Several toasts were proposed, amongst them "The British Forces in South Africa," by Mr. Mackay, in a humorous speech, after which Mr. Jackson very ably sang "Soldiers of the Queen," and Mr. Brier recited "An Absent-minded Beggar," a collection being made for the Patriotic Fund. The party concluded amid much enthusiasm a little before midnight. The large number of students present testifies to the popularity of this comparatively modern college.

'Oysters and Disease,' by W. A. Herdman, D.Sc., F.R.S., and Rubert Boyce, M.B., is the title of a publication just published (demy 4to., 68 pp., with eight plates. Price 7s. 6d. nett.) as No. 1 of the Lanceshire Sea-Fisheries Memoirs, giving an account of certain observations upon the normal and pathological histology and bacteriology of the oyster and other shellfish. The publishers are Messrs. George Philip and Son, 32, Fleet Street, London, E.C., and Messrs. Philip, Son and Nephew, 45—51, South Castle Street, Liverpool.

Prosecution of "Madame Frain."—On Monday, November 20, at the Central Criminal Court, before Mr. Justice Darling, William Brown, Abraham Emanuel Abrahams, Harriet Annie Cross, Philip Perron, and James Armitage Fox, all of whom were on bail in their own recognisances, were indicted for conspiring together and with other persons unknown to incite women who should read and become cognisant of pamphlets and circulars published in the name of Madame Frain to attempt to administer to themselves noxious things with intent to procure a miscarriage.—The defendants pleaded "not guilty."—The Attorney-General, who opened the case, said that the magistrate who heard it at the police-court dismissed the summons on a view which he took of the law. He should submit that the view of the law which the magistrate took was erroneous. The jury would be directed upon the law by the judge. There was carried on in the Hackney Road a business named Madame Frain's Herbal or Medical Institute, and as to what that business was and the class of medicine sold the jury would have to form an opinion. That was a business with which all the defendants had been connected one way or other over a period of time. The business apparently was an extremely lucrative one, the profits being considerable. Advertisements of the business were issued wholesale, and notices were delivered by the hundred and thousand by women who were dressed as nurses, literature was sent out, and mixtures and pills were supplied. It was stated that the mixtures and pills were not to be used for an illegal purpose, and women who wished to purchase them were required to fill up a form stating that they were not pregnant. It was suggested, on the part of the defendants, that the mixtures and pills were only supplied for ordinary female complaints. As far as the mixture was concerned, it was not a medicine which ordinarily would produce miscarriage, but he should contend that that was immaterial. The pills were extremely dangerous for pregnant women to take.—The case was adjourned, and was before the Court on Tuesday and Wednesday. Evidence for the prosecution having been given, counsel for the defence submitted that there was no case to go to the jury against the defendants.—Mr. Gill, for the defendants, contended that in order to constitute the offence charged it was necessary that

a woman should take something which in itself was noxious—not that she believed that she was taking something which was noxious—and it must be a drug capable of procuring abortion. In this case the evidence was that the medicines would not procure abortion. He contended (1) that if a woman, believing that she was taking a noxious thing, did with intent to procure abortion take a harmless thing she did not attempt to procure abortion; and (2) that a person who supplied a harmless thing to a woman who took it in the belief that it was a noxious thing did not incite her to commit the crime and did not commit an offence.—The Attorney-General submitted that there was a case to go to the jury. It was, he contended, immaterial that the medicines were not capable of procuring abortion. The contention that there could be no offence unless the drug would bring about abortion was, he argued, not in accordance with law.—Mr. Gill, in reply, said that the real question in cases of alleged incitement was the state of mind of the inciter—if the inciter knew an offence could not be committed he did not commit an offence.—Mr. Justice Darling: This raises a very difficult question in a form in which it has never been raised before. I, will therefore, reserve my decision upon the point.

SCOTTISH NEWS.

ARBROATH CHEMISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION.—The fortnightly meeting of this Association was held in the Y.M.C.A. Rooms on Tuesday, November 14, the President (Mr. Bennet) in the chair. The subject for the evening was a lecture by Dr. Duncan entitled "Remarks on Drugs Used in the Treatment of the Insane." Dr. Duncan in a very interesting discourse referred to the various forms of insanity mania, kleptomania, pyromania, etc., remarking that cerebral derangement often was the result of bodily disease. He also gave a detailed account of the physiological action of the various stimulants, sedatives, and hypnotics, as tobacco, bromides, paraldehyde, cannabis indica, etc., used in relieving patients suffering from mental diseases. At the conclusion of the lecture Dr. Duncan was awarded a very hearty vote of thanks.

IRISH NEWS.

MEDICINE IN WHISKY BOTTLES.—It will be remembered with what indignation the Parish Beadle in 'Oliver Twist' related the rejection of some stuff in a blacking bottle intended for a sick woman. *Nous avons changè tout cela,* but there still remain a few features of the ancient system, which have lately been responsible for a poisoning fatality. An old woman, Mary Mullin, of Limavady, had been attended by Dr. Higgins, dispensary medical officer, for over a year for an affection of the knee-joint. Some time ago she got a lotion which contained poison. A few days after he was called in to attend Mrs. Mullin, as she had taken the lotion in mistake for whisky. She had marked irritation on the pupils of the eyes, characteristic of belladonna poisoning. The usual antidotes were applied without avail. A verdict of "Death from misadventure."

HONEY GALORE.—Mr. David Hamilton, station-master, Limavady, has discovered under the flooring of a bedroom eleven sections of fine honey, weighing seventy pounds. The bees entered this unique habitation last summer, having toiled assiduously in amassing this hoard, which has been confiscated.

MEDICINE CONTRACTS.—At the last weekly meeting of the Guardians of the Killarney Union a letter was read from the Local Government Board stating that the Guardians should call upon the medicine contractor to the union to replace articles unfavourably reported upon by the analysts, and to furnish an explanation as to its quality. An order was made that the drugs unfavourably reported upon be returned to the contractor. On the same subject the following letter was received from the Cork Chemical Drug Company:—We beg to acknowledge receipt of your post card informing us that the Guardians have ordered a bond with Mr. Crowley for the supply of medicines, etc., to be signed. Be good enough to convey to them that in accepting the higher tender they are liable to be surcharged by the auditor, and we mean to see the matter through to the end with the Local Government Board."

FOREIGN NEWS.

TO AID THE BOERS.—Our Paris correspondent visited the Latin Quarter last week to obtain information about the Committee of Students formed to send reinforcements to the Boers. On arriving at the address given, he found that the Committee had moved to the Café Procope, where a student was receiving names—all minors being rigorously rejected. There were about 250 names on his list, Frenchmen, Luxemburgers, Belgians, Greeks, and Danes—men belonging to all classes of the great army of *déclassés*. Monsieur Landry, the promoter of the enterprise, explained that his committee was continuing the work begun in Germany, Russia, Belgium, and Holland. They meant to arm a company of free-lances, and send them to the Transvaal. A clothier had promised forty outfits, and the owner of a steamer, which could make nine knots an hour, would take them out for the cost of the coals. But it appears that they have no money, and are looking to Colonel Monteil. "What we want above all," said Monsieur Landry, "is that France should continue her generous traditions and not remain silent in the face of such an aggression. We also want to keep in our race the taste for adventure and the love of heroic enterprises. And then, is not our action a sort of revenge for Fashoda?" Evidently wearied of waiting for additional volunteers who fail to swell his list, Monsieur Landry hit upon the idea of having posters printed. This idea he put into practice on Friday last, and is now occupying his latent energy in disfiguring the columns of the Arcade in the Rue de Rivoli and other places with his blazing orange-coloured "affiche," the contents of which is as follows:—

COMITE D'ACTION DE LA JEUNESSE FRANCAISE EN FAVEUR DU TRANSVAAL.

SUS A L'ANGLAIS.

Au peuple français.—Au moment même où toute l'Europe continentale proteste hautement contre les agioteurs anglais qui ont fait entreprendre à leur pays la guerre la plus injuste que notre siècle ait vue, au moment où la capitale de l'Angleterre impuissante et désarmée est à la merci de 20,000 hommes, decidés, les croiseurs anglais à l'instigation d'un gouvernement provocateur pratiquent la politique du *Bluff* et s'arrogent le droit de visite dans les eaux neutres.

Ils viennent de tirer sur un navire français, montrant ainsi leur mépris pour nous.

Le coup de canon tiré sur le "Cordoba" coûtera cher aux anglais.

Nous sommes déjà plus d'un millier de français résolu à aller soutenir la liberté d'un peuple héroïque contre la cupidité anglais.

A l'heure où les Chambres politiquaillent, où les chancelleries commettent les crimes de silence et d'inaction, c'est à toi que nous nous adressons, grand peuple de France.

Viens en foule protester au siège de notre comité, 31, Rue de l'Ancienne Comédie; inscris-toi contre l'anglais. Que ceux qui sont libres viennent avec nous faire le coup de fer contre lui et que les autres nous aident de leur obole. Genereuse France, réveille-toi!

Le Président du Comité,
LANDRY.

Whilst it is regrettable that the authorities should permit the posting up of such inflammatory and hostile nonsense, seeing that Paris lives for the most part upon the money spent by the people it so readily "cries down," it is only fair to Parisians as a whole to add that this affair is not taken seriously, and that they are rather more inclined to pity the poor, deluded individual who is gaining cheap publicity than to become partisans of the campaign he with such facility would fain advocate. Perhaps this youth has Presidential aspirations.

LABORATORY ACCIDENT.—While the students at the Industrial Institute of Lille were engaged in the determination of chemical salts in the Laboratory on Wednesday last, Monsieur Beaubois, aged twenty-two, opened the apparatus in which the sulphuretted hydrogen was being prepared, and immediately fell suffocated to the ground. He was, however, able to get up in a few seconds, went out into the fresh air, and soon felt better. M. Beaubois had hardly left the laboratory when M. Giraud, aged eighteen, also fell to the ground, although, as it appears, he was standing several yards away from the apparatus. His fall was so violent that it was thought that he had been killed, and he was carried out into the courtyard, where, however, he soon regained consciousness. During more than an hour he walked about the court with the help of his friends, and appeared to have quite recovered. Towards three o'clock in the afternoon, however, he fainted again, and remained unconscious, apparently asleep. The doctor was sent for, and ordered his removal to the hospital, where his case received the greatest attention. He failed, however, to regain consciousness, and died at one o'clock on Friday morning.

Feminine Enterprise.—Women have in recent years adorned many spheres of activity. We have had lady doctors, lady lawyers, lady journalists, but, curiously enough, very few women seem to have gone into the industries. Yet there are some who are admirably fitted for this class of work, which requires not only energy and business capacity, but a spirit of enterprise and tact, qualities quite as strongly developed among the gentler sex as amongst men. The announcement that Madame Blanche Leigh, an English lady, had started an important soap factory in Paris, was received with much interest, not only by those who are watching the daily progress of the feminist movement, but also by the public to whom soap, this essential article of daily use, has always had a great attraction. When we think that there are few things about which the average woman is more particular than the soap she uses, and that nobody is better qualified than a woman to know women's requirements in this direction, it is surprising that up to the present there should never have been a lady manufacturer of soap. Yet, who is so well fitted to realise what delicate skins most need, especially when we take into consideration that nearly all the better soaps are made almost expressly for women. It is here that Madame Blanche Leigh has seen and seized her opportunity. An authority on skin treatment, as all Paris knows, she always found a difficulty in obtaining a soap which would not neutralise the beneficial effects of her creams and lotions, but, on the contrary, would materially aid their effects. She has, however, at last discovered a means of introducing into her specially-prepared paste a subtle something, best known to herself, which is the means of producing a soap superior to any yet on this market. Fired with the ardour of patriotism, she has responded to the "Hospital Ship Fund" demand for help, and her contribution has taken the form of 2,000 kilos of her excellent soap, whose merits are to be testified to by our brave soldiers now engaged in settling an account not of their own contracting. Lady Randolph Churchill, who knows both the soap and its giver, has requested it in bar form, and Madame Blanche Leigh has set to work to turn it out in the shape most acceptable upon this occasion. This is an example which many other soap firms might do well to follow. Not content with supplying the wants of the delicately-nurtured richer classes, she has thought of the woman of the people and of the tender skin of the infant, and is manufacturing soap that will benefit both rich and poor. From the lowest to the highest price there is no difference whatever in the purity or in the beneficial qualities of her soap.

Madame Blanche Leigh's Factory,

situated in the Rue de Lorraine, with its admirable and improved machinery by Messieurs Beyer Frères, is well worthy of a visit. Here our correspondent saw the blocks of rough soap subjected to the action of the so-called planing machine, which throws off the soap in the shape of very thin shavings, which then undergo the drying process. And it is here where may be seen in process of manufacture the bars of soap which ere long will be on their way to Tommy Atkins in South Africa. The grinding-machine next attracts attention. It is a machine of ingenious design, wherein the same paste is passed as many times as may be necessary between the cylinders, and at every passage a toothed cutter is made to divide the mass so as to secure a more perfect and thorough mixture. This same machine stretches and draws out the paste, prepares it for the "press," where it receives the shape into which the soap is to be moulded and the cakes receive the imprint, "Blanche Leigh Soap." Now the latter are taken to the packing-rooms, where rows of young girls in linen overalls are busy wrapping these dainty little cakes in delicate coverings, and placing them in boxes which will soon be on their way to all parts of the globe. And it may be remarked here that Madame Blanche Leigh, instead of employing the soft Japanese paper, which does not retain the perfume, envelopes each cake in thin parchment, a faithful reproduction of the writing paper used by Queen Marie Antoinette—a graceful tribute to the French Queen. In such skilled hands, and started under such favourable auspices, there is no doubt that before long "Blanche Leigh Soap" will become as popular in the palace as in the cottage—invaluable to rich and poor.

Formalin in Otorrhœa.—A. G. Cipriani finds that an injection of a one or two per cent. solution of formalin into the suppurating cavity affords the most successful means of treating otorrhœa. He reports a large number of cases, in which suppuration entirely disappeared, usually in about ten days, and did not recur. In some cases, the injection gave rise to pain. These were first anæsthetised with cocaine.—*Therapist*, **9**, 260.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. A. Sidney Campkin, J.P., M.P.S., will open the discussion on the Federation suggestion *re* "Company Pharmacy" on Friday, December 1, at a meeting of the Cambridge Pharmaceutical Association, to be held at the Bull Hotel, at 9.15 p.m.

Mr. George Seivwright, M.P.S., who has been elected—or rather re-elected after a time—to the office of Bailie in the Royal Burgh of Cullen, served his apprenticeship with the late Mr. Alexander, Aberchirder, subsequently serving for six years with Messrs. James Sim and Co., Aberdeen, and with Messrs. Barron, Harveys, London. About the year 1867 he took over the business of the late Mr. Lumsden, of Cullen, which he has since carried on. In 1878 Mr. Seivwright entered the Town Council and has served almost continuously up to the present time. For many years he was a member of the Parochial Board, and also the Harbour Board, and is still a member of the Parish Council.

Bailie Young, chemist, of Elgin, at a meeting of the Town Council on November 10, was unanimously elected to the Provostship.

Mr. Robert Hall, M.P.S., of Woodside, Aberdeen, was appointed one of the Justices of the Peace, at the creation of Aberdeen as the county of a city, on November 15 last, by reason of his connection with, and services to, the City of Aberdeen.

Mr. G. J. Shepherd, wholesale druggist, Aberdeen, was also appointed a Justice of the Peace at the same time and for similar reason.

THE PURITY OF FOOD AND DRUGS.

Calcined Magnesia.—At Tottenham police-court on Thursday, November 15, Charles Shepherd, 128, Myddleton Road, Bowes Park, was summoned for selling as light calcined magnesia an article which consisted of 50 per cent. of light calcined magnesia, and 50 per cent. of light carbonate of magnesia. For the defence it was stated that the defendant, who was the manager of the business, did not dispute the analysis. The business, with a small portion of stock, was purchased last February from a Mr. Morris, and this magnesia was a part of the old stock. Having no reason to doubt that there was anything wrong with it, he had not had it analysed. He, therefore, claimed to have the summons dismissed under Section 5 of the Act. The Bench said that Section did not apply to the case, and imposed a fine of 5s. and costs, including the analyst's fee.

Reports of Public Analysts:—*Durham.*—The Chief Inspector under the Food and Drugs Act reports that during the past quarter 181 samples of food and drugs were submitted to Mr. W. Keating-Stock, public analyst for the county. In two prosecutions for adulterated camphorated oil the full penalty of £20 and costs was inflicted in each case.——*Gloucestershire.*—Mr. G. Embrey, county analyst, reports that he has examined forty-three samples of perishable foods in order to ascertain how many contained preservatives and the nature of such preservatives. Mr. Embrey states that in his opinion the best method for preserving milk and cream is to observe the greatest cleanliness in regard to the vessels used in storage. As to chemical preservatives, salicylic acid is undoubtedly bad, and boric acid should only be used in small quantities, and even then it is objectionable. Formalin is very efficient even in small quantities, but very little is known as to its effect on digestion.——*West Riding of Yorkshire.*—In his quarterly report, Mr. Alfred H. Allen, F.I C., states that during the quarter ending March 31, 686 samples of food and drugs were examined by him. Of 37 samples of camphorated oil, 20 were deficient in camphor to the extent of 17.5 per cent. In several of the samples mineral oil had more or less replaced olive oil. Mr. Allen is of opinion that the numerous variations from the standard quality are intentional, or due to gross carelessness in the preparation of

the article, and that there is no foundation for the statement sometimes urged in mitigation of the offence that the preparation is liable to deteriorate on keeping, owing to the volatility of the contained camphor. Of sixteen samples purchased as milk of sulphur only three were genuine, the remaining thirteen containing from 57 to 79 per cent. of hydrated calcium sulphate. Of six samples of Gregory's powder three were adulterated, the calcined magnesia being replaced by magnesium carbonate. Two samples of spirit of sal volatile were adulterated. One of the samples contained only two-thirds of the amount of active ingredients (ammonia and ammonium carbonate) required by the B.P. In this case it was pleaded for the defence that the sal volatile had lost its strength by repeated openings of the bottle containing it, and that this was indicated by the lower specific gravity (0·8859) which had been reported in the certificate, as compared with the specific gravity (0·888 to 0·893) required by the B.P. But as Mr. Allen points out, any accidental or unavoidable loss of either alcohol or ammonia caused by opening the bottle would obviously tend to increase the gravity instead of diminishing it, so that the explanation put forward for the defence had no foundation. However, the magistrates dismissed the summons.

POISONING CASES.

CARBOLIC ACID.—On Tuesday, November 14, William Edward Bainting (aged one year and seven months), son of William Bainting, fisherman, of 10, Hamilton Street, Grimsby, died from the effects of carbolic acid poisoning. Deceased got a glass jar containing carbolic acid and drank some of the contents.——At Banbury, on Friday, November 17, an inquest was held with respect to the death of Mrs. Louisa Clarke, wife of Mr. Francis Clarke, seedsman, and daughter of a member of the Banbury Town Council. It appears that deceased, who was separated from her husband, went to a chemist's shop and asked for a bottle of carbolic acid, but as she had asked one of the assistants in an undertone how much it would take to kill a person, the chemist refused to supply her. She then went to another chemist and purchased a ten ounce bottle of the acid. She then went home and drank nearly the whole of the contents.—A verdict of "Suicide while of unsound mind" was returned.——In the case of Elizabeth Barker (55), wife of Richard Barker, schoolmaster, Caerphilly (Glamorgan), at an inquest held at the local police station on Tuesday, November 14, it was stated that she had been in the habit of drinking on and off for twenty years, and that on the previous Saturday she was drunk all day, and on the Sunday stayed in bed, as she felt ill. During the afternoon her son went into the bedroom and saw what he took to be carbolic acid in a jug by the bedside. He also noticed a brown bottle standing in a position from which he had previously removed a whisky bottle. As his mother appeared to be very ill, he sent for a doctor, but in spite of all efforts she died the same evening.—Dr. William Thomas stated that the cause of death was carbolic acid poisoning. He thought it should be stated that carbolic acid is one of the most virulent poisons. He made that statement because of the indiscriminate manner in which it is sold.—The jury found that deceased met her death by misadventure.——Another case of carbolic acid poisoning occurred at Hopkinstown (Glamorgan) on Saturday, November 11. It appeared from the evidence given at the inquest that Mrs. Mary H. Bodger (42), wife of a police constable in the town, taking advantage of her husband's absence at a funeral, sent a child to Pontypridd for carbolic acid. Soon after the child's return the other children in the house became alarmed at the pains which their mother was apparently experiencing, and ran to a neighbour's house for help. It then transpired that the woman had swallowed the carbolic acid with a fatal result.—The jury returned a verdict of "suicide committed whilst in a state of unsound mind."

Birth.

St. Cyr.—On October 25, 1899, the wife of E. L. Nelvil St. Cyr, M.P.S., pharmaceutical chemist, Aux Cayes (Hayti), West Indies, of a son.

Partnerships Dissolved.

(From the London Gazette.)

Stanley W. Marshall and Charles Rathbun, trading under the style of Stanley W. Marshall and Company, Dental Requisite Manufacturers, 57, Weymouth Street, London. Debts will be received and paid by Stanley W. Marshall.

William Henry Davidson and John McKerlie, Veterinary Surgeons, Hungerferd, Berks.

Charles Howard Strong and William Henry Hartley, Electro Medical and Surgical Institute, 18, Pall Mall East, London.

Receiving Order in Bankruptcy.

(From the London Gazette.)

Walter Williams, Veterinary Surgeon, George House, George Hill, Llandilo, Carmarthen.

Publications Received.

THE MEDICAL ANNUAL SYNOPTICAL INDEX TO REMEDIES AND DISEASES. (For the twelve years 1887 to 1898) Pp. xxiv + 411. Price 7s. 6d. net. Bristol: J. Wright and Co., 1899. From the Publisher.

CAVE'S CYLINDER REGISTER BOOK, by which at a glance the quantity of gas in stock may be ascertained. Price 4s. 6d. Southport: J. R. Cave, M.P.S., 52, Nevill Street, 1899. From the Publisher.

WELLCOME'S PHOTOGRAPHIC DIARY AND EXPOSURE RECORD, 1900. Price 1s. London: Burroughs, Wellcome and Co., Snow Hill Buildings, E.C. 1990. From the Publishers.

DER THERAPEUTISCHE WERTH DES CITROPHEN IN DER BEHANDLUNG GEWISSER NERVENKRANKHEITEN. Von Dr. J. W. FRIESER. Pp. 15. Reprinted from the 'Wiener Medizinische Presse.' 1899. Wien: Urban and Schwarzenberg, Maximilianstrasse 4. 1899. From the Publisher.

THE STORY OF THE WANDERINGS OF ATOMS. By M. M. PATTISON MUIR, M.A. Pp. 192. Price 1s. London: George Newnes, Limited, 7 to 12, Southampton Street, Strand, W.C. 1899. From the Publishers.

Calendar for the Week.

Sunday, Nov. 26. 26th after Trinity. Sun rises 7.37, sets 3.57.

Monday, Nov. 27. Sun rises 7.39, sets 3.56.

Tuesday, Nov. 28. Sun rises 7.40, sets 3.55.

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION, Blackburn.—Address by Dr. Riley Cunliffe on "Druggists and Drug Distribution."

ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—"Practical Three-colour Lantern Slide Making."

Wednesday, Nov. 29. Sun rises 7.42, sets 3.54.

NOTTINGHAM AND NOTTS. CHEMISTS' ASSOCIATION, Albert Hotel, Derby Road, at 8.30 p.m.—Smoking Concert and Social Evening.

PHARMACEUTICAL SOCIETY, 36, York Place, Edinburgh, at 8.30 p.m.—Evening Meeting; Inaugural Address by the Chairman of the North British Branch.

Thursday, Nov. 30. Sun rises 7.43, sets 3.53.

CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Paper by H. Hymans.

Friday, Dec. 1. Sun rises 7.45, sets 3.53.

CAMBRIDGE PHARMACEUTICAL ASSOCIATION, Bull Hotel, at 9.15 p.m.—A. Sidney Campkin will open the discussion on Company Pharmacy.

GLASGOW CHEMISTS' AND DRUGGISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—"Ambrose Pare and His Times," by Dr. J. Grant Andrew.

Saturday, Dec. 2. Sun rises 7.46, sets, 3.52.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

Thursday, November 23, 1899.

Business in Drugs and Chemicals has been somewhat disappointing during the past week, and there have been many complaints that so few orders were passing. Acid Carbolic continues very firm, with a further upward tendency, while it is expected that Salicylates and Salol will also follow the course of price of the raw material. Camphor is very firm, and a further advance in makers' quotation for the refined article would appear more than probable. Quicksilver has also been advanced in price, but so far, the makers of Mercurials have not followed suit. Thymol is very firm. Menthol excited at dearer price, and likely to still further advance. Cod Liver Oil firm. Quinine steady. Opium and Morphine quiet. Codeine very firm. Acid Citric dull. Acid Tartaric and Cream of Tartar steady. Bromides and Iodides unchanged. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE—Dull and weak at 9½d to 11d. per lb.

ACID BORACIC.—Crystals, 25s. ; powder, 27s. per cwt.

ACID CARBOLIC.—Very firm at the advanced price, the quotations being for 35° to 36° C. ice crystal in large bulk, 8¾d. to 9d. ; for 39° to 40° C., 9½d. to 9¾d. ; and 10½d. to 11d. for 39° to 40° C. detached crystals, B.P. quality ; and even at these high figures it would be difficult to place larger orders, especially for prompt delivery, some makers being sold out for months ahead. Crude, 60° F., 2s. 9d. per gallon ; 75° F., 3s. 6d. per gallon. Liquid, 95 to 98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon in 40-gallon casks; ditto, 25/30 per cent. of dark colour, 10d. to 11d. a gallon.

ACID CITRIC—Dull at 1s. 3d. to 1s. 3½d. per lb. for crystals, in 5 cwt. casks.

ACID TARTARIC—Is still quoted 1s. 1d. per lb. for English on the spot, and 1s. 0¼d. c.i.f. for foreign.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. ; Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. ; ditto commercial, 30s. per cwt. Sal Ammoniac: Firsts, 40s. per cwt. ; seconds, 38s. ; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate dearer. Gray prompt 24 per cent. London, £11 5s. Hull prompt, £11 2s. 6d. ; January-March, £11 7s. 6d. Leith prompt, £11 2s. 6d. Beckton prompt, nominally, £11. January to March, £11 7s. 6d. Beckton, terms prompt, £11. Sulpho-cyanide, 1s. 1d. to 1s. 2d. per lb.

BORAX.—Crystals, 16s. ; powder, 16s. 9d. per cwt.

CAMPHOR—Continues firm, but quiet. On the spot 200 cases Japan crude have been sold at 170s., China sellers at 160s. For arrival there are sellers near at hand of Japan at 165s., and China at 160s. c.f. and i. For refined makers prices remain unchanged at 2s. per lb. for Bells and Flowers in ton lots. An advance, however, is expected

CLOVES.—Privately Zanzibar dearer and in good demand, sales comprise spot at 3⅜d. ; Oct.-Dec. delivery at 3⅜d. ; Jan.-March, 3 7/16d. to 3½d. ; March-May, 3½d. At auction 81 bales Zanzibar offered, of which 75 bales sold at higher prices, middling rather dark at 3⅜d. Penang dull and easier, of 29 cases offered 19 sold, without reserve, good fair small picked at 5½d., ordinary small mixed dark 4⅛d. to 4¼d., good bright bought in at 7½d.

COCAINE.—There is a report that a further advance in makers' price for this article is impending. Their quotation remains, however, so far unaltered at 20s. 7d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins ; while second hand still offers in limited quantity at 19s. 6d. per oz. for some packing.

BROMIDES—Are firm at unchanged prices.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon ; pure, 2s. Benzole, 50 per cent., 10½d. per gallon ; 90 per cent., 8d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 6d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon ; 90 per cent. at 160°C., 1s. 4d. per gallon ; 90 per cent. at 190°C., 1s. 3d. per gallon ; 90 per cent., 9d. per gallon. Creosote, 3½d. per gallon. 34s. per ton, f.o.b. Tar, refined and crude, 12s 6d. per barrel, 2d. per gallon.

CODEINE—Very firm at 12s. 11d. to 13s. 6d. per oz. for the pure, and 1s. per oz. less for the salts.

CREAM OF TARTAR—Is still quoted 74s. per cwt. for first white crystals, 76s. for powder, and 77s. per cwt. for 95 per cent. ditto.

COD LIVER OIL—Continues steady at nominally unchanged price from last week.

CUBEBS—Are well held, and 24s. per cwt. is asked for fair quality.

GALLS.—The market for China remains firm ; spot scarce, and prices nominal. For arrival ordinary quoted 61s. 6d., and plums 66s. c.f. and i. Japan dearer, at 57s. 6d. to 59s. c.f. and i. Persian continue to be firmly held, which checks business ; blues now quoted 65s. to 70s. ; greens, 57s. 6d. to 60s. ; and white, 52s. 6d. to 53s. 6d. Morea and Smyrna quiet and unchanged.

GINGER.—Cochin, in moderate supply, was firmly held, and the small lots sold fetched better prices ; of 894 packages 140 sold, bold, some medium, roughly cut and scraped at 82s. ; small medium ditto, 50 to 50s. 6d. ; washed bright medium and small part lean at 27s. ; ditto but mouldy, 25s. ; dull, small, and medium, part shrivelled, rough and wormy, at 22s. ; good cuttings at 19s. Jamaica : 119 barrels offered and all bought in, except 3 barrels, which sold at 64s. for good middling.

GUM TRAGACANTH.—Fair sales of Persian kinds have been made at full prices. Medium qualities especially are in demand. Of Bagdad kinds the stock is very small, and the selection poor. The recent arrivals are not yet on the market.

MENTHOL.—Market is excited, and 10s. is asked for good dry white crystals, it being reported that an even higher price has been paid in Hamburg.

MERCURIALS.—So far the makers did not follow the advance in price of Quicksilver ; they still quote Calomel 3s. 1d. per lb., and Corrosive Sublimate 2s. 9d. per lb.

OILS (ESSENTIAL).—Peppermint: H. G. H. is quiet at 5s. 6d. per lb., whilst from the other side it is reported very firm. Japanese dementholised quoted 4s. per lb., and 40 per cent. 5s. 6d. per lb. Star Ainseed barely steady at 6s. 3d. per lb. Citronelle is dearer for arrival ; firm on the spot at 1s. per lb. Lemongrass firm, 3¼d. to 3⅜d. per oz. Santal. flav., 11s. 6d. per lb. Cubeb is firm and likely to be dearer ; present quotation 3s. 6d. per lb. Clove steady at 2s. 5d. per lb. Caraway: The English oil is very firm at the late advance to 6s. per lb. Lavender: English oil, 40s. per lb. Sassafras is wanted, and 2s. 2d. per lb. is nominal value.

OILS (FIXED) AND SPIRITS.—Linseed is lower. On the spot, pipes, London, £21 10s. to £21 15s. ; barrels, £21 15s. Hull, spot, naked, £21 5s. ; December £21 ; Jan.-April, £20 5s. ; May-Aug., £20 5s. Rape very firm, ordinary brown, on spot, £22 10s. ; December, £22 10s. ; Jan.-April, £22 10s. ; refined, spot, £24 ; Ravison, naked spot, £20 10s. ; Nov.-Dec., £20 10s. Cotton firmer ; London crude, spot, £16 12s. 6d. to £16 15s. ; Nov.-April, £16 12s. 6d. ; refined, spot, £18 5s. to £19 5s., according to make. Hull, naked, refined, spot, £16 7s. 6d. ; Nov.-April, £16 7s. 6d. ; crude, spot, £15 5s. ; Nov.-April, £15 5s. Olive—Mogador, £34 ; Spanish, £35 5s. ; Levant, £34 5s. Cocoanut quiet. Ceylon, on the spot, £25 10s. ; Cochin, spot, £29 10s. to £30 ; Mauritius, on spot, £25 10s. to £25, in hogsheads. Palm—Lagos, on the spot, quoted £26. Castor steady ; Belgian, first pressing, spot, £27 ; Jan.-June, £25 10s., f.o.b., Antwerp, second pressing, spot, 25 10s. per ton, ex-wharf. Hull, manufactured, guaranteed cold-drawn pure pharmaceutical oil, £29 10s. per ton in barrels, 3 9/16d. per lb. in cases. Pure firsts, £27 per ton, in barrels ; firsts, 3 3/16d. per lb., in cases, ex-wharf London. Lubricating Oil—Pale American, spot, 7s. to 9s. ; black, 6s. 3d. to 8s. ; Russian black, 5s. 6d. ; pale, 7s. to 8s. 6d. Petroleum Oil dearer ; spot Russion quoted 6¼d. to 6½d. ; American unchanged ; spot, 7⅛d. to 7¼d. ; water white, 8⅜d. to 8½d. Petroleum Spirit—American, 9¾d. ; deodorised, 10d. Turpentine dull ; American ,spot, 36s. 9d. to 36s. 10½d. ; July-Dec., 32s.

OPIUM.—The demand has continued slow, and little business has occurred, but holders are firm. A few sales have been made in "Druggists" and Soft Shipping at previous rates. Persian

remains firm at 12s. 3d. to 12s. 6d. for fine, with a small business passing.

OXALIC ACID—Is still quoted 3d. to 3⅛d. per lb. nett, free London, for spot delivery.

PHENACETINE—Unchanged at 3s. 3d. to 3s. 6d. per lb., according to quantity for both powder and crystals.

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt. Bichromate, 3½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, spot, London crystals, 3¾d; powder, 3⅞d. per lb. Iodide, 10s. 6d. per lb. Permanganate, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, Beckton make, 6⅞d.; other English makes, 7½d.; red, 1s. to 1s. 2d. per lb., according to quantity, etc.

QUICKSILVER.—Rothschild on Monday advanced his price 2s. 6d. per bottle to £9 10s. A still further advance in price is considered not unlikely. Second hand does not offer.

QUININE.—The market for best German brands is quiet, and no business of importance has occurred to-day, B&S and or Brunswick December delivery closing sellers at 1s. 2d., and March at 1s. 2¼d. The makers of these brands will only sell in quite limited quantity, and only to regular customers at 1s. 2d. per oz. for the sulphate for 1,000 oz. lots in 100 oz. tins.

SALICYLATES (ACID AND SODA)—Are so far unchanged in price, but in view of the altered position of acid carbolic an advance in makers' prices for Salicylates is considered inevitable.

SALOL—Is so far unchanged in price, and advance is, however, expected in consequence of the rise in price of acid carbolic.

SHELLAC.—The market in all positions remains quiet. On the spot moderate sales have been effected in TN Orange, ex the auctions, on a basis of 63s. to 64s. for fair to good, cash terms. Futures continue lifeless, and prices are nominal. At auction to-day the small supply was uninteresting, and with sellers holding for extreme prices only a few cases sold, Standard TN remaining at about 64s. for fair. A total of 383 cases were offered, and 23 cases sold. Second Orange: Of 177 cases 7 sold, fair bright worked at 63s., fine pale bought in at 76s., ditto block sold at 70s. Garnet: 17 cases common weak flat ruby bought in at 56s. Button: 189 cases offered and 16 sold, blocky BL1 at 65s. to 66s., the remainder (chiefly so-called pure) bought in.

SODA COMPOUNDS.—Crystals: barrels quoted 60s., in bags, 57s. 6d. Ash, £6 to £7 per ton, according to percentage, etc. Bicarbonate, landed, £7 5s. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic, 70 per cent. white, £10; 60 per cent., £1 less. Hyposulphate (Antichlor.) 6s. 6d. to 8s. 6d. per cwt., according to make, etc. Iodide, 11s. 10d. per lb. Nitrate on the spot, refined, £8; ordinary, £7 15s.

SPICES (VARIOUS).—Black Pepper: 361 bags Singapore bought in at 5¾d. to 5⅞d., also 60 bags Tellicherry at 6d.; 4 bags Ceylon sold, fair at 5½d. White Pepper: 280 bags Singapore bought in, fair to fine at 8⅞d. to 10d.; 81 bags fair Siam bought in at 8⅞d.; 10 bags Ceylon sold, good to fine small at 8⅞d. to 9⅛dfl Chillies firmly held: 122 bags Japan bought in at 44s. Capsicums firm: 2 bales Natal sold at 98s. for good red. Cinnamon quiet: Of 164 packages 47 bags Ceylon sold, coarse bark at 2½d. Mace quiet: 7 cases Penang bought in, fair red, part wormy, at 1s. 7d.; 40 packages West Indian sold, good pale at 1s. 8d. to 1s. 9d.; fair to good red, 1s. 4d. to 1s. 6d.; broken and pickings, 1s. 2d. to 1s. 3d. Nutmegs dull: 84 cases of Penang bought in, 80's to 81's at 1s. 8d., 91's at 1s. 5d., 109's at 1s. 1d.; 168 packages West Indian sold, 65's 2s. 1d., 71's 1s. 9d., 78's 1s. 6d., 84's 1s. 5d., 91's 1s. 2d., 108's to 114's 11d. to 11½d. Pimento dearer: Of 1,110 bags offered 369 sold, ordinary to fair at 3¼d. to 3½d.

STRAMONIUM SEEDS.—These have been in good demand for the United States, and are now very scarce. Price comes at 50s. per cwt., c.i.f.

SULPHONAL.—While the two known makers maintain their price of 17s. per lb. for both powder and crystals, there are still sellers in the market at 14s. to 14s. 6d. per lb., according to quantity.

THYMOL.—Market remains very firm, and there is very little obtainable, even at 10s. 3d. to 10s. 6d. per lb.

TURMERIC.—At auction 27 bags dull Madras finger offered and bought in. Privately business continues restricted, but prices are firm. Bengal now quoted 30s., Madras finger, fair to good bright, 35s. to 37s. 6d., and Cochin split bulbs at 12s.

VALERIAN ROOT.—37s. 6d. per cwt. has been paid for good root, and very little is obtainable at the price.

THURSDAY'S DRUG SALES.

To-day's Drug Sales consisted of an unusually large number of lots. Sennas sold at full prices, Asafetida of good quality sold cheaply. Palembang Gum Benzoin sold somewhat dearer. Cardamoms were easier, while Ipecacuanha showed a decline in value. The following are the particulars as far as it has been possible to procure same up to time of going to press:—

ALOES.—7 cases softish Zanzibar, part rather dark, sold at 52s. 6d. per cwt.; 22 boxes black Curaçoa sold at 20s. per cwt., subject to owner's confirmation. 11 cases fair hard bright Cape sold readily at 27s. to 28s. per cwt.

BALSAM COPAIBAE—3 casks fair Maranham taken out at 1s. 7d. per lb.

BALSAM PERU.—Four cases taken out at 8s. per lb.

BALSAM TOLU.—6 cases good sold cheaply at 1s. 3d. per lb.

BUCHU LEAVES.—One bale brownish yellow rounds realised the high price of 1s. per lb., another lot of three bales selling even dearer at 1s. 0½d. per lb., 9 bales poor longs sold subject to owner's owner's approval at 9d. per lb.

CARDAMOMS.—Medium Ceylon. Mysores realised 2s. 4d. per lb.; lower qualities, 1s. 10d. to 2s.; while fine fetched 2s. 9d. up to 3s. 4d. per lb. 2 cases wild Ceylon fetched 3s 8d. and 3s. 10d. per lb. respectively. Fair seed sold at 2s. 1d. to 2s. 3d. per lb., good ditto being held for 2s. 6d., a bid of 2s. 4d. per lb. being declined.

CAMPHOR.—23 cases Refined Japan were all bought in at 1s. 11d. per lb for 4-oz. tablets and 2s. per lb. for 1-oz. ditto, 100 cases China Crude at 170s. per cwt.

CASCARILLA BARK.—10 bales sorts bought in at 60s. per cwt.

CASTOR OIL.—60 cases good Italian were taken out at 4½d. per lb. 7 cases fair Calcutta firsts at 3¾d. per lb.

CASTORUM.—2 boxes were taken out at 72s. 6d. and 75s. per lb. respectively.

CHILLIES.—46 bales good Zanzibar were bought in at 75s. per cwt.

CINCHONA BARK.—Four bales Carthagena bought in at 4½d. per lb.

CIVET.—Five horns of only fair quality bought in at 10s. per lb.

COD LIVER OIL.—5 barrels Norwegian of only fair quality were taken out at 65s. per barrel; for another lot of 39 barrels of good quality a bid of 68s. per barrel was declined.

CUC CUS ROOT.—9 bales good red bought in at 21s. per cwt., very sandy ditto at 8s.

DRAGON'S BLOOD.—Fair reed, thick fingers, bought in at £10 per cwt. (only £7 10s. being bid); thin reeds were held for £11; dull lump for £9 10s.; good dark bright for £16; seedy lump for £12 10s.; and fair saucers for £10 per cwt. Zanzibar drop bought in at 80s. per cwt.

ERGOT OF RYE.—7 cases fair but somewhat lean Spanish held for 2s. 3d. per lb.

ESSENTIAL OILS.—Eight drums Citronelle taken out at 1s. per lb., twelve cases at 1s. 1d., seven cases Commercial Oil Eucalyptus, somewhat dark in colour, were bought in at 10d. per lb. Twenty-eight cases Oil Lemongrass at 3⅜d. per oz, one case West Indian Oil of Limes at 3s. per lb., thirty-one cases Cajeputa at 3s., ten cases Dementholised Japan Oil Peppermint at 3s. 9d. per lb., another lot Kobayastic brand at 4s. per lb.

GAMBOGE.—11 cases sold at £8 2s. 6d. per cwt. for fair bright softish down to £7 for good pickings, and £6 7s. 6d. per cwt. for dull ditto. Another lot of medium bright pickings bought in at £8 15s. per cwt.

GUM ARABIC.—10 bales Turkey sorts bought in at 72s. 6d. per cwt.

GUM ASAFETIDA.—69 cases were all bought in at 22s. 6d. to 65s. per cwt. according to quality. Another lot of 70 cases all sold at 45s. to 50s. for good grey almondy block, up to 72s. per cwt. for good greyish blocky almonds.

GUM BENZOIN.—Fine Sumatra seconds were held for £9 to £9 5s. per cwt., fair ditto selling at £7 15s., common ditto at £5. Good small almondy Siam realised £12, down to 67s. 6d. per cwt. for dark seedy block.

GUM GUAIACUM.—1 case sold at 10d. per lb. subject to owner's approval.

GUM KINO.—3 cases good Cochin bought in at 2s. per lb., 1 case African at 2s. 6d.

GUM MYRRH.—17 packages were bought in at 30s. per cwt. for common pickings, and 25s. to 37s. 6d. per cwt. for common sorts.

HONEY.—24 cases Australian were bought in at 24s. per cwt. 26 packages Jamaica practically all sold at 27s. for fine white, down to 23s. for less desirable quality.

IPECACUANHA.—One bale Carthagena ICCD sold at 9s. 9d. per lb.; other lots sold cheaper at 9s. Rio also sold at a decided decline at 13s. down to 12s. 1d. per lb.

KAMALA.—6 cases very dusty dull bought in at 5d. per lb.

KOLA NUTS.—100 bags African bought in at 2½d. to 3d. per lb., a bid of 1¾d. per lb. for 20 bags being declined.

LIQUORICE ROOT.—1 bale rough decorticated was bought in at 30s. per cwt.

MENTHOL.—2 cases Kobayashi brand bought in at 10s. per lb., a bid of 9s. being refused.

ORRIS ROOT.—9 packages Mogador sold freely at 22s. to 23s. per cwt., 13 bags medium Florentine sorts bought in at 47s. per cwt.

OTTO OF ROSES.—2 Vases of only fair quality were bought in.

PATCHOULY LEAVES.—6 packages were bought in at 3½d. to 5½d. per lb., according to quality.

RHUBARB.—Fair round and flat Canton was bought in at 1s. 1d. per lb.; bold round ditto at 1s. 2d.; rough horny high dried at 5¼d. to 6d.; medium to good small ditto at 9½d. to 1s.; pale-coated round Shensi at 1s. 2d. to 1s. 5d.; flat ditto at 1s. 4d. to 1s. 6d.; ditto round and flat mixed, showing dark fracture, at 1s. per lb.

SARSAPARILLA.—35 bales Lima sold readily at 10d. per lb., 2 lots C., damaged, fetching 9d. and 9½d. per lb. respectively. 5 serons good Honduras taken out at 1s. 6d. per lb. 27 bales Jamaica sold freely at 1s. 8d. per lb. down to 1s. 5d. per lb. for the less desirable lots.

SENNA.—Of 57 packages Tinnivelly the greater part sold at prices varying from 3¾d. to 6d. per lb., according to quality, comparatively full rates being paid for only medium leaf.

SOY.—20 casks China taken out at 1s. 3d. per gallon.

TAMARINDS.—60 packages East Indian were taken out at 10s. 6d. per cwt. in cases and 8s. per cwt. in mats.

WAX.—Fair to good Zanzibar sold at £6 10s. to £6 17s. 6d. per cwt., fair to good Jamaica at £6 5s. to £7, fair Madagascar at £6 2s. 6d. to £6 5s., fair Australian at £6 15s. per cwt. 1 cask Mogador bought in, a bid of 75s. per cwt. being declined. 24 bags good grey Carnauba were bought in at 60s. per cwt., 5 cases Japan at 32s. 6d. per cwt.

WOOD OIL (GURJUN BALSAM).—Five casks bought in at 28s. per cwt.

Newcastle-on-Tyne Chemical Report.

November 22, 1899.

This market is still very firm. Makers of heavy goods are practically sold fully up to the end of the year for most articles of production, and quotations at present are merely nominal. For next year's contracts higher figures are ruling, owing to dearer coals and other crude produce. Quotations are:—Bleaching Powder, £6 5s. to £6 10s. Soda Crystals, 55s. to 57s. 6d. Caustic Soda, 70 per cent., £9 to £9 5s. Alkali, 52 per cent., £5 10s. to £5 15s. Soda Ash, 52 per cent., £5. Sulphur, £5 per ton.

Manchester Chemical Report.

November 22, 1899.

The upward movement in heavy chemicals continues, and the demand for finer qualities used in the textile industries is also especially good. This is greatly accentuated by the general state of trade in the district, and merchants have been again notified that firm quotations at present rates only hold good when accepted by the manufacturers. Bleaching Powder is now quoted at £6 per ton, soft wood casks, on rails at works, with usual addition for hard woods f.o.b. Liverpool. There is nothing new to note in the position of Glycerin, which continues rather dull. Ammonia Alkali, 58 per cent., is firm at £4 7s. 6d. per ton, on rails. Chlorates of Potash and Soda are quiet. Brown Acetate of Lime is in strong request at £6 5s. per ton, Welsh and American, Manchester. Yellow Prussiate has had a turn for the better, and is scarce at 8d. to 8¼d. Sulphate of Oopper is rather at £25 5s. to £25 10s. per ton, best brands, delivered Manchester. White Powdered Arsenic is firm at £19 10s. per ton, ex ship, Garston. There appears to be a better feeling in coal tar products, and the heavy advance in Carbolic Acid is well maintained. The direct oil trade with the Ship Canal is reviving, and a large part of one cargo consigned to the Manchester Corporation will be used for the purpose of gas enrichment.

Liverpool Market Report.

November 22, 1899.

Business has been good generally, with no great alterations in price to report, and an improved demand in certain articles. Seeds are better in tone as regards Linseed, which has become steadier, and easier in the case of Canaryseed, which has improved in demand, with fair sales effected. In Oils, the only alterations are higher prices for Olive, and a drop in Spirits of Turpentine. Chemicals still continue brisk, and Caustic Soda, Bleaching Powder, and Soda Crystals are very firm.

AMMONIA SULPHATE—Is dearer, £10 17s. 6d. per ton.

BEESWAX.—Six blocks of Sierra Leone, at £6 per cwt.

CANARYSEED.—A moderate business has been doing at easier but firm rates. 200 bags of Turkish, at 35s. 6d. per 464 lbs.; 100 at 36s.; and 280 bags at 35s. 9d. per 464 lbs.

CARNAUBA WAX.—50 bags of fine yellow made 71s. 6d. per cwt.

COPPER SULPHATE—Is very dull at £24 15s. to £25 per ton.

COPPERAS—Is firm. Welsh, 37s. 6d. per ton; Lancashire, 39s. per ton.

LIME, CHLORINATED—Very firm, £5 15s. per ton.

LINSEED—Has recovered in tone after the recent fall. River Plate is quoted at 40s. 9d. to 40s. per 416 lbs., forward December to February. Calcutta, 4 per cent., November and December, 45s. 6d. per 416 lbs. North American, 45s. 3d. per 424 lbs.

OILS (FIXED) AND SPIRITS.—Castor Oils are quiet with sales of 100 cases of Calcutta, ex quay, at 3d. per lb., and small sales, ex store, at $3\frac{1}{32}$d. per lb. French, 1st pressure, has moved off in small parcels at $2\frac{13}{16}$d. to 2⅞d.; 2nd pressure at 2⅝d. per lb. Madras, $2\frac{13}{16}$d. per lb. Olive is very high in price with a consequent small amount of business doing in Spanish oils at £36 to £36 10s. per tun on the spot. Linseed oils of Liverpool make are unaltered at 23s. 6d. to 24s. per cwt. Cotton-seed oil, Liverpool refined, is held firmly at 19s. to 19s. 6d. per cwt. Spirits of Turpentine have fallen in price to 38s. 3d. per cwt., with a fair business doing.

POTASH SALTS.—Cream of Tartar is steady with small sales of Oporto, 95 per cent., at 75s. per cwt. Potashes still firm at 24s. 6d. to 24s. 9d. per cwt. Pearlashes, 32s. per cwt.

SODA SALTS.—Bicarbonote, £6 5s. to £6 15s. per ton. Borax, £16 to £16 10s. per ton. Crystals, £3 5s. per ton. Caustic, 76 and 77 per cent., £10 per ton. Nitrate slow of sale, 7s. 9d. to 8s. per cwt.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for.

Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C.

Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London, W.C.

Articles and Reports sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

Correspondents should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

Drawings for Illustrations should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

Names and Formulæ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

Reprints of Articles cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Abram, Bartlett, Bennison, Branch, Carter, Cave, Cummings, Davy, Donald, Dunford, Eberlin, Edwards, Essam, Forster, Fraser, Gibson, Hall, Hill, Hogg, Jones, M'Intosh, Mackerith, Mason, Newsholme, Phillips, Reid, Ring, Rix, Sargeant, Thorp, Tilley, Walker, Wallace, Wallis, Weddell, White, Woods.

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

What Offers? 9 years' *C. & D.* and 10 years' *P. J.*; or exchange for saleable patents.—Rowe, Chemist, Starcross.

Moulds.—Suppository, Pessary, Bougie, Capsule; Maw's patterns.—Warnes, 333, Gray's Inn Road, W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Pharmaceutical Journals: Volumes 17 to 25, inclusive, bound; 1895 to 1899, inclusive. P.J. posted weekly. Offers wanted.—Telescope cost £3, accept 30s.—Dunning, Ventnor.

Pharmaceutical Journal. A complete set, from 1841. First 29 volumes bound, perfect condition; remainder unbound, quite clean. Offers.—Elliott, Chemist, Gateshead.

Otto Roses, virgin, ounce bottle, original (gilt), 25s. Lavender Oil, Mitcham 1896, 1b. original bottle, capsuled, 25s., postage free.—Warnes, 333, Gray's Inn Road, W.C.

Christmas Decorations. Very best special White Glass Frost, 1 lb., full weight, posted, 1s. 7d.; 2 lbs., 2s. 11d.; 7 lbs., 9s. More satisfactory full weight.—Foster, 80, Navigation Street, Birmingham.

Good Second-hand, Hand Painted Lantern Slides, to clear, 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c. Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Formula suiting toilet or other speciality.—W. Lewis, 15, Shelden St., London, W.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

A set of "The Year Book of Pharmacy," also a set of "American Journal of Pharmacy" for the last ten years.—Moor, Analyst, Exeter.

Old Druggists' Crockery-ware wanted. Blue and white Syrup Jars, Ointment Pots, Oil Vases, and other Pharmaceutical Antiquities.—John Austen, Pharmaceutical Chemist, Dore, near Sheffield.

Advertisements.

(Received too late for Classification.)

MAIDSTONE. A competent ASSISTANT (indoors), age about 22.—Apply, stating age, height, references (2 last), and photo, to be returned, FARDON & Co., Maidstone.

ABROAD.—First-rate Minor Man wanted for eminent Wholesale and Retail house. Permanent engagement. Excellent opportunity for intelligent, energetic man. Liberal terms.—PRESCRIBER, "Pharm. Journal" Office, 5, Serle St., London, W.C.

THE COMPANY PHARMACY PROBLEM.

Since the beginning of October, when the winter session opened, a number of local pharmaceutical associations have passed definite resolutions on the subject of company pharmacy.

Restriction of Titles to Individuals.

The following twenty-one associations are agreed with regard to the necessity of restricting the assumption and use of chemists' titles to individuals registered under the Pharmacy Acts :—

Birkenhead Pharmaceutical Association,
Blackpool and District Chemists' Association,
Bradford and District Chemists' Association,
Bristol Pharmaceutical Association,
Burnley and District Chemists' Association,
Colchester Chemists' Association,
Derby and District Chemists' Association,
Dewsbury and District Chemists' Association,
Forfarshire and District Chemists' Association,
Great Yarmouth Chemists' Association,
Halifax and District Chemists' Association,
Newcastle-on-Tyne and District Chemists' Association,
North-East Lancashire Chemists' Association,
North Staffordshire Chemists' and Druggists' Association,
Nottingham and Notts. Chemists' Association,
Plymouth, Devonport, Stonehouse and District Chemists' Association
Preston Chemists' Association,
Sheffield Pharmaceutical and Chemical Society,
Swansea and District Chemists' and Druggists' Association,
Wolverhampton Pharmaceutical Association,
Wrexham and District Chemists' Association.

Restriction of Dispensing and Sale of Poisons.

The following fifteen associations would prohibit the retailing, dispensing, of compounding of scheduled poisons by companies of unregistered persons :—

Birkenhead.	Nottingham.
Blackpool.	North Staffordshire.
Bristol.	Plymouth.
Dewsbury.	Preston.
Forfarshire.	Sheffield.
Newcastle-on-Tyne.	Swansea.
North-East Lancashire.	Wolverhampton.

Wrexham.

The North-East Lancashire Chemists' Association would prohibit the retailing, dispensing, or compounding of poisons by *all* companies, whether consisting of registered persons or not. The North Staffordshire Chemists' and Druggists' Association would entirely prohibit the practice of pharmacy by companies of unregistered persons.

Registered Persons as Directors.

The following six associations would permit companies to retail and dispense scheduled poisons if the directors were registered persons :—

Bradford.	Derby.
Burnley.	Great Yarmouth.
Colchester.	Halifax.

The Bradford, Colchester, and Derby Associations stipulate, in addition, that each shop should be in charge of a registered chemist.

Associations not yet Decided.

The following thirty-one Associations do not appear to have passed any resolutions on the subject during the present session:—

Aberdeen and North of Scotland Society of Chemists and Druggists.
Bolton Pharmaceutical Association,
Bournemouth and District Pharmaceutical Association.
Brighton Association of Pharmacy.
Cambridge Pharmaceutical Association.
Chester Chemists' Association.
Dover Chemists' Association.
Dumfries and Maxwelltown Chemists' Association.
East Aberdeenshire Chemists' Association.
Edinburgh District Chemists' Trade Association.
Exeter Association of Chemists' and Druggists.
Glasgow and West of Scotland Pharmaceutical Association.
Grimsby and District Chemists' and Druggists' Association.
Hastings and St. Leonards Chemists' Association.
Hull Chemists' Association.
Inverness Chemists' Association.
Leeds Chemists' Association.
Leicester Chemists' Social Union.
Liverpool Chemists' Association.
Manchester Pharmaceutical Association.
Midland Pharmaceutical Association.
Newport and Monmouthshire Chemists' Association,
Northwich Chemists' Association.
Oxford Chemists' Association.
Scarborough Chemists' Association.
Southampton Chemists' Association.
Streatham and District Chemists' Association.
Sunderland Chemists' Association.
Tunbridge Wells and District Chemists' Association,
Western Chemists' Association (of London).
Windsor and District Chemists' Association.

Several associations in the last list have discussed the company-pharmacy problem at one time or another, and the Editor will be glad to hear from any which have recently adopted resolutions specifically dealing with the assumption and use of chemists' titles by companies, or the retailing, dispensing, or compounding of scheduled poisons by companies of unregistered persons.

Bristol Pharmaceutical Association.—A meeting of members was held at University College, on Friday, November 24, to discuss "the recent decision of the Council of the Pharmaceutical Society on the companies question," Mr. G. T. Turner, the President, in the chair, who reminded the meeting of resolutions passed in December, 1898, at which it was resolved to support the Pharmaceutical Society in its efforts to obtain legislation on the principle of personal proprietory of all retail shops and the abandonment of the Widows' Clause. Mr. Turner thought this was the most critical time in the history of their body. He contended that the whole foundation of the Pharmacy Act was that of personal qualification of the owner of the shop. They did not ask for monoply of trade, but having spent money and effort in obtaining a legal qualification, he thought it was monstrous to give away, as some seemed inclined to, their legal titles and position. He, for one, was prepared to fight for their rights and privileges.

Mr. Matthews thought that if the members of the trade throughout the country could be consulted there would be no diversity of opinion amongst them. He thought that some members of the Law and Parliamentary Committee were afraid to act upon the principle of the Act, which was that of personal qualification ; they were more anxious to please the legal profession than to act for the benefit of the whole trade. If chemists once recognised companies as legally entitled to call themselves chemists, etc., any advantage thus possessed as qualified men would be gone for ever. He also thought that if companies were allowed to take this position it would not be long before other unqualified individuals also would set up a chemist's department.

Mr. Plumley was strongly opposed to companies aping chemists' titles.

Mr. Allen thought there should be no compromise whatever with companies.

Mr. Ritchford alluded to the very limited control the assistant had in a company business. He believed that the public at large as well as the House of Commons would listen to representations made to them of the unreasonableness of companies of unqualified persons being able to do what was illegal for individuals to do.

After further discussion the following resolutions were unanimously passed :—

That the titles of registered chemists ought to be protected, and that it should be illegal for companies of unregistered persons to use the title of chemists, or keep open shop for retailing and dispensing of scheduled poisons, as in the case of individuals, and that this meeting deeply regrets the action taken by the majority of the Council, and thereby expresses its want of confidence in them.

In regard to any contravention of the Medical, the Dental, or the Pharmacy Act. . . . . a company or other corporation shall be deemed to be a person, and shall in all respects be subject to the liabilities attaching to a natural person who infringes the provisions of those Acts, or either of them.

Nottingham and Notts Chemists' Association.—The opening meeting of the session was held at the Albert Hotel on Wednesday evening, November 29, and took the form of a smoking concert. The chair was occupied by Mr. Councillor FitzHugh, J.P., who was supported, amongst others, by Messrs. Middleton, Gascoyne (Councillor Cook), T. Wilson, W. Gill. The Vice-President, Mr. R. H. Beverley, was unavoidably absent through indisposition. At the opening of the meeting nine new members were elected, and although the gathering was of a festal character, the time was felt to be an opportune one to pass a resolution relative to company pharmacy. Mr. W. Gill proposed, and Mr. F. Ross Sergeant (local secretary) seconded the following, which was unanimously carried :—

This meeting of the chemists of Nottingham and district is of opinion that a strong effort should be made to obtain in the Companies Bill the insertion of a clause which will protect chemists' titles, and make it illegal for companies of unregistered persons to keep open shop for selling and dispensing poisons as in the case of individuals.

The concert, which was a most enjoyable affair, was contributed to by the following gentlemen:—Messrs. Parkes, Clarke, Proctor, J. H. Wilford, Clarke, jun., Thompson, and Martin.

PHARMACEUTICAL CHEMISTS AND COMPANIES.—The following letter appeared in the *British Medical Journal* last week:—"SIR,—As one who has for some time taken a great interest in the difficulties that chemists have to contend with, I was pleased to read the article in the *British Medical Journal* of November 11 on pharmaceutical chemists and companies. Since the discussion on pharmacy and company law started great changes of opinion have occurred, not the least important of which has been the clearing away of the impression that chemists held—namely, that it was no good looking to the medical profession for any active assistance. Your article must banish that idea for ever, for, as you so ably put it, 'It is clear on all sides that the protection afforded to the public by preserving a proper significance to titles must not be weakened.' The fight for protection of title is as much medical as pharmaceutical. If gained at the expense of chemists it is but a lever with which to attack, first veterinary surgeons and dentists; then our own titles would become the object of capitalistic combinations. The only ground of dispute is, How should such titles be protected best? I have no hesitation in saying my opinion is with the minority of the Pharmaceutical Council. The Lord Chancellor says distinctly that individual qualification and company pharmacy will not cohere. Why, if this be true, should anyone attempt that which is impossible? If chemists cannot maintain their titles, rights, and privileges without giving up rights under the Limited Liability Acts, there is only one position they can logically occupy—that is, alongside of others who depend on qualification—to decline to avail themselves of the right to form limited liability companies. Hard as this position may seem to some, it is the only one which will adequately protect their title. Attempts in any other direction are foredoomed to failure. Questions of qualified directorate, or even of qualified shareholders, if admitted, are unworkable, and if attempted could only work for a few years; then by death the interest would be transferred to the unqualified, and the whole question would again crop up, to be dealt with at a greater disadvantage than even now. The great risk at the present time is that the Pharmaceutical Council should be inclined to barter away the rights of qualification. Should they do so a compromise might be forced upon them; but if chemists could be unanimous in declining to deal at all with company pharmacy I cannot believe that Parliament would force it on them in face of their opposition, backed up by strong expressions of opinion from the medical world.—RILEY CUNLIFFE, M.B., C.M., *Blackburn, November* 11, 1899."

THE LAY PRESS ON COMPANY PHARMACY.—The *Tonbridge, Tunbridge Wells, and Sevenoaks Free Press* of November 25 has the following pertinent comments on the company pharmacy problem:—"That 'the law is a hass' was the dictum of Dickens, and the truth of the saying is pretty constantly forcing itself upon one's attention. It has recently presented itself before the people of Tonbridge, for instance, in connection with the opening of a new chemist's shop by a company. With regard to that particular calling—than which no business or profession holds so much in its hands the health and life of its customers—the law allows a number of individuals, if they form themselves into a company, to do that which none of them individually may do. The compounding and sale of drugs and preparations which contain poison is rightly hedged about with many restrictions for the protection of life, and no man individually may sell poisons, or make up prescriptions which contain them, until he has been subjected to long and costly training, and has passed a series of severe examination tests. And yet—such is the stupidity of the law—if any number of unqualified individuals (seven is enough) choose to form themselves into a company, either bogus or real, and undertake in their corporate capacity the sale of drugs, they may with impunity do that which either of them individually would incur severe pains and penalties for doing. The company which has now honoured Tonbridge with its presence is a striking case in point. It consists of thirty-four individuals, many of them females and clergymen (and one of them a printer), but not one of the thirty-four is a qualified chemist. One of the original shareholders, when the company was formed in 1883, was a chemist and druggist, and had an eight thousand pounds' interest in the concern, but his name disappeared from the list three years later. And as far as management goes, the company is pretty well a one-man affair, an extraordinary meeting having been held two years ago to decide that 'two directors shall form a quorum.' We thought it would be of general interest just now to glean these particulars at Somerset House and the Pharmaceutical Society, because it does seem a scandal and a shame that the law should allow so delicate and dangerous a business to be carried on by unqualified men, if only they will constitute themselves into a company."

ENGLISH NEWS.

PHARMACY ACT CASE.—At the Mansion House, London, on Thursday, November 30, in the case of the Pharmaceutical Society *v.* Wrench and Co., Limited, three summonses were heard, viz., for (1) selling a poisonous vegetable alkaloid, called nicotine, contained in bottle not distinctly labelled with the name of the article and the word poison—penalty imposed £5, with 10 guineas costs; (2) not making the required entry in the poisons book—penalty 10s.; (3) the purchaser not being introduced to the seller by some person known to the latter—penalty 10s. Case granted for the High Court.

SHEFFIELD PHARMACEUTICAL SOCIETY.—The second annual smoking concert of this Society was held at the Wharncliffe Hotel, Sheffield, on Thursday evening, November 23, and was very successful and enjoyable. Mr. G. Squire presided over a good attendance, and a capital musical programme was presented, the contributors being Mr. Ernest Dale (character humorist), Dr. Sorley, Mr. Austen, Mr. J. C. Gibson, Mr. Hardcastle, Mr. Percival, Mr. Skinner, Mr. C. Ellis, and Mr. C. F. Carr, with Mr. Elliott at the piano.

METROPOLITAN COLLEGE OF PHARMACY.—The sixth annual dinner in connection with this College was held in the Royal Venetian Chamber, Holborn Restaurant, on Saturday, November 25, Mr. G. Claridge Druce, of Oxford, in the chair. The event was a complete success; there was a good dinner, genial company (numbering nearly 300), an excellent entertainment, an efficient chairman, and a generous host (Mr. W. Watson Will). Apart from the speeches, the programme was principally patriotic and Scotch, hence it goes without saying that there was no lack of enthusiasm.—After the toast of "The Queen," the Chairman in proposing "The Metropolitan College of Pharmacy," addressed his young brothers in the craft on the subject of pharmaceutical education. In the course of his remarks he alleged that in recent years the examinations had become more and more difficult, on account of the subordination of purely pharmaceutical subjects in favour of the scientific. He thought this was a mistake, as the real purpose of the examinations ought to be to produce as good pharmacists as possible, and in order to do this, greater attention should be given to technical matters, and less to the purely scientific. He then went on to advocate the desirability of a division of the Minor examination; touched upon the good work done by pharmacists in the past—such as Scheeley, Daniel Hanbury, and others—and urged his young friends to devote a portion of their energies to the study of some particular subject and to make it their life-work; referred to the modern joint-stock business methods as likely to crush out the old class of chemists who were wont to take an active interest in the conduct of municipal affairs, and to implant in their place branch managers whose sole interest will be to draw their salaries, leaving public affairs to take care of themselves so far as they are concerned; and concluded by offering a word of encouragement to those who have yet to qualify for the title "chemist."—Mr. Watson Will replied. He thought the Chairman had hit the nail on the head in his reference to the examinations.—The Chairman then distributed the medals and certificates to the successful students, the silver medallists being:—F. T. Roper, William S. Flick, and David J. Williams; bronze medallists (chemistry), O. C. M. Davis, T. T. Richards, G. A. Cawkwell; (pharmacy), O. C. M. Davis, W. V. Westlake, W. R. B. Arnold; (botany) O. C. M. Davis, G. W. French, F. Pickles; (materia medica) O. C. M. Davis, S. W. Wallis, W. J. Thomas; (dispensing) G. W. French, T. T. Richards, and M. A. H. Barley.—The toast of "The Demonstrators" was next proposed in a very complimentary speech by Mr. A. Brooke Britton.—Messrs. G. T. Branch, H. Lucas, and F. F. de Morgan replied. The former referred to his departure from the College in the near future, while Mr. Lucas and Mr. de Morgan advised the students present to apply a little common-sense to their studies.—Mr. Thomas Tyrer, in proposing the toast of "The Students," said he felt as much a boy as any of them, and went on to recommend to the students the advice given to him by his father when starting out in life, viz., "Don't be a fool." The essence of success in their particular calling was "accuracy," he therefore urged them to be careful and observant.—Mr. H. L. Ironmonger responded for the students in a clear and deliberate manner. The work and worries of a chemist's assistant, he said, were really greater than many people imagined. However, other people had gone through that period successfully and he did

not see why they—the present students—should not if they stick to their work. They were all sorry to learn that Mr. Branch was leaving them, but wished him every success in his future career. —Other toasts were "The Visitors," proposed by Mr. Watson Will and responded to by Captain David Peters, and "The Chairman" proposed by Dr. F. B. Power.—A most enjoyable evening was brought to a conclusion by the singing of "Auld Lang Syne."

The B.P. as a Standard for Drugs.—At the invitation of Mr. P. F. Rowsell, president of the local association, the chemists of Exeter assembled at Lion House, St. Thomas, on Tuesday last to meet Mr. C. G. Moor, M.A., F.I.C., F.C.S., the City Analyst for Exeter. Mr. and Mrs. Rowsell welcomed the guests, and after an excellent repast an interesting and instructive discussion took place in relation to pharmaceutical matters, particularly on the question of the B.P. as a standard for drugs.—Mr. Moor said his object was to promote their general interests so that there should be no unnecessary friction in the carrying out of their several duties. With regard to the question of the standard of drugs he read a paper on "Suggested Standards of Purity for Foods and Drugs" at the B.P.C., at Plymouth, in July last, but they were then told by Dr. Attfield that the British Pharmacopœia was not a legal standard under the Food and Drugs Act. They all knew that it was not a legalised standard, but it was practically accepted in Courts of Justice by magistrates as a legalised standard, so that for all intents and purposes it was a legalised standard. The fact, however, that it was not strictly a legalised standard was rather a benefit than otherwise, because if it were legalised they would be bound to carry out all processes and details according to the letter of the law.—Most analysts were agreed in taking the B.P. as a standard. — Mr. Moor then dealt with various preparations suggested by the members, including that of Gregory's Powders, the point at issue being that the oxide of magnesia became partly converted into carbonate. Mr. Moor agreed that some reasonable allowance for natural carbination should be made, and suggested that it could be determined by experiment. — A question was asked whether the presence of small quantities of chlorides in lime water would be held as an adulteration, and Mr. Moor said he considered that the strength of the lime was the most important point, and he did not consider that small quantities of chlorides would be a matter of great consequence. There was considerable discussion on the question of sweet spirit of nitre, and as to whether an improved method of keeping it could be suggested. Mr. Moor asked whether the allowance given in the B. P. for natural deterioration appeared to be sufficient—namely, that after being opened several times the liquid remaining in the bottle should yield on assay not less than five-sixths of the original volume of the gas. There was a consensus of opinion that it was not a sufficient allowance.—Mr. J. Hinton Lake raised the question of the tests of distilled waters, and Mr. Moor said he was not aware that they were frequently tested. There appeared to be only one method of doing so, which was not, to his knowledge, thoroughly worked out, but a process might possibly be based on the iodine absorption of the essential oils employed.—Mr. Lake also raised the question as to what allowance might be made for deterioration in alkaloidal strengths, or as to whether any discounts could be allowed for natural or accidental deteriorations of alkaloids in standardised preparations.—Mr. Moor, in reply, took the case of one particular article mentioned —that of liquid extract of ipecacuanha. The B.P. was perfectly clear in stating that the mixed alkaloids should be not less than 2 and not more than 2.25 grams per 100 C.c., and he did not see how any departure could be made from those figures unless it were shown that in any particular preparation there was a natural loss of alkaloids.—An interesting discussion also took place on tinctures, and Mr. Moor said that as regards many tinctures the total solids left on evaporation were a valuable indication as to whether the tincture was duly prepared and of full strength. On the other hand, there were some tinctures—as, for example, tincture of opium—in which the total solids were naturally variable with the kind of opium used, and, provided the alkaloid morphine was present in due quantity, the amount of total solid residue was of no significance within very wide limits. To take the case of another tincture—for example, the tincture of capsicum—abnormally low total solids would show that the tincture was deficient in oleo resin, which was the active ingredient. Such a deficiency might occur from the skin of the capsicum having been separated from the seeds in grinding and a portion containing more skin than seeds employed for tincture making.—A question was asked as to whether the total solids of cannabis indica were not variable, and Mr. Moor replied that of four samples which he had taken the total solid residue was practically identical in all cases—namely, about 4.2 per cent., which agreed closely with the 4 per cent. suggested by Barclay.—Several other preparations were dealt with, and at the close of an interesting discussion a cordial vote of thanks was voted to Mr. Moor.

The Sale of Potash Water.—At Swindon Petty Sessions, on Monday, November 27, John James Shawyer, chemist and druggist, Wood Street, Swindon; William Williams, pharmaceutical chemist, Bridge Street, New Swindon; William Evans, described as a chemist, Market Street, New Swindon; and Joseph Henry Green, chemist and druggist, Wood Street, Swindon, were summoned under the Food and Drugs Act for selling potash water not of the nature and quality demanded.—The case for the prosecution (Wilts County Council) was that according to the analysis of Dr. Bernard Dyer, the county analyst, the "potash water" in question was "carbonated water, destitute of potash."—After evidence had been given for the defence in the first two cases to the effect that the article was sold in exactly the same condition as received from the manufacturers, the magistrates decided that although they had not the slightest doubt as to the *bonâ fides* of Mr. Shawyer and Mr. Williams, as the proceedings were taken in the interests of the public there must be a nominal fine of 1s. and costs.—With regard to the case against Mr. Evans, the analysis was disputed, it being asserted by Mr. J. C. Fell, analytical chemist to C.A.M.W.A.L., who supplied the potash water, that it contained six grains of potassium bicarbonate to the pint. This was supported by Mr. F. W. Stoddart, Bristol city analyst, who stated that the sample examined by him contained potassium bicarbonate in the proportion of 5·95 grains to the pint, and 2½ grains of other solids. The case was therefore adjourned in order that Dr. Dyer and Mr. Stoddart might make a joint analysis of the third portion of the contents of the syphon purchased by the prosecution.—The case against Mr. Green was also adjourned, together with two summonses under the Merchandise Marks Act against C.A.M.W.A.L. for applying a false trade description to certain syphons of potash water.——Two cases under the Merchandise Marks Act were heard at the same court against Edwin Robert Ing, aërated water manufacturer, Swindon, trading as E. R. Ing and Co., and against Idris and Co., Limited, aërated water manufacturers, of Pratt Street, Camden Town, London, for applying a false trade description to certain syphons of potash water delivered to Mr. J. J. Shawyer and Mr. William Williams respectively, two of the defendants in the previous cases.—For the defence Mr. Ing stated that he never attempted to sell "potash water" which did not contain potash. He sold carbonated water, and he suggested that a potash water label was put on a syphon of carbonated water. —For Idris and Co., Limited, it was suggested that during the hot weather, when the firm was very busy, soda or other water might have been left in the pipes and cylinders in which they combined the gas and the water, and some of this probably escaped the notice of the foreman and got into the potash water syphons. There was no desire on the part of the company to sell "potash water" which did not contain potash.—The magistrates, while of opinion that the defendants had no intention of committing a fraud, were unanimously agreed that they had no alternative but to convict, because—through some want of supervision or another cause—the public did not get what they believed they were buying. Fines of 10s. and costs were accordingly imposed.—A second summons of a similar nature against Idris and Co., Limited, was withdrawn.

Prosecution of "Madame Frain."—At the Central Criminal Court on Saturday Mr. Justice Darling delivered judgment in the case referred to at page 506e last week. He said the defendants were accused of having carried on a regular business for many years, one or other of them—one in succession to the other—the object of which business was to sell drugs to women in order that they might attempt to procure abortion, and the jury had found that the defendants by means of advertisements incited the women to take these drugs, and thereby to attempt to procure abortion. The defendants raised two defences. In the first place they said that granted, for the sake of argument, that they did that, they were not guilty, because, as a matter of fact, the drugs would not procure abortion. They charged the women very large sums of money for those things, and then set up as a defence that the things were absolutely worthless, and compared

them to water or bread. They charged 22s. for a bottle of the mixture, and a considerable sum for the pills. If it had been true that the stuff had been what they contended, they could have been indicted, and, he thought, properly indicted, for obtaining money by means of false pretences. And he said that for this reason. It was said that the defendants in what they did were doing no more than other people did who advertised drugs calculated to cure all sorts of ailments. He could only say that, if those drugs were as worthless as the defendants submitted that theirs were, those people also had better take care that they did not stand in the dock charged with obtaining money by false pretences. But the case did not go to the jury on that basis at all. It went to the jury on the basis that the defendants incited the women to take something which would procure abortion—something which was not a harmless thing, but which was a dangerous thing, and the jury found that what they supplied was a noxious thing capable of procuring abortion, and in that respect they broke the law. He had consulted the Lord Chief Justice as to the sentence he was to pass upon them, and had his full approval. He sentenced Brown to twelve months' imprisonment in the second division; Abrahams and Fox to nine months' imprisonment in the second division. Cross and Perron were merely servants of the other defendants, therefore if they were content to be bound over in their own recognisances to come up for judgment if called upon they would be released. He desired to say one word with regard to others not before the Court. This crime was rendered possible because newspapers accepted advertisements of this illegal business. It was desirable that it should be known that anyone who incited by whatever means a person to commit crime himself committed a crime. The jury had found by their verdict that these advertisements were incitements, which were used by the men on whom he had passed sentence to the crime of abortion. If any advertisements which incited to this or any other crime appeared again the proprietors, editors, and printers of the newspapers which made them public would deserve to find themselves—aud if any words of his had any influence with the Treasury they would find themselves—in that dock; and, although they pointed out no particular means for the commission of the crime, if the jury found that they did incite to crime they would probably receive a more severe sentence than that passed in this case.—Cross and Perron entered into their own recognisances in £50 to come up for judgment if called upon, and were discharged.

IDRIS AND CO., LIMITED. — The ordinary general meeting of the company will be held at the office of the company, Pratt Street, Camden Town, London, on Thursday, December 7, at 3 p.m., to receive and consider the directors' report and balance-sheet, and to transact the other ordinary business of the company. Also to consider, and if thought fit, pass the following resolution:—

That the capital of the company shall be increased from £150,000 to £200,000, by the creation of 50,000 new A Preference shares of £1 each, which shall rank *pari passu* in all respects with the existing 70,000 A Preference shares of £1 each, and that Clause 9 of the Articles of Association be modified accordingly.

In the event of the resolution being passed, it will be submitted to a second extraordinary general meeting to be held at the same place on Friday, December 22. The balance-sheet includes the result of thirteen months' trading, and shows a profit considerably in advance of that made during any previous corresponding period. After charging interest on the debenture stock and making very full allowance for depreciation, it amounts to £17,864 4s. 4d., which with £1,163 6s. 11d. brought forward from the last account, makes a total amount of £19,027 11s. 3d. standing to the credit of the profit and loss account.

LONDON COLLEGE OF CHEMISTRY, ETC.—A smoking concert was held at the Gauden Hotel, Clapham, on November 16, in connection with the London College Football Club, Mr. Wootton, B.Sc., in the chair. The features of the evening were: A Welsh quartette, by Messrs. Franklin-Vallet, Pritchard, Jones and Evans; and recitations by Messrs. Edwards and Fred Ashford. Mr. Ashford gave "The Absent-Minded Beggar," after which a collection was made, resulting iu £3 being forwarded to the *Daily Mail* War Fund. The toasts were, "The Queen," Mr. Wootton; "The Principal," Mr. Ashford; "The Staff," Mr. Murray; and "The Pharmaceutical Society," Mr. Franklin-Vallet, The latter gentleman, in the course of his remarks, expressing the hope that students and others would defer criticism of the Society until they had become members. A large number of past and present students was present. The proceedings were brought to a close with the singing of "God Save the Queen."

SCOTTISH NEWS.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—The second meeting of the twenty-second session was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Wednesday, November 22, at 9.15 p.m., Mr. Fraser McDiarmid (President) in the chair. The minutes of last meeting were read and approved. Mr. W. B. Cowie explained and demonstrated practically the various methods adopted by determining vapour densities, and showed how this factor was utilised in fixing molecular weights. The vapour density of chloroform was practically determined by Meyer's method. The apparatus employed in the cryoscopic method of determining molecular weights was also exhibited and explained. Mr. Cowie then gave a practical demonstration of the volumetric composition of water by electrolytic analysis in a voltameter and by eudiometric synthesis. On the motion of the Chairman, a cordial vote of thanks was accorded to Mr. Cowie, and the meeting then closed.

IRISH NEWS.

STUDENTS RECREATE.—As a rule, students manage to mingle method with their madness, but the Cork Queen's Collegians at the triennial visitation conducted by Lord Justice Holmes, Sir Thornley Stoker, and Dr. Moore, developed a very excessive hilarity. Certain applications being refused, uproar ensued. The graduates subsequently proceeded to the grounds and converted the notice boards into banners. Having procured a garden hose, the President's residence, where the visitors were lunching, was saluted with discharges of water. A hunt was then organised, a stuffed tiger belonging to the natural history museum being commandeered for the purpose, and during the sport several botanical specimens were uprooted. An empty prison van was next attacked, overturned, and the driver seriously injured. In the evening the students swarmed into a music hall and furnished a few unrehearsed extras. Afterwards they marched through the streets singing Irish songs, but as this pleased the crowd they immediately started up "Rule Britannia," whereupon the mob charged them and broke them up into indistinguishable fragments.

WELSH NEWS.

SWANSEA CHEMISTS' ASSOCIATION.—At Swansea the Chemists Association has met under the presidency of Mr. Hughes, to discuss the suggestion already made public as to the proposed pharmacy legislation. The attendance included Messrs. Barrett, Lloyd, Yorath, Groves, J. T. D. Turner, J. Davies, and Mr. Davies, the Secretary. It was decided, on the motion of Mr. Yorath, seconded by Mr. Barrett, to support the proposal:—

To protect chemists' titles, and make it illegal for companies of unregistered persons to keep open shop for the dispensing and selling of scheduled poisons, as in the case of individuals.

This was the principal business.

Partnerships Dissolved.

(From the London Gazette.)

James Thomas Dunk and George Thomas Clark, Hairdressers and Perfumors, 187, Kensington High Street and 221, Brompton Road, Kensington. Debts will be received and paid by G. T. Clark in respect to 187, Kensington High Street, and by J. T. Dunk in respect to 221, Brompton Road.

Harold Charles Ling and Charles Campbell Baxter Tyrie, Physicians and Surgeons, Keighley, Yorks. All debts owing by the late firm will be paid by H. C. Ling; debts due to the late firm will be received by either H. C. Ling or C. C. B. Tyrie. Each will continue to practise independently.

George Adkins and Charles Hyde Cosins, Medical Practitioners, Paignton. Debts will be received and paid by C. H. Cosins.

Alfred Octavius Grosvenor and James William Anderson, Medical Practitioners, The Tower, 72, Priory Road, West Hampstead, and 1, St. James's Mansions, West Hampstead.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Miss Mary Ariel Stewart. at the University of London on November 22, last had conferred on her the degree of Bachelor of Medicine of the University of London. Dr. Mary Stewart is sister of Dr. Grace Stewart Billings, in practice at Cheltenham, and eldest daughter of Mr. James Stewart, chemist and druggist, Cheltenham.

Mr. John William Richards, M.P.S., Llwynypia, Rhondda Valley, has had his pharmacy entirely re-modelled, the fittings, jars, and bottles being supplied by Messrs. Ayrton and Saunders, Liverpool.

Mr. Horace Reeves, M.P.S., has accepted an appointment with Dr. Gerber, of 16, Rue Grimaldi, Condamine, Monaco, which is now Mr. Reeves' address.

Calendar for the Week.

Sunday, Dec. 3. 1st Advent. ●0.48M. Sun rises 7.48, sets 3.52.

Monday, Dec. 4. Sun rises 7.49, sets 3.51.

Tuesday, Dec. 5. Sun rises 7.51, sets 3.51.

Bradford and District Chemists' Association, County Restaurant, at 9 p.m.—Musical Evening, arranged by Mr. Severs.

Royal Photographic Society, 66, Russell Square, W.C., at 8 p.m.—F. N. Evans will lecture upon "Lincoln Cathedral." Ladies specially invited.

Wednesday, Dec. 6. Sun rises 7.52, sets 3.50

British Pharmaceutical Conference, 17, Bloomsbury Square London, W.C., at 3 p.m.—Representative meeting of all interested in the Conference.

Manchester Pharmaceutical Association, Victoria Hotel.—Prof. F. E. Weiss on "The Way Plants Protect Themselves."

Midland Chemists' Assistants' Association, Exchange Rooms, Stephenson Place, Birmingham, at 9.15 p.m.—Paper by Mr. Barclay.

Pharmaceutical Society, 17, Bloomsbury Square, London, W.C., at 11 a.m.—Meeting of Council.

Thursday, Dec. 7. Sun rises 7.53, sets 3.50,

Chemical Society, Burlington House, Piccadilly, London, W., at 8 p.m.—Papers will be read by Messrs. H. J. H. Fenton and H O. Jones: A. W. Crossley and H. R. Le Sueur; and F. R. Mallet.

Chemists' Assistants' Association, Dorset Hall, Portman Rooms, Baker Street, London, W., at 7.30 p.m.—First Cinderella Dance of the Season.

Linnean Society of London, Burlington House, Piccadilly, W., at 8 p.m.—Papers will be read by J. W. Fawcett, G. M. Thomson, and H. M. Bernard.

Midland Pharmaceutical Association, Great Western Hotel, Birmingham, at 8.45 p.m.—Smoking concert.

Friday, Dec. 8. ☽ 9.3 A. Sun rises 7.45, sets 3.50

Cambridge Paarmaceutical Association, University Lecture Theatre.—Dr. Lloyd Jones on "Sewer Gas."

Glasgow Chemists' and Druggists', Assistants', and Apprentices' Association, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Amusements.

Glasgow School of Pharmacy, North British Station Hotel, George Square, at 9 p.m.—Third annual supper.

Saturday, Dec. 9. Sun rises 7.56, sets 3.50

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

Thursday, November 30.

Business in Drugs and Chemicals has been somewhat quiet during the past week, and so far the hopes of an increasingly brisk trade up to the end of the year, and also well into the spring at least, have not been fully realised; at the same time there appears to be an exceedingly firm undertone, and the advanced prices now ruling show but little sign of sagging, in spite of the temporary absence of any very great actual activity in business. Possibly the prospect of dear money in the immediate future may have something to do with the apparent disinclination of buyers to do more than cover actual existing requirements. Acid Carbolic continues up in the skies, and may be confidently expected to further advance. Quicksilver is also very firm, and the same may be said of Mercurials. Menthol is dearer, Thymol very firm, while same may be said of both crude and refined Camphor. Bromides and Iodides steady. Quinine just a shade weaker again. Cod-liver Oil firm. Opium and Morphine quiet. Codein firm. Acid Citric dull and weak. Sulphate of Ammonia firmer. Bank rate was to-day advanced to 6 per cent. The following are prices ruling for some articles of principal interest:—

ACID CARBOLIC—Remains very firm, prices being nominally unchanged, there being, however, few sellers thereat. Quotations are nominally 8¾d. to 9d. for 35° to 36° C. ice crystal in large bulk; 9½d. to 9¾d. for 39° to 40° C.; and 10¾d. to 11¼d. for 39° to 40° C. detached crystals, B.P. quality. Crude 60 F. 2s. 9d. per gallon; 75° F., 3s. 6d. per gallon; liquid, 95 to 98 per cent. of pale straw colour, 1s. 7d. to 1s. 8d. per gallon in 40-gallon casks; ditto, 25 to 30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CITRIC—Dull, at 1s. 3d. to 1s. 3½d. per lb. for crystals in 5-cwt. casks.

ACETANILIDE—Continues very dull at 9½d. to 11d. per lb.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb.; Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate: Chemically pure small crystals, 33s. to 36s. per cwt.; ditto commercial, 30s. per cwt. Sal Ammoniac: First, 40s. per cwt.; seconds, 38s.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate dearer: Grey, 24 per cent., London, December, £11 7s. 6d.; Hull, December, £11 7s. 6d.; January-March, £11 10s. to £11 12s. 6d.; Leith, December, £11 7s. 6d.; Beckton, January-March, £11 10s.; Beckton, terms prompt, £11 2s. 6d.

ANTIMONY.—Regulus, £39 to £40 per ton; Crude Japan (Black Sulphide), £23 10s. to £24 per ton.

ASHES.—Pots, 26s.; Pearls, 32s.

ATROPINE—Is firm at 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d .per oz. for the Pure Alkaloid.

BELLADONNA ROOT—Continues very scarce, very high prices being asked for really good root which is, however, hardly obtainable, while 42s. 6d. per cwt. is the price for only medium quality.

BLEACHING POWDER (CHLORIDE OF LIME).—English is quoted £6 10s. to £6 15s. per ton, on the spot.

BORACIC ACID.—Crystals, 25s.; Powder, 27s. per cwt.

BORAX.—Crystals still quoted 16s. per cwt. and powder 16s. 9d.

BROMIDES—Are in good demand at steady prices, say 1s. 10½d. per lb. for Potassii bromid, 2s. 1½d. per lb. for Sodii bromid., and 2s. 2d. per lb. for Ammon. bromid. Bromine is also unchanged at 2s. 2d. to 2s. 3d. per lb. in cases of 60 lbs.

BUCHU LEAVES.—Both the round and long leaves are wanted, the nominal value of the former being 1s. 1d. per lb and of the latter 10d. per lb.

CAMPHOR.—Crude market continues very quiet, and no business is reported, but prices are firm. On the spot there are still sellers of China at 165s. and Japan at 170s., and for arrival at 160s. and 165s., c.f. and i. respectively. Refined is unchanged in price.

CLOVES.—At auction, 237 bales Zanzibar offered and 86 bales sold at steady rates, good fair at 3½d., fair at 3⅜d., dark at 3¼d. Penang dull and in small demand, 57 cases bought in, good bright picked, at 8½d. to 9d., ordinary dark 5¾d. to 6d. Privately market Zanzibar very quiet, sellers for March-May delivery at 3 7/16d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon; pure, 2s. Benzole, 50 per cent., 11d. per gallon; 90 per cent, 9d. per gallon. Creosote, 4d. per gallon. Crude Naphtha, 30 per cent, at 120° C., 6d. per gallon; solvent naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene: A, 4½d. per unit; B, 3d. per unit. Pitch, 55s. per ton f.o.b. Tar, refined and/or crude, 12s. 9d. per barrel; 2¼d. per gallon.

COCAINE.—So far the threatened advance in makers' price has not taken place; same remains at 20s. 6d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins; while from secondhand the article is obtainable at about 1s. per oz. below this figure.

CODEINE—Continues in good demand at firm prices—viz., 12s. 11d. to 13s. 6d. per oz. for the pure, and 1s. per oz. less for the muriate, phosphate, and sulphate salts.

COD-LIVER OIL.—Market remains firm with an upward tendency, best noncongealing Norwegian oil being quoted 77s. 6d. to 82s. 6d. per barrel, in tin-lined barrels of 25-gallons each.

CREAM OF TARTAR.—First white crystals are quoted 74s. per cwt. on the spot; powder, 76s. per cwt.; ditto, 95 per cent., 77s.

CUBEBS—Have been in good inquiry, and some business has been done at full rates. Bulk of stock is firmly held at 25s. per cwt. and upwards, according to holder.

ESERINE (PHYSOSTIGMINE).—Prices are firm at 2s. 3d. per gramme for both the Sulphate and Salicylate Salts.

GALLIC ACID—Is dearer, price being 2s. to 2s. 2d. per lb., according to quantity and bulk packing.

GALLS.—China continue firm, but quiet, owing to scarcity, and prices nominal. Japan, for arrival, quoted 58s., c.f. and i. Persian has been in rather more demand, resulting in fair sales of blues at 62s. to 70s. Greens are selling in retail quantities at full prices. Smyrna and Morea unaltered.

GINGER.—Cochin, in auction, in fair supply, met a moderate demand. Rough descriptions firm and unchanged; cut kinds again dearer. Out of 599 bags and 271 cases there were offered 251 bags and 119 cases sold, partly without reserve; bold selected, cut and scraped, 92s. 6d.; medium, some bold ditto, at 67s. 6d.; small and medium ditto at 48s. 6d. to 50s. 6d.; small ditto, 37s. to 38s.; medium and small, roughly cut and scraped, much limed, at 44s.; small and tips ditto at 30s.; cuttings, fair, at 18s. 6d. to 19s.; Calicut, rough bright medium and small, at 26s. to 26s. 6d.; small dull at 24s.; ditto, part shrivelled, at 23s.; washed rough, chiefly small and dusty, part mouldy and wormy, at 25s. Jamaica: 10 barrels sold, fair, small bright at 54s. 6d.

GLYCERIN.—Crude is quiet, but fairly steady at nominally unchanged prices, while refined is perhaps a trifle weaker at 55s. for English, and 56s. to 65s., according to brand, for German best white double distilled, chemically pure, 1260° quality, in tins and cases.

HYPOPHOSPHITES.—The makers still quote 3s. 3d. per lb. for the Lime, Soda, and Potash Salts.

IODIDES—Steady at 10s. 6d. per lb. for Potassi Iodid, 11s. 10d. per lb. for Sodii Iodid, 13s. 10d. per lb. for Ammon. Iodid, 13s. 10d. per lb. for Iodoform Crystals, powder, or precipitated; 12s. per lb. for Resublimed Iodine, and 7½d. per oz. for Crude Iodine.

JAPAN WAX—Is firm, but quiet. Good squares on the spot quoted 32s. For arrival the price comes higher at 33s., c.f. and i.

LITHIA SALTS.—Makers still quote 10s. 8d. to 11s. per lb. for the Carbonate and 6s. 9d. to 7s. 6d. per lb. for the Citrate Crystals and Powder.

MANDRAKE ROOT.—From New York it is reported that the only large holder of autumn dug root has advanced his to 4½c. = 23s. 9d. per cwt., c.i.f., London, and further that prices must advance again shortly.

MENTHOL—Is very firm, 9s. 6d. per lb. having been paid, and 9s. 9d. is now asked for Kobayashi brand in case lots.

MERCURIALS—Are very firm at unaltered price, say 3s. 1d. per lb. for Calomel and 2s. 9d. per lb. for Corrosive Sublimate, the other mercurial preparations being quoted at proportionate prices.

MORPHINE.—Quiet at nominally unchanged price—viz., 5s. per oz. for the Hydrochlorate Powder and 2d. per oz. more for the Crystal Salt.

OILS (ESSENTIAL).—Star Aniseed dull of sale at 6s. 3d. per lb. Cassia very quiet at 4s. per lb for 70 to 75 per cent.; 4s. 6d. per lb. for 75 to 80 per cent.; and 5s. per lb. for 80 to 85 per cent. Peppermint: H.G.H. dull at 5s. 6d. per lb.; Japanese, dementholised, 3s. 10d. per lb.; 40 per cent, 5s. 6d. per lb.; English, 27s. 6d. per lb. Sassafras firm at 1s. 9d. per lb. Lavender: English is quiet at 42s. 6d. per lb. Citronelle 1s. 1d. per lb. in drums. Sandal Wood firm at 11s. 6d. per lb. Cubeb very firm at 3s. 6d. per lb. Clove steady at 2s. 5d. to 2s. 6d. per lb.

OILS (FIXED) AND SPIRITS.—Linseed steady, at slightly higher prices. On the spot pipes, London, £21 12s. 6d. to £21 15s.; barrels, £21 17s. 6d. to £22. December, £21 17s. 6d. to £22. Hull, spot naked, £21. December, £21 5s. Rape steady. Ordinary brown, on spot, £22 10s. December, £22 10s. Refined spot, £24. Ravison naked spot, £20 15s. December, £20 15s. Cotton firm at higher prices. London crude spot, £17 10s. November-April, £17 10s. Refined spot, £19 to £19 15s., according to make. Hull naked refined spot, quoted £17 5s. Crude spot, £16 5s. November-April, £16 5s. Olive: Mogador, £34; Spanish, £35 5s. Levant, £34 5s. Cocoanut quiet. Ceylon: On the spot, £25 to £25 10s; near, £24 c.i.f.; December-February, £23 15s. to £24. Cochin spot, £29 10s.; near, £27 5s. to £27 10s. c.i.f.; January-March, £26 10s. to £26 15s. c.i.f. Mauritius: On spot, £25 10s. to £26, in hogsheads. Palm: Lagos on spot, quoted £25 10s. Castor quiet. Belgian: First pressing spot, £27; January-June, £25 10s. f.o.b. Antwerp: Second pressing spot, £26 per ton, ex wharf. Hull manufactured guaranteed cold drawn pure Pharmaceutical, £29 10s. per ton in barrels; 3 9/16d. per lb. in cases. Pure firsts, £27 per ton, in barrels; firsts, 3 3/16d. per lb in cases, ex wharf, London. Lubricating Oil: Pale American spot, 7s. 6d. to 11s.; Black, 7s. to 9s.; Russian Black, 5s. 6d. to 6s.; Pale, 7s. to 9s. 6d. Petroleum Oil firm. Russian spot, quoted 6 5/16d. to 6½d.; December-March, 7¼d. to 7⅜d; Water White, 8½d. to 8⅝d. Petroleum Spirit: American, 9¾d.; Deodorised, 10d. Turpentine easier; American spot, 36s. 9d.; December, 36s. 9d.; January-April, 37s. 1½d. to 37s. 3d.; July-December, 32s.

OPIUM.—The market for all descriptions continues dull, and only a small business has been done in "Druggists'" at previous rates. In "Soft Shipping" kinds no business is reported. Persian continues to be dealt in to a small extent at firm rates.

OXALIC ACID—Is quoted 3d. to 3¼d. per lb nett, free London, for spot delivery.

PARAFFIN WAX.—Crude, 2⅞d. to 3d. per lb.; Refined, 3⅛d. to 3⅜d. per lb.

PHENACETIN—Continues quiet at 3s. 3d. to 3s. 6d. per lb., according to quantity, for both crystals and powder.

PILOCARPINE—Is quoted 30s. per oz. for both the Hydrochlorate and the Nitrate Salts.

PITCH.—8s. to 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt; bichromate, 3½d. per lb.; bromide, 1s. 10½d. per lb.; chlorate, spot, London, crystals, 3¾d.; powder, 3⅞d. Iodide, 10s. 6d. per lb. Permanganate, quoted 50s. to 60s. cwt., according to make; large crystals, 5s. per cwt. more. Prussiate yellow quiet, Beckton, 6⅞d.; other English makes, 7½d.; red, 1s. to 1s. 2d. per lb., according to quantity.

QUICKSILVER.—Importer is very firm at £9 10s. in bottle, the article not being offered from second-hand.

QUININE.—The market for best German brands continues quite inactive, and no sales are reported, prices closing barely steady, with sellers of B&S and or Brunswick, December delivery, at 1s. 1⅞d., and March at 1s. 2⅛d.

ROSIN—Dearer at 5s. per cwt. for strained on the spot and 4s. 4½d. to 4s. 6d. per cwt. for November-December and January-March shipment for sailing vessel.

SALICYLATES.—So far makers have made no change in their prices, in spite of the altered position of acid carbolic. Salol is unchanged in price at 3s. 2d. per lb. for bulk packing.

SANTONIN.—Makers are firm at 11s. 3d. to 11s. 9d. per lb., according to quantity, while from second-hand the article can be obtained for rather less money.

SENEGA ROOT.—This is very scarce in New York, and 2s. 2d. per lb. is the c.i.f. quotation for Minnesota root.

SHELLAC.—The demand on the spot continues slow, with only retail sales at previous rates, including TN Orange on a basis of

63s. for fair. The market for futures is without alteration, and quite inactive.

SODA COMPOUNDS.—Crystals: barrels quoted 60s., bags 57s. 6d. Ash: £6 to £7 per ton, according to percentage, etc. Bicarbonate, landed, £7 5s. Bichromate, 2¾d. per lb. Bromide, 2s. 1½d. per lb. Caustic, 70 per cent., white, £10; 60 per cent., £1 less. Hypo-sulphate (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate quiet, on the spot, refined, £8; ordinary, £7 15s.

SPICES (VARIOUS).—Black Pepper: 7 bags were sold at 5⅜d.; 224 bags Penang offered and bought in, weight 31lb. 7ozs., dust 5 per cent. at 5½d. White Pepper was sparsely offered, only 60 bags Singapore were catalogued and bought in at 9½d. Chillies: 3 bales Zanzibar offered and sold without reserve at 46s. Pimento, in fair supply, met a slow demand, and of 532 bags in auction only 121 bags sold, ordinary to fair, at 3¼d. to 3⅜d. Mace neglected; 43 cases Penang bought in, including good bold pale at 2s. 4d. to 2s. 6d., and fair red at 1s. 7d. to 1s. 8d.; 12 cases Singapore also bought in at 1s. 6d. for fair red little wormy. Nutmegs dull; 52 cases and 20 bags Penang in auction were all bought in, including 80's at 1s. 2d. and shrivelled and broken at 4d.

STAR ANISEEDS.—Supplies are small, but so is the demand, and therefore the spot price of 100s. per cwt. is not readily obtainable.

STICKLAC—Remains very quiet, with only a small business in unsifted Siam at 39s. to 40s.

SULPHATE OF COPPER—Is quoted £24 10s. to £25 10s. per ton on the spot.

SULPHONAL.—While makers' price remains nominally 17s. per lb. for both Crystals and Powder, the article is offered quasi from second hand at 14s. to 14s. 6d. per lb.

TANNIC ACID.—Makers now ask 2s. to 2s. 1d. per lb. for the leviss. puriss., B.P. quality in 1-cwt. cases.

TAR.—Stockholm, 25s. 6d. to 26s.; Archangel, 18s. to 18s. 6d.

TARTARIC ACID—Quiet and unchanged at 1s. 1d. per lb. for English on the spot and 1s. per lb., c.i.f., for foreign.

THYMOL—Firm at 10s. 6d. to 11s. per lb., according to holder, makers generally not offering.

TURMERIC—Remains firm, although quiet, with only retail sales, including Bengal at 29s., Madras quoted 35s. to 37s. 6d. for fair to good bright finger. Cochin split bulbs sold at 12s.

WAHOO BARK AND ROOT.—The *Oil, Paint, and Drug Reporter* states that this is practically unobtainable, the nominal quotation being equal to 10d. per lb, c.i.f.

Liverpool Market Report.

November 29, 1899.

The prices of Cottonseed Oil and Spirits of Turpentine have advanced since last week, with prospects of higher rates still for the latter. Among general sales will be noted Gentian Root, on private terms, Beeswax, also privately, Carnauba Wax, and Cochin Ginger. Chemicals have been quieter, but prices are maintained, with an advance in that of Ammonium Sulphate.

AMMONIUM SALTS.—Sulphate is dearer and in better demand at £11 5s. to £11 7s. 6d. per ton.

BEESWAX.—119 packages of Gambia were disposed of privately.

CANARYSEED.—250 bags of Turkish sold for 36s. per 464 lbs., and the quotation rests between 35s. 6d. and 36s.

CARNAUBA WAX.—14 bags of Maranham grey fetched 45s. per cwt.

GENTIAN.—44 bales were disposed of on private terms.

GINGER.—80 bags of Cochin made 27s. per cwt.

GUM.—Arabic "sorts" 15 serons changed hands at full prices.

LINSEED—Continues idle. Calcutta, 4 per cent., November-December shipment, was offered at 45s. 6d. per 416 lbs., and River Plate, December-January, at 40s. 6d., January-February at 40s.

OILS (FIXED) AND SPIRITS.—Castor Oils are in limited demand, and sales so far have been only retail in amount. Calcutta at 2 15/16d. to 3d. per lb.; French, 1st pressure, at 2 13/16d.; 2nd French and Belgian at 2⅝d.; and Madras 2¾d. per lb. Olive oil is a strong market, with every prospect of still higher rates. Shipment lots of Seville are £35 per tun cost and freight, and Malaga £36 10s. per tun. Linseed oil is a little easier in price, and Liverpool makes in export casks are 23s. to 24s. per cwt. Cottonseed oil is in good demand at the higher rates of 19s. 6d. to 19s. 9d. per cwt. for Liverpool refined. Spirits of Turpentine are in moderate demand at 38s. 6d. per cwt.

POTASH SALTS—Unchanged.

SODA SALTS—Uncharged.

Manchester Chemical Report.

November 29, 1899.

There is not much to report on last week, and heavy chemicals generally are steady. White Caustic Soda is quoted £10 to £10 7s, 6d. for 77-78 per cent., and 70 per cent., £9 to £9 5s. Ammonia Alkali, 58 per cent., is firm at £4 7s. 6d., and Soda Ash, 48 per cent., £4 7s. 6d. to £5 2s. 6d. per ton, caustic and carbonated. Bicarbonate of Soda is unchanged. Soda Crystals are firm. Sulphur of all descriptions is about the same. Brown Acetate of Lime is unchanged on the week. Coal Tar products, owing to the increased price of fuel, are growing dearer daily. There is a fair business doing from this port in Pitch. Local makers of Carbolic Acid maintain their strong position, and there is a good demand for solvent Naphtha, large contracts for which have been placed over next year. In Creosote a fair amount of business is passing, but Anthracene is purely nominal. Muriate of Ammonia is in more request, and Carbonate of Ammonia is dearer. Owing to the demand in the States being heavy for Brown Acetate of Lime, there has been a fairly good advance, and this has stiffened the local product. Sulphate of Copper, in accord with the easier feeling in the metal, is lower on the week. Acetate of Soda is firmer. Yellow Prussiate is scarce locally, and notwithstanding the diminished demand for Cyanide consequent on the war, there is every appearance of an advance. Lead Salts continue on the up grade.

Newcastle-on-Tyne Chemical Report.

November 29, 1899.

Business on this market is still brisk. Contracts so far closed for next year are at advanced figures, in keeping with the dearer cost of production. Bleaching Powder and Caustic Soda are fully 10s. per ton up for home use and some of the oversea markets. Alkali keeps firm for prompt, as the article is now in few hands. Tar products have a stronger tone. Sulphur is steadier at quotations. Prices are: Bleaching Powder, £6 10s. to £6 15s.; Caustic Soda, 70 per cent., £9 10s.; 77 per cent., £10; Soda Crystals, in bags, 55s. to 57s. 6d.; Alkali, 52 per cent., £5 10s.; Soda Ash, 52 per cent., £4 10s.; Sulphur, £5; Pitch, 32s. 6d. per ton.

TRADE NOTES.

Colonial Readers may probably be interested to know that samples of Messrs. Ayrton and Saunders' screens and desks are on display in the showrooms of Messrs. Ellis Sellgren and Co., Elliot Street, Auckland, N.Z.; Messrs. Carl Zoeller and Co., Courier Buildings, Brisbane, Australia; Messrs. J. C. Langley and Co., 456, Collins Street, Melbourne; Messrs. Bertie Smith and Co. Apollo Street, Bombay, B.I.

Floral Thermometers.—Messrs. S. Maw, Son and Thompson 7 to 12, Aldersgate Street, London, E.C., have recently placed on the market a new form of thermometer which is exceedingly pretty, and is likely to sell largely as Christmas stock. The thermometer is fixed in a neat frame of bright twisted brass wire, decorated with leaves and flowers, and is intended to stand in any convenient position. The frames are of six different designs, viz.:—Acorn and oak leaves, violets, thistle, shamrock, daisies, and roses. The price is 15s. 9d. per dozen.

Deaths.

Evans.—On November 25, Samuel Evans, Chemist and Druggist, Caerphilly, Glamorganshire. Aged 76.

Prudhoe.—On November 25, Robert Prudhoe, Chemist and Druggist, West Hartlepool. Aged 75.

Thomson.—On November 26, at 85, Addison Road, Kensington, Louisa, wife of John Millar Thomson, of King's College, Examiner in Chemistry to the Pharmaceutical Society.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Alcock, Ashdown, Ayrton, Banbury, Bartlett, Bell Bishop, Campkin, Clayton, Cottingham, Cox, Crook, Cummings, Dawson, Deck, Franklin-Vallet, Gamble, Gifford, Gillard, Gray, Haydon, Heine, Hill, Howard, Keen, Lee, Lothian, Maddison, Marsden, Mason, Meadows, Mitchell, Morgan, Moseley, O'Halloran, Palmer, Pears, Reeves, Robins, St. Cry, Schissele, Sewell, Stewart, Stow, Tilley, Turner, Wallis, Watkins, Webster, White, Zimmermann

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

O'Brien's check-tills, practically as good as new, 30s. each.—Chambers & Son, Dunstable.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Surplus—Nos. 1, 3 & 5, Scarlet Felt Chest Protectors; also few Flannel and Chamois; 20 % off Maw's List; sale or suitable exchange.—J. Botham, Higher Broughton, Manchester.

Good Second-hand, Hand Painted Lantern Slides, to clear, 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c. Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Pharmaceutical Journal; first eighteen volumes, bound in half calf, for disposal. Offers wanted. Also handsome bent glass Dental Show Case for sale, with or without specimens.—Barton Dell, 148, King Street, Hammersmith, W.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements.

(Received too late for Classification.)

ASSISTANT wanted, Brighton.—J. Colby & Co., 101, Western Road, require a qualified ASSISTANT as second; to make preparations and assist in Dispensing as required. Must have been used to good class business. Outdoors. Salary £120.

NOTICES OF BOOKS AND OTHER PUBLICATIONS.

Merck's 'Manual of the Materia Medica' is a ready-reference pocket book, containing the names and chief synonyms of medicaments in actual use, together with brief statements of their physical form and appearance, solubilities, percentage strengths and physiological effects, therapeutic uses, modes of administration and application, dosage, incompatibles, antidotes, etc. It is a compact little volume of two hundred and thirty-six pages, and the contents are divided into three parts. The first treats of the materia medica in actual use to-day by British physicians, alphabetically arranged; part two deals with the therapeutic indications for the use of medicaments, and in part three the latter are classified according to their physiological action. Any pharmacist who would like a copy of the book can obtain one free of cost on application to Mr. E. Merck, 16, Jewry Street, London, E.C.

Wellcome's 'Photographic Diary and Exposure Record' for 1900 is as dainty a little pocket note-book as can well be imagined. It contains calendars for 1900 and 1901, all kinds of useful information—formulæ for development, exposure tables, etc.—for photographers, and a capital diary and exposure record. A pencil is provided for making notes and, in every way, the book has been made as useful as possible. It is intended to retail at 1s., and copies will be supplied by Messrs. Burroughs, Wellcome, and Co., at 9s. per dozen, less 20 per cent.; thirteen copies as twelve.

Gadd's 'Synopsis of the British Pharmacopœia, 1898' has now attained to the dignity of a fourth edition. It is a cheap shillingsworth, containing as it does, in addition to the very complete synopsis of the B.P. by Mr. H. Wippell Gadd, analytical notes and suggested standards by Mr. C. G. Moor. The book is published by Messrs. Baillière, Tindall, and Cox, at one shilling net, and every pharmacist and pharmaceutical student should make a point of possessing a copy.

'The Story of the Wandering Atoms,' by M. M. Pattison Muir, M.A. (London: George Newnes, Ltd. Pp. 192. Price 1s.), is really a popular and interesting account of the chief compounds of carbon. The author begins with a survey of the composition and reactions of the compounds of carbon, then sketches an outline of the classification of some of those compounds, and afterwards treats at some length of the properties of marsh gas, ethane, ethylene, sugars, starches, benzene, alkaloids, etc., etc.

'A Guide to Urine Testing, for Nurses and Others,' by Mark Robinson, L.R.C.P., L.R.C.S. (Bristol: John Wright and Co. Pp. 48. Price, 1s. net), is a slight production, based upon the works of Legg, Taylor, Scott, and other authorities. The author first gives the characteristics of normal urine, then proceeds to deal briefly with fallacies in testing, and describes the apparatus and methods used.

The 'Dictionnaire des Termes de Medecine,' par H. De Meric (London: Baillière, Tindall and Cox. Pp. 241. Price 4s. net), is the second part of a work which has already been referred to in these columns. In this case the French terms used in medicine are given in alphabetical order, with their English equivalents expressed concisely. The book is clearly printed, of handy size, and the matter is brought well up to date.

'The Medical Annual Synoptical Index to Remedies and Diseases' (Bristol: John Wright and Co. Pp. 411. Price, 7s. 6d. net) covers the twelve years from 1887 to 1898. It commences with a complete index to the twelve volumes of the 'Medical Annual,' the subjects being arranged under those headings which a medical practitioner would be most likely to look for. To each article is added a synopsis of the suggestions respecting treatment which have, year by year, been made by specialists. The first part of the book deals with remedies, the second with diseases; then follow Rogers' summary of the chief alterations in the new Pharmacopœia, test types for examining the acuteness of vision, pages for memoranda, and a supplementary index, giving additional cross-references to remedies and diseases not appearing in the alphabetical arrangement of the book.

ENGLISH NEWS.

School of Pharmacy Smoking Concert.—This annual and most popular meeting of members and friends of the School of Pharmacy Football Club was held on Thursday evening, November 30, in the Crown Room, at the Holborn Restaurant, which, as usual, was well filled. The President of the Pharmaceutical Society had kindly consented to occupy the chair, and promptly at eight o'clock he appeared, ready to open the proceedings, but, as is usual at such meetings, a little time is required in which to settle down, so that it was nearly the half hour before the Chairman took his seat. Professor Green was in the vice-chair, but, unfortunately, was obliged to leave early in the programme The School was also represented by Professor J. N. Collie, Professor H. G. Greenish, Dr. Lapworth, and among old students may be mentioned Mr. Walter Hills, Mr. C. B. Allen, Mr. W. Warren, Mr. T. Morley Taylor, Mr. C. Morley, and many others. The programme was well chosen and varied in its contents, commencing with a well-executed pianoforte solo by Mr. G. W. Wilton. It had been suggested to the Committee a few days before the concert that a collection should be made in aid of the fund for the relief of the families of soldiers engaged in the Transvaal war. The suggestion was at once taken up, and on approaching Mr. Morley Taylor, with his usual kindness, he consented to recite Rudyard Kipling's "Absent-Minded Beggar," in order to give a stimulus to the collection. About half-way through the programme this was carried out, and the collection amounted to £7. After the interval, the Chairman made a few remarks, chiefly with reference to the present state of affairs in the Transvaal, asking those present to sing the National Anthem, which was heartily responded to, together with "Rule Britannia." The toast of the evening, "The Pharmaceutical Football Club" was proposed by Mr. Surfleet, who, in a few well-chosen words, remarked that those who had seen the "Square" team at play, must have noticed that the students were not only assiduous in their work but also in their sports, and proposed the health of the captain, Mr. W. Owen, which was drunk with musical honours. Mr. Owen in reply, gave a brief *résumé* of this season's matches, and the position of the team as regarded the "Inter-Pharmacy Football Cup." Mr. Happold proposed a vote of thanks to Mr. Martindale for his kindness in coming there that evening to preside, which was heartily carried. The remaining items on the programme were then proceeded with, at the conclusion of which the Chairman concluded, what was acknowledged by all to have been a most successful gathering, by calling upon the company to sing "Auld Lang Syne," and leading off himself, although, as he remarked, he had not sung for many years.

Birmingham Pharmacists and the War.—At a meeting of the Relief Sub-Committee in connection with the Birmingham *Daily Mail* Fund for the relief of Reservists' wives and families, held on Monday, November 27, the Lady Mayoress, presiding, satisfaction was expressed at a suggestion as to the gratuitous services of the medical profession in deserving cases, and at a proposal made by Mr. C. Thompson, local secretary of the Pharmaceutical Society, that pharmacists should supply the medicine free of charge. Mr. Thompson in writing to the editor of the Birmingham *Daily Mail* on the subject, states that:—As there is a possibility of the medical men in Birmingham offering their services free to the wives and

families of the Reservists who have been called upon to rejoin their regiments, he feels sure that many pharmacists will be willing to supply the medicine necessary free of charge. He will therefore be glad to receive the names of any members of the Pharmaceutical Society who would like to join in such a movement, so as to divide the city into districts, and to make it known where medicines can be easily obtained. Mr. Thompson's address is 159, Stratford Road, Sparkbrook.

ROYAL INSTITUTION.—A general monthly meeting of the members of the Royal Institution was held on December 4, Sir J. Crichton Browne presiding. The following were elected members:—Professor H. E. Armstrong, F.R.S., Mr. J. H. Bowman, Mr. J. S. Brookfield, Mr. J. B. Carrington, Mr. W. B. Cloete, and Mr. L. Leigh Smith. The following letter from the Clerk of the Goldsmiths' Company was read:—

Goldsmiths' Hall, London, E.C.,
November 16, 1899.

Dear Sir,—I am directed to inform you that the attention of the Court of the Goldsmiths' Company having been drawn to the fact that the Royal Institution of Great Britain has lately celebrated its Centenary, they have, in order to mark their sense of the importance of that event, been pleased to make to the Institution the further grant of £1,000, for the continuation and development of original research, and especially for the prosecution of further investigations of the properties of matter at temperatures approaching that of the absolute zero of temperature. I enclose a cheque for this amount, and I shall feel obliged to you to acknowledge the receipt.

I am, dear Sir, your obedient servant,
(Signed) WALTER S. PRIDEAUX.

The Hon. Secretary,
The Royal Institution of Great Britain.

The following resolution was then passed:—"That the members of the Royal Institution of Great Britain, in general meeting assembled, having been informed that the Court of the Goldsmiths' Company have made a donation of £1,000 to the funds of the Royal Institution in commemoration of its Centenary, and in aid of the investigations which are being carried on in its laboratories into the properties of matter at low temperatures, desire to express to the Court their profound and grateful appreciation of this second munificient manifestation of their practical interest in the work of the Institution—a manifestation which has been made on this occasion at once reminiscent of past services to science and prescient of services yet to come."

THE CASE OF ALLEGED POISONING BY ATROPINE.—A few weeks ago John Spanton, chemist and druggist, of Malton, Yorks., was summoned at Malton County Court by Thomas Slack, groom, for negligence in supplying him with a noxious drug—said to be atropine—thereby causing him suffering, and Judge Raikes, who heard the case, awarded plaintiff £5 damages. (See *ante*, 430*b*.) At the same court, on November 22, application was made on behalf of the defendant for a new trial, on the ground that the medical evidence did not support the theory of atropine poisoning, and that, inasmuch as defendant was not aware that this theory was to be brought forward, it was impossible for him to provide evidence on the question. It was also argued that it had not been proved that atropine had been supplied by the defendant.—His Honour Judge Raikes, Q.C., granted a new trial for January 24, and allowed plaintiff to take out of court the costs in the previous hearing, and reserved the costs of the application.

ALLEGED THEFTS OF DRUGS.—At Southwark Police-court, before Mr. Slade, on Saturday, December 2, John Jones (30), labourer, of Parlin Street, Bermondsey, and Henry Parker (27), dealer, of Churchill Place, Southwark Park Road, were charged with being concerned with other men not in custody in stealing three casks of cod-liver oil, 8lb. of iodoform, 7lb. of camphor, and a bottle of mercury, value £27 12s., the property of Alan Hicks, 66, Park Street. Jethro Lardent (36), herbalist, of Southwark Park Road, was charged with receiving the same, well knowing the goods to have been stolen. Mr. Knight, for the prosecution, stated that Jones was in the employ of the prosecutor, and Parker had been in the habit of purchasing empty barrels from Mr. Hicks. Certain information was given to the prosecutor by a man who had been in Lardent's employ, and Jones was taxed with the affair. He denied having stolen anything. Detective-sergeant Divall, however, traced the cod-liver oil to a highly respectable wholesale firm in the City, and then went to Lardent's shop. At first Lardent denied all knowledge of the cod-liver oil, but subsequently admitted that he purchased it and the other things mentioned in the charge.—The prisoners were remanded, Lardent being allowed bail in two sureties in £100 each.

OVERDOSE OF CHLORODYNE.—The Sheffield City Coroner held an inquest on Wednesday, November 29, with respect to the death of Ann Eliza Garlick (35), widow of William Garlick, tailor's assistant, of London.—Evidence was given to the effect that deceased lost her husband five weeks ago, and had since been very unsettled in her mind, and had expressed the wish that she had died with him, as she felt lonely. On the previous Sunday, while she was on a visit to her parents at the "Bridge Inn," Sheffield, her sister went upstairs and found deceased frothing at the mouth. Medical aid was sought, but she died early on Monday morning, she having drunk nearly the whole of the contents of a bottle containing an ounce and a half of chlorodyne, which had been bought for the purpose of making some cough mixture. It was stated that deceased had been in the habit of taking chlorodyne in order to make her sleep, and it was thought that she had taken it for that purpose on Sunday.—The jury returned a verdict that the deceased died from an overdose of chlorodyne administered by herself, but for what purpose deceased had taken it there was not sufficient evidence to show.

DEATH UNDER CHLOROFORM.—An inquest was held at Kidderminster on Thursday, November 30, on the body of William Lloyd, aged twelve, who died while under chloroform at the Infirmary. Dr. Stretton said it was one of the unaccountable cases of heart failure from chloroform. All the organs of the body were healthy. The operation was for infantile hernia. The jury returned a verdict that death was due to misadventure, and that no blame attached to anyone.

SOWING POISONED SEEDS.—The *Daily Mail* reports that a Grantham chemist and his son, who are also farmers, have been heavily fined for sowing seeds poisoned with strychnine. They had lost a whole crop last year through the birds, and pleaded ignorance of the law in taking revenge by poisoned seed.

THE CHEMISTS' DEFENCE ASSOCIATION.—A meeting of chemists was held at the Great White Horse Hotel, Ipswich, on Wednesday, November 29, Mr. S. R. ANNESS in the chair. The object of the meeting was to consider the scheme for a Chemists' Defence Association. Mr. WILLIAM JOHNSTON having explained the scheme, a discussion followed, and a resolution was unanimously carried approving of the aims and objects of the Association.

NORTHERN COLLEGE OF PHARMACY.—The students of this College held their annual dinner and smoking concert on Friday evening, November 24, at the Alexandra Hotel, Manchester. There was a large muster of students, and a pleasant evening was spent listening to a varied and an interesting musical programme. During the evening presentations of handsome walking sticks were made to Mr. Clayton and Mr. Lawson by the students.

MESSRS. WOOLLEY, SONS, AND CO.'S ANNUAL DINNER.—On Saturday evening, November 25, the staff held their twenty-first annual dinner and smoking concert at the Mosley Hotel, Piccadilly, Manchester. Mr. W. Lane presided, and over 100 persons were present. An excellent musical programme was provided, the usual toasts and speeches taking place at appropriate intervals. In responding to the toast of "The Firm," proposed by Mr. A. Balmforth, Mr. Hermann Woolley contrasted the present conditions of business with those which existed when he, as a youth, first entered the house. Then the premises of the firm were quite modest compared with their present buildings; their manufacturing resources were not nearly so great, and such implements of modern commerce as the telephone, cheap telegrams, post-cards, and the splendid systems of modern despatch and delivery were unknown. Business, too, was not carried on at such high pressure—customers were not so exacting and precise, nor competition so keen. These changes had been the grand opportunities of the firm; they had shown what could be done under these conditions by strict observance of sound business principles. Mr. Johnstone, in supporting Mr. Woolley, impressed upon the younger members the advantages of commercial education and strict attention to all details of business. Mr. A. C. Vallance gave "The Visitors," and Dr. Webster, in responding, remarked on the courtesy of the staff and the good feeling which existed between them and their principals. Our soldiers in South Africa and the Soudan were not forgotten, and after drinking to their "Welfare and Success," "The Soldiers of the Queen" was sung by Mr. Vallance, who was enthusiastically assisted by the whole company. Songs were rendered by Messrs.

A. C. Vallance, J. H. Franklin, Hankinson, Crowe, Whitehead, Hibbert, and Wingfield, and recitations ("The Absent-Minded Beggar" and "The Charge of the Light Brigade") by Mr. Makinson. Mr. A. H. R. Balmforth officiated at the piano. "The Health of the Chairman" was proposed by Mr. Vallance, and accompanied by the singing of "For He's a Jolly Good Fellow." Mr. Lane suitably replied, and a thoroughly enjoyable evening terminated.

Vinolia War Fund.—We are requested to announce that 1,000,000 ha'pennies have been sent already by the Vinolia Company, Limited, for the soldiers' families, widows, and orphans, and that one halfpenny will be forwarded on every tablet of Vinolia soap sold for the United Kingdom until the end of the year, so that the Vinolia soapworks will have run during November and December for the benefit of the Transvaal War Fund.

A Chemist and his Watch.—At the County of London Sessions (Clerkenwell) on December 6, Andrew Wood (21), was indicted for attempting to steal a watch from Frank Cox, chemist and druggist, of Swanley, Kent. It appeared from the evidence that on November 23 Mr. Cox was at the Stanley Cycle Show at the Agricultural Hall. He saw a notice up "Beware of pickpockets." While he was looking at some musical instruments on a stall round which a small crowd was gathered, he put his hand down to feel if his watch was all right, and found that the hand of the prisoner, who was standing behind him, was on his watch-chain. He seized the prisoner and gave him into custody. The jury found the prisoner guilty, and, a number of previous convictions having been proved against him, he was sentenced to eighteen months' hard labour.

Camphorated Oil: Merchandise Marks Act Prosecutions.—At Pontypool Police-court, on December 2, Messrs. Bell, Sons and Co., wholesale druggists, Liverpool, were summoned for applying a false trade description to three bottles of camphorated oil, sold to Thomas Evans, grocer, Six Bells, in November last.—Mr. W. L. Moore prosecuted on behalf of the County Council.—Defendants pleaded guilty.—Mr. Moore stated that his instructions were to press the charge. The defendants were large wholesale dealers, but when a retail dealer to whom they supplied goods was prosecuted, although they were communicated with, they refused to intervene in the slightest degree. The Bench would appreciate the importance of the case when they knew that magistrates all over the country had dealt very severely with similar cases, and the defendants had been proceeded against and fined at various courts.—Mr. G. R. Thompson, county analyst, gave evidence to the effect that he had analysed the sample submitted to him, and found it deficient 75 per cent. in its active principle, camphor, and that the oil used was not olive oil as required by the B. P. 1898. The oil he had analysed would mean a saving to the defendants of 2s. 8d. per gallon out of 3s. 7d.—For the defence it was pleaded that the fault lay with the refiners of the oil, who had supplied an inferior quality to what defendants supposed they were receiving. It was also stated that the refiners had been made to pay the whole of the fines inflicted on defendants.—Mr. Moore pointed out that the defence had not touched upon the question of camphor.—The Chairman, in inflicting a fine of £25 and £10 10s. costs, said the magistrates thought the case was richly deserving of such a fine. They had been fining small tradesmen for the very same thing—for offences of which they were perfectly guiltless—and when the Bench had the right people before it they should be made an example of.

Hewlett's Cricket Club.—The members and friends of this club held their second annual supper and smoking concert at Kohler's Restaurant, Wool Exchange, E.C., on Saturday, November 25. About seventy were present, and an excellent supper was succeeded by a well-arranged concert. The Chairman, Mr. E. J. Millard, F.C.S., read letters of apology and regret for their unavoidable absence from Mr. John C. Hewlett, Mr. J. D. Allman, and others. The toast of "Success to the Club," proposed from the chair, was responded to by Mr. H. Fosenmeyer, the captain, who discussed the events of the past season and the arrangements for next. The concert was highly successful, and special mention must be made of the songs by Mr. A. Probert and Mr. J. Chance, whilst the comic songs by Mr. C. Charsley, Mr. A. Upton, and Mr. E. Thompson were received with great favour. Pianoforte solos were rendered by Master J. Chance and Mr. J. Britton, who ably accompanied the songs. Mr. H. Newman recited a poem of his own composition, entitled "Glencoe," which was loudly applauded. The patriotic enthusiasm was sustained by Mr. Corrie's recitation of Rudyard Kipling's "Absent-minded Beggar," which was followed by the audience singing "Rule, Britannia!" and "Soldiers of the Queen," and a collection for the fund promoted by the *Daily Telegraph* for the widows and orphans. An interesting incident, not included in the programme, was the presentation to the honorary secretary of the club of a handsome marble clock subscribed by the members in recognition of his services.

Football.—In connection with the Inter-Pharmacy Football League, a match was played between Muter's F.C. and Westminster College F.C. on Saturday, November 25, at Shepherd's Bush, and resulted in a win for Muter's by ten to one.

Football.—The third Cup match of the Metropolitan College F.C., in connection with the Inter-Pharmacy Football League, was played on Saturday, December 2, at Wormholt Farm, Shepherd's Bush, against the London College F.C. The game was started about 2.45, on a heavy ground, and play continued fairly equal until the "Metros" centre put in a neat shot, which secured the first goal. On restarting the "Metros" again attacked, but up to half-time were unable to increase their score. After half-time one or two sharp rushes were made by the London team, but without scoring. Some good passing from the "Metros" secured their second goal, which was quickly followed by a third. The London team again tried hard, and after some quick passing secured their first goal. This was followed by several rushes, but they failed to equalise, when the whistle blew, leaving the "Metros" the winners by three goals to one.

SCOTTISH NEWS.

Edinburgh Royal Dispensary.—The pharmacy students of the Royal Dispensary, Edinburgh, held their annual smoking concert, on Friday evening, December 1. The chair was occupied by Mr. Strachan, until Mr. Duncan arrived later in the evening. An excellent programme was gone through—the students showing great musical ability—instrumental and vocal. At the suggestion of Mr. Duncan a collection for the "Soldiers' Widows' and Orphans' Fund" was made, £2 10s. being received, which has been sent to the *Scotsman* Fund.

FOOD AND DRUGS ACT PROSECUTIONS.

Light Calcined Magnesia.—At Highgate Petty Sessions on Wednesday, November 22, Clifford B. Moore, chemist and druggist, North Finchley, was fined 20s. and costs for selling as light calcined magnesia a substance containing 30 per cent. or thereabouts of light carbonate of magnesia.—The defence was that the article in question was part of the stock purchased with the business in June last year, and that atmospheric influence would convert some of it into carbonate of magnesia.—The Bench considered that there had not been wilful adulteration, but attributed it to carelessness.

Camphorated Oil.—Amos Kaye, drysalter, Hepworth, was fined 32s. 6d., including costs, at Holmforth Police Court on November 11, for selling camphorated oil containing only 5 per cent. of camphor and 95 per cent. of olive oil, instead of 21 per cent. of camphor and 79 per cent. of olive oil.——At Durham County Petty Sessions on November 15, Messrs. Holmes and Richmond, wholesale druggists, Darlington, were fined the full penalty of £20 and costs, for selling camphorated oil to which a wrong label had been attached, the oil in question being compounded with 80·72 per cent. of colza oil, instead of olive oil.——William B. Baynham, chemist and druggist, Woking, was summoned at the Guildford Petty Sessions, on Saturday, November 25, for selling camphorated oil which was certified by the county analyst to be 15 per cent. deficient in camphor.—Defendant contended that there was only a deficiency of 3·15 per cent., and that this was due to evaporation. The case was adjourned in order that the county analyst might attend to speak with regard to evaporation.

Seidlitz Powders.—During the hearing of an adjourned case at Houghton-le-Spring Petty Sessions on November 16, in which George Reay was charged with selling seidlitz powders not compounded in accordance with the B. P., 1898, the county analyst was

warned by the magistrates to be more careful in making analyses in future, as they should certainly hesitate before convicting in similar cases, unless there was a much better analyst's opinion given than in the particular case before them. He had certified that the seidlitz powders in question, on an average, were deficient in sodium bicarbonate to the extent of at least 45 per cent., whereas on the case being adjourned for a Somerset House analysis the Government analyst certified that the powders had been compounded in accordance with B.P. 1898, and that they were not deficient in sodium bicarbonate.—The bench, in dismissing the case, made an order for the prosecution to pay the costs, £4 11s. 8d., and said it was hard lines for a shopkeeper to be summoned and then to be told that the county analyst had made a mistake.

MILK OF SULPHUR.—On Tuesday, November 28, Herbert Bunting, 16, Broadmarsh, Nottingham, was fined 30s. and costs at the Nottingham Police Court for selling milk of sulphur containing 50 per cent. of calcium sulphate.—The defence was that it was part of some old stock which was kept to be used for pig powders, and had been sold inadvertently by the book-keeper early in the morning before the defendant or his son had arrived at the shop. There was plenty of the standard article in stock.

TRADE NOTES.

NEW NAME FOR LIEBIG COMPANY'S EXTRACT.—"Lemco" is the combination of letters which the Liebig's Extract of Meat Company has decided to use in future as a distinguishing mark of the company's extract in addition to the well-known blue signature J. V. Liebig. On and after January 1, 1900, all the company's jars will have an additional label bearing the initials of the company, "Lemco," by which name the company's extract will soon be generally known.

POTASSIUM PERMANGANATE AND ALUM SOLOIDS.—Messrs. Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C., submit specimens of potassium permanganate and alum soloids which they are now issuing in bottles containing 100. Each contains 3 grs. of potassium permanganate and 5 grs. of alum. Such a preparation will be of great service as a ready means of carrying the active constituents of an antiseptic and astringent solution which can be used in a variety of circumstances.

FIRE.—Messrs. Idris and Co., Limited, Pratt Street, Camden Town, London, N.W., write as follows:—With reference to the report which has appeared in the daily papers respecting the fire which occurred here last Sunday night, this is very much exaggerated. Fortunately, the fire was not of a serious nature, and very little damage has been done, nothing in any way to interfere with the carrying on of our business as usual, and the loss we have sustained is fully covered by insurance.

COUNTER BILLS AND ALMANACK, ETC.—Messrs. Kay Brothers, Limited, St. Petersgate Mills, Stockport, are issuing a new set of counter bills, suitable for the winter season advertising, their "Linseed Compound," "Coaguline," "Linum Catharticum" Pills, and "Klinx," a new white inorganic cement recently introduced for piecing broken porcelain, earthenware, stone, etc. Chemists who distribute the bills may have their own names and addresses printed on. The old size of hand-bill advertising "Linseed Compound" is to be altered to 6″ × 7½″., printed on better paper, on one side only, and including a map of South Africa. The firm's "Family Reference Almanac," 1900, is an attractive and useful publication, containing a list of remedies for simple ailments; hints as to first aid in accidents and sudden illness, and most of the information usually included in almanacs. The name and address of the chemist distributing the almanac is printed at the foot of the front outside cover.

PERSONAL AND BUSINESS NOTES.

Mr. F. Palmer, 92, Packingham Street, Islington, has been awarded the prize of five guineas offered by Mr. G. S. V. Wills, of the Westminster College of Chemistry and Pharmacy, in September last, for the best design for a pharmaceutical certificate.

Mr. Alfred Higgs, J.P., M.P.S., of Kingston-on-Thames, has been additionally appointed by the Lord Chancellor a Justice of the Peace for the Lunacy Acts, within the Borough of Kingston-on-Thames.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

THURSDAY, December 7, 1899.

Business in drugs and chemicals has not been very active during the past week, although there have nevertheless been a moderate number of transactions passing. No doubt the dearness of money has made buyers hold off as much as possible, but we shall perforce, we think, see renewed activity after the commencement of the new year. The changes in value which have taken place since last week are comparatively few. Quinine, after sagging a bit, appears to be again recovering. Much depends, however, upon the course of to-day's Cinchona Bark sales in Amsterdam, the results of which had not become known at time of going to press. Quicksilver and mercurials are again dearer. Camphor, both crude and refined, very firm. Acid carbolic again dearer. Acid chrysophaine is also quoted higher. Bromides and Iodides steady at unchanged prices. Cod-liver Oil firm. Menthol again rather higher. Lycophodium is dearer, and is expected to still further advance. Opium steady. Morphine quiet. Codeine very firm. The following are prices ruling for some articles of principal interest:—

ACETANILIDE—Continues dull and weak at nominally unchanged prices.

ACID CITRIC—is dull and weak at nominally unchanged prices.

ACID BORIC—Quotations are without change.

ACID CARBOLIC—Very firm. Quotations are nominally 10d. for 35° to 36° C. ice crystal in large bulk, 11d. for 39° to 40° C., 1s. to 1s. 1d. for 39° to 40° C. detached crystals, B.P. quality. Most of the makers of refined Acid Carbolic state that they are sold out and unable to offer for next few months. Crude: 60° F., 2s. 10½d. per gallon, 75° F., 3s. 8d. per gallon; liquid, 95 to 98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon in 40-gallon casks; ditto, 25 to 30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CHRYSOPHANIC—Is dearer at 7s. 3d. to 7s. 6d. per lb., according to quantity and make.

ACID TARTARIC—Quiet and unchanged.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt.; ditto commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: First, 40s. per cwt.; seconds, 38s.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate dearer; Grey, 24 per cent. London prompt, £11 7s. 6d. Hull prompt, £11 6s. 3d. to £11 7s. 6d. Leith prompt, £11 7s. 6d. January-March, £11 12s. 6d. Beckton, January-March, £11 10s. Beckton, terms prompt, £11 3s. 9d. to £11 5s. Slphocyanide 1s. 2d. to 1s. 3d. per lb.

ASAFETIDA.—There is some enquiry for good quality, and a few cases of Persian Gulf Gum have been turned over this week at an advance on last sales' prices.

BLEACHING POWDER (CHLORIDE OF LIME).—Rather dearer at £6 10s. to £6 15s. per ton for English make.

BORAX—Unchanged in price.

BROMIDES—Are firm at unchanged prices.

CAMPHOR.—The market for Crude is quiet, but quotations are firm. On the spot there are sellers of Japan at 167s. 6d., and for arrival near shipment at 160s. c.f. and i. Refined is firm and unchanged.

CLOVES.—Privately, the market for Zanzibar is quiet but firm,

with buyers for March-May delivery at 3 7/16d. At auction 100 bales Zanzibar catalogued were withdrawn. No Penang offered.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 1s. 3d. per gallon; pure, 2s. 3d. Benzole, 50 per cent., 10½d. per gallon; 90 per cent., 9½d. per gallon. Cresote, 3¼d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 5d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 3½d. per gallon; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene: A., 4½d. per unit; B., 3d. per unit. Pitch, 65s. per ton, f.o.b. Tar: Refined and crude, 14s. per barrel; 3d. per gallon for refined, 2¾d. for crude

COCAINE.—Makers still quote 20s. 6d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins, while second-hand offers at about 1s. per oz. below this figure.

CODEINE—Is very firm at prices given last week.

COD-LIVER OIL—Is firm, with prices tending upwards, at, say, nominally 80s. per barrel for best new non-congealing Norwegian oil, in tin-lined barrels of 25 gallons.

COLOCYNTH.—Importers of Turkey apples are very firm owing to the reported deficiency in the supply. Small sales have been made at 1s. 6d. per lb.

CREAM OF TARTAR—Is steady and unchanged.

CUTCH.—Business continues on a small scale at previous rates.

GAMBIER.—The market for arrival continues very quiet, and no sales are reported, closing sellers October-December steamer at 14s. 3d. On the spot further small sales have been made in whole bales at 14s. 6d.

GALLS.—China remain quiet, without business on the spot, owing to dearth of supplies, and extreme prices are asked. Japan for arrival quoted higher at 59s. 6d., c. f. and i. Persian have been in less request, and only unimportant sales have occurred, but holders are firm for the small supplies.

GINGER.—Small supplies of Cochin met a slow demand. Of 208 cases and 52 bags offered, 95 packages sold, bold, some medium, roughly cut and scraped, rather heavily limed, at 88s.; medium ditto, at 72s. 6d.; small and medium ditto, at 51s. 6d. to 52s.; small ditto, at 36s.; fair cuttings, 18s. 6d. Calicut, medium, dullish rough limed, in cases, at 36s.; small rough, part shrivelled, at 22s. 6d. Jamaica quiet; and of 71 barrels offered, only 1 barrel sold; medium and small bright, at 63s.

GLYCERIN—Quiet at nominally unchanged prices, both for crude and also for refined.

IODIDES.—There is no change in prices to report.

LYCOPODIUM—Very firm at higher prices, say 1s. 10d. per lb. for double sifted in case lots. The article is expected to still further advance.

MERCURIALS—Have advanced 1d. per lb., owing to the rise in Quicksilver, Calomel now being quoted 3s. 2d.; Corrosive Sublimate, 2s. 10d.; red Precipitate, 3s. 6d.; white Precipitate, 3s. 7d,; and yellow Precipitate, 3s. 7d.

MORPHIA—Remains quiet, but nominally unchanged in price.

OILS (FIXED) AND SPIRITS.—Linseed flat. On the spot, pipes, London, £21 to £21 2s. 6d.; barrels, £21 5s.; Hull, spot, naked, £20 5s.; January-April, £19 15s. Rape quiet. Ordinary brown, on the spot, £22 5s.; refined, spot, £23 15s. Ravison, naked, spot, £20 5s. to £20 10s. Cotton steady. London, crude, spot, £17 10s. to £17 12s. 6d.; refined, spot, £19 to £19 15s., according to make; Hull, naked, refined, spot, quoted £17 7s. 6d.; crude, spot, £16 7s. 6d. Olive: Mogador, £34; Spanish, £35 5s.; Levant, £34 5s. Cocoanut quiet. Ceylon, on spot, £25 to £25 10s., near £24, c.i.f.; Cochin, spot, £28 10s., near £27 c.i.f. Palm: Lagos, on spot, quoted £25 10s. Castor quiet. Belgian, first, pressing, spot, £27; January-June, £25 10s. f.o.b. Antwerp; second, pressing, spot, £26 per ton, ex wharf; Hull manufactured, guaranteed cold drawn, pure, pharmaceutical, £29 10s. per ton in barrels, 3 9/16d. per lb., in cases; pure, firsts, £27 per ton in barrels; firsts, 3 3-16d. per lb. in cases, ex wharf, London; seconds not offering. Lubricating Oil: Pale, American, spot, 7s. 6d. to 11s.; black, 7s. to 9s.; Russian black, 5s. 6d. to 6s.; pale, 8s. to 9s. 6d. Petroleum Oil steady: Russian, spot, quoted 6 5 16d. to 6½d.; January-March, 6 5-16d. to 6½d.; American, spot, 7¼d. to 7⅞d.; water white, 8½d. to 8⅝d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. Turpentine slow, and easier: American, spot, 36s. 6d.; January-April, 37s. 1½d. to 37s. 3d.

OPIUM.—The market has been firmer for druggist and manufacturing kinds, owing to an advance in the producing districts, and business of good extent has been effected. In "Soft Shipping" descriptions sales have only been retail.

OXALIC ACID.—There is no change to report. The article is, however, if anything, rather steadier.

PHENACETINE—Is steady, without alteration in value.

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt.; Bichromate, 3½d. per lb.; Bromide, 1s. 10½d. per lb.; Chlorate, spot, London, crystals, 3¾d.; powder, 3⅞d. These prices are, however nominal, while lower prices are quoted for delivery over next year. Iodide, 10s. 6d. per lb.; Permanganate quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, quiet, Beckton, 6⅞d.; other English makes, 7½d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER.—Importer on Tuesday advanced his price to £9 12s. 6d. per bottle, at which advanced price the article is very firm, second-hand not offering.

QUININE—Continues very quiet, and only a restricted business has been done, including a few thousand ounces B&S and /or Brunswick March delivery at 1s. 1¼d. and buyers; spot buyers at 1s. 0¾d. and sellers at 1s. 1d. Price is, however, again tending upwards.

SAFFRON—Is very firm at 38s. to 42s. 6d. for good to very finest Valentia.

SALICYLATES AND SALOL.—So far the anticipated advance in makers' prices has not taken place.

SEEDLAC.—At auction 5 bags fine bright clean Kurrachee offered and sold at 60s.

SHELLAC.—The demand shows no improvement, and business on the spot is unimportant. The market for Futures remains quiet, with a sale of 100 cases TN March delivery at 64s., being easier. At auction to-day the moderate supplies met a slow demand and only a few cases sold, chiefly in small lots, at weaker prices, TN Orange being now quoted 63s. for fair quality. No AC Garnet was offered, good G bought in at 65s. Buttons neglected. A total of 559 cases offered and 84 cases sold. Second Orange; Of 335 cases 40 sold; fine OK in octagon bought in at 78s., and fine AA in circle at 74s.; good bright TN sold at 63s.; fair to good bright curly matted sold at 61s. to 63s.; bright red shivered at 60s.; block, fine pale at 71s.; middling 58s. Garnet: 32 cases offered and bought in, including good free G at 65s. Button: Of 192 cases 40 sold in oddments, chiefly block, from 41s. to 61s.

SODA COMPOUNDS.—Crystals, barrels, quoted 60s.; bags, 57s. 6d.; Ash, £6 to £7 per ton, according to percentage, etc.; bichromate, 2¾d. per lb.; bicarbonate, landed, £7 5s.; bromide, 2s. 1½d. per lb. Caustic, 70 per cent. white, £10; 60 per cent., £1 less. Hyposulphate (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate quiet, on the spot refined, £8; ordinary, £7 15s.

SPICES (VARIOUS).—Black Pepper all bought in. White Pepper in good supply met with slow demand; 200 bags Singapore sold, good at 9¼d.; 84 bags Siam bought in; also 355 bags Penang, fair at 8½d. Chillies quiet: 130 bags Japan bought in at 45s.; 2 bags Sumatra sold, fine bright at 51s. Capsicums: 1 bale Natal sold, without reserve, good bright at 96s. Cassia Lignea quiet; 148 cases withdrawn, and 200 bales broken bought in. Cinnamon Chips dull; of 183 packages Ceylon, only 61 sold in small lots from 1½d. to 3¼d. Mace quiet; 11 cases Penang bought in; fair to good bold red at 1s. 7d. to 1s. 10d.; 37 packages West Indian sold, fair to good pale at 1s. 6d. to 1s. 8d.; ditto red, at 1s. 3d. to 1s. 5d.; broken, at 1s. 2d. Nutmegs flat; 2 cases Penang sold, 80's at 1s. 7½d.; 112 packages West Indian sold, 59's at 2s. 8d.; 63's, 2s. 4d.; 68's, 2s.; 70's, 1s. 9d.; down to 120's to 122's at 9½d. to 10d.; and **140's at 6d.** Pimento in large supply and easier; of 1,254 bags, 339 sold, fair to good fair at 3¼d. to 3⅜d.

SULPHATE OF COPPER—Steady and unchanged.

SULPHONAL—Makers still quote 17s. per lb., while the article is selling from second-hand at shillings below this figure, for both crystals and powder.

TURMERIC.—At auction 40 bags Bengal offered and bought in. Privately there is only a restricted business passing, but prices are firm. Bengal quoted 30s. Good bright Madras finger sold at 37s. 6d., and Cochin split bulbs at 12s.

VERMILION.—In consequence of the further advance in Quicksilver the price of English has been raised 1d. per lb., making the quotations now 2s. 7d. to 2s. 9½d., according to quantity.

THURSDAY'S DRUG SALES.

To-day's drug auctions passed off quietly, many of the lots offered being bought in. Senna sold well, as also did cardamoms and honey. Ipecacuanha was again rather easier. The following are the particulars:—

ALOES.—100 boxes sold freely at 32s. per cwt. for good livery down to 23s. for bright capey,,5 cases, water damaged selling at 15s. 6d. to 17s. 6d. per cwt. 20 cases softish Cape sold readily at high prices, viz., 28s. to 29s. 6d. per cwt

AMBERGRIS.—1 tin, containing 8½ oz. of very fine flavour, sold, subject to owner's approval, at 92s. 6d. per oz.; 1 tin black undeveloped at 22s.

ANISEEDS.—30 bags good Spanish sold at 25s. per cwt.

ANNATTO SEEDS.—18 bags were taken out at 3d. per lb. Other 20 bags part sold at 3½d.

ARECA NUTS.—19 bags of fair quality were taken out at 30s. per cwt.

ARGOL.—4 bags Cape, part sold at 42s. to 47s. per cwt.

ASPHALTUM.—49 cases Syrian taken out at 33s. per cwt.

BALSAM COPAIBAE.—7 barrels were bought in at 1s. 4d. per lb., other 2 casks were taken out at 1s. 6½d.

BALSAM PERU.—3 cases held for 7s. 3d. per lb.

BITTER ALMONDS.—4 cases were taken out at 40s. per cwt.

BUCHU LEAVES.—9 bales were bought in at 1s. 1d. per lb., a bid of 11d. being declined. Other 4 bales sold at 9½d. to 9¾d. per lb.

CALUMBA ROOT.—20 bags fair sorts were bought in at 32s. per cwt., a bid of 27s. 6d. not being entertained. Another lot of 18 bags good sorts were taken out at 32s. 6d. Other 94 bags were also all bought in, washed root at 60s.

CAMPHOR.—3 tubes Japan crude fetched full price of 155s. per cwt. 2 casks French refined in Bells bought in at 1s. 11d. per lb. 25 cases Japan refined, part ¼oz. and part 1oz. tablets, at 2s. per lb.

CARDAMOMS.—4 cases fair heavy wild sold 3s. 10d. to 4s. per lb., down to 2s. 11d. to 3s. 1d. for small. 33 cases Ceylon Mysores all bought in at 2s. 2d. to 2s. 8d. per lb.; another lot of 81 cases sold at 1s. 6d. up to 4s. 1d. per lb., according to quality. 9 cases medium to fair seeds sold at 1s. 8d. to 2s. 3d. per lb.

CASCARILLA BARK.—16 barrels siftings were taken out at 25s. per cwt.

CHILLIES.—15 bags fair African were taken out at 50s. per cwt.

CHINA SOY.—50 casks taken out at 1s. 6d. per gallon.

CINCHONA BARK.—14 packages Crown and Grey all bought in at 7d. to 9d. per lb., 8 bales yellow bark at 9d.

COCAINE.—1 box Crude containing, according to Dr. Paul's analysis, 81·7 per cent. was taken out at 16s. per oz.

COD LIVER OIL.—15 barrels fair non-freezing Norwegian were taken out at 90s. per barrel. Other 70 barrels Norwegian were all bought in at 75s.

COLOCYNTH.—6 casks all sold at 1s. 5d. per lb. for fair pale, part small to medium brownish, and 1s. per lb. for brownish broken.

CROTON SEED.—58 bags bought in at 60s. to 65s. per cwt.

CUBEBS.—67 bags fair, somewhat dusty, bought in at 24s. to 25s. per cwt.

CUMMIN SEED.—25 bags Maltese taken out at nominally 35s. per cwt.

CUTTLE FISH BONE.—5 cases good bold were taken out at 9d. per lb.

DRAGON'S BLOOD.—8 cases bought in at £9 per cwt. for fair lump, and £4 5s. for very good saucers.; another lot of 9 cases were taken out at £12 to £15 per cwt.; other 5 cases were also bought in at £8 to £10 for medium to fair bright lump.

ELATERINE.—1 box, about 409oz. nett, bought in at 1s. 2d. per oz.

ERGOT OF RYE.—6 bags Spanish taken out at 2s. 9d. per lb.

ESSENTIAL OILS.—8 drums good, but rather darkish, Citronella taken out at 1s. per lb. 4 cases fair greenish West Indian Lime Oil realised 3s. 1d. per lb. 10 cases Dementholized Japan Oil Peppermint taken out at 4s. per lb. 7 cases Commercial Oil Eucalyptus were held for 9d. per lb., 1 case Portuguese selling at 1s. 9d. per lb. 4 cases Eucalyptus Rhisdonia held for 1s. 6d. per lb.; 6 cases Globulus, guaranteed 55 to 65 per cent. Eucalyptol, and B.P. 1898 for 2s. 4d. per lb. 3 cases Cinnamon Leaf for 3d. per oz.; 1 bottle Ylang Ylang for 12s 6d. per oz.; 1 case new Essence of Sweet Orange for 8s. per lb.

FENNEL SEED.—15 bags bought in at 21s. per cwt.

GALLS.—5 bags sold at 52s. to 72s. per cwt.

GENTIAN ROOT.—34 bags cut root were taken out at 14s. per cwt.

GRASS TREE GUM.—19 bags sold at 7s. 6d. per cwt.

GUAZA.—14 robbins fair tops taken out at 8d. per lb. 4 bags low dusty sold at 2½d. per lb.

GUM ARABIC.—21 cases part sold at 53s. for fair of the kind down to 29s. per cwt. for very inferior. For 25 bags Australian gum there was no bid. 32 bales Turkey sorts bought in at 75s. to 80s. per cwt.

GUM BENJAMIN.—8 cases small loose, part blocky, Siam were taken out at £11 per cwt; 9 cases ditto, part fair grain, part blocky, some almondy, offered without reserve, realised £10 to £10 5s. per cwt.; good Siam was bought in at £16; 30 cases fine seconds Sumatra were bought in at £11 per cwt.; fair ditto at £7, selling at £7 15s.; common at £6 5s.; 7 cases low inferior being bought in at 65s. to 85s. per cwt.

GUM GALBANUM.—15 packages good taken out at 1s. 1d. to 1s. 3d. per lb.

GUM GUAIACUM.—14 cases sold at 2½d. per lb. for fair glassy block, slightly drossy, down to 1¾s. per lb. for drossy. Other 5 cases and 2 barrels part sold at 1s. 9d. for bright glassy, 8d. for part drossy, and 4d. per lb. for common.

GUM KINO.—2 cases good Cochin were held for 1s. 9d. per lb.

GUM MASTIC.—16 cases yellow taken out at 1s. 7d. per lb.

GUM MYRRH.—Fine pale sorts were part sold prior to auction, remaining 4 cases being bought in at £5 5s. per cwt. and fair sorts at 75s., rather lower quality at 60s., down to 24s. to 35s. for inferior dark siftings and low pickings.

GUM TRAGACANTH.—4 bags of low quality bought in at £5 per cwt.; other 12 packages taken out at £13 to £15 10s. per cwt.

HONEY.—29 barrels Chilian sold at 24s. per cwt. 12 packages Jamaica all sold at 27s. for darkish down to 24s. per cwt. for dark colour. 59 cases Australian part sold at 25s., remainder bought in at 27s. per cwt. for good white. 28 cases fine Californian all sold at 34s. 6d. to 35s. per cwt. 11 cases Chilian were taken out at 35s.

IPECACUANHA.—29 bales Rio, part sold at 11s. 6d. to 12s. per lb., balance being bought in at 12s. 6d. 23 packages Carthagena were taken out at 8s. 9d. to 9s. per lb.

JALAP.—20 bags Vera Cruz part sold at 5¾d. to 6d. per lb for very small; other 6 bags taken out at 7d. per lb.

KOLA NUTS.—40 bags were taken out at 2½d. per lb.; other 30 bags were bought in at 3d. to 4½d.

LICORICE ROOT.— 25 bales decorticated impalpable powder bought in at 42s. to 50s. per cwt. 41 bales good natural cut root sold at 14s.

MANNA.—Two cases were bought in, there being no bid.

MENTHOL.—One case containing 12 × 5lb. tins, said to be good dry white crystals, but not bearing one of the brands most favourably known, was taken out at 10s. per lb.

MORPHINE.—500oz. Wink's hydrochlorate powder were bought in at 4s. 9d. per oz.

MYRABOLANES.—23 bags sold at 4s. 9d. per cwt.

ORANGE PEEL.—7 cases thin cut were taken out at 6d. per lb.

ORRIS ROOT.—15 bags very medium Verona were held for 28s. per cwt., 15 bags fair Florentine for 60s., 10 barrels finest English ground powdered Florentine for 65s.

PATCHOULY LEAVES.—2 cases sold without reserve at 3½d. per lb.

RHATANIA ROOT.—75 bales bought in at 4d. per lb.

RHUBARB.—45 cases were chiefly bought in at 11d. per lb., medium, round and flat, Canton, one case round being held for 1s. 1d. per lb. Good to fine Shensi bought in at 2s. 6d. to 3s. 6d. for flat and 2s. 2d. to 2s. 6d. per lb. for round. Various lots sold without reserve at 7d. to 1s. 2d. per lb. 13 cases rough, round, horny, high-dried, were bought in at 6d. per lb.

SANDAL WOOD CHIPS.—497 bundles bought in at £25 per ton.

SARSAPARILLA.—3 serons good Honduras were bought in at 1s. 5d. per lb.; 18 serons Mexican were also bought in, a bid of 5¼d. per lb. being declined; 1 bale red native Jamaica bought in at 1s. 5d. per lb.; 22 bales Jamaica part sold at 1s. 6d. to 1s. 7d. per lb; 10 bales Lima bought in at 1s. 3d.

SCAMMONY.—14 cases all bought in at 20s. to 22s. per lb.

SCAMMONY ROOT.—167 bags sold at 19s. per cwt.

SENNA.—227 bales Tinnivelly sold readily up to 5¼d. per lb. for fair leaf, lower qualities fetching less money in proportion; other 437 bales also sold readily at about similar rates, according to quality. 1 bale good green medium leaf realised 6½d. per lb. 13 packages Alexandrian part sold at 8d. for fair leaf; other 56 packages of Obovata Alexandrian leaf sold freely up to 9d. per lb.

SQUILLS.—28 bags bought in at 3d. to 4d. per lb.

STAR ANISEEDS.—5 cases fair China were taken out at £5 10s. per cwt.

STAR ANISEED OIL.—20 cases China taken out at 6s. 3d. per lb.

STROPHANTHUS SEEDS.—Six bags Kombe, taken out at 3s. to 4s. per lb., according to variety.

TAMARINDS.—65 casks good East Indian were chiefly taken out at 11s. per cwt., 15 casks of inferior quality selling without reserve at 6s. 6d. per cwt.

TONQUIN BEANS.—2 cases black Para, part foxy, sold at 11½d. per lb.; 2 casks Angostura held for 3s. per lb.

WAX.—1 cask Jamaica sold at £7 per cwt.; fair Zanzibar at £6 7s. 6d. to £6 10s.; Calcutta at £7 to £7 12s. 6d.; Bombay at £5 to £5 15s. 10 bags Morocco bought in at £6 15s.; 22 cases Japan sold at 30s. 6d. per cwt., subject to owner's approval.

Liverpool Market Report.

December 6, 1899.

A brisker tone has pervaded the market during the last week, inquiry has been better, and in many cases good transactions have been effected, with a consequent improvement in quotations. Chilian produce, Beeswax and Honey, has occupied the attention of buyers, and satisfactory amounts of Beeswax have consequently changed owners at full rates. The same remark applies to Honey, full prices for which are now asked. Oils are only slightly altered, Cottonseed Oil having advanced 3d. per cwt., and Spirits of Turpentine being down 6d. per cwt. A very firm feeling is noticeable in Chemicals, with advances in Carbonate and Sulphate of Ammonia and Bichromates of Potash and Soda; an advance in Caustic Soda is probable.

AMMONIA SALTS.—Carbonate higher, 3½d. per lb. lump. and 3¾d. powder. Salammoniac is firm at 38s. to 40s. per cwt. Sulphate £11 5s. per ton.

BEESWAX.—60 sacks of Chilian, £7 per cwt., now advanced to £7 5s. and £7 10s. per cwt. 20 sacks subsequently went for £7 10s. 7 bags of Buenos Ayres sold at £6 11s. 3d. to £6 17s. 6d. per cwt. 14 bales of Gambia also went at late rates.

BLEACHING POWDER—Has advanced to £6 per ton.

CANARYSEED—Is quietly steady on the spot at 35s. 6d. to 36s. per 464 lbs. for Turkish. 50 bags changed hands at 36s.

COPPERAS—Is very steady at 37s. per ton for Welsh, and 39s. per ton for Lancashire.

COPPER SULPHATE—Has become firmer, £25 to £25 10s. per ton.

HONEY.—100 barrels of Chilian sold at 29s. to 30s. per cwt. for Pile X, 24s. to 25s. 6d. for Pile 1, and 21s. 6d. for Pile 3.

LINSEED.—The tone remains firm, and a fair inquiry existed early in the week when 200 tons River Plate sold for December-January shipment at 40s. per 416 lbs, with option of January-February shipment at 39s. Calcutta was quoted at 45s. 6d., November-December shipment, and a little North American at 49s., November-December. At present the market is lifeless, and there is no disposition to operate either on the part of buyers or sellers.

OILS (FIXED) AND SPIRITS.—Castor Oils are in fair inquiry, with a slight move towards easier prices. Calcutta 2 15/16d. to 3d. per lb. store, 100 cases sold ex quay at 2⅞d. per lb. French, 1st pressure, 2¾d. per lb. store, with sellers forward, December to June, at £24 per ton f.o.b. to Marseilles, 2nd pressure, Belgian 2⅝d. per lb.; 2nd Sulphur 2½d. per lb.; Madras, 2¾d., 28 casks sold. Olive Oil: Sales from store of Spanish at £36 10s. to £37 per tun. Linseed Oil is easier 3d. per cwt., and is offering at 22s. 9d. to 24s. per cwt. Cottonseed Oil is very firm at an advance of 3d. per cwt., and sells at 19s. 9d. to 20s. per cwt. Spirits of Turpentine is only in moderate demand at 38s. per cwt.

POTASH SALTS.—Bichromate is 4d. per lb., and very firm. Chlorate 3½d. to 3¾d. per lb. Cream of Tartar is steady at 74s. to 80s. per cwt., and small sales of Greek from Patras have been made at 62s. 6d. Pearlash is nominal at 32s. per cwt. Potashes are still firm at 24s. 6d. to 24s. 9d. per cwt. Prussiate 7¾d. per lb.

SODA SALTS.—Bicarbonate £6 5s. to £6 15s. per ton. Bichromate dearer, 3¼d. per lb. Borax £16 per ton. Caustic, 76 to 77 per cent., £10 per ton, 70 per cent., £9 5s. Crystals £3 5s. per ton. Nitrate 7s. 9d. to 8s. per cwt., with moderate demand.

Manchester Chemical Report.

December 6, 1899.

There is a good business passing in both heavy and fine chemicals, and the textile and paper-making industries are absorbing large quantities owing to the active state of those trades. Caustic Soda and Ammonia Alkali are rather scarce for prompt delivery at full rates, and in regard to Bleaching Powder, makers are well supplied with orders. Acetic Acids are dearer, and Green Copperas is in active demand for export, although locally the Lancashire make seems too dear for buyers, Sulphate of Copper is rather dull at £24 10s. to £25 10s. per ton according to brand, delivered Manchester. Salt Cake is in full supply at 27s. to 28s. per ton in bulk on rails. Recovered Sulphur is firmer at £4 12s. 6d. to £5 2s. 6d. per ton, according to quantity and delivery. Notwithstanding low quotations in certain quarters, Yellow Prussiate is scarce here, and makers are firm at 8d. to 8¼d., except in quantity for forward delivery. Ammonia Salts seem to be again advancing. Arsenic is easier at £19 5s. to £19 10s. per ton ex ship, Garston. There is a rumour of the probable absorption of the firm of Bowman, Thompson and Co., Ltd., Northwich, by that of Brunner, Mond and Co., and that the probable settlement will be in the exchange of three shares of B. T. and Co. to one of B. M. and Co. This, if true, ought to be most satisfactory to the shareholders in the former firm. The flotation of the Electrolytic Alkali Co., Ltd. (Hargreaves Bird process), is attracting much attention in the trade here, and is expected to have important results in cheapening production. The direct oil trade has brightened up, and there have been important arrivals per Manchester Ship Canal during the past week.

Newcastle-on-Tyne Chemical Report.

December 6, 1899.

This chemical district is still very firm, and makers practically sold out for the remainder of the year. Bleaching powder is reported sold over the whole of next year at present quotation. Values are: Soda Crystals, 57s. 6d.; Caustic Soda, 70 per cent., £9 5s. to £9 10s.; Bleaching Powder, £6 10s. to £6 15s.; Soda Ash, 52 per cent., £5; Alkali, 52 per cent., £5 15s.; Sulphur, £5 per ton.

Deaths.

Tweedie.—On November 1, Jonathan J. Tweedie, Chemist and Druggist, late of Cambridge. Aged 35.

Greenwood.—On November 24, Samuel Greenwood, Chemis and Druggist, Bradford. Aged 54.

Heathcote.—On November 26, Edward Gilbert Heathcote, Chemist and Druggist, Bradford. Aged 53.

Milner.—On December 1, Thomas Milner, Chemist and Druggist, Consett. Aged about 45. Mr. Milner, who was a single man, and had been in business in the town for fifteen or sixteen years, was seized with a fit while at business, and expired almost immediately.

Hughes.—On December 2, Evan Griffiths Hughes, Chemist and Druggist, Manchester. Aged 64. Mr. Hughes, who had been a member of the Pharmaceutical Society since 1895, had been associated with the business life of Manchester for nearly half a century, and was a liberal supporter of the Botanical and Horticultural Society.

Publications Received.

Artificial Formation of a Rudimentary Nervous System. By Professor A. L. Herrera, Jun. Reprinted from *Natural Science*. Vol. XIII. Nos. 81 and 82. From the Author.

Effects of Borax and Boracic Acid on the Human System. By Dr. Oscar Liebreich. Berlin, 1899. (Translated from the German.) Pp. iv. + 44, with two plates. Price 2s. London: J. and A. Churchill, 7, Great Marlborough Street, W. From the Publishers.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Anness, Ashton, Attfield, Bagnall, Bartlett, Bennett, Beynon, Bilson, Branch, Cocks, Davies, Duncan, Dunning, Fisher, Forgie, Gilchrist, Gilderdale, Gill, Higgs, Hill, Hobbs, James, Jeffs, Johnston, Jones, Kirkby, Lennox, Linstead, Lucas, Lunan, Marshall, Mason, Reynolds, Ring, Rudd, Seabury, Shorthouse, Turner, Twelves, Wills.

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Drugs and Chemicals.—Cocaine Hydrochlorate, ⅛ oz. 2/9, ¼ oz. 5/3, ½ oz. 10/-, 1 oz. 20s. Post free for cash.—Collis, Bath.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Overstocked Potass. Iodid., 9/6 lb., 4 lbs. 36/-; Iodoform Prec., 12/6, Crystal, 12/-; Bismuth, Subnit., 5/3 lb., 4 lbs. £1 1s.; Morph. Acet. and Hydroch., 5/- oz.—Eastman, Forest Lane, Stratford.

A Number of gold labelled and other stoppered shop-rounds, ointment pots, and some large wide-mouth white bottles suitable for stock, for disposal; offers wanted.—Wilcox, 83, Mortimer Street, London, W.

Good Second-hand, Hand Painted Lantern Slides, to clear, 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c. Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements.

(Received too late for Classification.)

UNQUALIFIED, 24, 9 years' experience. Photography. Disengaged.—WILKINSON, 28, Finsbury Rd., Leeds.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for.

Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C.

Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London, W.C.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

Calendar for the Week.

Sunday, Dec. 10. 2nd in Advent. Sun rises 7.57, sets 3.49.

Monday, Dec. 11. Sun rises 7.58, sets 3.49.

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION, Town Hall, at 8.30 p.m.—Meeting to discuss the Chemists' Defence Scheme, and the Companies Bill.

EDINBURGH PHARMACY ATHLETIC CLUB, West-end Cafe, Prince's Street, at 8.30 p.m.—Annual Smoking Concert.

Tuesday, Dec. 12. Sun rises 7.59, sets 3.49.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C., at 8 p.m.—Evening meeting, when Professor J. Millar Thomson will lecture on "Some Relations of Water to Other Substances."

ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London W.C., at 8 p.m.—Two papers by Thomas Bolas, "Notes on the use of the Dallmeyer Focometer," and "The Origination of Printing Types by Photographic Methods."

Wednesday, Dec. 13. Sun rises 8.0, sets 3.49.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION, 36, York Place, at 9.15 p.m.—Paper on "New Remedies," by Donald M'Ewan.

MIDLAND CHEMISTS' ASSISTANTS, ASSOCIATION, Exchange Rooms, Birmingham, at 9.15 p.m.—"Laboratory Notes," by J. Barclay.

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION, Hotel Métropole, at 8.30 p.m.—Smoking Concert; the President (C. Ridley) in the chair.

Thursday, Dec. 14. Sun rises 8.1, sets 3.49

CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, at 9 a.m.—Musical and Society Evening.

LIVERPOOL CHEMISTS' ASSOCIATION, Royal Institution, at 7 p.m. —"Note on Liq. Bismuthi," by R. C. Cowley and J. P. Catford.

Friday, Dec. 15. Sun rises 8.2, sets 3.49.

GLASGOW CHEMISTS AND DRUGGISTS,' ASSISTANTS,' AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Lantern Lecture, "The Hospitals of Glasgow," by Councillor J. Erskine.

Saturday, Dec. 16. Sun rises 8.2, sets 3.49

ENGLISH NEWS.

Companies Acts Amendment.—At a meeting of the General Medical Council on Tuesday, December 5, the interim report from the Companies Act Amendment Committee was read and adopted by the Council. The report stated that the Committee was glad to be able to report that the Lord Chancellor's clause prohibiting the practice by companies of the business or profession of physician, surgeon, dentist, or midwife, which has now been placed in a Government measure (the Companies Acts Amendment Bill), was passed without amendment by the House of Lords towards the end of last session. It was too near to the close of the session for the Bill to be then introduced in the House of Commons, but it was understood that the Government intends to actively proceed with the measure, and it was hoped that it will be introduced in the House of Commons early in the ensuing session. In view of the doubt which still attaches to the application of the words "physician" and "surgeon," the Committee felt that the addition of the words "medical practitioner" was more than ever necessary, and it was using its best endeavours to procure their insertion, which would probably present no difficulty. Since its last report the Committee had received further information, which enabled it to state that both medical and dental companies are still actively pursuing highly objectionable forms of practice.

Midland Pharmaceutical Association.—In connection with this Association a very successful smoking concert was given at the Great Western Hotel, Birmingham, on the 7th inst. Mr. G. E. Perry, who presided, also contributed to the musical programme, and sang a song in which there were references to trade topics, conceived in the happiest vein. The other vocalists were Mr. Hubert Langford, Mr. Longmore, and Mr. Burton.

Leeds Chemists' Association.—At a meeting of this Association, held on November 23, a draft clause was adopted for insertion in the Companies Bill. The clause provides that no company shall carry on the business of a chemist and druggist or use titles implying qualification under the Pharmacy Act, unless its "controlling shareholders" are qualified.

Manchester Pharmaceutical Association.—This Association has obtained the signatures of 289 registered persons, carrying on business in Manchester and the neighbourhood, to a petition which has been sent to the Council of the Pharmaceutical Society, urging the promotion of legislation to render it illegal for limited companies to use chemists' titles; and that any attempt to regulate company trading should be strenuously opposed.

Warrington Chemists' Petition.—A petition similar to the one sent by the Manchester Association to the Council of the Pharmaceutical Society has been signed by all the chemists in business in Warrington, and has been forwarded to the Council.

Public Dispensers' Association.—A special general meeting of this Association will be held at the new rooms St. Bride's Institute, Ludgate Circus, on Wednesday, January 3, 1900, at 8 p.m., to make the necessary alteration of the rules, etc., in accordance with the motion of the late Poor Law Dispensers' Association. The annual general meeting will follow for election of officers, etc. The Association has made St. Bride's Institute its headquarters, and will hold meetings there on January 3 and 31, February 28, March 28, and April 25, subjects to be announced later. The Association hopes by thus taking the most central position in London to facilitate the attendance of dispensers. All public dispensers are welcome at the meetings of the Association, and are particularly invited to bring before the meetings any questions of interest that may occur to them. Any further information can be obtained from the Secretary, Mr. G. F. Forster, care of Shuttleworth Club, Fye Foot Lane, Queen Victoria Street, E.C

Yarmouth Chemists' Association.—On the 7th inst. Yarmouth chemists again discussed the defence movement. The following resolution was unanimously passed:—

That this Association, having carefully considered the objects and rules of the Chemists' Defence Association, recommends it to the favourable consideration of its members and chemists generally.

Grocers and the P.A.T.A.—The *Grocers' Review* has a lengthy article on the prospects of the Grocery Section of the P.A.T.A., and expresses a belief that nine out of every ten retailers are heartily sick of the cutting down of prices. In his concluding remarks the editor writes:—"We have not the least doubt about the prospects of the Grocery Section of the Proprietary Articles Trade Association, if the retailers themselves whom the scheme must benefit will give it their full support, because the gentlemen who have been appointed to represent the retail trade are gentlemen of high standing, and possess abilities which could only be calculated to be conducive to the welfare of the trade. We regard this as a fine opportunity for retailers to test whether anything tangible can be done in order to conduct what has been described as a 'fair trade in grocery proprietaries.' With such support from influential gentlemen and from influential firms, one would think that the retailers themselves should strike while the iron is hot, and immediately become associated with that organisation, the Grocery Section of the Proprietary Articles Trade Association, which is attempting to do such honourable work."

Cinderella Dance.—The first dance of the season in connection with the Chemists' Assistants' Association, was held on Thursday, December 7, at the Portman Rooms, Baker Street, London, W. It was moderately patronised, many of those usually present no doubt attending a dance given on the same evening by a leading pharmacist. Messrs. Martin and Solomon acted efficiently as M.C.'s, and dancing was kept up with spirit until midnight. The programme consisted of sixteen items, some of which were encored. There were also two extra dances.

Royal Institution.—The following are the Lecture arrangements at the Royal Institution, before Easter:—Mr. C. Vernon Boys, Six Christmas Lectures (specially adapted for young people) on Fluids in Motion and at Rest; Professor E. Ray Lankester, Twelve Lectures on The Structure and Classification of Fishes; Dr. W. H. R. Rivers, Three Lectures on The Senses of Primitive Man; Professor H. H. Turner, Three Lectures on Modern Astronomy; Dr. Charles Waldstein, Three Lectures on Recent Excavations at Argive Heræum (in Greece); Three Lectures by Sir Hubert H. Parry; Mr. W. L. Courtney, Three Lectures on The Idea of Tragedy in Ancient and Modern Drama; The Right Hon. Lord Rayleigh, Six Lectures on Polarised Light. The Friday Evening Meetings will begin on January 19, when a Discourse will be given by the Right Hon. Lord Rayleigh, on Flight; succeeding Discourses will probably be given by the Hon. C. A. Parsons, Professor J. Reynolds Green, Mr. H. Warington Smyth, Professor J. H. Poynting, Major Ronald Ross, Professor Frank Clowes, Sir Benjamin Stone, M.P., Professor J. Arthur Thomson, Sir A. Noble, Professor Dewar, and other gentlemen.

A Deficient Measure.—At the Leicester County Petty Sessional Court on Wednesday, December 6, Mr. Sidney B. White, chemist and druggist, Leicester, was summoned for having an unjust measure in his possession, at Syston, on the 28th ult.—Inspector Bowley

spoke to finding a quart measure at defendant's shop which was ten drachms deficient. The measure had not been submitted to an inspector since 1895.—Mr. Barnett appeared for the defendant, and said that Mr. White would plead guilty to the charge. Through an oversight on the part of the defendant's manager, the vessel had not been recently tested.—A fine of 24s., inclusive of costs, was imposed.

CLASSES IN PRACTICAL VISUAL OPTICS.—Readers of the Journal who intend to qualify for the Worshipful Company of Spectacle Makers' diploma will probably be interested to know that classes will be held in January and February in London, Manchester, and other provincial centres, conducted by Mr. Lionel Laurance (official instructor to the Spectacle Makers' Company), 1, Vernon Place, Bloomsbury Square, London, W.C., from whom particulars may be obtained.

C.A.M.W.A.L. ANNUAL REPORT.—The twenty-first annual report of the directors for the year ending September 30 last states that there has been a net increase of 294 in the number of members, making a total of 4,849, and an increase in the amount of sales and profits. The directors propose to pay the dividend (10 per cent.) on December 30, the amounts being placed to the credit of open accounts unless applied for before December 16. Those who received cash payments last year, however, need not apply. It is proposed to give the employees a liberal bonus, as hitherto. The dividend and bonus will absorb (income-tax included) £6,416 9s., and a balance will be carried forward of £1,299 14s. 4d., making a total of £7,716 3s. 4d. At the annual general meeting, which is to be held at Anderton's Hotel, Fleet Street, E.C., on Tuesday, December 19, Messrs. H. Davenport and A. Gould retire from the directorate, but offer themselves for re-election. The auditors, Messrs. Prideaux, Booker, Frere, and Co., London, and J. W. Close, Leeds, also retire, but offer themselves for re-election. Several resolutions will be proposed at this meeting, to the effect that it is desirable to sell the undertaking of the old company to a new company, to be formed with the name of "Camwal, Limited," and that accordingly the company be wound up voluntarily, and that the secretary, Mr. Henry Thomas Butler, be appointed liquidator for the purpose of such winding up.

CHEMISTS AND STOLEN GOODS.—On Friday, December 8, before the Hull Stipendiary, William Flynn and Alfred Lumley were charged with robbing their employers, Messrs. Cussons, Limited.—According to the evidence of the police, part of the stolen property was recovered from Mr. G. W. Anderson, chemist and druggist, Derringham Street, Hull, and other chemists (not named), to whom the prisoner Flynn had sold the goods.—Mr. Anderson was closely cross-examined as to his dealings with Flynn, and he admitted that he had 25 per cent. off wholesale prices, but alleged that he did not know that the goods were stolen, although there was certainly a great doubt as to whether the transactions were honest.—The prisoners were sentenced to four calendar months' imprisonment.

"RED TAPE AND INQUESTS" is the heading to a report in the *Kent County Examiner* of an inquest held on Edward Button (78), of Ashford, who was found dead in bed, although there was no doubt that death was due to natural causes.—The coroner explained to the jury that up to a few years ago a coroner could write to a medical attendant and ask whether there was any circumstances in the slightest degree suspicious attending any death reported to him, and if the doctor wrote back saying there were no such circumstances, but that death was, in his opinion, due to such-and-such a cause, then the coroner need not hold an inquest. But as the auditor had ruled that coroners could not pay a fee to a medical man unless an inquest was held, he was compelled to drag a jury there. The doctor could not give a certificate, as he had not seen the man for four or five years.—Mr. F. Guttridge, chemist and druggist, Ashford, stated that deceased came to him about a fortnight previously, and complained of a pain in his back. He gave him an innocuous mixture containing potassium bicarbonate, sodium salicylate, and gentian.—Medical evidence having been given, the deceased's eldest son stated that there was not the slightest suspicion in the case, but he thought that there was some red tapeism in the matter on account of the deceased going to a chemist instead of a doctor.—The jury returned a verdict of "Natural causes."

FOOTBALL.—The return match between Dartford and the Metropolitan College of Pharmacy F.C., which was to have been played on Saturday, December 9, was scratched at the last moment. The "Metros" managed, however, to fix up a match against the Amicables, Battersea, the final result being "Metros," 3 Amicables, 1.

SCOTTISH NEWS.

EVENING MEETING IN EDINBURGH.—The next meeting at 36, York Place, will be held on Wednesday, December 20, at 8.30 p.m. Mr. Peter Boa will preside, and Mr. Thomas Dunlop, a pharmaceutical chemist member from Glasgow, has promised to read two papers—one on a "Strychnine Mixture" and the other on "Maceration Tinctures." The customary reference to the recent additions to the Society's library and museum in Edinburgh will be made by the Assistant-Secretary.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—With a view to securing friendly intercourse and mutual acquaintanceship among assistants and apprentices, the office bearers and Committee issued invitations to all those engaged in Edinburgh and Leith to a meeting held in the Pharmaceutical Society's House, 36, York Place, on Wednesday, December 6, and lasting from 8.30 to 10.30 p.m. The President, Mr. Fraser McDiarmid, and the Committee received the company as they arrived. Tea and cake were served, and the time devoted chiefly to conversation and the examination of a large number of interesting exhibits. Mr. J. Hume Patterson, of the Royal College of Physicians' Research Laboratory, exhibited an exceedingly interesting series of pathogenic bacteria. Messrs. Duncan, Flockhart and Co. sent a collection of dried glandular extracts and preparations. On one table were laid out an interesting series of early herbals and pharmacopœias from the Society's library; on another several microscopic objects, including living specimens of *Volvox globator*, *Hydra fusca*, *Amœba*, and *Tyroglyphus siro* (cheese-mite), the circulation of the blood in a frog's foot, starch grains *in situ* under polarised light, etc. A collection of specimens and apparatus, lent by Mr. William Hume, scientific instrument maker, included a small working model gas-engine and Marconi's apparatus for wireless telegraphy. In the course of the evening the President formally welcomed the assistants and apprentices who had responded to the invitation, and expressed a hope that they would attend the regular meetings held once a fortnight. Mr. Hume Paterson also gave an interesting explanation of his exhibit. After a very pleasant and profitable evening the proceedings concluded with a cordial vote of thanks to all who had contributed to the success of the gathering.

GLASGOW SCHOOL OF PHARMACY.—The third annual supper took place in the North British Hotel, George Square, on Friday, 8th inst., when upwards of ninety past and present students of the School were present. Mr. John Lothian, Principal, occupied the chair, and Messrs. McLeod, Fraser, Carruthers, and Penman acted as Croupiers. After an excellent supper, Mr. Gilmour, in an eloquent speech, proposed "The School and Principal," which was acknowledged by the Chairman. Mr. W. L. Currie, on behalf of the Kinninmont Prize Committee, then presented the Kinninmont

Gold Medal to Mr. Henry Rodwell, a pupil and demonstrator in the School.—Mr. Martin Meldrum proposed "The Pharmaceutical Society," and Mr. Peter Boa, Chairman of the North British Branch Executive, replied. In doing so, he said the question of dividing the qualifying examination and allowing students to pass in subjects in which they had done well, was in the air, and would probably have to be carefully considered. He thought the Society, on fair consideration, would be found to deserve well of all qualified pharmacists, and that they would feel it to be a duty to give it every support.—Mr. J. Rutherford Hill proposed "The Students," and, in doing so, urged upon them the importance of facing the work of preparation with courage and a determination to win. He earnestly deprecated regarding the qualifying examination as an end in itself. It was only a means to an end, and the real end was the successful practice of pharmacy.—The evening was enlivened by numerous songs and recitations, and a pleasant time was brought to a close about 1 a.m. In the course of the evening Mr. John P. Taylor, in the name of past and present pupils, presented to Mr. Lothian a handsome roll-top writing-desk and chair, and an inkstand.

Edinburgh Pharmacy Athletic Club.—The eighth annua smoking concert was held in the West End Café, Princes Street, on Monday, December 11, Dr. George Coull, Hon. President, in the chair. There was a large and representative attendance. The Committee, under the skilful guidance of Mr. J. P. Gibb, Hon Secretary, submitted a capital programme, among the contributors being G. H. C. Rowland, G. Jamieson, Graham Courtney, D. Simpson, K. Brewster, J. P. Gibb, J. Bartleman, etc. A special feature was a cinematographic exhibition of historic pedestrian and other athletic events, which was enthusiastically received. The Chairman proposed "Success to the Club," and Mr. Rutherford Hill responded.

Attack on a Chemist.—At Bo'ness Burgh Court last week, Richard Orr, skipper of the tug-boat "Venus," was fined 10s., or seven days, for assaulting Marshall Thomson, chemist and druggist, manager of two shops occupied by Dr. Graham at Grangepans and Bo'ness.—It appeared from the evidence that Miss Orr, sister of the defendant, acted as assistant in charge of one of the shops, and after closing the shop at ten o'clock it was customary for her to go each night to the other shop to report to the plaintiff.—Defendant objected to his sister being kept out so late, and while in an excited state on November 25 went to remonstrate with the plaintiff, the result being an assault was committed.

IRISH NEWS.

Pharmaceutical Society of Ireland.—Applications for the January Preliminary Examinations must be lodged with the Registrar, 67, Lower Mount Street, Dublin, not later than eleven o'clock on the morning of Tuesday, the 19th instant.

Poisoning of Irish Foxhounds.—At the Munster Winter Assizes, at Cork, before Mr. Justice Gibson, during last week, Michael Curtin, a respectable farmer's son, residing near Newcastle West, County Limerick, was put forward on a charge of having been implicated in the recent poisoning of the West Limerick Foxhounds. Mr. Bourke, Q.C., intimated that the Crown did not intend to send a bill to the Grand Jury, and asked that the accused should be discharged. Curtin was accordingly released from custody. In this connection it may be mentioned that when the prisoner was arrested on the charge in the first instance, bail to any amount was offered, but the Crown could not then see its way to accept it, and the result was that the accused man was detained in prison for a week.

Accidental Poisoning by Ammonia.—A melancholy occurrence has taken place in the townland of Ballymulderg, situate about two miles from Magherafelt. A respectable farmer, named Edwards, got up in the early hours on Sunday morning intending to take some ether which he kept in a press for the purpose of relieving pains caused by asthma and chronic chest affection; but instead of taking the ether the unfortunate man in mistake took a dose of liquid ammonia which was in the press in a similar bottle to that containing the ether. Death occurred about two p.m. on Sunday evening. An inquest was held at deceased's residence on Monday. After hearing the evidence, the jury found that the deceased died from shock or collapse caused by drinking a quantity of ammonia through misadventure.

Poisoning Sensation.—Colonel Tynte, R.M., has investigated a sensational charge brought against Mrs. St. Clair of attempting to poison her husband, at Moville, during the past week. The case for the prosecution was that the accused woman placed matches in a kettle and then fled to Belfast, where she was subsequently arrested on the charge. Mr. St. Clair next morning made his own breakfast, using the kettle of poisoned water. When he had finished the meal he fell down and vomited. He remained unconscious for twelve hours. Dr. Newell deposed that he attended Mr. St. Clair and found him vomiting on the kitchen floor. There was a kettle strongly smelling of phosphorus. Match-heads were floating on the water in the kettle. The teapot also smelt of sulphur. He treated Mr. St. Clair for phosphorus poisoning until he got well again. In reply to Mr. Miller, solicitor for the accused, Dr. Newell stated that red phosphorus was not supposed to be poisonous even in large doses. After hearing further evidence, Colonel Tynte refused informations, and the accused woman, who is the daughter of a Liverpool hardware merchant, was discharged.

TRADE NOTES.

Vinolia War Fund.—The Vinolia Co., Limited, Malden Crescent, London, N.W., announce that one and a-half million ha'pennies (£3,125) have been forwarded by the Vinolia War Fund in aid of the soldiers', families, widows, and orphans. As previously stated in these columns, the company allows the fund ½d. on every tablet of Vinolia soap sold.

Waterproof Fluid Glue.—The Aqua Glue Co., 23, Brunswick Street, Liverpool, submits a sample of Water-Resisting Fluid Glue, put up in a tube from which it is squeezed out as required for joining new or fractured surfaces. It is a unique and valuable preparation, inasmuch as it is always ready for use and is packed in the most portable and convenient form. Its chief advantage—a most important one—over all similar preparations is the fact that articles joined with it successfully resist the action of water and damp, its exceptional merits adapting it to many uses for which the ordinary forms of glue are unsuitable.

Wellcome's Photographic Diary.—We are informed by Messrs. Burroughs, Wellcome, and Co. that the issue of this book (see *ante*, p. 562*a*) has been exceedingly successful. The number of advance orders received for the copies of the first edition prompted the publishers to reprint a second edition at once, but the demand has been so great that this issue will shortly be exhausted. A third edition is now being printed, and will probably be ready by the time that the second is exhausted, but in order to prevent disappointment those who have not already obtained a supply and intend to do so should give their orders as soon as possible, so that there may be no delay in getting the whole of them executed before Christmas.

POTASSIUM CHLORIDE TABLOIDS.—Potassium chloride having been recommended as preferable to common table salt for the use of gouty patients, Messrs. Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C., have introduced a 20 grain tabloid of the substance, so compressed that one or more may be easily crushed into powder at the table, when it may be taken with food.

NEW CHINOSOL PREPARATIONS.—The Chinosol Hygienic Company, 36, St. Mary-at-Hill, Eastcheap, London, E.C., submits specimens of Chinosol Sanitary Tablets and Chinosol Bath and Toilet Tablets. The former have for some time been recognised by sanitary authorities as an efficient and very convenient form of chinosol in odourless disinfection; hence, the company has prepared small packages or boxes of three tablets at sixpence, and boxes of six tablets at elevenpence each, to be offered to the public for the prompt and economical production of concentrated disinfectant fluids for the household, in place of the poisonous and objectionable fluids hitherto used. The Chinosol Bath and Toilet Tablets illustrate the adaptability of chinosol for toilet purposes. They are oomposed of pure chinosol compressed, and in their application are refreshing to the skin and fragrant in their perfume (otto of roses). Counter bills, giving particulars as to use, etc., are supplied to chemists in any quantity they may require.

FOOD AND DRUGS ACT PROSECUTIONS.

CAMPHORATED OIL.—At Birmingham Police-court, on Friday, December 8, William Curtis Miller, chemist and druggist, 107, Hockley Hill, was summoned for selling camphorated oil containing only 87 per cent. of the proper proportion of camphor.—The defendant pleaded that it was liable to evaporation, and this could not be avoided. A fine of 20s. and costs was imposed.——Samuel Partridge, chemist and druggist, 37, Grange Road, was summoned for selling camphorated oil containing only 87 per cent. of the proper proportion of camphor, and at least 50 per cent. of mineral oil.—Mr. Adcock defended, and stated that the ingredients had been mixed only the night previous to the sale, and the camphor had not properly dissolved. With regard to the oil, he stated that the defendant bought it from a Mr. John Cox as pure olive oil.—In reply to Mr. Fisher (Chairman of the Bench), the defendant said that it was not customary for chemists to test their drugs when they purchased them from respectable firms as pure articles.—Mr. John Cox, who also bought the oil as pure from a Liverpool firm, confirmed the defendant's statement, and Mr. Fisher said the magistrates were astonished that chemists should not examine the drugs they received. It seemed incredible. He did not think the public knew it, and the Bench certainly did not. The sooner such a custom was established the better it would be for the protection of the public.—Defendant would be fined 40s. and costs.——Emma Evans, 55, Cattell Road, was fined 20s. and costs for selling camphorated oil containing only one-fourth of the camphor prescribed by the British Pharmacopœia; and James Steen Harvey, chemist and druggist, 29, Arthur Street, was fined 40s. and costs for selling camphorated oil containing only two-thirds of the due proportion of camphor.——On Saturday, December 9, at the Guildford County Petty Sessions, the adjourned case against William B. Baynham, chemist and druggist, Woking (referred to last week, at page 562*c*), came up for hearing.—Dr. Stevenson now stated that he allowed 0·4 per cent. in favour of the vendor for evaporation, but the deficiency of 3·15 could not have occurred without great carelessness either in weighing or heating.—Defendant pointed out that the British Pharmacopœia in a number of preparations gave definite instructions as to the use of heat, but in regard to camphorated oil no such instructions were given.—Dr. Stevenson said a little gentle heat would not, perhaps, be objectionable. He did not consider it a serious case of adulteration.—The Bench acquitted defendant of any intention to defraud, and inflicted the nominal penalty of 1s.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Dr. A. B. Griffiths has had conferred on him, by his Majesty the Sultan, the Knight's Star of the Imperial Order of the Osmanie for scientific services rendered to the Ottoman Government.

Mr. Horatio C. Goodall, M.P.S., chemist and druggist, of St. Catherine's, Lincoln, was one of the successful candidates at the examination of the Sanitary Institute, held in London, December 1 and 2 last.

Mr. J. A. Dewhirst, Ph.C., chemist to Messrs. Curling, Wyman and Co., has been elected a Fellow of the Chemical Society.

Mr. Aubrey T. Hill is to have a congratulatory dinner given to him at the Wellcome Club and Institute, on Tuesday, December 19, by the members of the staff of Burroughs, Wellcome and Co., on his appointment as assistant manager of the works at Dartford.

Mr. C. F. Jarvis, chemist, Villa Road, Handsworth, owing to impaired health, has disposed of the business successfully carried on by him for the last seventeen years to Messrs. Snape and Son, of Great Hampton Street, who will continue the business.

Mr. Thomas J. Wild's friends and fellow students at the School of Pharmacy will doubtless be pleased to learn that, since taking up his appointment at the Government Civil Hospital, Hong Kong, his abilities as an athlete have already been recognised. The *Hong Kong Telegraph*, commenting on a match between the Hong Kong Cricket Club and the Garrison Eleven, states that Mr. Wild's was one of the best-played innings during the whole match.

Deaths.

Stanford.—On December 8, at "Glenwood," Dalmuir, Edward Charles Cortis Stanford. Mr. Stanford was an old prizeman of the School of Pharmacy, and a Life Member of the Pharmaceutical Society.

Richmond.—On December 9, Henry Richmond, Chemist and Druggist, M.R.C.V.S., Lytham. Aged 84.

Partnerships Dissolved.

(From the London Gazette.)

Carel Adelbert Gazan and Theophile Jeanc Baptiste Desnos, trading as Jules Denoual, Capsule Manufacturers, 4, New Cross Road, London. Debts will be received and paid by Theophile J. B Desnos, who will continue to carry on the business.

Alfred Peak and Samuel Hardman, trading as the Whitefield Mineral Water Company, Whitefield.

Reginald John Roberts and Wilson Tyson, Physicians and Surgeons, Lowestoft. Debts will be received and paid by Wilson Tyson.

Joseph Todd and George Dixon Todd, Medical Practitioners, Selby.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

Willian James Tivy, Physician and Surgeon, 8, Lansdown Place, Clifton, Bristol.

John George Nevitt, Surgeon, 128, Harrogate Road, Chapel Allerton, and 153, Roundhay Road, Leeds.

George Jeanes, chemist and druggist, 3, St. Maur's Place, Livingston Avenue, Sefton Park, Liverpool.

Edward James Francis Garner, Chemist and Druggist, 251, Netherfield Road North, Liverpool.

Charles Ernest Richmond, Surgeon, 5, Lime Grove, Chorlton-Medlock, Manchester

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

THURSDAY, December 14.

Business in drugs and chemicals has not been very brisk during the past few days, and we are now hardly likely to see any renewed activity until the turn of the year. The principal changes of the week have been a reduction in German refiners' price for camphor bells and flowers, an advance in makers' prices for quinine, and a rise in prices of pilocarpine, eserine, and veratrine. Quicksilver remains very firm, and the fact that second-hand does not offer would appear to point to the possibility of a further advance in importer's price, he apparently having the game entirely in his own hands. Other prices are mostly firm, or at least show a strong undertone. The following dates have been fixed for sales in 1900:—Drugs (usual), January 18, February 15, March 15, April 12, May 10, June 7, July 5, August 2 and 30, September 27, October 25, November 22. For goods not previously offered in sale: February 1, March 1 and 29, April 26, May 24, June 21, July 19, August 16, September 13, October 11, November 8, December 6. Vanilla: January 10, February 7, March 7, April 4, May 2 and 30, June 27, July 25, August 22, September 19, October 17, November 14, December 12. Below we give prices ruling for some articles of chief interest:—

ACETANILIDE—Dull, at 9½d. to 11d. per lb., according to quantity and make.

ACID BORACIC.—Crystals are quoted 25s. per cwt. and powder 27s.

ACID CARBOLIC—Very firm. Quotations are nominally 10d. for 35° to 36° C. ice crystal in large bulk, 11d. for 39° to 40° C., 1s. for 39° to 40° C. detached crystals B.P. quality. Crude 60° F. 3s.; 75° F., 4s.; liquid, 95 to 98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon in 40-gallon casks; ditto 25 to 30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CITRIC.—The article is weak at 1s. 3d. to 1s. 3½d. per lb. for crystals in 5 cwt. casks on the spot, and about 1d. per lb. less for delivery during next year. Makers are, however, not desirous of selling so far forward.

ACID OSMIC.—It is stated that this article will in future be very much dearer, as much as 7s. per gramme in 1 gramme sealed tubes being mentioned as the possible future price.

ACID TARTARIC—Is rather easier, at 1s. 0¾d. per lb. for English, on the spot; 11¾d. per lb., c.i.f., for foreign.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb.; Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing; Muriate, chemically pure, small crystals, 33s. to 36s. per cwt.; ditto, commercial, 30s. to 32s. 6d. per cwt.; Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s.; ditto, crushed for batteries, 2s per cwt. more; Iodide, 13s. 7d. per lb.; Sulphate weak, gray, 24 per cent., London, prompt, £11 6s. 3d.; Hull, prompt, £11 6s. 3d.; January-March, £11 12s. 6d.; Leith, prompt, £11 6s. 3d. to £11 7s. 6d.; January-June, £11 13s. 9d.; Beckton, prompt, £11 5s.; January-April, £11 10s.; Beckton terms, prompt, £11 3s. 9d.; Sulpho-cyanide, 1s. 2d. to 1s. 3d. per lb.

ANTIMONY.—Reguhis is quoted £39 to £40 per ton, and crude Japan (black sulphide) £23 10s. to £24 10s.

APOMORPHINE—Is firm at 19s. to 20s. per oz., according to make and quantity.

ASHES.—Pots 26s. 6d., pearls 33s.

BELLADONNA ROOT.—Good root remains very scarce. As much as 45s. per cwt. is asked for medium quality.

BISMUTH—Still unchanged at 5s. per lb. for the commercial quality of the metal, 5s. 1d. for the Subnitrate, and 5s. 8d. per lb. for the Carbonate. It is very strange that this article, an advance in which was so confidently predicted, has not moved at all. Some people, writer included, think that we may very likely see an upward movement at the turn of the year.

BLEACHING POWDER (CHLORIDE OF LIME)—Is quoted £6 10s. to £6 15s. per ton for English make.

BORAX.—Crystals are still quoted 16s. per cwt., and powder 16s. 9d.

BROMIDES—Are steady and unchanged at 1s. 10½d. per lb. for Potassii bromid, 2s. 1½d. per lb. for Sodii bromid, and 2s. 2d. per lb. for Ammon. bromid. Bromine is also unchanged at 2s. to 2s. 2d. per lb., in cases of 60 lb.

CAMPHOR.—Crude continues quiet and inactive, Japan, spot, 167s. 6d. per cwt., and for arrival 170s., c.i.f.; China, spot, 162s. 6d. English refiners maintain their price of 2s. per lb. for Bells and Flowers in ton lots, while Hamburg makers quote as low as 1s. 9d. per lb.; this latter quotation is apparently a ruse, in the hope of depressing market for crude, and thus being able to secure cheaper supplies. It remains to be seen in how far such hopes will be realised.

CASTORUM.—29 packages (about 688lb.) were offered at auction and sold, 1sts at 50s. to 63s., 2nds at 30s. to 41s., 2nds and 3rds at 33s. to 34s., 3rds at 34s. to 35s., pickings at 5s. to 14s.

CASTORUM.—The annual sales of this article took place on Wednesday, when 1,736 lbs. were offered by the Hudson Bay Company, and about 700 by other importers. The whole met with a good demand, 1sts and 2nds realising full rates, whilst 3rds and pickings sold rather irregularly at 6s. to 8s. decline. Firsts realising from 75s. to 50s.; seconds, 65s. to 30s.; thirds, at 33s. to 46s.; pickings, 33s. to 14s.

CLOVES.—At auction 10 bales Zanzibar were sold, fair at 3 5/16d. Privately the market for Zanzibar is very quiet, but steady. Business is reported to have been done at 3 13-32d. for March-May delivery.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial 1s. 4d.; pure, 2s. 4d. Benzole, 50 per cent., 10½d. per gallon; 90 per cent., 9d. per gallon. Creosote 3¼d. per gallon. Crude Naphtha 30 per cent. at 120° C., 5d. per gallon. Solvent Naphtha 95 per cent. at 160° C. 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d. per gallon. 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene: A., 4¼d. per unit; B., 2¾d. per unit. Pitch, 34s. per ton, f.o.b. Tar: Refined and crude, 12s. 6d. per barrel; 2d. per gallon.

COCAINE.—Prices are practically unchanged; makers still quote 20s. 6d. per oz. for the hydrochlorate for 200 oz. lots in 25 oz. tins, while second-hand offers at about 1s. per oz. less money.

CODEINE—Is very firm at 12s. 11d. to 13s. 6d. per oz. for the pure and 1s. per oz. less for the Muriate Phosphate and Sulphate Salts.

COD LIVER OIL—Is very firm, although there has not been very much business passing lately, quotations are nominally 80s. to 85s. per barrel, acording to brand for best non-freezing Norwegian oil in tin-lined barrels of 25 gallons.

CREAM OF TARTAR.—First white crystals are quoted 74s. per cwt. on the spot; powder, 75s. to 77s. per cwt., according to percentage.

CUTCH—Remains very quiet, and business restricted at previous rates.

ESERINE (PHYSOSTIGMINE).—Price of this article has been advanced to 2s. 6d. per gramme for the sulphate and salicylate, and 3s. 6d. for the pure, in quantities of at least 10 grammes.

EXTRACT FILICIS MARIS (OIL MALE FERN).—Makers ask 4s. 9d. to 5s. per lb. for this article.

FISH OILS.—52 tuns offered and all sold, very full prices being obtained. Seal, pale, £20 15s.; tinged, £19 10s.; fine straw, £18 10s. to £19; straw, £18 5s. to £18 15s.; yellow, £17 5s. to £18 10s.; dark to brown, £17 to £18 5s.; Cod, £18 10s. to £19 per tun.

GALLS.—Extreme prices continue to be quoted for the small supplies of China available on the spot; for arrival the price is still 63s. c.f. and i. A fair business has been done in Persian Blues at full rates, but holders are now asking higher prices for the small supply. Greens scarce, and firmly held.

GAMBIER—Remains steady, although quiet. For arrival no business is reported to-day; Oct.-Dec. steamer buyers at 14s. 6d.

GENTIAN ROOT.—Good dry root has been sold this week at 14s. per cwt., ex warehouse, London.

GINGER.—There is very little business doing privately, and in auction it was not represented.

GLYCERIN.—Crude is firm at nominally unchanged prices, while some of the German makers have advanced their price 2s. 6d. per cwt. for Refined. Quotations are: English, 55s. to 57s. 6d.; German, 57s. 6d. to 67s. 6d.; according to make, for best white double distilled chemically pure, 1260° quality, in tins and cases (2 or 4 × 56 lb. tins in a case).

IODIDES—Are in a somewhat uncertain position, owing to offers from various quarters at prices below those fixed by the Convention. Convention prices remain, however, unchanged at 10s. 6d. per lb. for Potassii Iodid., 11s. 10d. per lb. for Sodii Iodid., 13s. 10d. per lb. for Ammon. Iodid., 13s. 10d. per lb. for Iodoform, crystal. powder, or precipitate; 12s. per lb. for Iodine resublimed, and 7½d. per oz. for crude Iodine.

ISINGLASS.—At the Hudson's Bay sales, 1,616 lbs. offered, all sold at 2s. 1d. to 2s. 6d. per lb., a few lots of inferior quality fetching 1s. 4d. to 1s. 9d.

LITHIA.—The carbonate is unchanged at 11s. per lb., while the citrate is quoted 7s. and 7s. 6d. per lb. for the crystal and powder respectively.

MENTHOL—Very firm at 10s. 3d. to 10s. 6d. per lb. for case lots on the spot, price for arrival being even higher. It would appear probable that we shall see still higher prices for this article.

MERCURIALS.—Price is unchanged at 3s. 2d. per lb. for Calomel and 2s. 10d. per lb. for Corrosive Sublimate, other mercurial preparations being quoted in proportion.

MORPHINE—Market is decidedly firmer; makers have, however, so far made no alteration in their price, which remains nominally 5s. per oz. for the hydrochlorate powder, and 2d. per oz. more for the crystal. It is thought likely that we may see dearer prices for this article.

OILS (FIXED) AND SPIRITS.—Linseed firm, on the spot, pipes, London, quoted £21 12s. 6d.; barrels, £21 15s. to £21 17s. 6d. Hull: spot, naked, £21. Rape strong at 15s. advance. Ordinary brown, on spot, £23 5s. to £23 10s. Refined: Spot, £24 10s. Ravison, naked, spot, £21 5s. Cotton: Firm. London, crude, spot, £18; refined, spot, £19 10s. to £20, according to make. Hull: Naked, refined, spot, £18; crude, spot, £16 17s. 6d. Cocoanut steady. Ceylon, on spot, £25 5s.; Cochin, spot, £29 to £29 10s.; afloat, £26 15s. c.i.f. Olive: Mogador, £34; Levant, £34 5s.; Spanish, £35 5s. Palm: Lagos, on spot, quoted £26. Castor oil easier. Belgian, first pressing, spot, £27; second pressing, spot, £26 per ton, ex wharf. Hull manufactured, guaranteed cold drawn, pure pharmaceutical, £29 per ton, in barrels; 3½d. per lb., in cases. Pure firsts, £26 10s.; seconds, £25 10s. per ton, in barrels; firsts, 3⅛d. per lb., in cases; seconds, 3d., ex wharf, London. Lubricating oil: Pale American, spot, 7s. 6d. to 11s.; black, 7s. to 9s.; Russian black, 5s. 6d. to 6s.; pale, 8s. to 9s. 6d. Petroleum oil quiet. Russian, spot, quoted 6⅜d. to 6½d. American, spot, 7⅜d. to 7½d. Water white, 8⅝d. to 8¾d. Petroleum spirit: American, 9¾d.; deodorised, 10d. Turpentine: Firm. American, spot, 36s. 9d. to 37s.; January-April, 37s. 6d.; July-December, 32s. per cwt.

OPIUM.—There has not been very much business passing in this article during past few days. Price is, however, decidedly firmer, and an advance is fully expected.

OXALIC ACID—Is quoted 3d. to 3⅛d. per lb. nett, free delivered, London.

PARAFFIN WAX—Is still quoted 2⅞d. to 3d. per lb. for crude and 3⅛d. to 3¾d. for refined.

PHENACETINE.—Unchanged at 3s. 3d. to 3s. 6d. per oz., according to quantity, for both crystals and powder.

PILOCARPINE.—Makers advanced their price to 2s. per gramme for the nitrate, hydrochlorate, and other salts, and 2s. 6d. per gramme for the pure. It looks very much as if we were again on the eve of famine prices for this article.

PITCH—Is quoted 8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt.; bichromate, nominally 3¾d. per lb.; bromide, 1s. 10½d. per lb.; chlorate, spot, London, crystals, 3¾d.; powder, 3⅞d. Iodide, 10s. 6d. per lb. Permanganate: Small crystals are quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow Beckton, 7d.; other English makes, 7¾d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER.—Market is firm and unchanged at £9 12s. 6d. per bottle from the importer; second-hand still not offering.

QUININE.—Makers of the favourite German brands B & S and Brunswick advanced their price to 1s. 3d. per oz. for the sulphate, in 100 oz. tins and for 1,000 oz. lots, while from second-hand there are buyers of these brands at 1s. 2⅛d. to 1s. 2¼d. for spot, and 1s. 2⅝d. to 1s. 2¾d. for March delivery. The period of uncertainty appears now to be over, and the article will probably still further advance before very long. Last week's Amsterdam bark sales went off at an advance of about 12 to 15 per cent.

ROSIN—Easier at 4s. 9d. to 5s. per cwt. for strained on the spot, and 4s. 7½d. per cwt. for Feb.-April and March-May shipment per sailing vessel.

SALICINE—Is firm at 12s. to 12s. 6d. per lb., according to quantity.

SANTONINE—Continues firm at 11s. 6d. to 11s. 9d. per lb. from the agents of the makers, second-hand offering at a trifle below these figures.

SHELLAC.—The market remains very quiet. The demand on the spot is slow, and sales are of a retail character at about steady rates. Futures are unaltered, without business; for arrival Jan.-March steamer there are sellers of TN Orange at 62s. c.f. and i., and March delivery at 64s.

SODA COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d.; ash, £6 to £7, according to percentage, etc.; bichromate, 2¾d. per lb.; bicarbonate, landed, £7 5s.; bromide, 2s. 1½d.; caustic, 70 per cent, white, £10; 60 per cent., £1 less.; hyposulphate (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate, quiet on spot, refined, £8; ordinary, £7 15s.

SPICES (VARIOUS).—Black Pepper: At auction no Singapore was offered. 224 bags Penang bought in, weight 3lb. 7oz., dust 5 per cent., at 5½d.; 91 bags Ceylon offered, and bought in at 6d. White Pepper: A small supply, consisting of 8 bags fine Singapore, at 11d., and 50 bags fair Penang chiefly bought in. 8 bags Ceylon sold, fair, rather mixed, at 8¼d. Chillies: At auction 50 bags good bright Japan were bought in. Cinnamon chips, etc., neglected. 302 bags were all bought in at auction, including broken wild at 3½d. and coarse bark at 2d. Nutmegs: Slow of sale. Out of 41 cases Penang in auction only 3 cases sold, subject, 66's at 2s. 3d.; the remainder bought in, including 93's at 1s. 5d., and 208's, shrivelled, at 5½d. West Indian: 36 barrels sold cheaply, 54's at 2s. 9d., 62's at 2s. 4d., 77's at 1s. 6d., 83's at 1s. 5d., 89's at 1s. 2d., 95's (slightly mouldy) at 11½d. to 1s., 99's at 10d., 104's (slightly mouldy) at 9½d., 114's at 10d., 133's (mouldy) at 5d., 153's at 6d., 113's (wormy and broken) at 5½d. Mace: 16 cases Penang bought in, including fine pale bold, part wormy, at 2s. 6d.; fair bold, red, at 1s. 6d.; broken at 1s. 4d. West Indian: 13 packages sold, fair to good pale, at 1s. 5d. to 1s. 7d.; broken at 1s. 2d. to 1s. 3d.

SULPHATE OF COPPER—Is quoted £24 7s. 6d. to £25 10s. per ton.

SULPHONAL—Is still offering from quasi second-hand at 14s. to 14s. 6d. per lb., for both crystals and powder, while Bayer and Riedel maintain their quotation of 17s. per lb.

TAR.—Stockholm 25s. to 25s. 6d.; Archangel, 18s. to 18s. 6d.

THYMOL—Is firm at 10s. 6d. to 11s. per lb, according to quantity and make.

TURMERIC—Remains steady, although quiet, with only a small business passing. Bengal quoted 30s., good bright Madras finger sold at 37s. 6d., and Cochin split bulbs at 12s. China finger quoted 30s.

VERATRIA.—Makers' prices are now 4s. 8d. per oz. for the pure, 5s. 1d. per oz. for the sulphate, and 5s. 8d. per oz. for other salts, for any quantity below 16 oz.

VANILLA.—At auction the extensive supply offered consisted of 1,367 tins. It was in good demand; about 968 tins sold as follows: Good and fine qualities, of which bulk consisted, opened 1s. 6d. to 2s., and closed fully 3s. lower. Common qualities sold well at full rates. Seychelles: Of 1,086 tins offered about 786 sold, fair to good colour, 7 to 8½ inch, at 25s. 6d. to 28s.; 7½ to 8 inch at 25s. to 27s.; 7 to 7½ inch at 24s. to 25s. 6d., down to 14s. to 19s. 6d. for 2½ to 6 inch. Bourbon: Of 221 tins about 179 sold, fair to good colour, 6½ to 7 inch at 24s. to 25s. 6d., down to 3½ to 5½ inch, 21s. 6d. to 23s. 6d. Mauritius: 3 tins sold, rough, 3 to 5½ inch at 12s. 6d. The remainder Tahiti bought in.

WAX.—Japan quiet, at 31s. 6d. per cwt. for good squares on the spot, while for arrival the article is quoted tangibly higher.

Liverpool Market Report.

December 13, 1899.

Good business has been done this week in Chilian Honey, Guinea Grains, Beeswax, Ginger, and Quillaya Bark at full prices. In Seeds things have been quiet, but quotations are those of last week, and in the case of Linseed a better inquiry has set in. The prices of Oils are not appreciably altered. In consequence of advances in the price of most chemicals, business has been somewhat circumscribed, and the tone of the market at time of writing is extremely firm.

AMMONIA SALTS. — Carbonate, 3½d. to 3¾d. per lb. Sal ammoniac, 38s. to 40s. per cwt. Sulphate £11 10s. to £11 12s. 6d. per ton.

BEESWAX.—60 sacks of Chilian found ready buyers at £7 3s. 9d. per cwt.

BLEACHING POWDER—Is dearer, viz., £6 per ton.

CANARY SEED.—Business has been quiet, and no trade has been done, quotation, 35s. 6d. to 36s. per 464lbs. for Turkish.

COPPERAS—Is firm at 37s. and 39s. per ton.

COPPER SULPHATE—Is steady at £25 to £25 10s. per ton.

GINGER.—161 bags of old crop Sierra Leone sold at 26s. per cwt.

GUINEA GRAINS.—The market has been cleared at 100s. per cwt.

HONEY.—36 barrels of Chilian, Pile I., made 24s. to 25s. per cwt.

LINSEED.—An improved inquiry is experienced and January-February shipments of River Plate are offering at 39s. per 416lbs.

OILS (FIXED) AND SPIRITS.—Castor is in moderate demand, Calcutta at 2 15/16d. to 3d.; French 1st pressure, 2¾d. per lb.; 2nd pressure, Belgian, 2 11/16d. per lb.; 5 tons of French 1st pressure sold at 2¾d. per lb., and 5 tons to arrive, £24 per ton, f.o.b., Marseilles. Olive promises to be still dearer, Spanish being still quoted at £36 10s. to £37 per tun. Linseed Oil is easier a trifle, and is selling moderately at 22s. 6d. to 23s. 6d. per cwt. Cottonseed Oil is scarce, and holders of Liverpool refined are firm for 19s. 9d. to 20s. per cwt. Spirits of Turpentine is steady at 38s. per cwt., with moderate demand.

POTASH SALTS.—Bichromate is very scarce at 4d. per lb.; Chlorate firm, 3½d. to 3¾d. per lb.; Pearlashes, 32s. 6d. per cwt.; Potashes scarce and dearer, 25s. 6d. per cwt.; Prussiate quiet, 7¾d. per lb.

QUILLAYA BARK.—Chilian has been selling at £13 5s. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton; Borax, £16 to £16 10s. per ton; Caustic is likely to be considerably higher in price next year and is very firm, 76 to 77 per cent. at £10 per ton, 70 per cent. £9 5s. and 60 per cent. £8 5s.; Crystals, £3 5s. per ton; Nitrate is slow of sale at 7s. 7½d. to 8s. per cwt.

Manchester Chemical Report.

December 13, 1899.

The Board of Trade returns of exports for the past month are the most satisfactory that have been issued since the beginning of this year. Chemicals and chemical and medicinal preparations show an increase of 13 per cent., being £780,713, as against £690,973; Alkali, 22·1 per cent. in quantity, and Bleaching materials 26·3 per cent., respectively, 404,661 cwts. and 140,327 cwts. respectively, and in value 17·3 and 13·9 per cent. The most satisfactory and perhaps striking feature is that the exports to the United States approach and in some respects exceed those of the same period of 1897. Last year, 1898, they were scarcely half. The past month shows the quantity to have been 114,234 cwts. of alkali as against 64,808 cwts. last year, and 101,139 cwts. bleaching materials as against 66,568 cwts. It may be taken for granted, judging from the very substantial increase in the shares of the various companies, that the trade is looked upon as being in a flourishing condition. The changes during the past week have not been numerous, but, generally speaking, they have been of an upward character. Ammonia Alkali, 58 per cent., is exceedingly scarce, and heavy chemicals generally are not plentiful. In Brown Acetate of Lime, it is reported that contracts are being made for delivery over next year at £5 10s. per ton, but for prompt as high as £6 5s. is asked. Sulphate of Copper continues, owing to the easier tendency in the metal, on the dull side, and best brands vary from £25 to £26 per ton, delivered Manchester. Arsenic is a trifle firmer, varying from £19 5s. to £19 10s., ex ship, Garston. Yellow Prussiate is still scarce at 8d. to 8½d. for English make. It is reported hat the shares in the new Electrolytic Alkali Co., Limited (Hargreaves-Bird process) have been fully subscribed. The amalgamation of Bowman, Thompson and Co., Limited, with the firm of Brunner, Mond and Co. has been officially contradicted.

Newcastle-on-Tyne Chemical Report.

December 13, 1899.

A strong market still continues here particularly for Caustic Soda. The new process of "mercerising" Cotton to give it the appearance and the feeling to the touch of silk is causing for the moment, a heavy demand, so much so, that the price has been further advanced, assisting at the same time the status of Soda Ash and Bleaching Powder. Soda Crystals and other makes are pretty much in keeping. Quotations are:—Caustic Soda, 70 per cent., £9 10s.; Soda Ash, 52 per cent., £5 to £5 5s.; Bleaching Powder, according to markets, £6 10s. to £6 15s.; Soda Crystals, in bags, 57s. 6d. to 60s.; Alkali, 52 per cent., £6 to £6 5s.; Sulphur, £5 per ton.

Calendar for the Week.

Sunday, Dec. 17. 3rd in Advent. Sun rises 8.3, sets 3.49.

Monday, Dec. 18. ○ 1.31M. Sun rises 8.3, sets 3.50.

Tuesday, Dec. 19. Sun rises 8.4, sets 3.50.

Bradford and District Chemists' Association, County Restaurant.—Children's Evening.

CAMWAL, Anderton's Hotel, Fleet Street, London, E.C., at 2 p.m.—Important General Meeting of Shareholders.

Royal Photographic Society, 66, Russell Square, London, W.C. at 8 p.m.—Paper on "Negatives for Three-Colour Work," by Captain Abney.

Wednesday, Dec. 20. Sun rises 8.5, sets 3.50.

Midland Chemists' Assistants' Association, Great Western Hotel, Snow Hill, Birmingham, at 8.30 p.m.—Social Evening; Ladies and members of the Senior Association cordially invited.

Pharmaceutical Society of Great Britain, 36, York Place, Edinburgh, at 8.30 p.m.—Evening Meeting:—Papers by Thomas Dunlop on "Maceration Tinctures," and a "Strychnine Mixture."

Royal Microscopical Society, 20, Hanover Square, London, W., at 8 p.m.—"A Review of Photomicrography and its different methods," illustrated by numerous lantern slides, by Dr. E. J. Spitta.

Sheffield Pharmaceutical and Chemical Society, at 8.30 p.m.—Paper on "Fruits, Rare, and Interesting," by J. W. J. Turner.

Western Chemists' Association (of London), Westbourne Restaurant, Craven Road, W., at 9 p.m.—Address by the President, and a discussion on the Companies Acts Amendment Bill, opened by Walter Hills.

Thursday, Dec. 21. Sun rises 8.6, sets 3.50.

Chemical Society, Burlington House, Piccadilly, London, W. at 8 p.m.—Papers by H. Jackson; A. W. Gilbody, and W. H. Perkin, jun.,; N. E. Bowtell and W. H. Perkins, jun.; P. C. Ray.

Linnean Society of London, Burlington House, Piccadilly, W., at 8 p.m. —Papers by Professor T. W. Bridge and F. Chapman.

Friday, Dec. 22. Sun rises 8.6, sets 3.51.

Glasgow Chemists' and Druggists', Assistants', and Apprentices' Association, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Social symposium.

Saturday, Dec. 23. Sun rises 8.7, sets 3.52.

COMMUNICATIONS, LETTERS, NEWSPAPERS, etc., have been received from Messrs. Allen, Attenburrow, Barnes, Bartlett, Boa, Branch Davies, Dewhirst, Ferrall, Forster, Gilderdale, Gilmour, Goodall, Griffiths, Harris, Hebb, Hill, Jarvis, Johnston, Jones, Kermath, Lewis. Lucas, Marshall, Mumbray, Naylor, Philp, Pickering, Pickford, Richardson, Robins, Smith, Southwell, Thomas, Tirard, Wild, Wilson, Woolley, Wright.

EXCHANGE

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Drugs and Chemicals.—Cocaine Hydrochlorate, ⅛ oz. 2/9, ¼ oz. 5/3, ½ oz. 10/-, 1 oz. 20s. Post free for cash.—Collis, Bath.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

What Offers for one or more "Pharm. Journal," "Chemist and Druggist," and "British and Colonial Druggist" for 1900. Posted on Saturdays.—Drachma, 5, Serle Street, W.C.

Good Second-hand, Hand Painted Lantern Slides, to clear, 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c. Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Hot Water Bottles, best quality, thick rubber, under contract before advance, plush covers, detachable, included. 2 dozen assorted sizes; 10 by 6, 4/-; 12 by 6, 4/6; 12 by 8, 5/6; 14 by 10, 7/-; 16 by 12, 9/6.—Warnes, 333, Gray's Inn Road, W.C.

Chest Protectors. Bought largely, offer 4 dozen to realise; best quality wool felt, scarlet, natural undyed, and Pine (brown), silk bound, lockstitched, Maw's sizes, all double. No. 2, 16/-; 3, 21/-; 4, 26/-; 5, 34/-.—Warnes, 333, Gray's Inn Road, W.C.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Offer 7/6 for Attfield's Chemistry, latest edition, in good condition.—Wallbridge, St. Helens.

Chemist and Druggist Diary, 1900.—Lowest price to W. J. M., 75, Elsley Road, Lavender Hill, S.W.

Books.—Old, modern; text-books, formularies, herbals, dispensatories. Chemists having any such, bearing upon matters connected with the trade, for which they no longer have any use, are requested to send list, particulars, lowest price, Rouse Brothers, Charlotte Street, London, W.

Advertisements

Received too late for Classification.

TO CHEMISTS.—Commanding PREMISES, situate in the High Street; large shop, 5 rooms and bathroom; suit Store Chemist; to let on Agreement or Lease.—STONEHEWER, High Street, Wandsworth.

MANAGER, qualified and married; to take full charge of Branch Shop; to reside on the premises; specially comfortable roomy house; age 28 to 34; smart and active.—State height, age, salary required, photo and references, to WAND, Cash Chemist, Haymarket, Leicester.

ST. MARY'S HOSPITAL, PADDINGTON, W.

Contracts for Drugs, Chemicals, Dressings, &c.

The Board of Management invite Tenders for the supply of Drugs, Chemicals, Dressings, &c., for Three Months commencing 15th January, 1900.

Forms of Tender may be obtained on application to the Secretary.

Tenders must be delivered in sealed envelopes, addressed to the undersigned, marked "Tender for Drugs," on or before Saturday, 23rd December, 1899, at noon.

The Board does not bind itself to accept the lowest or any Tender, and reserves to itself the right of accepting the whole or any part of a Tender, or striking out any item.

By Order,

THOMAS RYAN, Secretary.

THE PHARMACEUTICAL JOURNAL

Is supplied from the Office, 5, Serle Street, London, W.C., post free to any part of the United Kingdom, the Colonies, and Abroad, on prepayment of 20s. for twelve months.

Cheques (crossed London Joint Stock Bank), and Postal Orders should be made payable to STREET BROTHERS; and letters addressed to

The PUBLISHERS, 5, Serle St., Lincoln's Inn, London, W.C.

ENGLISH NEWS.

Wholesale Prescriptions.—The following letters on the subject of "Wholesale Prescriptions," appeared in the *British Medical Journal* of December 16, 1899 :—

Sir,—We, the undersigned dispensing chemists, desire to express our concurrence in the view taken by the editor of the *British Medical Journal* in his note on Wholesale Prescriptions in the Journal of December 9, and we trust the medical profession will raise its voice against a system of medication detrimental to the interests of the public and faculty at large.

We are, etc.,

Dinneford and Co., Bond Street, W.
Hooper and Co., Davies Street, W.
W. E. Lowe and Co., 8, Stafford Street, W.
V. L. Fellows, 49, Hertford Street, W.
G. Jolley and Co., 13, Curzon Street, Mayfair.
A. Ralph Melhuish, 78, Duke Street, Grosvenor Square (Burden and Co.)
R. L. Wigham, 22, Brook Street, W.
Godfrey and Cooke, Conduit Street, W.
Frank A. Rogers, 327, Oxford Street, W.
R. A. Potts, 62, South Audley Street, W.

Berkeley Street, December 12.

Sir,—At a council meeting of the Chemists' Assistants' Union, held on December 11, the following resolution was passed:—

"That the Council of the Chemists' Assistants' Union fully endorses the opinion of the editor of the *British Medical Journal* in denouncing the continued spread of prescribing private specialities, instead of standard B.P. preparations, recently expressed in an article on wholesale prescriptions in the above Journal."

I am, etc.,

Stafford Street, December 12. R. E. Wright, Secretary.

Chemists' Assistants' Association.—The C. A. A. concluded the first half of the session on Thursday, December 14, when a most successful "Musical and Social" was held. Mr. J. H. Mathews presided over a small but appreciative assembly, and a very enjoyable programme was contributed to by Messrs. Walton. Leckenby, Martin, H. B. and E. J. Everson, and Stewart Donally, Mr. A. H. Brady ably performed the duties of accompanist. On the proposition of the President (Mr. F. W. Gamble), a hearty vote of thanks was accorded to Mr. Mathews for kindly taking the chair.

Plymouth and District Chemists' Association.—On December 6, a meeting of the Trade Section was held, at which the following officers were elected for the ensuing year :—President, Mr. W. Condy U'Ren; Hon. Treasurer, Mr. C. T. Weary; Hon. Sec., Mr. F. A. Goodwin.

Newcastle-on-Tyne and District Chemists' Association.—A smoking concert in connection with this Association was held on Wednesday, December 13, at the Hotel Metropole, Newcastle-on-Tyne, Mr. C. Ridley, President, in the chair. An excellent and varied programme was gone through. The proceedings closed with a vote of thanks being accorded to the artistes and also to the President. A collection was made for the Reservists' Fund, which amounted to £2 4s. 7d.

The Hospital Ship, "Maine."—A representative of the Journal had an opportunity early this week of viewing the hospital ship *Maine*, which has been fitted out by a committee of American ladies for the use of the sick and wounded in the present war. The ship was then lying in the West India Docks, and was not quite ready to sail, though it was hoped that she would be ready to go out on Thursday, December 21. The ship has been placed at the disposal of the committee by the Atlantic Transport Company, and has been fitted up at a cost of between £15,000 and £16,000. Five wards have been provided, occupying nearly the whole of the space on the main and the 'tween decks, while the orlop deck is utilised to carry large quantities of stores. There are 218 beds in the wards which are named the Britannia, Columbia, Whitelaw Reid, Bernard Baker, and Committee. The operating room contains a fine installation of Röntgen rays apparatus, and is excellently furnished with everything necessary for the use of the surgeons. The operating table is of glass. The entire medical equipment has been contributed by Messrs. Burroughs, Wellcome and Co., each ward being fitted with small cases of tabloid and soloid products, while the main outfit is placed in the dispensary. At the time of our representative's visit, the dispensary was not quite ready, so that the outfit was not on view, but a special case covered with tooled leather was exhibited in the operating room.

The Medicine Chest of the "Maine."—This case has been specially designed by Mr. Henry S. Wellcome, and the whole of the work has been done by the firm. On the top panel appears the Union Jack and Stars and Stripes entwined; portraits of George Washington, Queen Victoria and President McKinley and representations of the American Eagle and British Lion. The front panel bears portraits of Lady Randolph Churchill (President), Mrs. Ronalds (Hon. Treasurer), and Mrs. Blow (Hon. Secretary of the American Ladies' Hospital Ship Committee); a picture of the *Maine*; a scene representing the British Lion wounded by an arrow, being administered to by Britannia and Columbia. A frieze is formed by a representation of American Indian wampum, upon which are depicted Brother Jonathan and John Bull grasping hands. The panel at each end of the chest represents Britannia and Columbia supporting a banner bearing the Red Cross; also representations of the national emblems—the English oak and American corn. The panel at the back of the chest depicts a charge of British Regular and Colonial Lancers, and a Highland Brigade. The Boers hold their ground sheltered behind rocks and boulders. The bugler-boy who felled three Boers is noticeable in the scene. Prominently inscribed on the chest is Keble's line, "No distance breaks the tie of blood," and Ambassador Bayard's notable phrase, "Our kin across the sea." The chest is made of oak and covered with Carthaginian cowhide, upon which the designs are tooled by hand. With one exception the whole of the medical staff of the ship and five non-commissioned officers are Americans, acting under the direction of Surgeon-Major Cabell, of the United States Army. The exception is Surgeon-Lieut.-Colonel Hensman, of the British Army Medical Service, who is in command, as representing the War Office. Three American doctors have volunteered their services—Dr. George Eugene Dodge and Dr. Harry H. Hodman, of New York; and Dr. Charles H. Weber, of Philadelphia. Miss M. E. Hibbard is chief of the five nurses. Lady Randolph Churchill will also accompany the *Maine*, a special cabin elegantly and comfortably furnished on the main deck being placed at her service. The ship flies three flags—the Union Jack (presented by Her Majesty the Queen), the Stars and Stripes, and the Red Cross in addition to the Admiralty transport flag. She is the first vessel which any nation has ever dispatched to succour the wounded forces of another State.

Alleged Theft of Drugs.—At Southwark Police Court on Friday, December 15, the four men, Jones, Parker, Lardent, and Royou, charged, on remand, with stealing and receiving three barrels of cod-liver oil and a quantity of iodoform, mercury, and other goods, of the total value of £27 12s., belonging to Messrs. Davy Hill and Co., wholesale druggists, of Park Street (see *ante*, 562*b*), were all committed for trial.

Mr. Jesse Boot complains, in a letter sent to the Nottingham newspapers, that his "assistants are excluded from pharmaceutical study specially designed for chemists and given at the University College." He virtually threatens, therefore, to depart and, metaphorically, shake the dust of Nottingham from his feet, although,

as he almost plaintively states, he is himself a Nottingham man, and apparently he has so great a love for the place that in spite of the fact that he believes "we could save £60 to £80 a week—equivalent to £3,000 or £4,000 a year—for carriage" by removing elsewhere, he still remains. After that statement, doubtless, his shareholders will have something to say in the matter. In reply to Mr. Boot, Mr. A. Eberlin, Hon. Secretary of the Nottingham Chemists' Association, writes to the editor of the *Nottingham Daily Guardian* as follows:—"The Nottingham Chemists' Association admits as 'associates' all who are in the employment of duly qualified chemists and of registered medical practitioners. It provides, at considerable cost and trouble, a course of study suitable for the requirements of the qualifying examination of the Pharmaceutical Society. With this object it arranged with the authorities that certain classes should be provided at the University College, the Chemists' Association guaranteeing a minimum sum in each subject taught. These classes are in subjects quite extraneous to the ordinary college ones. So much so that in one, at least, the Nottingham Chemists' Association voluntarily finds teachers from amongst its own members. Now, to join these classes a student must be an associate of the Nottingham Chemists' Association, and, as above stated, must be in the employment of a legally qualified employer. And in this last requirement lies the point about which your correspondent labours so terribly. But this rule has been in force since the year 1870—long before drug companies came into existence. To say that the Nottingham Chemists' Association has ever refused entry to one of his employees, as such, is presumptuous on the part of Mr. Boot; for we have frequently pointed out that he had the remedy entirely in his own hands—namely, to qualify himself as a chemist. With this plain statement I would leave your readers to judge of the fairness of the charges Mr. Boot brings against an honourable association, which has done so much, at great labour and sacrifice, to provide facilities for study which, but for that association, would not exist, and which has been the means of inducing pharmaceutical students to settle in this town, because of the advantages offered them. In the words of a late President of the Pharmaceutical Society, 'Nottingham bids fair to become a leading centre for pharmaceutical study, owing to the energetic action of its association.'"

SCOTTISH NEWS.

WEST OF SCOTLAND COLLEGE OF PHARMACY.—The first annual dinner in connection with this institution was held in the Cockburn Hotel, Glasgow, on December 14, Mr. T. MABEN, F.C.S., in the chair. A company of upwards of sixty assembled, including Dr. Thomson, Messrs. W. L. Currie, Russell, Gilmour, Watson and T. S. Barrie. After dinner the usual loyal and patriotic toasts were honoured, Mr. Carson replying for the Army, Navy and Reserve Forces. The Chairman proposed the Pharmaceutical Society and the Glasgow Pharmaceutical Association, and in doing so spoke of the work done by the Society for fifty years in connection with education, the elevation of pharmacy and the Benevolent Fund. Speaking of the work of the local association, for which Mr. Currie had done so much, he hoped that when Mr. Currie was sent to the Council he would take a common-sense view of the many questions that waited solution. Mr Currie, who replied, spoke of the claims of the Society, and hoped that the young men would take advantage of the lowering of the franchise. So far as he was concerned there was little prospect of his being a councillor, but in whatever position he might be placed he would always do what he could in the interests of Pharmacy. Mr. Gilmour proposed the toast of the medical profession, and Dr. Thomson who replied, said that, as a constant reader of the *Pharmaceutical Journal*, he was well acquainted with the work of the Society. He endorsed what Mr. Gilmour had said, and hoped that the time would soon come when doctors would only prescribe and chemists only dispense. Mr. Anderson Russell, in proposing the West of Scotland College contrasted the teaching now with what he had as a student, and he almost wished he could begin again. Mr. T. S. Barrie, in reply, thanked the company for the way they had supported Mr. Maben and himself, and he hoped this was only the first of many such dinners, and that all of them would again meet next year. Mr. D. Watson proposed the health of the Chairman, who suitably replied. During the evening several songs and recitations were contributed by Messrs. Currie, Irvine, Lochhead, and the Chairman.

ARBROATH CHEMISTS' ASSISTANTS AND APPRENTICES ASSOCIATION.—A meeting of this Association was held in the Y.M.C.A. Rooms on Tuesday, December 12, Mr. D. M. Bruce, Vice-President, in the chair. Mr. F. W. M. Bennet read a paper on Thermometers. After giving a lucid description of the manner in which the thermometers were manufactured, Mr. Bennett described the various instruments now in use, viz., Centigrade, Fahrenheit, Reaumur, and Rutherford, explaining the various ways for graduating these different thermometers. The proceedings were brought to a close by the usual vote of thanks.

IRISH NEWS.

DEATH OF PROFESSOR J. F. HODGES, M.D., F.I.C., ETC., ETC.—This highly-respected and venerable Belfast gentleman has passed away, at the advanced age of eighty-four, at his residence, Sandringham, Malone Road. The late Dr. Hodges was one whose great achievements belonged to a past generation. In his youth, intending to pursue a medical career, he became an apprentice to Dr. M'Coubrey, in his native town of Downpatrick, the university of the student in those days, as of the apprentice to-day, evidently being the practical experience of the dispensing counter. In 1838 he took his degree of L.A.H., Dublin, and subsequently studied at Glasgow, where Professor Graham, afterwards Master of the Royal Mint, advised him to devote his talents to chemistry; and Dr. Hodges, whilst he started medical practice, also developed great interest and skill in chemico-agricultural science. In Germany he studied under Baron Liebig. The latter was so impressed with his pupil's indefatigable research ability that as a mark of his high appreciation he generously returned his fees, and thus was established betwixt both a life-lasting friendship. On his return to the north of Ireland Dr. Hodges lectured extensively on the New Agriculture, bringing about, in 1845, the formation of the Chemico-Agricultural Society, to which he became chemist. In 1846 he was appointed Professor of Chemistry in the old Belfast College. He occupied the chair of Agricultural Chemistry in Queen's College, being the author of various works upon the subject. He was also Lecturer in Medical Jurisprudence, holding both positions up to the time of his death. He was thus the last survivor of the original Q.C.B. professors. The Royal College of Chemistry, London, had him as one of its founders, and he was deputed to offer the Chair of Chemistry to Professor Will, then assistant to Baron Liebig; but the honour, being declined, was accepted by Professor Hoffmann. Dr. Hodges was also Government Analyst for many years and Public Analyst for five counties and the City of Belfast, though this short sketch does not by any means exhaust the record of the enterprises and high positions associated with his name, for almost every European country conferred upon him signal honours in recognition of his distinguished talents.

ACCIDENTAL POISONING.—Mr. E. S. Finnigan, H.M. Coroner for Belfast, held an inquest on the 16th inst. on the body of William Robb, who died owing to poisoning by carbonic acid gas issuing from a vat in Messrs. J. and J. M'Connell's brewery. Lewis H. Guinness, manager, deposed that deceased was working at a fermenting vessel. He was on a ladder looking out of an aperture in the vessel, and for the purpose of washing it clear of carbonic acid

gas he was in the tun. Witness did not know any means adopted for ascertaining presence of carbonic acid gas in the vessels. Deceased remarked that the gas was very strong, and shortly after he was taken out of the vessel unconscious but breathing, and removed on the ambulance to the Royal Hospital. Dr. Hunter certified the cause of death, and the jury, in returning a corresponding verdict, considered that there was neglect on the part of Messrs. M'Connell in not taking proper precautions to ascertain the presence of the gas in the vessel.

The Provincial "Pharmacist" is usually of a very composite character, judged by the experience of an authority who has spent a considerable period in an inland town, where he asserts everyone who sells anything considers it also his prerogative to sell poisons. Whether it is a dearth of the properly-qualified article, or merely the usual evasion of the Pharmacy Act, at any rate there seems to be a great deal of potential wealth at the disposal of any enterprising chemist in the host of small towns in Ireland. Some years ago in one of these hundred-score populations, a merchant had a bakery, whisky-shop, grocery, ironmongery store, post office, draper's shop, and medical hall, all under the ægis of one name—latitude sufficient, surely, for the scorner of "pharmacy proper." Prescriptions also were dispensed within the precincts of this conglomerate emporium, which recalls the fact that some time ago a medical man in a thriving townlet mentioned that he was entirely dependent upon a druggist to compound his prescriptions—about a dozen a week—which things suggest reflections!

POISONING CASES.

Camphorated Oil for Castor Oil.—An inquiry was held at Rotherham, on December 2, with respect to the death of a three-month-old child named Willie Bretton, who expired after taking a dose of camphorated oil, given in mistake for castor oil.—The evidence showed that the mother, on applying for a bottle of castor oil, was served with a bottle of camphorated oil, the latter having got into the box where the shopkeeper usually kept the castor oil bottles. In administering the oil to the child, the label on the bottle was, unfortunately, not noticed.—A verdict of "Death by misadventure" was returned.

Poisoning by Strychnine.—On December 13, an inquest was held at Ponder's End with respect to the death of Ernest James Stovell (32), described as a chemist's manager. [The name Ernest James Stovell does not appear on the Register of Chemists and Druggists for 1899. Ed. *P. J.*] From the evidence it appeared that deceased had been separated from his wife for two years. He had not been seen for about a week, and as the shop where he was employed remained closed the police effected an entrance, and found deceased's body lying on the floor, and near at hand a phial containing strychnine. Deceased's employer, said to be a Scarborough chemist, found everything connected with the business correct, but letters from his wife were found in his pockets, asking for money for the children.—A verdict of "Suicide by strychnine poisoning" was returned.

Fatal Dispensing Mistake.—The Manchester City Coroner on December 18 held an inquest on the bodies of John Smith (60) and William Wharton (65), late inmates of the Workhouse Hospital at Crumpsall. The Coroner stated that the deceased men were under medical treatment in the hospital, and the circumstances of their death pointed to strychnine poisoning. As other patients were also seized with illness, the case was one which required investigation. The doctor who was attending the patients, seeing that something was wrong, made inquiries about the medicine, and upon investigation found that there was a certain ingredient in all the bottles of medicine which had been administered. He at once stopped the further use of the medicine which contained that ingredient. Upon going to the dispensary he found that a bottle, which was supposed to contain spirits of nitrous ether, really contained "liquor strychnine," which had been used in mistake. From what one of the dispensers said to the doctor, there was no doubt that the dispenser had made the mistake. The drugs were in stock bottles, which were used to fill the dispensing bottles, and these were kept underneath the desk and shelves where the dispensing bottles were kept. The dispenser, having run out of his ordinary supply of nitrous ether, went to the cupboard for a fresh supply. It was supposed that by an unfortunate mistake he got hold of the strychnine bottle. If that was true the jury would have to consider whether the dispenser was not guilty of gross and criminal neglect. Had it not been for the prompt and intelligent action of the surgeon—who deserved the highest commendation—it was probable that other patients would have been poisoned. The case was one of the highest importance to the dispenser and to the hospital, and he thought it desirable that a special day should be fixed for the inquest.—After formal evidence the inquiry was adjourned until Wednesday, December 20.

FOOD AND DRUGS ACT PROSECUTIONS.

Boric Acid as a Preservative.—The case against Messrs. Hudson Brothers, Limited, for selling clotted cream preserved with boric acid (see *ante*, 484), was to have been resumed at Westminster Police Court, on Thursday, December 14, but at the request of the counsel for the defence, it was adjourned *sine die*.

Spirit of Nitre.—An important point was raised in a case at the County Police Court, Huddersfield, against Dennison Priestley, grocer, Golcar, who was charged, by Inspector Newbould, with having sold by the hands of his wife, sweet spirit of nitre, which was not of the nature substance, and quality demanded.—It was contended for the defence that the wrong person had been summoned, inasmuch as the sale was made by defendant's wife, who ought to have been summoned as the servant or agent, or it must be shown that defendant had a guilty knowledge of the transaction.—The Inspector asked that the case might be adjourned, as the point was so important that he ought to have legal assistance.—The Chairman said the Bench was inclined to dismiss the summons in face of the point raised by the defence. After some conversation, however, it was arranged that the case should be adjourned for a month, the Inspector paying a guinea-and-a-half expenses.

Milk of Sulphur.—Samuel Dean, manager of the Co-operative Society's Stores, Cononley, was fined 20s. and costs, at Skipton, on Saturday, December 9, for selling milk of sulphur which did not conform with the requirements of the British Pharmacopœia.

Olive Oil.—On Monday, December 11, before the Malling (Kent) Bench, Charles Coulter was charged with selling cotton-seed oil as olive oil.—The defence was that the purchaser was asked if he meant flask oil, and he replied that it would do.—Ordered to pay the costs.——On Saturday, December 9, at Dartford Police-court, the International Tea Company, in reply to a charge of selling cotton-seed oil when olive oil was asked for, stated, through its solicitor, that the oil was sold under a guarantee of purity given by a wholesale firm in London.—The Bench, in dismissing the case, expressed the hope that some action would be taken against the firm who supplied cotton-seed oil for olive oil under a guarantee of purity.

Copper in Peas.—David Rice, provision dealer, Acton, was fined £8 and costs at Brentford Police-court on Thursday, December 14, for selling bottled green peas containing 2·0 grains of copper sulphate per lb.—Defendant pleaded that he sold the peas as received.—The Chairman advised him to get the amount of the fine back from the wholesale people.

CAMPHORATED OIL.—Mr. C. J. G. Bunker, chemist and druggist, Stuart Road, Peckham, was summoned for selling camphorated oil containing only 12·9 per cent. of camphor instead of 21 per cent., as required by the B.P., 1898.—Mr. G. W. Marsden, solicitor to the Camberwell Vestry, appeared in support of the summons, and the defendant was represented by Mr. Beck.—Inspector Groom stated that a sample of the oil was submitted to Dr. Frank Teed, the public analyst, who certified that it contained 12·9 per cent. of camphor, being a deficiency of 48 per cent. of camphor to the prescribed quantity of olive oil.—In answer to Mr. Hopkins, Dr. Teed said he understood that camphorated oil was used in cases of rheumatism as a liniment. The camphor was the effective part.—Mr. Hopkins: Then it was 48 per cent. short of its effective part!—Dr. Teed: That is so.—Mr. Beck, as a matter of fact, thought the figures worked out at 40, and not 48.—In addressing the Court for the defence, Mr. Beck pointed out that camphor was an exceedingly volatile substance, and that the Pharmacopœia did not give any test by which camphorated oil could be tested after manufacture. He added that camphorated oil was used for external application only, and said one knew that the real value of it was in the friction that was used in applying it rather than in anything else.—Mr. William Thomas, chemist and druggist, the manager of the shop, gave evidence to the effect that he made the oil in the proportions laid down by the Pharmacopœia.—Mr. Hopkins ordered the defendant to pay a fine of 40s. and 27s. 6d. costs.——Mr. Frank H. Davies, chemist and druggist, Hindman's Road, East Dulwich, appeared to answer a similar summons, the alleged deficiency of camphor being 40 per cent.—The defendant said camphor was very volatile. He was prepared to say that the camphor was put in in the proper strength.—Mr. Hopkins ordered the defendant to pay a penalty of 40s. and 27s. 6d. costs.——At the Leicester County Police-court on Wednesday, December 20, Cecil A. Buzzard, manager of the Anstey Co-operative Society; William Lacey, grocer; George Morgan Grocer, grocer; and George Roe, general dealer, all of Anstey, were severally summoned for selling camphorated oil not compounded according to the B.P., 1898.—The defence was that the oil was purchased from wholesale chemists, and was accordingly looked upon as reliable.—Mr. H. Simpson appeared for Buzzard, and said his client had nothing whatever to do with the purchase of the oil.—The Bench reminded all the defendants that they should have obtained a guarantee as to the reliability of the oil before purchasing it.—Morgan, who did not appear, was fined 30s., inclusive of costs, and the other defendants 25s. each.

EXTRACTS FROM CONSULAR REPORTS.

ADULTERATION AND SUBSTITUTION is said to be still practised to an alarming extent in San Francisco, although much good has been accomplished by the Health Department in its efforts to suppress the sale of impure articles of food. The official chemist reports that last year he analysed 562 samples, principally prepared foods such as enter largely into the ordinary diet of the people, the result showing, as intimated above, that there is still room for improvement.

THE QUANTITY OF KOLA NUTS imported into Gambia last year was 33 per cent. less than in 1897, but owing to the rise in the price caused by the disturbances in Sierra Leone, where all the nuts were exported from, the value was the same—nearly £22,000. These kola nuts are consumed entirely by the natives, especially the Mahomedans, and, according to Administrator Sir R. B. Llewelyn, they are offered to a friend when visiting, in the same way that a European tenders a cigar or refreshment.

NEW IDEAS AND TRADE NOTES.

BETA-EUCAINE *v.* COCAINE.—It is claimed that beta-eucaine is far preferable to cocaine because, whilst identical with cocaine in anæsthetic action, it has only one-fourth of the toxicity of cocaine, and no unpleasant by-effects, is more constant in action, does not decompose on boiling, and its solutions can thus be rendered permanently sterile and kept for indefinite periods. It is also less than half the price of cocaine. As regards solubility, it is stated that, at ordinary temperatures, 100 Gm. of water will dissolve 10 Gm. of alpha-eucaine or 4·5 Gm. of beta-eucaine. If the water be boiling it will dissolve up to 15 Gm. of alpha-eucaine, or 8 Gm. beta-eucaine, and on cooling the excess re-crystallises very slowly. 100 Gm. of olive oil will dissolve 0·2 Gm. of alpha-eucaine or 0·1 Gm. of beta-eucaine. 100 Gm. of glycerin will dissolve 8 Gm. of alpha-eucaine or 3 Gm. of beta-eucaine. Warm glycerin will dissolve more, the excess re-crystallising very slowly. Ether dissolves less than 0·1 per cent. of alpha-eucaine, and beta-eucaine is insoluble. 100 Gm. of alcohol will dissolve 90 Gm. of alpha-eucaine or 3·5 Gm. of beta-eucaine. The foregoing particulars regarding the solubility of the two compounds, and of tests for the same, are printed in a circular published by Messrs. A. and M. Zimmermann, St. Mary-at-Hill, E.C., who also supply pamphlets treating of the use of eucaine in dentistry and minor surgery generally.

A GOOD WRITING INK.—Messrs. Bewley and Draper, Limited, 23, Mary Street, Dublin, submit a sample of their dichroic ink. After giving the ink a fair trial we have no hesitation in saying that Draper's Dichroic Ink is all that a good writing fluid should be. It is a first-class jet-black; excellent for rapid writing, running freely from the pen; is cleanly to use, as it does not thicken or deposit; and it dries rapidly. Moreover, it resists the action of water and dilute acids; does not corrode steel pens, and is quite free from greasiness.

BYNO-GLYCERO-PHOSPHATES.—Messrs. Allen and Hanburys, Limited, Plough Court, Lombard Street, London, E.C., direct attention to their preparation of Byno-Glycero-Phosphates, a solution of the glycero-phosphates in Bynin Liquid Malt, one fluid ounce containing two grains each of the glycero-phosphates of iron, potash, magnesia and soda, and four grains of the glycero-phosphate of lime. The glycero-phosphates being more assimilable than phosphates, the combination with Bynin Liquid Malt should be an excellent one for those recovering from wasting diseases seeing that malt extract aids the digestion of farinaceous foods

'SMITH'S CASH PRICE LIST,' printed and published by Mr. John H. Smith, pharmaceutical chemist, Bridge Street, Newark, demonstrates very forcibly the miscellanous character of a present-day chemist's business. The contents of the list include "patent" and homœopathic medicines, proprietary articles, photographic goods, drugs and chemicals, surgical appliances, perfumery, wines and spirits, etc. The list has been printed at Mr. Smith's own works, and is a creditable specimen of printing.

BLAUD PILLS IN TINS.—Mr. Stephen Wand, chemist, 18, Haymarket, Leicester, has recently introduced a good selling line of Blaud pills, put up in tin canisters, neatly enamelled blue and white, each containing one gross. The price is 2s. 6d. per dozen tins, or 28s. per gross, carriage paid. The Blaud pills are pearl-coated, perfectly soluble, and of excellent quality. Mr. Wand has also recently issued a new price-list of his pills, which is arranged alphabetically, thus making it easy to refer to any of the numerous formulæ included in the list.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

Thursday, December 21, 1899.

As might have been expected, the volume of actual business which has been passing in Drugs and Chemicals since our last report was issued has not been very large. There remains at the same time, however, a decidedly firm undertone, and it is not merely hoped, but, in fact, confidently anticipated, that with the turn of the year we shall see a distinct renewal of business activity in the articles usually referred to in these columns. Prices generally remain firm and unchanged. Ipecacuanha is, however, a trifle weaker; same may also perhaps be said of Tinnevelly Senna, except for really first-class leaf. Quicksilver very firm, as also are Mercurials, a further advance being considered not improbable. Salicylates have at last been advanced in price, as also has German Sulphate of Quinine. Menthol is also dearer. Acid Carbolic very firm, with a continued upward tendency. No alteration was made in Bank Rate to-day, which therefore remains at 6 per cent. The following are prices actually ruling for some articles of principal interest:—

ACETANILIDE—Continues dull and weak at 9½d. to 11d. per lb., according to quantity. There is a rumour, however, that we may possibly hear of an improvement in this article before very long.

ACID BORACIC.—Crystals are still quoted 25s. per cwt., and powder 27s.

ACID CARBOLIC—Firm, at about the same prices as last week—namely, 10d. for 35° to 36° C ice crystal in large bulk; 11d. for 39° to 40° C; 1s. for 39° to 40° C detached crystals, B.P. quality; crude, 60° F, 2s. 9d. per gallon; 75° F, 3s. 6d. per gallon; liquid, 95 to 98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon, in 40-gallon casks; ditto, 25 to 30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CITRIC—Dull and weak at 1s. 2¾d. to 1s. 3½d. per lb. for crystals in 5 cwt. casks.

ACID OXALIC—Is quoted 3d. to 3⅛d. per lb. nett, free London, for spot delivery.

ACID TARTARIC—Is easier, English being quoted 1s. 0½d. to 1s. 0¾d. per lb. on the spot; foreign, 11¾d. per lb.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb.; carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate: Chemically pure, small crystals, 33s. to 36s. per cwt.; ditto, commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: Firsts, 40s. per cwt.; seconds, 38s.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate, quiet. Grey, 24 per cent., London, prompt, £11 3s. 9d.; January-March, £11 2s. 6d.; Hull, prompt, £11 2s. 6d. to £11 3s. 9d.; Leith, prompt, £11 2s. 6d. Beckton, terms prompt, £11. Sulpho-cyanide, 1s. 2d. to 1s. 3d. per lb

ANTIMONY.—Regulus is still quoted £39 to £40 per ton, and Japan crude (black sulphide), £23 10s. to £24 per ton.

ASAFETIDA.—There is a good inquiry for fair quality with sales at 65s. per cwt. The "Sharistan," from the Persian Gulf, is in with about 200 cases.

BORAX—Unchanged at 16s. per cwt. for crystals, and 16s. 9d. per cwt. for powder.

BROMIDES—Are very firm at prices hitherto ruling.

CAMPHOR.—Market for crude continues inactive, without sales, but there is some inquiry for spot and near positions. English refiners still quote Bells and Flowers, in ton lots, 2s. per lb., and are very firm thereat.

CINCHONA BARK.—At these, the last auctions of the year, moderate supplies were catalogued, amounting to 2,793 packages of all descriptions, against 4,063 packages at the preceding sale. East India shipments again represented more than one-half of the offerings. A good demand prevailed, and nearly the whole found buyers, at and after the sale, at fully 6 per cent. advance on the last Dutch sales, the average unit being 1½d. against 1 5/16d. to 1⅜d. at the last London auctions, and fully 1⅜d. at the sales in Holland. For Succirubra bark a much higher unit in many instances was obtained. Ceylon: 118 packages offered and 73 sold, according to analysis; Succirubra, natural stem chips and shavings, at 3d. to 4¼d. East Indian: 32 cases, 1,407 bales, and 244 bags catalogued, and about 1,400 packages sold, red, natural stem chips and shavings, ordinary to good at 2d. to 4½d., renewed ditto at 3½d. to 4½d., root, ordinary to good, at 2½d. to 7⅜d.; Officinalis, stem chips and shavings, good rich at 5⅜d. to 6d.; ordinary to fair, at 3½d. to 4⅞d.; inferior dark, at 2¼d. to 3⅜d.; renewed ditto, fair to good rich, at 4⅝d. to 8d.; Ledger, natural stem chips, ordinary to good, 2d. to 8d.; renewed ditto, 6d. to 7½d.; root, at 5½d. Java: 406 packages offered, and about 300 packages sold; Ledger, natural stem chips, ordinary to good rich, at 3¾d. to 10½d.; root, 5⅛d. to 5½d. South American: 406 bales Bolivian cultivated Calisaya quills offered and sold, fair to good at 7d. to 10¼d. 131 bales Cuprea offered and sold at 2d. to 3⅜d. 28 bales soft Columbian sold at 1⅜d. to 1½d. The next auctions will be held on Jan. 16, 1900.

CLOVES.—In auction, 11 cases Penang were bought in, bold dark, picked, at 6d. No Zanzibar were offered. Privately Zanzibar have been in more demand, the sales being at easier prices, comprising January-March delivery at 3¼d., and March-May at 3 5/16d. to 3 11-32d.; closing buyers at 3 5/16.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 1s. 4d.; pure, 2s. 4d. Benzole 50°, 10½d. per gallon; 90° 8½d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 5½d. per gallon. Solvent Naptha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene A., 4½d. per unit; B., 2¾d. per unit. Pitch, 35s., per ton, f.o.b. Tar refined and crude 12s. 6d per barrel; 2d. per gallon.

COCAINE.—Makers maintain their price of 20s. 6d. for the Hydrochlorate in 25 oz. tins for 200 oz. lots. A fair amount of business has been done, however, this week from second-hand at 19s. to 19s. 6d. per oz., according to quantity and brand, for the hydrochlorate in 25 oz. tins. The future of this article remains somewhat of a puzzle.

CODEINE—Remains very firm at 12s. 11d. to 13s. 6d. per oz. for the pure and 1s. per oz. less for the salts.

COD-LIVER OIL.—Although there is not very much business passing in this article at the moment, quotations are very firm at 80s. to 85s. per barrel, according to brand, etc., for best non-congealing Norwegian oil, in tin-lined barrels of 25 gallons each.

CREAM OF TARTAR—Slightly lower at 73s. for first white crystals on the spot, 75s. per cwt. for powder, and 76s. for 95 per cent. ditto.

CUTCH.—Business continues on a small scale at previous rates.

GALLS.—All descriptions continue to be firmly held, and supplies are small. China for arrival is quoted in one quarter 65s. c. f. and i. for ordinary. In Persian no sales of importance have occurred; holders are asking higher rates.

GAMBIER.—The market remains quiet, and no business for arrival is reported, but prices are firm; distant positions quoted 14s. 9d. Sales have been made for January-March shipment, Liverpool, at 15s.

GINGER.—At auction there was only a small supply, consisting of 105 bags of Cochin, which were bought in, dullish plump medium and small slightly wormy and mouldy.

GLYCERIN.—While refined is unchanged for spot delivery at about the prices named last week, the agents for some of the makers are offering to book orders for next year's delivery at comparatively lower rates. This would look as if the future of the article were tending in a downward direction, and intending buyers would do well to act cautiously.

GUINEA GRAINS—Are scarce, and value has advanced to 100s. per cwt.

GUM ARABIC.—The inquiry for London sorts is good, and a fair business has resulted at 80s. per cwt. for good soft. Stock is very moderate.

IODIDES—Are fairly steady at unchanged prices.

IPECACUANHA.—Only a small business doing, as general opinion appears to anticipate lower prices.—Rio, 11s. 9d. per lb.: Carthagena, 8s. per lb.

LICORICE ROOTS.—Good thin clean Persian is selling at 14s. cwt.

MENTHOL.—10s. 6d. per lb. is now asked for good dry, white crystals, on the spot, for case lots (12 × 5 lb. tins in a case).

MERCURIALS—Are firm at unchanged price—viz., 3s. 2d. per lb. for calomel and 2s. 10d. per lb. for corrosive sublimate.

MORPHINE.—While makers' price remains nominally unchanged, at 5s. per oz. for the hydrochlorate powder and 2d. per oz. more for the crystal salt, the tone of the article is certainly somewhat harder, and would appear to point to a tendency to higher prices.

OILS (ESSENTIAL).—Star Aniseed very quiet at 6s. 3d. per lb. Cassia, 3s. 9d. to 4s. 6d. per lb., according to analysis. Citronella slow of sale at 11d. to 1s. per lb., as to package. Lemongrass steady at 3¼d. per oz. Peppermint: H.G.H. unchanged at 5s. 3d. to 5s. 6d. per lb.

OILS (FIXED) AND SPIRITS.—Linseed flat: on the spot, pipes, London, quoted £21 7s. 6d. to £21 10s.; barrels, £21 10s.; January-April, £21 7s. 6d.; May-August, £20 7s. 6d.; Hull, spot, naked, £20 12s. 6d.; January-April, £20 10s. Rape quiet: ordinary brown on spot, £23 5s.; refined, spot, £24 10s.; Ravison, naked, spot, £21; January-April, £21. Cotton firm: London, crude, spot, £18 2s. 6d.; refined, spot, £19 15s. to £20 5s., according to make; Hull, naked, refined, spot, £18; crude, spot, £17. Olive: Mogador, £34 5s.; Spanish, £35 10s.; Levant, £34 5s. Cocoanut steady: Ceylon, on spot, £25 5s. to £25 10s.; Cochin, spot, £29 to £29 10s.; afloat, £26 15s., c.i.f. Palm: Lagos, on the spot, quoted £26. Castor quiet: Belgian, first pressing, spot, £27; January-June, £25 10s., f.o.b. Antwerp; second pressing, spot, £26 per ton, ex wharf; Hull manufactured, guaranteed cold-drawn, pure, pharmaceutical, £29 per ton in barrels; 3½d. per lb. in cases; pure firsts, £26 10s.; seconds, £25 10s. per ton in barrels; firsts, 3⅛d. per lb. in cases; seconds, 3d., ex wharf, London. Lubricating oil: Pale American, spot, 7s. 6d. to 11s.; black, 7s. to 9s.; Russian, black, 5s. 6d. to 6s.; pale, 8s. to 9s. 6d. Petroleum oil dull: Russian, spot, quoted 6¼d. to 6½d.; American, spot, 7⅜d. to 7½d.; water white, 8⅝d. to 8¾d. Petroleum spirit: American, 9¾d.; deodorised, 10d. Turpentine opened easier, but closed steady: American, spot, after 37s. accepted, closed 37s. 1½d. to 37s. 3d.

OPIUM.—The market has been quieter and business restricted, owing to the high prices required by sellers. Dearer rates have been paid for manufacturing kinds, with small sales, "Soft Shipping" also being dealt in at full rates. Persian is without change, and business limited.

PHENACETIN.—Makers have agreed that lowest price for 5-cwt. lots shall be 3s. 6d. per lb., for both crystals and powder, smaller quantity being quoted at a higher figure in proportion.

PILOCARPINE.—The same London agent of one of the makers who has been hawking round Veratria at a figure below makers' lately advanced price has also been offering Pilocarpine at 31s. per oz., while the makers lately advanced their price to 41s. 9d. for 8 oz. lots. This does not look much like straightforward dealing!

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt.; bichromate, 5d. per lb.; bromide, 1s. 10½d. per lb.; chlorate, spot, London crystals, 3¾d.; powder, 3⅞d. per lb. Iodide, 10s. 6d. per lb. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 7¾d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER—Is very firm at £9 12s. 6d. per bottle from the importer; second-hand still not offering.

QUININE.—The agents here for the favourite B & S brand again advanced their price ½d. per oz., to 1s. 3½d. per oz. for the sulphate, in 100-oz. tins, for 1,000-oz. lots, while there have also been buyers in the speculative market at about this figure. Since then the market has, however, easied away a bit, and there are now sellers from second-hand at 1s. 2⅞d. per oz. Appearances would appear to point to the probability of a further advance in value of this article.

ROSIN—Is firmer at 5s. per cwt. for strained on the spot, and 4s. 8d. per cwt., ex ship, for January-March shipment per sailing vessel.

SALICYLATES.—It is stated that Acid Salicylic has been advanced 2d. per lb., and Soda Salicylate 5d. per lb; definite reliable details are, however, not yet to hand.

SENNA.—The special sale of 785 bales Tinnevelly took place today. Quality was very inferior, and showed evident signs of country damage. Only 11 bales of really good were offered, which sold at full to even higher prices at 4½d. to 5½d. per lb. The bulk sold with considerable trouble at a drop of about ½d. per lb., the last lots being forced off at perhaps even a greater reduction.

SHELLAC.—Business privately continues on a small scale at previous rates. TN Orange on the spot quoted 62s. 6d. for fair; March delivery 64s.; and January-March shipment at 61s. c.f. and i. At auction to-day the small supply of 150 cases Second Orange was offered, but bids being generally below valuations and sellers being firm, all was withdrawn at 66s. to 67s. for good to fine, with SG in diamond at 76s. 61 cases blocky Button offered and bought in at 55s. to 70s., according to quality.

SODA COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 4¼d. per lb.; bicarbonate, landed, £7 5s.; bromide, 2s. 1½d. Caustic, 70 per cent. white, £10; 60 per cent., £1 less. Hyposulphate (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate, quiet on the spot; refined, £8; ordinary, £7 15s.

SPICES (VARIOUS).—Black Pepper. At auction nothing was offered. White Pepper also was not represented in auction. Capsicums, 197 pkgs. Bombay, were offered at auction, and 72 bales sold at rather cheaper rates, red cherries, little mixed, at 33s. Cinnamon, slow of sale at auction. 91 bales Wild were bought in. Nutmegs quiet. In auction out of 5 cases Penang offered, 3 cases sold, 101's defective, 5¼d. West Indian, 11 barrels offered and sold, 83's at 1s. 3d.; 109's at 10½d.; 128's at 9d. Mace, neglected; in auction, 5 cases Penang were bought in; fair red but broken, at 1s. 5d. Of 69 cases Bombay Wild, 4 cases sold, good pale part broken, 5d. Pimento continues dull of sale, and of 247 bags offered, only 22 bags sold, fair at 3¼d.; remainder bought in at 3⅜d.

SULPHATE OF COPPER—Steady at £24 5s. to £25 10s. per ton, according to quantity and make.

SULPHONAL.—Bayer's and Riedel's price remains at 17s. per lb. for crystals and powder; outside makes are, however, offering at 14s. to 15s. per lb., according to quantity.

TRAGACANTH.—The market has been practically cleared of medium qualities, and any new arrivals will meet with a good demand.

TURMERIC.—Business has been on a small scale, but prices remain firm. Bengal quoted 30s.; Madras, fair to good, finger at 35s. to 36s. 6d.; and Cochin split bulbs at 12s.

VERATRIA.—While the makers last week advanced their price to 4s. 8d. per oz. for the pure, the agent here for one of the aforesaid makers has been hawking the article round (?) for his own account at 3s. 6d. to 3s. 7½d. per oz. This looks very much like what is called "ratting," and it remains to be seen what the other makers have to say on the subject.

Manchester Chemical Report.

DECEMBER 20, 1899.

Although the close of the year is usually marked by diminished orders and general quietude, this cannot be said to be the case in this centre. The paper making, as well as the textile industries continue to absorb increasing quantities of heavy chemicals, and it is not unlikely that there may be another advance in prices all round. Caustic Soda and Bleaching Powder are scarce for prompt delivery. Pitch continues to be shipped in fair quantities from the ship canal here, and is firm at 30s. 6d. to 31s. per ton, f.o.s. Foreign White Acetate of Lead has advanced 20s. per ton, and Bichromate of Potash is quoted 4½d., and Soda, 3¾d. Brown Acetate of Lime is very scarce at £6 5s. to £6 10s. per ton, and there is little offering for next year's delivery. Salt Cake is rather quiet. Yellow Prussiate of Potash scarce at 8¼d. to 8½d. per lb English make.

Newcastle-on-Tyne Chemical Report.

DECEMBER 20, 1899.

This market still keeps busy, but more with working off old orders. The demand for Caustic Soda is fully maintained, followed closely by Soda Ash and Bleaching Powder. Inquiries on a large scale for Soda Crystals are in circulation for next year. Quotations are:—Caustic Soda, 70 per cent. to £9 10s. Bleaching Powder, £6 5s. to £6 15s. Soda Ash, 52 per cent. £5 5s. Alkali, 52 per cent. £6 10s. Soda Crystals, 57s. 6d. to 60s. Sulphur, £5 per ton.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. Frank R. Dudderidge, Ph. C., Principal of the North of England School of Chemistry and Pharmacy, Newcastle-upon-Tyne, was elected a Fellow of the Chemical Society, on December 7.

Mr. J. E. Lockyer, wholesale photographic chemist, 87, Evelyn Street, Deptford, S.E., has published a handy blotting book, with a calendar for 1900, postal information, etc., printed inside the covers.

Mr. H. D. Kelf, Ph.C., has been appointed dispenser at the St. Saviour's Union Infirmary, East Dulwich, S.E.

Miss Mary Ariel Stewart, whose success in obtaining the degree of Bachelor of Medicine was recently recorded in this column, has just taken her degree of Bachelor of Surgery at the University of London.

Messrs. Typke and King, 7, Jeffreys Square, St. Mary Axe, London, E.C., ask us to notify that on account of the rebuilding of Jeffreys Square, St. Mary Axe, they are removing on January 1 to 47, Wilson Street, Finsbury Square, E.C., and have made this an opportunity for considerably improving their accommodation. They have much larger offices, and a good warehouse, where it is intended to hold stock of all their leading specialties so as to guarantee prompt delivery of all orders. The new telephone number will be "489 London Wall."

Mr. Horace Davenport, Chairman of the Chemists' Aerated and Mineral Waters Association, at the annual meeting held at Anderton's Hotel, Fleet Street, E.C., on Tuesday, December 19, was presented by the Secretary, Mr. H. T. Butler, on behalf of the staff and employees, with an illuminated address and a silver service, in commemoration of his having obtained his majority as Chairman of the Association.

Mr. A. C. Seward, M.A., F.R.S., Fellow of St. John's College, University Lecturer in Botany, and an examiner of the Pharmaceutical Society, has been elected a senior Fellow and tutor in natural science at Emmanuel College, Cambridge.

Publications Received.

Sionnimia Vulgar y Cientifica de los Principales Vertebrados Mexicanos. By Professor A. L. Herrera, Jun. P. 31. Mexico: Oficina Tipografica de la Secretaria de Fornento. 1899. From the Author.

Indigestion Clearly Explained, Treated and Dieted, with Special Remarks on Corpulancy and Gout. By Thomas Dutton, M.D. Univ. Durh. Fifth edition, enlarged and revised. Pp. xii. + 212, price 3s. London: Henry Kimpton, 82, High Holborn, W.C., 1899. From the Publishers.

The Chemists' and Druggists' Diary, 1900. Pp. 646. London: The *Chemist and Druggist*, 42, Cannon Street, E.C. From the Publishers.

Formulaire des Medicaments Nouveaux pour 1900. Par H. Bocquillon-Limousin. Introduction par le Dr. Huchard. Pp. viii. + 324. Price 3 fr. Paris: J. B. Baillière et fils, 19, Rue Hautefeuille. From the Publishers.

The Photo-Miniature: A Monthly Magazine of Photographic Information. October, 1899. Platinotype Processes. Vol. i., No. 7, price 6d. net. London: Dawbarn and Ward, Limited, 6, Farringdon Avenue, E.C. From the Publishers.

Opinions of over 100 Physicians on the Use of Opium in China. Compiled by William Hector Park, M.D. Pp. xiv.+98. Price 30 cents. Shanghai: American Presbyterian Mission Press, 1899. London: Society for the Suppression of the Opium Trade, Finsbury House, Blomfield Street, E.C. From the Society.

Atlas de Photomicrographie des Plantes Medicinales. Par Dr. L. Bræmer and Dr. A. Suis. Pp. 76 (Illustrated). Price 15 fr. Paris: Vigot Frères, 23, Place de l'École-de-Médecine, 1899. From the Publishers.

Receiving Orders in Bankruptcy.

(From the London Gazette.)

John Hornsey, described as a Chemist, Bourne, Lincolnshire.

Harrington Wyndham Darrell, Doctor of Medicine, All Saints' Green, Norwich, lately residing at 35, Surrey Street, Norwich.

Partnership Dissolved.

(From the London Gazette.)

Edgar Henry Swann and Frank Wakeman, Photographers, Stafford Road, Handsworth. Debts will be received and paid by Frank Wakeman, who will continue to carry on the business

Marriage.

Dey—Paterson.—At 5, St. Bernard's Row, Edinburgh, on December 14, by the Rev. Andrew Keay, Alexander John Dey, chemist and druggist, to Isabella Scott, second daughter of Andrew Paterson, cabinet maker, Edinburgh.

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Twenty £1 Camwal Shares. What offers?—Apply W., The Pharmacy, Richmond, Yorks.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. —Edward Peck, East Dereham.

Good Second-hand, Hand Painted Lantern Slides, to clear, 4½d. each, including Scripture, Temperance, Mottoes, Effects, &c. Not rubbish. Thorough good quality. Lists free.—T. T. Wing, Slide Maker, Chatteris.

Hot Water Bottles, best quality, thick rubber, under contract before advance, plush covers, detachable, included. 2 dozen assorted sizes; 10 by 6, 4/-; 12 by 6, 4/6; 12 by 8, 5/6; 14 by 10, 7/-; 16 by 12, 9/6.—Warnes, 333, Gray's Inn Road, W.C.

Chest Protectors. Bought largely, offer 4 dozen to realise; best quality wool felt, scarlet, natural undyed, and Pine (brown), silk bound, lockstitched, Maw's sizes, all double. No. 2, 16/-; 3, 21/-; 4, 26/-; 5, 34/-.—Warnes, 333, Gray's Inn Road, W.C.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash. —P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Calendar for the Week.

Sunday, Dec. 24. 4th in Advent. Sun rises 8.7; sets 3.53

Monday, Dec 25. Christmas Day. Sun rises 8.7; sets 3.53

Tuesday, Dec. 26. ☾ 3.57M. Sun rises 8.7; sets 3.54

Wednesday, Dec. 27. Sun rises 8.8; sets 3.54.

Thursday, Dec. 28. Sun rises 8.8; sets 3.55.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—First of a series of Lectures on "Fluids in Motion and at Rest," by Charles V. Boys.

Friday, Dec. 29. Sun rises 8.8; sets 3.56.

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—"Reproduction in Plants." by M. Meldrum.

Saturday, Dec. 30. Sun rises 8.8; sets 3.57,

ROYAL INSTITUTION, Albemarle Street, Piccadilly, at 3 p.m.—Second of Mr. Boys' Lectures on "Fluids in Motion and at Rest."

Pharmaceutical Journal

SUBSCRIPTION TERMS.

The annual subscription to the PHARMACEUTICAL JOURNAL, commencing at any time and including postage to any address throughout the world, is

£1 0s. 0d.

For the convenience of subscribers, the amounts payable in foreign currencies for one year's subscription are given below:—

United States	$4.90	Russia	Rbls. 6.20
Canada	$4.90	France	Fr. 25.25
Germany	Mks. 20.45	Switzerland	Fr. 25.30
Austria	Fl. 12.20	Belgium	Fr. 25.25
Hungary	Fl. 12.20	Italy	L. 27.10
Norway and Sweden	Kr. 18.20	Greece	Dr. 29.00
Denmark	Kr. 18.20	Spain	Pes. 27.50
Netherlands	Fl. 12.10	Portugal	Reis. 6.50

Subscriptions are payable in advance and should be addressed to

The Publishers, 5, Serle St., Lincoln's Inn, London, W.C.

Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "Loudon Joint-Stock Bank."

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, Londou, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inu, Londo n

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published iu the Journal is strictly reserved.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Alcock' Bennett Bewley, Carter, Cownley, Druce, Emary, Fielding, Gamble, Gardner, Gilderdale, Glyn-Jones, Goodwin, Greenwood, Griffiths, Hardy, Hewlett, Hill, Irving, Maben, Wilson, Wyatt.

MARKET REPORT.

The quotations here given are in all cases the lowest cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the retail pharmacist. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

London Report.

THURSDAY, DECEMBER 28, 1899.

Business in Drugs and Chemicals has been exceedingly quiet since Christmas, and we shall hardly now see any real revival in trade until after stocktaking. No doubt the weather, combined with the alarming prevalence of influenza, has had something to do with the prevailing dulness; the fact remains, however, that as regards actual business much remains to be desired. Quinine has remained steady, Opium is dearer, Cod Liver Oil very firm, as also is Acid Carbolic; otherwise, prices remain firm, but practically unchanged. We take this opportunity of wishing our readers a Happy and Prosperous New Year. The following are a few of the prices actually ruling for some articles of principal interest.

ACETANILIDE—Remains quiet and weak at 9½d. to 1s. per lb., according to quantity.

ACID BORACIC—Without change, at 25s. per cwt. for crystals and 27s. per cwt. for powder.

ACID CARBOLIC—Very firm, the prices being 10d. for 35° to 36° C. ice crystal in large bulk; 11d. for 39° to 40° C.; 1s. for 39° to 40° C. detached crystals, B.P. quality. Crude, 60° F., 2s. 9d. per gallon; 75° F., 3s. 6d. per gallon; liquid, of pale straw colour, 1s. 6d. to 1s. 8d. per gallon, in 40-gallon casks; ditto, 25 to 30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CITRIC—Quiet, at nominally 1s. 2½d. per lb. for crystals, in 5-cwt casks.

ACID OXALIC—Is quoted nominally 3d. to 3¼d. per lb. on the spot nett, free delivered London.

ACID TARTARIC.—English is quoted 1s. 0½d. per lb. on the spot; foreign, 11¾d. per lb.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate: Chemically pure, small crystals, 33s. to 36s. per cwt.; ditto commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: Firsts, 40s. per cwt.; seconds, 38s.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate flat; gray, 24 per cent., London, prompt, £11 to £11 2s. 6d.; Hull, prompt, £11 to £11 2s. 6d.; Jan.-March, £11 7s. 6d.; Leith, prompt, £11 to £11 1s. 3d.; Beckton, terms, prompt, £11; sulpho-cyanide, 1s. 2d. to 1s. 3d. per lb.

BELLODONNA ROOT.—Good or even fairly good quality remains very scarce, and high prices up to 46s. per cwt. are asked for only medium quality.

BICHROMATE OF POTASH.—Cause of late advance to 5d. per lb. for this article is stated to be that the Syndicate, which has, it is understood, been selling at a loss, has got tired of the game, and now refuses to sell even at the figure named above. It is further stated that after the first three months of next year the combination of the English makers comes to an end; whether there will be a fresh arrangement, or what the future of the article will be, appears to be a puzzle even to those best informed.

BLEACHING POWDER (CHLORIDE OF LIME).—English make is now quoted £6 10s. to £6 15s. per ton.

BORAX—Unchanged, at 16s. per cwt. for crystals and 16s. 6d. per cwt. for powder.

BROMINE AND BROMIDES—Very firm at prices hitherto ruling.

CAMPHOR—Quiet but steady, both for crude and for refined. The Hamburg refiners, after reducing their price, in the hope, it is said, of picking up cheap crude (as also possibly cheap second-hand lots of refined from weak or frightened holders), have stiffened up again as to price, they now quoting prices for Bells and Flowers which are more in accordance with those of their English confrères.

CLOVES, GINGER, AND OTHER SPICES.—Markets for these have been closed since Christmas.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 1s. 3½d. per gallon; pure, 2s. 4d. Benzole, 50 per cent., 10½d. per gallon; 90 per cent., 8d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 5½d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene A, 4½d. per unit; B, 2¾d. per unit. Pitch, 36s. per ton f.o.b. Tar, refined and crude, 12s. 6d. per barrel; 2d. per gallon.

COCAINE—Quiet at nominally unchanged price from the makers—viz., 20s. 6d. per oz. for the Hydrochlorate in 200 oz. lots in 25 oz. tins, second-hand offering at about 1s. per oz. less money.

CODEINE—Remains very firm, at 12s. 11d. to 13s. 6d. per oz., according to quantity, for the pure alkaloid, and 1s. per oz. less for the Muriate, Phosphate, and Sulphate Salts.

COD LIVER OIL—Remains very firm at 77s. 6d. to 82s. 6d. per barrel, according to brand, for best non-freezing Norwegian oil in tin-lined barrels of 25 gallons.

CREAM OF TARTAR.—First white crystals are quoted 73s. per cwt. on the spot; powder, 75s.; ditto 95 per cent., 76s. per cwt.

GLYCERIN—Is nominally unchanged, both for crude and for refined, there having been practically nothing doing in either during past few days.

IODINE AND IODIDES—Are steady, without change in prices.

MENTHOL.—This week there have been offers of Kobayashi brand in case lots at 10s. per lb. The arrival price comes, however, decidedly higher than this figure, and it would appear probable that we shall see a further advance in value of the article ere long.

MERCURIALS—Are firm at unchanged prices.

MORPHINE—Quiet, at nominally unchanged prices, say, 5s. per oz. for the hydrochlorate powder and 2d. per oz. more for the crystal salt. Should the advance in opium continue we shall certainly see higher prices for morphine and its salts.

OILS (FIXED) AND SPIRITS.—Linseed firm and dearer; on the spot, pipes, London quoted £21 7s. 6d. to £21 10s.; barrels, £21 12s. 6d.; Jan.-April, £21 15s.; May-Aug., £20 12s. 6d.; Hull, spot, naked, £20 10s.; Jan.-April, £21 15s. Rape steady; ordinary brown, on the spot, £23 5s.; refined, spot, £24 10s.; Ravison, naked, spot, £21. Cotton steady; London crude, spot, £18; refined, spot, £19s. 5s. to £20, according to make; Hull, naked, refined, spot, £18; crude, spot, £16 17s. 6d. Olive Mogador, £34 5s.; Spanish, £35 10s.; Levant, £34 5s. Cocoanut, Ceylon, on spot, £25 5s. to £25 10s.; Cochin, spot, £29; Jan.-March, £26, c.i.f. Palm: Lagos, on the spot, quoted, £26. Petroleum Oil dull; Russian, spot, quoted, 6¼d. to 6½d.; American, spot, 7⅜d. to 7½d.; water white, 8⅝d. to 8¾d. Turpentine firm; American, spot, 37s. 3d.; Jan.-April, 37s. 6d.

OPIUM.—The market in Smyrna has advanced about 6d. per lb., 9s. 1d. to 9s. 3d. per lb. having been paid there for fair tale quale, at which prices about 40 cases have changed hands. Cause of the advance appears to be the extremely cold weather which has prevailed on the other side, with consequent anticipated damage to the new crop. Holders in London now refuse to sell.

PHENACETIN.—Lowest price at which a really reliable quality can be obtained remains 3s. 6d. per lb. for 5 cwt. lots for both crystals and for powder, smaller quantity being charged higher in proportion.

PILOCARPINE—Is firm at the late advance to 41s. 9d. per oz. for 8-oz. lots, it being stated that in consequence of continued scarcity of suitable raw material, we may very likely see the article even dearer before any change in price takes place in a downward direction.

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt. Bichromate, 5d. per lb. Bromide, 1s. 10½d. Chlorate, spot, London, crystals, 3¾d.; powder, 3⅞d. Iodide, 10s. 6d. per lb. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to

make; large crystals, 5s. per cwt. more. Prussiate, yellow, 7¾d. for English makes; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER.—Importer is very firm at £9 12s. 6d. per bottle; second-hand not offering. Everything would appear to point to the probability of a further advance.

QUININE—Remains quiet, but steady, with sellers of the Sulphate, on the spot, at 1s. 3d. per oz., while there are buyers at this figure for March delivery; but no sellers. The agents here for the favourite B. and S. brand, quote nominally 1s. 3½d. per oz. for 1,000 oz. lots, in 100 oz. tins, but are by no means free sellers thereat. We shall probably see a further decided advance in value of this article after the turn of the year.

SALICYLATES.—The advance in makers' price is confirmed. Full particulars of same will be given in our next week's issue.

SHELLAC.—A small trade is passing on the spot at previous rates, including TN Orange on a basis of 62s. for fair, but futures are without alteration.

SODA COMPOUNDS.—Crystals, barrels, quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 4¼d. per lb. Bicarbonate, landed, £7 5s. Bromide, 2s. 1½d. Caustic, 70 per cent., white, £10; 60 per cent., £1 less. Hyposulphate (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate quiet on the spot; refined, £8; ordinary, £7 15s.

SULPHATE OF COPPER—Remains quiet at £24 5s. to £25 10s. per ton on the spot, according to make and quantity.

SULPHONAL.—Bayer and Ricdel, the two recognised makers of this article, continue to quote 17s. per lb. for both crystals and powder, while outside makes are being hawked round at 14s. to 14s. 6d. per lb.

THYMOL—Continues very firm, some makers asking 11s. per lb., while others state that they are unable to offer. From second-hand limited quantities are still obtainable at 10s. 6d. to 10s. 9d. per lb.

Liverpool Market Report.

DECEMBER 28, 1899.

Considerable advance has been made in the prices of Linseed, Beeswax, Potashes and Pearlashes, Cottonseed Oil, Linseed Oil, and Spirits of Turpentine. Miscellaneous sales have been somewhat numerous, and include Cloves, Honey, and Spermaceti.

AMMONIA SALTS.—Carbonate, 3½d. per lb. Salammoniac, 38s. to 40s. per cwt., and very firm. Sulphate quiet, at £11 7s. 6d. per ton.

BEESWAX.—50 packages of Gambia went for £6 15s. to £6 17s. 6d. per cwt., and 45 sacks of Chilian fetched £7 5s. to £7 10s. Holders now ask £7 12s. to £7 15s. per cwt.

BLEACHING POWDER—Is very firm at £6 to £6 5s. per ton.

CANARY SEED—Is quiet and unchanged, at 35s. to 36s. per 464 lbs. for Turkish, and 45s. for Spanish.

CLOVES.—100 bales were disposed of at auction, "with all faults," at 1⅞d. per lb.

COPPERAS—37s. to 39s. per ton.

COPPER SULPHATE—Remains quiet at £25 per ton.

HONEY.—Fine Californian has been sold at 46s. 6d. per cwt., and Pile 1 Chilian at 25s.

LINSEED—Is firm in tone. American has been sold on the spot at 44s. per 425 lbs., and there are now no sellers under 45s. Business is also reported in 4 per cent. Karachi at 45s. 9d. per 416 lbs.

OILS (FIXED) AND SPIRITS.—Castor oils are in moderate demand at steady prices: Calcutta at 2 15/16d. per lb.; French, first pressure at 2¾d. and second pressure Belgian at 2⅝d. per lb. Olive is firm, but there is little business doing and no sales to report. Spanish is quoted at £36 10s. to £37 per tun. Linseed oil of Liverpool pressure is quiet at 22s. 6d. to 23s. 6d. per cwt. Cottonseed Oil.—Stocks are somewhat low, and the price continues steady at 20s. 6d. to 21s. per cwt. for Liverpool refined Oil. Spirits of Turpentine are in fair request at 38s. 6d. per cwt.

POTASH SALTS.—Bichromate is dearer and scarcer at 4½d. to 4¾d. per lb. Chlorate is firmer at 3¾d. to 3⅞d. per lb. Cream of Tartar is slow of sale at 74s, to 80s. per cwt. Potashes are very firm at 26s. 9d. to 27s. per cwt. Pearlash 33s. 6d. to 35s. per cwt. Prussiate quiet, 7½d. to 7¾d. per lb.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is steady at £16 to £16 10s. per ton. Caustic is scarce, 76 per cent. to 77 per cent., £10; 70 per cent., £9 5s. per ton. Crystals, £3 5s. per ton. Nitrate, 7s. 7½d. to 8s. per cwt.

SPERMACETI.—62 bags of crude Chillian sold at 85s. per cwt. ex quay, and 27 cases of refined were disposed of privately, ex store.

The Chemical Trade of the Year.

(From Our Manchester Correspondent.)

The chemical trade of the past year has been, on the whole, fairly prosperous. Although in the early part there were growlings as to foreign tariffs hostile to our trade, yet the balance has asserted itself, and probably the volume at the close will be found to have been greater than that of the previous year. Prices during the past three months may be said to have advanced "by leaps and bounds," in regard to heavy chemicals. In fine chemicals, a branch in which pharmacists may be said to le especially interested, prices have been fairly steady. The imports of alkali, principally from Germany, have been steady (not much over those of last year), and the value is also about the same. The total value of imports of chemicals, dye stuffs, and tanning substances for the eleven months ending November has been £5,363,964, as against £5,091,022 in the corresponding period of 1898. The total exports of chemicals and medicinal preparations for the same period was £8,199,268, as against £7,678,009 for the corresponding period of 1898. The exports of alkali to all countries for 1899 show a slight increase in the aggregate over 1898, but there is still a notable decrease in the quantities sent to the United States and Germany. The trade with the United States has, however, shown signs of a revival of late, and for the month of December approximates more to the same period of 1897. The total quantity of alkali is given as 3,461,124 cwts. in 1899, as against 3,434,825 cwts. in 1898, but there is an increased value—£938,456 in 1899, as compared with £919,100 in 1898. The exports of bleaching materials and preparations to the United States, which is our best customer for these articles, have been not only maintained but increased, the value to the States alone being given as £293,613 in 1899, as against £284,351 in 1898. A matter of interest to chemists and druggists will be found in the fact that medicines, drugs, and medicinal preparations show an increase of £64,000 in value over the corresponding period of 1898. What has practically been a corner in the metal has materially affected sulphate of copper. The exports have been only 38,000 tons in round figures, as against 50,000 tons in 1898, but the value is nearly the same, being for the last-mentioned period £812,744, while for 1899, with 12,000 tons less, the amount is £813,686. This is satisfactory as far as it goes, but it must be remembered that the prices generally have been not at all remunerative for a long period, and future returns ought to show an increase of 20 or 30 per cent., especially when the cost of fuel and raw material is taken into consideration. As an indication of what may be expected in this direction, the increased consumption of chemicals used in the "mercerising" of cotton, which gives to the finished product the appearance of silk, has already made its mark, while the requirements of the paper-making industry have been almost phenomenal, and will no doubt continue for a long time to come. This has been reflected to some extent in the higher value attaching to shares in the various chemical manufacturing concerns. In the early months of the year a combine of English makers, of glycerin was formed, but it came to an end in May. Notwithstanding this, there has latterly been a fair demand for this article, and prices have been well maintained. It is pleasing to have to record that a growing trade has been done in pitch per the Manchester Ship Canal. The outlook forward is good, but the fuel question rather upsets the calculation of makers. Another branch of the Ship Canal of a growing and important character is the importation of mineral oil, which, with benzols, has been largely used for gas enrichment, not only by the Corporation, but by many gas companies in the surrounding district. Carbolic acid has advanced sharply within the past three months.

Newcastle-on-Tyne Chemical Report.

December 27, 1899.

The Christmas holidays have partially suspended business operations; besides, at this time of year the works close for some days for repairs to machinery, etc. With the exception of the usual annual contracts, not much mention is made of fresh orders for ordinary parcels. Quotations are unaltered, and are priced as follow:—Bleaching Powder, £6 10s. to £6 15s. Soda Crystals, 57s. 6d. to 60s. Caustic Soda, 70 per cent., £9 10s. Soda Ash, 52 per cent., £5 5s. to £5 10s. Alkali, 52 per cent., £6 5s. to £6 10s. Sulphur, £5 per ton.

Publications Received.

A Manual of Surgery. By Charles Stonham, F.R.C.S. Eng. in three volumes. Vol. iii. Regional Surgery. Pp. xxi. + 725. Price 10s. 6d. net. London: Macmillan and Co., Limited, 1899. From the Publishers.

Précis de Physique Pharmaceutique. Par le Dr. C. Sigalas. Pp. iv. + 656. Price, 7f. 50c. Lyon: A. Storck and Co., 8, Rue de la Mediterranée. 1900. From the Publishers.

PERSONAL AND BUSINESS NOTES.

[Notices are inserted free in this column, if sent by persons directly interested or otherwise properly authenticated.]

Mr. Alex. M'Intosh has been admitted into partnership by Messrs. Gibson and Co., chemists, Edinburgh. Mr. M'Intosh, who has been for several years one of Messrs. Gibson and Co's managers, is a member of the Pharmaceutical Society.

Alderman H. D. Simpson, J.P., M.P.S., Chairman of the Committee of the Louth Municipal Technical School, on Tuesdayl December 19, entertained the students to tea in the Council-Chamber of the Town Hall, the occasion being the successful completion of the first term of work.

Partnerships Dissolved.

(From the London Gazette.)

Thomas William Richardson and Eric Law Pritchard, Surgeons Norwich. Debts will be received and paid by Thomas W. Richardson.

George Ashbrooke and George Hartley Brewer, trading as George Ashbrooke, Mineral Water Manufacturer, 2, Grimshaw Street, Derby Road, Bootle. The business will in future be carried on by George H. Brewer.

EXTRACTS FROM CONSULAR REPORTS.

The Honey Harvest in California in 1898 is reported to have been so small that the Secretary of the Bee-keepers' Association complained last autumn of having orders for over 600 tons of honey, with not a ton on hand to execute them. Every section of the State contributes to the honey output, but the industry finds its greatest expansion in Southern California, where from 600 to 1,000 colonies of bees may be seen in a single apiary.

The Calcium Chloride Process of drying the vanilla bean is reported to give most satisfactory results, and has been adopted to the exclusion of all other methods by the Crédit Foncier Colonial. Vanilla prepared in this manner is said to command higher prices in Paris than ordinarily-dried vanilla. Vanilla is now so largely planted in Réunion and in places so widely different in climate, that the inevitable result, Consul Bennett thinks, must sooner or later be a rapid fall in price owing to over-production. The fall is said to have been fully expected this year, but a small cyclone in March did a good deal of damage to the vines and decreased the yield by about 25 per cent. Besides the high prices hitherto fetched by vanilla, an additional inducement for its cultivation is the fact that the crop has the advantage of quick returns upon capital and of not requiring a large amount of labour.

When in the Dentist's Hands, recently, Consul Hearn states in his report of the trade and commerce of Bordeaux and district, that he ventured to admire the very fine instrument which had been sawing through a tooth with the ease and noise with which its large type saws through a teak log. "These things," said the dentist, "we originally got from America and paid 25 cents a-piece for, no matter how many we took. Then we found that we could get them from Sheffield at the same price per unit, but with a reduction of 10s. the dozen. Now we get them from Germany, and they cost us less than 4½d. a-piece, and they could not be of better quality for the work they have to do." Consul Hearn quotes the foregoing as an instance of how trade slips into other hands unless the requirements and means of the consumer are carefully studied.

The Principal Chemical Products exported from Bordeaux during last year were chestnut and other vegetable tannin extracts, 69,545 cwts.; oxide of zinc, 2,508 cwts.; glycerin, 1,996 cwts.; raw tartar, 13,062 cwts.; tartar crystals, 3,526 cwts.; and cream of tartar, 32,303 cwts. Under the heading of pure oils exported were olive oil 6,315 cwts.; castor oil, 4,733 cwts.; and ground-nut oil, 12,760 cwts.

In the Importation of Chemical Products from Great Britain into Bordeaux in 1898 there was a substantial increase on the previous year, the principal items being sodium bicarbonate, 2,768 cwts.; sal ammoniac, 7,751 cwts.; superphosphate of lime, 21,253 cwts.; chemical manure, 77,867 cwts.; products distilled from coal tar, 237,582 cwts.; and copper sulphate, 266,088 cwts. The total amount of copper sulphate imported to Bordeaux was 273,458 cwts., the balance being made up from Sweden, 220 cwts.; Spain, 7,046 cwts.; and Algiers, 104 cwts. Of ink, out of a total importation of 46 cwts., the amount from Great Britain was 40 cwts. Of transparent soap, 26 cwts. were imported from Great Britain, also 37 cwts. of other toilet soaps, as well as 285 cwts. of starch out of a total importation of 1,172 cwts., whilst all the blacking imported, amounting to 86 cwts., went from this country.

The Importation of Senegambian Gum to Bordeaux in 1898 amounted to 39,000 bags, against 47,500 bags in 1897, thus showing a decrease of 8,500 bags. Prices, which had fallen away in the earlier part of the year, showed a slight increase later, and an advance of 5 to 10 per cent., owing to the scarceness of Turkey sorts, was noted, business remaining firm for both hard and soft gums.

Creosote is Principally Used, in the Bordeaux district, for pickling railway sleepers, and is very largely imported from Great Britain. It has, however, been employed for agricultural purposes in the form of a disinfectant and insect destroyer, a wood preserver, and other purposes where formerly coal tar was used. The importation in 1898 was 12,926 tons, and it is reported to be rapidly gaining favour, being cheaper and more efficacious than coal tar.

As a Preventative and Cure of the disease of the vine, known as "oidium," brimstone is sublimated or ground and sold in the agricultural district around Bordeaux. It arrives in bulk cargoes from Sicily to the amount of about 3,500 to 4,000 tons annually. The local factories where it is treated, however, are small, and manufacture but about one-fifth of the local requirements, the remainder being obtained from the large factories in the south of France (Marseilles, Cette, La Nouvelle, etc.). This fact is rather surprising seeing that there is so large a demand in the Bordeaux district.

Experiments with Acetylene Gas, made by a pine-wood proprietor in France, according to a recent report, demonstrated that by combining it with resin oil it does not evaporate so quickly, is less explosive, and gives the carbide a pleasant odour. The acetylene light has been adopted by several establishments in Bayonne, the calcium carbide employed being mostly imported from America and Switzerland, and sold at about £1 4s. per cwt. A number of calcium carbide factories are reported to be in course of construction in the neighbourhood of Lourdes (Hautes Pyrenées), which, it is expected, will in the course of time effect a considerable reduction in the price.

EXCHANGE.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free. —Edward Peck, East Dereham.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash. —P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Advertisements

Received too late for Classification.

WANTED, at a Dispensary, a part time DISPENSER. Hours 6 till 10 p.m., and Sundays 6 till 9 p.m. Suitable for a Student.—Apply, CYANIDE, "Pharm. Journal" Office, 5, Serle St., London, W.C.

Calendar for the Week.

Sunday, Dec. 31. 1st after Christmas. Sun rises 8.9; sets 3.56.

Monday, Jan. 1, 1900. ● 1.52 p.m. Sun rises 8.9 sets 3.57

Tuesday, Jan. 2. Sun rises 8.9; sets 3.59

ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m.—Third of a series of Lectures on "Fluids in Motion and at Rest," by C. Vernon Boys.

Wednesday, Jan. 3. Sun rises 8.9; sets 4.0,

PUBLIC DISPENSERS' ASSOCIATION, St. Bride's Institute, Ludgate Circus, E.C.e at 8 p.m.—Special General Meeting for the Alteration of Rules, etc., to b followed by the Annual Meeting. All public dispensers are invited to attend

Thursday, Jan. 4. Sun rises 8.9; sets.

CHEMISTS' ASSISTANTS' ASSOCIATION, Dorset Hall, Portman Rooms, Baker Street, London, W., at 7.30 p.m. — Second of the Fifth Series of Cinderella Dances.

ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m. — Fourtb Lecture on "Fluids in Motion and at Rest," by C. Vernon Boys.

Friday, Jan. 5. Sun rises 8.9; sets 4.2.

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Open Night—Short Papers.

Saturday, Jan. 6. Sun rises 8.8; sets 4.3.

ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m.—Fifth Lecture on "Fluids in Motion and at Rest," by C. Vernon Boys.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Abram, Andrew Bones, Coull, Delarne, Forster, Gibson, Hallaway, Hill, Ling, Maitland, Pemberton, Poingdestre, Ransom, Reynolds, Robins, Thompson.
